[1534.] By this time Ferdinand Pizarro had landed in Spain. The immense quantities of gold and silver which he imported [135] filled the kingdom with no less astonishment than they had excited in Panama and the adjacent provinces. Pizarro was received by the emperor with the attention due to the bearer of a present so rich as to exceed any idea which the Spaniards had formed concerning the value of their acquisitions in America, even after they had been ten years masters of Mexico. In recompense of his brother's services, his authority was confirmed with new powers and privileges, and the addition of seventy leagues, extending along the coast, to the southward of the territory granted in his former patent. Almagro received the honors which he had so long desired. The title of Adelantado, or governor, was conferred upon him, with jurisdiction over two hundred leagues of country, stretching beyond the southern limits of the province allotted to Pizarro. Ferdinand himself did not go unrewarded. He was admitted into the military order of St. Jago, a distinction always acceptable to a Spanish gentleman, and soon set out on his return to Peru, accompanied by many persons of higher rank than had yet served in that country.

Some account of his negotiations reached Peru before he arrived there himself. Almagro no sooner learned that he had obtained the royal grant of an independent government, than pretending that Cuzco, the imperial residence of the Incas, lay within its boundaries, he attempted to render himself master of that important station. Juan and Gonzalez Pizarro prepared to oppose him. Each of the contending parties was supported by powerful adherents, and the dispute was on the point of being terminated by the sword, when Francis Pizarro arrived in the capital. The reconciliation between him and Almagro had never been cordial. The treachery of Pizarro in engrossing to himself all the honors and emoluments, which ought to have been divided with his associate, was always present in both their thoughts. The former, conscious of his own perfidy, did not expect forgiveness; the latter feeling, that he had been deceived, was impatient to be avenged; and though avarice and ambition had induced them not only to dissemble their sentiments, but even to act in concert while in pursuit of wealth and power, no sooner did they obtain possession of these, than the same passions which had formed this temporary union, gave rise to jealousy and discord. To each of them was attached a small band of interested dependants, who, with the malicious art peculiar to such men, heightened their suspicions, and magnified every appearance of offence. But with all those seeds of enmity in their minds, and thus assiduously cherished, each was so thoroughly acquainted with the abilities and courage of his rival, that they equally dreaded the consequence of an open rupture. The fortunate arrival of Pizarro at Cuzco, and the address mingled with firmness which he manifested in his expostulations with Almagro and his partisans, averted that evil for the present. A new reconciliation took place; the chief article of which was, that Almagro should attempt the conquest of Chili; and if he did not find in that province an establishment adequate to his merit and expectations, Pizarro, by way of indemnification, should yield up to him a part of Peru. This new agreement, though confirmed [June 12] with the same sacred solemnities as their first contract, was observed with as little fidelity.

Soon after he concluded this important transaction, Pizarro marched back to the countries on the sea coast; and as he now enjoyed an interval of tranquillity undisturbed by any enemy, either Spaniard or Indian, he applied himself with that persevering ardor, which dis-

tinguishes his character, to introduce a form of regular government into the extensive provinces subject to his authority. Though ill qualified by his education to enter into any disquisition concerning the principles of civil policy, and little accustomed by his former habits of life to attend to its arrangements, his natural sagacity supplied the want both of science and experience. He distributed the country into various districts; he appointed proper magistrates to preside in each; and established regulations concerning the administration of justice, the collection of the royal revenue, the working of the mines, and the treatment of the Indians, extremely simple, but well calculated to promote the public prosperity. But though, for the present, he adapted his plan to the infant state of his colony, his aspiring mind looked forward to its future grandeur. He considered himself as laying the foundation of a great empire, and deliberated long, and with much solicitude, in what place he should fix the seat of government. Cuzco, the imperial city of the Incas, was situated in a corner of the empire, above four hundred miles from the sea, and much further from Quito, a province of whose value he had formed a high idea. No other settlement of the Peruvians was so considerable as to merit the name of a town, or to allure the Spaniards to fix their residence in it. But in marching through the country, Pizarro had been struck with the beauty and fertility of the valley of Rimac, one of the most extensive and best cultivated in Peru. There, on the banks of a small river of the same name with the vale which it waters and enriches, at the distance of six miles from Callao, the most commodious harbor in the Pacific Ocean, he founded a city which he destined to be the capital of his government, [Jan. 18, 1535.] He gave it the name of *Ciudad de los Reyes*, either from the circumstance of having laid the first stone at that season when the church celebrates the festival of the Three Kings, or, as is more probable, in honor of Juana and Charles, the joint sovereigns of Castile. This name it still retains among the Spaniards in all legal and formal deeds; but it is better known to foreigners by that of *Lima*, a corruption of the ancient appellation of the valley in which it is situated. Under his inspection, the buildings advanced with such rapidity, that it soon assumed the form of a city, which, by a magnificent palace that he erected for himself, and by the stately houses built by several of his officers, gave, even in its infancy, some indication of its subsequent grandeur.

In consequence of what had been agreed with Pizarro, Almagro began his march towards Chili; and as he possessed in an eminent degree the virtues most admired by soldiers, boundless liberality and fearless courage, his standard was followed by five hundred and seventy men, the greatest body of Europeans that had hitherto been assembled in Peru. From impatience to finish the expedition, or from that contempt of hardship and danger acquired by all the Spaniards who had served long in America, Almagro, instead of advancing along the level country on the coast, chose to march across the mountains by a route that was shorter indeed, but almost impracticable. In this attempt his troops were exposed to every calamity which men can suffer, from fatigue, from famine, and from the rigor of the climate in those elevated regions of the torrid zone, where the degree of cold is hardly inferior to what is felt within the polar circle. Many of them perished; and the survivors when they descended into the fertile plains of Chili, had new difficulties to encounter. They found there a race of men very different from the people of Peru, intrepid, hardy, independent, and in their bodily constitution, as well as vigor of spirit, nearly resembling the warlike tribes in North America. Though filled with wonder at the first appearance of the Spaniards, and still more astonished at the operations of their cavalry and the effects of their fire-arms, the Chiles soon recovered so far from their surprise, as not only to defend themselves with obstinacy, but to attack their new enemies with more determined fierceness than any American nation had hitherto discovered. The Spaniards, however, continued to penetrate into the country, and collected some considerable quantities of gold; but were so far from thinking of making any settlement amidst such formidable neighbors, that in spite of all the experience and valor of their leader, the final issue of the expedition still remained extremely dubious, when they were recalled from it by an unexpected revolution at Peru. The causes of this important event I shall endeavor to trace to their source.

So many adventurers had flocked to Peru from every Spanish colony in America, and all with such expectations of accumulating independent fortunes at

once, that, to men possessed with notions so extravagant, any mention of acquiring wealth gradually, and by schemes of patient industry, would have been not only a disappointment but an insult. In order to find occupation for men who could not with safety be allowed to remain inactive, Pizarro encouraged some of the most distinguished officers who had lately joined him, to invade different provinces of the empire, which the Spaniards had not hitherto visited. Several large bodies were formed for this purpose; and about the time that Almagro set out for Chili, they marched into remote districts of the country. No sooner did Manco Capac, the Inca, observe the inconsiderate security of the Spaniards in thus dispersing their troops, and that only a handful of soldiers remained in Cuzco, under Juan and Gonzalez Pizarro, than he thought that the happy period was at length come for vindicating his own rights, for avenging the wrongs of his country, and extirpating its oppressors. Though strictly watched by the Spaniards who allowed him to reside in the palace of his ancestors at Cuzco, he found means of communicating his scheme to the persons who were to be intrusted with the execution of it. Among people accustomed to revere their sovereign as a divinity, every hint of his will carries the authority of a command; and they themselves were now convinced, by the daily increase in the number of their invaders, that the fond hopes which they had long entertained of their voluntary departure were altogether vain. All perceived that a vigorous effort of the whole nation was requisite to expel them, and the preparations for it were carried on with the secrecy and silence peculiar to Americans.

After some unsuccessful attempts of the Inca to make his escape, Ferdinand Pizarro happening to arrive at that time in Cuzco [1536], he obtained permission from him to attend a great festival which was to be celebrated a few leagues from the capital. Under pretext of that solemnity, the great men of the empire were assembled. As soon as the Inca joined them, the standard of war was erected; and in a short time all the fighting men, from the confines of Quito to the frontier of Chili, were in arms. Many Spaniards, living securely on the settlements allotted them, were massacred. Several detachments, as they marched carelessly through a country which seemed to be tamely submissive to their dominion, were cut off to a man. An army amounting (if we may believe the Spanish writers) to two hundred thousand men, attacked Cuzco, which the three brothers endeavored to defend with only one hundred and seventy Spaniards. Another formidable body invested Lima, and kept the governor closely shut up. There was no longer any communication between the two cities; the numerous forces of the Peruvians spreading over the country, intercepted every messenger; and as the parties in Cuzco and Lima were equally unacquainted with the fate of their countrymen, each boded the worst concerning the other, and imagined that they themselves were the only persons who had survived the general extinction of the Spanish name in Peru.

It was at Cuzco, where the Inca commanded in person, that the Peruvians made their chief efforts. During nine months they carried on the siege with incessant ardor, and in various forms; and though they displayed not the same undaunted ferocity as the Mexican warriors, they conducted some of their operations in a manner which discovered greater sagacity, and a genius more susceptible of improvement in the military art. They not only observed the advantages which the Spaniards derived from their discipline and their weapons, but they endeavored to imitate the former, and turned the latter against them. They armed a considerable body of their bravest warriors with the swords, the spears, and bucklers, which they had taken from the Spanish soldiers whom they had cut off in different parts of the country. These they endeavored to march in that regular compact order, to which experience had taught them that the Spaniards were indebted for their irresistible force in action. Some appeared in the field with Spanish muskets, and had acquired skill and resolution enough to use them. A few of the boldest, among whom was the Inca himself, were mounted on the horses which they had taken, and advanced briskly to the charge like Spanish cavaliers, with their lances in the rest. It was more by their numbers, however, than by those imperfect essays to imitate European arts and to employ European arms, that the Peruvians annoyed the Spaniards [136]. In spite of the valor, heightened by despair, with which the three brothers defended Cuzco, Manco Capac recovered possession of one half of his capital; and in their various efforts to drive him out of it, the Spaniards

lost Juan Pizarro, the best beloved of all the brothers, together with some other persons of note. Worn out with the fatigue of incessant duty, distressed with want of provisions, and despairing of being able any longer to resist an enemy whose numbers daily increased, the soldiers became impatient to abandon Cuzco, in hopes either of joining their countrymen, if any of them yet survived, or of forcing their way to the sea, and finding some means of escaping from a country which had been so fatal to the Spanish name. While they were brooding over those desponding thoughts, which their officers labored in vain to dispel, Almagro appeared suddenly in the neighborhood of Cuzco.

The accounts transmitted to Almagro concerning the general insurrection of the Peruvians, were such as would have induced him, without hesitation to relinquish the conquest of Chili, and hasten to the aid of his countrymen. But in this resolution he was confirmed by a motive less generous, but more interesting. By the same messenger who brought him intelligence of the Inca's revolt, he received the royal patent creating him governor of Chili, and defining the limits of his jurisdiction. Upon considering the tenor of it, he deemed it manifest beyond contradiction, that Cuzco lay within the boundaries of his government, and he was equally solicitous to prevent the Peruvians from recovering possession of their capital, and to wrest it out of the hands of the Pizarros. From impatience to accomplish both, he ventured to return by a new route; and in marching through the sandy plains on the coast, he suffered from heat and drought, calamities of a new species hardly inferior to those in which he had been involved by cold and famine on the summits of the Andes.

1537.] His arrival at Cuzco was in a critical moment. The Spaniards and Peruvians fixed their eyes upon him with equal solicitude. The former, as he did not study to conceal his pretensions, were at a loss whether to welcome him as a deliverer, or to take precautions against him as an enemy. The latter, knowing the points in contest between him and his countrymen, flattered themselves that they had more to hope than to dread from his operations. Almagro himself, unacquainted with the detail of the events which had happened in his absence, and solicitous to learn the precise posture of affairs, advanced towards the capital slowly, and with great circumspection. Various negotiations with both parties were set on foot. The Inca conducted them on his part with much address. At first he endeavored to gain the friendship of Almagro; and after many fruitless overtures, despairing of any cordial union with a Spaniard, he attacked him by surprise with a numerous body of chosen troops. But the Spanish discipline and valor maintained their wonted superiority. The Peruvians were repulsed with such slaughter that a great part of their army dispersed, and Almagro proceeded to the gates of Cuzco without interruption.

The Pizarros, as they had no longer to make head against the Peruvians, directed all their attention towards their new enemy, and took measures to obstruct his entry into the capital. Prudence, however, restrained both parties for some time from turning their arms against one another, while surrounded by common enemies who would rejoice in the mutual slaughter. Different schemes of accommodation were proposed. Each endeavored to deceive the other, or to corrupt his followers. The generous, open, affable temper of Almagro gained many adherents of the Pizarros, who were disgusted with their harsh, domineering manners. Encouraged by this defection, he advanced towards the city by night, surprised the sentinels, or was admitted by them, and, investing the house where the two brothers resided, compelled them, after an obstinate defence, to surrender at discretion. Almagro's claim of jurisdiction over Cuzco was universally acknowledged, and a form of administration established in his name.

Two or three persons only were killed in this first act of civil hostility; but it was soon followed by scenes more bloody. Francisco Pizarro having dispersed the Peruvians who had invested Lima, and received some considerable reinforcements from Hispaniola and Nicaragua, ordered five hundred men, under the command of Alonso de Alvarado, to march to Cuzco, in hopes of relieving his brothers, if they and their garrison were not already cut off by the Peruvians. This body, which at that period of the Spanish power in America must be deemed a considerable force, advanced near to the capital before they knew that they had any enemy more formidable than Indians to encounter. It was with astonishment that they beheld their countrymen

posted on the banks of the river Abancay to oppose their progress. Almagro, however, wished rather to gain than to conquer them, and by bribes and promises, endeavored to seduce their leader. The fidelity of Alvarado remained unshaken; but his talents for war were not equal to his virtue. Almagro amused him with various movements, of which he did not comprehend the meaning, while a large detachment of chosen soldiers passed the river by night [July 12], fell upon his camp by surprise, broke his troops before they had time to form, and took him prisoner, together with his principal officers.

By the sudden route of this body, the contest between the two rivals must have been decided, if Almagro had known as well how to improve as how to gain a victory. Rodrigo Orgonez, an officer of great abilities, who having served under the Constable Bourbon, when he led the imperial army to Rome, had been accustomed to bold and decisive measures, advised him instantly to issue orders for putting to death Ferdinand and Gonzalo Pizarros, Alvarado, and a few other persons whom he could not hope to gain, and to march directly with his victorious troops to Lima, before the governor had time to prepare for his defence. But Almagro, though he discerned at once the utility of the counsel, and though he had courage to have carried it into execution, suffered himself to be influenced by sentiments unlike those of a soldier of fortune grown old in service, and by scruples which suited not the chief of a party who had drawn his sword in civil war. Feelings of humanity restrained him from shedding the blood of his opponents; and the dread of being deemed a rebel deterred him from entering a province which the king had allotted to another. Though he knew that arms must terminate the dispute between him and Pizarro, and resolved not to shun that mode of decision: yet, with a timid delicacy, preposterous at such a juncture, he was so solicitous that his rival should be considered as the aggressor, that he marched quietly back to Cuzco, to wait his approach.

Pizarro was still unacquainted with all the interesting events which had happened near Cuzco. Accounts of Almagro's return, of the loss of the capital, of the death of one brother, of the imprisonment of the other two, and of the defeat of Alvarado, were brought to him at once. Such a tide of misfortunes almost overwhelmed a spirit which had continued firm and erect under the rudest shocks of adversity. But the necessity of attending to his own safety, as well as the desire of revenge, preserved him from sinking under it. He took measures for both with his wonted sagacity. As he had the command of the seacoast, and expected considerable supplies both of men and military stores, it was no less his interest to gain time, and to avoid action, than it was that of Almagro to precipitate operations, and to bring the contest to a speedy issue. He had recourse to arts which he had formerly practised with success; and Almagro was again weak enough to suffer himself to be amused with a prospect of terminating their differences by some amicable accommodation. By varying his overtures, and shifting his ground as often as it suited his purpose, sometimes seeming to yield to every thing which his rival could desire, and then retracting all that he had granted, Pizarro dexterously protracted the negotiation to such a length, that, though every day was precious to Almagro, several months elapsed without coming to any final agreement. While the attention of Almagro, and of the officers with whom he consulted, was occupied in detecting and eluding the fraudulent intentions of the governor, Gonzalo Pizarro and Alvarado found means to corrupt the soldiers to whose custody they were committed, and not only made their escape themselves, but persuaded sixty of the men who formerly guarded them to accompany their flight. Fortune having thus delivered one of his brothers, the governor scrupled not at one act of perfidy more to procure the release of the other. He proposed that every point in controversy between Almagro and himself should be submitted to the decision of their sovereign; that until his award was known, each should retain undisturbed possession of whatever part of the country he now occupied; that Ferdinand Pizarro should be set at liberty, and return instantly to Spain, together with the officers whom Almagro purposed to send thither to represent the justice of his claims. Obvious as the design of Pizarro was in those propositions, and familiar as his artifices might now have been to his opponent, Almagro, with a credulity approaching to infatuation, relied on his sincerity, and concluded an agreement on these terms.

The moment that Ferdinand Pizarro recovered his liberty, the governor, no longer fettered in his opera-

BATTLE BETWEEN PIZARRO AND ALMAGRO, NEAR CUSCO, APRIL 26, 1537.

tions by anxiety about his brother's life, threw off every disguise which his concern for it had obliged him to assume. The treaty was forgotten; pacific and conciliating measures were no more mentioned; it was in the field he openly declared, and not in the cabinet,—by arms and not by negotiation,—that it must now be determined who should be master of Peru. The rapidity of his preparations suited such a decisive resolution. Seven hundred men were soon ready to march towards Cuzco. The command of these was given to his two brothers, in whom he could perfectly confide for the execution of his most violent schemes, as they were urged on, not only by the enmity flowing from the rivalry between their family and Almagro, but animated with the desire of vengeance, excited by recollection of their own recent disgrace and sufferings. After an unsuccessful attempt to cross the mountains in the direct road between Lima and Cuzco, they marched towards the south along the coast as far as Nasca, and then turning to the left, penetrated through the defiles in that branch of the Andes which lay between them and the capital. Almagro, instead of hearkening to some of his officers, who advised him to attempt the defence of those difficult passes, waited the approach of the enemy in the plain of Cuzco. Two reasons seem to have induced him to take this resolution. His followers amounted hardly to five hundred, and he was afraid of weakening such a feeble body by sending any detachment towards the mountains. His cavalry far exceeded that of the adverse party, both in number and discipline, and it was only in an open country that he could avail himself of that advantage.

The Pizarros advanced without any obstruction, but what arose from the nature of the desert and horrid regions through which they marched. As soon as they reached the plain, both factions were equally impatient to bring this long protracted contest to an issue. Though countrymen and friends, the subjects of the same sovereign, and each with the royal standard displayed; and though they beheld the mountains that surrounded the plain in which they were drawn up, covered with a vast multitude of Indians assembled to enjoy the spectacle of their mutual carnage, and prepared to attack whatever party remained master of the field; so fell and implacable was the rancor which had taken possession of every breast, that not one pacific counsel, not a single overture towards accommodation proceeded from either side. Unfortunately for Almagro, he was so worn out with the fatigues of service, to which his advanced age was unequal, that, at this crisis of his fate, he could not exert his wonted activity, and he was obliged to commit the leading his troops to Orgognez, who, though an officer of great merit, did not possess the same ascendancy either over the spirit or affections of the soldiers, as the chief whom they had long been accustomed to follow and revere.

The conflict was fierce, and maintained by each party with equal courage [April 26]. On the side of Almagro were more veteran soldiers, and a larger proportion of cavalry; but these were counterbalanced by Pizarro's superiority in numbers, and by two companies of well disciplined musketeers, which, on receiving an account of the insurrection of the Indians, the emperor had sent from Spain. As the use of fire arms was not frequent among the adventurers in America, hastily equipped for service, at their own expense, this small band of soldiers regularly trained and armed, was a novelty in Peru, and decided the fate of the day. Wherever it advanced, the weight of a heavy and well sustained fire bore down horse and foot before it; and Orgognez, while he endeavored to rally and animate his troops, having received a dangerous wound, the route became general. The barbarity of the conquerors stained the glory which they acquired by this complete victory. The violence of civil rage hurried on some to slaughter their countrymen with indiscriminate cruelty; the meanness of private revenge instigated others to single out individuals as the objects of their vengeance. Orgognez and several officers of distinction were massacred in cold blood; above a hundred and forty soldiers fell in the field; a large proportion, where the number of combatants was few, and the heat of the contest soon over. Almagro, though so feeble that he could not bear the motion of a horse, had insisted on being carried in a litter to an eminence which overlooked the field of battle. From thence, in the utmost agitation of mind, he viewed the various movements of both parties, and at last beheld the total defeat of his own troops, with all the passionate indignation of a veteran leader long accustomed to victory. He endeavored to save himself by flight, but was taken prisoner, and guarded with the strictest vigilance.

The Indians, instead of executing the resolution which they had formed, retired quietly after the battle was over; and in the history of the New World, there is not a more striking instance of the wonderful ascendancy which the Spaniards had acquired over its inhabitants, than that, after seeing one of the contending parties ruined and dispersed, and the other weakened and fatigued, they had not courage to fall upon their enemies, when fortune presented an opportunity of attacking them with such advantage.

Cuzco was pillaged by the victorious troops, who found there a considerable booty, consisting partly of the gleanings of the Indian treasures, and partly of the wealth amassed by their antagonists from the spoils of Peru and Chili. But so far did this, and whatever the bounty of their leader could add to it, fall below the high ideas of the recompense which they conceived to be due to their merit, that Ferdinand Pizarro, unable to gratify such extravagant expectations, had recourse to the same expedient which his brother had employed on a similar occasion, and endeavored to find occupation for this turbulent assuming spirit, in order to prevent it from breaking out into open mutiny. With this view, he encouraged the most active officers to attempt the discovery and reduction of various provinces which had not hitherto submitted to the Spaniards. To every standard erected by the leaders who undertook any of those new expeditions, volunteers resorted with the ardor and hope peculiar to the age. Several of Almagro's soldiers joined them, and thus Pizarro had the satisfaction of being delivered both from the importunity of his discontented friends, and the dread of his ancient enemies.

Almagro himself remained for several months in custody, under all the anguish of suspense. For although his doom was determined by the Pizarros from the moment that he fell into their hands, prudence constrained them to defer gratifying their vengeance, until the soldiers who had served under him, as well as several of their own followers in whom they could not perfectly confide, had left Cuzco. As soon as they set out upon their different expeditions, Almagro was impeached of treason, formally tried, and condemned to die. The sentence astonished him; and though he had often braved death with undaunted spirit in the field, its approach under this ignominious form appalled him so much, that he had recourse to abject supplications unworthy of his former fame. He besought the Pizarros to remember the ancient friendship between their brother and him, and how much he had contributed to the prosperity of their family; he reminded them of the humanity with which, in opposition to the repeated remonstrances of his own most attached friends, he had spared their lives when he had them in his power; he conjured them to pity his age and infirmities, and to suffer him to pass the wretched remainder of his days in bewailing his crimes, and in making his peace with Heaven. The entreaties, says a Spanish historian, of a man so much beloved touched many an unfeeling heart, and drew tears from many a stern eye. But the brothers remained inflexible. As soon as Almagro knew his fate to be inevitable, he met it with the dignity and fortitude of a veteran. He was strangled in prison, and afterwards publicly beheaded. He suffered in the seventy-fifth year of his age, and left one son by an Indian woman of Panama, whom, though at that time a prisoner in Lima, he named as successor to his government, pursuant to a power which the emperor had granted him.

1539.] As, during the civil dissensions in Peru, all intercourse with Spain was suspended, the detail of the extraordinary transactions there did not soon reach the court. Unfortunately for the victorious faction, the first intelligence was brought thither by some of Almagro's officers, who left the country upon the ruin of their cause; and they related what had happened, with every circumstance, unfavorable to Pizarro and his brothers. Their ambition, their breach of the most solemn engagements, their violence and cruelty, were painted with all the malignity and exaggeration of party hatred. Ferdinand Pizarro, who arrived soon after, and appeared in court with extraordinary splendor, endeavored to efface the impression which their accusation had made, and to justify his brother and himself by representing Almagro as the aggressor. The emperor and his ministers, though they could not pronounce which of the contending factions was most criminal, clearly discerned the fatal tendency of their dissensions. It was obvious that while the leaders, intrusted with the conduct of two infant colonies, employed the arms which should have been turned against the common enemy, in destroying one another, all attention to the public good

must cease, and there was reason to dread that the Indians might improve the advantage which the dissension of the Spaniards presented to them, and extirpate both the victors and vanquished. But the evil was more apparent than the remedy. Where the information which had been received was so defective and suspicious, and the scene of action so remote, it was almost impossible to chalk out the line of conduct that ought to be followed; and before any plan that should be approved of in Spain could be carried into execution, the situation of the parties, and the circumstances of affairs, might alter so entirely as to render its effects extremely pernicious.

Nothing therefore remained, but to send a person to Peru, vested with extensive and discretionary power, who, after viewing deliberately the posture of affairs with his own eyes, and inquiring upon the spot into the conduct of the different leaders, should be authorized to establish the government in that form which he deemed most conducive to the interest of the parent state, and the welfare of the colony. The man selected for this important charge was Christoval Vaca de Castro, a judge in the court of royal audience at Valladolid; and his abilities, integrity, and firmness justified the choice. His instructions, though ample, were not such as to fetter him in his operations. According to the different aspect of affairs, he had power to take upon him different characters. If he found the governor still alive, he was to assume only the title of judge, to maintain the appearance of acting in concert with him, and to guard against giving any just cause of offence to a man who had merited so highly of his country. But if Pizarro were dead, he was intrusted with a commission that he might then produce, by which he was appointed his successor in the government of Peru. This attention to Pizarro, however, seems to have flowed rather from dread of his power than from any approbation of his measures; for, at the very time that the court seemed so solicitous not to irritate him, his brother Ferdinand was arrested at Madrid, and confined to a prison, where he remained above twenty years.

1540.] While Vaca de Castro was preparing for his voyage, events of great moment happened in Peru. The governor, considering himself, upon the death of Almagro, as the unrivalled possessor of that vast empire, proceeded to parcel out its territories among the conquerors; and had this division been made with any degree of impartiality, the extent of country which he had to bestow was sufficient to have gratified his friends, and to have gained his enemies. But Pizarro conducted this transaction, not with the equity and candor of a judge attentive to discover and to reward merit, but with the illiberal spirit of a party leader. Large districts, in parts of the country most cultivated and populous, were set apart as his own property, or granted to his brothers, his adherents, and favorites. To others, lots less valuable and inviting were assigned. The followers of Almagro, amongst whom were many of the original adventurers to whose valor and perseverance Pizarro was indebted for his success, were totally excluded from any portion in those lands, towards the acquisition of which they had contributed so largely. As the vanity of every individual set an immoderate value upon his own services, and the idea of each concerning the recompense due to them rose gradually to a more exorbitant height in proportion as their conquests extended, all who were disappointed in their expectations exclaimed loudly against the rapaciousness and partiality of the governor. The partisans of Almagro murmured in secret, and meditated revenge.

Rapid as the progress of the Spaniards in South America had been since Pizarro landed in Peru, their avidity of dominion was not yet satisfied. The officers to whom Ferdinand Pizarro gave the command of different detachments, penetrated into several new provinces; and though some of them were exposed to great hardships in the cold and barren regions of the Andes, and others suffered distress not inferior amidst the woods and marshes of the plains, they made discoveries and conquests which not only extended their knowledge of the country, but added considerably to the territories of Spain in the New World. Pedro de Valdivia reassumed Almagro's scheme of invading Chili, and notwithstanding the fortitude of the natives in defending their possessions, made such progress in the conquest of the country, that he founded the city of St. Jago, and gave a beginning to the establishment of the Spanish dominion in that province. But of all the enterprises undertaken about this period, that of Gonzala Pizarro was the most remarkable. The governor, who seems to have resolved that no person

Peru should possess any station of distinguished eminence or authority but those of his own family, had deprived Benalcázar, the conqueror of Quito, of his command in that kingdom, and appointed his brother Gonzalo to take the government of it. He instructed him to attempt the discovery and conquest of the country to the east of the Andes, which, according to the information of the Indians, abounded with cinnamon and other valuable spices. Gonzalo, not inferior to any of his brothers in courage, and no less ambitious of acquiring distinction, eagerly engaged in this difficult service. He set out from Quito at the head of three hundred and forty soldiers, near one half of whom were horsemen; with four thousand Indians to carry their provisions. In forcing their way through the defiles, or over the ridges of the Andes, excess of cold and fatigue, to neither of which they were accustomed, proved fatal to the greater part of their wretched attendants. The Spaniards, though more robust, and inured to a variety of climates, suffered considerably, and lost some men: but when they descended into the low country, their distress increased. During two months it rained incessantly, without any interval of fair weather long enough to dry their clothes. The immense plains upon which they were now entering, either altogether without inhabitants, or occupied by the rudest and least industrious tribes in the New World, yielded little subsistence. They could not advance a step but as they cut a road through woods, or made it through marshes. Such incessant toil, and continual scarcity of food, seem more than sufficient to have exhausted and dispirited any troops. But the fortitude and perseverance of the Spaniards in the sixteenth century were insuperable. Allured by frequent but false accounts of rich countries before them, they persisted in struggling on, until they reached the banks of the Coca or Napo, one of the large rivers whose waters pour into the Maragnon, and contribute to its grandeur. There, with infinite labor, they built a bark, which they expected would prove of great utility in conveying them over rivers, in procuring provisions, and in exploring the country. This was manned with fifty soldiers, under the command of Francis Orellana, the officer next in rank to Pizarro. The stream carried them down with such rapidity, that they were soon far ahead of their countrymen, who followed slowly and with difficulty by land.

At this distance from his commander, Orellana, a young man of an aspiring mind, began to fancy himself independent; and transported with the predominant passion of the age, he formed the scheme of distinguishing himself as a discoverer, by following the course of the Maragnon until it joined the ocean and by surveying the vast regions through which it flows. This scheme of Orellana's was as bold as it was treacherous. For, if he be chargeable with the guilt of having violated his duty to his commander, and with having abandoned his fellow soldiers in a pathless desert, where they had hardly any hopes of success, or even of safety, but what were founded on the service which they expected from the bark; his crime is in some measure balanced by the glory of having ventured upon a navigation of near two thousand leagues, through unknown nations, in a vessel hastily constructed, with green timber, and by very unskilful hands, without provisions, without a compass, or a pilot. But his courage and alacrity supplied every defect. Committing himself fearlessly to the guidance of the stream, the Napo bore him along to the south, until he reached the great channel of the Maragnon. Turning with it towards the coast, he held on his course in that direction. He made frequent descents on both sides of the river, sometimes seizing by force of arms the provisions of the fierce savages seated on its banks; and sometimes procuring a supply of food by a friendly intercourse with more gentle tribes. After a long series of dangers, which he encountered with amazing fortitude, and of distresses which he supported with no less magnanimity, he reached the ocean [137,] where new perils awaited him. These he likewise surmounted, and got safely to the Spanish settlement in the island of Cubagua; from thence he sailed to Spain. The vanity natural to travellers who visit regions unknown to the rest of mankind, and the art of an adventurer solicitous to magnify his own merit, concurred in prompting him to mingle an extraordinary proportion of the marvellous in the narrative of his voyage. He pretended to have discovered nations so rich that the roofs of their temples were covered with plates of gold; and described a republic of women so warlike and powerful, as to have extended their dominion over a considerable tract of the fertile plains which he had

visited. Extravagant as those tales were, they gave rise to an opinion, that a region abounding with gold, distinguished by the name of *El Dorado*, and a community of Amazons, were to be found in this part of the world; and such is the propensity of mankind to believe what is wonderful, that it has been slowly and with difficulty that reason and observation have exploded those fables. The voyage, however, even when stripped of every romantic embellishment, deserves to be recorded not only as one of the most memorable occurrences in that adventurous age, but as the first event which led to any certain knowledge of the extensive countries that stretch eastward from the Andes to the ocean.

No words can describe the consternation of Pizarro, when he did not find the bark at the confluence of the Napo and Maragnon, where he had ordered Orellana to wait for him. He would not allow himself to suspect that a man, whom he had intrusted with such an important command, could be so base and so unfeeling as to desert him at such a juncture. But imputing his absence from the place of rendezvous to some unknown accident, he advanced above fifty leagues along the banks of the Maragnon, expecting every moment to see the bark appear with a supply of provisions [1541]. At length he came up with an officer whom Orellana had left to perish in the desert, because he had the courage to remonstrate against his perfidy. From him he learned the extent of Orellana's crime, and his followers perceived at once their own desperate situation, when deprived of their only resource. The spirit of the stoutest hearted veteran sunk within him, and all demanded to be led back instantly. Pizarro, though he assumed an appearance of tranquillity, did not oppose their inclination. But he was now twelve hundred miles from Quito; and in that long march the Spaniards encountered hardships greater than those which they had endured in their progress outward, without the alluring hopes which then soothed and animated them under their sufferings. Hunger compelled them to feed on roots and berries, to eat all their dogs and horses, to devour the most loathsome reptiles, and even to gnaw the leather of their saddles and swordbelts. Four thousand Indians, and two hundred and ten Spaniards, perished in this wild disastrous expedition, which continued near two years; and as fifty men were aboard the bark with Orellana, only four score got back to Quito. These were naked like savages, and so emaciated with famine, or worn out with fatigue, that they had more the appearance of spectres than of men.

But, instead of returning to enjoy the repose which his condition required, Pizarro, on entering Quito, received accounts of a fatal event that threatened calamities more dreadful to him than those through which he had passed. From the time that his brother made that partial division of his conquests which has been mentioned, the adherents of Almagro, considering themselves as proscribed by the party in power, no longer entertained any hope of bettering their condition. Great numbers in despair resorted to Lima, where the house of young Almagro was always open to them, and the slender portion of his father's fortune, which the governor allowed him to enjoy, was spent in affording them subsistence. The warm attachment with which every person who had served under the elder Almagro devoted himself to his interests, was quickly transferred to his son, who was now grown up to the age of manhood, and possessed all the qualities which captivate the affections of soldiers. Of a graceful appearance, dexterous at all martial exercises, bold, open, generous, he seemed to be formed for command; and as his father, conscious of his own inferiority from the total want of education, had been extremely attentive to have him instructed in every science becoming a gentleman; the accomplishments which he had acquired heightened the respect of his followers, as they gave him distinction and eminence among illiterate adventurers. In this young man the Almagrians found a point of union which they wanted, and, looking up to him as their head, were ready to undertake any thing for his advancement. Nor was affection for Almagro their only incitement; they were urged on by their own distresses. Many of them, destitute of common necessities, [138] and weary of loitering away life, a burden to their chief, or to such of their associates as had saved some remnant of their fortune from pillage and confiscation, longed impatiently for an occasion to exert their activity and courage, and began to deliberate how they might be avenged on the author of all their misery. Their frequent cabals did not pass unobserved; and the governor was warned to be on his guard against men who meditated some desperate deed, and had re-

solution to execute it. But either from the native intrepidity of his mind, or for contempt of persons whose poverty seemed to render their machinations of little consequence, he disregarded the admonitions of his friends. "Be in no pain," said he carelessly, "about my life: it is perfectly safe, as long as every man in Peru knows that I can in a moment cut off any head which dares to harbor a thought against it." This security gave the Almagrians full leisure to digest and ripen every part of their scheme; and Juan de Herrada, an officer of great abilities, who had the charge of Almagro's education, took the direction of their consultations with all the zeal which this connection inspired, and with all the authority which the ascendant that he was known to have over the mind of his pupil gave him.

On Sunday the twenty-sixth of June, at mid-day, the season of tranquillity and repose in all sultry climates, Herrada, at the head of eighteen of the most determined conspirators, sallied out of Almagro's house, in complete armor; and, drawing their swords, as they advanced hastily towards the governor's palace, cried out, "Long live the King, but let the tyrant die!" Their associates, warned of their motions by a signal, were in arms at different stations ready to support them. Though Pizarro was usually surrounded by such a numerous train of attendants as suited the magnificence of the most opulent subject of the age in which he lived; yet as he was just risen from table, and most of the domestics had retired to their own apartments, the conspirators passed through the two outer courts of the palace unobserved. They were at the bottom of the stair-case before a page in waiting could give the alarm to his master, who was conversing with a few friends in a large hall. The governor, whose steady mind no form of danger could appal, starting up, called for arms, and commanded Francisco de Chaves to make fast the door. But that officer, who did not retain so much presence of mind as to obey this prudent order, running to the top of the stair-case, wildly asked the conspirators what they meant, and whither they were going! Instead of answering, they stabbed him to the heart, and burst into the hall. Some of the persons who were there threw themselves from the windows; others attempted to fly; and a few drawing their swords followed their leader into an inner apartment. The conspirators, animated with having the object of their vengeance now in view, rushed forward after them. Pizarro, with no other arms than his sword and buckler, defended the entry; and, supported by his half brother Alcantara, and his little knot of friends, he maintained the unequal contest with intrepidity worthy of his past exploits, and with the vigor of a youthful combatant. "Courage" cried he, "companions! we are yet now to make those traitors repent of their audacity." But the armor of the conspirators protected them, while every thrust they made took effect. Alcantara fell dead at his brother's feet; his other defenders were mortally wounded. The governor, so weary that he could hardly wield his sword, and no longer able to parry the many weapons furiously aimed at him, received a deadly thrust full in his throat, sunk to the ground, and expired.

As soon as he was slain, the assassins ran out into the streets, and, waving their bloody swords, proclaimed the death of the tyrant. Above two hundred of their associates having joined them, they conducted young Almagro in solemn procession through the city, and, assembling the magistrates and principal citizens, compelled them to acknowledge him as lawful successor to his father in his government. The palace of Pizarro, together with the houses of several of his adherents, was pillaged by the soldiers, who had the satisfaction at once of being avenged on their enemies, and of enriching themselves by the spoils of those through whose hands all the wealth of Peru had passed.

The boldness and success of the conspiracy, as well as the name and popular qualities of Almagro, drew many soldiers to his standard. Every adventurer of desperate fortune, all who were dissatisfied with Pizarro (and from the rapaciousness of his government in the latter years of his life the number of malecontents was considerable), declared without hesitation in favor of Almagro, and he was soon at the head of eight hundred of the most gallant veterans in Peru. As his youth and inexperience disqualified him from taking the command of them himself, he appointed Herrada to act as general. But though Almagro speedily collected such a respectable force, the acquiescence in his government was far from being general. Pizarro had left many friends to whom his memory was dear; the barbarous assassination of a man to whom his country was so highly indebted, filled every impartial person with hor-

ror. The ignominious birth of Almagro, as well as the doubtful title on which he founded his pretensions, led others to consider him as a usurper. The officers who commanded in some provinces refused to recognize his authority until it was confirmed by the emperor. In others, particularly at Cuzco, the royal standard was erected, and preparations were begun in order to revenge the murder of their ancient leader.

Those seeds of discord, which could not have lain long dormant, acquired great vigor and activity when the arrival of Vaca de Castro was known. After a long and disastrous voyage, he was driven by stress of weather into a small harbor in the province of Popayan; and proceeding from thence by land, after a journey no less tedious than difficult, he reached Quito. In his way he received accounts of Pizarro's death, and of the events which followed upon it. He immediately produced the royal commission appointing him governor of Peru, with the same privileges and authority; and his jurisdiction was acknowledged without hesitation by Benalcázar, adelantado or lieutenant-general for the emperor in Popayan, and by Pedro de Puelles, who, in the absence of Gonzalo Pizarro, had the command of the troops left in Quito. Vaca de Castro not only assumed the supreme authority, but showed that he possessed the talents which the exercise of it at that juncture required. By his influence and address he soon assembled such a body of troops as not only to set him above all fear of being exposed to any insult from the adverse party, but enabled him to advance from Quito with the dignity which became his character. By despatching persons of confidence to the different settlements in Peru with a formal notification of his arrival and of his commission, he communicated to his countrymen the royal pleasure with respect to the government of the country. By private emissaries, he excited such officers as had discovered their disapprobation of Almagro's proceedings, to manifest their duty to their sovereign by supporting the person honored with his commission. Those measures were productive of great effects. Encouraged by the approach of the new governor, or prepared by his machinations, the loyal were confirmed in their principles, and avowed them with greater boldness; the timid ventured to declare their sentiments; the neutral and wavering, finding it necessary to choose a side, began to lean to that which now appeared to be the safest as well as the most just.

Almagro observed the rapid progress of this spirit of disaffection to his cause; and in order to give an effectual check to it before the arrival of Vaca de Castro, he set out at the head of his troops for Cuzco, [1542.] where the most considerable body of opponents had erected the royal standard, under the command of Pedro Alvarez Holguin. During his march thither, Herada, the skilful guide of his youth and of his counsels, died; and from that time his measures were conspicuous for their violence, but concerted with little sagacity, and executed with no address. Holguin, who, with forces far inferior to those of the opposite party, was descending towards the coast at the very time that Almagro was on his way to Cuzco, deceived his inexperienced adversary by a very simple stratagem, avoided an engagement, and effected a junction with Alvarado, an officer of note, who had been the first to declare against Almagro as a usurper.

Soon after Vaca de Castro entered their camp with the troops which he brought from Quito; and erecting the royal standard before his own tent, he declared that, as governor, he would discharge in person all the functions of general of their combined forces. Though formed by the tenor of his past life to the habits of a sedentary and pacific profession, he at once assumed the activity and discovered the decision of an officer long accustomed to command. Knowing his strength to be now far superior to that of the enemy, he was impatient to terminate the contest by a battle. Nor did the followers of Almagro, who had no hopes of obtaining a pardon for a crime so atrocious as the murder of the governor, decline that mode of decision. They met at Chupaz, [Sept. 16.] about two hundred miles from Cuzco, and fought with all the fierce animosity inspired by the violence of civil rage, the rancor of private enmity, the eagerness of revenge, and the last efforts of despair. Victory, after remaining long doubtful, declared at last for Vaca de Castro. The superior number of his troops, his own intrepidity, and the martial talents of Francisco de Carvajal, a veteran officer formed under the great captain in the wars of Italy, and who on that day laid the foundation of his future fame in Peru, triumphed over the bravery of his opponents, though led on by young Almagro No. 10.

with a gallant spirit worthy of a better cause, and deserving another fate. The carnage was great in proportion to the number of the combatants. Many of the vanquished, especially such as were conscious that they might be charged with being accessory to the assassination of Pizarro, rushing on the swords of the enemy, chose to fall like soldiers rather than wait an ignominious doom. Of fourteen hundred men, the total amount of combatants on both sides, five hundred lay dead on the field, and the number of the wounded was still greater.

If the military talents displayed by Vaca de Castro, both in the council and in the field, surprised the adventurers in Peru, they were still more astonished at his conduct after the victory. As he was by nature a rigid dispenser of justice, and persuaded that it required examples of extraordinary severity to restrain the licentious spirit of soldiers so far removed from the seat of government, he proceeded directly to try his prisoners as rebels. Forty were condemned to suffer the death of traitors, others were banished from Peru. Their leader, who made his escape from the battle, being betrayed by some of his officers, was publicly beheaded in Cuzco; and in him the name of Almagro, and the spirit of the party, was extinct.

During those violent convulsions in Peru, the emperor and his ministers were intently employed in preparing regulations, by which they hoped not only to re-establish tranquillity there, but to introduce a more perfect system of internal policy into all their settlements in the New World. It is manifest from all the events recorded in the history of America, that, rapid and extensive as the Spanish conquests there had been, they were not carried on by any regular exertion of the national force, but by the occasional efforts of private adventurers. After fitting out a few of the first armaments for discovering new regions, the court of Spain, during the busy reigns of Ferdinand and Charles V., the former the most intriguing prince of the age, and the latter the most ambitious, was encumbered with such a multiplicity of schemes, and involved in war with so many nations of Europe, that he had not leisure to attend to distant and less interesting objects. The care of prosecuting discovery, or of attempting conquest, was abandoned to individuals; and with such ardor did men push forward in this new career, on which novelty, the spirit of adventure, avarice, ambition, and the hope of meriting heaven, prompted them with combined influence to enter, that in less than half a century almost the whole of that extensive empire which Spain now possesses in the New World, was subjected to its dominion. As the Spanish court contributed nothing towards the various expeditions undertaken in America, it was not entitled to claim much from their success. The sovereignty of the conquered provinces, with the fifth of the gold and silver, was reserved for the crown; every thing else was seized by the associates in each expedition as their own right. The plunder of the countries which they invaded served to indemnify them for what they had expended in equipping themselves for the service, and the conquered territory was divided among them, according to rules which custom had introduced, as permanent establishments which their successful valor merited. In the infancy of those settlements, when their extent as well as their value was unknown, many irregularities escaped observation, and it was found necessary to connive at many excesses. The conquered people were frequently pillaged with destructive rapacity, and their country parcelled out among its new masters in exorbitant shares, far exceeding the highest recompense due to their services. The rude conquerors of America, incapable of forming their establishments upon any general or extensive plan of policy, attentive only to private interest, unwilling to forego present gain from the prospect of remote or public benefit, seem to have had no object but to amass sudden wealth, without regarding what might be the consequences of the means by which they acquired it. But when time at length discovered to the Spanish court the importance of its American possessions, the necessity of new-modelling their whole frame became obvious, and in place of the maxims and practices prevalent among military adventurers, it was found requisite to substitute the institutions of regular government.

One evil in particular called for an immediate remedy. The conquerors of Mexico and Peru imitated the fatal example of their countrymen settled in the islands, and employed themselves in searching for gold and silver with the same inconsiderate eagerness. Similar effects followed. The natives employed in this labor by masters, who in imposing tasks had no regard either

to what they felt or to what they were able to perform, pined away and perished so fast, that there was reason to apprehend that Spain, instead of possessing countries peopled to such a degree as to be susceptible of progressive improvement, would soon remain proprietor only of a vast uninhabited desert.

The emperor and his ministers were so sensible of this, and so solicitous to prevent the extinction of the Indian race, which threatened to render their acquisitions of no value, that from time to time various laws, which I have mentioned, had been made for securing to that unhappy people more gentle and equitable treatment. But the distance of America from the seat of empire, the feebleness of government in the new colonies, the avarice and audacity of soldiers unaccustomed to restraint, prevented these salutary regulations from operating with any considerable influence. The evil continued to grow, and at this time the emperor found an interval of leisure from the affairs of Europe to take it into attentive consideration. He consulted not only with his ministers and the members of the council of the Indies, but called upon several persons who had resided long in the New World to aid them with the result of their experience and observation. Fortunately for the people of America, among these was Bartholomew de las Casas, who happened to be then at Madrid on a mission from a Chapter of his order at Chiapa. Though since the miscarriage of his former schemes for the relief of the Indians, he had continued shut up in his cloister, or occupied in religious functions, his zeal in behalf of the former objects of his pity was so far from abating, that, from an increased knowledge of their sufferings, its ardor had augmented. He seized eagerly this opportunity of reviving his favorite maxims concerning the treatment of the Indians. With the moving eloquence natural to a man on whose mind the scenes which he had beheld had made a deep impression, he described the irreparable waste of the human species in the New World, the Indian race almost totally swept away in the islands in less than fifty years, and hastening to extinction on the continent with the same rapid decay. With the decisive tone of one strongly prepossessed with the truth of his own system, he imputed all this to a single cause, to the exactions and cruelty of his countrymen, and contended that nothing could prevent the depopulation of America, but the declaring of its natives to be freemen, and treating them as subjects, not as slaves. Nor did he confide for the success of this proposal in the powers of his oratory alone. In order to enforce them, he composed his famous treatise concerning the destruction of America, in which he relates, with many horrid circumstances, but with apparent marks of exaggerated description, the devastation of every province which had been visited by the Spaniards.

The emperor was deeply afflicted with the recital of so many actions shocking to humanity. But as his views extended far beyond those of Las Casas, he perceived that relieving the Indians from oppression was but one step towards rendering his possessions in the New World a valuable acquisition, and would be of little avail, unless he could circumscribe the power and usurpations of his own subjects there. The conquerors of America, however great their merit had been towards their country, were mostly persons of such mean birth, and of such an abject rank in society, as gave no distinction in the eye of a monarch. The exorbitant wealth with which some of them returned, gave umbrage to an age not accustomed to see men in inferior condition elevated above their level, and rising to emulate or to surpass the ancient nobility in splendor. The territories which their leaders had appropriated to themselves were of such enormous extent [139], that, if the country should ever be improved in proportion to the fertility of the soil, they must grow too wealthy and too powerful for subjects. It appeared to Charles that this abuse required a remedy no less than the other, and that the regulations concerning both must be enforced by a mode of government more vigorous than had yet been introduced into America.

With this view he framed a body of laws, containing many salutary appointments with respect to the constitution and powers of the supreme council of the Indies, concerning the station and jurisdiction of the royal audiences in different parts of America; the administration of justice; the order of government, both ecclesiastical and civil. These were approved of by all ranks of men. But together with them were issued the following regulations, which excited universal alarm, and occasioned the most violent convulsions: "That as the *repartimientos* or shares of land seized by several persons appeared to be excessive, the royal audiences are

empowered to reduce them to a moderate extent: That upon the death of any conqueror or planter, the lands and Indians granted to him shall not descend to his widow or children, but return to the crown: That the Indians shall henceforth be exempt from personal service, and shall not be compelled to carry the baggage of travellers, to labor in the mines, or to dive in the pearl fisheries: That the stated tribute due by them to their superior shall be ascertained, and they shall be paid as servants for any work they voluntarily perform: That all persons who are or have been in public offices, all ecclesiastics of every denomination, all hospitals and monasteries, shall be deprived of the lands and Indians allotted to them, and these be annexed to the crown: That every person in Peru, who had any criminal concerns in the contest between Pizarro and Almagro should forfeit his lands and Indians."

All the Spanish ministers who had hitherto been intrusted with the direction of American affairs, and who were best acquainted with the state of the country, remonstrated against those regulations as ruinous to their infant colonies. They represented, that the number of Spaniards who had hitherto emigrated to the New World was so extremely small, that nothing could be expected from any effort of theirs towards improving the vast regions over which they were scattered; that the success of every scheme for this purpose must depend upon the ministry and service of the Indians, whose native indolence and aversion to labor, no prospect of benefit or promise of reward could surmount; that the moment the right of imposing a task, and exacting the performance of it, was taken from their masters, every work of industry must cease, and all the sources from which wealth began to pour in upon Spain must be stopped for ever. But Charles, tenacious at all times of his own opinions, and so much impressed at present with the view of the disorders which reigned in America, that he was willing to hazard the application even of a dangerous remedy, persisted in his resolution of publishing the laws. That they might be carried into execution with greater vigor and authority, he authorized Francisco Tello de Sandoval to repair to Mexico as *Visitador*, or superintendent of that country, and to co-operate with Antonio de Mendoza, the viceroy in enforcing them. He appointed Blasco Nunez Vela to be governor of Peru, with the title of viceroy; and in order to strengthen his administration, he established a court of royal audience in Lima [1543], in which four lawyers of eminence were to preside as judges.

The viceroy and superintendent sailed at the same time; and an account of the laws which they were to enforce reached America before them. The entry of Sandoval into Mexico was viewed as the prelude of general ruin. The unlimited grant of liberty to the Indians affected every Spaniard in America without distinction, and there was hardly one who might not on some pretext be included under the other regulations, and suffer by them. But the colony in New Spain had now been so long accustomed to the restraints of law and authority under the steady and prudent administration of Mendoza, that, how much soever the spirit of the new statutes was detested and dreaded, no attempt was made to obstruct the publication of them by any act of violence unbecoming subjects. The magistrates and principal inhabitants, however, presented dutiful addresses to the viceroy and superintendent, representing the fatal consequences of enforcing them. Happily for them, Mendoza, by long residence in the country, was so thoroughly acquainted with its state, that he knew what was for its interest as well as what it could bear; and Sandoval, though new in office, displayed a degree of moderation seldom possessed by persons just entering upon the exercise of power. They engaged to suspend, for some time, the execution of what was offensive in the new laws, and not only consented that a deputation of citizens should be sent to Europe to lay before the emperor the apprehensions of his subjects in New Spain with respect to their tendency and effects, but they concurred with them in supporting their sentiments. Charles, moved by the opinion of men whose abilities and integrity entitled them to decide concerning what felt immediately under their own view, granted such a relaxation of the rigor of the laws as re-established the colony in its former tranquillity.

In Peru the storm gathered with an aspect still more fierce and threatening, and was not so soon dispersed. The conquerors of Peru, of a rank much inferior to those who had subjected Mexico to the Spanish crown, further removed from the inspection of the parent state, and intoxicated with the sudden acquisition of wealth,

carried on all their operations with greater license and irregularity than any body of adventurers in the New World. Amidst the general subversion of law and order, occasioned by two successive civil wars, when each individual was at liberty to decide for himself, without any guide but his own interest or passions, this turbulent spirit rose above all sense of subordination. To men thus corrupted by anarchy, the introduction of regular government, the power of a viceroy, and the authority of a respectable court of judicature, would of themselves have appeared formidable restraints, to which they would have submitted with reluctance. But they revolted with indignation against the idea of complying with laws, by which they were to be stripped at once of all they had earned so hardly during many years of service and suffering. As the account of the new laws spread successively through the different settlements, the inhabitants ran together, the women in tears, and the men exclaiming against the injustice and ingratitude of their sovereign in depriving them, unheard and unconvicted, of their possessions. "Is this," cried they, "the recompense due to persons, who, without public aid, at their own expense, and by their own valor, have subjected to the crown of Castile territories of such immense extent and opulence? Are these the rewards bestowed for having endured unparalleled distress, for having encountered every species of danger in the service of their country? Whose merit is so great, whose conduct has been so irreproachable, that he may not be condemned by some penal clause in regulations, conceived in terms as loose and comprehensive, as if it had been intended that all should be entangled in their snare? Every Spaniard of note in Peru has held some public office, and all, without distinction, have been constrained to take an active part in the contest between the two rival chiefs. Were the former to be robbed of their property because they had done their duty? Were the latter to be punished on account of what they could not avoid? Shall the conquerors of this great empire, instead of receiving marks of distinction, be deprived of the natural consolation of providing for their widows and children, and leave them to depend for subsistence on the scanty supply they can extort from unfeeling courtiers? We are not able now," continued they, "to explore unknown regions in quest of more secure settlements; our constitutions debilitated with age, and our bodies covered with wounds, are no longer fit for active service; but still we possess vigor sufficient to assert our just rights, and we will not tamely suffer them to be wrested from us."

By discourses of this sort, uttered with vehemence, and listened to with universal approbation, their passions were inflamed to such a pitch that they were prepared for the most violent measures; and began to hold consultations in different places, how they might oppose the entrance of the viceroy and judges, and prevent not only the execution but the promulgation of the new laws. From this, however, they were diverted by the address of Vaca de Castro, who flattered them with hopes, that, as soon as the viceroy and judges should arrive, and had leisure to examine their petitions and remonstrances, they would concur with them in endeavoring to procure some mitigation in the rigor of laws which had been framed without due attention either to the state of the country, or to the sentiments of the people. A greater degree of accommodation to these, and even some concessions on the part of government, were now become requisite to compose the present ferment, and to soothe the colonists into submission, by inspiring them with confidence in their superiors. But without profound discernment, conciliating manners, and flexibility of temper, such a plan could not be carried on. The viceroy possessed none of these. Of all the qualities that fit men for high command, he was endowed only with integrity and courage; the former harsh and uncompromising, the latter bordering so frequently on rashness or obstinacy, that, in his situation, they were defects rather than virtues. From the moment that he landed at Tumbez [March 4], Nunez Vela seems to have considered himself merely as an executive officer, without any discretionary power; and regardless of whatever he observed or heard concerning the state of the country, he adhered to the letter of the regulations with unrelenting rigor. In all the towns through which he passed, the natives were declared to be free, every person in public office was deprived of his lands and servants, and as an example of obedience to others, he would not suffer a single Indian to be employed in carrying his own baggage in his march towards Lima. Amusement and consternation went before him as he approached; and

so little solicitous was he to prevent these from augmenting, that, on entering the capital, he openly avowed that he came to obey the orders of his sovereign, not to dispense with his laws. This harsh declaration was accompanied with what rendered it still more intolerable, haughtiness in deportment, a tone of arrogance and decision in discourse, and an insolence of office grievous to men little accustomed to hold civil authority in high respect. Every attempt to procure a suspension or mitigation of the new laws, the viceroy considered as flowing from a spirit of disaffection that tended to rebellion. Several persons of rank were confined, and some put to death, without any form of trial. Vaca de Castro was arrested; and notwithstanding the dignity of his former rank, and his merit, in having prevented a general insurrection in the colony, he was loaded with chains, and shut up in the common jail.

But however general the indignation was against such proceedings, it is probable the hand of authority would have been strong enough to suppress it, or to prevent it bursting out with open violence, if the malecontents had not been provided with a leader of credit and eminence to unite and to direct their efforts. From the time that the purport of the new regulations was known in Peru, every Spaniard there turned his eyes towards Gonzalo Pizarro, as the only person able to avert the ruin with which they threatened the colony. From all quarters, letters and addresses were sent to him, conjuring him to stand forth as their common protector, and offering to support him in the attempt with their lives and fortunes. Gonzalo, though inferior in talents to his other brothers, was equally ambitious, and of courage no less daring. The behavior of an ungrateful court towards his brothers and himself dwelt continually on his mind. Ferdinand a state prisoner in Europe, the children of the governor in custody of the viceroy, and sent aboard his fleet, himself reduced to the condition of a private citizen in a country for the discovery and conquest of which Spain was indebted to his family—these thoughts prompted him to seek for vengeance, and to assert the rights of his family, of which he now considered himself as the guardian and the heir. But as no Spaniard can easily surmount that veneration for his sovereign which seems to be interwoven in his frame, the ideas of marching in arms against the royal standard filled him with horror. He hesitated long, and was still unresolved, when the violence of the viceroy, the universal call of his countrymen, and the certainty of becoming soon a victim himself to the severity of the new laws, moved him to quit his residence at Chuquisaca de la Plata, and repair to Cuzco. All the inhabitants went out to meet him, and received him with transports of joy as the deliverer of the colony. In the fervor of their zeal, they elected him procurator-general of the Spanish nation in Peru, to solicit the repeal of the late regulations. They empowered him to lay their remonstrances before the royal audience in Lima, and upon pretext of danger from the Indians, authorized him to march thither in arms [1544]. Under sanction of this nomination Pizarro took possession of the royal treasure, appointed officers, levied soldiers, seized a large train of artillery which Vaca de Castro had deposited in Gumsnga, and set out for Lima as if he had been advancing against a public enemy. Disaffection having now assumed a regular form, and being united under a chief of such distinguished name, many persons of note resorted to his standard; and a considerable part of the troops, raised by the viceroy to oppose his progress, deserted to him in a body.

Before Pizarro reached Lima, a revolution had happened there, which encouraged him to proceed with almost certainty of success. The violence of the viceroy's administration was not more formidable to the Spaniards of Peru than his overbearing haughtiness was odious to his associates, the judges of the royal audience. During their voyage from Spain, some symptoms of coldness between the viceroy and them began to appear. But as soon as they entered upon the exercise of their respective offices, both parties were so much exasperated by frequent contests, arising from interference of jurisdiction and contrariety of opinion, that their mutual disgust soon grew into open enmity. The judges thwarted the viceroy in every measure, set at liberty prisoners whom he had confined, justified the malecontents, and applauded their remonstrances. At a time when both departments of government should have united against the approaching enemy, they were contending with each other for superiority. The judges at length prevailed. The viceroy, universally odious, and abandoned even by his own guards, was seized in his palace [Sept. 18], and carried to a

desert island on the coast, to be kept there until he could be sent home to Spain.

The judges, in consequence of this, having assumed the supreme direction of affairs into their own hands, issued a proclamation suspending the execution of the obnoxious laws, and sent a message to Pizarro, requiring him, as they had already granted whatever he could request, to dismiss his troops, and to repair to Lima with fifteen or twenty attendants. They could hardly expect that a man so daring and ambitious would tamely comply with this requisition. It was made, probably, with no such attention, but only to throw a decent veil over their own conduct; for Cepeda, the president of the court of audience, a pragmatist and aspiring lawyer, seems to have held a secret correspondence with Pizarro, and had already formed the plan, which he afterwards executed, of devoting himself to his service. The imprisonment of the viceroy, the usurpation of the judges, together with the universal confusion and anarchy consequent upon events so singular and unexpected, opened new and vast prospects to Pizarro. He now beheld the supreme power within his reach. Nor did he want courage to push on towards the object which fortune presented to his view. Carvajal, the prompter of his resolutions, and guide of all his actions, had long fixed his eye upon it as the only end at which Pizarro ought to aim. Instead of the inferior function of procurator for the Spanish settlements in Peru, he openly demanded to be governor and Captain-general of the whole province, and required the court of audience to grant him a commission to that effect. At the head of twelve hundred men, within a mile of Lima, where there was neither leader nor army to oppose him, such a request carried with it the authority of a command. But the judges, either from unwillingness to relinquish power, or from a desire of preserving some attention to appearances, hesitated, or seemed to hesitate, about complying with what he demanded. Carvajal, impatient of delay, and impetuous in all his operations, marched into the city by night, seized several officers of distinction obnoxious to Pizarro, and hanged them without the formality of a trial. Next morning the court of audience issued a commission in the emperor's name, appointing Pizarro governor of Peru, with full powers, civil as well as military, and he entered the town that day with extraordinary pomp, to take possession of his new dignity.

Oct. 28.] But amidst the disorder and turbulence which accompanied this total dissolution of the frame of government, the minds of men, set loose from the ordinary restraints of law and authority, acted with such capricious irregularity, that events no less extraordinary than unexpected followed in rapid succession. Pizarro had scarcely begun to exercise the new powers with which he was invested, when he beheld formidable enemies rise up to oppose him. The viceroy having been put on board a vessel by the judges of the audience, in order that he might be carried to Spain under custody of Juan Alvarez one of their own number; as soon as they were out at sea, Alvarez, either touched with remorse, or moved by fear, kneeled down to his prisoner, declared him from that moment to be free, and that he himself, and every person in the ship, would obey him as the legal representative of their sovereign. Nuguez Vela ordered the pilot of the vessel to shape his course towards Tumbez, and as soon as he landed there, erected the royal standard, and resumed his functions of viceroy. Several persons of note, to whom the contagion of the seditious spirit which reigned at Cuzco and Lima had not reached, instantly avowed their resolution to support his authority. The violence of Pizarro's government, who observed every individual with the jealousy natural to usurpers, and who punished every appearance of disaffection with unforgiving severity, soon augmented the number of the viceroy's adherents, as it forced some leading men in the colony to fly to him for refuge. While he was gathering such strength at Tumbez, that his forces began to assume the appearance of what was considered as an army in America, Diego Centeno, a bold and active officer, exasperated by the cruelty and oppression of Pizarro's lieutenant-governor in the province of Charcas, formed a conspiracy against his life, cut him off, and declared for the viceroy.

1545.] Pizarro, though alarmed with those appearances of hostility in the opposite extremes of the empire, was not disconcerted. He prepared to assert the authority, to which he had attained, with the spirit and conduct of an officer accustomed to command, and marched directly against the viceroy as the enemy who was nearest as well as most formidable. As he was master of the public revenues in Peru, and most of the

military men were attached to his family, his troops were so numerous, that the viceroy, unable to face them, retreated towards Quito. Pizarro followed him; and in that long march, through a wild, mountainous country, suffered hardships, and encountered difficulties, which no troops but those accustomed to serve in America could have endured or surmounted. [140.] The viceroy had scarcely reached Quito, when the vanguard of Pizarro's forces appeared, led by Carvajal, who, though near fourscore, was as hardy and active as any young soldier under his command. Nuguez Vela, instantly abandoned a town incapable of defence, and, with a rapidity more resembling a flight than a retreat, marched into the province of Popayan. Pizarro continued to pursue; but, finding it impossible to overtake him, returned to Quito. From thence he despatched Carvajal to oppose Centeno, who was growing formidable in the southern provinces of the empire, and he himself remained there to make head against the viceroy.

By his own activity, and the assistance of Benalcázar, Nuguez Vela soon assembled four hundred men in Popayan. As he retained, amidst all his disasters, the same elevation of mind, and the same high sense of his own dignity, he rejected with disdain the advice of some of his followers who urged him to make overtures of accommodation to Pizarro, declaring that it was only by the sword that a contest with rebels could be decided. With this intention he marched back to Quito [1546.] Pizarro relying on the superior number, and still more on the discipline and valor of his troops, advanced resolutely to meet him [Jan. 18]. The battle was fierce and bloody, both parties fighting like men who knew that the possession of a great empire, the fate of their leaders, and their own future fortune, depended upon the issue of that day. But Pizarro's veterans pushed forward with such regular and well directed force, that they soon began to make impression on their enemies. The viceroy, by extraordinary exertions, in which the abilities of a commander and the courage of a soldier were equally displayed, held victory for some time in suspense. At length he fell, pierced with many wounds; and the route of his followers became general. They were hotly pursued. His head was cut off, and placed on the public gibbet in Quito, which Pizarro entered in triumph. The troops assembled by Centeno were dispersed soon after by Carvajal, and he himself compelled to fly to the mountains, where he remained for several months concealed in a cave. Every person in Peru, from the frontiers of Popayan to those of Chili, submitted to Pizarro; and by his fleet, under Pedro de Hinojosa, he had not only the unrivalled command of the South Sea, but had taken possession of Panama, and placed a garrison in Nombre de Dios, on the opposite side of the isthmus, which rendered him master of the only avenue of communication between Spain and Peru, that was used at that period.

After this decisive victory, Pizarro and his followers remained for some time at Quito; and during the first transports of their exultation, they ran into every excess of licentious indulgence, with the riotous spirit usual among low adventurers upon extraordinary success. But amidst this dissipation, their chief and his confidants were obliged to turn their thoughts sometimes to what was serious, and deliberated with much solicitude concerning the part that he ought now to take. Carvajal, no less bold and decisive in council than in the field, had from the beginning warned Pizarro, that in the career on which he was entering, it was vain to think of holding a middle course; that he must either boldly aim at all, or attempt nothing. From the time that Pizarro obtained possession of the government of Peru, he inculcated the same maxim with greater earnestness. Upon receiving an account of the victory at Quito, he remonstrated with him in a tone still more peremptory. "You have usurped," said he, in a letter written to Pizarro on that occasion, "the supreme power in this country, in contempt of the emperor's commission to the viceroy. You have marched in hostile array against the royal standard; you have attacked the representative of your sovereign in the field, have defeated him, and cut off his head. Think not that ever a monarch will forgive such insults on his dignity; or that any reconciliation with him can be cordial or sincere. Depend no longer on the precarious favor of another. Assume yourself the sovereignty over a country to the dominion of which your family has a title founded on the rights both of discovery and conquest. It is in your power to attach every Spaniard in Peru of any consequence involuntarily to your interest, by liberal grants of land and Indians, or by instituting ranks of nobility, and creating titles of honor similar to

those which are courted with so much eagerness in Europe. By establishing orders of knighthood, with privileges and distinctions resembling those in Spain, you may bestow a gratification upon the officers in your service, suited to the ideas of military men. Nor is it to your countrymen only that you ought to attend; endeavor to gain the natives. By marrying the Coya or daughter of the Sun next in succession to the crown, you will induce the Indians, out of veneration for the blood of their ancient princes, to unite with the Spaniards in support of your authority. Thus, at the head of the ancient inhabitants of Peru, as well as of the new settlers there, you may set at defiance the power of Spain, and repel with ease any feeble force which it can send at such a distance." Cepeda, the lawyer, who was now Pizarro's confidential counsellor, warmly seconded Carvajal's exhortations, and employed whatever learning he possessed in demonstrating, that all the founders of great monarchies had been raised to pre-eminence, not by the antiquity of their lineage, or the validity of their rights, but by their own aspiring valor and personal merit.

Pizarro listened attentively to both, and could not conceal the satisfaction with which he contemplated the object that they presented to his view. But, happily for the tranquillity of the world, few men possess that superior strength of mind, and extent of abilities, which are capable of forming and executing such daring schemes, as cannot be accomplished without overturning the established order of society, and violating those maxims of duty which men are accustomed to hold sacred. The mediocrity of Pizarro's talents circumscribed his ambition within more narrow limits. Instead of aspiring at independent power, he confined his views to the obtaining from the court of Spain a confirmation of the authority which he now possessed; and for that purpose he sent an officer of distinction thither, to give such a representation of his conduct, and of the state of the country, as might induce the emperor and his ministers, either from inclination or from necessity, to continue him in his present station.

While Pizarro was deliberating with respect to the part which he should take, consultations were held in Spain, with no less solicitude, concerning the measures which ought to be pursued in order to re-establish the emperor's authority in Peru. Though unacquainted with the last excesses of outrage to which the malecontents had proceeded in that country, the court had received an account of the insurrection against the viceroy, of his imprisonment, and the usurpation of the government by Pizarro. A revolution so alarming called for an immediate interposition of the emperor's abilities and authority. But as he was fully occupied at that time in Germany, in conducting the war against the famous league of Smalkalde, one of the most interesting and arduous enterprises in his reign, the care of providing a remedy for the disorders in Peru devolved upon his son Philip, and the counsellors whom Charles had appointed to assist him in the government of Spain during his absence. At first view, the actions of Pizarro and his adherents appeared so repugnant to the duty of subjects towards their sovereign, that the greater part of the ministers insisted on declaring them instantly to be guilty of rebellion, and on proceeding to punish them with exemplary rigor. But when the fervor of their zeal and indignation began to abate, innumerable obstacles to the execution of this measure presented themselves. The veteran bands of infantry, the strength and glory of the Spanish armies, were then employed in Germany. Spain, exhausted of men and money by a long series of wars, in which she had been involved by the restless ambition of two successive monarchs, could not easily equip an armament of sufficient force to reduce Pizarro. To transport any respectable body of troops to a country so remote as Peru, appeared almost impossible. While Pizarro continued master of the South Sea, the direct route by Nombre de Dios and Panama was impracticable. An attempt to march to Quito by land through the new kingdom of Granada, and the province of Popayan, across regions of prodigious extent, desolate, unhealthy, or inhabited by fierce and hostile tribes, would be attended with insurmountable danger and hardships. The passage to the South Sea by the Straits of Magellan was so tedious, so uncertain, and so little known in that age, that no confidence could be placed in any effort carried on in a course of navigation so remote and precarious. Nothing then remained but to relinquish the system which the ardor of their loyalty had first suggested, and to attempt by lenient measures what could not be effected by force. It was manifest from Pizarro's solicitude to represent his conduct in a favorable

light to the emperor, that notwithstanding the excesses of which he had been guilty, he still retained sentiments of veneration for his sovereign. By a proper application to these, together with some such concessions as should discover a spirit of moderation and forbearance in government, there was still room to hope that he might be yet reclaimed, or the ideas of loyalty natural to Spaniards might so far revive among his followers, that they would no longer lend their aid to uphold his usurped authority.

The success, however, of this negotiation, no less delicate than it was important, depended entirely on the abilities and address of the person to whom it should be committed. After weighing with much attention the comparative merit of various persons, the Spanish ministers fixed with unanimity of choice upon Pedro de la Gasca, a priest in no higher station than that of counsellor to the Inquisition. Though in no public office, he had been occasionally employed by government in affairs of trust and consequence, and had conducted them with no less skill than success; displaying a gentle and insinuating temper, accompanied with much firmness; probity, superior to any feeling of private interest; and a cautious circumspection in concerting measures, followed by such vigor in executing them as is rarely found in alliance with the other. These qualities marked him out for the function to which he was destined. The emperor, to whom Gasca was not unknown, warmly approved of the choice, and communicated it to him in a letter containing expressions of good will and confidence, no less honorable to the prince who wrote, than to the subject who received it. Gasca, notwithstanding his advanced age and feeble constitution, and though, from the apprehensions natural to a man, who, during the course of his life, had never been out of his own country, he dreaded the effects of a long voyage, and of an unhealthy climate, did not hesitate a moment about complying with the will of his sovereign. But as a proof that it was from this principle alone he acted, he refused a bishopric which was offered to him in order that he might appear in Peru with a more dignified character; he would accept of no higher title than that of President of the Court of Audience in Lima; and declared that he would receive no salary on account of his discharging the duties of that office. All he required was, that the expense of supporting his family should be defrayed by the public; and as he was to go like a minister of peace with his gown and breviary, and without any retinue but a few domestics, this would not load the revenue with any enormous burden.

But while he discovered such disinterested moderation with respect to whatever related personally to himself, he demanded his official powers in a very different tone. He insisted, as he was to be employed in a country so remote from the seat of government, where he could not have recourse to his sovereign for new instructions on every emergency; and as the whole success of his negotiations must depend upon the confidence which the people with whom he had to treat could place in the extent of his powers, that he ought to be invested with unlimited authority; that his jurisdiction must reach to all persons and to all causes; that he must be empowered to pardon, to punish, or to reward, as circumstances and the behavior of different men might require; that in case of resistance from the malecontents, he might be authorized to reduce them to obedience by force of arms, to levy troops for that purpose, and to call for assistance from the governors of all the Spanish settlements in America. These powers, though manifestly conducive to the great objects of his mission, appeared to the Spanish ministers to be inalienable prerogatives of royalty, which ought not to be delegated to a subject, and they refused to grant them. But the emperor's views were more enlarged. As, from the nature of his employment, Gasca must be intrusted with discretionary power in several points, and all his efforts might prove ineffectual if he was circumscribed in any one particular, Charles scrupled not to invest him with authority to the full extent that he demanded. Highly satisfied with this fresh proof of his master's confidence, Gasca hastened his departure, and, without either money or troops, set out to quell a formidable rebellion.

On his arrival at Nombre de Dios [July 27], he found Herman Mexia, an officer of note posted there, by order of Pizarro, with a considerable body of men, to oppose the landing of any hostile forces. But Gasca appeared in such pacific guise, with a train so little formidable, and with a title of no such dignity as to excite terror, that he was received with much respect. From Nombre de Dios he advanced to Panama, and

met with a similar reception from Hinojosa, whom Pizarro had intrusted with the government of that town, and the command of his fleet stationed there. In both places he held the same language, declaring that he was sent by their sovereign as a messenger of peace, not as a minister of vengeance; that he came to redress all their grievances, to revoke the laws which had excited alarm, to pardon past offences, and to re-establish order and justice in the government of Peru. His mild deportment, the simplicity of his manners, the sanctity of his profession, and a winning appearance of candor, gained credit to his declarations. The veneration due to a person clothed with legal authority, and acting in virtue of a royal commission, began to revive among men accustomed for some time to nothing more respectable than a usurped jurisdiction. Hinojosa, Mexia, and several other officers of distinction, to each of whom Gasca applied separately, were gained over to his interest, and waited only for some decent occasion of declaring openly in his favor.

This the violence of Pizarro soon afforded them. As soon as he heard of Gasca's arrival at Panama, though he received, at the same time, an account of the nature of his commission, and was informed of his offers not only to render every Spaniard in Peru easy concerning what was past, by an act of general oblivion, but secure with respect to the future, by repealing the obnoxious laws; instead of accepting with gratitude his sovereign's gracious concessions, he was so much exasperated on finding that he was not to be continued in his station as governor of the country, that he instantly resolved to oppose the president's entry into Peru, and to prevent his exercising any jurisdiction there. To this desperate resolution he added another highly preposterous. He sent a new deputation to Spain to justify this conduct, and to insist, in name of all the communities in Peru, for a confirmation of the government to himself during life, as the only means of preserving tranquillity there. The persons intrusted with this strange commission, intimated the intention of Pizarro to the president, and required him, in his name, to depart from Panama and return to Spain. They carried likewise secret instructions to Hinojosa, directing him to offer Gasca a present of fifty thousand pesos, if he would comply voluntarily with what was demanded of him; and if he should continue obstinate, to cut him off, either by assassination or poison.

Many circumstances concurred in pushing on Pizarro to those wild measures. Having been once accustomed to supreme command, he could not bear the thoughts descending to a private station. Conscious of his own desert, he suspected that the emperor studied only to deceive him, and would never pardon the outrages which he had committed. His chief confidants, no less guilty, entertained the same apprehensions. The approach of Gasca without any military force excited no terror. There were now above six thousand Spaniards settled in Peru; and at the head of these he doubted not to maintain his own independence, if the court of Spain should refuse to grant what he required. But he knew not that a spirit of defection had already begun to spread among those whom he trusted most. Hinojosa, amazed at Pizarro's precipitate resolution of setting himself in opposition to the emperor's commission, and disdaining to be his instrument in perpetrating the odious crimes pointed out in his secret instructions, publicly recognised the title of the president to the supreme authority in Peru. The officers under his command did the same. Such was the contagious influence of the example, that it reached even the deputies who had been sent from Peru; and at the time when Pizarro expected to hear either of Gasca's return to Spain, or of his death, he received an account of his being master of the fleet, of Panama, and of the troops stationed there.

[1547.] Irritated almost to madness by events so unexpected, he openly prepared for war; and in order to give some color of justice to his arms, he appointed the court of audience in Lima to proceed to the trial of Gasca, for the crimes of having seized his ships, seduced his officers, and prevented his deputies from proceeding in their voyage to Spain. Cepeda, though acting as a judge in virtue of the royal commission, did not scruple to prostitute the dignity of his function by finding Gasca guilty of treason, and condemning him to death on that account. Wild and even ridiculous as this proceeding was, it imposed on the low illiterate adventurers, with whom Peru was filled, by the semblance of a legal sanction warranting Pizarro to carry on hostilities against a convicted traitor. Soldiers accordingly resorted from every quarter to his standard, and he was soon at the head of a thousand

men, the best equipped that had ever taken the field in Peru.

Gasca, on his part, perceiving that force must be employed in order to accomplish the purpose of his mission, was no less assiduous in collecting troops from Nicaragua, Carthagena, and other settlements on the continent; and with such success, that he was soon in a condition to detach a squadron of his fleet, with a considerable body of soldiers, to the coast of Peru [April]. Their appearance excited a dreadful alarm; and though they did not attempt for some time to make any descent, they did more effectual service by setting ashore in different places persons who dispersed copies of the act of general indemnity, and the revocation of the late edicts; and who made known every where the pacific intentions, as well as mild temper, of the president. The effect of spreading this information was wonderful. All who were dissatisfied with Pizarro's violent administration, all who retained any sentiments of fidelity to their sovereign, began to meditate revolt. Some openly deserted a cause which they now deemed to be unjust. Centeno, leaving the cave in which he lay concealed, assembled about fifty of his former adherents, and with this feeble half-armed band advanced boldly to Cuzco. By a sudden attack in the night-time, in which he displayed no less military skill than valor, he rendered himself master of that capital, though defended by a garrison of five hundred men. Most of these having ranged themselves under his banners, he had soon the command of a respectable body of troops.

Pizarro, though astonished at beholding one enemy approaching by sea, and another by land, at a time when he trusted to a union of all Peru in his favor, was of a spirit more undaunted, or more accustomed to the vicissitudes of fortune, than to be disconcerted or appalled. As the danger from Centeno's operations was the most urgent, he instantly set out to oppose him. Having provided horses for all his soldiers, he marched with amazing rapidity. But every morning he found his force diminished, by numbers who had left him during the night; and though he became suspicious to excess, and punished without mercy all whom he suspected, the rage of desertion was too violent to be checked. Before he got within sight of the enemy at Huarina, near the lake of Titicaca, he could not muster more than four hundred soldiers. But these he justly considered as men of tried attachment, on whom he might depend. They were indeed the boldest and most desperate of his followers, conscious, like himself, of crimes for which they could hardly expect forgiveness, and without any hope but in the success of their arms. With these he did not hesitate to attack Centeno's troops, [Oct. 20,] though double to his own in number. The royalists did not decline the combat. It was the most obstinate and bloody that had hitherto been fought in Peru. At length the intrepid valor of Pizarro, and the superiority of Carvajal's military talents, triumphed over numbers, and obtained a complete victory. The booty was immense, [141] and the treatment of the vanquished cruel. By this signal success the reputation of Pizarro was re-established; and being now deemed invincible in the field, his army increased daily in number.

But events happened in other parts of Peru, which more than counterbalanced the splendid victory at Huarina. Pizarro had scarcely left Lima, when the citizens, weary of his oppressive dominion, erected the royal standard, and Aldana, with a detachment of soldiers from the fleet, took possession of the town. About the same time, Gasca landed at Tumbes with five hundred men. Encouraged by his presence, every settlement in the low country declared for the king. The situation of the two parties was now perfectly reversed; Cuzco and the adjacent provinces were possessed by Pizarro; all the rest of the empire, from Quito, southward, acknowledged the jurisdiction of the president. As his numbers augmented fast, Gasca advanced into the interior part of the country. His behavior still continued to be gentle and unassuming; he expressed on every occasion, his ardent wish of terminating the contest without bloodshed. More solicitous to reclaim than to punish, he upbraided no man for past offences, but received them as a father receives penitent children returning to a sense of their duty. Though desirous of peace, he did not slacken his preparations for war. He appointed the general rendezvous of his troops in the fertile valley of Xauxa, on the road to Cuzco. There he remained for some months, not only that he might have time to make another attempt towards an accommodation with Pizarro, but that he might train his new soldiers to the use of arms, and accustom them

to the discipline of a camp, before he led them against a body of victorious veterans. Pizarro, intoxicated with the success which had hitherto accompanied his arms, and elated with having again near a thousand men under his command, refused to listen to any terms, although Cepeda, together with several of his officers, and even Carvajal himself, [142] gave it as their advice, to close with the president's offer of a general indemnity, and the revocation of the obnoxious laws. Gasca, having tried in vain every expedient to avoid imbruing his hands in the blood of his countrymen, began to move towards Cuzco [Dec. 29] at the head of sixteen hundred men.

Pizarro, confident of victory, suffered the royalists to pass all the rivers which lie between Guamanga and Cuzco without opposition, [1548] and to advance within four leagues of that capital, flattering himself that a defeat in such a situation as rendered escape impracticable would at once terminate the war. He then marched out to meet the enemy, and Carvajal chose his ground, and made the disposition of the troops with the discerning eye and profound knowledge in the art of war conspicuous in all his operations. As the two armies moved forward slowly to the charge, [April 9,] the appearance of each was singular. In that of Pizarro, composed of men enriched with the spoils of the most opulent country in America, every officer, and almost all the private men, were clothed in stuffs of silk, or brocade, embroidered with gold and silver; and their horses, their arms, their standards, were adorned with all the pride of military pomp. That of Gasca, though not so splendid, exhibited what was no less striking. He himself, accompanied by the archbishop of Lima, the bishops of Quito and Cuzco, and a great number of ecclesiastics, marching along the lines, blessing the men, and encouraging them to a resolute discharge of their duty.

When both armies were just ready to engage, Cepeda set spurs to his horse, galloped off, and surrendered himself to the president. Garcilasso de la Vega, and other officers of note, followed his example. The revolt of persons in such high rank struck all with amazement. The mutual confidence on which the union and strength of armies depend, ceased at once. Distrust and consternation spread from rank to rank. Some silently slipped away, others threw down their arms, the greatest number went over to the royalists. Pizarro, Carvajal, and some leaders, employed authority, threats, and entreaties, to stop them, but in vain. In less than half an hour, a body of men, which might have decided the fate of the Peruvian empire, was totally dispersed. Pizarro, seeing all irretrievably lost, cried out in amazement to a few officers, who still faithfully adhered to him, "What remains for us to do?"—"Let us rush," replied one of them, "upon the enemy's firmest battalion, and die like Romans." Dejected with such a reverse of fortune, he had not spirit to follow this soldierly counsel, and with a tameness disgraceful to his former fame he surrendered to one of Gasca's officers. Carvajal, endeavouring to escape, was overtaken and seized.

Gasca, happy in this bloodless victory, did not stain it with cruelty. Pizarro, Carvajal, and a small number of the most distinguished or notorious offenders, were punished capitally. Pizarro was beheaded the day after he surrendered. He submitted to his fate with a composed dignity, and seemed desirous to atone by repentance for the crimes which he had committed. The end of Carvajal was suitable to his life. On his trial he offered no defence. When the sentence adjudging him to be hanged was pronounced, he carelessly replied, "One can die but once." During the interval between the sentence and execution, he discovered no sign either of remorse for the past, or of solicitude about the future; scoffing at all who visited him, in his usual sarcastic vein of mirth, with the same quickness of repartee and gross pleasantry as at any other period of his life. Cepeda, more criminal than either, ought to have shared the same fate; but the merit of having deserted his associates at such a critical moment, and with such decisive effect, saved him from immediate punishment. He was sent, however, as a prisoner to Spain, and died in confinement.

In the minute details which the contemporary historians have given of the civil dissensions that raged in Peru, with little interruption, during ten years, many circumstances occur so striking, and which indicate such an uncommon state of manners as to merit particular attention.

Though the Spaniards who first invaded Peru were of the lowest order in society, and the greater part of those who afterwards joined them were persons of des-

perate fortune, yet in all the bodies of troops brought into the field by the different leaders who contended for superiority, not one man acted as a hired soldier, that follows his standard for pay. Every adventurer in Peru considered himself as a conqueror, entitled by his services, to an establishment in that country which had been acquired by his valor. In the contests between the rival chiefs, each chose his side as he was directed by his own judgment or affections. He joined his commander as a companion of his fortunes, and disdained to degrade himself by receiving the wages of a mercenary. It was to their sword, not to pre-eminence in office, or nobility of birth, that most of the leaders whom they followed were indebted for their elevation; and each of their adherents hoped, by the same means, to open a way for himself to the possession of power and wealth.

But though the troops in Peru served without any regular pay, they were raised at immense expense. Among men accustomed to divide the spoils of an opulent country, the desire of obtaining wealth acquired incredible force. The ardor of pursuit augmented in proportion to the hope of success. Where all were intent on the same object, and under the dominion of the same passion, there was but one mode of gaining men, or of securing their attachment. Officers of name and influence, besides the promise of future establishments, received in hand large gratuities from the chief with whom they engaged. Gonzalo Pizarro, in order to raise a thousand men, advanced five hundred thousand pesos. Gasca expended in levying the troops which he led against Pizarro nine hundred thousand pesos. The distribution of property, bestowed as the reward of services, was still more exorbitant. Cepeda, as the recompense of his perfidy and address, in persuading the court of royal audience to give the sanction of its authority to the usurped jurisdiction of Pizarro, received a grant of lands which yielded an annual income of a hundred and fifty thousand pesos. Hinojosa, who by his early defection from Pizarro, and surrender of the fleet to Gasca, decided the fate of Peru, obtained a district of country affording two hundred thousand pesos of yearly value. While such rewards were dealt out to the principal officers, with more than royal munificence, proportional shares were conferred upon those of inferior rank.

Such a rapid change of fortune produced its natural effects. It gave birth to new wants and new desires. Veterans, long accustomed to hardship and toil, acquired of a sudden a taste for profuse and inconsiderate dissipation, and indulged in all the excesses of military licentiousness. The riot of low debauchery occupied some; a relish for expensive luxuries spread among others. The meanest soldier in Peru would have thought himself degraded by marching on foot; and at a time when the prices of horses in that country were exorbitant, each insisted on being furnished with one before he would take the field. But though less patient under the fatigue and hardships of service, they were ready to face danger and death with as much intrepidity as ever; and animated by the hope of new rewards, they never failed, on the day of battle, to display all their ancient valor.

Together with their courage, they retained all the ferocity by which they were originally distinguished. Civil discord never raged with a more fell spirit than among the Spaniards in Peru. To all the passions which usually envenom contests among countrymen, avarice was added, and rendered their enmity more rancorous. Eagerness to seize the valuable forfeitures, expected upon the death of every opponent, shut the door against mercy. To be wealthy was of itself sufficient to expose a man to accusation, or to subject him to punishment. On the slightest suspicions, Pizarro condemned many of the most opulent inhabitants in Peru to death. Carvajal, without searching for any pretext to justify his cruelty, cut off many more. The number of those who suffered by the hands of the executioner was not much inferior to what fell in the field; [143] and the greater part was condemned without the formality of any legal trial.

The violence with which the contending parties treated their opponents was not accompanied with its usual attendants, attachment and fidelity to those with whom they acted. The ties of honor, which ought to be held sacred among soldiers, and the principle of integrity, interwoven as thoroughly in the Spanish character as in that of any nation, seem to have been equally forgotten. Even regard for decency, and the sense of shame were totally lost. During their dissensions, there was hardly a Spaniard in Peru who did not abandon the party which he had originally espoused, betray

the associates with whom he had united, and violate the engagements under which he had come. The viceroys Nugnez Vela was ruined by the treachery of Cepeda and the other judges of the royal audience, who were bound by the duties of their function to have supported his authority. The chief advisers and companions of Gonzalo Pizarro's revolt were the first to forsake him, and submit to his enemies. His fleet was given up to Gasca by the man whom he had singled out among his officers to intrust with that important command. On the day that was to decide his fate, an army of veterans, in sight of the enemy, threw down their arms without striking a blow, and deserted a leader who had often conducted them to victory. Instances of such general and avowed contempt of the principles and obligations which attach man to man, and bind them together in social union, rarely occur in history. It is only where men are far removed from the seat of government, where the restraints of law and order are little felt, where the prospect of gain is unbounded, and where immense wealth may cover the crimes by which it is acquired, that we can find any parallel to the levity, the rapaciousness, the perfidy, and corruption prevalent among the Spaniards in Peru.

On the death of Pizarro, the malecontents in every corner of Peru laid down their arms, and tranquillity seemed to be perfectly re-established. But two very interesting objects still remained to occupy the president's attention. The one was to find immediately such employment for a multitude of turbulent and daring adventurers with which the country was filled, as might prevent them from exciting new commotions. The other, to bestow proper gratifications upon those to whose loyalty and valor he had been indebted for his success. The former of these was in some measure accomplished, by appointing Pedro de Valdivia to prosecute the conquest of Chili; and by empowering Diego Centeno to undertake the discovery of the vast regions bordering on the river De la Plata. The reputation of those leaders, together with the hopes of acquiring wealth, and of rising to consequence in some unexplored country, alluring many of the most indigent and desperate soldiers to follow their standards, drained off no inconsiderable portion of that mutinous spirit which Gasca dreaded.

The latter was an affair of greater difficulty and to be adjusted with a more attentive and delicate hand. The *repartimientos*, or allotments of lands and Indians which fell to be distributed, in consequence of the death or forfeiture of the former possessors, exceeded two millions of pesos of yearly rent. Gasca, when now absolute master of this immense property, retained the same disinterested sentiments which he had originally professed, and refused to reserve the smallest portion of it for himself. But the number of claimants was great; and whilst the vanity or avarice of every individual fixed the value of his own services, and estimated the recompense which he thought due to him, the pretensions of each were so extravagant that it was impossible to satisfy all. Gasca listened to them one by one, with the most patient attention; and that he might have leisure to weigh the comparative merit of their several claims with accuracy, he retired, with the archbishop of Lima and a single secretary, to a village twelve leagues from Cusco. There he spent several days in allotting to each a district of lands and number of Indians, in proportion to his idea of their past services and future importance. But that he might get beyond the reach of the fierce storm of clamor and rage, which he foresaw would burst out on the publication of his decree, notwithstanding the impartial equity with which he had framed it, he set out for Lima, leaving the instrument of partition sealed up, with orders not to open it for some days after his departure.

The indignation excited by publishing the decree of partition [Aug. 24] was not less than Gasca had expected. Vanity, avarice, emulation, envy, shame, rage, and all the other passions which most vehemently agitate the minds of men when both their honor and their interest are deeply affected, conspired in adding to its violence. It broke out with all the fury of military insolence. Calumny, threats, and curses, were poured out openly upon the president. He was accused of ingratitude, of partiality, and of injustice. Among soldiers prompt to action, such seditious discourse would have been soon followed by deeds no less violent, and they already began to turn their eyes towards some discontented leaders, expecting them to stand forth in redress of their wrongs. By some vigorous interpositions of government, a timely check was given to this mutinous spirit, and the danger of another civil war was averted for the present.

BOOK VII.

1549.] Gasca, however, perceiving that the flame was suppressed, rather than extinguished, labored with the utmost assiduity to soothe the malecontents, by bestowing large gratuities on some, by promising *repartimientos*, when they fell vacant, to others, and by caressing and flattering all. But that the public security might rest on a foundation more stable than their good affection, he endeavored to strengthen the hands of his successors in office, by re-establishing the regular administration of justice in every part of the empire. He introduced order and simplicity into the mode of collecting the royal revenue. He issued regulations concerning the treatment of the Indians, well calculated to protect them from oppression, and to provide for their instruction in the principles of religion, without depriving the Spaniards of the benefit accruing from their labor. Having now accomplished every object of his mission, Gasca, longing to return again to a private station, committed the government of Peru to the court of audience, and set out for Spain [Feb. 1, 1550]. As, during the anarchy and turbulence of the four last years, there had been no remittance made of the royal revenue, he carried with him thirteen hundred thousand pesos of public money, which the economy and order of his administration enabled him to save, after paying all the expenses of the war.

He was received in his native country with universal admiration of his abilities and of his virtue. Both were, indeed, highly conspicuous. Without army, or fleet, or public funds; with a train so simple, that only three thousand ducats were expended in equipping him, he set out to oppose a formidable rebellion. By his address and talents he supplied all those defects, and seemed to create instruments for executing his designs. He acquired such a naval force as gave him the command of the sea. He raised a body of men able to cope with the veteran bands which gave laws to Peru. He vanquished their leader, on whose arms victory had hitherto attended, and in place of anarchy and usurpation, he established the government of laws, and the authority of the rightful sovereign. But the praise bestowed on his abilities was exceeded by that which his virtue merited. After residing in a country where wealth presented allurements which had seduced every person who had hitherto possessed power there, he returned from that trying station with integrity not only untainted but unsuspected. After distributing among his countrymen possessions of greater extent and value than had ever been in the disposal of a subject in any age or nation, he himself remained in his original state of poverty; and at the very time when he brought such a large recruit to the royal treasury, he was obliged to apply by petition for a small sum to discharge some petty debts which he had contracted during the course of his service. Charles was not insensible to such disinterested merit. Gasca was received by him with the most distinguishing marks of esteem; and being promoted to the bishopric of Palencia, he passed the remainder of his days in the tranquillity of retirement, respected by his country, honored by his sovereign, and beloved by all.

Notwithstanding all Gasca's wise regulations, the tranquillity of Peru was not of long continuance. In a country where the authority of government had been almost forgotten during the long prevalence of anarchy and misrule, where there were disappointed leaders ripe for revolt, and seditious soldiers ready to follow them, it was not difficult to raise combustion. Several successive insurrections desolated the country for some years. But as those, though fierce, were only transient storms, excited rather by the ambition and turbulence of particular men, than by general or public motives, the detail of them is not the object of this history. These commotions in Peru, like every thing of extreme violence either in the natural or political body, were not of long duration; and by carrying off the corrupted humors which had given rise to the disorders, they contributed in the end to strengthen the society which at first they threatened to destroy. During their fierce contests, several of the first invaders of Peru, and many of those licentious adventurers whom the fame of their success had allured thither, fell by each other's hands. Each of the parties, as they alternately prevailed in the struggle, gradually cleared the country of a number of turbulent spirits, by executing, proscribing, or banishing their opponents. Men less enterprising, less desperate, and more accustomed to move in the path of sober and peaceable industry, settled in Peru; and the royal authority was gradually established as firmly there as in other Spanish colonies.

View of the institutions and manners of the Mexicans and Peruvians—Civilized states in comparison of other Americans—Recent origin of the Mexicans—Facts which prove their progress in civilization—View of their policy in its various branches—of their arts—Facts which indicate a small progress in civilization—What opinion should be formed on comparing these contradictory facts—Genius of their religion—Peruvian monarchy more ancient—its policy founded on religion—Singular effects of this—Peculiar state of property among the Peruvians—Their public works and arts—roads—bridges—buildings—Their unwarlike spirit—View of other dominions of Spain in America—Chilnao and Sonora—California—Yucatan and Honduras—Chili—Tucuman—Kingdom of Tierra Firme—New Kingdom of Granada.

As the conquest of the two great empires of Mexico and Peru forms the most splendid and interesting period in the history of America, a view of their political institutions, and a description of their national manners, will exhibit the human species to the contemplation of intelligent observers in a very singular stage of its progress. [144]

When compared with other parts of the New World, Mexico and Peru may be considered as polished states. Instead of small, independent, hostile tribes, struggling for subsistence amidst woods and marshes, strangers to industry and arts, unacquainted with subordination, and almost without the appearance of regular government, we find countries of great extent subjected to the dominion of one sovereign, the inhabitants collected together in cities, the wisdom and foresight of rulers employed in providing for the maintenance and security of the people, the empire of laws in some measure established, the authority of religion recognized, many of the arts essential to life brought to some degree of maturity, and the dawn of such as are ornamental beginning to appear.

But if the comparison be made with the people of the ancient continent, the inferiority of America in improvement will be conspicuous, and neither the Mexicans nor Peruvians will be entitled to rank with those nations which merit the name of civilized. The people of both the great empires in America, like the rude tribes around them, were totally unacquainted with the useful metals, and the progress which they had made in extending their dominion over the animal creation was inconsiderable. The Mexicans had gone no further than to tame and rear turkeys, ducks, a species of small dogs, and rabbits. By this feeble essay of ingenuity, the means of subsistence were rendered somewhat more plentiful and secure than when men depend solely on hunting; but they had no idea of attempting to subdue the more robust animals, or of deriving any aid from their ministry in carrying on works of labor. The Peruvians seem to have neglected the inferior animals, and had not rendered any of them domestic except the duck; but they were more fortunate in taming the Llama, an animal peculiar to their country, of a form which bears some resemblance to a deer, and some to a camel, and is of a size somewhat larger than a sheep. Under the protection of man, this species multiplied greatly. Its wool furnished the Peruvians with clothing, its flesh with food. It was even employed as a beast of burden, and carried a moderate load with much patience and docility. It was never used for draught; and the breed being confined to the mountainous country, its service, if we may judge by incidents which occur in the early Spanish writers, was not very extensive among the Peruvians in their original state.

In tracing the line by which nations proceed towards civilization, the discovery of the useful metals, and the acquisition of dominion over the animal creation, have been marked as steps of capital importance in their progress. In our continent, long after men had attained both, society continued in that state which is denominated barbarous. Even with all that command over nature which these confer, many ages elapse before industry becomes so regular as to render subsistence secure, before the arts which supply the wants and furnish the accommodations of life are brought to any considerable degree of perfection, and before any idea is conceived of various institutions requisite in a well ordered society. The Mexicans and Peruvians, without knowledge of the useful metals, or the aid of domestic animals, labored under disadvantages which must have greatly retarded their progress, and in their highest state of improvement their power was so limited, and their operations so feeble, that they can hardly be considered as having advanced beyond the infancy of civil life.

After this general observation concerning the most singular and distinguishing circumstances in the state of both the great empires in America, I shall endeavor

to give such a view of the constitution of the interior police of each as may enable us to ascertain their place in the political scale, to allot them their proper station between the rude tribes in the New World, and the polished states of the ancient, and to determine how far they had risen above the former, as well as how much they fell below the latter.

Mexico was first subjected to the Spanish crown. But our acquaintance with its laws and manners is not, from that circumstance, more complete. What I have remarked concerning the defective and inaccurate information on which we must rely with respect to the condition and customs of the savage tribes in America, may be applied likewise to our knowledge of the Mexican empire. Cortes, and the rapacious adventurers who accompanied him, had not leisure or capacity to enrich either civil or natural history with new observations. They undertook their expedition in quest of one object, and seemed hardly to have turned their eyes towards any other. Or, if during some short interval of tranquillity, when the occupations of war ceased, and the ardor of plunder was suspended, the institutions and manners of the people whom they invaded, drew their attention, the inquiries of illiterate soldiers were conducted with so little sagacity and precision, that the accounts given by them of the policy and order established in the Mexican monarchy are superficial, confused, and inexplicable. It is rather from incidents which they relate occasionally, than from their own deductions and remarks, that we are enabled to form some idea of the genius and manners of that people. The obscurity in which the ignorance of its conquerors involved the annals of Mexico, was augmented by the superstition of those who succeeded them. As the memory of past events was preserved among the Mexicans by figures painted on skins, on cotton cloths, on a kind of pasteboard, or on the bark of trees, the early missionaries, unable to comprehend their meaning, and struck with their uncouth forms, conceived them to be monuments of idolatry, which ought to be destroyed in order to facilitate the conversion of the Indians. In obedience to an edict issued by Juan de Zummaraga, a Franciscan monk, the first bishop of Mexico, as many records of the ancient Mexican story as could be collected were committed to the flames. In consequence of this fanatical zeal of the monks who first visited New Spain (which their successors soon began to lament), whatever knowledge of remote events such rude monuments contained was almost entirely lost, and no information remained concerning the ancient revolutions and policy of the empire, but what was derived from tradition, or from some fragments of their historical paintings that escaped the barbarous researches of Zummaraga. From the experience of all nations it is manifest, that the memory of past transactions can neither be long preserved, nor be transmitted with any fidelity, by tradition. The Mexican paintings which are supposed to have served as annals of their empire, are few in number, and of ambiguous meaning. Thus, amidst the uncertainty of the former, and the obscurity of the latter, we must glean what intelligence can be collected from the scanty materials scattered in the Spanish writers.*

* In the first edition, I observed that in consequence of the destruction of the ancient Mexican paintings, occasioned by the zeal of Zummaraga, whatever knowledge they might have conveyed was entirely lost. Every candid reader must have perceived that the expression was inaccurate; as in a few lines afterwards I mention some ancient paintings to be still extant. M. Clavigero, not satisfied with laying hold of this inaccuracy, which I corrected in the subsequent editions, labors to render it more glaring by the manner in which he quotes the remaining part of the sentence. He reprehends with great asperity the account which I gave of the scanty materials for writing the ancient history of Mexico. Vol. I. Account of Writers, p. xxi. Vol. II. 380. My words, however, are almost the same with those of Torquemada, who seems to have been better acquainted with the ancient monuments of the Mexicans than any Spanish author whose works I have seen. Lib. xiv. c. 6. M. Clavigero himself gives a description of the destruction of ancient paintings in almost the same terms I have used; and mentions as an additional reason of their being so small a number of ancient paintings known to the Spaniards, that the natives have become so solicitous to preserve and conceal them, that it is "dilegit, it is impossible, to make them part with one of them." Vol. I. 407. II. 194. No point can be more ascertained than that few of the Mexican historical paintings have been preserved. Though several Spaniards have carried on inquiries into the antiquities of the Mexican empire, no engravings from Mexican paintings have been communicated to the public, except those by Purchas, Gemelli Carreri, and Lorenzana. It affords me some satisfaction, that in the course of my researches I have discovered two collections of Mexican paintings which were unknown to former inquirers. The cut which I published is an exact copy of the original, and gives no high idea of the progress which the Mexicans had made in the art of painting. I cannot conjecture what could induce M. Clavigero to express some dissatisfaction with me for having published it without the same colors it has in the original painting, p. xxix. He might have recollected, that neither Purchas, nor Gemelli Carreri, nor Loren-

According to the account of the Mexicans themselves, their empire was not of long duration. Their country, as they relate, was originally possessed, rather than peopled, by small independent tribes, whose mode of life and manners resembled those of the rudest savages which we have described. But about a period corresponding to the beginning of the tenth century in the Christian era, several tribes moved in successive migrations from unknown regions towards the north and north-west, and settled in different provinces of *Anahuac*, the ancient name of New Spain. These, more civilized than the original inhabitants, began to form them to the arts of social life. At length, towards the commencement of the thirteenth century, the Mexicans, a people more polished than any of the former, advanced from the border of the Californian gulf, and took possession of the plains adjacent to the great lake near the centre of the country. After residing there about fifty years, they founded a town, since distinguished by the name of *Mexico*, which, from humble beginnings, soon grew to be the most considerable city in the New World. The Mexicans, long after they were established in their new possessions, continued, like other martial tribes in America, unacquainted with regal dominion, and were governed in peace, and conducted in war, by such as were entitled to pre-eminence by their wisdom or their valor. But among them, as in other states whose power and territories become extensive, the supreme authority centered at last in a single person; and when the Spaniards under Cortes invaded the country, Montezuma was the ninth monarch in order who had swayed the Mexican sceptre, not by hereditary right, but by election.

Such is the traditional tale of the Mexicans concerning the progress of their own empire. According to this, its duration was very short. From the first migration of their parent tribe, they can reckon little more than three hundred years. From the establishment of monarchical government, not above a hundred and thirty years according to one account, or a hundred and ninety-seven according to another computation, had elapsed. If, on one hand, we suppose the Mexican state to have been of higher antiquity, and to have subsisted during such a length of time as the Spanish accounts of its civilization would naturally lead us to conclude, it is difficult to conceive how, among a people who possessed the art of recording events by pictures, and who considered it as an essential part of their national education, to teach their children to repeat the historical songs which celebrated the exploits of their ancestors, the knowledge of past transactions should be so slender and limited. If, on the other hand, we adopt their own system with respect to the antiquities of their nation, it is no less difficult to account either for that improved state of society, or for the extensive dominion to which their empire had attained when first visited by the Spaniards. The infancy of nations is so long, and, even when every circumstance is favorable to their progress, they advance so slowly towards any maturity of strength or policy, that the recent origin of the Mexicans seems to be a strong presumption of some exaggeration in the splendid descriptions which have been given of their government and manners.

But it is not by theory or conjectures that history decides with regard to the state or character of nations. It produces facts as the foundation of every judgment which it ventures to pronounce. In collecting those which must regulate our opinion in the present inquiry, some occur that suggest an idea of considerable progress in civilization in the Mexican empire, and others which seem to indicate that it had advanced but little beyond the savage tribes around it. Both shall be exhibited to the view of the reader, that, from comparing them, he may determine on which side the evidence preponderates.

In the Mexican empire, the right of private property was perfectly understood, and established in its full extent. Among several savage tribes, we have seen,

zana, thought it necessary to color the prints which they have published, and they have never been censured on that account. He may rest assured, that though the colors in the paintings in the Imperial Library are remarkably bright, they are laid on without art, and without "any of that regard to light and shade, or the rules of perspective," which M. Clavigero requires. Vol. II. 378. If the public express any desire to have the seven paintings still in my possession engraved, I am ready to communicate them. The print published by Gemelli Careri, of the route of the ancient Mexicans when they travelled towards the lake on which they built the capital of their empire, (Churchill, Vol. IV. p. 481.) is the most finished monument of art brought from the New World, and yet a very slight inspection of it will satisfy every one, that the annals of a nation conveyed in this manner must be very meagre and imperfect.

that the idea of a title to the separate and exclusive possession of any object was hardly known; and that among all it was extremely limited and ill defined. But in Mexico, where agriculture and industry had made some progress, the distinction between property in land and property in goods had taken place. Both might be transferred from one person to another by sale or barter; both might descend by inheritance. Every person who could be denominated a freeman had property in land. This, however, they held by various tenures. Some possessed it in full right, and it descended to their heirs. The title of others to their lands was derived from the office or dignity which they enjoyed; and when deprived of the latter, they lost possession of the former. Both these modes of occupying land were deemed noble, and peculiar to citizens of the highest class. The tenure by which the great body of the people held their property, was very different. In every district a certain quantity of land was measured out in proportion to the number of families. This was cultivated by the joint labor of the whole; its produce was deposited in a common storehouse, and divided among them according to their respective exigencies. The members of the *Calpulle*, or associations, could not alienate their share of the common estate; it was an indivisible permanent property, destined for the support of their families. In consequence of this distribution of the territory of the state, every man had an interest in its welfare, and the happiness of the individual was connected with the public security.

Another striking circumstance, which distinguishes the Mexican empire from those nations in America we have already described, is the number and greatness of its cities. While society continues in a rude state, the wants of men are so few, and they stand so little in need of mutual assistance, that their inducements to crowd together are extremely feeble. Their industry at the same time is so imperfect, that it cannot secure subsistence for any considerable number of families settled in one spot. They live dispersed, at this period, from choice, as well as from necessity, or at the utmost assemble in small hamlets on the banks of the river which supplies them with food, or on the border of some plain left open by nature, or cleared by their own labor. The Spaniards, accustomed to this mode of habitation among all the savage tribes with which they were hitherto acquainted, were astonished, on entering New Spain, to find the natives residing in towns of such extent as resembled those of Europe. In the first fervor of their admiration, they compared Zempoalla, though a town only of the second or third size, to the cities of greatest note in their own country. When, afterwards, they visited in succession Tlascala, Cholula, Tacuba, Tezeuco, and Mexico itself, their amazement increased so much, that it led them to convey ideas of their magnitude and populousness bordering on what is incredible. Even when there is leisure for observation, and no interest that leads to deceive, conjectural estimates of the number of people in cities are extremely loose, and usually much exaggerated. It is not surprising, then, that Cortes and his companions, little accustomed to such computations, and powerfully tempted to magnify, in order to exalt the merit of their own discoveries and conquests, should have been betrayed into this common error, and have raised their descriptions considerably above truth. For this reason, some considerable abatement ought to be made from their calculations of the number of inhabitants in the Mexican cities, and we may fix the standard of their population much lower than they have done; but still they will appear to be cities of such consequence as are not to be found but among people who have made some considerable progress in the arts of social life. [145] From their accounts, we can hardly suppose Mexico, the capital of the empire, to have contained fewer than sixty thousand inhabitants.

The separation of professions among the Mexicans is a symptom of improvement no less remarkable. Arts, in the early ages of society, are so few and so simple, that each man is sufficiently master of them all, to gratify every demand of his own limited desires. The savage can form his bow, point his arrows, rear his hut, and hollow his canoe, without calling in the aid of any hand more skilful than his own. Time must have augmented the wants of men, and ripened their ingenuity, before the productions of art became so complicated in their structure, or so curious in their fabric, that a particular course of education was requisite towards forming the artificer to expertness in contrivance and workmanship. In proportion as refinement spreads, the distinction of professions increases, and they branch

out into more numerous and minute subdivisions. Among the Mexicans, this separation of the arts necessary in life had taken place to a considerable extent. The functions of the mason, the weaver, the goldsmith, the painter, and of several other crafts, were carried on by different persons. Each was regularly instructed in his calling. To it alone his industry was confined, and by assiduous application to one object, together with the persevering patience peculiar to Americans, their artisans attained to a degree of neatness and perfection in work, far beyond what could have been expected from the rude tools which they employed. Their various productions were brought into commerce; and by the exchange of them in the stated markets held in the cities, not only were their mutual wants supplied, in such orderly intercourse as characterizes an improved state of society, but their industry was daily rendered persevering and inventive.

The distinction of ranks established in the Mexican empire, is the next circumstance that merits attention. In surveying the savage tribes of America, we observed, that consciousness of equality, and impatience of subordination, are sentiments natural to man in the infancy of civil life. During peace, the authority of a superior is hardly felt among them, and even in war it is but little acknowledged. Strangers to the idea of property, the difference in condition resulting from the inequality of it is unknown. Birth or titles confer no pre-eminence; it is only by personal merit and accomplishments that distinction can be acquired. The form of society was very different among the Mexicans. The great body of the people was in a most humiliating state. A considerable number, known by the name of *Mayaques*, nearly resembled in condition those peasants who, under various denominations, were considered during the prevalence of the feudal system, as instruments of labor attached to the soil. The *Mayaques* could not change their place of residence without permission of the superior on whom they depended. They were conveyed, together with the lands on which they were settled, from one proprietor to another; and were bound to cultivate the ground, and to perform several kinds of servile work. Others were reduced to the lowest form of subjection, that of domestic servitude, and felt the utmost rigor of that wretched state. Their condition was held to be so vile, and their lives deemed of so little value, that a person who killed one of these slaves was not subjected to any punishment. Even those considered as freemen were treated by their haughty lords as beings of an inferior species. The nobles, possessed of ample territories, were divided into various classes, to each of which peculiar titles of honor belonged. Some of these titles, like their lands, descended from father to son in perpetual succession. Others were annexed to particular offices, or conferred during life as marks of personal distinction. The monarch, exalted above all, enjoyed extensive power and supreme dignity. Thus the distinction of ranks was completely established, in a line of regular subordination, reaching from the highest to the lowest member of the community. Each of these knew what he could claim, and what he owed. The people, who were not allowed to wear a dress of the same fashion, or to dwell in houses of a form similar to those of the nobles, accosted them with the most submissive reverence. In the presence of their sovereign, they durst not lift their eyes from the ground, or look him in the face. The nobles themselves, when admitted to an audience of their sovereign, entered barefooted, in mean garments, and, as his slaves, paid him homage approaching to adoration. This respect, due from inferiors to those above them in rank, was prescribed with such ceremonious accuracy, that it incorporated with the language, and influenced its genius and idiom. The Mexican tongue abounded in expressions of reverence and courtesy. The style and appellations used in the intercourse between equals would have been so unbecoming in the mouth of one in a lower sphere, when he accosted a person in higher rank, as to be deemed an insult. [146] It is only in societies, which time and the institution of regular government have moulded into form, that we find such an orderly arrangement of men into different ranks, and such nice attention paid to their various rights.

The spirit of the Mexicans, thus familiarized and bended to subordination, was prepared for submitting to monarchical government. But the description of their policy and laws, by the Spaniards who overturned them, are so inaccurate and contradictory, that it is difficult to delineate the form of their constitution with any precision. Sometimes they represent the monarchs of Mexico as absolute, deciding according to

their pleasure with respect to every operation of the state. On other occasions, we discover the traces of established customs and laws, framed in order to circumscribe the power of the crown, and we meet with rights and privileges of the nobles which seemed to be opposed as barriers against its encroachments. This appearance of inconsistency has arisen from inattention to the innovations of Montezuma upon the Mexican policy. His aspiring ambition subverted the original system of government, and introduced a pure despotism. He disregarded the ancient laws, violated the privileges held most sacred, and reduced his subjects of every order to the level of slaves. The chiefs, or nobles of the first rank, submitted to the yoke with such reluctance that, from impatience to shake it off, and hope of recovering their rights, many of them courted the protection of Cortes, and joined a foreign power against their domestic oppressor. It is not then under the dominion of Montezuma, but under the government of his predecessors, that we can discover what was the original form and genius of Mexican policy. From the foundation of the monarchy to the election of Montezuma, it seems to have subsisted with little variation. That body of citizens, which may be distinguished by the name of nobility, formed the chief and most respectable order in the state. They were of various ranks, as has been already observed, and their honors were acquired and transmitted in different manners. Their number seems to have been great. According to an author accustomed to examine with attention what he relates, there were in the Mexican empire thirty of this order, each of whom had in his territories about a hundred thousand people; and subordinate to these, there were about three thousand nobles of a lower class. The territories belonging to the chiefs of Tezeuco and Tacuba were hardly inferior in extent to those of the Mexican monarch. Each of these possessed complete territorial jurisdiction, and levied taxes from their own vassals. But all followed the standard of Mexico in war, serving with a number of men in proportion to their domain, and most of them paid tribute to its monarch as their superior lord.

In tracing those great lines of the Mexican constitution, an image of feudal policy, in its most rigid form, rises to view, and we discern its three distinguishing characteristics, a nobility possessing almost independent authority, a people depressed into the lowest state of subjection, and a king intrusted with the executive power of the state. Its spirit and principles seem to have operated in the New World in the same manner as in the ancient. The jurisdiction of the crown was extremely limited. All real and effective authority was retained by the Mexican nobles in their own hands, and the shadow of it only left to the king. Jealous to excess of their own rights, they guarded with the most vigilant anxiety against the encroachments of their sovereigns. By a fundamental law of the empire, it was provided that the king should not determine concerning any point of general importance without the approbation of a council composed of the prime nobility. Unless he obtained their consent, he could not engage the nation in war, nor could he dispose of the most considerable branch of the public revenue at pleasure; it was appropriated to certain purposes from which it could not be diverted by the regal authority alone. In order to secure full effect to those constitutional restraints, the Mexican nobles did not permit their crown to descend by inheritance, but disposed of it by election. The right of election seems to have been originally vested in the whole body of nobility, but was afterwards committed to six electors, of whom the chiefs of Tezeuco and Tacuba were always two. From respect for the family of their monarchs, the choice fell generally upon some person sprung from it. But as the activity and valor of their prince were of greater moment to a people perpetually engaged in war, than a strict adherence to the order of birth, collateral of mature age or of distinguished merit were often preferred to those who were nearer the throne in direct descent. To this maxim in their policy, the Mexicans appear to be indebted for such a succession of able and warlike princes, as raised their empire in a short period to that extraordinary height of power which it had attained when Cortes landed in New Spain.

While the jurisdiction of the Mexican monarch continued to be limited, it is probable that it was exercised with little ostentation. But as their authority became more extensive, the splendor of their government augmented. It was in this last state that the Spaniards beheld it; and struck with the appearance of Montezuma's court, they describe its pomp at great length, and with much admiration. The number of his attend-

ants, the order, the silence, and the reverence with which they served him; the extent of his royal mansion, the variety of its apartments allotted to different officers, and the ostentation with which his grandeur was displayed, whenever he permitted his subjects to behold him, seem to resemble the magnificence of the ancient monarchies in Asia, rather than the simplicity of the infant states in the New World.

But it was not in the mere parade of royalty that the Mexican potentates exhibited their power; they manifested it more beneficially in the order and regularity with which they conducted the internal administration and police of their dominions. Complete jurisdiction, civil as well as criminal, over its own immediate vassals, was vested in the crown. Judges were appointed for each department; and if we may rely on the account which the Spanish writers give of the maxims and laws upon which they founded their decisions with respect to the distribution of property and the punishment of crimes, justice was administered in the Mexican empire with a degree of order and equity resembling what takes place in societies highly civilized.

Their attention in providing for the support of government was not less assiduous. Taxes were laid upon land, upon the acquisitions of industry, and upon commodities of every kind exposed to sale in the public markets. These duties were considerable, but not arbitrary or unequal. They were imposed according to established rules, and each knew what share of the common burden he had to bear. As the use of money was unknown, all the taxes were paid in kind; and thus not only the natural productions of all the different provinces in the empire, but every species of manufacture, and every work of ingenuity and art, were collected in the public storehouses. From those the emperor supplied his numerous train of attendants in peace, and his armies during war, with food, with clothes, and ornaments. People of inferior condition, neither possessing land nor engaged in commerce, were bound to the performance of various services. By their stated labor the crown lands were cultivated, public works were carried on, and the various houses belonging to the emperor were built and kept in repair. [147]

The improved state of government among the Mexicans is conspicuous, not only in points essential to the being of a well ordered society, but in several regulations of inferior consequence with respect to police. The institution which I have already mentioned, of public couriers, stationed at proper intervals, to convey intelligence from one part of the empire to the other, was a refinement in police not introduced into any kingdom of Europe at that period. The structure of the capital city in a lake, with artificial dykes, and causeways of great length, which served as avenues to it from different quarters, erected in the water, with no less ingenuity than labor, seems to be an idea that could not have occurred to any but a civilized people. The same observation may be applied to the structure of the aqueducts or conduits, by which they conveyed a stream of fresh water from a considerable distance, into the city, along one of the causeways. [148] The appointment of a number of persons to clean the streets, to light them by fires kindled in different places, and to patrol as watchmen during the night, discovers a degree of attention which even polished nations are late in acquiring.

The progress of the Mexicans in various arts is considered as the most decisive proof of their superior refinement. Cortes and the early Spanish authors describe this with rapture, and maintain, that the most celebrated European artists could not surpass or even equal them in ingenuity and neatness of workmanship. They represented men, animals, and other objects, by such a disposition of various colored feathers, as is said to have produced all the effects of light and shade, and to have imitated nature with truth and delicacy. Their ornaments of gold and silver have been described to be of a fabric no less curious. But in forming any idea from general descriptions, concerning the state of arts among nations imperfectly polished, we are extremely ready to err. In examining the works of people whose advances in improvement are nearly the same with our own, we view them with a critical and often with a jealous eye. Whereas when conscious of our own superiority, we survey the arts of nations comparatively rude, we are astonished at works executed by them under such manifest disadvantages, and, in the warmth of our admiration, are apt to represent them as productions more finished than they really are. To the influence of this illusion, without supposing any intention to deceive, we may impute the exaggeration of some Spanish authors, in their accounts of the Mexican arts.

It is not from those descriptions, but from considering such specimens of their arts as are still preserved, that we must decide concerning that degree of merit. As the ship in which Cortes sent to Charles V. the most curious productions of the Mexican artisans, which were collected by the Spaniards when they first pillaged the empire, was taken by a french corsair, the remains of their ingenuity are less numerous than those of the Peruvians. Whether any of their works with feathers, in imitation of painting, be still extant in Spain, I have not learned; but many of their ornaments in gold and silver, as well as various utensils employed in common life, are deposited in the magnificent cabinet of natural and artificial productions lately opened by the king of Spain; and I am informed by persons on whose judgment and taste I can rely, that these boasted efforts of their art are uncouth representations of common objects, or very coarse images of the human and some other forms, destitute of grace and propriety. [149] The justness of these observations is confirmed by inspecting the wooden prints and copper plates of their paintings, which have been published by various authors. In them every figure of men, of quadrupeds, or birds, as well as every representation of animated nature, is extremely rude and awkward.* The hardest Egyptian style, stiff and imperfect as it was, is more elegant. The scrawls of children delineate objects almost as accurately.

But however low the Mexican paintings may be ranked, when viewed merely as works of art, a very different station belongs to them when considered as the records of their country, as historical monuments of its policy and transactions; and they become curious as well as interesting objects of attention. The noblest and most beneficial invention of which human ingenuity can boast, is that of writing. But the first essays of this art, which hath contributed more than all others to the improvement of the species, were very rude, and it advanced towards perfection slowly, and by a gradual progression. When the warrior, eager for fame, wished to transmit some knowledge of his exploits to succeeding ages; when the gratitude of a people to their sovereign prompted them to hand down an account of his beneficent deeds to posterity; the first method of accomplishing this, which seems to have occurred to them, was to delineate, in the best manner they could, figures representing the action, of which they were solicitous to preserve the memory. Of this, which has very properly been called *picture writing*, we find traces among some of the most savage tribes of America. When a leader returns from the field, he strips a tree of its bark, and with red paint scratches upon it some uncouth figures which represent

* As a specimen of the spirit and style in which M. Clavigero makes his structures upon my History of America, I shall publish his remarks upon this passage. "Thus far Robertson; to whom we answer, first, That there is no reason to believe that those rude works were really Mexican; secondly, That neither do we know whether those persons in whose judgment he confides, may be persons fit to merit our faith, because we have observed that Robertson trusts frequently to the testimony of Gage, Correal, Bagniez, and other such authors, who are entirely undeserving of credit: thirdly, It is more probable that the arms of copper, believed by those intelligent judges to be certainly Oriental, are really Mexican." Vol. II. 391.—When an author, not entirely destitute of integrity or discernment, and who has some solicitude about his own character, asserts that he received his information concerning any particular point from persons "on whose judgment and taste he can rely," a very slender degree of candor, one should think, might induce the reader to believe that he does not endeavor to impose upon the public by an appeal to testimony altogether unworthy of credit. My information concerning the Mexican works of art, deposited in the king of Spain's cabinet, was received from the late Lord Grantham, ambassador extraordinary from the court of London to that of Madrid, and from Mr. Archdeacon Wadholme, chaplain to the embassy; and it was upon their authority that I pronounced the coat of armor, mentioned in the note, to be of Oriental fabric. As they were both at Madrid in their public character, when the first edition of the History of America was published, I thought it improper concerning a matter of taste, or their testimony concerning a point of fact, stand in need of confirmation, I might produce the evidence of an intelligent traveller, who, in describing the royal cabinet of Madrid takes notice that it contains "specimens of Mexican and Peruvian utensils, vases, &c. in earthenware, wretched both in taste and execution." Dileon's Travels through Spain, p. 77. As Gage composed his Survey of New Spain with all the zeal and ardor of a new convert, I have paid little regard to his testimony with respect to points relating to religion. But as he resided in several provinces in New Spain, which travellers seldom visit, and as he seems to have observed their manners and laws with an intelligent eye, I have availed myself of his information with respect to matters where religious opinion could have little influence. Correal I have seldom quoted, and never rested upon his evidence alone. The station in which Bagniez was employed in America, as well as the credit given to his veracity, by printing his *Regno Jesuitico* among the large collection of documents published (as I believe by authority) at Madrid, A. D. 1767, justifies me for appealing to his authority.

the order of his march, the number of his followers, the enemy whom he attacked, the scalps and captives which he brought home. To those simple annals he trusts for renown, and soothes himself with hope that by their means he shall receive praise from the warriors of future times.

Compared with those awkward essays of their savage countrymen, the paintings of the Mexicans may be considered as works of composition and design. They were not acquainted, it is true, with any other method of recording transactions than that of delineating the objects which they wished to represent. But they could exhibit a more complex series of events in progressive order, and describe, by a proper disposition of figures, the occurrences of a king's reign from his accession to his death; the progress of an infant's education from its birth until it attain to the years of maturity; the different recompenses and marks of distinction conferred upon warriors, in proportion to the exploits which they had performed. Some singular specimens of this picture writing have been preserved, which are justly considered as the most curious monuments of art brought from the New World. The most valuable of these was published by Purchas in sixty-six plates. It is divided into three parts. The first contains the history of the Mexican empire under its ten monarchs. The second is a tribute roll, representing what each conquered town paid into the royal treasury. The third is a code of their institutions, domestic, political, and military. Another specimen of Mexican painting has been published in thirty-two plates, by the present archbishop of Toledo. To both is annexed a full explanation of what the figures were intended to represent, which was obtained by the Spaniards from Indians well acquainted with their own arts. The style of painting in all these is the same. They represent things, not words. They exhibit images to the eye, not ideas to the understanding. They may therefore be considered as the earliest and most imperfect essay of men in their progress towards discovering the art of writing. The defects in this mode of recording transactions must have been early felt. To paint every occurrence was from its nature a very tedious operation; and as affairs became more complicated, and events multiplied in any society, its annals must have swelled to an enormous bulk. Besides this, no objects could be delineated but those of sense; the conceptions of the mind had no corporeal form; and as long as picture writing could not convey an idea of these, it must have been a very imperfect art. The necessity of improving it must have roused and sharpened invention; and the human mind, holding the same course in the New World as in the Old, might have advanced by the same successive steps, first, from an actual picture to the plain hieroglyphic; next to the allegorical symbol; then to the arbitrary character; until, at length, an alphabet of letters was discovered, capable of expressing all the various combinations of sound employed in speech. In the paintings of the Mexicans we accordingly perceive that this progress was begun among them. Upon an attentive inspection of the plates, which I have mentioned, we may observe some approach to the plain or simple hieroglyphic, where some principal part or circumstance in the subject is made to stand for the whole. In the annals of their kings, published by Purchas, the towns conquered by each are uniformly represented in the same manner by a rude delineation of a house; but in order to point out the particular towns which submitted to their victorious arms, peculiar emblems, sometimes natural objects, and sometimes artificial figures, are employed. In the tribute-roll published by the Archbishop of Toledo, the house which was properly the picture of the town, is omitted, and the emblem alone is employed to represent it. The Mexicans seem even to have made some advances beyond this, towards the use of the more figurative and fanciful hieroglyphic. In order to describe a monarch who had enlarged his dominions by force of arms, they painted a target ornamented with darts, and placed it between him and those towns which he subdued. But it is only in one instance, the notation of numbers, that we discern any attempt to exhibit ideas which had no corporeal form. The Mexican painters had invented artificial marks, or *signs of convention*, for this purpose. By means of these, they computed the years of their kings' reigns, as well as the amount of tribute to be paid into the royal treasury. The figure of a circle represented unit; and in small numbers, the computation was made by repeating it. Larger numbers were expressed by a peculiar mark; and they had such as denoted all integral numbers, from twenty to eight thousand. The short duration of their empire

prevented the Mexicans from advancing further in that long course which conducts men from the labor of delineating real objects, to the simplicity and ease of alphabetic writing. Their records, notwithstanding some dawn of such ideas as might have led to a more perfect style, can be considered as little more than a species of picture-writing, so far improved as to mark their superiority over the savage tribes of America; but still so defective as to prove that they had not proceeded far beyond the first stage in that progress which must be completed before any people can be ranked among polished nations. [150]

Their mode of computing time may be considered as a more decisive evidence of their progress in improvement. They divided their year into eighteen months, consisting of twenty days; amounting in all to three hundred and sixty. But as they observed that the course of the sun was not completed in that time, they added five days to the year. These, which were properly intercalary days, they termed *supernumerary* or *vaste*; and as they did not belong to any month, no work was done, and no sacred rite performed on them; they were devoted wholly to festivity and pastime.* This near approach to philosophical accuracy is a remarkable proof, that the Mexicans had bestowed some attention upon inquiries and speculations to which men in a very rude state never turn their thoughts.

Such are the most striking particulars in the manners and policy of the Mexicans, which exhibit them to view as a people considerably refined. But from other circumstances, one is apt to suspect that their character, and many of their institutions, did not differ greatly from those of the other inhabitants of America.

Like the rude tribes around them, the Mexicans were incessantly engaged in war, and the motives which prompted them to hostility seem to have been the same. They fought in order to gratify their vengeance by shedding the blood of their enemies. In battle they were chiefly intent on taking prisoners; and it was by the number of these that they estimated the glory of victory. No captive was ever ransomed or spared. All were sacrificed without mercy, and their flesh devoured with the same barbarous joy as among the fiercest savages. On some occasions it arose to even wilder excesses. Their principal warriors covered themselves with the skins of the unhappy victims, and danced about the streets, boasting of their own valor, and exulting over their enemies. Even in their civil institutions we discover traces of that barbarous disposition which their system of war inspired. The four chief counsellors of the empire were distinguished by titles, which could have been assumed only by a people who delighted in blood. [151] This ferocity of character prevailed among all the nations of New Spain. The Tlascalans, the people of Mechoacan, and other states at enmity with the Mexicans, delighted equally in war, and treated their prisoners with the same cruelty. In proportion as mankind combine in social union, and live under the influence of equal laws and regular policy, their manners soften, sentiments of humanity arise, and the rights of the species come to be understood. The fierceness of war abates, and even while engaged in hostility, men remember what they owe one to another. The savage fights to destroy, the citizen to conquer. The former neither pities nor spares, the latter has acquired sensibility which tempers his rage. To this sensibility the Mexicans seem to have been perfect strangers; and among them war was carried on with so much of its original barbarity, that we cannot but suspect their degree of civilization to have been very imperfect.

Their funeral rites were not less bloody than those of the most savage tribes. On the death of any distinguished personage, especially of the emperor, a certain number of his attendants were chosen to accompany him to the other world; and those unfortunate victims were put to death without mercy, and buried in the same tomb.

Though their agriculture was more extensive than that of the roving tribes who trusted chiefly to their bow for food, it seems not to have supplied them with such subsistence as men require when engaged in efforts of active industry. The Spaniards appear not to have been struck with any superiority of the Mexicans over the other people of America in bodily vigor. Both, according to their observation, were of such a feeble frame as to be unable to endure fatigue, and the

* The Mexican mode of computing time, and every other particular relating to their chronology, have been considerably elucidated by M. Clavigero, vol. i. p. 288; vol. ii. p. 225, &c. The observations and theories of the Mexicans concerning these subjects discover a greater progress in speculative science than we find among any people in the New World.

strength of one Spaniard exceeded that of several Indians. This they imputed to their scanty diet, on poor fare, sufficient to preserve life, but not to give firmness to their constitution. Such a remark could hardly have been made with respect to any people furnished plentifully with the necessities of life. The difficulty which Cortes found in procuring subsistence for his small body of soldiers, who were often constrained to live on the spontaneous productions of the earth, seems to confirm the remark of the Spanish writers, and gives no high idea of the state of cultivation in the Mexican empire.

A practice that was universal in New Spain appears to favor this opinion. The Mexican women gave suck to their children for several years, and during that time they did not cohabit with their husbands. This precaution against a burdensome increase of progeny, though necessary, as I have already observed, among savages, who from the hardships of their condition, and the precariousness of their subsistence, find it impossible to rear a numerous family, can hardly be supposed to have continued among a people who lived at ease and in abundance.

The vast extent of the Mexican empire, which has been considered, and with justice, as the most decisive proof of a considerable progress in regular government and police, is one of those facts in the history of the New World which seems to have been admitted without due examination or sufficient evidence. The Spanish historians, in order to magnify the valor of their countrymen, are accustomed to represent the dominion of Montezuma as stretching over all the provinces of New Spain from the Northern to the Southern Ocean. But a great part of the mountainous country was possessed by the *Otomies*, a fierce uncivilized people, who seem to have been the residue of the original inhabitants. The provinces towards the north and west of Mexico, were occupied by the *Chichimecas*, and other tribes of hunters. None of these recognised the Mexican monarch as their superior. Even in the interior and more level country, there were several cities and provinces which had never submitted to the Mexican yoke. Tlascala, though only twenty-one leagues from the capital of the empire, was an independent and hostile republic. Cholula, though still nearer, had been subjected only a short time before the arrival of the Spaniards. Tepeaca, at the distance of thirty leagues from Mexico, seems to have been a separate state, governed by its own laws. Mechoacan, the frontier of which extended within forty leagues of Mexico, was a powerful kingdom, remarkable for its implacable enmity to the Mexican name. By these hostile powers the Mexican empire was circumscribed on every quarter, and the high ideas which we are apt to form of it from the description of the Spanish historians, should be considerably moderated.

In consequence of this independence of several states in New Spain upon the Mexican empire, there was not any considerable intercourse between its various provinces. Even in the interior country not far distant from the capital, there seems to have been no roads to facilitate the communication of one district with another; and when the Spaniards first attempted to penetrate into its several provinces, they had to open their way through forests and marshes. Cortes, in his adventurous march from Mexico to Honduras, in 1525, met with obstructions, and endured hardships little inferior to those with which he must have struggled in the most uncivilized regions of America. In some places he could hardly force a passage through impervious woods, and plains overflowed with water. In others he found so little cultivation, that his troops were frequently in danger of perishing by famine. Such facts correspond ill with the pompous description which the Spanish writers give of Mexican police and industry, and convey an idea of a country nearly similar to that possessed by the Indian tribes in North America. Here and there a trading or a war path, as they are called in North America, led from one settlement to another; but generally there appeared no sign of any established communication, few marks of industry, and fewer monuments of art.

A proof of this imperfection in their commercial intercourse no less striking is their want of money, or some universal standard by which to estimate the value of commodities. The discovery of this is among the steps of greatest consequence in the progress of nations. Until it has been made, all their transactions must be so awkward, so operose, and so limited, that we may boldly pronounce that they have advanced but a little way in their career. The invention of such a commercial standard is of such high antiquity in our hemis-

phere, and rises so far beyond the era of authentic history, as to appear almost coeval with the existence of society. The precious metals seem to have been early employed for this purpose; and from their permanent value, their divisibility, and many other qualities, they are better adapted to serve as a common standard than any other substance of which nature has given us the command. But in the New World, where these metals abound most, the use of them was not known. The exigencies of rude tribes, or of monarchies imperfectly civilized, did not call for it. All their commercial intercourse was carried on by barter; and their ignorance of any common standard by which to facilitate that exchange of commodities which contributes so much towards the comfort of life, may be justly mentioned as an evidence of the infant state of their policy. But even in the New World the inconvenience of wanting some general instrument of commerce began to be felt and some efforts were making towards supplying that defect. The Mexicans, among whom the number and greatness of their cities gave rise to a more extended commerce than in any other part of America, had begun to employ a common standard of value which rendered smaller transactions much more easy. As chocolate was the favorite drink of persons in every rank of life, the nuts or almonds of cacao, of which it is composed, were of such universal consumption, that, in their stated markets, these were willingly received in return for commodities of small price. Thus they came to be considered as the instrument of commerce and the value of what one wished to dispose of was estimated by the number of nuts of the cacao, which he might expect in exchange for it. This seems to be the utmost length which the Americans had advanced towards the discovery of any expedient for supplying the use of money. And if the want of it is to be held, on one hand, as a proof of their barbarity, this expedient for supplying that want should be admitted, on the other, as an evidence no less satisfying of some progress which the Mexicans had made in refinement and civilization beyond the savage tribes around them.

In such a rude state were many of the Mexican provinces when first visited by their conquerors. Even their cities, extensive and populous as they were, seem more fit to be the habitation of men just emerging from barbarity, than the residence of a polished people. The description of Tlascala nearly resembles that of an Indian village. A number of low straggling huts, scattered about irregularly, according to the caprice of each proprietor, built with turf and stone, and thatched with reeds, without any light but what they received by a door, so low that it could not be entered upright. To Mexico, though from the peculiarity of its situation, the disposition of the houses was more orderly, the structure of the greater part was equally mean. Nor does the fabric of their temples, and other public edifices, appear to have been such as entitled them to the high praise bestowed upon them by many Spanish authors. As far as one can gather from their obscure and inaccurate descriptions, the great temple of Mexico, the most famous in New Spain, which has been represented as a magnificent building, raised to such a height, that the ascent to it was by a flight of a hundred and fourteen steps, was a solid mass of earth of a square form, faced partly with stone. Its base on each side extended ninety feet; and decreasing gradually as it advanced in height, it terminated in a quadrangle of about thirty feet, where were placed a shrine of the deity, and two altars on which the victims were sacrificed. All the other celebrated temples of New Spain exactly resembled that of Mexico. [152] Such structures convey no high idea of progress in art and ingenuity: and one can hardly conceive that a form more rude and simple could have occurred to a nation in its first efforts towards erecting any great work.

Greater skill and ingenuity were displayed, if we may believe the Spanish historians, in the houses of the emperor, and in those of the principal nobility. There some elegance of design was visible, and a commodious arrangement of the apartments was attended to. But if buildings corresponding to such descriptions had ever existed in the Mexican cities, it is probable that some remains of them would still be visible. From the manner in which Cortes conducted the siege of Mexico, we can indeed easily account for the total destruction of whatever had any appearance of splendor in that capital. But as only two centuries and a half have elapsed since the conquest of New Spain, it seems altogether incredible that in a period so short, every vestige of this boasted elegance and grandeur should have disappeared; and that in the other cities, particularly in those which did not suffer by the destructive hand of the conquer-

ors, there are not any ruins which can be considered as monuments of their ancient magnificence.

Even in a village of the rudest Indians, there are buildings of greater extent and elevation than common dwelling houses. Such as are destined for holding the council of the tribe, and in which all assemble on occasions of public festivity, may be called stately edifices, when compared with the rest. As among the Mexicans the distinction of ranks was established, and property was unequally divided, the number of distinguished structures in their towns would of course be greater than in other parts of America. But these seem not to have been either so solid or magnificent as to merit the pompous epithets which some Spanish authors employ in describing them. It is probable that, though more ornamented, and built on a larger scale, they were erected with the same slight materials which the Indians employed in their common buildings. [153] And Time, in a space much less than two hundred and fifty years, may have swept away all remains of them [154].

From this enumeration of facts, it seems, upon the whole, to be evident, that the state of society in Mexico was considerably advanced beyond that of the savage tribes which we have delineated. But it is no less manifest that, with respect to many particulars, the Spanish accounts of their progress appear to be highly embellished. There is not a more frequent or a more fertile source of deception in describing the manners and arts of savage nations, or of such as are imperfectly civilized, than that of applying to them the names and phrases appropriated to the institutions and refinements of polished life. When the leader of a small tribe, or the head of a rude community, is dignified with the name of King or Emperor, the place of his residence can receive no other name than that of his palace; and whatever his attendants may be, they must be called his court. Under such appellations they acquire, in our estimation, an importance and dignity which does not belong to them. The illusion spreads; and giving a false color to every part of the narrative, the imagination is so much carried away with the resemblance, that it becomes difficult to discern objects as they really are. The Spaniards, when they first touched on the Mexican coast, were so much struck with the appearance of attainments in policy and in the arts of life, far superior to those of the rude tribes with which they were hitherto acquainted, that they fancied they had at length discovered a civilized people in the New World. This comparison between the people of Mexico and their uncultivated neighbors, they appear to have kept constantly in view; and observing with admiration many things which marked the pre-eminence of the former, they employ, in describing their imperfect policy and infant arts, such terms as are applicable to the institutions of men far beyond them in improvement. Both these circumstances concur in detracting from the credit due to the descriptions of Mexican manners by the early Spanish writers. By drawing a parallel between them and those of people so much less civilized, they raised their own ideas too high. By their mode of describing them, they conveyed ideas to others no less exalted above truth. Later writers have adopted the style of the original historians, and improved upon it. The colors with which De Solis delineates the character and describes the actions of Montezuma, the splendor of his court, the laws and policy of his empire, are the same that he must have employed in exhibiting to view the monarch and institutions of a highly polished people.

But though we may admit, that the warm imagination of the Spanish writers has added some embellishment to their descriptions, this will not justify the decisive and peremptory tone with which several authors pronounce all their accounts of the Mexican power, policy, and laws, to be the fictions of men who wished to deceive, or who delighted in the marvellous. There are few historical facts that can be ascertained by evidence more unexceptionable, than may be produced in support of the material articles in the description of the Mexican constitution and manners. Eye-witnesses relate what they beheld. Men who had resided among the Mexicans, both before and after the conquest, describe institutions and customs which were familiar to them. Persons of professions so different that objects must have presented themselves to their view under every various aspect; soldiers, priests, and lawyers, all concur in their testimony. Had Cortes ventured to impose upon his sovereign, by exhibiting to him a picture of imaginary manners, there wanted not enemies and rivals who were qualified to detect his deceit, and who would have rejoiced in exposing it.

But according to the just remark of an author, whose ingenuity has illustrated, and whose eloquence has adorned, the history of America, this supposition is in itself as improbable as the attempt would have been a audacious. Who, among the destroyers of this great empire, was so enlightened by science, or so attentive to the progress and operations of men in social life, as to frame a fictitious system of policy so well combined and so consistent, as that which they delineate in their accounts of the Mexican government? Where could they have borrowed the idea of many institutions in legislation and police, to which, at that period, there was nothing parallel in the nations with which they were acquainted? There was not, at the beginning of the sixteenth century, a regular establishment of posts for conveying intelligence to the sovereign of any kingdom in Europe. The same observation will apply to what the Spaniards relate with respect to the structure of the city of Mexico, the regulations concerning its police, and various laws established for the administration of justice, or securing the happiness of the community. Whoever is accustomed to contemplate the progress of nations will often, at very early stages of it, discover a premature and unexpected dawn of those ideas which gave rise to institutions that are the pride and ornament of its most advanced period. Even in a state as imperfectly polished as the Mexican empire, the happy genius of some sagacious observer, excited or aided by circumstances unknown to us, may have introduced institutions which are seldom found but in societies highly refined. But it is almost impossible that the illiterate conquerors of the New World should have formed in any one instance a conception of customs and laws beyond the standard of improvement in their own age and country. Or if Cortes had been capable of this, what inducement had those by whom he was superseded to continue the deception? Why should Cortes, or Motolinea, or Acosta, have amused their sovereign or their fellow-citizens with a tale purely fabulous?

In one particular, however, the guides whom we must follow have represented the Mexicana to be more barbarous, perhaps, than they really were. Their religious tenets and the rites of their worship are described by them as wild and cruel in an extreme degree. Religion, which occupies no considerable place in the thoughts of a savage, whose conceptions of any superior power are obscure, and his sacred rites few as well as simple, was formed, among the Mexicans, into a regular system, with its complete train of priests, temples, victims, and festivals. This, of itself, is a clear proof that the state of the Mexicans was very different from that of the ruder American tribes. But from the extravagance of their religious notions, or the barbarity of their rites, no conclusion can be drawn with certainty concerning the degree of their civilization. For nations, long after their ideas begin to enlarge, and their manners to refine, adhere to systems of superstition founded on the crude conceptions of early ages. From the genius of the Mexican religion we may, however, form a most just conclusion with respect to its influence upon the character of the people. The aspect of superstition in Mexico was gloomy and atrocious. Its divinities were clothed with terror, and delighted in vengeance. They were exhibited to the people under detestable forms, which created horror. The figures of serpents, of tigers, and of other destructive animals, decorated their temples. Fear was the only principle that inspired their votaries. Fasts, mortifications, and penances, all rigid, and many of them excruciating to an extreme degree, were the means employed to appease the wrath of their gods, and the Mexicans never approached their altars without sprinkling them with blood drawn from their own bodies. But, of all offerings, human sacrifices were deemed the most acceptable. Thus religious belief mingling with the implacable spirit of vengeance, and adding new force to it, every captive taken in war was brought to the temple, was devoted as a victim to the deity, and sacrificed with rites no less solemn than cruel. [155] The heart and head were the portion consecrated to the gods; the warrior, by whose prowess the prisoner had been seized, carried off the body to feast upon it with his friends. Under the impression of ideas so dreary and terrible, and accustomed daily to scenes of bloodshed rendered awful by religion, the heart of man must harden and be steel'd to every sentiment of humanity. The spirit of the Mexicans was accordingly unfeeling; and the genius of their religion so far counterbalanced the influence of policy and arts, that notwithstanding their progress in both, their manners, instead of softening, became more fierce. To what circumstances it was owing that superstition assumed

such a dreadful form among the Mexicans, we have not sufficient knowledge of their history to determine. But its influence is visible, and produced an effect that is singular in the history of the human species. The manners of the people in the New World, who had made the greatest progress in the arts of policy, were, in several respects, the most ferocious, and the barbarity of some of their customs exceeded even those of the savage state.

The empire of Peru boasts of a higher antiquity than that of Mexico. According to the traditionary accounts collected by the Spaniards, it had subsisted four hundred years, under twelve successive monarchs. But the knowledge of their ancient story, which the Peruvians could communicate to their conquerors, must have been both imperfect and uncertain. [156] Like the other American nations, they were totally unacquainted with the art of writing, and destitute of the only means by which the memory of past transactions can be preserved with any degree of accuracy. Even among people to whom the use of letters is known, the era where the authenticity of history commences is much posterior to the introduction of writing. That noble invention continued every where to be long subservient to the common business and wants of life, before it was employed in recording events, with a view of conveying information from one age to another. But in no country did ever tradition alone carry down historical knowledge, in any full continued stream, during a period of half the length that the monarchy of Peru is said to have subsisted.

The *Quipos*, or knots on cords of different colors, which are celebrated by authors fond of the marvellous, as if they had been regular annals of the empire, imperfectly supplied the place of writing. According to the obscure description of them by Acosta, which Garcilasso de la Vega has adopted with little variation and no improvement, the quipos seem to have been a device for rendering calculation more expeditious and accurate. By the various colors different objects were denoted, and by each knot a distinct number. Thus an account was taken, and a kind of register kept, of the inhabitants in each province, or of the several productions collected there for public use. But as these knots, however varied or combined, no moral or abstract idea, no operation or quality of the mind could be represented, they contributed little towards preserving the memory of ancient events and institutions. By the Mexican paintings and symbols, rude as they were, more knowledge of remote transactions seems to have been conveyed than the Peruvians could derive from their boasted quipos. Had the latter been even of more extensive use, and better adapted to supply the place of written records, they perished so generally, together with other monuments of Peruvian ingenuity, in the wreck occasioned by the Spanish conquest, and the civil wars subsequent to it, that no accession of light or knowledge comes from them. All the zeal of Garcilasso de la Vega, for the honor of that race of monarchs from whom he descended, all the industry of his researches, and the superior advantages with which he carried them on, opened no source of information unknown to the Spanish authors who wrote before him. In his *Royal Commentaries*, he confines himself to illustrate what they had related concerning the antiquities and institutions of Peru; and his illustrations, like their accounts, are derived entirely from the traditionary tales current among his countrymen.

Very little credit then is due to the minute details which have been given of the exploits, the battles, the conquests, and private character of the early Peruvian monarchs. We can rest upon nothing in their story as authentic, but a few facts so interwoven in the system of their religion and policy, as preserved the memory of them from being lost; and upon the description of such customs and institutions as continued in force at the time of the conquest, and fell under the immediate observation of the Spaniards. By attending carefully to these, and endeavoring to separate them from what appears to be fabulous or of doubtful authority, I have labored to form an idea of the Peruvian government and manners.

The people of Peru, as I have already observed, had not advanced beyond the rudest form of savage life, when Manco Capac, and his consort Mama Ocello, appeared to instruct and civilize them. Who these extraordinary personages were, whether they imported their system of legislation and knowledge of arts from some country more improved, or, if natives of Peru, how they acquired ideas so far superior to those of the people whom they addressed, are circumstances with respect to which the Peruvian tradition conveys no

information. Manco Capac and his consort, taking advantage of the propensity in the Peruvians to superstition, and particularly of their veneration for the Sun, pretended to be children of that glorious luminary, and to deliver their instructions in his name, and by authority from him. The multitude listened and believed. What reformation in policy and manners the Peruvians ascribe to those founders of their empire, and how, from the precepts of the Inca and his consort, their ancestors gradually acquired some knowledge of those arts, and some relish for that industry, which render subsistence secure and life comfortable, hath been formerly related. Those blessings were originally confined within narrow precincts; but in process of time, the successors of Manco Capac extended their dominion over all the regions that stretch to the west of the Andes from Chili to Quito, establishing in every province their peculiar policy and religious institutions.

The most singular and striking circumstance in the Peruvian government is the influence of religion upon its genius and laws. Religious ideas make such a feeble impression on the mind of a savage, that their effect upon his sentiments and manners is hardly perceptible. Among the Mexicans, religion, reduced into a regular system, and holding a considerable place in their public institutions, operated with conspicuous efficacy in forming the peculiar character of that people. But in Peru, the whole system of policy was founded on religion. The Inca appeared not only as a legislator, but as the messenger of Heaven. His precepts were received not merely as the injunctions of a superior, but as the mandates of the Deity. His race was to be held sacred; and in order to preserve it distinct, without being polluted by any mixture of less noble blood, the sons of Manco Capac married their own sisters, and no person was ever admitted to the throne who could not claim it by such a pure descent. To those *Children of the Sun*, for that was the appellation bestowed upon all the offspring of the first Inca, the people looked up with the reverence due to beings of a superior order. They were deemed to be under the immediate protection of the deity from whom they issued, and by him every order of the reigning Inca was supposed to be dictated.

From those ideas two consequences resulted. The authority of the Inca was unlimited and absolute in the most extensive meaning of the words. Whenever the decrees of a prince are considered as the commands of the Divinity, it is not only an act of rebellion, but of impiety, to dispute or oppose his will. Obedience becomes a duty of religion; and as it would be profane to control a monarch who is believed to be under the guidance of Heaven, and presumptuous to advise him, nothing remains but to submit with implicit respect. This must necessarily be the effect of every government established on pretensions of intercourse with superior powers. Such accordingly was the blind submission which the Peruvians yielded to their sovereigns. The persons of highest rank and greatest power in their dominions acknowledged them to be of a more exalted nature; and in testimony of this, when admitted into their presence, they entered with a burden upon their shoulders, as an emblem of their servitude, and willingness to bear whatever the Inca was pleased to impose. Among their subjects, force was not requisite to second their commands. Every officer intrusted with the execution of them was revered, and, according to the account of an intelligent observer of Peruvian manners, he might proceed alone from one extremity of the empire to another without meeting opposition; for, on producing a fringe from the royal *borla*, an ornament of the head peculiar to the reigning Inca, the lives and fortunes of the people were at his disposal.

Another consequence of establishing government in Peru on the foundation of religion was, that all crimes were punished capitally. They were not considered as transgressions of human laws, but as insults offered to the Deity. Each, without any distinction between such as were slight and such as were atrocious, called for vengeance, and could be expiated only by the blood of the offender. Consistently to the same ideas, punishment followed the trespass with inevitable certainty, because an offence against Heaven was deemed such a high enormity as could not be pardoned. Among a people of corrupted morals, maxims of jurisprudence so severe and unrelenting, by rendering men ferocious and desperate, would be more apt to multiply crimes than to restrain them. But the Peruvians, of simple manners and unsuspicious faith, were held in such awe by this rigid discipline, that the number of offenders was extremely small. Veneration for monarchs en-

lightened and directed, as they believed, by the divinity whom they adored, prompted them to their duty; the dread of punishment, which they were taught to consider as unavoidable vengeance inflicted by offended Heaven, withheld them from evil.

The system of superstition, on which the Incas ingrafted their pretensions to such high authority, was of a genius very different from that established among the Mexicans. Manco Capac turned the veneration of his followers entirely towards natural objects. The Sun, as the great source of light, of joy, and fertility in the creation, attracted their principal homage. The Moon and Stars, as co-operating with him, were entitled to secondary honors. Wherever the propensity in the human mind to acknowledge and to adore some superior power takes this direction, and is employed in contemplating the order and beneficence that really exists in nature, the spirit of superstition is mild. Wherever imaginary beings, created by the fancy and the fears of men, are supposed to preside in nature, and become the objects of worship, superstition always assumes a more severe and atrocious form. Of the latter we have an example among the Mexicans, of the former among the people of Peru. The Peruvians had not, indeed, made such progress in observation or inquiry, as to have attained just conceptions of the Deity; nor was there in their language any proper name or appellation of the Supreme Power, which intimated that they had formed any idea of him as the Creator and Governor of the world.

But by directing their veneration to that glorious luminary, which, by its universal and vivifying energy, is the best emblem of Divine beneficence, the rites and observances which they deemed acceptable to him were innocent and humane. They offered to the Sun a part of those productions which his genial warmth had called forth from the bosom of the earth, and reared to maturity. They sacrificed, as an oblation of gratitude, some of the animals which were indebted to his influence for nourishment. They presented to him choice specimens of those works of ingenuity which his light had guided the hand of man in forming. But the Incas never stained his altars with human blood, nor could they conceive that their beneficent father, the Sun, would be delighted with such horrid victims [157] Thus the Peruvians, unacquainted with those barbarous rites which extinguish sensibility, and suppress the feelings of nature at the sight of human sufferings, were formed by the spirit of the superstition which they had adopted, to a national character more gentle than that of any people in America.

The influence of this superstition operated in the same manner upon their civil institutions, and tended to correct in them whatever was adverse to gentleness of character. The dominion of the Incas, though the most absolute of all despotisms, was mitigated by its alliance with religion. The mind was not humbled and depressed by the idea of a forced subjection to the will of a superior; obedience, paid to one who was believed to be clothed with Divine authority, was willingly yielded, and implied no degradation. The sovereign, conscious that the submissive reverence of his people flowed from their belief of his heavenly descent, was continually reminded of a distinction which prompted him to imitate that beneficent power which he was supposed to represent. In consequence of those impressions, there hardly occurs in the traditional history of Peru, any instance of rebellion against the reigning prince, and among twelve successive monarchs there was not one tyrant.

Even the wars in which the Incas engaged were carried on with a spirit very different from that of other American nations. They fought not, like savages, to destroy and to exterminate; or, like the Mexicans, to glut blood-thirsty divinities with human sacrifices. They conquered, in order to reclaim and civilize the vanquished, and to diffuse the knowledge of their own institutions and arts. Prisoners seem not to have been exposed to the insults and tortures which were their lot in every other part of the New World. The Incas took the people whom they subdued under their protection, and admitted them to a participation of all the advantages enjoyed by their original subjects. This practice, so repugnant to American ferocity, and resembling the humanity of the most polished nations, must be ascribed, like other peculiarities which we have observed in the Peruvian manners, to the genius of their religion. The Incas, considering the homage paid to any other object than to the heavenly powers which they adored as impious, were fond of gaining proselytes to their favorite system. The idols of every conquered province were carried in triumph to the great temple at Cuzco, and

placed there as trophies of the superior power of the divinity who was the protector of their empire. The people were treated with lenity, and instructed in the religious tenets of their new masters, that the conqueror might have the glory of having added to the number of the votaries of his father the Sun.

The state of property in Peru was no less singular than that of religion, and contributed, likewise, towards giving a mild turn of character to the people. All the lands capable of cultivation were divided into three shares. One was consecrated to the Sun, and the product of it was applied to the erection of temples, and furnishing what was requisite towards celebrating the public rites of religion. The second belonged to the Inca, and was set apart as the provision made by the community for the support of government. The third and largest share was reserved for the maintenance of the people, among whom it was parcelled out. Neither individuals, however, nor communities had a right of exclusive property in the portion set apart for their use. They possessed it only for a year, at the expiration of which a new division was made in proportion to the rank, the number, and exigencies of each family. All those lands were cultivated by the joint industry of the community. The people summoned by a proper officer, repaired in a body to the fields, and performed their common task, while songs and musical instruments cheered them to their labor. By this singular distribution of territory, as well as by the mode of cultivating it, the idea of a common interest, and of mutual subserviency, was continually inculcated. Each individual felt his connexion with those around him, and knew that he depended on their friendly aid for what increase he was to reap. A state thus constituted may be considered as one great family, in which the union of the members was so complete, and the exchange of good offices so perceptible, as to create stronger attachment, and to bind man to man in closer intercourse than subsisted under any form of society established in America. From this resulted gentle manners and mild virtues unknown in the savage state, and with which the Mexicans were little acquainted.

But, though the institutions of the Incas were so framed as to strengthen the bonds of affection among their subjects, there was great inequality in their condition. The distinction of ranks was fully established in Peru. A great body of the inhabitants, under the denomination of *Yanaconas*, were held in a state of servitude. Their garb and houses were of a form different from those of freemen. Like the *Tamenes* of Mexico, they were employed in carrying burdens, and in performing every other work of drudgery. Next to them, in rank, were such of the people as were free, but distinguished by no official or hereditary honors. Above them were raised those whom the Spaniards call *Orejones*, from the ornaments worn in their ears. They formed what may be denominated the order of nobles, and in peace as well as war held every office of power or trust. And the head of all were the children of the Sun, who, by their high descent and peculiar privileges, were as much exalted above the *Orejones*, as these were elevated above the people.

Such a form of society, from the union of its members, as well as from the distinction in their ranks, was favorable to progress in the arts. But the Spaniards, having been acquainted with the improved state of various arts in Mexico several years before they discovered Peru, were not so much struck with what they observed in the latter country, and describe the appearances of ingenuity there with less warmth of admiration. The Peruvians, nevertheless, had advanced far beyond the Mexicans, both in the necessary arts of life, and in such as have some title to the name of elegant.

In Peru, agriculture, the art of primary necessity in social life, was more extensive, and carried on with greater skill than in any part of America. The Spaniards, in their progress through the country, were so fully supplied with provisions of every kind, that in the relation of their adventures we meet with few of those dismal scenes of distress occasioned by famine, in which the conquerors of Mexico were so often involved. The quantity of soil under cultivation was not left to the discretion of individuals, but regulated by public authority in proportion to the exigencies of the community. Even the calamity of an unfruitful season was but little felt; for the product of the lands consecrated to the Sun, as well as those set apart for the Incas, being deposited in the *Tambos*, or public storehouses, it remained there as a stated provision for times of scarcity. As the extent of cultivation was determined with such provident attention to the demands of the

state, the invention and industry of the Peruvians were called forth to extraordinary exertions, by certain defects peculiar to their climate and soil. All the vast rivers that flow from the Andes take their course eastward to the Atlantic Ocean. Peru is watered only by some streams which rush down from the mountains like torrents. A great part of the low country is sandy and barren, and never refreshed with rain. In order to render such an unpromising region fertile, the ingenuity of the Peruvians had recourse to various expedients. By means of artificial canals, conducted with much patience and considerable art from the torrents that poured across their country, they conveyed a regular supply of moisture to their fields. [158] They enriched the soil by manuring it with the dung of sea fowls, of which they found an inexhaustible store on all the islands scattered along the coasts. In describing the customs of any nation thoroughly civilized, such practices would hardly draw attention, or be mentioned as in any degree remarkable; but in the history of the improvident race of men in the New World, they are entitled to notice as singular proofs of industry and of art. The use of the plough, indeed, was unknown to the Peruvians. They turned up the earth with a kind of mattock of hard wood. Nor was this labor deemed so degrading as to be devolved wholly upon the women. Both sexes joined in performing this necessary work. Even the children of the Sun set an example of industry, by cultivating a field near Cuzco with their own hands, and they dignified this function by denominating it their triumph over the earth.

The superior ingenuity of the Peruvians is obvious, likewise, in the construction of their houses and public buildings. In the extensive plains which stretch along the Pacific Ocean, where the sky is perpetually serene, and the climate mild, their houses were very properly of a fabric extremely slight. But in the higher regions, where rain falls, where the vicissitude of seasons is known, and their rigor felt, houses were constructed with greater solidity. They were generally of a square form, the walls about eight feet high, built with bricks hardened in the sun, without any windows, and the door low and straight. Simple as these structures were, and rude as the materials may seem to be of which they were formed, they were so durable that many of them still subsist in different parts of Peru, long after every monument that might have conveyed to us any idea of the domestic state of the other American nations has vanished from the face of the earth. But it was in the temples consecrated to the Sun, and in the buildings destined for the residence of their monarchs, that the Peruvians displayed the utmost extent of their art and contrivance. The descriptions of them by such of the Spanish writers as had an opportunity of contemplating them, while in some measure entire, might have appeared highly exaggerated, if the ruins which still remain did not vouch the truth of their relations. These ruins of sacred or royal buildings are found in every province of the empire, and by their frequency demonstrate that they are monuments of a powerful people, who must have subsisted, during a period of some extent, in a state of no inconsiderable improvement. They appear to have been edifices various in their dimensions; some of a moderate size, many of immense extent, all remarkable for solidity, and resembling each other in the style of architecture. The temple of Pachacamac, together with a palace of the Inca, and a fortress, were so connected together as to form one great structure above half a league in circuit. In this prodigious pile, the same singular taste in building is conspicuous as in other works of the Peruvians. As they were unacquainted with the use of the pulley, and other mechanical powers, and could not elevate the large stones and bricks which they employed in building to any considerable height, the walls of this edifice, in which they seem to have made their greatest effort towards magnificence, did not rise above twelve feet from the ground. Though they had not discovered the use of mortar or of any other cement in building, the bricks or stones were joined with so much nicety, that the seams can hardly be discerned. [159] The apartments, as far as the distribution of them can be traced in the ruins, were ill disposed, and afforded little accommodation. There was not a single window in any part of the building; and as no light could enter but by the door, all the apartments of largest dimensions must either have been perfectly dark, or illuminated by some other means. But with all these, and many other imperfections that might be mentioned in their art of building, the works of the Peruvians which still remain must be considered as stupendous efforts of a people unacquainted with the use of iron, and con-

vey to us a high idea of the power possessed by their ancient monarchs.

These, however, were not the noblest or most useful works of the Incas. The two great roads from Cuzco to Quito, extending in an uninterrupted stretch above fifteen hundred miles, are entitled to still higher praise. The one was conducted through the interior and mountainous country, the other through the plains on the sea coast. From the language of admiration in which some of the early writers express their astonishment when they first viewed those roads, and from the more pompous description of later writers, who labor to support some favorite theory concerning America, one might be led to compare this work of the Incas to the famous military ways which remain as monuments of the Roman power; but in a country where there was no tame animal except the llama, which was never used for draught, and but little as a beast of burden, where the high roads were seldom trod by any but a human foot, no great degree of labor or art was requisite in forming them. The Peruvian roads were only fifteen feet in breadth, and in many places so slightly formed, that time has effaced every vestige of the course in which they ran. In the low country, little more seems to have been done than to plant trees or to fix posts at certain intervals, in order to mark the proper route to travellers. To open a path through the mountainous country was a more arduous task. Eminences were levelled, and hollows filled up, and for the preservation of the road it was fenced with a bank of turf. At proper distances, *Tambos*, or storehouses, were erected for the accommodation of the Inca and his attendants, in their progress through his dominions. From the manner in which the road was originally formed in this higher and more impervious region, it has proved more durable; and though, from the inattention of the Spaniards to every object but that of working their mines, nothing has been done towards keeping it in repair, its course may still be traced. Such was the celebrated road of the Incas; and even from this description, divested of every circumstance of manifest exaggeration or of suspicious aspect, it must be considered as a striking proof of an extraordinary progress in improvement and policy. To the savage tribes of America, the idea of facilitating communication with places at a distance had never occurred. To the Mexicans it was hardly known. Even in the most civilized countries in Europe, men had advanced far in refinement, before it became a regular object of national policy to form such roads as render intercourse commodious. It was a capital object of Roman policy to open a communication with all the provinces of their extensive empire by means of those roads which are justly considered as one of the noblest monuments both of their wisdom and their power. But during the long reign of barbarism, the Roman roads were neglected or destroyed; and at the time when the Spaniards entered Peru, no kingdom in Europe could boast of any work of public utility that could be compared with the great roads formed by the Incas.

The formation of those roads introduced another improvement in Peru equally unknown over all the rest of America. In its course from south to north, the road of the Incas was intersected by all the torrents which roll from the Andes towards the Western Ocean. From the rapidity of their course, as well as from the frequency and violence of their inundation, these were not fordable. Some expedient, however, was to be found for passing them. The Peruvians from their unacquaintance with the use of arches, and their inability to work in wood, could not construct bridges either of stone or timber. But necessity, the parent of invention, suggested a device which supplied that defect. They formed cables of great strength, by twisting together some of the pliable withs, or osiers, with which their country abounds; six of these cables they stretched across the stream parallel to one another, and made them fast on each side. These they bound firmly together by interweaving smaller ropes so close as to form a compact piece of net-work, which being covered with branches of trees and earth, they passed along it with tolerable security. [160] Proper persons were appointed to attend at each bridge, to keep it in repair, and to assist passengers. In the level country, where the rivers became deep and broad and still, they are passed in *balzas*, or floats; in the construction, as well as navigation of which the ingenuity of the Peruvians appears to be far superior to that of any people in America. These had advanced no further in naval skill than the use of the paddle or oar; the Peruvians ventured to raise a mast, and spread a sail, by means of which their *balzas* not only went nimbly before the

wind, but could veer and tack with great celerity.—Nor were the ingenuity and art of the Peruvians confined solely to objects of essential utility. They had made some progress in arts, which may be called elegant. They possessed the precious metals in greater abundance than any people of America. They obtained gold in the same manner with the Mexicans, by searching in the channels of rivers, or washing the earth in which particles of it were contained. But in order to procure silver, they exerted no inconsiderable degree of skill and invention. They had not, indeed, attained the art of sinking a shaft into the bowels of the earth, and penetrating to the riches concealed there; but they hollowed deep caverns on the banks of rivers and the sides of mountains, and emptied such veins as did not dip suddenly beyond their reach. In other places, where the vein lay near the surface, they dug pits to such a depth, that the person who worked below could throw out the ore, or hand it up in baskets. They had discovered the art of smelting and refining this, either by the simple application of fire, or, where the ore was more stubborn or impregnated with foreign substances, by placing it in small ovens or furnaces, on high grounds, so artificially constructed that the draught of air performed the function of a bellows, an engine with which they were totally unacquainted. By this simple device, the purer ores were smelted with facility, and the quantity of silver in Peru was so considerable, that many of the utensils employed in the functions of common life were made of it. Several of those vessels and trinkets are said to have merited no small degree of estimation, on account of the neatness of the workmanship as well as the intrinsic value of the materials. But as the conquerors of America were well acquainted with the latter, but had scarcely any conception of the former, most of the silver vessels and trinkets were melted down, and rated according to the weight and fineness of the metal in the division of the spoil.

In other works of mere curiosity or ornament, their ingenuity has been highly celebrated. Many specimens of those have been dug out of the *Guacas*, or mounds of earth, with which the Peruvians covered the bodies of the dead. Among these are mirrors of various dimensions, of hard shining stones highly polished; vessels of earthen ware of different forms; hatchets, and other instruments, some destined for war, and others for labor. Some were of flint, some of copper, hardened to such a degree by an unknown process, as to supply the place of iron on several occasions. Had the use of those tools, formed of copper, been general, the progress of the Peruvians in the arts might have been such as to emulate that of more cultivated nations. But either the metal was so rare, or the operation by which it was hardened so tedious, that their instruments of copper were few, and so extremely small, that they seem to have been employed only in slighter works. But even to such a circumscribed use of this imperfect metal, the Peruvians were indebted for their superiority to the other people of America in various arts. The same observation, however, may be applied to them, which I formerly made with respect to the arts of the Mexicans. From several specimens of Peruvian utensils and ornaments, which are deposited in the royal cabinet of Madrid, and from some preserved in different collections in other parts of Europe, I have reason to believe that the workmanship is more to be admired on account of the rude tools with which it was executed, than on account of its intrinsic neatness and elegance; and that the Peruvians, though the most improved of all the Americans, were not advanced beyond the infancy of arts.

But notwithstanding so many particulars, which seemed to indicate a high degree of improvement in Peru, other circumstances occur that suggest the idea of a society still in the first stages of its transition from barbarism to civilization. In all the dominions of the Incas, Cuzco was the only place that had the appearance, or was entitled to the name, of a city. Every where else the people lived mostly in detached habitations, dispersed over the country, or, at the utmost, settled together in small villages. But until men are brought to assemble in numerous bodies, and incorporated in such close union as to enjoy frequent intercourse, and to feel mutual dependence, they never imbibe perfectly the spirit, or assume the manners of social life. In a country of immense extent, with only one city, the progress of manners, and the improvement either of the necessary or more refined arts, must have been so slow, and carried on under such disadvantages, that it is more surprising the Peruvians should have advanced so far in refinement, than that they did not proceed further.

In consequence of this state of imperfect union, the separation of professions in Peru was not so complete as among the Mexicans. The less closely men associate, the more simple are their manners, and the fewer their wants. The crafts of common and most necessary use in life do not, in such a state, become so complex or difficult as to render it requisite that men should be trained to them by any particular course of education. All the arts, accordingly, which were of daily and indispensable utility, were exercised by every Peruvian indiscriminately. None but the artists employed in works of mere curiosity, or ornament, constituted a separate order of men, or were distinguished from other citizens.

From the want of cities in Peru, another consequence followed. There was little commercial intercourse among the inhabitants of that great empire. The activity of commerce is coeval with the foundation of cities; and from the moment that the members of any community settle in considerable numbers in one place, its operations become vigorous. The citizen must depend for subsistence on the labor of those who cultivate the ground. They, in return, must receive some equivalent. Thus mutual intercourse is established, and the productions of art are regularly exchanged for the fruits of agriculture. In the towns of the Mexican empire, stated markets were held, and whatever could supply any want or desire of man was an object of commerce. But in Peru, from the singular mode of dividing property, and the manner in which the people were settled, there was hardly any species of commerce carried on between different provinces and the community was less acquainted with that active intercourse, which is at once a bond of union and an incentive to improvement.

But the unwarlike spirit of the Peruvians was the most remarkable as well as the most fatal defect in their character. The greater part of the rude nations of America opposed their invaders with undaunted ferocity, though with little conduct or success. The Mexicans maintained the struggle in defence of their liberties, with such persevering fortitude, that it was with difficulty the Spaniards triumphed over them. Peru was subdued at once, and almost without resistance; and the most favorable opportunities of regaining their freedom, and of crushing their oppressors, were lost through the timidity of the people. Though the traditional history of the Peruvians represents all the Incas as warlike princes, frequently at the head of armies, which they led to victory and conquest, few symptoms of such a martial spirit appear in any of their operations subsequent to the invasion of the Spaniards. The influence, perhaps, of those institutions which rendered their manners gentle, gave their minds this unmanly softness; perhaps the constant serenity and mildness of the climate may have enervated the vigor of their frame; perhaps some principles in their government, unknown to us, was the occasion of this political debility. Whatever may have been the cause, the fact is certain; and there is not an instance in history of any people so little advanced in refinement, so totally destitute of military enterprise. This character has descended to their posterity. The Indians of Peru are now more tame and depressed than any people of America. Their feeble spirits, relaxed in lifeless inaction, seem hardly capable of any bold or manly exertion.

But, besides these capital defects in the political state of Peru, some detached circumstances and facts occur in the Spanish writers, which discover a considerable remainder of barbarity in their manners. A cruel custom, that prevailed in some of the most savage tribes, subsisted among the Peruvians. On the death of the Incas, and of other eminent persons, a considerable number of their attendants were put to death, and interred around their *Guacas*, that they might appear in the next world with their former dignity, and be served with the same respect. On the death of Huana Capac, the most powerful of their monarchs, above a thousand victims were doomed to accompany him to the tomb. In one particular their manners appear to have been more barbarous than those of most rude tribes. Though acquainted with the use of fire in preparing maize and other vegetables for food, they devoured both flesh and fish perfectly raw, and astonished the Spaniards with a practice repugnant to the ideas of all civilized people.

But though Mexico and Peru are the possessions of Spain in the New World, which, on account both of their ancient and present state, have attracted the greatest attention; her other dominions there are far from being inconsiderable either in extent or value. The

greater part of them was reduced to subjection during the first part of the sixteenth century, by private adventurers, who fitted out their small armaments either in Hispaniola or in Old Spain; and were we to follow each leader in his progress, we should discover the same daring courage, the same persevering ardor, the same rapacious desire for wealth, and the same capacity for enduring and surmounting every thing in order to attain it, which distinguished the operations of the Spaniards in their greater American conquests. But, instead of entering into a detail, which, from the similarity of the transactions, would appear almost a repetition of what has been already related, I shall satisfy myself with such a view of those provinces of the Spanish empire in America, which have not hitherto been mentioned, as may convey to my readers an adequate idea of its greatness, fertility, and opulence.

I begin with the countries contiguous to the two great monarchies of whose history and institutions I have given some account, and shall then briefly describe the other districts of Spanish America. The jurisdiction of the viceroy of New Spain extends over several provinces which were not subject to the dominion of the Mexicans. The countries of Chimaloa and Sonora that stretch along the east side of the Vermilion Sea, or Gulf of California, as well as the immense kingdoms of New Navarre, and New Mexico, which bend towards the west and north, did not acknowledge the sovereignty of Montezuma, or his predecessors. These regions, not inferior in magnitude to all the Mexican empire, are reduced some to a greater, others to a less degree of subjection to the Spanish yoke. They extend through the most delightful part of the temperate zone; their soil is, in general, remarkable fertile; and all their productions, whether animal or vegetable, are most perfect in their kind. They have all a communication either with the Pacific ocean, or with the Gulf of Mexico, and are watered by rivers which not only enrich them, but may become subservient to commerce. The number of Spaniards settled in these vast countries is indeed extremely small. They may be said to have subdued rather than to have occupied them. But if the population in their ancient establishments in America shall continue to increase, they may gradually spread over those provinces, of which, however inviting, they have not hitherto been able to take full possession.

One circumstance may contribute to the speedy population of some districts. Very rich mines both of gold and silver have been discovered in many of the regions which I have mentioned. Wherever these are opened, and worked with success, a multitude of people resort. In order to supply them with the necessities of life, cultivation must be increased, artisans of various kinds must assemble, and industry as well as wealth will be gradually diffused. Many examples of this have occurred in different parts of America since they fell under the dominion of the Spaniards. Populous villages and large towns have suddenly arisen amidst uninhabitable wilds and mountains; and the working of mines though far from being the most proper object towards which the attention of an infant society should be turned, may become the means both of promoting useful activity, and of augmenting the number of people. A recent and singular instance of this has happened, which, as it is but little known in Europe, and may be productive of great effects, merits attention. The Spaniards settled in the provinces of Chimaloa and Sonora had been long disturbed by the depredations of some fierce tribes of Indians. In the year 1765, the incursions of those savages became so frequent and so destructive, that the Spanish inhabitants, in despair, applied to the Marquis de Croix, viceroy of Mexico, for such a body of troops as might enable them to drive those formidable invaders from their places of retreat in the mountains. But the treasury of Mexico was so much exhausted by the large sums drawn from it, in order to support the late war against Great Britain, that the viceroy could afford them no aid. The respect due to his virtues accomplished what his official power could not effect. He prevailed with the merchants of New Spain to advance about two hundred thousand pesos for defraying the expenses of the expedition. The war was conducted by an officer of abilities; and after being protracted for three years chiefly by the difficulty of pursuing the fugitives over the mountains, and through defiles which were almost impassable, it terminated, in the year 1771, in the final submission of the tribes which had been so long the object of terror to the two provinces. In the course of this service, the Spaniards marched through countries into which they seem not to have penetrated before that time, and

discovered mines of such value as was astonishing even to men acquainted with the riches contained in the mountains of the New World. At Cineguilla, in the province of Sonora, they entered a plain of fourteen leagues in extent, in which, at the depth of only sixteen inches, they found gold in grains of such a size, that some of them weighed nine marks, and in such quantities, that in a short time, with a few laborers, they collected a thousand marks of gold in grains, even without taking time to wash the earth that had been dug, which appeared to be so rich, that persons of skill computed that it might yield what would be equal in value to a million of peaos. Before the end of the year 1771, above two thousand persons were settled in Cineguilla, under the government of proper magistrates, and the inspection of several ecclesiastics. As several other mines, not inferior in richness to that of Cineguilla, have been discovered, both in Sonora and Cinaloa, [161] it is probable that these neglected and thinly inhabited provinces may soon become as populous and valuable as any part of the Spanish empire of America.

The peninsula of California, on the other side of the Vermillion Sea, seems to have been less known to the ancient Mexicans than the provinces which I have mentioned. It was discovered by Cortes in the year 1536. During a long period it continued to be so little frequented, that even its form was unknown, and in most charts it was represented as an island, not as a peninsula. [162] Though the climate of this country, if we may judge from its situation, must be very desirable, the Spaniards have made small progress in peopling it. Towards the close of the last century, the Jesuits, who had great merit in exploring this neglected province, and in civilizing its rude inhabitants, imperceptibly acquired a dominion over it as complete as that which they possessed in their missions in Paraguay, and they labored to introduce into it the same policy, and to govern the natives by the same maxims. In order to prevent the court of Spain from conceiving any jealousy of their designs and operations, they seem studiously to have depreciated the country, by representing the climate as so disagreeable and unwholesome, and the soil as so barren, that nothing but a zealous desire of converting the natives could have induced them to settle there. Several public spirited citizens endeavored to undeceive their sovereigns, and to give them a better view of California; but in vain. At length, on the expulsion of the Jesuits from the Spanish dominions, the court of Madrid, as prone at that juncture to suspect the purity of the Order's intentions, as formerly to confide in them with implicit trust, appointed Don Joseph Galvez, whose abilities have since raised him to the high rank of minister for the Indies, to visit that peninsula. His account of the country was favorable; he found the pearl fishery on its coast to be valuable, and he discovered mines of gold of a very promising appearance. From its vicinity to Cinaloa and Sonora, it is probable that, if the population of these provinces shall increase in the manner which I have supposed, California may, by degrees, receive from them such a recruit of inhabitants, as to be no longer reckoned among the desolate and useless districts of the Spanish empire.

On the east of Mexico, Yucatan and Honduras was comprehended in the government of New Spain, though anciently they can hardly be said to have formed a part of the Mexican empire. These large provinces, stretching from the bay of Campeach beyond Cape Gracias a Dios, do not, like the other territories of Spain in the New World, derive their value either from the fertility of their soil, or the richness of their mines; but they produce in greater abundance than any part of America, the logwood tree, which, in dying some colors, is so far preferable to any other material, that the consumption of it in Europe is considerable, and it has become an article in commerce of great value. During a long period, no European nation intruded upon the Spaniards in those provinces, or attempted to obtain any share in this branch of trade. But after the conquest of Jamaica by the English, it soon appeared that a formidable rival was now seated in the neighborhood of the Spanish territories. One of the first objects which tempted the English settled in that island, was the great profit arising from the logwood trade, and the facility of wresting some portion of it from the Spaniards. Some adventurers from Jamaica made the first attempt at Cape Catoche, the south-east promontory of Yucatan, and by cutting logwood there carried on a gainful traffic. When most of the trees near the coast in that place were felled, they removed to the island of Trist,

in the bay of Campeachy, and in later times their principal station has been in the bay of Honduras. The Spaniards, alarmed at this encroachment, endeavored by negotiation, remonstrances, and open force, to prevent the English from obtaining any footing on that part of the American continent. But after struggling against it for more than a century, the disasters of the last war extorted from the court of Madrid a reluctant consent to tolerate this settlement of foreigners in the heart of its territories. The pain which this humbling concession occasioned seems to have prompted the Spaniards to devise a method of rendering it of little consequence, more effectual than all the efforts of negotiation or violence. The logwood produced on the west coast of Yucatan, where the soil is drier, is in quality far superior to that which grows on the marshy grounds where the English are settled. By encouraging the cutting of this, and permitting the importation of it into Spain without paying any duty, such vigor has been given to this branch of commerce, and the logwood which the English bring to market has sunk so much in value, that their trade to the bay of Honduras has gradually declined [163] since it obtained a legal sanction; and, it is probable, will soon be finally abandoned. In that event, Yucatan and Honduras will become possessions of considerable importance to Spain.

Still further east than Honduras lie the two provinces of Costa Rica and Veragua, which likewise belong to the viceroyalty of New Spain; but both have been so much neglected by the Spaniards, and are apparently of such small value, that they merit no particular attention.

The most important province depending on the viceroyalty of Peru is Chili. The Incas had established their dominion in some of its northern districts; but in the greater part of the country, its gallant and high spirited inhabitants maintained their independence. The Spaniards, allured by the fame of its opulence, early attempted the conquest of it under Diego Almagro; and after his death Pedro de Valdivia resumed the design. Both met with fierce opposition. The former relinquished the enterprise in the manner I have mentioned. The latter, after having given many displays both of courage and military skill, was cut off, together with a considerable body of troops under his command. Francisca de Villagra, Valdivia's lieutenant, by his spirited conduct checked the natives in their career, and saved the remainder of the Spaniards from destruction. By degrees all the champaign country along the coast was subjected to the Spanish dominion. The mountainous country is still possessed by the Fuelehes, Araucos, and other tribes of its original inhabitants, formidable neighbors to the Spaniards; with whom during the course of two centuries, they have been obliged to maintain an almost perpetual hostility, suspended only by a few intervals of insecure peace.

That part of Chili, then, which may properly be deemed a Spanish province, is a narrow district extended along the coast from the desert of Atacamas to the island of Chiloe, above nine hundred miles. Its climate is the most delicious in the New World, and is hardly equalled by that of any region on the face of the earth. Though bordering on the Torrid Zone, it never feels the extremity of heat, being screened on the east by the Andes, and refreshed from the west by cooling sea breezes. The temperature of the air is so mild and equable, that the Spaniards give it the preference to that of the southern provinces in their native country. The fertility of the soil corresponds with the benignity of the climate, and is wonderfully accommodated to European productions. The most valuable of these, corn, wine, and oil, abound in Chili as if they had been native to the country. All the fruits imported from Europe attained to full maturity there. The animals of our hemisphere not only multiply, but improve in this delightful region. The horned cattle are of larger size than those of Spain. Its breed of horses surpasses, both in beauty and spirit, the famous Andalusian race, from which they sprung. Nor has nature exhausted her bounty on the surface of the earth; she has stored its bowels with riches. Valuable mines of gold, of silver, of copper, and of lead, have been discovered in various parts of it.

A country distinguished by so many blessings, we may be apt to conclude, would early become a favorite station of the Spaniards, and must have been cultivated with peculiar predilection and care. Instead of this, a great part of it remains uncultivated. In all this extent of country, there are not above eighty thousand white inhabitants, and about three times that number of Negroes and people of a mixed race. The most fertile

soil in America lies uncultivated, and some of its most promising mines remain unwrought. Strange as this neglect of the Spaniards to avail themselves of advantages which seemed to court their acceptance may appear, the causes of it can be traced. The only intercourse of Spain with its colonies in the South Sea was carried on during two centuries by the annual fleet to Porto Bello. All the produce of these colonies was shipped in the ports of Callao or Arica in Peru, for Panama, and carried from thence across the isthmus. All the commodities which they received from the mother countries were conveyed from Panama to the same harbors. Thus both the exports and imports of Chili passed through the hands of merchants settled in Peru. These had of course a profit on each; and in both transactions the Chilese felt their own subordination; and having no direct intercourse with the parent state, they depended upon another province for the disposal of their productions, as well as for the supply of their wants. Under such discouragements, population could not increase, and industry was destitute of one chief incitement. But now that Spain, from motives which I shall mention hereafter, has adopted a new system, and carries on her commerce with the colonies in the South Sea by ships which go round Cape Horn, a direct intercourse is opened between Chili and the mother country. The gold, the silver, and the other commodities of the province, will be exchanged in its own harbors for the manufactures of Europe. Chili may speedily rise into that importance among the Spanish settlements to which it is entitled by its natural advantages. It may become the granary of Peru, and the other provinces along the Pacific Ocean. It may supply them with wine, with cattle, with horses, with hemp, and many other articles for which they now depend upon Europe. Though the new system has been established only a few years, those effects of it begin already to be observed. If it shall be adhered to with any steadiness for half a century, one may venture to foretell that population, industry, and opulence will advance in this province with rapid progress.

To the east of the Andes, the provinces of Tucuman and Rio de la Plata border on Chili, and like it were dependent on the viceroyalty of Peru. These regions of immense extent stretch in length from north to south above thirteen hundred miles, and in breadth more than a thousand. This country, which is larger than most European kingdoms, naturally forms itself into two great divisions, one on the north and the other on the south of Rio de la Plata. The former comprehends Paraguay, the famous missions of the Jesuits, and several other districts. But as disputes have long subsisted between the courts of Spain and Portugal, concerning its boundaries, which, it is probable, will be soon finally ascertained, either amicably or by the decision of the sword, I choose to reserve my account of this northern division, until I enter upon the history of Portuguese America, with which it is intimately connected; and in relating it, I shall be able, from authentic materials supplied both by Spain and Portugal, to give a full and accurate description of the operations and views of the Jesuits, in rearing that singular fabric of policy in America, which has drawn so much attention, and has been so imperfectly understood. The latter division of the province contains the governments of Tucuman and Buenos Ayres, and to these I shall at present confine my observations.

The Spaniards entered this part of America by the river De la Plata; and though a succession of cruel disasters befell them in their early attempts to establish their dominion in it, they were encouraged to persist in the design, at first by the hopes of discovering mines in the interior country, and afterwards by the necessity of occupying it, in order to prevent any other nation from settling there, and penetrating by this route into their rich possessions in Peru. But except at Buenos Ayres, they have made no settlement of any consequence in all the vast space which I have mentioned. There are indeed, scattered over it, a few places on which they have bestowed the name of towns, and to which they have endeavored to add some dignity, by erecting them into bishoprics; but they are no better than paltry villages, each with two or three hundred inhabitants. One circumstance, however, which was not originally foreseen, has contributed to render this district, though thinly peopled, of considerable importance. The province of Tucuman, together with the country to the south of the Plata, instead of being covered with wood like other parts of America, forms one extensive open plain, almost without a tree. The soil is a deep fertile mould, watered by many streams descending from the Andes, and clothed in perpetual

verdure. In this rich pasturage, the horses and cattle imported by the Spaniards from Europe have multiplied to a degree which almost exceeds belief. This has enabled the inhabitants not only to open a lucrative trade with Peru, by supplying it with cattle, horses, and mules, but to carry on a commerce no less beneficial, by the exportation of hides to Europe. From both, the colony has derived great advantages. But its commodious situation for carrying on contraband trade has been the chief source of its prosperity. While the court of Madrid adhered to its ancient system, with respect to its communication with America, the river De la Plata lay so much out of the course of Spanish navigation, that interlopers, almost without any risk of being either observed or obstructed, could pour in European manufactures in such quantities, that they not only supplied the wants of the colony, but were conveyed into all the eastern districts of Peru. When the Portuguese in Brazil extended their settlements to the banks of Rio de la Plata, a new channel was opened, by which prohibited commodities flowed into the Spanish territories with still more facility, and in greater abundance. This illegal traffic, however detrimental to the parent state, contributed to the increase of the settlement which had the immediate benefit of it, and Buenos Ayres became gradually a populous and opulent town. What may be the effect of the alteration lately made in the government of this colony, the nature of which shall be described in the subsequent Book, cannot hitherto be known.

All the other territories of Spain in the New World, the islands excepted, of whose discovery and reduction I have formerly given an account, are comprehended under two great divisions; the former denominated the kingdom of Tierra Firme, the provinces of which stretch along the Atlantic, from the eastern frontier of New Spain to the mouth of the Orinoco; the latter, the New Kingdom of Granada, situated in the interior country. With a short view of these I shall close this part of my work.

To the east of Veragua, the last province subject to the viceroy of Mexico, lies the isthmus of Darien. Though it was in this part of the continent that the Spaniards first began to plant colonies, they have made no considerable progress in peopling it. As the country is extremely mountainous, deluged with rain during a good part of the year, remarkably unhealthy, and contains no mines of great value, the Spaniards would probably have abandoned it altogether, if they had not been allured to continue by the excellence of the harbor of Porto Bello on the one sea, and that of Panama on the other. These have been called the keys to the communication between the north and south sea, between Spain and her most valuable colonies. In consequence of this advantage, Panama has become a considerable and thriving town. The peculiar noxiousness of its climate has prevented Porto Bello from increasing in the same proportion. As the intercourse with the settlements in the Pacific Ocean is now carried on by another channel, it is probable that both Porto Bello and Panama will decline, when no longer nourished and enriched by that commerce to which they were indebted for their prosperity, and even their existence.

The provinces of Cartagena and Santa Martha stretch to the eastward of the isthmus of Darien. The country still continues mountainous, but its valleys begin to expand, are well watered, and extremely fertile. Pedro de Heredia subjected this part of America to the crown of Spain about the year 1532. It is thinly peopled, and of course ill cultivated. It produces, however, a variety of valuable drugs, and some precious stones, particularly emeralds. But its chief importance is derived from the harbor of Cartagena, the safest and best fortified of any in the American dominions of Spain. In a situation so favorable, commerce soon began to flourish. As early as the year 1544, it seems to have been a town of some note. But when Cartagena was chosen as the port in which the galleons should first begin to trade on their arrival from Europe, and to which they were directed to return, in order to prepare for their voyage homeward, the commerce of its inhabitants was so much favored by this arrangement, that it soon became one of the most populous, opulent, and beautiful cities in America. There is, however, reason to apprehend that it has reached its highest point of exaltation, and that it will be so far affected by the change in the Spanish system of trade with America, which has withdrawn from it the desirable visits of the galleons, as to feel at least a temporary decline. But the wealth now collected there will soon find or create employment for itself, and may be turned with advantage into some new channel. Its harbor is

so safe, and so conveniently situated for receiving commodities from Europe, its merchants have been so long accustomed to convey these into all the adjacent provinces, that it is probable they will still retain this branch of trade, and Cartagena continue to be a city of great importance.

The provinces contiguous to Santa Martha on the east, was first visited by Alonso de Ojeda, in the year 1499; and the Spaniards, on their landing there, having observed some huts in an Indian village, built upon piles, in order to raise them above the stagnated water which covered the plain, were led to bestow upon it the name of Venezuela, or little Venice, by their usual propensity to find a resemblance between what they discovered in America, and the objects which were familiar to them in Europe. They made some attempts to settle there, but with little success. The final reduction of the province was accomplished by means very different from those to which Spain was indebted for its other acquisitions in the New World. The ambition of Charles V. often engaged him in operations of such variety and extent, that his revenues were not sufficient to defray the expense of carrying them into execution. Among other expedients for supplying the deficiency of his funds, he had borrowed large sums from the Velsers of Augsburg, the most opulent merchants at that time in Europe. By way of retribution for these, or in hopes, perhaps, of obtaining a new loan, he bestowed upon them the province of Venezuela, to be held as an hereditary fief from the crown of Castile, on condition that within a limited time they should render themselves masters of the country, and establish a colony there. Under the direction of such persons, it might have been expected that a settlement would have been established on maxims very different from those of the Spaniards, and better calculated to encourage such useful industry, as mercantile proprietors might have known to be the most certain source of prosperity and opulence. But unfortunately they committed the execution of their plan to some of those soldiers of fortune with which Germany abounded in the sixteenth century. These adventurers, impatient to amass riches, that they might speedily abandon a station which they soon discovered to be very uncomfortable, instead of planting a colony in order to cultivate and improve the country, wandered from district to district in search of mines, plundering the natives with unfeeling rapacity, or oppressing them by the imposition of intolerable tasks. In the course of a few years, their avarice and exactions, in comparison with which those of the Spaniards were moderate, desolated the province so completely, that it could hardly afford them subsistence, and the Velsers relinquished a property from which the inconsiderate conduct of their agents left them no hope of ever deriving any advantage. When the wretched remainder of the Germans deserted Venezuela, the Spaniards again took possession of it; but notwithstanding many natural advantages, it is one of their most languishing and unproductive settlements.

The provinces of Caracas and Cumana are the last of the Spanish territories on this coast; but in relating the origin and operations of the mercantile company in which an exclusive right of trade with them has been vested, I shall hereafter have occasion to consider their state and productions.

The New Kingdom of Granada is entirely an inland country of great extent. This important addition was made to the dominions of Spain about the year 1536, by Sebastian de Benalcazar and Gonzalo Ximenes de Quesada, two of the bravest and most accomplished officers employed in the conquest of America. The former, who commanded at that time in Quito, attacked it from the south; the latter made his invasion from Santa Martha on the north. As the original inhabitants of this region were further advanced in improvement than any people in America but the Mexicans and Peruvians, they defended themselves with great resolution and good conduct. The abilities and perseverance of Benalcazar and Quesada surmounted all opposition, though not without encountering many dangers, and reduced the country into the form of a Spanish province.

The New Kingdom of Granada is so far elevated above the level of the sea that, though it approaches almost to the equator, the climate is remarkably temperate. The fertility of its valleys is not inferior to that of the richest districts in America, and its higher grounds yield gold and precious stones of various kinds. It is not by digging into the bowels of the earth that this gold is found; it is mingled with the soil near the surface, and separated from it by repeated washing with water. This operation is carried on wholly by

Negro slaves; for though the chill subterranean air has been discovered, by experience, to be so fatal to them, that they cannot be employed with advantage in the deep silver mines, they are more capable of performing the other species of labor than Indians. As the natives in the New Kingdom of Granada are exempt from that service, which has wasted their race so rapidly in other parts of America, the country is still remarkably populous. Some districts yield gold with a profusion no less wonderful than that in the vale of Cineguilla, which I have formerly mentioned, and it is often found in large *petitas*, or grains, which manifest the abundance in which it is produced. On a rising ground near Pamplona, single laborers have collected in a day what was equal in value to a thousand pesos. A late governor of Santa Fe brought with him to Spain a lump of pure gold, estimated to be worth seven hundred and forty pounds sterling. This, which is perhaps the largest and finest specimen ever found in the New World, is now deposited in the royal cabinet of Madrid. But without founding any calculation on what is rare and extraordinary, the value of the gold usually collected in this country, particularly in the provinces of Popayan and Choco, is of considerable amount. Its towns are populous and flourishing. The number of inhabitants in almost every part of the country daily increases. Cultivation and industry of various kinds begin to be encouraged, and to prosper. A considerable trade is carried on with Cartagena, the produce of the mines, and other commodities, being conveyed down the great river of St. Magdalene to that city. On another quarter, the New Kingdom of Granada has a communication with the Atlantic by the river Orinoco; but the country which stretches along its banks towards the east, is little known, and imperfectly occupied by the Spaniards.

BOOK VIII.

View of the interior government, commerce, &c. of the Spanish colonies—Depopulation of America—first effects of their settlements—not the consequence of any system of policy—not to be imputed to religion—Number of Indians still remaining—Fundamental maxims on which the Spanish system of colonization is founded—Condition of different orders of men in their colonies—Chapetones—Creoles—Negroes—Indians—Ecclesiastical state and policy—Character of secular and regular clergy—Small progress of Christianity among the natives—Mines, chief object of their attention—Mode of working these—their produce—Effects of encouraging this species of industry—Other commodities of Spanish America—First effects of this new commerce with America on Spain—Why the Spanish colonies have not been as beneficial to the parent state as those of other nations—Errors in the Spanish system of regulating this commerce—confined to one port—carried on by annual fleets—Contraband trade—Decline of Spain both in population and wealth—Remedies proposed—View of the wise regulations of the Bourbon princes—A new and more liberal system introduced—beneficial effects of this—probable consequences—Trade between New Spain and the Philippines—Revenue of Spain from America—whence it arises—to what it amounts.

AFTER tracing the progress of the Spaniards in their discoveries and conquests during more than half a century, I have conducted them to that period when their authority was established over almost all the vast regions in the New World still subject to their dominion. The effect of their settlements upon the countries of which they took possession, the maxims which they adopted in forming their new colonies, the interior structure and policy of these, together with the influence of their progressive improvement upon the parent state, and upon the commercial intercourse of nations, are the objects to which we now turn our attention.

The first visible consequence of the establishments made by the Spaniards in America, was the diminution of the ancient inhabitants, to a degree equally astonishing and deplorable. I have already, on different occasions, mentioned the disastrous influence under which the connection of the Americans with the people of our hemisphere commenced, both in the islands and in several parts of the continent, and have touched upon various causes of their rapid consumption. Wherever the inhabitants of America had resolution to take arms in defence of their liberty and rights, many perished in the unequal contest, and were cut off by their fierce invaders. But the greatest desolation followed after the sword was sheathed, and the conquerors were settled in tranquillity. It was in the islands, and in those provinces of the continent which stretch from the Gulf of Trinidad to the confines of Mexico, that the fatal effects of the Spanish dominion were first and most sensibly felt. All these were occupied either by wandering tribes of hunters, or by such as had made but small progress in cultivation and industry. When they were compelled by their new masters to take up a fixed res,

dence, and to apply to regular labor; when tasks were imposed upon them disproportioned to their strength, and were enacted with unrelenting severity, they possessed not vigor either of mind or of body to sustain this unusual load of oppression. Dejection and despair drove many to end their lives by violence. Fatigue and famine destroyed more. In all those extensive regions, the original race of inhabitants wasted away; in some it was totally extinguished. In Mexico, where a powerful and martial people distinguished their opposition to the Spaniards by efforts of courage worthy of a better fate, great numbers fell in the field; and there, as well as in Peru, still greater numbers perished under the hardships of attending the Spanish armies in their various expeditions and civil wars, worn out with the incessant toil of carrying their baggage, provisions, and military stores.

But neither the rage nor cruelty of the Spaniards was so destructive to the people of Mexico and Peru, as the inconsiderate policy with which they established their new settlements. The former were temporary calamities, fatal to individuals: the latter was a permanent evil, which, with gradual consumption, wasted the nation. When the provinces of Mexico and Peru were divided among the conquerors, each was eager to obtain a district from which he might expect an instantaneous recompense for all his services. Soldiers, accustomed to the carelessness and dissipation of a military life, had neither industry to carry on any plan of regular cultivation, nor patience to wait for its slow but certain returns. Instead of settling in the valleys occupied by the natives, where the fertility of the soil would have amply rewarded the diligence of the planter, they chose to fix their stations in some of the mountainous regions, frequent both in New Spain and in Peru. To search for mines of gold and silver was the chief object of their activity. The prospects which this opens, and the alluring hopes which it continually presents, correspond wonderfully with the spirit of enterprise and adventure that animated the first emigrants to America in every part of their conduct. In order to push forward those favorite projects, so many hands were wanted, that the service of the natives became indispensably requisite. They were accordingly compelled to abandon their ancient habitations in the plains, and driven in crowds to the mountains. This sudden transition from the sultry climate of the valleys to the chill penetrating air peculiar to high lands in the torrid zone; exorbitant labor, scanty or unwholesome nourishment, and the despondency occasioned by a species of oppression to which they were not accustomed, and of which they saw no end, affected them nearly as much as their less industrious countrymen in the islands. They sunk under the united pressure of those calamities, and melted away with almost equal rapidity. In consequence of this, together with the introduction of the small-pox, a malady unknown in America, and extremely fatal to the natives, the number of people both in New Spain and Peru was so much reduced, that in a few years the accounts of their ancient population appeared almost incredible. [164]

Such are the most considerable events and causes which, by their combined operation, contributed to depopulate America. Without attending to these, many authors, astonished at the suddenness of the desolation, have ascribed this unexampled event to a system of policy no less profound than atrocious. The Spaniards, as they pretend, conscious of their own inability to occupy the vast regions which they had discovered, and foreseeing the impossibility of maintaining their authority over a people infinitely superior to themselves in number, in order to preserve the possession of America, resolved to exterminate the inhabitants, and, by converting a great part of the country into a desert, endeavored to secure their own dominion over it. [165] But nations seldom extend their views to objects so remote, or lay their plans so deep; and for the honor of humanity we may observe, that no nation ever deliberately formed such an execrable scheme. The Spanish monarchs, far from acting upon any such system of destruction, were uniformly solicitous for the preservation of their new subjects. With Isabella, zeal for propagating the Christian faith, together with the desire of communicating the knowledge of truth, and the consolations of religion, to people destitute of spiritual light, were more than ostensible motives for encouraging Columbus to attempt his discoveries. Upon his success, she endeavored to fulfil her pious purpose, and manifested the most tender concern to secure not only religious instruction, but mild treatment, to that offensive race of men subjected to her crown. [166] Her successors adopted the same ideas;

and, on many occasions, which I have mentioned, their authority was interposed, in the most vigorous exertions, to protect the people of America from the oppression of their Spanish subjects. Their regulations for this purpose were numerous, and often repeated. They were framed with wisdom, and dictated by humanity. After their possessions in the New World became so extensive as might have excited some apprehensions of difficulty in retaining their dominion over them, the spirit of their regulations was as mild as when their settlements were confined to the islands alone. Their solicitude to protect the Indians seems rather to have augmented as their acquisitions increased: and from ardor to accomplish this, they enacted, and endeavored to enforce the execution of laws, which excited a formidable rebellion in one of their colonies, and spread alarm and disaffection through all the rest. But the avarice of individuals was too violent to be controlled by the authority of laws. Rapacious and daring adventurers, far removed from the seat of government, little accustomed to the restraints of military discipline while in service, and still less disposed to respect the feeble jurisdiction of civil power in an infant colony, despised or eluded every regulation that set bounds to their exactions and tyranny. The parent state, with persevering attention, issued edicts to prevent the oppression of the Indians; the colonists, regardless of these, or trusting to their distance for impunity, continued to consider and treat them as slaves. The governors themselves, and other officers employed in the colonies, several of whom were as indigent and rapacious as the adventurers over whom they presided, were too apt to adopt their contemptuous ideas of the conquered people; and, instead of checking, encouraged or connived at their excesses. The desolation of the New World should not then be charged on the court of Spain, or be considered as the effect of any system of policy adopted there. It ought to be imputed wholly to the indigent and often unprincipled adventurers, whose fortune it was to be the conquerors and first planters of America, who, by measures no less inconsiderate than unjust, counteracted the edicts of their sovereign, and have brought disgrace upon their country.

With still greater injustice have many authors represented the intolerating spirit of the Roman Catholic religion, as the cause of exterminating the Americans, and have accused the Spanish ecclesiastics of animating their countrymen to the slaughter of that innocent people, as idolaters and enemies of God. But the first missionaries who visited America, though weak and illiterate, were pious men. They early espoused the defence of the natives, and vindicated their character from the aspersions of their conquerors, who, describing them as incapable of being formed to the offices of civil life, or of comprehending the doctrines of religion, contended, that they were a subordinate race of men, on whom the hand of nature had set the mark of servitude. From the accounts which I have given of the humane and persevering zeal of the Spanish missionaries, in protecting the helpless flock committed to their charge, they appear in a light which reflects lustre upon their function. They were ministers of peace, who endeavored to wrest the rod from the hands of oppressors. To their powerful interposition the Americans were indebted for every regulation tending to mitigate the rigor of their fate. The clergy in the Spanish settlements, regular as well as secular, are still considered by the Indians as their natural guardians, to whom they have recourse under the hardships and exactions to which they are too often exposed. [167]

But, notwithstanding the rapid depopulation of America, a very considerable number of the native race still remains both in Mexico and Peru, especially in those parts which were not exposed to the first fury of the Spanish arms, or desolated by the first efforts of their industry, still more ruinous. In Guatemala, Chiapa, Nicaragua, and the other delightful provinces of the Mexican empire, which stretch along the South Sea, the race of Indians is still numerous. Their settlements in some places are so populous as to merit the name of cities. [168] In the three audiences into which New Spain is divided, there are at least two millions of Indians; a pitiful remnant, indeed, of its ancient population, but such as still forms a body of people superior in number to that of all the other inhabitants of this extensive country. [169] In Peru several districts, particularly in the kingdom of Quito, are occupied almost entirely by Indians. In other provinces they are mingled with the Spaniards, and in many of their settlements are almost the only persons who

practise the mechanic arts, and fill most of the inferior stations in society. As the inhabitants both of Mexico and Peru were accustomed to a fixed residence, and to a certain degree of regular industry, less violence was requisite in bringing them to some conformity with the European modes of civil life. But wherever the Spaniards settled among the savage tribes of America, their attempts to incorporate with them have been always fruitless, and often fatal to the natives. Impatient of restraint, and disdaining labor as a mark of servility, they either abandoned their original seats, and sought for independence in mountains and forests inaccessible to their oppressors, or perished when reduced to a state repugnant to their ancient ideas and habits. In the districts adjacent to Carthage, to Panama, and to Buenos Ayres, the desolation is more general than even in those parts of Mexico and Peru of which the Spaniards have taken most full possession.

But the establishments of the Spaniards in the New World, though fatal to its ancient inhabitants, were made at a period when that monarchy was capable of forming them to best advantage. By the union of all its petty kingdoms, Spain was become a powerful state, equal to so great an undertaking. Its monarchs, having extended their prerogatives far beyond the limits which once circumscribed the regal power in every kingdom of Europe, were hardly subject to control, either in concerting or in executing their measures. In every wide-extended empire, the form of government must be simple, and the sovereign authority such, that its resolutions may be taken with promptitude, and may pervade the whole with sufficient force. Such was the power of the Spanish monarchs when they were called to deliberate concerning the mode of establishing their dominions over the most remote provinces which had ever been subjected to any European state. In this deliberation, they felt themselves under no constitutional restraint, and that, as independent masters of their own resolves, they might issue the edicts requisite for modelling the government of the new colonies, by a mere act of prerogative.

This early interposition of the Spanish crown, in order to regulate the policy and trade of its colonies, is a peculiarity which distinguishes their progress from that of the colonies of any other European nation. When the Portuguese, the English, and French took possession of the regions in America which they now occupy, the advantages which these promised to yield were so remote and uncertain, that their colonies were suffered to struggle through a hard infancy, almost without guidance or protection from the parent state. But gold and silver, the first productions of the Spanish settlements in the New World, were more alluring, and immediately attracted the attention of their monarchs. Though they had contributed little to the discovery, and almost nothing to the conquest of the New World, they instantly assumed the function of its legislators; and having acquired a species of dominion formerly unknown, they formed a plan for exercising it, to which nothing similar occurs in the history of human affairs.

The fundamental maxim of the Spanish jurisprudence, with respect to America, is to consider what has been acquired there as vested in the crown, rather than in the state. By the bull of Alexander VI., on which, as its great charter, Spain founded its right, all the regions that had been or should be discovered were bestowed as a free gift upon Ferdinand and Isabella. They and their successors were uniformly held to be the universal proprietors of the vast territories which the arms of their subjects conquered in the New World. From them all grants of land there flowed, and to them they finally returned. The leaders who conducted the various expeditions, the governors who presided over the different colonies, the officers of justice, and the ministers of religion, were all appointed by their authority, and removeable at their pleasure. The people who composed infant settlements were entitled to no privileges independent of the sovereign, or that served as a barrier against the power of the crown. It is true, that when towns were built, and formed into bodies corporate, the citizens were permitted to elect their own magistrates, who governed them by laws which the community enacted. Even in the most despotic states, this feeble spark of liberty is not extinguished. But in the cities of Spanish America, this jurisdiction is merely municipal, and is confined to the regulation of their own interior commerce and police. In whatever relates to public government, and the general interest, the will of the sovereign is law. No political power originates from the people. All centres in the crown, and in the officers of its nomination.

When the conquests of the Spaniards in America

were completed, their monarchs, in forming the plan of internal policy for their new dominions, divided them into two immense governments, one subject to the viceroy of New Spain, the other to the viceroy of Peru. The jurisdiction of the former extended over all the provinces belonging to Spain in the northern division of the American continent. Under that of the latter, was comprehended whatever she possessed in South America. This arrangement, which, from the beginning, was attended with many inconveniences, became intolerable when the remote provinces of each viceroyalty began to improve in industry and population. The people complained of their subjection to a superior, whose place of residence was so distant, or so inaccessible, as almost excluded them from any intercourse with the seat of government. The authority of the viceroy over districts so far removed from his own eye and observation, was unavoidably both feeble and ill directed. As a remedy for those evils, a third viceroyalty has been established in the present century, at Santa Fe de Bogota, the capital of the new kingdom of Granada, the jurisdiction of which extends over the whole kingdom of Tierra Firme and the province of Quito. Those viceroys not only represent the person of their sovereign, but possess his regal prerogatives within the precincts of their own governments in their utmost extent. Like him, they exercise supreme authority in every department of government, civil, military, and criminal. They have the sole right of nominating the persons who hold many offices of the highest importance, and the occasional privilege of supplying those which, when they become vacant by death, are in the royal gift, until the successor appointed by the king shall arrive. The external pomp of their government is suited to its real dignity and power. Their courts are formed upon the model of that of Madrid, with horse and foot guards, a household regularly established, numerous attendants, and ensigns of command, displaying such magnificence as hardly retains the appearance of delegated authority.

But as the viceroys cannot discharge in person the functions of a supreme magistrate in every part of their extensive jurisdiction, they are aided in their government by officers and tribunals similar to those in Spain. The conduct of civil affairs in the various provinces and districts, into which the Spanish dominions in America are divided, is committed to magistrates of various orders and denominations; some appointed by the king, others by the viceroy, but all subject to the command of the latter, and amenable to his jurisdiction. The administration of justice is vested in tribunals, known by the name of *Audiencias*, and formed upon the model of the court of Chancery in Spain. These are eleven in number, and dispense justice to as many districts into which the Spanish dominions in America are divided. [170] The number of judges in the Court of Audience is various, according to the extent and importance of their jurisdiction. The station is no less honorable than lucrative, and is commonly filled by persons of such abilities and merit as render this tribunal extremely respectable. Both civil and criminal causes come under their cognizance, and for each peculiar judges are set apart. Though it is only in the most despotic governments that the sovereign exercises in person the formidable prerogative of administering justice to his subjects, and, in absolving or condemning, consults no law but what is deposited in his own breast; though, in all the monarchies of Europe, judicial authority is committed to the magistrates, whose decisions are regulated by known laws and established forms; the Spanish viceroys have often attempted to intrude themselves into the seat of justice, and, with an ambition which their distance from the control of a superior rendered bold, have aspired at a power which their master does not venture to assume. In order to check a usurpation which must have annihilated justice and security in the Spanish colonies, in subjecting the lives and property of all to the will of a single man, the viceroys have been prohibited in the most explicit terms, by repeated laws, from interfering in the judicial proceedings of the Courts of Audience, or from delivering an opinion, or giving a voice, with respect to any point litigated before them. In some particular cases, in which any question of civil right is involved, even the political regulations of the viceroy may be brought under the review of the Court of Audience, which in those instances may be deemed an intermediate power placed between him and the people, as a constitutional barrier to circumscribe his jurisdiction. But as legal restraints on a person who represents the sovereign, and is clothed with his authority, are little suited to the genius of Spanish policy; the hesitation

and reserve with which it confers this power on the Courts of Audience are remarkable. They may advise, they may remonstrate; but, in the event of a direct collision between their opinion and the will of the viceroy, what he determines must be carried into execution, and nothing remains for them, but to lay the matter before the king and the Council of the Indies. But to be entitled to remonstrate, and inform against a person before whom all others must be silent, and tamely submit to his decrees, is a privilege which adds dignity to the Courts of Audience. This is further augmented by another circumstance. Upon the death of a viceroy, without any provision of a successor by the king, the supreme power is vested in the Court of Audience resident in the capital of the viceroyalty; and the senior judge, assisted by his brethren, exercises all the functions of the viceroy while the office continues vacant. In matters which come under the cognizance of the Audiencias, in the course of their ordinary jurisdiction, as courts of justice, their sentences are final in every litigation concerning property of less value than six thousand pesos; but when the subject in dispute exceeds that sum, their decisions are subject to review, and may be carried by appeal before the royal Council of the Indies.

In this council, one of the most considerable in the monarchy for dignity and power, is vested the supreme government of all the Spanish dominions in America. It was first established by Ferdinand in the year 1511, and brought into a more perfect form by Charles V. in the year 1524. Its jurisdiction extends to every department, ecclesiastical, civil, military, and commercial. All laws and ordinances relative to the government and police of the colonies originate there, and must be approved of by two-thirds of the members before they are issued in the name of the king. All the offices, of which the nomination is reserved to the crown, are conferred in this council. To it each person employed in America, from the viceroy downwards, is accountable. It reviews their conduct, rewards their services, and inflicts the punishments due to their malversations. Before it is laid whatever intelligence, either public or secret, is received from America; and every scheme of improving the administration, the police, or the commerce of the colonies, is submitted to its consideration. From the first institution of the Council of the Indies, it has been the constant object of the Catholic monarchs to maintain its authority, and to make such additions from time to time, both to its power and its splendor, as might render it formidable to all their subjects in the New World. Whatever degree of public order and virtue still remains in that country, where so many circumstances conspire to relax the former, and to corrupt the latter, may be ascribed in a great measure to the wise regulations and vigilant inspection of this respectable tribunal.

As the king is supposed to be always present in his Council of the Indies, its meetings are held in the place where he resides. Another tribunal has been instituted in order to regulate such commercial affairs, as required the immediate and personal inspection of those appointed to superintend them. This is called *Casa de la Contratacion*, or the house of trade, and was established in Seville, the port to which commerce with the New World was confined, as early as the year 1501. It may be considered both as a board of trade, and as a court of judicature. In the former capacity it takes cognizance of whatever relates to the intercourse of Spain with America, it regulates what commodities should be exported thither, and has the inspection of such as are received in return. It decides concerning the departure of the fleets for the West Indies, the freight and burden of the ships, their equipment and destination. In the latter capacity, it judges with respect to every question, civil, commercial, or criminal, arising in consequence of the transactions of Spain with America; and in both these departments its decisions are exempted from the review of any court but that of the Council of the Indies.

Such is the great outline of that system of government which Spain has established in her American colonies. To enumerate the various subordinate boards and officers employed in the administration of justice, in collecting the public revenue, and in regulating the interior police of the country; to describe their different functions, and to inquire into the mode and effect of their operations; would prove a detail no less intricate than minute and uninteresting.

The first object of the Spanish monarchs was to secure the productions of the colonies to the parent state, by an absolute prohibition of any intercourse with foreign nations. They took possession of America by

right of conquest, and conscious not only of the feebleness of their infant settlements, but aware of the difficulty in establishing their dominion over regions so extensive, or in retaining so many reluctant nations under the yoke, they dreaded the intrusion of strangers; they even shunned their inspection, and endeavored to keep them at a distance from their coasts. This spirit of jealousy and exclusion, which at first was natural, and perhaps necessary, augmented as their possessions in America extended, and the value of them came to be more fully understood. In consequence of it, a system of colonizing was introduced, to which there had hitherto been nothing similar among mankind. In the ancient world, it was not uncommon to send forth colonies. But they were of two kinds only. They were either migrations, which served to disburden a state of its superfluous subjects, when they multiplied too fast for the territory which they occupied; or they were military detachments, stationed as garrisons in a conquered province. The colonies of some Greek republics, and the swarms of northern barbarians which settled in different parts of Europe, were of the first species. The Roman colonies were of the second. In the former, the connection with the mother country quickly ceased, and they became independent states. In the latter, as the disjunction was not complete, the dependence continued. In their American settlements, the Spanish monarchs took what was peculiar to each, and studied to unite them. By sending colonies to regions so remote, by establishing in each a form of inferior policy and administration, under distinct governors, and with peculiar laws, they disjoined them from the mother country. By retaining in their own hands the rights of legislation, as well as that of imposing taxes, together with the power of nominating the persons who filled every department of executive government, civil or military, they secured their dependence upon the parent state. Happily for Spain, the situation of her colonies was such as rendered it possible to reduce this new idea into practice. Almost all the countries which she had discovered and occupied, lay within the tropics. The productions of that large portion of the globe are different from those of Europe, even in its most southern provinces. The qualities of the climate and of the soil naturally turn the industry of such as settle there into new channels. When the Spaniards first took possession of their dominions in America, the precious metals which they yielded were the only object that attracted their attention. Even when their efforts began to take a better direction, they employed themselves almost wholly in rearing such peculiar productions of the climate as, from their rarity or value, were of chief demand in the mother country. Allured by vast prospects of immediate wealth, they disdained to waste their industry on what was less lucrative, but of superior moment. In order to render it impossible to correct this error, and to prevent them from making any efforts in industry which might interfere with those of the mother country, the establishment of several species of manufactures, and even the culture of the vine or olive, are prohibited in the Spanish colonies, [171] under severe penalties. They must trust entirely to the mother country for the objects of primary necessity. Their clothes, their furniture, their instruments of labor, their luxuries, and even a considerable part of the provisions which they consume were imported from Spain. During a great part of the sixteenth century, Spain, possessing an extensive commerce and flourishing manufactures, could supply with ease the growing demands of her colonies from her own stores. The produce of their mines and plantations was given in exchange for these. But all that the colonies received, as well as all that they gave, was conveyed in Spanish bottoms. No vessel belonging to the colonies was ever permitted to carry the commodities of America to Europe. Even the commercial intercourse of one colony with another was either absolutely prohibited, or limited by many jealous restrictions. All that America yields flows into the ports of Spain; all that it consumes must issue from them. No foreigner can enter its colonies without express permission; no vessel of any foreign nation is received into their harbors; and the pains of death, with confiscation of moveables, are denounced against every inhabitant who presumes to trade with them. Thus the colonies are kept in a state of perpetual pupillage; and by the introduction of this commercial dependence, a refinement in policy which Spain set the first example to European nations, the supremacy of the parent state hath been maintained over remote colonies during two centuries and a half.

Such are the capital maxims to which the Spanish monarchs seem to have attended in forming their new settlements in America. But they could not plant with the same rapidity that they had destroyed; and from many concurring causes, their progress has been extremely slow in filling up the immense void which their devastations had occasioned. As soon as the rage for discovery and adventure began to abate, the Spaniards opened their eyes to dangers and distresses which at first they did not perceive, or had despised. The numerous hardships with which the members of infant colonies have to struggle, the diseases of unwholesome climates fatal to the constitution of Europeans; the difficulty of bringing a country covered with forests into culture; the want of hands necessary for labor in some provinces, and the slow reward of industry in all, unless where the accidental discovery of mines enriched a few fortunate adventurers, were evils universally felt and magnified. Discouraged by the view of these, the spirit of migration was so much damped, that sixty years after the discovery of the New World, the number of Spaniards in all its provinces is computed not to have exceeded fifteen thousand. [172]

The mode in which property was distributed in the Spanish colonies, and the regulations established with respect to the transmission of it, whether by descent or by sale, were extremely unfavorable to population. In order to promote a rapid increase of people in any new settlement, property in land ought to be divided into small shares, and the alienation of it should be rendered extremely easy. But the rapaciousness of the Spanish conquerors of the New World paid no regard to this fundamental maxim of policy; and, as they possessed power which enabled them to gratify the utmost extravagance of their wishes, many seized districts of great extent, and held them as *encomiendas*. By degrees they obtained the privilege of converting a part of these into *Mayorazgos*, a species of fief, introduced into the Spanish system of feudal jurisprudence, which can neither be divided nor alienated. Thus a great portion of landed property, under this rigid form of entail, is withheld from circulation, and descends from father to son unimproved, and of little value either to the proprietor, or to the community. In the account which I have given of the reduction of Peru, various examples occur of enormous tracts of country occupied by some of the conquerors. The excesses in other provinces were similar; for, as the value of the lands which the Spaniards acquired was originally estimated according to the number of Indians which lived upon them, America was in general so thinly peopled, that only districts of great extent could afford such a number of laborers as might be employed in the mines with any prospect of considerable gain. The pernicious effects of those radical errors in the distribution and nature of property in the Spanish settlements are felt through every department of industry, and may be considered as one great cause of a progress in population so much slower than that which has taken place in better constituted colonies. [173]

To this we may add, that the support of the enormous and expensive fabric of their ecclesiastical establishment has been a burden on the Spanish colonies, which has greatly retarded the progress of population and industry. The payment of tithes is a heavy tax on industry; and if the exaction of them be not regulated and circumscribed by the wisdom of the civil magistrate, it becomes intolerable and ruinous. But, instead of any restraint on the claims of ecclesiastics, the inconsiderate zeal of the Spanish legislators admitted them into America in their full extent, and at once imposed on their infant colonies a burden which is in no slight degree oppressive to society, even in its most improved state. As early as the year 1501, the payment of tithes in the colonies was enjoined, and the mode of it regulated by law. Every article of primary necessity, towards which the attention of new settlers must naturally be turned, is subjected to that grievous exaction. Nor were the demands of the clergy confined to articles of simple and easy culture. Its more artificial and opulent productions, such as sugar, indigo, and cochineal, were soon declared to be titheable; and thus the industry of the planter was taxed in every stage of its progress, from its rudest essay to its highest improvement. To the weight of this legal imposition, the bigotry of the American Spaniards has made many voluntary additions. From their fond delight in the external pomp and parade of religion, and from superstitious reverence for ecclesiastics of every denomination, they have bestowed profuse donations on churches and monasteries, and have unprofitably wasted a large proportion of that wealth, which might have

nourished and given vigor to productive labor in growing colonies.

But so fertile and inviting are the regions of America, which the Spaniards have occupied, that, notwithstanding all the circumstances which have checked and retarded population, it has gradually increased, and filled the colonies of Spain with citizens of various orders. Among these, the Spaniards who arrive from Europe, distinguished by the name of *Chapetones*, are the first in rank and power. From the exclusive attention of the Spanish court to secure the dependence of the colonies on the parent state, all departments of consequence are filled by persons sent from Europe; and in order to prevent any of dubious fidelity from being employed, each must bring proof of a clear descent from a family of *Old Christians*, untainted with any mixture of Jewish or Mahometan blood, and never disgraced by any censure of the Inquisition. In such pure hands power is deemed to be safely lodged, and almost every function, from the viceroyalty downwards, is committed to them alone. Every person, who, by his birth or residence in America, may be suspected of any attachment or interest adverse to the mother country, is the object of distrust to such a degree, as amounts nearly to an exclusion from all offices of confidence or authority. [174] By this conspicuous predilection of the court, the *Chapetones* are raised to such pre-eminence in America, that they look down with disdain upon every other order of men.

The character and state of the *Creoles*, or descendants of Europeans settled in America, the second class of subjects in the Spanish colonies, have enabled the *Chapetones* to acquire other advantages hardly less considerable than those which they derived from the partial favor of government. Though some of the *Creolian* race are descended from the conquerors of the New World; though others can trace up their pedigree to the noblest families in Spain; though many are possessed of ample fortunes; yet, by the enervating influence of a sultry climate, by the rigor of a jealous government, and by their despair of attaining that distinction to which mankind naturally aspire, the vigor of their minds is so entirely broken, that a great part of them waste life in luxurious indulgences, mingled with an illiberal superstition still more debasing.

Languid and unenterprising, the operations of an active extended commerce would be to them so cumbersome and oppressive, that in almost every part of America they decline engaging in it. The interior traffic of every colony, as well as any trade which is permitted with the neighboring provinces, and with Spain itself, is carried on chiefly by the *Chapetones*; who, as the recompense of their industry, amass immense wealth, while the *Creoles*, sunk in sloth, are satisfied with the revenues of their paternal estates.

From this stated competition for power and wealth between those two orders of citizens, and the various passions excited by a rivalry so interesting, their hatred is violent and implacable. On every occasion, symptoms of this aversion break out, and the common appellations which each bestows on the other are as contemptuous as those which flow from the most deep-rooted national antipathy. The court of Spain, from a refinement of distrustful policy, cherishes those seeds of discord, and foment this mutual jealousy, which not only prevents the two most powerful classes of its subjects in the New World from combining against the parent state, but prompts each, with the most vigilant zeal, to observe the motions and to counteract the schemes of the other.

The third class of inhabitants in the Spanish colonies is a mixed race, the offspring either of a European and a Negro, or of a European and Indian, the former called *Mulattoes*, the latter *Mestizos*. As the court of Spain, solicitous to incorporate its new vassals with its ancient subjects, early encouraged the Spaniards settled in America to marry the natives of that country, several alliances of this kind were formed in their infant colonies. But it has been more owing to licentious indulgence, than to compliance with this injunction of their sovereigns, that this mixed breed has multiplied so greatly as to constitute a considerable part of the population in all the Spanish settlements. The several stages of descent in this race, and the gradual variations of shade until the African black or the copper color of America brighten into a European complexion, are accurately marked by the Spaniards, and each distinguished by a peculiar name. Those of the first and second generations are considered and treated as mere Indians and Negroes; but in the third descent, the characteristic hue of the former disappears; and in the fifth, the deeper tint of the latter is so entirely effaced,

that they can no longer be distinguished from Europeans, and become entitled to all their privileges. It is chiefly by this mixed race, whose frame is remarkably robust and hardy, that the mechanic arts are carried on in the Spanish settlements, and other active functions in society are discharged, which the two higher classes of citizens, from pride, or from indolence, disdain to exercise.

The Negroes hold the fourth rank among the inhabitants of the Spanish colonies. The introduction of that unhappy part of the human species into America, together with their services and sufferings there, shall be fully explained in another place; here they are mentioned chiefly in order to point out a peculiarity in their situation under the Spanish dominion. In several of their settlements, particularly in New Spain, Negroes are mostly employed in domestic service. They form a principal part in the train of luxury, and are cherished and caressed by their superiors, to whose vanity and pleasures they are equally subservient. Their dress and appearance are hardly less splendid than that of their masters, whose manners they imitate, and whose passions they imbibe. Elevated by this distinction, they have assumed such a tone of superiority over the Indians, and treat them with such insolence and scorn, that the antipathy between the two races has become implacable. Even in Peru, where Negroes seem to be more numerous, and are employed in field work as well as domestic service, they maintain their ascendancy over the Indians, and the mutual hatred of one to the other subsists with equal violence. The laws have industriously fomented this aversion, to which accident gave rise, and, by most rigorous injunctions, have endeavored to prevent every intercourse that might form a bond of union between the two races. Thus, by an artful policy, the Spaniards derive strength from that circumstance in population which is the weakness of other European colonies, and have secured, as associates and defenders, those very persons who elsewhere are objects of jealousy and terror.

The Indians form the last and most depressed order of men in the country which belonged to their ancestors. I have already traced the progress of the Spanish ideas with respect to the condition and treatment of that people; and have mentioned the most important of their more early regulations, concerning a matter of so tough consequence in the administration of their new dominions. But since the period to which I have brought down the history of America, the information and experience acquired during two centuries have enabled the court of Spain to make such improvements in this part of its American system, that a short view of the present condition of the Indians may prove both curious and interesting.

By the famous regulations of Charles V. in 1542, which have been so often mentioned, the high pretensions of the conquerors of the New World, who considered its inhabitants as slaves to whose service they had acquired a full right of property, were finally abrogated. From that period, the Indians have been reputed freemen, and entitled to the privileges of subjects. When admitted into this rank, it was deemed just that they should contribute towards the support and improvement of the society which had adopted them as members. But as no considerable benefit could be expected from the voluntary efforts of men unacquainted with regular industry, and averse to labor, the court of Spain found it necessary to fix and secure, by proper regulations, what it thought reasonable to exact from them. With this view, an annual tax was imposed upon every male, from the age of eighteen to fifty; and at the same time the nature as well as the extent of the services, which they might be required to perform, was ascertained with precision. This tribute varies in different provinces; but if we take that paid in New Spain as a medium, its annual amount is nearly four shillings a head; no exorbitant sum in countries where, as at the source of wealth, the value of money is extremely low. [175] The right of levying this tribute likewise varies. In America, every Indian is either an immediate vassal of the crown, or depends upon some subject to whom the district in which he resides has been granted for a limited time, under the denomination of an *encomienda*. In the former case, about three-fourths of the tax is paid into the royal treasury; in the latter, the same proportion of it belongs to the holder of the grant. When Spain first took possession of America, the greater part of it was parcelled out among its conquerors, or those who first settled there, and but a small portion reserved for the crown. As these grants, which were made for two lives only, reverted successively to the sovereign, he had it in his

power either to diffuse his favors by grants to new proprietors, or to augment his own revenue by valuable annexations. [176] Of these, the latter has been frequently chosen; the number of Indians now depending immediately on the crown is much greater than in the first stage after the conquest, and this branch of the royal revenue continues to extend.

The benefit arising from the services of the Indians accrues either to the crown, or to the holder of the *encomienda*, according to the same rule observed in the payment of tribute. Those services, however, which can now be legally exacted, are very different from the tasks originally imposed upon the Indians. The nature of the work which they must perform is defined, and an equitable recompense is granted for their labor. The stated services demanded of the Indians may be divided into two branches. They are either employed in works of primary necessity, without which society cannot subsist comfortably, or are compelled to labor in the mines, from which the Spanish colonies derive their chief value and importance. In consequence of the former, they are obliged to assist in the culture of maize, and other grain of necessary consumption; in tending cattle; in erecting edifices of public utility; in building bridges; and in forming high roads; but they cannot be constrained to labor in raising vines, olives, and sugar-canes, or any species of cultivation which has for its object the gratification of luxury or commercial profit. In consequence of the latter, the Indians are compelled to undertake the more unpleasant task of extracting ore from the bowels of the earth, and of refining it by successive processes, no less unwholesome than onerous. [177]

The mode of exacting both these services is the same, and is under regulations framed with a view of rendering it as little oppressive as possible to the Indians. They are called out successively in divisions, termed *Mitas*, and no person can be compelled to go but in his turn. In Peru, the number called out must not exceed the seventh part of the inhabitants in any district. In New Spain, where the Indians are more numerous, it is fixed at four in the hundred. During what time the labor of such Indians as are employed in agriculture continues, I have not been able to learn. [178] But in Peru, each *mita*, or division, destined for the mines, remains there six months; and while engaged in this service, a laborer never receives less than two shillings a day, and often earns more than double that sum. No Indian, residing at a greater distance than thirty miles from a mine, is included in the *mita*, or division employed working it; nor are the inhabitants of the low country exposed now to certain destruction, as they were at first when under the dominion of the conquerors, by compelling them to remove from that warm climate to the cold elevated regions where minerals abound. [179]

The Indians who live in the principal towns are entirely subject to the Spanish laws and magistrates; but in their own villages they are governed by caziques, some of whom are the descendants of their ancient lords, others are named by the Spanish viceroys. These regulate the petty affairs of the people under them, according to maxims of justice transmitted to them by tradition from their ancestors. To the Indians this jurisdiction, lodged in such friendly hands, affords some consolation; and so little formidable is this dignity to their new masters, that they often allow it to descend by hereditary right. For the further relief of men so much exposed to oppression, the Spanish court has appointed an officer in every district with the title of Protector of the Indians. It is his function, as the name implies, to assert the rights of the Indians; to appear as their defender in the courts of justice; and, by the interposition of his authority, to set bounds to the encroachments and exactions of his countrymen. A certain portion of the reserved fourth of the annual tribute is destined for the salary of the caziques and protectors; another is applied to the maintenance of the clergy employed in the instruction of the Indians. Another part seems to be appropriated for the benefit of the Indians themselves, and is applied for the payment of their tribute in years of famine, or when a particular district is affected by any extraordinary local calamity. Besides this, provision is made by various laws, that hospitals shall be founded in every new settlement for the reception of Indians. Such hospitals have accordingly been erected, both for the indigent and infirm, in Lima, in Cuzco, and in Mexico, where the Indians are treated with tenderness and humanity.

Such are the leading principles in the jurisprudence and policy by which the Indians are now governed in the provinces belonging to Spain. In those regula-

tions of the Spanish monarchs, we discover no traces of that cruel system of extermination, which they have been charged with adopting; and if we admit that the necessity of securing subsistence for their colonies, or the advantages derived from working the mines, give them a right to avail themselves of the labor of the Indians, we must allow, that the attention with which they regulate and recompense that labor is provident and sagacious. In no code of laws is greater solicitude displayed, or precautions multiplied with more prudent concern, for the preservation, the security, and the happiness of the subject, than we discover in the collection of the Spanish laws for the Indies. But those latter regulations, like the more early edicts which have been already mentioned, have too often proved ineffectual remedies against the evils which they were intended to prevent. In every age, if the same causes continue to operate, the same effects must follow. From the immense distance between the power intrusted with the execution of laws, and that by whose authority they are enacted, the vigor even of the most absolute government must relax, and the dread of a superior, too remote to observe with accuracy or to punish with despatch, must insensibly abate. Notwithstanding the numerous injunctions of the Spanish monarch, the Indians still suffer, on many occasions, both from the avarice of individuals, and from the exactions of the magistrates who ought to have protected them; unreasonable tasks are imposed; the term of their labor is prolonged beyond the period fixed by law, and they groan under many of the insults and wrongs which are the lot of a dependent people. [180] From some information on which I can depend, such oppression abounds more in Peru than in any other colony. But it is not general. According to the accounts even of those authors who are most disposed to exaggerate the sufferings of the Indians, they, in several provinces, enjoy not only ease but affluence; they possess large farms; they are masters of numerous herds and flocks; and, by the knowledge which they have acquired of European arts and industry, are supplied not only with the necessities but with many luxuries of life.

After explaining the form of civil government in the Spanish colonies, and the state of the various orders of persons subject to it, the peculiarities in their ecclesiastical constitution merit consideration. Notwithstanding the superstitious veneration with which the Spaniards are devoted to the Holy See, the vigilant and jealous policy of Ferdinand early prompted him to take precautions against the introduction of the Papal dominion in America. With this view, he solicited Alexander VI. for a grant to the crown of the tithes in all the newly-discovered countries, which he obtained on condition of his making provision for the religious instruction of the natives. Soon after Julius II. conferred on him and his successors, the right of patronage, and the absolute disposal of all ecclesiastical benefices there. But these Pontiffs, unacquainted with the value of what he demanded, bestowed these donations with an inconsiderate liberality, which their successors have often lamented, and wished to recall. In consequence of those grants, the Spanish monarchs have become in effect the heads of the American church. In them the administration of its revenues is vested. Their nomination of persons to supply vacant benefices is instantly confirmed by the Pope. Thus, in all Spanish America, authority of every species centres in the crown. There no collision is known between spiritual and temporal jurisdiction. The King is the only superior, his name alone is heard of, and no dependence upon any foreign power has been introduced. Papal bulls cannot be admitted into America, nor are they of any force there until they have been previously examined and approved of by the royal council of the Indies; and if any bull should be surreptitiously introduced and circulated in America without obtaining that approbation, ecclesiastics are required not only to prevent it from taking effect, but to seize all the copies of it, and transmit them to the council of the Indies. To this limitation of the Papal jurisdiction, equally singular, whether we consider the age and nation in which it was devised, or the jealous attention with which Ferdinand and his successors have studied to maintain it in full force, Spain is indebted, in a great measure, for the uniform tranquillity which has reigned in her American dominions.

The hierarchy is established in America in the same form as in Spain, with its full train of archbishops, bishops, deans, and other dignitaries. The inferior clergy are divided into three classes, under the denomination of *Curas*, *Doctrineros*, and *Missioneros*. The first are parish priests in those parts of the country where the Spaniards have settled. The second have the charge of

such districts as are inhabited by Indians subjected to the Spanish government, and living under its protection. The third are employed in instructing and converting those fiercer tribes which disdain submission to the Spanish yoke, and live in remote or inaccessible regions to which the Spanish arms have not penetrated. So numerous are the ecclesiastics of all those various orders, and such the profuse liberality with which many of them are endowed, that the revenues of the church in America are immense. The Romish superstition appears with its utmost pomp in the New World. Churches and convents there are magnificent, and richly adorned; and on high festivals, the display of gold and silver, and precious stones, is such as exceeds the conception of a European. An ecclesiastical establishment so splendid and extensive is unfavorable, as has been formerly observed, to the progress of rising colonies; but in countries where riches abound, and the people are so delighted with parade that religion must assume it in order to attract their veneration, this propensity to ostentation has been indulged, and becomes less pernicious.

The early institution of monasteries in the Spanish colonies, and the inconsiderate zeal in multiplying them, have been attended with consequences more fatal. In every new settlement, the first object should be to encourage population, and to incite every citizen to contribute towards augmenting the number and strength of the community. During the youth and vigor of society, while there is room to spread, and sustenance is procured with facility, mankind increase with amazing rapidity. But the Spaniards had hardly taken possession of America, when, with a most preposterous policy, they began to erect convents, where persons of both sexes were shut up, under a vow to defeat the purpose of nature, and to counteract the first of her laws. Influenced by a misguided piety, which ascribes transcendental merit to a state of celibacy, or allured by the prospect of that listless ease which in sultry climates is deemed supreme felicity, numbers crowded into those mansions of sloth and superstition, and are lost to society. As none but persons of Spanish extract are admitted into the monasteries of the New World, the evil is more sensibly felt, and every monk or nun may be considered as an active person withdrawn from civil life. The impropriety of such foundations in any situation where the extent of territory requires additional hands to improve it, is so obvious, that some Catholic states have expressly prohibited any person in their colonies from taking the monastic vows. Even the Spanish monarchs, on some occasions, seem to have been alarmed with the spreading of a spirit so adverse to the increase and prosperity of their colonies, that they have endeavored to check it. But the Spaniards in America, more thoroughly under the influence of superstition than their countrymen in Europe, and directed by ecclesiastics more bigoted and illiterate, have conceived such a high opinion of monastic sanctity, that no regulations can restrain their zeal; and, by the excess of their ill-judged bounty, religious houses have multiplied to a degree no less amazing than pernicious to society. [181.]

In viewing the state of colonies, where not only the number but influence of ecclesiastics is so great, the character of this powerful body is an object that merits particular attention. A considerable part of the secular clergy in Mexico and Peru are natives of Spain. As persons long accustomed, by their education, to the retirement and indolence of academic life are more incapable of active enterprise, and less disposed to strike into new paths than any order of men, the ecclesiastical adventurers by whom the American church is recruited, are commonly such as, from merit or rank in life, have little prospect of success in their own country. Accordingly, the secular priests in the New World are still less distinguished than their brethren in Spain for literary accomplishments of any species; and though, by the ample provision which has been made for the American church, many of its members enjoy the ease and independence which are favorable to the cultivation of science, the body of secular clergy has hardly, during two centuries and a half, produced one author whose works convey such useful information, or possess such a degree of merit, as to be ranked among those which attract the attention of enlightened nations. But the greatest part of the ecclesiastics in the Spanish settlements are regulars. On the discovery of America, a new field opened to the pious zeal of the monastic orders; and, with a becoming alacrity, they immediately sent forth missionaries to labor in it. The first attempt to instruct and convert the Americans was made by monks; and as soon as the conquest of any

province was completed, and its ecclesiastical establishment began to assume some form, the Popes permitted the missionaries of the four mendicant orders, as a reward for their services, to accept of parochial charges in America, to perform all spiritual functions, and to receive the tithes and other emoluments of the benefice, without depending on the jurisdiction of the bishop of the diocese, or being subject to his censures. In consequence of this, a new career of usefulness, as well as new objects of ambition, presented themselves. Whenever a call is made for a fresh supply of missionaries, men of the most ardent and aspiring minds, impatient under the restraint of a cloister, weary of its insipid uniformity, and fatigued with the irksome repetition of its frivolous functions, offer their service with eagerness, and repair to the New World in quest of liberty and distinction. Nor do they pursue distinction without success. The highest ecclesiastical honors, as well as the most lucrative preferments in Mexico and Peru, are often in the hands of regulars; and it is chiefly to the monastic orders that the Americans are indebted for any portion of science which is cultivated among them. They are almost the only Spanish ecclesiastics from whom we have received any accounts either of the civil or natural history of the various provinces in America. Some of them, though deeply tinged with the indelible superstition of their profession, have published books which give a favorable impression of their abilities. The natural and moral history of the New World, by the Jesuit Acosta, contains more accurate observations, perhaps, and more sound science, than are to be found in any description of remote countries published in the sixteenth century.

But the same disgust with monastic life, to which America is indebted for some instructors of worth and abilities, filled it with others of a very different character. The giddy, the profligate, the avaricious, to whom the poverty and rigid discipline of a convent are intolerable, consider a mission to America as a release from mortification and bondage. There they soon obtain some parochial charge; and far removed by their situation, from the inspection of their monastic superiors, and exempt, by their character, from the jurisdiction of their diocesan, they are hardly subjected to any control. According to the testimony of the most zealous catholics, many of the regular clergy in the Spanish settlements are not only destitute of the virtues becoming their profession, but regardless of that external decorum and respect for the opinion of mankind, which preserve a semblance of worth where the reality is wanting. Secure of impunity, some regulars, in contempt of their vow of poverty, engage openly in commerce, and are so rapaciously eager in amassing wealth, that they become the most grievous oppressors of the Indians whom it was their duty to have protected. Others, with no less flagrant violation of their vow of chastity, indulge with little disguise in the most dissolute licentiousness. [182]

Various schemes have been proposed for redressing enormities so manifest and so offensive. Several persons, no less eminent for piety than discernment, have contended, that the regulars, in conformity to the canons of the church, ought to be confined within the walls of their cloisters, and should no longer be permitted to enroach on the functions of the secular clergy. Some public-spirited magistrates, from conviction of its being necessary to deprive the regulars of a privilege bestowed at first with good intention, but of which time and experience had discovered the pernicious effects, openly countenanced the secular clergy in their attempts to assert their own rights. The prince D'Esquilache, viceroy of Peru under Philip III., took measures so decisive and effectual for circumscribing the regulars within their proper sphere as struck them with general consternation. [183] They had recourse to their usual arts. They alarmed the superstitious, by representing the proceedings of the viceroy as innovations fatal to religion. They employed all the refinements of intrigue in order to gain persons in power; and seconded by the powerful influence of the Jesuits, who claimed and enjoyed all the privileges which belonged to the Mendicant orders in America, they made a deep impression on a bigoted prince and a weak ministry. The ancient practice was tolerated. The abuses which it occasioned continued to increase, and the corruption of monks, exempt from the restraints of discipline, and the inspection of any superior, became a disgrace to religion. At last, as the veneration of the Spaniards for the monastic orders began to abate, and the power of the Jesuits was on the decline, Ferdinand VI. ventured to apply the only effectual remedy, by issuing an edict [June 23, 1767,]

prohibiting regulars of every denomination from taking the charge of any parish with the cure of souls; and declaring that on the demise of the present incumbents, none but secular priests, subject to the jurisdiction of their dioceses, shall be presented to vacant benefices. If this regulation is carried into execution with steadiness in any degree proportional to the wisdom with which it is framed, a very considerable reformation may take place in the ecclesiastical state of Spanish America, and the secular clergy may gradually become a respectable body of men. The deportment of many ecclesiastics, even at present, seems to be decent and exemplary; otherwise we can hardly suppose that they would be held in such high estimation, and possess such a wonderful ascendancy over the minds of their countrymen throughout all the Spanish settlements.

But whatever merit the Spanish ecclesiastics in America may possess, the success of their endeavors in communicating the knowledge of true religion to the Indians, has been more imperfect than might have been expected, either from the degree of their zeal, or from the dominion which they had acquired over that people. For this, various reasons may be assigned. The first missionaries, in their ardor to make proselytes, admitted the people of America into the Christian church without previous instruction in the doctrines of religion, and even before they themselves had acquired such knowledge in the Indian language, as to be able to explain to the natives the mysteries of faith, or the precepts of duty. Resting upon a subtle distinction in scholastic theology, between that degree of assent which is founded on a complete knowledge and conviction of duty, and that which may be yielded when both these are imperfect, they adopted this strange practice, no less inconsistent with the spirit of a religion which addresses itself to the understanding of men, than repugnant to the dictates of reason. As soon as any body of people overawed by dread of the Spanish power, moved by the example of their own chiefs, incited by levity, or yielding from mere ignorance, expressed the slightest desire of embracing the religion of their conquerors, they were instantly baptized. While this rage of conversion continued, a single clergyman baptized in one day above five thousand Mexicans, and did not desist until he was so exhausted by fatigue that he was unable to lift his hands. In the course of a few years after the reduction of the Mexican empire, the sacrament of baptism was administered to more than four millions. Proselytes adopted with such inconsiderate haste, and who were neither instructed in the nature of the tenets to which it was supposed they had given assent, nor taught the absurdity of those which they were required to relinquish, retained their veneration for their ancient superstitions in full force, or mingled an attachment to its doctrine and rites with that slender knowledge of Christianity which they had acquired. These sentiments the new converts transmitted to their posterity, into whose minds they have sunk so deep, that the Spanish ecclesiastics, with all their industry, have not been able to eradicate them. The religious institutions of their ancestors are still remembered and held in honor by many of the Indians, both in Mexico and Peru; and whenever they think themselves out of reach of inspection by the Spaniards, they assemble and celebrate their idolatrous rites.

But this is not the most unsurmountable obstacle to the progress of Christianity among the Indians. The powers of their uncultivated understandings are so limited, their observations and reflections reach so little beyond the mere objects of sense, that they seem hardly to have the capacity of forming abstract ideas, and possess not language to express them. To such men the sublime and spiritual doctrines of Christianity must be, in a great measure, incomprehensible. The numerous and splendid ceremonies of the Popish worship catch the eye, please and interest them; but when their instructors attempt to explain the articles of faith with which those external observances are connected, though the Indians may listen with patience, they so little conceive the meaning of what they hear, that their acquiescence does not merit the name of belief. Their indifference is still greater than their incapacity. Attentive only to the present moment, and engrossed by the objects before them, the Indians so seldom reflect upon what is past, or take thought for what is to come, that neither the promises nor threats of religion make much impression upon them; and while their foresight rarely extends so far as the next day, it is almost impossible to inspire them with solicitude about the concerns of a future world. Astonished equally at their slowness of comprehension, and at their insensibility, some of the early missionaries pronounced them a race

of men so brutish as to be incapable of understanding the first principles of religion. A council held at Lima decreed, that, on account of this incapacity, they ought to be excluded from the sacrament of the Eucharist. Though Paul III., by his famous bull issued in the year 1537, declared them to be rational creatures entitled to all the privileges of Christians; yet after the lapse of two centuries, during which they have been members of the church, so imperfect are their attainments in knowledge that very few possess such a portion of spiritual discernment as to be deemed worthy of being admitted to the holy communion. From this idea of their incapacity and imperfect knowledge of religion, when the zeal of Philip II. established the inquisition in America in the year 1570, the Indians were exempted from the jurisdiction of that severe tribunal, and still continue under the inspection of their dioceses. Even after the most perfect instruction, their faith is held to be feeble and dubious; and though some of them have been taught the learned languages, and have gone through the ordinary course of academic education with applause, their frailty is still so much suspected, that few Indians are either ordained priests, or received into any religious order. [184]

From this brief survey some idea may be formed of the interior state of the Spanish colonies. The various productions with which they supply and enrich the mother country, and the system of commercial intercourse between them, come next in order to be explained. If the dominions of Spain in the New World had been of such moderate extent as bore a due proportion to the parent state, the progress of her colonising might have been attended with the same benefit as that of other nations. But when, in less than half a century, her inconsiderate rapacity had seized on countries larger than all Europe, her inability to fill such vast regions with inhabitants sufficient for the cultivation of them was so obvious, as to give a wrong direction to all the efforts of the colonists. They did not form compact settlements, where industry, circumscribed within proper limits, both in its views and operations, is conducted with that sober persevering spirit which gradually converts whatever is in its possession to a proper use, and derives thence the greatest advantage. Instead of this, the Spaniards, seduced by the boundless prospect which opened to them, divided their possessions in America into governments of great extent. As their number was too small to attempt the regular culture of the immense provinces which they occupied rather than people, they bent their attention to a few objects that allured them with hopes of sudden and exorbitant gain, and turned away with contempt from the humbler paths of industry, which lead more slowly, but with greater certainty, to wealth and increase of national strength.

Of all the methods by which riches may be acquired, that of searching for the precious metals is one of the most inviting to men who are either unaccustomed to the regular assiduity with which the culture of the earth and the operations of commerce must be carried on, or who are so enterprising and rapacious as not to be satisfied with the gradual returns of profit which they yield. Accordingly, as soon as the several countries in America were subjected to the dominion of Spain, this was almost the only method of acquiring wealth which occurred to the adventurers by whom they were conquered. Such provinces of the continent as did not allure them to settle, by the prospect of their affording gold and silver, were totally neglected. Those in which they met with a disappointment of the sanguine expectations they had formed, were abandoned. Even the value of the islands, the first fruits of their discoveries, and the first object of their attention, sunk so much in their estimation, when the mines which had been opened in them were exhausted, that they were deserted by many of the planters, and left to be occupied by more industrious possessors. All crowded to Mexico and Peru, where the quantities of gold and silver found among the natives, who searched for them with little industry and less skill, promised an unexhausted store, as the recompense of more intelligent and persevering efforts.

During several years, the ardor of their researches was kept up by hope rather than success. At length, the rich silver mines of Potosi in Peru were accidentally discovered in the year 1545 by an Indian, as he was clambering up the mountains in pursuit of a llama which had strayed from his flock. Soon after, the mines of Sacotecas in New Spain, little inferior to the other in value, were opened. From that time successive discoveries have been made in both colonies, and silver mines are now so numerous, that the working of

them, and of some few mines of gold in the provinces of Tierra Firme, and the new kingdom of Granada, has become the capital occupation of the Spaniards, and is reduced into a system no less complicated than interesting. To describe the nature of the various ores, the mode of extracting them from the bowels of the earth, and to explain the several processes by which the metals are separated from the substances with which they are mingled, either by the action of fire, or the attractive powers of mercury, is the province of the natural philosopher or chymist, rather than of the historian.

The exuberant profusion with which the mountains of the New World poured forth their treasures astonished mankind, who had been accustomed hitherto to receive a penurious supply of the precious metals from the more scanty stores contained in the mines of the ancient hemispheres. According to principles of computation, which appear to be extremely moderate, the quantity of gold and silver that has been regularly entered in the ports of Spain, is equal in value to four millions sterling annually, reckoning from the year 1492, in which America was discovered to the present time. This, in two hundred and eighty-three years, amounts to eleven hundred and thirty-two millions. Immense as this sum is, the Spanish writers contend, that as much more ought to be added to it in consideration of treasure which has been extracted from the mines, and reported fraudulently into Spain without paying duty to the King. By this account, Spain has drawn from the New World a supply of wealth amounting at least to two thousand millions of pounds sterling [185].

The mines, which have yielded this amazing quantity of treasure, are not worked at the expense of the crown or of the public. In order to encourage private adventurers, the person who discovers and works a new vein is entitled to the property of it. Upon laying his claim to such a discovery before the governor of the province, a certain extent of land is measured off, and a certain number of Indians allotted him, under the obligation of his opening the mine within a limited time, and of his paying the customary duty to the King for what it shall produce. Invited by the facility with which such grants are obtained, and encouraged by some striking examples of success in this line of adventure, not only the sanguine and the bold, but the timid and diffident, enter upon it with astonishing ardor. With vast objects always in view, fed continually with hope, and expecting every moment that fortune will unveil her secret stores, and give up the wealth which they contain to their wishes, they deem every other occupation insipid and uninteresting. The charms of this pursuit, like the rage for deep play, are so bewitching, and take such full possession of the mind, as even to give a new bent to the natural temper. Under its influence the cautious become enterprising, and the covetous profuse. Powerful as this charm naturally is, its force is augmented by the arts of an order of men known in Peru by the cant name of *searchers*. These are commonly persons of desperate fortune, who, availing themselves of some skill in mineralogy, accompanied with the insinuating manner and confident pretensions peculiar to projectors, address the wealthy and the credulous. By plausible descriptions of the appearances which they have discovered of rich veins hitherto unexplored; by producing, when requisite, specimens of promising ore; by affirming, with an imposing assurance, that success is certain, and that the expense must be trifling, they seldom fail to persuade. An association is formed; a small sum is advanced by each copartner; the mine is opened; the searcher is intrusted with the sole direction of every operation; unforeseen difficulties occur; new demands of money are made; but, amidst a succession of disappointments and delays, hope is never extinguished, and the ardor of expectation hardly abates. For it is observed, that if any person once enters this seducing path, it is almost impossible to return, his ideas alter, he seems to be possessed with another spirit; visions of imaginary wealth are continually before his eyes, and he thinks, and speaks, and dreams of nothing else.

Such is the spirit that must be formed, wherever the active exertions of any society are chiefly employed in working mines of gold and silver. No spirit is more adverse to such improvements in agriculture and commerce as render a nation really opulent. If the system of administration in the Spanish colonies had been founded upon principles of sound policy, the power and ingenuity of the legislator would have been exerted with as much ardor in restraining its subjects from such

pernicious industry, as is now employed in alluring them towards it. "Projects of mining," says a good judge of the political conduct of nations, "instead of replacing the capital employed in them, together with the ordinary profit of stock, commonly absorb both capital and profit. They are the projects, therefore, to which, of all others, a prudent lawgiver, who desired to increase the capital of his nation, would least choose to give any extraordinary encouragement, or to turn towards them a greater share of that capital than would go to them of its own accord. Such, in reality, is the absurd confidence which all men have in their own good fortune, that wherever there is the least probability of success, too great a share of it is apt to go to them of its own accord." But in the Spanish colonies, government is studious to cherish a spirit which it should have labored to depress, and, by the sanction of its approbation, arguments that inconsiderate credulity which has turned the active industry of Mexico and Peru into such an improper channel. To this may be imputed the slender progress which Spanish America has made, during two centuries and a half, either in useful manufactures, or in those lucrative branches of cultivation which furnish the colonies of other nations with their staple commodities. In comparison with the precious metals every bounty of nature is so much despised, that this extravagant idea of their value has mingled with the idiom of language in America, and the Spaniards settled there, denominate a country *rich*, not from the fertility of its soil, the abundance of its crops, or the exuberance of its pastures, but on account of the minerals which its mountains contain. In quest of these, they abandon the delightful plains of Peru and Mexico, and resort to barren and uncomfortable regions, where they have built some of the largest towns which they possess in the New World. As the activity and enterprise of the Spaniards originally took this direction, it is now so difficult to bend them a different way, that although, from various causes, the gain of working mines is much decreased, the fascination continues, and almost every person, who takes any active part in the commerce of New Spain or Peru, is still engaged in some adventure of this kind. [186]

But though mines are the chief object of the Spaniards, and the precious metals which these yield form the principal article in their commerce with America; the fertile countries which they possess there abound with other commodities of such value, or scarcity, as to attract a considerable degree of attention. Cochineal is a production almost peculiar to New Spain, of such demand in commerce that the sale is always certain, and yet yields such profit as amply rewards the labor and care employed in rearing the curious insects of which this valuable drug is composed, and preparing it for the market. Quinquina, or Jesuits' Bark, the most salutary simple, perhaps, and of most restorative virtue, that Providence, in compassion to human infirmity, has made known unto man, is found only in Peru, to which it affords a lucrative branch of commerce. The Indigo of Guatemala is superior in quality to that of any province in America, and cultivated to a considerable extent. Cacao, though not peculiar to the Spanish colonies, attains to its highest state of perfection there, and, from the great consumption of chocolate in Europe, as well as in America, is a valuable commodity. The Tobacco of Cuba, of more exquisite flavor than any brought from the New World; the Sugar raised in that island, in Hispaniola, and in New Spain, together with drugs of various kinds, may be mentioned among the natural productions of America which enrich the Spanish commerce. To these must be added an article of no inconsiderable account, the exportation of hides; for which, as well as for many of those which I have enumerated, the Spaniards are more indebted to the wonderful fertility of the country, than to their own foresight and industry. The domestic animals of Europe, particularly horned cattle, have multiplied in the New World with a rapidity which almost exceeds belief. A few years after the Spaniards settled there, the herds of tame cattle became so numerous that their proprietors reckoned them by thousands. Less attention being paid to them as they continued to increase, they were suffered to run wild; and spreading over a country of boundless extent, under a mild climate and covered with rich pasture, their number became immense. They range over the vast plains which extend from Buenos Ayres towards the Andes, in herds of thirty or forty thousand; and the unlucky traveller who once falls in among them, may proceed several days before he can disentangle himself from among the crowd that covers the face of the earth, and seems to have no end. They are hardly less numerous in New

Spain, and in several other provinces; they are killed merely for the sake of their hides; and the slaughter at certain seasons is so great, that the stench of the carcasses, which are left in the field, would infect the air, if large packs of wild dogs, and vast flocks of *gallinazos*, or American vultures, the most voracious of all the feathered kind, did not instantly devour them. The number of those hides exported in every fleet to Europe, is very great, and is a lucrative branch of commerce.

Almost all these may be considered as staple commodities peculiar to America, and different, if we except that last mentioned, from the productions of the mother country.

When the importation into Spain of those various articles from her colonies first became active and considerable, her interior industry and manufactures were in a state so prosperous, that with the product of these she was able both to purchase the commodities of the New World, and to answer its growing demands. Under the reigns of Ferdinand and Isabella, and Charles V., Spain was one of the most industrious countries in Europe. Her manufactures in wool, and flax, and silk, were so extensive, as not only to furnish what was sufficient for her own consumption, but to afford a surplus for exportation. When a market for them, formerly unknown, and to which she alone had access, opened in America, she had recourse to her domestic store, and found there an abundant supply. [187] This new employment must naturally have added vivacity to the spirit of industry. Nourished and invigorated by it, the manufactures, the population, and wealth of Spain, might have gone on increasing in the same proportion with the growth of her colonies. Nor was the state of the Spanish marine at this period less flourishing than that of its manufactures. In the beginning of the sixteenth century, Spain is said to have possessed above a thousand merchant ships, a number probably far superior to that of any nation in Europe in that age. By the aid which foreign trade and domestic industry give reciprocally to each other in their progress, the augmentation of both must have been rapid and extensive, and Spain might have received the same accession of opulence and vigor from her acquisitions in the New World that other powers have derived from their colonies there.

But various causes prevented this. The same thing happens to nations as to individuals. Wealth, which flows in gradually, and with moderate increase, feeds and nourishes that activity which is friendly to commerce, and calls it forth into vigorous and well conducted exertions; but when opulence pours in suddenly, and with too full a stream, it overturns all sober plans of industry, and brings along with it a taste for what is wild and extravagant and daring in business or in action. Such was the great and sudden augmentation of power and revenue that the possession of America brought into Spain; and some symptoms of its pernicious influence upon the political operations of that monarchy soon began to appear. For a considerable time, however, the supply of treasure from the New World was scanty and precarious; and the genius of Charles V. conducted public measures with such prudence, that the effects of this influence were little perceived. But when Philip II. ascended the Spanish throne, with talents far inferior to those of his father, and remittances from the colonies became a regular and considerable branch of revenue, the fatal operation of this rapid change in the state of the kingdom, both on the monarch and his people, was at once conspicuous. Philip, possessing that spirit of undaunted assiduity which often characterizes the ambition of men of moderate talents, entertained such a high opinion of his own resources that he thought nothing too arduous for him to undertake. Shut up himself in the solitude of the Escorial, he troubled and annoyed all the nations around him. He waged open war with the Dutch and English; he encouraged and aided a rebellious faction in France; he conquered Portugal, and maintained armies and garrisons in Italy, Africa, and both the Indies. By such a multiplicity of great and complicated operations, pursued with ardor during the course of a long reign Spain was drained both of men and money. Under the weak administration of his successor, Philip III., [A. D. 1611.] the vigor of the nation continued to decrease, and sunk into the lowest decline, when the inconsiderate bigotry of that monarch expelled at once near a million of his most industrious subjects, at the very time when the exhausted state of the kingdom required some extraordinary exertion of political wisdom to augment its numbers, and to revive its strength. Early in the seventeenth century, Spain felt such a

diminution in the number of her people, that from inability to recruit her armies she was obliged to contract her operations. Her flourishing manufactures were fallen into decay. Her fleets, which had been the terror of all Europe, were ruined. Her extensive foreign commerce was lost. The trade between different parts of her own dominion was interrupted, and the ships which attempted to carry it on were taken and plundered by enemies whom she once despised. Even agriculture, the primary object of industry in every prosperous state, was neglected, and one of the most fertile countries in Europe hardly raised what was sufficient for the support of its own inhabitants.

In proportion as the population and manufactures of the parent state declined, the demands of her colonies continued to increase. The Spaniards, like their monarchs, intoxicated with the wealth which poured in annually upon them, deserted the paths of industry to which they had been accustomed, and repaired with eagerness to those regions from which this opulence issued. By this rage of emigration another drain was opened, and the strength of the colonies augmented by exhausting that of the mother country. All those emigrants, as well as the adventurers who had at first settled in America, depended absolutely upon Spain for almost every article of necessary consumption. Engaged in more alluring and lucrative pursuits, or prevented by restraints which government imposed, they could not turn their own attention towards establishing the manufactures requisite for comfortable subsistence. They received (as I have observed in another place) their clothing, their furniture, whatever ministers to the ease or luxury of life, and even their instruments of labor, from Europe. Spain, thinned of people and decreasing in industry, was unable to supply their growing demands. She had recourse to her neighbors. The manufactures of the Low Countries, of England, of France, and of Italy, which her wants called into existence or animated with new vivacity, furnished in abundance whatever she required. In vain did the fundamental law, concerning the exclusion of foreigners from trade with America, oppose this innovation. Necessity, more powerful than any statute, defeated its operation, and constrained the Spaniards themselves to concur in eluding it. The English, the French, and Dutch, relying on the fidelity and honor of Spanish merchants, who lend their names to cover the deceit, send out their manufactures to America, and receive the exorbitant price for which they are sold there, either in specie, or in the rich commodities of the New World. Neither the dread of danger, nor the allurements of profit ever induced a Spanish factor to betray or defraud the person who confided in him; and that probity, which is the pride and distinction of the nation, contributes to its ruin. In a short time, not above a twentieth part of the commodities exported to America was of Spanish growth or fabric. All the rest was the property of foreign merchants, though entered in the name of Spaniards. The treasure of the New World may be said henceforward not to have belonged to Spain. Before it reached Europe it was anticipated as the price of goods purchased from foreigners. That wealth which by an internal circulation, would have spread through each vein of industry, and have conveyed life and movement to every branch of manufacture, flowed out of the kingdom with such a rapid course as neither enriched nor animated it. On the other hand, the artisans of rival nations, encouraged by this quick sale of their commodities, improved so much in skill and industry as to be able to afford them at a rate so low, that the manufactures of Spain, which could not vie with theirs either in quality or cheapness of work, were still further depressed. This destructive commerce drained off the riches of the nation faster and more completely than even the extravagant schemes of ambition carried on by its monarchs. Spain was so much astonished and distressed at beholding her American treasures vanish almost as soon as they were imported, that Philip III., unable to supply what was requisite in circulation, issued an edict, by which he endeavored to raise copper money to a value in currency nearly equal to that of silver; and the lord of the Peruvian and Mexican mines was reduced to a wretched expedient, which is the last resource of petty impoverished states.

Thus the possessions of Spain in America have not proved a source of population and of wealth to her in the same manner as those of other nations. In the countries of Europe, where the spirit of industry subsists in full vigor, every person settled in such colonies as are similar in their situation to those of Spain, is supposed to give employment to three or four at home

in supplying his wants. But wherever the mother country cannot afford this supply, every emigrant may be considered as a citizen lost to the community, and strangers must reap all the benefit of answering his demands.

Such has been the internal state of Spain from the close of the sixteenth century, and such her inability to supply the growing wants of her colonies. The fatal effects of this disproportion between their demands, and her capacity of answering them, have been much increased by the mode in which Spain has endeavored to regulate the intercourse between the mother country and her colonies. It is from her idea of monopolising the trade with America, and debarring her subjects there from any communication with foreigners, that all her jealous and systematic arrangements have arisen. These are so singular in their nature and consequences as to merit a particular explanation. In order to secure the monopoly at which she aimed, Spain did not vest the trade with her colonies in an exclusive company, a plan which has been adopted by nations more commercial, and at a period when mercantile policy was an object of greater attention, and ought to have been better understood. The Dutch gave up the whole trade with their colonies, both in the East and West Indies, to exclusive companies. The English, the French, the Danes, have imitated their example with respect to the East Indian commerce; and the two former have laid a similar restraint upon some branches of their trade with the New World. The wit of man cannot, perhaps, devise a method for checking the progress of industry and population in a new colony more effectual than this. The interest of the colony, and of the exclusive company, must in every point be diametrically opposite; and as the latter possesses such advantages in this unequal contest, that it can prescribe at pleasure the terms of intercourse, the former must not only buy dear and sell cheap, but must suffer the mortification of having the increase of its surplus stock discouraged by those very persons to whom alone it can dispose of its productions.

Spain, it is probable, was preserved from falling into this error of policy by the high ideas which she early formed concerning the riches of the New World. Gold and silver were commodities of too high a value to vest a monopoly of them in private hands. The crown wished to retain the direction of a commerce so inviting; and, in order to secure that, ordained the cargo of every ship fitted out for America to be inspected by the officers of the *Casa de Contratacion* in Seville before it could receive a license to make the voyage; and that, on its return, a report of the commodities which it brought should be made to the same board before it could be permitted to land them. In consequence of this regulation, all the trade of Spain with the New World centred originally in the port of Seville, and was gradually brought into a form, in which it has continued, with little variation, from the middle of the sixteenth century almost to our own times. For the greater security of the valuable cargoes sent to America, as well as for the more easy prevention of fraud, the commerce of Spain with its colonies is carried on by fleets which sail under strong convoys. These fleets, consisting of two squadrons, one distinguished by the name of the *Galeons*, the other by that of the *Flota*, are equipped annually. Formerly they took their departure from Seville; but as the port of Cadiz has been found more commodious, they have sailed from it since the year 1720.

The Galeons destined to supply Tierra Firme, and the kingdoms of Peru and Chili, with almost every article of luxury or necessary consumption, that an opulent people can demand, touch first at Carthagena, and then at Porto Bello. To the former, the merchants of Santa Martha, Caraccas, the New Kingdom of Granada, and several other provinces, resort. The latter is the great mart for the rich commerce of Peru and Chili. At the season when the Galeons are expected, the product of all the mines in these two kingdoms, together with their other valuable commodities, is transported by sea to Panama. From thence, as soon as the appearance of the fleet from Europe is announced, they are conveyed across the isthmus, partly on mules and partly down the river Chagre to Porto Bello. This paltry village, the climate of which, from the pernicious union of excessive heat, continual moisture; and the putrid exhalations arising from a rank soil, is more fatal to life than any perhaps in the known world, is immediately filled with people. From being the residence of a few Negroes and Mulattoes, and of a miserable garrison relieved every three months, Porto Bello assumes suddenly a very different aspect, and its streets

are crowded with opulent merchants from every corner of Peru and the adjacent provinces. A fair is opened, the wealth of America is exchanged for the manufactures of Europe; and, during its prescribed term of forty days, the richest traffic on the face of the earth is begun and finished with that simplicity of transaction, and that unbounded confidence, which accompany extensive commerce. [189] The Flota holds its course to Vera Cruz. The treasures and commodities of New Spain, and the depending provinces, which were deposited at Puebla de los Angeles, in expectation of its arrival, are carried thither; and the commercial operations of Vera Cruz, conducted in the same manner with those of Porto Bello, are inferior to them only in importance and value. Both fleets, as soon as they have completed their cargoes from America, rendezvous at the Havana, and return in company to Europe.

The trade of Spain with her colonies, while thus fettered and restricted, came necessarily to be conducted with the same spirit, and upon the same principles as that of an exclusive company. Being confined to a single port, it was of course thrown into a few hands, and almost the whole of it was gradually engrossed by a small number of wealthy houses, formerly in Seville, and now in Cadiz. These by combinations, which they can easily form, may altogether prevent that competition which preserves commodities at their natural price; and by acting in concert, to which they are prompted by their mutual interest, they may raise or lower the value of them at pleasure. In consequence of this, the price of European goods in America is always high, and often exorbitant. A hundred, two hundred, and even three hundred per cent. are profits not uncommon in the commerce of Spain with her colonies. From the same engrossing spirit it frequently happens that traders of the second order, whose warehouses do not contain a complete assortment of commodities for the American market, cannot purchase from the more opulent merchants such goods as they want at a lower price than that for which they are sold in the colonies. With the same vigilant jealousy that an exclusive company guards against the intrusion of the free trader, those overgrown monopolists endeavor to check the progress of every one whose encroachments they dread. This restraint of the American commerce to one port not only affects its domestic state, but limits its foreign operations. A monopolist may acquire more, and certainly will hazard less, by a confined trade which yields exorbitant profit, than by an extensive commerce in which he receives only a moderate return of gain. It is often his interest not to enlarge, but to circumscribe the sphere of his activity; and instead of calling forth more vigorous exertions of commercial industry, it may be the object of his attention to check and set bounds to them. By some such maxim the mercantile policy of Spain seems to have regulated its intercourse with America. Instead of furnishing the colonies with European goods in such quantity as might render both the price and the profit moderate, the merchants of Seville and Cadiz seem to have supplied them with a sparing hand, that the eagerness of competition, among customers obliged to purchase in a scanty market, might enable the Spanish factors to dispose of their cargoes with exorbitant gain. About the middle of the last century, when the exclusive trade to America from Seville was in its most flourishing state, the burden of the two united squadrons of the Galeons and Flota did not exceed twenty-seven thousand five hundred tons. The supply which such a fleet could carry must have been very inadequate to the demands of those populous and extensive colonies, which depended upon it for all the luxuries and many of the necessities of life.

Spain early became sensible of her declension from her former prosperity; and many respectable and virtuous citizens employed their thoughts in devising methods for reviving the decaying industry and commerce of their country. From the violence of the remedies proposed, we may judge how desperate and fatal the malady appeared. Some, confounding a violation of police with criminality against the state, contended that, in order to check illicit commerce, every person convicted of carrying it on should be punished with death, and confiscation of all his effects. Others, forgetting the distinction between civil offences and acts of impiety, insisted that contraband trade should be ranked among the crimes reserved for the cognizance of the Inquisition; that such as were guilty of it might be tried and punished according to the secret and summary form in which that dreadful tribunal exercises its jurisdiction. Others, uninstructed by observing the pernicious effects of monopolies in every country where

they have been established, have proposed to vest the trade with America in exclusive companies, which interest would render the most vigilant guardians of the Spanish commerce against the encroachment of the interlopers.

Besides these wild projects, many schemes, better digested and more beneficial, were suggested. But under the feeble monarchs with whom the reign of the Austrian line in Spain closed, incapacity and indecision are conspicuous in every department of government. Instead of taking for their model the active administration of Charles V., they affected to imitate the cautious procrastinating wisdom of Philip II.; and destitute of his talents, they deliberated perpetually, but determined nothing. No remedy was applied to the evils under which the national commerce, domestic as well as foreign languished. These evils continued to increase; and Spain, with dominions more extensive and more opulent than any European state, possessed neither vigor, nor money, [189] nor industry. At length, the violence of a great national convulsion roused the slumbering genius of Spain. The efforts of the two contending parties in the civil war kindled by the dispute concerning the succession of the crown at the beginning of this century, called forth, in some degree, the ancient spirit and vigor of the nation. While men were thus forming, capable of adopting sentiments more liberal than those which had influenced the councils of the monarchy during the course of a century, Spain derived from an unexpected source the means of availing itself of their talents. The various powers who favored the pretensions either of the Austrian or Bourbon candidate for the Spanish throne, sent formidable fleets and armies to their support; France, England, and Holland remitted immense sums to Spain. These were spent in the provinces which became the theatre of war. Part of the American treasure, of which foreigners had drained the kingdom, flowed back thither. From this era one of the most intelligent Spanish authors dates the revival of the monarchy; and, however humiliating the truth may be, he acknowledges, that it is to her enemies his country is indebted for the acquisition of a fund of circulating specie in some measure adequate to the exigencies of the public.

As soon as the Bourbons obtained quiet possession of the throne, they discerned this change in the spirit of the people and in the state of the nation, and took advantage of it; for although that family has not given monarchs to Spain remarkable for superiority of genius, they have all been beneficent princes, attentive to the happiness of their subjects, and solicitous to promote it. It was, accordingly, the first object of Philip V. to suppress an innovation which had crept in during the course of the war, and had overturned the whole system of the Spanish commerce with America. The English and Dutch, by their superiority in naval power, having acquired such command of the sea as to cut off all intercourse between Spain and her colonies, Spain, in order to furnish her subjects in America those necessities of life without which they could not exist, and as the only means of receiving from thence any part of their treasure, departed so far from the usual rigor of its maxims as to open the trade with Peru to her allies the French. The merchants of St. Malo, to whom Louis XIV. granted the privilege of this lucrative commerce, engaged in it with vigor, and carried it on upon principles very different from those of the Spaniards. They supplied Peru with European commodities at a moderate price, and not in stinted quantity. The goods which they imported were conveyed to every province of Spanish America in such abundance as had never been known in any former period. If this intercourse had been continued, the exportation of European commodities from Spain must have ceased, and the dependence of the colonies on the mother country have been at an end. The most peremptory injunctions were therefore issued [1713.] prohibiting the admission of foreign vessels into any port of Peru or Chili, and a Spanish squadron was employed to clear the South Sea of intruders, whose aid was no longer necessary.

But though, on the cessation of the war which was terminated by the treaty of Utrecht, Spain obtained relief from one encroachment on her commercial system, she was exposed to another which she deemed hardly less pernicious. As an inducement that might prevail with Queen Anne to conclude a peace, which France and Spain desired with equal ardor, Philip V., not only conveyed to Great Britain the *Assiento*, or contract for supplying the Spanish colonies with Negroes, which had formerly been enjoyed by France, but granted it the more extraordinary privilege of sending

annually to the fair of Porto Bello a ship of five hundred tons, laden with European commodities. In consequence of this, British factories were established at Cartagena, Panama, Vera Cruz, Buenos Ayres, and other Spanish settlements. The veil with which Spain had hitherto covered the state and transactions of her colonies was removed. The agents of a rival nation, residing in the towns of most extensive trade, and of chief resort, had the best opportunities of becoming acquainted with the interior condition of the American provinces, of observing their stated and occasional wants, and of knowing what commodities might be imported into them with the greatest advantage. In consequence of information so authentic and expeditious, the merchants of Jamaica and other English colonies who traded to the Spanish main were enabled to assort and proportion their cargoes so exactly to the demands of the market, that the contraband commerce was carried on with a facility and to an extent unknown in any former period. This, however, was not the most fatal consequence of the *Assiento* to the trade of Spain. The agents of the British South Sea Company, under cover of the importation which they were authorized to make by the ship sent annually to Porto Bello, poured in their commodities on the Spanish continent without limitation or restraint. Instead of a ship of five hundred tons, as stipulated in the treaty, they usually employed one which exceeded nine hundred tons in burden. She was accompanied by two or three smaller vessels, which, mooring in some neighboring creek, supplied her clandestinely with fresh bales of goods to replace such as were sold. The inspectors of the fair, and officers of the revenue, gained by exorbitant presents, connived at the fraud. [190] Thus, partly by the operations of the company, and partly by the activity of private interlopers, almost the whole trade of Spanish America was engrossed by foreigners. The immense commerce of the Galeons, formerly the pride of Spain, and the envy of other nations, sunk to nothing [1737]; and the squadron itself, reduced from fifteen thousand to two thousand tons, served hardly any purpose but to fetch home the royal revenue arising from the fifth on silver.

While Spain observed those encroachments, and felt so sensibly their pernicious effects, it was impossible not to make some effort to restrain them. Her first expedient was to station ships of force, under the appellation of *guarda costas*, upon the coasts of those provinces to which interlopers most frequently resorted. As private interest concurred with the duty which they owed to the public, in rendering the officers who commanded those vessels vigilant and active, some check was given to the progress of the contraband trade, though in dominions so extensive and so accessible by sea, hardly any number of cruisers was sufficient to guard against its inroads in every quarter. This interruption of an intercourse which had been carried on with so much facility, that the merchants in the British colonies were accustomed to consider it almost as an allowed branch of commerce, excited murmurs and complaints. These, authorized in some measure, and rendered more interesting by several unjustifiable acts of violence committed by the captains of the Spanish *guarda costas*, precipitated Great Britain into a war with Spain [1739]; in consequence of which the latter obtained a final release from the *Assiento*, and was left at liberty to regulate the commerce of her colonies without being restrained by any engagement with a foreign power.

As the formidable encroachments of the English on their American trade, had discovered to the Spaniards the vast consumption of European goods in their colonies, and taught them the advantage of accommodating their importations to the occasional demand of the various provinces, they perceived the necessity of devising some method of supplying their colonies, different from their ancient one of sending thither periodical fleets. That mode of communication had been found not only to be uncertain, as the departure of the Galeons and Flota was sometimes retarded by various accidents, and often prevented by the wars which raged in Europe; but long experience had shown it to be ill adapted to afford America a regular and timely supply of what it wanted. The scarcity of European goods in the Spanish settlements frequently became excessive; their price rose to an enormous height; the vigilant eye of mercantile attention did not fail to observe this favorable opportunity: an ample supply was poured in by interlopers from the English, the French, and Dutch islands; and when the Galeons at length arrived, they found the markets so glutted by this illicit commerce, that there was no demand for the

commodities with which they were loaded. In order to remedy this, Spain has permitted a considerable part of her commerce with America to be carried on by *register ships*. These are fitted out during the intervals between the stated seasons when the Galeons and Flota sail, by merchants in Seville or Cadiz, upon obtaining a license from the council of the Indies, for which they pay a very high premium, and are destined for those ports in America where any extraordinary demand is foreseen or expected. By this expedient, such a regular supply of the commodities for which there is the greatest demand is conveyed to the American market, that the interloper is no longer allured by the same prospect of excessive gain, or the people in the colonies urged by the same necessity to engage in the hazardous adventures of contraband trade.

In proportion as experience manifested the advantages of carrying on trade in this mode, the number of register ships increased; and at length, in the year 1748, the Galeons, after having been employed upwards of two centuries, were finally laid aside. From that period there has been no intercourse with Chili and Peru but by single ships, despatched from time to time as occasion requires, and when the merchants expect a profitable market will open. These ships sail round Cape Horn, and convey directly to the ports in the South Sea the productions and manufactures of Europe, for which the people settled in those countries were formerly obliged to repair to Porto Bello or Panama. These towns, as has been formerly observed, must gradually decline, when deprived of that commerce to which they owed their prosperity. This disadvantage, however, is more than compensated by the beneficial effects of this new arrangement, as the whole continent of South America receives new supplies of European commodities with so much regularity, and in such abundance, as must not only contribute greatly to the happiness, but increase the population of all the colonies settled there. But as all the register ships destined for the South Seas must still take their departure from Cadiz, and are obliged to return thither, this branch of the American commerce, even in its new and improved form, continues subject to the restraints of a species of monopoly, and feels those pernicious effects of it which I have already described.

Nor has the attention of Spain been confined to regulating the trade with its more flourishing colonies; it has extended likewise to the reviving commerce in those settlements where it was neglected, or had decayed. Among the new tastes which the people of Europe have acquired in consequence of importing the productions of those countries which they conquered in America, that for chocolate is one of the most universal. The use of this liquor, made with a paste formed of the nut or almond of the cacao tree compounded with various ingredients, the Spaniards first learned from the Mexicans; and it has appeared to them, and to the other European nations, so palatable, so nourishing, and so wholesome, that it has become a commercial article of considerable importance. The cacao tree grows spontaneously in several parts of the torrid zone; but the nuts of the best quality, next to those of Guatemala on the South Sea, are produced in the rich plains of Caraccas, a province of Tierra Firme. In consequence of this acknowledged superiority in the quality of cacao in that province, and its communication with the Atlantic, which facilitates the conveyance to Europe, the culture of the cacao there is more extensive than in any district of America. But the Dutch, by the vicinity of their settlements in the small islands of Curazoa and Buenos Ayres, to the coast of Caraccas, gradually engrossed the greatest part of the cacao trade. The traffic with the mother country for this valuable commodity ceased almost entirely; and such was the supine negligence of the Spaniards, or the defects of their commercial arrangements, that they were obliged to receive from the hands of foreigners this production of their own colonies at an exorbitant price. In order to remedy an evil no less disgraceful than pernicious to his subjects, Philip V., in the year 1728, granted to a body of merchants an exclusive right to the commerce with Caraccas and Cumana, on condition of their employing, at their own expense, a sufficient number of armed vessels to clear the coast of interlopers. This society, distinguished sometimes by the name of the Company of Guipuscoa, from the province of Spain in which it is established, and sometimes by that of the Company of Caraccas, from the district of America to which it trades, has carried on its operations with such vigor and success, that Spain has recovered an important branch of commerce which she had suffered to be wrested from her, and is plentifully supplied

with an article of extensive consumption at a moderate price. Not only the parent state, but the colony of Caracas, has derived great advantages from this institution; for although, at the first aspect, it may appear to be one of those monopolies whose tendency is to check the spirit of industry instead of calling it forth to new exertions, it has been prevented from operating in this manner by several salutary regulations framed upon foresight of such bad effects, and on purpose to obviate them. The planters in the Caracas are not left to depend entirely on the company, either for the importation of European commodities or the sale of their own productions. The inhabitants of the Canary islands have the privilege of sending thither annually a register ship of considerable burden; and from Vera Cruz, in New Spain, a free trade is permitted in every port comprehended in the charter of the company. In consequence of this, there is such a competition, that both with respect to what the colonies purchase and what they sell, the price seems to be fixed at its natural and equitable rate. The company has not the power of raising the former, or of degrading the latter, at pleasure; and accordingly, since it was established, the increase of culture, of population, and of live stock, in the province of Caracas, has been very considerable. [191]

But as it is slowly that nations relinquish any system which time has rendered venerable, and as it is still more slowly that commerce can be diverted from the channel in which it has long been accustomed to flow, Philip V., in his new regulations concerning the American trade, paid such deference to the ancient maxim of Spain, concerning the limitation of importation from the New World to one harbor, as to oblige both the register ships which returned from Peru, and those of the Guipuscoan Company from Caracas, to deliver their cargoes in the port of Cadiz. Since his reign, sentiments more liberal and enlarged begin to spread in Spain. The spirit of philosophical inquiry, which it is the glory of the present age to have turned from frivolous or abstruse speculations to the business and affairs of men, has extended its influence beyond the Pyrenees. In the researches of ingenious authors concerning the police or commerce of nations, the errors and defects of the Spanish system with respect to both met every eye, and have not only been exposed with severity, but are held up as a warning to other states. The Spaniards, stung with the reproaches of these authors, or convinced by their arguments, and admonished by several enlightened writers of their own country, seem at length to have discovered the destructive tendency of those narrow maxims, which, by cramping commerce in all its operations, have so long retarded its progress. It is to the monarch now on the throne that Spain is indebted for the first public regulation formed in consequence of such enlarged ideas.

While Spain adhered with rigor to her ancient maxim concerning her commerce with America, she was so much afraid of opening any channel by which an illicit trade might find admission into the colonies, that she almost shut herself out from any intercourse with them but that which was carried on by her annual fleets. There was no establishment, for a regular communication of either public or private intelligence, between the mother country and its American settlements. From the want of this necessary institution, the operations of the state, as well as the business of individuals, were retarded or conducted unskilfully, and Spain often received from foreigners her first information with respect to very interesting events in her own colonies. But though this defect in police was sensibly felt, and the remedy for it was obvious, that jealous spirit with which the Spanish monarchs guarded the exclusive trade, restrained them from applying it. At length Charles III. surmounted those considerations which had deterred his predecessors, and in the year 1764 appointed packet boats to be despatched on the first day of each month from Corugna to the Havana or Porto Rico. From thence letters are conveyed in smaller vessels to Vera Cruz and Porto Bello, and transmitted by post through the kingdoms of Tierra Firme, Granada, Peru, and New Spain. With no less regularity packet boats sail once in two months to Rio de la Plata, for the accommodation of the provinces to the east of the Andes. Thus provision is made for a speedy and certain circulation of intelligence throughout the vast dominions of Spain, from which equal advantages must redound to the political and mercantile interest of the kingdom. With this new arrangement a scheme of extending commerce has been more immediately connected. Each of the packet boats, which are vessels of some considerable burden, is allowed to take

in half a loading of such commodities as are the product of Spain, and most in demand in the ports whither they are bound. In return for these, they may bring home to Corugna an equal quantity of American productions. This may be considered as the first relaxation of those rigid laws, which confined the trade with the New World to a single port, and the first attempt to admit the rest of the kingdom to some share in it.

It was soon followed by one more decisive. In the year 1765, Charles III. laid open the trade to the windward Islands, Cuba, Hispaniola, Porto Rico, Margarita, and Trinidad, to his subjects in every province of Spain. He permitted them to sail from certain ports in each province, which are specified in the edict, at any season, and with whatever cargo they deemed most proper, without any other warrant than a simple clearance from the custom-house of the place whence they took their departure. He released them from the numerous and oppressive duties imposed on goods exported to America, and in place of the whole substituted a moderate tax of six in the hundred on the commodities sent from Spain. He allowed them to return either to the same port, or to any other where they might hope for a more advantageous market, and there to enter the homeward cargo on payment of the usual duties. This ample privilege, which at once broke through all the fences which the jealous policy of Spain had been laboring for two centuries and a half to throw round its commercial intercourse with the New World, was soon after extended to Louisiana, and to the provinces of Yucatan and Campeachy.

The propriety of this innovation, which may be considered as the most liberal effort of Spanish legislation, has appeared from its effects. Prior to the edict in favor of the free trade, Spain derived hardly any benefit from its neglected colonies in Hispaniola, Porto Rico, Margarita, and Trinidad. Its commerce with Cuba was inconsiderable, and that of Yucatan and Campeachy was engrossed almost entirely by interlopers. But as soon as a general liberty of trade was permitted, the intercourse with those provinces revived, and has gone on with a rapidity of progression of which there are few examples in the history of nations. In less than ten years, the trade of Cuba has been more than tripled. Even in those settlements where, from the languishing state of industry, greater efforts were requisite to restore its activity, their commerce has been doubled. It is computed that such a number of ships is already employed in the free trade, that the tonnage of them far exceeds that of the Galeons and Flota at the most flourishing era of their commerce. The benefits of this arrangement are not confined to a few merchants established in a favorite port. They are diffused through every province of the kingdom; and, by opening a new market for their various productions and manufactures, must encourage and add vivacity to the industry of the farmer and artificer. Nor does the kingdom profit only by what it exports; it derives advantage likewise from what it receives in return, and has the prospect of being soon able to supply itself with several commodities of extensive consumption, for which it formerly depended on foreigners. The consumption of sugar in Spain is perhaps as great, in proportion to the number of its inhabitants, as that of any European kingdom. But though possessed of countries in the New World whose soil and climate are most proper for rearing the sugar-cane; though the domestic culture of that valuable plant in the kingdom of Granada was once considerable; such has been the fatal tendency of ill judged institutions in America, and such the pressure of improper taxes in Europe, that Spain has lost almost entirely this branch of industry, which has enriched other nations. This commodity, which has now become an article of primary necessity in Europe, the Spaniards were obliged to purchase of foreigners, and had the mortification to see their country drained annually of great sums on that account. But, if that spirit which the permission of free trade has put in motion shall persevere in its efforts with the same vigor, the cultivation of sugar in Cuba and Porto Rico may increase so much, that in a few years it is probable that their growth of sugars may be equal to the demand of the kingdom.

Spain has been induced, by her experience of the beneficial consequences resulting from having relaxed somewhat of the rigor of her ancient laws, with respect to the commerce of the mother country with the colonies, to permit a more liberal intercourse of one colony with another. By one of the jealous maxims of the old system, all the provinces situated on the South seas were prohibited, under the most severe penalties, from holding any communication with one another. Though

each of these yields peculiar productions, the reciprocal exchange of which might have added to the happiness of their respective inhabitants, or have facilitated their progress in industry, so solicitous was the Council of the Indies to prevent their receiving any supply of their wants but by the periodical fleets from Europe, that, in order to guard against this, it cruelly debarr'd the Spaniards in Peru, in the southern provinces of New Spain, in Guatimala, and the new kingdom of Granada, from such a correspondence with their fellow subjects as tended manifestly to their mutual prosperity. Of all the numerous restrictions devised by Spain for securing the exclusive trade with her American settlements, none perhaps was more illiberal, none seems to have been more sensibly felt, or to have produced more hurtful effects. This grievance, coeval with the settlements of Spain in the countries situated on the Pacific Ocean, is at last redressed. In the year 1774, Charles III. published an edict, granting to the four great provinces which I have mentioned the privilege of a free trade with each other. [192] What may be the effects of opening this communication between countries destined by their situation for reciprocal intercourse, cannot yet be determined by experience. They can hardly fail of being beneficial and extensive. The motives for granting this permission are manifestly no less laudable than the principle on which it is founded is liberal; and both discover the progress of a spirit in Spain, far elevated above the narrow prejudices and maxims on which her system for regulating the trade and conducting the government of her colonies was originally founded.

At the same time that Spain has been intent on introducing regulations, suggested by more enlarged views of policy, into her system of American commerce, she has not been inattentive to the interior government of her colonies. Here, too, there was much room for reformation and improvement; and Don Joseph Galvez, who has now the direction of the department of Indian affairs in Spain, has enjoyed the best opportunities, not only of observing the defects and corruption in the political frame of the colonies, but of discovering the sources of those evils. After being employed seven years in the New World on an extraordinary mission, and with very extensive powers, as inspector-general of New Spain; after visiting in person the remote provinces of Chualoa, Sonora, and California, and making several important alterations in the state of the police and revenue; he began his ministry with a general reformation of the tribunals of justice in America. In consequence of the progress of population and wealth in the colonies, the business of the Courts of Audience has increased so much that the number of judges of which they were originally composed has been found inadequate to the growing labors and duties of the office, and the salaries settled upon them have been deemed inferior to the dignity of the station. As a remedy for both, he obtained a royal edict, establishing an additional number of judges in each Court of Audience, with higher titles, and more ample appointments.

To the same intelligent minister Spain is indebted for a new distribution of government in its American provinces. Even since the establishment of a third viceroyalty in the new kingdom of Granada, so great is the extent of the Spanish dominions in the New World, that several places subject to the jurisdiction of each viceroy were at such an enormous distance from the capitals in which they resided, that neither their attention nor authority could reach so far. Some provinces subordinate to the viceroy of New Spain lay above two thousand miles from Mexico. There were countries subject to the viceroy of Peru still further from Lima. The people in those remote districts could hardly be said to enjoy the benefit of civil government. The oppression and insolence of its inferior ministers they often feel, and rather submit to these in silence than involve themselves in the expense and trouble of resorting to the distant capital, where alone they can find redress. As a remedy for this, a fourth viceroyalty has been erected. [Aug. 1776] to the jurisdiction of which are subjected the provinces of Rio de la Plata, Buenos Ayres, Paraguay, Tucuman, Potosi, St. Cuz de la Sierra Charcas, and the towns of Mendoza and St. Juan. By this well judged arrangement two advantages are gained. All the inconveniences occasioned by the remote situation of those provinces, which had been long felt, and long complained of, are in a great measure removed. The countries most distant from Lima are separated from the viceroyalty of Peru, and united under a superior, whose seat of government at Buenos Ayres will be commodious and accessible.

The contraband trade with the Portuguese, which was become so extensive as must have put a final stop to the exportation of commodities from Spain to her southern colonies, may be checked more thoroughly, and with greater facility, when the supreme magistrate, by his vicinity to the places in which it was carried on, can view its progress and effects with his own eyes. Don Pedro Zavallos, who has been raised to this new dignity, with appointments equal to those of the other viceroys, is well acquainted both with the state and the interests of the countries over which he is to preside, having served in them long, and with distinction. By this dismemberment, succeeding that which took place at the creation of the viceroyalty of the new kingdom of Granada, almost two-thirds parts of the territories originally subject to the viceroys of Peru, are now lopped off from their jurisdiction.

The limits of the viceroyalty of New Spain have likewise been considerably circumscribed, and with no less propriety and discernment. Four of its most remote provinces, Sonora, Cinaloa, California, and New Navarre, have been formed into a separate government. The Chevalier de Croix, who is intrusted with this command, is not dignified with the title of viceroy, nor does he enjoy the appointments belonging to that rank; but his jurisdiction is altogether independent on the viceroyalty of New Spain. The erection of this last government seems to have been suggested not only by the consideration of the remote situation of those provinces from Mexico, but by attention to the late discoveries made there which I have mentioned. Countries containing the richest mines of gold that have hitherto been discovered in the New World, and which probably may rise into greater importance, required the immediate inspection of a governor to whom they should be specially committed. As every consideration of duty, of interest, and of vanity, must concur in prompting those new governors to encourage such exertions as tend to diffuse opulence and prosperity through the provinces committed to their charge, the beneficial effects of this arrangement may be considerable. Many districts in America, long depressed by the languor and feebleness natural to provinces which compose the extremities of an overgrown empire, may be animated with vigor and activity when brought so near the seat of power as to feel its invigorating influence.

Such, since the accession of the princes of the house of Bourbon to the throne of Spain, has been the progress of their regulations, and the gradual expansion of their views with respect to the commerce and government of their American colonies. Nor has their attention been so entirely engrossed by what related to the more remote parts of their dominions, as to render them neglectful of what was still more important, the reformation of domestic errors and defects in policy. Fully sensible of the causes to which the declension of Spain from her former prosperity ought to be imputed, they have made it a great object of their policy to revive a spirit of industry among their subjects, and to give such extent and perfection to their manufactures as may enable them to supply the demands of America from their own stock, and to exclude foreigners from a branch of commerce which has been so fatal to the kingdom. This they have endeavored to accomplish by a variety of edicts issued since the peace of Utrecht. They have granted bounties for the encouragement of some branches of industry; they have lowered the taxes on others; they have entirely prohibited, or have loaded with additional duties, such foreign manufactures as come in competition with their own; they have instituted societies for the improvement of trade and agriculture; they have planted colonies of husbandmen in some uncultivated districts of Spain, and divided among them the waste fields; they have had recourse to every expedient devised by commercial wisdom or commercial jealousy, for reviving their own industry, and discountenancing that of other nations. These, however, it is not my province to explain, or to inquire into their propriety and effects. There is no effort of legislation more arduous, no experiment in policy more uncertain than an attempt to revive the spirit of industry where it has declined, or to introduce it where it is unknown. Nations, already possessed of extensive commerce, enter into competition with such advantages, derived from the large capitals and extensive credit of their merchants, the dexterity of their manufacturers, and the alertness acquired by habit in every department of business, that the state which aims at rivalling or supplanting them, must expect to struggle with many difficulties, and be content to advance slowly. If the quantity of productive industry, now in Spain, be compared with that of the kingdom under the last listless

monarchs of the Austrian line, its progress must appear considerable, and is sufficient to alarm the jealousy, and to call forth the most vigorous efforts of the nations now in possession of the lucrative trade which the Spaniards aim at wresting from them. One circumstance may render those exertions of Spain an object of more serious attention to the other European powers. They are not to be ascribed wholly to the influence of the crown and its ministers. The sentiments and spirit of the people seem to second the provident care of their monarchs, and to give it greater effect. The nation has adopted more liberal ideas, not only with respect to commerce, but domestic policy. In all the later Spanish writers, defects in the arrangement of their country concerning both are acknowledged, and remedies proposed, which ignorance rendered their ancestors incapable of discerning, and pride would not have allowed them to confess. [193]. But after all that the Spaniards have done, much remains to do. Many pernicious institutions and abuses, deeply incorporated with the system of internal policy and taxation, which has been long established in Spain, must be abolished before industry and manufactures can recover an extensive activity.

Still, however, the commercial regulations of Spain with respect to her colonies are too rigid and systematical to be carried into complete execution. The legislature that loads trade with impositions too heavy, or fetters it by restrictions too severe, defeats its own intention, and is only multiplying the inducements to violate its statutes, and proposing a high premium to encourage illicit traffic. The Spaniards, both in Europe and America, being circumscribed in their mutual intercourse, by the jealousy of the crown, or oppressed by its exactions, have their invention continually on the stretch how to elude its edicts. The vigilance and ingenuity of private interest discover means of effecting this, which public wisdom cannot foresee nor public authority prevent. This spirit, counteracting that of the laws, pervades the commerce of Spain with America in all its branches; and from the highest departments in government descends to the lowest. The very officers appointed to check contraband trade are often employed as instruments in carrying it on; and the boards instituted to restrain and punish it are the channels through which it flows. The king is supposed, by the most intelligent Spanish writers, to be defrauded, by various artifices, of more than one half of the revenue which he ought to receive from America; and as long as it is the interest of so many persons to screen those artifices from detection, the knowledge of them will never reach the throne. "How many ordinances," says Corita, "how many instructions, how many letters from our sovereign, are sent in order to correct abuses! and how little are they observed, and what small advantage is derived from them! To me the old observation appears just, that where there are many physicians and many medicines, there is a want of health; where there are many laws and many judges, there is a want of justice." We have viceroys, presidents, governors, oydors, corregidores, alcaldes; and thousands of algnazils abound every where; but notwithstanding all these, public abuses continue to multiply. Time has increased the evils which he lamented as early as the reign of Philip II. A spirit of corruption has infected all the colonies of Spain in America. Men far removed from the seat of government; impatient to acquire wealth, that they may return speedily from what they are apt to consider as a state of exile in a remote unhealthy country; allured by opportunities too tempting to be resisted, and seduced by the example of those around them; find their sentiments of honor and of duty gradually relax. In private life they give themselves up to a dissolute luxury, while in their public conduct they become unmindful of what they owe to their sovereign and to their country.

Before I close this account of the Spanish trade in America there remains one detached but important branch of it to be mentioned. Soon after his accession to the throne, Philip II. formed a scheme of planting a colony in the Philippine islands which had been neglected since the time of their discovery; and he accomplished it by means of an armament fitted out from New Spain [1564]. Manila, in the island of Luconia, was the station chosen for the capital of this new establishment. From it an active commercial intercourse began with the Chinese, and a considerable number of that industrious people, allured by the prospect of gain, settled in the Philippine islands under the Spanish protection. They supplied the colony so amply with all the valuable productions and manufactures of the East as enabled it to open a trade with America, by a course of navigation the longest from land to land on our

globe. In the infancy of this trade, it was carried on with Callao, on the coast of Peru; but experience having discovered the impropriety of fixing upon that as the port of communication with Manila, the staple of the commerce between the East and West was removed from Callao to Acapulco, on the coast of New Spain.

After various arrangements it has been brought into a regular form. One or two ships depart annually from Acapulco, which are permitted to carry out silver to the amount of five hundred thousand pesos; but they have hardly any thing else of value on board; in return for which they bring back spices, drugs, china, and japan wares, calicoes, chintz, muslins, silks, and every precious article with which the benignity of the climate, or the ingenuity of its people has enabled the East to supply the rest of the world. For some time the merchants of Peru were admitted to participate in this traffic, and might send annually a ship to Acapulco, to wait the arrival of the vessels from Manila, and receive a proportional share of the commodities which they imported. At length the Peruvians were excluded from this trade by most rigorous edicts, and all the commodities from the East reserved solely for the consumption of New Spain.

In consequence of this indulgence, the inhabitants of that country enjoy advantages unknown in the other Spanish colonies. The manufactures of the East are not only more suited to a warm climate, and more showy than those of Europe, but can be sold at a lower price; while, at the same time, the profits upon them are so considerable as to enrich all those who are employed either in bringing them from Manila or vending them in New Spain. As the interest both of the buyer and seller concurred in favoring this branch of commerce, it has continued to extend in spite of regulations concerted with the most anxious jealousy to circumscribe it. Under cover of what the laws permit to be imported, great quantities of India goods are poured into the markets of New Spain; [194] and when the Flota arrives at Vera Cruz, from Europe, it often finds the wants of the people already supplied by cheaper and more acceptable commodities.

There is not, in the commercial arrangements of Spain, any circumstance more inexplicable than the permission of this trade between New Spain and the Philippines, or more repugnant to its fundamental maxim of holding the colonies in perpetual dependence on the mother country, by prohibiting any commercial intercourse that might suggest to them the idea of receiving a supply of their wants from any other quarter. This permission must appear still more extraordinary, from considering that Spain herself carries on no direct trade with her settlements in the Philippines, and grants a privilege to one of her American colonies which she denies to her subjects in Europe. It is probable that the colonists, who originally took possession of the Philippines, having been sent out from New Spain, began this intercourse with a country which they considered, in some measure, as the parent state, before the court of Madrid was aware of its consequences, or could establish regulations in order to prevent it. Many remonstrances have been presented against this trade, as detrimental to Spain, by diverting into another channel a large portion of that treasure which ought to flow into the kingdom, as tending to give rise to a spirit of independence in the colonies, and to encourage innumerable frauds, against which it is impossible to guard, in transactions so far removed from the inspection of government. But as it requires no slight effort of political wisdom and vigor to abolish any practice which numbers are interested in supporting, and to which time has added the sanction of its authority, the commerce between New Spain and Manila seems to be as considerable as ever, and may be considered as one chief cause of the elegance and splendor conspicuous in this part of the Spanish dominions.

But notwithstanding this general corruption in the colonies of Spain, and the diminution of the income belonging to the public, occasioned by the illicit importations made by foreigners, as well as by the various frauds of which the colonists themselves are guilty in their commerce with the parent state, the Spanish monarchs receive a very considerable revenue from their American dominions. This arises from taxes of various kinds, which may be divided, into three capital branches. The first contains what is paid to the king, as sovereign, or superior lord of the New World; to this class belongs the duty on the gold and silver raised from the mines, and the tribute exacted from the Indians; the former is termed by the Spaniards the *right of signory*, the latter is the *duty of vassalage*. The second branch comprehends the numerous duties upon commerce

which accompany and oppress it in every step of its progress, from the greatest transactions of the wholesale merchant to the petty traffic of the vender by retail. The third includes what accrues to the king, as had of the church, and administrator of ecclesiastical funds in the New World. In consequence of this he receives the first fruits, annates, spoils, and other spiritual revenues, levied by the apostolic chamber in Europe; and is entitled likewise to the profit arising from the sale of the bull of Cruzado. This bull, which is published every two years, contains an absolution from past offences by the Pope, and, among other immunities, a permission to eat several kinds of prohibited food during Lent, and on meagre days. The monks employed in dispersing those bulls extol their virtues with all the fervor of interested eloquence; the people, ignorant and credulous, listen with implicit assent; and every person in the Spanish colonies, of European, or Creolian, or mixed race, purchases a bull, which is deemed essential to his salvation, at the rate set upon it by government. [195]

What may be the amount of those various funds, it is almost impossible to determine with precision. The extent of the Spanish dominions in America, the jealousy of government, which renders them inaccessible to foreigners, the mysterious silence which the Spaniards are accustomed to observe with respect to the interior state of their colonies, combine in covering this subject with a veil which it is not easy to remove. But an account, apparently no less accurate than it is curious, has lately been published of the royal revenue in New Spain, from which we may form some idea with respect to what is collected in the other provinces. According to that account the crown does not receive from all the departments of taxation in New Spain above a million of our money, from which one half must be deducted as the expense of the provincial establishment. [196] Peru, it is probable, yields a sum not inferior to this; and if we suppose that all the other regions of America, including the islands, furnish a third share of equal value, we shall not perhaps be far wide from the truth if we conclude that the net public revenue of Spain, raised in America, does not exceed a million and a half sterling. This falls far short of the immense sums to which suppositions, founded upon conjecture, have raised the Spanish revenue in America. [197] It is remarkable, however, upon one account. Spain and Portugal are the only European powers who derive a direct revenue from their colonies. All the advantage that accrues to other nations from their American dominions arises from the exclusive enjoyment of their trade; but besides this, Spain has brought her colonies towards increasing the power of the state, and, in return for protection, to bear a proportional share of the common burden.

Accordingly, the sum which I have computed to be the amount of the Spanish revenue from America arises wholly from the taxes collected there, and is far from being the whole of what accrues to the king from his dominions in the New World. The heavy duties imposed on the commodities exported from Spain to America [198], as well as what is paid by those which she sends home in return; the tax upon the Negro slaves with which Africa supplies the New World, together with several smaller branches of finance, bring large sums into the treasury, the precise extent of which I cannot pretend to ascertain.

But if the revenue which Spain draws from America be great, the expense of administration in her colonies bears proportion to it. In every department, even of her domestic police and finances, Spain has adopted a system more complex, and more encumbered with a variety of tribunals and a multitude of officers, than that of any European nation in which the sovereign possesses such extensive power. From the jealous spirit with which Spain watches over her American settlements, and her endeavors to guard against fraud in provinces so remote from inspection, boards and officers have been multiplied there with still more anxious attention. In a country where the expense of living is great, the salaries allotted to every person in public office must be high, and must load the revenue with an immense burden. The parade of government greatly augments the weight of it. The viceroys of Mexico, Peru, and the new kingdom of Granada, as representatives of the king's person, among people fond of ostentation, maintain all the state and dignity of royalty. Their courts are formed upon the model of that at Madrid, with horse and foot guards, a household regularly established, numerous attendants, and ensigns of power, displaying such pomp as hardly retains the appearance of a delegated authority. All the expense incurred by

supporting the external and permanent order of government is defrayed by the crown. The viceroys have, besides, peculiar appointments suited to their exalted station. The salaries fixed by law are indeed extremely moderate; that of the viceroy of Peru is only thirty thousand ducats; and that of the viceroy of Mexico twenty thousand ducats. Of late they have been raised to forty thousand.

These salaries, however, constitute but a small part of the revenue enjoyed by the viceroys. The exercise of an absolute authority extending to every department of government, and the power of disposing of many lucrative offices, afford them many opportunities of accumulating wealth. To these, which may be considered as legal and allowed emoluments, large sums are often added by exactions, which, in countries so far removed from the seat of government, it is not easy to discover, and impossible to restrain. By monopolising some branches of commerce, by a lucrative concern in others, by conniving at the frauds of merchants, a viceroy may raise such an annual revenue as no subject of any European monarch enjoys. [199] From the single article of presents made to him on the anniversary of his *Nome-day* (which is always observed as a high festival), I am informed that a viceroy has been known to receive sixty thousand pesos. According to a Spanish saying, the legal revenues of a viceroy are unknown, his real profits depend upon his opportunities and his conscience. Sensible of this, the kings of Spain, as I have formerly observed, grant a commission to their viceroys only for a few years. This circumstance, however, renders them often more rapacious, and adds to the ingenuity and ardor wherewith they labor to improve every moment of a power which they know is hastening fast to a period; and short as its duration is, it usually affords sufficient time for repairing a shattered fortune, or for creating a new one. But even in situations so trying to human frailty, there are instances of virtue that remains unshaken. In the year 1772, the Marquis de Croix finished the term of his viceroyalty in New Spain with unsuspected integrity; and, instead of bringing home exorbitant wealth, returned with the admiration and applause of a grateful people, whom his government had rendered happy.

NOTES AND ILLUSTRATIONS.

NOTE [1]. PAGE 70.—Tyre was situated at such a distance from the Arabian Gulf, or Red Sea, as made it impracticable to convey commodities from thence to that city by land carriage. This induced the Phœnicians to render themselves masters of *Rainocœura* or *Rhinocœura*, the nearest port in the Mediterranean to the Red Sea. They landed the cargoes which they purchased in Arabia, Ethiopia, and India, at Elath, the safest harbor in the Red Sea towards the North. Thence they were carried by land to Rhinocœura, the distance not being very considerable; and, being re-shipped in that port were transported to Tyre, and distributed over the world. Strabon. Geogr. edit. Casaub. lib. xvi. p. 1128. Diodor. Sicul. Biblioth. Histor. edit. Wesselingii, lib. i. p. 70.

NOTE [2]. p. 70.—The *Periplus Hannonis* is the only authentic monument of the Carthaginian skill in naval affairs, and one of the most curious fragments transmitted to us by antiquity. The learned and industrious Mr. Dodwell, in a dissertation prefixed to the *Periplus of Hanno*, in the edition of the *Minor Geographers* published at Oxford, endeavors to prove that this is a spurious work, the composition of some Greek, who assumed Hanno's name. But M. de Montesquieu, in his *l'Esprit des Loix*, lib. xxi. c. 8. and M. de Bougainville, in a dissertation published tom. xxvi. of the *Memoires de l'Academie des Inscriptions*, &c. have established its authenticity by arguments which to me appear unanswerable. Ramusio has accompanied his translation of this curious voyage with a dissertation tending to illustrate it. *Raccolte de Viaggi*, vol. i. p. 112. M. de Bougainville has, with great learning and ability, treated the same subject. It appears that Hanno, according to the mode of ancient navigation, undertook this voyage in small vessels so constructed that he could keep close in with the coast. He sailed from Gades to the island of Cerne in twelve days. This is probably what is known to the moderns by the name of the Isle of Arguim. It became the chief station of the Carthaginians on that coast; and M. de Bougainville contends, that the eisteros found there are monuments of the Carthaginian power and ingenuity. Proceeding from Cerne, and still following the winding of the coast, he arrived in seventeen days, at a promontory which he called *The West Horn*, probably Cape Pali-

neas. From this he advanced to another promontory, which he named *The South Horn*, and which is manifestly Cape de Tres Puntas, about five degrees north of the line. All the circumstances contained in the short abstract of his journal, which is handed down to us, concerning the appearance and state of the countries on the coast of Africa, are confirmed and illustrated by a comparison with the accounts of modern navigators. Even those circumstances which, from their seeming improbability, have been produced to invalidate the credibility of his relation, tend to confirm it. He observes, that in the country to the south of Cerne, a profound silence reigned through the day; but during the night innumerable fires were kindled along the banks of the rivers, and the air resounded with the noise of pipes and drums and cries of joy. The same thing, as Ramusio observes, still takes place. The excessive heat obliges the Negroes to take shelter in the woods, or in their houses, during the day. As soon as the sun sets, they sally out, and by torchlight enjoy the pleasure of music and dancing, in which they spend the night. Ramus. i. 113. F. In another place, he mentions the sea as burning with torrents of fire. What occurred to M. Adanson, on the same coast, may explain this: "As soon," says he, "as the sun dipped beneath the horizon, and night overspread the earth with darkness, the sea lent us its friendly light. While the prow of our vessel ploughed the foaming surges, it seemed to set them all on fire. Thus we sailed in a luminous inclosure, which surrounded us like a large circle of rays, from whence darted in the wake of the ship a long stream of a light." Voy. to Senegal, p. 176. This appearance of the sea, observed by Hunter, has been mentioned as an argument against the authenticity of the *Periplus*. It is, however, a phenomenon very common in warm climates. Captain Cook's second voyage, vol. i. p. 15. The *Periplus of Hanno* has been translated, and every point with respect to it has been illustrated with much learning and ingenuity, in a work published by Don Pedr. Rodrigo Campomanes, entitled, *Antiguedad maritima de Cartago, con el Periplus de su General Hannon traducido e ilustrado*. Mad. 1756, 4to.

NOTE [3]. p. 70.—Long after the navigation of the Phœnicians and of Eudoxus round Africa, Polybius, the most intelligent and best informed historian of antiquity, and particularly distinguished by his attention to geographical researches, affirms, that it was not known, in his time, whether Africa was a continued continent stretching to the south, or whether it was encompassed by the sea. Polybii Hist. lib. iii. Pliny the naturalist asserts, that there can be no communication between the southern and northern temperate zones. Plinii Hist. Natur. edit. in usum. Delph. 4to. lib. ii. c. 68. If they had given full credit to the accounts of those voyages, the former could not have entertained such a doubt, the latter could not have delivered such an opinion. Strabo mentions the voyage of Eudoxus, but treats it as a fabulous tale, lib. ii. p. 155; and, according to his account of it, no other judgment can be formed with respect to it. Strabo seems not to have known any thing with certainty concerning the form and state of the southern parts of Africa. Geogr. lib. xvii. p. 1180. Ptolemy, the most inquisitive and learned of all the ancient geographers, was equally unacquainted with any parts of Africa situated a few degrees beyond the equinoctial line; for he supposes that this great continent was not surrounded by the sea, but that it stretched, without interruption, towards the south pole; and he so far mistakes its true figure that he describes the continent as becoming broader and broader as it advanced towards the south. Ptolemai Geogr. lib. iv. c. 9. Briedii *Parallela Geogr. veteris et novæ*, p. 86.

NOTE [4]. p. 71.—A fact recorded by Strabo affords a very strong and singular proof of the ignorance of the ancients with respect to the situation of the various parts of the earth. When Alexander marched along the banks of the Hydaspes and Acesine, two of the rivers which fall into the Indus, he observed that there were many crocodiles in those rivers, and that the country produced beans of the same species with those which were common in Egypt. From these circumstances he concluded that he had discovered the source of the Nile, and prepared a fleet to sail down the Hydaspes to Egypt. Strab. Geogr. lib. xv. p. 1020. This amazing error did not arise from any ignorance of geography peculiar to that monarch; for we are informed by Strabo, that Alexander applied with particular attention in order to acquire the knowledge of this science, and had accurate maps or descriptions of the

countries through which he marched. Lib. ii. p. 120. But in his age the knowledge of the Greeks did not extend beyond the limits of the Mediterranean.

NOTE [5]. p. 71.—As the flux and reflux of the sea is remarkably great at the mouth of the river Indus, this would render the phenomenon more formidable to the Greeks. Varen Geogr. vol. i. p. 251.

NOTE [6]. p. 71.—It is probable that the ancients were seldom induced to advance so far as the mouth of the Ganges, either by motives of curiosity or views of commercial advantage. In consequence of this, their idea concerning the position of that great river was very erroneous. Ptolemy places that branch of the Ganges, which he distinguishes by the name of the Great Mouth, in the hundred and forty-sixth degree of longitude from his first meridian in the Fortunate Islands. But its true longitude, computed from that meridian, is now determined, by astronomical observations, to be only a hundred and five degrees. A geographer so eminent must have been betrayed into an error of this magnitude by the imperfection of the information which he had received concerning those distant regions; and this affords a striking proof of the intercourse with them being extremely rare. With respect to the countries of India beyond the Ganges, his intelligence was still more defective, and his errors more enormous. I shall have occasion to observe, in another place, that he has placed the country of the Seres, or China, no less than sixty degrees further east than its true position. M. d'Anville, one of the most learned and intelligent of the modern geographers, has set this matter in a clear light, in two dissertations published in *Mém. de l'Académie des Inscriptions*, &c. tom. xxxii. p. 573. 604.

NOTE [7]. p. 71.—It is remarkable, that the discoveries of the ancients were made chiefly by land; those of the moderns are carried on chiefly by sea. The progress of conquest led to the former, that of commerce to the latter. It is a judicious observation of Strabo, that the conquests of Alexander the Great made known the East, those of the Romans opened the West, and those of Mithridates King of Pontus the North. Lib. i. p. 26. When discovery is carried on by land alone, its progress must be slow and its operations confined. When it is carried on only by sea, its sphere may be more extensive, and its advances more rapid; but it labors under peculiar defects. Though it may make known the position of different countries, and ascertain their boundaries as far as these are determined by the ocean, it leaves us in ignorance with respect to their interior state. Above two centuries and a half have elapsed since the Europeans sailed round the southern promontory of Africa, and have traded in most of its ports; but, in a considerable part of that great continent, they have done little more than survey its coasts, and mark its capes and harbors. Its interior regions are in a great measure unknown. The ancients, who had a very imperfect knowledge of its coasts, except where they were washed by the Mediterranean or Red Sea, were accustomed to penetrate into its inland provinces, and, if we may rely on the testimony of Herodotus and Diodorus Siculus, had explored many parts of it now altogether unknown. Unless both modes of discovery be united, the geographical knowledge of the earth must remain incomplete and inaccurate.

NOTE [8]. p. 72.—The notions of the ancients concerning such an excessive degree of heat in the torrid zone as rendered it uninhabitable, and their persisting in this error long after they began to have some commercial intercourse with several parts of India lying within the tropics, must appear so singular and absurd, that it may not be unacceptable to some of my readers to produce evidence of their holding this opinion, and to account for the apparent inconsistency of their theory with their experience. Cicero, who had bestowed attention upon every part of philosophy known to the ancients, seems to have believed that the torrid zone was uninhabitable, and, of consequence, that there could be no intercourse between the northern and southern temperate zones. He introduces Africanus thus addressing the younger Scipio: "You see this earth encompassed, and as it were bound in by certain zones, of which two, at the greatest distance from each other, and sustaining the opposite poles of heaven, are frozen with perpetual cold; the middle one, and the largest of all, is burnt with the heat of the sun; two are habitable; the people in the southern one are antipodes to us, with whom we have no connection."

Somnium Scipionis, c. 6. Geminus, a Greek philosopher, contemporary with Cicero, delivers the same doctrine, not in a popular work, but in his *Εισαγωγή εις Φαινομενα*, a treatise purely scientific. "When we speak," says he, "of the southern temperate zone and its inhabitants, and concerning those who are called antipodes, it must be always understood, that we have no certain knowledge or information concerning the southern temperate zone, whether it be inhabited or not. But from the spherical figure of the earth, and the course which the sun holds between the tropics, we conclude that there is another zone situated to the south, which enjoys the same degree of temperature with the northern one which we inhabit." Cap. xiii. p. 31. ap. Petavii *Opus de Doctr. Temporis*. in quo Uranologium sive Systemata var. Auctorum. Amst. 1705. vol. 3. The opinion of Pliny the naturalist, with respect to both these points, was the same: "There are five divisions of the earth, which are called zones. All that portion which lies near to the two opposite poles is oppressed with vehement cold and eternal frost. There, unblest with the aspect of milder stars, perpetual darkness reigns, or at the utmost, a feeble light reflected from surrounding snows. The middle of the earth, in which is the orbit of the sun, is scorched and burnt up with flames and fiery vapor. Between these torrid and frozen districts lie two other portions of the earth, which are temperate; but, on account of the burning region interposed, there can be no communication between them. Thus Heaven has deprived us of three parts of the earth." Lib. ii. c. 68. Strabo delivers his opinion to the same effect, in terms no less explicit: "The portion of the earth which lies near the equator, in the torrid zone, is rendered uninhabitable by heat." Lib. ii. p. 154. To these I might add the authority of many other respectable philosophers and historians of antiquity.

In order to explain the sense in which this doctrine was generally received, we may observe, that Parmenides, as we are informed by Strabo, was the first who divided the earth into five zones, and extended the limits of the zone which he supposed to be uninhabitable on account of heat beyond the tropics. Aristotle, as we learn likewise from Strabo, fixed the boundaries of the different zones in the same manner as they are defined by modern geographers. But the progress of discovery having gradually demonstrated that several regions of the earth which lay within the tropics were not only habitable, but populous and fertile, this induced later geographers to circumscribe the limits of the torrid zone. It is not easy to ascertain with precision the boundaries which they allotted it. From a passage in Strabo, who, as far as I know, is the only author of antiquity from whom we receive any hint concerning this subject, I should conjecture, that those who calculated according to the measurement of the earth by Eratosthenes, supposed the torrid zone to comprehend near sixteen degrees, about eight on each side of the equator; whereas such as followed the computation of Posidonius allotted about twenty-four degrees, or somewhat more than twelve degrees on each side of the equator to the torrid zone. Strabo, lib. ii. p. 151. According to the former opinion, about two-thirds of that portion of the earth which lies between the tropics was considered as habitable; according to the latter, about one-half of it. With this restriction, the doctrine of the ancients concerning the torrid zone appears less absurd; and we can conceive the reason of their asserting this zone to be uninhabitable, even after they had opened a communication with several places within the tropics. When men of science spoke of the torrid zone, they considered it as it was limited by the definition of geographers to sixteen, or at the utmost to twenty-four degrees; and as they knew almost nothing of the countries nearer to the equator they might still suppose them to be uninhabitable. In loose and popular discourse, the name of the torrid zone continued to be given to all that portion of the earth which lies within the tropics. Cicero seems to have been unacquainted with those ideas of the later geographers; and, adhering to the division of Parmenides, describes the torrid zone as the largest of the five. Some of the ancients rejected the notion concerning the intolerable heat of the torrid zone as a popular error. This we are told by Plutarch was the sentiment of Pythagoras; and we learn from Strabo, that Eratosthenes and Polybius had adopted the same opinion, lib. ii. p. 154. Ptolemy seems to have paid no regard to the ancient doctrine and opinions concerning the torrid zone.

NOTE [9]. p. 74.—The court of Inquisition, which effectually checks a spirit of liberal inquiry, and of literary improvement, wherever it is established, was un-

known in Portugal in the fifteenth century, when the people of that country began their voyages of discovery. More than a century elapsed before it was introduced by John III., whose reign commenced A. D. 1521.

NOTE [10]. p. 75.—An instance of this is related by Hakluyt, upon the authority of the Portuguese historian Garcia de Resende. Some English merchants having resolved to open a trade with the coast of Guinea, John II. of Portugal despatched ambassadors to Edward IV., in order to lay before him the right which he had acquired by the Pope's bull to the dominion of that country, and to request of him to prohibit his subjects to prosecute their intended voyage. Edward was so much satisfied with the exclusive title of the Portuguese, that he issued his orders in the terms which they desired. Hakluyt, *Navigations, Voyages, and Traffics of the English*, vol. ii. part. ii. p. 2.

NOTE [11]. p. 76.—The time of Columbus's death may be nearly ascertained by the following circumstances. It appears from the fragment of a letter addressed by him to Ferdinand and Isabella, A. D. 1501, that he had at that time been engaged forty years in a seafaring life. In another letter he informs them that he went to sea at the age of fourteen: from those facts it follows, that he was born A. D. 1447. Life of Christa. Columbus, by his son Don Ferdinand. Churchill's Collection of Voyages, vol. ii. p. 484, 485.

NOTE [12]. p. 77.—The spherical figure of the earth was known to the ancient geographers. They invented the method, still in use, of computing the longitude and latitude of different places. According to their doctrine, the equator, or imaginary line which encompasses the earth, contained three hundred and sixty degrees; these they divided into twenty-four parts, or hours, each equal to fifteen degrees. The country of the Seres or Sina, being the furthest part of India known to the ancients, was supposed by Marinus Tyrius, the most eminent of the ancient geographers before Ptolemy, to be fifteen hours, or two hundred and twenty-five degrees to the east of the first meridian, passing through the Fortunate Islands. Ptolemai Geogr. lib. i. c. 11. If this supposition was well founded, the country of the Seres, or China, was only nine hours, or one hundred and thirty-five degrees west from the Fortunate or Canary Island; and the navigation in that direction was much shorter than by the course which the Portuguese were pursuing. Marco Polo, in his travels, had described countries, particularly the island of Cipango or Zipangri, supposed to be Japan, considerably to the east of any part of Asia known to the ancients. Marcus Paulus de Region. Oriental. lib. ii. c. 70. lib. iii. c. 2. Of course, this country, as it extended further to the east, was still nearer to the Canary Islands. The conclusions of Columbus, though drawn from inaccurate observations, were just. If the suppositions of Marinus had been well founded, and if the countries which Marco Polo visited, had been situated to the east of those whose longitude Marinus had ascertained, the proper and nearest course to the East Indies must have been to steer directly west. Herrera, dec. i. lib. i. c. 2. A more extensive knowledge of the globe has now discovered the great error of Marinus, in supposing China to be fifteen hours, or two hundred and twenty-five degrees east from the Canary Islands; and that even Ptolemy was mistaken, when he reduced the longitude of China to twelve hours, or one hundred and eighty degrees. The longitude of the western frontier of that vast empire is seven hours, or one hundred and fifteen degrees from the meridian of the Canary Islands. But Columbus followed the light which his age afforded, and relied upon the authority of writers, who were at that time regarded as the instructors and guides of mankind in the science of geography.

NOTE [13]. p. 79.—As the Portuguese, in making their discoveries, did not depart far from the coast of Africa, they concluded that birds, whose flight they observed with great attention, did not venture to any considerable distance from land. In the infancy of navigation it was not known that birds often stretched their flight to an immense distance from any shore. In sailing towards the West Indian Islands, birds are often seen at the distance of two hundred leagues from the nearest coast. Sloane's Nat. Hist. of Jamaica, vol. i. p. 30. Catesby saw an owl at sea when the ship was six hundred leagues distant from land. Nat. Hist. of Carolina, pref. p. 7. Hist. Naturelle de M. Buffon, tom. xvi. p. 32. From which it appears that this indi-

cation of land, on which Columbus seems to have relied with some confidence, was extremely uncertain. This observation is confirmed by Capt. Cook, the most extensive and experienced navigator of any age or nation. "No one yet knows (says he) to what distance any of the oceanic birds go to sea; for my own part, I do not believe that there is one in the whole tribe that can be relied on in pointing out the vicinity of land." *Voyage towards the South Pole*, vol. i. p. 275.

NOTE [14]. p. 81.—In a letter of the Admirals to Ferdinand and Isabella, he describes one of the harbors in Cuba with all the enthusiastic admiration of a discoverer. "I discovered a river which a galley might easily enter: the beauty of it induced me to sound, and I found from five to eight fathoms of water. Having proceeded a considerable way up the river, every thing invited me to settle there. The beauty of the river, the clearness of the water through which I could see the sandy bottom, the multitude of palm trees of different kinds, the tallest and finest I had seen, and an infinite number of other large and flourishing trees, the birds, and the verdure of the plains are so wonderfully beautiful, that this country excels all others as far as the day surpasses the night in brightness and splendor, so that I often said that it would be in vain for me to attempt to give your Highness a full account of it, for neither my tongue nor my pen could come up to the truth; and indeed I am so much amazed at the sight of such beauty, that I know not how to describe it." *Life of Columbus*, c. 30.

NOTE [15]. p. 81.—The account which Columbus gives of the humanity and orderly behavior of the natives on this occasion is very striking. "the king (says he in a letter to Ferdinand and Isabella) having been informed of our misfortune, expressed great grief for our loss, and immediately sent aboard all the people in the place in many large canoes; we soon unloaded the ship of every thing that was upon deck, as the king gave us great assistance: he himself, with his brothers and relations, took all possible care that every thing should be properly done, both aboard and on shore. And, from time to time, he sent some of his relations weeping, to beg of me not to be dejected, for he would give me all that he had. I can assure your Highnesses, that so much care could not have been taken in securing our effects in any part of Spain, as all our property was put together in one place near his palace, until the houses which he wanted to prepare for the custody of it were emptied. He immediately placed a guard of armed men, who watched during the whole night, and those on shore lamented as if they had been much interested in our loss. The people are so affectionate, so tractable, and so peaceable, that I swear to your Highnesses, that there is not a better race of men, nor a better country in the world. They love their neighbor as themselves; their conversation is the sweetest and mildest in the world, cheerful and always accompanied with a smile. And although it is true that they go naked, yet your Highnesses may be assured that they have many very commendable customs; the king is served with great state, and his behavior is so decent that it is pleasant to see him, as it is likewise to observe the wonderful memory which these people have, and their desire of knowing every thing, which leads them to inquire into its cause and effects." *Life of Columbus*, c. 32. It is probable that the Spaniards were indebted for this officious attention to the opinion which the Indians entertained of them as a superior order of beings.

NOTE [16]. p. 82.—Every monument of such a man as Columbus is valuable. A letter which he wrote to Ferdinand and Isabella, describing what passed on this occasion, exhibits a most striking picture of his intrepidity, his humanity, his prudence, his public spirit, and courtly address. "I would have been less concerned for this misfortune had I alone been in danger, both because my life is a debt that I owe to the Supreme Creator, and because I have at other times been exposed to the most imminent hazard. But what gave me infinite grief and vexation was, that after it had pleased our Lord to give me faith to undertake this enterprise, in which I had now been so successful, that my opponents would have been convinced, and the glory of your Highnesses, and the extent of your territory, increased by me; it should please the Divine Majesty to stop all by my death. All this would have been more tolerable had it not been attended with the loss of those men whom I had carried with me, upon promise of the greatest prosperity, who, seeing them-

selves in such distress, cursed not only their coming along with me, but that fear and awe of me which prevented them from returning, as they often had resolved to have done. But besides all this, my sorrow was greatly increased by recollecting that I had left my two sons at school at Cordova, destitute of friends, in a foreign country, when it could not in all probability be known that I had done such services as might induce your Highnesses to remember them. And though I comforted myself with the faith that our Lord would not permit that which tended so much to the glory of his Church, and which I had brought about with so much trouble, to remain imperfect, yet I considered, that, on account of my sins, it was his will to deprive me of that glory which I might have attained in this world. While in this confused state, I thought on the good fortune which accompanies your Highnesses, and imagined that although I should perish, and the vessel be lost, it was possible that you might somehow come to the knowledge of my voyage, and the success with which it was attended. For that reason I wrote upon parchment with the brevity which the situation required, that I had discovered the lands which I promised, in how many days I had done it, and what course I had followed. I mentioned the goodness of the country, the character of the inhabitants, and that your Highnesses' subjects were left in possession of all that I had discovered. Having sealed this writing, I addressed it to your Highnesses, and promised a thousand ducats to any person who should deliver it sealed, so that if any foreigner found it, the promised reward might prevail on them not to give the information to another. I then caused a great cask to be brought to me, and wrapping up the parchment in an oiled cloth, and afterwards in a cake of wax, I put it into the cask, and having stopped it well, I cast it into the sea. All the men believed that it was some set of devotion. Imagining that this might never chance to be taken up, as the ships approached nearer to Spain, I made another packet like the first, and placed it at the top of the poop, so that, if the ship sunk, the cask remaining above water might be committed to the guidance of fortune."

NOTE [17]. p. 82.—Some Spanish authors, with the meanness of national jealousy, have endeavored to detract from the glory of Columbus, by insinuating that he was led to the discovery of the New World, not by his own inventive or enterprising genius, but by information which he had received. According to their account a vessel having been driven from its course by easterly winds, was carried before them far to the west, and landed on the coast of an unknown country, from which it returned with difficulty; the pilot and three sailors being the only persons who survived the distresses which the crew suffered from want of provisions and fatigue in this long voyage. In a few days after their arrival, all the four died; but the pilot having been received into the house of Columbus, his intimate friend disclosed to him before his death, the secret of the discovery which he had accidentally made, and left him his papers containing a journal of the voyage, which served as a guide to Columbus in his undertaking. Gomara, as far as I know, is the first author who published this story. Hist. c. 13. Every circumstance is destitute of evidence to support it. Neither the name of the vessel nor its destination is known. Some pretend that it belonged to one of the seaport towns in Andalusia, and was sailing either to the Canaries or to Madeira; others, that it was a Biscayan in its way to England; others, a Portuguese ship trading on the coast of Guinea. The name of the pilot is alike unknown, as well as that of the port in which he landed on his return. According to some, it was in Portugal; according to others, in Madeira, or the Azores. The year in which this voyage was made is no less uncertain. Monson's Nav. Tracts. Churchill iii. 371. No mention is made of this pilot, or his discoveries, by And. Bernaldes, or Pet. Martyr, the contemporaries of Columbus. Herrera, with his usual judgment, passes over it in silence. Oviedo takes notice of this report, but considers it as a tale fit only to amuse the vulgar. Hist. lib. ii. c. 2. As Columbus held his course directly west from the Canaries, and never varied it, some later authors have supposed that this uniformity is a proof of his being guided by some previous information. But they do not recollect the principles on which he founded all his hopes of success, that by holding a westerly course he must certainly arrive at those regions of the east described by the ancients. His firm belief of his own system led him to take that course, and to pursue it without deviation.

The Spaniards are not the only people who have called in question Columbus's claim to the honor of having discovered America. Some German authors ascribed this honor to Martin Behaim their countryman. He was of the noble family of the Behaims of Schwarzbach, citizens of the first rank in the Imperial town of Nuremberg. Having studied under the celebrated John Muller, better known by the name of Regiomontanus, he acquired such knowledge of cosmography as excited a desire of exploring those regions, the situation and qualities of which he had been accustomed, under that able master, to investigate and describe. Under the patronage of the Duchess of Burgundy he repaired to Lisbon, whither the fame of the Portuguese discoveries invited all the adventurous spirits of the age. There, as we learn from Herman Schedel, of whose *Chronicon Mundi*, a German translation was printed at Norimberg, A. D. 1493, his merit as a cosmographer raised him, in conjunction with Diego Cano, to the command of a squadron fitted out for discovery in the year 1483. In that voyage he is said to have discovered the kingdom of Congo. He settled in the kingdom of Fayal, one of the Azores, and was a particular friend of Columbus. Herrera, dec. 1. lib. i. c. 2. Magellan had a terrestrial globe made by Behaim, on which he demonstrated the course that he proposed to hold in search of the communication with the South Sea, which he afterwards discovered. Gomara Hist. c. 19. Herrera, dec. 11. lib. ii. c. 19. In the year 1492, Behaim visited his relations in Nuremberg, and left with them a map drawn with his own hand, which is still preserved among the archives of the family. Thus far the story of Martin Behaim seems to be well authenticated; but the account of his having discovered any part of the New World appears to be merely conjectural.

In the first edition, as I had at that time hardly any knowledge of Behaim but what I derived from a frivolous dissertation 'De vero Novi Orbis Inventore,' published at Frankfurt, A. D. 1714, by Jo. Frid. Stuevinius, I was induced, by the authority of Herrera, to suppose that Behaim was not a native of Germany; but from more full and accurate information, communicated to me by the learned Dr. John Reinhold Forster, I am now satisfied that I was mistaken. Dr. Forster has been likewise so good as to favor me with a copy of Behaim's map, as published by Doppelmayr in his account of the Mathematicians and Artists of Nuremberg. From this map the imperfection of cosmographical knowledge at that period is manifest. Hardly one place is laid down in its true situation. Nor can I discover from any reason to suppose that Behaim had the least knowledge of any region in America. He delineates, indeed, a "Island to which he gives the name of St. Brandon. This, it is imagined, may be some part of Guiana, supposed at first to be an island. He places it in the same latitude with the Cape Verde Isles, and I suspect it to be an imaginary island which has been admitted into some ancient maps on no better authority than the legend of the Irish St. Brandon, or Brendan, whose story is so childishly fabulous as to be unworthy of any notice. Girald. Cambrensis ap. Misingham Florilegium Sanctornum, p. 427.

The pretensions of the Welsh to the discovery of America seem not to rest on a foundation much more solid. In the twelfth century, according to Powell, a dispute having arisen among the sons of Owen Guyneth, King of North Wales, concerning the succession to his crown, Madoc, one of their number, weary of this contention, betook himself to sea in quest of a more quiet settlement. He steered due west, leaving Ireland to the North, and arrived in an unknown country, which appeared to him so desirable, that he returned to Wales and carried thither several of his adherents and companions. This is said to have happened about the year 1170, and after that, he and his colony were heard of no more. But it is to be observed, that Powell, on whose testimony the authenticity of this story rests, published his history above four centuries from the date of the event which he relates. Among a people as rude and as illiterate as the Welsh at that period, the memory of a transaction so remote must have been very imperfectly preserved, and would require to be confirmed by some author of greater credit, and nearer to the era of Madoc's voyage than Powell. Later antiquaries have indeed appealed to the testimony of Meredith ap Rees, a Welsh bard, who died A. D. 1477. But he too lived at such a distance of time from the event, that he cannot be considered as a witness of much more credit than Powell. Besides, his verses, published by Hakluyt, vol. iii. p. 1., convey no information, but that Madoc, dissatisfied with his domestic situation, employed himself in searching the

ocean for new possessions. But even if we admit the authenticity of Powell's story, it does not follow that the unknown country which Madoc discovered by steering west, in such a course as to leave Ireland to the north, was any part of America. The naval skill of the Welsh in the twelfth century was hardly equal to such a voyage. If he made any discovery at all, it is more probable that it was Madeira, or some other of the western isles. The affinity of the Welsh language with some dialects spoken in America, has been mentioned as a circumstance which confirms the truth of Madoc's voyage. But that affinity has been observed in so few instances, and in some of these is so obscure, or so fanciful, that no conclusion can be drawn from the casual resemblance of a small number of words. There is a bird, which, as far as is yet known, is found only on the coasts of South America, from Port Desire to the Straits of Magellan. It is distinguished by the name of *Penguin*. This word in the Welsh language signifies *Whitehead*. Almost all the authors who favor the pretensions of the Welsh to the discovery of America, mention this as an irrefragable proof of the affinity of the Welsh language with that spoken in this region of America. But Mr. Penant, who has given a description of the Penguin, observes that all the birds of this genus have black heads, "so that we must resign every hope (adds he) founded on this hypothesis of retrieving the Cambrian race in the New World." *Philos. Transact.* vol. lviii. p. 91, &c. Besides this, if the Welsh, towards the close of the twelfth century, had settled in any part of America, some remains of the Christian doctrine and rites must have been found among their descendants, when they were discovered about three hundred years posterior to their migration; a period so short that, in the course of it, we cannot well suppose that all European ideas and arts would be totally forgotten. Lord Lyttleton, in his notes to the fifth book of his History of Henry II., p. 371, has examined what Powell relates concerning the discoveries made by Madoc, and invalidates the truth of his story by other arguments of great weight.

The pretensions of the Norwegians to the discovery of America seem to be better founded than those of the Germans or Welsh. The inhabitants of Scandinavia were remarkable in the middle ages for the boldness and extent of their maritime excursions. In 874, the Norwegians discovered and planted a colony in Iceland. In 982, they discovered Greenland, and established settlements there. From that, some of their navigators proceeded towards the west, and discovered a country more inviting than those horrid regions with which they were acquainted. According to their representation, this country was sandy on the coasts, but in the interior parts level and covered with wood, on which account they gave it the name of *Helle-land*, and *Mark-land*, and having afterwards found some plants of the vine which bore grapes, they called it *Vin-land*. The credit of this story rests, as far as I know, on the authority of the *saga*, or chronicle of King Olaf, composed by Snorro Sturlonides, or *Sturlusons*, published by Perinskjöld, at Stockholm, A. D. 1697. As Snorro was born in the year 1179, his chronicle might be compiled about two centuries after the event which he relates. His account of the navigation and discoveries of *Biorn*, and his companion *Lief*, is a very rude confused tale, p. 104. 110. 326. It is impossible to discover from him what part of America it was in which the Norwegians landed. According to his account of the length of the days and nights, it must have been as far north as the fifty-eighth degree of latitude, or some part of the coast of Labrador, approaching near to the entry of Hudson's Straits. Grapes certainly are not the production of that country. Torfeus supposes that there is an error in the text, by rectifying of which the place where the Norwegians landed may be supposed to be situated in latitude 49°. But neither is that the region of the vine in America. From perusing Snorro's tale, I should think that the situation of Newfoundland corresponds best with that of the country discovered by the Norwegians. Grapes, however, are not the production of that barren island. Other conjectures are mentioned by M. Mallet, *Introd. à l'Hist. de Danemar.* 175, &c. I am not sufficiently acquainted with the literature of the north to examine them. It seems manifest, that if the Norwegians did discover any part of America at that period, their attempt to plant colonies proved unsuccessful, and all knowledge of it was soon lost.

NOTE [18]. p. 82.—Peter Martyr, ab Angleria, a Milanese gentleman, residing at that time in the court of Spain, whose letters contain an account of the trans-

actions of that period, in the order wherein they occurred, describes the sentiments with which he himself and his learned correspondents were affected in very striking terms. "Præ lætitia prosluissae te, vixque a lachrymis præ gaudio temperasse, quando literas adpexisti meas quibus, de antipodum orbe latenti hæcenus, te certiorum feci, mi suavisime Pomponi, insinuasti. Ex tuis ipse literis colligo, quid senseris. Sensisti autem, tantique rem fecisti, quanti virum summa doctrina insignitum decuit. Quis namque cibus sublimibus præstari potest ingenii, isto suavior? quod condimentum gratius? A me facio conjecturam. Beati sentio spiritus meos, quando acceitos alloquor prudentes aliquos ex his qui ab ea redeunt provincia. Implicent animos pecuniarum cumulis augendis miseri avari, libidinibus obsceni; nostras nos mentes, postquam Deo pleni aliquando fuerimus, contemplando, hujusmodi rerum notitia demulciamus." *Epist.* 152, Pomponio Læto.

NOTE [19]. p. 84.—So firmly were men of science, in that age, persuaded that the countries which Columbus had discovered were connected with the East Indies, that Bernaldes, the Cura de los Palacios, who seems to have been no inconsiderable proficient in the knowledge of cosmography, contends that Cuba was not an island, but a part of the continent, and united to the dominions of the Great Khan. This he delivered as his opinion to Columbus himself, who was his guest for some time on his return from his second voyage; and he supports it by several arguments, mostly founded on the authority of Sir John Mandeville. *MS. penes me.* Antonio Gallo, who was secretary to the magistracy of Genoa towards the close of the fifteenth century, published a short account of the navigations and discoveries of his countryman Columbus, annexed to his *Opuscula Historica de Rebus Populi Genuensis*: in which he informs us, from letters of Columbus which he himself had seen, that it was his opinion, founded upon nautical observations, that one of the islands he had discovered was distant only two hours or thirty degrees from Cattigara, which, in the charts of the geographers of that age, was laid down, upon the authority of Ptolemy, lib. vii. c. 3, as the most easterly place in Asia. From this he concluded, that if some unknown continent did not obstruct the navigation, there must be a short and easy access, by holding a westerly course, to this extreme region of the East. *Muratori Scriptores Rer. Italicarum*, vol. xxiii. p. 304.

NOTE [20]. p. 84.—Bernaldes, the Cura or Rector de los Palacios, a contemporary writer, says, that five hundred of these captives were sent to Spain, and sold publicly in Seville as slaves; but that, by the change of climate and their inability to bear the fatigue of labor, they all died in a short time. *MS. penes me.*

NOTE [21]. p. 86.—Columbus seems to have formed some very singular opinions concerning the countries which he had now discovered. The violent swell and agitation of the waters on the coast of Trinidad led him to conclude this to be the highest part of the terra-queous globe, and he imagined that various circumstances concurred in proving that the sea was here visibly elevated. Having adopted this erroneous principle, the apparent beauty of the country induced him to fall in with a notion of Sir John Mandeville, c. 102, that the terrestrial paradise was the highest land in the earth; and he believed that he had been so fortunate as to discover this happy abode. Nor ought we to think it strange that a person of so much sagacity should be influenced by the opinion or reports of such a fabulous author as Mandeville. Columbus and the other discoverers were obliged to follow such guides as they could find; and it appears from several passages in the manuscript of Andr. Bernaldes, the friend of Columbus, that no inconsiderable degree of credit was given to the testimony of Mandeville in that age. Bernaldes frequently quotes him, and always with respect.

NOTE [22]. p. 87.—It is remarkable that neither Gomara nor Oviedo, the most ancient Spanish historians of America, nor Herrera, consider Ojeda, or his companion Vespucci, as the first discoverers of the continent of America. They uniformly ascribe this honor to Columbus. Some have supposed that national resentment against Vespucci, for deserting the service of Spain, and entering into that of Portugal, may have prompted these writers to conceal the actions which he performed. But Martyr and Benzoni, both Italians, could not be warped by the same prejudice. Martyr was a contemporary author; he resided in the court of

Spain, and had the best opportunity to be exactly informed with respect to all public transactions; and yet neither in his Decads, the first general history published of the New World, nor in his Epistle, which contain an account of all the remarkable events of his time, does he ascribe to Vespucci the honor of having first discovered the continent. Benzoni went as an adventurer to America in the year 1541, and resided there a considerable time. He appears to have been animated with a warm zeal for the honor of Italy, his native country, and yet does not mention the exploits and discoveries of Vespucci. Herrera, who compiled his general history of America from the most authentic records, not only follows those early writers, but accuses Vespucci of falsifying the dates of both the voyages which he made to the New World, and of confounding the one with the other, in order that he might arrogate to himself the glory of having discovered the continent. *Her. dec.* 1. lib. iv. c. 2. He asserts, that in a judicial inquiry into this matter by the royal fiscal, it was proved by the testimony of Ojeda himself, that he touched at Hispaniola when returning to Spain from his first voyage; whereas Vespucci gave out that they returned directly to Cadiz from the coast of Paria, and touched at Hispaniola only in their second voyage; and that he had finished the voyage in five months; whereas, according to Vespucci's account, he had employed seventeen months in performing it. *Viaggio primo de Am. Vespucci*, p. 36. *Viag. secundo*, p. 45. Herrera gives a more full account of this inquest in another part of his Decads, and to the same effect. *Her. dec.* 1. lib. vii. c. 5. Columbus was in Hispaniola when Ojeda arrived there, and had by that time come to an agreement with Roldan, who opposed Ojeda's attempt to excite a new insurrection, and of consequence, his voyage must have been posterior to that of the admiral. *Life of Columbus*, c. 84. According to Vespucci's account, he set out on his first voyage May 10th, 1497. *Viag. primo*, p. 6. At that time Columbus was in the court of Spain preparing for his voyage, and seems to have enjoyed a considerable degree of favor. The affairs of the New World were at this juncture under the direction of Antonio Torres, a friend of Columbus. It is not probable that, at that period, a commission would be granted to another person to anticipate the admiral by undertaking a voyage which he himself intended to perform. Fonseca, who patronized Ojeda, and granted the license for his voyage, was not recalled to court, and reinstated in the direction of Indian affairs, until the death of Prince John, which happened September, 1497. (*P. Martyr*, Ep. 182.) several months posterior to the time at which Vespucci pretends to have set out upon his voyage. A life of Vespucci was published at Florence by the Abate Blandini, A. D. 1745. 4to. It is a work of no merit, written with little judgment and less candor. He contends for his countryman's title to the discovery of the continent with all the blind zeal of national partiality, but produces no new evidence to support it. We learn from him that Vespucci's account of his voyage was published as early as the year 1510, and probably sooner. *Vita di Am. Vesp.* p. 52. At what time the name of AMERICA came to be first given to the New World is not certain.

NOTE [23]. p. 92.—The form employed on this occasion served as a model to the Spaniards in all their subsequent conquests in America. It is so extraordinary in its nature, and gives us such an idea of the proceedings of the Spaniards, and the principles upon which they founded their right to the extensive dominions which they acquired in the New World, that it well merits the attention of the reader. "I Alonso de Ojeda, servant of the most high and powerful kings of Castile and Leon, the conquerors of barbarous nations, their messenger and captain, notify to you, and declare in as ample form as I am capable, that God our Lord, who is one and eternal, created the heaven and the earth, and one man and one woman, of whom you and we, and all the men who have been or shall be in the world, are descended. But as it has come to pass through the number of generations during more than five thousand years, that they have been dispersed into different parts of the world, and are divided into various kingdoms and provinces, because one country was not able to contain them, nor could they have found in one the means of subsistence and preservation: therefore God our Lord gave the charge of all those people to one man named St. Peter, whom he constituted the lord and head of all the human race, that all men, in whatever place they are born, or in whatever faith or place they are educated, might yield obedience unto him. He

bath subjected the whole world to his jurisdiction, and commanded him to establish his residence in Rome, as the most proper place for the government of the world. He likewise promised and gave him power to establish his authority in every other part of the world, and to judge and govern all Christians, Moors, Jews, Gentiles, and all other people of whatever sect or faith they may be. To him is given the name of *Pope*, which signifies admirable, great father and guardian, because he is the father and governor of all men. Those who lived in the time of this holy father obeyed and acknowledged him as their Lord and King, and the superior of the universe. The same has been observed with respect to them who, since his time, have been chosen to the pontificate. Thus it now continues, and will continue to the end of the world.

"One of these Pontiffs, as lord of the world, hath made a grant of these islands, and of the Tierra Firme of the ocean sea, to the Catholic Kings of Castile, Don Ferdinand and Donna Isabella, of glorious memory, and their successors, our sovereigns, with all they contain, as is more fully expressed in certain deeds passed upon that occasion, which you may see if you desire it. Thus His Majesty is King and lord of these islands, and of the continent, in virtue of this donation; and, as King and lord aforesaid, most of the islands to which his title hath been notified, have recognised His Majesty, and now yield obedience and subjection to him as their lord, voluntarily and without resistance; and instantly, as soon as they received information, they obeyed the religious men sent by the King to preach to them, and to instruct them in our holy faith; and all these, of their own free will, without any recompense or gratuity, became Christians, and continue to be so; and His Majesty having received them graciously under his protection, has commanded that they should be treated in the same manner as his other subjects and vassals. You are bound and obliged to act in the same manner. Therefore I now entreat and require you to consider attentively what I have declared to you; and that you may more perfectly comprehend it, that you take such time as is reasonable in order that you may acknowledge the Church as the superior and guide of the universe, and likewise the holy father called the Pope, in his own right, and his Majesty, by his appointment, as King and sovereign lord of these Islands, and of the Tierra Firme; and that you consent that the aforesaid holy fathers shall declare and preach to you the doctrines above mentioned. If you do this, you act well, and perform that to which you are bound and obliged; and His Majesty, and I in his name, will receive you with love and kindness, and will leave you, your wives and children, free and exempt from servitude, and in the enjoyment of all you possess, in the same manner as the inhabitants of the islands. Besides this, His Majesty will bestow upon you many privileges, exemptions, and rewards. But if you will not comply, or maliciously delay to obey my injunction, then, with the help of God, I will enter your country by force, I will carry on war against you with the utmost violence, I will subject you to the yoke of obedience to the Church and King, I will take your wives and children, and will make them slaves, and sell or dispose of them according to His Majesty's pleasure; I will seize your goods, and do you all the mischief in my power, as rebellious subjects, who will not acknowledge or submit to their lawful sovereign. And I protest, that all the bloodshed and calamities which shall follow are to be imputed to you, and not to His Majesty, or to me, or the gentlemen who serve under me; and as I have now made this declaration and requisition unto you, I require the notary here present to grant me a certificate of this, subscribed in proper form." Herrera, dec. 1. lib. vii. c. 14.

NOTE [24]. p. 94.—Balboa, in his letter to the king, observes that of the hundred and ninety men, whom he took with him, there were never above eighty fit for service at one time. So much did they suffer from hunger, fatigue, and sickness. Herrera, dec. 1. lib. x. c. 16. P. Mart. decad. 226.

NOTE [25]. p. 95.—Fonseca, Bishop of Palencia, the principal director of American Affairs, had eight hundred Indians in property; the commendator Lope de Conchillos, his chief associate in that department, eleven hundred; and other favorites had considerable numbers. They sent overseers to the islands, and hired out those slaves to the planters. Herrera, dec. 1. lib. ix. c. 14. p. 325.

NOTE [26]. p. 98.—Though America is more plentifully supplied with water than the other regions of the

globe, there is no river or stream of water in Yucatan. This peninsula projects from the continent a hundred leagues, but, where broadest, does not extend above twenty five leagues. It is an extensive plain, not only without mountains, but almost without any inequality of ground. The inhabitants are supplied with water from pits, and, wherever they dig them, find it in abundance. It is probable, from all those circumstances, that this country was formerly covered by the sea. Herrera Descriptio Indiæ Occidentalis, p. 14. Histoire Naturelle, par M. de Buffon, tom. i. p. 593.

NOTE [27]. p. 98.—M. Clavigero censures me for having represented the Spaniards who sailed with Cordova and Grijalva, as fancying in the warmth of their imagination, that they saw cities on the coast of Yucatan adorned with towers and cupolas, I know not what translation of my history he has consulted (for his quotation from it is not taken from the original,) but I never imagined that any building erected by the Americans could suggest the idea of a cupola or dome, a structure which their utmost skill in architecture was incapable of rearing. My words are, that they fancied the villages which they saw from their ships "to be cities adorned with towers and pinnacles." By pinnacles I meant some elevation above the rest of the building; and the passage is translated almost literally from Herrera, dec. 2. lib. iii. c. 1. In almost all the accounts of new countries given by the Spanish discoverers in that age, this warmth of admiration is conspicuous; and led them to describe these new objects in the most splendid terms. When Cordova and his companions first beheld an Indian village of greater magnitude than any they had beheld in the islands, they dignified it by the name of *Grand Carro*. B. Diaz, c. 2. From the same cause Grijalva and his associates thought the country, along the coast of which they held their course, entitled to the name of New Spain.

NOTE [28]. p. 99.—The height of the most elevated point in the Pyrenees is, according to M. Cassini, six thousand six hundred and forty-six feet. The height of the mountain Genévi, in the canton of Berne, is ten thousand one hundred and ten feet. The height of the Peak of Teneriffe, according to the measurement of P. Feuille, is thirteen thousand one hundred and seventy-eight feet. The height of Chimborazo, the most elevated point of the Andes, is twenty thousand two hundred and eighty feet; no less than seven thousand one hundred and two feet above the highest mountain in the ancient continent. Voyage de D. Juan Ulloa, Observations Astron. et Physiq. tom. ii. p. 114. The line of congelation on Chimborazo, or that part of the mountain which is covered perpetually with snow, is no less than two thousand four hundred feet from its summit. Prevot Hist. Gener. des Voyages, vol. iii. p. 636.

NOTE [29]. p. 99.—As a particular description makes a stronger impression than general assertions, I shall give one of Rio de la Plata by an eye-witness, P. Caltanco, a Modenesse Jesuit, who landed at Buenos Ayres in 1749, and thus represents what he felt when such new objects were first presented to his view. "While I resided in Europe, and read in books of history or geography, that the mouth of the river de la Plata was a hundred and fifty miles in breadth, I considered it as an exaggeration, because in this hemisphere we have no example of such vast rivers. When I approached its mouth, I had the most vehement desire to ascertain the truth with my own eyes; and I found the matter to be exactly as it was represented. This I deduce particularly from one circumstance: When we took our departure from Monte Video, a fort situated more than a hundred miles from the mouth of the river, and where its breadth is considerably diminished, we sailed a complete day before we discovered the land on the opposite side of the river; and when we were in the middle of the channel, we could not discern land on either side and saw nothing but the sky and water as if we had been in some great ocean. Indeed we should have taken it to be sea, if the fresh water of the river, which was turbid like the Po, had not satisfied us that it was a river. Moreover, at Buenos Ayres, another hundred miles up the river, and where it is still much narrower, it is not only impossible to discern the opposite coast, which is indeed very low, but perceive the houses or the tops of the steeples in the Portuguese settlement at Colônia on the other side of the river." Lettera prima, published by Muratori, Il Christianesimo Felice, &c. i. p. 257.

NOTE [30]. p. 99.—Newfoundland, part of Nova Scotia, and Canada, are the countries which lie in the same parallel of latitude with the kingdom of France; and in every part of these the water of the rivers is frozen during winter to the thickness of several feet; the earth is covered with snow as deep; almost all the birds fly during that season from a climate where they could not live. The country of the Eskimaux, part of Labrador, and the countries on the south of Hudson's Bay, are in the same parallel with Great Britain; and yet in all these the cold is so intense that even the industry of Europeans has not attempted cultivation.

NOTE [31]. p. 99.—Acosta is the first philosopher, as far as I know, who endeavored to account for the different degrees of heat in the old and new continents, by the agency of the winds which blow in each. Histoire Moral. &c. lib. ii. and iii. M. de Buffon adopts this theory, and has not only improved it by new observations, but has employed his amazing powers of descriptive eloquence in embellishing it and placing it in the most striking light. Some remarks may be added, which tend to illustrate more fully a doctrine of much importance in every inquiry concerning the temperature of various climates.

When a cold wind blows over land, it must in its passage rob the surface of some of its heat. By means of this the coldness of the wind is abated. But if it continue to blow in the same direction, it will come, by degrees, to pass over a surface already cooled, and will suffer no longer any abatement of its own keenness. Thus, as it advances over a large tract of land, it brings on all the severity of intense frost.

Let the same wind blow over an extensive and deep sea; the superficial water must be immediately cooled to a certain degree, and the wind proportionally warmed. But the superficial and colder water, becoming specifically heavier than the warmer water below it, descends; what is warmer supplies its place, which, as it comes to be cooled in its turn, continues to warm the air which passes over it, or to diminish its cold. This change of the superficial water and successive ascent of that which is warmer, and the consequent successive abatement of coldness in the air, is aided by the agitation caused in the sea by the mechanical action of the wind, and also by the motion of the tides. This will go on, and the rigor of the wind will continue to diminish until the whole water is so far cooled, that the water on the surface is no longer removed from the action of the wind fast enough to hinder it from being arrested by frost. Whenever the surface freezes, the wind is no longer warmed by the water from below, and it goes on with undiminished cold.

From those principles may be explained the severity of winter frosts in extensive continents; their mildness in small islands; and the superior rigor of winter in those parts of North America with which we are best acquainted. In the north-west parts of Europe, the severity of winter is mitigated by the west winds, which usually blow in the months of November, December, and part of January.

On the other hand, when a warm wind blows over land, it heats the surface, which must therefore cease to abate the fervor of the wind. But the same wind blowing over water, agitates it, brings up the colder water from below, and thus is continually losing somewhat of its own heat.

But the great power of the sea to mitigate the heat of the wind or air passing over it, proceeds from the following circumstance: that on account of the transparency of the sea, its surface cannot be heated to a great degree by the sun's rays; whereas the ground, subjected to their influence, very soon acquires great heat. When, therefore, the wind blows over a torrid continent, it is soon raised to a heat almost intolerable; but during its passage over an extensive ocean, it is gradually cooled; so that on its arrival at the furthest shore it is again fit for respiration.

Those principles will account for the sultry heats of large continents in the torrid zone; for the mild climate of islands in the same latitude; and for the superior warmth in summer which large continents, situated in the temperate or colder zones of the earth, enjoy when compared with that of islands. The heat of a climate depends not only upon the immediate effect of the sun's rays, but on their continued operation, on the effect which they have formerly produced, and which remains for some time in the ground. This is the reason why the day is warmest about two in the afternoon, the summer warmest about the middle of July, and the winter coldest about the middle of January.

The forests which cover America, and hinder the sunbeams from heating the ground, are a great cause of the temperate climate in the equatorial parts. The ground, not being heated, cannot heat the air; and the leaves, which receive the rays intercepted from the ground, have not a mass of matter sufficient to absorb heat enough for this purpose. Besides, it is a known fact, that the vegetative power of a plant occasions a perspiration from the leaves in proportion to the heat to which they are exposed: and, from the nature of evaporation, this perspiration produces a cold in the leaf proportional to the perspiration. Thus the effect of the leaf in heating the air in contact with it is prodigiously diminished. For those observations, which throw much additional light on this curious subject, I am indebted to my ingenious friend, Mr. Robison, professor of natural philosophy in the university of Edinburgh.

NOTE [32]. p. 99.—The climate of Brazil has been described by two eminent naturalists, Piso and Margrave, who observed it with a philosophical accuracy for which we search in vain in the accounts of many other provinces in America. Both represent it as temperate and mild when compared with the climate of Africa. They ascribe this chiefly to the refreshing wind which blows continually from the sea. The air is not only cool, but chilly through the night, insomuch that the natives kindle fires every evening in their huts. Piso de Medicina Brasiliensis, lib. i. p. 1. &c. Margravius Histor. Rerum Natural. Brasiliæ, lib. viii. c. 3. p. 264. Nieuhoff, who resided long in Brazil, confirms their description. Churchill's Collection, vol. ii. p. 26. Gumilla, who was a missionary many years among the Indians upon the river Orinoco, gives a similar description of the temperature of the climate there. Hist. de l'Orinoco, tom. 1. p. 26. P. Acugna felt a very considerable degree of cold in the countries on the banks of the river Amazons. Relat. vol. ii. p. 56. M. Biot, who lived a considerable time in Cayenne, gives a similar account of the temperature of that climate, and ascribes it to the same cause. Voyage de la France, Equinox, p. 330. Nothing can be more different from these descriptions than that of the burning heat of the African coast given by M. Adanson. Voyage to Senegal, passim.

NOTE [33]. p. 99.—Two French frigates were sent upon a voyage of discovery in the year 1739. In latitude 44° south, they began to feel a considerable degree of cold. In latitude 48°, they met with islands of floating ice. Histoire des Navigations aux Terres Australes, tom. ii. p. 256, &c. Dr. Halley fell in with ice in latitude 59°. Id. tom. i. p. 47. Commodore Byron, when on the coast of Patagonia, latitude 50° 33' south, on the fifteenth of December, which is midsummer in that part of the globe, the twenty-first of December being the longest day there, compares the climate to that of England in the middle of winter. Voyages by Hawkesworth, i. 25. Mr. Banks having landed on Terra del Fuego, in the Bay of Good Success, latitude 55°, in the sixteenth of January, which corresponds to the month of July in our hemisphere, two of his attendants died in one night of extreme cold, and all the party were in the most imminent danger of perishing. Id. ii. 51, 52. By the fourteenth of March, corresponding to September in our hemisphere, winter was set in with rigor, and the mountains were covered with snow. Ibid. 72. Captain Cook, in his voyage towards the South Pole, furnishes new and striking instances of the extraordinary predominance of cold in this region of the globe. "Who would have thought (says he) that an island of no greater extent than seventy leagues in circuit, situated between the latitude of 54° and 55°, should in the very height of summer be, in a manner, wholly covered, many fathoms deep, with frozen snow; but more especially the S. W. coast? The very summits of the lofty mountains were cased with snow and ice; but the quantity that lay in the valleys is incredible; and at the bottom of the bays, the coast was terminated by a wall of ice of considerable height." Vol. ii. p. 217.

In some places of the ancient continent, an extraordinary degree of cold prevails in very low latitudes. Mr. Bogle, in his embassy to the court of the Delai Lama, passed the winter of the year 1774, at Chamnanning, in latitude 31° 39' N. He often found the thermometer in his room twenty-nine degrees under the freezing point by Fahrenheit's scale; and in the middle of April the standing waters were all frozen, and heavy showers of snow frequently fell. The extraordinary elevation of the country seems to be the cause of this

excessive cold. In travelling from Indostan to Thibet, the ascent to the summit of the Boutan Mountains is very great, but the descent on the other side is not in equal proportion. The kingdom of Thibet is an elevated region, extremely bare and desolate. Account of Thibet, by Mr. Stewart, read in the Royal Society, p. 7. The extraordinary cold in low latitudes in America cannot be accounted for by the same cause. Those regions are not remarkable for elevation. Some of them are countries depressed and level.

The most obvious and probable cause of the superior degree of cold towards the southern extremity of America, seems to be the form of the continent there. Its breadth gradually decreases as it stretches from St. Antonia southwards, and from the bay of St. Julian to the Straits of Magellan its dimensions are much contracted. On the east and west sides it is washed by the Atlantic and Pacific Oceans. From its southern point it is probable that a great extent of sea without any considerable tract of land, reaches to the Antarctic pole. In whichever of these directions the wind blows, it is cooled before it approaches the Magellanic regions, by passing over a vast body of water; nor is the land there of such extent, that it can recover any considerable degree of heat in its progress over it. These circumstances concur in rendering the temperature of the air in this district of America more similar to that of an insular, than to that of a continental climate, and hinder it from acquiring the same degree of summer heat with places in Europe and Asia in a correspondent northern latitude. The north wind is the only one that reaches this part of America, after blowing over a great continent. But from an attentive survey of its position, this will be found to have a tendency rather to diminish than augment the degree of heat. The southern extremity of America is properly the termination of the immense ridge of the Andes, which stretches nearly in a direct line from north to south, through the whole extent of the continent. The most sultry regions in South America, Guiana, Brazil, Paraguay, and Tucuman, lie many degrees to the east of the Magellanic regions. The level country of Peru, which enjoys the tropical heats, is situated considerably to the west of them. The north wind then, though it blows over land, does not bring to the southern extremity of America an increase of heat collected in its passage over torrid regions; but before it arrives there, it must have swept along the summits of the Andes, and becomes impregnated with the cold of that frozen region.

Though it be now demonstrated that there is no southern continent in that region of the globe which it was supposed to occupy, it appears to be certain from Captain Cook's discoveries, that there is a large tract of land near the south pole, which is the source of most of the ice spread over the vast southern ocean. Vol. ii. p. 230, 239, &c. Whether the influence of this remote frozen continent may reach the southern extremity of America, and affect its climate, is an inquiry not unworthy of attention.

NOTE [34]. p. 100.—M. Condamine is one of the latest and most accurate observers of the interior state of South America. "After descending from the Andes (says he,) one beholds a vast and uniform prospect of water and verdure, and nothing more. One treads upon the earth, but does not see it; as it is so entirely covered with luxuriant plants, weeds, and shrubs, that it would require a considerable degree of labor to clear it for the space of a foot." Relation abrégée d'un Voyage, &c. p. 48. One of the singularities in the forests is a sort of osiers, or withes, called *bejuco*s by the Spaniards, *lianes* by the French, and *nibbes* by the Indians, which are usually employed as ropes in America. This is one of the parasitical plants, which twists about the trees it meets with, and rising above their highest branches, its tendrils descend perpendicularly, strike into the ground, take root, rise up around another tree, and thus mount and descend alternately. Other tendrils are carried obliquely by the wind, or some accident, and form a confusion of interwoven cordage, which resembles the rigging of a ship. Bancroft, Nat. Hist. of Guiana, 99. These withes are often as thick as the arm of a man. Id. p. 75. M. Bogue's account of the forests in Peru perfectly resembles this description. Voyages au Peru, p. 16. Oviedo gives a similar description of the forests in other parts of America. Hist. lib. ix. p. 144. D. The country of the Moxos is so much overflowed, that they are obliged to reside on the summit of some rising ground during some part of the year, and have no communication with their countrymen at any distance. Lettres Edifiantes, tom. x. p. 187. Garcia gives a full and just description of the

river, lakes, woods, and marshes in those countries of America which lie between the tropics. Origen de los Indios, lib. ii. c. 5. § 4, 5. The incredible hardship to which Gonzalez Pizarro was exposed in attempting to march into the country to the east of the Andes, convey a very striking idea of that part of America in its original uncultivated state. Garcil. de la Vega, Royal Comment, of Peru, part ii. book iii. c. 2—5.

NOTE [35]. p. 100.—The animals of America seem not to have been always of a size inferior to those in other quarters of the globe. From antlers of the moose-deer which have been found in America, it appears to have been an animal of great size. Near the banks of the Ohio, a considerable number of bones of an immense magnitude have been found. The place where this discovery has been made lies about one hundred and ninety miles below the junction of the river Scioto with the Ohio. It is about four miles distant from the banks of the latter, on the side of the marsh called the Salt lick. The bones lie in vast quantities about five or six feet under ground, and the stratum is visible in the bank on the edge of the Lick. *Journal of Colonel George Croghan, MS. penes me.* This spot seems to be accurately laid down by Evans in his map. These bones must have belonged to animals of enormous bulk; but naturalists being acquainted with no living creature of such size, were at first inclined to think they were mineral substances. Upon receiving a greater number of specimens, and after inspecting them more narrowly, they are now allowed to be the bones of an animal. As the elephant is the largest known quadruped, and the tusks which were found, nearly resembled, both in form and quality, the tusks of an elephant, it was concluded that the carcasses deposited on the Ohio were of that species. But Dr. Hunter, one of the persons of our age best qualified to decide with respect to this point, having accurately examined several parcels of tusks, and grinders, and jaw-bones, sent from the Ohio to London, gives it as his opinion that they did not belong to an elephant, but to some huge carnivorous animal of an unknown species. Phil. Transact. vol. lviii. p. 34. Bones of the same kind, and as remarkable for their size, have been found near the mouths of the great rivers Obi, Jeniseia, and Lena in Siberia. *Strahlenberg, Descript. of North and East Parts of Europe and Asia*, p. 402, &c. The elephant seems to be confined in his range to the torrid zone, and never multiplies beyond it. In such cold regions as those bordering on the frozen sea, he could not live. The existence of such large animals in America might open a wide field for conjecture. The more we contemplate the face of nature, and consider the variety of her productions, the more we must be satisfied that astonishing changes have been made in the terraqueous globe by convulsions and revolutions, of which no account is preserved in history.

NOTE [36]. p. 100.—This degeneracy of the domestic European animals in America may be imputed to some of these causes. In the Spanish settlements, which are situated either within the torrid zone, or in countries bordering upon it, the increase of heat and diversity of food prevent sheep and horned cattle from attaining the same size as in Europe. They seldom become so fat, and their flesh is not so juicy, or of such delicate flavor. In North America, where the climate is more favorable, and similar to that of Europe, the quality of the grasses which spring up naturally in their pasture grounds is not good. Mitchell, p. 151. Agriculture is still so much in its infancy, that artificial food for cattle is not raised in any quantity. During a winter, long in many provinces, and rigorous in all, no proper care is taken of their cattle. The general treatment of their horses and horned cattle is injudicious and harsh in all the English colonies. These circumstances contribute more, perhaps, than any thing peculiar in the quality of the climate, to the degeneracy of breed in the horses, cows, and sheep of many of the North American provinces.

NOTE [37]. p. 100.—In the year 1518, the island of Hispaniola was afflicted with a dreadful visitation of those destructive insects, the particulars of which Herrera describes, and mentions a singular instance of the superstition of the Spanish planters. After trying various methods of exterminating the ants, they resolved to implore protection of the saints; but as the calamity was new, they were at a loss to find out the saint who could give them the most effectual aid. They cast lots in order to discover the patron whom they should invoke. The lots decided in favor of St. Saturnus.

They celebrated his festival with great solemnity, and immediately, adds the historian, the calamity began to abate. Herrera, dec. 2. lib. iii. c. 15. p. 107.

NOTE [38]. p. 100.—The author of *Recherches Philosophiques sur les Americains* supposes this difference in heat to be equal to twelve degrees, and that a place thirty degrees from the equator in the old continent is as warm as one situated eighteen degrees from it in America, tom. i. p. 11. Dr. Mitchell, after observations carried on during thirty years, contends that the difference is equal to fourteen or fifteen degrees of latitude. Present State, &c. p. 257.

NOTE [39]. p. 100.—January 3d, 1765, Mr. Bertram, near the head of St. John's river, in East Florida, observed a frost so intense that in one night the ground was frozen an inch thick upon the banks of the river. The limes, citrons, and banana trees, at St. Augustin, were destroyed. Bertram's Journal, p. 20. Other instances of the extraordinary operations of cold in the southern provinces of North America are collected by Dr. Mitchell. Present State, p. 206, &c. February 7th, 1747, the frost at Charleston was so intense, that a person having carried two quart bottles of hot water to bed, in the morning they were split to pieces, and the water converted into solid lumps of ice. In a kitchen where there was a fire, the water in a jar in which there was a live large eel, was frozen to the bottom. Almost all the orange and olive trees were destroyed. Description of South Carolina, 8vo. Lond. 1761.

NOTE [40]. p. 100.—A remarkable instance of this occurs in Dutch Guiana, a country every where level, and so low, that during the rainy seasons it is usually covered with water near two feet in height. This renders the soil so rich, that on the surface, for twelve inches in depth, it is a stratum of perfect manure, and as such has been transported to Barbadoes. On the banks of the Essequibo, thirty crops of ratan canes have been raised successively; whereas in the West Indian islands not more than two is ever expected from the richest land. The expedients by which the planters endeavor to diminish this excessive fertility of soil are various. Bancroft, Nat. Hist. of Guiana, p. 10, &c.

NOTE [41]. p. 102.—Muller seems to have believed, without sufficient evidence, that the Cape had been doubled, tom. i. p. 11, &c.; and the imperial academy of St. Petersburg give some countenance to it by the manner in which *Tschukotskoi-ross* is laid down in their charts. But I am assured, from undoubted authority, that no Russian vessel has ever sailed round that cape; and as the country of *Tshutki* is not subject to the Russian empire, it is very imperfectly known.

NOTE [42]. p. 102.—Were this the place for entering into a long and intricate geographical disquisition, many curious observations might arise from comparing the accounts of the two Russian voyages and the charts of their respective navigations. One remark is applicable to both. We cannot rely with absolute certainty on the position which they assign to several of the places which they visited. The weather was so extremely foggy, that they seldom saw the sun or stars; and the position of the islands and supposed continents was commonly determined by reckoning, not by observation. Behring and Tschirikow proceeded much further towards the east than Krenitzin. The land discovered by Behring, which he imagined to be part of the American continent, is in the 236th degree of longitude from the first meridian in the isle of Ferro, and in 58° 28' of latitude. Tschirikow came upon the same coast in longitude 241°, latitude 56°. Muller, i. 248, 249. The former must have advanced 60 degrees from the port of Petropawlowski, from which he took his departure, and the latter 65 degrees. But from the chart of Krenitzin's voyage, it appears that he did not sail further towards the east than to the 208th degree, and only 32 degrees from Petropawlowski. In 1741, Behring and Tschirikow, both in going and returning, held a course which was mostly to the south of that chain of islands, which they discovered; and observing the mountains and rugged aspect of the headlands which they descried towards the north, they supposed them to be promontories belonging to some part of the American continent, which, as they fancied, stretched as far south as the latitude 56. In this manner they are laid down in the chart published by Muller, and likewise in a manuscript chart drawn by a mate of Behring's ship, communicated to me by Mr. Professor

Robison. But in 1769, Krenitzin, after wintering in the island Alaxa, stood so far towards the north in his return, that his course lay through the middle of what Behring and Tschirikow had supposed to be a continent, which he found to be an open sea, and that they had mistaken rocky isles for the headlands of a continent. It is probable, that the countries discovered in 1741, towards the east, do not belong to the American continent, but are only a continuation of the chain of islands. The number of volcanos in this region of the globe is remarkable. There are several in Kamtschatka, and not one of the islands, great or small, as far as the Russian navigation extends, is without them. Many are actually burning, and the mountains in all bear marks of having been once in a state of eruption. Were I disposed to admit such conjectures as have found place in other inquiries concerning the peopling of America, I might suppose that this part of the earth, having manifestly suffered violent convulsions from earthquakes and volcanos, an isthmus, which may have formerly united Asia to America, has been broken, and formed into a cluster of islands by the shock.

It is singular, that at the very time the Russian navigators were attempting to make discoveries in the north-west of America, the Spaniards were prosecuting the same design from another quarter. In 1769, two small vessels sailed from Loreto in California to explore the coasts of the country to the north of that peninsula. They advanced no further than the port of Monte-Rey, in latitude 36. But, in several successive expeditions fitted out from the port of St. Blas in New Galicia, the Spaniards have advanced as far as the latitude 58. *Gazeta de Madrid*, March 19, and May 14, 1776. But as the journals of those voyages have not yet been published, I cannot compare their progress with that of the Russians, or show how near the navigators of the two nations have approached to each other. It is to be hoped that the enlightened minister who has now the direction of American affairs in Spain, will not withhold this information from the public.

NOTE [43]. p. 102.—Our knowledge of the vicinity of the two continents of Asia and America, which was very imperfect when I published the History of America in the year 1777, is now complete. Mr. Coxe's account of the Russian Discoveries between Asia and America, printed in the year 1780, contains many curious and important facts with respect to the various attempts of the Russians to open a communication with the New World. The history of the great voyage of Discovery, begun by Captain Cook in 1776, and completed by Captains Clerk and Gore, published in the year 1780, communicates all the information that the curiosity of mankind could desire with regard to this subject.

At my request, my friend, Mr. Playfair, Professor of Mathematics in the University of Edinburgh, has compared the narrative and charts of those illustrious navigators with the more imperfect relations and maps of the Russians. The result of this comparison I communicate in his own words, with much greater confidence in his scientific accuracy, than I could have ventured to place in any observations which I myself might have made upon the subject.

"The discoveries of Captain Cook in his last voyage have confirmed the conclusions which Dr. Robertson had drawn, and have connected together the facts from which they were deduced. They have now rendered it certain that Behring and Tschirikow touched on the coast of America in 1741. The former discovered land in latitude 58°, 28', and about 236° east from Ferro. He has given such a description of the Bay in which he anchored, and the high mountain to the westward of it which he calls St. Elias, that though the account of his voyage is much abridged in the English translation, Captain Cook recognised the place as he sailed along the western coast of America in the year 1778. The isle of St. Hermogenes, near the mouth of Cook's river, Schumagins isles on the coast of Alashka, and Foggy Isle, retain in Captain Cook's chart the names which they had received from the Russian navigators. Cook's Voy. vol. ii. p. 347.

"Tschirikow came upon the same coast about 2° 30' farther south than Behring, near the Mount Edgumbe of Captain Cook.

"With regard to Krenitzin, we learn from Coxe's Account of the Russian Discoveries, that he sailed from the mouth of the Kamtschatka river with two ships in the year 1768. With his own ship he reached the island of Oonolashka, in which there had been a Russian settlement since the year 1762, where he wintered probably in the same harbor or bay where Captain

Cook afterwards anchored. The other ship wintered at Alashka, which was supposed to be an island, though it be in fact a part of the American continent. Krenitzin accordingly returned without knowing that either of his ships had been on the coast of America; and this is the more surprising, because Captain Cook has informed us that Alashka is understood to be a great continent, both by the Russians and the natives of Oonolashka.

"According to Krenitzin, the ship which had wintered at Alashka had hardly sailed 30° to the eastward of the harbor of St. Peter and St. Paul in Kamtschatka; but, according to the more accurate charts of Captain Cook, it had sailed no less than 37° 17' to the eastward of that harbor. There is nearly the same mistake of 5° in the longitude which Krenitzin assigns to Oonolashka. It is remarkable enough, that in the chart of those seas, put into the hand of Captain Cook by the Russians on that island, there was an error of the same kind, and very nearly of the same extent.

"But what is of most consequence to be remarked on the subject is, that the discoveries of Captain Cook have fully verified Dr. Robertson's conjecture 'that it is probable that future navigators in those seas, by steering farther to the north than Behring and Tschirikow or Krenitzin had done, may find that the continent of America approaches still nearer to that of Asia. See p. 102. It has accordingly been found that these two continents, which in the parallel of 55°, or that of the southern extremity of Alashka, are about four hundred leagues asunder, approach continually to one another as they stretch together toward the north, until, within less than a degree from the polar circle, they are terminated by two capes only thirteen leagues distant. The east cape of Asia is in latitude 66° 6' and in longitude 190° 22' east from Greenwich: the western extremity of America, or Prince of Wales' Cape, is in latitude 65° 46', and in longitude 191° 45'. Nearly in the middle of the narrow strait (Behring's Strait) which separates these capes, are the two islands of St. Diomedes, from which both continents may be seen. Captain King informs us, that as he was sailing through this strait, July 5, 1779, the fog having cleared away, he enjoyed the pleasure of seeing from the ship the continents of Asia and America at the same moment, together with the islands of St. Diomedes lying between them. Cook's Voy. vol. iii. p. 241.

"Beyond this point the strait opens towards the Arctic Sea, and the coasts of Asia and America diverge so fast from one another, that in the parallel of 69° they are more than one hundred leagues asunder. Ib. p. 277. To the mouth of the strait there are a number of islands, Clerk's, King's, Anderson's, &c. which, as well as those of St. Diomedes, may have facilitated the migrations of the natives from the one continent to the other. Captain Cook, however, on the authority of the Russians at Oonolashka, and for other good reasons has diminished the number of islands which had been inserted in former charts of the northern Archipelago. He has also placed Alashka, or the promontory which stretches from the continent of America S. W. towards Kamtschatka, at the distance of five degrees of longitude farther from the coast of Asia than it was reckoned by the Russian navigators.

"The geography of the Old and New World is therefore equally indebted to the discoveries made in this memorable voyage: and as many errors have been corrected, and many deficiencies supplied, by means of these discoveries, so the accuracy of some former observations has been established. The basis of the map of the Russian empire, as far as regarded Kamtschatka, and the country of the Tschutski, was the position of four places, Yakutsk, Ochotz, Boleheresk, and Petropawlowski, which had been determined by the astronomer Krassilnicow in the year 1744. Nov. Comment. Petrop. vol. iii. p. 465, &c. But the accuracy of his observations was contested by M. Engel, and M. Robert de Vaugondy; Coxe, Append. i. No. 2. p. 267, 272. and the former of these geographers ventured to take away no less than 28 degrees from the longitude, which on the faith of Krassilnicow's observations, was assigned to the eastern boundary of the Russian empire. With how little reason this was done, will appear from considering that our British navigators, having determined the position of Petropawlowski by a great number of very accurate observations, found the longitude of that port 158° 43' E. from Greenwich, and its latitude 53° 1'; agreeing, the first to less than seven minutes, and the second to less than half a minute, with the calculations of the Russian astronomer: a coincidence which, in the situation of so remote a place, does not leave an uncertainty of more than four

English miles, and which, for the credit of science, deserves to be particularly remarked. The chief error in the Russian maps has been in not extending the boundaries of that empire sufficiently towards the east. For as there was nothing to connect the land of the Tschitzki and the north-east point of Asia with those places whereof the position had been carefully ascertained, except the imperfect accounts of Behring's and Synd's voyages, considerable errors could not fail to be introduced, and that point was laid down as not more than $23^{\circ} 2'$ east of the meridian of Petropawlski. Cox, App. i. No. 2. By the observations of Captain King, the difference of longitude between Petropawlski and the East Cape is $31^{\circ} 9'$; that is, $8^{\circ} 7'$ greater than it was supposed to be by the Russian geographers." It appears from Cook's and King's Voy. iii. p. 272, that the continents of Asia and America are usually joined together by ice during winter. Mr. Samwell confirms this account of his superior officer. "At this place, viz. near the latitude of 66° N. the two coasts are only thirteen leagues asunder, and about midway between them lie two islands, the distance from each to either shore is short of twenty miles. At this place the natives of Asia could find no difficulty in passing over to the opposite coast, which is in sight of their own. That in a course of years such an event would happen, either through design or accident, cannot admit of a doubt. The canoes which we saw among the Tschitzki were capable of performing a much longer voyage; and, however rude they may have been at some distant period, we can scarcely suppose them unequal to a passage of six or seven leagues. People might have been carried over by accident on floating pieces of ice. They might also have travelled across on sledges or on foot; for we have reason to believe that the strait is entirely frozen over in the winter; so that, during that season, the continents, with respect to the communication between them, may be considered as one land." Letter from Mr. Samwell, Scot's Magazine for 1788, p. 694. It is probable that this interesting portion of geographical knowledge will, in the course of a few years, receive farther improvement. Soon after the publication of Captain Cook's last voyage, the great and enlightened Sovereign of Russia, attentive to every thing that may contribute to extend the bounds of science, or to render it more accurate, formed the plan of a new voyage of discovery, in order to explore those parts of the ocean lying between Asia and America, which Captain Cook did not visit, to examine more accurately the islands which stretch from one continent almost to the other, to survey the north-east coast of the Russian empire, from the mouth of the Koryma, or Kolyma, to the North Cape, and to settle, by astronomical observations, the position of each place worth notice. The conduct of this important enterprise is committed to Captain Billings, an English officer in the Russian service, of whose abilities for that station it will be deemed the best evidence, that he accompanied Captain Cook in his last voyage. To render the expedition more extensively useful, an eminent naturalist is appointed to attend Captain Billings. Six years will be requisite for accomplishing the purposes of the voyage, Cox's Supplement to Russian Discoveries, p. 27, &c.

NOTE [44]. p. 103.—Few travellers have had such opportunity of observing the natives of America, in its various districts, as Don Antonio Ulloa. In a work lately published by him, he thus describes the characteristic features of the race: "A very small forehead, covered with hair towards its extremities, as far as the middle of the eye-brows; little eyes; a thin nose, small and bending towards the upper lip; the countenance broad; the ears large; the hair very black, lank, and coarse; the limbs well turned, the feet small, the body of just proportion; and altogether smooth and free from hair, until old age, when they acquire some beard, but never on the cheeks." Noticias Americanas, &c. p. 307. M. le Chevalier de Pinto, who resided several years in a part of America which Ulloa never visited, gives a sketch of the general aspect of the Indians there. "They are all copper color with some diversity of shade, not in proportion to their distance from the equator, but according to the degree of elevation of the territory which they inhabit. Those who live in a high country are fairer than those in the marshy low lands, on the coast. Their face is round, further removed perhaps, than that of any people from an oval shape. Their forehead is small, the extremity of their ears far from the face, their lips thick, their nose flat, their eyes black, or of a chestnut color, small, but capable of discerning objects at a great dis-

vol. i.—12.

tance. Their hair is always thick and sleek, and without any tendency to curl. They have no hair on any part of their body but the head. At the first aspect a southern American appears to be mild and innocent, but on a more attentive view, one discovers in his countenance something wild, distrustful, and sullen." MS. penes me. The two portraits drawn by hands very different from those of common travellers, have a near resemblance.

NOTE [45]. p. 104. Amazing accounts are given of the persevering speed of the Americans. Adair relates the adventures of a Chickasaw warrior who ran through woods and over mountains, three hundred computed miles, in a day and a half and two nights. Hist. of Amer. Ind. 396.

NOTE [46]. p. 104. M. Godin Le Jenne, who resided fifteen years among the Indians of Peru and Quito, and twenty years in the French colony of Cayenne, in which there is a constant intercourse with the Galibis and other tribes on the Orinoco, observes, that the vigor of constitution among the Americans is exactly in proportion to their habits of labor. The Indians in warm climates, such as those on the coasts of the South Sea, on the river of Amazons, and the river Orinoco, are not to be compared for strength with those in cold countries; and yet, says he, boats daily set out from Para, a Portuguese settlement on the river of Amazons, to ascend that river against the rapidity of the stream, and with the same crew they proceed to San Pablo, which is eight hundred leagues distant. No crew of white people, or even of Negroes, would be found equal to a task of such persevering fatigue, as the Portuguese have experienced; and yet the Indians being accustomed to this labor from their infancy, perform it. MS. penes me.

NOTE [47]. p. 105. Don Antonio Ulloa, who visited a great part of Peru and Chili, the kingdom of New Granada, and several of the provinces bordering on the Mexican Gulf, while employed in the same service with the French Mathematicians during the space of ten years, and who afterwards had an opportunity of viewing the North Americans asserts "that if we have seen one American, we may be said to have seen them all, their color and make are so nearly the same." Notice. Americanas, p. 328. A more early observer, Pedro de Cieca de Leon, one of the conquerors of Peru, who had likewise traversed many provinces of America, affirms that the people, men and women, although there is such a multitude of tribes or nations as to be almost innumerable, and such diversity of climates, appear nevertheless like the children of one father and mother. Chronica del Peru, parte i. c. 19. There is, no doubt, a certain combination of features, and peculiarity of aspect, which forms what may be called a European or Asiatic countenance. There must likewise be one that may be denominated American, common to the whole race. This may be supposed to strike the traveller at first sight, while not only the various shades, which distinguish people of different regions, but the peculiar features which discriminate individuals, escape the notice of a transient observer. But when persons who had resided so long among the Americans concur in bearing testimony to the similarity of their appearance in every climate, we may conclude that it is more remarkable than that of any other race. See likewise Garcia Origen de los Indios, p. 51. 242. Torquemada Monarch. Indiana, ii. 571.

NOTE [48]. p. 105.—M. le Chevalier de Pinto observes, that in the interior parts of Brazil, he had been informed that some persons resembling the white people of Darien had been found; but that the breed did not continue, and their children became like other Americans. This race, however, is very imperfectly known. MS. penes me.

NOTE [49]. p. 105.—The testimonies of different travellers concerning the Patagonians, have been collected and stated with a considerable degree of accuracy by the author of Recherches Philosophiques, &c. tom. i. 281, &c. iii. 181, &c. Since the publication of his work, several navigators have visited the Magellanic regions, and like their predecessors, differ very widely in their accounts of its inhabitants. By Commodore Byron and his crew, who sailed through the Straits in 1764, the common size of the Patagonians was estimated to be eight feet, and many of them much taller. Phil. Transact. vol. lvii. p. 78. By Captain Wallis and Carteret, who actually measured them in 1766, they were found to be from six feet to six feet

five and seven inches in height. Phil. Trans. vol. ix. p. 22. These, however, seem to have been the very people whose size had been rated so high in the year 1764; for several of them had beads and red baize of the same kind with what had been put on board Captain Wallis's ship, and he naturally concluded that they had got those from Mr. Byron. Hawkesw. i. In 1767 they were again measured by M. Bougainville, whose account differs little from that of Captain Wallis. Voy. 129. To these I shall add a testimony of great weight. In the year 1762, Don Bernardo Ibanez de Echavarri accompanied the Marquis de Valdelirios to Buenos Ayres, and resided there several years. He is a very intelligent author, and his reputation for veracity unimpeached among his countrymen. In speaking of the country towards the southern extremity of America. "By what Indians," says he, "is it possessed? Not certainly by the fabulous Patagonians who are supposed to occupy this district. I have from many eye-witnesses, who have lived among those Indians, and traded much with them, a true and accurate description of their persons. They are of the same stature with the Spaniards. I never saw one who rose in height two varas and two or three inches," i. e. about 80 or 81-332 inches English, if Echavarri makes his computation according to the vara of Madrid. This agrees nearly with the measurement of Captain Wallis. Reyno Jesuitico, 238. Mr. Falkner, who resided as a missionary forty years in the southern parts of America, says that the Patagonians, or Puelches, are a large bodied people; but I never heard of that gigantic race which others have mentioned, though I have seen persons of all the different tribes of southern Indians." Introd. p. 26. M. Dobrizhoffer, a Jesuit, who resided eighteen years in Paraguay, and who had seen great numbers of the various tribes which inhabit the countries situated upon the Straits of Magellan, confirms in every point, the testimony of his brother missionary Falkner. Dobrizhoffer enters into some detail with respect to the opinions of several authors, concerning the stature of the Patagonians. Having mentioned the reports of some early travellers with regard to the extraordinary size of some bones found on that coast which were supposed to be human; and having endeavored to show that these bones belonged to some large marine or land animal, he concludes, "de hisce ossibus crede quicquid liberit, dummodo, me suatore, Patagones pro gigantibus desinas habere." Hist. de Abissinibus, vol. ii. p. 19, &c.

NOTE [50]. p. 106. Antonio Sanches Ribeiro, a learned and ingenious physician, published a dissertation in the year 1765, in which he endeavors to prove that this disease was not introduced from America, but took its rise in Europe, and was brought on by an epidemic and malignant disorder. Did I chose to enter into a disquisition on this subject, which I should not have mentioned if it had not been intimately connected with this part of my inquiries, it would not be difficult to point out some mistakes with respect to the facts upon which he founds, as well as some errors in the consequences which he draws from them. The rapid communication of this disease from Spain over Europe, seems however to resemble the progress of an epidemic, rather than that of a disease transmitted by infection. The first mention of it is in the year 1493, and before the year 1497, it had made its appearance in most countries of Europe, with such alarming symptoms as rendered it necessary for the civil magistrates to interpose, in order to check its career. Since the publication of this work, a second edition of Dr. Sanchez's Dissertation has been communicated to me. It contains several additional facts in confirmation of his opinion, which is supported with such plausible arguments, as render it a subject of inquiry well deserving the attention of learned physicians.

NOTE [51]. p. 106.—The people of Otahite have no denomination for any number above two hundred, which is sufficient for their transactions. Voyages by Hawkesworth, ii. 228.

NOTE [52]. p. 107.—As the view which I have given of rude nations is extremely different from that exhibited by very respectable authors, it may be proper to produce some of the many authorities on which I found my description. The manners of the savage tribes in America have never been viewed by persons more capable of observing them with discernment, than the philosophers employed by France and Spain, in the year 1735, to determine the figure of the earth. M. Bouguer, D. Antonio d'Ulloa, and D. Jorge Juan, re-

sided long among the natives of the least civilized provinces in Peru. M. de la Condamine had not only the same advantages with them for observation, but, in his voyage down the Maragnon, he had an opportunity of inspecting the state of the various nations seated on its banks, in its vast course across the continent of South America. There is a wonderful resemblance in their representation of the character of the Americans. "They are all extremely indolent," says M. Hougner, "they are stupid; they pass whole days sitting in the same place, without moving, or speaking a single word. It is not easy to describe the degree of their indifference for wealth, and all its advantages. One does not well know what motive to propose to them, when one would persuade them to perform any service. It is vain to offer them money; they answer, that they are not hungry." Voyage au Perou, p. 102. "If one considers them as men, the narrowness of their understanding seems to be incompatible with the excellence of the soul. Their imbecility is so visible that one can hardly form an idea of them different from what one has of the brutes. Nothing disturbs the tranquillity of their souls, equally insensible to disasters and to prosperity. Though half naked, they are as contented as a monarch in his most splendid array. Riches do not attract them in the smallest degree, and the authority of dignities to which they may aspire are so little the objects of their ambition that an Indian will receive with the same indifference the office of a judge (Alcade) or that of a hangman, if deprived of the former and appointed to the latter. Nothing can move or change them. Interest has no power over them, and they often refuse to perform a small service, though certain of a great recompense. Fear makes no impression upon them, and respect as little. Their disposition is so singular that there is no method of influencing them, no means of rousing them from that indifference which is proof against all the endeavors of the wisest persons; no expedient which can induce them to abandon that gross ignorance, or lay aside that careless negligence which disconcert the prudence and disappoint the care of such as are attentive to their welfare." Voyage d'Ulloa, tom. i. 335. 356. Of those singular qualities he produces many extraordinary instances, p. 336. 347. "Insensibility," says M. de la Condamine, "is the basis of the American character. I leave others to determine, whether this should be dignified with the name of apathy, or disgraced with that of stupidity. It arises, without doubt, from the small number of their ideas, which do not extend beyond their wants. Gluttons even to voracity, when they have wherewithal to satisfy their appetite. Temperate, when necessity obliges them, to such a degree, that they can endure want without seeming to desire any thing. Pusillanimous and cowardly to excess, unless when they are rendered desperate by drunkenness. Averse to labor, indifferent to every motive of glory, honor, or gratitude; occupied entirely by the object that is present, and always determined by it alone, without any solicitude about futurity; incapable of foresight or of reflection; abandoning themselves when under no restraint, to a puerile joy, which they express by frisking about and immoderate fits of laughter; without object or design, they pass their life without thinking, and grow old without advancing beyond childhood, of which they retain all the defects. If this description were applicable only to the Indians in some provinces of Peru, who are slaves in every respect but the name, one might believe, that this degree of degeneracy was occasioned by the servile dependence to which they are reduced; the example of the modern Greeks being proof how far servitude may degrade the human species. But the Indians in the missions of the Jesuits, and the savages who still enjoy unimpaired liberty, being as limited in their faculties, not to say as stupid, as the other, one cannot observe without humiliation, that man, when abandoned to simple nature, and deprived of the advantages resulting from education and society, differs but little from the brute creation." Voyage de la Riv. de Amaz. 52. 53. M. de Chanvalon, an intelligent and philosophical observer, who visited Martinico in 1751, and resided there six years, gives the following description of the Caribs: "It is not the red color of their complexion, it is not the singularity of their features, which constitutes the chief difference between them and us. It is their excessive simplicity: it is the limited degree of their faculties. Their reason is not more enlightened or more provident than the instinct of brutes. The reason of the most gross peasants, that of the negroes brought up in the parts of Africa most remote from intercourse with Europeans, is such, that we discover appearances of intelligence, which, though

imperfect, is capable of increase. But of this the understanding of the Caribs seems to be hardly susceptible. If sound philosophy and religion did not afford us their light, if we were to decide according to the first impression which the view of that people makes upon the mind, we should be disposed to believe that they do not belong to the same species with us. Their stupid eyes are the true mirror of their souls; it appears to be without functions. Their indolence is extreme; they have never the least solicitude about the moment which is to succeed that which is present." Voyage à la Martinique, p. 44, 45. 51. M. de la Borde, Tetre, and Rochefort, confirm this description. "The characteristics of the Californians," says P. Venegas, "as well as of all other Indians, are stupidity and insensibility; want of knowledge and reflection; inconstancy, impetuosity, and blindness of appetite; an excessive sloth, and abhorrence of all labor and fatigue; an excessive love of pleasure and amusement of every kind, however trifling or brutal; pusillanimity; and, in fine, a most wretched want of every thing which constitutes the real man, and renders him rational, inventive, tractable, and useful to himself and society. It is not easy for Europeans, who never were out of their own country, to conceive an adequate idea of those people; for, even in the least frequented corners of the globe, there is not a nation so stupid, of such contracted ideas, and so weak both in body and mind, as the unhappy Californians. Their understanding comprehends little more than what they see; abstract ideas, and much less a chain of reasoning, being far beyond their power; so that they scarce ever improve their first ideas, and these are in general false, or at least inadequate. It is in vain to represent to them any future advantages which will result to them from doing or abstaining from this or that particular immediately present; the relation of means and ends being beyond the stretch of their faculties. Nor have they the least notion of pursuing such intentions as will procure themselves some future good, or guard them against future evils. Their will is proportional to their faculties, and all their passions move in a very narrow sphere. Ambition they have none, and are more desirous of being accounted strong than valiant. The objects of ambition with us, honor, fame, reputation, titles, posts, and distinctions of superiority, are unknown among them; so that this powerful spring of action, the cause of so much seeming good and real evil in the world, has no power here. This disposition of mind, as it gives them up to an amazing languor and lassitude, their lives fleeting away in a perpetual inactivity and detestation of labor, so it likewise induces them to be attracted by the first object which their own fancy, or the persuasion of another, places before them; and at the same time renders them as prone to alter their resolutions with the same facility. They look with indifference upon any kindness done them; nor is even the bare remembrance of it to be expected from them. In a word, the unhappy mortals may be compared to children, in whom the development of reason is not completed. They may indeed be called a nation who never arrive at manhood." Hist. of California, English Transl. i. 64. 67. Mr. Ellis gives a similar account of the want of foresight and inconsiderate disposition of the people adjacent to Hudson's Bay. Voyage, p. 194, 195.

The incapacity of the Americans is so remarkable, that negroes from all the different provinces of Africa are observed to be more capable of improving by instruction. They acquire the knowledge of several particulars which the Americans cannot comprehend. Hence the negroes, though slaves, value themselves as a superior order of beings, and look down upon the Americans with contempt, as void of capacity and of rational discernment. Ulloa Notic. Americ. 322, 323.

Note [53]. p. 107.—Dobrizhoffer, the last traveller I know who has resided among any tribe of the rude Americans, has explained so fully the various reasons which have induced their women to suckle their children long, and never to undertake rearing such as were feeble or distorted, and even to destroy a considerable number of their offspring, as to throw great light on the observations I have made, p. 144. 154. Hist. de Abissinibus, vol. ii. p. 107. 221. So deeply were these ideas imprinted in the minds of the Americans, that the Peruvians, a civilized people when compared with the barbarous tribes whose manners I am describing, retained them; and even their intercourse with the Spaniards has not been able to root them out. When twins are born in any family, it is still considered as an ominous event, and the parents have recourse to

rigorous acts of mortification, in order to avert the calamities with which they are threatened. When a child is born with any deformity, they will not, if they can possibly avoid it, bring it to be baptised, and it is with difficulty they can be brought to rear it. Arriaga Extirpac. de la Idolat. del Peru, p. 32, 33.

Note [54]. p. 108.—The number of the fish in the rivers of South America is so extraordinary as to merit particular notice. "In the Maragnon (says P. Acugna) fish are so plentiful, that, without any art, they may take them with the hands." p. 138. "In the Orinoco (says P. Gumilla,) besides an infinite variety of other fish, tortoise or turtle abound in such numbers, that I cannot find words to express it. I doubt not but that such as read my account will accuse me of exaggeration; but I can affirm that it is as difficult to count them as to count the sands on the banks of that river. One may judge of their number by the amazing consumption of them; for all the nations contiguous to the river, and even many who are at a distance, flock thither at the season of breeding, and not only find sustenance during that time, but carry off great numbers both of the turtles and of their eggs." Hist. de l'Orenoque, ii. c. 22. p. 59. M. De la Condamine confirms their accounts, p. 159.

Note [55]. p. 108.—Piso describes two of these plants, the *Cururupae* and the *Guajana-Timbo*. It is remarkable, that though they have this fatal effect upon fishes, they are so far from being noxious to the human species, that they are used in medicine with success. Piso, lib. iv. c. 88. Bancroft mentions another, the *Hiarree*, a small quantity of which is sufficient to inebriate all the fish to a considerable distance, so that in a few minutes they float motionless on the surface of the water, and are taken with ease. Nat. Hist. of Guiana, p. 106.

Note [56]. p. 108.—Remarkable instances occur of the calamities which rude nations suffer by famine. Alvar Nugnez Cabeza de Vaca, one of the most gallant and virtuous of the Spanish adventurers, resided almost nine years among the savages of Florida. They were unacquainted with every species of agriculture. Their subsistence was poor and precarious. "They live chiefly (says he) upon roots of different plants, which they procure with great difficulty, wandering from place to place in search of them. Sometimes they kill game, sometimes they catch fish, but in such small quantities, that their hunger is so extreme as compels them to eat spiders, the eggs of ants, worms, lizards, serpents, a kind of unctuous earth, and, I am persuaded, that if in this country there were stones, they would swallow these. They preserve the bones of fishes and serpents, which they grind into powder and eat." The only season when they do not suffer much from famine, is, when a certain fruit, which he calls *Tunas*, is ripe. This is the same with the *Opuntia*, or prickly pear, of a reddish and yellow color, with a sweet insipid taste. They are sometimes obliged to travel far from their usual place of residence in order to find them. Naufragios, c. xviii. p. 20, 21, 22. In another place he observes, that they are frequently reduced to pass two or three days without food, c. xxiv. p. 27.

Note [57]. p. 108.—M. Fermin has given an accurate description of the two species of manioc, with an account of its culture, to which he has added some experiments, in order to ascertain the poisonous qualities of the juice extracted from that species which he calls the bitter cassava. Among the Spaniards it is known by the name of *Yuca brava*. Descr. de Surin. tom. i. p. 66.

Note [58]. p. 108.—The plantain is found in Asia and Africa, as well as in America. Oviedo contends, that it is not an indigenous plant of the New World, but was introduced into the Island of Hispaniola, in the year 1516, by Father Thomas de Berlanga, and that he transplanted it from the Canary Islands, whither the original slips had been brought from the East Indies. Oviedo, lib. viii. c. 1. But the opinion of Acosta and other naturalists, who reckon it an American plant, seems to be better founded. Acosta Hist. Nat. lib. iv. 21. It was cultivated by rude tribes in America, who had little intercourse with the Spaniards, and who were destitute of that ingenuity which disposes men to borrow what is useful from foreign nations. Gumil. iii. 186. Wafer's Voyage, p. 87.

NOTE [59]. p. 108.—It is remarkable that Acosta, one of the most accurate and best informed writers concerning the West Indies, affirms that maize, though cultivated in the continent, was not known in the islands, the inhabitants of which had none but cassada bread. Hist. Nat. lib. iv. c. 16. But P. Martyr, in the first book of his first Decad, which was written in the year 1493, upon the return of Columbus from his first voyage, expressly mentions maize as a plant which the islanders cultivated, and of which they made bread, p. 7. Gomara likewise asserts that they were acquainted with the culture of maize. Histor. Gener. cap. 28. Oviedo describes maize without any intimation of its being a plant that was not natural to Hispaniola. Lib. vii. c. 1.

NOTE [60]. p. 109.—New Holland, a country which formerly was only known, has lately been visited by intelligent observers. It lies in a region of the globe where it must enjoy a very favorable climate, as it stretches from the 10th to the 38th degree of southern latitude. It is of great extent, and from its square form must be much more than equal to all Europe. The people who inhabit the various parts of it appear to be of one race. They are evidently ruder than most of the Americans, and have made still less progress in improvement and the arts of life. There is not the least appearance of cultivation in any part of this vast region. The inhabitants are extremely few, so that the country appears almost desolate. Their tribes are still more inconsiderable than those of America. They depend for subsistence almost entirely on fishing. They do not settle in one place, but roam about in quest of food. Both sexes go stark naked. Their habitations, utensils, &c. are more simple and rude than those of the Americans. Voyages by Hawkesworth, iii. 622, &c. This, perhaps, is the country where man has been discovered in the earliest stage of his progress, and exhibits a miserable specimen of his condition and powers in that uncultivated state. If this country shall be more fully explored by future navigators, the comparison of the manners of its inhabitants with those of the Americans will prove an instructive article in the history of the human species.

NOTE [61]. p. 109.—P. Gabriel Marest, who travelled from his station among the Illinois to Michilimackinac, thus describes the face of the country:—"We have marched twelve days without meeting a single human creature. Sometimes we found ourselves in vast meadows, of which we could not see boundaries, through which there flowed many brooks and rivers, but without any path to conduct us. Sometimes we were obliged to open a passage across thick forests, through bushes, and underwood filled with briars and thorns. Sometimes we had to pass through deep marshes, in which we sunk up to the middle. After being fatigued through the day, we had the earth for our bed, or a few leaves, exposed to the wind, the rain, and all the injuries of the air." Lettr. Edifiante, ii. 360. Dr. Bieknell, in an excursion from North Carolina towards the mountains, A. D. 1730, travelled fifteen days without meeting with a human creature. Nat. Hist. of North Carolina, 389. Diego de Ordaz, in attempting to make a settlement in South America, A. D. 1532, marched fifty days through a country without one inhabitant. Herrera, dec. 5. lib. i. c. 11.

NOTE [62]. p. 109.—I strongly suspect that a community of goods, and an undivided store, are known only among the rudest tribes of hunters; and that as soon as any species of agriculture or regular industry is known, the idea of an exclusive right of property to the fruits of them is introduced. I am confirmed in this opinion by accounts which I have received concerning the state of property among the Indians in very different regions of America. "The idea of the natives of Brazil concerning property is, that if any person cultivate a field, he alone ought to enjoy the produce of it, and no other has a title to pretend to it. If an individual or family go a hunting or fishing, what is caught belongs to the individual or to the family, and they communicate no part of it to any but to their cazique, or to such of their kindred as happen to be indisposed. If any person in the village come to their hut, he may sit down freely, and eat without asking liberty. But this is the consequence of their general principle of hospitality; for I never observed any partition of the increase of their fields, or the produce of the chase, which I could consider as the result of any idea concerning a community of goods. On the contrary, they are so much attached to what they deem to be their

property, that it would be extremely dangerous to encroach upon it. As far as I can see or can learn, there is not one tribe of Indians in South America among whom the community of goods which has been so highly extolled is known. The circumstance in the government of the Jesuits, most irksome to the Indians of Paraguay, was the community of goods which those fathers introduced. This was repugnant to the original ideas of the Indians. They were acquainted with the rights of private exclusive property, and they submitted with impatience to regulations which destroyed them." M. le Cheval, do Pinto, MS. *penes me*. "Actual possession (says a missionary who resided several years among the Indians of the five nations) gives a right to the soil; but, whenever a possessor sees fit to quit it, another has as good right to take it as he who left it. This law, or custom, respects not only the particular spot on which he erects his house, but also his planting-ground. If a man has prepared a particular spot of ground on which he designs in future to build or plant, no man has a right to incommode him, much less to the fruit of his labors, until it appears that he voluntarily gives up his views. But I never heard of any formal conveyance from one Indian to another in their natural state. The limit of every canton is circumscribed; that is, they are allowed to hunt as far as such a river on this hand, and such a mountain on the other. This area is occupied and improved by individuals and their families: individuals, not the community, have the use and profit of their own labors, or success in hunting." MS. of Mr. Gideon Hawley, *penes me*.

NOTE [63]. p. 109.—This difference of temper between the Americans and Negroes is so remarkable, that it is a proverbial saying in the French islands, "Regarder un sauvage de travers, c'est le battre; le battre, c'est le tuer; battre un Negre, c'est le nourrir." Tertre, ii. 490.

NOTE [64]. p. 109.—The description of the political state of the people of Cinaloa perfectly resembles that of the inhabitants of North America. "They have neither laws nor kings (says a missionary who resided long among them) to punish any crime. Nor is there among them any species of authority, or political government, to restrain them in any part of their conduct. It is true that they acknowledge certain caziques, who are heads of their families or villages; but their authority appears chiefly in war, and the expeditions against their enemies. This authority the caziques obtain not by hereditary right, but by their valor in war, or by the power and number of their families and relations. Sometimes they owe their pre-eminence to their eloquence in displaying their own exploits." Ribas Histor. de las Triunph, &c. p. 11. The state of the Chiquitos in South America is nearly the same. "They have no regular form of government or civil life, but in matters of public concern they listen to the advice of their old men, and usually follow it. The dignity of Cazique is not hereditary, but conferred according to merit, as the reward of valor in war. The union among them is imperfect. Their society resembles a republic without any head, in which every man is master of himself, and, upon the least disgust, separates from those with whom he seemed to be connected." Relacion Historica de las Misiones de los Chiquitos, por P. Juan, Patr. Fernandez, p. 32, 33. Thus, under very different climates, when nations are in a similar state of society, their institutions and civil government assume the same form.

NOTE [65]. p. 111.—"I have known the Indians (says a person well acquainted with their mode of life) to go a thousand miles for the purpose of revenge, in pathless woods, over hills and mountains, through huge cane swamps, exposed to the extremities of heat and cold, the vicissitude of seasons, to hunger and thirst. Such is their overboiling revengeful temper, that they utterly contemn all those things as imaginary trifles, if they are so happy as to get the scalp of the murderer, or enemy, to satisfy the craving ghosts of their deceased relations." Adair's Hist. of Amer. Indians, p. 150.

NOTE [66]. p. 111.—In the account of the great war between the Algonquins and Iroquois, the achievements of Piskaret, a famous chief of the Algonquins, performed mostly by himself alone, or with one or two companions, make a capital figure. De la Potherie, i. 297, &c. Colden's Hist. of Five Nations, 125, &c.

NOTE [67]. p. 111.—The life of an unfortunate leader is often in danger, and he is always degraded

from the rank which he had acquired by his former exploits. Adair, p. 388.

NOTE [68]. p. 111.—As the ideas of the North Americans, with respect to the mode of carrying on war, are generally known, I have founded my observations chiefly upon the testimony of the authors who describe them. But the same maxims took place among other nations in the New World. A judicious missionary has given a view of the military operations of the people in Gran Chaco, in South America, perfectly similar to those of the Iroquois. "They are much addicted to war (says he), which they carry on frequently among themselves, but perpetually against the Spaniards. But they may rather be called thieves than soldiers, for they never make head against the Spaniards, unless when they can assault them by stealth, or have guarded against any mischance by spies, who may be called indefatigable; they will watch the settlements of the Spaniards for one, two, or three years, observing by night every thing that passes with the utmost solicitude, whether they may expect resistance or not, and until they are perfectly secure of the event, they will not venture upon an attack; so that, when they do give the assault, they are certain of success, and free from all danger. These spies, in order that they may not be observed, will creep on all four like cats in the night; but if they are discovered, make their escape with much dexterity. But, although they never choose to face the Spaniards, if they be surrounded in any place whence they cannot escape, they will fight with desperate valor, and sell their lives very dear." Lozano Descript. del Gran Chaco, p. 78.

NOTE [69]. p. 111.—Lery, who was an eye-witness of the proceedings of the *Tupinambos*, a Brazilian tribe, in a war against a powerful nation of their enemies, describes their courage and ferocity in very striking terms. Ego cum Gallo altero paulo curiosius, magno nostro periculo (si enim ad hostibus capti aut lesi fuissimus, devorati fuissimus devoti,) barbaros nostros in militiam euntes comitari volui. Hi, numero 4000 capita, cum hostibus ad litus decurrerunt, tanta ferocitate, ut vel rabidos et furiosos quosque asperarent. Cum primum hostes conspexere, in magnos atque editos ululatus perreperunt. Hæc gens adeo fera est et truculenta, ut tantisper dum virum vel tantillum restat, continuo dimicant, fugamque nunquam eapessant. Quod a natura illis inditum esse reor. Testor interea me, qui non semel, tum peditum tum equitum copias ingentes, in aciem instructas hic conspexi, tanta nunquam voluptate videndis peditum legionibus armis fulgentibus, quanta tum pugnantis istis percussum fuisse. Lery Hist. Navigat. in Brasil. ap. de Bry, iii. 207, 208, 209.

NOTE [70]. p. 111.—It was originally the practice of the Americans, as well as of other savage nations, to cut off the heads of the enemies whom they slew, and to carry them away as trophies. But, as they found these combersome in their retreat, which they always make very rapidly, and often through a vast extent of country, they became satisfied with tearing off their scalps. This custom, though most prevalent in North America, was not unknown among the Southern tribes. Lozano, p. 79.

NOTE [71]. p. 112.—The terms of the war song seem to be dictated by the same fierce spirit of revenge. "I go to war to revenge the death of my brothers; I shall kill; I shall exterminate; I shall burn my enemies; I shall bring away slaves; I shall devour their heart, dry their flesh, drink their blood; I shall tear off their scalps, and make cups of their skulls." Bossu's Travels through Louisiana, vol. i. p. 102. I am informed, by persons on whose testimony I can rely, that as the number of people in the Indian tribes has decreased so much, almost none of their prisoners are now put to death. It is considered as better policy to spare and to adopt them. Those dreadful scenes which I have described occur now so rarely, that missionaries and traders who have resided long among the Indians, never were witnesses to them.

NOTE [72]. p. 112.—All the travellers who have visited the most uncivilized of the American tribes, agree in this. It is confirmed by two remarkable circumstances, which occurred in the conquest of different provinces. In the expedition of Narvaez into Florida in the year 1528, the Spaniards were reduced to such extreme distress by famine, that, in order to preserve their own lives, they ate such of their companions as

happened to die. This appeared so shocking to the natives, who were accustomed to devour none but prisoners, that it filled them with horror and indignation against the Spaniards. Torquemada Monarch. Ind. ii. p. 584. Naufragios de Alv. Nùgues Cabeça de Vaca, c. xiv. p. 15. During the siege of Mexico, though the Mexicans devoured with greediness the Spaniards and Tlascalans whom they took prisoners, the utmost rigor of the famine which they suffered could not induce them to touch the dead bodies of their own countrymen. Bern. Diaz del Castillo Conquist. de la N. España, p. 156.

NOTE [73]. p. 112. Many singular circumstances concerning the treatment of prisoners among the people of Brasil, are contained in the narrative of Stadius, a German officer in the service of the Portuguese, published in the year 1556. He was taken prisoner by the *Toupinambos*, and remained in captivity nine years. He was often present at those horrid festivals which he describes, and was destined himself to the same cruel fate with other prisoners. But he saved his life by his extraordinary efforts of courage and address. Do Bry, iii. p. 34, &c. M. de Lery, who accompanied M. de Villagagnon in his expedition to Brasil in the year 1556, and who resided some time in that country, agrees with Stadius in every circumstance of importance. He was frequently an eye-witness of the manner in which the Brasilians treated their prisoners. De Bry, iii. 210. Several striking particulars omitted by them, are mentioned by a Portuguese author. Purch. Pilgr. iv. 1294, &c.

NOTE [74]. p. 112.—Though I have followed that opinion concerning the apathy of the Americans, which appeared to me most rational, and supported by the authority of the most respectable authors, other theories have been formed with regard to it, by writers of great eminence. D. Ant. Ulloa, in a late work, contends that the texture of the skin and bodily habit of the Americans is such, that they are less sensible of pain than the rest of mankind. He produces several proofs of this, from the manner in which they endure the most cruel chirurgical operations, &c. Noticias Americanas, p. 313, 314. The same observation has been made by surgeons in Brasil. An Indian, they say, never complains under pain, and will bear the amputation of a leg or an arm without uttering a single groan. MS. penes me.

NOTE [75]. p. 112.—This is an idea natural to all rude nations. Among the Romans, in the early periods of their commonwealth, it was a maxim that a prisoner "tum decessisse videtur cum captus est." Digest. lib. xlix. tit. 15. c. 18. And afterwards, when the progress of refinement rendered them more indulgent with respect to this article, they were obliged to employ two fictions of law to secure the property, and permit the return of a captive; the one by the *Lex Cornelia*, and the other by the *Jus Postliminii*. Heinec. Elem. Jur. Civ. sec. ord. Pand. ii. p. 294. Among the Negroes the same ideas prevail. No ransom was ever accepted for a prisoner. As soon as one is taken in war, he is reputed to be dead; and he is so in effect to his country and his family. Voy. du Cheval. des Marchais, i. p. 369.

NOTE [76]. p. 113.—The people of Chili, the most gallant and high-spirited of all the Americans, are the only exception to this observation. They attack their enemies in the open field; their troops are ranged in regular order; their battalions advance to the charge not only with courage, but with discipline. The North Americans, though many of them have substituted the European fire-arms in place of their own bows and arrows, still adhere to their ancient maxims of war, and carry it on according to their own peculiar system. But the Chilese nearly resemble the warlike nations of Europe and Asia in their military operations. Ovalle's Relation of Chili. Church. Coll. iii. p. 71. Lozano's Hist. Parag. i. 144, 145.

NOTE [77]. p. 113.—Herrera gives a remarkable proof of this. In Yucatan, the men are so solitious about their dress, that they carry about with them mirrors, probably made of stone, like those of the Mexicans, Dec. iv. lib. iii. c. 8, in which they delight to view themselves; but the women never use them. Dec. iv. lib. x. c. 3. He takes notice that among the fierce tribe of the *Panches*, in the new kingdom of Granada, none but distinguished warriors were permitted either to pierce their lips and to wear green

stones in them, or to adorn their heads with plumes of feathers. Dec. vii. lib. ix. c. 4. In some provinces of Peru, though that empire had made considerable progress in civilization, the state of women was little improved. All the toil of cultivation and domestic work was devolved upon them, and they were not permitted to wear bracelets, or other ornaments, with which the men were fond of decking themselves. Zarate Hist. de Peru, i. p. 15, 16.

NOTE [78]. p. 113.—I have ventured to call this mode of annointing and painting their bodies, the *dress* of the Americans. This is agreeable to their own idiom. As they never stir abroad if they are not completely annoointed; they excuse themselves when in this situation, by saying that they cannot appear because they are naked. Guinilla, Hist. de l'Orénoque, i. 191.

NOTE [79]. p. 113.—Some tribes in the province of Cinaloa, on the gulf of California, seem to be among the rudest people of America united in the social state. They neither cultivate nor sow; they have no houses in which they reside. Those in the inland country subsist by hunting; those on the seacoast chiefly by fishing. Both depend upon the spontaneous productions of the earth, fruits, plants, and roots of various kinds. In the rainy season, as they have no habitations to afford them shelter, they gather bundles of reeds, or strong grass; and binding them together at one end, they open them at the other, and fitting them to their heads, they are covered as with a large cap, which, like a penthouse, throws off the rain, and will keep them dry for several hours. During the warm season, they form a shed with the branches of trees, which protects them from the sultry rays of the sun. When exposed to cold they make large fires, round which they sleep in the open air. Historia de los Triunfos de Nuestra Santa Fe entre Gentres las mas Barbaras, &c. por. P. And. Perez de Ribas, p. 7, &c.

NOTE [80]. p. 113.—These houses resemble barns. "We have measured some which were a hundred and fifty paces long, and twenty paces broad. Above a hundred persons resided in some of them." Wilson's Account of Guiana. Purch. Pilgr. vol. iv. p. 1263. Ibid. 1291. "The Indian houses," says Mr. Barrere, "have a most wretched appearance, and are a striking image of the rudeness of early times. Their huts are commonly built on some rising ground, or on the banks of a river, huddled sometimes together, sometimes straggling, and always without any order. Their aspect is melancholy and disagreeable. One sees nothing but what is hideous and savage. The uncultivated fields have no gayety. The silence which reigns there, unless when interrupted by the disagreeable notes of birds, or cries of wild beasts, is extremely dismal." Relat. de la France Equin. p. 146.

NOTE [81]. p. 113.—Some tribes in South America can send their arrows to a great distance, and with considerable force, without the aid of the bow. They make use of a hollow reed, about nine feet long and an inch thick, which is called a *Sarbacane*. In it they lodge a small arrow, with some unspun cotton wound about its great end; this confines the air, so that they can blow it with astonishing rapidity, and a sure aim, to the distance of above a hundred paces. These small arrows are always poisoned. Fermin. Desc. de Surin. i. 55. Bancroft's Hist. of Guiana, p. 281, &c. The *Sarbacane* is much used in some parts of the East Indies.

NOTE [82]. p. 113.—I might produce many instances of this, but shall satisfy myself with one taken from the Eskimaux. "Their greatest ingenuity (says Mr. Ellis) is shown in the structure of their bows, made commonly of three pieces of wood, each making part of the same arch, very nicely and exactly joined together. They are commonly of fir or larch; and as this wants strength and elasticity, they supply both by bracing the back of the bow with a kind of thread, or line, made of the sinews of their deer, and the bow-string of the same materials. To make them draw more stiffly, they dip them into water, which causes both the back of the bow and the string to contract, and consequently gives it the greater force; and as they practice from their youth, they shoot with very great dexterity." Voyage to Hudson's Bay. p. 134.

NOTE [83]. p. 113.—Necessity is the great prompter and guide of mankind in their inventions. There is, however, such inequality in some parts of their pro-

gress, and some nations get so far the start of others in circumstances nearly similar, that we must ascribe this to some events in their story, or to some peculiarity in their situation, with which we are unacquainted. The people in the island of Otalente, lately discovered in the South Sea, far excel most of the Americans in the knowledge and practice of the arts of ingenuity, and yet they had not invented any method of boiling water; and having no vessel that could bear the fire, they had no more idea that water could be made hot, than that it could be made solid. Voyages by Hawkesworth, i. 466, 484.

NOTE [84]. p. 118.—One of these boats, which would carry nine men, weighed only sixty pounds. Gosnol. Relat. des Voy. a la Virgin. Rec. de Voy. au Nord, tom. v. p. 403.

NOTE [85]. p. 113.—A remarkable proof of this is produced by Ulloa. In weaving hammocks, coverlets, and other coarse cloths which they are accustomed to manufacture, their industry has discovered no more expeditious method than to take up thread after thread, and, after counting and sorting them each time, to pass the woof between them, so that in finishing a small piece of those stuffs they frequently spend more than two years. Voyage, i. 336. Bancroft gives the same description of the Indians of Guiana, p. 255. According to Adair, the ingenuity and despatch of the North American Indians are not greater, p. 422. From one of the engravings of the Mexican paintings in Purchas. vol. iii. p. 1106, I think it probable that the people of Mexico were unacquainted with any better or more expeditious mode of weaving. A loom was an invention beyond the ingenuity of the most improved Americans. In all their works they advance so slowly, that one of their artists is two months at a tobacco-pipe with his knife before he finishes it. Adair, p. 423.

NOTE [86]. p. 114.—The article of religion in P. Laftau's *Mœurs des Sauvages* extends to 347 tedious pages in quarto.

NOTE [87]. p. 114.—I have referred the reader to several of the authors who describe the most uncivilized nations in America. Their testimony is uniform. That of P. Ribas concerning the people of Cinaloa coincides with the rest. "I was extremely attentive (says he), during the years I resided among them, to ascertain whether they were to be considered as idolaters; and it may be affirmed with the most perfect exactness, that though among some of them there may be traces of idolatry, yet others have not the least knowledge of God, or even of any false deity, nor pay any formal adoration to the Supreme Being who exercises dominion over the world; nor have they any conception of the providence of a Creator, or Governor, from whom they expect in the next life the reward of their good or the punishment of their evil deeds. Neither do they publicly join in any act of divine worship." Ribas Triunfos, &c. p. 16.

NOTE [88]. p. 114.—The people of Brasil were so much affrighted by thunder, which is frequent and awful in their country, as well as in other parts of the torrid zone, that it was not only the object of religious reverence, but the most expressive name in their language for their Deity was *Toupan*, the same by which they distinguished thunder. Piso de Medec. Brasil. p. 8. Nieuhoff. Church. Coll. ii. p. 132.

NOTE [89]. p. 115.—By the account which M. Dumont, an eye-witness, gives of the funeral of the great chief of the Natchez, it appears that the feelings of the persons who suffered on that occasion were very different. Some solicited the honor with eagerness; others labored to avoid their doom, and several saved their lives by flying to the woods. As the Indian Brahmins give an intoxicating draught to the women who are to be burned together with the bodies of their husbands, which renders them insensible of their approaching fate, the Natchez obliged their victims to swallow several large pills of tobacco, which produces a similar effect. Mem. de Louis. i. 227.

NOTE [90]. p. 115.—On some occasions, particularly in dances instituted for the recovery of persons who are indisposed, they are extremely licentious and indecent. De la Potherie Hist. &c. ii. p. 42. Charlov. N. Fr. iii. p. 319. But the nature of their dances is commonly such as I have described.

NOTE [91]. p. 115.—The *Othomacoas*, a tribe seated on the banks of the Orinoco, employ for the same purpose a composition which they call *Yupa*. It is formed of the seeds of an unknown plant reduced to powder, and certain shells burned and pulverized. The effects of this when drawn up into the nostrils are so violent that they resemble madness rather than intoxication. Gumilla, i. 286.

NOTE [92]. p. 115.—Though this observation holds true among the greater part of the southern tribes, there are some in which the intemperance of the women is as excessive as that of the men. Bancroft's Nat. Hist. of Guiana, p. 275.

NOTE [93]. p. 116.—Even in the most intelligent writers concerning the manners of the Americans, one meets with inconsistent and inexplicable circumstances. The Jesuit Charlevoix, who, in consequence of a controversy between his order and that of the Franciscans, with respect to the talents and abilities of the North Americans, is disposed to represent their intellectual as well as moral qualities in the most favorable light, asserts, that they are engaged in continual negotiations with their neighbors, and conduct these with the most refined address. At the same time he adds, "that it behooves their envoys or plenipotentiaries to exert their abilities and eloquence, for, if the terms which they offer are not accepted, they had need to stand on their guard. It frequently happens that a blow with the hatchet is the only return given to their propositions. The envoy is not out of danger, even if he is so fortunate as to avoid the stroke; he may expect to be pursued, and, if taken, to be burnt." Hist. N. Fr. iii. 251. What occurs, p. 147, concerning the manner in which the Tlascalans treated the ambassadors from Zempoalla, corresponds with the fact related by Charlevoix. Men capable of such acts of violence seem to be unacquainted with the first principles upon which the intercourse between nations is founded; and instead of the perpetual negotiations which Charlevoix mentions, it seems almost impossible that there should be any correspondence whatever among them.

NOTE [94]. p. 117.—It is a remark of Tacitus concerning the Germans, "*Gaudent muneribus, sed nec data imputant, nec acceptis obligantur.*" C. 21. An author who had a good opportunity of observing the principle which leads savages neither to express gratitude for favors which they had received, nor to expect any return for such as they bestowed, thus explains their ideas: "If (say they) you give me this, it is because you have no need of it yourself; and as for me, I never part with that which I think necessary to me." *Memoire sur le Gabibis*; Hist. des Plantes de la Guiane Francoise par M. Aublet, tom ii. p. 110.

NOTE [95]. p. 118.—And Bernaldes, the contemporary and friend of Columbus, has preserved some circumstances concerning the bravery of the Caribbees, which are not mentioned by Don Ferdinand Columbus, or the other historians of that period whose works have been published. A Caribbean canoe, with four men, two women, and a boy, fell in unexpectedly with the fleet of Columbus in his second voyage, as it was steering through their islands. At first they were struck almost stupid with astonishment at such a strange spectacle, and hardly moved from the spot for above an hour. A Spanish bark, with twenty-five men, advanced towards them, and the fleet gradually surrounded them, so as to cut off their communication with their shore. "When they saw that it was impossible to escape (says the historian), they seized their arms with undaunted resolution, and began the attack. I use the expression *with undaunted resolution*, for they were few, and beheld a vast number ready to assault them. They wounded several of the Spaniards, although they had targets, as well as other defensive armour; and even after their canoe was overset, it was with no little difficulty and danger that part of them were taken, as they continued to defend themselves, and to use their bows with great dexterity while swimming in the sea." Hist. de D. Fern. y Ysab. MS. c. 119.

NOTE [96]. p. 118.—A probable conjecture may be formed with respect to the cause of the distinction in character between the Caribbees and the inhabitants of the larger islands. The former appear manifestly to be a separate race. Their language is totally different from that of their neighbors in the large islands. They themselves have a tradition, that their ancestors came originally from some part of the continent, and, having

conquered and exterminated the ancient inhabitants, took possession of their lands, and of their women. Rochefort, 334. Tertro, 310. Hence they call themselves *Banaree*, which signifies a man come from beyond sea. Labat, vi. 131. Accordingly, the Caribbees still use two distinct languages, one peculiar to the men, and the other to the women. Tertre, 361. The language of the men has nothing common with that spoken in the large islands. The dialect of the women considerably resembles it. Labat, 129. This strongly confirms the tradition which I have mentioned. The Caribbees themselves imagine that they were a colony from the *Galabiz*, a powerful nation of Guiana, in South America. Tertre, 361. Rochefort, 348. But as their fierce manners approach nearer to those of the people in the northern continent, than to those of the natives of South America; and as their language has likewise some affinity to that spoken in Florida, their origin should be deduced rather from the former than from the latter. Labat, 129, &c. Herrera, dec. i. lib. ix. c. 4. In their wars, they still observe their ancient practice of destroying all the males, and preserving the women either for servitude or for breeding.

NOTE [97]. p. 197.—Our knowledge of the events which happened in the conquest of New Spain, is derived from sources of information more original and authentic than that of any transaction in the history of America. The letters of Cortes to the Emperor Charles V. are an historical monument, not only first in order of time, but of the greatest authenticity and value. As Cortes early assumed a command independent of Velasquez, it became necessary to convey such an account of his operations to Madrid, as might procure him the approbation of his sovereign.

The first of his despatches has never been made public. It was sent from Vera Cruz, July 16th, 1519. As I imagined that it might not reach the Emperor until he arrived in Germany, for which he set out early in the year 1520, in order to receive the Imperial crown; I made diligent search for a copy of this despatch, both in Spain and in Germany, but without success. This, however, is of less consequence, as it could not contain any thing very material, being written so soon after Cortes arrived in New Spain. But, in searching for the letter from Cortes, a copy of one from the colony of Vera Cruz to the Emperor has been discovered in the Imperial library at Vienna. Of this I have given some account in its proper place, see p. 122. The second despatch, dated October 30th, 1520, was published at Seville A. D. 1522, and the third and fourth soon after they were received. A Latin translation of them appeared in Germany A. D. 1532. Ramusio soon after made them more generally known, by inserting them in his valuable collection. They contain a regular and minute history of the expedition, with many curious particulars concerning the policy and manners of the Mexicans. The work does honor to Cortes; the style is simple and perspicuous; but as it was manifestly his interest to represent his own actions in the fairest light, his victories are probably exaggerated, his losses diminished, and his acts of rigor and violence softened.

The next in order is the *Chronica de la Nueva Espana*, by Francisco Lopez de Gomara, published A. D. 1554. Gomara's historical merit is considerable. His mode of narration is clear, flowing, always agreeable, and sometimes elegant. But he is frequently inaccurate and credulous; and as he was the domestic chaplain of Cortes after his return from New Spain, and probably composed his work at his desire, it is manifest that he labors to magnify the merit of his hero, and to conceal or extenuate such transactions as were unfavorable to his character. Of this, Herrera accuses him in one instance, Dec. ii. lib. iii. c. 2, and it is not once only that this is conspicuous. He writes, however, with so much freedom concerning several measures of the Spanish Court, that the copies both of his *Historia de las Indias*, and of his *Chronica*, were called in by a decree of the Council of the Indies, and they were long considered as prohibited books in Spain; it is only of late that license to print them has been granted. Puelo Biblioth. 589.

The *Chronicle of Gomara* induced Bernal Diaz del Castillo to compose his *Historia Verdadera de la Conquista de la Nueva Espana*. He had been an adventurer in each of the expeditions to New Spain, and was the companion of Cortes in all his battles and perils. When he found that neither he himself, nor many of his fellow soldiers, were once mentioned by Gomara, but that the fame of all their exploits was ascribed to Cortes, the gallant veteran laid bold of his pen with indignation, and composed his true history. It contains a

prolix, minute, confused narrative of all Cortes's operations, in such a rude vulgar style as might be expected from an illiterate soldier. But as he relates transactions of which he was witness, and in which he performed a considerable part, his account bears all the marks of authenticity, and is accompanied with such a pleasant *navette*, with such interesting details, with such amusing vanity, and yet so pardonable in an old soldier who had been (as he boasts) in a hundred and nineteen battles, as renders his book one of the most singular that is to be found in any language.

Pet. Martyr ab Angleria, in a treatise *De Insulis nuper inventis*, added to his *Decades de Rebus Occidentis et Novo Orbe*, gives some account of Cortes's expedition. But he proceeds no further than to relate what happened after his first landing. This work, which is brief and slight, seems to contain the information transmitted by Cortes in his first despatches, embellished with several particulars communicated to the author by the officers who brought the letters from Cortes.

But the book to which the greater part of modern historians have had recourse for information concerning the conquest of New Spain, is *Historia de la Conquista de Mexico*, por D. Antonio de Solis, first published A. D. 1684. I know no author in any language whose literary fame has risen so far beyond his real merit. De Solis is reckoned by his countrymen one of the purest writers in the Castilian tongue; and if a foreigner may venture to give his opinion concerning a matter of which Spaniards alone are qualified to judge, he is entitled to that praise. But though his language be correct, his taste in composition is far from being just. His periods are so much labored as to be often stiff, and sometimes tumid; the figures which he employs by way of ornament are frequently trite or improper, and his observations superficial. These blemishes, however, might easily be overlooked, if he were not defective with respect to all the great qualities of an historian. Destitute of that patient industry in research which conducts to the knowledge of truth; a stranger to that impartiality which weighs evidence with cool attention; and ever eager to establish his favorite system of exalting the character of Cortes into that of a perfect hero, exempt from error, and adorned with every virtue; he is less solicitous to discover what was true than to relate what might appear splendid. When he attempts any critical discussion, his reasonings are fallacious, and founded upon an imperfect view of facts. Though he sometimes quotes the *despatches* of Cortes, he seems not to have consulted them; and though he sets out with some censure on Gomara, he frequently prefers his authority, the most doubtful of any, to that of the other contemporary historians.

But of all the Spanish writers, Herrera furnishes the fullest and most accurate information concerning the conquest of Mexico, as well as every other transaction of America. The industry and attention with which he consulted not only the books, but the original paper and public records, which tended to throw any light upon the subject of his inquiries, were so great, and he usually judges of the evidence before him with so much impartiality and candor, that his *Decads* may be ranked among the most judicious and useful historical collections. If, by attempting to relate the various occurrences in the New World in a strict chronological order, the arrangement of events in his work had not been rendered so perplexed, disconnected, and obscure that it is an unpleasant task to collect from different parts of his book, and piece together the detached shreds of a story, he might justly have been ranked among the most eminent historians of his country. He gives an account of the materials from which he composed his work, Dec. vi. lib. iii. c. 19.

NOTE [98]. p. 119.—Cortes purposed to have gone in the train of Ovando when he set out for his government in the year 1502, but he was detained by an accident. As he was attempting in a dark night to scramble up to the window of a lady's bed-chamber, with whom he carried on an intrigue, an old wall, on the top of which he had mounted, gave way, and he was so much bruised by the fall as to be unfit for the voyage. Gomara, *Chronica de la Nueva Espana*, cap. 1.

NOTE [99]. p. 119.—Cortes had two thousand pesos in the hands of Andrew Duero, and he borrowed four thousand. Those sums are about equal in value to fifteen hundred pounds sterling; but as the price of every thing was extremely high in America, they made but a scanty stock when applied towards the equipment of a military expedition. Herrera, dec. ii. lib. iii. c. 2. B. Diaz, c. 20.

NOTE [100.] p. 119.—The names of those gallant officers, which will often occur in the subsequent story, were Juan Velasquez de Leon, Alonso Hernandez Portocarrero, Francisco de Montejo, Christoval de Olid, Juan de Escalante, Francisco de Morla, Pedro de Alvarado, Francisco de Salceda, Joan de Escobar, Gines de Nortes. Cortes himself commanded the Capitana, or Admiral. Francisco de Orozco, an officer formed in the wars of Italy, had the command of the artillery. The experienced Alaminos acted as chief pilot.

NOTE [101.] p. 119.—In these different conflicts, the Spaniards lost only two men, but had a considerable number wounded. Though there be no occasion for recourse to any supernatural cause to account either for the greatness of their victories, or the smallness of their loss, the Spanish historians fail not to ascribe both to the patronage of St. Jago, the tutelar saint of their country, who, as they relate, fought at the head of their countrymen, and, by his prowess, gave a turn to the fate of the battle. Gomara is the first who mentions this apparition of St. James. It is amusing to observe the embarrassment of B. Diaz del Castillo, occasioned by the struggle between his superstition and his veracity. The former disposed him to believe this miracle, the latter restrained him from attesting it. "I acknowledge," says he, "that all our exploits and victories are owing to our Lord Jesus Christ, and that in this battle there was such a number of Indians to every one of us, that if each had thrown a handful of earth they might have buried us, if by the great mercy of God we had not been protected. It may be that the person whom Gomara mentions as having appeared on a mottled grey horse, was the glorious apostle Signor San Jago, or, Signor San Pedro, and that I, as being a sinner, was not worthy to see him. This I know, that I saw Francisco de Morla, on such a horse, but as an unworthy transgressor, did not deserve to see any of the holy apostles. It may have been the will of God, that it was so as Gomara relates, but until I read his Chronicle, I never heard among any of the conquerors that such a thing had happened." Cap. 34.

NOTE [102.] p. 120.—Several Spanish historians relate this occurrence in such terms as if they wished it should be believed that the Indians, loaded with the presents, had carried them from the capital, in the same short space of time that the couriers performed that journey. This is incredible, and Gomara mentions a circumstance which shows that nothing extraordinary happened on this occasion. This rich present had been prepared for Grijalva, when he touched at the same place some months before, and was now ready to be delivered, as soon as Montezuma sent orders for that purpose. Gomara Cron. c. xxvii. p. 28.

According to B. Diaz del Castillo, the value of the silver plate representing the moon was alone above twenty thousand pesos, above five thousand pounds sterling.

NOTE [103.] p. 121.—This private traffic was directly contrary to the instructions of Velasquez, who enjoined, that whatever was acquired by trade should be thrown into the common stock. But it appears that the soldiers had each a private assortment of toys and other goods proper for the Indian trade, and Cortes gained their favor by encouraging this underhand barter. B. Diaz, c. 41.

NOTE [104.] p. 122.—Gomara has published a catalogue of the various articles of which this present consisted. Cron. c. 49. P. Martyr ab Angleria, who saw them after they were brought to Spain, and who seems to have examined them with great attention, gives a description of each, which is curious, as it conveys some idea of the progress which the Mexicans had made in several arts of elegance. De Insulis nuper inventis Liber, p. 354, &c.

NOTE [105.] p. 123.—There is no circumstance in the history of the conquest of America which is more questionable than the account of the numerous armies brought into the field against the Spaniards. As the war with the republic of Tlascala, though of short duration, was one of the most considerable which the Spaniards waged in America, the account given of the Tlascalcan armies merits some attention. The only authentic information concerning this is derived from three authors. Cortes in his second despatch to the Emperor, dated at Segura de la Frontera, Oct. 30, 1520, thus estimates the number of their troops; in the first battle 6000; in the second battle 100,000; in

the third battle 150,000. Relat. ap. Ramus. iii. 228. Bernal Diaz del Castillo, who was an eye witness, and engaged in all the actions of this war, thus reckons their numbers: in the first battle, 3000, p. 43; in the second battle 6000, *ibid*; in the third battle 50,000, p. 45. Gomara, who was Cortes's chaplain after his return to Spain, and published his *Cronica* in 1552, follows the computation of Cortes, except in the second battle, where he reckons the Tlascalans at 60,000, p. 49. It was manifestly the interest of Cortes to magnify his own dangers and exploits. For it was only by the merit of extraordinary services that he could hope to atone for his irregular conduct in assuming an independent command. Bern. Diaz, though abundantly disposed to place his own prowess, and that of his fellow-conquerors, in the most advantageous point of light, had not the same temptation to exaggerate; and it is probable that his account of the numbers approaches nearer to the truth. The assembling of an army of 150,000 men, requires many previous arrangements, and such provisions for their subsistence as seems to be beyond the foresight of Americans. The degree of cultivation in Tlascala does not seem to have been so great as to have furnished such a vast army with provisions. Though this province was so much better cultivated than other regions of New Spain that it was called the *country of bread*, yet the Spaniards in their march suffered such want, that they were obliged to subsist upon *Tunas*, a species of fruit which grows wild in the fields. Herrera, dec. ii. lib. vi. c. 5. p. 182.

NOTE [106.] p. 123.—These unhappy victims are said to be persons of distinction. It seems improbable that so great a number as fifty should be employed as spies. So many prisoners had been taken and dismissed, and the Tlascalans had sent so many messages to the Spanish quarters, that there appears to be no reason for hazarding the lives of so many considerable people in order to procure information about the position and state of their camp. The barbarous manner which Cortes treated a people unacquainted with the laws of war established among polished nations, appears so shocking to the later Spanish writers, that they diminish the number of those whom he punished so cruelly. Herrera says, that he cut off the hands of seven, and the thumbs of some more. Dec. ii. lib. ii. c. 8. De Solis relates, that the hands of fourteen or fifteen were cut off, and the thumbs of all the rest. Lib. ii. c. 20. But Cortes himself, Relat. p. 228. b. and after him Gomara, c. 48, affirm, that the hands of all the fifty were cut off.

NOTE [107.] p. 124.—The horses were objects of the greatest astonishment to all the people of New Spain. At first they imagined the horse and the rider, like the Centaurs of the ancients, to be some monstrous animal of a terrible form; and supposing that their food was the same as that of men, brought flesh and blood to nourish them. Even after they discovered their mistake, they believed the horses devoured men in battle, and, when they neighed, thought that they were demanding their prey. It was not the interest of the Spaniards to undeceive them. Herrera, dec. ii. lib. vi. c. 11.

NOTE [108.] p. 124.—According to Bart. de las Casas, there was no reason for this massacre, and it was an act of wanton cruelty, perpetrated merely to strike terror into the people of New Spain. Relac. de la destruy. p. 17, &c. But the zeal of Las Casas often leads him to exaggerate. In opposition to him, Bern. Diaz, c. 83, asserts, that the first missionaries sent into New Spain by the Emperor, made a judicial inquiry into this transaction; and, having examined the priests and elders of Cholula, found that there was a real conspiracy to cut off the Spaniards, and that the account given by Cortes was exactly true. As it was the object of Cortes at that time, and manifestly his interest, to gain the good will of Montezuma, it is improbable that he should have taken a step which tended so visibly to alienate him from the Spaniards, if he had not believed it to be necessary for his own preservation. At the same time, the Spaniards who served in America, had such contempt for the natives, and thought them so little entitled to the common rights of men, that Cortes might hold the Cholulans to be guilty upon slight and imperfect evidence. The severity of the punishment was certainly excessive and atrocious.

NOTE [109.] p. 124.—This description is taken almost literally from Bernal Diaz del Castillo, who was

so unacquainted with the art of composition as to be incapable of embellishing his narrative. He relates in a simple and rude style what passed in his own mind and that of his fellow soldiers on that occasion; "and let it not be thought strange," says he, "that I should write in this manner of what then happened, for it ought to be considered, that it is one thing to relate, another to have beheld things that were never before seen, or heard, or spoken of among men." Cap. 68. p. 64. b.

NOTE [110.] p. 126.—B. Diaz del Castillo, gives us some idea of the fatigue and hardships they underwent in performing this and other parts of duty. During the nine months that they remained in Mexico, every man, without any distinction between officers and soldiers, slept on his arms in his quilted jacket and gorget. They lay on mats, or straw spread on the floor, and each was obliged to hold himself as alert as if he had been on guard. "This," adds he, "became so habitual to me, that even now, in my advanced age, I always sleep in my clothes, and never in any bed. When I visit my *Encomienda*, I reckon it suitable to my rank to have a bed carried along with my other baggage, but I never go into it; but, according to custom, I lie in my clothes, and walk frequently during the night into the open air to view the stars, as I was wont when in service." Cap. 108.

NOTE [111.] p. 126.—Cortes himself, in his second despatch to the Emperor, does not explain the motives which induced him either to condemn Quialpopoca to the flames, or to put Montezuma in irons. Ramus. iii. 236. B. Diaz is silent with respect to his reasons for the former; and the only cause he assigns for the latter was, that he might meet with no interruption in executing the sentence pronounced against Quialpopoca, c. xcv. p. 75. But as Montezuma was his prisoner, and absolutely in his power, he had no reason to dread him, and the insult offered to that monarch could have no effect but to irritate him unnecessarily. Gomara supposes that Cortes had no other object than to occupy Montezuma with his own distress and sufferings, that he might give less attention to what befel Quialpopoca. Cron. c. 89. Herrera adopts the same opinion. Dec. ii. lib. viii. c. 9. But it seems an odd expedient, in order to make a person bear one injury, to load him with another that is greater. De Solis imagines, that Cortes had nothing else in view than to intimidate Montezuma, so that he might make no attempt to rescue the victims from their fate; but the spirit of that monarch was so submissive, and he had so tamely given up the prisoners to the disposal of Cortes, that he had no cause to apprehend any opposition from him. If the explanation which I have attempted to give of Cortes's proceedings on this occasion be not admitted, it appears to me, that they must be reckoned among the wanton and barbarous acts of oppression which occur too often in the history of the conquest of America.

NOTE [112.] p. 126.—De Solis asserts, lib. iv. c. 3, that the proposition of doing homage to the king of Spain came from Montezuma himself, and was made in order to induce the Spaniards to depart out of his dominions. He describes his conduct on this occasion as if it had been founded upon a scheme of profound policy, and executed with such refined address as to deceive Cortes himself. But there is no hint or circumstance in the contemporary historians, Cortes, Diaz, or Gomara, to justify this theory. Montezuma, on other occasions, discovered no such extent of art and abilities. The anguish which he felt in performing this humiliating ceremony is natural, if we suppose it to have been involuntary. But, according to the theory of De Solis, which supposes that Montezuma was executing what he himself had proposed, to have assumed an appearance of sorrow would have been preposterous, and inconsistent with his own design of deceiving the Spaniards.

NOTE [113.] p. 127.—In several of the provinces, the Spaniards, with all their industry and influence, could collect no gold. In others, they procured only a few trinkets of small value. Montezuma assured Cortes, that the present which he offered to the king of Castile, after doing homage, consisted of all the treasure amassed by his father; and told him, that he had already distributed the rest of his gold and jewels among the Spaniards. B. Diaz. c. 104. Gomara relates that all the silver collected amounted to 500 marks Cron. c. 83. This agrees with the account given by Cortes, that the royal fifth of silver was 100 marks

Relat. 239. B. So that the sum total of silver was only 4000 ounces, at the rate of eight ounces a mark, which demonstrates the proportion of silver to gold to have been exceedingly small.

NOTE [115]. p. 127.—De Solis, lib. iv. c. 5. calls in question the truth of this transaction, from no better reason than that it was inconsistent with that prudence which distinguishes the character of Cortes. But he ought to have recollected the impetuosity of his zeal at Tlascala, which was no less imprudent. He asserts, that the evidence for it rests upon the testimony of B. Diaz del Castillo, of Gomara, and of Herrera. They all concur, indeed, in mentioning this inconsiderate step which Cortes took; and they had good reason to do so, for Cortes himself relates this exploit in his second despatch to the Emperor, and seems to glory in it. Cort. Relat. Ramus. iii. 149. D. This is one instance, among many, of De Solis's having consulted with little attention the letters of Cortes to Charles V. from which the most authentic information with respect to his operations must be derived.

NOTE [114]. p. 127.—Herrera and de Solis suppose that Velasquez was encouraged to equip this armament against Cortes by the account which he received from Spain concerning the reception of the agents sent by the colony of Vera Cruz, and the warmth with which Fonseca Bishop of Burgos had espoused his interest, and condemned the proceedings of Cortes. Herrera, dec. ii. lib. ix. c. 18. De Solis, lib. iv. c. 5. But the chronological order of events refutes this supposition. Portocarrero and Montejo sailed from Vera Cruz, July 26, 1519. Herrera, dec. ii. lib. v. c. 4. They landed at St. Lucar in October, according to Herrera, *Ibid.* But P. Martyr, who attended the court at that time, and communicated every occurrence of moment to his correspondents day by day, mentions the arrival of these agents for the first time in December, and speaks of it as a recent event. Epist. 650. All the historians agree that the agents of Cortes had their first audience of the Emperor at Tordesillas, when he went to that town to visit his mother in his way to St. Jago de Compostella. Herrera, dec. ii. lib. v. c. 4. De Solis, lib. iv. c. 5. But the Emperor set out from Valladolid for Tordesillas on the 11th of March, 1520; and P. Martyr mentions his having seen at that time the presents made to Charles. Epist. 1665. The armament under Narvaez sailed from Cuba in April 1520. It is manifest then that Velasquez could not receive any account of what passed in this interview at Tordesillas previous to his hostile preparations against Cortes. His real motives seem to be those which I have mentioned. The patent appointing him *Adelantado* of New Spain, with such extensive powers, bears date November 13, 1519. Herrera, dec. ii. lib. iii. c. 11. He might receive it about the beginning of January. Gomara takes notice, that as soon as this patent was delivered to him, he began to equip a fleet and levy forces. Cron. c. 96.

NOTE [116]. p. 127.—De Solis contends, that as Narvaez had no interpreters, he could hold no intercourse with the people of the provinces, nor converse with them in any way but by signs, that it was equally impossible for him to carry on any communication with Montezuma. Liv. iv. c. 7. But it is upon the authority of Cortes himself that I relate all the particulars of Narvaez's correspondence both with Montezuma and with his subjects in the maritime provinces. Relat. Ramus. iii. 244. A. C. Cortes affirms that there was a mode of intercourse between Narvaez and the Mexicans, but does not explain how it was carried on. Bernal Diaz supplies this defect, and informs us that the three deserters who joined Narvaez acted as interpreters, having acquired a competent knowledge of the language, c. 110. With his usual minuteness he mentions their names and characters, and relates, in chapter 122, how they were punished for their perfidy. The Spaniards had now resided above a year among the Mexicans; and it is not surprising that several among them should have made some proficiency in speaking their language. This seems to have been the case. Herrera, dec. 2. lib. x. c. 1. Both B. Diaz, who was present, and Herrera, the most accurate and best informed of all the Spanish writers, agree with Cortes in his account of the secret correspondence carried on with Montezuma. Dec. 2. lib. x. c. 18, 19. De Solis seems to consider it as a discredit to Cortes, his hero, that Montezuma should have been ready to engage in a correspondence with Narvaez. He supposes that monarch to have contracted such a wonderful affection for the Spaniards, that he was not solicitous to be deli-

vered from them. After the indignity with which he had been treated, such an affection is incredible; and even De Solis is obliged to acknowledge, that it must be looked upon as one of the miracles which God had wrought to facilitate the conquest, lib. iv. c. 7. The truth is, Montezuma, however much overawed by his dread of the Spaniards, was extremely impatient to recover his liberty.

NOTE [117]. p. 129.—These words I have borrowed from the anonymous Account of the European Settlements in America, published by Dodsley, in two volumes 8vo.; a work of so much merit, that I should think there is hardly any writer in the age who ought to be ashamed of acknowledging himself to be the author of it.

NOTE [118]. p. 130.—The contemporary historians differ considerably with respect to the loss of the Spaniards on this occasion. Cortes in his second despatch to the Emperor, makes the number only 150. Relat. ap. Ramus. iii. p. 219. A. But it was manifestly his interest, at that juncture, to conceal from the court of Spain the full extent of the loss which he had sustained. De Solis, always studious to diminish every misfortune that befell his countrymen, rates their loss at about two hundred men. Lib. iv. c. 19. B. Diaz affirms that they lost 870 men, and that only 440 escaped from Mexico, c. 128. B. Palafox, Bishop of Los Angeles, who seems to have inquired into the early transactions of his countrymen in New Spain with great attention, confirms the account of B. Diaz with respect to the extent of their loss. Virtudes del Indio, p. 22. Gomara states their loss at 450 men. Cron. c. 109. Some months afterwards, when Cortes had received several reinforcements, he mustered his troops, and found them to be only 590. Relat. ap. Ramus. iii. p. 255. E. Now, as Narvaez brought 880 men into New Spain, and about 400 of Cortes's soldiers were then alive, it is evident that his loss, in the retreat from Mexico, must have been much more considerable than what he mentions. B. Diaz, solicitous to magnify the dangers and sufferings to which he and his fellow conquerors were exposed, may have exaggerated their loss; but, in my opinion, it cannot well be estimated at less than 600 men.

NOTE [119]. p. 132.—Some remains of this great work are still visible, and the spot where the brigantines were built and launched is still pointed out to strangers. Torquemada viewed them. Monarq. Indiana, vol. i. p. 531.

NOTE [120]. p. 133.—The station of Alvarado on the causeway of Tacuba was the nearest to the city. Cortes observes, that there they could distinctly observe what passed when their countrymen were sacrificed. Relat. ap. Ramus. iii. p. 273. E. B. Diaz, who belonged to Alvarado's division, relates what he beheld with his own eyes. C. 151. p. 148. b. 149. a. Like a man whose courage was so clear as to be above suspicion, he describes with his usual simplicity the impression which this spectacle made upon him. "Before (says he) I saw the breasts of my companions opened, their hearts yet fluttering, offered to an accursed idol, and their flesh devoured by their exulting enemies; I was accustomed to enter a battle not only without fear, but with high spirit. But from that time I never advanced to fight with the Mexicans without a secret horror and anxiety; my heart trembled at the thoughts of the death which I had seen them suffer." He takes care to add, that as soon as the combat began, his terror went off; and indeed, his adventurous bravery on every occasion is full evidence of this. B. Diaz, c. 156. p. 157. a.

NOTE [121]. p. 133.—One circumstance in this siege merits particular notice. The account which the Spanish writers give of the numerous armies employed in the attack or defence of Mexico seems to be incredible. According to Cortes himself, he had at one time 150,000 of auxiliary Indians in his service. Relat. Ramus. iii. 275. E. Gomara asserts that they were above 200,000. Cron. c. 136. Herrera, an author of higher authority, says they were about 200,000. Dec. iii. lib. i. c. 19. None of the contemporary writers ascertain explicitly the number of persons in Mexico during the siege. But Cortes on several occasions mentions the number of Mexicans who were slain, or who perished for want of food; and, if we may rely on those circumstances, it is probable that above two hundred thousand must have been shut up in the town.

But the quantity of provisions necessary for the subsistence of such vast multitudes assembled in one place, during three months, is so great, that it requires so much foresight and arrangement to collect these, and lay them up in magazines, so as to be certain of a regular supply, that one can hardly believe that this could be accomplished in a country where agriculture was so imperfect as in the Mexican empire, where there were no tame animals, and by a people naturally so improvident, and so incapable of executing a complicated plan, as the most improved Americans. The Spaniards, with all their care and attention, fared very poorly, and were often reduced to extreme distress for want of provisions. B. Diaz, p. 142. Cortes Relat. 271. D. Cortes on one occasion mentions slightly the subsistence of his army; and, after acknowledging that they were often in great want, adds, that they received supplies from the people of the country, of fish, and of some fruit, which he calls the cherries of the country. *Ibid.* B. Diaz says that they had cakes of maize, and serasas de la tierra; and when the season of these was over, another fruit, which he calls *Tunas*; but their most comfortable subsistence was a root which the Indians use as food, to which he gives the name of *Quilites*, p. 142. The Indian auxiliaries had one means of subsistence more than the Spaniards. They fed upon the bodies of the Mexicans whom they killed in battle. Cortes Relat. 176. C. B. Diaz confirms his relation, and adds, that when the Indians returned from Mexico to their own country, they carried with them large quantities of flesh of the Mexicans salted or dried, as a most acceptable present to their friends, that they might have the pleasure of feeding upon the bodies of their enemies in their festivals, p. 157. De Solis, who seems to consider it as an imputation of discredit to his countrymen, that they should act in concert with auxiliaries who fed upon human flesh, is solicitous to prove that the Spaniards endeavored to prevent their associates from eating the bodies of the Mexicans, lib. v. c. 24. But he has no authority for this from the original historians. Neither Cortes himself nor B. Diaz seems to have had any such scruple; and on many occasions they mention the Indian repasts, which were become familiar to them, without any mark of abhorrence. Even with this additional stock of food for the Indians, it was hardly possible to procure subsistence for armies amounting to such numbers as we find in the Spanish writers. Perhaps the best solution of the difficulty is, to adopt the opinion of B. Diaz del Castillo, the most artless of all the *Historiadores primitivos*. "When Gomara (says he) on some occasions relates, that there were so many thousand Indians our auxiliaries, and on others, that there were so many thousand houses in this or that town, no regard is to be paid to his enumeration, as he has no authority for it, the numbers not being in reality the fifth of what he relates. If we add together the different numbers which he mentions, that country would contain more millions than there are in Castile." C. 129. But though some considerable deduction should certainly be made from the Spanish accounts of the Mexican forces, they must have been very numerous; for nothing but an immense superiority in number could have enabled them to withstand a body of nine hundred Spaniards, conducted by a leader of such abilities as Cortes.

NOTE [122]. p. 135.—In relating the oppressive and cruel proceedings of the conquerors of New Spain, I have not followed B. de las Casas as my guide. His account of them, Relat. de la Destruyc. p. 18, &c. is manifestly exaggerated. It is from the testimony of Cortes himself, and of Gomara who wrote under his eye, that I have taken my account of the punishment of the Panucans, and they relate it without any disapprobation. B. Diaz, contrary to his usual custom, mentions it only in general terms, c. 162. Herrera, solicitous to extenuate this barbarous action of his countrymen, though he mentions 63 caziques, and 400 men of note, as being condemned to the flames, asserts that 30 only were burnt, and the rest pardoned. Dec. 3. lib. v. c. 7. But this is contrary to the testimony of the original historians, particularly of Gomara, whom it appears he had consulted, as he adopts several of his expressions in this passage. The punishment of Guatimozin is related by the most authentic of the Spanish writers. Torquemada has extracted from a history of Tezeuce, composed in the Mexican tongue, an account of this transaction, more favorable to Guatimozin than that of the Spanish authors. Mon. Indiana, i. 575. According to the Mexican account, Cortes had scarcely a shadow of evidence to justify such a wanton act of cruelty. B. Diaz affirms, that Guatimozin and his

fellow-sufferers asserted their innocence with their last breath, and that many of the Spanish soldiers condemned this action of Cortes as equally unnecessary and unjust, p. 200. b. 201. a.

NOTE [123]. p. 135.—The motive for undertaking this expedition was, to punish Christoval de Olid, one of his officers who had revolted against him, and aimed at establishing an independent jurisdiction. Cortes regarded this insurrection as of such dangerous example, and dreaded so much the abilities and popularity of its author, that in person he led the body of troops destined to suppress it. He marched, according to Gomara, three thousand miles, through a country abounding with thick forests, rugged mountains, deep rivers, thinly inhabited, and cultivated only in a few places. What he suffered from famine, from the hostility of the natives, from the climate, and from hardships of every species, has nothing in history parallel to it, but what occurs in the adventures of the other discoverers and conquerors of the New World. Cortes was employed in this dreadful service above two years; and though it was not distinguished by any splendid event, he exhibited, during the course of it, greater personal courage, more fortitude of mind, more perseverance and patience than in any other period or scene in his life. Herrera, dec. 3. lib. vi. vii. viii. ix. Gomara, Cron. c. 163—177. B. Diaz, 174—190. Cortes, MS. *pence ms.* Were one to write a life of Cortes, the account of this expedition should occupy a splendid place in it. In a general history of America, as the expedition was productive of no great event, the mention of it is sufficient.

NOTE [124]. p. 135.—According to Herrera, the treasure which Cortes brought with him, consisted of fifteen hundred marks of wrought plate, two hundred thousand pesos of fine gold, and ten thousand of inferior standard, many rich jewels, one in particular worth forty thousand pesos, and several trinkets and ornaments of value. Dec. 4. lib. iii. c. 8. lib. iv. c. 1. He afterwards engaged to give a portion with his daughter of a hundred thousand pesos. Gomara Cron. c. 237. The fortune which he left his sons was very considerable. But, as we have before related, the sum divided among the conquerors, on the first reduction of Mexico, was very small. There appears, then, to be some reason for suspecting that the accusations of Cortes's enemies were not altogether destitute of foundation. They charged him with having applied to his own use a disproportionate share of the Mexican spoils; with having concealed the royal treasures of Montezuma and Guatimozin; with defrauding the king of his fifth; and robbing his followers of what was due to them. Herrera, dec. 3. lib. viii. c. 15. dec. 4. lib. iii. c. 8. Some of the conquerors themselves entertained suspicions of the same kind with respect to this part of his conduct. B. Diaz, c. 157.

NOTE [125]. p. 136.—In tracing the progress of the Spanish arms in New Spain, we have followed Cortes himself as our most certain guide. His despatches to the Emperor contain a minute account of his operations. But the unlettered conqueror of Peru was incapable of relating his own exploits. Our information with respect to them, and other transactions in Peru, is derived, however, from contemporary and respectable authors.

The most early account of Pizarro's transactions in Peru was published by Francisco de Xerez, his secretary. It is a simple, unadorned narrative, carried down no further than the death of Atahualpa, in 1533; for the author returned to Spain in 1534, and, soon after he landed, printed at Seville his short History of the Conquest of Peru, addressed to the Emperor.

Don Pedro Sancho, an officer who served under Pizarro, drew up an account of his expedition, which was translated into Italian by Ramusio, and inserted in his valuable collection, but has never been published in its original language. Sancho returned to Spain at the same time with Xerez. Great credit is due to what both these authors relate concerning the progress and operations of Pizarro; but the residence of the Spaniards in Peru had been so short, at the time when they left it, and their intercourse with the natives was so slender, that their knowledge of the Peruvian manners and customs is very imperfect.

The next contemporary historian is Pedro Cieva de Leon, who published his *Cronica del Peru* at Seville in 1553. If he had finished all that he purposed in the general division of his work, it would have been the most complete history which had been published of any region in the New World. He was well qualified to

execute it, having served during seventeen years in America, and having visited in person most of the provinces concerning which he had occasion to write. But only the first part of his chronicle has been printed. It contains a description of Peru, and several of the adjacent provinces, with an account of the institutions and customs of the natives, and is written with so little art, and such an apparent regard for truth, that one must regret the loss of the other parts of his work.

This loss is amply supplied by Don Augustine Zarate, who published, in 1553, his *Historia del Descubrimiento y Conquista de la Provincia del Peru*. Zarate was a man of rank and education, and employed in Peru, as comptroller-general of the public revenue. His history, whether we attend to its matter or composition, is a book of considerable merit: as he had an opportunity to be well informed, and seems to have been inquisitive with respect to the manners and transactions of the Peruvians, great credit is due to his testimony.

Don Diego Fernandez published his *Historia del Peru* in 1571. His sole object is to relate the dissensions and civil wars of the Spaniards in that empire. As he served in a public station in Peru, and was well acquainted both with the country and with the principal actors in those singular scenes which he describes, as he possessed sound understanding and great impartiality, his work may be ranked among those of the historians most distinguished for their industry in research, or their capacity in judging with respect to the events which they relate.

The last author who can be reckoned among the contemporary historians of the conquest of Peru is Garcilasso de la Vega, Inca. For though the first part of his work, entitled *Comentarios Reales del Origen de los Incas Reyes del Peru*, was not published sooner than the year 1609, seventy-six years after the death of Atahualpa the last Emperor, yet as he was born in Peru, and was the son of an officer of distinction among the Spanish conquerors, by a *Coya*, or lady of the royal race, on account of which he always took the name of Inca; as he was master of the language spoken by the Incas, and acquainted with the traditions of his countrymen, his authority is rated very high, and often placed above that of all the other historians. His work, however, is little more than a commentary upon the Spanish writers of the Peruvian story, and composed of quotations taken from the authors whom I have mentioned. This is the idea which he himself gives of it, lib. i. c. 10. Nor is it in the account of facts only that he follows them servilely. Even in explaining the institutions and rites of his ancestors, his information seems not to be more perfect than theirs. His explanation of the Quipos is almost the same with that of Acosta. He produces no specimen of Peruvian poetry, but that wretched one which he borrows from Blas Valera, an early missionary, whose memoirs have never been published. Lib. ii. c. 15. As for composition, arrangement, or a capacity of distinguishing between what is fabulous, what is probable, and what is true, one searches for them in vain in the commentaries of the Inca. His work, however, notwithstanding its great defects, is not altogether destitute of use. Some traditions which he received from his countrymen are preserved in it. His knowledge of the Peruvian language has enabled him to correct some errors of the Spanish writers, and he has inserted in it some curious facts taken from authors whose works were never published, and are now lost.

NOTE [126]. p. 136.—One may form an idea both of the hardships which they endured, and of the unhealthy climate in the regions which they visited, from the extraordinary mortality that prevailed among them. Pizarro carried out 112 men, Almagro 70. In less than nine months 130 of these died. Few fell by the sword; most of them were cut off by diseases. Xerez, p. 180.

NOTE [127]. p. 137.—This island, says Herrera, is rendered so uncomfortable by the unwholesomeness of its climate, its impenetrable woods, its rugged mountains, and the multitude of insects and reptiles, that it is seldom any softer epithet than that of *infernal* is employed in describing it. The sun is almost never seen there, and throughout the year it hardly ever ceases to rain. Dec. iii. lib. x. c. 3. Dampier touched at this island in the year 1685; and his account of the climate is not more favorable. Vol. i. p. 172. He, during his cruise on the coast, visited most of the places where Pizarro landed, and his description of them throws light on the narrations of the early Spanish historians.

NOTE [128]. p. 138.—By this time horses had multiplied greatly in the Spanish settlements on the continent. When Cortes began his expedition in the year 1518, though his armament was more considerable than that of Pizarro, and composed of persons superior in rank to those who invaded Peru, he could procure no more than sixteen horses.

NOTE [129]. p. 139.—In the year 1740, D. Ant. Ulloa and D. George Juan travelled from Guayaquil to Motupe by the same route which Pizarro took. From the description of their journey, one may form an idea of the difficulty of his march. The sandy plains between St. Michael de Picura and Motupe extend 90 miles, without water, without a tree, a plant, or any green thing, on a dreary stretch of burning sand. Voyage, tom. i. p. 399, &c.

NOTE [130]. p. 139.—This extravagant and unreasonable discourse of Valverde has been censured by all historians, and with justice. But though he seems to have been an illiterate and bigotted monk, nowise resembling the good Olmedo, who accompanied Cortes; the absurdity of his address to Atahualpa must not be charged wholly upon him. His harangue is evidently a translation or paraphrase of that form, concerted by a junto of Spanish divines and lawyers in the year 1509, for explaining the right of their king to the sovereignty of the New World, and for directing the officers employed in America how they should take possession of any new country. See Note 23. The sentiments contained in Valverde's harangue must not then be imputed to the bigotted imbecility of a particular man, but to that of the age. But Gomara and Benzoni relate one circumstance concerning Valverde, which, if authentic, renders him an object not of contempt only but of horror. They assert, that during the whole action Valverde continued to excite the soldiers to slaughter, calling to them to strike the enemy not with the edge but with the points of their swords. Gom. Cron. c. 113. Benz. Histor. Nov. Orbis, lib. iii. c. 3. Such behavior was very different from that of the Roman Catholic clergy in other parts of America, where they uniformly exerted their influence to protect the Indians, and to moderate the ferocity of their countrymen.

NOTE [131]. p. 139.—Two different systems have been formed concerning the conduct of Atahualpa. The Spanish writers, in order to justify the violence of their countrymen, contend that all the Inca's professions of friendship were feigned; and that his intention in agreeing to an interview with Pizarro at Caxamalea, was to cut off him and his followers at one blow; that for this purpose he advanced with such a numerous body of attendants, who had arms concealed under their garments to execute this scheme. This is the account given by Xerez and Zarate, and adopted by Herrera. But if it had been the plan of the Inca to destroy the Spaniards, one can hardly imagine that he would have permitted them to march through the desert of Motupe, or have neglected to defend the passes in the mountains, where they might have been attacked with so much advantage. If the Peruvians marched to Caxamalea with an intention to fall upon the Spaniards, it is inconceivable that of so great a body of men, prepared for action, not one should attempt to make resistance, but all tamely suffer themselves to be butchered by an enemy whom they were armed to attack. Atahualpa's mode of advancing to the interview has the aspect of a peaceable procession, not of a military enterprise. He himself and his followers were in their habits of ceremony, preceded, as on days of solemnity, by unarmed harbingers. Though rude nations are frequently cunning and false; yet if a scheme of deception and treachery must be imputed either to a monarch that had no great reason to be alarmed at a visit from strangers who solicited admission into his presence as friends, or to an adventurer so daring and so little scrupulous as Pizarro, one cannot hesitate in determining where to fix the presumption of guilt. Even amidst the endeavors of the Spanish writers to palliate the proceedings of Pizarro, one plainly perceives that it was his intention, as well as his interest, to seize the Inca, and that he had taken measures for that purpose previous to any suspicion of that monarch's designs.

Garcilasso de la Vega, extremely solicitous to vindicate his countrymen the Peruvians, from the crime of having concerted the destruction of Pizarro and his followers, and no less afraid to charge the Spaniards with improper conduct towards the Inca, has framed

another system. He relates, that a man of majestic form, with a long beard, and garments reaching to the ground, having appeared in a vision to Viracocha, the eighth Inca, and declared that he was a child of the Sun, that monarch built a temple in honor of this person, and erected an image of him, resembling as nearly as possible the singular form in which he had exhibited himself to his view. In this temple divine honors were paid to him by the name of Viracocha. P. i. lib. iv. c. 21. lib. v. c. 22. When the Spaniards first appeared in Peru, the length of their beards, and the dress they wore, struck every person so much with their likeness to the image of Viracocha, that they supposed them to be children of the Sun, who had descended from heaven to earth. All concluded that the fatal period of the Peruvian empire was now approaching, and that the throne would be occupied by new possessors. Atahualpa himself, considering the Spaniards as messengers from heaven, was so far from entertaining any thoughts of resisting them, that he determined to yield implicit obedience to their commands. From these sentiments flowed his professions of love and respect. To those were owing the cordial reception of Soto and Ferdinand Pizarro in his camp, and the submissive reverence with which he himself advanced to visit the Spanish general in his quarters; but from the gross ignorance of Philipillo, the interpreter, the declaration of the Spaniards, and his answer to it, were so ill explained, that, by their mutual inability to comprehend each other's intentions, the fatal rencontre at Caxamalca, with all its dreadful consequences was occasioned.

It is remarkable, that no traces of this superstitious veneration of the Peruvians for the Spaniards are to be found either in Xeres, or Sancho, or Zarate, previous to the interview at Caxamalca; and yet the two former served under Pizarro at that time, and the latter visited Peru soon after the conquest. If either the Inca himself, or his messengers, had addressed the Spaniards in the words which Garcilasso puts in their mouths, they must have been struck with such submissive declarations; and they would certainly have availed themselves of them to accomplish their own designs with greater facility. Garcilasso himself, though his narrative of the intercourse between the Inca and the Spaniards, preceding the rencontre at Caxamalca, is founded on the supposition of his believing them to be Viracochas, or divine beings, p. ii. lib. i. c. 17, &c., yet, with his usual inattention and inaccuracy, he admits in another place that the Peruvians did not recollect the resemblance between them and the god Viracocha, until the fatal disasters subsequent to the defeat at Caxamalca, and then only began to call them Viracochas. P. i. lib. v. c. 21. This is confirmed by Herrera, dec. v. lib. ii. c. 12. In many different parts of America, if we may believe the Spanish writers, their countrymen were considered as divine beings who had descended from heaven. But in this instance, as in many which occur in the intercourse between nations whose progress in refinement is very unequal, the ideas of those who used the expression were different from those who heard it. For such is the idiom of the Indian languages, or such is the simplicity of those who speak them, that when they see any thing with which they were formerly unacquainted, and of which they do not know the origin, they say that it came down from heaven. Nugnez. Ram. iii. 327. C.

The account which I have given of the sentiments and proceedings of the Peruvians, appears to be more natural and consistent than either of the two preceding, and is better supported by the facts related by the contemporary historians.

According to Xeres, p. 200, two thousand Peruvians were killed. Sancho makes the number of the slain six or seven thousand. Ram. iii. 274. D. By Garcilasso's account, five thousand were massacred. P. ii. lib. i. c. 25. The number which I have mentioned, being the medium between the extremes, may probably be nearest the truth.

NOTE [132]. p. 139.—Nothing can be a more striking proof of this, than that three Spaniards travelled from Caxamalca to Cuzco. The distance between them is six hundred miles. In every place throughout this great extent of country, they were treated with all the honors which the Peruvians paid to their sovereigns, and even to their divinities. Under pretext of amassing what was wanting for the ransom of the Inca, they demanded the plates of gold with which the walls of the Temple of the Sun in Cuzco were adorned; and though the priests were unwilling to alienate those sacred ornaments, and the people refused to violate the shrine of their God, the three Spaniards, with their own

hands, robbed the Temple of part of this valuable treasure; and such was the reverence of the natives for their persons, that though they beheld this act of sacrilege with astonishment, they did not attempt to prevent or disturb the commission of it. Zarate, lib. ii. c. 6. Sancho ap. Ramus. iii. 375. D.

NOTE [133]. p. 141.—According to Herrera, the spoil of Cuzco after setting apart the King's fifth, was divided among 480 persons. Each received 4000 pesos. This amounts to 1,920,000 pesos. Dec. v. lib. vi. c. 3. But as the general and other officers were entitled to a share far greater than that of the private men, the sum total must have risen much beyond what I have mentioned. Gomara, c. 123, and Zarate, lib. ii. c. 5, satisfy themselves with asserting in general, that the plunder of the Cuzco was of greater value than the ransom of Atahualpa.

NOTE [134]. p. 141.—No expedition in the New World was conducted with more persevering courage than that of Alvarado, and in none were greater hardships endured. Many of the persons engaged in it were, like their leader, veterans who had served under Cortes, inured to all the rigor of American war. Such of my readers as have not an opportunity of perusing the striking description of their sufferings by Zarate, or Herrera, may form some idea of the nature of their march from the sea-coast to Quito, by consulting the account which D. Ant. Ulloa gives of his own journey in 1736, nearly in the same route. Voy. tom. i. p. 178, &c., or that of M. Bouguer, who proceeded from Puerto Viejo to Quito by the same road which Alvarado took. He compares his own journey with that of the Spanish leader, and by the comparison gives a most striking idea of the boldness and patience of Alvarado in forcing his way through so many obstacles. Voyage de Perou, p. 28, &c.

NOTE [135]. p. 141.—According to Herrera, there was entered on account of the king in gold, 155,300 pesos, and 5,400 marks (each 8 ounces) of silver, besides several vessels and ornaments, some of gold and others of silver; on account of private persons, in gold 499,000 pesos, and 54,000 marks of silver. Dec. 5. lib. vi. c. 13.

NOTE [136]. p. 142.—The Peruvians not only imitated the military arts of the Spaniards, but had recourse to devices of their own. As the cavalry were the chief objects of their terror, they endeavored to render them incapable of acting by means of a long thong with a stone fastened to each end. This, when thrown by a skilful hand, twisted about the horse and its rider, and entangled them so as to obstruct their motions. Herrera mentions this as an invention of their own. Dec. 5. lib. viii. c. 4. But as I have observed, p. 113, this weapon is common among several barbarous tribes towards the extremity of South America; and it is more probable that the Peruvians had observed the dexterity with which they used it in hunting, and on this occasion adopted it themselves. The Spaniards were considerably annoyed by it. Herrera, *ibid.* Another instance of the ingenuity of the Peruvians deserves mention. By turning a river out of its channel, they overflowed a valley, in which a body of the enemy was posted, so suddenly, that it was with the utmost difficulty the Spaniards made their escape. Herrera, dec. 4. lib. viii. c. 5.

NOTE [137]. p. 142.—Herrera's account of Orellana's voyage is the most minute and apparently the most accurate. It was probably taken from the journal of Orellana himself. But the dates are not distinctly marked. His navigation down the Coca, or Napo, began early in February, 1541; and he arrived at the mouth of the river on the 26th of August, having spent near seven months in the voyage. M. de la Condamine in the year 1743, sailed from Cuenca to Para, a settlement of the Portuguese at the mouth of the river, a navigation much longer than that of Orellana, in less than four months. Voyage, p. 179. But the two adventurers were very differently provided for the voyage. This hazardous undertaking to which ambition prompted Orellana, and to which the love of science led M. de la Condamine, was undertaken in the year 1769, by Madame Godin des Odonais from conjugal affection. The narrative of the hardships which she suffered, of the dangers to which she was exposed, and of the disasters which befell her, is one of the most singular and affecting stories in any language, exhibiting in her conduct a striking picture of the fortitude

which distinguishes the one sex, mingled with the sensibility and tenderness peculiar to the other. Lettre de M. Godin a M. de la Condamine.

NOTE [138]. p. 142.—Herrera gives a striking picture of their indigence. Twelve gentlemen, who had been officers of distinction under Almagro, lodged in the same house, and having but one cloak among them, it was worn alternately by him who had occasion to appear in public, while the rest, from the want of a decent dress were obliged to keep within doors. Their former friends and companions were so much afraid of giving offence to Pizarro, that they durst not entertain, or even converse with them. One may conceive what was the condition, and what the indignation of men once accustomed to power and opulence, when they felt themselves poor and despised, without a roof under which to shelter their heads, while they beheld others, whose merits and services were not equal to theirs, living in splendor in sumptuous edifices. Dec. 6. lib. viii. c. 6.

NOTE [139]. p. 145.—Herrera, whose accuracy entitles him to great credit, asserts, that Gonzalo Pizarro possessed domains in the neighborhood of Chuquesaca de la Plata, which yielded him an annual revenue greater than that of the Archbishop of Toledo, the best endowed see Europe. Dec. 7. lib. vi. c. 3.

NOTE [140]. p. 147.—All the Spanish writers describe his march, and the distresses of both parties, very minutely. Zarate observes, that hardly any parallel to it occurs in history, either with respect to the length of the retreat, or the ardor of the pursuit. Pizarro, according to his computation, followed the viceroys upwards of three thousand miles. Lib. v. c. 16. 26.

NOTE [142]. p. 148.—It amounted, according to Fernandez, the best informed historian of that period, to one million four hundred thousand pesos. Lib. ii. c. 79.

NOTE [142]. p. 149.—Carvajal, from the beginning, had been an advocate for an accommodation with Gasca. Finding Pizarro incapable of holding that bold course which he originally suggested, he recommended to him a timely submission to his sovereign as the safest measure. When the president's offers were first communicated to Carvajal, "By our Lady, (save me in that strain of buffoonery which was familiar to him,) the priest issues gracious bulls. He gives them both good and cheap; let us not only accept them, but wear them as reliques about our necks." Fernandez, lib. ii. c. 63.

NOTE [143]. p. 149.—During the rebellion of Gonzalo Pizarro, seven hundred men were killed in battle, and three hundred and eighty were hanged or beheaded. Herrera, dec. 8. lib. iv. c. 4. Above three hundred of these were cut off by Carvajal. Fernandez, lib. ii. c. 91. Zarate makes the number of those put to a violent death five hundred. Lib. vii. c. 1.

NOTE [144]. p. 150.—In my inquiries concerning the manners and policy of the Mexicans, I have received much information from a large manuscript of Don Alonso de Corita, one of the judges in the Court of Audience at Mexico. In the year 1553, Philip II., in order to discover the mode of levying tribute from his Indian subjects, that would be most beneficial to the crown, and least oppressive to them, addressed a mandate to all the Courts of Audience in America, enjoining them to answer certain queries which he proposed to them concerning the ancient form of government established among the various nations of Indians, and the mode in which they had been accustomed to pay taxes to their kings or chiefs. In obedience to this mandate, Corita, who had resided nineteen years in America, fourteen of which he passed in New Spain, composed the work of which I have a copy. He acquaints his sovereign, that he made it an object, during his residence in America, and in all its provinces which he had visited, to inquire diligently into the manners and customs of the natives; that he had conversed for this purpose with many aged and intelligent Indians, and consulted several of the Spanish Ecclesiastics, who understood the Indian language most perfectly, particularly some of those who landed in New Spain soon after the conquest. Corita appears to be a man of some learning, and to have carried on his inquiries with the diligence and accuracy to which he pretends. Greater credit is due to his testimony from one circumstance.

Hia work was not composed with a view to publication, or in support of any particular theory, but contains simple though full answers to queries proposed to him officially. Though Herrera does not mention him among the authors whom he had followed as guides in his history, I should suppose, from several facts of which he takes notice, as well as from several expressions which he uses, that this memorial of Corita was not unknown to him.

NOTE [145]. p. 151.—The early Spanish writers were so hasty and inaccurate in estimating the numbers of people in the provinces and towns in America, that it is impossible to ascertain that of Mexico itself with any degree of precision. Cortes describes the extent and populousness of Mexico in general terms, which imply that it was not inferior to the greatest cities in Europe. Gomara is more explicit, and affirms, that there were 60,000 houses or families in Mexico. Cron. c. 78. Herrera adopts his opinion, Dec. 2. lib. vii. c. 13; and the generality of writers follow them implicitly without inquiry or scruple. According to this account, the inhabitants of Mexico must have been about 300,000. Torquemada, with his usual propensity to the marvellous, asserts, that there were 120,000 houses or families in Mexico, and consequently about 600,000 inhabitants. Lib. iii. c. 23. But in a very judicious account of the Mexican empire, by one of Cortes's officers, the population is fixed at 60,000 people. Ramusio, iii. 399. A. Even by this account, which probably is much nearer the truth than any of the foregoing, Mexico was a great city.

NOTE [146]. p. 151.—It is to P. Torribio de Benavente that I am indebted for this curious observation. Palafox, Bishop of Ciudad de la Puebla Los Angeles, confirms and illustrates it more fully. The Mexican (says he) is the only language in which a termination indicating respect, *silabas reverenciales y de cortesia*, may be affixed to every word. By adding the final syllable *zin* or *azin* to any word, it becomes a proper expression of veneration in the mouth of an inferior. If, in speaking to an equal, the word Father is to be used, it is *Tati*, but an inferior says *Tatzin*. One priest speaking to another, calls him *Teopixque*; a person of inferior rank calls him *Teopixotzin*. The name of the emperor who reigned when Cortes invaded Mexico, was *Montezuma*; but his vassals, from reverence, pronounced it *Montezumazin*. Torribio, MS. Palafox. Virtudes del Indio, p. 65. The Mexicans had not only reverential nouns, but reverential verbs. The manner in which these are formed from the verbs in common use is explained by D. Jos. Aug. Aldama y Guevara in his Mexican Grammar, No. 188.

NOTE [147]. p. 152.—From comparing several passages in Corita and Herrera, we may collect, with some degree of accuracy, the various modes in which the Mexicans contributed towards the support of government. Some persons of the first order seem to have been exempted from the payment of any tribute, and as their only duty to the public, were bound to personal service in war, and to follow the banner of their sovereign with their vassals. 2. The immediate vassals of the crown were bound not only to personal military service, but paid a certain proportion of the produce of their lands in kind. 3. Those who held offices of honor or trust paid a certain share of what they received in consequence of holding these. 4. Each *Capulla*, or association, cultivated some part of the field allotted to it, for the behoof of the crown, and deposited the produce in the royal granaries. 5. Some part of whatever was brought to the public markets, whether fruits of the earth, or the various productions of their artists and manufacturers, was demanded for the public use, and the merchants who paid this were exempted from every other tax. 6. The *Mayeques* or *ascripti glebae*, were bound to cultivate certain districts in every province, which may be considered as *crown lands*, and brought the increase into public storehouses. Thus the sovereign received some part of whatever was useful or valuable in the country, whether it was the natural production of the soil, or acquired by the industry of the people. What each contributed towards the support of government seems to have been inconsiderable. Corita, in answer to one of the queries put to the Audience of Mexico by Philip II., endeavors to estimate in money the value of what each citizen might be supposed to pay, and does not reckon it at more than three or four *reals*, about eighteen pence or two shillings a head.

NOTE [148]. p. 152.—Cortes, who seems to have been as much astonished at this, as with any instance

of Mexican ingenuity, gives a particular description of it. Along one of the causeways, says he, by which they enter the city, are conducted two conduits, composed of clay tempered with mortar, about two paces in breadth, and raised about six feet. In one of them is conveyed a stream of excellent water, as large as the body of a man, into the centre of the city, and supplies all the inhabitants plentifully. The other is empty, that when it is necessary to clean or repair the former, the stream of water may be turned into it. As this conduit passes along two of the bridges, where there are breaches in the causeway, through which the salt water of the lakes flows, it is conveyed over them in pipes as large as the body of an ox, then carried from the conduit to the remote quarters of the city in canoes, and sold to the inhabitants. Relat. ap. Ramus. 241. A.

NOTE [149]. p. 152.—In the armoury of the royal palace of Madrid are shown suits of armour, which are called Montezuma's. They are composed of thin lacquered copperplates. In the opinion of very intelligent judges, they are evidently eastern. The forms of the silver ornaments upon them, representing dragons, &c. may be considered a confirmation of this. They are infinitely superior, in point of workmanship, to any effort of American art. The Spaniards probably received from them the Philippine islands. The only unquestionable specimen of Mexican art, that I know of in Great Britain, is a cup of very fine gold, which is said to have belonged to Montezuma. It weighs 5oz. 12dw. Three drawings of it were exhibited to the Society of Antiquaries, June 10, 1765. A man's head is represented on this cup. On one side the full face, on the other the profile, on the third the back parts of the head. The relief is said to have been produced by punching the inside of the cup, so as to make the representation of a face on the outside. The features are gross, but represented with some degree of art, and certainly too rude for Spanish workmanship. This cup was purchased by Edward Earl of Oxford, while he lay in the harbor of Cadiz with the fleet under his command, and is now in the possession of his grandson, Lord Archer. I am indebted for this information to my respectable and ingenious friend Mr. Barrington. In the sixth volume of the *Archæologia*, p. 107, is published an account of some masks of Terra Cotta, brought from the burying ground on the American continent, about seventy miles from the British settlement on the Mosquito shore. They are said to be likenesses of chiefs, or other eminent persons. From the descriptions and engravings of them, we have an additional proof of the imperfect state of arts among the Americans.

NOTE [150]. p. 153.—The learned reader will perceive how much I have been indebted, in this part of my work, to the guidance of the Bishop of Gloucester, who has traced the successive steps by which the human mind advanced in this line of its progress, with much erudition, and greater ingenuity. He is the first, as far as I know, who formed a rational and consistent theory concerning the various modes of writing practised by nations, according to the various degrees of their improvement. Div. Legation of Moses, iii. 69, &c. Some important observations have been added by M. le President de Brosses, the learned and intelligent author of the *Traite de la Formation Mecanique des Langues*, tom. i. 295, &c.

As the Mexican paintings are the most curious monuments extant of the earliest mode of writing, it will not be improper to give some account of the means by which they were preserved from the general wreck of every work of art in America, and communicated to the public. For the most early and complete collection of these published by Purchas, we are indebted to the attention of that curious inquirer, Hakluyt. Don Antonio Mendoza, viceroy of New Spain, having deemed those paintings a proper present for Charles V., the ship in which they were sent to Spain was taken by a French cruiser, and they came into the possession of Thetot, the King's geographer, who, having travelled himself into the New World, and described one of its provinces, was a curious observer of whatever tended to illustrate the manners of the Americans. On his death, they were purchased by Hakluyt, at that time chaplain of the English ambassador to the French court; and being left by him to Purchas, were published at the desire of the learned antiquary, Sir Henry Spelman. Purchas, iii. 1065. They were translated from English into French by Melchizedeck Thevenot, and published in his collection of voyages, A. D. 1683.

The second specimen of Mexican picture-writing was published by Dr. Francis Gonelli Carreri, in two

copper-plates. The first is a map, or representation of the progress of the ancient Mexicans on their first arrival in the country, and of the various stations in which they settled, before they founded the capital of their empire in the lake of Mexico. The second is a Chronological Wheel, or Circle, representing the manner in which they computed and marked their cycle of fifty-two years. He received both from Don Carlos de Sigüenza y Congorra, a diligent collector of ancient Mexican Documents. But as it seems now to be a received opinion (founded, as far as I know, on no good evidence), that Carreri was never out of Italy, and that his famous *Giro del Mundo* is an account of a fictitious voyage, I have not mentioned these paintings in the text. They have, however, manifestly the appearance of being Mexican productions, and are allowed to be so by Boturini, who was well qualified to determine whether they were genuine or supposititious. M. Clavigero likewise admits them to be genuine paintings of the ancient Mexicans. To me they always appeared to be so, though from my desire to rest no part of my narrative upon questionable authority, I did not refer to them. The style of painting in the former is considerably more perfect than any other specimen of Mexican design; but as the original is said to have been much defaced by time, I suspect that it has been improved by some touches from the hand of a European artist. Carreri, Churchill, iv. p. 487. The Chronological Wheel is a just delineation of the Mexican mode of computing time, as described by Acosta, lib. vi. c. 2. It seems to resemble one which that learned Jesuit had seen; and if it be admitted as a genuine monument, it proves that the Mexicans had artificial or arbitrary characters, which represented several things besides numbers. Each month is there represented by a symbol expressive of some work or rite peculiar to it.

The third specimen of Mexican painting was discovered by another Italian. In 1736, Lorenzo Boturini Benaducci set out for New Spain, and was led by several incidents to study the language of the Mexicans, and to collect the remains of their historical monuments. He persisted nine years in his researches, with the enthusiasm of a projector, and the patience of an antiquary. In 1746, he published at Madrid, *Idea de una Nueva Historia General de la America Septentrional*, containing an account of the result of his inquiries; and he added to it a catalogue of his American Historical Museum, arranged under thirty-six different heads. His idea of a New History appears to me the work of a whimsical credulous man. But his catalogue of Mexican maps, paintings, tribute-rolls, calendars, &c. is much larger than one could have expected. Unfortunately a ship, in which he had sent a considerable part of them to Europe, was taken by an English privateer during the war between Great Britain and Spain, which commenced in the year 1739; and it is probable that they perished by falling into the hands of ignorant captors. Boturini himself incurred the displeasure of the Spanish court, and died in an hospital at Madrid. The history of which the *Idea*, &c. was only a *prospectus*, was never published. The remainder of his Museum seems to have been dispersed. Some part of it came into the possession of the present Archbishop of Toledo, when he was primate of New Spain; and he published from it that curious tribute-roll which I have mentioned.

The only other collection of Mexican paintings, as far as I can learn, is in the Imperial Library at Vienna. By order of their Imperial Majesties I have obtained such a specimen of these as I desired, in eight paintings made with so much fidelity, that I am informed the copies could hardly be distinguished from the originals. According to a note in this *Codex Mexicanus*, it appears to have been a present from Emmanuel, King of Portugal, to Pope Clement VII. who died A. D. 1523. After passing through the hands of several illustrious proprietors, it fell into those of the Cardinal of Saxe-Eisenach, who presented it to the Emperor Leopold. These paintings are manifestly Mexican, but they are in a style very different from any of the former. An engraving has been made of one of them, in order to gratify such of my readers as may deem this an object worthy of their attention. Were it an object of sufficient importance, it might perhaps be possible, by recourse to the plates of Purchas, and the Archbishop of Toledo, as a key, to form plausible conjectures concerning the meaning of this picture. Many of the figures are evidently similar. A. A. are targets and darts, almost in the same form with those published by Purchas, p. 1070, 1071, &c. B. B. are figures of temples, nearly resembling those in Purchas, p. 1109 and 1113, and in Lorenzana. Plate II. C

is a bale of mantles, or cotton cloths, the figure of which occurs in almost every plate of Purchas and Loreuzana. E. E. E. seem to be Mexican captains in their war dress, the fantastic ornaments of which resemble the figures in Purchas, p. 1110, 1111, 2113. I should suppose this picture to be a tribute-roll, as their mode of noting numbers occurs frequently. D. D. D., &c. According to Boturini, the mode of computation by the number of knots was known to the Mexicans as well as to the Peruvians, p. 85, and the manner in which the number of units is represented in the Mexican paintings in my possession seems to confirm this opinion. They plainly resemble a string of knots on a cord or slender rope.

Since I published the former edition, Mr. Waddilove, who is still pleased to continue his friendly attention to procure me information, has discovered, in the Library of the Escorial, a volume in folio, consisting of forty sheets of a kind of pasteboard, each the size of a common sheet of writing paper, with great variety of uncouth and whimsical figures of Mexican painting, in very fresh colors, and with an explanation in Spanish to most of them. The first twenty-two sheets are the signs of the months, days, &c. About the middle of each sheet are two or more large figures for the month, surrounded by the signs of the days. The last eighteen sheets are not so filled with figures. They seem to be signs of Deities, and images of various objects. According to this Calendar in the Escorial, the Mexican year contained 236 days, divided into 22 months of 13 days. Each day is represented by a different sign, taken from some natural object, a serpent, a dog, a lizard, a reed, a house, &c. The signs of days in the Calendar of the Escorial are precisely the same with those mentioned by Boturini. *Idea*, &c. p. 45. But, if we may give credit to that author, the Mexican year contained 360 days, divided into 18 months of 20 days. The order of days in every month was computed, according to him, first by what he calls a *tridecennary* progression of days from one to thirteen, in the same manner as in the Calendar of the Escorial, and then by a *septenary* progression of days from one to seven, making in all twenty. In this Calendar, not only the signs which distinguish each day, but the qualities supposed to be peculiar to each month are marked. There are certain weaknesses which seem to accompany the human mind through every stage of its progress in observation and science. Slender as was the knowledge of the Mexicans in astronomy, it appears to have been already connected with judicial astrology. The fortune and character of persons born in each month are supposed to be decided by some superior influence predominant at the time of nativity. Hence it is foretold in the Calendar, that all who are born in one month will be rich, in another warlike, in a third luxurious, &c. The pasteboard, or whatever substance it may be on which the Calendar in the Escorial is painted, seems, by Mr. Waddilove's description of it, to resemble nearly that in the Imperial Library at Vienna. In several particulars the figures bear some likeness to those in the plate which I have published. The figures marked D, which induced me to conjecture that this painting might be a tribute-roll similar to those published by Purchas and the Archbishop of Toledo, Mr. Waddilove supposes to be signs of days: and I have such confidence in the accuracy of his observations, as to conclude his opinion to be well founded. It appears, from the characters in which the explanations of the figures are written, that this curious monument of Mexican art has been obtained soon after the conquest of the Empire. It is singular that it should never have been mentioned by any Spanish author.

NOTE [151]. p. 153.—The first was called the Prince of the Deathful Lance; the second the Divider of Men; the third the Shedder of Blood; the fourth the Lord of the Dark-house. *Acosta*, lib. vi. c. 25.

NOTE [152]. p. 154.—The temple of Cholula, which was deemed more holy than any in New Spain, was likewise the most considerable. But it was nothing more than a mount of solid earth. According to Torquemada, it was above a quarter of a league in circuit at the base, and rose to the height of forty fathoms. *Mon. Ind.* lib. iii. c. 19. Even M. Clavigero acknowledges that all the Mexican temples were solid structures, or earthen mounts, and of consequence cannot be considered as any evidence of their having made any considerable progress in the art of building. *Clavig.* ii. 207.

From inspecting various figures of temples in the paintings engraved by Purchas, there seems to be some reason for suspecting that all their temples were con-

structed in the same manner. See vol. iii. p. 1109, 1110, 1113.

NOTE [153]. p. 154.—Not only in Tlascala and Tepeaca, but even in Mexico itself, the houses of the people were mere huts built with turf or mud, or the branches of trees. They were extremely low and slight, and without any furniture but a few earthen vessels. Like the rudest Indians, several families resided under the same roof, without having any separate apartments. *Herrera*, dec. 2. lib. vii. c. 13. lib. x. c. 22. dec. 3. lib. iv. c. 17. *Torquem.* lib. iii. c. 23.

NOTE [154]. p. 154.—I am informed by a person who resided long in New Spain, and visited almost every province of it, that there is not, in all the extent of that vast empire, any monument or vestige of any building more ancient than the conquest, nor of any bridge or highway, except some remains of the causeway from Guadalupe to that gate of Mexico by which Cortes entered the city. *MS. penes me*. The author of another account in manuscript observes, "That at this day there does not remain even the smallest vestige of the existence of any ancient Indian building, public or private, either in Mexico or in any province of New Spain. I have travelled, says he, through all the countries adjacent to them, viz. New Galicia, New Biscay, New Mexico, Sonora, Cinaloa, the New Kingdom of Leon, and New Santandero, without having observed any monument worth notice, except some ruins near an ancient village in the valley de Casas Grandes, in lat. N. 3°. 46'. long. 258°. 24'. from the island of Tenerife, or 460 leagues N. N. W. from Mexico." He describes these ruins minutely, and they appear to be the remains of a paltry building of turf and stone, plastered over with white earth or lime. A missionary informed that gentleman, that he had discovered the ruins of another edifice similar to the former, about a hundred leagues towards N. W. on the banks of the river St. Pedro. *MS. penes me*.

These testimonies derive great credit from one circumstance, that they were not given in support of any particular system or theory, but as simple answers to queries which I had proposed. It is probable, however, that when these gentlemen assert that no ruins or monuments of any ancient work whatever are now to be discovered in the Mexican empire, they meant that there were no such ruins or monuments as conveyed any idea of grandeur or magnificence in the works of its ancient inhabitants. For it appears from the testimony of several Spanish authors, that in Otumba, Tlascala, Cholula, &c. some vestiges of ancient buildings are still visible. *Villa Segnor Theatro Amer.* p. 143. 308. 353. D. Fran. Ant. Loreuzana, formerly Archbishop of Mexico, and now of Toledo, in his introduction to that edition of the *Cartas de Relacion* of Cortes, which he published at Mexico, mentions some ruins which are still visible in several of the towns through which Cortes passed in his way to the capital, p. 4, &c. But neither of these authors gives any description of them, and they seem to be so very inconsiderable, as to show only that some buildings had once been there. The large mount of earth at Cholula, which the Spaniards dignified with the name of temple, still remains, but without any steps by which to ascend, or any facing of stone. It appears now like a natural mount, covered with grass and shrubs, and possibly it was never any thing more. *Torquem.* lib. iii. c. 19. I have received a minute description of the remains of a temple near Cuernavaca, on the road from Mexico to Acapulco. It is composed of large stones, fitted to each other as nicely as those in the buildings of the Peruvians, which are hereafter mentioned. At the foundation it forms a square of twenty-five yards; but as it rises in height it diminishes in extent, not gradually, but by being contracted suddenly at regular distances, so that it must have resembled the figure B. in the plate. It terminated, it is said, in a spire.

NOTE [155]. p. 154.—The exaggeration of the Spanish historians, with respect to the number of human victims sacrificed in Mexico, appears to be very great. According to Gomara, there was no year in which twenty thousand human victims were not offered to the Mexican Divinities, and in some years they amounted to fifty thousand. *Cron.* c. 229. The skulls of those unhappy persons were ranged in order in a building erected for that purpose, and two of Cortes's officers, who had counted them, informed Gomara that their number was a hundred and thirty-six thousand. *Ibid.* c. 82. *Herrera's* account is still more incredible, that the number of victims was so great, that five thousand

have been sacrificed in one day, nay, on some occasions, no less than twenty thousand. *Dec.* iii. lib. ii. c. 16. Torquemada goes beyond both in extravagance; for he asserts that twenty thousand children, exclusive of other victims, were slaughtered annually. *Mon. Ind.* lib. vii. c. 21. The most respectable authority in favor of such high numbers is that of Zumurruga, the first Bishop of Mexico, who, in a letter to the chapter-general of his order, A. D. 1631, asserts, that the Mexicans sacrificed annually twenty thousand victims. *Davila. Teatro Eccles.* 126. In opposition to all these accounts, B. de las Casas observes, that if there had been such an annual waste of the human species, the country could never have arrived at that degree of populousness for which it was remarkable when the Spaniards first landed there. This reasoning is just. If the number of victims in all the provinces of New Spain had been so great, not only must population have been prevented from increasing, but the human race must have been exterminated in a short time. For besides the waste of the species by such numerous sacrifices, it is observable that wherever the fate of captives taken in war is either certain death or perpetual slavery, as men can gain nothing by submitting speedily to an enemy, they always resist to the uttermost, and war becomes bloody and destructive to the last degree. Las Casas positively asserts, that the Mexicans never sacrificed more than fifty or a hundred persons in a year. See his dispute with Sepulveda, subjoined to his *Brevissima Relacion*, p. 105. Cortes does not specify what number of victims was sacrificed annually; but B. Diaz del Castillo relates that, an inquiry having been made with respect to this by the Franciscan monks who were sent into New Spain immediately after the conquest, it was found that about two thousand five hundred were sacrificed every year in Mexico, C. 207.

NOTE [156]. p. 155.—It is hardly necessary to observe, that the Peruvian Chronology is not only obscure, but repugnant to conclusions deduced from the most accurate and extensive observations, concerning the time that elapses during each reign, in any given succession of Princes. The medium has been found not to exceed twenty years. According to Acosta and Garcilasso de la Vega, Huana Capac, who died about the year 1527, was the twelfth Inca. According to this rule of computing, the duration of the Peruvian monarchy ought not to have been reckoned above two hundred and forty years; but they affirm that it had subsisted four hundred years. *Acosta*, lib. vi. c. 19. *Vega*, lib. i. c. 9. By this account each reign is extended at a medium to thirty-three years, instead of twenty, the number ascertained by Sir Isaac Newton's observations; but so imperfect were the Peruvian traditions, that though the total is boldly marked, the number of years in each reign is unknown.

NOTE [157]. p. 155.—Many of the earliest Spanish writers assert that the Peruvians offered human sacrifices. *Xeros*, p. 190. *Zarate*, lib. i. c. 11. *Acosta*, lib. v. c. 19. But Garcilasso de la Vega contends, that though this barbarous practice prevailed among their uncivilized ancestors, it was totally abolished by the Incas, and that no human victim was ever offered in any temple of the Sun. This assertion, and the plausible reasons with which he confirms it, are sufficient to refute the Spanish writers, whose accounts seem to be founded entirely upon report, not upon what they themselves had observed. *Vega*, lib. ii. c. 4. In one of their festivals, the Peruvians offered cakes of bread moistened with blood drawn from the arms, the eyebrows, and noses of their children. *Id.* lib. vii. c. 6. This rite may have been derived from their ancient practice, in their uncivilized state, of sacrificing human victims.

NOTE [158]. p. 156.—The Spaniards have adopted both those customs of the ancient Peruvians. They have preserved some of the aqueducts or canals, made in the days of the Incas, and have made new ones, by which they water every field that they cultivate. *Ulloa Voyage*, tom. i. 422. 477. They likewise continue to use *guano*, or the dung of sea-fowls, as manure. *Ulloa* gives a description of the almost incredible quantity of it in the small islands near the coast. *Ibid.* 481.

NOTE [159]. p. 156.—The temple of Cayanbo, the palace of the Inca at Callo in the plain of Lacatunga, and that of Atun-Cannar, are described by Ulloa, tom. i. 286, &c. who inspected them with great care. M. de Condamine published a curious memoir concerning

the ruins of Atun-Cannar. Mein. de l'Academie de Berlin, A. D. 1746, p. 435. Acosta describes the ruins of Cuzco, which he had examined. Lib. vi. c. 14. Garcilasso, in his usual style, gives pompous and confused descriptions of several temples and other public edifices. Lib. iii. c. 1. c. 21. lib. vi. c. 4. Don. —Zapata, in a large treatise concerning Peru, which has not hitherto been published, communicates some information with respect to several monuments of the ancient Peruvians, which have not been mentioned by other authors. MS. *penes me*. Articulo xx. Ulloa describes some of the ancient Peruvian fortifications, which were likewise works of great extent and solidity. Tom. i. 391. Three circumstances struck all those observers; the vast size of the stones which the Peruvians employed in some of their buildings. Acosta measured one, which was thirty feet long, eighteen broad, and six in thickness; and yet, he adds, that in the fortress at Cuzco there were stones considerably larger. It is difficult to conceive how the Peruvians could move these, and raise them to the height even of twelve feet. The second circumstance is, the imperfection of the Peruvian art, when applied to working in timber. By the patience and perseverance natural to Americans, stones may be formed into any shape, merely by rubbing one against another, or by the use of hatchets or other instruments made of stone; but with such rude tools little progress can be made in carpentry. The Peruvians could not mortise two beams together, or give any degree of union or stability to any work composed of timber. As they could not form a centre, they were totally unacquainted with the use of arches in building; nor can the Spanish authors conceive how they were able to frame a roof for those ample structures which they raised.

The third circumstance is a striking proof, which all the monuments of the Peruvians furnish, of their want of ingenuity and invention, accompanied with patience no less astonishing. None of the stones employed in those works were formed into any particular or uniform shape, which could render them fit for being compacted together in building. The Indians took them as they fell from the mountains, or were raised out of the quarries. Some were square, some triangular, some convex, some concave. Their art and industry were employed in joining them together, by forming such hollows in the one as perfectly corresponded to the projections or risings in the other. This tedious operation, which might have been so easily abridged by adapting the surface of the stones to each other, either by rubbing, or by their hatchets of copper, would be deemed incredible, if it were not put beyond doubt by inspecting the remains of those buildings. It gives them a very singular appearance to a European eye. There is no regular layer or stratum of building, and no one stone resembles another in dimensions or form. At the same time, by the persevering but ill-directed industry of the Indians, they are all joined with that minute nicety which I have mentioned. Ulloa made this observation concerning the form of the stones in the fortress of Atun-Cannar. Voy. i. p. 387. Penito gives a similar description of the fortress of Cuzco, the most perfect of all the Peruvian works. Zapata MS. *penes me*. According to M. de Condomine, there were regular strata of building in some parts of Atun-Cannar, which he remarks as singular, and as a proof of some progress in improvement.

NOTE [160] p. 156.—The appearance of those bridges which bend with their own weight, wave with the wind, and are considerably agitated by the motion of every person who passes along them, is very frightful at first. But the Spaniards have found them to be the easiest mode of passing the torrents in Peru, over which it would be difficult to throw more solid structures either of stone or timber. They form those hanging bridges so strong and broad, that loaded mules pass along them. All the trade of Cuzco is carried on by means of such a bridge over the river Apurimac. Ulloa, tom. i. p. 358. A more simple contrivance was employed in passing smaller streams: A basket, in which the traveller was placed, being suspended from a strong rope stretched across the stream, it was pushed or drawn from one side to the other. Ibid.

NOTE [161]. p. 158.—My information with respect to those events is taken from *Noticia breve de la expedicion militar de Sinora y Cinaloa, su exito feliz, y vantajoso estado, en que por consecuencia de ello, se han puesto ambas provincias*, published at Mexico, June 17th, 1771, in order to satisfy the curiosity of the merchants, who had furnished the viceroy with money

for defraying the expense of the armament. The copies of this *Noticia* are very rare in Madrid; but I have obtained one, which has enabled me to communicate these curious facts to the public. According to this account, there was found in the mine Yecorato in Cinaloa a grain of gold of twenty-two carats, which weighed sixteen marks four ounces four ochavas; this was sent to Spain as a present fit for the king, and is now deposited in the royal cabinet at Madrid.

NOTE [162]. p. 158.—The uncertainty of geographers with respect to this point is remarkable, for Cortes seems to have surveyed its coasts with great accuracy. The Archbishop of Toledo has published from the original in the possession of the Marquis del Valle, the descendant of Cortes, a map drawn in 1541, by the pilot Domingo Castillo, in which California is laid down as a peninsula, stretching out nearly in the same direction which is now given to it in the best maps; and the point where Rio Colorado enters the gulf is marked with precision. Hist. de Nueva Espagna, 327.

NOTE [163]. p. 158—I am indebted for this fact to M. L'Abbe Raynal, tom. iii. 103; and upon consulting an intelligent person, long settled on the Mosquito shore, and who has been engaged in the logwood trade, I find that ingenious author has been well informed. The logwood cut near the town of St. Francis of Campechy is of much better quality than that on the other side of Yucatan: and the English trade in the Bay of Honduras is almost at an end.

NOTE [164]. p. 160.—P. Torribio de Benevente, or Motolinia, has enumerated ten causes of the rapid depopulation of Mexico, to which he gives the name of the Ten Plagues. Many of these are not peculiar to that province. 1. The introduction of the small pox. This disease was first brought into New Spain in the year 1520, by a Negro-slave, who attended Narvaez in his expedition against Cortes. Torribio affirms, that one half of the people in the provinces visited with this distemper died. To this mortality, occasioned by the small pox, Torquemada adds the destructive effects of two contagious distempers which raged in the year 1545 and 1576. In the former 800,000, in the latter, above two millions perished, according to an exact account taken by order of the viceroys. Mon. Ind. i. 642. The small pox was not introduced into Peru for several years after the invasion of the Spaniards; but, there, too, that distemper proved very fatal to the natives. Garcia Origin, p. 88. 2. The numbers who were killed or died of famine in their war with the Spaniards, particularly during the siege of Mexico. 3. The great famine that followed after the reduction of Mexico, as all the people engaged, either on one side or other, had neglected the cultivation of their lands. Something similar to this happened in all the other countries conquered by the Spaniards. 4. The grievous tasks imposed by the Spaniards upon the people belonging to their Repartimientos. 5. The oppressive burden of taxes which they were unable to pay, and from which they could hope for no exemption. 6. The numbers employed in collecting the gold carried down by the torrents from the mountains, who were forced from their own habitations, without any provision made for their subsistence, and subjected to all the rigor of cold in those elevated regions. 7. The immense labor of rebuilding Mexico, which Cortes urged on with such precipitate ardor as destroyed an incredible number of people. 8. The number of people condemned to servitude, under various pretexts, and employed in working the silver mines. These, marked by each proprietor with a hot iron, like his cattle, were driven in herds to the mountains. 9. The nature of the labor to which they were subjected there, the noxious vapours of the mines, the coldness of the climate, and scarcity were so fatal, that Torribio affirms the country round several of those mines, particularly near Guaxago, was covered with dead bodies, the air corrupted with their stench, and so many vultures and other voracious birds hovered about for their prey, that the sun was darkened with their flight. 10. The Spaniards, in the different expeditions which they undertook, and by the civil wars which they carried on, destroyed many of the natives whom they compelled to serve them as *Tunemes*, or carriers of burdens. This last mode of oppression was particularly ruinous to the Peruvians. From the number of Indians who perished in Gonzalo Pizarro's expedition into the countries to the east of the Andes, one may form some idea of what they suffered in similar services, and how fast they were wasted by them. Torribio, MS. Curita, in his Breve y Summaria Relacion,

illustrates and confirms several of Torribio's observations, to which he refers. MS. *penes me*.

NOTE [165]. p. 160.—Even Montesquieu has adopted this idea, lib. viii. c. 18. But the passion of that great man for system sometimes rendered him inattentive to research; and from his capacity to refine, he was apt, in some instances, to overlook obvious and just causes.

NOTE [166]. p. 160.—A strong proof of this occurs in the testament of Isabella, where she discovers the most tender concern for the humane and mild usage of the Indians. Those laudable sentiments of the queen have been adopted in the public law of Spain, and serve as the introduction to the regulations contained under the title *Of the good treatment of the Indians*. Recopil. lib. vi. tit. x.

NOTE [167] p. 160.—In the seventh Title of the first book of the *Recopilacion*, which contains the laws concerning the powers and functions of archbishops and bishops, almost a third part of them relates to what is incumbent upon them as guardians of the Indians, and points out the various methods in which it is their duty to interpose, in order to defend them from oppression either with respect to their persons or property. Not only do the laws commit to them this honorable and humane office, but the ecclesiastics of America actually exercise it.

Innumerable proofs of this might be produced from Spanish authors. But I rather refer to Gage, as he was not disposed to ascribe any merit to the popish clergy to which they were not fully entitled. Survey, p. 142. 192, &c. Henry Hawks, an English merchant, who resided five years in New Spain previous to the year 1572, gives the same favorable account of the popish clergy. Hakluyt, iii. 466. By a law of Charles V. not only bishops, but other ecclesiastics, are empowered to inform and admonish the civil magistrates, if any Indian is deprived of his just liberty and rights; Recopilac. lib. vi. tit. vi. ley 14. and thus were constituted legal protectors of the Indians. Some of the Spanish ecclesiastics refused to grant absolution to such of their countrymen as possessed *Encomendas*, and considered the Indians as slaves, or employed them in working their mines. Gonz. Davil. Teatro. Eccles. i. 157.

NOTE [168]. p. 160.—According to Gage, Chiapa dos Indos contains 4000 families; and he mentions it only as one of the largest Indian towns in America, p. 104.

NOTE [169]. p. 160.—It is very difficult to obtain an accurate account of the state of population in those kingdoms of Europe where the police is most perfect, and where science has made the greatest progress. In Spanish America, where knowledge is still in its infancy, and few men have leisure to engage in researches merely speculative, little attention has been paid to this curious inquiry. But in the year 1741, Philip V. enjoined the viceroys and governors of the several provinces in America, to make an actual survey of the people under their jurisdiction, and to transmit a report concerning their number and occupations. In consequence of this order, the Conde de Fuen-Clara, Viceroy of New Spain, appointed D. Jos. Antonio de Villa Segnor y Sanchez to execute that commission in New Spain. From the reports of the magistrates in the several districts, as well as from his own observations and long acquaintance with most of the provinces, Villa Segnor published the result of his inquiries in his *Treinta Americano*. His report, however, is imperfect. Of the nine dioceses, into which the Mexican empire has been divided, he has published an account of five only, viz. the archbishop of Mexico, the bishoprics of Puebla de los Angeles, Mechoacan, Oaxaca and Nova Galicia. The bishoprics of Yucatan, Verapaz, Chiapa, and Guatemala, are entirely omitted, though the two latter comprehend countries in which the Indian race is more numerous than in any part of New Spain. In his survey of the extensivo diocese of Nova Galicia, the situation of the different Indian villages is described, but he specifies the number of people only in a small part of it. The Indians of that extensive province, in which the Spanish dominion is imperfectly established, are not registered with the same accuracy as in other parts of New Spain. According to Villa Segnor, the actual state of population in the five dioceses above mentioned is of Spaniards, negroes, mulattoes, and mestizos, in the dioceses of,

	Families.
Mexico	105,202
Los Angeles	30,600
Mechoacan	30,840
Oaxaca	7,206
Nova Galicia	16,770
	190,708

At the rate of five to a family, the total number is 953,540

Indian families in the diocese of Mexico	119,511
Los Angeles	88,240
Mechoacan	36,196
Oaxaca	44,222
Nova Galicia	6,222
	294,391

At the rate of five to a family, the total number is 1,471,955. We may rely with great certainty on this computation of the number of Indians, as it is taken from the *Matricula*, or register, according to which the tribute paid by them is collected. As four dioceses of nine are totally omitted, and in that of Nova Galicia the numbers are imperfectly recorded, we may conclude that the number of Indians in the Mexican empire exceeds two millions.

The account of the number of Spaniards, &c. seems not to be equally complete. Of many places, Villa Segnor observes in general terms, that several Spaniards, negroes, and people of mixed race, reside there, without specifying their number. If, therefore, we make allowance for these, and for all who resided in the four dioceses omitted, the number of Spaniards, and of those of a mixed race, may probably amount to a million and a half. In some places Villa Segnor distinguishes between Spaniards and the three inferior races of negroes, mulattoes, and mestizos, and marks their number separately. But he generally blends them together. But from the proportion observable in those places, where the number of each is marked, as well as from the account of the state of population in New Spain by other authors, it is manifest that the number of negroes and persons of a mixed race far exceeds that of Spaniards. Perhaps the latter ought not to be reckoned above 500,000 to a million of the former.

Defective as this account may be, I have not been able to procure such intelligence concerning the number of people in Peru, as might enable me to form any conjecture equally satisfying with respect to the degree of its population. I have been informed that in the year 1761, the protector of the Indians in the viceroyalty of Peru computed that 612,780 paid tribute to the king. As all females, and persons under age are exempted from this tax in Peru, the total number of Indians ought by that account to be 2,449,120. MS. *penes me*.

I shall mention another mode by which one may compute, or at least form a guess concerning the state of population in New Spain and Peru. According to an account which I have reason to consider as accurate, the number of copies of the bull of Cruzada exported to Peru on each new publication, is, 1,171,953; to New Spain, 2,649,326. I am informed that but few Indians purchase bulls, and that they are sold chiefly to the Spanish inhabitants, and those of mixed race; so that the number of Spaniards, and people of a mixed race, will amount, by this mode of computation, to at least three millions.

The number of inhabitants in many of the towns in Spanish America may give us some idea of the extent of population, and correct the inaccurate but popular notion entertained in Great Britain concerning the weak and desolate state of their colonies. The city of Mexico contains at least 150,000 people. It is remarkable that Torquemada, who wrote his *Monarquia Indiana* about the year 1612, reckons the inhabitants of Mexico at that time to be only 7000 Spaniards and 8000 Indians. Lib. iii. c. 26. T Puebla de los Angeles contains above 60,000 Spaniards, and people of a mixed race. Villa Segnor, p. 247. Guadalajara contains above 30,000 exclusive of Indians. Ibid. ii. 206. Lima contains 54,000. De Cosme Buena Descr. de Peru, 1764. Cartagena contains 25,000. Potosi contains 25,000. Bueno, 1767. Popayan contains above 20,000. Ulloa, i. 287. Towns of a second class are still more numerous. The cities in the most thriving settlements of other European nations in America cannot be compared with these.

Such are the detached accounts of the number of people in several towns, which I found scattered in

authors whom I thought worthy of credit. But I have obtained an enumeration of the inhabitants of the towns in the province of Quito, on the accuracy of which I can rely; and I communicate it to the public, both to gratify curiosity, and to rectify the mistaken notion which I have mentioned. St. Francisco de Quito contains between 50 and 60,000 people of all the different races. Besides the city, there are in the *Corregimiento* twenty-nine *curas* or parishes established in the principal villages, each of which has smaller hamlets depending upon it. The inhabitants of these are mostly Indians and mestizos. St. Juan de Pasto has between 6 and 8000 inhabitants, besides twenty-seven dependent villages. St. Miguel de Ibarra, 7000 citizens and ten villages. The district of Havalla, between 18 and 20,000 people. The district of Tacuna, between 10 and 12,000. The district of Ambato, between 8 and 10,000, besides sixteen depending villages. The city of Riobamba, between 16 and 20,000 inhabitants, and nine depending villages. The district of Chimbo, between 6 and 8000. The city of Guayaquil, from 16 to 20,000 inhabitants, and fourteen depending villages. The district of Atunsi, between 5 and 6000 inhabitants, and four depending villages. The city of Cuenca, between 25 and 30,000 inhabitants, and nine populous depending villages. The town of Laxa, from 8 to 10,000 inhabitants, and fourteen depending villages. This degree of population, though slender if we consider the vast extent of the country, is far beyond what is commonly supposed. I have omitted to mention, in its proper place, that Quito is the only province in Spanish America that can be denominated a manufacturing country; hats, cotton stuffs, and coarse woollen cloths are made there in such quantities as to be sufficient not only for the consumption of the province, but to furnish a considerable article for exportation into other parts of Spanish America. I know not whether the uncommon industry of this province should be considered as the cause or the effect of its populousness. But among the ostentatious inhabitants of the New World, the passion for every thing that comes from Europe is so violent, that I am informed the manufactures of Quito are so much undervalued as to be on the decline.

NOTE [170]. p. 161.—These are established at the following places:—St. Domingo in the island of Hispaniola, Mexico in New Spain, Lima in Peru, Panama in Tierra Firme, Santiago in Guatemala, Guadalajara in New Galicia, Santa Fe in the New Kingdom of Granada, La Plata in the country of Los Charcas, St. Francisco de Quito, St. Jago de Chili, Buenos Ayres. To each of these are subjected several large provinces, and some so far removed from the cities where the courts are fixed, that they can derive little benefit from their jurisdiction. The Spanish writers commonly reckon up twelve Courts of Audience, but they include that of Manila, in the Philippine islands.

NOTE [171]. p. 161.—On account of the distance of Peru and Chili from Spain, and the difficulty of carrying commodities of such bulk as wine and oil across the isthmus of Panama, the Spaniards in those provinces have been permitted to plant vines and olives: but they are strictly prohibited from exporting wine or oil to any of the provinces on the Pacific Ocean, which are in such a situation as to receive them from Spain. Reco. lib. i. tit. xvii. l. 15—18.

NOTE [172]. p. 162.—This computation was made by Benzoni, A. D. 1550, fifty-eight years after the discovery of America. Hist. Novi Orbis, lib. iii. c. 21. But as Benzoni wrote with the spirit of a malecontent, disposed to detract from the Spaniards in every particular, it is probable that his calculation is considerably too low.

NOTE [173]. p. 162.—My information with respect to the division and transmission of property in the Spanish colonies is imperfect. The Spanish authors do not explain this fully, and have not perhaps attended sufficiently to the effects of their own institutions and laws. Solorzano de Jure Ind. (vol. ii. lib. ii. l. 16,) explains in some measure the introduction of the tenure of *Mayorazgo*, and mentions some of its effects. Villa Segnor takes notice of a singular consequence of it. He observes, that in some of the best situations in the city of Mexico, a good deal of ground is unoccupied, or covered only with the ruins of the houses once erected upon it; and adds, that as this ground is held by right of *Mayorazgo*, and cannot be alienated, that desolation and those ruins become perpetual. Teatr. Amer. vol. i. p. 34.

NOTE [174]. p. 162.—There is no law that excludes Creoles from offices either civil or ecclesiastic. On the contrary, there are many *Cedulas*, which recommend the conferring places of trust indiscriminately on the natives of Spain and America. Betancourt y Figueroa Derecho, &c. p. 5, 6. But, notwithstanding such repeated recommendations, preference in almost every line is conferred on native Spaniards. A remarkable proof of this is produced by the author last quoted. From the discovery of America to the year 1637, three hundred and sixty-nine bishops, or archbishops, have been appointed to the different dioceses in that country, and of all that number only twelve were Creoles, p. 40. This predilection for Europeans seems still to continue. By a royal mandate, issued in 1776, the chapter of the cathedral of Mexico is directed to nominate European ecclesiastics of known merit and abilities, that the King may appoint them to supply vacant benefices. MS. *penes me*.

NOTE [175]. p. 162.—Moderate as this tribute may appear, such is the extrema poverty of the Indians in many provinces of America, that the exacting of it is intolerably oppressive. Pegna Itiner. par Paroches de Indios, p. 192.

NOTE [176]. p. 163.—In New Spain, on account of the extraordinary merit and services of the first conquerors, as well as the small revenue arising from the country previous to the discovery of the mines of Satecas, the *encomiendas* were granted for three, and sometimes for four lives. Recopil. lib. vi. tit. ii. c. 14, &c.

NOTE [177]. p. 163.—D. Ant. Ulloa contends, that working in mines is not noxious, and as a proof of this informs us, that many Mestizos and Indians, who do not belong to any Repartimiento, voluntarily hire themselves as miners; and several of the Indians, when the legal term of their service expires, continue to work in the mines of choice. *Entreten*. p. 265. But his opinion concerning the wholesomeness of this occupation is contrary to the experience of all ages; and wherever men are allured by high wages, they will engage in any species of labor, however fatiguing or pernicious it may be. D. Hern. Carillo Altamirano relates a curious fact incompatible with this opinion. Wherever mines are wrought, says he, the number of Indians decreases; but in the province of Campeachy, where there are no mines, the number of Indians has increased more than a third since the conquest of America, though neither the soil nor climate be so favorable as in Peru or Mexico. Colbert Collect. In another memorial presented to Philip III. in the year 1600, Captain Juan Gonzales de Azevedo asserts, that in every district of Peru where the Indians are compelled to labor in the mines, their numbers were reduced to the half, and in some places to the third, of what it was under the viceroyalty of Don Fran. Toledo in 1581. Colb. Collect.

NOTE [178]. p. 163.—As labor of this kind cannot be prescribed with legal accuracy, the tasks seem to be in a great measure arbitrary, and, like the services exacted by feudal superiors in *vinca prato*, *aut messe*, from their vassals, are extremely burdensome, and often wantonly oppressive. Pegna Itiner. par Paroches de Indios.

NOTE [179]. p. 163.—The turn of service known in Peru by the name of *Mita* is called *Tanda* in New Spain. There it continues no longer than a week at a time. No person is called to serve at a greater distance from his habitation than 24 miles. This arrangement is less oppressive to the Indians than that established in Peru. Memorial of Hern. Carillo Altamirano. Colbert Collect.

NOTE [180]. p. 163.—The strongest proof of this may be deduced from the laws themselves. By the multitude and variety of regulations to prevent abuses, we may form an idea of the number of abuses that prevail. Though the laws have wisely provided that no Indian shall be obliged to serve in any mine at a greater distance from his place of residence than thirty miles; we are informed, in a memorial of D. Hernan Carillo Altamirano presented to the king, that the Indians of Peru are often compelled to serve in mines at the distance of a hundred, a hundred and fifty, and even two hundred leagues from their habitation. Colbert Collect. Many mines are situated in parts of the country so barren and so distant from the ordinary habitations of the Indians, that the necessity of procuring laborers

to work there has obliged the Spanish monarchs to dispense with their own regulations in several instances, and to permit the viceroys to compel the people of more remote provinces to resort to those mines. Escalona Gazophyl. Perub. lib. i. c. 16. But, in justice to them, it should be observed that they have been studious to alleviate this oppression as much as possible, by enjoining the viceroys to employ every method in order to induce the Indians to settle in some part of the country adjacent to the mines. Id. *ibid*.

NOTE [181]. p. 163.—Torquemada, after a long enumeration which has the appearance of accuracy, concludes the number of monasteries in New Spain to be four hundred. Mon. Ind. lib. xix. c. 32. The number of monasteries in the city of Mexico alone was, in the year 1745, fifty-five. Villa Segnor Theat. Amer. i. 34. Ulloa reckons up forty convents in Lima; and mentioning those for nuns, he says that a small town might be peopled out of them, the number of persons shut up there is so great. Voy. i. 429. Philip III. in a letter to the Viceroy of Peru, A. D. 1620, observes, that the number of convents in Lima was so great, that they covered more ground than all the rest of the city. Solorz. lib. iii. c. 23. n. 57. Lib. iii. c. 16. Torquem. lib. xv. c. 3. The first monastery in New Spain was founded A. D. 1525, four years only after the conquest. Torq. lib. xv. c. 16.

According to Gil Gonzalez Davila, the complete establishment of the American church in all the Spanish settlements was, in the year 1649, 1 patriarch, 6 archbishops, 32 bishops, 346 prebends, 2 abbots, 5 royal chaplains, 840 convents. Teatro Ecclesiastico de las Ind. Occident. Vol. i. Pref. When the order of Jesuits was expelled from all the Spanish dominions, the colleges, *professed* houses, and residences which it possessed in the province of New Spain were thirty, in Quito sixteen, in the New Kingdom of Granada thirteen, in Peru seventeen, in Chili eighteen, in Paraguay eighteen; in all, a hundred and twelve. Collection General de Providencias hasta aqui tomadas sobre estranamiento, &c. de la Compagnia, part i. p. 19. The number of Jesuits, priests, and novices in all these amounted to 2245. MS. *pence me*.

In the year 1644 the city of Mexico presented a petition to the king, praying that no new monastery might be founded, and that the revenues of those already established might be circumscribed, otherwise the religious houses would soon acquire the property of the whole country. The petitioners request likewise, that the bishops might be laid under restrictions in conferring holy orders, as there were at that time in New Spain above six thousand clergymen without any living. *Ibid*. p. 16. These abuses must have been enormous indeed, when the superstition of American Spaniards was shocked, and induced to remonstrate against them.

NOTE [182]. p. 166.—This description of the manners of the Spanish clergy I should not have ventured to give upon the testimony of Protestant authors alone, as they may be suspected of prejudice or exaggeration. Gage, in particular, who had a better opportunity than any Protestant to view the interior state of Spanish America, describes the corruption of the church which he had forsaken with so much of the acrimony of a new convert, that I should have distrusted his evidence, though it communicates some very curious and striking facts. But Benzon mentions the profligacy of ecclesiastics in America at a very early period after their settlement there. Hist. lib. ii. c. 19. 20. M. Frazier, an intelligent observer, and zealous for his own religion, paints the dissolute manners of the Spanish ecclesiastics in Peru, particularly the regulars, in stronger colors than I have employed. Voy. p. 51. 215, &c. M. Gentil confirms this account. Voy. i. 34. Correa concurs with both, and adds many remarkable circumstances. Voy. i. 61. 155. 161. I have good reason to believe that the manners of the regular clergy, particularly in Peru, are still extremely indecent. Acosta himself acknowledges that great corruption of manners had been the consequence of permitting monks to forsake the retirement and discipline of the cloister, and to mingle again with the world, by undertaking the charge of the Indian parishes. De Pracur. Ind. Salute, lib. iv. c. 13, &c. He mentions particularly those vices of which I have taken notice and considers the temptations to them as so formidable, that he leans to the opinion of those who hold that the regular clergy should not be employed as parish priests. Lib. v. c. 20. Even the advocates of the regulars admit, that many and great enormities abounded among the monks of different orders, when set free from the restraint of

monastic discipline; and from the tone of their defence, one may conclude that the charge brought against them was not destitute of truth. In the French colonies the state of the regular clergy is nearly the same as in the Spanish settlements, and the same consequences have followed. M. Biet, superior of the secular priests in Cayenne, inquires, with no less appearance of piety than of candor, into the causes of this corruption, and imputes it chiefly to the exemption of regulars from the jurisdiction and censures of their diocessans; to the temptations to which they are exposed; and to their engaging in commerce. Voy. p. 320. It is remarkable, that all the authors who censure the licentiousness of the Spanish regulars with the greatest severity, concur in vindicating the conduct of the Jesuits. Formed under a discipline more perfect than that of the other monastic orders, or animated by that concern for the honor of the society which takes such full possession of every member of the order, the Jesuits, both in Mexico and Peru, it is allowed, maintain a most irreproachable decency of manners. Frazier, 223. Gentil. i. 34. The same praise is likewise due to the bishops and most of the dignified clergy. Frazier. *Ibid*.

A volume of the Gazette de Mexico for the years 1728, 1729, 1730, having been communicated to me, I find there a striking confirmation of what I have advanced concerning the spirit of low illiberal superstition prevalent in Spanish America. From the newspapers of any nation one may learn what are the objects which chiefly engross its attention, and which appear to it most interesting. The Gazette of Mexico is filled almost entirely with accounts of religious functions, with descriptions of processions, consecrations of churches, beatifications of saints, festivals, autos de fe, &c. Civil or commercial affairs, and even the transactions of Europe, occupy but a small corner in this magazine of monthly intelligence. From the titles of new books, which are regularly inserted in this Gazette, it appears that two-thirds of them are treatises of scholastic theology or of monkish devotion.

NOTE [183]. p. 164.—Solorzano, after mentioning the corrupt morals of some of the regular clergy, with that cautious reserve which became a Spanish layman in touching on a subject so delicate, gives his opinion very explicitly, and with much firmness, against committing parochial charges to monks. He produces the testimony of several respectable authors of his country, both divines and lawyers, in confirmation of his opinion. De Jure Ind. ii. lib. iii. c. 16. A striking proof of the alarm excited by the attempt of the Prince d'Esquilache to exclude the regulars from parochial cures, is contained in the Colbert collection of papers. Several memorials were presented to the king by the procurators for the monastic orders, and replies were made to these in name of the secular clergy. An eager and even rancorous spirit is manifest on both sides in the conduct of this dispute.

NOTE [184]. p. 164.—Not only the native Indians, but the *Mestizos*, or children of a Spaniard and Indian, were originally excluded from the priesthood, and refused admission into any religious order. But by a law issued Sept. 28th, 1588, Philip II. required the prelates of America to ordain such mestizos born in lawful wedlock, as they should find to be properly qualified, and to permit them to take the vows in any monastery where they had gone through a regular novitiate. Recopil. lib. i. tit. vii. l. 7. Some regard seems to have been paid to this law in New Spain; but none in Peru. Upon a representation of this to Charles II. in the year 1697, he issued a new edict, enforcing the observation of it, and professing his desire to have all his subjects, Indians and mestizos, as well as Spaniards, admitted to the enjoyment of the same privileges. Such, however, was the aversion of the Spaniards in America to the Indians and their race, that this seems to have produced little effect; for in the year 1795 Philip V. was obliged to renew the injunction in a more peremptory tone. But so unsurmountable are hatred and contempt of the Indians among the Peruvian Spaniards, that the present king has been constrained to enforce the former edicts anew, by a law published September 11, 1774. Real Cedula, MS. *pence me*.

M. Clavigero has contradicted what I have related concerning the ecclesiastical state of the Indians, particularly their exclusion from the sacrament of the eucharist, and from holy orders, either as seculars or regulars, in such a manner as cannot fail to make a deep impression. He, from his own knowledge, asserts, that in New Spain not only are Indians permitted to

partake of the sacrament of the altar, but that Indian priests are so numerous that they may be counted by hundreds; and among these have been many hundreds of rectors, canons, and doctors, and, as report goes, even a very learned bishop. At present there are many priests, and not a few rectors, among whom there have been three or four of our own pupils." Vol. II. 348, &c. I owe it, therefore, as a duty to the public as well as to myself, to consider each of these points with care, and to explain the reasons which induced me to adopt the opinion which I have published.

I knew that in the Christian church there is no distinction of persons, but that men of every nation, who embrace the religion of Jesus, are equally entitled to every Christian privilege which they are qualified to receive. I knew likewise that an opinion prevailed, not only among most of the Spanish laity settled in America, but among "many ecclesiastics (I use the words of Herrera, dec. ii. lib. ii. c. 15), that the Indians were not perfect or rational men, and were not possessed of such capacity as qualified them to partake of the sacrament of the altar, or of any other benefit of our religion." It was against this opinion that Las Casas contended with the laudable zeal which I have described in Books III. and VI. But as the Bishop of Darien, Doctor Sepulveda, and other respectable ecclesiastics, vigorously supported the common opinion concerning the incapacity of the Indians, it became necessary, in order to determine the point, that the authority of the Holy See should be interposed; and accordingly Paul III. issued a bull, A. D. 1537, in which, after condemning the opinion of those who held that the Indians, as being on a level with brute beasts, should be reduced to servitude, he declares that they were really men, and as such were capable of embracing the Christian religion, and participating of all its blessings. My account of this bull, notwithstanding the cavils of M. Clavigero, must appear just to every person who takes the trouble of perusing it; and my account is the same with that adopted by Torquemada, lib. xvi. c. 25, and by Garcia, Orig. p. 311. But even after this decision, so low did the Spaniards residing in America rate the capacity of the natives, that the first council of Lima (I call it by that name on the authority of the best Spanish authors) discountenanced the admission of Indians to the holy communion Torquem. lib. xvi. c. 20. In New Spain the exclusion of Indians from the sacrament was still more explicit. *Ibid*. After two centuries have elapsed, and notwithstanding all the improvement that the Indians may be supposed to have derived from their intercourse with the Spaniards during that period, we are informed by D. Ant. Ulloa, that in Peru, where, as will appear in the sequel of this note, they are supposed to be better instructed than in New Spain, their ignorance is so prodigious that very few are permitted to communicate, as being altogether destitute of the requisite capacity. Voy. i. 341, &c. Solorz. Polit. Ind. i. 203.

With respect to the exclusion of Indians from the priesthood, either as seculars or regulars, we may observe that while it continued to be the common opinion that the natives of America, on account of their incapacity, should not be permitted to partake of the holy sacrament, we cannot suppose that they would be clothed with that sacred character which entitled them to consecrate and to dispense it. When Torquemada composed his *Monarquia Indiana* it was almost a century after the conquest of New Spain; and yet in his time it was still the general practice to exclude Indians from holy orders. Of this we have the most satisfying evidence. Torquemada having celebrated the virtues and graces of the Indians at great length, and with all the complacency of a missionary, he starts as an objection to what he had asserted, "If the Indians really possess all the excellent qualities which you have described, why are they not permitted to assume the religious habit? Why are they not ordained priests and bishops, as the Jewish and Gentile converts were in the primitive church, especially as they might be employed with such superior advantage to other persons in the instruction of their countrymen?" Lib. xvii. c. 13.

In answer to this objection, which establishes, in the most unequivocal manner, what was the general practice at that period, Torquemada observes, that although by their natural dispositions the Indians are well fitted for a subordinate situation, they are destitute of all the qualities requisite in any station of dignity and authority; and that they are in general so addicted to drunkenness, that upon the slightest temptation one cannot promise on their behaving with the decency suitable to the clerical character. The propriety of excluding them from it, on these accounts, was, he ob-

served, so well justified by experience, that when a foreigner of great erudition, who came from Spain, condemned the practice of the Mexican church, he was convinced of his mistake in a public disputation with the learned and most religious Father D. Juan de Gaona, and his retraction is still extant. Torquemada indeed acknowledges, as M. Clavigero observes with a degree of exultation, that in his own time some Indians had been admitted into monasteries; but, with the art of a disputant, he forgets to mention that Torquemada specifies only two examples of this, and takes notice that in both instances those Indians had been admitted by mistake. Relying upon the authority of Torquemada with regard to New Spain, and of Ulloa with regard to Peru, and considering the humiliating depression of the Indians in all the Spanish settlements, I concluded that they were not admitted into the ecclesiastical order, which is held in the highest veneration all over the New World.

But when M. Clavigero, upon his own knowledge asserted facts so repugnant to the conclusion I had formed, I began to distrust it, and to wish for further information. In order to obtain this, I applied to a Spanish nobleman, high in office, and eminent for his abilities, who, on different occasions, has permitted me to have the honor and benefit of corresponding with him. I have been favored with the following answer: "What you have written concerning the admission of Indians into holy orders, or into monasteries, in Book VIII., especially as it is explained and limited in Note LXXXVIII. of the quarto edition, is in general accurate, and conformable to the authorities which you quote. And although the congregation of the council resolved and declared, Feb. 13. A. D. 1682, that the circumstance of being an Indian, or mulatto, or mestizo, did not disqualify any person from being admitted into holy orders, if he was possessed of what was required by the canons to entitle him to that privilege; this only proves such ordinations to be legal and valid (of which Solorzano and the Spanish lawyers and historians quoted by him, Pol. Ind. lib. ii. c. 29, were persuaded), but it neither proves the propriety of admitting Indians into holy orders, nor what was then the common practice with respect to this; but, on the contrary, it shows that there was some doubt concerning the ordaining of Indians, and some repugnance to it.

"Since that time there have been some examples of admitting Indians into holy orders. We have now at Madrid an aged priest, a native of Tlascala. His name is D. Juan Cerilo de Castilla Aquihual Cattehutle, descended of a cazique converted to Christianity soon after the conquest. He studied the ecclesiastical sciences in a seminary of Puebla de los Angeles. He was a candidate, nevertheless, for ten years, and it required much interest before Bishop Abren would consent to ordain him. This ecclesiastic was a man of unexceptionable character, modest, self-denied, and with a competent knowledge of what relates to his clerical functions. He came to Madrid above thirty-four years ago with the sole view of soliciting admission for the Indians into the colleges and seminaries in New Spain, that if, after being well instructed and tried, they should find an inclination to enter into the ecclesiastical state, they might embrace it, and perform its functions with the greatest benefit to their countrymen, whom they could address in their native tongue. He has obtained various regulations favorable to his scheme, particularly that the first college which became vacant in consequence of the exclusion of the Jesuits should be set apart for this purpose. But neither these regulations, nor any similar ones inserted in the laws of the Indies, have produced any effect, on account of objections and representations from the greater part of persons of chief consideration employed in New Spain. Whether their opposition be well founded or not is a problem difficult to resolve, and towards the solution of which several distinctions and modifications are requisite.

"According to the accounts of this ecclesiastic, and the information of other persons who have resided in the Spanish dominions in America, you may rest assured, that in the kingdom of Tierra Firme no such thing is known as either an Indian secular priest or monk; and that in New Spain there are very few ecclesiastics of Indian race. In Peru, perhaps, the number may be greater, as in that country there are more Indians who possess the means of acquiring such a learned education as is necessary for persons who aspire to the clerical character."

NOTE [185]. p. 165.—Uztariz, an accurate and cautious calculator, seems to admit, that the quantity of

silver which does not pay duty, may be stated thus high. According to Herrera there was not above a third of what was extracted from Potosi that paid the king's fifth. Dec. 8. lib. ii. c. 15. Solorzano asserts likewise, that the quantity of silver which is fraudulently circulated, is far greater than that which is regularly stamped, after paying the fifth. De Ind. Jure, vol. ii. lib. v. p. 846.

NOTE [186]. p. 165.—When the mines of Potosi were discovered in the year 1545, the veins were so near the surface, that the ore was easily extracted, and so rich that it was refined with little trouble and at a small expense, merely by the action of fire. The simple mode of refining by fusion alone continued until the year 1574, when the use of mercury in refining silver, as well as gold, was discovered. Those mines having been wrought without interruption for two centuries, the veins are now sunk so deep, that the expense of extracting the ore is greatly increased. Besides this, the richness of the ore, contrary to what happens in most other mines, has become less as the vein continued to dip. The vein has likewise diminished to such a degree, that one is amazed that the Spaniards should persist in working it. Other rich mines have been successively discovered, but in general the value of the ores has decreased so much, while the expense of extracting them has augmented, that the court of Spain in the year 1736 reduced the duty payable to the king from a fifth to a tenth. All the quicksilver used in Peru is extracted from the famous mine of Guancabellca, discovered in the year 1563. The crown has reserved the property of this mine to itself; and the persons who purchase the quicksilver pay not only the price of it, but likewise a fifth, as a duty to the king. But in the year 1761 this duty on quicksilver was abolished, on account of the increase of expense in working mines. Ulloa, *Entretenimientos*, xii.—xv. Voyage, i. p. 505. 523. In consequence of this abolition of the fifth, and some subsequent abatements of price, which became necessary on account of the increasing expense of working mines, quicksilver which was formerly sold at eighty pesos the quintal, is now delivered by the king at the rate of sixty pesos. Campomanes, *Educ. Popul.* ii. 132, note. The duty on gold is reduced to a twentieth, or five per cent. Any of my readers who are desirous of being acquainted with the mode in which the Spaniards conduct the working of their mines, and the refinement of the ore, will find an accurate description of the ancient method by Acosta, lib. iv. c. 1—13, and of their more recent improvements in the metallurgic art, by Gamboa *Comment. a las ordenanz. de Minas*, c. 22.

NOTE [187]. p. 165.—Many remarkable proofs occur of the advanced state of industry in Spain at the beginning of the sixteenth century. The number of cities in Spain was considerable, and they were peopled far beyond the proportion that was common in other parts of Europe. The causes of this I have explained. Hist. of Cha. V. p. 68. Wherever cities are populous that species of industry which is peculiar to them increases: artificers and manufacturers abound. The effect of the American trade in giving activity to these is manifest from a singular fact. In the year 1545, while Spain continued to depend on its own industry for the supply of its own colonies, so much work was bespoke from the manufacturers, that it was supposed they could hardly finish it in less than six years. Campomanes, i. 406. Such a demand must have put much industry in motion, and have excited extraordinary efforts. Accordingly, we are informed, that in the beginning of Philip II.'s reign, the city of Seville alone, where the trade with America centered, gave employment to no fewer than 16,000 looms in silk or woollen work, and that above 130,000 persons had occupation in carrying on these manufactures. Campomanes, ii. 472. But so rapid and pernicious was the operation of the causes which I shall enumerate, that before Philip III. ended his reign the looms in Seville were reduced to 400. Uztariz, c. 7.

Since the publication of the first edition, I have the satisfaction to find my ideas concerning the early commercial intercourse between Spain and her colonies confirmed and illustrated by D. Bernardo Ward, of the Junta de Comercio at Madrid, in his *Proyecto Economico*, part ii. c. i. "Under the reigns of Charles V. and Philip II." says he, "the manufactures of Spain and of the Low Countries subject to her dominion were in a most flourishing state. Those of France and England were in their infancy. The republic of the United Provinces did not then exist. No European

power but Spain had colonies of any value in the New World. Spain could supply her settlements there with the productions of her own soil, the fabrics wrought by the hands of her own artisans, and all she received in return for these belonged to herself alone. Then the exclusion of foreign manufactures was proper, because it might be rendered effectual. Then Spain might lay heavy duties upon goods exported to America, or imported from it, and might impose what restraints she deemed proper upon a commerce entirely in her own hands. But when time and successive revolutions had occasioned an alteration in all those circumstances, when the manufactures of Spain began to decline, and the demands of America were supplied by foreign fabrics, the original maxims and regulations of Spain should have been accommodated to the change in her situation. The policy that was wise at one period became absurd in the other."

NOTE [188]. p. 166.—No bale of goods is ever opened, no chest of treasure is examined. Both are received on the credit of the persons to whom they belong; and only one instance of fraud is recorded, during the long period in which trade was carried on with this liberal confidence. All the coined silver that was brought from Peru to Porto-bello in the year 1654 was found to be adulterated, and to be mingled with a fifth part of base metal. The Spanish merchants, with sentiments suitable to their usual integrity, sustained the whole loss, and indemnified the foreigners by whom they were employed. The fraud was detected, and the treasurer of the revenue in Peru, the author of it, was publicly burnt. B. Ulloa, *Retablis. de Manuf.*, &c. liv. ii. p. 102.

NOTE [189]. p. 167.—Many striking proofs occur of the scarcity of money in Spain. Of all the immense sums which have been imported from America, the amount of which I shall afterwards have occasion to mention, Moutcada asserts, that there did not remain in Spain, in 1619, above two hundred millions of pesos, one-half in coined money, the other in plate and jewels. *Restaur. de Espagna*, disc. iii. c. 1. Uztariz, who published his valuable work in 1724, contends, that in money, plate, and jewels, there did not remain a hundred million. *Theor. &c.* c. 3. Campomanes, on the authority of a remonstrance from the community of merchants in Toledo to Philip III., relates, as a certain proof how scarce cash had become, that persons who lent money received a third of the sum which they advanced as interest and premium. *Educ. Popul.* i. 417.

NOTE [190]. p. 167.—The account of the mode in which the factors of the South Sea company conducted the trade in the fair of Porto-bello, which was opened to them by the Assiento, I have taken from Don Dion. Alcedo y Herrera, president of the court of Audience in Quito, and governor of that province. Don Dionysio was a person of such respectable character for probity and discernment, that his testimony in any point would be of much weight; but greater credit is due to it in this case, as he was an eye-witness of the transactions which he relates, and was often employed in detecting and authenticating the frauds which he describes. It is probable, however, that his representation, being composed at the commencement of the war which broke out between Great Britain and Spain, in the year 1739, may, in some instances, discover a portion of the acrimonious spirit natural at that juncture. His detail of facts is curious; and even English authors confirm it in some degree, by admitting both that various frauds were practised in the transactions of the annual ship, and that the contraband trade from Jamaica, and other British colonies, was become enormously great. But for the credit of the English nation it may be observed, that those fraudulent operations are not to be considered as deeds of the company, but as the dishonorable arts of their factors and agents. The company itself sustained a considerable loss by the Assiento trade. Many of its servants acquired immense fortunes. Anderson *Chronol. deduct.* ii. 388.

NOTE [191]. p. 168.—Several facts with respect to the institution, the progress, and the effects of this company, are curious, and but little known to English readers. Though the province of Venezuela, or Caracacas, extends four hundred miles along the coast, and is one of the most fertile in America, it was so much neglected by the Spaniards, that during the twenty years prior to the establishment of the company, only five

ships sailed from Spain to that province; and, during sixteen years, from 1706 to 1722, not a single ship arrived from the Caraccas in Spain. *Noticias de Real Campania de Caraccas*, p. 28. During this period Spain must have been supplied almost entirely with a large quantity of cacao, which it consumes, by foreigners. Before the erection of the company neither tobacco nor hides were imported from Caraccas into Spain. *Ibid.* p. 117. Since the commercial operations of the company, begun in the year 1731, the importation of cacao into Spain has increased amazingly. During thirty years subsequent to 1701, the number of *fanegas* of cacao (each a hundred and ten pounds) imported from Caraccas was 643,215. During eighteen years subsequent to 1731, the number of *fanegas* imported was 869,247; and if we suppose the importation to be continued in the same proportion during the remainder of thirty years, it will amount to 1,448,746 *fanegas*, which is an increase of 805,531 *fanegas*. *Id.* p. 148. During eight years subsequent to 1756, there have been imported into Spain by the company 88,482 *arrobas* (each twenty-five pounds) of tobacco; and hides to the number of 177,354. *Id.* p. 161. Since the publication of the *Noticias de Compania*, in 1715, its trade seems to be on the increase. During five years subsequent to 1769, it has imported 179,156 *fanegas* of cacao into Spain, 36,208 *arrobas* of tobacco, 75,496 hides, and 221,432 pesos in specie. *Campomanes*, ii. 162. The last article is a proof of the growing wealth of the colony. It receives cash from Mexico in return for the cacao, with which it supplies that province, and this it remits to Spain, or lays out in purchasing European goods. But, besides this, the most explicit evidence is produced, that the quantity of cacao raised in the province is double what it yielded in 1731; the number of its live stock is more than treble, and its inhabitants much augmented. The revenue of the bishop, which arises wholly from tithes, has increased from eight to twenty thousand pesos. *Notic.* p. 60. In consequence of the augmentation of the quantity of cacao imported into Spain, its price has decreased from eighty pesos for the *fanega* to forty. *Ibid.* 61. Since the publication of the first edition, I have learned that Guyana, including all the extensive provinces situated on the banks of Orinoco, the Islands of Trinidad and Margarita are added to the countries with which the company of Caraccas had liberty of trade by their former charters. *Real Cedula*, Nov. 19, 1776. But I have likewise been informed, that the institution of this company has not been attended with all the beneficial effects which I have ascribed to it. In many of its operations the illiberal and oppressive spirit of monopoly is still conspicuous. But in order to explain this, it would be necessary to enter into minute details, which are not suited to the nature of this work.

NOTE [192]. p. 168.—This first experiment made by Spain of opening a free trade with any of her colonies, has produced effects so remarkable, as to merit some further illustration. The towns to which this liberty has been granted are Cadiz and Seville, for the province of Andalusia; Alicante and Cartagena, for Valencia and Murcia; Barcelona, for Catalonia and Aragon; Santander, for Castile; Corugna, for Galicia; and Gijon, for Asturias. *Append.* ii. a la Educ. Popul. p. 41. These are either the ports of chief trade in their respective districts, or those most conveniently situated for the exportation of their respective productions. The following facts give a view of the increase of trade in the settlements to which the new regulations extend. Prior to the allowance of free trade, the duties collected in the custom house at the Havana were computed to be 104,208 pesos annually. During the five years preceeding 1774, they rose at a medium to 308,000 pesos a year. In Yucatan the duties have arisen from 8000 to 15,000. In Hispaniola, from 2500 to 5600. In Porto Rico, from 1200 to 7000. The total value of goods imported from Cuba into Spain was reckoned, in 1774, to be 1,500,000 pesos. *Educ. Popul.* i. 450, &c.

NOTE [193]. p. 169.—The two treatises of Don Pedro Rodriguez Campomanes, *Fiscal del real Consejo y Supremo* (an officer in rank and power nearly similar to that of Attorney-General in England), and Director of the Royal Academy of History, the one entitled *Discurso sobre el Fomento de la Industria Popular*; the other *Discurso sobre la Educacion Popular de los Artesanos y su Fomento*; the former published in 1774, and the latter in 1775, afford a striking proof of this. Almost every point of importance with respect

to interior police, taxation, agriculture, manufactures, and trade, domestic as well as foreign, is examined in the course of these works; and there are not many authors, even in the nations most eminent for commercial knowledge, who have carried on their inquiries with a more thorough knowledge of those various subjects, and a more perfect freedom from vulgar and national prejudices, or who have united more happily the calm researches of philosophy with the ardent zeal of a public spirited citizen. These books are in high estimation among the Spaniards; and it is a decisive evidence of the progress of their own ideas, that they are capable of relishing an author whose sentiments are so liberal.

NOTE [194]. p. 169.—The galeon employed in that trade, instead of the six hundred tons to which it is limited by law, *Recop. lib. xlv. l. 15*, is commonly from twelve hundred to two thousand tons burden. The ship from Acapulco, taken by Lord Anson, instead of the 500,000 pesos permitted by law, had on board 1,313,843 pesos, besides uncoined silver equal in value to 43,611 pesos more. *Anson's Voy.* 384.

NOTE [195]. p. 169.—The price paid for the bull varies according to the rank of different persons. Those in the lowest order who are servants or slaves, pay two reals of plate, or one shilling; other Spaniards pay eight reals, and those in public office, or who hold encomiendas, sixteen reals. *Solarz. de Jure Ind.* vol. ii. lib. iii. c. 25. According to Chilton, an English merchant who resided long in the Spanish settlements, the bull of Cruzado bore a higher price in the year 1570, being then sold for four reals at the lowest. *Hakluyt*, iii. 461. The price seems to have varied at different periods. That exacted for the bulls issued in the last *Predicacion* will appear from the ensuing table, which will give some idea of the proportional numbers of the different classes of citizens in New Spain and Peru.

There were issued for New Spain—

Bulls at 10 pesos each	-	-	-	4
at 2 pesos each	-	-	-	22,601
at 1 peso each	-	-	-	164,220
at 2 reals each	-	-	-	2,462,500
				<hr/> 2,649,325
For Peru—				
at 16 pesos 4½ reals each	-	-	-	3
at 3 pesos 3 reals each	-	-	-	14,202
at 1 peso 5½ reals each	-	-	-	78,822
at 4 reals each	-	-	-	410,325
at 3 reals each	-	-	-	668,601
				<hr/> 1,171,953

NOTE. [196] p. 169.—As Villa Segnor, to whom we are indebted for this information contained in his *Theatro Americano*, published in Mexico A. D. 1746, was accompanant-general in one of the most considerable departments of the royal revenue, and by that means had access to proper information, his testimony with respect to this point merits great credit. No such accurate detail of the Spanish revenues in any part of America has hitherto been published in the English language; and the particulars of it may appear curious and interesting to some of my readers.

From the bull of Cruzado, published every two years, there arises an annual revenue in pesos	-	-	-	150,000
From the duty on silver	-	-	-	700,000
From the duty on gold	-	-	-	60,000
From tax on cards	-	-	-	70,000
From tax on pulque, a drink used by the Indians	-	-	-	161,000
From tax on stamped paper	-	-	-	41,000
From ditto on ice	-	-	-	15,522
From ditto on leather	-	-	-	2,500
From ditto on gunpowder	-	-	-	71,550
From ditto on salt	-	-	-	32,000
From ditto on copper of Mechoachan	-	-	-	1,000
From ditto on alum	-	-	-	6,500
From ditto on Juego de los gallos	-	-	-	21,100
From the half of ecclesiastical annuats	-	-	-	49,000
				<hr/> 1,381,172

From royal ninth of bishoprics, &c.	-	-	-	1,381,172
From the tribute of Indians	-	-	-	650,000
From Alcala, or duty on sale of goods	-	-	-	721,875
From the Almajorifazgo, custom house	-	-	-	373,333
From the mint	-	-	-	357,500
				<hr/> 3,552,680

This sum amounts to 819,161 sterling; and if we add to it the profit accruing from the sale of 5000 quintals of quicksilver, imported from the mines of Almadan, in Spain, on the King's account, and what accrues from the *Averia*, and some other taxes which Villa Segnor does not estimate, the public revenue in new Spain may well be reckoned above a million pounds sterling money. *Theat. Mex.* vol. i. p. 38, &c. According to Villa Segnor, the total produce of the Mexican mines amounts at a medium to eight millions of Pesos in silver annually, and to 5912 marks of gold. *Ibid.* p. 44. Several branches of the revenue have been explained in the course of the history; some of which there was no occasion of mentioning, require a particular illustration. The right to the *tithes* in the New World is vested in the crown of Spain, by a bull of Alexander VI. Charles V. appointed them to be applied in the following manner: One fourth is allotted to the bishop of the diocese, another fourth to the dean and chapter, and other officers of the cathedral. The remaining half is divided into nine equal parts. Two of these, under the denomination of *los dos Novenos reales*, are paid to the crown, and constitute a branch of the royal revenue. The other seven parts are applied to the maintenance of the parochial clergy, the building and support of churches, and other pious uses. *Recopil. lib. i. tit. xvi. Ley, 23, &c.* *Avendano Thesaur. Indic.* vol. i. p. 184.

The *Alcalala* is a duty levied by an excise on the sale of goods. In Spain it amounts to ten per cent. In America to four per cent. *Salorzano, Polit. Indiana.* lib. vi. c. 8. *Avendano*, vol. i. 186.

The *Almajorifazgo*, or custom paid in America on goods imported and exported, may amount on an average to fifteen per cent. *Recopil. lib. viii. tit. xiv. Ley, i.* *Avendano*, vol. i. p. 188.

The *Averia*, or tax paid on account of convoys to guard the ships sailing to and from America, was first imposed when Sir Francis Drake filled the New World with terror by his expedition to the South Sea. It amounts to two per cent. on the value of goods. *Avendano*, vol. i. p. 189. *Recopil. lib. ix. tit. ix. Ley, 43, 44.*

I have not been able to procure any accurate detail of the several branches of revenue in Peru later than the year 1614. From a curious manuscript containing a state of that viceroyalty in all its departments, presented to the Marquis of Montes-Claros by *Fran. Lopez Caravantes*, accompanant-general in the tribunal of Lima, it appears that the public revenue, as nearly as I can compute the value of the money in which Caravantes states his accounts, amounted in *ducats* at 4s. 11d. to - - - - - 2,372,768

Expenses of government - - - - - 1,242,992

Net free revenue 1,129,776

The total in sterling money - - - - - £583,303

Expenses of government - - - - - 305,568

Net free revenue 277,735

But several articles appear to be omitted in this computation, such as the duty on stamped paper, leather, ecclesiastical annuats, &c. so that the revenue of Peru may be well supposed equal to that of Mexico.

In computing the expense of government in New Spain, I may take that of Peru as a standard. There the annual establishment for defraying the charge of administration exceeds one half of the revenue collected, and there is no reason for supposing it to be less in New Spain.

I have obtained a calculation of the total amount of the public revenue of Spain from America and the Philippines, which, as the reader will perceive from the two last articles, is more recent than any of the former.

Alcalalas (Excise) and Aduanas (Customs), &c. in pesos fuertes	-	-	-	2,500,000
Duties on gold and silver	-	-	-	3,000,000
				<hr/> 5,500,000

Brought forward	5,500,000
Bull of Cruzado	1,000,000
Tribute of the Indiana	2,000,000
By sale of quicksilver	200,000
Paper exported on the king's account, and sold in the royal warehouses	300,000
Stamped paper, tobacco, and other small duties	1,000,000
Duty on coinage of, at the rate of one real de la Plata for each mark	300,000
From the trade of Acapulco, and the coasting trade from province to province	500,000
Asiento of Negroes	200,000
From the trade of <i>Mathe</i> , or herb of Paraguay, formerly monopolized by the Jesuits	500,000
From other revenues formerly belonging to that order	400,000
Total	12,000,000
Total in sterling money	£2,700,009

Deduct half, as the expense of administration, and there remains net free revenue £1,350,000

NOTE [197]. p. 169.—An author long conversant in commercial speculation has computed, that from the mines of New Spain alone the king receives annually, as his fifth, the sum of two millions of our money. Harris, Collect. of Vey. ii. p. 164. According to this calculation, the total produce of the mines must be ten millions sterling; a sum so exorbitant, and so little corresponding with all accounts of the annual importation from America, that the information on which it is founded must evidently be erroneous. According to Campomanes, the total product of the American mines may be computed at thirty millions of pesos, which, at at four shillings and sixpence a peso, amounts to 7,425,000*l.* sterling, the king's fifth of which (if that were regularly paid) would be 1,485,000*l.* But from this sum must be deducted what is lost by a fraudulent withholding of the fifth due to the crown, as well as the sum necessary for defraying the expense of administration. Educ. Popular. vol. ii. p. 131. note. Both these sums are considerable.

NOTE [198]. p. 169.—According to Bern. de Ulloa, all foreign goods exported from Spain to America pay duties of various kinds, amounting in all to more than 25 per cent. As most of the goods with which Spain supplies her colonies are foreign, such a tax upon a trade so extensive must yield a considerable revenue. Retablis. de Manuf. et du Commerce d'Esp. p. 151. He computes the value of goods exported annually from Spain to America to be about two millions and a half sterling. p. 97.

NOTE [199]. p. 169.—The Marquis de Serralvo, according to Gage, by a monopoly of salt, and by embarking deeply in the manilla trade, as well as in that to Spain, gained annually a million of ducats. In one year he remitted a million of ducats to Spain, in order to purchase from the Conde Olivares, and his creatures, a prolongation of his government, p. 61. He was successful in his suit, and continued in office from 1624 to 1635, double the usual time.

THE

HISTORY OF NORTH AMERICA.

BY JAMES GRAHAME, ESQ.

EDITOR'S PREFACE.

HAVING presented to our readers two interesting works, "Belknap's Biographia of the Early Discoverers of America," and "Robertson's History of South America," works which will hold a high rank in the estimation of many generations yet unborn, we shall now begin in good earnest, upon the History of the North American Colonies which in little more than two centuries have grown up into a great nation, whose history will hereafter be sought for, not only by Americans, but by every civilized nation under the sun, as most of the reform going on in the world sprung from the influence of our institutions. Several writers of distinction have made great researches among the worm-eaten pages of manuscripts, pamphlets, and partial histories to obtain a knowledge of the rise and progress of this nation from its beginning up to its present growth. Foreigners have taken a deep interest in the subject, and several of them have written on it with great candor and ability. Among these historians no one stands higher, in the estimation of the judicious and discriminating, than James Grahame, Esq. He writes without prejudice, in a style of neatness and perspicuity which often rises to eloquence. As yet, he has only given us two volumes of his work, which contain the events of the first half century of our history, but has, in his preface, promised more, but has not up to this time fulfilled it, but we are informed that a continuation of his labors will soon be published. If an additional volume should reach us before we have reprinted the two on our table, we shall lose no time in presenting it to our readers; but if it should not arrive in season, we shall draw our matter from other approved sources which we believe will afford an abundant supply. We are happy to find that the subject of American history is attracting all classes of men. A society for collecting and preserving the neglected or half forgotten events of the revolutionary and late war, is now about being formed in the city of New York. From the character and talents of the persons zealously engaged in the praiseworthy undertaking we augur favorably for the results. There is no danger of doing too much. Every history adds something to enlighten the public. Like stars in the *milky way* although of different magnitude and brightness these works shed a lustre on each other and increase the glory of the hemisphere of knowledge. From time to time we shall add some notes when we think the text requires them.

PREFACE.

THE composition which I now deliver to the public, is the first of a threefold series of works, which, when completed, will form *The History of the United States of North America, from the Plantation of the English Colonies to the Establishment of their Independence*. My plan is restricted to the history of those provinces of North America (originating all except New York and Delaware, from British colonization,) which, at the era of the American Revolution, were included in the United States; the illustration of the rise and formation of this great republic, being the end of my labors.

The present work, the first of the projected series, embraces the rise of such of those States, comprehended within my general plan, as were founded prior to the British Revolution in 1688, and traces their progress till that epoch. In some instances I have found it necessary to carry forward the history of particular states, somewhat beyond this precise boundary; partly because the influence of the British Revolution did not immediately extend to them, and partly in order to exhibit a complete view of certain interesting transactions, of

which the account would otherwise be broken and defective. A second performance, for which I have already collected a considerable mass of materials, will embrace the further history of these earlier states, together with the rise and progress of those which were subsequently formed, till the commencement of the American Revolution. This second work, which like the present, will occupy, I believe, two volumes, I consider the most difficult and important portion of my labors. Two additional volumes, I trust, will enable me to complete my general plan, and embrace the history of the revolutionary war, and the establishment and consolidation of the North American Republic.

In the collection of materials for the composition of this work, I have been obliged to incur a degree of labor and expense, which, had I originally foreseen, I doubt if I could have ventured to encounter. Considering the connection that so long subsisted between Great Britain and the American States, the information concerning the early history of many of these provinces, which the public libraries of Great Britain are capable of supplying, is amazingly scanty. Many valuable works illustrative of the history and statistics both of particular states and of the whole North American

commonwealth; * a defect the more discreditable, as these works have long enjoyed a high repute at the seats of learning on the continent of Europe, and as the greater part of them might be procured without difficulty in London or from America.

After borrowing all the materials that I could so procure, and purchasing as many more as I could find in Britain, my collection proved still so defective in many respects, that in the hope of enlarging it, I undertook a journey to Gottingen; and in the library of this place, as I had been taught to expect, I found an ampler col-

* In the Advocates' Library of Edinburgh, for example, there is not a single separate history of Rhode Island, Connecticut, New Hampshire, Maine, Maryland, New Jersey, or Pennsylvania; there is not one of the statistical works of Pitkin or Seybert; and although there are the first volumes, respectively, of Hutchinson's History of Massachusetts, and of Hazard's Historical Collections, none of the posterior volumes of these interesting works have ever been procured. But the negative catalogue of the Advocates' Library, in this department, is too copious for further quotation.

To the British Museum I am indebted for the perusal of several works of very great rarity; particularly Denton's description of New York, and Archdale's Description of Carolina. But this collection, though much richer than the Advocates' Library, is yet exceedingly defective in American history.

lection of North American literature, than any or indeed all the libraries of Britain could supply. From the resources of the Gottingen Library, aided by the liberality with which its administrators are always willing to render it subservient to the purposes of literary inquiry, I have derived the greatest advantage and assistance. Yet even this admirable repository of history is not entirely perfect; and I have still to lament my inability to procure some works illustrative of my subject, which, whatever may be their value, it would have been satisfactory to have had an opportunity of perusing. Hopkin's History of Providence in particular, Vanderdonck's History of New Netherlands, and Holm's History of Swedeland in America, are books which I have been hitherto unable to procure. The learned Ebeling has characterized the first of these as a book not easily met with; and that I am not chargeable with negligent inquiry, may be inferred, I think, from the fact, that I have succeeded in procuring and consulting various works which Ebeling confesses his inability to obtain, besides many of whose existence he seems not to have been aware.* Even those which for the present I am obliged to dispense with, as well as various other works of infrequent occurrence and applicable to a later portion of time, I still hope to procure for the elucidation of the vast and varied subject of my second composition.

History addresses her lessons to all mankind: but when she records the fortunes of an existing people, it is to them that her admonitions are especially directed. There has never been a people on whose character their own historical recollections were calculated to exercise a more animating or salutary influence, than the nation whose history I have undertaken to relate.

In national societies established after the manner of the United States of North America, history does not begin with obscure or fabulous legends. The origin of the nation, and the rise and progress of all its institutions, may be distinctly known. The people may obtain an accurate and familiar acquaintance with the character of their earliest national ancestors, and of every succeeding generation through which the inheritance of the national name and fortunes has devolved to themselves. When this interesting knowledge is blended with the information that their existence as a people originated in the noblest efforts of wisdom, fortitude, and magnanimity, and that every successive acquisition by which their liberty and happiness have been extended and secured, has arisen from the exercise of the same qualities, and evinced their faithful preservation and unimpaired efficacy,—respect for antiquity becomes the motive and the pledge of virtue; the whole nation feels itself ennobled by ancestors whose renown will continue to the end of time the honor or reproach of their successors; and the love of virtue is so interwoven with patriotism and with national glory, as to prevent the one from becoming a selfish principle, and the other a splendid or mischievous illusion. If an inspired apostle might with complacency proclaim himself a citizen of no mean city, a North American may feel grateful exultation in avowing himself the native of no ignoble land,—but of a land that has yielded as great an increase of glory to God and of happiness to man, as any other portion of the world, since the first syllable of recorded time, has ever had the honor of producing. A nobler model of human character could hardly be proposed to the inhabitants of New England, Pennsylvania, and others of the North American States, than that which their own early history supplies. It is at once their interest and their honor to preserve with sacred care a model so richly fraught with the instructions of wisdom and the incitements of duty. The memory of the saints and heroes whom they claim as their natural or national ancestors will bless all those who account it blessed; and the ashes of their fathers will give forth a nobler influence than the bones of the prophet of Israel, in reviving piety and invigorating virtue. So much, at the same time, of human weakness and imperfection is discernible in the conduct, or is attested by the avowals of these eminent men, and so steady and explicit was their reference to heavenly aid, for all the good they were enabled to perform or attain, that the admiration they so strongly claim never exceeds a just subordination to the glory of the Most High, and enforces the

scriptural testimony to the riches of divine grace, and the reflected lustre of human virtue.

The most important requisite of historical compositions, and that in which, I suspect, they are commonly most defective, is truth—a requisite, of which even the sincerity of the historian is insufficient to assure us. In tracing ascertained and important facts, either backward into their original, or forward into their operation, the historian frequently encounters, on either hand, a perplexing variety of dissimilar causes and diverging effects; among which it is no less difficult than important to discriminate the peculiar springs of action, and to preserve the moral stream of events. Indiscriminate detail would produce intolerable fatigue and confusion; while selection inevitably infers the risk of error. The sacred historians often record events with little or no reference to their historical pedigree; and have thus given to some parts of the only history that is infallibly authentic, an appearance of improbability, which the more reasoning productions of uninspired narrators have exchanged, at least as frequently, for substantial misrepresentation. It may be thought an imprudent avowal, and yet I have no desire to conceal, that, in examining and comparing historical records, I have often been forcibly reminded of Sir Robert Walpole's assurance to his son, that "*History must be false*."† Happily, this apophthegm applies, if not exclusively, at least most forcibly to that which Walpole probably regarded as the main trunk of history, but which is really the most insignificant branch of it,—the intrigues of cabinets, the secret machinations and designs of ministers, and the contests of trading politicians.

In surveying the contests of human beings, it is difficult, or rather it is impossible, for a man of like feelings with themselves, to escape entirely the contagion of those passions which the contests arose from or engendered. Thus partialities are secretly insinuated into the mind; and in balancing opposite testimony, these partialities find a sure, though secret means of exerting their influence. I am not desirous of concealing that I feel such partialities within myself; and if my consciousness of their existence should not exempt me from their influence, I hope the avowal, at least, will prevent the error from extending to my readers. I am sensible of a strong predilection in favor of America, and the colonial side in the great controversies between her people and the British government, which must occupy so prominent a place in the ensuing pages. Against the influence of this predilection, I hope I am sufficiently on my guard; and my apprehensions of it are moderated by the recollection that there is a wisdom which is divinely declared to be *without partiality, and without hypocrisy*, and attainable by all who seek it in sincerity from its heavenly source.

I am far from thinking or from desiring it should be thought, that every part of the conduct of America throughout these controversies to which I have alluded, was pure and blameless. Much guile, much evil passion, violence, and injustice, dishonored many of the councils and proceedings of the leaders and assemblies of America; and it was the conduct of one of the States, the most renowned for piety and virtue, that suggested to her historian the melancholy observation, "that in all ages and countries communities of men have done that, of which most of the individuals of whom they consisted would, acting separately, have been ashamed."‡ But mingled masses are justly denominated from the elements and qualities that preponderate in their composition; and sages and patriots will be equally voted out of the world if we can never recognize the lineaments of worth and wisdom under the rags of mortal imperfection. There exists in some romantic speculative minds, a platonic love of liberty, as well as virtue, that consists with a cordial disgust for every visible and actual incarnation of either

* Horace Walpole's works.—A curious illustration of historical inaccuracy was related by the late President Jefferson to an intelligent English traveler. The Abbe Raynal, in his History of the British Settlements in America, has recounted a remarkable story which implies the existence of a particular law in New England. Some Americans being in company with the Abbe at Paris, questioned the truth of the story, alleging that no such law had ever existed in New England. The Abbe maintained the authenticity of his history, till he was interrupted by Dr. Franklin, who was present, and after listening for some time in silence to the dispute, said, "I can account for all this: you took the anecdote from a newspaper, of which I was at that time editor, and, happening to be very short of news, I composed and inserted the whole story." Hall's Travels in Canada and the United States, p. 382, 383.

† Hutchinson's History of Massachusetts, vol. i. p. 156. This observation referred to the dispute between Massachusetts and the confederated States of New England in 1649.

of these principles; and which, when not corrected by sense and experience, conduces to endless error or incurable misanthropy.

Whoever examines the histories of individuals or communities, must expect to be disappointed and perplexed by numberless inconsistencies. Much error is produced and continued in the world by unwillingness or inability to make candid concessions, or indeed to distinguish candor from sincerity—to admit in an adversary the excellence that condemns our vehement hate; in a friend or hero, the defects that sully the pleasing image of virtue, that diminish our exultation, bid us *cease from man*, and shew us *the end of all perfection*. With partial views, we encounter the opposite partialities of antagonists, and by mutual commission and perception of injustice, render each other's misapprehensions incurable. It should be the great end of his history to correct the errors by which experience is thus rendered useless: and this end I have proposed, in humble reliance on Divine Guidance, to pursue.

Hastings, January, 1827.

BOOK I.

VIRGINIA.

CHAPTER I.

CABOT despatched by Henry the Seventh—visits the Coast of North America—Neglect of Henry to profit by Cabot's Discovery—and of his immediate Successors—Reign of Elizabeth—favorable to maritime Adventures—Rise of the Slave Trade—Sir Walter Raleigh—projects a colony in North America—first Expedition fails—Elizabeth names the Country Virginia—Greenville despatched by Raleigh—establishes a Colony at Roanoke—Misfortunes of the Colonists—their Return—Use of Tobacco introduced in England—Further Efforts of Raleigh—terminate unsuccessfully—Accession of James to the English Crown—Gosnold's Voyage—its Effects—James divides North America between two Companies—Tenor of their Charters—Royal Code of Laws—The first Body of Colonists embarked by the London Company—arrive in the Bay of Chesapeake—found James Town—Dissensions of the Colonists—Hostility of the Indians—Distress and Confusion of the Colony—Services of Captain Smith—he is taken Prisoner by the Indians—his Liberation—he preserves the Colony—The Colonists deceived by Appearances of Gold—Smith surveys the Bay of Chesapeake—elected President of the Colony—New Charter—Lord Delaware appointed Governor—Newport, Gates, and Somers sent out to preside till Lord Delaware's Arrival—are wrecked on the Coast of Bermuda—Captain Smith Returns to England.

It was on the third of August, 1492, a little before sun-rise, that Christopher Columbus, undertaking the most memorable enterprise that human genius ever planned or human skill and courage ever performed, set sail from Spain for the discovery of the western world. On the 13th of October, about two hours before midnight, a light in the island of San Salvador was descried by Columbus from the deck of his vessel, and America for the first time beheld by European eyes.* Of the vast and important consequences that depended on this spectacle, perhaps not even the comprehensive mind of Columbus was fully sensible; but to the end of time, the heart of every human being who reads the story will confess the interest of that eventful moment, and partake the feelings of that illustrious man. On the following day, the adventurers, preceded by their commander, took possession of the soil; and a connexion that was to subsist for ever was established between Europe and America. The cross was planted on the shores of the western world; and in the hour that witnessed this great re-union of mankind, the knee was bowed to that Being who has proclaimed himself the brother of the whole human race, and the author of a common salvation to all the ends of the earth.

The intelligence of this successful voyage was received in Europe with the utmost surprise and admiration. In England, more especially, it was calculated to produce a very powerful impression, and to awaken at once emulation and regret. While Columbus was proposing his schemes with little prospect of success at the court of Spain, he had despatched his brother

* Dr. Robertson is of opinion that the Ancients had no notion of the existence of the western world, and has collected from ancient writers many proofs, not only of ignorance, but of most barbarous error respecting the territorial resources of the earth: Hist. of America, B. I. Yet a Roman writer, to whose sentiments he has not adverted, is supposed to have prophesied the discovery of America 1400 years before this event took place. The passage occurs in one of Seneca's tragedies.

"Venient annus
Secula seris, quibus oceanus
Vincula rerum laxet, et ingens
Patet tellus, Tiphysique novos
Detegat orbis; nec sit terminus
Ultima Thule."

MEDUS. Act II. Chorus.

* I am indebted to the private collections of various individuals for the perusal of some very rare and not less interesting works; and in particular I beg leave to acknowledge the kindness with which the valuable library of the late George Chalmers was submitted to my examination, by his nephew and executor, Mr. James Chalmers of London.

Bartholomew to the court of Henry the VIIth in England, there to solicit patronage and offer the fruits of discovery. Bartholomew was taken prisoner by pirates, and after a long detention was reduced to such poverty that on his arrival in London he was compelled, by the labor of his hands, to procure the means of arraying himself in habiliments suited to his interview with a monarch. On such slight circumstances the fates of nations, at times, seem to depend; while in reality, they are over-ruled, not by circumstances, but by that Being who arranges and disposes circumstances in harmony with the predeterminations of his own will. The propositions of Bartholomew were favorably received by Henry: but before a definitive arrangement was concluded, Bartholomew was recalled by the intelligence that his brother's plans had at length been sanctioned and adopted by Ferdinand and Isabella of Spain.

If the cautious temper and frugal disposition of Henry contributed to diminish his regrets for the abandonment of a hazardous and expensive undertaking, the astonishing success with which its actual prosecution by others had been attended, revived the former projects of his mind, and whetted it to a degree of enterprise that showed him both instructed and provoked by his disappointment. In this disposition he listened readily to the proposals of one Gaboto or Cabot, a Venetian, residing in Bristol; who, from considering the discoveries of Columbus towards the south-west, had formed the opinion that lands might likewise be discovered towards the north-west, and now offered the king to conduct an expedition in this direction. Henry, prompted by his avarice and stung by his disappointment, eagerly embraced the proposals of Cabot, and not only granted him a commission of discovery, but, on two subsequent occasions, issued similar commissions for the discovery and appropriation of unknown territories.

The commission to Cabot, the only one which was productive of interesting consequences, was granted on the 5th of March, 1495, (about two years after the return of Columbus from America,) and empowered this adventurer and his sons to sail under the flag of England in quest of countries yet unoccupied by any christian state; to take possession of them in the name of Henry, and plant the English banner on the walls of their castles and cities, and to maintain with the inhabitants a traffic exclusive of all competitors, and exempted from customs; under the condition of paying a fifth part of the free profit on every voyage to the crown. About two years after the date of his commission, [1497,] Cabot, with his second son, Sebastian, embarked at Bristol, in a ship furnished by the king, and was attended by four small vessels equipped by the merchants of that city. Sebastian Cabot appears to have greatly excelled his father in genius and nautical science; and it is to him alone that historians have ascribed all the discoveries with which the name of Cabot is associated.

The navigators of that age were not less influenced by the opinions than incited by the example of Columbus, who erroneously supposed that the islands he had discovered in his first voyage were outskirts or dependencies of India, and not far remote from the Indian continent. Influenced by this notion, Sebastian Cabot conceived the hope that by steering to the north-west he might fulfil the design, and even improve the performance of Columbus, and reach India by a shorter course than his predecessor had taken. Pursuing this track, he discovered the islands of Newfoundland and St. John; and still continuing to hold a westerly course, soon reached the continent of North America, and sailed along it from the confines of Labrador to the coast of Virginia. Thus conducted by Cabot, who was himself guided by the genius of Columbus, did the English achieve the honor of being the second nation that had visited the western world, and the first that had discovered that vast continent that stretches from the Gulf of Mexico towards the North Pole. For it was not till the following year [1498] that Columbus, in his second voyage, was enabled to complete his own discovery, and proceed beyond the islands he had first visited, to the continent of America.

Cabot, disappointed in his main object of finding a western passage to India, returned to England to relate the discoveries he had already effected, without attempting either by settlement or conquest to gain a footing on the American continent.* He would wil-

lingly have resumed his voyages in the service of England, but he found that in his absence the king's ardor for discovery had greatly abated. Seated on a throne which he had gained by conquest in a country exhausted by civil wars, involved in hostilities with Scotland, and harassed by the insurrections of his subjects and the machinations of pretenders to his crown, Henry had little leisure for the execution of distant projects; and his sordid disposition found little attraction in the prospect of a colonial settlement, which was not likely to be productive of immediate pecuniary gain. He was engaged, too, at this time, in negotiating the marriage of his son with the daughter of Ferdinand of Spain, and must, therefore, have felt himself additionally disinclined to pursue a project that could not fail to give umbrage to this jealous prince, who claimed the whole continent of America, in virtue of a donation from the Pope. Nor were the subjects of Henry in a condition to avail themselves of the ample field that Cabot's discovery had opened to their enterprise and activity. The civil wars had dissipated wealth, repressed commerce, and even excluded the English people from sharing in the general improvement which the nations of Europe had now begun to experience. All the advantages, then, that England, for the present, derived from the voyage of Cabot was, that right of property which is supposed to arise from priority of discovery—a right which, from the extent of the territory, the mildness of its climate, and the fertility of its soil, afforded an ample prospect of advantageous colonization. But from the circumstances in which the nation was placed, or rather from the designs of that Providence which governs circumstances, and renders them subservient to the destinies of nations and individuals, was England prevented from occupying this important field, till the moral and religious advancement which her people were soon to undergo, had qualified her to become the parent of North America. Cabot finding that Henry had abandoned his colonial projects, soon after transferred his services to the Spaniards; and the English seemed contented to surrender their discoveries and the discoverer to the superior fortune of that successful people. The only immediate fruit that England derived from his enterprise is said to have been the importation from America of the first turkeys* that had ever been seen in Europe.

It is remarkable, that of these first expeditions to the western world, by Spain and England, not one was either projected or commanded by a citizen of the state which supplied the subordinate adventurers, defrayed the expense of the equipment, and reaped the benefit of the enterprise. The honor of the achievement was thus more widely distributed. The Spanish adventurers were conducted by Columbus, a native of Genoa; the English, by John Cabot, a citizen of Venice: and though Sebastian Cabot, whose superior genius soon assumed the chief direction of the enterprise, had himself been born in England, it was by the experience and instructions of his father that his genius had been trained to naval affairs, and it was to the father that the projection of the voyage was due, and the chief command intrusted. Happily for the honor of the English nation, the parallel extends no farther; and the treatment which the two discoverers experienced from the countries that had employed them, differed as widely as the histories of the two empires which they respectively contributed to found. Columbus was loaded with chains in the country which he had the glory of discovering, and died the victim of ingratitude and disappointment among the people whom he had conducted to so much wealth and renown. Cabot, after spending some years in the service of Spain, also experienced her ingratitude; and returning, in his old age, to England, he obtained a kind and honorable reception from the nation which had, as yet, derived only barren hopes, and a seemingly relinquished title from his expedition. He received the dignity of knighthood, the appointment of Grand Pilot of England, and a pension that enabled him to spend his old age in circumstances of honor and comfort.

From this period till the reign of Elizabeth, no general or deliberate design was formed in England for the acquisition of territory, or the establishment of colonies in America. During the reign of Henry the VIIIth, the vigor and attention of the English government were

suspended in the Privy Gallery at Whitehall, and is supposed to have perished by the fire which destroyed that Gallery, in the reign of William the IIIrd. Entick's Gen. Hist. of the Late War, vol. i. p. 169.

* Why this bird received the name it enjoys in England, has never been satisfactorily explained. By the French it was called "coq d'Inde," on account of its American origin; America being then generally termed Western India.

for many years absorbed by the wars and intrigues of the continent; and the innovations in religious doctrine and ecclesiastical constitution that attended its close, found ample employment at home for the minds of the king, and of the great bulk of the people. It was during this reign that the full light of the Reformation broke forth in Germany, and was rapidly diffused over Europe. Henry, at first, resolutely opposed himself to the adversaries of the church of Rome, and even attempted, by his pen, to stem the progress of the innovations. But his subsequent controversy with the Papal See excited and sanctioned a spirit of inquiry among his own subjects, which spread far beyond his expectations and desires, and eluded all his attempts to control and restrain it. A discussion of the pretensions of the church of Rome naturally begot inquiry into her doctrines; for her grand pretensions to infallibility formed the only authority to which many of these doctrines were indebted for their reception. The very art that had been employed (says an ingenious philosopher) to weave the whole of the popish institutions into one coherent system, and to make every superstitious device repose on the authority and conduce to the aggrandisement of the church of Rome, now contributed to accelerate and complete her downfall. In a system so overgrown with abuses, the spirit of inquiry, wherever it obtained admission, could not fail to detect error; and even a single instance of such detection, by loosening the corner-stone of infallibility, shook the whole edifice to its foundation. The progress of this spirit of inquiry exercised a powerful and salutary influence on the character and fortune of every nation in which it gained admission. A subject of intellectual exercise had at length been found, that could interest the dulllest, and engross the most vigorous faculties; the contagion of fervent zeal and earnest inquiry was rapidly propagated; a universal promotion of mind attended the spread of the reformed doctrines, and every nation into which they flowed was elevated in the scale of moral and intellectual being. Introduced into England by the power of a haughty, capricious, and barbarous tyrant, whose object was not the emancipation of his subjects, but the deliverance of himself from a power which he wrested from the Pope only to exercise with his own hands; it was some time before these doctrines worked their way into the minds of the people, and, expelling the corruptions and adulterations of the royal teacher, attained their full maturity of influence and vigor. Besides leavening the national creed with much of the ancient superstition, Henry enumbered the national worship with many of the popish institutions: retaining whatever was calculated to prove a useful auxiliary to royal authority, or to gratify the pomp and pride of his own sensual imagination. In the composition of the ecclesiastical body, he preserved the powerful hierarchy, and in the solemnities of worship the gorgeous ceremonial of the church of Rome. But he found it easier to establish ecclesiastical constitutions, than to limit the stream of human opinion, or stay the heavenly shower by which it was slowly but gradually reinforced and enlarged; and in an after age, the repugnance that manifested itself between the constitution of the English church and the religious sentiments of the English people, produced consequences of very great importance in the history of England and the settlement of America.

The rupture between Henry the VIIIth and the Roman see removed whatever obstacle the popish doctrine to Spain might have interposed to the appropriation of American territory by the English crown: but of the two immediate successors of that monarch, the one neglected this advantage, and the other renounced it. During the reign of Edward the VIth, the court of the royal minor was distracted by faction, or occupied by the war with Scotland; and the attention of the king and people was engrossed by the care of extending and confirming the establishment of the protestant doctrines. Introduced by Henry, and patronized by Edward, these doctrines multiplied their converts with a facility that savored somewhat of the weight of human authority, and the influence of secular interests; till, under the direction of Providence, the same earthly power that had been employed to facilitate the introduction of truth, was permitted to attempt its suppression. The royal authority, which Henry had blindly made subservient to the establishment of the protestant doctrines, was now employed by Mary with equal blindness as an instrument to sift and purify the protestant body, to separate the genuine from the unsound, and to enable the true believers, by more than mortal fortitude, faithfulness, and patience, to make full proof

* Churchill's Collection of Voyages, iii. 211. He composed, on his return, a chart of the whole North American continent. This interesting document (attached to which was a portrait of the Navigator, and a brief account of his voyage) was long

of christian character and divine grace. This prince restoring the connexion between England and the church of Rome, and united in marriage to Philip of Spain, was bound by double ties to refrain from contesting the Spanish claims on America. It was not till the reign of Elizabeth, that the obstacles created by the pretensions of Spain were finally removed, and the prospect of collision with the designs of that power, so far from appearing objectionable, presented the strongest attractions to the minds of the English.

But, although during this long period the occupation of America had been utterly neglected, the naval resources adapted to the formation and maintenance of colonies were diligently cultivated in England, and a vigorous impulse was communicated to the spirit of commercial enterprise. Under the directions of Cabot, in the reign of Henry the VIIIth, the English merchants visited the coast of Brazil, and traded with the settlements of the Portuguese. In the reign of Edward the VIth, the fisheries on the banks of Newfoundland, which had been previously established, were extended and encouraged; and an association of adventurers for the discovery of new countries was incorporated by royal charter. Even Mary contributed to promote this direction of the national spirit; she founded the Corporation of Merchants to Russia, and endeavored to protect their traffic, by establishing a friendly relation with the sovereign of that country. During her reign, an attempt highly creditable to the national energy, and not wholly unsuccessful, was made to reach India by land; and a commercial intercourse was established with the coast of Africa. Many symptoms conspired to indicate with what steady vigor and persevering ardor the people of England might be expected to improve every opportunity of exercising and extending their resources, and how high a rank they were destined to hold in the scale of nations, when the strength of their character should be thoroughly developed by the progress of their recent improvement, and the principles and policy of their government should more happily concur with the genius and sentiments of the people.

The Spaniards in the meantime had extended their settlements over the continent of South America, and achieved an extent of conquest and accession of treasure that dazzled the eyes and excited the emulation of all Europe. The more active spirits among the Spanish people, restrained at home by the illiberal genius of their government, eagerly rushed into the outlet of enterprise presented to them on the vast theatre of Mexico and Peru. The paganism of the natives of these regions allured the invasion of bigots long wedded to a faith that recognised compulsion as an instrument of conversion; and their wealth and effeminacy not less powerfully tempted the cupidity of men in whom pride inflamed the desire of riches, while it inspired contempt of industry. Thus every prospect that could address itself prevailing to human desires, or to the peculiarities of Spanish character, contributed to promote that series of rapid and vigorous invasions, by which the Spaniards overran so large a portion of the continent of South America. The real and lasting effect of their acquisitions has corresponded in a manner very satisfactory to the moral eye, with the character and merit of the achievements by which they were earned. The history of the expeditions which terminated in the conquest of Mexico and Peru displays, perhaps, more strikingly than any other portion of the records of the human race, what amazing exertions the mind of man can prompt him to attempt, and sustain him to endure—how signally he is capable of misdirecting the energies with which his Creator has endowed him—and how fatally disposed to exercise them more vigorously in the commission of wickedness than the practice of virtue. Wholly revolted from God, in the darkness of a disordered nature, and never wholly returning in this life to an entire subordination, men seem to be capable of obtaining a more perfect co-operation of their active faculties, and more extensive contribution of the resources of their nature to the production of evil than to the prosecution of good.* To consider the courage, the patience, the vigor, the fortitude, evinced by the conquerors of South America, in conjunction with the sordid, unjust, and barbarous ends to which they were made subservient, might degrade these virtues for ever in our esteem, if we did not recollect that energy is the gift of God, and the abuse of it the invention of man; and that genius and valor, even when employed to debase and oppress mankind, are

not more justly obnoxious to reproach, than the wine which often wastes the strength it was given to restore, or the food which sometimes abridges the life it was meant to prolong. The inflexible pride and deliberate tyranny of these adventurers, their arrogant disregard of the rights of human nature, and calm survey of the desolation of empires and destruction of happiness and life, is rendered the more striking and instructive by the humility of their own original circumstances, which seemed to level and unite them by habit and sympathy with the mass of mankind. Whence we reasonably conclude, that the illusions of royalty are not indispensably requisite to distend the heart with pride and to harden it with cruelty, and that Pyrrhus and Alexander were composed of the same materials with Cortes and Pizarro. The conquests of the Spaniards were accomplished with such rapidity, and followed with such barbarous oppression, that a very few years sufficed not only entirely to subjugate, but almost wholly to extirpate, the slothful and effeminate idolaters whom it was the will of God to destroy by their hands. The settlements that were founded in the conquered countries produced, from the nature of the soil, a vast influx of gold and silver into Spain, and finally exercised a most pernicious influence on the liberty, industry, and prosperity of her people. But it was long before the bitter harvest of this golden shower was reaped; and in an age so ignorant of political science, it could not be foreseen through the pomp and renown with which the acquisition of so much empire, and the administration of so much treasure, seemed to invest the Spanish monarchy. The achievements of the original adventurers, embellished by the romantic genius of Spain, and softened by national partiality,* had now occupied the pens of Spanish historians, and excited a thirst for similar projects, and hopes of similar enrichment in every nation where the tidings were made known. The study of the Spanish language, and the acquaintance with Spanish literature which the marriage of Philip and Mary introduced into England, awakened the more active spirits in this country to similar views and projects, and gave to the rising spirit of adventure a strong determination towards the continent of America.

The reign of Elizabeth was productive of the first attempts that the English had ever made to establish a permanent settlement in America. But many causes contributed to enfeeble their exertions for this purpose, and to retard the accomplishment of this great design. The civil government of Elizabeth in the commencement of her reign was highly acceptable to her subjects; and her commercial policy, though frequently perverted by the interests of arbitrary power, and the principles of a narrow and erroneous system, was in the main, perhaps, not less laudably designed than judiciously directed to the cultivation of their resources and the promotion of their prosperity. By permitting a free exportation of corn, she promoted at once the agriculture and the commerce of England; and by treaties with foreign powers, she endeavored to establish commercial relations between their subjects and her own.† Sensible how much the strength and safety of the state and the prosperity of the people must depend on a naval force, she took every means to encourage navigation; and so much increased the shipping of the kingdom both by building large vessels herself, and by promoting ship-building among the merchants, that she was styled by her subjects the Restorer of naval glory, and the Queen of the northern seas. Rigidly just in discharging the ancient debts of the crown, as well as in fulfilling all her own engagements, yet forbearing towards her people in the imposition of taxes; frugal in the expenditure of her resources, and yet evincing a steady vigor in the prosecution of well directed projects; the policy of her civil government at once conveyed the wisest lessons to her subjects,

* Truth is proverbially the daughter of Time; and the proverb has been remarkably verified by the progress of human opinion with respect to the conduct of the Spanish conquerors of South America. Some specimens of the ignorance that prevailed at a pretty late period in England on this subject will be found in Note II.

† She obtained from John Basilides, the czar of Muscovy, a patent which conferred the whole trade of his dominions on the English. With this grant the tyrant, who lived in continual dread of a revolt of his subjects, purchased from Elizabeth the assurance of an asylum from their fury in England. But his son Theodore revoked it, and answered to the Queen's remonstrances, that he was determined to rob neither his own subjects nor foreigners by subjecting to monopolies what should be free to all mankind. Camden, p. 493. So superior was the commercial policy which natural justice taught this barbarian, to the system which Elizabeth derived from her boasted learning and renowned ability, and which loaded the freedom and industry of her people with patents, monopolies, and exclusive companies.

and happily concurred with the general frame of their sentiments and character. Perhaps there never was a human being (assuredly never a woman) so little smiable, who, as a sovereign, was so popular and so much respected.

During a reign so favorable to commercial enterprise, the spirit that had been long growing up in the minds of the English was called forth into vigorous and persevering exertion. Under the patronage of Dudley, Earl of Warwick, and conducted by Martin Frobisher, an expedition was despatched for the discovery of a north-west passage to India; but after exploring the coasts of Labrador and Greenland, Frobisher was compelled to return with the tidings of disappointment. [1578.] If the ardor of the English was damped by the result of this enterprise, it was quickly revived by the successful expedition of Sir Francis Drake, who, with a feeble squadron, undertook and accomplished the same enterprise that for sixty years had formed the peculiar glory of the Portuguese navigator Magellan, and obtained for England the honor of being the second nation that had completely circumnavigated the globe. A general enthusiasm was excited by this splendid achievement, and a passion for naval exploits laid hold of the spirits of almost all the eminent leaders of the age.

But still no project of effecting a permanent settlement abroad had been entertained or attempted in England. The happiness that was enjoyed by the subjects of Elizabeth enforced those attractions that bind the hearts of men to their native land, and which are rarely surmounted but by the experience of intolerable hardships at home, or the prospect of sudden enrichment abroad.* But the territory of North America held out none of the allurements that had invited and rewarded the Spanish adventurers; it presented no hopes but of distant gain, and invited no exertions but of patient industry. The prevalence of the protestant doctrines in England, and the increasing influence of a sense of religion on the minds of the people, disinclined many to abandon the only country where the Reformation appeared to be securely established; engrossed the minds of others with schemes for the improvement of the constitution and ritual of their national church; and probably repressed in some ardent spirits the epidemical thirst of adventure, and reconciled them to that moderate competency which the state of society in England rendered easily attainable, and the simplicity of manners preserved from contempt.

But if the immediate influence of religious principle was unfavorable to projects of emigration, it was to the further development of this noble principle that England was soon to be indebted for her greatest and most illustrious colonial establishment. The ecclesiastical policy of Elizabeth was far from giving the same general satisfaction that her civil government afforded to her subjects. Inheriting the arrogant temper, the lofty pretensions, and ambitious taste of her father, with little of his zeal and none of his bigotry, religious considerations often mingled with her policy; but religious sentiments had but little, if any, influence on her heart. Like him, she wished to adapt the establishments of christianity to the pomp and vanity of royalised human nature; and by a splendid hierarchy and gorgeous ceremonial, mediate an agreement between the loftiness of her heart and the humility of the gospel. But the persecution that the English protestants had undergone from Mary had not only deepened and purified the religious sentiments of a great body of the people, but associated with many of the ceremonies retained in the national church the idea of popery and the recollection of persecution. This repugnance between the sentiments of the men who now began to be termed puritans, and the ecclesiastical policy of the English government, continued to increase during the whole reign of Elizabeth: but as the influence which it exercised on the colonization of America did not appear till the following reign, I shall defer the further account of it till we come to trace its effects in the rise and progress of the colonies of New England.

During this reign, there was introduced into England a branch of that inhuman traffic in negro slaves, which afterwards engrossed so large a portion of her commercial wealth and adventure, and converted a numerous body of her merchants into a confederacy of robbers, and much of what she termed her trade into

* If some examples in the history of the world, and even in the colonization of (Northern) America, seem to dispute this position, they can only turn a universal into a general maxim.

* Who is he that hath judgment, courage, and any industry or quality, with understanding, will leave his country, his hopes at home, his certain estate, his friends, pleasures, liberty, and the preferment that England doth afford to all degrees, were it not to advance his fortunes by enjoying his deserts? Smith's Hist. of Virginia, &c. B. vi.

acts of deliberate fraud and atrocious violence. The first Englishman who brought this guilt upon himself and his country was Sir John Hawkins, who afterwards attained so much nautical celebrity, and was created an admiral and treasurer of the British navy. His father, an expert English seaman, having made several voyages to the coast of Guinea, and from thence to Brazil and the West Indies, had acquired considerable knowledge of these countries, which he transmitted to his son in the copious journals of his voyages and observations, which he left behind him at his death. In these compositions he described the soil of America and the West Indies as endowed with extraordinary richness and fertility, but utterly neglected from the want of cultivators. The natives of Europe were represented as unequal to the toil of agriculture in so sultry a climate; but those of Africa as peculiarly well adapted to this employment. Forcibly struck with these remarks, Hawkins deduced from them the project of transporting Africans into the western world; and having drawn up a plan for the execution of this design, he laid it before some of his opulent neighbors, and solicited their approbation and concurrence. A subscription was opened and speedily completed by Sir Lionel Ducket, Sir Thomas Lodge, Sir William Winter, and others, who plainly perceived the vast emolument that might be derived from such a traffic. By their assistance Hawkins was enabled to set sail for Africa in the year 1562, and, having reached Sierra Leone,* he began his commerce with the negroes. While he trafficked with them in the usual articles of barter, he took occasion to give them an inviting description of the country to which he was bound, contrasting the fertility of its soil and the enjoyments of its inhabitants with the barrenness of Africa and the poverty of the African tribes. Finding that the unsuspecting negroes listened to him with implicit belief, and were greatly delighted with the European luxuries and ornaments which he displayed to them, he offered, if any of them were willing to exchange their destitute circumstances for a happier condition, to transport them to this more bountiful region, where he assured them of a kind reception, and of an ample participation of the luxuries with which he had made them acquainted, as the certain recompense of easy labor. The negroes were ensnared by his flattering promises, and three hundred of them, accepting his offer, consented to embark along with him for Hispaniola. On the night before their embarkation, they were attacked by a hostile tribe; and Hawkins hastening with his crew to their assistance, repulsed the assailants, and carried a number of them as prisoners on board his vessels. The next day he set sail with his mixed cargo of human creatures, and during the passage treated the negroes who had voluntarily accompanied him in a different manner from his prisoners of war. On his arrival at Hispaniola he disposed of the whole cargo to great advantage, and endeavored to inculcate on the Spaniards who bought the negroes, the same distinction in the treatment of them which he himself had observed. But having now put the fulfilment of his promises out of his own power, it was not permitted to him so to limit the evil consequences of his perfidy; and the Spaniards having purchased all the Africans at the same rate, considered them as slaves of the same condition, and consequently treated them all alike.

When Hawkins returned to England with a rich freight of pearls, sugar, and ginger, which he had received in exchange for his slaves, the success of his voyage excited universal interest and curiosity respecting this novel and extraordinary description of trade. At first the nation was shocked with the barbarous aspect of a traffic in the persons of men; and the public feeling having penetrated into the court, the queen sent for Hawkins to inquire in what manner this new branch of commerce was conducted; declaring to him that "if any of the Africans were carried away without their own consent, it would be detestable, and call down the vengeance of Heaven upon the undertakers." Hawkins, in reply, assured her that no expedition where he had the command should any of the natives of Africa be carried away without their own free will and consent, except such captives as might be taken in war: and he declared that so far from feeling any scruple concerning the justice of his undertaking, he considered it an act of humanity to carry men from a worse condition to a better; from a state of heathen barbarism

to an opportunity of sharing the blessings of civil society and the christian religion. It is believed, indeed, and seems consonant with probability, that Hawkins, so far from intending that the negroes whom he sold should be consigned to a state of perpetual slavery, expected that they would be advanced to the condition of free servants whenever their labors had yielded to their masters an equivalent for the expense of their purchase. The queen appeared to be satisfied with his account, and dismissed him with the assurance that, while he and his associates acted with humanity and justice, they should enjoy her countenance and protection.

The very next voyage that Hawkins undertook, demonstrated still more clearly the deceitfulness of that union which he had applied to his conscience, and the futility even of those intentions of which the fulfilment seemed to depend entirely on himself. In his passage he met with an English ship of war, which joined itself to the expedition, and accompanied him to the coast of Africa. On his arrival, he began as formerly to traffic with the negroes, and endeavored, by reiteration of his former topics of persuasion, to induce them to embark in his vessels. But they had now become reserved and jealous of his designs, and as none of their neighbors had returned, they were apprehensive that the English had killed and devoured them; a supposition which, however offensive to the English, did greatly and erroneously extenuate the inhumanity of which they had been actually guilty. The crew of the ship of war, observing the Africans backward and suspicious, began to deride the gentle and dilatory methods of proceeding to which Hawkins confined himself, and proposed having immediate recourse to violence and compulsion. The sailors belonging to his own fleet joined with the crew of the man of war, and, applauding the proposal, began to make preparations for carrying it into effect. Hawkins protested against such unwarrantable cruelty, and vainly endeavored to prevail on them to desist from their purpose; the instructions of the queen and the dictates of conscience were ineffectually cited to men whom he had initiated in piracy and injustice, and who were not able to discover the moral superiority of calm treachery over undisguised violence. They pursued their design, and after several unsuccessful attacks, in which many of them lost their lives, the cargo was at length completed by force and barbarity. Such was the origin of the English branch of the slave trade, which I have related the more minutely, not only on account of the remarkable and instructive circumstance that attended the commencement of the practice, [See Note 1] but on account of the influence which it subsequently exercised on the colonization and condition of some of the provinces of North America.

The spirit of adventure which had been excited in England found a more inviting scene for its exertion in the southern than in the northern regions of America: and when, after twenty years of peace, Elizabeth was involved in hostilities with Philip, the prospect of enrichment and renown by the plunder of the Spanish colonies opened a new career, which was eagerly embraced and successfully prosecuted by the enterprising spirit of adventurers of all ranks in England. Accordingly, for many years, the most eminent and popular exploits of the English were performed in the predatory wars which they waged with the colonies and colonial commerce of Spain. Even in scenes so unfavorable to the production or display of the better qualities of human nature, the manly character and moral superiority of the English were frequently and signally evinced. Drake and many others of the adventurers in the same career were men equally superior to avarice and fear, and who, how willing soever to encounter danger in quest of wealth, thought it not valuable enough to be obtained by cruelty or fraud.

And yet it was to this spirit, so unfavorable to industrious colonization, and so strongly attracted to a more congenial sphere in the south, that North America was indebted for the first attempt to colonize her territory. Thus irregular and incalculable (to created wisdom) is the influence of human passions on the stream of human affairs.

The most illustrious adventurer in England was Sir Walter Raleigh, a man endowed with brilliant genius, unbounded ambition, and unconquerable activity; whose capacious mind, strongly impregnated with the enthusiasm, credulity, and sanguine expectation peculiar to the age, no single project, however vast, could fill, and whose ardent spirit no single enterprise, however arduous, could absorb. The extent of his capacity combined acquirements that are commonly

esteemed remote, and almost incomputable with each other. He was, at once, the most industrious scholar and the most accomplished courtier of his age; a profound and indefatigable projector, yet a gallant soldier; so contemptible (says an old writer) that he might have been judged unfit for action; so active that he seemed to have no leisure for speculation. Whatever was sublime and brilliant, touched his kindred soul; and whatever he undertook, he seemed to have been born for. Uncontrolled by steady principle and sober calculation, his fancy and his passions so far prevailed over his moral sentiments, as sometimes to sully his character,* and something of the boundless and transcendent so mingled with his designs, as frequently to mar his conduct, and discomfit his undertakings. But, though adversity might cloud his fortunes, it could never depress his spirit, or strip his genius of a single ray. The frustration of his efforts and the wreck of his projects served only to display the exhaustless opulence and indestructible vigor of that mind, of which no accumulation of disaster nor variety of discouragement could either repress the ardor or narrow the range. Amidst disappointment and impoverishment, pursued by royal hatred, and forsaken by his popularity, he continued to project and attempt the foundation of empires; and in old age and a prison he composed the History of the World. Perhaps there never was a distinguished reputation so much indebted to genius, and so little to success. So powerful indeed is the association that connects merit with success, and yet so strong the claim of Raleigh to evade the censure that this rule implies, that it is with the greatest difficulty that, even amidst uninterrupted disaster, we can bring ourselves to consider him an unsuccessful man. He had unfortunately adopted the maxim that "whatever is not extraordinary, is nothing;"† and his mind (till the last scene of his life) was not sufficiently pervaded by religion to recognize that nobility of purpose which ennobles the commonest actions, and directs to the attainment of a dignity that consist less in performing things great in themselves, than in doing ordinary things with an extraordinary elevation of soul. Whatever judgment may be formed of his character, we must acknowledge that in genius he was worthy of the honor which he may perhaps be considered to have attained, of originating the settlements that grew up into the North American republic.

In conjunction with his half-brother and kindred spirit, Sir Humphry Gilbert, Raleigh projected the establishment of a colony in that quarter of America which Cabot had visited; and a patent for this purpose was procured without difficulty in favor of Gilbert, from Elizabeth. [1578] This patent authorized him to discover and appropriate all remote and barbarous lands unoccupied by christian powers, and to hold them of the crown of England, with the obligation of paying the fifth part of the produce of all gold or silver mines; it permitted the subjects of Elizabeth to accompany the expedition,‡ and guaranteed to them a continuance of the enjoyment of all the rights of free denizens of England; it invested Gilbert with the powers of civil and criminal legislation over all the inhabitants of the territory he might occupy; but with this provision, that his laws should be framed with as much conformity as possible to the statutes and policy of England, and should not derogate from the supreme allegiance due

* One of the most formidable charges to which the character of Raleigh has been exposed is derived from the monstrous fictions with which his account of Guiana is replete. But Hume and the other writers who have loaded him with the guilt of these fictions have very unfairly omitted to notice that not one of them is related on his own authority. He has merely repeated (no doubt in a manner very little creditable to his own judgment) the fables that were related to him by the natives with whom he conversed. Savages and barbarians are very prone to practise such deceptions upon travellers. The Barbary Moors not only described a petrified city to Bruce, but persisted in their story till they came near to the place.

† Lloyd, 671. This will remind the classical reader of the vision of aliquid immensum infinitumque, that warmed the fancy of Cicero, but could not actuate his disposition or influence his conduct with the same power which it exerted over the conceptions, the undertakings, and the fortunes of Raleigh. To the Englishman may, with equal justice, be applied that beautiful apostrophe to the memory of the Roman—"admirabile posteris vigebris ingenium; et uno proscriptus sæculo, prosperes tyrannum omnibus."

‡ Strange as it may appear, this provision was absolutely necessary to evade the obstruction of the existing law of England. By the ancient law, as declared in the Great Charter of King John, all men might go freely out of the kingdom, saving their faith due to the king. But no such clause appears in the charter of his successor; and during the reign of Elizabeth it was enacted, that any subject departing the realm without a license under the Great Seal should forfeit his personal estate, and lose the profits of his lands for life. 23 Eliz. cap. III. Even now a king of England may enjoin any of his subjects not to leave the kingdom, or having left it, to return, and enforce his injunction by the severest penalties.

* It is remarkable that this should be the very spot where, two centuries after, the most distinguished efforts of the English have been made to promote the liberty and happiness of the Africans.

to the English crown. The endurance of this patent, in so far as related to the appropriation of territory, was limited to six years; and all persons were prohibited from establishing themselves within two hundred leagues of any spot which the adventurers might occupy during that period.

The extraordinary powers thus committed to the leader of the expedition did not prevent the accession of a numerous body of subordinate adventurers. Gilbert had gained distinction by his services both in France and Ireland; and the weight of his character concurring with the spirit of the times, and powerfully aided by the zeal of Raleigh, whose admirable genius peculiarly fitted him to obtain an ascendancy over the minds of men, and to spread the contagion of his own enthusiasm, soon collected a sufficient body of associates, and effected the equipment of the first expedition of British emigrants to America. But in the composition of this body there were elements very ill fitted to establish an infant society on a solid or respectable basis; the officers were disunited, the crew licentious and ungovernable; and happily for the credit of England, it was not the will of Providence that the adventurers should gain a footing in any new region. Gilbert approaching the continent too far towards the north, was dismayed by the inhospitable aspect of the coast of Cape Breton; his largest vessel was shipwrecked; [1580] and two voyages, in the last of which he himself perished, finally terminated in the frustration of the enterprise and dispersion of the adventurers.*

But the ardor of Raleigh, neither daunted by difficulties nor damped by misadventure, and continually refreshed by the suggestions of a fertile and uncurbed imagination, was incapable of abandoning a project that had gained his favor and exercised his genius. Applying to the queen, in whose esteem he then held a distinguished place, he easily prevailed with her to grant him a patent, in all respects similar to that which had been previously intrusted to Gilbert. [1584.] Not less prompt in executing than intrepid in projecting his schemes, Raleigh quickly despatched two small vessels commanded by Amadas and Barlow, to visit the districts he intended to occupy, and to examine the accommodations of their coasts, the productions of the soil, and the circumstances of the inhabitants. These officers, avoiding the error of Gilbert in holding too far north, steered their course by the Canaries, and, approaching the North American continent by the Gulf of Florida, anchored in Roanoke bay, which now makes a part of Carolina. Worthy of the trust reposed in them, they behaved with great courtesy to the inhabitants, whom they found living in all the rude independence and laborless, but hardy, simplicity of savage life, and of whose hospitality, as well as of the mildness of the climate and fertility of the soil, they published the most flattering accounts on their return to England. The intelligence diffused general satisfaction, and was so agreeable to Elizabeth, that, in exercise of the prerogative she proposed to assume over the country, and as a memorial that this acquisition originated with a virgin queen, she thought proper to bestow on it the name of Virginia.

This encouraging prospect not only quickened the diligence of Raleigh, but, by its influence on the public mind, enabled him the more rapidly to complete his preparations for a permanent settlement; and he was soon enabled to equip and despatch a squadron of seven ships under the command of Sir Richard Grenville, one of the most generous spirits of the time, and eminent for valor in the age of the brave. But this gallant leader unfortunately was more infected with the spirit of predatory enterprise than so prevalent among the English, than endowed with the qualities which his peculiar duty required; and commencing his expedition by cruising among the West India islands and capturing the vessels of Spain, he familiarized his followers to habits and views very remote from pacific industry, patience, and moderation. At length he landed a hundred and eight men [Aug. 1585] at Roa-

noak, and left them there to attempt, as they best could, the arduous task of founding and maintaining a social establishment. The command of this feeble body was committed to Captain Lane, assisted by some persons of note; of whom the most eminent were Amadas, who had conducted the former voyage, and Thomas Hariot, the celebrated improver of algebraical calculation, a man whose sense and virtue might have saved the colony, if they had been shared by his associates, and whose unremitting endeavors to instruct the savages, and diligent inquiries into their habits and character, by adding to the stock of human knowledge, and by extending the example of virtue, rendered the expedition not wholly unproductive of benefit to mankind, and honor to their Creator. The selection of such a man to accompany and partake the enterprise reflects additional honor on his friend and patron Raleigh. Hariot endeavored to avail himself of the admiration expressed by the savages for the guns, the clock, the telescopes, and other implements that attested the superiority of the colonists, in order to lead their minds to the great Source of all sense and science. But while they hearkened to his instructions, they accommodated their import to their own depraved notions of Divine Nature; they acknowledged that the God of the strangers was more powerful and more beneficent to his people than the deities they served, and discovered a great anxiety to touch and embrace the Bible, and apply it to their breasts and heads.* In the hands of an artful or superstitious priest, such practices, and dispositions would probably have produced a plentiful crop of pretended miracles and imaginary cures, and terminated in an exchange of superstition, instead of a renovation of nature. But Hariot was incapable of flattering or deceiving the savages by encouraging their idolatry and merely changing its direction: he labored to convince them that salvation was to be attained by sequentance with the contents of the Bible, and not by an ignorant veneration of the exterior of the book. By these labors, which were too soon interrupted, and which have obtained but little notice from the historians of the visible kingdoms of this world, he succeeded in making such impression on the minds of the Indians, that Wingina, the king, when attacked by a severe disorder, rejected the assistance of his own priests, and sent to beg the attendance and prayers of the English; and his example was followed by many of his subjects.

But unfortunately for the stability of the settlement, the majority of the colonists were much less distinguished by piety or prudence than by a vehement impatience to acquire sudden wealth: their first pursuit was gold; and smitten with the persuasion that every part of America was pervaded by the mines that enriched the Spanish colonies, their chief efforts were directed to the discovery and attainment of treasures that happily had no existence. The natives soon discovering the object which they sought with such avidity, amused them with tales of a neighboring country abounding in mines, and where pearl was so plentiful, that even the walls of the houses glittered with it. Eagerly listening to these agreeable fictions, the adventurers consumed their time and endured amazing hardships in pursuit of a phantom, to the utter neglect of the means of providing for their future subsistence. The detection of the imposture produced mutual suspicion and disgust between them and the savages, and finally led to open enmity and acts of bloodshed. The stock of provisions brought from England was exhausted; the additional supplies they had been taught to expect did not arrive; and the hostility of the Indians left them no other dependence than on the precarious resources of the woods and rivers. Thus straitened for provisions and surrounded by enemies, the colonists were reduced to the extremity of distress and danger, when a prospect of deliverance was unexpectedly presented to them by the arrival of Sir Francis Drake with a fleet which he was conducting home from a successful expedition against the Spaniards in the West Indies. Drake agreed to furnish them with a reinforcement to their numbers, and a liberal supply of provisions; and if this had been effected, it seems probable that, from the ample aid soon after transmitted by Raleigh, the colonists might have been able to maintain their footing in America. But Drake's intentions were frustrated by a violent storm which carried out to sea the very ship which he had freighted with these necessary supplies. And as he could not afford to weaken his fleet by a further contribution for their

defence or subsistence, the adventurers, now completely exhausted and discouraged, unanimously determined to abandon the country. In compliance with their united request, Drake accordingly received them on board his vessels, and reconducted them to England. [1586.] Such was the abortive issue of the first colony planted by the English in America.

Of the political consequences that resulted from this expedition, the catalogue, though not very copious, is by no means devoid of interest. An important accession was made to the scanty stock of knowledge respecting North America; the spirit of mining adventure received a signal check; and the use of tobacco, already introduced by the Spaniards and Portuguese into other parts of Europe, was now imported into England. This herb the Indians esteemed their principal medicine, and ascribed its virtues to the inhabitation of one of those spiritual beings which they supposed to reside in all the extraordinary productions of nature. Lane and his associates, acquiring a relish for its properties, brought a quantity of tobacco with them to England, and taught the use of it to their countrymen. Raleigh eagerly adopted, and with the help of some young men of fashion, encouraged the practice, which soon established and spread itself with a vigor that outran the help of courtiers, and defied the hindrance of kings, and, creating a new and almost universal appetite in human nature, formed an important source of revenue to England and multiplied the ties that united Europe with America.*

But the disasters that attended this unsuccessful undertaking did not terminate with the return of Lane and his followers to England. A few days after their departure from Roanoke, a vessel, despatched by Raleigh, reached the evacuated settlement with a plentiful supply of whatever they could require; and only a fortnight after this bark set sail to return from its fruitless voyage, a still stronger reinforcement of men and provisions arrived in three ships equipped by Raleigh, and commanded by Sir Richard Grenville. Disappointed of meeting the vessel that had preceded him, and unable to obtain any tidings of the colony, yet unwilling to abandon the possession of the country, Grenville landed fifty men at Roanoke, and leaving them in possession of an ample supply of provisions, returned to England to communicate the state of affairs and obtain further directions.

This succession of disasters excited much gloomy speculation and superstitious alarm in England, but could neither vanquish the hopes nor exhaust the resources of Raleigh. In the following year [1587] he fitted out and despatched three ships under the command of Captain White, with directions to join the small body that Grenville had established at Roanoke, and thence to transfer the settlement to the bay of Chesapeake, of which the superior advantages had been discovered in the preceding year by Lane. A charter of incorporation was granted to White and twelve of his more eminent associates, as Governor and Assistants of the city of Raleigh, in Virginia. Instructed by the calamities that had befallen the former expeditions, more efficacious means were adopted in the equipment of this squadron for preserving and continuing the colony. The stock of provisions was more abundant; the number of men greater, and the means of recruiting their numbers afforded by a competent intermixture of women. But the full extent of the preceding calamities had yet to be learned; and on landing at Roanoke in quest of the detachment that Grenville had placed there, White and his companions could find no other trace of them than the significant memorial presented by a ruined fort and a parcel of scattered bones. The apprehensions excited by this melancholy spectacle were confirmed by the intelligence of a friendly native, who informed them that their countrymen had fallen victims to the enmity of the Indians. Instructed rather than discouraged by this calamity, they endeavored to effect a reconciliation with the savages; and, determining to remain at Roanoke, they proceeded to repair the houses and revive the colony. One of the natives was baptised into the christian faith, and, retaining an unshaken attachment to the English, contributed his efforts to pacify and conciliate his countrymen. But finding themselves destitute of many articles which they judged essential to their comfort and preservation in a country covered

* Hakluyt, iii. 143. Hakluyt has preserved (p. 11) a very masterly performance from the pen of Sir Humphrey Gilbert, entitled "A Discourse to prove a passage by the northwest, to the East Indies," &c. The style of this treatise places this author on a level with the most distinguished writers of his age. In the House of Commons he was highly admired for his eloquence, and not less esteemed for his patriotism and integrity. The most admirable feature in his character was his strong and fervent piety. In the extremity of danger at sea, he was observed sitting unmoved in the stern of his ship with a Bible in his hand, and often heard to say, "Courage, my lads! we are as near heaven as sea or land."

† Smith, B. I. Robertson has erroneously stated the number at a hundred and eighty.

* Hariot, apud Smith, B. I. p. 11. Hariot has not escaped the imputation of deism. But from this charge he was defended by Bishop Corbet, who declared that "Hariot's deep mine was without dross," Still, p. 20.

* In the year 1622, that is, thirty-six years after its first introduction into England, and seven years after its first cultivation in an English colony, the annual import of tobacco into England amounted to an hundred and forty-two thousand and eighty-five pounds weight. Still, p. 246. Yet this quantity appears quite insignificant when compared with the present consumption of tobacco in Britain.

with forests and peopled only by a few scattered tribes of savages, the colonists deputed their governor to solicit for them the requisite supplies; and White proceeded for this purpose to England. On his voyage thither, he touched at a port in Ireland, where he is said to have left some specimens of the potatoe plant which he had brought with him from America. But whether this memorable importation was due to him, or, as some writers have maintained, to certain of the earlier associates of Raleigh's adventures, it must be acknowledged that to the enterprise of Raleigh and the soil of America Great Britain is indebted for her acquaintance with the potatoe, and with tobacco, the staple article of diet, and the most cherished as well as most innocent luxury of a great proportion of her people.

White arrived at a juncture the most unfavorable for the success of his mission. All England was now engrossed with the more immediate concern of self-preservation: the formidable armada of Spain was preparing to invade her, and the whole naval and military resources of the empire were under requisition for the purposes of national defence. The hour of his country's danger could not fail to find ample employment for the generous spirit of Raleigh: yet he mingled with his distinguished efforts to repel the enemy some exertions for the preservation of the colony he had planted. For this purpose, he had with his usual promptitude equipped a small squadron which he committed to the conduct of Sir Richard Grenville, when the queen interposed to detain the ships of force, and to prohibit Grenville from leaving England at such a crisis. [1588.] White, however, was enabled to rebark for America with two vessels; but yielding to the temptation of trying his fortune by the way, in a cruise against the Spaniards, he was beaten by a superior force, and totally disabled from pursuing his voyage. The colony at Roanoke was therefore left to depend on its own feeble resources, which probably the hope of foreign succour contributed to render the less available. What its fate was may be easily guessed, but never was known. [1589.] An expedition conducted by White in the following year found the territory evacuated of the colonists, and no further tidings of their destiny were ever obtained.

This last expedition was not despatched by Raleigh, but by his successors in the American patent. And our history is now to take leave of that illustrious man, with whose schemes and enterprises it ceases to have any further connexion. The ardor of his mind was not exhausted, but diverted by a multiplicity of new and not less arduous undertakings. Intent on peopling and improving a large district in Ireland which the queen had conferred on him; involved in the conduct of a scheme, and expense of an armament for establishing Don Antonio on the throne of Portugal; and already revolving his last and wildest project of an expedition for the discovery of mines in Guiana; it became impossible for him to continue the attention and prolong the efforts he had devoted to his Virginia colony. Desirous, at the same time, that a project which he had carried so far should not be entirely abandoned, and hoping that the spirit of commerce would preserve an intercourse with Virginia that might terminate in a colonial establishment, he consented to assign his patent to Sir Thomas Smith, and a company of merchants in London, who undertook to establish and maintain a traffic between England and Virginia. The patent which he thus transferred had already cost him the enormous sum of 40,000*l.*, without affording him the slightest return of pecuniary profit: yet the only personal consideration for which he stipulated with the assignees was a small share of whatever gold or silver ore they might eventually discover. It is impossible to consider the fate of this his earliest and most illustrious project—the unrivalled genius to which it owed its conception—the steady vigor with which it was pursued—the insurmountable patience with which it was revived from disaster and disappointment—and the surprising train of incidents by which the design was so often baffled, and success only brought so near, that it might seem as if by some fatality to elude his grasp, without acknowledging that the course of this world is overruled by a higher Power than the wisdom of man, and that human exertion has, in itself, no efficacy to accomplish its designs. The same Almighty Being that enables created agency to advance a certain length, enjoins that it prevails no farther; and is glorified alike by the magnitude of human efforts, and the failure of human designs.

It appeared very soon that Raleigh had transferred his patent to hands very different from his own. The

last mentioned expedition, which was productive of nothing but tidings of the destruction of those adventurers whom White had conducted, was the most considerable effort that the London company performed. Satisfied with a paltry traffic carried on by a few small vessels, they made no attempt to take possession of the country: and at the period of Elizabeth's death, not a single Englishman was settled in America. The exertions of Raleigh, however, had united the views and hopes of his countrymen, by a strong association, with settlements in Virginia, and given a bias to the national mind which only the encouragement of more favorable circumstances was wanting to develop. But the war with Spain, that endured till the close of Elizabeth's reign, allured men of enterprise and activity into the career of predatory adventure, and obstructed the formation of peaceable and commercial settlements.

[1603.] The accession of James to the English crown, was by a singular coincidence, an event no less favorable to the colonization of America, than fatal to the illustrious projector of this design. Peace was immediately concluded with Spain; and England, in the enjoyment of uninterrupted tranquillity, was enabled to direct to more bloodless pursuits the energies matured in a war which had strongly excited the spirit of the nation without impairing its strength. From the inability of government in that age to collect and blend all the resources and wield with its own hand all the disposable force of the empire, war was chiefly productive of a series of partial efforts and privateering expeditions, which widely diffused the allurements of ambition, and multiplied the opportunities of advancement. This had been remarkably exemplified in the war with Spain; and many ardent spirits to which it had supplied opportunities of animating exertion and flattering ascendancy became impatient of the restraint and inactivity to which the peace consigned them, and began to look abroad for a new sphere of enterprise and exertion.

The prevalence of this disposition naturally led to a revival of the projects for colonizing North America, and was the more readily guided into that direction by the success of a voyage that had been undertaken in the last year of Elizabeth's reign. Bartholomew Gosnold, who planned and performed this voyage in a small vessel containing only thirty men, was led by his experience in navigation to suspect that the right track had not yet been discovered, and that in steering by the Canary Islands and the Gulf of Florida, a circuit of at least a thousand leagues was unnecessarily made. In prosecution of this conjecture, he abandoned the southern track, and, steering more to the westward, was the first who reached America by this directer course. He found himself further north than any of Raleigh's colonists had gone, and landing in the region which now forms the province of Massachusetts* bay, he carried on an advantageous trade with the natives, and freighted his vessel with abundance of rich peltry. He visited two adjacent islands, one of which he named Martha's Vineyard, the other Elizabeth's Island. The aspect of the country appeared so inviting, and the climate so salubrious, that twelve of the crew at first determined to remain there: but reflecting on the melancholy fate of the colonists at Roanoke, their resolution failed; and the whole party reluctantly quitting this agreeable quarter, returned to England after an absence of less than four months.

The report of this voyage produced a strong impression on the public mind, and led to important consequences. Gosnold had discovered a route that greatly shortened the voyage to North America, and found a healthy climate, a fertile soil, and a coast abounding with excellent harbours. He had seen many fruits esteemed in Europe growing plentifully in the woods; and having sown some European grain, had found it grow with rapidity and vigor. Encouraged by his success, and perhaps not insensible to the hope of finding gold and silver or some new and lucrative subject of commerce in the unexplored interior of so fine a country, he endeavored to procure associates in an undertaking to transport a colony to America. Similar plans began to be formed in various parts of the kingdom; but the spirit of adventure was controlled by a salutary caution awakened by the recollection of past disappointments.

These projects were powerfully aided by the judicious counsel and zealous encouragement of Richard

* He appears to have been the second Englishman who landed in New England. The first was Sir Francis Drake, who remained there a few days and traded with the natives in his return from the West Indies in 1586. It is even said that Drake persuaded one of the Indian chiefs of that region to declare his territories subject to queen Elizabeth. Oldmixon's Brit. Emp. in Amer. i. 25.

Hakluyt, prebendary of Westminster, a man of eminent attainments in naval and commercial knowledge, the patron and counsellor of many of the English expeditions of discovery, the correspondent of the leaders who conducted them, and the historian of the exploits they gave rise to. [1603.] By his persuasion two vessels were fitted out by the merchants of Bristol, and despatched to examine the discoveries of Gosnold, and verify his statement. They returned with an ample confirmation of his veracity. [1605.] A similar expedition was equipped and despatched by Lord Arundel of Wardour, which not only produced additional testimony to the same effect, but reported so many additional particulars in favor of the country, that all doubts were removed; and an association sufficiently numerous, wealthy, and powerful, to attempt a settlement being soon formed, a petition was presented to the king for his sanction of the plan and the interposition of his authority towards its execution.

The attention of James had been already directed to the advantages that might be derived from colonies, at the time when he attempted to civilize the more barbarous clans of his ancient subjects by planting detachments of industrious traders in the Highlands of Scotland. Well pleased to resume a favorite speculation, and willing to encourage a scheme that opened a safe and peaceful career to the active genius of his new subjects, he listened readily to the application, and, highly commending the plan, acceded to the wishes of its projectors. Letters patent were issued [1606,] to Sir Thomas Gates, Sir George Somers, Richard Hakluyt, and their associates, granting to them those territories in America lying on the sea-coast between the thirty-fourth and forty-fifth degrees of north latitude, together with all islands situated within a hundred miles of their shores. The design of the patentees is declared to be "to make habitation, plantation, and to deduce a colony of sundry of our people into that part of America commonly called Virginia;" and, as the main recommendation of the design, it set forth, that "so noble a work may, by the providence of Almighty God, hereafter tend to the glory of his Divine Majesty, in propagating of christian religion to such people as yet live in darkness and miserable ignorance of the true knowledge and worship of God, and may in time bring the infidels and savages living in those parts to human civility, and to a settled and quiet government."

The patentees were required to divide themselves into two distinct companies, the one consisting of London adventurers, termed the first or southern colony, the second or northern colony composed of merchants belonging to Plymouth and Bristol. The territory appropriated to the first or southern colony was generally called Virginia, and retained that appellation after the second or northern colony obtained, in 1614, the name of New England. The adventurers were authorized to transport to their respective territories as many English subjects as should be willing to accompany them, and to make shipments of arms and provisions for their use, with exemption from customs for the space of seven years. The colonists and their children were to enjoy the same liberties and privileges in the American settlements as if they had remained or were born in England.* The administration of each of the colonies was committed to two boards of council; the supreme government being vested in a board resident in England, to be nominated by the king, and directed by such ordinances as he might enact for their use; and the subordinate jurisdiction devolving on a colonial council equally indebted to the appointment and subjected to the instructions of the king. Liberty to search for and open mines (which, under all the feudal governments, were supposed to have been originally reserved by the sovereign), was conferred on the colonists, with an appropriation of part of the produce to the crown; and the more valuable privilege of unrestrained liberty of trade with other nations was also extended to them. The president and council within the colonies were authorised to levy duties on foreign commodities, which, for twenty-one years, were to be applied to the use of the adventurers, and afterwards to be paid into the royal exchequer.

* This provision (whether suggested by the caution of the prince or the apprehension of the colonists) occurs in almost all the colonial charters. It is, however, omitted in the most accurate of them all, the charter of Pennsylvania, which was attentively revised and adjusted by that eminent lawyer the Lord Keeper Guildford. When King William was about to renew the charter of Massachusetts, after the Revolution, he was advised by the ablest lawyers in England that such a provision was nugatory; the law necessarily inferring that the colonists were Englishmen, and both entitled to the rights and burdened with the duties attached to that character. Chalmers's Annals, p. 15.

The terms of this charter strongly illustrates both the character of the monarch who granted, and the designs of the persons who procured it. Neither of these parties seem to have intended or foreseen the foundation of a great and opulent society. The arbitrary spirit of the royal grantor is discernable in the subjection of the emigrant body to a corporation in which they were not represented, and over whose deliberations they had no control. There is likewise a manifest inconsistency between the reservation to the colonists of all the privileges of Englishmen, and the assumption of legislative power by the king, the control of whose legislative functions constitutes the most valuable political privilege that Englishmen enjoy. But we have no reason to suppose that the charter was unacceptable to the patentees; on the contrary, its most objectionable provisions are not more congenial to the character of the king than conformable to the views which the leading members of that body plainly appear to have adopted. Their object (notwithstanding the more liberal designs professed in the charter) was rather to explore the continent and appropriate its treasures by the agency of a body of adventurers over whom they retained a complete control, than to establish a permanent and extensive settlement. The instructions to the colonial governors which accompanied the second shipment sent out by the London company demonstrated (very disagreeably to the wiser emigrants, and very injuriously to the rest), that the chief objects of their concern were not patient industry and colonization, but territorial discovery and immediate gain. In furtherance of these views they took care, by mixing no women with the first emigrants, to retain the colony in dependence upon England for its supplies of men, and to give free scope to the cupidity and the roving spirit of minds undivided by the hopes and unfixed by the comforts and attachments of domestic life.

Lightly as we must esteem the wisdom and liberality of James's institutions, it will enhance our estimate of the difficulty of his task, and abate our censure of his performance, if we compare him as a maker of constitutions with the most eminent philosopher that England has produced, aided too by the knowledge and experience of an additional century. The materials for this judgment will be supplied when the progress of our history shall have reached the settlement of Carolina. but I will venture to anticipate it by affirming, that, unfortunately for the credit of philosophy, the production of James will rather gain than lose by comparison with the performance of Locke.

The king appears to have been more honestly occupied with genuine colonizing ideas than the patentees. While their leaders were employed in making preparations to secure the benefits of the grant, James was assiduously engaged in the task, which his vanity rendered a rich enjoyment, and the well guarded liberties of England a rare one, of digesting a code of laws for the colonies that were about to be planted. This code being at length prepared, was issued under the sign manual and privy seal of England. [1606.] It enjoined the preaching of the gospel and the observance of divine worship, in conformity with the doctrines and rites of the church of England. The legislative and executive powers within the colonies were vested in the colonial councils; but with this important provision, that laws originating there should in substance be consonant to the English laws, that they should continue in force only till modified or repealed by the king or the supreme council in England, and that their penal inflictions should not extend to death or demerment. Persons attempting to withdraw the people from their allegiance to the English crown were to be imprisoned; or, in cases highly aggravated, to be remitted for trial to England. Tumults, mutiny, and rebellion, murder and incest, were to be punished with death; and for these the criminal was to be tried by a jury. Inferior crimes were to be punished in a summary way at the discretion of the president and council. Lands were to be holden by the same tenures that were established in England; but for five years after the settlement of each colony, a community of labor and gains was to have place among the colonists. Kindness to the heathen, and the communication of religious instruction to them, were enjoined. And finally, a power was reserved to the king and his successors to enact further laws, provided they should be consistent with the jurisprudence of England.

These regulations in the main are creditable to the sovereign who enacted them. No attempt was made nor right pretended to legislate for the Indian tribes; and if the ancient territories which they rather claimed

than occupied, were appropriated and disposed of without any regard to their pretensions, at least, no jurisdiction was assumed over their actions, and, in point of personal liberty, they were regarded as an independent people. This was an advance in equity beyond the practice of the Spaniards, and the ideas of queen Elizabeth, whose patents asserted the jurisdiction of the English crown and of the colonial laws over the old as well as the new inhabitants of her projected colonies. In the criminal legislation of this code, we may observe a distinction which trial by jury has enabled to prevail over that ingenious and perhaps necessary principle of ancient colonial policy, which intrusted the proconsular governors with the power of inflicting death, but restrained them from awarding less formidable penalties, as more likely to give scope to the operation of interest or caprice. If the charter evinced a total disregard of political liberty, the code, by introducing trial by jury, interwove with the very origin of society a habit and practice well adapted to keep alive the spirit and principles of freedom.

The London company, to which the plantation of the southern colony was committed applied themselves immediately to the formation of a settlement. But though many persons of distinction were included among the proprietors, their funds at first were scanty, and their first efforts proportionably feeble. Three small vessels, of which the largest did not exceed a hundred tons burthen, under the command of Captain Newport, formed the first squadron that was to execute what had been so long and so vainly attempted, and sailed [Dec.] with a hundred and five men destined to remain in America. Several of these were of distinguished families, particularly George Percy, a brother of the Earl of Northumberland; and several were officers of reputation, of whom we may notice Bartholomew Gosnold the navigator, and Captain John Smith, one of the most remarkable persons of an age that was prolific of memorable men.

Thus at length, after a research fraught with perplexity and disappointment, but I hope not devoid of interest, into the sources of the great transatlantic commonwealth, we have reached the first inconsiderable spring, whose progress, feebly opposed to innumerable obstructions, and nearly diverted in its very outset, yet always continuous, expands under the eye of patient inquiry into the majestic stream of American population. After the lapse of a hundred and ten years from the discovery of the continent by Cabot, and twenty-two years after its first occupation by Raleigh, were the number of the English colonists limited to a hundred and five; and this handful of men proceeded to execute the arduous task of peopling a remote and uncultivated land, covered with woods and marshes, and inhabited only by tribes of savages and beasts of prey. Under the sanction of a charter which bereaved Englishmen of their most valuable rights, and banished from the American constitution the first principles of liberty, were the foundations laid of the colonial greatness of England, and of the freedom and prosperity of America. From this period, or at least very shortly after, a regular and connected history arises out of the progress of Virginia and New England, the two eldest born colonies, by whose example all the others were engendered, and under whose shelter they were successively planted and reared.*

Newport and his squadron, pursuing for some unknown reason the ancient circuitous track to America, did not accomplish their voyage in a shorter period than four months; but its termination was rendered peculiarly fortunate by the effect of a storm which overruled their destination to Roanoke, and carried them into the bay of Chesapeake. [April, 1607.] As they advanced into the bay that seemed to invite their approach, they beheld all the advantages of this spacious haven, replenished by the waters of so many great rivers that fertilize the soil of that extensive district of America, and affording commodious inlets into the interior parts, facilitate their foreign commerce and mutual communication. Newport first landed on a promontory forming the southern boundary of the bay, which, in honor of the Prince of Wales, he named Cape Henry. Thence coasting the southern shore, he entered a river which the natives called Powhatan, and explored its banks for the space of forty miles from

its mouth. Strongly impressed with the superior advantages of the coast and region to which they had been thus happily conducted, the adventurers unanimously determined to make this the place of their abode. They gave to their infant settlement, as well as to the neighboring river, the name of their king; and Jamestown retains the distinction of being the oldest existing habitation of the English in America.

But the dissensions that broke out among the colonists soon threatened to deprive them of all the advantages of their well-selected station. Their animosities were powerfully inflamed by an arrangement which, if it did not originate with the king, at least evinces a strong affinity to that ostentatious mystery and driftless artifice which he affected as the perfection of political dexterity. The names of the colonial council were not communicated to the adventurers when they departed from England; but the commission which contained them was inclosed in a sealed packet, which was directed to be opened within twenty-four hours after their arrival on the coast of Virginia, when the counsellors were to be installed in their office, and to elect their own president. The dissensions incident to a long voyage and a body of adventurers rather conjoined than united, had free scope among men unaware of the relations they were to occupy towards each other, and of the absurdation which their relative stations might imply; and when the names of the council were proclaimed, they were far from giving general satisfaction. Captain Smith, whose superior talents and courage had excited the envy and jealousy of his colleagues, was excluded from the seat in council which the commission conferred on him, and even accused of traitorous designs so unproved and improbable, that none less believed the charge than the parties who preferred it. The privation of his counsel and services in the difficulties of their outset was a serious loss to the colonists, and might have been attended with ruin to the settlement, if his merit and generosity had not been superior to their mean injustice. The jealous suspicions of the person who had been elected president restrained the use of arms, and discouraged the construction of fortifications; and a misunderstanding having arisen with the Indians, the colonists, unprepared for hostilities, suffered severely from one of the sudden attacks characteristic of the warfare of these savages.

Newport had been ordered to return with the ships to England; and as the time of his departure approached, the accusers of Smith, affecting a humanity they did not feel, proposed that he should return with Newport, instead of being prosecuted in Virginia. But, happily for the colony, he scorned so to compromise his integrity; and demanding a trial, was honorably acquitted, and took his seat in the council.

The fleet had been better victualled than the stores of the colony; and while it remained with them, the colonists were permitted to share the abundance enjoyed by the sailors. But when Newport set sail for England, [June,] they found themselves limited to scanty supplies of unwholesome provisions; and the sultry heat of the climate, and moisture of a country overgrown with wood, concurring with the defects of their diet, brought on diseases that raged with fatal violence. Before the month of September one half of their number had perished, and among them was Bartholomew Gosnold, who had planned the expedition, and eminently contributed to its accomplishment. This scene of distress was heightened by internal dissensions. The President was accused of embezzling the stores, and finally detected in an attempt to seize a pinnace and escape from the colony and its calamities. At length, in the extremity of their distress, when ruin seemed alike to impend from famine, and the fury of the savages, the colony was delivered from danger by a supply which the piety of Smith is not ashamed to ascribe to the influence of God in suspending the passions and controlling the sentiments of men. The savages, actuated by a sudden change of feeling, presented them with a supply of provisions so abundant as at once to dissipate their apprehensions of famine and hostility.

Resuming their spirit, the colonists now proved themselves not entirely un instructed by their misfortunes. In seasons of exigency merit is illustrated, and the envy that pursues it absorbed by interest and alarm. Their sense of common and inevitable danger suggested and enforced submission to the man whose talents were most likely to extricate them from the difficulties with which they were surrounded. Every eye was now turned on Smith, and all willingly devoted on him the authority which they had formerly evinced

* It is only, or at least generally, their accomplishment, which produces the historical predictions of poetry. The subsequent progress of America has enabled one of her scholars to direct our attention to this stage of her history in the following lines:—

"Ingenuum, pietas, artes ac bellica virtus,
Huc protigæ venient, et regna illustria condent;
Et domina his Virtus erit, et Fortuna ministra."

POCAHONTAS SAVING THE LIFE OF CAPTAIN SMITH, A. D. 1608.

so much jealousy of his acquiring. This eminent person, whose name will be for ever associated with the foundation of civilized society in America was descended of a respectable family in Lincolnshire, and born to a competent fortune. At a very early age his ardent mind had been strongly smitten with the spirit of adventure that prevailed so powerfully in England during the reign of Elizabeth; and, yielding to his inclinations, he had passed through a vast variety of military service, with little gain, but great reputation, and with the acquisition of an experience the more valuable that it was obtained without exhausting his ardor or tainting his morals. The vigor of his constitution had preserved his health unimpaired amidst the general sickness; his undaunted temper retained his spirits unbroken, and his judgment unclouded, amidst the general misery and dejection; and the ardor of his disposition, which once subjected him to the reproach of overweening ambition, was now felt to diffuse an animating glow of hope and courage among all around him. A strong sense of religion predominated in the mind of this superior man, combined and duly subordinated all his faculties, refreshed his confidence, extended and yet regulated his views, and gave dignity to his character, and consistency to his conduct. Assuming the direction of the affairs of the colonists, he instantly adopted the only plan that could save them from destruction. Under his directions Jamestown was fortified by such defences as were sufficient to repel the attacks of the savages; and, by dint of great labor, which he was always the foremost to share, the colonists were provided with dwellings that afforded shelter from the weather, and contributed to restore and preserve their health. Finding the supplies of the savages discontinued, he put himself at the head of a detachment of his people, and penetrated into the country; and by courtesy and liberality to the tribes whom he found well disposed, and vigorously repelling the hostilities of such as were otherwise minded, he obtained for the colony the most abundant supplies.

In the midst of his successes he was surprised on an expedition by a hostile body of savages, who, having succeeded in making him prisoner, after a gallant and nearly successful defence, prepared to inflict on him the usual fate of their captives. His eminent faculties did not desert him on this trying occasion. He desired to speak with the sachem or chief, and, presenting him with a mariner's compass, expatiated on the wonderful discoveries to which it had led, described the shape of the earth, the vastness of its lands and oceans, the course of the sun, the varieties of nations, and the singularity of their relative positions, which made some of them antipodes to the others. With equal prudence and magnanimity he refrained from all solicitations for his life, which would only have weakened the impression which he hoped to produce. The savages listened with amazement and admiration. They had handled the compass, and viewing with surprise the play of the needle, which they plainly saw, but found it impossible to touch, from the intervention of the glass, this marvellous object prepared their minds for the reception of those vast impressions by which their captive endeavored to gain ascendancy over them. For an hour after he had finished his harangue they seem to have remained undecided; till their habitual sentiments reviving, they resumed their suspended purpose, and, having bound him to a tree, prepared to despatch him with their arrows. But a stronger impression had been made on their chief; and his soul, enlarged for a season by the admission of knowledge, or subdued by the influence of wonder, revolted from the dominion of habitual ferocity. This chief was named Opechancanough, and destined at a future period to invest his barbarous name with horror and celebrity. Holding up the compass in his hand, he gave the signal of reprieve, and Smith, though still guarded as a prisoner, was conducted to a dwelling where he was kindly treated and plentifully entertained.* But the strongest impressions

pass away, while the influence of habit remains. After vainly endeavoring to prevail on their captive to betray the English colony into their hands, they referred his fate to Powhatan, the king or principal sachem of the country, to whose presence they conducted him in triumphal procession. The king received him with much ceremony, ordered a plentiful repast to be set before him, and then adjudged him to suffer death by having his head laid on a stone and beat to pieces with clubs. At the place appointed for this barbarous execution, he was again rescued from impending fate by the interposition of Pocahontas, the favorite daughter of the king, who, finding her first entreaties disregarded, threw her arms around the prisoner, and declared her determination to save him or die with him. Her generous affection prevailed over the cruelty of her tribe, and the king not only gave Smith his life, but soon after sent him back to Jamestown, where the beneficence of Pocahontas continued to follow him with supplies of provisions that delivered the colony from famine.

After an absence of seven weeks Smith returned to Jamestown, barely in time to prevent the desertion of the colony. His associates, reduced to the number of thirty-eight, impatient of farther stay in a country where they had met with so many discouragements, and where they seemed fated to re-enact the disasters of Roanoke, were preparing to abandon the settlement; and it was not without the utmost difficulty, and alternately employing persuasion, remonstrance, and even violent interference, that Smith prevailed with them to relinquish their design. The provisions that Pocahontas had sent to him relieved their present wants; his account of the plenty he had witnessed among the savages revived their hopes; and he endeavored, by a diligent improvement of the favorable impressions he had made upon the savages, and by a judicious regulation of the intercourse between them and the colonists, to effect a union of interests and mutual participations of advantages between the two races of people. His generous efforts were successful; he preserved plenty among the English, and extended his influence and repute among the Indians, who began to respect and consult their former captive as a superior being. If Smith had sought only to magnify his own repute and establish his dominion, he might easily have passed with the savages for a demi-god; for they were not more averse to yield the allegiance which he claimed for their Creator, than forward to render it to himself, and to embrace every pretension he might advance in his own behalf. But no alluring prospect of dominion over men could tempt him to forget that he was the servant of God, or aspire to be regarded in any other light by his fellow creatures. He employed his best endeavors to divert the savages from their idolatrous superstition, and made them all aware that the man whose superiority they acknowledged despised their false deities, adored the true God, and obtained from Him, by prayer, the wisdom they so highly commended. The effect of his pious endeavors was obstructed by imperfect acquaintance with their language, and very ill seconded by the conduct of his associates, which contributed to persuade the Indians that his religion was something peculiar to himself. The influence, too, of human superiority, however calculated to impress, is by no means formed to convert the mind. It is so apt to give a wrong direction to the impressions which it produces, and is so remote from the channel in which Christianity from the beginning has been appointed to flow, that the first and most successful efforts to convert mankind were made by men who possessed little of it, and who renounced the little they possessed. Smith, partly from the difficulties of his situation, partly from the defectiveness of his instruction, and doubtless, in no small degree, from the stubborn blindness and wilful ignorance of the persons he attempted to instruct, succeeded no farther than Heriot had formerly done. The savages extended their respect for the man to a Being whom they termed "the God of Captain Smith," and some of them acknowledged that this Being excelled their own deities in the same proportion that artillery excelled bows and arrows, and sent to Jamestown to entreat that Smith would pray for rain when their idols seemed to refuse a supply.

[1608.] While the affairs of the colony were thus prospering under the direction of Captain Smith, a reinforcement of a hundred and twenty men, with an abundant stock of provisions, and a supply of seeds

pears not to have uttered a single word to the savages that was not strictly true. The triumph was very great; for it was obtained over ferocity intimated by education and confirmed by habit, and revenge excited by the death of some of the savages whom he had killed in defending himself.

and instruments of husbandry, arrived in two vessels from England. Universal joy was excited among the colonists by this accession to their comforts and their force. But, unhappily, the jealousies which danger had restrained rather than extinguished, reappeared in this ray of prosperity; the influence of Captain Smith with the Indians excited the envy of the very persons whose lives it had preserved, and his authority now began visibly to decline. Nor was it long before the cessation of his influence, together with the defects in the composition of the new body of emigrants, gave rise to the most serious mischiefs in the colony. The restraints of discipline were relaxed, and a free traffic permitted with the natives, who soon began to complain of fraudulent and unequal dealing, and to resume their ancient animosity. In an infant settlement, where habits of life are unfixed, and habitual submission to authority has yet to be formed, the well-being, and indeed the existence of society are much more dependent on the manners and moral character of individuals, than on the influence of laws. But in recruiting the population of this colony, too little consideration was shown for those habits and pursuits which must every where form the basis of national prosperity. This arose, as well from the peculiar views of the proprietors, as from the circumstances of the English people, whose working classes where by no means overcrowded, and among whom, consequently, the persons whose industry and moderation best fitted them to form a new settlement were least disposed to abandon their native country. Of the recruits who had lately arrived in the colony, a large proportion were *gentlemen*, a few were *laborers*, and some were *jewellers and refiners of gold*. Unfortunately, some of this latter description of artists soon found an opportunity of exercising their peculiar departments of industry, and of demonstrating (but too late) their utter unskilfulness even in the worthless qualifications they professed.

A small stream of water which issued from a bank of sand near Jamestown was found to deposit in its channel a glittering sediment which resembled golden ore, and was fondly mistaken for that precious material by the colonists. Only this discovery was wanting to re-excite the passions which America had so fatally kindled in the bosoms of her first invaders. The deposition of the ore was supposed to indicate the neighborhood of a mine; every hand was eager to explore; and considerable quantities of the dust were amassed, and subjected to the scrutiny of ignorance prepossessed by the strongest and most deceptive of human passions, and misled by the blundering guidance of superficial pretenders to superior skill. Captain Smith exerted himself to disabuse his countrymen, and vainly strove to stem the torrent that threatened to devastate all their prospects, and direct to the pursuit of a phantom, the industry on which their subsistence must speedily depend. The worthless dust having undergone the unskilful assay of the refiners who had recently been united to the colony, was pronounced to be ore of a very rich quality, and from that moment the thirst of gold was inflamed into a rage that reproduced those extravagant excesses, but, happily, without conducting to the same profligate enormities for which the followers of Cortes and Pizarro had been distinguished. All productive industry was suspended, and the operations of mining occupied all the conversation, engrossed every thought, and absorbed every effort of the colonists. The two vessels that had brought their late supplies returning to England, the one laden with this valueless dross, and the other with cedar wood, carried the first remittance that an English colony ever made from America. They carried back with them also some persons who had been invested and sent out to the colony with the absurd appointments of admirals, recorders, chronologers, and justices of the peace—a supply as useless to America as the remittance of dust was to Europe.

Foreseeing the disastrous issue to which the delusion of the colonists inevitably tended, Captain Smith, in the hope of preventing some of its most fatal consequences, adopted the resolution of extending his researches far beyond the range they had hitherto attained, and of exploring the whole of the great bay of Chesapeake, for the purpose of ascertaining the qualities and resources of its territories, and promoting a beneficial intercourse with the remoter tribes of its inhabitants. This arduous design he executed with his usual resolution and success; and while his fellow colonists were actively engaged in dissipating the hopes of England, and rivalling the sordid excesses that had characterized the adventurers of Spain, he singly sustained the honor of his country, and, armed with a nobler emulation, achieved an enterprise that equals the most

* Smith, B. ii. p. 47. Stith, p. 51.—This admirable triumph of knowledge and genius over barbarity and ferocity has been obscured by the inaccuracy of Dr. Robertson, who has ascribed Smith's deliverance on this occasion to his artifice in amusing the savages with wonderful accounts of the virtues of the compass. Marshall, the biographer of Washington, has transferred this misstatement into the pages of his history also. Had Smith resorted to artifice, he would only have availed himself of a resource which Columbus had previously employed, when he found his advantage in imposing on a savage tribe the prediction for the production of an eclipse. But Smith's attempt was at once more original and more honorable. The device of Columbus had been successfully practised by a Roman general, and is related by Livy. Smith, unassisted by precedent, and guided only by that "inspiration of the Almighty which giveth understanding," ap-

celebrated exploits of the Spanish discoverers. When we compare the slenderness of the auxiliary means which he possessed, with the magnitude of the ends which he accomplished, the hardships he endured, and the difficulties he overcame, we recognize in this achievement a monument of human power no less eminent than honorable, and willingly transmit a model so well calculated to warm the genius, to animate the fortitude, and sustain the patience of mankind. With his friend, Dr. Russell, and a small company of followers, whose courage and perseverance he was frequently obliged to resuscitate, and over whom he possessed no other authority than the ascendancy of a vigorous character and superior mind, he performed, in an open boat, two voyages of discovery that occupied more than four months, and embraced a navigation of above three thousand miles. With immense labor and danger he visited every inlet and bay on both sides of the Chesapeake, from Cape Charles to the river Susquehanna; he sailed up many of the great rivers to their falls, and diligently examined the successive territories into which he penetrated, and the various tribes that possessed them. He brought back with him an account so ample, and a plan so accurate, of that great portion of the American continent now comprehended in the provinces of Virginia and Maryland, that all the subsequent researches which it has undergone have only expanded his original view; and his map has been made the groundwork of all posterior delineations, with little other diversity than what the varieties of appropriation and the progress of settlements have necessarily effected. But to come and to see were not his only objects; to overcome was also the purpose of his enterprise, and the attainment of his exertions. In his intercourse with the various tribes which he visited, he displayed the genius of a commander in a happy exercise of all those talents that overcome the antipathies of a rude people, and enforce the respect, and even good will, of mankind. By the wisdom and liberality with which he negotiated and traded with the friendly, and by the courage and vigor with which he repelled and overcame the hostile, he never failed to inspire the savages with the most exalted opinion of himself and his nation, and laid the foundation of an intercourse that promised the most beneficial results to the Virginian colony. This was indeed the heroic age of North America: and such were the men, and such the labors, by which the first foundations of her greatness and prosperity were appointed to be laid.

While this expedition was in progress, the golden dreams of the colonists were at length dispelled; and they had awaked to all the miseries of sickness, scarcity, disappointment, and discontent, when Smith once more returned to them, to revive their spirits with his successes, and relieve their wants by the resources he had created. Immediately after his return he was [10th Sept.] chosen president by the council; and, accepting the office, he employed his influence so successfully with the savages, that present scarcity was banished, and exerted his authority so vigorously and judiciously in the colony, that a spirit of industry and good order began generally to prevail, and gave promise of lasting plenty and steady prosperity. If we compare the actions of Smith, during the period of his presidency, with the enterprise that immediately preceded his election, it may appear, at first sight, that the sphere of his exertions was both narrowed and degraded by this event, and we might almost be tempted to regret the returning reasonableness of the colonists, which, by confining this active spirit to the petty details of their government, withdrew it from a range more congenial to its exursive vigor, and more advantageous to mankind. Yet, reflection might persuade us that a truly great mind, especially when united with an ardent temper, will never be contracted by the seeming restriction of its sphere; it will always be nobly, as well as usefully employed, and not the less nobly when it dignifies what is ordinary, and improves the models that invite the widest imitation, and are most level with the opportunities of mankind. Accordingly, when we examine the history of that year over which the official supremacy of Captain Smith was extended, and consider the results of the multifarious details which it embraces, we discern a dignity as real, though less glaring than that which invests his celebrated voyage of discovery, and are sensible of consequences even more interesting to human nature than any which that expedition produced. In a small society, where the circumstances of all the members were nearly equal, where power derived no aid from pomp and circumstance, and where he owed his office to the appointment of his associates, and held it by the

tenure of their good will,* he preserved order and enforced morality among a crew of dissolute and discontented men; and so successfully opposed his authority to the temptations to indolence arising from their previous habits and dispositions, and fortified by the community of gains that then prevailed, as to introduce and maintain a respectable degree of laborious, and even contented industry. What one governor afterwards effected in this respect by the weight of an imposing rank, and others by the strong engine of martial law, Smith, without these advantages, and with greater success, accomplished by the continual application of his own vigor and activity. Some plots were formed against him; but these he detected and defeated without either straining or compromising his authority. The caprice and suspicion of the Indians assailed him with numberless trials of his temper and capacity. Even Powhatan, notwithstanding the friendly ties that united him to his ancient guest, was induced, by the treacherous artifices of certain Dutchmen, who deserted to him from Jamestown, first to form a secret conspiracy, and then to excite and prepare open hostility against the colonists. [1609.] Some of the fraudulent designs of the royal savage were revealed by the unabated kindness of *Pocahontas*, others were detected by Captain Smith, and from them all he contrived to extricate the colony with honor and success, and yet with little, and only defensive, bloodshed; displaying to the Indians a vigor and dexterity they could neither overcome nor overreach—a courage that commanded their respect, and a generosity that carried his victory into their minds, and reconciled submission with their pride. In thus demonstrating (to use his own words) “what small cause there is that men should starve or be murdered by the savages, that have discretion to manage them with courage and industry,” he bequeathed a valuable lesson to his successors in the American colonies, and to all succeeding settlers in the vicinity of savage tribes; and in exemplifying the power of a superior people to anticipate the cruel and vulgar issue of battle, and to prevail over an inferior race without either extirpating or enslaving them, he obtained a victory which *Cæsar*, with all his boasted superiority to the rest of mankind was too ungenerous to appreciate, or was incompetent to achieve.

But Smith was not permitted to complete the work he had so honorably begun. His administration was unacceptable to the company in England, for the same reasons that rendered it beneficial to the settlers in America. The patentees, very little concerned about the establishment of a happy and respectable society, had eagerly counted on the accumulation of sudden wealth by the discovery of a shorter passage to the South Sea, or the acquisition of territory replete with mines of the precious metals. In these hopes they had been hitherto disappointed; and the state of affairs in the colony was far from betokening even the retribution of their heavy expenditure. The prospect of a settled and improving state of society at Jamestown, so far from meeting their wishes, threatened to promote the growth of habits and interests perfectly incompatible with them. Still hoping, therefore, to realize their avaricious dreams, they conceived it necessary for this purpose to remove all authority into their own hands, and to abolish all jurisdiction originating in America. In order to enforce their pretensions, as well as to increase their funds, they now courted the acquisition of additional members; and having strengthened their interests by the accession of some persons of the highest rank and influence in the nation, they applied for and obtained a new charter.

[23d May.] If the new charter thus arbitrarily introduced showed an utter disregard of the rights of the colonists who had emigrated on the faith of the original one its provisions equally demonstrated the intention of restricting their privileges and increasing their dependence on the English patentees. The new charter was granted to twenty-one peers, ninety-eight knights, and a great multitude of doctors, esquires, gentlemen, merchants, and citizens, and sundry of the corporations

* It was the testimony of his soldiers and fellow adventurers, says Stith, “that he was ever fruitful in expedients to provide for the people under his command, whom he would never suffer to want any thing he either had or could procure; that he rather chose to lead than send his soldiers into danger;” that in all their expeditions he partook the common fare, and never gave a command that he was not ready to execute; “that he would suffer want rather than borrow, and starve sooner than not pay; that he had nothing in him counterfeit or shy, but was open, honest, and sincere.” Stith adds, respecting this founder of civilized society in North America, what the son of Columbus has, with a noble elation, recorded of his father, that though habituated to naval manners, and to the command of factious and licentious men, he was never heard to utter an oath.

of London, in addition to the former adventurers; and the whole body was incorporated by the title of “The Treasurer and Company of Adventurers of the City of London for the first colony in Virginia.” The boundaries of the colony and the power of the corporation were enlarged; the offices of president and council in Virginia were abolished; a new council was established in England, and the company empowered to fill all future vacancies in it by election; and to this council was committed the power of new-modelling the magistracy of the colony, of enacting all the laws that were to have place in it, and nominating all the officers by whom these laws were to be carried into execution. Nevertheless, was it still provided that the colonists and their posterity should retain all the rights of Englishmen. To prevent the doctrines of the church of Rome from gaining admission into the plantations, it was declared that no persons should pass into Virginia but such as should first have taken the oath of supremacy.

The new council appointed Lord Delaware governor, and captain-general of the colony; and the hopes inspired by the distinguished rank, and not less eminent character of this nobleman, contributed to strengthen the company by a considerable accession of funds and associates. Availing themselves of the favourable disposition of the public, they quickly equipped a squadron of nine ships, and sent them out with five hundred emigrants, under the command of Captain Newport, who was authorized to supersede the existing administration, and to govern the colony till the arrival of Lord Delaware with the remainder of the recruits and supplies. But by an unlucky combination of caution and indiscretion, the same powers were severally intrusted to Sir Thomas Gates and Sir George Somers, without any adjustment of precedence between these gentlemen; and they finding themselves unable to settle this point among themselves, agreed to embark on board the same vessel, and to be companions during the voyage—thus deliberately hazarding and eventually effecting the disappointment of the main object which their association in authority was intended to secure. The vessel that contained the triumvirate was separated from the fleet by a storm, and stranded on the coast of Bermudas.* The residue of the squadron arrived safely at Jamestown, but so little were they expected, that when they were first described at sea they were mistaken for enemies; and this rumor gave occasion to a very satisfactory proof of the friendly disposition of the Indians, who came forward with the utmost alacrity, and offered to fight in defence of the colony.

These apprehensions, which were dissipated by the nearer approach of the fleet, gave place to more substantial and more formidable evils arising from the composition of the reinforcement which it brought to the colonial body. A great proportion of these new emigrants consisted of profligate and licentious youths, sent out by their friends with the hope of changing their destinies, or for the purpose of screening them from the justice or contempt of their country; of indigent gentlemen too proud to beg, and too lazy to work; tradesmen of broken fortunes and broken spirit; idle retainers whom the great were eager to get rid of; and dependents too infamous to be decently protected at home; with others, like these, more fitted to waste and corrupt a commonwealth than to found or maintain one. The leaders of this pernicious crew, though totally unprovided with legal documents entitling them either to assume or supersede authority proclaimed the changes which the constitution of the colony had undergone, and proceeded to execute that part of the innovation which consisted in the overthrow of the colonial presidency and council. Their conduct soon demonstrated that their title to assume authority was not more defective than their capacity to exercise it. Investing themselves with the powers, they were unable to devise any frame of government, or establish even among themselves any fixed subordination; sometimes the old commission was resorted to, sometimes a new model attempted; and the chief direction passed from hand to hand in one uninterrupted succession of presumption and incapacity. The whole colony was involved in distress and disorder by this revolutionary state of its new government, and the Indian tribes were alienated and exasperated by the turbulence, injustice, and insolence of the new settlers.

* It was this disaster, no doubt, which produced the only allusion which Shakespeare ever makes to the regions of America. In *The Tempest*, which was composed about three years after this period, Ariel celebrates the stormy coast “the still vex’d Bermudas.”

This emergency strongly called on the man who had so often rescued the settlement from ruin, again to attempt its deliverance; the call was seconded by the wishes of the best and wisest of the colonists; and, aided as much by the vigor of his own character, as by the cooperation of these individuals, Smith once more assumed his natural ascendant and official supremacy, and declared his intention of retaining the authority created by the old commission till a regal revocation of it and legitimate successors to himself should arrive. He boldly imprisoned the chief promoters of tumult; and having restored regularity and obedience, he endeavored to prevent a recurrence of the former mischiefs by detaching from Jamestown a portion of the new colonists to form a subordinate settlement at some distance. This was an unfortunate step; and it is remarkable that the only signal failure in the policy of this eminent man seems to have arisen from the only instance in which he showed a distrust of his own vigor and capacity. The detachments which he removed from Jamestown conducted themselves so imprudently as to convert all the neighboring Indians into enemies, and to involve themselves in continual difficulty and danger. The Indians assailed him with complaints, the detached settlers with requisitions of counsel and assistance; and Smith, who never spent in lamenting misfortunes the time that might be employed in repairing them, was exerting himself with his usual vigor and good sense in redressing these disorders, when he received a dangerous wound from the accidental explosion of a quantity of gunpowder. Completely disabled by this misfortune, and destitute of surgical aid in the colony, he was compelled to resign his command, and take his departure for England. He never returned to Virginia again. It was natural that he should abandon with regret the society he had so often preserved, the settlement he had conducted through difficulties as formidable as the infancy of Carthage or Rome had to encounter, and the scenes he had dignified by so much wisdom and virtue. But our sympathy with his regret is abated by the reflection that a longer residence in the colony would speedily have consigned him to very subordinate office, and might have deprived the world of that stock of valuable knowledge, and his own character of that accession of fame,* which the publication of his travels has been the means of perpetuating. Such reflections are not foreign to the purpose, nor inconsistent with the dignity of history, which may well be allowed to linger with interest on the fortunes of this excellent person, and is well employed in teaching by example how powerfully an enlargement of our view contributes to purify the moral aspect of events.

CHAPTER II.

The Colony a Prey to Anarchy—and Famine—Gates and Somers arrive from Bermudas—Abandonment of the Colony determined—prevented by the Arrival of Lord Delaware—His wise Administration—his Return to England—Sir Thomas Dale's Administration—Martial Law established—Indian Chief's Daughter seized by Captain Argal—married to Mr. Rolfe—Right of private Property in Land introduced into the Colony—Expeditions of Argal against Port Royal and New York—Tobacco cultivated by the Colonists—First Assembly of Representatives convened in Virginia—New Constitution of the Colony—Introduction of Negro Slavery—Migration of young Women from England to Virginia—Dispute between the King and the Colony—Conspiracy of the Indians—Massacre of the Colonists—Dissentions of the London Company—The Company dissolved—the King assumes the Government of the Colony—his Death—Charles I. pursues his father's arbitrary Views—Tyrannical Government of Sir John Harvey—Sir William Berkeley appointed Governor—The popular Assembly restored—Virginia espouses the Royal Cause—subdued by the Long Parliament—Restraints imposed on the Trade of the Colony—Revolt of the Colony—Sir William Berkeley resumes the Government—Restoration of Charles II.

[1609.] SMITH left the colony inhabited by five hundred persons, and amply provided with all necessary stores of arms, provisions, cattle, and implements of agriculture: but the sense to improve its opportunities was wanting, and its fortune departed with him. For a short time the command was intrusted to Mr. Percy, a man of worth but devoid of the vigor that gives efficacy to virtue; and the direction of affairs soon fell into the hands of persons whom their native country had cast from it as a useless burden or intolerable nuisance. The colony was delivered up to the wildest excesses of a seditious and distracted rabble, and presented a scene of riot, folly, and profligacy, strongly invoking vindictive retribution, and speedily overtaken by it. [1610.] The provisions were quickly exhausted; and the In-

dians, incensed by repeated injuries, and aware that the man whom they so much respected had ceased to govern the colonists, not only refused them all assistance, but harassed them with continual attacks. Famine ensued, and completed their misery and degradation by transforming them into cannibals, and forcing them to subsist on the bodies of the Indians they had killed, and of their own companions who perished of hunger or disease. Six months after the departure of Smith there remained no more than sixty persons alive at Jamestown, still prolonging their wretchedness by a vile and precarious diet, but daily expecting its final and fatal close.

In this calamitous state was the colony found by Sir Thomas Gates, Sir George Somers, and Captain Newport, who at length arrived from Bermudas, where the shipwreck they had encountered had detained them and their crew for ten months. The bounty of Nature in that delightful region maintained them in comfort while they built the vessels that were to transport them to Jamestown, and might have supplied them with ample stores for the use of the colony; but they had neglected these resources, and arrived almost empty-handed, in the expectation of receiving from the magazines of a thriving settlement the relief that was now vainly implored from themselves by the famishing remnant of their countrymen. Their disappointment was equalled only by the difficulty of comprehending the causes of the desolation they beheld, amidst the mutual and contradictory accusations of the surviving colonists. But there was no time for deliberate inquiry, or adjustment of complaints. It was immediately determined to abandon the settlement, and with this view they all embarked in the vessels that had just arrived from Bermudas, and set sail for England. Their stores were insufficient for so long a voyage; but they hoped to obtain an additional supply at the English fishing station on the coast of Newfoundland. Such a horror had many of them conceived for the scene of their misery, that they were importunate with the commanders for leave to burn the fort and houses in Jamestown. But Sir Thomas Gates could not find in their or his distresses any reason for demolishing the buildings, that might afford shelter to future settlers; and happily, by his interposition, they were preserved from destruction, and the colonists prevented from wreaking additional vengeance on themselves.

For it was not the will of Providence that this settlement should perish; the calamities with which it had been visited were commissioned to punish merely, but not utterly to destroy; and the more worthless members being now cut off, and a memorable lesson afforded both to the governors who collect,* and the members who compose such communities, a deliverance no less signal was vouchsafed by the Disposer of all events, just when hope was over, and the colony advanced to the very brink of annihilation. Before the fugitives had reached the mouth of James river they were met by Lord Delaware, who arrived with three ships, containing a large supply of provisions, a considerable number of new settlers, and an ample stock of every thing requisite for defence or cultivation.

This nobleman, who now presented himself as captain-general of the colony, was eminently well fitted for the exigency of the situation in which he was thus unexpectedly involved. To exalted rank, in an age when such distinctions were regarded with much veneration, he joined a noble demeanor, a disinterested character, and a manly understanding. The hope of rendering an important service to his country, and the generous pleasure of cooperating in a great design, had induced him to exchange his ease and splendor at home for a situation of the difficulties of which he was perfectly aware: and the same firmness and elevation of purpose preserved him undaunted and unperplexed by the scene of calamity he encountered on his arrival in Virginia. Stemming the torrent of evil fortune, he carried back the fugitives to Jamestown, and began his administration by attendance on Divine worship; and having held a short consultation on the affairs of the settlement, he summoned all the colonists together, and addressed them in a short but forcible and dignified harangue. He justly rebuked the pride, and sloth, and immorality that had produced such disasters, and earnestly recommended a return to the virtues most likely to repair them: he declared his determination not to hold the

sword of justice in vain, but to punish the first recurrence of disorder by shedding the blood of the delinquents, though he would infinitely rather shed his own to protect the colony from injury. He nominated proper officers for every department, and allotted to every man his particular place and business. This address was received with general applause and satisfaction; and the idle factious humours of a divided multitude soon appeared to be substantially healed by the splendor, unity, and authority of Lord Delaware's administration. [1611.] By an assiduous attention to his duty, and a happy union of qualities fitted equally to inspire esteem and enforce submission, he succeeded in maintaining peace and good order in the settlement, in diffusing a spirit of industry and alacrity among the colonists, and in again impressing the dread and reverence of the English name on the minds of the Indians. This promising beginning was all he was permitted to effect. Oppressed by diseases occasioned by the climate, he was compelled to quit the country; having first committed the administration to Mr. Percy [3].

The restoration of this gentleman to the supreme command seems to have been attended with the same relaxation of discipline, and would probably have led to a repetition of the same disorders, that had so fatally distinguished his former government. But happily for the colony, a squadron that had been despatched from England before Lord Delaware's return with a supply of men and provisions, brought also with it Sir Thomas Dale, whose commission authorised him, in the absence of that nobleman, to assume the administration. This new governor found the colonists fast relapsing into idleness and penury; and though he exerted himself strenuously, and not unsuccessfully, to restore better habits, yet the loss of Lord Delaware's imposing rank and authoritative character was sensibly felt. What he could not accomplish by milder means, he was soon enabled, and compelled to effect by a system of notable rigor and severity. A code of rules and articles had been compiled by Sir Thomas Smith, the treasurer of the company of patentees, from the martial law of the Low Countries, the most severe and arbitrary frame of discipline that then existed in the world; and having been printed by the compiler for the use of the colony, but without the sanction or authority of the council, was transmitted to him by the governor.* [4] This code did not long remain inoperative. Sir Thomas Dale caused it to be proclaimed as the settled law of the colony; and some conspiracies having broken out, he enforced its provisions with great rigor, but not greater than was judged by all who witnessed it to have effected the preservation of the settlement. The wisdom and honor of the governor, who thus became the first depository of these formidable powers, and the salutary consequences that resulted from the first exercise of them, seem to have prevented the alarm which the introduction of a system so destructive to liberty was calculated to provoke. Dale was succeeded in the supreme command by Sir Thomas Gates, who arrived with six vessels, containing a powerful reinforcement to the numbers and resources of the colonists. The late and the present governors were united by mutual friendship and similarity of character. Gates approved and pursued the system of strict discipline and steady but moderate enforcement of the martial code, that had been introduced by Dale; and under the directions of Dale, who continued in the country and willingly occupied a subordinate station, various bodies of the colonists began to form additional settlements on the banks of James river and at some distance from Jamestown.

[1612.] An application was now made by the company of patentees to the king, for an enlargement of their charter. The accounts they had received from the persons who were shipwrecked on Bermudas, of the fertility and agreeableness of that territory impressed them with the desire of obtaining possession of its resources for the supply of Virginia.† Their increasing influence enforced their request; and a new charter was issued, investing them with all the islands situated within three hundred leagues of the coast of Virginia. Some innovations were made in the structure and forms of the corporation; the term of ex-

* Smith, p. 122. Nothing can be more fanciful or erroneous than Dr. Robertson's account of the introduction of this system, which without the slightest reason he ascribes to the advice of Lord Bacon, and, in opposition to all evidence, represents as the act of the company.

† Smith, p. 126. About this time the patentees promoted a subscription among devout persons in London for building churches in the colony; but the money was diverted to other purposes, and it was not till some years after that churches were built in Virginia. Oldmixon's Brit. Emp. in Amer. i. 231. 300.

* He became so famous in England before his death, that his adventures were dramatised and represented on the stage, to his own great annoyance. Smith, p. 112.

emption from payment of duties on commodities exported by them was prolonged; the company was empowered to apprehend and remand persons returning by stealth from the settlement, in violation of their engagements; and, for the more effectual advancement of the colony and indemnification of the large sums that had been expended on it, license was given to open lotteries in any part of England. The lottery which was set on foot in virtue of this license, was the first establishment of the kind that had ever received public countenance in England: it brought twenty-nine thousand pounds into the treasury of the company, but loaded it with the reproach of defrauding the people, by allowing them to play a game in which they must certainly be the losers. The House of Commons, which then represented the sense and guarded the morality of England, remonstrated against this odious concession of their ignoble sovereign, as a measure equally unconstitutional and impolitic; and the license was soon after recalled. Happy if their example had been copied by later times, and the rulers of mankind restrained from polluting their financial administration by a system of chicanery, and promoting in their subjects that gambling habit of mind which dissolves industry and virtue, and is generally the parent even of the most atrocious crimes! Notwithstanding the eagerness of the company to acquire the Bermuda islands, they did not retain them long, but sold them to certain of their own members, who were erected into a separate corporation by the name of the Somers Islands Company.*

The colony of Virginia had once been saved, in the person of its own deliverer Captain Smith, by Pocahontas the daughter of the Indian king Powhatan. She had ever since maintained a friendly intercourse with the English, and she was destined now to render them a service of the highest importance. A scarcity prevailing at Jamestown, and supplies being obtained but scantily and irregularly from the neighboring Indians, with whom the colonists were often embroiled, Captain Argal was despatched to the Potomac for a cargo of corn. Here he learned that Pocahontas was living in retirement at no great distance from him; and hoping, by possession of her person, to attain such an ascendancy over Powhatan as would enforce an ample contribution of provisions, he prevailed on her by some artifice, to come on board his vessel, and then set sail with her to Jamestown, where she was detained in a state of honorable captivity. But Powhatan, more indignant at such treachery than overcome by his misfortune, rejected with scorn the demand of a ransom; he even refused to hold any communication with the ruffians who still kept his daughter a prisoner, but declared that if she were restored to him he would forget the injury, and, feeling himself at liberty to regard them as friends, would gratify all their wishes. But the colonists were too conscious of not deserving the performance of such promises, to be able to give credit to them; and the most injurious consequences seemed likely to arise from the unjust detention, which they could no longer continue with advantage nor relinquish with safety, when all at once the aspect of affairs underwent a surprising and beneficial change. During her residence in the colony, Pocahontas, who is represented as a woman distinguished by her personal attractions, made such impression on Mr. Rolfe, a young man of rank and estimation among the settlers, that he offered her his hand, and, with her approbation and the warm encouragement of the governor, solicited the consent of Powhatan to their marriage: this the old prince readily granted, and sent some of his relations to attend the ceremonial, which was performed with extraordinary pomp, and laid the foundation of a firm and sincere friendship between his tribe and the English. This happy event also enabled the colonial government to conclude a treaty with the Chickahominy, a brave and martial tribe, who consented to acknowledge themselves subjects of the British monarch, and style themselves henceforward Englishmen, to assist the colonists with their arms in war, and to pay an annual tribute of Indian corn.

[1613.] But a material change which now took place in the interior arrangements of the colony contributed

* Smith, p. 127. It is said that Waller the poet subsequently became a partner of this company, and that during his banishment from England he resided some time in Bermuda: a statement that seems to derive some confirmation, from the minute description of the scenery and produce of the place in his poem, "The Battle of the Somers Islands." It is a pity that the muse of Waller and of Marvel, which travelled as far across the Atlantic as Bermuda, should not have extended their range to that illustrious continent whose aspect was able to transform Bishop Berkeley from a metaphysician into a poet.

to establish its prosperity on foundations more solid and respectable than the alliance or dependence of the Indian tribes. The industry which had been barely kept alive by the severe discipline of martial law, languished under the discouragement of that community of property and labor which had been introduced, as we have seen, by the provisions of the original charter. As a temporary expedient, this system could not have been easily avoided; and the censure which historians have so liberally bestowed on its introduction seems to be quite misplaced. The impolicy consisted in prolonging its duration beyond the time when the colony acquired stability, when modes of life came to be fixed, and when the resources of the place and the productive powers of labor being fully understood, the government might safely and advantageously remit every individual to the stimulus of his own interest and dependence on his own industry. But at first it was unavoidable that the government should charge itself with the support of its subjects and the regulation of their industry; and that their first experimental exertions should be referred to the principle and adapted to the rules of a system of partnership. How long such a system may endure, when originated and maintained by a strong and general impulse of that Christian spirit which teaches every man to regard his office on earth as that of a steward, his life as a stewardship, and the superiority of his powers as designating, not the extent of his interest, but the increase of his responsibility, is a problem to be solved by the future history of mankind. But as a permanent arrangement, supported only by municipal law, it attempts an impossibility, and commits the enforcement of its observances to an influence destructive of its own principles. As soon as the sense of individual interest and security begins to dissolve the bond of common hazard, danger, and difficulty, the law is felt to be an intolerable restriction; but as in theory it retains a generous aspect, and its inconvenience is at first evinced by the idleness and immorality which its secret suggestions give scope to, it is not to be wondered at that rulers should seek to remove the effect while they preserve the cause, and even by additional securities of regulation extinguish every remains of the virtue they vainly attempt to revive.

Sir Thomas Dale, by his descent from the supreme direction of affairs to a more active participation in the conduct of them, was enabled to observe with an accurate and unprejudiced eye the operation of the colonial laws on the dispositions of the colonists, and in particular the utter incompatibility of this regulation with all the ordinary motives by which human industry is maintained. He saw that every one was eager to evade or abridge his own share of labor; that the universal reliance on the common stock impaired, in every individual, the efforts on which its replenishment depended; that the slothful reposed in dependence on the industrious, while the industrious were deprived of their alacrity by impatience of supporting and confirming the slothful in their idleness; and that the most honorable would hardly take as much pains for the community in a week as he would do for himself in a day. Under his direction, the evil was redressed by a radical and effectual remedy: a sufficient portion of land was divided into lots, and one of them was assigned in full property to every settler. From that moment, industry, freed from the obstruction that had relaxed its incitements and intercepted its recompense, took vigorous root in Virginia, and the prosperity of the colony evinced a steady and rapid advancement. [1614.] Gates returning to England, the supreme direction again devolved on Sir Thomas Dale, whose virtue seems never to have enlarged with the enlargement of his authority. He continued for two years longer in the colony; and in his domestic administration continued to promote its real welfare; but he launched into foreign operations little productive of advantage, and still less of honor. In Captain Argal, the author of the fortunate seizure of Pocahontas, he found a fit instrument, and perhaps a counsellor, of designs of a similar character and tendency. The French settlers in Acadie had, in the year 1605, built Port Royal in the Bay of Fundy, and had ever since retained quiet possession of the country, and successfully cultivated a friendly intercourse with the neighboring Indians. Under the pretext that the French, by settling in Acadie, had invaded the rights derived by the English from the first discovery of the continent, was Argal despatched in a time of profound peace, to make a hostile attack on this settlement. Nothing could be more unjust or unwarranted than this enterprise. The Virginian charters, with the enforcement of which alone

Sir Thomas Dale was intrusted, did not embrace the territory which he now presumed to invade, and which the French had peaceably possessed for nearly ten years, in virtue of charters from their sovereign Henry the IVth. Argal easily succeeded in surprising and plundering a community that were totally unsuspecting of hostility, and unprepared for defence; but leaving no garrison in the place, the French soon resumed their station, and the expedition produced no other permanent effect than the recollections it left in the minds of the French, and the impression it produced on the sentiments of the Indians. But a few years elapsed before an attack on themselves, by their own Indian neighbors, equally iniquitous and far more fatal avenged the outrage on Port Royal, and taught the government of Virginia to detest the policy which it had thus sanctioned by its example. Returning from this expedition, Argal executed a similar enterprise against New York, which was then in possession of the Dutch, whose claim was derived from Captain Hudson's discovery or visit to the territory in 1609, when he commanded one of their vessels, and was employed in their service. But Argal maintained, that Hudson being an Englishman, there accrued from his acquisition an indefeasible right to his country; and the Dutch governor being unprepared for resistance, was compelled to submit and declare the colony to be a dependency of England, and tributary to Virginia. But another governor arriving soon after, with better means of asserting the title of his countrymen, the concession was retracted, and the English claim successfully defied.

[1615.] One of the first objects to which the increasing industry of the colonists was directed, was the cultivation of tobacco, which was now for the first time introduced into Virginia. King James had conceived a strong antipathy to the use of this weed, and in his celebrated *Counterblast against Tobacco*, had endeavored to prevail over one of the strongest tastes of human nature by the force of fustian and pedantry. The issue of the contest corresponded better with his interests than his wishes; his testimony, though pressed with all the vehemence of exalted folly, could not prevail with his subjects over the evidence of their own senses; and though he summoned his prerogative to the aid of his logic, and prohibited the pollution of English ground by the cultivation of tobacco,* he found it impossible to withstand its importation from abroad: the demand for it rapidly extended, and its value and consumption daily increased in England. Incited by the hopes of sharing a trade so profitable, the colonists of Virginia devoted their fields and labor almost exclusively to the culture of tobacco. Sir Thomas Dale observing their inconsiderate ardor, and sensible of the danger of neglecting the cultivation of the humble but more necessary productions, on which the subsistence of the colony depended, interposed his authority to check the excesses of the planters; and adjusted by law the proportion between the corn crop and the tobacco crop of every proprietor of land. But after his departure, [1616.] his wise policy was neglected and his laws forgotten; and the culture of tobacco so exclusively occupied the attention of the settlers that even the streets of Jamestown were planted with it, and a scarcity of provisions very soon resulted. In this extremity they were compelled to renew their exactions upon the Indians, and involved themselves in disputes and hostilities, which gradually alienated the regard of these savages, and paved the way to one of those schemes of vengeance which they are noted for forming with the most impenetrable secrecy, maturing with consummate artifice and executing with unrelenting rancor.† This fatal consequence was not fully experienced till after the lapse of one of those intervals which to careless eyes appear to disconnect the misconduct from the sufferings of nations, but impress reflective minds with an awful sense of that strong unbroken chain which subsists undisturbed by time or

* The following preamble to one of his proclamations on this subject is highly characteristic:—"Whereas we, out of the dislike we had of the use of tobacco, tending to a general and new corruption both of men's bodies and manners, and nevertheless holding it of the two more honorable that the same should be imported among other vanities and superfluities which come from beyond the seas than be permitted to be planted here within the realm, whereby to abuse and misemploy the soil of this fruitful kingdom, did prohibit the planting of it in England," &c. Rymer, vol. xvii. p. 233. Hazard, p. 93.

† Smith, B. iv. Smith, p. 140, 147, 164, 168. Purchas, iv. 178. In the year 1615 was published at London, "A True Discourse of the present State of Virginia," by Ralph Hamar secretary to the colony; a tract which has no other merit but its scarcity.

distance, and both preserves and extends the moral consequences of human actions.

But a nobler plant than tobacco was preparing to rise in Virginia; and we are now to contemplate the first indication of that active principle of liberty which was destined to become the most considerable staple and appropriate moral produce of America. When Sir Thomas Dale returned to England, he had committed the government to Mr. George Yeardley, whose lax administration, if it removed a selfish restraint on the improvident cupidity of the planters, enabled them to taste, and prepared them to value, the dignity of independence and the blessings of liberty. He was succeeded [1617]* by Captain Argal, a man of considerable talents and resolution, but selfish, haughty, and tyrannical. Argal provided with ability for the wants of the colony, and introduced some useful regulations of the traffic and intercourse with the Indians; but he encumbered personal liberty with needless and minute restrictions, and enforced their observance by a harsh and constant exercise of martial law. While he pretended to promote piety in others by punishing absence from church with a temporary slavery, he postponed in his own practice every other consideration to the acquisition of wealth, which he effected by a profligate abuse of the opportunities of his office, and defended by the terrors of despotic authority. Universal discontent was excited by his administration, and the complaints of the colonists at length reached the ears of the company in England. In Lord Delaware their interests had always found a zealous friend and powerful advocate; and he now consented, for their deliverance, to resume his former office, and again to undertake the direction of their affairs. He embarked for Virginia with a splendid train, but died on the voyage. [1618.†] His loss was deeply lamented by the colonists; but it was in the main, perhaps, an advantageous circumstance for them that an administration of such pomp and dignity was thus timely intercepted, and the improvement of their affairs committed to men and manners nearer the level of their own condition; and it was no less advantageous to the memory of Lord Delaware, that he died in the demonstration of a generous willingness to attempt what it was very unlikely he could have succeeded in effecting. The tidings of his death were followed to England by increasing complaints of the odious and tyrannical proceedings of Argal; and the company having conferred the office of captain-general on Mr. Yeardley, the new governor received the honor of knighthood, and proceeded to the scene of his administration. [1619.]

Sir George Yeardley, on his arrival in Virginia, to the inexpressible joy of the inhabitants, declared his intention of reinstating them in full possession of the privileges of Englishmen, by convoking a colonial assembly. This first legislative body that America ever produced, consisted of the governor, the council, and burgesses elected by the seven existing boroughs, who, assembling at Jamestown, in one apartment, conducted their deliberations with good sense and harmony, and debated all affairs that involved the general welfare. The laws which they enacted were transmitted to

England for the approbation of the treasurer and company, and are no longer extant; but they are declared by competent judges to have been in the main wisely and judiciously framed, though (as might reasonably be expected) somewhat intricate and unsystematical.* The company sometime after passed an ordinance by which they substantially approved and established this constitution of the Virginian legislature. They reserved, however, to themselves the creation of a council of state, which should assist the governor with advice in the executive administration, and should also form a part of the colonial assembly; and they provided, on the one hand, that the enactments of the assembly should not have the force of law till ratified by the court of proprietors in England; and conceded, on the other hand, that the orders of this court should have no force in Virginia till ratified by the colonial assembly. Thus early was planted in America that representative system that forms the soundest political frame in which liberty was ever embodied, and at once the safest and most efficient organ by which its energies are exercised and developed. So strongly imbued were the minds of Englishmen in this age with the vigorous spirit of that liberty which was rapidly advancing to a first manhood in their country, that wherever they settled themselves, the institutions of freedom took root and grew up along with them.

It had been happy for the morals and the prosperity of Virginia, if her inhabitants, like their brethren in Massachusetts, had oftener elevated their eye from subordinate agency to the great First Cause, and had referred, in particular, the signal blessing that was now bestowed on them to the will and gift of God. Liberty so derived acquires at once its firmest and noblest basis—it becomes respected as well as beloved; the dignity of the origin to which it is referred, influences the ends to which it is made subservient; and all are taught to feel that it can neither be violated nor abused without provoking the Divine displeasure. It is this preservative principle alone that prevents the choicest blessings and most estimable qualities from cherishing in human hearts an ungrateful and counteracting spirit of insolence and pride—a spirit which led the Virginians too soon to plant the rankest weeds of tyranny in that field where the seeds of liberty had been so happily sown.

The company had received orders from the king to transport to Virginia a hundred idle dissolute persons who were in custody for various misdemeanours in London.† These men were dispersed through the colony as servants to the planters; and the degradation of the colonial character and manners, produced by such an intermixture, was overlooked, in consideration of the assistance that was derived from them in executing the plans of industry that were daily extending themselves. [1620.] Having once associated felons with their labors, and committed the cultivation of their fields to servile hands, the colonists were prepared to yield to the temptation which speedily presented itself, and to blend in barbarous combination the character of oppressors with the claims and condition of freemen. A Dutch ship, from the coast of Guinea, having sailed up James river, sold a part of her cargo of Negroes to the planters: and as that hardy race was found more capable of enduring fatigue in a sultry climate than Europeans, the number was increased by continual importation, till a large proportion of the inhabitants of Virginia were reduced to a state of slavery by the selfish ingratitude of men who turned into a prison for others the territory that had proved a seat of liberty and happiness to themselves.

But, about this time, another addition, more productive of virtue and felicity, was made to the number of the colonists. Few women had as yet ventured to

cross the Atlantic; and the English being restrained by the pride and rigidity of their character from that incorporation with the native Americans which the French and Portuguese have found so conducive to their interests, and so accordant with the pliancy of their manners and disposition, were generally destitute of the comforts and connexions of married life. Men so situated could not regard Virginia as a permanent residence, but proposed to themselves, after amassing a competency of wealth as expeditiously as possible, to return to their native country. Such views are inconsistent with patient industry, and with those extended interests that produce or support patriotism; and under the more liberal system which the company had now begun to pursue towards the colony, it was proposed to send out a hundred young women of agreeable persons and respectable characters, as wives for the settlers. Ninety were accordingly sent, and the speculation proved so profitable to the company, that a repetition of it was suggested to the emptiness of their exchequer in the following year, [1621,] and sixty more were collected and sent over. They were immediately disposed of to the young planters, and produced such an accession of happiness to the colony, that the second consignment fetched a better price than the first. The price of a wife was estimated first at a hundred and twenty, and afterwards at a hundred and fifty pounds of tobacco, of which the selling price was then three shillings per pound; and the subject of the transaction was held to impart its own dignity to the debt, which accordingly was allowed to take precedence of all other engagements.* The young women were not only bought with avidity, but received with such fondness, and so comfortably established, that others were invited to follow their example, and virtuous sentiments and provident habits spreading daily among the planters, enlarged the happiness and prosperity of the colony. To the blessings of marriage naturally succeeded some provision for the benefits of education. A sum of money had been collected by the English bishops by direction of the king, for the maintenance of an institution in Virginia for the christian education of Indian children; and in emulation of this good example, various steps were taken by the company towards the foundation of a colonial college, which was afterwards completed by William and Mary.

It is remarkable that the rise of liberty in America was nearly coeval with her first dispute with the government of the mother country, and that the earliest of those dissensions, which in a succeeding generation were destined to wrest America from England, occurred with a province long distinguished for the ardor of its loyalty to the English crown. With the increasing industry of the colony, the produce of its tobacco-fields became more than sufficient for the consumption of England, where its disposal, too, was severely hampered by the weak and unsteady counsels of the king, in granting monopolies for the sale of it, in limiting the quantities to be imported, in appointing commissioners "for garbling the drug called tobacco," with arbitrary powers to seize whatever portions of it they might consider of inferior quality, in loading the importation with a heavy duty, and, at the same time, encouraging the import of Spanish tobacco. The company, harassed by these vexatious regulations, had opened a trade with Holland, and established warehouses there, to which they sent their tobacco directly from Virginia; but the king interposed to prohibit such evasion of his revenue, and directed that all the Virginia tobacco should be brought in the first instance to England. A lengthened and acrimonious dispute arose between this feeble prince and the colonists and colonial company. Against the monopoly established in England, they petitioned the House of Commons; and in support of their right to trade directly with Holland, they both contended for the general privilege of Englishmen to carry their commodities to the best market, and pleaded the particular concessions of their charter, which expressly conferred on them unlimited liberty of commerce. At length, the dispute was adjusted by a compromise, by which the company obtained, on the one hand, the exclusive right of im-

* This year died Pocahontas. She had accompanied her husband on a visit to England, where her history excited universal interest, and the grace and dignity of her manner no less respect and admiration. Captain Smith introduced her to the queen, and her society was courted by the most eminent of the nobility. But the mean soul of the king regarded her with jealousy, and expressed alternate murmurs at Rolfe's presumption in marrying a princess, and alarm at the title that his posterity might acquire to the sovereignty of Virginia. Pocahontas died in the faith, and with the sentiments and demeanor of a Christian. She left a son by Mr. Rolfe, whose descendants in Virginia unite the blood of the old and new races of the inhabitants of America, Smith, B. iv. Stith, p. 142-6.

† This year was productive of an event more interesting to the feelings than to the fortunes of the people of America—the death of Sir Walter Raleigh. After a career of dazzling brilliancy, but not of unstained virtue, or unclouded popularity, he found in the severe affliction of his closing scene a remedy for the errors of his own character, and the envy and odium in which they had involved him: and the sunset of his life, guided by the pure and gentle light of religion, added the tender respect and compassion of mankind to the various sentiments which his history had excited. On the night before his execution he composed some beautiful lines on his approaching fate. Perhaps calmer contemplation of death was never evinced than in the passage where he prays that Heaven would

"Just at the stroke—when my veins start and spread—
Set on my soul an everlasting head."

It is pleasing to observe how the earlier historians of America claim kindred between him and their country, and blend with their narrative occasional reference to his fortunes and fate. When we consider the jealousy with which the king pursued him, it seems fortunate for America that his interests had so long been separated from hers.

* Rolfe, apud Smith, B. iv. Stith, p. 160—The Assembly, when they transmitted their own enactments to England, requested the general court to prepare a digest for Virginia of the laws of England, and to procure for it the sanction of the king's approbation, adding, "that it was not fit that his subjects should be governed by any other rules than such as received their influence from him."—Chalmers, p. 44.

† Stith, p. 167—Captain Smith observes, that since his departure from the colony, the number of felons and vagabonds transported to Virginia brought such evil report on the place "that some did choose to be hanged ere they would go thither, and were." Not long after the massacre in 1622, however, he remarks, that "there are more honest men now suitors to go, than ever have been constrained knaves." Many persons have been transported as felons to America whom no community would be ashamed to recognize as fellow citizens. The crews of the first squadron conducted by Columbus to America were partly composed of convicts, pardoned on condition of undertaking the voyage. In the reign of Charles II. before the voluntary emigration of the Quakers, a considerable number of these sectaries were transported as felons to America.

* Stith, p. 166, 197—A very different account has been transmitted to us of the first female emigration to Canada. About the middle of the seventeenth century the French Government sent out several ship loads of prostitutes to this province, as wives to the settlers. Though the demand was so pressing that they were all disposed of in less than fifteen days, the colonists showed more regard to virtue in selecting their mates than their government had done in assorting the cargo. The fattest, we are told, were in most request, being judged least active and volatile (consequently, it was hoped, most faithful), and best able to endure the cold.—Nouveaux Voyages de La Hontan, Vol. i. Lettre ii.

porting tobacco into the kingdom, and engaged, on the other, to pay an import duty of ninepence per pound, and to send all the produce of Virginia to England.

But a cloud had been for some time gathering over the colony, and even the circumstances that most forcibly indicated the growing prosperity of the planters were but inviting and enabling the storm to burst with more destructive violence on their heads. Externally at peace with the Indians, unapprehensive of danger, and wholly engrossed with the profitable cultivation of their fertile territory, their increasing numbers had spread so extensively over the province, that no less than eighty settlements had already been formed; and every planter being guided only by his own convenience or caprice in the choice of his dwelling, and more disposed to shun than to court the neighborhood of his countrymen, the settlements were universally straggling and uncompact. The Scriptures, which the colonists received as their rule of faith, bore ample testimony to the cruelty and treachery of mankind in their natural state; and their past experience might have convinced them that the savages by whom they were surrounded could claim no exemption from this testimony of Divine wisdom and truth. Yet the pious labors by which the evil dispositions of the Indians might have been overcome, and the military exercises and precautions by which their hostility might have been overawed or repelled, were equally neglected by the colonists, while, at the same time, they contributed to fortify the martial habits of the Indians by employing them as hunters, and enlarged their resources of destruction by furnishing them with fire-arms, which they quickly learned to use with dexterity. The marriage of Mr. Rolfe and Pocahontas had not produced as lasting a good understanding between the English and the Indians as it had at first seemed to betoken. The Indians eagerly courted a repetition of such intermarriages, and were deeply offended with the pride with which the English receded from their advances, and declined to become the husbands of Indian women. The colonists forgot that they had inflicted this mortification; but it was remembered by the Indians, who never forgot or forgave an affront. Numberless earnest recommendations had been transmitted from England to attempt the conversion of the savages; but these recommendations had not been enforced by a sufficient attention to the means requisite for their execution. Yet they were not wholly neglected by the colonists. Some attempts at conversion were made by a few pious individuals, and the success of one of them undoubtedly mitigated the dreadful calamity that was impending; but these efforts were feeble and partial, and the majority of the colonists had contented themselves with cultivating a friendly intercourse and intimate acquaintance with the Indians, who were admitted at all times into their habitations, and encouraged to consider themselves as familiar guests.* It was in the midst of this free and unguarded intercourse that the Indians formed, with cold and unrelenting deliberation, the plan for a general massacre of the English, which should involve every man, woman, and child in the colony in indiscriminate slaughter. The death of Powhatan, in 1618, devolved the power of executing a scheme so detestable into the hands of a man fully capable of contriving and maturing it. Opechancanough, who succeeded, not only to the supremacy over Powhatan's tribe, but to his influence over all the neighboring tribes of Indians, was distinguished by his fearless courage, his profound dissimulation, and a rancorous hatred and jealousy of the new inhabitants of America. He renewed the pacific treaty† which Powhatan had made, and faithfully kept, with the English after the marriage of Pocahontas to Mr. Rolfe; and he availed himself of the tranquillity it produced to prepare, during the four ensuing years, his friends and followers for the several parts they were to act in the tragedy he projected. The tribes in the neighborhood of the English, except those on the eastern shore, whom, on account of their peculiar friendship for the colonists—

he did not venture to intrust with the plan, were successively gained over; and all co-operated with that single-mindedness and intensity of purpose characteristic of a project of Indian revenge. In a tribe of savage idolaters, the passions of men are left unpurified by the influence of religion, and unrestrained by a sound or elevated morality; and human character is not subjected to that variety of impulse and impression which it undergoes in civilized society. The sentiments inculcated, and the dispositions contracted, in the family and in the tribe, in domestic education and in public life, in all the scenes through which the savage passes from his cradle to his grave, are the same; there is no contest of opposite principles or conflicting habits to dissipate his mind or weaken its determinations; and the system of morals (if it may be so called) which he embraces, being the offspring of wisdom and dispositions congenial to his own, a seeming dignity arises from the vigor and consistency of that conduct which his moral sentiments never disturb or reproach. The understanding, unoccupied by objects suitable to its dignity, and unemployed by variety of knowledge, instead of moderating the passions, becomes the instrument of their designs, and the abettor of their violence. Men in malice, but children in understanding; it is in the direction of cunning and dissimulation that the intellectual faculties of savages are chiefly exercised: and such is the perfect harmony between their passions and their reflective powers, that the same delay which would cool the cruelty of more cultivated men, serves but to confirm their ferocity, and mature the devices for its gratification. Notwithstanding the long interval that elapsed between the formation and the execution of their present enterprise, and the perpetual intercourse that subsisted between them and the white people, the most impenetrable secrecy was preserved; and so consummate and fearless was their dissimulation, that they were accustomed to borrow boats from the English to cross the river, in order to concert and communicate the progress of their design.

An incident which, though minute, is too curious to be omitted, contributed to sharpen the ferocity of the Indians by the sense of recent provocation. There was a man, belonging to one of the neighboring tribes, named Nemattanow, who, by his courage, craft, and good fortune, had attained the highest repute among his countrymen. In the skirmishes and engagements which their former wars with the English produced, he had exposed his person with a bravery that commanded their esteem, and an impunity that excited their astonishment. They judged him invulnerable, whom so many wounds seemed to have approached in vain; and the object of their admiration partook, or at least encouraged, the delusion which seemed to invest him with a character of sanctity. Opechancanough, the king, whether jealous of this man's reputation, or desirous of embroiling the English with the Indians, sent a message to the governor of the colony, to acquaint him that he was welcome to cut Nemattanow's throat. Such a representation of Indian character as this message conveyed, one would think, ought to have excited the strongest suspicion and distrust in the minds of the English. Though the offer of the king was disregarded, his wishes were not disappointed. Nemattanow, having murdered a planter, was shot by one of his servants in an attempt to apprehend him. Finding the pangs of death coming strong upon him, the pride, but not the vanity, of the savage was subdued, and he entreated his captors to grant his two last requests, one of which was that they would never reveal that he had been slain by a bullet, and the other, that they would bury him among the English, that the secret of his mortality might never be known to his countrymen. The request seems to infer the possibility of its being complied with, and the disclosure of the fatal event was no less imprudent than disadvantageous. The Indians were filled with grief and indignation; and Opechancanough inflamed their anger by pretending to share it. Having counterfeited displeasure for the satisfaction of his subjects, he proceeded with equal success to counterfeit placability for the delusion of his enemies, and assured the English that the sky should sooner fall than the peace be broken by him. But the plot now advanced rapidly to its maturity, and, at length, the day was fixed on which all the English settlements were at the same instant to be attacked. The respective stations of the various troops of assassins were assigned to them; and that they might be enabled to occupy them without exciting suspicion, some carried presents of fish and game into the interior of the colony, and others presented themselves as

guests soliciting the hospitality of their English friends, on the evening before the massacre. As the fatal hour drew nigh, the rest, under various pretences, and with every demonstration of kindness, assembled around the detached and unguarded settlements of the colonists; and not a sentiment of compunction, not a rash expression of hate, nor an unguarded look of exultation, had occurred to disconcert or disclose the designs of their well disciplined ferocity.

The universal destruction of the colonists seemed unavoidable, and was prevented only by the consequences of an event which perhaps appeared but of little consequence in the colony at the time when it took place—the conversion of an Indian to the Christian faith. On the night before the massacre, this man was made privy to it by his own brother, who communicated to him the command of his king and his countrymen to share in the exploit that would enrich their race with spoil, revenge, and glory. The exhortation was powerfully calculated to impress a savage mind; but a new mind had been given to this convert, and as soon as his brother left him he revealed the alarming intelligence to an English gentleman in whose house he was residing. This planter immediately carried the tidings to Jamestown, from whence the alarm was communicated to the nearest settlers, barely in time to prevent the last hour of the perfidious truce from being the last hour of their lives.

But the intelligence came too late to be more generally available. At midday, the moment they had previously fixed for this execrable deed, the Indians, raising a universal yell, rushed at once on the English in all their scattered settlements, and butchered men, women, and children with undistinguishing fury, and every aggravation of brutal outrage and enormous cruelty. In one hour, three hundred and forty-seven persons were cut off, almost without knowing by whose hands they fell. The slaughter would have been still greater if the English, even in some of those districts where the warning that saved others did not reach, had not flown to their arms with the energy of despair, and defended themselves so bravely as to repulse the assailants, who almost universally displayed a cowardice proportioned to their cruelty, and fled at the sight of arms in the hands even of the women and boys, whom, unarmed, they were willing to attack and destroy. If in this foul and revolting exhibition of humanity, some circumstances appear to be referable to the peculiarities of savage life and education, we shall greatly err if we overlook, in its more general and important features, the testimony it has given to the deep depravity of fallen nature. The previous massacre of the French protestants on the day of St. Bartholomew, and the subsequent massacre of the Irish protestants in 1641, present, not only a barbarous people, but a civilized nation and accomplished court, as the rivals of these American savages in perfidy, fury, and cruelty.

The colony had received a wound no less deep and dangerous, than painful and alarming. Six of the members of council, and many of the most eminent and respectable inhabitants, were among the slain; at some of the settlements the whole of their population had been exterminated; at others a remnant had escaped the general destruction by the efforts of despair; and the survivors were impoverished, terrified, and confounded by a stroke that at once bereaved them of friends and fortune, and showed that they were surrounded by legions of enemies, whose existence they had never dreamt of, and whose brutality and ferocity seemed to proclaim them a race of fiends rather than men.* To the massacre succeeded a vindictive and exterminating war between the English and the Indians; and the colonists were at last provoked to retaliate, in some degree, on their savage adversaries, the evils of which they had set so bloody an example, and which seemed to be the only weapons capable of waging effectual war upon them. Yet though a direful necessity might seem to justify or palliate the measures which it taught the colonists to apprehend and provide for, their warfare was never wholly divested of honor and magnanimity. During this disastrous period, the design for erecting a colonial college, and many other public institutions, was abandoned; the number of the settlements was reduced from eighty to six; and the affliction of scarcity was added to the horrors of war.†

* It was long before any of the British colonies were properly on their guard against the characters of men capable of such consummate treachery, and who "in anger were not, like the English, talkative and boisterous, but sullen and revengeful." *Trumbull's Connecticut*, i. 44.

† *Stith*, p. 219, 235, 238. As far as I am able to discover, the retaliatory deed practised by the colonists in their hostilities with the Indians has been greatly overrated. Through

* *Stith*, p. 210.—To the remonstrances of some persons in the colony against their worship of demons, some of the Indians of Virginia answered that they believed in two great spirits, a good and an evil one; that the first was a being sunk in the enjoyment of everlasting indolence and ease, who showered down blessings indiscriminately from the skies, leaving men to scramble for them as they chose, and totally indifferent to their concerns; but that the second was an active jealous spirit, whom they were obliged to propitiate that he might not destroy them—*Oldmixon*, i. 283.

† *Stith*, p. 155—Opechancanough, in imitation of the English, had built himself a house, and was so delighted with the contrivance of a lock and key, that he used to spend whole hours in the repetition of the experiment of locking and unlocking his door—*Oldmixon*, i. 238.

When intelligence of this calamity arrived in England, it excited, with much disapprobation of the defective policy and inefficient precautions of the company, a powerful sympathy with the danger and distress of the colonists. By order of the king, a supply of arms from the Tower was delivered to the treasurer and company; and vessels were despatched with cargoes of such articles as the exigency of the time seemed to render most pressing requisite. Captain Smith submitted to the company a project, which he offered to conduct, for effecting the restoration of peace by the expulsion or subjugation of the savages; but, though generally approved, it was not adopted. By dint of the exertions they made in their own behalf, with the assistance of the supplies that were actually sent to them from England, the colonists were barely saved from perishing with hunger; and it was not till after a long struggle with their calamities, that they were at length enabled again to resume their prospects and extend their settlements.*

More ample supplies, and more active assistance, would have been rendered to the colonists from England, but for the dissensions among the patentees, which had been spreading for a considerable period, and had at this juncture attained a height that manifestly tended to the dissolution of the corporation. The company was now a numerous body, and being composed of able and enterprising men drawn from every class in society, it represented very faithfully the state of party feeling in the nation; while its frequent courts afforded a convenient arena in which the parties tried their strength, and a powerful organ by which the prevailing sentiments were publicly expressed. At every meeting, the proceedings were impeded by the intrigues of rival factions, and the debates inflamed and lengthened by their vehement alterations. At every election, the offices of the company were courted and contested by the most eminent persons in the state. The distinction between the court party and the country party that was spreading through the nation, was the more readily insinuated into the councils of the company [1623] from the infrequency and irregularity of its more legitimate theatre, the parliament; and various circumstances in the history of the company tended to fortify and maintain this distinction. Many of the proprietors, dissatisfied with the slender returns that the colony had yielded, were disposed to blame the existing officers and administration for the disappointment of their hopes: not a few resented the procurement of the third charter, the exclusion of Captain Smith from the direction which he had shown himself so well qualified to exercise, and the insignificance to which they were themselves condemned by the arbitrary enlargement of the association; and a small but active and intriguing party, who had labored with earnest but unsuccessful rapacity, to engross the offices of the company, to usurp the direction of its affairs, and to convert the trade of the colony into their own private patrimony by monopolies which they bought from needy courtiers, naturally ranged themselves on the side of the court, and by their complaints and misrepresentations to the king and privy council, sought to interest them in the quarrels, and infect them with suspicions of the corporation. At the head of this least numerous but most dangerous faction, was the notorious Captain Argal, who continued to display a rancorous enmity to the liberty of the colony, and hoped to compass by intrigue and servility at home the same objects which he had pursued by tyranny and violence abroad. Sir Thomas Smith too, the treasurer, whose predilection for arbitrary government we have already had occasion to notice, encouraged every complaint and proposition that tended to abridge the privileges of the colony, and give to its administration a less popu-

lar form. The arbitrary alterations of the charter taught all the malcontents to look up to the crown for such further changes as might remove the existing obstructions to their wishes; and the complete ascendancy which the country party acquired in the company, strongly disposed the king to suppress or modify an institution that served to cherish public spirit and disseminate liberal opinions. The spirit which the company had displayed in their late dispute with him concerning the restrictions of their tobacco trade, the freedom with which his policy had been canvassed in their deliberations, the firmness with which his measures had been resisted, and the contempt they had shown for the supremacy alike of his wisdom and his prerogative in complaining to the House of Commons, eradicated from the mind of James all that partiality to an institution of his own creation, that might have sheltered it from the dislike and suspicion with which he regarded the influence of a popular assembly. But the same influence that rendered them odious, caused them also to appear somewhat formidable, and enforced some attention to equitable appearances, and deference to public opinion in wreaking his displeasure upon them. The murmurs and discontent that were excited by the intelligence of the massacre, furnished him with an opportunity which he did not fail to improve. Having signalled his own concern for the misfortunes of the colony by sending thither a supply of arms for defence against the Indians, and by issuing his orders to the company to despatch an ample supply of provisions, he proceeded to institute an inquiry into the cause of the disaster, and the conduct of the company. A commission was directed to certain of the English judges and other persons of distinction, requiring them to examine the transactions of the company since its first establishment, and to report to the privy council the causes that might seem to them to have occasioned the misfortunes of the colony, and the measures most likely to prevent their recurrence. To obstruct the efforts which the company might have made in their own vindication, and to discover, if possible, additional matter of accusation against them, measures still more violent and arbitrary were resorted to. All their charters, books, and papers, were seized, two of their principal officers were arrested, and all letters from the colony intercepted and carried to the privy council. Among the witnesses whom the commissioners examined was Captain Smith, who might reasonably be supposed to entertain little favor for the existing constitution of the company, by which his career of honor and usefulness had been abridged, and who had recently sustained the mortification of seeing his offer to undertake the defence of the colony and subjugation of the Indians disregarded by the company, notwithstanding the approbation of a numerous party of the proprietors. Smith ascribed the misfortunes of the colony, and the slenderness of the income that had been derived from it, to the neglect of military precautions; the rapid succession of governors, which inflamed the rapacity of their dependents; the multiplicity of offices, by which industry was loaded and emolument absorbed; and, in general, to the inability of a numerous company to conduct an enterprise so complex and arduous. He recommended the annexation of the colony to the crown, the introduction of greater simplicity and economy into the frame of its government, and an abandonment of the practice of transporting criminals to its shores†.

The commissioners did not communicate any of their proceedings to the company, who were first apprised of the terms of the report by an order of the king and privy council, signifying to them that the misfortunes of Virginia had arisen from their misgovernment, and that, for the purpose of repairing them, his majesty had resolved to revoke the old charter and issue a new one, which should commit the powers of government to fewer hands. In order to quiet the minds of the colonists, it was declared that private property should be respected, and all past grants of land remain inviolate. An instant surrender of their privileges was required from the company; and, in default of their voluntary submission, they were assured that the king had resolved to enforce his purpose by process of law‡.

* Smith, B. iv. Smith's answers to the commissioners demonstrate his usual good sense, moderation and humanity. He warmly commends the active and disinterested efforts of many of the leading members of the company for the advantage of the colony. Great errors, he observes, had been committed in the administration of its affairs; but he declines to particularise the faults of any one individual—adding, "I have so much ado to amend my own, I have no leisure to look into any other man's particular failings."

† Smith, p. 308, 304. It was in the midst of those distractions,

This arbitrary proceeding excited such surprise and consternation in the assembled court of proprietors, that a long and deep silence followed the reading of the order of council. But resuming their spirit, they proposed to defend their rights with a resolution which, if it could not avert their fate, at least redeemed their character. They indignantly refused to sanction the stigma affixed to their conduct by the order of council, to surrender the franchises which they had legally obtained, and on the faith of which they had expended large sums of money, or to consent to the abolition of a popular government, and deliver up their countrymen in Virginia to the dominion of a narrow junta dependent on the pleasure of the king. In these sentiments they persisted in spite of all the threats and promises by which their firmness was assailed; and by a vote, which only the dissent of Captain Argal and seven of his adherents rendered not quite unanimous, they finally rejected the king's proposal, and declared their determination to defend themselves against any process he might institute. [1624.] Incensed at their presumption in disputing his will, James directed a writ of *quo warranto* to be issued against the company, in order to try the validity of their charter in the King's Bench. In the hope of collecting additional proofs of their maladministration, he despatched commissioners to Virginia to inspect the state of the colony, and to endeavor to form a party there opposed to the pretensions of the company. The commissioners finding the colonial assembly embodied, endeavored with great artifice and magnificent promises of military aid, and other marks of royal favor, to detach them from their connexion with the company, and to procure an address to the king, expressive of "their willingness to submit themselves to his princely pleasure in revoking the ancient patents." But their endeavors were unsuccessful. The assembly transmitted a petition to the king, acknowledging their satisfaction to find themselves the objects of his especial care, beseeching him to continue the existing form of government, and soliciting, that if the promised military force should be granted to them, it might be subjected to the control of their own governor and house of representatives. This was the last assembly that Virginia was to enjoy for a considerable period. Its domestic legislation was marked by the same good sense and patriotism that appeared in the reception which it gave to the propositions of the royal commissioners. The governor was deprived of an arbitrary authority which he had hitherto exercised. It was enacted that he should no longer have power to withdraw the inhabitants from their private labor to his own service, and should levy no taxes on the colony but such as the general assembly should impose and appropriate. Various other wise and judicious laws were enacted, for the reformation of manners, the support of divine worship, the security of civil and political freedom, the regulation of traffic with the Indians, and the observance of precautions conducive to the general safety.

Whether the suit between the king and the company was prosecuted to an issue or not, is a point involved in some uncertainty, and truly of very little importance, for the issue of a suit between the king and the subject in that age, could never be doubtful for a moment. Well aware of this, the company looked to protection more efficient than the law could afford them, and presented a petition to the House of Commons, enumerating their grievances, and soliciting redress. Their application was entertained by the House so cordially, that had it been presented at an earlier period it might have saved the corporation; but they had deferred this last resource till so late a period of the session, that there was not time to enter on so wide an inquiry; and fearing to exasperate the king by preferring odious charges which they could not hope to substantiate, they confined their pleading before the House to the discouragement of their tobacco trade, which the Commons accordingly voted to be a grievance. They gained no other advantage from their complaint, nor from their limitation of it. The king enraged at their presumption, and encouraged by their timidity, issued a proclamation, suppressing the courts of the company, and committing the temporary administration of the colonial affairs to certain of his privy counsel-

tions, says Stith, that the Muses for the first time opened their lips in North America. One of the earliest literary productions of the English colonists was a translation of Ovid's *Metamorphoses*, composed in 1623 by George Sandys, treasurer of the Virginia company. It was afterwards published in England, and dedicated to Charles the First. Stith terms it "a laudable performance for the times;" and Dryden mentions the author with respect in the preface to his own translations from Ovid.

lors in conjunction with Sir Thomas Smith and some other gentlemen. The company was thus dissolved, and its rights and privileges re-absorbed by the crown.*

James did not suffer the powers he had resumed to remain long unexercised. He issued, very shortly afterwards, a special commission, appointing a governor and twelve counsellors, to whom the entire direction of the affairs of the colony was intrusted. No mention was made of a house of representatives; nor had the king the slightest intention to permit the continuance of any such body. The commission ascribes the disasters of the settlement to the popular shape of the late system, which had intercepted and weakened the beneficial influence of the king's superior understanding, and, in strains of the most vulgar and luscious self-complacency, anticipates the prosperity which the colony must rapidly attain when blessed with the direct rays of royal wisdom. With this subversion of liberty, there was mingled, however, some attention to the interests of the colonists; for, in consequence of the remonstrance of the English parliament, he issued a proclamation renewing his former prohibition of the culture of tobacco in England, and restricting the importation of it to Virginia and the Somer Isles, and to vessels belonging to British subjects. This was his last public act in relation to the colony; [1625] for his intentions of composing a code of laws for its domestic administration were frustrated by his death. He died the first British sovereign of an established empire in America, and closed a reign of which the only illustrious feature was the colonization which he impelled or promoted. To this favorite object, both the virtues and the vices of his character proved subservient. If the merit he might claim from his original patronage of the Virginian colonists, be cancelled by his subsequent efforts to bereave them of their liberties, and if his prosecution of the puritans in their native country be but feebly counterbalanced by his willingness to grant them an asylum in New England;—his attempts to civilize Ireland by colonization, connect him more honorably with the great events of his reign. Harassed by the turbulent and distracted state of Ireland, and averse to resort to military operations, he endeavored to infuse a new character into its population by planting colonies of the English in the six northern counties of that kingdom. He prosecuted this plan with so much wisdom and steadiness, that in the space of nine years he made greater advances towards the reformation of that kingdom than had been made in the four hundred and forty years that had elapsed since the conquest of it was first attempted, and laid the foundation of whatever affluence and security it has since been enabled to attain. It is difficult to recognise the dogmatical oppressor of the puritans and the weak and arrogant tyrant of Virginia, in the wise and humane legislator of Ireland. The experience of such inconsistencies of character, suggests the likelihood of their existing more frequently and extensively than they are displayed; enforces candor and indulgence; and abates the fervor both of inordinate dislike and extreme admiration.

The fall of the Virginia company had excited the least sympathy, and the arbitrary proceedings of the king the less odium in England, from the disappointments and calamities of which the settlement had been productive. More than a hundred and fifty thousand pounds had been expended on the colony, and upwards of nine thousand inhabitants had been sent to it from the mother country. Yet at the dissolution of the company, the value of the annual imports from Virginia did not exceed twenty thousand pounds, and its population was reduced to about eighteen hundred persons. The effect of this unprosperous issue in facilitating the overthrow of this corporation, may be regarded as a fortunate circumstance for America: for however unjust and tyrannical were the designs and proceedings of the king, they were overruled to the production of

a most important benefit to the colony, in the removal of an institution that would have dangerously loaded and restrained its growing freedom and prosperity. It is an observation of the most eminent teacher of political science, that of all the expedients that could possibly be contrived to stunt the natural growth of a new colony, the institution of an exclusive company is the most effectual; and the observation is amply confirmed by the experience of history. In surveying the constitutions and tracing the progress of the various colonial establishments which the nations of Europe have successively formed, we find a close and invariable connexion between the decline and the revival of their prosperity, and the ascendancy and overthrow of sovereign mercantile corporations. The administration of the Dutch and the English East India companies has demonstrated on a larger and distincter scale how inconsistent the genius of an exclusive company will always prove with the liberty and happiness of its subjects, and what powerful temptations, and not less powerful means, it possesses of sacrificing their lasting advantage to its own immediate profit. A sovereign company of merchants must ever consider their power but as an appendage to their trade, and as deriving its chief value from the means it gives them to repress competition, to buy cheaply the commodities they obtain from their subject customers, and to sell as dearly as possible the articles with which they supply them—that is, to diminish the incitement and the reward of industry to their subjects, by restricting their facility of acquiring what they need, and disposing of what they have. Their mercantile habits prevail over their interest as sovereigns, and lead them not only to prefer transitory profit to permanent revenue, but to adapt their administration to this preference, and to render government subservient to the interest of monopoly. They are almost necessarily led to devote a large discretionary power on their colonial officers, over whom they retain at the same time but a very feeble control. Whether we regard the introduction of martial law into Virginia as the act of the company, or (as it really seems to have been) the act of the treasurer and the colonial governors, the prevalence it obtained displays, in either case, the unjust and arbitrary policy of an exclusive company, or the inability of such a sovereign body to protect its subjects against the oppression of its officers. How incapable a body of this description must be to conduct a plan of civil policy on permanent principles, and how strongly its system of government must tend to perpetual fluctuation, is evinced by the fact, that, in the course of eighteen years, no fewer than ten successive governors had been appointed to preside over the province. Even after the vigorous spirit of liberty, which was so rapidly gaining ground in that age, had enabled the colonists to extort from the company the right of enacting laws for the regulation of their own community, still, as the company's sanction was requisite to give legal establishment to the enactments of the provincial legislature, the paramount authority resided with men who had but a temporary interest in the fate of their subjects and the resources of their territories. While, therefore, we sympathize with the generous indignation which the historians of America have expressed at the tyrannical proceedings by which the company was dissolved, we must congratulate their country on an event which, by the means that led to it, inculcated an abhorrence of arbitrary power, and by its operation overthrew a system under which no colony has ever grown up to a vigorous maturity.

Charles the First inherited, with his father's throne, [March] all the maxims that had latterly regulated his colonial policy. Of this he hastened to give assurance to his subjects, by a series of proclamations which he issued soon after his accession to the crown, and which distinctly unfolded the arbitrary principles he entertained, and the tyrannical administration he had determined to pursue. He declared, that, after mature deliberation, he had adopted his father's opinion, that the misfortunes of the colony had arisen entirely from the popular shape of its late administration, and the incapacity of a mercantile company to conduct even the most insignificant affairs of state; that he held himself in honor engaged to accomplish the work that James had begun; that he considered the American colonies to be a part of the royal empire devolved to him with the other dominions of the crown; that he was fully resolved to establish a uniform course of government through the whole British monarchy; and that henceforward the government of the colony of Virginia should immediately depend upon himself. But, unless we should suppose that he meditated even

then a violent innovation of the whole British constitution, we must conclude, from the provisions which follow this preamble, that he considered the colonies to stand in a very different relation to him from that which the territory of Great Britain enjoyed, and to have descended to him as a personal estate independent of his crown or political capacity. For he proceeded to declare, that the whole administration of the Virginian government should be vested in a council, nominated and directed by himself, and responsible to him alone. While he expressed the utmost scorn of the capacity of a mercantile corporation, he did not disdain to assume its liberal spirit, and copy its interested policy. As a specimen of the extent of legislative authority which he intended to exert, and of the purposes to which he meant to render it subservient, he prohibited the Virginians, under the most absurd and frivolous pretences, from selling their tobacco to any persons but certain commissioners appointed by himself to purchase it on his own account. Thus the colonists found themselves subjected to an administration that combined the vices of both its predecessors—the unlimited prerogative of an arbitrary prince, with the narrowest maxims of a mercantile corporation; and saw their legislature superseded, their laws abolished, all the profits of their industry engrossed, and their only valuable commodity monopolized, by the sovereign who pretended to have resumed the government of the colony only in order to blend it more perfectly with the rest of the British empire.

Charles conferred the office of governor of Virginia on Sir George Yeardley, and empowered him, in conjunction with a council of twelve, to exercise supreme authority there; to make and execute laws; to impose and levy taxes; to seize the property of the late company, and apply it to public uses; and to transport the colonists to England, to be tried there for offences committed in Virginia. The governor and council were specially directed to exact the oaths of allegiance and supremacy from every inhabitant of the colony, and to conform in every point to the instructions which from time to time the king might transmit to them. [1627.] Yeardley's early death prevented the full weight of his authority from being experienced by the colonists during his short administration. He died in the beginning of the year 1627, and, two years after, was succeeded by Sir John Harvey. During this period, and for many years after, the king, who seems to have inherited his father's prejudices respecting tobacco, continued to harass the importation and sale of it by a series of regulations so vexatious, oppressive, and unsteady, that it is difficult to say whether they excite greater contempt for the fluctuations and caprice of his counsels, or indignant pity for the wasted prosperity and insulted patience of his people.

[1629.] Sir John Harvey, the new governor, proved a fit instrument in Virginia to carry the king's system of arbitrary rule into complete execution. Haughty, rapacious, and cruel, he exercised an odious authority with the most offensive insolence, and aggravated every legislative severity by the rigor of his executive energy. So congenial was his disposition with the system he conducted, and so thoroughly did he personify, as well as administer, tyranny, as not only to enact, but to engross, in his own person, the odium of which a large share was undoubtedly due to the prince who employed him. Of the length to which he carried his arbitrary exactions and forfeitures, some notion may be formed from a letter of instructions by which the royal committee of council for the colonies in England at length thought it prudent to check his excesses. [July, 1634.] It signified, that the king, of his royal favor, and for the encouragement of the planters, desired that the interests which had been acquired under the corporation should be exempted from forfeiture, and that the colonists, "for the present, might enjoy their estates with the same freedom and privilege as they did before the recalling of the patent." We might suppose this to be the mandate of an eastern sultan to one of his bashaws; and indeed the rapacious tyranny of the governor seems hardly more odious than the cruel mercy of the prince, who interposed to mitigate oppression only when it had reached an extreme which is proverbially liable to inflame the wise with madness, and drive the patient to despair. The most significant comment on the letter is, that Harvey was neither censured nor displaced for the excesses which it commanded him to restrain. The effect, too, which it was calculated to produce, in ascertaining the rights and quieting the apprehensions of the colonists, was counterbalanced by large and vague grants of territory within the province, which Charles inconsider-

* It is stated by Chalmers, and repeated by Gordon, Robertson, and Marshall, that in the process of quo warranto, judgment was pronounced against the company in June, 1624. Robertson refers to the commission in August 1624, which no doubt contains a clause setting forth that the quo warranto had been issued, and adding, that the charter was now legally annulled. The same form of words occurs in the prior proclamation in July, 1624; but no judgment of the Court of King's Bench is either expressly mentioned or referred to. Captain Smith, on the other hand, after mentioning the writ of quo warranto, refers not to any judgment upon it, but to the proclamation in July, as having dissolved the company. B. iv. p. 168. Smith likewise asserts expressly, that this proclamation was issued while the quo warranto was depending, and that no judgment on the quo warranto was ever pronounced, p. 329, 330. It is very immaterial whether the king accomplished his arbitrary purpose by superseding or perverting the forms of law.

ately bestowed on his courtiers, and which gave rise to numerous encroachments on established possession, and excited universal distrust of the validity of titles, and the stability of property. The effect of one of these grants was the formation of the state of Maryland, by dismembering a large portion of territory that had been previously annexed to Virginia. For many years this event proved a source of much discontent and serious inconvenience to the Virginian colonists, who had endeavored to improve their trade by restricting themselves to the exportation only of tobacco of superior quality, and now found themselves deprived of all the advantage of this sacrifice by the transference of a portion of their own territory to neighbors who refused to unite in their regulations.

The restrictions prescribed by the letter of the royal committee, left Harvey still in possession of ample scope to his tyranny; and the colonists respecting, or overawed by, the authority with which he was invested, for a long time endured it without resistance. Roused, at length, by reiterated provocation, [1636.] and impatient of farther suffering, the Virginians, in a transport of general rage, seized the person of Harvey, and sent him a prisoner to England, along with two deputies from their own body, who were charged with the duty of representing the grievances of the colony and the misconduct of the governor. But their reliance on the justice of the king proved to be very ill founded. Charles was fated to teach his subjects, that if they meant to retain their liberties, they must prepare to defend them; that neither enduring patience nor respectful remonstrance could avail to relax or divert his arbitrary purpose; and that if they would obtain justice to themselves, they must deprive him of the power to withhold it. The inhabitants of Virginia had never irritated the king by disputing, like their fellow-subjects in England, the validity of his civil or ecclesiastical edicts; they had entered into no contest with him, and neither possessed forces nor pretended to privileges which could alarm his jealousy. They had borne extreme oppression (of which he had already evinced his consciousness) with long patience, and even when driven to despair, had shown that they neither imputed their wrongs to him nor doubted his justice. Defenceless and oppressed, they appealed to him as their protector; and their appeal was enforced by every circumstance that could impress a just, or move a generous mind. Yet so far from commiserating their sufferings, or redressing their wrongs, Charles regarded their conduct as an act of presumptuous audacity little short of rebellion; and all the applications of their deputies were rejected with calm injustice and inflexible disdain. He refused even to admit them to his presence, or to hear a single article of their charges against Harvey; and, having reinstated that obnoxious governor in his office, [1637.] he sent him back to Virginia, with an ample renewal of the powers, which he had so grossly abused. There, elated with his triumph, and inflamed with rage, Harvey resumed and aggravated a tyrannical sway that has entailed infamy on himself and disgrace on his sovereign, and provoked complaints so loud and vehement that they began to penetrate into England, and produce an impression on the minds of the people which could not be safely disregarded. It is in those scenes and circumstances in which men feel themselves entirely delivered from restraint, that their natural character most distinctly betrays itself. Enjoying absolute power over Virginia, Charles has inscribed his character more legibly on the history of that province, than of any other portion of his dominions.

[1638.] Had the government of Sir John Harvey been continued much longer, it must have ended in the revolt or the ruin of the colony. So great was the distress it occasioned, as to excite the attention of the Indians, and awaken their slumbering enmity by suggesting the hope of revenge. Opechancanough, the ancient enemy of the colonists, was now far advanced in years; but age had not dimmed his discernment, nor extinguished his animosity. Seizing the favorable occasion presented by the distracted state of the province, he again led his warriors to a sudden and furious attack, which the colonists did not repel without the loss of five hundred men. A general war ensued between them and all the Indian tribes under the influence of Opechancanough.

[1639.] But a great change was now at hand, which was to reward the patience of the Virginians with a bloodless redress of their grievances. The public discontents which had for many years been multiplying in England, were now advancing with rapid strides to a full maturity, and threatened the kingdom with some great convulsion. After a long intermission, Charles was forced

to contemplate the re-assembling of a parliament, and, well aware of the ill humor which his government at home had excited, he had the strongest reason to dread that the displeasure of the commons would be inflamed, and their worst suspicions confirmed, by complaints and descriptions of the despotism that had been exercised in Virginia. There was yet time to soothe the irritation, and even secure the adherence of a people who, in spite of every wrong, retained a generous attachment to the prince whose sovereignty was felt still to unite them with the parent state: and, from the propagation of the complaints of colonial grievances in England, there was every reason to apprehend that the redress of them, if longer withheld by the king, would be granted, to the great detriment of his credit and influence, by the parliament. To that body the Virginians had applied on a former occasion, and the encouragement they had met with increased the probability both of a repetition of their application and of a successful issue to it. These considerations alone seem to account for the sudden and total change which the colonial policy of the king now evinced. Harvey was recalled, and the government of Virginia committed to Sir William Berkeley, a person not only of superior rank and abilities to his predecessor, but distinguished by every popular virtue of which Harvey was deficient—of upright and honorable character, mild and prudent temper, and manners at once dignified and engaging. A change, not less gratifying, was introduced into the system of government. The new governor was instructed to restore the Colonial Assembly, and to invite it to enact a body of laws for the province, and to improve the administration of justice by introduction of the forms of English judicial procedure. Thus, all at once, and when they least expected it, was restored to the colonists the system of freedom which they had originally derived from the Virginia company; which had been involved in the same ruin with that corporation, and the recollection of which had been additionally endeared to them by the oppression that had succeeded its overthrow.—Universal joy and gratitude was excited throughout the colony by this signal and happy change; and the king, who, amidst the hostility that was gathering around him in every other quarter, was addressed in the language of affection and attachment by this people, seems to have been somewhat struck and softened by the generous sentiments which he had so little deserved; and which forcibly proved to him how cheap and easy were the means by which princes may render their subjects grateful and happy. And yet so strong were the illusions of his self-love, or so deliberate his artifice, that in his answer to an address of the colonists, he eagerly appropriated the praise for which he was indebted to their generosity alone, and endeavored to extend the application of their grateful expressions even to the administration which he had abandoned in order to procure them.

[1640.] While Charles thus again introduced the principles of the British constitution into the internal government of Virginia, he did not neglect to take precautions for preserving its connexion with the mother country, and securing to England an exclusive possession of the colonial trade. For this purpose Sir William Berkeley was instructed to prohibit all commerce with other nations, and to take a bond from the master of every vessel that sailed from Virginia, obliging him to land his cargo in some part of the king's dominions in Europe. Yet the pressure of this restraint was more than counterbalanced by the liberality of the other instructions; and with a free and mild government, which offered a peaceful asylum, and distributed ample tracts of land to all who sought its protection, the colony advanced so rapidly in prosperity and population, that at the beginning of the Civil Wars it contained upwards of twenty thousand inhabitants. [1641.] By the vigor and conduct of Sir William Berkeley, the Indian war, after a few expeditions, was brought to a successful close: Opechancanough was taken prisoner,* and a peace concluded with the savages, which endured for many years.

It was happy for Virginia that the restoration of its

* Beverley, p. 52, 53. It was the intention of Sir William Berkeley, to have sent this remarkable personage to England; but he was shot after being taken prisoner by a soldier, in resentment of the calamities he had inflicted on the province. He lingered under the wound for several days, and died with the pride and firmness of an old Roman. Indignant at the crowds who came to gaze at him on his death-bed, he exclaimed, "If I had taken Sir William Berkeley prisoner, I would not have exposed him as a show to the people." Perhaps he remembered that he had saved the life of Captain Smith, and forgot the numberless instances in which he had exposed other prisoners to public derision and lingering torture.

domestic constitution was accomplished in this manner, and not deferred till a later period, when it would probably have been accompanied by a restoration of the exclusive company. To this consummation some of the members of that body had been eagerly looking forward; and notwithstanding the disappointment that their hopes had sustained by the redress of those grievances which would have forced their pretensions, they endeavored to avail themselves of the avidity with which every complaint against the king was received by the Long Parliament, by presenting a petition in the name of the assembly of Virginia, praying for a restoration of the ancient patents and government. This petition, though supported by some of the colonists, who were justly dissatisfied with the discouragement which the puritan doctrines and the preachers of them, whom they had invited from Massachusetts,* had experienced from the government of Virginia, was, undoubtedly, not the act of the assembly, nor the expression of the prevailing sentiment in the colony. The assembly had tasted the sweets of unrestricted freedom, and were not disposed to hazard or encumber their system of liberty, by re-attaching it to the mercantile corporation from which it had been originally derived. No sooner were they apprised of the petition to the House of Commons than they transmitted an explicit disavowal of it; and at the same time presented an address to the king, acknowledging his bounty and favor to them, and desiring to continue under his immediate protection. In the fervor of their loyalty, they enacted a declaration [1642] "that they were born under monarchy, and would never degenerate from the condition of their births by being subject to any other government." The only misfortune attending the manner in which the Virginians had regained their liberties, was that it thus allied their partial regards to an authority which was destined to be overthrown in the approaching civil war, and which could no more reward than it deserved their adherence. During the whole of the struggle between the king and parliament in England, they remained unalterably attached to the royal cause; and after Charles the First had been beheaded, and his son driven out of the kingdom, acknowledged the fugitive prince as their sovereign, and conducted their government under a commission which he transmitted to Sir William Berkeley from Breda.† The royal family, though they had little opportunity, during their exile, [June, 1650.] of cultivating their interest in Virginia, were not wholly regardless of it. Henrietta Maria, the queen mother, obtained the assistance of the French government to the execution of a scheme projected by Sir William Davenant, the poet, of emigrating in company with a large body of artificers, whom he collected in France, and founding with them a new plantation in Virginia. The expedition was intercepted by the English fleet; and Davenant, who was taken prisoner, owed his safety to the friendship of Milton.‡

But the parliament having prevailed over all opposition in England, was not disposed to suffer its authority to be questioned in Virginia. Incensed at this open defiance of its power, it issued an ordinance, [October,] declaring that the settlement of Virginia having been founded by Englishmen and English money, and by the authority of the nation, ought to be subordinate to and dependent upon the English commonwealth, and subject to the legislation of parliament; that the colonists, instead of rendering this dutiful submission, had audaciously disclaimed the supremacy of the state, and rebelled against it; and that they were now therefore denounced as notorious robbers and traitors. Not only was all connexion prohibited with these refractory colonists, and the council of state empowered to send out a fleet and army to enforce their obedience to the authority of parliament, but all foreign states were expressly interdicted from trading with any of the English settlements in America. It might reasonably be supposed that this latter restriction would have created a common feeling throughout all the British colonies of opposition to the English government. But the colonists of Massachusetts were much more cordially united by similarity of political sentiments and religious opinions with the leaders of

* This transaction will form a part of the History of New England.

† Hume's England, vol. vii. p. 205. Chalmers, p. 122. This year a tract was published at London by one Edward Williams, recommending the culture of silk in Virginia.

Such 'twas the noble boldness of the muse
Did thy desire to seek new worlds infuse."

the commonwealth, than by identity of commercial interest with the inhabitants of Virginia. The religious views that had founded their colonial establishment, long regulated all its policy, and prevailed over every other consideration. And no sooner were the people of Massachusetts apprised of the parliamentary ordinance, than they hastened to enforce its prohibition of intercourse with Virginia, by a corresponding enactment of their own legislature.

The efforts of the parliamentary rulers of England were as prompt and vigorous as their declarations. They quickly despatched a powerful armament under the command of Sir George Ayscue to reduce all their enemies to submission. The commissioners whom they appointed to accompany the expedition were furnished with instructions which, if they reflect credit on the vigor of the parliament, convey a very unfavorable impression of their moderation and humanity. These functionaries were empowered to try, in the first instance, the efficacy of pardons and other peaceful propositions in bringing the colonists to obedience; but if these should prove ineffectual, they were then to employ every act of hostility to set free the servants and slaves of all the planters who continued refractory, and furnish them with arms to assist in the subjugation of their masters. Such a plan of hostility resembles less a war than a massacre, and suggests the painful reflection that an assembly, possessed of absolute power, and professing the glory of God and the liberty of mankind to be the chief ends for which they held it, never once projected the liberation of the negro slaves in their own dominions, except for the purpose of converting them into an instrument of bloodshed and conquest.

The English squadron, after reducing the colonies in Barbadoes and the other islands to submit to the commonwealth, entered the bay of Chesapeake. [1651.] Berkeley, apprised of the invasion, made haste to hire the assistance of a few Dutch ships which were then trading to Virginia, contrary both to the royal and the parliamentary injunctions, and with more courage than prudence prepared to oppose this formidable armament; but though he was cordially supported by the loyalists, who formed the great majority of the inhabitants, he could not long maintain so unequal a contest. Yet his gallant resistance, though unavailing to repel the invaders, enabled him to procure favorable terms of submission to the colony. By the articles of surrender, a complete indemnity was stipulated for all past offences; and the colonists, while they recognised the authority, were admitted into the bosom of the commonwealth, and expressly assured of an equal participation in all the privileges of the free people of England. In particular it was provided that the general assembly should transact as formerly the affairs of the settlement, and enjoy the exclusive right of taxation; and that "the people of Virginia shall have a free trade, as the people of England, to all places and with all nations." Berkeley disdained to make any stipulation for himself with those whom his principles of loyalty taught him to consider as usurpers. Without leaving Virginia, he withdrew to a retired situation, where he continued to reside as a private individual, universally beloved and respected, till a new revolution was again to call him to preside once more over the colony.

But it was the dependence and not the alliance of the colonies, that the rulers of the English commonwealth were concerned to obtain; and in their shameless disregard of the treaty concluded by their commissioners, they signally proved with how little equity absolute power is exercised even by those who have shown themselves most prompt to resent and most vigorous to resist the endurance of its excesses. Having succeeded in obtaining from the colonies a recognition of the authority which they administered, they proceeded to the adoption of measures calculated to enforce their dependence on England, and to secure the exclusive possession of their increasing commerce. With this view, as well as for the purpose of provoking hostilities with the Dutch, by aiming a blow at their carrying trade, the parliament not only forbore to repeal the ordinance of the preceding year, which prohibited commercial intercourse between the colonies and foreign states, but framed another law which was to introduce a new æra of commercial jurisprudence, and to found the celebrated navigation system of England. This remarkable law enacted that no production of Asia, Africa, or America, should be imported into the dominions of the commonwealth, but in vessels belonging to English owners or the inhabitants of the English colonies, and navigated by crews of which the captain and the majority of the sailors should be

Englishmen.* Willing at the same time to encourage the cultivation of the staple commodity of Virginia, the parliament soon after [1652.] passed an act confirming all the royal proclamations against planting tobacco in England.

This unjust and injurious treatment kept alive in Virginia the attachment to the royal cause, which was farther maintained by the emigrations of the distressed cavaliers, who resorted in such numbers to Virginia, that the population of the colony amounted to thirty thousand persons at the epoch of the restoration. But Cromwell had now prevailed [1653.] over the parliament, and held the reins of the commonwealth in his vigorous hands; and though the discontents of the Virginians were secretly inflamed by the severity of his policy and the invidious distinctions which it evinced, their expression was repressed by the terror of his name, and the energy which he infused into every department of his administration; and under the superintendence of governors appointed by him, the exterior, at least, of tranquillity was maintained in Virginia till the period of his death. Warmly attached by similarity of religious and political sentiments to the colonists of Massachusetts, Cromwell indulged them with a dispensation from the commercial laws of the Long Parliament, while he rigorously exacted their observance in Virginia. The enforcement of these restrictions on the obnoxious colonists, at a time when England could neither afford a sufficient market to their produce nor an adequate supply to their wants, and while Massachusetts enjoyed a monopoly of the advantages of which they were deprived, strongly impeached the magnanimity of the protector and the fearless justice by which he professed to dignify his usurped dominion, and proved no less burthensome than irritating to the Virginians. Such partial and illiberal policy subverts in the minds of subjects those sentiments which facilitate the administration of human affairs and assure the stability of government, and habituates them to ascribe every burden and restriction which views of public expediency may impose, to causes that provoke enmity and redouble impatience. In the minds of the Virginians it produced not only this evil habit, but other no less unfortunate consequences; for retorting the dislike with which they found themselves treated, and encountering the partiality of their adversaries with prejudices equally unjust, they conceived a violent antipathy against all the doctrines, sentiments, and practices that seemed peculiar to the puritans, and rejected all communication of the knowledge that flourished in Massachusetts, from hatred of the authority under whose shelter it grew, and of the principles to whose support it seemed to administer.† At length the disgust and impatience of the inhabitants of Virginia could no longer be restrained. [1658.] Matthews, the last governor appointed by Cromwell, died nearly at the same period with the protector; and the Virginians, though not yet apprized of the full extent of their deliverance, took advantage of the suspension of authority caused by the governor's demise; and having forced Sir William Berkeley from his retirement, unanimously elected him to preside over the colony.‡ Berkeley refusing to act under usurped authority, the colonists boldly erected the royal standard, and proclaimed Charles the Second to be their lawful sovereign; thus venturously adopting a measure which,

* Scobell's Acts, 1651, cap. 22. The germ of this famous system of policy occurs in English Legislation so early as the year 1381, when it was enacted by the statute of 5 Rich. II. cap. 3, "that to increase the navy of England, no goods or merchandizes shall be either exported or imported but only in ships belonging to the king's subjects." This enactment was premature, and soon fell into disuse. An act to revive it to a limited extent in 1460, was rejected by Henry the Sixth.

† The prejudices of an old cavalier who had acquired the habit, so general and inveterate in seasons of violent party contentions, of lumping his opinions and taking them in the gross, whether by assent to his friends or opposition to his adversaries, are displayed by Sir William Berkeley in a letter descriptive of the state of Virginia, some years after the Restoration. "I thank God," he says, "there are no free schools nor printing; and I hope we shall not have them these hundred years. For learning has brought heresy and disobedience and sects into the world, and printing has divulged them, and libels against the best government; God keep us from both!" Chalmers, p. 328.

‡ That Cromwell had meditated some important changes in Virginia, which death prevented him from attempting to realize, may be inferred from the publication of a small treatise at London, in the year 1657, entitled "Public good without private interest," written by Dr. Gaford and dedicated to the Protector. In this little work the Protector is advised to reform the numerous abuses extant in Virginia—the disregard of religion—the neglect of Education—and the fraudulent dealings of the planters with the Indians; on all which topics the author descends very forcibly. Of this treatise, as well as of the tracts by Hamer, and Williams, and some others, which I have had occasion to notice elsewhere, I found copies in the library of the late George Chalmers.

according to all appearances, involved a contest with the arms of Cromwell and the whole resources of England. Happily for the colony, the distractions that ensued in England deferred the vengeance which the ruling powers had equal ability and inclination to inflict upon it, till the sudden and unexpected restoration of Charles to the throne of his ancestors, [1660.] converted their imprudent temerity into meritorious service, and enabled them safely to exult in the singularity which they long mentioned with triumph, that they had been the last of the British subjects who had renounced and the first who had resumed their allegiance to the crown.

THE intelligence of the restoration soon reached America, and excited in the different colonies very different emotions. In Virginia, whose history we must still separately pursue, it was received like the surprising fulfilment of an agreeable dream, and hailed with acclamations of unfeigned and unbounded joy. These sentiments, confirmed by the gracious expressions of esteem and good-will* which the king very readily vouchsafed, excited hopes of substantial favor and recompense which it was not easy to gratify, and which were fated to undergo a speedy and severe disappointment. For a short time, however, the Virginians were permitted to indulge their satisfaction, and some of the proceedings of the first colonial assembly that was held after the restoration demonstrate that this event was by no means unproductive of important benefits to them. Trial by jury, which had been discontinued during the usurpation, was now again restored, and judicial proceedings were disencumbered of various abuses and considerably improved. It was enacted that no county should send more than two burgesses to the assembly; and that every district which should "people an hundred acres of land with as many titheable persons," should acquire the privilege of being represented in that body. The church of England was established by law: provision was made for its ministers; and none but those who had received their ordination from some bishop in England, and who should subscribe an engagement of conformity to the orders and constitutions of the established church, were permitted to preach either publicly or privately within the colony. A law was shortly after passed against the importation of quakers under the penalty of five thousand pounds of tobacco on the importers of them; but with a special exception of such quakers as might be transported from England for breach of the laws.

The same principles of government which prevailed in England during this reign constantly extended their influence, whether salutary or baneful, across the Atlantic; and the colonies, no longer deemed by the court the mere property of the prince, were recognized as extensions of the British territory, and considered as subject to parliamentary legislation. The strong declarations of the Long Parliament introduced principles which received the sanction of the courts of Westminster Hall, and were thus interwoven with the fabric of English law. In a variety of cases which involved this great constitutional point, the judges declared that by virtue of those principles of the common law which bind the territories to the state, the plantations were in all respects like the other subordinate dominions of the crown, and like them equally bound by acts of parliament when specially named, or when necessarily supposed within the contemplation of the legislature. The declarations of the courts of justice were con-

* Sir William Berkeley, who made a journey to England to congratulate the king on his restoration, was received at court with distinguished regard; and Charles, in honor of his loyal Virginians, wore at his coronation a robe manufactured of Virginian silk. Oldmixon.

This was not the first royal robe that America supplied. Queen Elizabeth wore a gown made of the silk grass, of which Raleigh's colonists sent a quantity to England. Coxe's Description of Carolina, p. 93.

firmed and enforced by the uniform tenor of the parliamentary proceedings; and the colonists soon perceived that although the Long Parliament was no more, it had faithfully bequeathed to its successors the spirit which influenced its commercial deliberations. The House of Commons determined not only to retain the commercial system which the Long Parliament had introduced, but to mature and extend it, to render the trade of the colonies completely subject to parliamentary legislature, and exclusively subservient to English commerce and navigation. No sooner was Charles seated on the throne, than they voted a duty of five per cent. on all merchandize exported from, or imported into, any of the dominions belonging to the crown: and the same session produced the celebrated *Navigation Act*, the most memorable statute in the English commercial code. By this statute (in addition to many other important provisions which are foreign to our present consideration), it was enacted that no commodities should be imported into any British settlement in Asia, Africa, or America, or exported from them, but in vessels built in England or the plantations, and navigated by crews of which the masters and three-fourths of the mariners should be English subjects, under the penalty of forfeiture of ship and cargo; that none but natural-born subjects, or such as had been naturalised should exercise the occupation of merchant or factor in any English settlement under the penalty of forfeiture of goods and chattels; that no sugar, tobacco, cotton, wool, indigo, ginger, or woods used in dyeing, produced or manufactured in the colonies, should be shipped from them to any other country than England; and to secure the observance of this regulation, the owners were required before sailing to give bonds with surety for sums proportioned to the rate of their vessels. The restricted articles have been termed *enumerated commodities*; and when new articles of colonial produce, as the rice of Carolina, or the copper ore of the northern colonies, were raised into importance and brought into commerce by the increasing industry of the colonists, they were successively added to the list, and subjected to the same regulations. As some compensation to the colonies for these commercial restraints, the parliament at the same time conferred on them the exclusive supply of tobacco, by prohibiting its cultivation in England, Ireland, Guernsey, or Jersey. The navigation act was soon after enlarged, and additional restraints imposed by a new law, [1663,] which prohibited the importation of European commodities into the colonies, except in vessels laden in England, and navigated and manned according to the provisions of the original statute. More effectual provision was made by this law for inflicting the penalties attached to the transgression of the navigation act; and the principles of commercial policy on which the whole system is founded were openly avowed in a declaration that, as it was the usage of other nations to keep the trade of their plantations to themselves, so the colonies that were founded and peopled by English subjects ought to be retained in firm dependence upon England, and made to contribute to her advantage in the employment of English shipping, the vent of English commodities and manufactures, and the rendering of England a staple, not only of the productions of her colonies, but also of such commodities of other countries as the colonies themselves might require to be supplied with. Advancing a step further in the prosecution of its encroaching policy, the parliament proceeded to tax the trade of the several colonies with each other; and as the act of navigation had left all the colonists at liberty to export the enumerated commodities from one settlement to another without paying any duty, this exemption was subsequently withdrawn, and they were subjected to a tax equivalent to what was levied on the consumption of these commodities in England.

The system pursued and established by these regulations, of securing to England a monopoly of the trade of her colonies by shutting up every other channel which competition might have formed for it, and into which interest might have caused it preferably to flow, excited the utmost disgust and indignation in the minds of the inhabitants of the colonies, and was justly denounced by them as a manifest violation of the most sacred and undoubted rights of mankind. In England it was long applauded as a master-piece of political sagacity, enforced and cherished as a main source of opulence and power, and defended on the plea of that expediency which its supposed advantages were held so abundantly to demonstrate. But the philosophy of political science has amply refuted this illiberal doctrine, and would long ago have corrected the views and

amended the institutions which it was thought to sanction, but that, from the prevalence of various jealousies, and of those obstinate and passionate prepossessions that constitute wilful ignorance, the effects of philosophy have much more frequently terminated in the production of knowledge merely speculative, than exercised any visible operation in the improvement of human conduct, or the increase of human happiness. Nations, biassed by enmities to their neighbors, as well as partialities to themselves, have suffered an illiberal jealousy of other states to contract the views they have formed of their own interests, and to induce a line of policy of which the operation is to procure a smaller portion of exclusive gains, in preference to a larger contingent in the participation of a general advantage. Too gross sighted to use, or too passionate to feel, the bonds that connect the interests of all the members of the great family of mankind, they have accounted the exclusion of their rivals equivalent to an extension of the advantages reserved to themselves; committing herein the same error that pervades the policy of slave owners, and leads them to suppose that, to inflict depression and privation on others, is, by necessary consequence, to enhance their own elevation and enrichment. In such mistaken policy nations are apt to be confirmed by the interested representations of the few who contrive to extract a temporary and partial advantage from every abuse, however generally pernicious; and if, in spite of the defects of its policy, the prosperity of the country should be increased by the force of its natural advantages, this effect will be eagerly ascribed to the very causes that abridge, though they may be insufficient to prevent it. The discoveries, however, which the cultivation of political science has yielded, have in this respect confirmed the dictates of religion, and demonstrated that, in every transaction between nations and individuals, the intercourse most solidly and lastingly beneficial to both and each of the parties, is that which is founded on the principles of a fair reciprocity and mutual subservience; that an indisposition to regard the interests of others, implies a narrow and perverted view of our own; and that to do as we would be done by, is not less the maxim of prudence than the precept of piety. So coherent must true philosophy ever be with the dictates of Divine wisdom. But unfortunately this coherence has not always been recognised even by those philosophers whose speculations have tended to its display; and confining themselves to reasonings, sufficiently clear and convincing, no doubt, to persons contemplating human affairs in the simplicity and disinterested abstraction of theoretical survey, they have neglected to enforce the acceptance of important truths by reference to those principles that derive them from Divine wisdom, and connect them with the strongest sanctions of human duty.

They have demonstrated* that a parent state by restraining the commerce of her colonies with other nations, depresses the industry and productiveness both of the colonies and of foreign nations; and hence, by enfeebling the demand of foreign purchasers, which must be proportioned to their ability, and lessening the quantity of colonial commodities actually produced, enhances the price of the colonial produce to herself as well as to the rest of the world, and so far diminishes its power to increase the enjoyments and augment the industry of her own citizens as well as of other states. Besides, the monopoly of the colony trade produces so high a rate of profit to the merchants who carry it on, as to attract into this channel a great deal of the capital that would, in the natural course of things, be directed to other branches of trade: and in these branches, the profits must consequently be augmented in proportion to the diminished competition of the capitals employed in them. But whatever raises in any country the ordinary rate of profit higher than it otherwise would be, necessarily subjects that country to great disadvantage in every branch of trade of which she has not the monopoly. Her merchants cannot obtain this higher profit without selling dearer than they

otherwise would do, both the commodities of foreign countries which they import into their own, and the goods of their own country which they carry abroad. The country thus finds herself frequently undersold in foreign markets; and the more so, because in foreign states much capital has been forced into these branches by her exclusion of foreigners from her colonial trade, which would have absorbed a part of them. Thus, by the operation of a monopoly of the colonial trade, the parent state obtains an overgrowth of one branch of distant traffic, at the expense of diminishing the advantages which her own citizens might derive from the produce of the colonies, and of impairing all those other branches of nearer trade which, by the greater frequency of their returns, afford the largest and most beneficial excitement to the industry of the country. Her commerce, instead of flowing in a great number of small channels, is taught to run principally in one great conduit; and hence the whole system of her trade and industry is rendered less secure.

But the injurious consequences of this exclusive system are not confined to its immediate operation upon trade. The progress of our history will abundantly show that the connexion which a parent state seeks to maintain with its colonies by the aid of such a system, carries within itself the principles of its own dissolution. During the infancy of the colonies, a perpetual and vexatious exertion is required from the parent state to enforce and extend her restraining laws, and endeavors no less unremitting are made by the colonies to obstruct or elude their operation. Every rising branch of trade which is left for a time, or for ever, free to the colonists, serves by the effect of contrast, to render more visible the disadvantages of their situation in the regulated branches; and every extension of the restrictions affords an occasion of renewed discontent. As the colonies increase their internal strength, and make advances in the possession and appreciation of national consequence, the disposition of their inhabitants to emancipate themselves from such restraints, is combined with ability to effect their deliverance, by the very circumstances, and at the very period, which will involve the trade of the parent state in the greatest loss and disorder. And the advantages which the commerce of other nations must expect from the destruction of the monopoly, unites the wishes of the whole world with the revolt of the colonies, and gives assurance of the most powerful assistance to effect it.

A better apology for the system which England adopted towards her colonies, than the boasted expediency of her measures would thus appear to supply, may be derived from the admitted fact, that her policy on the whole was much less illiberal and oppressive than that which any other nation of Europe has ever been known to pursue. While the foreign trade of the colonies was restrained, for the supposed advantage of the parent state, whose prosperity they partook, and by whose power they were defended, their internal liberty was suffered to grow up under the shelter of wise and liberal institutions; and even the commercial restrictions imposed on them were much less rigorous and injurious than the colonies of France, Spain, Portugal, and Denmark, were compelled to undergo from their respective parent countries. The trade of the British settlements was not committed, according to the practice of some of these states, to exclusive companies, nor restricted, according to the practice of others, to a particular port; but, being left free to all the subjects, and admitted to all the harbors of England, employed a body of British traders too numerous and dispersed to admit of their superseding mutual competition, and uniting in a general confederacy to oppress the colonies and extort exorbitant profits to themselves. This apology is obviously very unsatisfactory, as every attempt to palliate injustice must necessarily be. It was urged with a very bad grace by the people of England, and utterly disregarded by the inhabitants of America.

In none of the American colonies did this oppressive system excite greater indignation than in Virginia where the larger commerce and pre-eminent loyalty of the people rendered the pressure of the burden more severe, and the infliction of it more exasperating*. No sooner was the navigation act

* Smith's *Wealth of Nations*, B. iv. cap. 7. The eminent philosopher of whose reasoning I have endeavored to present a condensed view in this paragraph of the text, is particularly obnoxious to the charge of not merely neglecting, but wilfully suppressing, the recognition of that confirmation which divine testimony derives from an enlarged view of human interests, sentiments, and actions. In the first edition of his "Theory of Moral Sentiments," he could not refrain from avowing the coherence which he plainly observed between the doctrines of divine revelation, and the sentiments of men in all ages and nations on the subject of sacrifice and foreign intercession. Part II. § 2. ad finem. But, misled by science falsely so called, he expunged this passage from the subsequent editions of the work.

* It was to Virginia alone that Montesquieu's justiciary principle of the system of restricted trade could be considered as in any degree applicable. "It has been established," says this writer, "that the mother country alone shall trade in the colonies, and that from very good reason, because the design of the settlement was the extension of commerce, and not the foundation of a city, or of a new empire." *Spirit of Laws*, B.

known in Virginia, and its effects experienced, than the colony warmly remonstrated against it as a grievance, and petitioned earnestly for relief. But, although the English monarchs were accustomed at this period to exercise a dispensing power over the laws;—in so much that when the court at a later period ventured to adopt a plan of arbitrary government, even the act of navigation itself, so great a favorite with the nation, was suspended for a while by an exertion of this stretch of prerogative; yet, during the early period of his reign, Charles, unassured of the stability of his throne, and surrounded by ministers of constitutional principles, was compelled to observe the limits of a legal administration, and to interpose his authority for the enforcement even of those laws that were most repugnant to his principles and wishes*. So far from lending a favorable ear to the petition over Virginia, Charles and his ministers adopted measures for carrying the act into strict execution. Intelligence having been received that its provisions were almost as generally disregarded as detested, and that the colonial authorities were not prompt to enforce what they saw as so disagreeable to the persons of whom they presided, instructions were issued to the governors of the settlements, reprimanding them for the "neglects, or rather contempt," which the law had sustained, and enjoining their future attention to its rigid enforcement; and in Virginia, in particular, demonstration was made of the determined purpose of the English government to overcome all resistance to the act, by the erection of forts on the banks of the principal rivers, and the appointment of vessels to cruise on the coast. But, notwithstanding the threatening measures employed to overawe them, and the vigilance with which they were watched, the Virginians contrived to evade the law, and to obtain some vent to the accumulating stores of their depreciated produce by a clandestine trade with the settlement of the Dutch on Hudson's river. The relief, however, was inconsiderable, and the discontents, inflamed by the hostilities which the frontier Indians now resumed, began to spread so widely as to inspire some veteran soldiers of Cromwell, who had been banished to Virginia, with the hope of rendering themselves masters of the colony, and delivering it from the yoke of England. A conspiracy, which has received the name of *Birkhead's Plot*, was formed for this purpose; but, having been detected before the design was ripe, it was easily suppressed by the prudence of Sir William Berkeley, and with no farther bloodshed than the execution of four of the conspirators.

The distress of the colony continuing to increase with the increasing depreciation of tobacco, now confined almost entirely to one market, and the augmentation of the price of all foreign commodities, now derivable only from the supplies which one country could furnish, various efforts were made from time to time by the colonial assembly for the relief of their constituents. Retaliating to some extent the injustice with which they were treated, it was enacted by a colonial law, that in the payment of debts, country creditors should have the priority, and that all courts of justice should give precedence in judgment to contracts made within the colony. Acts were passed for restraining the growth of tobacco; and attempts were made to introduce a new staple, by encouraging the plantation of mulberry trees and the manufacture of silk; but neither of these designs was successful. [1666.] Numerous French protestant refugees being attracted to Maryland by the naturalization act which that settlement passed in their favor in the year 1666, the Virginian assembly endeavored to recruit the wealth and population of its territories from this source, by framing, in like manner, a series of laws which empowered the governor to confer on aliens taking the oath of allegiance all the privileges of naturalization;†

xxi. cap. 17. This was in some measure true as to Virginia, though its first charter professes more enlarged designs; but it was not true as to New England, Maryland, or the other posterior settlements of the English.

* When the parliament, in 1666, introduced the unjust and violent act against the importation of Irish cattle into England, the king was so much struck with the remonstrances of the Irish people against this measure, that he not only used all his interest to oppose the bill, but openly declared that he could not give his assent to it with a safe conscience. But the commons were resolute, and the king was compelled to submit. "The spirit of tyranny," says Hume, "of which nations are as susceptible as individuals, had extremely animated the English to exert their authority over their dependent state." vii. 448.

† It was not till after the Revolution of 1688 that the population of Virginia received any accession from the influx of these or other foreigners. In 1671, Sir William Berkeley thus de-

but it was provisionally subjoined, that this concession should not be construed to vest aliens with the power of exercising any function which they were disabled from performing by the acts of the English parliament relative to the colonies. This prudent reference to a restriction which the colonial letters of naturalization must inevitably have received from the common law, was intended to guard against the losses and disputes which might ensue from the attempts of the naturalized aliens to infringe the navigation act. But the precaution was unavailing; and at an after period many forfeitures of property were incurred, and much vehement dispute created, by the traffic which aliens in the colonies carried on under the authority of general letters of denization granted to them by the ignorance or inattention of the royal governors. Their pretensions, though flatly opposed to the acts of navigation, were supported by the American courts of justice, but uniformly disallowed by the English government, which, after repeatedly enforcing the principle that the acts of a provincial legislature cannot operate against the general jurisprudence of the empire, at length prohibited the granting of farther denizations.

The discontents in Virginia, so far from being abated by the lapse of time, were maintained by the constant pressure of the commercial restrictions, and the repeated attempts to provide more effectually for their enforcement. Various additional causes concurred to inflame the angry feelings of the colonists; and a considerable native population having now grown up in Virginia, the discontents of these persons were no way abated by the habitual regard and fond remembrance which emigrants retain for the parent state which is also the land of their individual nativity. The defectiveness of their instruction,* prevented the influence of education from acting in this respect as a substitute to experience; and they knew little of England beyond the wrongs which they heard daily imputed to her injustice. The Indian hostilities, after infesting the frontiers, began to penetrate into the interior of the province; and while the colonists were thus reduced to defend their property at the hazard of their lives, the most alarming apprehensions of the security of that property were created by the large and imprudent grants which the king, after the example of his father, very lavishly accorded to the solicitations of his favorites. [1673.] The fate of that parent had warned him to avoid, in general, rather the arrogance that provoked, than the injustice that deserved it; and, in granting these applications, without embarrassing himself by any inquiry into their merits, he at once indulged the indolence of his disposition, and exerted a liberality that cost him nothing that he cared for. These grants were not only of such exorbitant extent as to be unfavorable to the progress of cultivation, but, from ignorance or inaccuracy in the definition of their boundaries, were frequently made to include tracts of land that had already been planted and appropriated. Such a complication of exasperating circumstances brought the discontents of the colony to a crisis. In the beginning of the year 1675, two slight insurrections, which were rather explosions of popular impatience than the consequence of matured designs, were easily suppressed by the prudence and vigor of the governor, but gave significant intimation of the state and the tendency of public feeling in Virginia. In the hope of averting the crisis, and obtaining redress of the more recent grievances which were provoking and maturing it, the assembly despatched deputies to England,

scribes the state of its population.—"There are in Virginia above 40,000 persons, men, women, and children; of which there are 2,000 black slaves, 6,000 christian servants for a short time, and the rest have been born in the country, or have come in to settle, or serve, in hope of bettering their condition in a growing country. Yearly, we suppose, there come in of servants about 1,500, of which most are English, few Scotch, and fewer Irish; and not above two or three ships of negroes in seven years." Answers to the Lords of the Committee of Colonies, apud Chalmers, 3. 327. The numerous importations of servants mentioned by Sir William Berkeley were probably checked by the troubles that preceded and attended Bacon's Rebellion. The later importations were more available than the earlier ones; the diseases of the country having diminished in frequency and violence as the woods were progressively cut down. The mortality among the new comers, we learn from Sir William Berkeley, was at first enormous, but had become very trifling prior to 1671.

* We have seen Sir William Berkeley, with the prejudice of a cavalier, boast of the absence of the seditious influence of learning, but a few years prior to those violent disturbances by which Virginia was peculiarly distinguished. The commonwealth party, and especially those who were termed Puritans, though reproached as the enemies of literature, were in reality its most successful cultivators, and most zealous patrons. The reproach has been clearly refuted, and their claims ably and successfully vindicated by the Rev. Mr. Orme, in his Life of Dr. John Owen.

who, after a tedious negotiation with the king and his ministers, had brought matters to the point of a happy adjustment, when their expectations were frustrated and the proceedings suspended by intelligence of a formidable rebellion in the colony. [1676.] A tax which had been imposed by the assembly to delay the expense of the deputation, had irritated the discontents which the deputation was intended to compose; and when the dilatory proceedings of the English government, who disdained to allow the intelligence of past insurrections, or the apprehensions of future rebellion, to quicken, their diligence, seemed to confirm the assurances of the factious leaders of the colonists, that even their last sacrifice had been thrown away, the tide of rage and disaffection began again to swell to the point of rebellion. It did not long wait for additional provocation to excite, or an able leader to impel, its fury. For, to crown the colonial distress, the war with the Susquehanna Indians, which had continued to prevail notwithstanding all the governor's attempts to suppress it, now burst forth with redoubled rage, and threatened a formidable addition of danger, hardship, and expense. Even the popularity of their long-tried and magnanimous friend, Sir William Berkeley, was overcast by the blackness of this cloud of calamities. The spirit and fidelity with which he had adhered to the colony through every variety of fortune, the earnestness with which he had remonstrated with the English government against the commercial restraints, and the disinterestedness he had shown in declining, during the unprosperous state of the colonial finances, to accept the addition which the assembly had made to his emoluments, were disregarded, denied, or forgotten. To his age and incapacity were attributed the burdens of the people, and the distractions of the times; and he was loudly accused of wanting alike honesty to resist the oppressions of the mother country, and courage to repel the hostility of the savages. Such ungrateful injustice is rarely, if ever, evinced by the people, but when the insidious acts of factious leaders have imposed on their credulity and inflamed their passions. The populace of Holland, when, a few years before this period, they tore in pieces their benefactor John De Witt, were not only terrified by the progress of their national calamities, but deluded by the profligate retainers of the Orange party. To similar influence (and in similar circumstances) were the Virginians now exposed from the artifice and ambition of Nathaniel Bacon.

This man had been trained to the profession of the law in England, and, only three years before this period, had emigrated to Virginia. This short interval had sufficed to advance him to a conspicuous situation in the colony, and to indicate the disposition and talents of a popular leader. The consideration he derived from his legal attainments, and the esteem he acquired by an insinuating address, had quickly procured him a seat in the council, and the rank of colonel in the militia. But his temper was not accommodated to subordinate office, and, unfortunately, the discontents of the colony soon presented him with a sphere of action more congenial to his character and capacity. Young, sanguine, eloquent, and daring, he mixed with the malcontents, and, by his vehement harangues on the grievances under which they labored, he inflamed their passions and attracted their favor. He was implicated in the insurrection of the preceding year, and had been taken prisoner, but pardoned by the governor, but less affected by the clemency, than encouraged by the impunity which he had experienced, and sensible that the avenue to legitimate promotion was forever closed against him, he determined to cast in his lot with the malcontent party, and, taking advantage of their present excitation, he now again came forward, and addressed them with artifice which their un instructed understandings were unable to detect, and eloquence which their untamed passions rendered utterly irresistible. Finding that the sentiments most prevalent with his auditory were the alarm and indignation excited by the Indian ravages, he boldly charged the governor with neglect or incapacity to exert the vigor that was requisite for the general safety; and, having expatiated on the facility with which the whole Indian race might be exterminated, he exhorted them to take arms in their own defence, and accomplish the deliverance they must no longer expect from any other quarter. So acceptable was this address and its author to the disposition of the popular mind, that his exhortation was instantly complied with, and his main object no less successfully effected. A great multitude proceeded to embody themselves for an expedition against the Indians, and, electing Bacon to be their general,

committed themselves to his direction. He assured them, in return, that he would never lay down his arms till he had avenged their sufferings and redressed their grievances. To give some color of legitimacy to the authority he had acquired, and, perhaps, expecting to precipitate matters to the extremity which his interest required that they should speedily reach, he applied to the governor for an official confirmation of the popular election, and offered instantly to march against the common enemy. Berkeley, suspecting his real designs, though it prudent to temporise, and try the effect of negotiation; but he had to deal with a man whose own artifice kept him on his guard against the snares of others, and who was well aware that promptitude and resolute perseverance alone could extricate him with safety or credit from the dangers of his situation. Pressed for an answer, and finding that the applicants were not to be soothed by his conciliating demeanor, Berkeley issued a proclamation, commanding the multitude, in the king's name, to disperse immediately under the pains of rebellion.

Bacon, no more disconcerted by the vigor of this address than he had been duped by the negotiation that preceded it, instantly marched to Jamestown, at the head of six hundred of his followers, and surrounding the house where the governor and assembly were engaged in their deliberations, he demanded the commission which his proceedings and retinue showed how little he either needed or regarded. Berkeley, undismayed by the dangers that environed him, clearly perceived his inability to resist the force of the insurgents, and yet disdained to yield to their pretensions. Confronting with invincible courage the men who had charged him with defect of that virtue, he peremptorily commanded them to depart, and, when they refused, he presented his breast to their weapons, and calmly awaited the last extremity of their rage. But the council, more considerate of their own safety, and fearful of driving the multitude to despair, hastily prepared a commission, by which Bacon was appointed captain-general of all the forces of Virginia, and, by dint of the most earnest entreaty, at length prevailed with the governor to subscribe it. The insurgents having rewarded their acquiescence with insulting acclamations, retired in triumph; and the assembly no sooner felt themselves delivered from the immediate presence of danger, then, passing from the extreme of timidity to the height of presumption, they voted a resolution annulling the commission they had granted, as extorted by force, denouncing Bacon as a rebel, commanding his followers to deliver him up, and summoning the militia to arms in defence of the constitution. They found too little difficulty in prevailing with the governor to confirm, by his sanction, this indiscreet assumption of a vigor which they were totally incapable of maintaining. The consequences might have been easily foreseen. Bacon and his army, flushed with their recent triumph, and incensed at this impotent menace, which they denounced as the height of baseness and treachery, returned immediately to Jamestown, and the governor, unsupported by any effective force that could cope with the insurgents, retired across the bay to Accomack, on the eastern shore. Some of the councillors accompanied him thither; the rest retired to their own plantations; the frame of the colonial administration seemed to be dissolved, and Bacon took unresisted possession of the vacant government.

The authority which he had thus acquired by the vigor of his proceedings, Bacon employed with great address to add strength and reputation to his party. To give to this usurped jurisdiction the appearance of a legal establishment, he called a convention of the gentlemen of the country, and prevailed with a numerous body of them to pledge themselves by oath to support his authority and resist his enemies. A declaration was published, in the name of this body, setting forth that Sir William Berkeley had wickedly fomented a civil war among the people, and that, after thus violating his trust, he had abdicated the government, to the great astonishment of the country; that the general had raised an army for the public service, and with the public approbation; that the late governor having, as was reported, falsely informed the king that the general and his followers were rebels, and advised his majesty to send forces to subdue them, the welfare of the colony and their true allegiance to his most sacred majesty equally required that they oppose and suppress all forces whatsoever, till the king be fully informed of the true state of the case by such persons as should be sent to him by Nathaniel Bacon, to whom in the interim all the inhabitants were required to take an oath of alle-

giance. It was remarked by the wise, that this declaration, which might have been expected to display the genuine cause of the revolt, mentioned none of the original subjects of discontent; and, hence, they justly suspected that the leader of the insurgents had designs of his own, to which the discontents of his followers were merely subservient, which extended beyond the temporary precaution of hostilities with the Indians, and had already suggested to him a specious plea, on which he proposed to involve the colony in a war with the forces of the mother country. Yet, such was the spirit of the times, and the sympathy with resistance to every branch of an administration which Charles was daily rendering more and more odious and suspected, that, when this declaration was made known in England, it met with many advocates among the people, and even within the walls of that parliament whose injustice formed the only grievance that Virginia had yet to complain of.

Sir William Berkeley, in the mean time, having collected a force from levies among the planters who remained well affected to him, and from the crews of the English shipping on the coast, commenced a series of attacks on the forces of the usurper, and several sharp encounters ensued between the parties with various success. All the horrors of civil war began to descend on the colony. Jamestown was reduced to ashes by the insurgents; the estates of the loyalists were pillaged, their friends and relatives seized as hostages, and the richest plantations in the province were laid waste. The governor was compelled, by the rage of his own partisans, to retaliate these extremities, and even to execute some of the insurgents by martial law; and the animosity of both parties was rapidly mounting to a pitch that threatened a war of mutual extermination. The superiority of the insurgent force had hitherto confined the efforts of the loyalists in the field to mere skirmishing engagements; but the tidings of an approaching armament, which the king had despatched from England under Sir John Berry, to the assistance of the governor, gave promise of a wider range of carnage and desolation. Charles had issued a proclamation, declaring Bacon, a traitor and the sole promoter of the insurrection; granting pardon to all his followers who should forsake him, and offering freedom to all slaves who would assist in suppressing the revolt. However elated the loyalists might be with the intelligence of the approaching succor, the leader of the insurgents was no way dismayed by it; and his influence over his followers was unbounded. Conscious now that his power and his life were indissolubly connected, he determined to encounter whatever force might be sent against him. He was aware, at the same time, of the importance of striking a decisive blow while the advantage of numbers remained with him; and with this view having enlarged his resources by proclaiming a general forfeiture of the property of all who either opposed his pretensions or even affected neutrality, he was preparing to take the field, when his career was arrested by that Power which restrains the remainder of human wrath, and can wither in an instant the uplifted arm of the destroyer. Happily for his country, and to the manifest advantage not less of his followers than his adversaries, Bacon unexpectedly sickened and died. [1677.]

How entirely this extraordinary man had been the soul of his party, was strikingly evinced by the effect of his death on their sentiments and proceedings. The bands of their confederacy seemed to be cut asunder by the loss of their general, and no successor even attempted to re-unite them. To their sanguine hopes and resolute adherence to Bacon, succeeded mutual distrust and universal despondency; eagerness for battle, and dreams of conquest, gave place to an earnest concern to secure their own safety, and effect an accommodation with the ancient government; and, after a short treaty they laid down their arms, and submitted to Sir William Berkeley, on condition of receiving a general pardon. Thus suddenly and providentially was dissipated a tempest that seemed to portend the inevitable ruin of Virginia. From the man whose evil genius excited and impelled its fury, this insurrection has been distinguished by the name of *Bacon's Rebellion*. It placed the colony for seven months in the power of that daring usurper, involved the inhabitants during all that period in bloodshed and confusion, and was productive of a devastation of property to the extent of at least a hundred thousand pounds.* To the mother country it conveyed a les-

son which she appears never to have understood till the loss of her colonies illustrated its meaning, and the consequence of disregarding it. For, after every allowance for the ability and artifice of Bacon, it was manifest that his influence had been originally derived from the general discontent and irritation occasioned by the commercial restrictions; and it required little sagacity to foresee that these sentiments would be rendered more inveterate and more formidable by the growth of the province, and by the increased connexion and sympathy with the other colonial settlements, which the lapse of time and the habitual consciousness of common interests and grievances would infallibly promote. Had Bacon been a more honest and disinterested leader, this lesson would perhaps have been more clearly expressed, and the rebellion, it is probable, would not have ended with himself. But, instead of sincerely embracing the cause of his associates, he contrived to render their passions subservient to his own ambitious purposes. The assertions of the interests of Virginia were thus converted into the partizans of an individual; and when his presence and influence were withdrawn, they perceived at once that they were embarked in a contest which to themselves had neither interest nor object.

No sooner were the insurgents disbanded, and the legitimate government restored than Sir William Berkeley convened the colonial assembly, to assist, by its deliberations, in the re-establishment of public order. The acts of this assembly have received from some writers the praise of moderation, which, no doubt, they must be admitted to evince in a degree no less honorable than surprising, if we confine our attention to the circumstance of its having met but a few weeks after Bacon's death, when the memory of insults and injuries was recent, when the passions of the parties were yet warm, and the agitations of the contest had barely subsided. By others, they have been loaded with a reproach which they plainly appear to deserve, when we recollect that they were infractions of the treaty with the insurgents. Still, with all their imperfections, they will be admitted by every one who is acquainted with the history of civil commotions, to form a finer model than the records of any other people have ever transmitted of the moderation of a successful party in a civil war. Bacon, and a few of his principal officers, who had perished in the contest, were attainted; none of the survivors of the party were punished capitally, but a few of the more noted of them were subjected to fines and disabilities; and with these exceptions, the promise of general indemnity was confirmed by law. An attainder of the dead seems an arrogant attempt of human power to extend its arm beyond the bounds of life, to invade with its vengeance the inviolable dominion of the grave, and to reclaim to the jurisdiction of delegated authority and fallible judgment the offender, who has already been removed by the act of Sovereign Power to abide the decree of its infallible justice. It was probably resorted to on this occasion in order to assert the vindictive power of the law, without infringing the indemnity that had been stipulated to the insurgents. But, in England, it was regarded as an act of sovereignty beyond the competence of a subordinate legislature, and held to be void from defect of power; and all the other acts of the assembly in relation to the insurgents were disallowed by the king as derogatory to the terms of his proclamation. The attainder, however, was afterwards re-enacted, by passing a bill to that effect, which was framed in England, and transmitted under the great seal to the colonial assembly.

The tardy aid which had been detached from England to the defence of the colonial government, did not reach Virginia till after the complete re-establishment of tranquillity. With the fleet arrived Colonel Jefferys, appointed by the king to signify the royal and succeed to the office of Sir William Berkeley, who now closed in peace an administration of nearly forty years; and shortly after, closing his life, may be said to have died in the service of Virginia. This gallant and honorable man was thus spared the mortification of beholding the injustice with which the royal authority was soon after employed to blacken his fame, and to weaken all those sentiments of loyalty in the colony which it

the causes and circumstances of this rebellion, differing materially from that which I have adopted, very discreditably to Sir William Berkeley, and proportionably favorably to Bacon, occurs in the Appendix to the first volume of Williamson's History of North Carolina. But it is opposed by all existing evidence, supported by none, and strongly impeached by its own manifest improbability. Williamson's dislike of Sir William Berkeley was probably occasioned by the very unfavorable opinion which Berkeley had expressed of the planters of North Carolina at this period.

* Beverley, 70—70. Oldmixon, i. 250—257. Modern Universal History, xli. 358. Sir William Keith's History of Virginia, p. 156—161. Chalmers, 332—335. 336. An account of

had been the great object of his wishes, and in no small degree the effect of his administration, to cultivate and maintain. Holding all the principles of an old cavalier; endowed with a character well formed to recommend his principles; and presiding in a colony where the prevailing sentiments of the people were congenial with his own, he had hoped to make Virginia an asylum where the loyalty that was languishing in Europe might be renovated by transmigration into a young and growing body politic, and expand to a new and more vigorous majority. But this was not the destination of the provinces of America. Strongly infected with the prejudices of his age and party, Berkeley was always more willing to make the most generous exertions for a people who committed their interests to his protection, than to enlighten them with the knowledge that would have enabled them more justly to appreciate and more extensively to administer those interests themselves. The naked republican principle that substitutes the respect and approbation of citizens to their magistrate, in place of the reverence and attachment of subjects to their sovereign, was held by all the cavaliers in utter abhorrence; and a more favorable specimen of the opposite principle which they maintained, and of that mixed system of opinion and sentiment which it tended to produce, will not easily be found than in the administration of Sir William Berkeley. The courageous regard he demonstrated for the people, not only excited their grateful admiration, but recommended to their esteem the generous loyalty to his king with which it was in his language and demeanor inseparably blended; and while he claimed their sympathy with his loyalty to their common sovereign, he naturally asserted his own share in the sentiment as the delegate of the crown. The exalted distinction which he thought due to rank and office, he employed to give efficacy to prudence, moderation, and benevolence; and tempering the dignity of aristocratical elevation with the kindness of a patriarch and the mild courtesy of a gentleman, his administration realized that elegant resemblance which many have preferred to more real and substantial equality: as there are many who confess that they find politeness more gratifying than solid benefaction. He was a wise legislator, as well as a benevolent and upright magistrate; and we are informed by the editor of the laws of Virginia, that the most judicious and most popular of them were framed by Sir William Berkeley. When his death was made known, and he was no longer an object of flattery or of fear, the assembly recorded the sentiments which the colony entertained of his conduct in the grateful declaration "that he had been an excellent and well deserving governor;" and earnestly recommended his widow to the justice and generosity of the king.* Happily perhaps for themselves, the bosom of the king was quite a stranger to any such sentiments; and his administration was calculated to dispel instead of confirming the impressions of cavalier loyalty, and to teach the Virginian colonists that the object of their late governor's homage was a very worthless idol, and the animating principle of his political creed a mere illusion of his own generous imagination.

The most remarkable event that distinguished the government of Colonel Jefferys was the conclusion of the Indian war, which had raged so long, and contributed, with other causes, to the production of the late rebellion, by a treaty which gave universal satisfaction. This too was the only act of his administration that was attended with consequences so agreeable. Jefferys, together with Sir John Berry and Colonel Moryson, had been appointed commissioners to inquire into, and report on, the causes of Bacon's rebellion. They commenced their inquiries with an avowed prepossession in favor of the insurgents, and conducted them with the most indecent partiality. The temptations which their office presented to magnify the importance of their labors, by new and striking discoveries, and to prove, by censure of the late administration, that they had not been appointed its arbiters in vain, co-operated, no doubt, to produce the malignity and injustice which they displayed in a degree that would otherwise seem quite unaccountable. Instead of indemnifying, or even applauding, they discountenanced the

loyalists who had rallied in the time of danger round the person of the governor; and, having invited all the persons who had been engaged in the insurrection to come forward and state their grievances without fear, and unequivocally demonstrated the favorable acceptance which such representations might expect, they revived in the colony all the angry passions that had been so happily composed, and collected a mass of senseless and inconsistent complaints which had never been uttered before, and which they compiled into a body of charges against Sir William Berkeley and his council.* While their folly or malignity thus tended to rekindle the dissensions of the colonists, their intemperance involved them in a dispute that united all parties against themselves. Having violently taken the records of the assembly out of the hands of its clerk, the house, incensed at this insult, demanded satisfaction from Jefferys; and when he appealed to the authority of the great seal of England, under which the commissioners acted, they declared to him, in language worthy of the descendants of Englishmen, and the parents of Americans, "that such a breach of privilege could not be commanded under the great seal, because they could not find that any king of England had ever done so in former times." The spirit of the assembly will appear the more commendable if we consider that a body of regular troops, the first that had ever been sent to Virginia, were now stationed in the colony under the command of Sir John Berry. Informed of this proceeding, the king, in strains that rival the arrogance of his father and grandfather, commanded the governor "to signify the royal indignation at this seditious declaration, and to give the leaders marks of the royal displeasure." Berry and Moryson soon after returned to England, leaving the colony in a state of ferment, and all parties disgusted and disappointed.

To the other causes of discontent, was added the burden of supporting the soldiery, who receiving no remittances of pay from England, lived at free quarters upon the inhabitants. Their impatience, however, was mitigated by the friendly and prudent demeanor of an aged officer, and venerable man, Sir Henry Chicheley, to whom, as lieutenant governor, the administration devolved on the death of Jefferys: [1678.] and as, during his presidency, the large and improvident grants of the crown that had been so much complained of were recalled, and some other grievances corrected, a short gleam of prosperity was shed on the colony, and an interval of comparative repose gave the people time to breathe before the resumption of tyranny with a violence which was to endure till the era of the revolution.

It was not to the intentions of the king that the colonists were indebted for the mild administration of Sir Henry Chicheley. Charles had sometime before conferred the government on Lord Culpepper, who though very willing to accept the important office, showed so little readiness to perform the duties of it, that it was not till he had been reprimanded by the king for his neglect, that he at length made his voyage to Virginia. [1680.] His administration was conducted with the same arbitrary spirit that the royal government had now begun to exercise without control in the mother country. Having wrested from the assembly the nomination of its own most confidential officer, the secretary who kept its journals; having abolished the power it had hitherto exercised of arbitrating appeals from the decisions of the provincial judicatories; and having endeavored to silence all complaint of his tyranny by establishing a law that prohibited, under the severest penalties, all disrespectful speeches against the governor or his administration, he returned, after a very short stay in Virginia, to enjoy in England the money he had contrived to divert from the revenues of the colonial government. Yet on this ignoble lord did the king confer the commission of governor for life, and a salary twice as large as the emoluments of Sir William Berkeley. The irritation which his proceedings had created, sharpened the sense of the hardships which the colonists were now enduring from the depressed price of tobacco; and at length the public impatience exploded in a tumultuary attempt to destroy all the new tobacco plantations that threatened to increase the depression of price by multiplying still farther the quantities of produce. [1682.] The insurrection might have proceeded to very serious extremities, if the prudence and vigor of Sir Henry Chicheley had not again

been exerted to compose the public discontent, and preserve the peace of the colony. To a mind influenced by liberal justice, or susceptible of humane impressions, this short and feeble insurrection was powerfully recommended to an indulgent consideration. It was but a momentary expression of popular impatience created by undoubted suffering; and the earnest, though ineffectual addresses by which the assembly had recently solicited from the king a prohibition of the increase of tobacco plantations, had both suggested and seemed to sanction the object to which the violence of the rioters was directed. But to the king it appeared in the light of an outrage which his dignity could not suffer to pass without a severe vindictive retribution; and Lord Culpepper, again obeying the royal mandate to proceed to Virginia, caused a number of the insurgents to be tried for high treason; and by a series of bloody executions diffused that terror which tyrants denominate tranquillity. Having thus enforced a submission, no less unpropitious to the colony than the ferment which had attended his former departure, Lord Culpepper again set sail for England, where he was immediately ordered into confinement for returning without leave; and on a charge of misappropriating the colonial revenues, was shortly after arraigned before a jury, and in consequence of their verdict, deprived of his commission.

In displacing this nobleman, it was the injury done to himself, and not the wrongs of the colony, that Charles intended to redress. The last act of his royal authority, of which Virginia was sensible, was the appointment of a successor to Culpepper, in Lord Edlingham, [1683.] whose character was very little, if at all, superior, and whom, among other instructions, he expressly commanded to suffer no person within the colony to make use of a printing press on any occasion or pretence whatsoever. Along with the new governor was sent a frigate, which was appointed to be stationed on the coast for the purpose of enforcing a stricter execution of the navigation act than that obnoxious measure had yet been able to obtain.

[1685.] On the death of Charles the Second, his successor, James, was proclaimed in Virginia with demonstrations of joy, expressive less of the acquaintance of the colonists with the character of their new sovereign, than of that impatient hope with which men, under the pressure of extreme discontent, are ready to hail any change as desirable. Acclamations much more expressive of hope and joy had attended the commencement of the preceding reign; and if the hopes that were entertained on the present occasion were more moderate, they were not on that account the less fallacious. The colonists soon learned with regret, that in his first parliament James had procured the imposition of a tax on the consumption of tobacco in England; and in imploring the suspension of this tax, which threatened still farther to depreciate their only commodity, they descended to an abjectness of entreaty which produced no other effect than to embitter their disgust with the consciousness of unavailing degradation. Though the assembly was compelled to present an address of felicitation to the king on the defeat of Monmouth's invasion of England, the colonists found an opportunity of indulging very different sentiments on that occasion in the kindness with which they treated those of the insurgents whom James, from a satiety of bloodshed, which he termed the plenitude of royal mercy, appointed to be transported to the plantations; and even the assembly paid no regard to the significance of the royal desire that they should frame a law to prevent these unfortunate persons from redeeming themselves from the servitude to which they had been consigned. This conduct, however, of the colonists and their assembly, in so far as it was not prompted by simple humanity, indicated merely their dissatisfaction with the king's treatment of themselves, and proceeded from no participation of their wishes or opinions in the designs of Monmouth. The general discontent was increased by the personal character of the governor, through whom the rays of royal influence were transmitted. Lord Edlingham, like his predecessor, engrafted the vices of a sordid disposition on the arbitrary administration which he was appointed to conduct. He instituted a court of chancery, in which he himself presided as judge; and, besides multiplying and enhancing the fees attached to his own peculiar functions, he condescended to share with the clerks the meaner perquisites of ministerial offices. For some time he contrived to stifle the remonstrances which his extortions produced, by arbitrary imprisonment and other severities; but at length, the public displeasure became so general and uncontrollable, that he found it impossible

* Chalmers, p. 336, 7. Preface to Moryson's Edition of the Laws of Virginia. Life of Sir William Berkeley. The very great portion of this eminent person's life which was identified with the history of the colony will seem to excuse, I hope, the length of this allusion to his interesting character. The only reference I have observed in his expressions to the state of religion in the colony, or to his own sentiments thereupon, occurs in his answers to the Lords of the Committee of Colonies, where he says, "Our ministers are well paid, and by my consent should be better if they would pray oftener and preach less." Chalmers, p. 328.

* The memory of Sir William Berkeley was defended against the misrepresentations of the commissioners, by his brother Lord Berkeley (Chalmers, p. 350), and his fame suffered no diminution from their report.

to prevent the complaints of the colony from being carried to England, for which country he in consequence resolved himself to embark, in order to be present at his own arraignment. [1688.] He was accompanied by Colonel Ludwell, whom the assembly had appointed their agent to advocate the complaints of his conduct and urge his removal.

But before the governor and his accuser arrived in England, the revolution which the tyranny of James at length provoked in that country, had transferred the allegiance of all parties to new sovereigns. The Virginians, though they readily acquiesced in the change, appear to have surveyed with very little emotion, an event which coincided with none of their anticipations, and to the production of which their concurrence had never been demanded. Whatever might be its remote consequences, its immediate effect was forcibly to remind them of their own insignificance, as the appendages of a distant empire, whose political changes they were fated to follow, but unable to control. The most deep-seated and lasting grievances under which they labored having proceeded from the nation and the parliament, were such as the present event gave no promise of mitigating. Their immediate complaints were to be submitted to sovereigns of whom they knew absolutely nothing; and their late experience had abated their trust in princes, and their hope from changes of royalty. The coolness, then, with which the Virginians are said to have regarded the great event of the English revolution, so far from implying that their minds were not touched with a sense of freedom, may, with much greater probability, be referred to the ardor with which they cherished a regard for liberty, and the deliberate reflection with which they combined it. In some respects, too, the acts of the new government were very little calculated to convey to them more satisfactory impressions of the change that had taken place, or to excite their sympathy with the feelings of that portion of their fellow-subjects by whose exertions it had been effected. Notwithstanding the representations of Colonel Ludwell (who himself was gratified with the appointment of governor of Carolina.) King William, unwilling, and perhaps unable, to dispossess such of the officers of the old government as were willing to transfer their personal and official service to the new, continued Lord Effingham in the government of Virginia; but he never returned thither again, and as long as his commission was suffered to endure, the administration was conducted by a deputy governor. He was removed in the year 1692, and replaced by a successor still more obnoxious to the colonists, Sir Edmund Andros, whose tyrannical proceedings under the late reigns, in the government of other American provinces, more justly merited a capital punishment than continuance in office. If such appointments remind us that the English ministry was still composed of many of the persons who had dispensed patronage in the preceding reigns, they may also in part be accounted for by other considerations. Of the officers who were thus undeservedly retained, some pretended to great local experience and official ability. This was particularly the case with Sir Edmund Andros, whose administration proved highly beneficial to Virginia. And they excused the arbitrary proceedings they had conducted in the former reigns, by pleading the authority of the sovereign whose command they had obeyed—a plea which always finds favor with a king, when not opposed to wrongs which he deems personal to himself. Besides, the complaints of the colonists were not always accurate; for anger is a more copious than discriminating accuser. Justice suffered, as usual, from the passion and partiality with which it was contended for; and the guilty artfully availed themselves of the undiscerning rage they had provoked in their accusers, to defeat or enfeeble the charges they preferred. The insolence and severity, for example, that had pervaded the whole of Lord Effingham's government, had produced many representations of grievances in which the accusers had either neglected or been unable to discriminate between the legality of official acts, and the tyrannical demeanor or malignant motives of the party by whom they had been performed. Accordingly, while some of the remonstrances which the Virginians transmitted to England by Colonel Ludwell were complied with, there were others that produced only explanations, by which the Assembly was given to understand that it had mistaken certain points of English constitutional law.*

* Beverley, p. 90, 91, 94, 96. Chalmers, 347, 8, 359. One of the grievances complained of by the assembly of Virginia was, that Lord Effingham having, by a proclamation, declared the royal dissent to an act of assembly which repealed a former law, gave notice that the abrogated law was now in force. This was erroneously deemed by the assembly an act of legislation.

In the infancy of a free state, collisions and disputes not unfrequently arise from the discordant claims of the different branches of its constitution, before time has given consistence to the whole, and those limits which reason finds it difficult to assign to the respective parts, have been determined by the convenience of practice and the authority of precedent.

The revolution of the British government, both in its immediate and its remote operation, was attended with consequences highly beneficial to Virginia, in common with all the existing states of America. Under the patronage, and by the pecuniary aid, of William and Mary, the college which had been projected in the reign of James the First was established. The political institutions under which the manly character of Englishmen is formed, had already been planted in the soil to which so large a portion of their race had migrated: the literary and religious institutions, by which that character is refined and improved, were now, in like manner, transported to Virginia; and a fountain opened within her own territory which promised to dispense to her children the streams of science and the water of life.

But the most certain and decisive influence which the British revolution exercised on the condition of the colonies, consisted in the abridgment and almost total overthrow of their dependence on the personal character of the sovereign. A conservative principle was infused by this great event into the British constitution at home, and into all the shoots from the parent stem that had been planted in the settlements abroad. The permanence and the supremacy which the parliament acquired in Britain, extended the constitutional superintendence of this body to every subordinate organ of popular privileges; and if in the oppression of their trade, the provinces of America still continued to feel the harsh dominion, in the security of their legislative constitutions they now began to experience the powerful protection of the strong. The king still continued to appoint the governors of Virginia and of some of the other settlements; and men of sordid dispositions and of weak or profligate character were frequently the objects of this branch of the royal patronage. But the powers of these officers were abridged and defined; and the influence of the colonial assemblies was able to restrain, and even overawe, the most vigorous administration of the executive functionaries. Whatever evil influence a wicked or artful governor might exert on the harmony of the people among themselves, or their good will towards the authority which he represented, he could commit no serious inroad on the constitution of the province over which he presided. From this period an equal and impartial policy distinguished the British dominion over the American provinces: the diminution of the personal influence of the sovereign put an end to the inequalities of treatment that were produced by the different degrees of favor with which he regarded the religious or political sentiments of the people of the respective states, and consequently extinguished, or at least greatly abated, the jealousies they had hitherto entertained of each other. A farther abatement of the mutual jealousies of the states was produced by the religious toleration which the provincial governments were henceforward compelled to observe. Even when intolerant statutes were permitted to subsist, their enforcement was disallowed; and the principles cherished in one state could no longer be persecuted in another.

We have now to transfer our inquiries to the rise of the other colonies in North America which were founded antecedently to the British Revolution, and to trace their separate progress till that era. But before withdrawing our undivided attention from this, the earliest of the settlements, I shall subjoin a few particulars of its civil and domestic condition at the period at which we have now arrived.

Notwithstanding the unfavorable circumstances to which the colony had been exposed in a greater or less degree ever since the Restoration, the number of its inhabitants had continued to increase. The deputies that were sent to Charles the Second in 1675, represented the population to amount, at that time, to 50,000 persons. If their statement were not exaggerated (as I think it probably was) we must suppose that Bacon's rebellion, and the subsequent tyranny, gave a very severe check to this rapid increase; for I think there is no reason to suppose that the colony contained a much greater number than 50,000 at the Revolution of 1688.* From a table appended to the first edition of

* Dr. Robertson, indeed, states the population of Virginia at the Revolution to have exceeded 60,000 persons, and professes to derive his statement from Chalmers. But the refer-

Beverley's History, it appears, that, in 1703, the population of Virginia (exclusive of 800 French refugees sent over by King William) amounted to 60,606 souls. Of this number, 20,023 were *theftables* (a denomination embracing all white men above the age of sixteen, and all negro slaves, male and female, above that age), and 35,583 children of both races, and white women. Many circumstances contributed to give free scope to the increase of the colonial population, and to counterbalance the influence of commercial restraint and despotic administration. The healthfulness of the settlement had greatly increased; and the diminution of disease not only shut up the drain that had been originally created by a frequent mortality, but rendered the general strength more available to the general support. The use of tobacco now prevailed extensively in Europe; and the diminution of its price was in some degree compensated by the increased demand for it. In 1671 it was computed, that, on an average, 80 vessels came annually from England and Ireland to Virginia for tobacco. In 1675 there were exported from Virginia above 23,000 hogsheads of tobacco, and in the following year upwards of 2000 more. In this latter year the customs on tobacco from Virginia and Maryland, collected in England, amounted to 135,000*l*. Sir William Berkeley rates the number of the militia, in the year 1681, at nearly 8000, and adds, that the people were too poor to afford an equipment of cavalry. In the year 1680 the militia amounted to 8568, of whom 1300 served as cavalry. Our estimate, however, of the increased wealth which the cavalry establishment seems to indicate, must be abated by the consideration of the increased exertions which the Indian war and Bacon's rebellion had rendered necessary. In the year 1703, we learn from Beverley, that the militia amounted to 9522, of whom 2363 were light horse, and the remainder foot and dragoons; and that, as few of the planters were then destitute of horses, it was considered that the greater part of them might, if necessary, be converted into dragoons. In 1722 he calculates the numbers of the militia at 18,000 men. Every freeman (a denomination embracing all the inhabitants except the slaves and the indented servants) from sixteen to sixty years of age, was enrolled in the militia; and as the people were accustomed all their lives to shoot in the woods, they were universally expert in the use of firearms. The militia was commanded by the governor, whose salary was 1000*l*. a year, till the appointment of Lord Culpepper, who, on the plea of peerage, procured it to be doubled.

The twelve councillors, as well as the governor, were appointed by the king; and a salary of 350*l*. was assigned to the whole body, which they divided in proportion to the public services which each performed. In all matters of importance the concurrence of the council with the governor was indispensably requisite. The Colonial Assembly was composed of the councillors, who termed themselves the Upper House, and exercised the privilege of the English House of Lords, and the burgesses, who were elected by the freemen of the respective counties, and performed the functions of the House of Commons, receiving wages proportioned to their services, and derived, like all the other colonial salaries, from the colonial taxes. Until the year 1680, the several branches of the assembly had formed one deliberative body; but in that year the councillors separated themselves from the burgesses, and formed a distinct house. In conjunction with the governor, the councillors formed the supreme tribunal of the province, from whose judgments, however, in all cases involving more than 300*l*., an appeal lay to the king and privy council of England. In 1681 the province contained twenty counties; in 1703 it contained twenty-five. A quit rent of two shillings for every hundred acres of land was paid by the planters to the crown.

In the year 1688, the province contained forty-eight parishes, embracing upwards of 200,000 acres of appropriated land. A church was built in every parish, and a house and glebe assigned to the clergyman, along

ence is erroneous; and that the statement itself is no less so, seems to follow, by very strong inference, from Beverley's table, mentioned in the text. There is no reason to doubt the accuracy of that table; and consistently with it, we cannot admit the accuracy of Robertson's estimate, without believing that the colony had added 20,000 to its numbers in the course of seventeen years, notwithstanding the ravages of civil war and the distress occasioned by tyrannical government, and only about 600 to its numbers during fifteen subsequent years of increased freedom and prosperity.

The Abbe Raynal has so carelessly considered Beverley's table, as to have added 6000 to its returns, and to have supposed this the amount of the white population alone. This error has led him to waste his ingenuity in conjecturing the causes why the population of Virginia never afterwards increased so rapidly.

with a stipend, which was fixed by law at 16,000 pounds of tobacco. This mode of remuneration obviously tends to give a secular cast to the life and character of the ministers, and to entangle them with concerns remote from their spiritual warfare. The equalization which it proposes to effect is quite fallacious; the different degrees of fertility of different parishes rendering the burden unequal to the people, and the very different quality of the tobacco produced in different soils, making the remuneration unequal to the clergy. The presentation to the livings, prior to the English Revolution, belonged to the governor, but was generally usurped or controlled by the parishioners. After the Revolution it devolved into the hands of parochial vestries, which, though originally elected by the people, came, in process of time, to exercise the power of supplying vacancies in their numbers by their own appointment. The bishop of London was accounted the diocesan of the province; and a resident commissary (generally a member of the council) appointed by that prelate, presided over the clergy, with the power of convoking, censoring, and even suspending them in cases of neglect or immorality. The doctrines and rites of the church of England were established by law; attendance on divine worship at the parochial churches, and the observance of the sacraments of the church, enjoined under heavy penalties; the preaching of dissenters, and the participation in the ordinances of dissenting congregations, were prohibited, and subjected to various degrees of punishment. There was one bloody law, which subjected quakers returning from banishment to the punishment of death; but no execution ever took place in consequence of this enactment, and it was repealed soon after the revolution of 1688. The other laws were not then repealed, but they were no longer enforced; and though the statute-book continued to prohibit the preaching and practices of dissenters, the prohibition was utterly disregarded, and liberty of conscience practically realized. In 1688, almost the whole body of the people belonged to the established church. Other opinions and practices, however, began to arise, and were aided probably by the influence of the free schools, of which a considerable number were founded and endowed soon after that period; and the government being restrained from enforcing the intolerant laws, endeavored to cherish its own church establishment by heaping temporal advantages upon its ministers. This policy produced its usual fruits, and introduced so much indolence and worthlessness into the order of the state clergy, that at the era of the American revolution two-thirds of the inhabitants of Virginia had become dissenters, and were subject, on that account, to the ban of their own municipal law.

Of every just and humane system of laws, one main object should be to protect the weak against the strong, and to correct instead of confirming and perpetuating the inequalities of condition that from time to time arise from inequalities of strength, skill, success or virtue. This wise and benevolent principle must be sacrificed, to a considerable extent, in the code of every country where slavery is admitted. By the laws of Virginia, all persons brought into the colony by sea or land, not having been christians in their native country, were subjected to slavery, even though they might be converted to christianity after their arrival. A slave committing a capital crime was appointed to be tried by commissioners named by the governor, without the intervention of a jury; and if the punishment of death were inflicted, indemnification to the extent of the value of the slave was awarded from the public revenue to the master. In the year 1669, it was enacted that the death of a slave occasioned by the correction of a master, should not be accounted felony; "since it cannot be presumed," says the act, "that premeditated malice, which alone makes murder felony, should induce any man to destroy his own estate." But experience has amply refuted this pernicious sophistry, which ascribes to absolute power a tendency to repress human irascibility, and accounts avarice and selfishness sufficient motives and surerets of justice, humanity, and liberality. Neither infidels nor negroes, mulattoes nor Indians, were allowed to purchase christian white servants; and if any person having christian white servants should marry an infidel, or a negro, mulatto, or Indian,* all such servants were made free. Any free white person intermarrying with

a negro or mulatto, and any minister celebrating such marriage was punished with fine and imprisonment. It will excite the merriment of a satirist, the surprise of a philosopher, and the indignant concern of a christian, to find, combined with such inhuman and insolent laws, the strictest injunctions of the worship of that great pattern of love and humility who commanded his worshippers to do good to and honor all men; together with many solemn denunciations and penal enactments against travelling on Sunday, profane cursing or profanely getting drunk. But thus mankind attempt to unite what religion has sundered, the service of God and the service of mammon: and to sunder what religion has united, the rendering of glory to God and the demonstration of good will to men. Justices of the peace were commanded to hear and determine the complaints of all sorts of servants except slaves, against their masters; various regulations were made for securing mild and equitable treatment to indentured servants; at the close of their period of service they received from their masters each a musket, a small sum of money, and a quantity of corn; but if during the currency of their term of service they should presume to marry without the consent of their master or mistress, they were punished with an additional year of servitude. All persons riotously assembling to the number of eight or more, for the purpose of destroying tobacco, were subjected to the pains of treason. Every person, not being a servant or slave, committing adultery or fornication, was, for the greater offence, fined 1000, for the lesser 500 pounds of tobacco. Women convicted of slander were ordered to be ducked, in default of their husbands' consenting to redeem them from immersion by payment of a fine. There being no inns in the country, strangers were entertained at the houses of the inhabitants, and were frequently involved in law-suits by the exorbitant claims of their hosts for indemnification of the expenses of their entertainment; for remedy whereof it was enacted, that an inhabitant neglecting in such circumstances to forewarn his guest, and to make an express paction with him, should be reputed to have entertained him from mere courtesy. All these laws continued in force long after the British Revolution.

It would appear, from the first of the statutes, that even their Indian neighbors coming into the territories of the state were liable to be made slaves by the colonists; and we are informed by Mr. Jefferson, that the practice of enslaving these people did at one time actually prevail. But with the Indian tribes situated in their immediate vicinity, and comprehended in the pacification effected by Colonel Jefferys, the colonists maintained relations more approaching to friendship and equality. The Indians paid, indeed, in conformity with the treaty of peace, an annual tribute of beaver skins to the colonial government. But their territories were ascertained by the treaty, and guaranteed to them so securely by law, that all bargains and sales by which the colonists might acquire or pretend right to any portion of them, were disallowed and declared null and void; and every wrong they might sustain at the hands of any of the colonists was punished in the same manner as if it had been done to an Englishman. By the aid of a donation from that illustrious philosopher and christian philanthropist, the honorable Robert Boyle, an attempt was made to render the institution, which, from its founders, has been called William and Mary College, subservient to the instruction of the Indians. Some young persons belonging to the friendly tribes received in this manner the elements of civil and religious education; and the colonists, sensible of the advantages they derived from the possession of those who might be considered hostages for the pacific demeanor of their parents, prevailed with some of the more remote nations of the Indians to send a few of their children to drink of the same fountain of knowledge. But as the pupils were restored to their respective tribes when they attained the age that fitted them for hunting and other warlike exercises, it is not likely that this institution produced any general or permanent impression on the character of the Indians, or made any adequate compensation for the destructive vices and diseases which the Europeans were unhappily much more successful in imparting. Attempts to convert barbarians very frequently disappoint their promoters; and not those only who have assisted the undertaking from secular ends, but those also who truly regarding the Divine glory in the end, disregard, at least in some

measure, the Divine agency in the means. As an instrument of civilization, the preaching of the gospel will ever be found to disappoint all those who have no higher or ulterior views. In a civilized and christian land, the great bulk of the people are christians merely in name; reputation, convenience, and habit, are the sources of their profession; vices are so disguised, that the testimonies of christian preachers against them often miss their aim: and a seeming service of God is easily reconciled with, and esteemed a decent livery of, the real service of mammon. But among heathens and savages, a convert must change his way of life, overcome his habits, and forfeit his reputation; and none, or at least very few, become professors unless from the influence of real conviction, more or less lasting and profound. Those who remain unconverted, if they be honestly addressed by their missionaries, are incensed at the testimony against their evil deeds and evil nature; and the conduct of many professing christians among their civilized neighbors too often concurs to mislead and confirm them in error. But this topic will derive an ampler illustration from occurrences that relate to others of the North American States, than the early history of Virginia is fitted to supply.

Literature was not much cultivated in Virginia. There was not at this period, nor for many years after, a single bookseller's shop in the colony.* Yet a history of Virginia was written some years after by Beverley, a native of the province, who had taken an active part in public affairs prior to the Revolution of 1688.† The first edition of this work in 1705, and a later edition in 1722, were published in England. Beverley is a brief and rather agreeable analyst, and has appended to his narrative of events an ample account of the institutions of the province, and of the manners of the colonial and aboriginal inhabitants. He is chargeable with great ignorance and incorrectness in those parts of his narrative that embrace events occurring in England or elsewhere beyond the immediate precincts of Virginia. Only the initial letters of his name appear on the title-page of his book, whence Oldmixon was led into the mistake of supposing his name to have been *Bullock*; and in some of the critical catalogues of Germany he has received the erroneous appellation of *Bird*.‡ A much more enlarged and elaborate history of Virginia (but unfortunately carried no further down than the year 1624) was written at a later period by Stith, also a native of the province, and one of the governors of William and Mary College. Stith is a candid, accurate and accomplished writer; tediously minute in relating the debates in the Court of Proprietors of the Virginia Company, and their disputes with the king, but generally impressive and interesting. A manly and generous spirit pervades every page of his work, which was first published at Williamsburg in 1747.

Beverley warmly extols the hospitality of his countrymen; a commendation which the peculiar circumstances of their condition renders very generally credible, though the preamble of one of their laws, which we have already noticed, demonstrates that its application was by no means universal. He reproaches them with indolence, which he ascribes to their residence in scattered dwellings, and their destitution of that collected life which invigorates industry, excites active thought, and generates adventurous speculation. It may be ascribed also to the influence of slavery in augmenting pride and degrading labor. A life like that of the first Virginian colonists, remote from public haunt, unoccupied by a crowd of busy purposes, and sequestered from the intelligence of passing events, is the life of those to whom the company of strangers is peculiarly acceptable. All the other circumstances of such a lot contribute to the promotion of hospitable habits. As for many of their hours they can find no such interesting occupation, so for much of their superfluous produce they can find no more profitable use than the entertainment of visitors.‡ The interest which

* The literature of North America was at this time monopolized almost entirely by New England. In the beginning of the eighteenth century, when Boston contained five printing-offices and many booksellers' shops, there was but one bookseller's shop in New York, and not one in Virginia, Maryland, or Carolina. Neal's History of New England, ii. 367. From the Memoirs of Dr. Franklin it appears that even at so late a period as the year 1670, there was not one good bookseller's shop in Pennsylvania.

† Warden, a late American writer, has repeated this error, and described as the production of Bird, what in reality was the first edition of Beverley's work.

‡ "Mr. Jefferson told me that in his father's time it was no uncommon thing for gentlemen to post their servants on the main road for the purpose of amicably waylaying and bringing to their houses any travellers who might chance to pass" Hall's Travels in Canada and the United States, 412.

* It would not have been easy to induce the framers of this law to believe that a time might come when the legislature of Virginia would seriously entertain a proposal of promoting, by a bounty, the marriages of the white inhabitants and the Indians. Yet a bill for this purpose was actually introduced

into the assembly during the revolutionary war; and after having been twice read, was lost at the third reading in consequence of the absence of the member who had introduced it. Wirt's Life of Governor Henry, p. 241.

all men feel in the concerns of their fellows, is refined and extended by crowded and polished society; in remote districts, especially if they be inhabited by men whose origin or recollections connect them with a distant country, it assumes the shape of an intense and somewhat indiscriminate curiosity—a quality for which the Americans have been always distinguished.

It was the remarkable and advantageous peculiarity of their local situation, that prevented a people so early devoted to commerce as the Virginians have been, from congregating in large towns, and forming crowded marts of trade. The same peculiarity belongs to that portion of their original territory that now forms the province of Maryland, and has there been attended with the same effect. The whole of that vast country is pervaded by numerous streams, that impart fertility to the land, and carry the produce they have nourished to the great highway of nations. From the bay of Chesapeake, where all these streams unite, the greater number of them afford an extensive navigation into the interior of the country; and the colonists, perceiving that in order to embark their produce they needed not to quit their plantations, but might load the merchant ships at the doors of their country warehouses, dispersed themselves along the banks of the rivers, and united the sweets of rural life with the advantages of commerce. Except the small town of Williamsburgh, which succeeded Jamestown as the capital of Virginia, and Annapolis, the capital of Maryland, no cities grew up for a very long period in either of these settlements. This state of life has proved highly favorable to those two great sources of national happiness, good morals, and the facility of gaining by industry a moderate competence and a respectable stake in society. The convicts who were transported to the colony, finding none of the opportunities of confederacy, vice, and shelter, that large towns afford, either quitted the settlement at the expiration of their periods of service; or, impressed with the advantages which the country so liberally held forth to industry and morality they melted into the mass of humble and respectable free laborers. To this important class of society the virtues of industry and economy were recommended by prizes both greater and nearer than any other country has ever presented. Labor was so valuable, and land so cheap, that a very few years of industry could promote the laborer to the rank of a proprietor; * none needed to despair of a competence; and none found it practicable to amass enormous wealth. Toil, no longer the badge of hopeless poverty, was respected as the certain passport to independence; nor was there among the free population any distinction of rank which industry and virtue were unable to surmount. A constant and general progression, effected without scramble or peril; gave a quiet alacrity to life; and fellow-feeling was not obstructed, nor insolence and servility engendered, by numerous instances of a wide inequality of condition; they were and are undoubtedly a happy people. But how happy had they been, had they rightly known their happiness; had they imbibed with the sweetness of their lot, the spirit of its author, and in the abundance of his goodness recognised the extent of his claims!

Two causes have contributed in this and others of the American provinces, to impede the operation and abridge the influence of circumstances so favorable to happiness and virtue. Of these, by far the most important is the institution of domestic slavery; an institution fraught with incalculable evil to the morals, manners, and felicity of every country into which it has gained admission. The slaves are reduced to a state of misery and degradation; to a state which has always been found so destructive to virtue, that in many languages a slave and a thief are expressed by the same word. The masters are justly loaded with the guilt of all the wretchedness and worthlessness which that state inevitably infers; every mind is tainted with the evil which it engenders and displays, and sustains an abatement either of happiness or virtue. Every master of a slave, whether he term himself citizen or subject, is a monarch endowed with more uncontrolled authority than any sovereign in Europe enjoys; and every country where slavery is admitted, whether it calls itself kingdom or republic, is a country subject to the dominion of tyrants. Nay, the more liberal its political constitution, the more severe in general is its system of domestic tyranny; for from the days of

Sparta it has ever held true, that none are so completely enslaved as the slaves of the free. Human character is as much corrupted and depraved by the spirit of dominion as by the yoke of servitude; and slavery is a state wherein *one man ruleth over another to his own hurt*. The same wisdom which assigned to man his duties, adapted them to the development of his understanding and the refinement of his sensibility. This adaptation is particularly visible in the duties that regulate the mutual intercourse of men. To violate therein the law of kindness and the principles of equity, is to warp the understanding* as well as to corrupt the heart; to lower the dignity of rational, and the happiness of sensible being. There is a continual reciprocation of evil between a master and his slaves. His injustice consigns them to their present state; and the evil qualities that this state engenders tend continually to provoke his irascibility. His power effects their degradation; and their degradation at once tempts and facilitates the excesses of his power. Hence the commerce between master and slave exercises and exhibits all that is hateful in human passion and contemptible in human conduct. The delicate susceptibility of women is exposed to the impression of this spectacle, and the imitative character of children formed amidst its continual display. The female slaves lose alike the virtues and the rights of women, and introduce into rural life the worst vices and most dangerous temptations of profligate cities. Every description of work that is committed to the slaves is performed with as much neglect and indolence as they dare to indulge, and is so degraded in common estimation, that the poorest freeman disdains to perform it except when he is working for himself. As the numbers of the slaves are multiplied, the industry of the free is thus depressed by the extension of slave labor, and the safety of the state is endangered by the strength of a body of internal enemies ready to conspire against its tranquility or join its first invader.† The number of the slaves and gladiators contributed to the downfall of Rome: and indeed, every body politic, compounded of parts so heterogeneous as freemen and slaves, plainly contains within itself a principle of destruction. Such a mixture tends also to pervert and confound the moral sentiments of all mankind, and to degrade the value of those free institutions which are seen to form a canopy for the shelter of domestic tyranny, to mock one portion of the people with such liberty and dignity as jailors enjoy, and to load all the rest with such fetters as only felons should wear.

Such long consequences have guilt and injustice! The first introduction of slavery into a country plants an evil of which the full mischief is not felt till in an after age, when it has attained such an extent that its extirpation becomes almost impossible. This consideration, while it increases our abhorrence of a system so fraught with evil and danger, abates the severity of our censure on those to whom the system already matured by long endurance has unfortunately descended. And even with regard to the race who first introduced it, we shall not fulfil the duty of fellow-men, if we omit to consider the apologies which probably misled their understandings, and veiled from their view the wickedness they committed and the misery they introduced. The negroes that were first brought to Virginia were enslaved before they came there, and by the

* An illustration of this remark may, perhaps, be derived from the apologetic theory which philosophical slave owners have introduced into the world, that the negroes are a separate and inferior race of men—a notion by which the degradation that men inflict on their fellows by reducing them to the level of the brute creation, is charged on Him who made man in the image of the Godhead, and whose word assures us that he fashioned all souls alike. Interest and pride harden the heart; the decaying faculties of the heart perverts the understanding; and men find it agreeable to consider those as brutes whom they think it convenient to treat as such. The best refutation of this theory that I have ever seen is the production of an American writer. It occurs in Dr. S. Smith's interesting "Essay on the causes of the variety of figure and complexion in the human species."

† "I tremble for my country," says Mr. Jefferson, in his observations on the slave population of this province, "when I reflect that God is just; that his justice cannot sleep for ever; that considering numbers, nature, and natural means only, a revolution of the wheel of fortune, an exchange of situation is among possible events; that it may become probable by supernatural interference! The Almighty has no attribute which can take side with us in such a contest." Notes on Virginia, p. 173. Seneca relates that it was once proposed at Rome to discriminate the slaves by a peculiar habit; but it was justly apprehended that there might be some danger in acquainting them with their own numbers. This information is conveyed to the negroes by their color; and this color being always a mark of contempt, even those negroes who become free in countries where their race is generally enslaved, continue allied both by the most irritating feelings and by the sympathy they must entertain for men of the same complexion, with all those who remain in a state of bondage.

purchase of the colonists were delivered from the hold of a slave ship and the cruelty of the Dutch. When slaves were neither numerous nor formidable, they appear to have been kindly treated;* and their masters perhaps intended to emancipate them at that convenient season for adjusting the accounts of interest and conscience, which every added year and every addition to their numbers tended still farther to postpone. So great is the deceivableness of unrighteousness.

Negro slavery lingered long in the settlements of the puritans in New England, and of the quakers in Pennsylvania; Las Casas, so distinguished by his compassion for the unfortunate, first suggested its introduction into Mexico and Peru; George Fox, the most intrepid and enthusiastic of reformers, demanded no more of his followers than a mitigation of its severity in Barbadoes; and John Locke, the glory of modern philosophy, and the champion of religious and political freedom, introduced it into the fundamental constitution of Carolina. Considerations such as these are calculated to increase at once our charity for mankind, and our abhorrence of that insidious and formidable evil which has so signally baffled the penetration of the wise, and triumphed over the beneficence of the humane.

It is in those colonial plantations where the residence of the free inhabitants is merely temporary, that slavery exhibits its worst features, and produces its most debasing effects. Wherever a respectable stationary population of freemen exists, a restraining principle arises to control and qualify those evil consequences. The harsher slave laws have been long since repealed in Virginia, and the treatment of the slaves in this province has long been noted for comparative mildness. An Englishman who should suppose that humanity and delicacy could not exist in a province where slavery prevailed, would commit as great a practical error as an American who should maintain the incompatibility of the same qualities with those spectacles of vice and misery exhibited in the great towns and public places of England. In both countries, doubtless, human character is evil affected by the contemplation of evil; but in both, the taint is obstructed by delusions that disguise, by humanity that deplores, or by virtue that labors to mitigate and finally efface the evil.

The other cause to which I have alluded, as having exercised an unfavorable influence on the prosperity of Virginia, is the inordinate cultivation of tobacco. As long as Virginia and Maryland were the only provinces of North America where this commodity was produced, their inhabitants devoted themselves almost exclusively to a culture which is attended with much inconvenience to those engaged in it, and no small disadvantage to their country even when moderately pursued. It requires unusually fatiguing labor from the cultivators, and exhausts the fertility of the soil: and as little food of any kind is raised on the tobacco plantations, the men and cattle employed on them are badly fed, and the soil gradually impoverished. This evil continued long to be felt in Virginia; but has been diminished by the introduction into the markets of Europe of the tobacco produce of territories more recently cultivated.

THE NEW ENGLAND STATES.

CHAPTER I.

Attempts of the Plymouth Company to colonize the Northern Coasts of America—Popham establishes a colony at Fort Saint George—Sufferings and Return of the Colonists—Captain Smith's Voyage and Survey of the Country—which is named New England—His ineffectual Attempt to conduct a Colony thither—The Company relinquish the Design of colonizing New England—History and Character of the Puritans—Rise of the Brownists or Independents—A Congregation of Independents retire to Holland—they resolve to settle in America—their negotiation with King James—they arrive in Massachusetts—and found New Plymouth—Hardships—And Virtue of the Colonists—Their civil Institutions—Community of Property—Increase of civil and ecclesiastical Tyranny in England—Project of a new Colony in Massachusetts—Salem built—Charter of Massachusetts Bay obtained from Charles the First by an Association of Puritans—Embarkation of the Emigrants—Arrival at Salem—Their Constitution in Church and State—Two Persons banished from the Colony for Schism—Intolerance of some of the Puritans.

[1606.] When James the First gave his sanction to the project of colonizing the vast district of North America which was comprehended at that time under the name of Virginia, he made a partition of the

* The treatment of slaves at Rome, latterly distinguished by the most enormous cruelty, was originally kind and humane. Plutarch. Life of Coriolanus.

* "I remember the time when five pound was left by a charitable testator to the poor of the parish he lived in; and it lay nine years before the executors could find one poor enough to be entitled to any part of this legacy; and at last it was all given to one old woman. So that this may in truth be recognised the best poor man's country in the world." Beverley, B. iv. p. 39.

territory between two trading companies, and established the residence of the one at London, and of the other at Plymouth. If the object of this partition was to diminish the inconvenience of monopoly, and diffuse the benefit of colonial relations more extensively in England, the means were very ill adapted to the end, consequently, the effect was far from corresponding with the design. The resources of the adventurers who had already prepared to undertake colonial projects were divided so unequally, and yet so much to the disadvantage of all parties, that the more powerful company found its vigor and success considerably abridged, while the weaker, without ability to effect the purpose of its association, retained only the privilege of debarring others from attempting it. We have seen that the southern colony, though promoted by a company which reckoned among its members some of the richest and most powerful men in the state, and enjoyed the advantage of being situated in the place which then absorbed almost all the commercial wealth and activity of England, was yet enabled, with all these advantages, to make but slow and laborious advances to a secure establishment. The Plymouth company possessing much narrower resources, and a very inferior situation, its efforts were proportionally feeble and unavailing.

The most eminent members of the Plymouth company were Sir John Popham, Chief Justice of England, Sir Ferdinando Gorges, the Governor of Plymouth fort, and Sir John Gilbert, the nephew of the first patentee, and leader of emigrants to America. Animated by the zeal of these men, and especially of Popham, who assumed the principal direction of their proceedings, the Plymouth company very early despatched a small vessel to inspect their territories; but had soon the mortification of learning that it had been attacked and captured by the Spaniards, who still pretended a right to exclude every other people from the navigation of the American seas. The chief justice and his friends, however, were too much bent on the prosecution of their purpose to be discouraged by this disaster. At his own expense, Popham quickly despatched another vessel to resume the survey; and having received a favorable report of the appearances of the country, he availed himself of the intelligence to raise a sufficient supply of men and money for the formation of a colony. [1607.] Under the command of his brother, Henry Popham, and of Raleigh Gilbert, brother of Sir John, two vessels freighted with a hundred emigrants proceeded to the territory of what was still called Northern Virginia, and landing in autumn, they took possession of a piece of ground near the river Sagadahoc, where they built Fort Saint George. The district where they established themselves was rocky and barren, and their provisions so scanty, that they were obliged, soon after their arrival, to send back all but forty-five of their own number. The winter proved extremely severe, and confined this small remnant to their miserable dwelling, and a helpless contemplation of the dreary waste that surrounded them. Disease, the offspring of famine and hardship, augmented the general gloom; and, before the return of Spring, several of their number, and among others their president, Henry Popham, had sunk into the grave. With the spring arrived a vessel with supplies from England, but the intelligence that accompanied these supplies more than counterbalanced the satisfaction they afforded; for the colonists were now informed of the deaths of Chief Justice Popham and Sir John Gilbert, the most powerful of their patrons, and most active of their benefactors. Their resolution was completely vanquished by so many misfortunes; and all exclaiming against longer continuance in scenes so dismal, they forsook the settlement and returned to England, [1608.] which they filled with the most distressing accounts of the soil and climate of Northern Virginia. The American historians are careful to note that this disastrous expedition originated with the judge who three years before had presided, with the most scandalous injustice, at the trial of Raleigh, and condemned to an infamous death, the man to whom England and America had been so highly indebted.*

The frustration of this enterprise, and the evil report

that was raised against the land, deterred the company for some time from any further attempt to erect a settlement in Northern Virginia, and produced an impression on the minds of the people very unfavorable to emigration to that territory. For several years, the adventures of the company were confined to a few fishing voyages to Cape Cod, and a traffic in peltry and oil with the natives. At length their prospects were cheered by a gleam of better fortune; and the introduction of Captain Smith into their service seemed to betoken more vigorous and successful enterprise. Sir Ferdinando Gorges, and some other leading members of the Plymouth Company, justly appreciating the merit of this extraordinary man, made haste to appropriate his valuable services, which the Virginia Company had so unworthily neglected. [1614.] Six years after the return of the settlers at Sagadahoc, two vessels were despatched, under the command of Captain Smith and Captain Hunt, on a voyage of trade and discovery to the company's territories. Smith, having concluded his traffic with the natives, left his crew engaged in fishing on the coast, and accompanied by only eight men, travelled into the interior of the country, surveyed its condition, explored with great care and diligence the whole coast, from Cape Cod to Penobscot, and composed a map, in which its appearance was accurately delineated. On his return to England, he presented his map, with an account of his travels and observations, to Prince Charles, who was so much pleased with the country, that he bestowed on it the name of New England, which it has ever since retained.

The success of Captain Smith's voyage, and the favorable accounts that he gave of the country, though they contributed not a little to stimulate the vigor of commercial adventure, could not overcome the general aversion to a permanent settlement in the territory, which the misfortunes of the first colonists had created in England, and which was appointed to preserve that corner of the Almighty's creation for the habitation of the most faithful and oppressed of his people. The impediments to a colonial establishment in New England were greatly increased by the conduct of Hunt, who had been associated with Smith in the late voyage. This sordid and profligate man, unwilling that the benefit of the existing narrow traffic with the company's territories, which was exclusively shared by himself and a few others who were aware of its advantages, should be more generally diffused by the formation of a colony, resolved to defeat the design by embroiling his countrymen with the natives; and for this purpose, having enticed a number of these people on board his ship, he set sail with them for Malaga, where he had been ordered to touch on his homeward voyage, and sold them for slaves to the Spaniards. The company, indignant at his wickedness, instantly dismissed him from their service; but the mischief was done, and the next vessel that returned from New England brought intelligence of the vindictive hostilities of the savages. Undismayed by all these difficulties and dangers, Smith determined to make an effort for the colonization of the northern territory; and having infused his own resolute hope and courage into some of the leading patentees, he was enabled, by their assistance, to equip a small squadron, [1615.] and set sail at the head of a body of emigrants for New England. Thus far could energy prevail; but in a struggle with fate, farther advancement was impracticable; and Captain Smith, having now accomplished all that man could do, was destined to experience that all was unavailing. The voyage was one uninterrupted scene of disaster. After encountering a violent tempest, by which the vessels had nearly perished, Smith found his authority invaded by the mutinous disposition of his crew; and in this situation he fell an easy prey to a squadron of Froch pirates, who confiscated his ships, and detained him long in captivity. It was happy for himself and for mankind that he lived to return to his country, and write the history of his travels, instead of reaching New England; where his blood would probably have stained the land which his talent and virtue had contributed to illustrate. [1619.] Several years afterwards, the company having discovered that an Indian named Squanto, one of the persons whom Hunt had kidnapped, had escaped from the Spaniards, and found his way to Britain, acquitted themselves to his satisfaction of the injury he had suffered, loaded him with kindness, and sent him back to New England, along with a small expedition commanded by one Dormer, who was instructed to avail himself of Squanto's assistance in regaining the friendship of the Indians. But although Squanto earnestly endeavored to conciliate the minds

of his countrymen, and assured them that Hunt's treachery had been reprobated and punished in England, they refused to be pacified, and watching a favorable opportunity, attacked and dangerously wounded Dormer and many of his party, who, escaping with difficulty from the hostile region, left Squanto behind to enforce at more leisure and with better success his topics of apology and conciliation. Disgusted by so many disappointments, the company laid aside all farther thoughts of establishing colonies in New England. An insignificant traffic bounded their own adventures; and they made no other exercise of their dominion over the territory than by disposing of small portions of the northern quarter of it to private adventurers, who occupied them in summer as mercantile factories or victualling stations for the use of vessels resorting there for trade.

We have sufficient assurance that the course of this world is not governed by chance; and that the series of events is regulated by divine ordinance, and adapted to wise though often inscrutable purposes. As it could not then be without design, so it seems to have been for no common object that discomfiture was thus entailed on the counsels of princes, the schemes of the wise, and the efforts of the brave. It was for no ordinary people that the land was reserved, and of no common qualities or vulgar superiority that it was ordained to be the prize. New England was the destined asylum of oppressed piety and liberty of conscience; and its colonization, denied to the pretensions of greatness and the efforts of might, was reserved for men whom the great and mighty despised for their littleness, overcome from their weakness, and persecuted for their integrity. The recent growth of the Virginian colony, and the repeated attempts to form a settlement in New England, naturally turned to this quarter the eyes of men who felt little reluctance to forsake a country where, for conscience's sake, they had already incurred the loss of all things; when persecution had fortified to the endurance of hardship, and piety had taught to despise it. It was at this juncture accordingly, that the project of colonizing New England was undertaken by the puritans; a body of men of whose rise, sentiments, and previous history, it is proper that we here subjoin some account.

Of all the national churches of Europe, which at the era of the Reformation renounced the doctrine and revolted from the dominion of the see of Rome, there was none in which the origin of the reform had been so discreditable, or the immediate proceedings to which it gave rise so unreasonable and inequitable as the church of England. This arose partly from the circumstance of the reform in this church having originated exclusively with the temporal magistrate,* and partly from the character of the individual by whom this interposition of magisterial authority was employed. In the Palatinate, in Brandenburg, Holland, Geneva, and Scotland, where the reform proceeded from the general conviction, the doctrine and constitution of the national church corresponded with the religious sentiments of the people. The biblical christianity taught by Calvin and Luther (with varieties occasioned by variety of human weakness and inequality of attainment) superseded the traditional dogmas of the church of Rome; and the primitive simplicity of the presbyterian administration (with similar varieties of similar origin) superseded the pompous pageantry of her ecclesiastical constitution. In England, the reformation originating from a very different source, its institutions received a strong tincture from qualities proportionally different. The same haughty and imperious disposition that had prompted Henry the Eighth to abolish the authority of the church of Rome in his dominions, regulated all his proceedings in constructing a substitute for the system he had taken away. Abetted by a crew of servile dependants and sordid nobles, whom he enriched with the spoils of the plundered monasteries, and by a compliant House of Commons, whose pro-

* It has been asserted by a host of English writers that, owing to this interposition of the magistrate, the invasion of supposed rights and established possessions, that ensued on the Reformation was conducted with much greater sobriety and equity in England than in Scotland. The very reverse, appears to me a juster proposition. Henry's robberies of the ecclesiastical orders were the more inequitable in proportion to their deliberation. The Scotch populace rose in tumultuous indignation against their oppressors; Henry trampled on the defenceless, and arrayed his rapine in the solemn apparel of the acts of state. The explosions of popular justice are attended with a marked violence, and have but a short-lived duration. As palpable deviations from the ordinary line of human action, they influence does not affect general morality. The actions of despotism cover their violence with a grave disguise; and associating them with principles and precedents, render their evil fatally permanent.

* One American writer, however, has been betrayed by carelessness into an observation so very different, that he represents Raleigh as one of the commanders of this unsuccessful expedition. Marshall's Life of Washington, vol. 1, p. 73. This writer has mistaken Raleigh Gilbert for two persons. Sir Walter was at this time a prisoner in the Tower, under sentence of death. I have more than once had occasion to notice inaccuracies occurring in the first volume of Marshall's Life of Washington; a volume which all who have read the others must regret that he ever published. It has greatly obstructed the popularity of a most excellent and interesting work.

fession of faith veered about with every variation of the royal creed, he paid no respect whatever, in the institutions which he successively established, to the sentiments of the body of the people—a portion of his subjects to whose petitions he once answered, by a public proclamation, that they were “but brutes and inexpert folk,” and as unfit to advise him as blind men were to judge of colors. His object was to substitute himself and his successors as heads of the church in place of the pope; and for the maintenance of this usurped dominion, he retained, both in the ceremonies of worship and the constitution of the ministry, a great deal of the machinery which his predecessor in the supremacy had found useful. The vehemence of his character detracted somewhat from the policy of his devices, and very much abated their politic appearance by that show of good faith and sincerity which accompanied all his actions, and which was but the natural result of sincere and vehement selfishness, and an undoubting conviction of the superiority of his understanding and the infallibility of his judgment.* While he rigidly denied the right of private judgment to his subjects, his own inordinate exercise of this right continually tempted them to partake the satisfaction it seemed to afford him; and the frequent variations of the creeds he imposed, at once excited a spirit of speculation akin to his own, and practically refuted the only pretence that could entitle his judgment to the implicit assent of fallible men. The pope, expressly maintaining that he could never be in the wrong, was disabled from correcting both his own errors and those bequeathed to him by his predecessors. Henry, merely pretending to the privilege of being always in the right, defeated this pretension by the variety and inconsistency of the creeds to which he applied it. While he insisted on retaining much of the peculiar doctrine of the church of Rome, he attacked, in its infallibility, a doctrine not only highly important to itself, but the sole sanction and foundation of a great many others. Notwithstanding all his exertions, and aided indeed by some part of his own conduct, a spirit of religious inquiry began to arise among the multitude of professors who blindly or interestedly had followed the fortunes and the variations of the royal creed: and the knowledge of divine truth, combined with an ardent regard for simplicity of divine worship arising first in the higher classes, spread downwards through the successive grades of society in this and the following reigns. The administration of inquisitorial oaths, and the infliction in various instances of decapitation, torture, and burning, for the crime of heresy during Henry's reign, demonstrate how fully he had embraced the character as well as the pretensions of the Romish see,† and how ineffectually he had labored to impose his own heterogeneous creed on the understandings of his subjects. Even in his lifetime, the protestant doctrines had spread far beyond the limits of his own creed; and in their illegitimate extent had made numerous proselytes in his court and kingdom. The propagation of them was aided by the translation and diffusion of the Scriptures, which he vainly endeavored to prevent, and which enabled his people to draw truth for themselves unstinted and unadulterated from its everlasting wells. The open profession of these illicit opinions was in many instances repressed by the terror of his inflexible cruelty, and by the influence over his measures which his lay and clerical courtiers found it easy to obtain by feigning implicit submission to his capricious and imperious temper. The temptations which these men were exposed to proved fatal in some instances to their virtue; and several of them (even the virtuous Crammer) thought themselves obliged though reluctantly to concur in punishing by fire and faggot the open profession of the sentiments which they secretly cherished in their own breasts. They were afterwards compelled themselves to drink of the same cup; and enabled to make some atonement to the cause of truth by the heroism with which, in Mary's bloody reign, they suffered for the doctrines which they had persecuted before.

By the death of Henry the Eighth, his protestant subjects were exempted from the necessity of farther dissimulation. In the reign of Edward the Sixth, the catholic doctrines were expunged from the national creed,

* The public disputation which he held with one of his subjects, the noble-minded though unfortunate Lambert, who denied the doctrine of the real presence, was, perhaps, regarded at the time as an act of admirable zeal and most generous condescension. It might have merited this praise if the horrid death by which he revenged the impotence of his logic, did not prove it to have been an overflowing of arrogance and vain glory.

† One of his laws (31 Henry VIII. cap. 14.) bears the presumptuous title of “An act for abolishing diversity of opinions in certain articles concerning the Christian religion.”

and the fundamental articles of the protestant faith recognised and established by law. As among the other practices of the preceding reign, the weak and wicked policy of enforcing uniformity of faith and worship by persecution was still retained, the influence of temporal fear and favor contributed, no doubt, to encumber the protestant church with many reluctant and hypocritical professors. In the hope of reconciling the minds of men as extensively as possible to the system which they had established, the ministers of Edward preserved not only the ecclesiastical constitution which Henry had retained, but as much of the ancient ceremonial of worship as they thought would gratify the taste and predilections of minds that still hankered after catholic pageantry. They rather yielded to the necessity of the times, than indulged their own sentiments or followed out their principles; and pretty plainly insinuated their opinion, that whenever the times could bear it, a further reformation should be introduced into the establishment, by inserting a prayer to that purpose in the Liturgy. But in this attempt, the rulers of the English reformed church encountered a spirit of resistance, originating in the protestant body, of which they considered themselves the heads. During the late reign the disaffection that had been cherished in secret towards the national church had not confined itself to the doctrines of the establishment, which many protestants connected in their opinion and esteem with the ceremonial rites and clerical habits that had for ages been their inveterate associate and distinctive livery. With their enmity to popish doctrine, they combined an aversion to those ceremonies which had proved so subservient to popish imposture; which seemed to owe their survival in the national system to the same error that had retained so much catholic heresy; and which diverted the mind from that spiritual worship claimed by Him who is a spirit, and has commanded all men to worship him in spirit and in truth. These sentiments, which were subsequently matured into the doctrines of the puritans, had already taken possession of the minds of some of the English protestants: but their operation was as yet neither very powerful nor extensive. One of the most powerful indications of their influence that has been transmitted to us was evinced by Bishop Hooper, who, in the reign of Edward, refused to be consecrated to his office in what he deemed the superstitious habits appropriated by the church to the episcopal order. His protestant opinions had rendered him an exile from England during the latter part of the preceding reign, and his puritan sentiments had been confirmed by the conversation of the presbyterian teachers, with whom he associated during his residence abroad. Crammer and Ridley, who were afterwards his fellow martyrs under the persecution of Mary, resorted to arguments, threats, entreaties, and imprisonment, to overcome Hooper's objections; and it was not without very great difficulty that his inflexible spirit condescended to terminate the dispute by a compromise. The sentiments which had thus received the sanction of a man so distinguished by the excellence of his character as well as the eminence of his station in the church, continued to manifest themselves throughout the short reign of Edward; and there was scarcely a rite of the established worship, or habit of the clergy, that escaped objection and contention. The defenders of the practices that were thus assailed did not contend that they were of divine appointment, or in themselves of essential importance. They maintained that they were in themselves inoffensive, and that by long establishment and inveterate association they had taken possession of the reverence of the people, and attached their affections to the national worship. They admitted that, as useless appendages, it was desirable that time and reason should obliterate these practices: but insisted that it would be both unwise and illiberal to abolish them forcibly, and at the risk of unhinging the important sentiments with which they had accidentally connected themselves. This reasoning was very unsatisfactory to the puritans, who rejected such temporizing policy as the counsel of lukewarm piety and worldly wisdom, and regarded with abhorrence the mixture of superstitious attractions with the motives to that which should be entirely a reasonable service, and whatever weight the arguments of the prevailing party may be considered to possess, they certainly cannot be allowed to justify their violent imposition of observances, which at best they regarded as inoffensive, on persons who considered them as sinful and pernicious. But the doctrines of the puritans, whether supported or not by superior weight of reason, were overborne by the weight of superior numbers; and their sentiments might perhaps have gradually died away if the reign of

Edward had been much farther prolonged, or his acceptor been transmitted to a protestant successor. But the reign of Mary was appointed not only to purify the protestant body, by separating the true from the false or formal professors, but to radiate every protestant sentiment by exposing it to the fiery test of papal rage and persecution.

The administration of Queen Mary was productive of events that tended to revive and disseminate the puritan sentiments, and at the same time to confirm the opposition of some of their adversaries. During the heat of her bloody persecution, many of the protestants forsook their country and took refuge in the protestant states of Germany and Switzerland. There, in regulating for themselves the forms and ordinances of divine worship, their ancient disputes naturally revived, and were animated by the approach of the two parties to an equality of numbers that had never before subsisted between them, and protracted by the utter want of a spirit of mutual forbearance, and the absence of any tribunal from which an authoritative decision could be obtained. The puritans beheld with pleasure in the continental churches the establishment of a constitution and ritual which had been the object of their warm approbation and earnest desire; and they either composed for themselves a formula of religious association on a similar model, or entered into communion with the churches established in the places where they resided. Their opponents, on the other hand, clung more firmly than ever to their ancient practices: they refused to surrender any one of the institutions of the faith, for the sake of which they had forsaken their country; and they plumed themselves on reviving, amidst the misfortunes of their church at home, an entire and accurate model of her ordinances in the scene of their banishment. Both parties were willing to have united in church fellowship with each other, if either could have yielded in the dispute concerning forms of office, habits, and ceremonies. But though each considered itself strongest in faith, neither felt disposed on that account to bear the infirmities of the other; and though united in the great fundamental points of christian belief, and associated by the common calamity that rendered their fellow-exiles in a foreign land, their fruitless controversies separated them more widely than they had ever been before, and inflamed them with mutual dislike and animosity. On the death of Mary both parties returned to England: the one joyfully expecting to see their ancient worship restored: the other more firmly wedded to their puritan sentiments by the opportunity they had obtained of freely indulging them, and entertaining (in common with many who had remained at home) an increased antipathy to the habits and ceremonies which the recent ascendancy and proceedings of the catholics had strongly associated with the odious features of popish fraud, delusion, and cruelty.

The hopes which the puritans derived from the accession of Elizabeth were seconded by the disposition of many, even of their opponents among the leading protestant churchmen, who had weathered the storm at home. Several of the most distinguished persons of this class expressed the strongest reluctance, in restoring the protestant constitution, to interweave with its fundamental canons, any subordinate regulations that might be injurious to men endeared to them by their common calamity, and so recently associated with them as confessors for the substance, not the mere forms of religion. Some of the puritans, no doubt, were bent on reducing the model of the church to a conformity with their own sentiments; and some of their opponents were as eager to prohibit and suppress every trace of puritan practice. The majority, however, as well as the leading members of both parties were earnestly desirous to effect an accommodation on the principles of mutual forbearance, and willingly agreed that the disputed habits and ceremonies should be retained in the church, as observances of a discretionary and indifferent nature, not to be controverted by the one nor enforced by the other, but left to be confirmed or abolished by the silent progress of sentiment and opinion. But the hopes of the zealous and the concessions of the candid were frustrated by the character of the queen; whose strong hand and imperious temper soon defaced the fair prospect of concord and happiness, and involved the people committed to her care in a long and widening scene of strife, malignity, and misery. Elizabeth inherited the haughty character of her father and his taste for splendid pageantry. And though she had been educated with her brother Edward, and her understanding had received a strong tincture of protestant opinions, her sentiments powerfully biased

her in favor of the rites, discipline, and even doctrine of the catholics—of every thing, in short, that could lend an imposing aspect to the establishment of which she was the supreme head, and increase the strictness of the dominion which she was resolved to maintain over the clergy. She publicly thanked one of her chaplains for preaching in defence of the real presence, and rebuked another for mentioning with little reverence the popish notion of an inherent virtue in the symbol of the cross. She desired to make the clergy priests, and not preachers; discouraged their sermons; and would have interdicted them from marriage had she not been restrained by the remonstrances of her minister Lord Burleigh. Disregarding the wishes and entreaties both of churchmen and puritans, she restored King Edward's constitutions with no other alteration than the omission of a few passages in the liturgy which were offensive to the catholics; and caused a law to be framed for the enforcement, by fine, imprisonment, and deprivation, of a strict uniformity of religious worship. This was the first step in a line of policy which the church of England has had deep and lasting cause to deplore, and which, by compelling thousands of her best and ablest ministers reluctantly to forsake her communion, afflicted her with a decay of internal piety, from which, after the lapse of many generations, she has even now but imperfectly revived.

But this law was for some time very feebly and imperfectly enforced. The queen could not at once find a sufficient number of men fitted to sustain the dignity of episcopal elevation, and yet willing to become the instruments of her arbitrary designs; nor could all her efforts for some time excite general strife and ill-will among men of whom so many, though differing from each other on subordinate points, had but lately been united by community of sentiment and suffering in the noblest cause that can interest human hearts. Her first bench of bishops were not only eager to clear themselves of the reproach of having composed or approved the existing laws,* but by a general forbearance to enforce them, enabled the puritan ministers and practices to obtain a considerable footing in the church. And though she reprimanded the primate Parker for his negligence, and at length stimulated him to the exertion of some severities in the enforcement of the act of uniformity, it was far from receiving general execution; and by various acts of connivance on the one side, and prudent reserve on the other, the puritans were enabled to enjoy some semblance of peace. Their tranquillity was lengthened and increased by the succession of Grindall to the primacy. The liberal principles and humane disposition of this man revolted against the tyrannical injustice which he was required to enforce; and at the expense of his own imprisonment and the disfavor of his temporal sovereign, he prolonged the duration of lenient policy, and the peace of the church.

At length, on the death of Grindall, the primacy was bestowed on Whitgift, a man of severe temper, a rigid votary of the discipline and policy of the church, and an implacable adversary of the puritans, against whom he had repeatedly directed the hostility of his pen, and was eager to be intrusted with the exercise of a more formidable weapon. From this period all the force of the law was spent in uninterrupted efforts to vex the persons, or violate the consciences of the puritans. A numerous body of puritan ministers were deprived of their livings; and many of their parishioners were punished by fine and imprisonment for following their ministry into the fields and woods, where they continued to exercise it. Great endeavors were used by the wise and good to move the queen, ere yet it was too late, to stay the waters of strife she was letting out upon the land. Burleigh and Walsingham earnestly interceded for the suspended ministers, and pressed every consideration of the indulgence due to their conscientious scruples, the humane concern to which their families were entitled, and the respect which policy demanded for the sentiments of so great a body of the people by whom they were esteemed and beloved. The House of Commons too showed a desire to procure some relief for the oppressed puritans. But

* In their letters to their friends at home and abroad, they not only reprobate the obnoxious institutions, but promise "to withstand them 'till they be sent back to hell, from whence they came," to sow discord, confusion, and vain formality in the church. Burnet, part iii. p. 314. Nesl, i. 49. There seems to be very little difference between these expressions of English bishops and the language of a Scotch presbyterian minister about the same time, who pronounced, in a sermon, that the Queen of England was no better than an atheist, and "all kings were the devil's children." Spottiswoode's History of the Church of Scotland. The difference was, that the conduct and language of the one were more consistent than those of the other.

Whitgift flung himself on his knees before the queen and implored her to uphold the sinking church, and to suffer no alteration that would give men leave to say that she had maintained an error. His humiliation, most probably, was prompted rather by flattery than fear; for Elizabeth had shown no inclination whatever to mitigate an imperious policy so congenial to her own character. The enforcing of implicit deference to her judgment, and of rigid conformity to the model she had enacted, was the result of her early and stubborn choice, and maintained with her usual vigor and vehemence of determination. She overbore all opposition; and the primate and his associates being encouraged to proceed in the course they had begun, their zeal enlarging as it flowed, soon transported them beyond all bounds of decency and humanity. They were allowed to establish a court of commissioners for the detection of non-conformity, which even the privy council remonstrated against as a copy of the Spanish inquisition. By the assistance of this tyrannical engine, they made freer course for the severities of the law; and having rendered integrity hazardous, they made prudence unavailing to the puritans. In vain were they reminded of the maxim of the first christian council, which recommended the imposition of no greater burthen on the people than the observation of necessary things. For the purpose of imposing a load of ceremonies, which without the actual profession of popery they could never represent as observances essential to salvation, they committed such oppression as rendered the ceremonies themselves tenfold more obnoxious to those to whom even indulgent treatment would have failed to recommend them, and roused the opposition of others who would willingly have complied with the ceremonial ordinances if they had been proposed to them merely as matters of convenient observance, but revolted from them, as fraught with danger and mischief, when it was attempted to bind them on the conscience, and place them on a level with the most sacred obligations. The most signal fruit of this increased severity was the enkindling of great additional zeal and fervor in the minds of the puritans; a rapid multiplication of their numbers by strong sympathy with their courage, and compassion for their sufferings; and a growing abhorrence in their body to the order of bishops and the whole frame of a church which to them was an organ of injustice and tyranny. It is certain that the puritans of those times were exceedingly averse to separate from the church of England; and their ministers were still more reluctant to abet a schism and renounce their preferments. They willingly allowed her to be a true church, and merely claimed indulgence in the matter of a few ceremonies which did not affect her constitution. But the injurious treatment they received, held out a premium to very different considerations, and not only influenced their passions, but stimulated their inquiries and extended their objections. Cast out of the national church, they were forced to inquire if they could not do without that which they found they could not have; and were easily led to question if the features of a true church could be discerned in that body, which not only rejected but persecuted them for a conscientious adherence, in a matter of ceremonial observance, to what they believed to be the will of Christ. As the puritan principles spread through the mass of society, and encountered in their progress a greater variety of character in their votaries, and of treatment from their adversaries, considerable differences and inequalities of sentiment and conduct appeared in different portions of the puritan body. Some of them caught the spirit of their oppressors, and, in words at least, retaliated the unchristian usage they underwent. They combined the doctrines of the New with the practices of the Old Testament, in a manner which will not excite the wonder of those who recollect that the very first little flock of Christians who were collected in the world committed the same error; and so far forgot the spirit they had received, as even in the presence of their Divine Head to propose the invocation of fire from heaven on the men who had insulted them. But the instances of this spirit were exceedingly rare; and it was not till the following reigns that it prevailed either strongly or widely. In general the oppressed puritans conducted themselves with the fortitude of heroes and the patience of saints; and, what is surprising, they made more zealous and successful efforts to maintain their loyalty, than the queen and the bishops did to extinguish it.* Many, in defiance of

* Numberless instances might be adduced of the patience with which they endured the severities of ecclesiastical vengeance. Nor was their patience and magnanimity less conspicuous in the endurance of civil tyranny. A puritan having

every danger, followed the preaching of their ministers into the highways and fields, or assembled privately in conventicles, which the general sympathy, or the continuance of their secret partisans within the church, sometimes preserved from detection. Many reluctantly abided in the national church, unweariedly pursuing their ineffectual attempts to promote parliamentary interference in behalf of the puritans, and casting a wistful eye on the presumptive succession of a prince who had been educated in a presbyterian society. Some at length openly disclaimed the national establishment, and were led, by the cruel excesses of human authority, to the conviction, that human authority had no proper place in the administration of the kingdom of Christ.

The proceedings of the queen were, doubtless, cordially abetted by the angry zeal of those churchmen who had partaken of the controversy that had raged between the two parties during their exile on the continent in the preceding reign. But the whole civil and ecclesiastical policy of this reign was mainly and essentially the offspring of Elizabeth's own character. The Puritan writers, bestowing an undue proportion of their resentment on the persons whose functions rendered them the instruments as well as the apologists of the queen's ecclesiastical system, have been disposed to impute the tyrannical features of this system exclusively to the bishops, and particularly to Whitgift, whose influence with Elizabeth they ascribe to his constant habit of addressing her on his knees. But Whitgift, in abetting her enmity to the Puritans, merely paid his court to a disposition which she had already evinced in the strongest manner, and swam with the tide of that resolute determination which he saw must prevail. The abject homage which he paid her was nothing more than she was universally accustomed to receive; and the observation which it has seemed to deserve from the Puritans, denotes rather a peculiarity in their own manners, than any thing remarkable in the conduct of their adversary. Not one of her subjects ever addressed the queen without kneeling; wherever she turned her eye, every one fell on his knees; and even in her absence, the nobility, who were alone thought worthy to cover her table, made three genuflexions every time they approached or retired from it in the performance of their menial duty.* This was an exact counterpart of the homage rendered by the catholics to the Real Presence, which they believed to reside in the Host; and the sentiments which it tended to form both in the party receiving, and the parties who rendered it, were confirmed by the language of Parliament, in which the queen was continually flattered with praises and attributes appropriated to the Supreme Being. Nor was this servile system of manners peculiar to the reign of Elizabeth. On the contrary, it had been carried even to a greater extent under the government of her predecessors; and her ministers frequently noted and deplored the decay of that fearfulness and reverence of their superiors which had formerly characterized the inferior estates of the realm. Sense and reason participated in the ignominy and degradation of manners; arrogance disordered the understanding of the prince, while servility deformed the sentiments of the people; and if Henry the Eighth, by a royal proclamation, assured the populace that they were *brutes*, the same populace, in their petitions against his measures, represented the promotion of *low-born persons* to public trust and honor, as one of the most serious and intolerable grievances that they had to complain of.

The sentiments which such practices and manners tended to form in the mind of the queen, enhanced the displeasure with which she regarded the Puritans, who were fated to offend her by their political conduct, as well as their religious opinions. Many of the more eminent persons among them obtained seats in Parliament, where they endeavored to revive a spirit of liberty and direct its energy to the protection of their oppressed brethren. Impelled by the severity of the restraints

written a book against the danger which might attend the marriage of the queen with a popish prince, was condemned to lose his right hand as a rebel. The instant the blow was struck, he took off his hat with his other hand, and, waving it in the air, cried "God save the queen." The puritans were much more afraid of the revival of popery in England, than of the severity of those ecclesiastical laws under which papists and puritans were equally liable to oppression. To this extent they concurred with the ecclesiastical policy of Elizabeth.

* Hentzner's Journey into England in 1598 (Strawberry Hill edition), a. 50, 51. This abject ceremonial was abolished by King James, who, though highly pleased with adulation, found himself embarrassed by a mode of displaying it so ill suited to his awkward manners and ungainly appearance.

they experienced, to investigate the boundaries of that authority from which they originated, and regulating their sentiments rather by the consequences they foresaw than by the precedents that confronted them, they questioned the most inveterate abuses, and obtained the confidence of the people by showing themselves the indefatigable and fearless defenders of the oppressed. In the annals of these times, we find them continually supporting petitions in parliament against monopolies, and advocating motions for reformation of ecclesiastical abuses. Attracting popular favor, and willing to undergo the burden of parliamentary attendance, they gradually multiplied their numbers in the House of Commons, and acquired an ascendancy over its deliberations. The queen, observing that the Puritans were the sole abettors of measures calculated to restrict her prerogative, was easily led to ascribe the peculiarity of their religious and political opinions to the same source—a malignant aversion to dignities, and impatience of subordination. Their reluctance to render to the Deity that ceremonious homage which the most illustrious persons in the land rendered to herself, and their eagerness to control her prerogative, which nowhere else experienced resistance, appeared to her the indications of an insolent disregard, no less of the Supreme Being than of herself.—His acknowledged vicegerent and representative; a presumptuous insurrection of spirit against the reverence due to God, and the loyalty due to the prince.* Nothing could be more unjust and fallacious than this royal reasoning. The religion, as well as the loyalty, of the Puritans, was the less ceremonious, only because it was the more reflective, profound, and substantial. To preserve a good conscience, they encountered the extremities of ecclesiastical rigor. In spite of every wrong, they evinced a resolute constancy of regard to their sovereign. And neither intimidated by danger nor dispirited by defeat, they maintained a continual effort to check the excesses of despotic authority, and to rear and cherish the public liberties of their country. They have been charged with a sour and caustic spirit, by those who forced them to eat their bread in bitterness and carry their lives in their hands; of an enmity to literature, and an exclusive reference to the Bible, by those who destroyed their writings, committed the press to episcopal licensers, and deprived them of every source of comfort and direction but what the Bible could supply; of an exaggerated estimate of little things, by those who made such things the cause of cruel suffering and enormous wrong; of a stern jealousy of civil power, by those who made it continually their interest to question and abridge the authority by which they were oppressed. It is acknowledged by an eminent philosophic historian, who will not be suspected of any undue partiality for these people, that the puritans were the preservers of civil and religious liberty in England.† It was a scion of the same stock that was destined to propagate these blessings in America.

The minds of a considerable party among the Puritans had been gradually prepared to disclaim the authority of the national church, and to deny the lawfulness of holding communion with it; inasmuch, that when these opinions were first publicly preached by Robert Brown in 1586, they rapidly obtained the assent and open profession of multitudes. Brown, who gained the distinction of bestowing his name on a sect which derived very little credit from the appellation, was a

young clergyman, of good family, endowed with a restless, daring character, a fiery temper, and a heart of controversy. Encountering the wrath of the ecclesiastics with fiercer wrath, and trampling on their arrogance with more than clerical pride,* he roamed about the country inveighing against bishops, ecclesiastical courts, ceremonies, and ordination of ministers, and exulting, above all, in the boast that he had been committed to thirty-two prisons, in some of which he could not see his hand at noon-day. His impetuous and illiberal spirit accelerated the declaration of opinions which were not yet matured in the puritan body, and which, but for his unseasonable interposition and perverting influence, might sooner have been ripened into the system of the independents. The queen and the bishops applied the usual remedy of persecution to this innovation, with even more than the usual evidence of the unfitness of their policy to effect its object. Supported by powerful arguments, maintained with zeal and courage, and opposed by cruelties that disgraced the name of religion, the principles of the Brownists spread widely through the land. Brown himself, and a congregation more immediately attached to him, expatriated to Middleburgh, in Zealand, where they were permitted to establish themselves unmolested. But Brown had collected around him spirits too congenial to his own, to preserve their union when the strong band of oppression was withdrawn. The congregation crumbled into parties, and was soon dissolved; and Brown, returning to England, joined the national church, and, contracting dissolute habits, ended his days in indolence and contempt. But the doctrines which he had been the means of introducing to public notice had firmly rooted themselves in the puritan body, and received daily accessions to the numbers and respectability of the votaries.

The Brownists did not differ from the church of England in any of her articles of faith, but they looked upon her discipline as popish and anti-christian, and all her sacraments and ordinances as invalid; and they renounced communion, not only with her, but with every other protestant church that was not constructed on the same model as their own. Their model was derived from the closest imitation of the primitive institutions, as delineated in scripture. When a church was to be gathered, all who desired to be members of it, made a confession of their faith before one another, and signed a covenant by which they obliged themselves to walk together in the order of the gospel. Each congregation formed an independent church, and the admission or exclusion of members resided with the brethren composing it. Their church officers were elected from among themselves, and separated to their several offices of preaching the word, administering their ordinances, and taking care of the poor, by fasting and prayer and the imposition of the hands of some of the brethren. They did not allow the priesthood to be a distinct order, or to invest a man with an indelible character; but, as the appointment of the church conferred his function (which in its exercise, too, was limited to the special body to which he was attached), so the same authority was sufficient to deprive him of it. It was lawful for any one of the brethren to exercise the liberty of prophesying, as it was called, which meant the giving a word of exhortation to the people; and it was usual for some of them, after sermon, to ask questions, and reason upon the doctrines that had been preached. The condition to which the puritans were reduced by their oppressors, favored the acceptance of all that was separating and unsocial in the principles of the Brownist teachers; for, while every congregation had to assemble by stealth, it was impossible to maintain any intercourse between their churches, or to ascertain how far they mutually agreed in doctrine and discipline.

Against these men, in whose characters were united more piety, virtue, courage, and loyalty than any other portion of her people displayed, did Elizabeth and her ecclesiastical counsellors direct the whole fury of the law. John Udall, one of their ministers, was tried in the year 1591, for having published a defence of their tenets, which he entitled *A Demonstration of the Discipline which Christ hath prescribed in his Word for the Government of the Church in all Times and Places until the World's End*. This, consistently with Elizabeth's declaration, that whoever attacked the church, slandered the queen, was regarded as a scandalous

libel, and Udall was arraigned for a capital felony. When he was told by one of the judges that a book replete with sentiments so inconsistent with the established institutions, tended to the overthrowing of the state and the rousing of rebellion, he replied, "My lords, that be far from me; for we teach that, reforming things amiss, if the prince will not consent, the weapons that subjects are to fight with all, are repentance and prayers, patience and tears." The judge offered him his life if he would recant; and added, that he was now ready to pronounce sentence of death. "And I am ready to receive it," cried this magnanimous man; "for I protest before God (not knowing that I am to live an hour) that the cause is good, and I am contented to receive sentence, so that I may leave it to posterity how I have suffered for the cause." He was condemned to die; and being still urged to submit to the queen, he willingly expressed his sorrow that any of his writings should have given her offence, and disclaimed any such wish or intention, but resolutely refused to disown what he believed to be the cause of truth and of liberty of conscience. By the interest of some powerful friends, a conditional pardon was obtained for him; but before the terms of it could be adjusted, or the queen prevailed on to sign it, he died in prison. Penry, Greenwood, Barrow,* and Dennis, of whom the first two were clergymen, and the others laymen, were soon after tried on similar charges, and perished by the hands of the executioner. These men were offered a pardon if they would retract their profession; but, inspired by a courage which no earthly motive could overcome, they clung to their principles, and committed their life to its author. Some others were hanged for dispersing the writings, and several for attending the discourses, of the Brownists. Many more endured the torture of severe imprisonment, and numerous families were reduced to indigence by heavy fines. As the most virtuous and honorable are ever, on such occasions, most exposed to danger, every stroke of the oppressor's arm is aimed at those very qualities in his adversaries that constitute his own defence and security; and, hence, severities so odious to mankind, and so calculated to unite by the strongest sympathy the minds of the spectators and sufferers together, are more likely to diminish the virtue than the numbers of a party. By dint of long continuance, and of the exertion of their influence on a greater variety of character, they finally divested a great many of the puritans of the spirit of meekness and non-resistance for which the fathers of the party had been so conspicuous. But this fruit was not gathered till a subsequent reign; and their first effort was not only to multiply the numbers, but to confirm the virtue of the puritans. When persecution had as yet but invigorated their fortitude without inspiring ferocity, a portion of this people was happily conducted to the retreat of America, there to plant and extend the principles of their noble cause, while their brethren in England remained behind to avenge its accumulated wrongs.

When the queen was informed, by Dr. Reynolds, of the calm piety which these martyrs had displayed, how they had blessed their persecuting sovereign, and turned the scaffold to which she had consigned them into an altar, whence they had prayed for her long and happy reign, her heart was touched with a sentiment of remorse, and she expressed regret that she had taken their lives away. But repentance with all mankind is too often but a barren anguish; and princes have been known to bewail, even with tears, the mortality of multitudes whom they were conducting to slaughter, and the shortness of that life which they were contributing still farther to abridge. Elizabeth, so far from abating, increased the legislative severities whose effects she had deplored; and was fated never to see her error till it was too late to repair them. In the year 1593, a few months after the executions which we have alluded to, a new and severer law was enacted against the puritans. This body was not only extending itself every day, but so rapidly adopting the independent opinions, that, in the debate which took place in the House of Commons on the introduction of this law, Sir Walter Raleigh stated, that the numbers of professed Brownists alone then amounted to twenty thousand. The humane arguments, however, which he

* In a speech from the throne, she informed the commons (after a candid confession that she knew nobody who had read or reflected as much as herself) that whoever attacked the constitutions of the church, slandered her as its supreme head, divinely appointed; and that, if the papists were inveterate enemies to her person, the modern sectaries were no less formidable to all kingly government. She added, that she was determined to suppress their overboldness in presumptuously scanning the will of God Almighty,—thus presuming, by the word of her mouth, to arrest the stayless course of thought, and practically appropriating the power of that Being whose honor she pretended to vindicate. D'Ewes Account of Queen Elizabeth's Parliament, p. 328. The cruel law that was passed in the thirty-fifth year of the queen's reign, against all recusants to attend the national church, is entitled "An act to retain her majesty's subjects in their due obedience," and was intended, as the preamble declared, to repress the evil practices of "seditious sectaries and disloyal persons"—anyonymous descriptions of guilt in the estimation of Elizabeth.

† "So absolute indeed was the authority of the crown, that the precious spark of liberty had been kindled and was preserved by the puritans alone; and it was to this sect, whose principles appear so frivolous and habits so ridiculous, that the English owe the whole freedom of their constitution." *Hume's England*, vol. v. p. 163. Again, "It was only during the next generation that the noble principles of liberty took root, and, spreading themselves under the shelter of puritanical absurdities, became fashionable among the people." *Ibid.* p. 469. The only fault that this historian can find with the puritans is, that they were imbued with the only principles which can inspire men with a courage insurmountable by any human motive.

* His grandfather had a charter from Henry the Eighth, confirmed by act of Parliament, "giving him leave to put on his cap in the presence of the king, or his heirs, or any lord spiritual or temporal in the land, and not to put it off but for his own ease or pleasure." The cap seems to have transmitted its properties with its privileges to the grandson of him whose arrogance could solicit such a distinction.

* This man, while lingering in the dungeon, where he awaited his fate, presented a supplication to parliament, which contains a frightful picture of the horrors of imprisonment in that age. "We crave for all of us," he says, "but the liberty either to die openly or to live openly in the land of our nativity. If we deserve death, it becometh the majesty of justice not to see us closely murdered, yea, starved to death with hunger and cold, and stifled in loathsome dungeons," &c. Neal, i. 64. But the parliament was compelled to leave Barrow and his fellow sufferers to the mercy of the queen and the bishops.

derived from this consideration were unavailing to prevent the passing of a law, which enacted, that any person above sixteen years of age who obstinately refused, during the space of a month, to attend public worship, should be committed to prison; that, if he persisted three months in his refusal, he must abjure the realm; and that, if he either refused this condition, or returned after banishment, he should suffer death as a felon. If this act was not more fortunate than its predecessors in accomplishing the main object of checking the growth of puritan principles, it effected at least the subordinate purpose of driving a great many of the professors of independency out of England. One body of these fugitives was collected about the close of the sixteenth century, at Amsterdam, where they flourished in peace and piety for upwards of a hundred years. Others retired to different protestant states on the continent, whence with fond delusive hope, they expected to be recalled to their native land by the accession of Elizabeth's successor. The remainder continued in England to fluctuate between the evasion and the violation of the law, cherishing with their principles a stern impatience arising from the galling restraints that impeded their expression; and yet retained in submission by the hope which in common with the exiles they indulged of a mitigation of their sufferings on the demise of the queen. Some historians have expressed no small wonder at the ungrateful impatience for a new reign that was manifested in the close of Elizabeth's life, and at the very sudden disgust which the government of her successor experienced. But these seeming inconsistencies arose from the same cause. Elizabeth had exhausted the patience and loyalty of a great body of her subjects; and the adherence to her policy which her successor so unexpectedly manifested, disappointed all the hopes by which these virtues had been sustained.

The hopes of the puritans were derived from the education of the Scottish king, and supported by many of his declarations, which were eagerly repeated in England. James had been bred a presbyterian; he had publicly declared that the kirk of Scotland was the purest church in the world, and that the English Liturgy sounded in his ears like an *ill-mumbled mass*. On his accession to the English crown, he was eagerly assailed by petitions from the puritans; and at first he showed himself so far disposed to attend to their wishes as to appoint a solemn conference between them and the heads of the church party at Hampton Court. But the hopes inspired by this conference were completely disappointed by its result [Jan. 1604]. If James had ever been sincere in preferring a presbyterian to an episcopal establishment, his opinion was entirely reversed by the opportunity he now enjoyed of comparing them with each other, and by the very different treatment he experienced from the ministers of both. In Scotland he had been involved in perpetual contentions with the clergy, who did not recognise in his regal office any supremacy over their church, and who differed from him exceedingly in their estimate of his piety, capacity, and attainments. Precluded by his poverty from a display of royal pomp that might have dazzled their eyes and hid the man behind the king, he stood plainly revealed to their keen glance, an awkward personification of conceit and pedantry, obstinate but unsteady, fraught with learning, void of knowledge. They have been accused of disturbing his government by exercising a censorial power over it; but it was himself that first taught them thus to overstep their functions. Extending his administration into their peculiar province, where it had no right to penetrate, he seemed to legitimize as well as provoke their censorial strictures on his intrusion. Mingling religion with his politics, he attempted to remodel the church; and the clergy, mingling politics with their divinity, complained of his interference and censured his government. Defending institutions not less respected than beloved by the people, they easily obtained the victory; and James met with the same success in attempting to control the sentiments of the Scotch, that in his tobacco controversy he afterwards experienced in attempting to prevail over the senses of the English. One of the ministers had gone the length of declaring that "all kings were the devil's children;" and the king retorted the discourtesy when he found himself safe in England, by vehemently protesting that "a Scottish presbytery agrees as well with monarchy as God and the devil." The sentiments that naturally resulted from offended arrogance and mortified presumption, were expanded to their amplest plenitude by the blaze of flattery and adulation with which the dignitaries of the English church received him. By them he was readily hailed

the supreme head of their establishment, the protector of its privileges, the source of its splendor, the patron of its dignities; and Whitgift went so far as to declare, in the conference at Hampton Court, that undoubtedly his majesty spake by the special assistance of God's spirit. This was the last impulse that Whitgift was able to lend to royal pride and folly. Confounded at the universal explosion of puritan sentiments, which he had flattered himself with the hope of having almost completely extinguished, his grief and concern so violently affected his aged body as to cause his death very shortly after. But he had already contributed to revive the ecclesiastical spirit of Elizabeth in the mind of her successor; and James, inflamed with admiration of a church which, like a faithful mirror, so fairly reflected and illustrated his royal perfections, became henceforward the determined patron of the establishment, and the persecutor of all who opposed its institutions. His natural arrogance, fortified by such unexceptionable testimony, soared to a height which nothing but royalty or a disordered understanding has ever attained; and he who in Scotland had found himself curbed in every attempt to interfere with the religious institutions of his own narrow realm, now thought himself entitled to dictate the ecclesiastical policy of foreign nations. Having entered into a dispute with Vorstius, professor of theology in a Dutch university, and finding his adversary insensible to the weight of his arguments, he resolved to make him feel at least the weight and length of his arm; and roused to a degree of energy and haughtiness to which no other foreign concernment was ever able to excite him, he remonstrated so vigorously with the states of Holland, that to put an end to his clamor, they submitted to the mean injustice of deposing and banishing the professor. With this sacrifice to his insulted logic, James was forced to be contented, though he had endeavored to rouse his republican allies to more royal revenge, by informing them "that as to the burning of Vorstius for his blasphemies and atheism, he left them to their own christian wisdom: but surely never heretic better deserved the flames." He did not fail to reinforce this charitable counsel by his own example; and in the course of his reign burned at the stake two persons who were so unhappy as to entertain the Arian heresy, and an unfortunate lunatic who mistook himself for the Deity,* and whose frenzy was thus cruelly treated by a much more dangerous and deliberate invader of the divine attributes. If James had not been restrained by the growing political ascendancy of the puritans, there would probably have been more of such executions in England. He did, however, as much as he dared; and finding in Bancroft a fit successor to Whitgift, he made with his assistance so vigorous a commencement, that in the second year of his reign three hundred puritan ministers were deprived, imprisoned or banished. To prevent the communication of light from abroad, the importation of any books hostile to the restraints imposed by the laws of the realm or the king's proclamations, was forbidden under the severest penalties; to prevent its rise and repress its spread at home, no books were suffered to be printed in England without the consent of a committee of bishops or their deputies; and arbitrary jurisdictions for the trial of ecclesiastical offences were multiplied and extended. Persons suspected of entertaining puritan sentiments, even though they adhered to the church, were subjected to fine and imprisonment for barely repeating to their families, in the evening, the substance of the discourses they had heard at church during the day, under the pretence that this constituted the crime of irregular preaching. Some of the puritans having conceived the design of withdrawing to Virginia, where they hoped that distance would at least mitigate the violence of oppression, a small number of them proceeded to carry their purpose into effect; and a larger body were preparing to follow, when Bancroft, apprised of their intention, obtained a proclamation from the king, commanding that none of his subjects should settle in Virginia without an express licence under the great seal. Thus harassed and oppressed in England, and deprived of a refuge in Virginia, the puritans began to retire in considerable numbers to the protestant states of the continent; and the hopes of the still greater and increasing numbers who remained at home were fixed on the House of Commons. In this assembly the puritan ascendancy

* One of these victims is termed by Fuller, in his *Church History* (B. x. § 4), "Our English Vorstius." The king, in imitation of Henry the Eighth's generosity to Lambert, held a personal dispute with him, and concluded it by delivering him to the hands of the executioner.

at length became so manifest, that in spite of the king's proclamations for encouraging mirthful games on Sunday, a bill was introduced for compelling a more strict and solemn observance of the day, to which it gave the denomination of the sabbath; and when one member objected to this as a puritan appellation, and ventured to justify dancing by a gay misapplication of some passages in scripture, he was, on the suggestion of Mr. Pym, expelled the house for his profanity. But we have now reached the period at which we must forsake the main stream of the history of the puritans, to follow the fortunes of that illustrious branch which was destined to visit and enoble the deserts of America. In reviewing the strange succession of events which we have beheld, and the various impressions they have produced on our minds, it may perhaps occur to some as a humiliating consideration, that the crimes and follies, the cruelties and weaknesses which would excite no other sentiments but those of horror, grief, or pity, in an angelic beholder, are capable of presenting themselves in such an aspect to less purified eyes, as to excite the splenetic mirth even of those whose nature is degraded by the odious or absurd display.

In the year 1610, a congregation of Brownists, driven by royal and ecclesiastical tyranny from their native land, had removed to Leyden, where they were permitted to establish themselves in peace under the ministry of their pastor, John Robinson.* This excellent person was the father of the Independents, having been the first who realized a middle course between the path of Brownism and the Presbyterian system; to one or other of which the views and desires of the Puritans were now generally tending. The sentiments which he entertained when he first quitted his country, bore the impress of the persecution under which they had been formed; and when he began his ministry at Leyden he was a rigid Brownist: but after he had seen more of the world, and been enabled to converse in a friendly manner with learned and good men of different ecclesiastical denominations, he began to entertain a more charitable opinion of those minor differences, which he plainly perceived might subsist, without injury to the essentials of religion, and without violating charity, or inciting persecution. Though he always maintained the lawfulness and expediency of separating from those established protestant churches among which he lived, he willingly allowed them the character of true churches; esteemed it lawful to communicate with them in preaching and prayer, though not in the sacraments and discipline; and freely admitted their members to partake the sacrament with his congregation. He maintained that each particular church, or society of Christians, was vested with the power of choosing its own officers, administering the gospel ordinances, and exercising over its own members every necessary act of discipline and authority; and consequently, that it was completely independent of all classes, synods, convocations and councils. He admitted the expediency of synods and councils for the reconciling of differences among churches, and the tendering of friendly advice to them; but denied their competence to exercise any act of jurisdiction, or authoritatively to impose any articles or canons of doctrine. These sentiments Mr. Robinson recommended to esteem by exemplifying, in his life and demeanor, the fruits of that spirit by whose teaching they were communicated; by a character, in which the most eminent faculties, and the highest attainments, were absorbed by the predominating power of a solemn, affectionate piety.

Enjoying the counsel and direction of such a pastor, and blessed with an adequate sense of his value, the English congregation remained for ten years at Leyden, in harmony with each other, and at peace with their neighbors. But, at the end of that period, the same pious views that had prompted their original departure from England incited them to undertake a more distant migration. They beheld with deep concern the loose profane manners that prevailed very generally around them, and, in particular, the utter neglect among the Dutch of a reverential observance of Sunday; and they reflected with apprehension on the danger to which their children were exposed from the natural contagion manners so unfavorable to serious piety; their country too, still retained a hold on their affections; and they were loth to see their posterity melted into the Dutch population. The fewness of their numbers, and the difference of language, forbade the hope of propagating, in Holland, the principles

* Cardinal Bentiveglio, in his *Account of the United Provinces*, describes them as a body of English puritans, who had resorted to Holland for purposes of commerce.

which, with so much suffering and hazard, they had hitherto maintained; and the state of the English government extinguished every hope of toleration in their native land. In these circumstances, it occurred to them that they might combine the indulgence of their patriotic attachment with the propagation of their religious principles, by establishing themselves in some distant quarter of the English dominions; and, after many days of earnest supplication for the counsel and direction of Heaven, they unanimously determined to transport themselves and their families to the territory of America. It was resolved that a part of the congregation should go out before the rest, to prepare a settlement for the whole; and that the main body should till then, remain behind at Leyden with their pastor. In choosing the particular scene of their establishment, they hesitated, for some time, between the territory of Guiana, of which Sir Walter Raleigh had published a most dazzling and fanciful description, and the province of Virginia, to which they latterly gave the preference; but the hand of Providence was exerted no less in the general direction of their counsels, than in the control of their political proceedings, and their residence was ordained to be established in New England.

Through the medium of agents, whom they deputed to solicit the interposition of the proper authorities, they represented to the English government, "that they were well weaned from the delicate milk of their mother country, and inured to the difficulties of a strange land: that they were knit together in a strict and sacred bond, by virtue of which they held themselves bound to take care of the good of each other, and of the whole; that it was not with them as with other men, whom small things could discourage, or small discontent cause to wish themselves at home again." The king, wavering between his desire to promote the colonization of America, and his reluctance to suffer the consciences of any portion of his subjects to be emancipated from his control, refused to grant them a charter assuring the free exercise of their religion, but promised to connive at their practices, and on no account to molest them. They were forced to accept this precarious security; but relied with more reason on their distance from the Spiritual Courts of England, and from the eye and arm of their persecuting sovereign. Having procured from the Virginia Company a grant of a tract of land, lying, as was supposed, within the limits of its patent, several of the congregation sold their estates, and with the money equipped two vessels, in which a hundred and twenty of their number were appointed to embark from an English port for America.

All things being ready for the departure of this detachment of the congregation from Delft haven, where they took leave of their friends, for the English port of embarkation, Mr. Robinson held a day of solemn worship with his people, to implore a blessing upon the hazardous enterprise. He preached a sermon to them from Ezra, viii. 21:—*I proclaimed a fast there at the river Ahava, that we might afflict our souls before God, to seek of him a right way for us, and for our little ones, and for all our substance.* He concluded his discourse with the following noble exhortation, to which, with all its intrinsic merits, our sentiments will fail to do justice, if we neglect to remember, that such a spirit of Christian liberty as it breathes was then hardly known in the world. "Brethren, said he, "we are now quickly to part from one another, and whether I may ever live to see your faces on earth any more, the God of Heaven only knows; but whether the Lord has appointed that or no, I charge you, before God and his blessed angels, that you follow me no farther than you have seen me follow the Lord Jesus Christ.

"If God reveal anything to you, by any other instrument of his, be as ready to receive it as ever you were to receive any truth by my ministry; for I am verily persuaded, I am very confident, the Lord has more truth yet to break forth out of his holy word. For my part, I cannot sufficiently bewail the condition of the reformed churches, who are come to a period in religion, and will go at present no farther than the instruments of their reformation. The Lutherans cannot be drawn to go beyond what Luther saw; whatever part of his will our good God has revealed to Calvin, they will rather die than embrace it; and the Calvinists, you see, stick fast where they were left by that great man of God, who yet saw not all things.

"This is a misery much to be lamented; for though they were burning and shining lights in their times,

yet they penetrated not into the whole counsel of God; but, were they now living, would be as willing to embrace further light, as that which they first received. [1620.] I beseech you remember it, 'tis an article of your church covenant, that you be ready to receive whatever truth shall be made known to you from the written word of God. Remember that, and every other article of your sacred covenant. But I must herewithal exhort you to take heed what you receive as truth. Examine it, consider it, and compare it with other scriptures of truth before you receive it; for 'tis not possible the christian world should come solately out of antichristian darkness, and that perfection of knowledge should break forth at once.

"I must also advise you to abandon, avoid, and shake off the name of Brownist; 'tis a mere nickname, and a brand for the making religion, and the professors of it, odious to the Christian world." Having said thus much, he exchanged with them embraces and affectionate farewells; and kneeling down with them all on the sea shore, commended them in a fervent prayer, to the blessing and protection of Heaven. Such were the men, nobler than all his tribe, whom the English monarch cast out of his dominions; and such were the scenes of wisdom and piety, which the control of Providence elicited from the folly, insolence, and bigotry, of a tyrant.

The emigrants, after having been once driven back by a storm, and lost one of their vessels, finally embarked from Plymouth, in the other, on the sixth of September, and, after a long and dangerous voyage, reached the coast of America. Hudson's river had been the place of their destination, and its banks the scene of their intended settlement; but the Dutch, who conceived that a preferable right to this territory accrued to them from its discovery by Captain Hudson, had maintained there, for some years, a small commercial establishment, and were actually projecting a scheme of more extensive occupation, which they were neither disposed to forego, nor yet prepared to defend. In order to defeat the design of the English emigrants, they bribed the captain of their vessel, who was a Dutchman, to carry them so far towards the north, that the first land which they made was Cape Cod, a region, not only beyond the precincts of their grant, but beyond the territories of the company from which the grant was derived. But the lateness of the season, and the sickness occasioned by the hardships of a long voyage, compelled the adventurers to settle on the soil to which their destiny had conducted them, and which seemed to have been expressly prepared and evacuated for their reception by a pestilential disease, which, in the former year, had swept away nine-tenths of its savage and idolatrous population. After exploring the coast, they chose for their station a place now belonging to the province of Massachusetts bay, to which they gave the name of New Plymouth, either as a testimony of respect to the company within whose jurisdiction they found themselves situated, or in commemoration of the city with which their last recollections of England were associated. To remedy in some measure, their defect of formal title, they composed and subscribed an instrument declaratory of the purpose with which they had come to America, recognising the authority of the English crown, and expressing their own combination into a civil body politic, and their determination to enact all just and necessary laws, and honour them by a due obedience.* Here, then, remote from the scenes and paths of human grandeur, these men embarked on a career of life, which, if the true dignity of actions be derived from the motives that prompt them, the principles they express, and the ends they contemplate, I cannot term otherwise than elevated and admirable.

The speedy approach and intense severity of their first winter in America painfully convinced the settlers that a more unfavourable season of the year could not have been selected for the formation of their colony; and that the slender stores with which they were provided were far short of what was requisite to comfortable subsistence, and constituted a very inadequate preparation to meet the rigour of the climate. Their exertions to provide themselves with suitable dwellings were obstructed, for some time, by the hostile attacks of some of the neighbouring Indians, who had not forgotten the provocation they had received

from Captain Hunt; and the colonists had scarcely succeeded in repulsing them, when disease occasioned by scarcity of provisions, and the increasing horrors of the season afflicted them with a calamity, perhaps less dangerous to their virtue, but more destructive to their strength and numbers than the perils of war.—More than one half of their number, including John Carver, their first governor, perished of hunger or disease before the return of spring; and, during the whole of the winter, but few were capable of providing for themselves, or rendering assistance to the rest; but hope and virtue survived, and rising into greater vigour beneath the pressure of accumulated suffering surmounted and ennobled every calamity. [1621.] Those who retained their strength became the servants of the weak, the sick, and the dying; and nor distinguished himself more in this honourable duty than Mr. Carver, the governor. He was a gentleman of large estate, but larger heart; he had spent his whole fortune on this project; and now, willing, contributing his life to its accomplishment, he exhausted a feeble body in laboriously discharging the meanest offices of kindness and service to the sick.—When the distress of the colony was at its height, the approach of a powerful Indian chief seemed to portend the utter destruction of the settlers; but, happily, in the train of this personage, was the ancient guest and friend of the English, Squanto, who eagerly and successfully laboured to mediate a good understanding between them and his countrymen. He afterwards cancelled the merit of this useful service, and endeavoured to magnify his own importance by fabricating charges of plots and conspiracies against some of the neighboring tribes, while at the same time he kept these tribes in terror, by secret information that the English were in possession of a cask filled with the plague, which only his influence prevented them from setting afloat for the destruction of the Indians. But, before he resorted to this mischievous policy, the colonists had become independent of his services. Some of the neighbouring tribes, from time to time, made alarming demonstrations of hostility; but they were at length completely overawed by the courage and resolution of Captain Miles Standish, a gallant and skilful officer, who, with a handful of men, was always ready to encounter their greatest force, and anticipate their most rapid movements.*

With the arrival of summer the health of the colonists were restored, and their numbers continued to be reinforced from time to time, by successive emigrations of their friends from Europe. But these additions fell far short of their expectations; and of the main reinforcement which they had looked for from the accession of the remainder of the congregation at Leyden, they were utterly disappointed. The unexpected death of Mr. Robinson deprived his people at Leyden of the only leader whose animating counsels could have overcome the timidity inspired by the accounts of the distresses sustained by their friends in New England; and, accordingly, upon that event the greater part of those who had remained behind at Leyden now retired to join the other English exiles at Amsterdam, and very few had the courage to proceed to New Plymouth. This small colony, however, had evinced a hardy virtue that showed it was formed for endurance; and having surmounted its first misfortunes, continued to thrive in the cultivation of piety, and the enjoyment of liberty of conscience and political freedom. A noble attachment was formed to the soil which had been earned with so much virtue, and to the society whose continuance attested so manly a contest and so signal a victory over every variety of ill. While they demonstrated a proper respect for the claims of the original inhabitants of the country, by purchasing from them the territory over which the settlement extended, they neglected no preparation to defend by force what they had acquired with justice; and, alarmed by the tidings of the massacre of their countrymen in Virginia, they erected a timber fort, and adopted other prudent precautions for their defence. This purchase from savages, who rather occasionally traversed than continually occupied the territory, is perhaps the first instance on record of the full prevalence of the principles of justice in a treaty between a civilized and a barbarous people. [1621—4]. The constitution of their church was the same with that which

* Mather, b. i. Cap. ii. § 5.—Neal, i. 80—82, 87. Olmixon, i. 29. Hutchinson, ii. Append. 452. The fraud, by which the Dutch had contrived to divert these emigrants from Hudson's river, was discovered and stated in a memorial, which was published in England before the close of this year (1620). Prince's New England Chronology, p. 83.

* Mather, Neal. Peter Martyr declares that the hardships endured by the Spaniards in South America were such as none but Spaniards could have supported. But the hardships sustained by the first colonists of Plymouth appear to have exceeded them both in duration and intensity. See Hutchinson, ii. Append. 417.

which had been established at Leyden, and their system of civil government was founded on those ideas of the natural equality among men to which their ecclesiastical policy, so long the main object of their concern, had habituated their minds. The supreme legislative body was composed of all the freemen who were members of the church, and it was not until the year 1639 that they established a house of representatives. The executive power was committed to a governor and council annually elected by the members of the legislative assembly. Their jurisprudence was founded on the laws of England, with some diversity, however, in the scale of punishments, which was more nearly approximated to the Mosaic institutions. Considering the protection of morals more important than the preservation of wealth, they punished fornication with flogging, and adultery with death, while on forgery they inflicted only a moderate fine. The clearing and cultivation of the ground, fishing, and the curing of fish for exportation, formed the occupation of the colonists. The peculiarity of their situation naturally led them, like the Virginians, for some time, to throw all their property into a common stock, and, like members of one family, to carry on every work of industry by their joint labor for the public behoof. But the religious zeal which enforced this self-denying policy was unable to overcome the difficulties which must always attend it, and which are continually revived and augmented in a society deriving its increase not so much from its own internal growth as from the confluence of strangers. About three years after the foundation of New Plymouth, it was judged proper to introduce separation of possessions, though the full right of separate property was not admitted till a much later period; and even that change is represented as having produced a great and manifest increase of the industry of the people. The slow increase which, for a considerable period of time, the numbers of the colonists evinced, has been ascribed to the prolonged operation of this system of equality; but it seems more likely that the slowness of the increase (occasioned by the poverty of the soil and the tidings of the hardships attending a settlement in New England) was the cause of the retardation of the complete establishment of the right of private property. In the first society of men collected by the bond of christianity, and additionally united by persecution, we find an attempt made to abolish individual property; and, from the apostolic direction that *he who would not work should not eat*, we may conclude that the disadvantage which the operation of this principle is exposed to in a society deriving its increase from the continual confluence of strangers of dissimilar characters, was pretty early experienced. In Paraguay, the Jesuits formed a settlement where this peculiar disadvantage was not experienced, and which affords the only instance of the introduction and prolonged subsistence of a state of equality in a numerous society. But there the great fundamental difficulty was rather evaded than encountered by a system of tuition adapted, with exquisite skill, to confound all diversities of talent and disposition among the natives, in an unbounded and degrading dependence on their Jesuitical instructors.

[1624.] After having continued for some years without a patent for their occupation, the colonists, whose numbers now amounted to a hundred and eighty, employed one Pierce as their agent in England to solicit a grant of this nature from the English government and the grand council of Plymouth—a new corporation by which James, in the year 1620, had superseded the original Plymouth company, and to which he had granted all the territory lying within the fortieth and forty-eighth degrees of northern latitude. This corporate body continued to subsist for a considerable time, notwithstanding a vote of the House of Commons, in the year after its creation, declaring its privileges a grievance, and its patent void. Pierce procured a charter from the council, and caused it to be framed in his own name, with the appropriation of large territories and privileges to himself and his family; but, having embarked with a numerous body of associates, whom he had collected in England, to accompany him, and assist in the enforcement of his designs, his vessel was shipwrecked, and Pierce himself so dismayed with the disastrous issue of his injustice, that he confessed what he had done, and resigned his patent. The colonists, informed of his treachery, sent over Mr. Winslow,

one of their own number, to resume the solicitation for a charter. He appears not to have been able to procure a patent from the crown, but he obtained, after long delay, a grant of land and charter of privileges from the council. It was directed to William Bradford, the existing governor, and the immunities it conferred were appropriated to him, his heirs, associates, and assignees; but Mr. Bradford willingly surrendered all that was personal in the grant, and associated the general court of the freemen to all the privileges it conferred. By this grant of the grand council of Plymouth, the colonists were authorised to choose a governor, council, and general court, for the enacting and executing all laws which should be judged necessary for the public good. The colonial historians have mistaken this grant for a patent from the crown. But no such patent was ever issued; and the settlement of New Plymouth was never incorporated into a body politic, but remained a subordinate and voluntary association until it was united to its more powerful neighbor the colony of Massachusetts Bay. Both before and after the reception of this charter, the colonists were aware of the doubts that might be entertained of the validity of the acts of government which they exercised. Perhaps this defect was not altogether unfavorable to the interests and happiness of the settlers, and may have contributed to the moderate principles and conciliatory strain by which their administration was honorably distinguished from that which afterwards unfortunately prevailed among their neighbors in New England. But the soil around New Plymouth was so meagre, and the supplies they received from Europe so scanty and infrequent, that in the tenth year of their colonial existence their numbers did not exceed three hundred. But their exertions were not destitute of great and important consequences. They held up to the view of the oppressed puritans in the parent state, a scene where persecuted virtue might retire to, and where only the hardy virtue that could withstand persecution seemed fated to obtain a permanent establishment. At the expense of the noblest sacrifices and most undaunted efforts, this handful of men laid the foundations of New England. A few years after their first establishment at Plymouth, a messenger arrived at this settlement from the governor of the Dutch plantation on Hudson's river, with letters congratulating the English on their prosperous and commendable enterprise, tendering the good will and friendly services of the Dutch, and proposing a commercial intercourse between the two settlements. The governor and council of Plymouth returned a courteous answer to this communication, expressing a thankful sense of the kindness which they had received in the native country of the Dutch, and a grateful acceptance of the proffered friendship. Nothing farther seems to have ensued from this overture than a series of small commercial dealings, and an occasional interchange of similar civilities, which, but a few years after, gave place to the most inveterate jealousy, and a continual reciprocation of complaints between the Dutch and the English colonists.

Various attempts had been made during this interval to emulate the successful establishment of New Plymouth; but they had all failed from inability to emulate the virtues from which the success of this colony was derived. In the year 1622, a rival colony was planted in New England by one Weston and a troop of disorderly adventurers, who, in spite of the friendly assistance of the settlers at New Plymouth, quickly sunk into such helplessness that some of them condescended to become servants to the Indians, some perished of hunger, others turned robbers, and by their depredations involved both themselves and the colonists of New Plymouth in hostilities with the natives, and the rest were glad to find their way back to England. In the following year an attempt of greater importance was made under the patronage of the grand council of Plymouth, which bestowed on Captain Gorges, the leader of the expedition, the title of governor-general of the whole country, with an ample endowment of arbitrary power, and on a clergyman whom he had brought with him, the office of bishop and superintendent of all the churches. But New England was not in such a condition that an establishment of this description could take root in it; and the governor and his bishop, deserting their charge, made haste to return to a climate more congenial to the growth

of temporal dominion and ecclesiastical dignity. Of their followers, some retired to Virginia, and others returned to England.* At a later period a similar undertaking, conducted by Captain Wollaston, was attended with a repetition of the same disastrous issue. Yet, all these unsuccessful plantations were attempted on land more fertile, and at a situation more commodious, than the settlers at New Plymouth enjoyed. The situation which they pitched upon was that of Massachusetts Bay, where, a few years after, a colony, which was formed on the same principles that had founded New Plymouth, and whose origin I now proceed to relate, afforded the second example of a successful establishment in New England.

The reign of Charles the First was destined to produce the consummation and the retribution of royal and ecclesiastical tyranny. Charles committed the government of the church to men who openly professed the most arbitrary principles, and whose inclinations carried them much more strongly to enforce an approximation to the church of Rome, than to promote agreement among the professors of the protestant faith. Abbot, the Archbishop of Canterbury, being restrained by the moderation of his principles and the mildness of his temper from lending his instrumentality to the designs of the court, was treated with harshness, and, at length, suspended from his office,† [1627] of which the functions were committed to a board of prelates, of whom the most eminent was Laud, who afterwards succeeded to the primacy. From this period, both in the civil and ecclesiastical administration of the realm, a system of deliberate and insolent invasion of whatever was most valued by freemen, or most revered by protestants, was pursued with stubborn pride and folly, and enforced by cruelties that at length exhausted the patience of mankind. To the historian of England, the political abuses that distinguished this period will probably appear the most interesting features in its history; and, doubtless, they contributed at least as powerfully as any other cause to the production of the great convulsions that ensued. But, as it was the ecclesiastical administration that mainly contributed to the peopling of America, it is this branch of the English history that chiefly merits our attention, in investigating the sources of the colonization of New England.

Not only were the ancient ceremonies, which long oppression had rendered so obnoxious, enforced with additional rigor on the increasing numbers of the puritans, but new and more offensive rites were introduced into the church. A design seems to have been formed of enabling the church of England to vie with the Romish see in the splendor of its pageantry, the superstitious ceremonial of its worship, and the power of its hierarchy. Laud, indeed, boasted that he had refused the offer of a cardinal's hat from Rome; but the offer was justly considered a much more significant circumstance than the refusal; and, having already assumed to himself the papal title of *His Holiness*, which he substituted in place of *His Grace*, his style would have been lowered instead of elevated by the Romish promotion which he rejected. The communion table was converted into an altar, and all per-

* The most important act of Captain Gorges' administration that has been transmitted to us, is one which affords an explanation of a passage in Hudibras, where the New Englanders are accused of hanging an innocent, but bedrid, weaver, in stead of a guilty, but useful, cobbler—

“That sinners may supply the place
Of suffering saints, is a plain case.
Our brethren of New England use
Choice malefactors to excuse,
And hang the guiltless in their stead,
Of whom the churches have less need—
As lately happened. In a town
There lived a cobbler,” &c. Hudibras, Canto ii.

Some of Gorges' people had committed depredations on the Indians, who insisted that the ringleader should be put to death. Gorges satisfied and deceived them by hanging up either a dying man or a dead body. Hutchinson, i. p. 6. Butler's witty malice, studious to defame the puritans, has rescued from oblivion an act of which the whole merit or demerit is exclusively due to his own party.

† The pretext commonly assigned for Abbot's disgrace is, that, in shooting at a deer with a cross-bow, he had accidentally killed a man. But he had been solemnly acquitted of this charge, and declared exempt from all its consequences, long before he was sequestered from ecclesiastical functions; and the real causes of his temporal disgrace seem to have been, that he opposed the persecution of the puritans, that he refused to license a sermon that had been preached in support of the king's right to tax the people without the intervention of parliament, and that he could not be prevailed with to countenance the infamous proceedings for the divorce of the countess of Essex. Weldon's Court and Character of King James. Fuller's Worthies.

sens commanded to bow to it on entering the church. All the week-day lectures, and all afternoon sermons on Sunday, were abolished, and, instead of them, games and sports were permitted to all the people, "excepting knoien recusants," who were thus with matchless absurdity debarred, as a punishment, from practices which they regarded with the utmost detestation. Every minister was commanded to read the royal proclamation of games and sports from his pulpit, under the pain of deprivation. This ordinance, like all the other novelties, was productive of the greater discontent and disturbance, from the extent to which puritan sentiments had made their way into the church, and the number of puritan ministers within the establishment whom habit had taught to fluctuate between the performance and the evasion of the ancient obnoxious canons, and trained to submit, without at all reconciling to the burden. Nothing could be more ill timed than an aggravation of the load under which these men were laboring; it reduced many to despair, provoked others to the most vehement indignation, and deprived the church of a numerous body of her most attached and most popular ministers. Nor were these the only measures that were calculated to excite discontents within as well as without the establishment. Three-fourths of the English clergy were Calvinists; but Laud and the ruling prelates being Arminians, they caused a royal proclamation to be issued against the preaching of the Calvinistic tenets: and while the Arminian pulpits resounded with the sharpest invectives against them, a single sentence that could be construed into their defence exposed the preacher to the pains of contempt of the king's authority.

In the reign of Elizabeth, the churchmen had been eager to shift from themselves upon the courts of common law as much as possible of the odium of enforcing the ecclesiastical statutes. But Laud* and his associates, inaccessible to fear, remorse, or shame, courted the office of persecution, and in the court of commission exercised such arbitrary power, and committed such enormous cruelty, as procured to that odious tribunal the name of the *protestant inquisition*. Fines, imprisonment, banishment, the pillory, were among the most lenient of the punishments inflicted by this tribunal. Its victims were frequently condemned to have their flesh torn from their bodies by the lash of the executioner, their nostrils slit, and their ears cut off, and in this condition exhibited to the people as monuments of what was termed the justice of their sovereign and the zeal of the prelates. Of the extent as well as the severity to which this arbitrary system was pushed, some notion may be formed from the accounts that have been transmitted to us of the proceedings within the diocese of Norwich alone. In the articles of impeachment afterwards exhibited against Bishop Wren, it is stated, that during his possession of that diocese, which lasted only for two years and a half, fifty ministers were deprived for not complying with the innovations, and three thousand of the laity compelled to abandon the kingdom.† In perfect harmony with the ecclesiastical, was the civil policy of Charles's administration. Arbitrary impositions superseded the functions of parliament: the patents of judicial office had their tenure altered from the good behavior of the judges to the good pleasure of the king; every organ of liberty was suspended or perverted; and the kingdom at length subjected to the exclusive dominion of a stern and uncontrolled prerogative. Insult was employed, as if purposely to stimulate the sensibility

which injuries might not have sufficiently excited. A clergyman having maintained in a sermon before the king that his majesty's simple requisition of money from his subjects, obliged them to comply with it "under pain of eternal damnation;" Charles at first observed that he owed the man no thanks for giving him his due; but a censure of the House of Commons having followed the discourse, the preacher was forthwith accounted a proper object of royal favor, and promoted, first to a valuable living, and afterwards to a bishopric. A system of such diffusive and exasperating hostility waged by the government against the people, wanted only a sufficient duration to provoke from universal rage a vindictive retribution the more to be dreaded from the patience with which the heavy arrear of injury had been endured and accumulated. But before the system of oppression had time to mature the growing discontents, and to produce extremities so perilous to the virtue of all who are called to abide them, it was destined to give occasion to efforts of nobler energy and purer virtue; and much good was yet to be deduced out of all this scene of evil, and great and happy consequences were yet to be effected, by the dominion of Providence over the passions of men.

The severities exercised on the puritans in England, and the gradual extinction of the hopes they had so long entertained of a mitigation of ecclesiastical rigor, had for some time directed their thoughts to that distant territory in which their brethren at New Plymouth had achieved a secure establishment and obtained the enjoyment of civil and religious liberty. In the last year of James's reign, a few non-conformist families had removed to New England and taken possession of a corner of Massachusetts Bay; but being disappointed in the hope they had entertained of the accession of numbers sufficient to found a permanent society, they were on the point of returning to England, when they received the agreeable intelligence of the approach of a numerous and powerful reinforcement. Mr. White, a non-conformist minister at Dorchester, had projected a new settlement at Massachusetts Bay, and by his zeal and activity he succeeded in forming an association of a number of the gentry in his neighborhood who had imbibed the puritan sentiments, for the purpose of conducting a colony to that region. The views and feelings that actuated the leaders of this enterprise were committed to writing, and circulated among their friends under the title of *General Considerations for the Plantation of New England*. The framers of this remarkable and characteristic document, began by adverting to the progress of the Jesuit establishments in South America, and to the duty and advantage of counteracting their influence by the propagation of the gospel in that quarter of the world. They observed that all the other churches of Europe had been brought under desolations; that the same fate seemed to impend over the church of England; and that it might reasonably be supposed that God had provided this unoccupied territory as a land of refuge for many whom he purposed to save from the general destruction. England, they alleged, grew weary of her inhabitants; insomuch that man, which is the most precious of all creatures, was there more vile and base than the earth he trod upon; and children and friends (if unwealthy) were accounted a burdensome incumbrance, instead of being hailed as the choicest earthly blessings. A taste for expensive living, they added, prevailed so strongly, and the means of indulging it had become so exclusively the object of men's desires, that all arts and trades were tainted by sordid maxims and deceitful practices; and the seminaries of learning abounded with so many spectacles and temptations of dissolute irregularity, that vice was there more effectually communicated by example, than knowledge or virtue were imparted by precept. "The whole earth," they proclaimed, "is the Lord's garden, and he hath given it to the sons of Adam to be tilled and improved by them: Why, then, should any stand starving here for places of habitation, and, in the mean time, suffer whole countries, as profitable for the use of man, to lie waste, without any improvement?" They concluded by adverting to the situation of the colony of New Plymouth, and strongly enforced the duty of supporting the infant church which had there been so happily planted. Actuated by such views, these magnanimous projectors purchased from the council of Plymouth all the territory extending in length from three miles north of the river Merrimack to three miles south of Charles river, and, in breadth, from the Atlantic to the Southern Ocean. Their acts were as vigorous as their designs were elevated. As the precursors of the main body of emigrants whom it was intended to transport, a small body of planters and

servants were despatched under Mr. Endicot, one of the leading projectors; who, arriving safely in Massachusetts, [1628,] were cordially greeted and kindly assisted by the colonists of New Plymouth, and laid the foundations of a town, which they denominated Salem, from a Hebrew word that signifies Peace.

But zealous as these projectors were to accomplish their favorite purpose, they very soon perceived their total inability to maintain effectual possession of such an extensive territory, without the aid of more opulent coadjutors. Of these, by the influence and activity of Mr. White, they obtained a sufficient number in London, among the commercial men who openly professed, or secretly favored the tenets of the puritans. These auxiliaries brought an accession of prudent precaution, as well as of pecuniary resources, to the conduct of the design; and, justly doubting the expediency of founding a colony on the basis of a grant from a private company of patentees, who might convey a right of property in the soil, but could not confer jurisdiction, or the privilege of governing the society which it was proposed to establish, they persuaded their associates to unite with them in an application to the crown for a royal charter. The readiness with which this application was granted, and the terms in which the charter was framed, are absolutely unaccountable, except on the supposition that Charles and his ecclesiastical counsellors were willing, at this time, to disencumber the church, in which they meditated such extensive innovations, of a body of men, from whom the most unbending opposition to their measures might be expected; a line of policy which appears perfectly credible; although, at a subsequent period, they endeavored to counteract it, when they were sensible of the reflective influence exercised on the puritan body in England by the spread and predominance of their tenets in America. It seems impossible, on any other supposition, to account for the remarkable facts that, at the very time when this monarch was introducing despotic authority into the government of Virginia, he extended to a colony of puritans a constitution containing all the immunities of which the Virginians beheld themselves so unjustly deprived; and that, well aware of the purpose of the applicants to escape from the constitutions of the church of England, he granted them a charter containing ample commendation of the religious ends they had in view, without the imposition of a single ordinance respecting the constitution of their church government, or the forms and ceremonies of their worship; nay, so completely in this instance, did he surrender the maxims of his colonial policy to the wishes of the projectors of a puritan colony, that, although he had recently declared, in a public proclamation, that a mercantile company was utterly unfit to administer the affairs of a remote colony; yet, on the present occasion, he scrupled not, in compliance with the wishes of the mercantile part of the adventurers, to commit the supreme direction of the colony to be planted in the province of Massachusetts Bay, to a corporation consisting chiefly of merchants resident in London. The new adventurers were incorporated as a body politic; and their right to the territory which they had purchased from the council of Plymouth being confirmed by the king, they were empowered to dispose of the lands, and to govern the people who should settle upon them. The first governor of the company and his council were named by the crown; the right of electing their successors was vested in the members of the corporation. The executive power was committed to the governor and a council of assistants; the legislative, to the body of proprietors, who might make and enforce statutes and orders for the good of the community, not inconsistent with the laws of England. They obtained the same temporary exemption that had been granted to the Virginian company from internal taxes, and from duties on goods exported or imported; and notwithstanding their migration to America, they and their descendants were declared to be entitled to all the rights of natural-born subjects.

The meaning of this charter, with respect to the religious rights of the colonists of Massachusetts Bay, has given rise to a great deal of discussion. By the puritans, and the puritan writers of that age, it was universally regarded as bestowing on them the amplest liberty to regulate their worship by the dictates of their own conscience. And this, I think, is manifestly, its import. The grantors were fully aware, and the grantees had neither the wish nor the power to conceal, that their object was to make a peaceable secession from a church which they could no longer conscientiously adhere to, and to establish for themselves, at Massachusetts Bay, an ecclesiastical constitution similar to that

* It is impossible to read the speeches of this prelate on the trials of the puritans without astonishment at the strange meanness of which his mind was composed. Learning and elegance are combined with vulgar railing and obscene ribaldry; and the most beautiful delineations of Christian mildness and mercy, with the proposition or approbation of vindictive cruelties that would have disgraced an American savage. The light within him was darkness; and his acquaintance with the theory of religion seemed only to give him assurance of his safety and rectitude in practically disregarding it. The sentences proposed by the bishops in the Star Chamber were always severer than the suggestions of the lay judges. The bishops, no doubt, were frequently exasperated by the sarcasms of their victims. Bastwick, before his trial, wrote a letter to his family petitioning for a writ from the archbishop's court, to support him in prison, and concluding thus:—"How than fairest in thy palace, demandeth, in limbo patrum, John Bastwick." One of the lay judges in the Star Chamber, on one occasion, addressed a puritan on his trial with a text of which the bishops probably did not admire the application:—"Be not righteous over much; neither make thyself over wise: why shouldst thou destroy thyself?" See Howell's State Trials, vol. i. Nos. 131, 135, 142, 145, &c.

† Neal, i. 117-121. These bishops, said a member of the Long Parliament, "placed the excellency of priesthood in worldly pomp and greatness, and gave the glory of the invisible God to pictures, images, and altars; therefore God gave them up to vile affections, to be implacable, unmerciful, and without natural affection." Howell's State Trials, iv. 27.

which was already established and maintained without molestation at New Plymouth. A silent acquiescence in such designs was all that could reasonably be expected from the king and his ministers; and when this emphatic silence on a point which is quite ludicrous to suppose could have escaped the attention of either party, is coupled with such a ready departure from all the arbitrary principles which the king was preparing to enforce in every other branch of his domestic and colonial administration, it seems impossible to doubt that Charles was at this time not unwilling to make a temporary sacrifice of authority, in order to rid himself of these puritan petitioners, and that the interpretation which they gave to their charter was perfectly correct. And yet writers have not been wanting, whom enmity to the puritans has induced to explain this charter in a manner totally repugnant to every rule of legal or equitable construction. It is a maxim of law, and the dictate of common sense and universal equity, that, in all cases of doubtful construction, the presumption lies against that party whose office it was to speak, and who had the power to clear every ambiguity away. In defiance of this rule, these writers have insisted that the silence of the charter respecting the ecclesiastical constitution of the colony, implies the imposition on the colonists of every particular of the constitution of the church of England.* The most eminent writer of this party has taken occasion from hence to reproach the colonists of Massachusetts Bay with having laid the foundations of their church establishment in fraud. "Without regard," says this distinguished author, "to the sentiments of that monarch, under the sanction of whose authority they settled in America, and from whom they derived right to act as a body politic, and in contempt of the laws of England, with which the charter required that none of their acts or ordinances should be inconsistent, they adopted in their infant church that form of policy which has since been distinguished by the name of independence." He accounts for the silence of the charter on a point which was unquestionably uppermost in the minds of both parties, by remarking, that "the king seems not to have foreseen, nor to have suspected, the secret intentions of those who projected the measure;" and he explains the conduct of the colonists, by pronouncing that they were "animated with a spirit of innovation in civil policy as well as in religion." But, truly, it seems not a little unreasonable to make it matter of reproach to the puritans, who were driven by oppression from their native land, that they did not cross the Atlantic and settle in a savage desert for the purpose of cultivating a more perfect conformity to the sentiments of their oppressor. The provision in their charter, that the laws to be enacted by them should not be repugnant to the jurisprudence of England, could never be understood to imply any thing farther than a general conformity to the common law of England, suitable to the acknowledged dependence of the colony on the main body of the British dominions. The unsuspecting ignorance, too, that is imputed to the king and his counsellors, appears perfectly incredible, when we consider that the example of New Plymouth, where a bare exemption from express restrictions had been followed by the establishment of the independent model, was fresh in their recollection; that it was avowed and notorious puritans who now applied for permission to proceed to the land where that constitution was established; and, above all, that, in their application to the king, they expressly desired leave to withdraw in peace from the bosom of a church to whose ordinances they could not conscientiously conform. Whether the king and Laud were, or were not, aware of the intentions of the puritans, they must surely be allowed to be the best judges of what they themselves had intended to convey; and their acquiescence in the constitution which the colonists of Massachusetts Bay proceeded forthwith to establish, demonstrates, in the strongest manner, that they were aware they had no violation of the charter to complain of. When they afterwards became sensible that the progress of puritan establishments in New England increased the ferment which

their measures were creating in the parent state, they interposed to check the intercourse between the two countries, but tacitly acknowledged that the system which they followed so rigidly in England was excluded by positive agreement from the colonial territory.

Soon after the power of the adventurers to establish a colony had been rendered complete by the royal charter, they equipped and despatched five ships for New England, containing three hundred and fifty emigrants, chiefly zealous puritans, accompanied by some eminent non-conformist ministers. The regrets which an eternal farewell to their native land was calculated to inspire, the distressing inconvenience of a long voyage to persons unaccustomed to the sea, and the formidable scene of toil and danger that confronted them in the barbarous land where so many preceding adventurers had found an untimely grave, seem to have vanished entirely from the minds of these men, sustained by the worth and dignity of the purpose which they had combined to pursue. Their hearts were knit to each other by community of generous design; and they experienced none of those jealousies which inevitably spring up in confederacies for ends merely selfish, among men unequally qualified to obtain the object of their association. Behind them, indeed, was the land of their fathers; but it had long ceased to wear an aspect of parental kindness towards them, and, in forsaking it, they fled from the prisons and scaffolds to which its saints and patriots were daily consigned. Before them lay a vast and dreary wilderness; but they hoped to irradiate its gloom by kindling and preserving there the sacred fires of religion and liberty, which so many efforts were made to extinguish in the shrines of England, whence they carried their embers. They confidently hoped that the religious and political sentiments which had languished under such protracted persecution in Europe would now, at length, shine forth in their full lustre in America. Establishing an asylum where the professors of their sentiments might at all times find shelter, they justly expected to derive continual accessions to the vigor of their own virtue from the resolute character of men who might hereafter be prompted to forsake their native habitations, and be willing, like them, to recognize their country wherever they could find the lineaments of truth and liberty. They did not postpone the practice of piety till the conclusion of their voyage; but, occupied continually with the exercises of devotion, they caused the ocean which they traversed to resound with unvoiced acclaim of praise and thanksgiving to its great Creator. The seamen, partaking their spirit, readily joined in all their religious exercises and ordinances, and expressed their belief that they had practised the first *sea-fasts* that had ever been kept in the world. After a prosperous voyage, the emigrants had the happiness of re-uniting themselves to their friends already established at Salem, under Mr. Endicot, who had been appointed deputy-governor of the colony.

To the body of men thus collected together, the institution of a church appeared the most interesting of all their concerns, and it occupied, accordingly, their earliest and most solemn deliberation. They had been advised before they quitted England to agree among themselves on the form of church government which was to be established in the colony; but, neglecting this advice, they had gone no farther than to express their general concurrence in the principle that the *reformation of the church was to be endeavored according to the written word of God*. They now applied to their brethren at Plymouth, and desired to be acquainted with the grounds of the constitution which had there been established; and, having heard these fully explained, and devoted some time to a diligent comparison of the model with the warrants of scripture which were cited in its vindication, and earnestly besought the enlightening aid of Him who alone can teach his creatures how to worship him with acceptance, they declared their entire approbation of the sister church, and proceeded to copy her structure in the establishment of their own. They united together in religious society by a covenant, in which, after a solemn dedication of themselves to live in the fear of God, and to walk in his ways, so far as he should be pleased to reveal himself to them, they engaged to each other to cultivate watchfulness and tenderness in their mutual intercourse; to avoid jealousies, suspicions, and secret risings of spirit; and in all cases of offence to bear and forbear, give and forgive, after the example of their Divine pattern. They promised, in the congregation, to repress their forwardness to display their gifts; and, in their intercourse, whether with sister churches or with the

mass of mankind, to study a conversation remote from the very appearance of evil. They engaged, by a dutiful obedience to all who should be set over them in church or commonwealth, to encourage them to a faithful performance of their duty; and they expressed their resolution to approve themselves in their particular callings, the stewards and servants of God, shunning idleness as the bane of every community, and dealing hardly or oppressively with none of the human race. The form of policy which they adopted was that which distinguished the churches of the independents, and which I have already had occasion to describe. The form of public worship which they instituted, rejected a liturgy and every superfluous ceremony, and was adapted to the strictest standard of Calvinistic simplicity. They elected a pastor, a teacher, and an elder, whom they set apart for their respective offices by imposition of the hands of the brethren. All who were that day admitted members of the church signified their assent to a confession of faith drawn up by their teachers, and gave an account of the foundation of their own hopes as christians; and it was declared that no person should thereafter be permitted to subscribe the covenant, or be received into communion with the church, until he had given satisfaction to the elders with respect to the purity of his faith and the consistency of his conduct.

The constitution of which we have now beheld an abstract, and especially the covenant or social engagement so fraught with sentiments of genuine piety and enlarged benevolence, has excited the derision of some writers, who refuse to consider the speculative liberality which it indicates in any other point of view than as contrasted with the practical intolerance which the colonists soon after displayed. But however agreeable this aspect may be to eyes that watch for the frailties of the good and the weaknesses of the strong, this is not the only light in which it will present itself to humane and liberal minds. Philosophy admits that the soul is enlarged by the mere purpose of excellence; and religion has pronounced that even those designs which men are not deemed worthy to perform, it may be well for them to have entertained in their minds. The error of the inhabitants of Salem was the universal error of their age; the virtues they demonstrated were peculiar to themselves and their puritan brethren. In the ecclesiastical constitution which they established for themselves, and the sentiments which they interwove with it, they rendered a sincere and laudable homage to the rights of conscience and the requirements of piety; and these principles, no doubt, exercised a highly beneficial influence on the practice which unhappily they did not entirely control. The influence of principles that tend to the restraint of human ferocity and intolerance is frequently invisible to mortal eyes, because it is productive chiefly of negative consequences: and when great provocation or alarm has led the professors of these principles to violate the restraints they impose, they will be judged with little justice, if charity neglect to supply the imperfection of that knowledge to which we are limited while we see but in part, and to suggest the secret and honorable forbearance which may have preceded the visible action which we condemn or deplore. In the very first instance of intolerant proceeding with which the adversaries of the puritans have reproached this American colony, it appears to me that the influence of genuine piety in mitigating human impatience is very strikingly apparent. It is a notable fact that, although these emigrants were collected from a body embracing such diversity of opinion respecting church government and the rights of worship as then prevailed among the puritans of England, and though they had landed in America without having previously ascertained how far they were likely to agree on this very point, for the sake of which they had incurred banishment from England, the constitution which was copied from the church of New Plymouth gave satisfaction to almost every individual among them. Two brothers, however, of the name of Browne, one a lawyer, and the other a merchant, both of them men of note and among the number of the original patentees, dissented from this constitution, and arguing with vehement absurdity that all who adhered to it would infallibly become anabaptists, endeavored to obtain converts to their opinion, and to establish a separate congregation on a model more approximated to the forms of the church of England. The defectiveness of their argument they endeavored to supply by the vehemence of their clamor; and they obtained a favorable audience from a few who regarded with unfriendly eye the discipline which the colonial church was disposed to exercise upon offenders against the

* Chalmers attempts to support this interpretation by citing from the charter the following clause,—"That the oath of supremacy shall be administered to every one who shall pass to the colony to inhabit there." *Annals*, p. 141. Dr. Robertson cites the same words for the same purpose. But there is no such clause in the charter. There is a clause, not requiring, but empowering, the governor, if he think proper, to administer the oath of allegiance and supremacy. Chalmers makes himself exceedingly merry with the enthusiasm of the puritans, who "considered the charter as sacred, because they supposed it to be derived from the providence of heaven," p. 139. Dr. Robertson is less charitable. He supposes the puritans to have wilfully misinterpreted the charter which he himself misrepresents.

laws of morality. Mr. Endicott, the governor, called these men, together with the ministers, before the people; who, after hearing both parties, repeated their approbation of the system they had consented to; and, as the two brothers still persisted in their attempts to create a schism in the church, and even endeavored to excite a mutiny against the government, they were judged unfit to remain in the colony, and sent back by the vessels in which they had accompanied the other emigrants in the voyage from England.* Their absence restored unity of sentiment to the colonists, who were proceeding to complete their settlement and extend their occupation of the country, when they were interrupted by the approach of winter, and the ravages of disease, which quickly deprived them of nearly one half of their number, but produced no other change on their minds than to cause the sentiments of hope and fear to converge more steadily to the Author of their existence.

Notwithstanding the sarcastic comments which the banishment of the two individuals whose case I have just related has received from some eminent writers, the justice of the proceeding cannot fail, I think, to commend itself to the sentiments of all impartial men: and I should hardly have thought it necessary to notice the charge of intolerance to which the colonists have been subjected, if their conduct had never given greater occasion to it. But unfortunately a great proportion of the puritans at this period were strongly infected with the prevalent error of their age,† and regarded the peaceable co-existence of different sects in the same community as nearly impossible—a notion which, it must be confessed, the treatment they received from their adversaries tended very strongly to enforce. If it was right that they who had suffered from persecution, should themselves abstain from what their own experience had feelingly shown to be so hateful and odious, it was natural that flying to deserts for the sake of particular opinions, they should expect to see these opinions flourish unmolested and undisputed. The sufferings they had endured from their adversaries, they regarded as one of the legitimate consequences of the pernicious errors that these adversaries had imbibed; and they customarily regarded their opponents as the enemies of their persons as well as persecutors of their opinions. The activity of government in support of the national opinion, they were far from condemning in the abstract. They admitted the legitimacy of such interposition, and condemned it only when it seemed to them erroneously directed. Even when oppressed themselves, they exclaimed against indiscriminate toleration. They contradicted so far their own principles; and maintained that human beings might and ought to punish what God alone could correct and alter.‡ Some of them, no doubt, had already anticipated the sentiments which at a later period came to be generally characteristic of the independents, and which induced them to reject all connexion between church and state, and disallow the competence of the interposition of human authority to sustain one church or to suppress another. Unfortunately some of the early votaries of

these liberal sentiments combined with them a set of political opinions which it would not be easy to realize without subverting civil society. Of this, a remarkable instance will very shortly occur in the progress of our narrative. But very opposite sentiments prevailed among the bulk of the colonists of Massachusetts, who came to America fresh from the influence of persecution, and had not, like their brethren at New Plymouth, the advantage of an intermediate residence in a land where a peaceful co-existence of different sects was demonstrated to be not only practicable, but eminently conducive to the promotion of those excellent graces of christian character, patience, charity, and a spirit of forbearance. Much might be urged and will doubtless suggest itself, in extenuation of this error, which long remained a root of bitterness to disturb their peace and felicity. But the considerations which may be allowed to mitigate our censure of the intolerant spirit which these people displayed, can never be permitted to transform it into a virtue. It was sharpened by the copious infusions which the colony received of the feelings excited in England by the increased severity of persecution, from which the victims began to fly in increasing numbers to America.

The British dominion in America underwent, about this period, some vicissitudes which in after years affected materially the prosperity both of New England and of the other colonial establishments in the same quarter of the world. The war which the king so wantonly declared against France in 1627, and which produced only disgrace and disaster to the British arms in Europe, was attended with events of a very different complexion in America. Sir David Kirk having obtained a commission to attack the American dominions of France, invaded Canada in the summer of 1628; and so successful was the expedition, that in July, 1629, Quebec was reduced to surrender to the arms of England. Thus was the capital of New France subdued by the English, about one hundred and thirty years before they achieved its final conquest by the sword of Wolfe. This signal event was unknown in Europe when peace was re-established between France and England; and Charles, by the subsequent treaty of St. Germain, not only restored this valuable acquisition to France, but expressed the cession he made in terms of such extensive application, as undeniably inferred a recognition of the French, and a surrender of the British claims to the province of Nova Scotia. This arrangement manifestly threatened no small prejudice to the settlements of the English; and we shall speedily find that what it threatened, it did not fail to produce.

CHAPTER II.

The Charter Government transferred from England to Massachusetts—Numerous Emigration—Foundation of Boston—Hardships of the New Settlers—Disfranchisement of Dissenters in the Colony—Influence of the colonial clergy—John Cotton and his Colleagues and Successors—Williams' Schism—He founds Providence—Representative Assembly established in Massachusetts—Arrival of Hugh Peters and Henry Vane, who is elected Governor—Foundation of Connecticut and New Haven—War with the Pequot Indians—Severities exercised by the victorious Colonists—Disturbances created by Mrs. Hutchinson—Colonization of Rhode Island—and of New Hampshire and Maine—Jealousy, and fluctuating Conduct of the King—Measures adopted against the Liberties of Massachusetts—interrupted by the Civil Wars—State of New England—Population—Laws—Manners.

The directors of the Massachusetts Bay company in England meanwhile exerted their utmost endeavors to reinforce the colony with a numerous body of additional settlers. Their designs were promoted by the rigor and intolerance of Land's administration, which, daily multiplying the hardships imposed on all who scrupled entire conformity to the ecclesiastical ordinances, proportionably diminished, in their estimation, the danger and hardships attending a retreat to America. Many persons began to treat with the company for a settlement in New England, and several of these were people of distinguished family and fortune. But foreseeing the misrule inseparable from the residence of the legislative power in Britain, they demanded, as a previous condition of their emigration, that the charter and all the powers of government should be transferred to New England, and exercised within the territory of the colony. The company, who had incurred a considerable expense with little prospect of speedy remuneration, were very well disposed to obtain such important aid by embracing the measure that was proposed to them: but doubting its legality, they thought proper to consult lawyers of eminence on the subject. Unaccountable as it must appear to every

person in the slightest degree conversant with legal considerations, they received an opinion favorable to the wishes of the emigrants; and accordingly it was determined, by general consent, "that the charter should be transferred, and the government be settled in New England." To the members of the corporation who choose to remain at home, was reserved a share in the trading, stock, and profits of the company, for the term of seven years. By this transaction, one of the most singular that is recorded in the history of a civilized people, the liberties of the New England communities were placed on a sure and respectable basis. When we consider the means by which this was effected, we find ourselves encompassed with doubts and difficulties, of which the only solution that I am able to discover is the opinion I have already expressed, that the king was at this time exceedingly desirous to rid the realm of the puritans, and had unequivocally signified to them, that if they would bestow their presence on another part of his dominions, and employ their energies in peopling the deserts of America, instead of disturbing his operations on the church of England, they were free to arrange their internal constitution, whether civil or ecclesiastical, according to their own discretion. An English corporation, appointed by its charter to reside in London, resolved itself, by its own act, into an American corporation, and transferred its residence to Massachusetts: and this was openly transacted by men whose principles rendered them peculiarly obnoxious to their rules, and under the eyes of a prince no less vigilant to observe, than vigorous to repress every encroachment on the limits of his prerogative. So far was Charles from entertaining the slightest dissatisfaction at this proceeding, or from desiring, at this period of his reign, to obstruct the removal of the puritans to New England, that about two years after this change had been carried into effect, when a complaint of arbitrary and illegal proceedings was preferred against the colony by a papist who had been banished from it, and who was supported by Sir Ferdinando Gorges, the king, after a full hearing of the case in the privy council, issued a proclamation not only justifying but commending the whole conduct of the colonial government, reprobating the prevalent reports that he "had no good opinion of that plantation," and engaging not only to maintain the privileges of its inhabitants, but to supply whatever else might contribute to their further comfort and prosperity.† From the terms of this document (of which no notice is taken by the writers inimical to the puritans,) and from the whole complexion of the king's conduct towards the founders of this settlement, it would appear that, whatever designs he might secretly cherish of adding the subjugation of New England, at a future period, to that of his British and Virginian dominions, his policy at this time was to persuade the leaders of the puritans, that if they would peaceably abandon the contest for their rights in England, they were at liberty to embody and enjoy them in whatever institutions they might think fit to establish in America. And yet some writers, whom it is impossible to tax with ignorance, as they had access to all the existing materials of information, whom it would justly be held presumptuous to charge with defect of discernment, and whom it may perhaps appear uncharitable to reproach with malignity towards the puritans, have not scrupled to accuse the founders of this colony of effecting their ends by a policy not less impudent than fraudulent, and by acts of disobedience little short of rebellion. The colonists themselves, notwithstanding all the facilities which the king presented to them, and

* There is not the slightest reason for supposing that the opinion was dishonest, or that it proceeded on erroneous information. Even at a subsequent period, the attorney-general, Sawyer, gave it as his official opinion, "that the patent having created the grantees and their assigns, a body corporate, they might transfer their charter, and act in New England." Chalmers, p. 173. He had not perused the charter with its assigns; but conferred the powers of government on the corporation and its successors. His mistake, however, may well seem to acquit the patentees of intentional deviation from the terms of their grant.

† Neal, i, 137, 8. This proclamation is very artfully worded, and contains indications of deeper designs, which were kept in reserve till the present policy had produced the effect that was expected from it. The ample inquiry that preceded the proclamation, must have induced the puritans to believe, that the whole proceedings of the colonists had received the royal approbation; and yet the pledge of protection and security is dexterously qualified with the condition of its appearing to the satisfaction of the king that the charter had been in all things effectuated according to its true meaning—an indication that a day might come when it would be more convenient for him to seek for a cause of quarrel with the colony. Had he succeeded in extinguishing liberty in England, the freedom of Massachusetts would not long have survived it.

* Mather, B. i. cap. 4. sect. 8. Neal, i. 129. On their return to England they preferred a heavy complaint against the colonists of oppressive demeanor to themselves and enmity to the church of England. The total disregard which their complaint experienced (Chalmers, p. 146) strongly confirms the opinion I have expressed of the indolence of all parties with regard to the real import of the charter.

† The richest endowment of reason could not exempt the greatest of philosophers from intolerance; nor could the experience of persecution fully evince its injustice even to its own victims. Lord Bacon thought that uniformity in religious sentiment and worship was essential to the support of government, and that no toleration could with safety be granted to sectaries. Bacon, De unitate ecclesie. During the administration of Cromwell, an eminent presbyterian minister, who had himself felt the hand of persecution, published a treatise against what he was pleased to term "this cursed intolerable toleration." Orme's Life of Owen.

To the objection that persecution serves to make men hypocrites, an eminent minister in New England answered "Better tolerate hypocrites and tares, than briars and thorns." Another, in a work published in 1645, thus expresses himself. "It is said that men ought to have liberty of conscience, and that it is persecution to debar them of it. I can rather stand amazed than reply to this. It is an astonishment that the brains of men should be parboiled in such unchristian ignorance." Belknap's History of New Hampshire, vol. i. cap. 3.

‡ None have condemned them more strongly than the popish theologians, who have insultingly urged that persecution, however congenial to the Roman catholic principle, or submitting all private judgment to the regulation of an infallible church, was totally repugnant to the fundamental principle of protestantism, which asserts the supremacy of private judgment and individual opinion. But there is a fallacy here: for although the particular dogmas of catholic faith may be derived, not immediately from private judgment, but from the canons of the church, it must be to the private judgment of every catholic that this church is indebted for the recognition of its authority to enact such canons.

the unwonted liberality and consideration with which he showed himself willing to grace their departure, were so fully aware of his rooted enmity to their principles, and so little able to reconcile his present conduct with his favorite policy, that they openly declared they had been led by Providence to a land of rest, through ways that were unintelligible to themselves, and that they could ascribe the blessings they obtained to nothing else but the special interposition of that Being who orders all the steps of his people, and holds the hearts of princes and of all men in his hands. It is indeed a strange coincidence, that this arbitrary prince, at the very time when he was exercising the sternest despotism over the royalists in Virginia, should have been cherishing the principles of liberty among the puritans in New England.

Having effected this important revolution in their system of government, the adventurers proceeded to make the most vigorous exertions to realize the designs they had undertaken. In a general court, John Winthrop was appointed governor, and Thomas Dudley, deputy-governor, and eighteen assistants were chosen; in whom, together with the body of freemen who should settle in New England, were vested all the corporate rights of the company. With such zeal and activity did they prepare for emigration, that, in the course of the ensuing year, above fifteen hundred settlers, among whom were several wealthy and high-born persons, both men and women, who chose to follow truth into a desert, rather than to enjoy all the pleasures of the world under the dominion of error, set sail aboard a fleet of seventeen ships for New England. On their arrival at Salem [1630] many of them were so ill satisfied with its situation, that they explored the country in quest of better stations; and settling in different places around the bay, according to their various predilections, laid the foundation of Boston, Charlestown, Dorchester, Roxbury, and other societies which have since expanded into considerable towns. In each of these a church was established on the same model with that of Salem. This, together with the care of making provision for their subsistence during winter, occupied them entirely for several months. The approach of winter was attended with a repetition of those trials and distresses through the ordeal of which every body of settlers in New England was long fated to pass. Afflicted with severe scarcity, which all the generous contributions of the other settlements in the province were able but feebly to mitigate, attacked with various distempers, the consequence of hunger, cold, and the peculiarities of a soil and climate uncongenial to constitutions formed in Europe, and lodged for the most part in booths and tents that afforded but imperfect protection from the weather, great numbers of them were carried to the grave. But the noble determination of spirit which had impelled them to emigrate, preserved all its force; the survivors endured their calamities with unshaken fortitude; and the dying expressed a grateful exultation at having at least beheld with their eyes the gathering of a church of Christ in these desolate ends of the earth. The continuance of the pestilence enforced their devout supplications; and its cessation, which they recognised as the answer to their prayers, excited their devotional gratitude. This calamity was hardly removed when they were alarmed by the tidings of a universal conspiracy of the neighboring Indians for their destruction. The colonists, instead of relying on their patent, had, on their first arrival, fairly purchased from the Indians all the tracts of land which they afterwards possessed; and in the hour of their peril, both they and the faithless vendors who menaced them, reaped the fruit of their concurrence or collusion with the designs of Eternal Justice. The hostility of these savages was interrupted by a pestilential disorder that broke out among themselves, and with rapid desolation swept whole tribes of them away. This disorder was the small-pox, which has always proved a much more formidable malady to Indian than to European constitutions. In spite of the most charitable exertions on the part of the colonists to arrest the progress of the distemper by their superior medical skill, nine-tenths of the neighboring savages were cut off, and many of the survivors flying from the infection, removed their habitations to more distant regions.

1631.] When the restoration of plenty, by the arrival of supplies from England, and the abatement of the severity of winter, permitted the colonists to resume their assemblies for the transaction of public business, their very first proceedings demonstrated that a great majority of them were considerably leavened with a spirit of intolerance, and were determined in their practical administration to exemplify a thorough intermixture,

and mutual dependence of church and state. A law was passed, enacting that none should hereafter be admitted freemen, or be entitled to any share in the government, or be capable of being chosen magistrates, or even of serving as jury-men, but such as had been or should hereafter be received into the church as members. This law at once divested every person who did not hold the prevailing opinions, not only on the great points of doctrine, but with respect to the discipline of the church and the ceremonies of worship, of all the privileges of a citizen. An uncontrolled power of approving or rejecting the claims of those who applied for admission into communion with the church, being vested in the ministers and leading men of each congregation, the most valuable civil rights were made to depend on their decision with respect to qualifications purely ecclesiastical. Even at a later period, when the colonists were compelled, by the remonstrances of Charles the Second, to make some alteration of this law, they altered it only in appearance, and enacted that every candidate for the privilege of a freeman, should produce a certificate from some minister of the established church, that they were persons of orthodox principles, and of honest life and conversation—a certificate which they who did not belong to the established church necessarily solicited with great disadvantage. The consequence of such laws was to elevate the clergy to a very high degree of influence and authority,* and, happily for the colony, she was long blessed with a succession of ministers whose admirable virtues were calculated to counteract the mischief of this inordinate influence, and even to convert it into an instrument of good. Though dissenters from the colonial church were thus deprived of political privileges, it does not appear that they were subjected to any other inconvenience, except where their tenets were considered as blasphemous, or when they endeavored by the propagation of them to detach others from the established church, or by the practical realization of them to disturb the public peace. The exclusion from political privileges to which they were subjected, seems not at first to have given them any annoyance; but to have been felt to be the necessary consequence of that intertexture of church and commonwealth in which the main end of political institutions was the preservation of the church estate, and the chief value of political privileges considered to arise from their subservience to this end. Various persons resided in peace within the colony, though excluded from political franchises: and one episcopal minister is particularly noted for having said, when he signified his refusal to join any of the colonial congregations, that as he had left England because he did not like the lord bishops, so they might rest assured he had not come to America to live under the lord brethren.

1632.] The diminution of their original numbers, which the colonists had suffered from hardship and disease, was soon much more than compensated by the ample reinforcements which they continually received from their persecuted brethren in England. [1633.] Among the new settlers who arrived not long after the transference of the seat of government to Massachusetts, were some eminent puritan ministers, of whom the most remarkable were Elliot and Mayhew, the first protestant missionaries to the Indians, and John Cotton, a man whose singular worth procured, and long preserved, to him a patriarchal repute and authority in the colony. After ministering for twenty years in England to a congregation by whom he was highly respected and beloved, Mr. Cotton had been summoned before the Court of High Commission on a charge of neglecting to kneel at the sacrament. Lord Dorset and other persons of distinction by whom he was known and valued, employed the strongest intercession in his behalf with Laud: but their exertions proving unavailing, Dorset sent to inform him, "that if it had been only drunkenness or adultery he had committed, he might have found favor, but the sin of puritanism was unpardonable." Mr. Cotton, in consequence, retired to New England, and found there a scene peculiarly calculated to develop and give efficacy to his piety and virtue. To an earnest concern for religion he united a deep and ever prevail-

* Many instances of their influence in matters of importance will occur in the further progress of our narrative. An instance of their control over public opinion on a point which, being quite beyond the province of reason, was the more likely to interest the most obstinate and unassailable prejudices, is mentioned by Hutchinson, p. 152. Tobacco was at first prohibited under a penalty; and in some writings that were popular in the colony, the smoke of it is, with most audacious absurdity, compared to the fumes of the bottomless pit. But some of the clergy having fallen into the practice of smoking, tobacco was instantly, by an act of government, "set at liberty."

ing sense of it; and continually marching in front of his doctrine, he enforced its acceptance by the weight of his character and the animating influence of his example. The kindness of his disposition, and the courteous benevolence of his manners, enabled him, in all his intercourse with others, to diffuse the influence of his piety no less sensibly than agreeably through the veins of his conversation. The loftiness of the standard which he had continually in his view, and the assimilating influence of that strong admiration which he entertained for it, communicated to his character an elevation that commanded respect; while the continual sense of his dependence on divine aid, and of his short-coming to his great pattern, graced his manners with a humility that attracted love, and disarmed the contentious opposition of petulance and envy. It is recorded of him, that having been once followed from the church where he had been preaching to his house, by an ignorant disputatious mechanic, who told him with a frown that his ministry had become dark and flat, he replied, "Both, brother, it may be both; let me have your prayers that it may be otherwise." On another occasion, being accosted in the street by a pragmatical cockcomb, who insolently told him that he was an old fool, Mr. Cotton, with a mildness that showed he forgave his rudeness, and a solemnity that evinced he was very far from disregarding the opinion of his brethren, answered, "I confess I am so; the Lord make thee and me wiser than we are, even wise unto salvation." The character of this excellent clergyman, and of many of his contemporaries in the colonial ministry, seems to have been formed by Providence for the express purpose of counteracting, by strong individual influence, the violent, divisive, and contentious spirit that long continued to ferment among a community of men whom persecution had rendered rigid and inflexible in following out their opinions, whose sentiments had not been harmonized by previous habits of union, who were daily receiving into their body a fresh infusion of dissimilar characters and exasperated feeling, and among whom each naturally considered the opinions for which he had individually suffered, as the most important features in the common cause. When we recollect the presence of such elements of discord, and the severe and lengthened operation that had been given to that influence which tends to drive even the wise to frenzy, we shall be less disposed to marvel at the vehement heats and acrimonious contentions that in some instances broke forth to disturb the peace of the colony, than that in the midst of such threatening symptoms so much coherence and stability was preserved, and so much virtue, happiness, and prosperity attained. Among the instruments which the Divine Being adapted and employed to compose the frenzy and moderate the fervor of his people, were this eminent individual John Cotton, Thomas Hooker, a man very little inferior to him in worth, and, at a later period, Dr. Increase Mather, who succeeded to the estimation which Mr. Cotton had enjoyed, and whose family supplied no less than ten of the most popular ministers of their age to the church of Massachusetts, and produced the celebrated author of the ecclesiastical history of New England. Had the colonial ministry been composed entirely of such or such-like men, the agitated minds of the inhabitants might have much sooner attained a settled composure; but, unfortunately, the wild and impetuous spirit that was working in many of them did not long wait for leaders to excite and develop its powers.

The first religious dissension that arose in the colony was promoted by Roger Williams, [1634.] who had come over to New England in 1620, and preached for some years to the inhabitants of New Plymouth; but, not finding there an audience suitable to his purposes, he had solicited his dismission, and had recently been appointed minister of Salem. This man was a rigid Brownist, precise, illiberal, unforbearing, and passionate: he began to vent from the pulpit which he had gained by his substantial piety and fervid zeal, a singular medley of notions; some wildly speculative, some boldly opposed to the constitutions of civil society, and some which, if unexceptionable in theory, were highly unsuitable to the place from which they were delivered, and the exercises and sentiments with which he endeavored to associate them. He maintained that it was not lawful for an unregenerate man to pray, nor for christians to join in family prayer with those whom they judged unregenerate; that it was not lawful to take an oath to the civil magistrate, not even the oath of allegiance, which he had declined himself to take, and advised his congregation equally to refuse; that King Charles had no right to usurp the power of disposing of the territory of the Indians, and hence the

colonial patent was utterly invalid; that the magistrate had no right to restrain or direct the consciences of men; and that any thing short of unlimited toleration for all religions was detestable persecution. These liberal principles of toleration he combined with a spirit so rigid and separating, that he not only refused all communion with any who did not profess every one of the foregoing opinions, but forbade the members of the church at Salem to communicate with any of the other churches in the colony; and, when they refused to obey this prohibition, he withdrew from them, and set up a separate meeting in his own house. Here he was attended by a select assembly of zealous admirers, composed of men, in whose minds an impetuous temper, inflamed by persecution, had greatly impaired the sense of moral perspective; who entertained disproportioned ideas of those branches of the trunk of godliness, for the sake of which they had endured such mighty sufferings, and had seen worth and piety so foully wronged; and who abhorred every symbol, badge, and practice, that was associated with the remembrance, and spotted, as they conceived, with the iniquity of their idolatrous oppressors. One of his followers, Mr. Endicot, a magistrate of the place, and formerly deputy-governor of the colony, in a transport of zeal against superstition, cut the red cross out of the king's colors; and many of the trained bands, who had hitherto followed these colors without objection, caught the contagion of Endicot's zeal, and protested that they would follow them no longer, if the cross were permitted to remain. The riotous and violent conduct of Endicot was universally disapproved, and the colonial authorities punished his misdemeanor by reprimand and disability of holding office for one year; but they were obliged to compromise the dispute with the protesters among the trained bands, and comply, to a certain extent, with their remonstrances. They were preparing to call Williams to a judicial reckoning, when Mr. Cotton and other ministers interposed and desired to be allowed to reason with him, alleging that his violence was prompted rather by a misguided conscience, than seditious principles; and that there was hope they might gain, instead of losing, their brother. *You are deceived in that man, if you think he will condescend to learn of any of you,* was the prediction of the governor, and the result of the conference proving the justice of it,* sentence of banishment from the colony was forthwith pronounced upon Williams. This sentence excited a great uproar in Salem, and was so successfully denounced as persecution by the adherents of Williams, that the bulk of the inhabitants of the place were preparing to follow him into exile; when an earnest and pious admonition, transmitted to them by Mr. Cotton and the other ministers of Boston, induced them to relinquish their purpose, to acknowledge the justice of the proceeding, and abandon Williams to his fortunes. He was not, however, abandoned by his more select adherents, whose esteem and affection he had gained to such a degree, that they resolved to incur every hazard, in order to live and die with him. Accompanying him in his exile, they directed their march towards the south, and settling at a place beyond the jurisdiction of Massachusetts, they bought a considerable tract of land from the Indians, and bestowed on their settlement the name of Providence. Had this man encountered the treatment to which the publication of his peculiar opinions would have exposed him in England, he would probably have been driven to madness: the wiser and kinder treatment he experienced from the Massachusetts authorities was productive of happier effects; and Mr. Cotton and his associates were not deceived, in supposing that they would gain their brother. They gained him in a manner, indeed, less flattering to themselves than a triumphant issue of the conference would have been, but much more beneficial to the interests of America. He concurred, as we shall see, at a later period, in founding the state of Rhode Island, and was one of its most eminent benefactors. He lived to an advanced age; and soon throwing off the wild and separating spirit with which his sentiments had been leavened, he regained the friendship and esteem of his ancient fellow colonists,

* Though he would not retract his dogmas, it seems that some of the arguments that were employed with him sank into his mind, and at least reduced him to silence. Mr. Hooker, one of the ministers who was sent to deal with him, urged, among other reasons,—"If it be unlawful for an unregenerate person to pray, it is unlawful for your unregenerate child to ask a blessing on his meat; and if so, it is unlawful for him to eat, since food is sanctified by prayer, and without prayer unsanctified (1 Tim. iv. 4, 5); and it must be equally unlawful for you to invite him to eat, since you ought not to tempt him to sin." To this he declined making any answer. Cotton Mather.

and preserved a friendly correspondence with Mr. Cotton and others of them till his death. The principles of toleration, which he had formerly discredited, by the rigidity with which he disallowed the slightest difference of opinions between the members of his own communion, he now enforced by exercising that forbearance by which the differences that distinguish Christians are prevented from dividing them, and by cultivating that charity, by which even the sense of these differences is often melted down. The great fundamental principles of Christianity daily acquiring a more exclusive and absorbing influence over his mind, he began to labor for the conversion of the Indians; and, in addition to the benefits of which his ministry among them was productive to themselves, he acquired over them an influence which he rendered highly advantageous to his old associates in Massachusetts, whom he was enabled frequently to warn of conspiracies formed against them by the savages in their vicinity, and communicated to him by the tribes with whom he maintained relations of friendship. The vehemence that Endicot had displayed, was not less mellowed by time and the ascendancy of sound wisdom and piety. He remained in Massachusetts, and, at a later period, held for many years the chief office in its government with great advantage and general respect.

The colony of Massachusetts had continued meanwhile to attain stability and prosperity, and to extend its settlements; and this year an important and beneficial change took place in its internal constitution. The mortality that had prevailed among the Indians, had vacated a great many of the stations which their tribes had occupied, and as many of these were well chosen, the colonists took possession of them with an eagerness that dispersed their settlements widely over the province. This necessarily led to the introduction of representative government, and, accordingly, at the period of assembling the general court, the freemen, instead of attending it in person, according to the prescription of the charter, elected representatives in their several districts, whom they authorised to appear in their name and act in their behalf. The representatives were admitted, and henceforward considered themselves, in conjunction with the governor and assistants, as the supreme legislative assembly of the colony. The abstract wisdom of this innovation could not admit of doubt, and, in defence of their right to effect it, it was forcibly urged that the colonists were only making a new way to the enjoyment of a right already extended to them, and preventing their assemblies from becoming either too numerous to transact business, or too thin and partial to represent the interests which they were intended to administer, and supposed to embrace. The number of freemen had greatly increased since the charter was granted; many resided at a distance from the places where the supreme courts were held; personal attendance had become inconvenient; and, in such circumstances, it will not be easy to blame them for making with their own hands the improvement that was necessary to preserve their existing rights, instead of applying to the government of England, which was steadily pursuing the plan of subverting the organs of liberty in the mother country, and had already begun to exhibit an altered countenance towards the colony.* In consequence of this important measure the colony advanced beyond the state of a corporation, and acquired by its own act the condition of a society which was endowed with political liberty, and which had framed for itself a government derived from the model of the English constitution. The representatives having established themselves in their office, proceeded to assert the rights which necessarily attached to it, by enacting that no law should be passed, no tax imposed, and no public officer appointed but by the general assembly.

The increasing violence and injustice of the royal government in England meanwhile co-operated so powerfully with the tidings that were circulated of the prosperity of Massachusetts; and the simple frame of ecclesiastical policy that had been established in the colony presented a prospect so desirable, and rendered the gorgeous hierarchy and recent superstitious innovations in the ceremonies of the English church so additionally odious, that the flow of emigration seemed

* In the preceding year the privy council, alarmed by the strong sensation which was excited in England by the intelligence of the happiness enjoyed by the puritans under their ecclesiastical establishments in Massachusetts, issued an order to stay certain vessels which were about to proceed thither with emigrants.—Chalmers, p. 155—probably with the view of suppressing the agitations and discussions which the projects of emigration engendered. The order was not carried into effect.

rather to enlarge than subside, and crowds of new settlers continued to flock to New England. [1635] Among the passengers, in a fleet of twenty vessels that arrived in the following year, were two persons who afterwards made a distinguished figure on a more conspicuous theatre. One of these was Hugh Peters, the celebrated chaplain and counsellor of Oliver Cromwell, and the other was Vane, whose father, Sir Henry Vane the elder, was a privy councillor, and high in office and credit with the king. Peters became minister of Salem, and, possessing a mind unusually active and enterprising, he not only discharged his sacred functions with zeal and advantage, but roused the planters to new courses of useful industry, and encouraged them by his own successful example. His labors were blessed with a produce not less honorable than enduring. The spirit which he excited has continued to prevail with unabated vigor; and nearly two centuries after his death, the piety, good morals, and industry by which Salem has ever been distinguished, have been traced to the effects of Peters's ministry. He remained in New England till the year 1641, when, at the request of the colonists, he went to transact some business for them in the mother country, from which he was fated never to return.* Vane, afterwards Sir Henry Vane the younger, had been for some time restrained from indulging his wish to proceed to New England by the prohibition of his father, who was at length induced to waive his objections by the interference of the king. A young man of noble family, animated with such ardent devotion to the cause of pure religion and liberty, that, relinquishing all his hopes in England, he chose to settle in an infant colony which as yet afforded little more than a bare subsistence to its inhabitants, was received in New England with the fondest regard and admiration. He was then little more than twenty-four years of age. His youth, which seemed to magnify the sacrifice he had made, increased no less the impression which his manners and appearance were calculated to produce. The awful composure of his aspect and demeanor stamped a serious grace and grandeur on the bloom of manhood; his countenance appeared the surface of a character not less resolute than profound, and whose energy was not extinguished, but concentrated into a sublime and solemn calm. He has been charged with enthusiasm by some who have remarked the intensity with which he pursued purposes which to them have appeared worthless and ignoble; and with hypocrisy by others who have contrasted the strength and stretch of his resolution with the calmness of his manners. But a juster consideration, perhaps, may suggest that it was the habitual energy of his determination that repressed every symptom of vehement impetuosity, and induced an equality of manner that scarcely appeared to exceed the pitch of a grave composure and constancy. It is the disproportion so frequently evinced between the genius and the character of eminent men, that occasions their irregular conduct and impetuous demeanor. But Vane, fully embracing the loftiest projects of his genius with all the faculties of his being, was deeply impressed with the vast and arduous nature of the work he undertook, and devoted himself to it with such a diligence and concentration of his forces as to the idle, the careless, and the speculative part of mankind, appears like insanity. So much did his mind predominate over his senses, and the nobler control the more ignoble part of his being, that, though constitutionally timid and susceptible, in no common degree, of impressions of pain, yet his whole life was one continued course of great and daring enterprise; and when amidst the wreck of his fortunes and the treachery of his associates, death was presented to himself in the appalling form of a bloody execution, he prepared for it with an animated and even cheerful intrepidity, and encountered it with dignified composure. The man who could so subdue himself, was formed to exercise a strong influence on the minds of others. He was instantly complimented with the freedom of the colony; and enforcing his claims to respect, by the address and ability which he showed in conducting business, he was elected governor in the year subsequent to his arrival, by the

* Bishop Burnet has termed this man "an enthusiastical buffoon," and reproached him with cowardice at his execution. But his life (stained, no doubt, with moral imperfection) evinced a piety that Burnet never knew, and his death was dignified by a courage that distinguished him even among the regicides. After his fellow-sufferer Cook had been quartered before his face, the executioner approached him, and, rubbing his bloody hands, said, "Come, Mr. Peters, how do you like this work?" Peters answered, "I thank God I am not terrified at it; you may do your worst." Trials and Deaths of the Regicides.

universal consent of the colonists, and with the highest expectations of a happy and advantageous administration. [1636.] These hopes, however, were disappointed. Vane, not hiding the political affairs of the colonists a wide enough field for the excursion of his active spirit, embarked his energy in their theological discussions; and, unfortunately, connecting himself with a party who had conceived singularly just and profound views of doctrine, but associated them with some dangerous errors, and discredited them by the wildest vehemence and disorder, he very soon witnessed the abridgement of his usefulness and the decline of his popularity.

The increasing numbers of the colonists, causing the inhabitants of some of the towns to feel themselves straitened for room, suggested the formation of additional establishments. A project of founding a new settlement on the banks of the river Connecticut was now embraced by Mr. Hooker, one of the ministers of Boston, and a hundred of the members of his congregation. After enduring extreme hardship, and encountering the usual difficulties that attended the foundation of a society in this quarter of America, with the usual display of puritan fortitude and resolution, they at length succeeded in establishing a plantation, which gradually enlarged into the flourishing state of Connecticut. Some Dutch settlers from New York, who had previously occupied a post in the country, were compelled to surrender it to them; and they soon after obtained from Lord Brooke and Lord Say and Sele, an assignation to a district which these noblemen had acquired in this region, with the intention of flying from the royal tyranny to America.* They had at first carried with them a commission from the government of Massachusetts Bay, for the administration of justice in their new settlement; but, afterwards reflecting that their territory was beyond the jurisdiction of the authorities from whom this commission was derived, they combined themselves by a voluntary association into a body politic, constructed on the same model with the state from which they had separated. They continued in this condition till the Restoration, when they obtained a charter for themselves from King Charles the Second. That this secession from the colony of Massachusetts Bay was occasioned by lack of room in a province as yet so imperfectly peopled, has appeared so improbable to some writers, that they have thought it necessary to assign another cause, and have found none so satisfactory as the jealousy which they conclude Mr. Hooker must inevitably have entertained towards Mr. Cotton, whose influence had become so great in Massachusetts that even a formidable political dissension was quelled by one of his pacific discourses. But envy was not a passion that could dwell in the humble and holy breast of Hooker, or be generated by such influence as the character of Cotton was formed to exert. The sense of a redundant population was the more readily experienced at first from the unwillingness of the settlers to remove far into the interior of the country and deprive themselves of an easy communication with the coast. Another reason, indeed, appears to have enforced the formation of this new settlement: but it was a reason that argued not dissension, but community of feeling and design between the settlers who remained in Massachusetts and those who removed to Connecticut. By the establishment of this advanced station, a barrier, it was hoped, would be erected against the troublesome incursions of the Pequot Indians.† Nor is it utterly improbable that some of the seceders to this new settlement were actuated by a restless spirit which had hoped too much from

external change, and which vainly urged a farther pursuit of that spring of contentment which must rise up in the mind of him who would enjoy it.

In the immediate neighborhood of this new settlement, another plantation was formed about two years after, by a numerous body of emigrants who arrived from England under the guidance of Theophilus Eaton, a gentleman of fortune, and John Davenport, an eminent puritan minister. Massachusetts Bay appearing to them overstocked, and being informed of a large and commodious bay to the south-west of Connecticut river, they purchased from the natives all the land that lies between that stream and Hudson's river, which divides the southern parts of New England from New York. Seating themselves in this bay, they spread along the coast, where they built first the town of Newhaven, which has given its name to the settlement, and then the towns of Guilford, Milford, Stamford, and Braintree. After some time they crossed the bay, and planted several settlements in Long Island; in all places where they came, erecting churches on the model of the independents. When we perceive the injustice and cruelty exercised by the government of Britain, thus contributing to cover the earth with cities and to plant religion and liberty in the savage deserts of America, we recognise the overruling providence of that great Being who can render even the fierceness of men conducive to his praise. Having no patent, nor any other title to their lands than the vendition of the natives, and not being included within the boundaries of any colonial jurisdiction, these settlers entered into a voluntary association of the same nature and for the same ends with that which the settlers in Connecticut had formed for themselves: and in this condition they remained till the Restoration, when Newhaven and Connecticut were united together by a charter of King Charles the Second.*

When the settlement of Connecticut was projected, it was hoped that it might conduce to overawe the hostility of the Indians; but it produced a perfectly opposite effect. The tribes of Indians in the immediate vicinity of Massachusetts Bay were comparatively feeble and unwarlike; but the colonies of Providence and Connecticut were planted in the midst of powerful and martial hordes. Among these, the most considerable were the Naragansets, who inhabited the shores of the bay which bear their name, and the Pequods, who occupied the territory which stretches from the river Pequot to the banks of the Connecticut. The Pequods were a formidable people, who could bring into the field a thousand warriors not inferior in courage to any in the new world. They had early entertained a jealous hatred of the European colonists, and for some time past had harassed them with unprovoked attacks, and excited their abhorrence and indignation by the monstrous outrages to which they had subjected their captives. Unoffending men, women, and children, who had the misfortune to fall into their hands, were scalped and sent back to their friends, or put to death with every circumstance of torture and indignity, while the assassins with diabolical joy called aloud to them to invoke the God of the christians, and put to the proof his power to save them. The extension of the English settlements excited their fury anew, and produced a repetition of attacks, which Mr. Vane the governor of Massachusetts, determined at length to encounter and punish by offensive operations. Receiving intelligence of a serious attack that had been made by the Pequods on the Connecticut settlers, [1637.] he summoned all the New England communities to embody the strongest force they could spare, and march to defend their brethren and vindicate the common cause. The Pequods, aware of the impending danger, were not wanting in endeavors to encounter and repel it. For this purpose, they sought a reconciliation with the Naragansets, their hereditary enemies and rivals in power, and requested these people to forget their ancient animosities, and for once to co-operate cordially with them against a common foe, whose progressive

encroachments threatened to confound them both in one common destruction. But the Naragansets had long cherished a vehement hatred against the Pequods; and less moved by a distant prospect of danger to themselves, than by the hope of an instant gratification of their unplaceable revenge, they rejected the proposals of accommodation, and determined to assist the English in the prosecution of the war.

The Pequods incensed, but not dismayed, by this disappointment, proceeded by the vigor of their operations to anticipate the junction of the allied colonial forces; and the Connecticut troops, while as yet they had received but a small part of the reinforcements that their friends were preparing to send them, found it necessary to advance towards the enemy. The Pequods, commanded by Sassacus, their principal sachem, occupied two fortified stations, against one of which Captain Mason and the Connecticut militia, attended by a body of Indian allies, directed their attack. Their approach was quickened by the information they obtained, that the enemy, deceived by a seeming retrograde movement of the colonial forces, had abandoned themselves to the conviction that the English dared not encounter them, and were celebrating in perfect security the supposed evacuation of their country. About daybreak, while in deep slumber and supine security, they were approached by the English; and the surprise would have been complete, if they had not been alarmed by the barking of a dog. The war-whoop was immediately sounded, and they flew to their arms. The English rushed on to the attack; and while some of them fired on the Indians through the palisades, others forced their way by the entrances into the fort, and setting fire to the huts which were covered with reeds, involved their enemies in the confusion and terror of a general conflagration. After a manly and desperate resistance, the Pequods were totally defeated with the slaughter of at least five hundred of their tribe. Many of the women and children perished in the flames; and the warriors, in endeavoring to escape, were either slain by the English, or, falling into the hands of the Indian allies, who surrounded the fort at a distance, were reserved for a more cruel fate. Soon after this action, Captain Stoughton having arrived with the auxiliary troops from Massachusetts, it was resolved to pursue the victory. Several engagements took place which terminated unfavorably for the Pequods; and in a short time they sustained another general defeat which put an end to the war. A few only of this once powerful nation survived, who, abandoning their country to the English, dispersed themselves among the neighboring tribes, and lost their existence as a distinct people. Sassacus had been an object of superstitious terror to the Naragansets, who had endeavored to dissuade the English from risking a personal encounter with him, by the assurance that his person was divine and invulnerable. After the destruction of his people, when he fled for refuge to a distant tribe, the Naragansets, exchanging their terror for cruelty, solicited and prevailed with his hosts to cut off his head. Thus terminated a struggle more important in its consequences, than from the numbers of the combatants, or the celebrity of their names. On its issue there had been ataked no less than the question, whether christianity and civilization, or paganism and barbarity should prevail in New England.

This first military enterprise of the colonists was conducted with vigor and ability, and impressed on the aborigines a high opinion of their invincible courage and superior skill. Their victory, however, it must be confessed, was sullied by cruelties which it is easy to account for and extenuate, but painful to recollect. The Massachusetts militia had been exceedingly diligent before their march in purging their ranks of all whose religious sentiments were thought to argue want or weakness of faith.* It had been well if they could have purged their own bosoms of the vindictive feelings which the outrages of the savages were but too powerfully calculated to inspire. Some of the prisoners were tortured by the Indian allies, whose cruelties we can hardly doubt that the English might have prevented: a considerable number were sold as slaves in Bermudas,† and the rest were reduced to servitude in the colonial settlements. In aggravation of the vio-

* Lord Brooke and Lord Say and Sele had proceeded so far in their design as to send over an agent to take possession of their territory, and build a fort. Happily for America, the sentiments and habits that rendered their unfit members of a society where complete civil freedom and perfect simplicity of manners were esteemed requisite to the general happiness, prevented these noblemen from carrying their project into execution. They proposed to establish an order of nobility and hereditary magistracy in America; and consumed so much time in arguing this important point with the other settlers who were to be associated with them, that at length their ardor for emigration abated, and nearer and more interesting prospects opened to their activity in England. Chalmers 289, 290.

† Mather, B. i. cap. 6. sect. 2, 3. Hutchinson, i. 43–45. Trumbull's History of Connecticut, vol. i. cap. 4. It appears from Mather's Lives of Cotton and Hooker, that these men were knit together in the firmest bonds of christian friendship and cordial esteem. Paul and Barnabas (doubtless for wise purposes) were separated from each other. So were Cotton and Hooker, though by less unpleasant instrumentality. These men who forsook houses, lands, and country for the sake of the gospel, are described by Dr. Robertson as "rival competitors in the contest for fame and power." This is the only light in which many eminent and even reverend writers are capable of regarding the labors of the patriot, the saint, and the sage.

* Neal, i. 132. The colonists of Massachusetts were very desirous that Mr. Davenport and his associates should settle among them. But "it had been an observation of Mr. Davenport's, that whenever a reformation had been effected in any part of the world, it had rested where it had been left by the reformers. It could not be advanced another step. He was now embarked in a design of forming a civil and religious constitution as near as possible to scripture precept and example. The principal gentlemen who had followed him to America had the same views. In laying the foundations of a new colony, there was a fair probability that they might accommodate all matters of church and commonwealth to their own feelings and sentiments. But in Massachusetts the principal men were fixed in the chief seats of government, which they were likely to keep, and their civil and religious polity was already formed." Trumbull, i. 97.

* Recurrent chaplains accompanied the New England forces in their campaigns; and in circumstances of doubt or danger, the chaplain was invited to pray for divine direction and assistance. Trumbull, i. 81, 89. When a commander-in-chief was appointed, his military staff was delivered to him by one of the clergy. Ib. 95.

† A similar punishment was inflicted many years after in England on some of the royalists who had been implicated in Penruddock's insurrection. Hume, vii. 244.

active spirit displayed in these proceedings, it has been urged, but with very little reason, that the Pequods were entitled to the treatment of an independent people making a gallant effort to defend their property, their rights and their freedom. But in truth, the Pequods were the aggressors in a causeless quarrel, and were fighting all along in support of barbarous outrage and purposes of extermination. The colonists had conducted themselves with undeviating justice, civility and piety towards the Indians. They had treated fairly with them for their territories; assisted them by counsel and help in their diseases and their agriculture, and labored to communicate to them the blessings of religion. They disallowed all acquisitions of territory from the Indians but such as should undergo the scrutiny of the general court; and they offered a participation of all their privileges and property to every Indian who would adopt the religion of a christian and the manners of a civilized human being. In return for these demonstrations of good-will, they were treated with outrage and barbarity, directed against all that they revered or loved; and were forcibly impressed with the conviction that they must extirpate these sanguinary idolaters, or leave their fellow-christians, their wives, children, and brethren, exposed to a more horrid destruction from their barbarous hands.* Even in the course of the war, they made propositions of lenity to the savages on the condition of their delivering up the murderers of the English; but their offers were uniformly rejected; and the people who adopted the murders as national acts, invited the avengers of blood to visit them with national punishments. The mutual hostilities of civilized nations, conducted by dispassionate mercenaries, and directed by leaders more eager for fame than prompted by anger or personal apprehension, may be administered on the principles of a splendid game. But such hostilities as those which the New England colonists were compelled to urge with the hordes of savage assassins who attacked them, will always display human passions in their naked horror and ferocity. The permission (for I suppose they could have prevented it) of the barbarity of their savage allies, appears the least excusable feature in their conduct. And yet, in considering it, we must add to our allowance for passion inflamed by enormous provocation, the recollection of the danger and inexpediency of checking that mutual hostility of the savages which prevented a combination that might have proved fatal to the European name. The reduction of their captives to servitude was unquestionably a great evil; but one for which it would not have been easy to suggest a substitute to men too justly alarmed to permit the enemies whom, overcoming by force, they had but half subdued, to go free, and too poor to support them in idle captivity. The captive Pequods were treated with the utmost possible kindness, and regarded rather as indentured servants than slaves. It must be acknowledged at least that the colonists observed a magnanimous consistency in their international policy, and gave the Indians the protection of the same stern principles of justice of which they had taught them to feel the vindictive energy. They not only offered a participation of their own privileges and territory to all civilized and converted Indians; but having ascertained the stations which the savages most highly valued, and the range of territory that seemed necessary to their comfort and happiness, they prohibited and annulled every transaction by which these domains might be added to the European acquisitions. A short time after the termination of the Pequot war, an Indian having been wantonly killed by some vagabond Englishman, the murderers were solemnly tried and executed for the crime; and the Indians beheld with astonishment the blood of three men deliberately shed for the slaughter of one. The sense of justice co-operating with the repute of valor, secured a long tranquillity to the English settlements.

While the military force of Massachusetts was thus employed in the field, the commonwealth was shaken and torn by intestine disputes, which had been excited by theological discussions, and inflamed by the gall of unruly tongues and the bitterness of railing accusation. It was the custom at that time in Boston, that the members of every congregation should assemble in

weekly meetings to repeat the sermons of the preceding Sunday; to debate the doctrines they had heard; to revive the impressions that had been produced by their Sabbath exercises; and extend the sacred influence of the Sabbath throughout the week. Mrs. Hutchinson, the wife of one of the most respectable inhabitants of the colony, a lady of masculine spirit and great subtlety and vivacity of apprehension, submitted with impatience to the regulation by which women at these meetings were debarred from the privilege of joining in the debates: and at length, apprehending that she was authorised to exercise her qualifications by the precepts of Scripture which enjoins the *elder women to teach the younger*, she established separate meetings of the christians of her own sex, where her zeal and talent soon procured her a numerous and admiring audience. These women, who had partaken the struggles and perils of the male colonists, had also caught no small portion of the various hues of their spirit; and as many of them had been accustomed to a life more replete with external elegance and variety of interest and employment than the state of the colony could supply, they found a listless craving for something to animate and engage their faculties, and judged nothing fitter for this purpose than an imitation of those exercises for the promotion of the great common cause which seemed to minister such comfort and support to the spirits of the men. The issue of their design illustrated very signally some of the least estimable peculiarities of female character, and amply demonstrated that its defects are not cured but fortified by such irregular congregation. Mrs. Hutchinson, their leader, had by her earnest zeal gained the cordial esteem of Mr. Cotton, whose charity never failed to recognise in every human being the slightest trace of those graces which he continually looked for; and towards him she entertained and professed for some time a very high veneration. The friendship of Mr. Vane and some others had a less favorable influence on her mind; and the admiration they expressed of the depth and vigor of her ratiocination, seems to have elevated in her apprehension the gifts of intellect above the graces of character. She acquired the title of *The Amazon*, which the admiration of her followers had eagerly derived from an anagrammatical transposition of the letters of her name; and gave to her female assemblies the title of *gossippings*; a term at that time of respectable import, but which the scandalous repute of female conventions and debates has since consigned to contempt and ridicule. Doing amiss what the Scriptures plainly forbade her to do at all, she constituted herself a teacher of orthodoxy, and a censor of the faith of all the ministers and inhabitants of the colony. Her canons of doctrine were received by her associates as the unerring standard of truth, and a defamatory persecution was industriously waged against all who rejected or professed themselves unable to understand them. A scrutiny was instituted into the characters of all the clergy and laity of the province; and of those who refused to receive the doctrinal testimony of the conclave, few found it easy to stand the test of a censorious gaze, quickened by female petulance and controversial rancor. Women, neither fitted by the constitution of their nature, nor prepared by their education and habits, for the rough contests and collisions of the world, demonstrate, in general, great pertinacity, severity, and impatience, when they assume the direction of affairs, or arrogate a jurisdiction over those who conduct them. Losing the gentle graces of their own sex when they step beyond the sphere of its duties, without acquiring the hardy virtues of the other sex, whose province they invade, they show themselves keenly susceptible and utterly unforbearing, swift to speak and slow to hear, headlong in conduct, prompt to accuse, intolerant of contradiction, acrimonious in reproach. In these female assemblies, there was trained and exercised a keen pugnacious spirit and unbridled license of tongue, of which the actings were quickly felt in the serious disturbance, first of domestic happiness, and then of the public peace. The matrons of Boston were transformed into a synod of *tattlers and busy bodies*, whose bold decrees and slanderous deliberations sent their influence into the innermost recesses of society: and the spirits of men being in that combustible state which the application of a very feeble flash will kindle into a formidable conflagration, the whole colony was set on fire by the incontinence of female spleen and verbosity. A line of demarcation was drawn between those whom Mrs. Hutchinson esteemed the sound, and those whom she denominated the unsound; and all who were included in this latter description heard themselves continually

stigmatized as a generation of unchristian vipers, or helpless bondslaves to a covenant of works.

The tenets which this faction, and a few ministers who united with it, adopted and inculcated, were denounced by their adversaries as constituting the heresy of antinomianism—a charge which, when preferred by the world at large, indicates no more than the reproach which the gospel, from its first promulgation, has been fated to sustain, and when advanced by christians against members of their own body, generally implies nothing else than the deductions which they draw from certain views of doctrine, but which the holders of these views utterly reject and disallow. Nothing can be more perfectly antinomian than the system of the gospel; nor any thing more powerfully operative than the influence which it is fitted to exert. Mrs. Hutchinson and her adherents contended more earnestly for the freedom, than for the constraining influence of divine grace: and with the eagerness and impetuosity of female feeling, were not slow to brand with terms of heretical and contemptuous designation, every inhabitant of the colony, and particularly every minister, whose views did not coincide with their own. The doctrines which they gave forth, and the censures which they propagated, were received with equal eagerness by a considerable party; and equally provoking the displeasure of others, excited the most violent dissensions throughout the whole colony. Mr. Cotton endeavored to reconcile or moderate the heats that arose, by representing to the parties that their strife was prejudicial to that which he firmly believed to be the great object of both, the exalting and honoring of divine grace; *the one (said he) seeking to advance the grace of God within us in the work of sanctification, the other seeking to advance the grace of God without us, in the work of justification*. But the strife was not to be stopped; and his endeavors to arrest it attracted upon himself the fulmination of a censure of timorous and purblind incapacity from the assembly of the women; and, as even this could not induce him to take a strong part against them, he incurred a temporary abatement of his popularity with the bulk of the inhabitants. He could not consent to condemn the form of sound words by which some of the tenets of the sectaries were peculiarly distinguished; but he viewed with grief and amazement the fierce and contemptuous spirit with which they were maintained, and the wild and dangerous errors with which they very soon came to be associated. The controversy raged with a violence very unfavorable to the discernment and reception of truth. Mrs. Hutchinson and her adherents, both male and female, persuaded (and justly so, I think, on some points) of the superior clearness, truth, and simplicity of their system of doctrines, forgot to consider how far the opposition which it encountered might be traced to the obscurity and imperfection with which they themselves received and enforced it—a consideration which no human being is entitled to disregard, and which is eminently fitted to render superior attainments more amiable and efficacious, by rendering them more productive of candor and humility. The principles they discarded from their creed laid hold upon their spirit; and while they contended for the sovereignty of divine grace in communicating truth, they attacked the sentiments of their adversaries with an acrimony and invective that might have been thought to imply that truth was easily and exclusively attainable by the mere will and endeavor of men. The most enlightened and consistent christian will ever be the most ready to acknowledge that *he knows nothing yet as he ought to know*, and may have more cause than he can yet discover, to blush for the defectiveness of a testimony, which, exhibited with more clearness and simplicity, might have found greater acceptance with mankind. But no such considerations suggested themselves to mitigate the vehemence, or soften the asperity, of those busy, bold, and presumptuous spirits; nor did it ever occur to them that the truths they held forth would be liable to be evil spoken of, from association with the deadly poison of that world of iniquity, an untamed, licentious tongue. It is asserted that the heat of their tempers gradually communicated itself to the understandings of Mrs. Hutchinson and her party, and that in addition to their original tenets, that believers are personally united with the spirit of God, that commands to work out salvation with fear and trembling belong only to those who are under a covenant of works, and that sanctification is not the proper evidence of christian condition, they received that unhappy error of the Quakers, that the spirit of God communicates with the minds of believers independently of the written word; and, in consistency with this, received many

* The colonists considered themselves in some degree accessory to the crimes which they might fail to prevent by neglect of any of the means warranted by strict justice. Belknap cites the following entry in a MS. Journal of events in New-England, some years posterior to this period. "The house of John Keniston was burned and he killed at Greenland. The Indians are Simon, Andrew, and Peter. Those three we had in prison and should have killed. The good Lord pardon us." History of New Hampshire, l. 155

revelations of future events announced to them by Mrs. Hutchinson as equally infallible with the prophecies of Scripture. But the accounts that are transmitted to us of such theological dissensions are always obscured by the cloud of contemporary passion, prejudice, and error: hasty effusions of passionate zeal are mistaken for deliberate sentiments; and the excesses of the zealots of a party held up as the standard by which the whole body may fairly be tried.*

Some ministers adopting Mrs. Hutchinson's opinions, began to enforce them from the pulpit with such vehement invectives against all by whom they were rejected, as at length brought the dissenters to a crisis; and Mr. Vane being considered the confederate and protector of Mrs. Hutchinson, his continuance in office, or dismissal from it at the approaching annual election, was the first test by which the parties were to try with which of them resided the power of imposing silence on the other. So much had been done to gall and irritate the feelings of the people, and to stimulate them to mutual dislike and suspicion, that the utmost efforts of the sober and humane could barely prevent the day of election from being disgraced by a general riot. All the exertions of Vane's partisans failed to obtain his re-appointment; and, by a great majority of votes, the government was conferred on Mr. Winthrop. Vane still remained in the colony, professing his willingness to serve the cause of God in the meanest capacity; and the followers of Mrs. Hutchinson, regarding his deprivation of office as a dangerous blow to themselves, ceased not to labor for his reinstatement with as much warmth as they had exerted in the propagation of their tenets. The government was loudly declaimed against, and Mr. Winthrop openly slighted and affronted. At length it was determined by the prevailing party, to cut up this source of contention by the roots; and a general synod of the churches of the colony having been assembled, the new opinions were condemned as erroneous and heretical. As this proceeding seemed only to provoke their professors to assert them with greater vehemence than ever, the leaders of the party were summoned before the general court. Mrs. Hutchinson rebuked her judges for their wicked persecution of truth, compared herself to the prophet Daniel when cast into the den of lions, and proceeded to complete the comparison by venturing to exercise what she believed to be the gift of prophecy, and predicting that her exile would be attended with the ruin of her adversaries and all their posterity.† To this punishment, nevertheless, she was condemned, together with her brother Wheelwright, who was a preacher, and had been the great pulpit champion of her doctrines; and some of the inferior members of the faction, partly on account of the violence with which they still maintained their theological tenets, and partly for the seditious insolence with which they had treated the new governor, were fined and disfranchised. In consequence of these proceedings, Vane quitted the colony and returned to England, "leaving a caveat," says Mather, "that all good men are not fit for government."

From the unpleasant contemplations of these religious dissensions, we now turn to the more agreeable survey of some of the consequences of which their issue was productive. A considerable number of per-

sons, highly dissatisfied with the proceedings of the synod and the general court of Massachusetts, voluntarily forsook the colony; some of these proceeded to join Roger Williams and his friends at Providence; and, being soon after abandoned by Mrs. Hutchinson, they fell under the guidance of that meliorated spirit which Williams had now begun to display. By a transaction with the Indians, these associated exiles obtained a right to a fertile island in Naraganset Bay, which acquired the name of Rhode Island.‡ Williams remained among them upwards of forty years, respected as the father and director of the colony which he had planted, and of which he was several times elected governor. In the year 1643, he made a journey to England, and, by the interest of Sir Henry Vane, obtained and brought back to them a parliamentary charter, by which Providence and Rhode Island remained united till the Restoration. Others of the exiles, under the guidance of Wheelwright, betook themselves to the north-east parts of New England; and, being joined by associates who were allured by the prospects of rich fisheries and an advantageous beaver trade, they gradually formed and peopled the provinces of New Hampshire and Maine. These provinces had been respectively purchased by Mason and Gorges from the council of Plymouth, and many ineffectual attempts were made by these two adventurers to colonise their acquisitions with advantage to themselves. Mason and Gorges were actuated by very different views from those which prevailed in general among the colonists of New England; they wished to become the proprietaries or hereditary chiefs of vast manors and seignories, and to establish in America the institutions which the emigrants to America were generally seeking to escape from. They found it totally impracticable to obtain a revenue from the settlers in New Hampshire and Maine, or to establish among them a form of government suited to their own views. These settlers, composed partly of adventurers from England, and partly of exiles and voluntary emigrants from Massachusetts, framed for themselves separate governments, under which they continued to subsist, till, wearied with internal disputes and divisions, they petitioned the general court of Massachusetts to be taken under its protection, and were again associated with the colony from which they had departed.

A schism, similar to that which Mrs. Hutchinson had created, was fomented at Plymouth by one Samuel Gorton; but his career in this place was cut short by a conviction for swindling. Thence he went to Rhode Island, where he created such disturbance, that even in this community, where unlimited toleration was professed, he was sentenced to be flogged and banished. Proceeding to Providence, he had nearly involved the people of this settlement in a war with the Indians; till, at length, on the entreaty of Roger Williams, the government of Massachusetts sent a party to apprehend him, and, after imprisoning him and some of his adherents in the workhouse, obliged them to depart the colony.† [1638]

The losses, which the population of Massachusetts sustained by the various emigrations which we have witnessed, were supplied, in the following year, by the arrival of a fleet of twenty ships, with three thousand settlers from England. The same year witnessed the establishment of an institution calculated to improve the moral condition of the people. This was Harvard College, at Cambridge, in Massachusetts, the first seminary of learning erected in North America. So highly prized were the advantages of knowledge and the influence of education by these generous colonists, that, as early as the close of the year 1630, and while yet struggling with the first difficulties and distresses of their arrival, the general court at Boston had appropriated four hundred pounds to the erection of a seminary of learning. The bequest of a colonial minister, who desired his whole fortune to be applied to the same design, enabled them now to enrich their country with an establishment whose operation has proved as beneficial to their posterity, as its institution, at so early a period of their history, is honorable to themselves.‡

* The price paid to the Indians was fifty fathoms of white beads, ten coats, and twenty shoes. Chalmers, 271.

† Gorges America painted to the Life, Part ii. Cap. 24. Ned i. 179, 180. Gorton went to England, and, during the civil wars, involved the colony in no small trouble by his complaints of the persecution he had undergone.

‡ Mather, B. iv. cap. 1. Neal, i. 181, &c. Hutchinson, i. 85. For some time the college labored under the defect of a library. The efforts of the managers to accumulate one, were aided by considerable donations of books made to them by that great and pious ecclesiastic Archbishop Usher, the celebrated non-conformist minister Richard Baxter, and that distinguished warrior and philosopher Sir Kenelm Digby. It is an interest-

The population of New England was now to be left to depend on its own resources; and the impulse which had been communicated to it by the stream of emigration from the parent state was to cease. For some time past, the policy of the English government towards the colony had been singularly irresolute and unsteady: many demonstrations had been made of jealous dislike and tyrannical design; but, never being carried into execution, they had served merely to keep the colonists united by a sense of common danger, and to endear the institutions of liberty by the destruction with which they were ineffectually menaced. The king appears to have doubted pretty early the congeniality of his first proceedings towards the emigrants with the general policy of his administration: the experience of every year had confirmed his doubts, and he had wavered in irresolute perplexity between his original wish to evacuate England of the puritans, and his apprehension of the dangerous and increasing influence which their triumphant establishment in America was visibly exerting. The success of his politic devices had appeared at first to answer all his expectations, and he seemed likely to prevail over the puritans by the demonstration of a hollow good-will or lenity suspended on the condition of their abandoning the realm. A considerable portion of the embers of puritan and patriotic feeling had been removed from England, and seemingly cast away in deserts, where as yet no colony had been able to survive. But they had neither languished nor perished; and, on the contrary, had kindled in America a conflagration so powerful and extensive that all England was warned and enlightened by the blaze. The jealous attention of Laud was soon awakened to the disastrous issue of this branch of the royal policy, and while he meditated the means by which its effects might be counteracted, he maintained spies in New England, whose intelligence confirmed his misgivings, and who counted his favor by traducing the objects of his dislike. The detection of this correspondence served to animate the resentment and enforce the caution and the union of the colonists. So early as the year 1633, the English government, yielding to its first alarm, made a hasty and ill-considered attempt to repair its error by issuing a proclamation reprobating the designs that prompted emigration to New England, and ordering all ships that were about to proceed thither with passengers to be detained. It was quickly felt that this measure was premature, and that it could serve no other end than to irritate the impatience of the puritans to obtain either at home or abroad the institutions which they had made preparation to realize and enjoy. Not only was the proclamation suffered to remain unenforced, but even, at a later period, Charles reverted so far to his original policy as to promote, by his own interposition, the expatriation of young Vane, of whose political and religious sentiments he was perfectly aware. After an interval of hesitation, measures more deliberate were adopted for subverting the colonial liberties. In the year 1635, a commission was granted to the great officers of state and some of the nobility for the regulation and government of the plantations. By this commission the archbishop of Canterbury (Laud,) and a few others, were authorized to make laws and constitution for the colony; to establish an order of clergy, and assign them a maintenance; and to punish capitally, or otherwise, all who should violate their ordinances. The general body of the commissioners were directed to examine all existing colonial patents and charters, and if they found that any had been unduly obtained, or that the liberties they conferred were hurtful to the prerogative royal, to cause them to be revoked and quashed. The English grand council of Plymouth were easily persuaded to give the first example of submission to this arbitrary authority; and, accordingly, the same year they surrendered their useless patent to the king, under reservation of their claims as individuals to the property of the soil. These reserved claims gave occasion at an after period to much dispute, perplexity, and inconvenience. The only proceeding, however, which immediately ensued against the New England colonists, was the institution of a process of *quo warranto* against their charter in the Court of King's Bench, of which no intimation

line fact, and which seems to strengthen and dignify the relationship between the two countries, that many of the most illustrious men that England has ever produced, contributed to lay the foundation of civilized society in America. The enumeration of the patentees in the Virginian charters, includes almost every distinguished individual in England at the time.

* This strongly corroborates the opinion I have expressed of the real meaning, understanding, and intention of the king and the puritan emigrants at the time when the New England charter was framed and granted.

* That to a certain extent, however, this error had crept in among them, seems undeniably manifest; and it is remarkable that the notion which united them with the fundamental tenet of the Quakers should have issued from a society which, with farther resemblance to the Quakers, admitted the anti-scriptural irregularity of female teaching. Captain Underhill, one of Mrs. Hutchinson's followers, carried this error to a monstrous length, and combined with it the grossest immorality of conduct. He gave great offence by publicly maintaining that he had received a special communication of his everlasting safety while he was smoking a pipe. He was banished along with his patroness; and, a few years after, returned to Boston, where he made a public confession of hypocrisy, adultery, and delusion. Bulkley's Hist. of New Hampshire, vol. i. cap. ii. Another of Mrs. Hutchinson's followers was a woman named Mary Dyer, who retired to Rhode Island, where she subsequently became a Quaker. Winthrop's History (Savage's edition), l. 201.

† Her presumption was very signally punished. The ruin she predicted as the consequence of her exile fell on herself and her family. She went to Rhode Island, but not liking that situation, removed to one of the Dutch settlements, where she and all her family were murdered by the Indians. We may hope that the errors, by which she darkened and discredited the truth, were occasioned by a head over-heated with controversy, and rendered giddy by an undue elevation. Before she quitted Massachusetts, she signed a recantation of some of the erroneous tenets she had propounded; but maintained, in the face of the clearest evidence to the contrary, that she had never entertained them. This was considered a proof of dissimulation. Perhaps it might rather have warranted the inference that the visionary and violent spirit which had laid hold of her had departed or subsided, and that she no longer knew or understood the opinions which through its medium had formerly presented themselves to her imagination.

was made to the parties interested, and which was never prosecuted to a judicial issue.* It is vain to speculate on all the varying motives and purposes that from time to time directed and varied the policy of the king. He was formed to hate and oppress political freedom and the rights of conscience; but fated to do them signal service by his unavailing and ill-directed hostility. In the year 1637 he granted a commission to Sir Ferdinando Gorges, appointing him governor-general of New England, and issued a proclamation prohibiting all persons from transporting themselves, or others, to that country without a special warrant from the king, which, it was added, would be granted to none who could not produce credible certificates of their having taken the oaths of supremacy and allegiance, and fully conformed to the discipline of the church of England. But the critical state of affairs at home prevented the adoption of measures requisite to give effect to Gorges' commission; and the irresistible impatience of the oppressed puritans and friends of liberty to escape from impending ruin, or approaching civil war, rendered the restrictions imposed on their emigration utterly unavailing. We have seen that, in the year 1638, a numerous transportation of additional emigrants was effected. But, in the course of that year, the king at length was roused to a vigor which now alone was wanting to mature and accelerate his ruin; and, after this long course of blundering, wavering, and failure, he adopted a measure which, unfortunately for himself, was effectual. Hearing that another fleet was about to sail for New England with a body of emigrants, among whom were some of the most eminent leaders of the patriots and puritans, he caused an order of council to be issued for their detention; and the order being promptly enforced, the voyage was prevented. On board this fleet there appeared to have been, among other eminent individuals, Hazlerig, Hampden, Pym, and Oliver Cromwell—men to whom, but a few years after, he was fain to tender the highest offices in his realm, and whom his injustice now detained to avenge the tyranny by which so many of their brethren had been driven away. Various proclamations were issued the same year in restraint of emigration to New England, which, from this time, accordingly, appears to have been discontinued.† This proceeding naturally inflamed the public mind to the highest pitch of discontent. Even the hospitality of rude deserts, it was exclaimed, was denied to the oppressed inhabitants of England; and men were constrained to inquire if the evils which could not be evaded might not be repelled, and since retreat was impracticable, if resistance might not be unavailing. By promoting emigration at first, the king had opened a vein which it was eminently hazardous to close; and the increased severity of his administration augmented the flow of evil humours at the very time when he thus imprudently deprived them of their accustomed vent. The previous emigration had already drained the puritan body of a great number of those of its members whose milder tempers and more submissive piety rendered them more willing than their brethren to decline

a contest with him: the present restrictions forcibly retained in the realm men of more daring spirit and trained in long habits of enmity to his person and opposition to his measures.* He had now at length succeeded in stripping his subjects of every protection that the law could extend to their rights; and was destined soon to experience how completely he had divested them of every restraint that the law could impose on the vindictive retribution of their wrongs. From this period till the assembling of the long parliament, he pursued a short and headlong career of disgrace and disaster, while the cloud of calamities in which he had involved himself seemed to veil his eyes from the destruction to which he was infallibly advancing.

In pursuance of the policy which the king at length seemed determined openly and vigorously to pursue, a requisition was transmitted by the privy council to the governor and general court of Massachusetts, commanding them to deliver up their patent and send it back by the first ship that should sail for England, that it might abide the issue of the process of *quo warranto* that was depending against the colony. To this requisition the general court returned for answer, a humble and earnest petition that the colonists might be heard before they were condemned. They declared that they had transported their families to America, and embarked their fortunes in the colony, in reliance on his majesty's licence and encouragement; that they had never willingly or knowingly offended him, and now humbly deprecated his wrath, and solicited to be heard with their patent in their hands. If it were wrested from them, they must either return to England or seek the hospitality of more distant regions. But they prayed that they might "be suffered to live in the wilderness," where they had as yet found a resting-place, and might experience in their exile some of that favor from the ruler of their native land which they had largely experienced from the Lord and Judge of all the earth. They retained possession of their patent while they waited an answer to this petition, which, in the shape wherein they looked for it, they were happily destined never to receive. The insurrections which soon after broke out in Scotland, directed the whole attention of the king to matters which more nearly concerned him; and the long gathering storm which was now visibly preparing to burst upon him from every corner of his dominions, forcibly induced him to contract as far as possible the sphere of hostility in which he found himself involved.† The benefit of his altered views was experienced by the Virginians, [1639,] in the abolition of the despotism to which he had hitherto subjected them, and by the inhabitants of New England, in the cessation of his attempts to supersede by a similar despotism the liberal institutions which they had hitherto enjoyed. He would doubtless now have cordially consented to disencumber himself of his adversaries by promoting the emigration which he had so imprudently obstructed: but such a revolution of sentiment had now taken place in England, and such interesting prospects began to open to the patriots and puritans at home, that the motives which had formerly induced them to migrate to the new world ceased any longer to prevail.

1640.] When the intercourse which had for twenty years subsisted between the colony and the parent state underwent this modification, the number of the inhabitants of New England appears to have amounted to about twenty-one thousand persons,‡ or four thousand

* The commencement of resistance in Scotland originated with some individuals of that country who had purchased an allotment of territory in New England, and made preparation to transport themselves thither, but were prevented (it does not appear how) from carrying their design into execution. They had obtained from the colonial assembly an assurance of the free exercise of their presbyterian form of church government. Mather, B. i. cap. 5. sec. 7.

† Hutchinson, i. 87. and Appendix, No. v. Chalmers, p. 162. This year (1638) was distinguished by an earthquake in New England, which extended through all the settlements, and shook the ships in Boston harbor and the neighboring islands. The sound of it reminded some of the colonists of the rattling of coaches in the streets of London. Winthrop's Journal, 155. Trumbull, i. 93.

This work had been for some time in the press, when an opportunity was afforded me (by the kindness of my friend Mr. Hershell) of examining a recent American publication entitled "The History of New England from 1630 to 1649," by Governor Winthrop, of which a copy had been sent as a present to the Royal Society of London. It is a republication of Winthrop's Journal (which I had already consulted at Gottingen), with the lately discovered continuation of it till 1649. Mr. Savage, the editor, has bestowed much labor and learning on the illustration of a work which I think hardly deserved such care.

‡ Josselyn's Voyage to New England, p. 258. Hutchinson, i. 93. Neal's error, in computing the number of the settlers at only 4000, seems to have been occasioned by the mistake or inaccuracy of Dr. Mather in mentioning that number of

families, including about a hundred ministers. The money that had been expended during that period in equipping vessels and transporting emigrants, amounted to nearly two hundred thousand pounds—a prodigious sum in that age, and which nothing but the noble and unconquerable principle that animated the puritans could have persuaded men to expend on the prospect of forming an establishment in a remote uncultivated desert, which offered to its inhabitants only a naked freedom and difficult subsistence. When the civil war commenced, the colonists had already planted fifty towns and villages; they had erected upwards of thirty churches and ministers' houses; and combining with their preponderating regard to the concerns of religion, a diligent and judicious conduct of their temporal affairs, they had improved their plantations to a high degree of cultivation. For the first seven years after the foundation of the settlement that was made in 1630, even subsistence was procured with difficulty, and trade was not generally attempted; * but soon after that period, they began to extend their fishery and to open a trade in lumber, which subsequently proved the staple article of the colonial commerce. In the year 1637 there were but thirty ploughs in the whole colony of Massachusetts; and less than the third of that number in Connecticut. The culture of the earth was generally performed with hoes, and was consequently very slow and laborious. Every commodity bore a high price. Valuable as money was at that period the price of a good cow was thirty pounds; Indian corn cost five shillings a bushel; labor and every other article of use was proportionately dear. Necessity at first introduced what the jurisprudence of the colonists afterwards confirmed; and desiring to perpetuate the habits that had proved so conducive to piety and virtue, they endeavored by legislative enactments to exclude luxury and promote industry. When the assembling of the long parliament opened a prospect of safety, and even of triumph and supremacy to the puritans in England, a number of those who had taken refuge in America returned to their native country: but the great majority of the settlers had experienced so much of the life and happiness of religion in the societies that had sprung up and the mode of living that had been formed in the colony, that they felt themselves united to New England by stronger ties than any that patriotic recollections could supply, and resolved to remain in the region which their virtue had converted from a wilderness into a garden. In an infant colony, where all hearts were strongly united by community of feeling on subjects the most interesting and important, where the inhabitants were in general very nearly on a level in point of temporal condition, and where the connexions of neighborhood were but extended family ties, the minds of men were warmed and invigorated by a freedom and simplicity of mutual communication unrepresed by the restraints of ceremony, or the withering influence of that spirit of sarcasm, and that dread of ridicule, which operate so powerfully in crowded and highly polished societies. And yet some indications of an aristocratical disposition, arising, not unnaturally, out of some of the peculiar circumstances in the formation of the colony, did occasionally manifest themselves. Several of the first planters, particularly Dudley, Winslow, Winthrop, Bradford, Bellingham, and Bradstreet, were gentlemen of considerable fortune, and besides the transportation of their own families, they had incurred the expense of transporting many poor families who must otherwise have remained in England. Others were members of the original body of patentees, and had incurred expenses in the procurement of the charter, the formation of the company, and the equipment of the first body of adventurers, of which they had now no prospect of obtaining indemnification. It was probably owing to the prevalence of the peculiar sentiments which these persons may very well be supposed to have entertained, that in the first general court that was held in the colony, the election of the governor, the appointment of all the other officers, and even the power of legislation, were

planters or heads of families in such terms as seem to comprehend the whole body of the inhabitants. It is amply refuted by his own and the other accounts of the particulars of the several emigrations. In the "History of New England from 1628 till 1692," (published in London in 1654) it is stated that prior to the year 1643 there had sailed for New England 298 ships and 21,200 emigrants, p. 31.

Josselyn, who visited New England more than once, was intrusted by Charles the poet with some of his metrical versions of Scripture to be submitted to the perusal and consideration of Mr. Cotton. Josselyn, p. 20.

* Yet in the year 1636 a ship of 120 tons was built at Marblehead by the people of Salem. Collections of the Massachusetts' Hist. Soc. vi. 232.

* Chalmers asserts that judgment was given against the colony: but the reverse appears from the authorities to which he refers, and still more clearly from the record of the proceedings preserved in Hazard, p. 425.

† That Hampden and Cromwell were on board this fleet, or that they even intended to proceed to America, has been undoubted; but I think without any reason. Hume has rather confirmed than removed the doubt by the manner in which he has referred to a passage in Hutchinson, the meaning of which he has evidently misunderstood. But Dr. Mather, who preceded Hutchinson, expressly names all the individuals mentioned in the text as having prepared for their voyage, and been arrested by the order of council. Oldmixon recites the grant of land in America in favor of Hampden and others, which the emigrants were proceeding to occupy. Mather's statement is confirmed by Neal, Clarendon, Bates, and Dugdale. The strong mind of Cromwell appears long to have retained the bias it had once received towards emigration, and the favorable opinion of the settlers of New England from which that bias had been partly derived. After the Remonstrance was voted in the Long Parliament, he told Lord Falkland that if the question had been lost he was prepared next day to have converted his effects into ready money and left the kingdom. When he was invested with the Protectorate he treated Massachusetts with distinguished partiality. Hume considered himself as levelling a most sarcastic reflection against Hampden and Cromwell, when he described them as willing to cross the Atlantic ocean for the sake of saying their prayers. Some writers, who partake the political, but not the religious, sentiments of these eminent persons, have been very willing to defend them from so scandalous an imputation.

‡ Mather, B. i. cap. 5. Neal, i. 148, 149, 151. Hutchinson, i. 32, 42, 86. and Appendix, No. iv. Oldmixon, i. 42, and in Pref. p. 12. Chalmers, 155, 159, 160, 161. Hazard, 421, 422, 423, &c. 433, 434. The American historians of this period are exceedingly careless, and most perplexingly discordant in their notation of dates, as I have frequently experienced, though never with so much inconvenience as in the arrangement of the events related in this paragraph.

withdrawn from the freemen, and vested in the council of assistants; and although the freemen reclaimed and renewed their rights in the following year, yet the exercise of legislation was confined almost entirely to the council of assistants, till the introduction of the representative system in the year 1631. From this time the council and the freemen, assembled together, formed one general court, till the year 1644, when it was ordained that the governor and assistants should sit apart; and thence commenced the separate existence of the democratic branch of the legislature, or house of representatives. Elections were conducted by ballot, in which the balls or tickets tendered by the electors were appointed to consist of Indian beans.

Some notice of the peculiarities of legislation that already prevailed in the various communities of New England, seems proper to illustrate the state of society and manners among this singular people. By a fundamental law of Massachusetts it was enacted, "that all strangers professing the christian religion, who shall flee to this country from the tyranny of their persecutors, shall be succored at the public charge till some provision can be made for them." Jesuits and popish priests, however, were subjected to banishment, and in case of their return, to death. This persecuting law was afterwards extended to the quakers; and all persons were forbidden, under the severest penalties, to import any of "that cursed sect," or of their writings, into the colony. By what provocations the quakers of that period excited these severities, we shall have an opportunity of considering hereafter. These persecuting edicts had no place in Rhode Island, where none were subjected to active molestation for religious opinions, and all were admitted to the full rights of citizenship except Roman Catholics. The usual punishments of great crimes were disfranchisement, banishment and servitude; but slavery was not permitted to be inflicted upon any except captives lawfully taken in the wars; and these were to be treated with the gentleness of christian manners, and to be entitled to all the mitigations of their lot enjoined by the law of Moses. Disclaiming all but defensive war, the colonists considered themselves entitled and constrained in self-defence to deprive their assailants of a liberty which they had abused and rendered inconsistent with the safety of their neighbors. The practice, however, was highly impolitic, and served to pave the way, at a later period, for the introduction of negro slavery into New England.

Adultery was punished by death; and fornication by compelling the offending parties to marry (an absurd device, which served to degrade the institution of marriage), or by fine and imprisonment. Burglary or robbery was punished, for the first offence by branding, for the second with superaddition of a severe flogging, and for the third with death; but if either of these crimes, while yet not inferring a capital punishment, were committed on Sunday, an ear was to be cut off in addition to the other inflictions. We must beware of supposing that these penal enactments indicate the existence, much less the frequency, of the crimes to which they refer. In those communities where civilization has been a gradual attainment, penal laws denote the prevalence of the crimes they condemn. But in the colonial establishments of a civilized people, many of the laws must be regarded merely as the expression of the opinion of the legislators, and by no means as indicating the actual condition of society. Blasphemy and idolatry were punishable with death; and though it was acknowledged in the preamble to one of the laws, "that no human power is lord over the faith and consciences of men," yet heresy, by this very law, was punished with banishment from the province. Witchcraft, and perjury directed against human life, were capitally punished. No capital charge was deemed capable of being proved by evidence less weighty than the oaths of two witnesses—a regulation that deserves to be universally established, as well on account of its own intrinsic soundness, as of its original derivation from the wisdom of the Creator and searcher of human hearts.

All gaming was prohibited; cards and dice were forbidden to be imported, and dancing in ordinaries was proscribed. By a law enacted in 1646, kissing a woman in the street, even in the way of civil salute, was punished by flogging. This law was executed about a century afterwards, on the captain of an English man of war, for saluting his wife, whom he met, after a long separation, in the streets of Boston. Flogging was not considered an infamous punishment by the people of Massachusetts; and even so late as the

middle of the eighteenth century, there were instances of persons who after undergoing this punishment, have associated with the most respectable circles of society in Boston. The economy of inns was regulated with a strictness that deserves to be noted as explanatory of a circumstance that has frequently excited the surprise of European travellers in America. The intemperance and immorality which these places are apt to promote, was punished with the utmost rigor; and all innkeepers were required, under the severest penalties, to restrain the excesses of their guests, or to acquaint the magistrates with their perpetration. For the more effectual enforcement of this law, it was judged expedient that innkeepers should be divested of the temptation that poverty presents to its infraction, and enjoy such personal consideration as would facilitate the exercise of their difficult duty; and, accordingly, none were permitted to follow this calling but persons of approved character and competent estate. One of the consequences of this policy has been, that an employment very little respected in other countries, has ever been creditable in the highest degree in New England, and not unfrequently pursued by men who have retired from the most honorable stations in the civil or military service of the state.

Persons wearing apparel which the grand jury should account unsuitable to their estate, were to be admonished in the first instance, and if continuacious, fined. * Idleness, lying, swearing, and drunkenness, were subjected to various penalties and marks of disgrace. † Usury was forbidden; and the prohibition was not confined to the interest of money, but extended to the hire of laboring cattle and implements of husbandry. Persons deserting the English settlements, and living in heathen freedom and profanity, were punished by fine and imprisonment. A male child above sixteen years of age, accused by his parents of rebellion against them and other notorious offences; was (in conformity with the Mosaic code) subjected to capital punishment; and any person courting a maid without the sanction of her parents, was fined and imprisoned. Yet the parental authority was not left unregulated. All parents were commanded to instruct and catechise their children and servants, whom the select men or overseers were directed to remove from their authority and commit to fitter hands, if they were found deficient in this duty; ‡ and children were allowed to seek redress from the magistrate if they were denied convenient marriage. The celebration of the ceremony of marriage was confined to the magistrate or such other persons as the general court should authorize. Their law of tenures was exceedingly simple and concise. The charter had conveyed the general territory to the company and its assigns; and it was very early enacted, "that five years' quiet possession shall be deemed a sufficient title." Instead of enacting or in-

* The regulation of apparel was considered a fit subject of public policy in England as late as the reign of Elizabeth, who, by a proclamation, appointed watches of grave citizens to be stationed at the gates of London in order to circumscribe with their scissiors all the ruffs of passengers that exceeded certain legal dimensions. Stow. Chron. 869. By an act passed in the thirteenth year of the same sovereign's reign, hats were considered as a luxury; and all persons under a certain age commanded to wear woollen caps. In the churchwardens' accounts of the parish of Fulham is this item: "1678, paid for discharge of the parish for wearing hats, contrary to the statute, 5s. 2d."

† That these laws were not allowed to be a dead letter, appears from the following extracts from the earliest records of the colonial court. "John Wedgewood, for being in the company of drunkards, to be set in the stocks. Catharine, the wife of Richard Cornish, was found suspicious of incontinency, and seriously admonished to take heed. Thomas Pettit, for suspicion of slander, idleness, and stubbornness, is censured to be severely whipped. Captain Lovel admonished to take heed of light carriage. Josias Plasterow, for stealing four baskets of corn from the Indians, is ordered to return them eight baskets, to be fined five pounds, and hereafter to be called by the name of Josias, and not Mr., as formerly he used to be." Hutchinson, p. 436. Few obtained the title of Mr. in the colony; still fewer that of Esquire, Goodman and goodwife were the common appellations. It was to merit and services rather than wealth, that the distinctive appellations were given. Ibid. The strictness and scrupulousness of manners affected by many of the inhabitants exceeded the standard of the laws; and associations appear to have been formed for suppressing the drinking of healths, and wearing of long hair and of periwigs. Ibid. 151. In some instances, the purposes of these associations were afterwards adopted and enforced by the laws. It is related of some of the earlier settlers, that with a most absurd exaggeration of rigidity, they refrained from brewing on Saturday, because the beer would work upon Sunday. Douglas, Summary of the British settlements in America, i. 371.

‡ Such regulations were not unknown in Scotland. So late as the year 1678, a law was enacted by the corporation of the town of Rutherglen, commanding all parents to send their children to school, and adjudging that the schoolmaster should be entitled to his fees for every child in the parish, whether sent to his school or not. Ure's History of Rutherglen, p. 79.

tending that the deficiencies of their legislative code should be supplied by the common or statute law of England. it was declared, that when the customs of the commonwealth were found defective, recourse should be had to the word of God.*

Like the tribes of Israel, the colonists of New England had forsaken their native land after a long and severe bondage, and journeyed into the wilderness for the sake of religion. They endeavored to cherish a resemblance of condition, so honorable and so fraught with incitements to piety, by cultivating a conformity between their laws and customs and those which had distinguished the people of God. Hence arose some of the peculiarities which we have observed in their legislative code; and hence arose also the practice of commencing their sabbatical observances on Saturday evening, and of accounting every evening the commencement of the ensuing day. The same predilection for Jewish customs begot, or at least promoted, among them the habit of bestowing significant names on children, of whom the first three that were baptised in Boston church received the names of Joy, Recompense, and Pity. This custom seems to have prevailed with the greatest force in the town of Dorchester, which long continued to be remarkable for such names as Faith, Hope, Charity, Deliverance, Dependence, Preserved, Content, Prudent, Patience, Thankful, Hate-evil, Holdfast, and others of a similar character.

CHAPTER III.

New England embraces the cause of the Parliament—Federal Union between the New England States—Provincial coinage of money—Disputes occasioned by the Disfranchisement of Dissenters in Massachusetts—Imprisonment and trial of Governor Winthrop—Arbitrary proceedings against the Dissenters—Attempts to convert and civilize the Indians—Character and labors of Elliot and Mayhew—Indian Bible printed in Massachusetts—Effects of the Missionary labor—A synod of the New England churches—Dispute between Massachusetts and the Long Parliament—the Colony foils the Parliament and is favored by Cromwell—The Protector's administration beneficial to New England—He conquers Acadia—His propositions to the inhabitants of Massachusetts—declined by them—Persecution of the Anabaptists in Massachusetts—Conduct and sufferings of the Quakers—The Restoration—Address of Massachusetts to Charles the Second—Alarm of the colonists, and their declaration of Rights—The king's Message to Massachusetts—how far complied with—Royal charter of incorporation to Rhode Island and Providence, and to Connecticut and Newhaven

THE coincidence between the principles of the colonists and the prevailing party in the Long Parliament, was cemented by the consciousness, that with the success of this body was identified the defence of the colonial liberties from the dangers that had so recently menaced them. [1641.] As soon as the colonists were informed of the convocation of that famous assembly, they despatched Hugh Peters and two other persons to promote the colonial interests in England. The mission terminated more fortunately for the colony than for its ambassadors. By a vote of the House of Commons in the following year, [1642] the inhabitants of all the various plantations of New England were exempted from payment of any duties, either upon goods exported thither, or upon those which they imported into the mother country, "until the House shall take further order therein to the contrary." The colonists, in return, cordially embraced the cause of their benefactors; and when the civil wars broke out in England, they passed an ordinance expressive of their approbation of the measures of parliament, and denouncing capital punishment against any who should disturb the peace of the commonwealth by endeavoring to raise a party for the King of England, or by discriminating between the king and the parliament, who

* Abridgment of the Ordinances of New England, apud Neal, ii. Append. iv. p. 665, &c. Trumbull, i. 124. Josselyn, 178. Burnaby's Travels in America, 146. Chalmers, 167, 8. 276. W.throp's Hist. (Savage's edition), i. 73. The primitive rigidity discernible in some of these laws was tempered by a patriarchal benevolence of administration. Many instances of this occur in Mather's Lives of the Governors. One I may be permitted to notice as a specimen. Governor Winthrop being urged to prosecute and punish a man who pillaged his magazine of firewood in winter, declared he would soon cure him of that bad practice; and, accordingly, sending for the delinquent, he told him, "You have a large family, and I have a large magazine of wood; come as often to it as you please, and take as much of it as you need to make your dwelling comfortable.—And now," he added, turning to his friends, "I defy him to steal my fire-wood again."

† The reasons assigned by the House for this resolution, are, that the plantations of New England are likely to conduce to the propagation of the gospel, and already "have by the blessing of the Almighty had good and prosperous success without any public charge to the state." Yet, a few years after, the parliament expressed a different opinion of the obligations of Virginia to the endowment of the mother country, though, in this respect, the situation of the two colonies was precisely the same.

truly maintained the cause of the king as well as their own. Happily for themselves, they were unable to signalize their predilection by more active interference in the contest; and, with a wise regard to their commercial interests, they gave free ingress into their harbors to trading vessels from the ports in possessions of the king. They had likewise the good sense to decline an invitation that was sent to them, to depute Mr. Cotton, and others of their ministers, to attend, on their behalf, the Assembly of Divines at Westminster. Encouraged by the privileges that had been conferred on them, their industry made vigorous progress, and population rapidly increased. From the continent, they began to extend their occupation to the adjacent islands; and Mr. Maybaw, having obtained a grant of Martha's Vineyard, Nantucket, and Elizabeth Isles, laid the foundation there of settlements that afterwards proved eminently serviceable to the conversion and civilization of the Indians. But an attempt which they made at the same time to extend, if not their settlements, at least their principles, in another quarter of the continent, proved quite unsuccessful. The colonists of Virginia were in general staunch royalists, and, with comparatively little of the substance of religion, united a strong attachment to the forms and constitutions of the church of England. Yet, as we have seen, they had received, even as early as the reign of James, an accession to their numbers, composed of persons who had imbibed puritan sentiments, and had fled from ecclesiastical persecution in England. A deputation from this portion of the Virginian settlers had been lately sent to Boston to represent their destitution of a gospel ministry, and solicit a supply of ministers from the New England churches. In compliance with this request, three clergymen were selected to proceed to Virginia, and furnished with recommendatory letters from the governor of Massachusetts to Sir William Berkeley. On their arrival in Virginia, they began to preach in several parts of the country, and the people flocked to hear them with an eagerness that might have been productive of important consequences. But the puritan principles, no less than the political sentiments of the colonists of New England, were too much the objects of aversion to Sir William Berkeley to admit of his encouragement being extended to proceedings so calculated to propagate their influence among his own people. So far from complying with the desire of his brother governor, he issued an order by which all persons who would not conform to the ceremonies of the church of England were commanded to depart from Virginia by a certain day. The preachers returned to their own settlement; and thus was laid the foundation of a jealousy which long subsisted between the two oldest colonies of North America.

The failure of this endeavor to establish a friendly intercourse with the sister colony of Virginia, was amply compensated to the New England settlements by an important event in their history, which occurred during the following year; [1643.] the formation of a league by which they were knit together in the frame of a confederacy that greatly increased their security and power. The Naraganset Indians had by this time had ample leisure to reflect on the policy of their conduct towards the Pequods; and the hatred which they had formerly cherished against that tribe being extinguished in the destruction of its objects, had been succeeded by an angry jealousy of those strangers who had obviously derived the chief and only advantage of which that event was productive. They saw the territories of their ancient rivals occupied by a much more powerful neighbor; and, mistaking their own inability to improve their advantages for the effect of fraud and injustice on the part of the colonists, who were so rapidly surpassing them in number, wealth, and power, they began to complain that the plunder of the Pequods had not been fairly divided, and proceeded to concert measures with the neighboring tribes for an universal insurrection of the Indians against the English. Their designs had advanced but a little way towards maturity, when they were detected in consequence of a sudden gust of that inordinate passion of private revenge which seemed fated to pervert and defeat their political views. The colonists, from the groundless murmurs they found themselves exposed to, and which proved only the rooted dislike of the savages, were sensible of their own danger without yet being aware of its extent, or feeling themselves entitled to anticipate some more certain indication of it; when, happily, they were called upon to act as umpires between two contending tribes. The Naragansets having conceived some disgust against a neighboring chief, employed an assassin to kill him; and failing in this attempt, plunged into a

war with the declared intention of exterminating the whole of his tribe. This tribe, who were at peace with the English, sent their chief to implore the protection of the Massachusetts colonists, who promised their interposition in his behalf. The Naragansets, apprised of this proceeding, recollecting the fate of the Pequods, and aware how well they deserved to share it, were struck with terror, and throwing down their arms, concluded a peace dictated to them by the English. When they found the danger blown over, they paid so little attention to the performance of their paction, that it was not till the colonists had made a demonstration of their readiness to employ force that they sullenly fulfilled it. Alarmed by such indications of fickleness, dislike, and furious passion, the government of Massachusetts deemed it prudent to provide by a mutual concert of the colonies, for the common danger which they might expect to encounter at no distant day, when the savages, instructed by experience, would sacrifice their private feuds to combined hostility against a people whose progressive advancement seemed to minister occasion of incurable jealousy. Having conceived, for this purpose, a plan which was framed in imitation of the bond of union among the Dutch provinces, and which readily suggested itself to some of their leading characters who had resided with the Brownist congregation in Holland, they proposed it to the neighboring settlements of Plymouth, Connecticut, and Newhaven, by which it was cordially embraced. These four colonies accordingly entered into a league of perpetual confederacy, offensive and defensive. It was stipulated that the confederates should thenceforth be distinguished by the title of the United Colonies of New England: that each colony should remain separate and distinct, and have exclusive jurisdiction within its own territory; that in every war, offensive or defensive, each of the confederates should furnish its quota of men, money, and provisions, at a rate to be fixed from time to time in proportion to the number of people in each settlement; that an assembly composed of two commissioners from each colony should be held annually, with power to deliberate and decide on all points of common concern to the confederacy; and every determination sanctioned by the concurrence of six of their number, should be binding on the whole. The state of Rhode Island, which was not included in this confederacy, having petitioned a few years after to be admitted into it, her request was refused, except on the condition, which she declined, of merging her separate existence in an incorporation with the state of Plymouth. Thus excluded from the protection of the league or union, the inhabitants of Rhode Island and Providence endeavored to provide for their security by conciliating the friendship of the Indians; and in the prosecution of their humane and courteous policy they were eminently successful.

The colonists have been reproached with arrogating the rights of sovereignty in this transaction, which truly may be regarded as a considerable step to independence. Yet it was a measure that could hardly be avoided by a people surrounded with enemies, and abandoned to their own resources in a territory many thousand miles removed from the seat of the government that claimed sovereign dominion over them. Every step that a people so situated made in enlarging their numbers, combining their resources, or otherwise promoting their security, was a step towards independence. Nothing but some politic system, or a series of events that might have kept the various settlements continually disunited in mutual jealousy and weakness, could have secured their perpetual existence as a dependent progeny of England. But whatever effects the transaction which we have considered may have secretly produced on the course of American sentiment and opinion, and however likely it may now appear to have planted the seminal idea of independence in the minds of the colonists, it was regarded neither by themselves nor by their English rulers as indicating pretensions unsuitable to their condition. Even after the Restoration, the commissioners of the union were repeatedly noticed and recognised in the letters and official instruments of Charles the Second; and the union itself with some alterations subsisted till the year 1686, when all the charters were in effect vacated by a commission from King James. A few years after its establishment, the principal concern to which its efforts and deliberations were devoted was the conversion of the Indians, in co-operation with the society instituted by parliament in Britain for propagating the gospel in New England.

While the colonists were thus employed in measures calculated to secure and protect their institutions, the

parliament passed an ordinance carrying a most formidable aspect, and fraught with consequences the most injurious to their rights. It appointed the Earl of Warwick governor-in-chief, and lord high admiral of the colonies, with a council of five peers and twelve commoners to assist him; it empowered him, in conjunction with his associates, to examine the state of affairs in the colonies; to send for papers and persons; to remove governors and officers, and to appoint others in their place, and delegate to them as much of the power granted to himself by the ordinance as he should think proper. This appointment, which created an authority that might have new-modelled all the colonial governments, and abrogated all their charters, was not suffered to remain entirely inoperative. To some of the settlements the parliamentary council extended protection, and even granted new patents. Happily for Massachusetts, either the favor which it was thought to deserve, or the absorbing interest of the great contest that was carrying on in England, prevented the council from interfering with its institutions till a period when the colonial assembly were able, as we shall see, to employ defensive measures that defeated its undesirable interposition without disputing its formidable authority.

Various disputes had subsisted between the inhabitants of New England and the French settlers in Acadia. [1644] These were at length adjusted by a treaty between a commissioner for the king of France on the one part, and John Endicot, Esq. governor of New England, and the rest of the magistrates there, on the other.* The colonists had already debarred themselves from recognising the king as distinct from the parliament; and they probably found it difficult to explain to the other contracting parties to what denomination of authority they considered themselves to owe allegiance. This state of things, as it led to practices, so it may have secretly fostered sentiments, that savoured of independence. A practice strongly fraught with the character of sovereign authority was adopted a few years after, when the increasing trade of the colony with the West Indies, and the quantity of Spanish bullion that was brought through this channel into New England, induced the colonial authorities, for the purpose of preventing frauds in the employment of the circulating medium in this inconvenient shape, to erect a mint for the coining of silver money at Boston. The coin was stamped with the name of New England on the one side, of Massachusetts, as the principal settlement, on the other, and with a tree as an apt symbol of the progressive vigor which the colony had evinced. Maryland was the only other colony that ever presumed to coin any metal into money; and indeed this prerogative has been always regarded as the peculiar attribute of sovereignty. "But it must be considered" says one of the colonial historians, "that at this time there was no king in Israel." In the distracted state of England it might well be judged unsafe to send their bullion there to be coined; and from the uncertainty respecting the form of government which might finally arise out of the civil wars, it might reasonably be apprehended that an impress received during their continuance would not long retain its favor and currency. The practice gave no umbrage whatever to the English government. It received the tacit allowance of the parliament, of Cromwell, and even of Charles the Second during twenty years of his reign.

The separation of the two branches of the legislature of Massachusetts naturally gave rise to some disputes respecting the boundaries of jurisdiction in a constitution not yet matured by practice. But what precedent could not supply, the influence and estimation of the clergy of the province was able to effect. [1645] By common consent, all the ministers were summoned to attend the session of the assembly, and the points at issue being submitted to them, their judgment was willingly embraced and assented to.† But in the following year [1646] a

* Journals of the House of Lords, vol. vi. p. 291. Chalmers, 175, 6. The people of Maine appear to have solicited the protection of the council in 1651. Hazard, 539.

† Hutchinson, 142, 4. One of the controversies that had occurred at this time between the two houses originated in a matter not more illustrious, than a difference of sentiment respecting the identity of a sow, which was claimed from the herd of a richer neighbor by a poor woman, who pretended that it had strayed from her some years before. Behold how great a matter a little fire will kindle! Not the court only, but the whole country was divided by this question, which, poverty concurring with re-resentment of imposition on the one part, and indignation at a charge that effected his character on the other, induced the parties to contest with the utmost rage and pertinacity. The identity of Martin Guerre was not more keenly controverted in France. Compassion for the poor woman prevailed with the poorer class of people over

dissension much more violent in its nature, and much less creditable and satisfactory in its issue, was occasioned in this state by the intolerance which we have already noted in its original institutions. With the increasing prosperity and importance of the colony, the value of its political franchises had been proportionably augmented; and the increasing opulence and respectability of the dissenters seemed to aggravate the hardship of the disfranchisement to which they were subjected. Some of these having violently assumed the privileges from which they were excluded by law, and disturbed an election by their interference, were punished by Mr. Winthrop, the deputy-governor, who vigorously resisted and defeated their pretensions. They complained of this treatment to the general court by a petition couched in very strong language, demanding leave to impeach the deputy-governor before the whole body of his fellow-citizens, and to submit to the same tribunal the consideration of their general grievances, as well as of the particular severities they had experienced from Winthrop. The grievances under which they labored were enumerated in the petition, which contained a forcible remonstrance against the injustice of depriving them of their rights as freemen, and of their privileges as christians, because they could not join as members with the congregational churches, or when they solicited admission into them were arbitrarily rejected by the ministers. They petitioned that, either the full rights of citizenship might be communicated to them, or that they might no longer be required to obey laws to which they had not given assent,—to contribute to the maintenance of ministers who denied them the benefit of their ministry, and to pay taxes imposed by an assembly in which they were not represented. The court were so far moved by the petition, or by the respectability of its promoters, that Mr. Winthrop was commanded to defend himself publicly from the charges which it advanced against him.

On the day appointed for his trial he descended from the tribunal, and placing himself at the bar in presence of a numerous assemblage of the inhabitants, he proceeded to vindicate his conduct to his judges and fellow citizens. Having clearly proved that his proceedings had been warranted by law, and had no other end than to maintain the existing institutions, by the exercise of the authority which had been committed to him for that purpose, he concluded an excellent harangue in the following manner*. "Though I be justified before men, yet it may be the Lord hath seen so much amiss in my administration as calls me to be humbled: and indeed for me to have been thus charged by men is a matter of humiliation, whereof I desire to make a right use before the Lord. If Miriam's father spit in her face, she is to be ashamed." Then proceeding to enforce some considerations calculated, he said, to rectify the opinions of the people on the nature of government: "The questions," he observed, "that have troubled the country have been about the authority of the magistracy and the liberty of the people. It is you who have called us unto this office; but being thus called we have our authority from God. Magistracy is the ordinance of God, and it hath the image of God stamped upon it; and the contempt of it has been vindicated by God with terrible examples of his vengeance. I entreat you to consider that when you choose magistrates, you take them from among yourselves, men subject unto like passions with yourselves. If you see our infirmities, reflect on your own, and you will not be so severe censors of ours. The covenant between us and you is the oath you have exacted of us, which is to this purpose, 'That we shall govern you and judge your causes according to God's laws and the particular statutes of the land, according to our best skill.' As for our skill, you must run the hazard of it; and if there be an error only therein, and not in the will, it becomes you to bear it. Nor would I have you to mistake in the point of your own liberty. There is a liberty of corrupt nature, which is affected both by men and beasts, to do what they list. This liberty is inconsistent with authority; impatient of all restraint (by this liberty *sumus omnes deteriores*;) 'tis the grand enemy of truth and peace, and all the ordinances of God are bent against it. But there is a civil, a moral, a federal liberty, which is the proper end and object of authority: it is a liberty for

that only which is just and good. For this liberty you are to stand with the hazard of your very lives; and whatsoever crosses it is not authority but a distemper thereof. This liberty is maintained in a way of subjection to authority; and the authority set over you will, in all administrations for your good, be quietly submitted unto by all but such as have a disposition to shake off the yoke, and lose their true liberty by their murmuring at the honor and power of authority."

The circumstances in which this address was delivered, remind us of scenes in Greek and Roman history; while the wisdom, worth, and dignity that it breathes, resemble the magnanimous vindication of a Judge of Israel. Mr. Winthrop was not only honorably acquitted by the sentence of the court and the voice of the public, but recommended so powerfully to the esteem of his fellow citizens by this and all the other indications of his character, that he was chosen governor of the province every year after as long as he lived*. His accusers incurred a proportional degree of public displeasure: their petition was dismissed, and several of the chief promoters of it severely reprimanded, and adjudged to make confession of their fault in seeking to subvert the fundamental laws of the colony. Refusing to acknowledge that they had done wrong, and still persisting in their demands of an alteration of the law, with very indiscreet threats of complaining to the parliament, they were punished with fine or imprisonment. As several of these persons were known to be inclined to the form of presbytery, and as that constitution was also affected by the prevailing party in the English House of Commons, the menace of a complaint to parliament excited general alarm and indignation; and several of the petitioners having made preparations to sail for England, with very significant hints of the changes they hoped to effect by their machinations there, some of them were placed under arrest, and their papers were violently taken from them. Among these papers were found petitions to Lord Warwick, urging a forfeiture of the colonial charter, the introduction of a presbyterian establishment, and of the whole code of English jurisprudence, into the colonial institutions, with various other innovations, which were represented as no less accordant with legislative wisdom and justice, than adapted to the important end of securing and effectuating the supreme dominion of the parliament over the colony. The discovery of the intolerance meditated by these persons served to exasperate the intolerance which themselves were experiencing from the society of which they formed but an insignificant fraction. The contents of their papers excited so much resentment that not a voice was raised against the arbitrary measure by which they had been intercepted; and the alarm was increased by the conviction of the utter impossibility of preventing designs so dangerous from being still attempted. The warmth of the public sentiment, as well as the peculiar nature of the subject that had excited it, introduced this all-prevalent topic into the pulpit; and even Mr. Cotton was so far overtaken with infirmity, as to declare, in a sermon, "That if any one should carry writings or complaints against the people of God in this country to England, he would find himself in the case of Jonas in the vessel." This was a prediction which a long voyage was very likely to realize. In effect, a short time after, certain deputies from the petitioners having embarked for England, were overtaken by a violent storm, and the sailors recollecting the prediction that had gone abroad, and, happily, considering the papers, and not the bearers of them, as the guilty parties, insisted so vehemently on casting all obnoxious writings overboard, that the deputies were compelled to commit their credentials to the waves. When they arrived in England, however, they did not fail to prosecute their application; but the attention of the parliamentary leaders at that time being deeply engaged with more important matters, and Winslow and Hugh Peters, on behalf of the colony, actively labouring to counteract their purposes, they obtained little attention and no redress.

From the painful contemplation of the intolerance of the colonists, and their inordinate contentions about the forms of religion, it is pleasing to turn to the substantial fruits of christian character evinced by those

noble exertions for the conversion of the Indians that originated in the same year that had witnessed so much dissension and violence. The circumstances that had promoted the emigrations to New England, had operated with particular force on the ministers of the puritans; and so many of them had accompanied the other settlers, that among a people who derived less enjoyment from the exercises of piety, the numbers of the clergy would have been thought exceedingly burdensome and very much disproportioned to the wants of the laity. This circumstance was highly favorable to the promotion of religious habits among the colonists, as well as to the extension of their settlements, in the plantation of which the co-operation of a minister was considered indispensable. It contributed also to suggest and facilitate missionary labor among the heathens, to whom the colonists had associated themselves by superadding the ties of a common country to those of a common nature. While the people at large were daily extending their industry, and overcoming by cultivation the rudeness of desert nature, the clergy eagerly looked around for some addition to their peculiar sphere of usefulness, and at a very early period entertained designs of redeeming to the dominion of piety and civility, the neglected wastes of human character that lay stretched in savage ignorance and idolatry around them. John Elliot, one of the ministers of Roxbury, a man whose large soul glowed with the intensest flame of zeal and charity, was strongly penetrated with a sense of this duty, and for some time had been diligently laboring to overcome the preliminary difficulty by which its performance was obstructed. He had now at length attained such acquaintance with the Indian language as enabled him not only himself to speak it with fluency, but to facilitate the acquisition of it to others, by the construction and publication of a system of *Indian grammar*. Having completed his preparatory inquiries, he began, in the close of this year, a scene of labor which has been traced with great interest and accuracy by the ecclesiastical historians of New England, and still more minutely, I doubt not, in that eternal record where alone the actions of men attain their just, their final, and everlasting proportions. It is a remarkable feature in his long and arduous career, that the energy by which he was actuated never sustained the slightest abatement, but, on the contrary, evinced a steady and vigorous increase. He appears never to have doubted its continuance; but, constantly referring it to God, he felt assured of its derivation from a source incapable of being wasted by the most liberal communication. He delighted to maintain this communication by incessant prayer, and before his missionary labors commenced, he had been known in the colony by the name of "praying Elliot"—a noble designation, if the noblest employment of a rational creature be the cultivation of access to the Author of his being. Rarely, very rarely, I believe, has human nature been so completely embued, refined, and elevated by religion. Every thing he saw or knew occurred to him in a religious aspect: every faculty, and every acquisition that he derived from the employment of his faculties, was received by him as a ray let into his soul from that Eternity for which he continually panted. As he was one of the holiest, so was he also one of the happiest of men; and his life for many years was a continual outpouring of his whole being in devotion to God and charity to mankind*.

The kindness of Mr. Elliot's manner soon gained him a favorable reception from many of the Indians; [7] and both parties were sensible of the expediency of altering the civil and domestic habits that counteracted the impressions which he attempted to produce, he obtained from the general court an allotment of land in the neighborhood of the settlement of Concord, in Massachusetts, upon which a number of Indian families proceeded, by his directions, to build fixed habitations, and where they eagerly received his instructions both spiritual and secular. It was not long before a violent opposition to these innovations was excited by the powaws, or Indian priests, who threatened death and other imitations of the vengeance of the idols on all who should embrace christianity. The menaces and

* He died in the year 1690. As his bodily strength decayed, the energy of his being seemed to retreat into his soul, and at length all his faculties (he said) seemed absorbed in holy love. Being asked, shortly before his departure, how he did, he replied, "I have lost every thing; my understanding leaves me, my memory fails me, my utterance fails me; but I thank God my charity holds out still, I find that rather grows than fails." Richard Baxter declared that these words had given him inexpressible comfort, and that the account of Elliot's life, which he read when he himself was laboring under a dangerous illness, had recalled him from the brink of the grave. Mather, B. iii. Neal, ii. 470.

all sense of equity: and, at length, even those magistrates who considered the defendant in the right, concurred in persuading him to surrender the object of dispute, and to forbear to seek his own at the expense of the tranquillity of the colony.

* Various editions of this speech have been published. It appears now, from the continuation of Winthrop's own journal (edited by Mr. Savage), that all these were abridgments. Mather's which I have followed, is the best.

* This excellent magistrate (says Cotton Mather) continually exemplified the maxim of Theodosius, that "if any man speak evil of the ruler, if it be through lightness, 'tis to be condemned; if it be through madness, 'tis to be pitied; if through malice, 'tis to be forgiven." One of the colonists who had long manifested much ill-will towards his person, at length wrote to him, "Sir, your overcoming of yourself hath overcome me." His death, in 1649, was deeply and universally bewailed; and all declared that he had been the father of the colony, and the first no less in virtue than in place. Mather, B. iv.

artifices of these persons caused several of the seeming converts to draw back, but induced others to separate themselves more entirely from the society and converse of their countrymen, and seek the benefit and protection of a closer association with that superior race of men who showed themselves so generously willing to diffuse and communicate all the means and benefits of their superiority. A considerable body of Indians resorted to the land allotted them by the colonial government, and exchanged their wild and barbarous habits for the modes of civilized living and industry. Mr. Elliot was continually among them, instructing, animating, and directing them. They felt his superior wisdom, and saw him continually happy; and there was nothing in his circumstances or appearance that indicated sources of enjoyment from which they were debarred; on the contrary, it was obvious that of every article of selfish comfort he was willing to divest himself in order to communicate to them what he esteemed the only true riches of an immortal being. He who gave him this spirit, gave him favor in the eyes of the people among whom he ministered: and their affection for him reminds us of those primitive ages when the converts were willing, as it were, to pluck out their eyes if they could have given them to their pastor. The women in the new settlement learned to spin, the men to dig and till the ground, and the children were instructed in the English language, and taught to read and write. As the numbers of domesticated Indians increased they built a town by the side of Charles river, which they called *Natick*; and they desired Mr. Elliot to frame a system of internal government for them. He directed their attention to the counsel that Jethro gave to Moses; and, in conformity with it, they elected for themselves rulers of hundreds, of fifties, and of tens. The colonial government also appointed a court which, without assuming jurisdiction over them, offered the assistance of its judicial wisdom to all who should be willing to refer to it the determination of their more difficult or important subjects of controversy. In endeavoring to extend their missionary influence among the surrounding tribes, Mr. Elliot and his associates encountered a variety of success corresponding to the visible varieties of human character and the invisible predeterminations of the Divine will. Many expressed the utmost abhorrence and contempt of christianity: some made a hollow profession of willingness to hear, and even of conviction, with the view, as it afterwards appeared, of obtaining the tools and other articles of value that were furnished to those who proposed to embrace the modes of civilized living. In spite of every discouragement the missionaries persisted; and the difficulties that at first mocked their efforts seeming at length to vanish under an invisible touch, their labors were blessed with astonishing success. The character and habits of the lay colonists tended to promote the efficacy of these pious labors, in a manner which will be forcibly appreciated by all who have examined the history and progress of missions. Simple in their manners, devout, moral, and industrious in their lives, they enforced the lessons of the missionaries by demonstrating their practicability and beneficial effects, and presented a model which, in point of refinement, was not too elevated for Indian imitation.

While Mr. Elliot and an increasing body of associates were thus employed in the Province of Massachusetts, Thomas Mayhew, a man who combined in a wonderful degree an affectionate mildness that nothing could disturb with an ardor and activity that nothing could overcome, together with a few coadjutors, not less diligently and successfully prosecuted the same design in Martha's Vineyard, Nantucket and Elizabeth Isles, and within the territory comprehended in the Plymouth patent. Abasing themselves that they might elevate their species and promote the Divine glory, they wrought with their own hands among those Indians whom they persuaded to forsake savage habits; and zealously employing all the influence they acquired to the communication of moral and spiritual improvement, their labors were eminently blessed by the same Power which had given them the grace so fully to devote themselves to his service. [1647.] The character and manners of Mayhew appear to have been singularly calculated to excite the tenderness no less than the veneration of the objects of his benevolence, and to make them feel at once how amiable and how awful true goodness is. His address derived a captivating interest from that earnest concern, and high and holy value, which he manifestly entertained for every member of the family of mankind. Many years after his death the Indians could not hear his name mentioned without shedding tears and expressing transports of grateful emotion.

Both Elliot and Mayhew found great advantage in the practice of selecting the most docile and ingenious of their Indian pupils, and by especial attention to their instruction, qualifying them to act as schoolmasters among their brethren. To a zeal that seemed to increase by exercise, they added insurmountable patience and admirable prudence; and, steadily fixing their view on the glory of the Most High, and declaring that, whether outwardly successful or not in promoting it, they felt themselves blessed and happy in pursuing it, they found its influence sufficient to light them through every perplexity and peril, and finally conducted them to a degree of success and victory unparalleled, perhaps, since that era when the miraculous endowments of the apostolic ministry caused a nation to be born in a day. They were slow to push the Indians upon improved institutions; they desired rather to lead them insensibly forward, more especially in the adoption of religious ordinances. Those practices, indeed, which they considered likely to commend themselves by their beneficial effects to the natural understanding of men, they were not restrained from recommending to their early adoption; and trial by jury very soon superseded the savage modes of determining right or ascertaining guilt, and contributed to improve and refine the sense of equity. In the dress and mode of cohabitation of the savages, they also introduced at an early period, alterations calculated to form and develop a sense of modesty, in which the Indians were found to be grossly and universally defective. But all these practices which are, or ought to be, exclusively the fruits of renewed nature and Divine light, they desired to teach entirely by example, and by diligently radiating and cultivating in the minds of their flocks the principles out of which alone such practices can lastingly and beneficially grow. It was not till the year 1660 that the first Indian church was founded by Mr. Elliot and his fellow-laborers in Massachusetts. There were at that time no fewer than ten settlements within the province, occupied by Indians comparatively civilized.

Mr. Elliot had from time to time translated and printed various approved religious works for the use of the Indians, and, at length, in the year 1664, the Bible was printed, for the first time in the language of the new world, at Cambridge in Massachusetts.* This great achievement was not effected without the assistance of pecuniary contributions from the mother country. The colonists had zealously and gladly co-operated with their ministers, and assisted to defray the cost of their charitable undertakings; but the increasing expenses threatened at last to exceed what their means were able to supply. Happily, the tidings of this great work excited a kindred spirit in the parent State, and in the year 1649 was formed there, by act of parliament, a *Society for Propagating the Gospel in New England*, whose co-operation proved of essential service to the missionary cause. This society, having been dissolved at the Restoration, was afterwards re-erected by a charter from Charles the Second, obtained by the exertions of the pious Richard Baxter and the influence of the great Robert Boyle, who was thus the benefactor of New England as well as of Virginia. Supported by its ample endowments, and the no less liberal contributions of their own fellow-colonists, the American missionaries exerted themselves with such energy and success in the work of converting and civilizing the savages, that, before the close of the seventeenth century, there were in the province of Massachusetts more than thirty congregations of Indians, comprising upwards of three thousand persons reclaimed from a gross degrading barbarism, and advanced to the comfort and respectability of civilized life, and the dignity and happiness of worshippers of the true God, through the mediation of the only name by which men can know or approach him. There were nearly as many converts to religion and civility in the islands of Massachusetts Bay; there were several Indian congregations in the Plymouth territories; and among some of the tribes that still adhered to their roving barbarous mode of life, there was introduced a considerable improvement in their civil and moral habits. When we reflect on the toils that these missionaries encountered, on the vast and varied difficulties they were enabled to overcome, and survey the magnificent expanse of happiness and virtue that arose from their exertions; and,

* I have seen a copy of this edition of the Bible in the library of the late George Chalmers. It is a beautiful piece of typography.

Many earlier publications had already issued from the fertile press of New England. One of the first was a new metrical translation of the Psalms—very literal, and very unpoetical. To this last imputation the New Englanders answered, "that God's altars needs not our polishings." Oldmixon i. 109, 110.

when looking backwards, we trace the stream of events to its first spring in the pride and cruelty that was let loose to fortify the zeal of the puritans, and finally, to drive them from their native land to the scene appointed for this great and happy achievement;—we acknowledge the unseen but eternal control of that Being who projects the end from the beginning, who alone does the good that is done in the earth, and beneath whose irresistible will, the depravity that opposes, no less than the virtue that coincides with it, are but the instruments that blindly or knowingly effect its fulfilment.

Among the various difficulties that obstructed the changes which the missionaries attempted to introduce into the habits of the Indians, it was found that the human constitution had been deeply deteriorated by ages of savage life. Habits of alternate energy and sloth, indulged from generation to generation, seemed at length to have given a character or bias to the animal faculties almost as deeply ingrained as the depraved hue of the negro body, and to have seriously impaired the capacity of continuous exertion. In every employment that demanded steady labor, the Indians were found decidedly inferior to the Europeans. The first missionaries, and their immediate successors, sustained this discouragement without shrinking, and animated their converts to resist or endure it. But, at a later period, when it was found that the taint which the Indian constitution had received continued to be propagated among descendants educated in habits widely different from those of their forefathers, many persons began too hastily to apprehend that the imperfection was incurable; and missionary ardor was abated by the very circumstance that most strongly demanded its revival and enlargement. In concurrence with this cause of decline in the progress of the great work which we have contemplated, the energetic gratitude of the first converts from darkness to light had subsided; and the consequence unhappily was, that a considerable abatement ensued of the piety, morality, and industry, of the Indian communities that had been reclaimed from savage life. But the work has not been lost; its visible traces were never suffered to perish: amidst occasional decline and revival, it has always been manifest, and the people gathered to God from this barbarous and deeply-revolted kindred have never been permitted to disappear.

I have been induced to overstep very considerably the march of time, in order to exhibit a brief but unbroken view of this great scene of missionary labor. We now return to follow more leisurely the general stream of the affairs of the colony.

Shortly after the dissensions that had prevailed in the year 1646, the general court recommended the assembling of a general synod of the churches in order to frame a uniform scheme of church discipline for all the colonial congregations. The proposal was resisted by several of the churches, which expressed great apprehension of the arbitrary purposes and superstitious devices which might be promoted by the dangerous practice of convoking synods. [1648.] But, at length, the persuasion generally prevailing that an assembly of this description possessed no inherent authority, and that its functions were confined to the tendering of counsel, the second synod of New England was called together at Cambridge. The confession of faith that had recently been published by the Assembly of Divines at Westminster, was thoroughly examined and unanimously approved. Three of the most eminent ministers of the colony, Cotton, Partridge, and Mather, were then appointed to prepare a model of discipline for the instruction of the colonial churches. The *Platform of Church Discipline*, which they composed accordingly, and presented to the synod, after many long debates, received the general approbation and universal acquiescence.

1649.] A dispute had for some time subsisted between Massachusetts and Connecticut respecting a tax which the latter state had imposed, and which Massachusetts considered with good reason to operate unfairly on a portion of her people. Having complained to the confederacy, and not obtaining redress as speedily as they considered themselves entitled to expect, the legislative authorities of Massachusetts passed an act imposing a retaliatory duty not only on goods from Connecticut, but on importations from all the other states of the confederation. This unjust proceeding could be supported only by an appeal to the privilege of the strongest; a privilege which Massachusetts was well able to enforce, that the other confederates had nothing to oppose but the usual, though often ineffectual, expedient of the weak. Happily for them and for herself, their ally, though liable to be betrayed into error by resentment and partially, was not intoxicated

with conscious power. They presented a remonstrance to the general court of Massachusetts, desiring it "seriously to consider whether such proceedings agree with the law of love, and the tenor of the articles of confederation." On receiving this remonstrance, the government of Massachusetts, superior to the mean shame of acknowledging a wrong, consented to suspend the obnoxious ordinance.* [1650.]

But Massachusetts, in the following year, [1651.] was engaged in a dispute with a power still more formidable to her than she was to her confederates, and much less susceptible of sentiments of moderation and forbearance. The Long Parliament having now established its authority at home, was determined to exact an implicit recognition of it from all the dependencies of the state, and even to introduce such recognition into all the charters and official proceedings of subordinate communities. A requisition was accordingly transmitted to the governor and assembly of Massachusetts, to send their charter to London, to take out a new patent from the keepers of the liberties of England, and to hold all courts, and issue all writs, in the name of this description of authority. This command excited the utmost alarm in the colony; nor could all the attachment of the people to the cause of the parliament† reconcile them to a surrender of the title under which their settlements and institutions had been formed, and which had never obstructed their subordination to the authorities that now proposed to revoke it. The parliament had no more right to supersede the original patent of the colony, than to require the city of London, or any of the other corporations of England, to submit their charters to similar dissolution and renovation. But the colonists were well aware that the authorities which had issued this arbitrary mandate had the power to enforce it; and, accordingly, declining a direct collision, they reverted to the policy, which they had once successfully employed to counteract the tyrannical intentions of the king, and succeeded in completely foiling this assembly, so renowned for its success, resolution, and capacity. The general court, instead of surrendering the patent, transmitted a petition to the parliament against the enforcement of this mandate, setting forth, that "these things not being done in the late king's time or since, it was not able to discern the need of such an injunction." It represented the condition and authority on which the settlers had originally come to New England, their steadfast adherence to the cause of the parliament throughout the civil wars, and their present explicit recognition of its supremacy; and prayed that the people might not now be worse dealt with than in the time of the king, and instead of a governor and magistrates annually chosen by themselves, be required to submit to others imposed on them against their wills. The general court at the same time addressed a letter to "the

Lord General Cromwell," for the purpose of interesting his powerful mediation in their behalf, as well as of dissuading him from the prosecution of certain measures which he himself had projected for their advantage. The peculiar character which the New England colonists had displayed, the institutions they had established, and their predilection for the independent model of church government which he himself so highly admired, had recommended them in the most powerful manner to the esteem of this extraordinary man: and his favorable regards were enhanced by the recollection of the plan he had formed, and so nearly realized, of uniting his destiny with theirs in America. Nor were they at all abated by the compassion and benevolence with which the colonists received a considerable body of unfortunate Scots whom Cromwell had caused to be transported to Massachusetts after the battle of Dunbar, and of which he was informed by a letter from Mr. Cotton.* He seemed to consider that he had been detained in England for their interests as well as his own, and never ceased to desire that they should be more nearly associated with his fortunes, and cheered with the rays of his grandeur. He had conceived an ardent desire to be the author of an enterprise so illustrious as the revocation of these men to the country from which they had been so unworthily expelled; and as an act of honorable justice to themselves, as well as for the advantage of Ireland, he had recently broached the proposal of transporting them from America, and establishing them in a district of this island, which was to be evacuated for their reception. In their letter to him, the general court, which had been apprised of this scheme, acknowledged, with grateful expressions, the kind consideration which it indicated; but declined to avail themselves of it, or abandon a land where they had experienced so much of the favor of God, and were blessed with such prospects of converting the heathen. They at the same time recommended their petition against the parliamentary measures to his friendly countenance, and beseeched "his Excellence to be pleased to show whatsoever God shall direct him unto, on the behalf of the colony, to the most honorable parliament." It may be presumed, that Cromwell's mediation was successfully employed, as the requisition that had been transmitted to the general court was not further prosecuted.†

The successes of the Long Parliament had begotten in its leading members a growing spirit of dominion, of which the colonies did not fail to experience the operation. In the history of Virginia we have beheld the laws by which the traffic of all the colonies with foreign nations was prohibited, and the ordinances and proceedings by which the subjugation of that refractory settlement was enacted and enforced. The state of Massachusetts, which was desirous, as far as possible, to act in concurrence with the parliament, and was perfectly sincere in recognizing its supremacy, co-operated with its ordinance against Virginia, by prohibiting all intercourse with that colony till it had been reduced by the parliamentary forces. But it was not over those settlements alone, which opposed its supremacy, that the parliament was disposed to indulge the spirit of dominion; and though Massachusetts was protected from its designs by the interference of Cromwell, Maryland, which had received its establishment from

Charles the First, was compelled to receive the alterations of its official style which Massachusetts had evaded; [1652]* and Rhode Island beheld the very form of government which it had received from the parliament itself in 1643, suspended by an order of the council of state. What might have ensued upon this order, and what similar or further proceedings might have been adopted by the parliament relative to the other colonies, were intercepted by its own dissolution, and the convergence of the whole power of the English commonwealth in the strong hands of Oliver Cromwell.

[1653.] The ascendancy of the protector proved highly beneficial to all the American colonies, except Virginia, which, on account of the political tenets of its inhabitants, he regarded even with greater displeasure than the catholic establishment of Maryland. Rhode Island, immediately after his elevation, resumed the form of government which the parliament had recently suspended; and, by the decisive vigor of his interference, the people of Connecticut and Newhaven were relieved from the apprehensions they had long entertained of the hostile designs of the Dutch colonists of New York. All the New England states were thenceforward exempted from the operation of the parliamentary ordinance against trade with foreign nations; and both their commerce and security derived a great increase from the conquest which the protector's arms achieved, of the province of Acadia from the French. But it was Massachusetts that occupied the highest place in his esteem; and to the inhabitants of this settlement he earnestly longed to impart a dignity of external condition proportioned to the elevation which he believed them to enjoy in the favor of the great Sovereign of all mankind. The reasons for which they had declined his offer of a settlement in Ireland, however likely to commend themselves to his approbation, were still more calculated to draw forth his regard for a people who felt the force of such generous considerations. When his arms had effected the conquest of Jamaica, he conceived the project of transplanting the colonists of Massachusetts to that beautiful island; [1655.] and, with this view, he strongly represented to them, that, by establishing themselves and their principles in the West Indies, they would carry the sword of the gospel into the very heart of the territories of popery, and that consequently they ought to deem themselves as strongly called to this ulterior removal, as they had been to their original migration. He endeavored to incite them to embrace this project by promises of his amplest countenance and support, and of having the whole powers of government vested entirely in their own hands, and by expatiating on the rich productions of the torrid zone, with which their industry would be rewarded in this new settlement: and with these considerations he blended an appeal to their conscience, in pressing them to fulfil, in their own favor, the promise which, he said, the Almighty had given to *make his people the head, and not the tail*. He not only urged these views upon the agents and correspondents of the colonists in England, but despatched one of his own officers to solicit on the spot their compliance with his proposal. But the colonists were exceedingly averse to abandon a country where they found themselves happy and in possession of a sphere of increasing usefulness; and the proposal was the more unacceptable to them from the accounts they had received of the sickness of Jamaica. [1656] The general court accordingly returned an address, declining, in the name of their fellow-citizens, to embrace the protector's offer, and withal beseeching his Highness not to impute their refusal to indifference to his service, or to an ungrateful disregard of his concern for their welfare.† Thus, by the overruling influence of that Power by which their steps had been so signally directed, were the colonists prevented, on two occasions, from availing themselves of the injudicious promotion which Cromwell was so eager to bestow. Had they removed to Ireland, they would themselves shortly after have been subjected to slavery: had they pro-

* Hutchinson i. 156. Chalmers, 192, 3. Another dispute, which occurred about three years after between Massachusetts and the other confederated states, is related with great minuteness, and I think with no small injustice and partiality, by the respectable historian of Connecticut. In 1653, a discovery was supposed to have been made of a conspiracy between Stuyvesant, the governor of the Dutch colony, and the Indians, for the extermination of the English. The evidence of this sanguinary project (which Stuyvesant indignantly disclaimed) was held sufficient, and the resolution of a general war embraced, by all the commissioners of the union except those of Massachusetts. The general court of this province judged the proof inconclusive, and were fortified in this opinion by the judgment of their clergy, which they consented to abide by. To all the remonstrances of their allies, they answered, that no articles of confederation should induce them to undertake an offensive war which they considered unjust, and on which they could not ask or expect the blessing of God. The historian of Connecticut, not content with reproaching this breach of the articles of union, vehemently maintains that the scruples of Massachusetts were insincere. Trumbull, vol. i. cap. x. But, in truth, the evidence of the Dutch plot labored under very serious defects, which were much more coolly weighed by the people of Massachusetts, than by the inhabitants of Connecticut and Newhaven, exasperated by frequent disputes with the Dutch, and, by their proximity, exposed to the greatest danger from Dutch hostilities. In the beginning of the following century, the situation of the provinces was so far reversed, that Massachusetts was compelled to solicit Connecticut for aid in a general war with the Indians; and, on this occasion, Connecticut remote from the scene of action, at first refused her aid upon scruples, which she afterwards ascertained to be groundless, respecting the lawfulness of the war. Trumbull, vol. ii. cap. 5.

† Though attached to the cause of the parliament, the people of New England had so far forgotten their own wrongs, and escaped the contagion of the passions engendered in the civil war, that the tragical fate of the king appears to have excited general grief and concern. The public expression of such sentiments would have been equally inexpedient and unavailing; but that they were entertained is very manifest. See Hutchinson, i. 157. In this the puritans of America were not singular. No man in England made greater efforts to save Charles' life than William Prynne the puritan, than whom no man had suffered more severely from his tyranny.

* Cromwell was far from being incapable of appreciating the merit or tolerating the praise of a foe; and the finest tribute that was ever paid to the dignified courage with which Charles the First encountered his fate, is contained in an ode by the patriot and poet, Andrew Marvell, addressed to the protector.

† Hutchinson i. 176. and Append. 516, 520. Hutchinson's Collection of papers, 235. Chalmers, 184, 5. The commissioners for New England, who were sent thither by Charles the Second, asserted, in their narrative, that the colony solicited Cromwell to be declared a free state. Hutchinson's Collection of papers, p. 420. This is highly unlikely, and was suggested perhaps by misrepresentation or misapprehension of the circumstances related in the text. The publication of Governor Winthrop's Journal has now clearly proved that the leading men in Massachusetts entertained from the beginning a considerable jealousy of parliamentary jurisdiction. "In 1641," says Winthrop, "some of our friends in England wrote to us advice to send over some to solicit for us in the parliament, giving us hopes that we might obtain much; but, consulting about it, we declined the motion for this consideration: that if we should put ourselves under the protection of parliament, we must then be subject to all such laws as they should make, or, at least, such as they might impose upon us; in which course, though they should intend our good, yet it might prove very prejudicial to us." Winthrop's Journal, p. 218. Hence it is obvious that the people of New England, in acknowledging the supremacy of parliament, had respect to it not as a legislative body, but as administering the functions of royalty. They never willingly admitted that the mother country possessed a legislative control over them; or that, in forsaking her shores, they had left behind them an authority capable of sending after them the evils from which they had fled.

* This year Massachusetts lost its eminent preacher, patriarch, and peace-maker, John Cotton. Finding himself dying, he sent for the magistrates and ministers of the colony, and, with solemnity and tenderness, bade them farewell for a while. Few men have ever occupied so large room as this man possessed in the hearts of his countrymen.

† Hutchinson, i. 180, 190—192. Chalmers, 292, 192, 188, Hazard, 633. A similar answer was returned by Newhaven to a similar application from the protector. Trumbull, i. 228. There were not wanting some wild spirits among the colonists, who relished the protector's proposals. The notorious Venner, who headed the insurrection of the Fifth Monarchy men in England after the Restoration, was for some time an inhabitant of Salem, and prevailed with a party of zealots there to unite in a scheme of emigration to the West Indies. But the design was discouraged by the clergy, and intercepted by the magistrates. Oldmixon, i. 47.

ceeded to Jamaica, they would have been exposed to a strong and dangerous temptation of inflicting that injustice upon others. In the mind of Cromwell, a vehement ardor was singularly combined with the most profound and deliberate sagacity; and enthusiastic sentiments were not unfrequently blended with politic considerations, in proportions which it is little likely that he himself was aware of, or that any spectator of his actions can hope to adjust. It is obvious, on the one hand, that his propensities to the colonists, on both occasions, were connected with the securer establishment of his own dominion in Ireland, and the preservation of his conquest in the West Indies. But it is equally certain, on the other, that the colonists incurred neither displeasure, nor even abatement of his cordial friendship, by refusing to promote the schemes on which he was so strongly bent: nay, so powerfully had they captivated his rugged heart, that they were able to maintain his favor, even while their intolerance discredited the independent principles which he and they concurred in professing; and none of the complaints with which he was long harassed on their account by the anabaptists and quakers, whose proceedings and treatment in the colony we are now to consider, were ever able to deprive the people of the place they had gained in the protector's esteem.

The colonists had been of late years involved occasionally in hostilities with some of the Indian tribes, and in disputes with the Dutch, by whose machinations it was suspected that these savages were more than once instigated to conspire against them. But these events had been productive of greater alarm than injury: and by far the most serious troubles with which the colonists were infested were those which arose from religious dissensions. Of all the instances of persecution that occur in the history of New England, the most censurable in its principle, though happily also the least vehement in the severities which it produced, was the treatment inflicted on the anabaptists by the government of Massachusetts. The first appearance of these sectaries in this province was in the year 1651, when, to the great astonishment and concern of the community, seven or eight persons, of whom the leader was one Obadiah Holmes, all at once professed the baptist tenets, and separated from the congregation to which they had belonged, declaring that they could no longer take council, or partake divine ordinances, with unbaptized men, as they pronounced all the other inhabitants of the province to be. The erroneous doctrine which thus unexpectedly sprang up was at this time regarded with peculiar dread and jealousy, on account of the horrible enormities of sentiment and practice with which the first professors of it in Germany had associated its reputation; and no sooner did Holmes and his friends set up a baptist conventicle for themselves, than complaints of their proceedings, as an intolerable nuisance, came pouring into the general court from all quarters of the colony. From the tenor of these complaints, it appears, that the influence of that infamous association, by which the wretched Baeckold and his frantic followers at Munster had stained and degraded the baptist tenets, still preserved its force in the minds of men, and that the profession of these tenets was calculated to awaken suspicions of the grossest immorality of conduct. Holmes was accused of having dishonored the Almighty, not only by scattering his people and denying his ordinance, but by the commission of profligate impurities, and the shameful indecency with which it was alleged that his distinctive rite was administered. It is admitted by the colonial historians, that the evidence that was adduced in support of these latter charges was insufficient to establish them. The court at first proceeded no farther than to adjudge Holmes and his friends to desist from their unchristian separation: and they were permitted to retire, having first, however, publicly declared that they would follow out the leadings of their consciences, and obey God rather than man. Some time after, they were apprehended on a Sunday, while attending the preaching of one Clark, a baptist, from Rhode Island, who had come to propagate his tenets in Massachusetts. The constables who took them into custody carried them to church, as a more proper place of christian worship; where Clark put on his hat the moment that the minister began to pray. Clark, Holmes, and another, were sentenced to pay small fines, or be flogged: and thirty lashes were actually inflicted on Holmes, who resolutely persisted in choosing a punishment that would enable him to show with what constancy he could suffer for what he believed to be the truth. A law was at the same time passed, subjecting to banishment from the colony every person who should openly condemn or oppose the baptism of infants, who

should attempt to seduce others from the use or approbation thereof, or purposely depart from the congregation when that rite was administered, "or deny the ordinance of the magistracy, or their lawful right or authority to make war." From these last words it would appear, that the baptists either held, or were reported to hold, along with the proper tenets from whence they have derived their denomination, principles that might well be deemed adverse to the stability of government and the safety of society. In addition to this, we are assured by Cotton Mather, that it was the practice of the anabaptists, in order to strengthen their party and manifest their contempt for the clerical congregations, to receive at once into their body every person whom the established church had suspended from ecclesiastical privileges for licentiousness of conduct, and even to appoint these persons administrators of the sacrament among them. Yet, even with these and other extenuating considerations, it is impossible to acquit the government of Massachusetts of having violated in this instance the rights of conscience, and made men offenders for the fidelity with which they adhered to what they firmly, though erroneously, believed to be the will of God, in relation of a matter purely ecclesiastical.* The eagerness with which every collateral charge against the baptists was credited in the colony, and the vehement impatience with which their claim of toleration was rejected, forcibly indicate the illiberality and delusion by which their persecutors were governed; and may suggest to the christian philosopher a train of reflections no less instructive than interesting on the self-deceit by which men so commonly infer the honesty of their convictions, and the rectitude of their proceedings, from that resentful perturbation which far more truly indicates a secret consciousness of injustice and inconsistency. There is not a more common nor more pernicious error in the world than that one virtue may be practised at the expense of another. Where sincerity without charity is professed, there is always reason to suspect the professor of a dishonest disregard of the secret surmises of his own spirit.

It is mortifying to behold such tares growing up in the field that was already so richly productive of missionary exertion and other fruits of genuine and exalted piety. The severities that were employed proved in the end totally ineffectual to restrain the growth of the baptists' tenets; though for the present the professors of these doctrines appear to have either desisted from holding separate assemblies, or to have retired from Massachusetts. Some of them proceeded to England, and complained to Cromwell of the persecution they had undergone; but he rejected their complaint, and applauded the conduct of the colonial authorities.

The treatment which the quakers experienced in Massachusetts was much more severe, but, at the same time, undoubtedly much more justly provoked. It is difficult for us, in the calm and rational demeanor of the quakers of the present age, to recognise the successors of those wild enthusiasts who first appeared in the north of England, about the year 1644, and began a few years after to be distinguished by the name of quakers. In the mind of George Fox, the collector of this sectarian body and the founder of their system of doctrine, there existed a singular mixture of christian sentiment and gospel truth, with a deep shade of error and delusion. Profoundly pious and contemplative, but constitutionally visionary and hypochondriacal,† he appears at first to have suspected that the peculiarities of his mental impressions might have arisen from some malady which advice could remove; and an old clergyman, to whom he applied for counsel, advised him to seek a cure of what was spiritual in his disorder by

* The baptists who were exiled from Massachusetts were allowed to settle in the colony of Plymouth (Hutchinson, ii. 478), whence it may be strongly inferred, that they did not in reality profess (as they were supposed by the people of Massachusetts to do) principles adverse to the safety of society. The charge probably originated in the extravagance of a few of their own number, and the impatience and injustice of their adversaries.

† Several eminent christian teachers have been afflicted with hypochondriacal affections, and in a greater or less degree deluded by the strange impressions of which they render the mind susceptible. That great and good man, David Brainerd, in particular, labored under this of disease all his life; and though it did not affect his views of doctrine, it exercised a much unhappy influence on his sentiments, and produced much of what is gloomy and visionary in the account which he composed of his own experience. This is expressly avowed by his biographer, President Edwards, who was intimately acquainted with him. So delusive is this insidious malady, that perhaps none of its victims has ever been aware how far he was subject to its influence. Brainerd's partial consciousness of it, prevented it from extending its influence from his feelings to his understanding.

singing psalms, and of what was bodily by smoking tobacco. Fox rejected both parts of the prescription as unsuitable to his condition, because disagreeable to his taste; and being now convinced that others were incapable of understanding his case, he took it entirely into his own hands, and resolved to cherish, study, and, if possible, cultivate into distinctness the unintelligible motions of his spirit; in short, to follow the leadings of his fancy as far as they would carry him. Unsuspicious of morbid influence, or of the deceitfulness of his own imagination, he yielded implicit credence to every suggestion of his mind, and was given up in an amazing degree to the delusions which, by prayer to the Almighty, he might have been enabled to overcome and dispel. Yet the powerful hold which the Scriptures had already taken of his mind, and the strong determination towards solid and genuine piety which his spirit had thence derived, prevented him from wandering into the same monstrous extravagance which the conduct of many of his associates and followers very speedily evinced. In his journal, which is one of the most remarkable and interesting productions of the human mind, he has faithfully related the influence which his tenets produced on the sentiments and conduct both of himself and his followers. It displays in many parts a wonderful insight into spiritual things, together with numberless instances of that delusion by which he mistook a strong perception of wrong and disorder in human nature and civil society, for a supernatural power to rectify what he saw amiss. He relates with perfect approbation many instances of contempt of decency and order in his own conduct, and of most insane and disgusting outrage in that of his followers; and though he reprobates the extravagancies of some whom he denominates *Ranters*, it is not easy to discriminate between the extravagance which he sanctions and that which he condemns. Amidst much darkness, there glimmers a bright and beautiful ray of truth: many passages of Scripture are powerfully illustrated; and labors of zeal and piety, of courage and integrity, are recorded, that would do honor to the ministry of an inspired apostle. That his personal character was elevated and excellent in an unusual degree, appears from the impression it produced on the minds of all who approached him. Penn and Barclay in particular, who to the most eminent virtue added talents of the first order, regarded Fox with the utmost fondness and veneration.

It was this man who first embraced and promulgated those tenets which have ever since remained the distinctive principles of quaker doctrine—that the Holy Spirit, instead of operating (as the generality of christians believe it in all ordinary cases to do) by insensible control of the ordinary motions of the mind, acts by direct and sensible impulse on the spirit of man; that its influence, instead of being obtained by prayer to Him who has promised to bestow it on those who ask it, is procured by an introversion of the intellectual eye upon the mind where it already resides, and in the stillness and watchful attention of which, the hidden spark will blaze into a clear inward light and sensible flame; and that the Spirit, instead of simply opening the minds of men to understand the Scriptures and receive their testimony, can and does convey instruction independently of the written word, and communicate knowledge which is not to be found in the Scriptures. These dangerous errors have never been renounced by the quakers, though their practical influence has long since abated, and indeed had considerably declined before the end of that century, about the middle of which they arose. In proportion as they have been cultivated and realized, has been the progress of the sect into heresy of opinion or wild delusion of fancy and irregularity of conduct: in proportion as they have subsided, has been the ascendancy which real piety or rational and philosophical principle has obtained over the minds of the quakers. Even in the present day, we behold the evil influence of these erroneous doctrines, in the frequently silent meetings of the quakers, in the licence which they give to women to assume the office of teachers in the church, and in the abolition of the sacraments so distinctly instituted and enjoined in Scripture. But when these doctrines were first published, the effects which they produced on many of their votaries, far exceeded the influence to which modern history restricts them, or which the experience of this cool and rational age finds it easy to conceive. In England, at that time, the minds of men were in an agitated unsettled state, inflamed with the rage of speculation, strongly endued with religious sentiment, and yet strongly averse to restraint. The bands that had so long restrained liberty of speech being suddenly broken, many crude thoughts were eagerly broached,

and many peculiar notions that had long been fermenting in the unwholesome silence of locked up bosoms, were brought forth: and all these were presented to minds roused and whetted by civil war, kindled by great alarms or by vast and indeterminate designs, and so accustomed for a length of time to effect or contemplate the most surprising changes, that the distinction between speculation and certainty was greatly effaced. The presbyterians alone, or nearly alone, appear to have been generally willing to submit to, as well as to impose, restraint on the lawless licence of speculation; and to them the quakers, from the beginning, were objects of unmixed disapprobation and even abhorrence. But to many other persons, this new scheme, opening a wide field of enthusiastic speculation, and presenting itself without the restrictive accompaniment of a creed, exhibited irresistible attractions, and rapidly absorbed a great variety of human character and feeling. Before many years had elapsed, the ranks of the quakers were recruited, and their doctrines, without being substantially altered, were moulded into a more systematic shape, by such an accession of philosophical votaries, as, in the early ages of the church, christianity itself derived from the pretended adoption and real adulteration of its doctrines, by the disciples of the Platonic philosophy. But it was the wildest and most enthusiastic dreamers in the country, that the quaker tenets counted among their earliest votaries, and to whom they afforded a sanction and stimulus to the boldest excursions of lawless and uncertain thought, and a principle that was thought to consecrate the most irregular and disorderly conduct. And accordingly these sectarians, who have always professed and inculcated the maxims of inviolable peace, who not many years after were accounted a class of philosophical deists seeking to pave the way to a scheme of natural religion, by allegorizing the distinguishing articles of the christian faith, and who are now in general remarkable for a calm benevolence and a peculiar remoteness from every active effort to make proselytes to their distinctive tenets, were, in the infancy of their body, the most impetuous zealots and inveterate disputers; and in their eagerness to proselytize the world, and to bear witness from the fountain of oracular testimony, which they supposed to reside within them, against a regular ministry which they called a priesthood of Baal, and against the sacraments which they termed carnal and idolatrous observances, many of them committed the most revolting blasphemy, indecency, and disorderly outrage.* The unfavorable impression that these actions created, long survived the extinction of the frenzy and folly that produced them.

While in pursuance of their intentions to make proselytes of the whole world, some of the quakers proceeded to Rome, in order to convert the pope, and others to Constantinople, for the purpose of instructing the Grand Turk; a party of them proceeded to America and established themselves in Rhode Island, where persons of every religious denomination were permitted to settle in peace, and none gave heed to the sentiments or practices of his neighbors. From hence they soon made their way into the Plymouth territory, where they succeeded in persuading some of the people to embrace the mystical dispensation of an inward light as comprising the whole of religion, and to oppose all order, both civil and ecclesiastical, as a vain and judaizing substitution of the kingdom of the flesh for the kingdom of the spirit. On their first appearance in Massachusetts, where two male and six female quakers arrived from Rhode Island and Barbadoes, they found that the reproach which their sect had incurred by the insane extravagance of some of its members in England, had preceded their arrival, and that they were objects of the utmost terror and dislike to the great body of the people. They were instantly apprehended by the government, and diligently examined for what were considered bodily marks of witchcraft. None such having been found, they were sent back to

* The frenzy that possessed many of the quakers had reached its height in the year 1656, the very year in which the quakers first presented themselves in Massachusetts. See the proceedings in the House of Commons against James Nayler, a quaker, for blasphemy. *Howells State Trials*, vol. v. p. 801. This unhappy person represented himself as the redeemer of the human race. Some particulars of his frenzy are related in Note IX. He lived to repent his errors, and even wrote sensibly in defence of the quaker body, who were by this time increasing in respectability, and were yet so magnanimous as to acknowledge as a friend the man who had done such disservice to their cause. It is a remarkable and significant fact, that at the very time when the separate teaching of the spirit was most strongly insisted on by the quakers, and the office and work of the Saviour of mankind of consequence least alluded to, several of their own members (more or less insane, no doubt) believed this office to be vested in themselves.

the place whence they came, by the same vessels that had brought them, and prohibited with threats of the severest penal inflictions from ever again returning to the colony. A law was passed at the same time subjecting every ship-master importing quakers or quaker writings to a heavy fine; adjudging all quakers who should intrude into the colony to stripes and labor in the house of correction, and all defenders of their tenets to fine, imprisonment or exile. The four associated states concurred in this law, and urged the authorities of Rhode Island to co-operate with them in stemming the progress of quaker opinions; but the assembly of that island returned for answer, that they could not punish any man for declaring his mind with regard to religion; that they were much disturbed by the quakers, and by the tendency of their doctrines to dissolve all the relations of society; but that they found that the quakers delighted to encounter persecution, quickly sickened of a patient audience, and had already begun to loathe Rhode Island as a place where their talent of patient suffering was completely buried.* It is much to be lamented that the advice contained in this good-humored letter was not adopted. The penal enactments resorted to by the other settlements, served only to inflame the impatience of the quaker zealots to carry their teaching into places that seemed to them so much in need of it; and the persons who had been disappointed in their first attempt returned almost immediately, and, dispersing themselves through the colony, began to announce their mysterious impressions, and succeeded in communicating them to some of the inhabitants of Salem. They were soon joined by Mary Clarke, the wife of a tailor in London, who announced that she had left her husband and six children, in order to carry a message from heaven, which she was commissioned to deliver to New England. Instead of joining with the colonial missionaries in attempts to reclaim the savages from their barbarous superstition and profligate immoralities, or themselves prosecuting separate missions of the same description, these people raised their voices against every thing that was most highly approved and revered in the doctrine and practice of the colonial churches. Having been seized and flogged, they were again dismissed with severer threats from the colony, and again they returned by the first vessels they could procure. The government and the great body of the colonists were incensed at their pertinacity, and shocked at the impression they had already produced on some minds, and which threatened to corrupt and subvert a system of piety whose establishment and perpetuation supplied their fondest recollections, their noblest enjoyment, and most energetic desires. [1657.] New punishments were introduced into the legislative enactments against the intrusion of quakers and the profession of quakerism; and in particular the abscission of an ear was added to the former ineffectual severities. [1658.] Three male quaker preachers endured the rigor of this cruel law.

But all the exertions of the colonial authorities proved utterly unavailing, and seemed rather to stimulate the zeal of the obnoxious sectaries to encounter the danger and court the glory of persecution. Clouds of quakers descended upon the colony; and, violent and impetuous in provoking persecution, calm, resolute, and inflexible in sustaining it, they opposed their powers of endurance to their adversaries' power of infliction, and not only multiplied their converts, but excited a considerable degree of favor and pity in the minds of men whose own experience had taught them to respect and sympathize with the virtue of suffering well †

* Gordon and other writers have represented the letter from Rhode Island to Massachusetts as conveying a disguised rebuke of intolerance, and have quoted a passage to this effect, which they have found somewhere else than in the letter itself.

Roger Williams, who contributed to found the state of Rhode Island, endeavored, some years after this period, to extirpate the quaker heresy, by challenging some of the leaders of the sect, who had come out on a mission to their brethren from England, to hold a public disputation with him on their tenets. They accepted his challenge, and their historians assure us that the disputation, which lasted for several days, ended "in a clear conviction of the envy and prejudice of the old man." Gough and Stowel, ii. 134. It is more probable that, like other public disputations, it ended as it began.

† Except one of the women, Mary Fisher, who travelled to Adrianople, and had an interview with the Grand Vizier, by whom she was received with courteous respect. Bishop, the quaker, in his "New England Judged," observes that she fared better among heathens than her associates did among professing Christians. He was perhaps not aware that the Turks regard insane persons as inspired. But whether insane or not, she was not altogether divested of a prudent concern for her own safety; for "when they asked her what she thought of their prophet Mahomet, she made a cautious reply, that she knew him not."

† A story is told by Whitelocke, p. 599, strongly illustrative

When the quakers were committed to the house of correction, they refused to work; when they were subjected to fines, they refused to pay them. In the hope of enforcing compliance, the court adjudged two of these contumacious persons to be sold as slaves in the West Indies; but as even this appalling prospect could not move their stubborn resolution, the court, instead of executing its inhuman threat, resorted to the unavailing device of banishing them beyond its jurisdiction. It was by no slight provocations, that the quakers attracted these and additional severities upon themselves. Men trembled for the faith and morals of their families and their friends, when they heard the blasphemous denunciations that were uttered against "a carnal Christ;" and when they beheld the frantic and indecent outrages that were prompted by the mystical impressions which the quakers inculcated and professed to be guided by. In public assemblies, and in crowded streets, it was the practice of some of the quakers to denounce the most tremendous manifestations of divine wrath on the people, unless they forsook their carnal system. Others interrupted divine service of the churches, by calling aloud that these were not the sacrifices that God would accept; and one of them enforced this assurance by breaking two bottles in the face of the congregation, exclaiming, "Thus will the Lord break you in pieces." They declared that the Scriptures were replete with allegory, that the inward light was the only infallible guide to religious truth, and that all were blind beasts and liars who denied it. The female preachers far exceeded their male associates in folly, frenzy, and indecency. One of them presented herself to a congregation with her face begrimed with coal dust, announcing it as an emblem of the black pot, which heaven had commissioned her to threaten as an approaching judgment on all carnal worshippers. Some of them in rueful attire perambulated the streets, declaring the immediate coming of an angel with a drawn sword to plead with the people. One woman entered stark naked into a church in the middle of divine service, and desired the people to take heed to her as a sign of the times; and her associates highly extolled her submission to the inward light, that had revealed to her the duty of exposing the nakedness of others by the indecent exhibition of her own person. Another was arrested as she was making a similar display in the streets of Salem. The horror that these insane enormities were fitted to inspire, was inflamed into the most vehement indignation, by the deliberate manner in which they were defended, and the disgusting profanity with which Scripture was linked in impure association with every thing that was odious, ridiculous, and contemptible. Among their other singularities, the quakers exemplified and inculcated the forbearance of every mark of respect to courts and magistrates: they declared that governors, judges, lawyers, and constables were trees that must be cut down that the true light might have leave to shine and space to rule alone; and, forgetting to what diabolical ends quotation of Scripture has been made subservient they freely indulged every contumacious whimsey, which they could connect, however absurdly, with the language of the Bible. One woman who was summoned before the court to answer for some extravagance, being desired to tell where she lived, refused to give any other answer than that she lived in God, "for in him we live, and move, and have our being." Letters replete with coarse and virulent railing were addressed by others to the magistrates of Boston and Plymouth. Such was the inauspicious outset of the quakers in America; a country where, a few years after, under the guidance of better judgment and feeling, they were destined to extend the empire of piety and benevolence, and to found establishments that have been largely productive of happiness and virtue.

It has been asserted by some of the modern apologists of the quakers, that these frantic irregularities, which excited so much indignation, and produced such tragical consequences, were committed, not by genuine quakers, but by the *ranters* or wild separatists from the

of the singularity with which the quakers of these times combined all that was frantic in action with all that was dignified and affecting in suffering. Some quakers at Haddington in Northumberland, having interrupted a minister employed in divine service, were severely beaten by the people. Instead of resisting, they went out of the church, and falling on their knees, besought God to pardon their persecutors, who knew not what they did; and afterwards addressing the people, so convinced them of the cruelty of their violence, that their auditors fell a quarrelling among themselves, and beat one another more than they had formerly beaten the quakers. These sectarians would seem, indeed, to have imitated the prophets of the Old Testament in provoking their fate, and the christian apostles and martyrs in enduring it.

quaker body. Of these ranters, indeed, a very large proportion appear to have betaken themselves to America; attracted chiefly by the glory of persecution, but in some instances, perhaps by the hope of attaining among their brethren in that country a distinction from which they were excluded in England by the established pre-eminence of George Fox.* It is certain, however, that these persons assumed the name of quakers, and traced all their frenzy to the peculiar quaker principle of seeking within themselves for sensible admonitions of the spirit, independent of the written word. And many scandalous outrages were committed by persons whose profession of quaker principles was recognized by the quaker body, and whose sufferings are related, and their frenzy applauded, by the pens of quaker writers.

Exasperated by the repetition and increase of these enormities, and the extent to which the contagion of the principle whence they seemed to arise was propagating itself in the colony, the magistrates of Massachusetts at length, in the close of this year, introduced a law, denouncing the punishment of death upon all quakers returning from banishment. This law met with much opposition; and many persons, who would have hazarded their own lives to extirpate the opinions of the quakers, solemnly protested against the cruelty of shedding their blood. It was at first rejected by the deputies, and finally carried by the narrow majority of a single voice. In the course of the two following years, [1650, 1660.] this law was carried into execution on three separate occasions, when four quakers, three men and a woman, were put to death at Boston. It does not appear that any of these unfortunate persons had been guilty of the outrages which the conduct of many of their brethren had associated with the profession of quakerism. Oppressed by the prejudice which had been created by the frantic conduct of others, they were adjudged to die for returning from banishment and continuing to preach the quaker doctrines. In vain the court entreated them to accept a pardon on condition of abandoning for ever the colony from which they had been repeatedly banished. They answered by reciting the heavenly call to continue there, which on various occasions, they said, had sounded in their ears, in the fields, and in their dwellings distinctly, syllabing their names, and whispering their prophetic office and the scene of its exercise.† When they were conducted to the scaffold, their demeanour evinced the most inflexible zeal and courage, and their dying declarations breathed in general the most sublime and affecting piety. These executions excited a great clamor against the government, many persons were offended by the representation of severities against which the establishment of the colony itself seemed intended to bear a perpetual testimony; and many were touched with an indignant compassion for the sufferings of the quakers, that effaced all recollection of the indignant disgust that their principles had heretofore inspired. The people began to flock in crowds to the prisons, and load the unfortunate quakers with demonstration of kindness and pity. The magistrates published a very strong vindication of their proceedings, for the satisfaction of their fellow-citizens and of their friends in other countries, who united in blaming them; but at length the rising sentiments of humanity and

justice attained such general and forcible prevalence as to overpower all opposition. On the trial of Leddra, the last of the sufferers, another quaker named Wenlock Christison, who had been banished upon pain of death, came boldly into court with his hat on, and reproached the magistrates for shedding innocent blood. He was taken into custody, and soon after put upon his trial. Being called to plead to his indictment, he desired to know by what law they tried him. When the last enactment against the quakers was cited to him, he asked, Who empowered them to make that law, and whether it were not repugnant to the jurisprudence of England! The governor very inappositively answered, that there was a law in England that appointed Jesuits to be hanged. But Christison replied, that they did not even accuse him of being a Jesuit, but acknowledged him to be a quaker, and that there was no law in England that made quakerism a capital offence. The court, however, overruled his plea, and the jury found him guilty. When sentence of death was pronounced upon him, he desired his judges to consider what they had gained by their cruel proceedings against the quakers. "For the last man that was put to death," said he, "here are five come in his room; and if you have power to take my life from me, God can raise up the same principle of life in ten of his servants, and send them among you in my room, that you may have torment upon torment." The talent and energy displayed by this man, who seems to have been greatly superior in mind to the bulk of his sectarian associates, produced an impression which could not be withstood. The law now plainly appeared to be unsupported by public consent, and the magistrates hastened to interpose between the sentence and its execution. Christison, and all the other quakers who were in custody, were forthwith released and sent beyond the precincts of the colony; and as it was impossible to prevent them from returning, only the minor punishments of flogging and reiterated exile were employed. Even these were gradually relaxed as the quakers became gradually a more orderly people; and in the first year after the restoration of Charles the Second, even this degree of persecution was suspended by a letter from the king to Mr. Endicott,* and the other governors of the New England settlements, requiring that no quakers should thenceforward undergo any corporal punishment in America, but if charged with offences that might seem to deserve such infliction, they should be remitted for trial to England. Happily the moderation of the colonial governments was more permanent than the policy of the king, who retracted his interposition in behalf of the quakers in the course of the following year.

The persecution which was thus put an end to was not equally severe in all the New England states: the quakers suffered most in Massachusetts and Plymouth, and comparatively little in Connecticut and Newhaven. It was only in Massachusetts that the law inflicting capital punishment upon them was enacted. At a late period, the laws relating to *vagabond quakers* were so far revived, that quakers disturbing public assemblies, or violating public decency, were subjected to corporal chastisement. But little occasion ever again occurred of enforcing these severities; the wild excursions of the quaker spirit having generally ceased, and the quakers gradually subsiding into a decent and orderly submission to all the laws except such as related to the militia and the support of the ministry; in their scruples as to which, the legislature, with corresponding moderation, consented to indulge them.†

During the long period that had elapsed since the commencement of the English civil wars, the states of New England had continued steadily and rapidly to advance in the increase of their numbers, and the enlargement of their territories. They were surrounded with abundance of cheap and fertile land, and secured in the possession of their religious privileges, and of civil and political freedom. The people were exempted from the payment of all taxes except for the support of their internal government, which was administered with great economy; and they enjoyed the extraordinary privilege of importing commodities into England free

from that custom which all others were constrained to pay. By the favor of Cromwell, too, the commercial ordinances of the Long Parliament, of which the other plantations had reason to complain, were not enforced against them, and they continued to trade wherever they pleased. These particular causes, which had combined to promote the prosperity which New England had attained at the Restoration, contributed proportionally to overcast the prospects which that event awakened. There was the strongest reason to expect an abridgement of commercial advantages, and to tremble for the security of religious and political privileges. Various other circumstances contributed to retard the recognition of the royal authority. On the death of Cromwell, the colonists had been urged to recognise, first his son Richard as protector, afterwards the Long Parliament, which for a short time resumed its authority, and subsequently the Committee of Safety, as the sovereign authority of England. But, doubtful of the stability of any of these forms of administration, they had prudently declined to commit themselves by any declaration. In the month of July, the arrival of a vessel, on board of which were Generals Whaley and Goffe, two of the late king's judges, announced the restoration of Charles the Second: but no authoritative or official communication of this event was received, and England was represented as being in a very unsettled and distracted condition. The colony had no inducement to imitate Virginia in a premature declaration for the king; and while farther intelligence was anxiously expected, Whaley and Goffe were freely permitted to travel through the states, and to accept the friendly attentions which many persons tendered to them, and with which Charles afterwards bitterly reproached the colony.

At length decisive intelligence was received that the royal authority was firmly established in England, and that complaints against the colony of Massachusetts had been presented by various royalists, quakers, and other adversaries of its institutions or administration, to the privy council and the houses of parliament. A general court was immediately convened, and an address voted to the king, in which, with considerable ability, and with that conformity which they studied to the language of Scripture, they justified their whole conduct, professed a dutiful attachment to their sovereign, and entreated his protection and favor, which they declared themselves the more willing to hope from one who, having been himself a wanderer, was no stranger to the lot and the feelings of exiles. Having defended their proceedings against the quakers, by a summary of the heretical doctrines and seditious and indecent excesses which these sectaries had introduced into the colony, they desired permission to be heard in their own vindication against every other charge that might be preferred against them. "Let not the king hear men's words," they said; "your servants are true men, fearers of God and the king, and not given to change, zealous of government and order, orthodox and peaceable in Israel. We are not seditious as to the interest of Cæsar, nor schismatics as to matters of religion. We distinguish between churches and their impurities; between a living man, though not without sickness and infirmity, and no man. Irregularities either in ourselves or others we desire may be amended. We could not live without the worship of God: we were not permitted the use of public worship without such a yoke of subscription and conformity as we could not consent unto without sin. That we might, therefore, enjoy divine worship without human mixtures, without offence either to God or man, or our consciences, we, with leave, but not without tears, departed from our country, kindred, and fathers' houses, into this Patmos." They assimilated their secession from England to that of "the good old nonconformist Jacob," from Syria; but declared that "the providential exception of us thereby from the late wars and temptation of either party, we account as a favor from God." They solicited the king to protect their ecclesiastical and civil institutions, declaring that they considered the chief value of the latter to consist in their subservience to the enjoyment of religious liberty. A similar address was made to parliament; and letters were written to Lord Manchester, Lord Say and Sele, and other persons of distinction, who were known to be friends of the colony, soliciting their interposition in its behalf. Leveret, the agent for the colony, was instructed, at the same time, to use every effort to procure a continuance of the exemption from customs which it had hitherto enjoyed. But before he had time to make any such vain attempt, the parliament had already established the duties of tonnage and poundage

* One of the most noted of these separatists was John Perrot, who, in order to convert the Pope, had made a journey to Italy, where he was confined for some time as a lunatic. This persecution greatly endeared him to the quakers, and exalted him so much in his own esteem that he began to consider himself more enlightened than George Fox. He prevailed with a considerable party in the sect to wear long beards, and to reject the practice of uncovering their heads in time of prayer as a vain formality. Fox having succeeded, by dint of great exertions, in stemming these innovations, Perrot betook himself to America, where he appears to have multiplied his absurdities, and yet propagated them among the quakers to an amazing extent. Various missions were undertaken by George Fox and other English quakers to reclaim their brethren in America from the errors of Perrot, who finally abandoned every pretence to quakerism, and became a strenuous assessor of the observances against which he had formerly borne testimony. Gough and Sewell's Hist. of the Quakers, (edit. 1799.) i. 169-165; ii. 121, 122, &c.

† The first quakers, instead of following the apostolic injunction to Christians, that when persecuted in one city they should flee to another, seem to have found strong attractions in the prospect of persecution. One of those who were put to death declared, that as he was hailing the plough in York shire, he was directed by a heavenly voice to leave his wife and children, and proceed to Barbadoes: but hearing of the banishment of the quakers from New England, and of the severe punishments inflicted on persons returning there after banishment, he began to ponder on the probability of his receiving a spiritual direction to proceed thither, and very soon after received it accordingly. — Tonkins' and Kendal's Lives, Services, and dying Sayings of the Quakers, vol. i. The woman who was executed was Mary Dyer, who twenty years before, had been a follower of Mrs. Hutchinson, and a disturber of New England.

over every dominion of the crown. To make amends for this disappointment, a gracious answer to the colonial address was returned by the king, [1661.] accompanied by an order for the apprehension of Whaley and Goffe. This prompt display of favor excited general satisfaction, and a day of thanksgiving was appointed, to acknowledge the favor of Heaven in moving the heart of the king to receive and incline to the desires of the people. With regard to Whaley and Goffe, the colonial authorities were greatly perplexed between the performance of a duty which it was impossible to decline, and reluctance to betray to a horrible fate two men who had lately been members of a government recognised in all the British dominions, who had fled to New England as an inviolable sanctuary from royal vengeance, and had been recommended to their kindness by letters from the most eminent of the English independent ministers. It is generally supposed, and is highly probable, that intimation was conveyed to these individuals of the orders that had been received; and, although warrants for their apprehension were issued, and by the industry of the royalists a diligent search for their persons was instituted, they were enabled, by the assistance of their friends, by dexterous evasion from state to state, and by strict seclusion, to end their days in New England.*

But the apprehensions which the colonists had originally entertained of danger to their institutions in church and state were speedily revived by intelligence that reached them from England of the representations that were daily made to their prejudice, of the countenance that these representations visibly received from the king, and of the formidable designs that were believed to be entertained against them. It was strongly rumored that their commercial intercourse with Virginia and the West India Islands was to be cut off; that three frigates were preparing to sail from England, in order to enforce arbitrary authority; and that the armament was to be accompanied by a governor-general, whose jurisdiction was to extend over all the North American plantations. Apprehensions of these and other changes at length prevailed so strongly in Massachusetts, as to produce a public measure of a very remarkable character. The general court, having declared the necessity of promoting unity among the inhabitants in the assertion of their just privileges, and the observance of due fidelity to the authority of England, appointed a committee of eight of the most eminent persons in the state to prepare a report, ascertaining the extent of their rights and the nature of their obedience; and, shortly after, the court, in conformity with the report of their committee, framed and published a series of resolutions expressive of their solemn and deliberate opinion on these important subjects. It was resolved that the patent (under God) is the first and main foundation of the civil policy of the colony; that the governor and company are, by the patent, a body politic invested with power to make freemen, and that these freemen have authority to elect annually their governor, assistants, representatives, and all other officers; that the government thus constituted hath full power, both legislative and executive, for the government of all the people, whether inhabitants or strangers, without appeal, save only in the case of laws repugnant to those of England; that the government is privileged by all means, even by force of arms, to defend itself both by land and sea against all who should attempt injury to the plantation or its inhabitants; and that any imposition, prejudicial to the country, and contrary to its just laws, would be an infringement of the fundamental rights of the people of New England. These strong and characteristic resolutions were accompanied with a recognition of the duties to which the people were engaged by their allegiance, and which were declared to consist in upholding the colony as belonging of right to his majesty, and preventing its subjection to any foreign prince; in preserving, to the utmost of

their power, the king's person and dominions; and in maintaining the peace and prosperity of the king and nation, by punishing crimes, and by propagating the gospel.

These proceedings indicate very plainly the alarming apprehensions that the colonists entertained of the designs of their new sovereign, and the resolution with which they clung to the dear-bought rights of which they suspected his intention to bereave them. How far they are to be considered as indicating a settled design to resist tyrannical oppression by force, is a matter of uncertain speculation. It is not improbable, that the framers of them hoped, by strongly expressing their rights, and indicating the extremities which an attempt to violate them would legally warrant, and might eventually provoke, to caution the king from awakening, in the commencement of his reign, the recollection of a contest which had proved fatal to his father; and which, if once rekindled, even to an extent so little formidable as a controversy with an infant colony must appear, might soon become less unequal, by presenting an occasion of revival and exercise to passions hardly yet extinguished in England. If such were the views of the colonial leaders, the soundness of them would seem to have been approved by the event. But, in the mean time, the colonial authorities, in order to manifest their willingness to render a just obedience, issued the strictest injunctions to cause search to be made for Goffe and Whaley, and intimated, by public resolutions, that no persons obnoxious to the laws of England, and flying from her tribunals, would receive shelter in a colony that recognised her sovereign authority. Having now declared the terms on which they recognised the dominion of the English crown, the general court caused the king to be solemnly proclaimed as their undoubted prince and sovereign lord. They issued, at the same time, an order of court, prohibiting all disorderly behavior on the occasion, and in particular commanding that none should presume to drink his majesty's health, "which," it was added, "he hath, in an especial manner, forbidden"—an injunction very remote from the thoughts and habits of the king, and imputed to him on no better grounds, than that drinking of healths was prohibited by the ordinances of Massachusetts. This meaningless practice, on account of its heathen original, had been offensive to the more scrupulous of the puritan settlers, who were desirous in all things to study conformity to the will of God, and accounting nothing unimportant that afforded occasion to exercise such conformity, had at length prevailed to have the practice of drinking healths interdicted by law; and all were now desirous that the revival of royal authority should not be signalled by a triumph over any, even what some might esteem the least important, of the colonial institutions. Intelligence having arrived soon after of the progress of the complaints that were continually exhibited to the privy council against the colony, and an order at the same time being received from the king, that deputies should be sent forthwith to England to make answer to these complaints, the court committed this important duty to Simon Bradstreet, one of the magistrates, and John Norton, one of the ministers, of Boston. These agents were instructed to maintain the loyalty and defend the conduct of the colony; to discover, if possible, what were the designs which the king meditated, or the apprehensions that he entertained; and neither to do nor agree to anything prejudicial to the charter. They undertook their thankless office with great reluctance, and obtained before their departure a public assurance, that whatever danger they might sustain by detention of their persons or otherwise, in England, should be made good by the general court.

Whether from the vigor and resolution that the recent proceedings of the colony had displayed, or from the moderation of the wise counsellors by whom the king was then surrounded, enforced by the influence which Lord Say and some other eminent persons employed in behalf of the colony, the agents were received with unexpected favor, and were soon enabled to return to Boston with a letter from the king, [1662] confirming the colonial charter, and promising to renew it under the great seal whenever this formality should be desired. The royal letter likewise announced an amnesty for whatever treasons might have been committed during the late troubles, to all persons but those who were attainted by act of parliament, and might have fled to New England. But it contained other matters by no means acceptable to the colony; it required that the general court should hold all the ordinances it had enacted during the abeyance of royalty as invalid, and forthwith proceed to renew them, and

to repeal every one that might seem repugnant to the royal authority that the oath of allegiance should be duly administered to every person; that justice should be distributed in the king's name; that all who desired it should be permitted to use the book of common prayer, and to perform their devotions according to the ceremonial of the church of England; that, in the choice of the governor and assistants of the colony, the only qualifications to be regarded should be wisdom, virtue and integrity, without any reference to the peculiarities of religious faith and profession; and that all freeholders of competent estates, and not vicious in their lives, should be admitted to vote in the election of officers, civil and military, whatever might be their opinion with respect to church-government. "We cannot be understood," it was added, "hereby to direct or wish that any indulgence should be granted to quakers, whose principles, being inconsistent with any kind of government, we have found it necessary with the advice of our parliament here, to make a sharp law against them, and are well content you do the like there." However reasonable some of these requisitions may now appear, the greater number of them were highly disagreeable to the colonists. They considered themselves entitled to maintain the form of policy in church and state, which they had fled to a desert in order to cultivate, without the intrusion and mixture of different principles; and they regarded with the utmost jealousy the precedent of an interference with their fundamental constitutions by a prince who, they were firmly persuaded, desired nothing so much as to enfeeble the system which he only waited a more convenient season to destroy. To comply with the royal injunctions would be to introduce among their children the spectacles and corruptions which they had incurred such sacrifices in order to withdraw from their eyes, and to throw open every office in the state to papists, Socinians, and every unbeliever who might think power worth the purchase of a general declaration, that he was (according to his own unexamined interpretation of the term) a believer in Christianity. The king, never observing, was never able to obtain credit with his subjects for good faith or moderation; he was from the beginning suspected of a predilection for popery; and the various efforts which he made to procure a relaxation of the penal laws against the dissenters in England, were viewed with jealousy and disapprobation by all these dissenters themselves, except the quakers, who regarded the other protestants and the papists as very much on a level with each other, and were made completely the dupes of the artifices by which Charles and his successor endeavored to introduce all the intolerance of popery under the specious disguise of universal toleration.

Of all the requisitions in the royal message, the only one that was complied with was that which directed the judicial proceedings to be carried on in the king's name. The letter had commanded that its contents should be published in the colony, which was accordingly done, with an intimation, however, that the requisitions relative to church and state were reserved for the deliberation which would be necessary to adjust them to the existing constitutions. The treatment which the colonial agents experienced from their countrymen, it is painful but necessary to relate. The ill humor which some of the requisitions engendered was unjustly extended to these men; and their merits, though at first eagerly acknowledged, were quickly forgotten. Strongly impressed with the danger from which the colony had obtained a present deliverance, but which still impended over it from the designs of a prince who visibly abetted every complaint of its enemies, the agents increased their unpopularity by strongly urging, that all the requisitions should be instantly complied with. Mr. Norton, who, on the first unofficial intelligence that had been received of the king's restoration, had ineffectually urged his fellow-citizens to proclaim the royal authority, in now again pressing upon them a proceeding to which they were still more averse, went the length of declaring to the general court, that if they complied not with the king's letter, they must blame themselves for the bloodshed that would ensue. Such declarations were ill calculated to soothe the popular disquiet, or recommend an ungracious cause; and the deputies, who had been actuated by the most disinterested zeal to serve rather than flatter their fellow-citizens, now found themselves opprobriously identified with the grievances of the colony, and the evils, which it was not in their power to prevent, ascribed to their neglect or unnecessary concessions. Bradstreet, who was endowed with a disposition somewhat stoical, was the less sensibly touched with this ingratitude: but

* Mather, B. iii. Cap. ii. § 20. Neal, ii. 332. Hutchinsen, i. 211, 212. Chalmers, 251, 264, &c. Small as was the number of royalists in Massachusetts, it was too great to enable the people to shelter Goffe and Whaley, as they could have wished to do. But in Newhaven there were no royalists at all; and even those who disapproved of the great action of the ragicides regarded it (with more of admiration than hatred) as the error of noble and generous minds. Lett, the governor of Newhaven, and his council, when summoned by the pursuers of Goffe and Whaley to assist in the apprehension of them, first consumed abundance of time in deliberating on the extent of their powers, and then answered, that, in a matter of such importance, they could not act without the orders of an assembly. The royalist pursuers, incensed at this answer, desired the governor to say at once whether he owned and honored the king; to which he replied, "We do honor his majesty; but we have tender consciences, and wish first to know whether he will own us." Trumbull, i. 242—245.

Norton, who to great meekness and piety united keen sensibility, could not behold the eyes of his countrymen turned upon him with disapprobation, without the most painful emotion. When he heard many say of him, that "he had laid the foundation for the ruin of our liberties," he expressed no resentment, but sunk into a profound melancholy; and while struggling with his grief, and endeavoring to do his duty to the last, he died soon after of a broken heart. Deep and vehement were then the regrets of the people; and the universal mourning that overspread the province expressed a late but lasting remembrance of his virtue, and bewailed an ungrateful error which only repentance was now permitted to repair.

The colony of Rhode Island had received the tidings of the restoration with much real or apparent satisfaction. It was hoped that the suspension of its charter by the Long Parliament would more than compensate the demerit of having accepted a charter from such authority; and that its exclusion from the confederacy, of which Massachusetts was the head, would operate as a recommendation to royal favor. The king was early proclaimed; and one Clarke was soon after sent as deputy from the colony to England, in order to carry the dutiful respects of the inhabitants to the foot of the throne, and to solicit a new charter in their favor. Clarke conducted his negotiation with a baseness that rendered the success of it dearly bought. He not only vaunted the loyalty of the inhabitants of Rhode Island, while the only proof he could give of it was, that they had bestowed the name of *King's Province* on a territory which they had acquired from the Indians; but meeting this year the deputies of Massachusetts at the court, he publicly challenged them to mention any one act of duty or loyalty shown by their constituents to the present king or his father, from their first establishment in New England. Yet the inhabitants of Rhode Island had taken a patent from the Long Parliament in the commencement of its struggle with Charles the First; while Massachusetts had declined to do so when the parliament was at the height of its power and success.* Clarke succeeded in obtaining this year a charter which assured the inhabitants of Rhode Island and Providence of the amplest enjoyment of religious liberty, and most extensive privileges with regard to jurisdiction. The patentees and such as should be admitted free of the society were incorporated by the title of the Governor and Company of the English Colony of Rhode Island and Providence. The supreme or legislative power was invested in an assembly consisting of the governor, assistants, and representatives, elected from among the freemen. This assembly was empowered to make ordinances and forms of government and magistracy, with as much conformity to the laws of England as the nature of the place and condition of the people would allow: to erect courts of justice; to regulate the manner of election to all places of trust; to inflict all lawful punishments; and to exercise the prerogative of pardon. A governor, deputy governor, and ten assistants were appointed to be annually chosen by the assembly; and the first board of these officers, nominated by the charter, on the suggestion of their agent, were authorised to carry its provisions into execution. The governor and company were empowered to transport such merchandise and persons as were not prohibited by any statute of the kingdom, paying such customs as are, or ought to be, paid for the same; to exercise martial law when necessary; and upon just causes to invade and destroy the native Indians or other enemies. The territory granted to the governor and company, and their successors, was described as that part of the dominions of the crown in New England, containing the islands in Narraganset Bay, and the countries and parts adjacent, which were declared to be holden of the manor of East Greenwich in common socage. The inhabitants and their children were declared to be entitled to the same immunities as if they had resided or been born within the realm. This, I believe, is the first instance of the creation, by a British patent, of an authority of that peculiar description which was then established in Rhode Island. Corporations had been formerly created within the realm, for the government of colonial plantations. But now a body politic was created with specific powers for administering all the affairs of the colony

within the colonial territory. The charter was received with great satisfaction by the colonists, who entered immediately into possession of the democratical constitution which it appointed for them, and continued to pursue the same system of civil and ecclesiastical policy that they had heretofore observed.

Though the inhabitants of Connecticut neither felt nor affected the same rejoicing that Rhode Island had expressed at the restoration of the king, they did not fail to send a deputy to England to express their recognition of the royal authority, and to solicit a new charter.* They were happy in the choice of the man to whom they committed this important duty, John Winthrop, the son of the eminent person of the same name who had presided with so much honor and virtue over the province of Massachusetts. This gentleman deriving a hereditary claim on the kindness of the king, from a friendship that had subsisted between his grandfather and Charles the First, employed it so successfully as to obtain for his constituents a charter in almost every respect the same with that which had been granted to Rhode Island. The most considerable differences were, that by the Connecticut charter the governor was required to administer the oaths of allegiance and supremacy to the inhabitants; a formality which was not required by the charter of Rhode Island, where many of the people scrupled to take an oath; and that, by the last-mentioned charter, liberty of conscience was expressly conceded in its fullest extent, while the other made no express mention of the concerns of religion, and no other allusion to them, than what might seem to be implied in the requisition of the oath of supremacy. By this charter, Newhaven was united with Connecticut; an arrangement which for some time did not obtain the unanimous approbation of the people of Newhaven, although they afterwards heartily concurred in it; and the description of the provincial territory was indefinite and incorrect. But on the whole it gave so much satisfaction, that Winthrop, on his return, was received with the grateful approbation of his fellow citizens, and annually chosen governor of the united colony as long as he lived.

There was thus established by royal charters, both in Connecticut and Rhode Island, a perfect model of democratic government; and the singular spectacle of subordinate political corporations almost wholly disconnected by any efficient tie with the organ of sovereign authority. Every power, as well deliberative as active, was invested in the freemen of the corporation or their delegates; and the supreme executive magistrate of the empire was excluded from every constitutional means of interposition or control. A conformity to the laws of England, no doubt, was enjoined on the colonial legislatures; and this conformity was conditioned as the tenure by which their privileges were enjoyed; but no method of ascertaining or enforcing its observance was established. At a later period, the crown lawyers of England were sensible of the oversight which their predecessors had committed, and proposed that an act of parliament should be obtained for obliging these colonies to transmit their laws for the inspection and approbation of the king. But this suggestion was never carried into effect.

CHAPTER IV.

Emigration of ejected Ministers to New England—Royal Commissioners sent to the Province—Address of the Assembly of Massachusetts to the King—rejected—Policy pursued by the Commissioners—Their Disputes with the Government of Massachusetts—and Return to England—Policy of the Colonists to conciliate the King—Effects of it—Cession of Acadia to the French—Prosperous State of New England—Conspiracy of the Indians—Philip's War—The King resumes his designs against Massachusetts—Controversy respecting the Right to Maine and New Hampshire—Progress of the Dispute between the King and the Colony—State of Parties in Massachusetts—State of Religion and Morals—Surrender of the Charter of Massachusetts demanded by the King—refused by the Colonists—Writ of Quo Warranto issued against the Colony—Firmness of the People—Their Charter adjudged to be forfeited.

SETTLED originally by people of the same nation and whom the same motives had conducted to Ame-

* The Rhode Islanders had also presented an address to the Rulers of England in 1659, beseeching favor to themselves, as "a poor colony, an outcast people, formerly from our mother nation in the bishops' days, and since from the New English over-zealous colonies." Douglas' Seminary, ii. 110.

† Although the charter was framed in 1662, yet, in consequence of a dispute between Connecticut and Rhode Island, it was not finally passed till July, 1663.

rica, [1663,] and assimilated by their religious tenets, their government, laws, and manners, a similar policy naturally pervaded all the colonies of New England. The commercial system which the English parliament thought fit to pursue tended still further to confirm this identity of interest and purpose in the colonies. The navigation acts which it framed, and which we have considered at much length in the history of Virginia, created for a time more discontent than inconvenience, and served rather to announce than to enforce the restrictions with which it was intended to fetter the colonial trade. These restrictions were a copious source of displeasure and controversy between the two countries. The colonies had been accustomed in their infancy to a free trade, and its surrender was exacted with the more injustice and yielded with the greater reluctance, because England was not then a mart in which all the produce of the colonies could be vended, or from which all the wants of their inhabitants could be supplied. Even in the southern colonies, where similar restraints had been enforced by Cromwell, the act of navigation was executed very imperfectly; and in New England, where the governors were elected by the people, it appears, for a considerable time, to have been entirely disregarded.

If the commercial policy of the English parliament thus strongly tended to unite the colonies by community of interest and opposition to the parent state, the ecclesiastical policy which now prevailed in England was calculated in no slight degree to promote the remembrance of the original causes of secession from her territory, and at once to revive their influence, and enforce the virtue of toleration by sympathy with the victims of an opposite policy. In consequence of the rigid enforcement of the act of uniformity in the close of the preceding year, about two thousand of the English clergy, the most eminent of the order for piety, virtue, and knowledge, were ejected from the church; and, to the astonishment of the prevailing party, sacrificed their interests to their conscience. They were afterwards banished to the distance of five miles from every corporation in England, and many of them died in prison for privately exercising their ministry contrary to law. While the majority of them remained in England to preserve by their teaching and their sufferings the decaying piety of their native land, a considerable number were conducted to New England, there to invigorate the national virtue by a fresh example of conscientious sacrifice, and to form a living and touching memorial of the cruelty and injustice of intolerance.* The merits and the sufferings of these men made a strong impression on the people of New England; and this year an invitation was despatched to the celebrated Dr. John Owen, one of the greatest scholars and divines that the world has ever produced, to accept an ecclesiastical appointment in Massachusetts, and the designs which he had reason to believe would be soon undertaken for the subjugation of its civil and religious liberties. Other countries beside America contended for the honor of sheltering this illustrious man from the persecutions of the church of England, and the happiness and advantage that might be expected from his sojourn. But he preferred suffering in a country where his language was understood, to enjoyment and honor among a people with whom his communication must necessarily have been more restricted. At a later period, when the presidency of Harvard college was offered to him, he consented to embrace this sphere of useful and important duty; and having shipped his effects for New England, was preparing to accompany them, when his steps were arrested by an order from Charles, expressly commanding him not to depart from the kingdom.

The apprehension which the inhabitants of Massachusetts had entertained all along of the hostile designs of the English government, and which had been confirmed by the reasons assigned by Dr. Owen for refusing the first invitation which they had tendered to him, were strengthened by all the intelligence they received from England. A great number of the ejected non-conformist ministers who had taken measures for proceeding to Massachusetts, now declined to embark for a country on which the extremity of royal vengeance was daily expected to descend: and at length the most

declared that he accounted it one of his richest jewels, which indeed was the opinion that New England had of the band that carried it." B. ii. Cap. xi. § 5. See Note XI.

* When the proceedings against the congregationalists in England were complained of, these dissenters were told by an eminent English prelate (Stillingfleet) that the severities which they so much resented were justified by the proceedings of their own brethren in New England against dissenters from the established worship there. Stillingfleet's *Mischief of Separation*.

positive information was received that the king had declared that, although he was willing to preserve the colonial charter, he was determined to send out commissioners to inquire and report how far the provisions of the charter were legally complied with. Tidings no less indubitable arrived soon after of the rupture between Great Britain and Holland, of the determination of the king to despatch an expedition for the reduction of the Dutch settlement of New York, and to send along with it a body of commissioners who were empowered to hear and determine (according to their own discretion) all complaints in causes civil or military that might exist within New England, and to take every step that they might judge necessary for settling the peace and security of the country on a solid foundation. This information was correct; and a commission for these purposes, as well as for the reduction of New York, had been issued by the king to Sir Robert Carr, Colonel Nichols, George Cartwright, and Samuel Maverick. These tidings, in concurrence with the reports that had long prevailed of the designs entertained by the court of England against the liberties of the colonists, were calculated to strike them, with dismay. They knew that plausible pretenses were not wanting to justify an inquiry into their proceedings; but they were also aware that the dislike and suspicion with which they were regarded by the king could never be satisfied by any measure short of the utter subversion of their institutions. Various controversies had arisen between the different settlements concerning the boundaries of their respective territories; and loud complaints were preferred by the representatives of Mason, and by Gorges, and other members of the old council of Plymouth, of the occupations of districts and sovereignties to which they claimed a preferable right. The claim of Mason to New Hampshire, derived from the assignment of the Plymouth council, had never been expressly surrendered; and Gorges' title to Maine had been confirmed and enlarged by a grant from the late king in the year 1639. As Gorges had adhered to the royal cause in the civil wars, the death of the king proved the temporary death of his patent; and he as well as Mason's heirs had long abandoned their projects in despair of ever prosecuting them to a successful issue. But now the revival of royalty in England presented them with an opportunity of vindicating their claims; and the establishment of inhabitants in the territories promised advantage from such vindication. They had as yet got no return for the money they had expended on their acquisitions; but they now embraced the prospect and claimed the right of entering upon the labors of others, who in ignorance of their pretensions had occupied and colonized a vacant soil, and held it by the title of fair purchase from its native proprietors. In addition to this formidable controversy, many complaints had been preferred by the royalists, quakers, and episcopallians, of abuses in the civil and ecclesiastical administration of Massachusetts. The adjustment of these controversies and investigation of these complaints were the principal reasons assigned for the commission.* But, doubtless, the main object of concern to the English court was the suppression or essential modification of institutions founded and administered on principles that had so long waged war with monarchy, and so lately prevailed over it. The colonists very readily believed the accounts they received from their friends in England of this hostile disposition of their sovereign; and the public orders by which they had cautioned the enemies of his government not to expect shelter in Massachusetts, had been intended to remove or appease it. When intelligence was received of the visitation that must soon be expected from England, the general court of Massachusetts appointed a day of fasting and prayer to be observed throughout its jurisdiction, in order to implore the mercy of God under their many distractions and troubles; and apprehending it to be of the greatest concernment that the patent or charter should be kept "safe and secret," they ordered their secretary to bring it into court, and to deliver it to four of the members of court, who were directed to dispose of it in such manner as they should judge most consistent with the safety of the country. Aware of the usual licentiousness of sailors and sol-

diers, and recollecting the peculiar strictness of the colonial laws, the court adopted at the same time the most prudent precautions for preventing the necessity of either a hazardous enforcement, or a dishonest and pusillanimous relaxation of its municipal ordinances.

The royal expedition having arrived at Boston in the following year, the commissioners presented their credentials to the governor and council, and demanded in the first instance, that a body of troops should be raised to accompany the English forces in the invasion of New York. [1664] The governor not being empowered by the forms of the constitution to raise forces without the consent of the general court, proceeded to convoke that body; but the commissioners not having leisure to wait its deliberations, proceeded with the fleet against New York, desiring the colonial auxiliaries to follow as quickly as possible, and signifying to the governor and council that they had many important communications to make to them on their return from New York, and that in the mean time the general court would do well to give a fuller consideration than they seemed yet to have done to the letter which the king had addressed to them two years before. The vague mysterious terms of this communication were powerfully calculated, and would seem to have been deliberately intended, to increase the disquiet and apprehensions of the colonists. That they produced this impression in a very strong degree is manifest from the proceedings that were adopted by the general court. On the assembling of that body it was declared by an immediate and unanimous vote that they were "resolved to hear true allegiance to his majesty, and to adhere to a patent so dearly obtained and so long enjoyed by undoubted right." They proceeded to render a prompt obedience to the requisition of the commissioners, and had raised a regiment of two hundred men, who were preparing to proceed for New York, when intelligence was received from the commissioners that the place had already surrendered, and that the junction of the English and colonial forces was no longer necessary. The assembly next resumed the consideration of the king's letter, which had been so emphatically commended to their deliberation, and passed a law extending the elective franchise to all the inhabitants of English or colonial birth, paying public rates to a certain amount, and certified by a minister as orthodox in their principles and not immoral in their lives, whether within or without the pale of the established church. They next proceeded to frame and transmit to the king an address strongly expressive of their present apprehensions and their habitual sentiments. They set forth at considerable length the dangers and difficulties they had encountered in founding and rearing their settlement; the explicit confirmation which their privileges had received both from the present king and his predecessor; and their own subjection to the royal authority, and willingness to testify their duty in any righteous way. They expressed their concern at the appointment of four commissioners, one of whom, Maverick, was their known and professed enemy, who were invested with an indefinite authority, in the exercise of which they were to proceed, not in conformity with any established law, but according to their own discretion; and they declared, that although as yet they had but tasted the words and actions of these persons, they had enough to satisfy them that the powers derived from the commission would be improved to the complete subversion of the provincial government. If any profit was expected to be gained by the imposition of new rules and the bereavement of their liberties, the design, they protested, would produce only disappointment; for the country was so poor that it produced little more than a bare subsistence to its inhabitants, and the people were so much attached to their institutions that, if deprived of them in America, they would seek them in new and more distant habitations; and, if they were driven out of the country, it would not be easy to find another race of inhabitants who would be willing to sojourn in it.* They appealed to God, that they came not into this wilderness to seek great things for themselves, but for the sake of a quiet life, and concluded in the following strains of earnest anxiety: "Let our government live, our patent live, our magistrates live, our laws and liberties live, our re-

ligious enjoyments live: so shall we all yet have farther cause to say from our hearts, Let the king live for ever." Letters going for favor and friendly mediation were transmitted at the same time to several of the English nobility, and particularly to the chancellor, Lord Clarendon. But these applications were no longer attended with success. Lord Clarendon was no friend to puritan establishments; he had instigated the persecution that was then carrying on against the sectaries of every denomination in England; and he was at present too painfully sensible of his declining credit with the king, to risk the farther provocation of his displeasure by opposing a favorite scheme of royal policy. In a letter to the governor, he defended the commission as a constitutional* exercise of royal power and wisdom, and strongly indicative of his majesty's grace and goodness; and recommended to the colonists, by a prompt submission, to deprecate the indignation which their ungrateful clamor must already have excited in the breast of the king. The answer of Charles, which was transmitted by Secretary Morrice, to the address of the general court, excited less surprise. It reproached that assembly with making unreasonable and groundless complaints; justified the commission as the only proper method of rectifying the colonial disorders; and affected to consider the address as "the contrivance of a few persons who infuse jealousies into their fellow subjects as if their charter were in danger."

Having effected the conquest of New York, the commissioners proceeded to the exercise of their civil functions in New England. [1665] One of the first official acts that they were called on to perform, was the adjustment of a dispute respecting boundaries, that arose out of the occupation of the New York territory. A patent had been granted to the Duke of York of all the territory occupied by the Dutch, including large districts that had been already comprehended in the charter of Connecticut. A controversy concerning limits had thus been created by the deliberate act of the crown, between the state of Connecticut and the new province erected by the patent to the Duke of York. Their boundaries were now adjusted by the commissioners in a manner which appears to have been highly satisfactory to the people of Connecticut, but which entailed a great deal of subsequent dispute. Another controversy, in which Connecticut was involved, arose out of a claim to part of its territory preferred by the Duke of Hamilton and others, in virtue of the rights that had accrued to themselves or their ancestors as members of the grand council of Plymouth. The commissioners desirous of giving satisfaction to both parties, adjudged the property of the disputed soil to these individual claimants, but declared the right of government to pertain to Connecticut. It appears manifestly to have been their policy to detach the other New England states from the obnoxious province of Massachusetts, and to procure their co-operation by the example of implicit submission on their own part, and the accumulation of complaints against that province, in the design of abridging her liberties and altering her institutions. In the prosecution of this policy they were but partially successful. The people of Connecticut received the commissioners with the utmost coldness, and plainly showed that they regarded their proceedings with aversion, and considered the cause of Massachusetts as their own. So strongly impressed were the inhabitants of this state with the danger to their liberties from the interposition of such arbitrary authority, that some disagreements, which had subsisted between Connecticut and Newhaven, and which had hitherto prevented their union under the late charter by which they had been associated, were entirely composed by the very tidings of the visitation of the commissioners. At Plymouth the commissioners met with little opposition, the inhabitants being deterred from the expression of their sentiments by a consciousness of their weakness, and being exempted from the apprehensions that prevailed in the more powerful states by a sense of their insignificance. In Rhode Island alone was their insidious policy attended with success. There, the people received them with every mark of deference and attention; their inquiries were answered, and their mandates

* In addition to these reasons, the commission sets forth that complaints have been made to his majesty of acts of violence and injustice by the colonial authorities against the natives of America, "whereby not only our government is traduced, but the reputation and credit of christian religion is brought into reproach and prejudice with the gentiles and inhabitants of those countries who know not God; the reduction of whom to the true knowledge of God is the end of these plantations," &c.—a statement of matchless falsehood and effrontery.

* It is curious to observe the expression of a similar sentiment by the inhabitants of the province of Arragon in the days of their freedom. It is declared in the preamble to one of the laws of Arragon, that such was the barrenness of the country and the poverty of the inhabitants, that if it were not for the sake of the liberties by which they were distinguished from other nations, the people would abandon it and go in quest of a settlement to some more fruitful region. Robertson's View of the State of Europe, sect. 3. History of Charles the Fifth.

* Even Chalmers, though the panegyrist of Charles and his policy, and animated with the strongest dislike and contempt of the colonists, expresses his surprise that Clarendon should defend the commission as a constitutional act; observing, that "an act of parliament was assuredly necessary in order to cut up effectually those principles of independence that had rooted with the settlement of New England," p. 288. One of the articles of impeachment against Lord Clarendon was, "That he introduced an arbitrary government in his majesty's plantations." But this charge seems to have related to some proceedings in Barbadoes. Howell's State Trials, vol. vi. p. 331, &c.

obeyed or assented to without any demur to the authority from which they proceeded; and during their stay in this settlement they were enabled to amplify their reports with numberless complaints against the injustice and misgovernment alleged to have been committed in Massachusetts. This people, as we have seen, had gained their late charter by a display of subservience and devotion to the crown; and the liberal institutions which it introduced had not yet had time to form a spirit that disdained to hold the enjoyment of liberty by so ignoble a tenure. The freedom thus spuriouly begotten was tainted in its birth by principles that long rendered its existence precarious; and we shall find the inhabitants of Rhode Island, a few years after, abjectly offering to strip themselves of the privileges which they had gained so ill, and of which they now showed themselves unworthy by their willingness to strengthen the hands that were preparing to oppress the liberties of Massachusetts. We must not, however discard from our recollection that Rhode Island was yet but a feeble community, and that the unfavorable sentiments with which many of its inhabitants regarded Massachusetts, arose from the persecution which their religious tenets had experienced in that province. Their conduct to the commissioners received the warmest approbation from Charles, who assured them that he would never be unmindful of the claims they had acquired on his goodness by a demeanor so replete with duty and humility. In justice to the king, whose word was proverbially the object of very little reliance, we may observe that he does not appear ever after to have withdrawn his favor from Rhode Island; and in justice to a moral lesson that would be otherwise incomplete, we may here so far anticipate the order of time as to remark, that when Charles's successor proceeded to extend to Rhode Island the destruction in which the liberties of the other New England provinces had been involved, and when the people endeavored to avert the blow by a repetition of the abjectness that had formerly availed them, their prostration was disregarded, and their complete subjection pursued and effected with an insolence that feelingly taught them to detest oppression and despise servility.

It was in Massachusetts that the main object of the commission was to be pursued; and from the difference between the purposes as well as the opinions entertained by the English government and the colonial authorities, it was undoubtedly foreseen that the proceedings of the commissioners would beget the most resolute opposition. Among other communications which the commissioners were charged by the king to impress on the colonists, was, that he considered them to stand in precisely the same relation to him as the inhabitants of Kent or Yorkshire in England. Very different was the opinion that prevailed among the colonists. They considered that, having been forced by persecution to depart from the realm of England, and having established themselves by their own unassisted efforts in territories which they had purchased from the original proprietors, they retained no other political connexion with their sovereign than what was created by their charter, which they regarded as the sole existing compact between the parent state and themselves, and as specifying all the particulars and limits of their obedience. They acknowledged difference of sentiment in religion and politics between themselves and their ancient rulers in which their settlement had originated, and the habits of self-government that they had long been enabled to indulge, confirmed their prepossessions, and had tended generally and deeply to impress the conviction that their original allegiance as natives of England and subjects of the crown was entirely dissolved, and superseded by the stipulations which they had voluntarily contracted by accepting their charter. These opinions, however strongly cherished, it was not prudent distinctly to profess; but their prevalence is alleged by a respectable colonial historian, on the authority of certain manuscript compositions of the leading persons in Massachusetts at this period, which he had an opportunity of examining. The colonists were not the less attached to these opinions, from the apprehension that they would find as little favor in the eyes of the English government as those which had led to the persecution and emigration of their ancestors; they were indeed totally repugnant to the principles of the English law, which holds the allegiance of subjects to their sovereign, not as a local or provisional, but as a perpetual and indissoluble tie, which distance of place does not sunder, nor lapse of time relax. Forcibly aware of these differences of opinion, of the dangerous collisions which they might beget, and of the disadvantages with which they must conduct a discussion with

persons who sought nothing so much as to find or make them offenders, the colonists waited, with much anxiety, the proceedings of the commissioners.

The temper and disposition of these commissioners increased the probability of an unfriendly issue to their discussions with the colonial authorities. If conciliation was, as the king professed, the object which he had in view in issuing the commission, he was singularly unfortunate in the selection of the instruments to whom the discharge of its important duties was confided. Nicholas was a man of sense and moderation; but it was for the reduction and subsequent settlement of the affairs of New York, that he had been mainly appointed; he remained at that place after its capitulation; and when he afterwards rejoined his colleagues, he found himself unable to control their proceedings, or repair the breach they had already created. The other commissioners appear to have been remarkable for no other qualities than insolence, presumption, and incapacity,* to which Maverick farther added an inveterate hostility to the colony which had induced him for years to solicit the commission which he now eagerly hastened to execute. On their return to Boston, the very first requisition which they made to the governor demonstrated how little they were disposed to recognise the colonial authorities; for they required that all the inhabitants of the province should be assembled to receive and reply to their communication; and when the governor desired to know the reason for such a proceeding, they answered, "that the motion was so reasonable, that he who would not attend to it was a traitor." They afterwards thought proper to make trial of a more conciliating tone, and informed the general court that they had properly represented to the king the promptness with which his commands had been obeyed in the raising of a colonial regiment; but it afterwards appeared that they had actually made a representation of a perfectly opposite import to the secretary of state. The suspicions which the commissioners and the general court reciprocally entertained of each other, effectually prevented any cordial co-operation between them. The communications of the commissioners display the most lofty ideas of their own authority as representatives of the crown, with a preconceived opinion that there was an indisposition on the part of the general court to pay due respect to that authority, as well as to the source from which it was derived. The answers of the general court manifest an anxious desire to avoid a contest with the crown, and to gratify his Majesty by professions of loyalty and submission, and by every change that seemed likely to meet his wishes, without compromising the fundamental principles of their institutions. They expressed, at the same time, a deliberate conviction of having done nothing that merited displeasure or required apology, and a steady determination to abide by the charter. Under such circumstances, the correspondence soon degenerated into an altercation. The commissioners at length demanded from the court an explicit answer to the question, if they acknowledged the authority of his Majesty's commission? but the court desired to be excused from giving any other answer, than that they acknowledged the authority of his Majesty's charter, with which they were a great deal better acquainted. Finding that their object was not to be attained by threats or expostulations, the commissioners attempted a practical assertion of their powers: they granted letters of protection to parties under prosecution before the colonial court; and in a civil suit, which had been already determined by the colonial judges, they promoted an appeal to themselves from the unsuccessful party, and summoned him and his adversary to plead their cause before them. The general court perceived that they must now or never make a stand in defence of their authority; and, with a decision which showed the high value they entertained for their privileges, and the vigor with which they were prepared to protect them, they proclaimed, by sound of trumpet, their disapprobation of this measure, and declared that, in discharge of their

* The senselessness of their proceedings appears very manifestly from a case related at considerable length by the colonial historians. They had been drinking one Saturday night in a tavern after the hours when, by the colonial laws, all taverns were ordered to be shut. A constable, who warned them not to infringe the law, was beaten by them. Hearing that Mason, another constable, had declared that he would not have been deterred by their violence from doing his duty, they sent for him, and extorted from him an admission that he would have arrested the king himself if he had found him drinking in a public-house after lawful hours. They insisted that he should be tried for high treason, and actually prevailed to have this injustice committed. The jury returned a special verdict; and the court, considering the words offensive and insolent, but not treasonable, inflicted only a slight punishment. Hutchinson, i. 254, 255.

duty to God and the king, and of the trust reposed in them by the king's good subjects in the colony, they could not consent to such proceedings, nor countenance those who would conduct or abet them. They accompanied this vigorous step with an offer to compromise the matter by hearing the cause themselves in presence of the commissioners; but this proposition was scornfully rejected, and every effort to reunite these conflicting authorities proved utterly unavailing.

Suspending for a time their proceedings at Boston, the commissioners proceeded to New Hampshire and Maine, and instantly giving judgment in favor of the claims of Mason and Gorges against the government of Massachusetts, they suppressed the existing authorities, and erected a royal government in each of these provinces. On their return to Boston, the general court declared that these proceedings tended to the disturbance of the public peace, and demanded a conference with the commissioners, which was refused with a bitterness of expression that put an end to all further communication. Sir Robert Carr even went the length of assuring the general court that the king's pardon for their manifold treasons during the late rebellion had been entirely conditional, and was forfeited by their evil behavior; and that the contrivers of their late measures would speedily experience the punishment which their associates in rebellion had lately met with in England.

The king having been apprised of these proceedings, and assured by the commissioners that it was fruitless for them to continue a treaty with persons who were determined to misconstrue all their words and actions, issued letters, recalling the commissioners to England, [1666.] expressing his satisfaction with all the colonies except Massachusetts, and commanding the general court of this province to send deputies to plead their cause before himself. But the inhabitants of Massachusetts were well aware that in such a controversy they could not have the most remote chance of success, and that it was not by the cogeny of argument they could hope to pacify the displeasure of their sovereign. Instead of complying with this injunction, the general court addressed a letter to the secretary of state, in which they hinted real or pretended doubts of the authority of the royal letter, and declared that the case had already been so fully pleaded that the ablest among them would be utterly unable to render it any clearer. At the same time they endeavored to appease his majesty by humble addresses expressive of their loyalty; and in order to demonstrate the sense they attached to their professions, they purchased a ship-load of masts, which they presented to the king; and hearing that his fleet in the West Indies was in want of provisions, they promoted a contribution among themselves, and victualled it at their own expense. The king accepted their presents very graciously; and a letter under the sign manual having been transmitted to the general court, declaring that their zeal for the royal service was "taken well by his majesty," the cloud that had gathered over the colony in this quarter seemed for the present to be dispersed. Nevertheless, the design that had been prosecuted to such a length, of remodelling the institutions of New England, was by no means abandoned. The report of the commissioners had furnished Charles with the very pretexts that were wanting to the accomplishment of his plans: and the proceedings which at a later period he adopted, evinced that it was not the dutiful professions or liberalities of the colonists that would deter him from availing himself of pretexts which he had made such efforts to obtain. But the great plague which broke out with such violence as in one year to destroy ninety thousand of the inhabitants of London, and to banish for a time the seat of government to Oxford—the great fire of London,* the wars and intrigues on the continent, and the rising discontents of the people of England, occupied so entirely the attention of the king, as to suspend the execution of his designs against the government of Massachusetts.

After the departure of the royal commissioners, the provinces of New England enjoyed for some years a quiet and prosperous condition. The only disturbance which their internal tranquillity sustained, arose from the persecutions which in all the states, except Rhode Island, continued to be waged against the anabaptists, as these sectaries from time to time attempted to propagate their tenets and establish their ordinances. Let-

* A liberal contribution was made by the people of Massachusetts, and transmitted to London for relief of the sufferers by the fire. Hutchinson, i. 257. The people of New England have always been honorably distinguished by their charitable participation of the misfortunes of other communities. In the year 1703, they contributed 2000*l*. for the relief of the inhabitants of Nevise and St. Christophers, which had been ravaged by the French. Holmes, ii. 69.

ters were written in their behalf to the colonial magistrates by the most eminent dissenting ministers in England: but though it was strongly urged by the writers of these letters, that the severe persecution which the anabaptists were then enduring in England should recommend them to the sympathy of the colonists,* and that their conversion was more likely to be effected by holding forth to them the peaceable fruits of righteousness than by pursuing their errors and infirmities with penal inflictions, which could have no other effect than to ensnare or oppress their consciences, the interposition of these persons, though respectfully received, was utterly disregarded. The colonial authorities persisted in believing that they were doing God service by employing the civil power with which they were invested, to guard their territories from the intrusion of heresy, and to maintain the purity of those religious principles for the preservation of which their settlements had been originally formed. A considerable number of anabaptists were fined, imprisoned, and banished: and persecution produced its usual effect of confirming and propagating the tenets which it attempted to extirpate, by causing the professors of them to connect them in their own minds, and to exhibit them to others in connexion with suffering for conscience sake. These proceedings, however, contributed more to attain the character of the colonies than to disturb their tranquillity. Much greater disquiet was created by the intelligence of the cession of Acadia, or as it had come to be termed *Nova Scotia*, to the French at the treaty of Bréda. [1667.] Nothing had contributed more to promote the commerce and security of New England than the conquest of that province by Cromwell; and the inhabitants of Massachusetts, apprised of the extreme solicitude of the French to regain it, and justly regarding such an issue as pregnant with danger to themselves, sent agents to England to remonstrate against it. But the influence of the French proved too powerful for the interest of the people; and the conduct of Charles on this occasion evinced as little concern for the external security of the colonies, as his previous proceedings had shown respect for their internal liberties. The French regained possession of their ancient establishment: and both New England and the mother country had afterwards abundant cause to regret the admission of a restless and litigious neighbor, who for years exerted her peculiar arts of intrigue to interrupt the pursuits and disturb the repose of the English colonists.

The government of Massachusetts was highly acceptable to the great body of the people; and even those acts of its administration that imposed restraints on civil liberty were respected on account of their manifest design, and their supposed efficiency to promote an object which the people held dearer than liberty itself. A printing press had been established at Cambridge for upwards of twenty years; and the general court had recently appointed two persons to be licensers of the press, and prohibited the publication of any books or papers that had not undergone their supervision. The licensers having given their sanction to the publication of Thomas à Kempis' admirable treatise [1668.] *De Imitatione Christi*, the court interposed, and, declaring that "the book was written by a popish minister, and contained some things less safe to be infused among the people," they recommended a more diligent revision to the licensers, and in the meantime suspended the publication. In a constitution less popular, such an act would have been esteemed an iniquitous abridgment of the liberty of the subject. But the government of Massachusetts expressed, and was supported by, the sentiments and opinions of the people; and so acceptable was its administration, that the inhabitants of New Hampshire and Maine rejecting the constitution they had received from the royal commissioners, again solicited and were received into the rank of dependencies on its jurisdiction. All traces of the violation of these commissioners having been thus effaced, and the apprehensions that their measures had excited forgotten, the affairs of the colonies continued for several years to glide on in a course of silent but cheerful prosperity.† The navigation act not being

enforced by the establishment of a custom-house, and depending for its execution upon officers annually elected by their fellow citizens, was entirely disregarded. [1668—1672.] The people enjoyed a commerce as extensive as they could desire; a consequent increase of wealth was visible among the merchants and planters; and a spirit of industry and economy prevailing no less generally, the plantations were diligently improved, and the settlements considerably extended. From a document preserved in the archives of the colonial office of England, and published by Chalmers, it appears, that in the year 1673 New England was estimated to contain one hundred and twenty thousand souls, of whom about sixteen thousand were able to bear arms; and of the merchants and planters there were no fewer than five thousand persons, each of whom was worth 3000*l*.* Three-fourths of the wealth and population of the country centred in the territory of Massachusetts and its dependencies. The town of Boston alone contained fifteen hundred families. Theft was rare, and beggary unknown in New England. Josselyn, who returned about two years before this period from his second visit to America, commends highly the beauty and agreeableness of the towns and villages of Massachusetts and Connecticut, and the substantial structure and comfort of all the private dwellings.† During this interval of tranquil prosperity, many of the most aged inhabitants of New England closed the career of a long and interesting life, and the original race of settlers was now almost entirely extinguished. The annals of this period are filled with accounts of their deaths, of the virtues by which they had contributed to the foundation of the new commonwealth, and of the fondness with which their closing eyes lingered upon its prosperity. To our view, enlarged by the acquaintance which history supplies of the approaching calamities from which these persons were thus happily removed, not the least enviable circumstance of their lot appears to have been that they died in scenes so fraught with serene enjoyment and agreeable promise, and bequeathed to their descendants not only the example of their virtue, but the fruits of it, in a prosperity as eminent as any people was ever blessed with. Yet, so short-sighted and imperfect are the views of men, so strongly are they led by an instinctive and unquenchable propensity to figure and desire something better than they behold, and so apt to restrict to the present fleeting and disordered scene the suggestions of this secret longing after original and immortal perfection, that many of the fathers of the colony could not refrain from lamenting that they had been born too soon to see more than the first faint dawn of New England's glory. Others, with greater enlargement of wisdom and piety, considered that *the eye is not satisfied with seeing*, nor the conceptions of an immortal spirit capable of being adequately filled by any thing short of the vision of its Divine Author, for whose contemplation it was created; and were contented to drop like leaves into the bosom of their adopted country, in the confidence of being gathered into nobler and more lasting habitations.

1674.] The state of prosperous repose which New England had enjoyed for several years was interrupted by a formidable combination of the Indian tribes, that produced a war so general and bloody as to threaten for some time the utter destruction of the plantations. This hostile combination was promoted by a young chief whose character and history reminds us of the enterprises of Opechancanough in Virginia. He was the second son of Massasoit, a prince who had ruled a powerful tribe inhabiting territories adjacent to the settlement of Plymouth at the time when the English first settled in the country. The father had entered into an alliance with the colonists, and, after his death, his two sons demonstrated an earnest desire to retain and cultivate their friendship. They even repaired to the court of Plymouth, and requested, as a mark of

might serve to introduce a body of divinity, commences in this manner:—"To our beloved brethren and neighbours, the inhabitants of Connecticut, the general court of that colony wish grace and peace in our Lord Jesus." It was ordered that every household should have a copy of the code, and that the capital laws should be read weekly in every family. Trumbull, i. 290, 322.

In Connecticut, by a law of 1667 (still existing,) three years voluntary separation of married persons is held to dissolve their matrimonial engagement.

* John Dunton, who visited New England about twelve years after this period, mentions a merchant in Salem worth 30,000*l*. Dunton's Life and Errors, p. 171.

† Josselyn's Second Voyage. Even at this early period Josselyn has remarked the prevalence of that inveterate but unexplained peculiarity of the premature decay of the teeth of white persons, and especially women, in North America, p. 185.

identification with their allies, that English names might be given them; and, in compliance with their desire, the elder had received the name of Alexander, and the younger of Philip. But it very soon appeared that these demonstrations of good will were but the artifice that entered into their schemes of hostility; and they were both shortly after detected in an ineffectual attempt to involve the Narragansets in hostilities with the colonists. The disappointment of that attempt overwhelmed the proud spirit of the elder brother with such intolerable rage and mortification, that, in spite of, and perhaps still more deeply wounded by, the conciliating demeanour of the colonists, he was unable long to survive the detection of his villany and discomfiture of his designs. Philip, after the death of his brother, renewed the alliance between his tribe and the English, but intended nothing less than the observance of his engagements. Daring, cruel, and perfidious, he meditated a universal conspiracy of the Indians for the extirpation of the colonists, and for several years carried on his designs as secretly and effectually as the numerous difficulties that surrounded him would permit. Next to the growing power of the colonial settlements, nothing seemed to excite his indignation more strongly than the progress of their missionary labors; and, in reality, it was to these labors, and some of the consequences they had produced, that the colonists were indebted for their preservation from the ruin that would have attended the success of Philip's machinations. Some of the tribes to whom he applied revealed his propositions to the missionaries; and some who had entered into his designs were persuaded by their converted brethren to renounce them. From time to time the court of Plymouth had remonstrated with him on the designs of which they obtained intelligence; and by renewed and more solemn engagements than before, he had endeavored to disarm their vigilance and remove their suspicions. For two or three years before this period he had pursued his treacherous hostility with so much success that his proceedings appear to have been wholly unsuspected; and he had succeeded in uniting some of the fiercest and most warlike tribes in a confederacy to make war on the colonists to the point of extermination.

A converted Indian, who was laboring as a missionary among the tribes of his countrymen, having at length discovered the plot, revealed it to the governor of Plymouth, and was soon after found dead in a field, with appearances that strongly indicated assassination. Suspicions having fallen on some neighboring Indians, they were apprehended, and solemnly tried before a jury consisting half of English and half of Indians, who returned a verdict of guilty. At their execution one of them confessed the murder, and declared that they had been instigated by Philip to commit it. This crafty chief, incensed at the execution of his friends, and apprehending the vengeance of the colonists, now threw off the mask, and summoned his confederates to his aid. The states of Massachusetts, Plymouth, and Connecticut proceeded to arm for their common defence, having first employed every means to induce Philip to accommodate the quarrel by a friendly treaty. But a friendly issue was not what Philip desired; [1675] and being now fully assured that the season of secret conspiracy was over, he rejected all negotiation, and commenced a general war, which was carried on with great vigor and various success. Though Philip's own tribe supplied no more than five hundred warriors, he had so increased his force by alliances that he was able to bring three thousand men into the field. This formidable body, conducted by a chief who believed that the war must terminate in the total ruin of one or other of the conflicting parties, made exertions of which the Indians had been hitherto supposed incapable. Several battles were fought, and all the fury, havoc, and cruelty which distinguish Indian warfare were experienced in their fullest extent. Wherever the enemy marched their route was marked with murder, fire, and desolation. Massachusetts and Plymouth were the states that suffered principally from the contest. There, especially, the Indians were so interspersed among the European colonists that there was scarcely a part of the country in perfect security, or a family which had not to bewail the loss of a relative or friend. It is a truth that has not been sufficiently adverted to, that in all the Indian wars of this period the savages, from the condition of the country, their own superior acquaintance with it, and their peculiar habits of life, enjoyed advantages which might seem well nigh to counterbalance the superiority of European skill. Changing their own settlements with facility, and advancing upon those of the colonists with the dexterous secrecy of beasts of prey;

* The colonists might have pondered, with advantage, an observation of their ancient friend, that eminent and greatly misrepresented man Hugh Peters, while he was awaiting his execution in Newgate. Some in the prison speaking of the differences in religion, Mr. Peters said, "Pray talk not of controversies now; we have but a little time to live, and cannot spend it in such discourses." Trials and Deaths of the Regicides.

† In the year 1672, the laws of Connecticut (till then preserved in manuscript, and promulgated by public proclamation in the respective towns) were collected into a code, printed, and published. The preface, written with a solemnity that

with them there was almost always the spirit and audacity of attack, and with their adversaries the disadvantages of defence and the consternation produced by surprise; nor could the colonists obtain the means of attacking in their turn without following the savages into forests and swamps, where the benefit of their superior discipline was nearly lost, and the peculiarities of European warfare almost impracticable. The savages had long been acquainted with fire-arms, and were remarkably expert in the use of them.

For some time the incursions of the enemy could not be restrained, and every successful enterprise or skirmish that they maintained increased the number of their allies. The savage artifice, however, which Philip adopted in one instance for the purpose of recruiting his forces, recoiled with injury on himself. Having repaired with some of his adherents to the territory of the Mohawks, he caused some of their people to be surprised and assassinated; and then proceeding to the head quarters of the tribe, he declared that he had seen the murder committed by a party of the Plymouth soldiers. The tribe in a flame of passion declared war on the colonists: but their rage soon took another direction: for one of the wounded men having recovered his senses, made a shift to crawl to the habitations of his countrymen, and, though mortally injured, was able to disclose the real author of the murder before he died. The Mohawks instantly declared war on Philip, and themselves the allies of his enemies. Hostilities were protracted till near the close of the following year, when, at length, the steady efforts and invincible bravery of the colonists prevailed; and after a series of defeats, and the loss of all his family and chief counsellors, Philip himself was killed by one of his own tribe whom he had offended. Deprived of its chief abettor, the war was soon terminated by the submission of the enemy. From some of the tribes, however, the colonists refused to accept any submissions, and warned them before their surrender that their treachery had been so gross and unprovoked, and their outrages so atrocious and unpardonable, that they must abide the issue of criminal justice. In pursuance of these declarations, some of the chiefs were tried and executed for murder; and a number of their followers were transported to the West Indies, and sold for slaves. Never had the people of New England been engaged in so fierce, so bloody, or so desolating a conflict as this. Many houses and flourishing villages were reduced to ashes; and in the course of the war six hundred persons, composing the flower and strength of several of the districts, were either killed in battle or murdered by the savages. The military efforts of the colonists in these campaigns were thought, and justly perhaps, to evince less of tactical skill than had been displayed in the Pequot war. They were indeed no longer commanded by the experienced officers who had accompanied their ancestors from Europe; and they were opposed to an enemy much more formidable than the Pequods. But the heroic courage and calm contempt of danger that they displayed, was worthy of men whose characters were formed under institutions no less favorable to freedom than virtue, and who fought in defence of every thing that was dear and valuable to mankind. In the commencement of the war, the surprising treachery that the Indians displayed, excited strong apprehensions of the defection of the Indian congregations which the missionaries had collected and partly civilized. But not one of these people proved unfaithful to their benefactors.

The Indian warfare in which New England had been thus involved, was not bounded by the hostilities with Philip and his confederates. An attack was made at the same time on New Hampshire and Maine, by the tribes that were situated in the vicinity of these settlements. The Indians complained that they had been defrauded and insulted by some of the English traders in that quarter;* but suspicions were strongly entertained that their hostilities were promoted by the French

* One of these complaints was occasioned by the brutal act of some English sailors in overturning an Indian canoe in which they observed an infant child, in order to ascertain the truth of a story they had heard that swimming was as natural to a young Indian as to a young duck. The child died in consequence of the immersion it sustained; and its father, who was highly respected as a necromancer by the Indians, became the inveterate enemy of the English. Belknap, i. 132. An action that excited still greater resentment was committed by Major Waldron of New Hampshire during the war. He had made a treaty of friendship with a body of 400 Indians; but on discovering that some of them had served in Philip's army, he laid hold of these, by a stratagem and sent them as prisoners to Boston. Their associates never forgave this treacherous act; and thirteen years after, a party of them having surprised the major in his house by a stratagem still more artful than his own, put him to death by the most horrible indications of cruelty. Ibid. 142. 145—148.

government, now re-established in Acadia. The invasion of these territories was distinguished by the usual ferocity and cruelty of the savages. Many of the inhabitants were massacred, and others carried into captivity. Prompt assistance was rendered by Massachusetts; and after a variety of severe engagements the Indians sustained a considerable defeat. They were still however both able and willing to continue the war; and both their numbers and their animosity were increased by a measure which the colonial government adopted against them. It was proposed to the general court of Massachusetts to invite the Mohawk tribe, who, from time immemorial, had been the enemies of the eastern Indians, to make a descent on their territories at this juncture. The lawfulness of using such auxiliaries was questioned by some; but it was thought a satisfactory answer, that Abraham had confederated with the Amorites for the recovery of his kinsman Lot from the hands of a common enemy; and messengers were accordingly despatched to the Mohawks. Little persuasion was necessary to induce them to comply with the proposal, and a body of Mohawk warriors quickly marched against their hereditary foes. The expedition, however, so far from producing the slightest benefit, was attended with serious disadvantage to the cause of the colonists. The Indians who were their proper enemies, suffered very little from the Mohawk invasion; and some powerful tribes who had been hitherto at peace with them, exasperated by injuries or affronts which they received from these invaders, now declared war both against them and their English allies. At length, the intelligence of the defeat of Philip, and the probability of stronger forces being thus enabled to march against them, inclined the eastern Indians to hearken to proposals of peace. The war in this quarter was terminated by a treaty highly favorable to the Indians, to whom the settlers became bound to pay a certain quantity of corn yearly as a kind of quit-rent for their lands.*

Although the province of New York was now a British settlement, no assistance was obtained from it by the New England states in this long and obstinate contest with the Indians. On the contrary, a hostile demonstration from this quarter had been added to the dangers of the Indian war. Andros, who was then governor of this newly acquired British province, having claimed for the Duke of York a considerable part of the Connecticut territory, proceeded to enforce this pretension by advancing with an armament against the town and fort of Saybrook, which he summoned to surrender. The inhabitants, though at first alarmed to behold the English flag unfurled against them, quickly recovered from their surprise; and hoisting the same flag on their walls, prepared to defend themselves against the assailants. Andros, unprepared for such resolute opposition, hesitated to fire upon the English flag; and learning that Captain Bull, an officer of distinguished bravery and determination, had marched with a party of the Connecticut militia for the defence of the place, judged it expedient to abandon the enterprise and return to New York.

The cessation of the Indian hostilities was not attended with a restoration of the happiness and tranquillity which had preceded them. The king had now matured the scheme of arbitrary government which he steadily pursued during the remainder of his inglorious reign; and the colonists, while yet smarting with the sense of their recent calamities, were summoned to abide a repetition of their ancient contest with the crown, which they had vainly hoped was forgotten or abandoned by the English government. Instead of approbation for the bravery and vigorous reliance on their own resources with which they had conducted their military operations, without involving the mother country in expenses, and repelled hostilities which were partly owing to the disregard which the mother country had shown for their interests in restoring Acadia to the French, they found themselves overwhelmed with reproaches for a seditious obstinacy in refusing to solicit assistance from the king, and a sordid parsimony in the equipment of their levies, which (they were told) had caused the war to be so greatly protracted, and rendered them utterly unfit to be longer intrusted with the government of a country in which their sovereign possessed so deep a stake. Indications of this revival of

* Neal, ii. 400—406. Hutchinson, i. 307, 308. Belknap, i. 135. Hutchinson's History of Massachusetts, and Belknap's History of New Hampshire, are the best of the modern historical productions of North America. Trumbull's History of Connecticut would have been esteemed superior to them both, if the author (a clergyman) had not bestowed a most disproportioned attention on the biography of the clergy and the proceedings of ecclesiastical synods.

royal dislike and of the resumption of the king's former designs had appeared before the conclusion of the war with Philip. While hostilities were still raging in the province, the government of Massachusetts found it necessary to direct a part of its attention to the claims of Mason and Gorges with respect to New Hampshire and Maine. In the summer of 1676 Randolph a messenger despatched by the king, announced to the general court that a judgment would be pronounced by his majesty in council against the pretensions of the province, unless deputies were sent to plead its cause within six months; and as letters were received at the same time from the friends of the colony in England, giving assurance that this resolution would be adhered to, and that any instance of contumacy on the part of the general court would but accelerate the execution of the more formidable designs that were undoubtedly in agitation at the English court, the royal message received immediate attention, and Stoughton and Bulkeley were despatched as deputies to represent and support the colonial interests.

The respective titles and claims of the parties having been submitted to the consideration of the two chief justices of England, [1677] the legal merits of the question were at length extracted by their experienced eyes from the confused mass of inconsistent grants in which they were involved. It was adjudged that the jurisdiction of New Hampshire was incapable of being validly conveyed by the council of Plymouth, and had therefore reverted to the crown on the dissolution of the council, with reservation, however, of Mason's claims upon the property of the soil—a reservation which for more than a century rendered all the property in New Hampshire insecure, and involved the inhabitants in continual uneasiness, dispute, and litigation. As Gorges, in addition to his original grant from the Plymouth council, had procured a royal patent for the province of Maine, the full right both of seigniorial and territorial of this province was adjudged to be vested in him. In consequence of this decision, the jurisdiction of Massachusetts over New Hampshire ceased; but it was preserved in the province of Maine by an arrangement with the successful claimant. The king had been for some time in treaty for the purchase of Maine, which he designed to unite with New Hampshire, and to bestow on his favorite son the Duke of Monmouth; but straitened for money, and expecting no competitor in the purchase, he had deferred the completion of the contract. This was not unknown to Massachusetts; and that colony being strongly urged by the inhabitants of Maine to prevent their territories from being dismembered from its jurisdiction, directed its agent to purchase the title of Gorges, which he very willingly sold to them for twelve hundred pounds. This transaction gave great offence to the king, who peremptorily insisted that the authorities of Massachusetts should waive their right and relinquish their contract to him; but they, blending as a sufficient apology for what they had done, that it had been in compliance with the wishes of the people, retained the purchase and governed the country as a subordinate province. The people of New Hampshire were no less reluctant to be separated from Massachusetts; but they were compelled to submit, and to receive a royal governor.* One of the first acts of their legislature was to vote an affectionate address to Massachusetts, acknowledging the former kindness of that colony, and declaring it to have been their general wish to retain their former connexion, had such been the pleasure of their common sovereign. The government that had been forced upon them proved utterly incapable of preserving tranquillity or commanding respect. The attempts that were made to enforce Mason's title to the property of the soil, and to render the inhabitants tributary to him for the possessions which they had purchased from others and improved into value by their own labor, excited the most violent ferment, and resulted in a train of vexatious but indecisive legal warfare.† Cranfield, the governor, after involving himself in contentions and altercations with the settlers and their legislative body, in which he

* In the first commission that was issued for the government of this province, the king engaged to continue to the people their ancient privilege of an assembly "unless by inconvenience arising therefrom, he or his heirs should see cause to alter the same." Belknap, i. 172.

† The people were sometimes provoked to oppose club law to parchment law. An irregular judgment having been pronounced in favor of Mason against some persons who refused to submit to it, Cranfield sent a party of sheriff's officers to serve a writ on them while they were in church. The congregation was incensed at such a proceeding; a young woman knocked down a sheriff's officer with her bible; and the attack becoming general, the whole legal army was routed. It was found necessary to abandon the judgment. Belknap.

found it totally impossible to prevail, transmitted an assurance to the British government, "that while the clergy were allowed to preach, no true allegiance could be found in those parts." He wreaked his vengeance upon some nonconformist ministers, to whose preaching he imputed the resolute spirit of the people, and whose general denunciations against vice he construed into personal reflections on himself and his favorites, by arbitrarily commanding them to administer the sacrament to him according to the liturgy of the church of England, and committing them to prison on receiving the refusal which he expected. His misgovernment at length provoked a few rash individuals hastily, and without concert, to revolt from his authority. They were instantly suppressed; and having been arraigned of high treason, were convicted and condemned. But Crafield, aware of the unpopularity of his government, had employed artifices in the composition of the jury, which excited universal indignation; and afraid to carry his sentence into effect within the colony, he adopted the strange and unwarrantable proceeding of sending the prisoners to be executed in England. The English government actually sanctioned this irregularity, and were preparing to execute the sentence of a colonial governor, and to exhibit to the English people the tragical issue of a case, with the merits of which they were totally unacquainted, when a pardon was obtained for the unfortunate persons, by the solicitation of Crafield himself, who, finding it impossible to maintain order in the province, or to withstand the numerous complaints of his injustice and oppression, had solicited his own recall. Shortly after his departure, New Hampshire was again united to the government of Massachusetts, and shared her fortunes till the period of the British revolution.*

1678.] Although the troubles of the Popish Plot began now to engage the attention and anxiety of the king, he was no longer to be diverted from the resolution he had adopted of effecting the subjugation of Massachusetts; and though the concern of the Duke of Monmouth with that celebrated imposture and the connexions he had formed with the profligate Shaftesbury and its other promoters, might diminish the king's regret for the privation of the appanage he had meant to invest him with, the presumptuous interference of Massachusetts to defeat this transaction had inflamed his displeasure and fortified his resolution. That additional pretexts might not be wanting to justify his measures, every complaint that could be collected against the colony was promoted and encouraged. The quakers who had refused, during the Indian war, either to perform military service or to pay the fines imposed by law on defaulters, complained bitterly of the persecution they had undergone by the enforcement of these fines, as well as of the law which obliged them to contribute to the maintenance of the colonial ministers. When the dangers of the Indian war were at their height, some of the colonists apprehending that these calamities were a judgment of Heaven upon the land for tolerating such heretics as the quakers within its bosom, procured the re-enactment of an old law, prohibiting assemblies for quaker worship; and though it does not appear that this law was enforced, its enactment was justly regarded as persecution, and alienated the regards of many who had hitherto been friends of the colony. The agents who had been deputed to manage the interests of Massachusetts in the disputes respecting New Hampshire and Maine, were detained to answer these complaints which were gravely preferred by the quakers to a government which was itself enforcing with far greater rigor upon them the very policy which it now encouraged them to impute to one of its own provincial dependencies as the most scandalous persecution. Other and more serious complaints contributed to detain the agents and increase their perplexity. Randolph, whom the people of New England described as "going up and down seeking whom he might devour," had faithfully complied with his instructions to collect as much matter of complaint as he could obtain within the colony, and loaded with the hatred of the people, which he cordially reciprocated, he now returned to England and opened his budget of arraignment and vituperation. The most just and most formidable of his charges was that the navigation act was utterly disregarded, and a free trade maintained by the colonists with all parts of the world. This was a charge which the agents could neither deny

nor extenuate, and they anxiously pressed their constituents to put end to the occasion of it. Any proceedings which the king might adopt, either for the enforcement of the navigation acts, or the punishment of the neglect they had hitherto experienced, were the more likely to coincide with the sentiments of the English people, from the interest of a considerable portion of the mercantile class of society in the monopoly which it was the object of these laws to secure. A petition had been presented to the king and privy council by a number of merchants and manufacturers, complaining of the disregard of the navigation acts in New England, and praying that they might hereafter be vigorously enforced, for the sake of promoting the trade of England, as well as of preserving her dominion over the colonies. That a stronger impression might be made on the public mind, the petitioners were solemnly heard in presence of the council, and suffered to plead at great length in support of their commercial complaints and political reasonings. The general court of Massachusetts, alarmed by these movements, at length intimated, by a letter to their agents, that "they apprehended the navigation acts to be an invasion of the rights, liberties, and properties of the subjects of his majesty in the colony, they not being represented in parliament; and, according to the usual sayings of the learned in the law, the laws of England being bounded within the four seas, and not reaching to America." They added, however, that, "as his majesty had signified his pleasure that those acts should be observed in Massachusetts, they had made provision, by a law of the colony, that they should be strictly attended to from time to time, although it greatly discouraged trade, and was a great damage to his majesty's plantation." These expressions, and the recent colonial law to which they refer, demonstrate the peculiar notions which were entertained by the people of Massachusetts of the connexion that subsisted between themselves and the parent state. [1679.] Their pretensions were the same with those which a few years after were advanced by the people of Ireland;—that, although dependent on the crown, and obliged by their patent to conform their jurisprudence, as far as possible, to the law of England, the statutes of the British parliament did not operate in the colony, till re-enacted, or otherwise recognized, by its own native legislature. So strongly did this notion possess the minds of the people of New England, and so obstinately did their interests resist the enforcement of the commercial regulations, that even the submissive province of Rhode Island, although, about this time, in imitation of Massachusetts, it took some steps towards a conformity with these regulations, never expressly recognized them till the year 1700, when its legislature empowered the governor "to put the acts of navigation in execution."*

The colonial agents, aware of the strong interests that prevailed among their countrymen still to overstep the boundaries of their regulated trade, furnished them with correct information of the threatening aspect of their affairs in England, and assured them that only a thorough compliance with the navigation acts could shelter them from the designs that were entertained by the crown. These honest representations produced the too frequent effect of unwelcome truths: they diminished the popularity of the agents, and excited suspicions in Boston that they had not advocated the interests of the colony with sufficient zeal. The people were always too apt to suspect that their deputies in England were overawed by the state, and infected with the subservience that prevailed at the royal court; and they neglected to make due allowance for the different aspect which a dispute with England presented to men who beheld face to face her vast establishments and superior power, and to those who speculated on the probability of such dispute at the opposite extremity of the Atlantic ocean. The agents at length obtained leave to return; and though some impatience and ill humor had been excited by their fidelity in the discharge of an unwelcome office, the deliberate sentiments of their countrymen were so little perverted, that when the king again intimated his desire of the re-appointment of agents in England, they twice again elected the same persons to resume their former duty, which unfortunately, however, these persons could never again be persuaded to undertake. They carried

with them a letter containing the requisitions of the king, of which the most considerable were, that the oath of allegiance should be rendered more explicit, and should be administered to every person holding an office of trust; that all civil and military commissions should be issued in the king's name; and all laws repugnant to the English commercial statutes abolished. The general court, eagerly indulging the hope that, by a compliance with these moderate demands, they could appease their sovereign and avert his displeasure, proceeded instantly to enact laws in conformity with his requisitions. They trusted that he had now abandoned the designs which they had been taught to apprehend; and which, in reality, were merely suspended by the influence of the proceedings connected with the popish plot, and the famous bill for the exclusion of the Duke of York. Although the requisitions which the king had transmitted by the hands of Stroughton and Bulkeley were obeyed, he continued to intinate, from time to time, his desire that new agents might be appointed to represent the colony in London; but partly from the apprehensive jealousy with which the colonists regarded such a measure, and partly from the reluctance that prevailed among their leading men to undertake so arduous and perplexing an employment, the king's desires on this point were not complied with. The short interval of independence which the colonists were yet permitted to enjoy was very remote from a state of tranquillity. Randolph, who had commended himself to the king and his ministers by the diligence and activity with which he had co-operated with their views, was appointed collector of the customs at Boston, and a custom-house establishment, which some years before had been erected without opposition in Virginia, and Maryland, was now extended to New England.* But it was in Massachusetts that this measure was intended to produce the effects which it was easily foreseen would result from its own nature, as well as from the temper and the unpopularity of the person who was appointed to conduct it. The navigation acts were evaded in Rhode Island, and openly contemned and disregarded in Connecticut; yet these states were permitted to practice such irregularity without molestation. It seems to have been less the enforcement of the acts themselves that the king desired, than the advantage which would accrue from the attempt to enforce them after such long neglect in the obnoxious province of Massachusetts. To this province he confined his attention; and justly considered that the issue of his contest with it, would necessarily involve the fate of all the other settlements of New England. Randolph proceeded to exercise his office with the most offensive rigor, and very soon complained that the stubbornness of the people defeated all his activity, and presented insuperable obstacles to the execution of the laws. Almost every suit that he instituted for the recovery of penalties or forfeitures was decided against him. He proceeded to England in order to lay his complaints before his employers, and returned invested with more extensive powers, in the exercise of which he was not more successful. [1680.] He reproached the colonial authorities with injustice and partiality; and they denied the charge, and accused him of unnecessary and vexatious litigation. The requisitions and remonstrances which the king continued to make, from time to time, were answered by professions of loyalty, and by partial compliances with what was thus suggested; but the main subject of contest still continued to subsist, and the colony, though repeatedly desired, still delayed, to send deputies to England. The general court was at this time divided between two parties, who cordially agreed in their estimate of the value of their chartered privileges, but differed in opinion as to the extent to which it was advisable to contend for them. Bradstreet, the governor, at the head of the moderate party, promoted every compliance with the will of the parent state short of a total surrender of their civil and ecclesiastical constitution. Danforth, the deputy-governor, at the head of another party, impeded the appointment of deputies, and opposed all submission to the acts of trade; maintaining that the colony should adhere to the strict construction of its charter, resist every abridgment of it as a dangerous precedent, no less than an injurious aggression, and standing on their right, com-

* Hutchinson, i. 312—318. Chalmers, 396, 7. 492, 493—498 Belknap, i. cap. vi. vii. & viii. These events, and the particular history of New Hampshire at this period, are related in considerable detail, with every appearance of accuracy, and with much spirit, good sense, and liberality, by Dr. Belknap.

* Neal, ii. 365, 6. Hutchinson, i. 319, 320, 322, 3. Chalmers, 277, 400. From Warden's population tables, it appears that Connecticut at this period (1679) contained twelve thousand five hundred inhabitants, having sustained a diminution of two thousand five hundred since the year 1670 (Warden, ii. 9.)—a fact unexplained by the history of this state, which had suffered comparatively little by the late Indian war.

* As a measure, partly of terror, and partly of punishment, it was determined by the English court, about this time, "that no Mediterranean passes shall be granted to New England to protect its vessels against the Turks, till it is seen what dependence it will acknowledge on his majesty, or whether his custom-house officers are received as in other colonies." Chalmers, 402.

mit the event to Providence. These parties conducted their debates with warmth, but without acrimony; and as the sentiments of one or other respectively prevailed, a greater or lesser degree of compliance with the demands of the king was infused into the undecided policy of the general court.*

The various misfortunes in which the colony had for a series of years been involved, did not fail to produce a deep and solemn impression on the minds of men habituated to regard all the events of life in a religious aspect; and contributed to revive the piety for which New England had been at first so highly distinguished, among the posterity of the original settlers. A short time before the commencement of their troubles, a natural phenomenon that excited much awe and attention at the time, and was long recollected with solemn remembrance, was visible for several nights successively in the heavens. It was a bright meteor in the form of a spear, of which the point was directed towards the setting sun, and which, with slow majestic motion, descended through the upper regions of the air, and gradually disappeared beneath the horizon. The inhabitants were deeply struck with this splendid personification of agency that seemed to unite the visible and invisible world in its range; and the colonial magistrates, without expressly alluding to it, yielded to its influence on their own minds, and endeavored to improve its effects on the minds of others, by promoting a general reformation of manners. Circular letters were transmitted to all the clergy, urging them to greater diligence in exemplifying and inculcating the precepts of religion, especially on the young, and instructing their parishioners from house to house. The dopes of science falsely so called may deride these impressions, and trace to ignorant wonder the piety which they produced; but enlightened philosophy will confess the worth and dignity of that principle which recognizes in every display of the great phenomena of nature, additional calls to serve and glorify its Almighty Creator, and which elevates and refines human faculties by placing every object that forcibly strikes them in a noble and graceful light derived from connexion with the interests of morality and the honor of God. The events of the Indian war, the losses sustained from a train of unfavorable weather that ensued, and, latterly, the disquiet occasioned by the contentions with the English government, served, in like manner, to humble the people beneath the Almighty Power which controls the passions of men as well as the elements of nature, and were equally productive of increased diligence in the observance of piety and the reformation of manners. Deeply lamenting the imperfections and deficiencies of themselves and others, many of the ministers, magistrates, and leading men of the province earnestly besought their countrymen to consider, if the interruption of Divine favor did not betoken neglect of the Divine will, and by precept and example labored to eradicate every evil habit or licentious practice that a state of war and an influx of commercial wealth were supposed to have produced. Men were strongly exhorted to carry a continual respect to the Divine will into the minutest ramifications of their affairs, and to enoble whatever they did by doing it to the Lord. The general court published a catalogue of the epidemical vices of the times, in which we find enumerated, neglect of the education of children, pride displayed in the manner of cutting and curling hair, excess of finery and immodesty of apparel, negligent carriage at church, failure in due respect to parents, a sordid eagerness of shopkeepers to obtain high prices, profane swearing, idleness, and frequenting of taverns. Grand juries were directed to make presentment of offenders in these respects: but either the happier influence of example and remonstrance was sufficient to control the obnoxious practices, or they never attained such height and prevalence as to justify the infliction of legal severities. In many instances the scrupulous piety of the colonial authorities has reprobated existing vices, and the extent to which they prevailed, in language which, when compared with the common tone of the world, is apt to beget misapprehension; and, hence, a writer no less eminent than Chalmers has fallen into the gross mistake of deriving a charge of unusual immorality against the inhabitants of Massachusetts from the very circumstances that prove the

strength of their piety, the purity of their moral habits, and the still superior purity of their moral aspirations. The strong sense that religion inspires of the vicious propensities inherent in human nature, causes the expression of the moral sentiments of religious men to appear to the world as the ravings of hypocritical cant or fanatical delusion.*

The king had never abandoned his design of effecting a complete alteration of the constitution of Massachusetts; but his moderation had been enforced by the more personal and pressing concern of resisting the attempts of Shaftesbury to re-enact the deep and daring policy of the Duke of Gloucester, and control his sovereign by the formation and supremacy of a protestant league in England. While Shaftesbury and his party were able to retain their influence on the public mind by the artifice of the popish plot, and to attack the monarchy by the device of the exclusion bill, it might well be deemed unsafe to signalize the royal administration by any public act of extraordinary tyranny in a province so eminent for zeal in the protestant cause as Massachusetts. [1681.] But Charles had now obtained a complete victory over his domestic adversaries; and, among other excesses of retaliatory violence and arbitrary power by which he proceeded to improve his success, he instituted writs of *quo warranto* against the principal corporations in England, and easily obtained judgments from the courts of law that declared all their liberties and franchises forfeited to the crown. About two years before this period, he had deliberated on the possibility of superseding entirely the government of Massachusetts without the observance of any legal solemnity, but, on consulting Jones and Winnington, the attorney and solicitor general, he had learned that his object could not be securely or effectually attained except by the instrumentality of a writ of *quo warranto*, which at that time it was not deemed expedient to employ. But now every impediment was removed; and the colonists received the most positive intelligence from their friends in England that the abrogation of their charter was finally resolved on, and was to be instantly accomplished. Randolph, who spent much of his time in making voyages between England and America, and had lately affixed a protest on the exchange of Boston against the acts of its government, now brought from London a letter from the king, dated the 26th of October, 1681, recapitulating all the complaints against the colony, and commanding that deputies should instantly be sent to him, not only to answer these complaints, but "with powers to submit to such regulations of government as his majesty should think fit;" which if they should fail to do, it was intimated that a writ of *quo warranto* would be directed against them. A new matter of charge, suggested by the inquisitive hostility of Randolph, was at the same time preferred against them,—that they coined money within the province in contempt of the king's prerogative. The general court, in answer to this sudden arraignment of a practice which had been permitted so long to prevail without question, explained how and when it had originated, and appealed to these circumstances as decisively proving that no contempt had been designed: but, withal, declared that if it were regarded as a trespass on his majesty's authority, they humbly entreated pardon for the ignorance under which it had been committed. Among the other complaints that were urged by the king, were the presumptuous purchase of the province of Maine, which the colonists were again commanded to surrender, and the disallowance of any other worship than that of the established churches within the colony. To the first of these they answered by repeating their former apology, and still declining what was required of them; and to the second, that liberty of worship was now granted to all denominations of Christians in Massachusetts. The royal letter contained many other charges; but they were all answered by solemn protestations that either the commands they imported had been already fulfilled, or the disobedience they alleged had not been committed.

An assembly of the general court having been held [1682] for the purpose of electing deputies to pro-

ceed to England, and Stoughton again declining to accept this office, it was conferred on Dudley and Richards, two of the wealthiest and most respectable citizens of the province. But as the powers which the royal letter required that they should be invested with, of submitting to whatever regulations of government the king should think fit, were nothing else than powers to surrender all the rights of the colony, the court was careful to grant no such authority, and, on the contrary, plainly expressed in their instructions that the deputies were not to do or consent to any thing that should infringe the liberties granted by the charter, or alter the existing form of government. The deputies set sail for England, whither they were soon followed by Randolph, to confront, oppose, and counteract them. A public fast was appointed to be observed throughout the colony, to pray for the preservation of their charter and the success of the deputation. Means less pure, though I think by no means unjustifiable, were adopted, or at least sanctioned, by the assent of the court of assistants, for the promotion of the colonial interests in England. Cranfield, who was still the royal governor of New Hampshire, being on a visit at Boston, suggested to these authorities that their agents should be directed to wait on Lord Hyde, and tender the sum of two thousand guineas for the private service of the king, which he assured them, from the notorious poverty and venality of the court,* would infallibly procure a stay of all hostile proceedings. They fell headlong into the snare; and having written letters to this effect to the deputies, Cranfield despatched letters at the same time to the king, which he assured them contained the strongest recommendations of their interests to royal favor. But though these men were willing, in a cause where no interests but their own were involved, to sacrifice their money for their liberty, and to buy their country out of the hands of a sordid and dissolute tyrant, it was not the will of Providence that the liberties of Massachusetts should be bought with gold, or that the prayers which had been associated with such means should prevail. Letters soon arrived from the deputies, informing that Cranfield had written a ludicrous account of the whole proceeding to the king, and vaunted his dexterity in outwitting the people of Boston, whom he described as a crew of rascals and rebels, and that the publication of the story had exposed them to the derision of the whole court.†

The deputies found the king intoxicated with prosperous tyranny, and incensed to the highest degree against a province that had so long presumed to withstand his will. Their credentials, which they were desired to exhibit to Sir Lionel Jenkins, the secretary of state, were at once declared to be insufficient; and they were informed, that unless others, satisfactory in every respect, were immediately obtained, it was his majesty's pleasure that a *quo warranto* against their charter should issue without delay. The deputies communicated this peremptory injunction to their constituents; assuring them, at the same time, that the case of the colony was desperate, and leaving them to determine whether it was most advisable to submit themselves unreservedly to his majesty's pleasure, or to abide the issue of a process which would certainly be fatal. This important question, the determination of which was to be the last exercise of their beloved liberty, was solemnly discussed both in the general court and, as was meet, by the inhabitants of the province at large; [1683.] and the general sentiment was declared to be, "that it was better to die by other hands than their own." An earnest address to the king was framed by the general court; a corresponding one was signed by the inhabitants; and the agents were directed to present them or not, as they should think proper.

They were authorized to deliver up the titles of the province of Maine, if by so doing they could preserve the

* Hutchinson, i. 310, 321, 326, 327, 330, 331, 331. Chalmers, 297, 409. From a report presented this year (1680) to the lords of trade, it appears that Connecticut, then in the forty-fourth year of its settlement, contained twenty-one churches, each of which had its minister; a militia of 2500 men; a very few indentured servants, and thirty slaves. Holmes, i. 377.

* After this manner the New England ministers were accustomed to address their hearers. "It concerneth New England always to remember that they are originally a plantation religious, not a plantation of trade. Let merchants, and such as are increasing cent per cent, remember this, that worldly gain was not the end and design of the people of New England, but religion. And if any man among us make religion as twelve, and the world as thirteen, such an one hath not the spirit of a true New Englishman." Higginson's Election Sermon, 1663, apud Belknap, i. 69.

† Every thing was venal that Charles the Second could obtain a price for. He sold his alliance to the king of France, and the officers of government to his own ministers. From the Memoirs of Sir William Temple, it appears that this eminent person was obliged, in 1674, to decline the office of secretary of state from inability to advance 8000l, which was the price of it. Temple's Works (Dean Swift's edition, folio,) i. 379.

† Hutchinson, i. 333, 335, 337. Chalmers, 409, 430, 443, 450. Notwithstanding the unpromising aspect of affairs in New England at this period, her population received frequent additions from the emigration of English nonconformists. Among a considerable body of those who about the year 1692 sought an asylum in Massachusetts was Josias Franklin, the father of that distinguished philosopher and politician who in the following century contributed so signally to effect the independence of the American states. See Franklin's Memoirs of his own Life.

CHAPTER V.

charter; but otherwise not; and they were finally informed of the irrevocable determination of their constituents to adhere to the charter, and never to show themselves unworthy of liberty by voluntarily disowning it.

The communication of this magnanimous answer put an end to the functions of the deputies; and a writ of *quo warranto* having been issued forthwith against the colony, they desired leave to retire from the spectacle of such proceedings, and were permitted to return to Boston. They were instantly followed by Randolph, who had presented to the committee of plantations articles of high crimes and misdemeanors against the colony, and was now selected to carry the fatal writ across the Atlantic. The message was perfectly suitable to the hand that conveyed it; and Randolph performed his office with a triumphant eagerness that added insult to injury, and increased the detestation with which he was universally regarded. The king at the same time made a last attempt to induce the colonists to spare him the tedious formalities of legal process. He transmitted a declaration, that if before judgment they would make a full submission and entire resignation to his pleasure, he would consider their interest as well as his own service in composing the new charter, and make no farther departure from the original constitution than should be necessary for the support of his government. In order to enforce this suggestion, the colonists were apprised, that all the corporations in England except the city of London, had surrendered their privileges to the king; and copies of the proceedings against the charter of London were dispersed through the province, that all might know that a contest with his authority was utterly hopeless. But the people of Massachusetts were not to be moved from their purpose by the threats of despotic power or the example of general servility. They had acted well, and had now to suffer well; and disdainfully refused to diminish the infamy of their oppressor by sharing it with him. The majority of the court of assistants, overwhelmed by their calamities, voted an address of submission to the king; but the house of delegates, animated with the general feeling of the people, and supported by the approbation of the clergy, rejected the address, and adhered to their former resolutions. The process of *quo warranto* was in consequence urged forward with all the vigor that the formalities of law would admit. A requisition to the colony to make appearance was promptly complied with; but it was found that the legal period of appearance had elapsed before the requisition was transmitted. At length, in Trinity term of the following year, [1694.] judgment was pronounced against the governor and company of Massachusetts, "That their letters patent and the enrolment thereof be cancelled;" and in the year after, [1695.] an official copy of this judgment was received by the secretary of the general court.

Thus the liberties of Massachusetts were overthrown by the descendant of the princes whose oppressions had contributed to lay their foundations; after being defended by the children of the original settlers with the same resolute unbending virtue that their fathers had exerted in establishing them. The venerable Bradstreet, who had accompanied the first emigrants to Massachusetts in 1630, was still alive, and was governor of the colony at the period of the subversion of those institutions which he had contributed originally to plant in the desert, and had so long continued to adorn and enjoy. Perhaps he now discerned the vanity of those sentiments that had prompted so many of the covetous whom he had survived, to lament their deaths as premature. But the aged eyes that beheld this eclipse of New England's prosperity, were not yet to close till they had seen the return of better days.

That the proceedings of the king were in the highest degree unjust and tyrannical, appears manifest beyond all decent denial; and that the legal adjudication by which he masked his tyranny was never annulled by the English parliament, is a circumstance very little creditable to English justice. The House of Commons, indeed, shortly after the Revolution, inflamed with indignation at the first recital of the proceedings we have seen, passed a resolution declaring "that those *quo warrantos* against the charters of New England were illegal and void;" but they were afterwards prevailed with to depart from this resolution by the arguments of Treby, Somers, and Holt, whose eminent faculties and constitutional principles could not exempt them from the influence of a superstitious prejudice, generated by their professional habits, in favor of the sacredness of legal formalities.

[1685.] So eager was Charles to complete the execution of his long cherished designs on Massachusetts, that in November, 1684, immediately after the judgment was pronounced, he began to make arrangements for the new government of the colony. Though not even a complaint had been urged against New Plymouth, he scrupled not to involve that settlement in the same fate: and as if he intended to consummate his tyranny by a measure that should teach the inhabitants of New England how dreadful the vengeance of a king could be, he selected for the execution of his designs an individual, than whom it would not be easy in the whole records of human cruelty and wickedness to point out a man who has excited to a greater degree the abhorrence and indignation of his fellow-creatures. The notorious Colonel Kirke, whose brutal and sanguinary excesses have secured him an immortality of infamy in the history of England, was appointed governor of Massachusetts, New Hampshire, Maine, and New Plymouth: and it was determined that no assembly should be permitted to exist, but that the legislative and executive powers should be combined in a governor and council appointed during the royal pleasure. This arbitrary policy was approved by all the ministers of Charles, except the Marquis of Halifax, who espoused the cause of the colonists with a generous zeal, and warmly but vainly urged that they were entitled to enjoy the same laws and institutions that were established in England.* Though Kirke had not yet committed the enormities by which he was destined to illustrate his name in the west of England, he had already given such indications of his disposition in the government of Tangier, that the tidings of his appointment filled the inhabitants of the colony with horror and dismay. But before Kirke's commission and instructions could be finally settled, the career of Charles himself was interrupted by death: and Kirke was reserved to contribute by his atrocities in England to bring hatred and exile on Charles's successor. This successor, James the Second, from whose stern inflexible temper, and high toned opinions respecting government, the most gloomy presages of tyranny had been drawn, was proclaimed in Boston with melancholy pomp.

These presages were verified by the administration of the new monarch. Soon after his accession to the throne, a commission was issued for the temporary government of Massachusetts, New Hampshire, Maine, and New Plymouth, by a president and council selected from among the inhabitants of Massachusetts, whose powers were entirely executive and judicial, and were to endure till the arrival of a permanent governor. They were directed to allow liberty of conscience to all, but to bestow peculiar encouragement on the church of England; to determine all suits originating within the colony, but to admit appeals from their sentences to the king in council; and to defray the expenses of their government by levying the taxes formerly imposed. This commission was laid before the general court at Boston, not as being any longer considered a body invested with political authority, but as being composed of individuals of the highest respectability and influence in the province. In answer to the communication they had thus received, [1686.] this assembly agreed unanimously to an address, in which they declared that the inhabitants of Massachusetts were deprived of the rights of freemen by the

new system, and that it deeply concerned both those who introduced and those who were subjected to a system of this nature, to consider how far it was safe to pursue it. They added, that if the newly appointed officers meant to assume the government of the people, though they would never give assent to such proceedings, they would nevertheless demean themselves as loyal subjects, and humbly make their addresses to God, and in due time to their prince for relief. The president named in the commission was Mr. Dudley, who had lately been one of the deputies of the province to England, and whose conduct had justified in some degree the jealousy with which the colonists ever regarded the men whom they were compelled to intrust with the performance of that arduous duty. His patriotic virtue, without being utterly dissolved, was relaxed by the beams of royal influence. Despairing of being able to serve his country, he applied himself with more success to cultivate his own interest at the English court: and in pursuing this crooked policy, he would seem to have been animated by the hope that the interest of his fellow-citizens might be more effectually promoted by his own advancement to office among them, than by the exclusion which he would incur, in common with them, by a stricter adherence to the line of integrity. Though he accepted the commission, and persuaded those who were associated with him to imitate his example, he continued to show himself friendly to the rights of the people, and to those institutions which they so highly regarded. Not only was any immediate alteration in the internal arrangements of the colony avoided, but the commissioners, in deference to the public feeling, transmitted a memorial to the English ministers stating that a well regulated assembly of the representatives of the people was extremely necessary, and ought in their opinion to be established without delay. This moderate conduct, however, gave little satisfaction to any of the parties whom they desired to please. The people were indignant to behold a system which was erected on the ruins of their liberty, promoted by their own fellow-citizens, and above all by the man whom they had lately appointed to resist its introduction among them; and nothing but the apprehensions of seeing him replaced by Kirke, whose massacres in England excited the direst presage of the fate of America, prevented the strongest expressions of their displeasure. The conduct of the commissioners was no less unsatisfactory both to the abettors of arbitrary government in England, and to the creatures of Randolph within the province, who were anxious to pay court to the king by prostrating beneath his power every obstacle to the execution of his will. Complaints were soon transmitted by these persons to the English ministers, charging the commissioners with conniving at former practices in opposition to the laws of trade, and countenancing ancient principles in religion and government.

In addition to these causes of dissatisfaction with the conduct of the commissioners, the king was now compelled to resume the prosecution of his plans by the imperfection of the temporary arrangement he had made. It was found that the acts of taxation were about to expire, and the commissioners being totally devoid of legislative authority, had no power to renew them. They had employed this consideration to enforce their suggestion of a representative assembly; but it determined the king to enlarge the arbitrary authority of his colonial officers, and at the same time to establish a permanent administration for New England. He had consulted the crown lawyers respecting the extent of his powers; and they had given as their official opinion, "that notwithstanding the forfeiture of the charter of Massachusetts, its inhabitants continued English subjects, invested with English liberties;" a truth which, though it required little legal acuteness to discover, seems to imply more honesty than we might be prepared to expect from the persons selected by this monarch from a bar which, in that age, could supply such instruments as Jeffries and Scroggs. We must recollect, however, that lawyers, though professionally partial to the authority that actuates the system they administer, cherish also in their strong predilection for those forms and precedents that constitute their own influence and the peculiar glory of their science, a principle that frequently protects liberty and befriends substantial justice.* But James was too much enamored

* The French court and the Duke of York reprobated with Charles on the impolicy of retaining in office a man who had professed such sentiments. Baildon's Correspondence, in the Appendix to Fox's History of James the Second. "Even at this early period," says Mr. Eox, "a question relative to North American liberty, and even to North American taxation, was considered as the test of principles friendly or adverse to arbitrary power at home."

* Many remarkable instances illustrative of this remark will occur to all who are acquainted with the history of English jurisprudence; and it is this which gives to the English state trials, even in the worst of times, an interest which the state prosecutions of no other country possess. Not the least signal instance of this principle was displayed by Chief Justice

of arbitrary power, to be deterred from the indulgence of it by any obstacle inferior to invincible necessity; and accordingly, without paying the slightest regard to an opinion supported only by the pens of lawyers, he determined to establish a complete tyranny in New England, by combining the whole legislative and executive authority of government in the persons of a governor and council to be named by himself. Kirke had been found too useful as an instrument of terror in England, to be spared to America. But Sir Edmund Andros, who had signalized his devotion to arbitrary power in the government of New York, was now appointed captain-general and vice-admiral of Massachusetts, New Hampshire, Maine, New Plymouth, and certain dependent territories, during the pleasure of the king. He was empowered, with consent of a council to be appointed by the crown, to make ordinances for the colonies, not inconsistent with the laws of England, and which were to be submitted to the king for his approbation or dissent, and to impose taxes for the support of government. He was directed to govern the people, according to the tenor of his commission, of a separate letter of instructions with which he was at the same time furnished, and of the laws which were then in force or might be afterwards enacted. The governor and council were also constituted a court of record; and from their decisions an appeal lay to the king in council. The greater part of the instructions that were given to Andros are of a nature that would do honor to the patriotism of the king, if the praise of that virtue were due to a barren desire to promote the welfare of the people, accompanied with the most effectual exertions to strip them of every security by which their welfare might be guarded. Andros was instructed to promote no persons to offices of trust but those of the best estates and characters, and to displace none without sufficient cause; to continue the former laws of the country, so far as they were not inconsistent with his commission or instructions; to dispose of the crown lands at moderate quit rents; "to take away or to harm no man's life, member, freehold, or goods, but by established laws of the country, not repugnant to those of the realm;" to discipline and arm the inhabitants for the defence of the country, but not to impede their necessary affairs; to encourage freedom of commerce by restraining ingrossers; to hinder the excessive severity of masters to their servants, and to punish with death the slayers of Indians or negroes; to allow no printing press to exist; and to give universal toleration in religion, but special encouragement to the church of England. Except the restraint of printing, there is none of these instructions that breathes a spirit of despotism; and yet the whole system was silently pervaded by that spirit; for as there were no securities provided for the enforcement of the king's benevolent directions, so there were no checks established to restrain the abuse of the powers with which the governor was intrusted. The king was willing that his subjects should be happy, but not that they should be free or happy independently of himself; and this association of a desire to promote human welfare, with an enmity to the means most likely to secure it, suggests the explanation, perhaps the apology, of an error to which king's are inveterately liable. Trained in habits of indulgence of their will, and in sentiments of respect for its force and efficacy, they come to consider it as what not only ought to be, but must be irresistible; and feel no less secure of ability to make men happy without their own concurrence, than of a right to balk the natural desire of mankind to commit their happiness to the keeping of their own courage and wisdom. The possession of absolute power renders self-denial the highest effort of virtue; and the absolute monarch who should demonstrate a just regard to the rights of his fellow creatures, would deserve to be honored as one of the most magnanimous of human beings. Furnished with the instructions which we have seen for the mitigation of his arbitrary power, and attended with a few companies of soldiers for its enforcement, Andros arrived at Boston; and presenting himself as the substitute for the dreaded and detested Kirke, and commencing his administration with many gracious expressions of good will, he was at first received more favorably than might have been expected. But his popularity was short lived. Instead of conforming to the instructions, he copied and even exceeded the arbitrary rule of his master in England,

and committed the most tyrannical violence and oppressive exactions.*

It was the purpose of James to consolidate the strength of all the colonies in one united government; and Rhode Island and Connecticut were now to experience that their destiny was involved in the fate of Massachusetts. The inhabitants of Rhode Island, on learning the accession of the king, immediately transmitted an address congratulatory of that event, acknowledging themselves his loyal subjects, and begging his protection of their chartered rights. Yet the humility of their supplications could not protect them from the effects of the plans he had resolved to adopt in the government of New England. Articles of high misdemeanor were exhibited against them before the lords of the committee of colonies, charging them with breaches of their charter, and with opposition to the acts of navigation; and before the close of the year 1685, they received notice of the commencement of a process of *quo warranto* against their patent. Without hesitation they resolved that they would not stand suit with the king, and passed an act, in full assembly, formally surrendering the charter and all the powers it contained. By a fresh address they "humbly prostrated themselves, their privileges, their all, at the gracious feet of his majesty, with an entire resolution to serve him with faithful hearts." These servile expressions dishonored, but did not avail them; and the king, judging all forms of law superfluous, proceeded without ceremony, to impose the subjugation which the people sought to evade by deservings it. His eagerness, however, to accomplish his object with rapidity, though it probably inflicted a salutary disappointment on the people at the time, proved ultimately highly beneficial to their political interests, by preserving their charter from a legal dissolution: and we shall find that this benefit, which, with equal improvidence, was extended to the people of Connecticut, was sensibly experienced at the era of the British revolution. In consequence of the last address that had been transmitted by Rhode Island, Andros had been charged to extend his government to this province also: and in the same month that witnessed his arrival at Boston, he proceeded to Rhode Island, where he dissolved the government, broke its seal, and, admitting five of the inhabitants into his legislative council, assumed the administration of all the functions of government.

Connecticut had also transmitted an address to the king on his accession, and vainly solicited the preservation of her privileges. At the same time when the articles of misdemeanor were exhibited against Rhode Island, a similar proceeding was adopted against the governor and company of Connecticut, who were charged with making laws contrary to those of England; of extorting unreasonable fines; of enforcing an oath of fidelity to their own corporation, in opposition to the oath of allegiance; of intolerance in religion; and of denial of justice. These charges, which were supposed to infer a forfeiture of the charter, were remitted to Sawyer, the attorney-general, with directions to issue a writ of *quo warranto* against the colony. The writ was issued, and Randolph, the general enemy and accuser of the free, offered his services to carry it across the Atlantic. The governor and the assembly of Connecticut had for some time beheld the storm approaching, and knowing that courage alone was vain, and resistance impracticable, they endeavored, with considerable address, to elude what they were unable to repel. After delaying as long as possible to make any signification of their intentions, the arrival of Sir Edmund Andros at Boston, and his proceedings in Rhode Island, seem to have convinced them that the measures of the king were to be vigorously pursued, and that they could not hope to be allowed to deliberate any longer. [1687.] They wrote, accordingly, to the secretary of state, expressing their strong desire to be permitted to retain their present constitution; but requesting, if it were the royal purpose to dispose otherwise of them, that they might be annexed to Massachusetts, and share the fortunes of a people who were their former correspondents and confederates, and whose principles and manners they understood and approved. This was construed by the British government into a surrender of the colonial privileges, and Andros was commanded to annex this province also to his jurisdiction. Randolph, who seems to have been qualified not less by genius than inclination to promote

the execution of tyrannical designs, advised the English minister to prosecute the *quo warranto* to a judicial issue; assuring them that the government of Connecticut would never consent to do, nor acknowledge that they had done what was equivalent to an express surrender of the rights of the people. It was matter of regret to the ministers and crown lawyers of a later age, that this politic suggestion was not adopted. But the king was too eager to snatch the boon that seemed within his reach, to wait the tedious formalities of the law; and no further proceedings ensued on the *quo warranto*. In conformity with his orders, Andros marched at the head of a body of troops to Hartford, the seat of the provincial government, where he demanded that the charter should be delivered into his hands. The people had been extremely desirous to preserve at least the document of rights, which the return of better times might enable them to assert with effect. The charter was laid on the table of the assembly, and the leading persons of the colony addressed Andros at considerable length, relating the exertions that had been made, and the hardships that had been incurred, in order to found the institutions which he was come to destroy: entreating him yet to spare them, or at least to leave the people in possession of the patent, as a testimonial of the favor and happiness they had formerly enjoyed. The debate was earnest, but orderly, and protracted to a late hour in the evening. As the day declined, lights were introduced into the hall, and it was gradually surrounded by a considerable body of the bravest and most determined men in the province, prepared to defend their representatives against the violence of Andros and his armed followers. At length, finding that their arguments were ineffectual, a measure that seems to have been previously concerted by the inhabitants, was coolly, resolutely, and successfully adopted. The lights were extinguished as if by accident; and Captain Wadsworth laying hold of the charter, disappeared with it before they could be rekindled. He conveyed it securely through the crowd, who opened to let him pass, and closed their ranks as he proceeded, and deposited it in the hollow of a venerable elm tree, which retained the precious deposit till the era of the English revolution, and was long regarded with veneration by the people, as the contemporary and associate of a transaction so interesting to their liberties. Andros finding all his efforts ineffectual to recover the charter, or ascertain the person by whom it had been secreted, contented himself with declaring the ancient government dissolved; and assuming the administration into his own hands, he created two of the principal inhabitants members of his general legislative council.

Having thus united the whole of New England under one administration, Andros proceeded, with the assistance of his grand legislative council selected from the inhabitants of the several provinces, to enact laws and regulations calculated to fortify his government, and to effectuate the changes which he deemed necessary to its security. An act reviving the former taxation was obtained from the council; and yet, even this necessary proceeding was obstructed by the reluctance with which these persons, though selected by himself, consented to become the instruments of riveting the shackles of their country. The only farther opposition which he experienced, proceeded from the inhabitants of the county of Essex, who, insisting that they were freemen, refused to appropriate the assessments of a taxation which they considered unlawfully imposed. But their opposition was easily suppressed, and many of them severely punished. Andros very quickly found that the revenues of the ancient government would be insufficient to support the expenses of his more costly administration; and while he notified this defalcation to the king, he intimated, at the same time, with a degree of humanity that at least deserves to be noticed, that the country was so much impoverished by the effects of the Indian war and recent losses at sea and scanty harvests, that an increase of taxation could with difficulty be borne. But the king had exhausted his humanity in the letter of instructions, and returned peremptory orders to raise the taxes to a level with the charges of administration; and Andros from this moment, either stifling his humanity, or discarding his superfluous respect to the moderation of the king, proceeded to exercise his power with a rigor and injustice that rendered his government universally odious. The weight of taxation was oppressively augmented, and all the fees of office screwed up to an enormous height. The ceremonial of marriage was altered, and the celebration of that rite, which had been hitherto exercised by the magistrates, was confined to the ministers c

Jeffries himself, who, after he had trampled on the plainest principles of justice and equity in order to procure the conviction of a dissenting minister, suffered himself to be deterred from passing sentence in conformity with the verdict, by a technical objection which is almost unintelligible. Case of Rosewell. Howel's State Trials, vol. x. p. 147.

* Hutchinson, i. 353-355. Chalmers, 419-421. During the administration of Andros, a new great seal was appointed for New England, with the motto *Nunquam libertas eratior extat*. Chalmers, 463.

the church of England, of whom there was only one in the province of Massachusetts. The fasts and thanksgivings appointed by the congregational churches were arbitrarily suppressed by the governor, who gave notice that the regulation of such matters belonged entirely to the civil power. He declared repeatedly in council that the people would find themselves mistaken if they supposed that the privileges of Englishmen would follow them to the end of the world, and that the only difference between their condition and that of slaves, was that they were neither bought nor sold. It was declared unlawful for the colonists to assemble in public meetings, or for any one to quit the province without a passport from the governor; and Randolph, now at the summit of his wishes, was not ashamed to boast in his letters that the rulers of New England "were as arbitrary as the great Turk." While Andros mocked the people with the semblance of trial by jury, he easily contrived, by the well-known practice of *packing juries*, to convict and wreak his vengeance on every person who offended him, as well as to screen the enormities of his own dependents from the punishment they deserved. And, as if to complete the discontent that such proceedings excited, he took occasion to question the validity of individual titles to land, declaring that the rights acquired under the sanction of the ancient government were tainted with its vices and must share its fate.* New grants or patents from the governor were declared to be requisite to mend the defective titles to land; and writs of intrusion were issued against those who refused to apply for such patents and to pay the enormous fees that were charged for them. The king, indeed, had now encouraged Andros to consider the people whom he governed as a society of felons or rebels; for he transmitted to him express directions to grant his majesty's most gracious pardon to as many of the people as should apply for it. But none had the meanness to ask for a grace that suited only the guilty. The only act of the king that was favorably regarded by the inhabitants of the colony, was his *declaration of indulgence*, which excited so much dissatisfaction in Britain, even among the protestant dissenters who shared its benefit. Notwithstanding the intolerance that has been imputed to New England, this declaration produced general satisfaction there, though there were not wanting some who had discernment enough to perceive that the sole object of the king was the gradual re-introduction of popery.

After many ineffectual remonstrances against his oppressive proceedings had been made by the colonists to Andros himself, two deputies, one of whom was Increase Mather, the most eminent divine and most popular minister in Massachusetts, were sent over to England, [1688,] to submit the grievances of the colony to the humane consideration of the king. Randolph, who was revelling in the profits of the office of post-master-general of New England, with which his servility had been rewarded, labored to defeat the success of the deputation by writing to the English ministry that Mather was a seditious and profligate incendiary, and that his object was to pave the way to the overthrow of regal government. Yet the requests of the colonists were extremely moderate. Whatever they might desire, all that they demanded was that their freeholds might be respected, and that a colonial assembly might be established for the purpose, at least, of adjusting their taxation. The first of these points was conceded by the king; but as to the other, he was inexorable. When Sir William Phipps, who had gained his esteem by his spirit and gallantry, pressed him to grant the colonists an assembly, he replied, "Any thing but that, Sir William;" and even the opinion of Powis, the attorney-general, to whom the application of the deputies had been submitted, and who reported in favor of it, produced no change in his determination. James had now matured and extended his system of colonial policy. He had determined to reduce all the American governments, as well those which were denominated *proprietary* as others, to an immediate dependence on the crown, for the double purpose of effacing the examples that might diminish the resignation of the people of New England, and of combining the force of all the colonies from the banks of the Delaware to the shores of Nova Scotia, into a compact body that might be capable of presenting a barrier to the formidable encroachments of France. A general aversion to liberal institutions, no doubt, concurred with these purposes; and the panegyrics that resounded from his

oppressed subjects in Britain on the happiness that was reported to be enjoyed in America, contributed, at this period, in no slight degree to whet his dislike to American institutions.* With a view to the accomplishment of this design, he had in the preceding year commanded writs of *quo warranto* to be issued for the purpose of cancelling all the patents that still remained in force; and, shortly before the arrival of the deputation from Massachusetts, a new commission had been directed to Andros, annexing New York and New Jersey to his government, and appointing Francis Nicholson his lieutenant. Andros effected this annexation with his usual promptitude; and, having appointed Nicholson deputy-governor at New York, he administered the whole of his vast dominion with a vigor that rendered him formidable to the French, but, unhappily, still more formidable and odious to the people whom he governed.

Sir William Phipps, who had employed his influence with the king in behalf of the deputation from Massachusetts, was himself a native of the province, and, notwithstanding a mean education and the depression of the humblest circumstances, had raised himself by the mere vigor of his mind to a conspicuous rank, and gained a high reputation for spirit, skill, and success. He kept sheep in his native province till he was eighteen years of age, and was afterwards apprenticed to a ship carpenter. When he was freed from his indentures, he pursued a seafaring life, and attained the station of captain of a merchant vessel. Having met with an account of the wreck of a Spanish ship, loaded with great treasures, near the Bahama islands, about fifty years before, he conceived a plan of extricating the buried treasure from the bowels of the deep; and, transporting himself to England, he stated his scheme so plausibly that the king was struck with it, and in 1683 sent him out with a vessel to make the attempt. It proved unsuccessful; and all his urgency could not induce the king to engage in a repetition of it. But the Duke of Albermarle, resuming the design, equipped a vessel for the purpose, and gave the command of it to Phipps, who now realizing the expectations he had formed, succeeded in raising specie to the value of at least 300,000*l.* from the bottom of the ocean. Of this treasure, he obtained a portion sufficient to make his fortune, with a still larger meed of general consideration and applause. The king was exhorted by some of his courtiers to confiscate the whole of the specie thus recovered, on pretence that a fair representation of the project had not been made to him; but he declared that the representation had been perfectly fair, and that nothing but his own misgivings, and the evil advice and mean suspicions of these courtiers themselves, had deprived him of the treasure that this honest man had labored to procure him. He conceived a high regard for Phipps, and conferred the rank of knighthood upon him. Sir William employed his influence at court for the benefit of his country; and his patriotism seems not to have harmed him in the opinion of the king. Finding that he could not prevail to obtain the restoration of the charter privileges, he solicited and received the appointment of high sheriff of New England; in the hope that by remedying the abuses that were committed in the impannelling of juries, he might create a barrier against the tyranny of Andros. But the governor and his creatures, incensed at this interference, made an attempt to have him assassinated, and soon compelled him to quit the province and take shelter in England. James, shortly before his own abdication, among the other attempts he made to conciliate his subjects, offered Phipps the government of New England; but, happily for his pretensions to an office he so well deserved, he refused to accept it from a falling tyrant, and under a system which, instead of seeking any longer to mitigate, he hoped speedily to see dissolved.

The dissatisfactions of the people of New England continued meanwhile to increase to such a height, that every act of the government was viewed through the medium of a strong dislike: In order to discredit the ancient administration, Andros and Randolph had

* Dryden, whose servile nose faithfully re-echoed the sentiments of the court, thus expresses himself in a theatrical prologue written in the year 1686—

"Since faction ebbs, and rogues grow out of fashion,
Their penny scribes take care to inform the nation
How well men thrive in this or that plantation:

How Pennsylvania's air agrees with quakers,
And Carolina's with associators;
Both e'en too good for madmen and for traitors.

Truth is, our land with saints is so run o'er,
And every age produces such a store,
That now there's need of two New Englands more."

labored to propagate the opinion that the Indians had hitherto been treated with a cruelty and injustice, to which all the hostilities with these savages ought reasonably to be imputed; and had vaunted their own ability to rule them by gentleness and equity.* But this year their theory and their policy were alike disgraced by the furious hostilities of the Indians on the eastern frontiers of New England. The movements of these savages were excited on this, as on former occasions, by the insidious artifices of the French, whose unprincipled suppleness of character and demeanor has always been much more acceptable to the Indians in their native condition, than the grave unbending spirit of the English, and has found it easier to cultivate and employ than to check or eradicate the treachery and ferocity of their Indian neighbors. The English settlers offered to the Indians terms of accommodation, which at first they seemed willing to accept; but the encouragements of their French allies soon prevailed with them to reject all friendly overtures, and their native ferocity prompted them to signalize this declaration by a series of unprovoked and unexpected massacres. Andros published a proclamation requiring that the murderers should be delivered up to him; but the Indians treated him and his proclamation with contempt. In the depth of winter he found himself obliged to march against them; and though he succeeded in occupying and fortifying positions which enabled him to curb their insolence, he made little or no impression on their numerical strength, and lost a great many of his own men in vain attempts to follow them into their fastnesses, in the most rigorous season of the year. So strong and so indiscriminating was the dislike he had excited among the people of New England, that this expedition was unjustly ascribed to a wish to destroy the troops, whom he conducted, by cold and famine.

At length the smothered rage of the people burst forth. In the following spring [1689,] some vague intelligence was received, by way of Virginia, of the proceedings of the prince of Orange in England. The old magistrates and leading men of the colony ardently wished and secretly prayed that success might attend him; but they determined in so great a cause to commit nothing unnecessarily to hazard, and quietly to await an event which they supposed that no movement of theirs could either accelerate or retard. But New England was destined to effect, by her own efforts, her own liberation; and the inhabitants of Massachusetts were now to exercise the brave privilege which nearly a century after, and in a conflict still more arduous, their children again were ready to assert, of being the first to resist oppression, and showing their countrymen the way to independence. The cautious policy and prudential dissuasions from violence that were employed by the older inhabitants of the province, were utterly disregarded by the great body of the people. Stung with the recollection of past injuries, their impatience, on the first prospect of relief, could not be restrained. All at once, and apparently without any preconcerted plan, an insurrection broke forth in the town of Boston; the drums beat to arms, the people flocked together; and in a few hours the revolt became so universal, and the energy of the people so overpowering, that all thoughts of resisting their purpose were abandoned by the government. The scruples of the more wealthy and cautious inhabitants were completely overcome by the obvious necessity of interfering to calm and regulate the fervor of the populace. Andros and about fifty of the most obnoxious characters were seized and imprisoned. On the first intelligence of the tumult, Andros had sent a party of soldiers to apprehend Mr. Bradstreet; a measure that served only to suggest to the people who their leader ought to be, and to anticipate the unanimous choice by which this venerable man was reinstated in the office he had held when his country was deprived of her liberties. Though now bending under the weight of ninety years, his intellectual powers seemed to have undergone but little abatement: he retained (says Cotton Mather) a vigor and wisdom that would have recommended a younger man to the government of a greater colony. As the tidings of the revolt spread through the province, the people eagerly flew to arms, and hurried to Boston to co-operate with their countrymen in the cause which they found already crowned with complete success. To the assembled crowds a declaration was read from the balcony of the Court House, enumerating the

* The titles of many of the proprietors of estates in New England depended upon conveyances executed by the Indians; but Andros declared that Indian deeds were no better than "the scratch of a bear's paw." Belknap, i. 233.

* It appears that Randolph cultivated the good opinion of William Penn, by writing to him in this strain, as well as by condemning the former persecution of the quakers in Massachusetts. Hutchinson, 364. Chalmers, 423, 424.

grievances of the colony, and tracing the whole to the tyrannical abrogation of the charter. A committee of safety was appointed by general consent; and an assembly of representatives being convened soon after, this body, by an unanimous vote, and with the hearty concurrence of the whole province, declared their ancient charter and its constitutions to be resumed; re-appointed Bradstreet and all the other magistrates who had been in office in the year 1686; and directed these persons in all things to conform to the provisions of the charter, "that this method of government may be found among us when order shall come from the higher powers in England." They declared that Andros and the counsellors who had been imprisoned along with him were detained in custody to abide the directions that might be received concerning them from his highness the Prince of Orange and the English parliament. What would be the extent of the revolution that was in progress in the parent state, and to what settlement of affairs it would finally conduct, was yet wholly unknown in the colonies.

The example of Massachusetts was immediately followed by the other provinces of New England. When the tidings of the revolution at Boston reached Connecticut, the inhabitants determined no longer to acknowledge a governor who from the command of one half of the colonies was now reduced to the situation of a delinquent in jail. Their charter reappeared from its concealment; and the chartered government, which had never been either expressly surrendered or legally dissolved, was instantly resumed with universal satisfaction. The people of Rhode Island had never been required to give up the charter whose privileges they had so solemnly and formally surrendered; and they now scrupled not to declare that it was still in force, and to remove as well as they could the only obstruction to this plea, by repealing the act of surrender. New Plymouth, in like manner, resumed instantaneously its ancient form of government. In New Hampshire, a general convention of the inhabitants was called, and the resolution adopted, of re-annexing the province to Massachusetts. In conformity with this resolution, deputies were elected to represent them in the general court at Boston; but King William refused to comply with the wishes of the people, and some time after appointed a separate governor for New Hampshire.

Although the people of Massachusetts had at first intimated very plainly their purpose to revive by their own act their ancient charter, the cool consideration that succeeded the ferment during which this purpose had been entertained, convinced them that it was necessary to forego it, and that the restoration of a charter so formally vacated by the existing authorities of the parent state could proceed only from the crown or legislature of England. Hearing of the convention of estates that had been convoked by the Prince of Orange in England, the provincial government of Massachusetts called together a similar convention of the counties and towns of the province; and it was the opinion of the majority of this assembly that the charter could not be resumed. Intelligence having arrived of the settlement of England and the investiture of William and Mary with the crown, they were proclaimed in the colony with extraordinary solemnity and universal satisfaction. A letter was soon after addressed by the new sovereigns, To the Colony of Massachusetts, expressing the royal allowance and approbation of the late proceedings of the people, and authorising the present magistrates to continue the administration of the public affairs, till their majesties, with the advice of the privy council, should settle them on a basis that would be satisfactory to all their subjects in the colony. An order was transmitted, at the same time, to send Andros and the other prisoners to England, that they might answer the charges preferred against them. Additional deputies were chosen by the colony to join Mr. Mather, who still continued in England, and, in concurrence with him, to substantiate the charges against Andros, and, above all, to endeavor to procure the restoration of the charter.

But before the colonists were able to ascertain if this favorite object was to be promoted by the English revolution, they felt the evil effects of that great event, in the consequences of the war that had already broken out between England and France. The war between the two parent states quickly extended itself, to their possessions in America and the colonies of New England and New York were now involved in bloody and desolating hostilities with the forces of the French in Canada, and their Indian auxiliaries and allies. The hostilities that were directed against New York be-

long to another portion of this history. In concert with them, various attacks were made by considerable bodies of the Indians in the conclusion of this year on the settlements and forts in New Hampshire and Maine; and in several instances being crowned with success, they were productive of the most horrid extremities of savage cruelty. Folly aware that these depredations originated in Canada and Acadia, the general court of Massachusetts prepared during the winter an expedition against both Port Royal and Quebec. The command of it was intrusted to Sir William Phipps, who, on the dissolution of the late arbitrary government, had come to New England in the hope of being able to render some service to his countrymen. Eight small vessels, with seven or eight hundred men, sailed under his command in the following spring, and, almost without opposition, took possession of Port Royal and of the whole province of Acadia; and, within a month after its departure, the fleet returned loaded with plunder enough to defray the whole expense of the expedition. But the Count Frontignac, the governor of Canada, retorted by severe and bloody attacks on the more remote of the colonial settlements; and, animating the hostilities of his Indian allies, kept the frontiers in a state of incessant alarm by their continued incursions. Letters had been written by the general court to King William, urging the importance of the conquest of Canada, and soliciting his aid towards that attempt; but he was too much occupied in Europe to extend his exertions to America, and the general court determined to prosecute the expedition without his assistance. New York and Connecticut engaged to furnish a body of men who should march by the way of Lake Champlain to the attack of Montreal, while the troops of Massachusetts should proceed by sea to Quebec. The fleet destined for this expedition consisted of nearly forty vessels, the largest of which carried forty-four guns, and the number of troops on board amounted to two thousand. The command of this considerable armament was confided to Sir William Phipps, who, in the conduct of it, demonstrated his usual courage, and every qualification except that military experience, without which, in warfare waged on so large a scale with a civilized enemy, all the others will prove unavailing. The troops of Connecticut and New York, retarded by defective arrangements, and disappointed of the assistance of the friendly Indians who had engaged to furnish them with canoes for crossing the rivers they had to pass, were compelled to retire without attacking Montreal, and the whole force of Canada was thus concentrated to resist the attack of Phipps. His armament arrived before Quebec so late in the season, that only a *coup de main* could have enabled him to carry the place; but by unskilful delay, the time for such an attempt was suffered to pass unimproved. The English were worsted in various severe encounters, and compelled at length to make a precipitate retreat; and the fleet, after sustaining considerable loss in the voyage homeward, returned to Boston. Such was the unfortunate conclusion of an expedition which had involved the colony in an enormous expense, and cost the lives of at least a thousand men. The French had so strongly apprehended that it would be successful, that they scrupled not to ascribe its failure to the immediate interposition of Heaven, in confounding the devices of the enemy, and depriving them of common sense; and, under this impression the people of Quebec established an annual procession in commemoration of their deliverance. It is, however, a strong proof of the good conduct of Phipps, that a result so disastrous exposed him to no blame, and deprived him in no degree of the favor of his countrymen. And yet the disappointment, and the effects that resulted from it, were remarkably severe. The general court of Massachusetts had not even anticipated the possibility of miscarriage, and had expected to derive, from the success of the expedition, the same reimbursement of its expenses, of which their former enterprise had been productive. The returning army, finding the government totally unprepared to satisfy their claims, were on the point of mutinying for their pay; and it was found necessary to issue bills of credit, which the soldiers consented to accept in place of money. The colony was now in a very depressed and suffering state. Endeavoring to improve the calamities which they were unable to avoid, the government earnestly endeavored to promote the increase of piety and the reformation of manners; and urged upon the ministers and the people the duty of strongly resisting that worldliness of mind, which the necessity of contending violently for the things of this world is apt to beget. The stacks of the Indians on the eastern frontiers were

attended with a degree of success and barbarity that diffused general terror; and the colonists were expecting in this quarter to be driven from their settlements, when, all at once, these savages, of their own accord, proposed a peace of six months, which was accepted by the government with great willingness and devout gratitude. As it was perfectly ascertained that the hostile proceedings of these savages were continually fostered by the intrigues, and rendered the more formidable by the assistance and instructions of the French authorities in Canada, the conquest of this province began to be considered by the people of New England indispensable to their safety and tranquillity. In the hope of prevailing with the king to sanction and embrace this enterprise, as well as for the purpose of aiding the other deputies in the no less interesting application for the restoration of the colonial charter, Sir William Phipps, soon after his return from Quebec, by desire of his countrymen proceeded to England.*

[1691.] In the discharge of the duties of their mission, the deputies appear to have employed every effort that patriotic zeal could prompt, and honorable policy could admit, to obtain satisfaction to their constituents in the punishment of their oppressors, and the restitution of their charter. But in both these objects their endeavors were unsuccessful; and the failure (whether justly or not) was generally ascribed to the unbending integrity with which Mather and Phipps rejected every art and intrigue that seemed inconsistent with the honor of their country. It was soon discovered that the king and his minister were extremely averse to an inquiry into the conduct of Andros and Randolph, and not less so to the restitution of the ancient charter of the colony. The proceedings of the British court on this occasion present a confused and disgusting picture of intrigue and duplicity. The deputies were beset by pretended counsellors and partisans, some perhaps indiscreet, and some no doubt insincere. They were persuaded, by certain of their advisers, to present to the privy council the charges against Andros *unsigned*, and assured by others, that in so doing they had *cut the throat of their country*. When they attended to present their charges, they were anticipated by Andros and Randolph, who came prepared with a charge against the colony for rebellion against lawful authority, and the imprisonment of their legitimate governor. Sir John Somers, the counsel for the deputies consented that they should abandon the situation of accusers and stand on the defensive, and he tendered the unsigned charges as an answer to the accusations of Andros and Randolph. The council demurred to the reception of a plea presented in the name of a whole people, and required that some individuals should appear and make the plea their own. "Who was it," said the Lord President, "that imprisoned Sir Edmund and the rest? you say it was the country, and that they rose as one man. But that is nobody. Let us see the persons who will make it their own case." The deputies thereupon offered to sign the charges, and to undertake individually every responsibility for the acts of their countrymen. But they were deterred from this proceeding by the remonstrances of Sir John Somers, who insisted (for no intelligible purpose) on persisting in the course in which they had begun. Some of the counsellors too, protested against the injustice and chicanery of encountering the complaint of a whole country with objections of such a technical description. "Is not it plain," they urged, "that the revolution in Massachusetts was carried on exactly in the same manner as the revolution in England! Who seized and imprisoned Chancellor Jeffries! who secured the garrison of Hull! These were the acts of the people, and not of private individuals." This difference of opinion on a point of form seems to have been the object which the ministry had

* Neal, ii. 449—450. Hutchinson, i. 393—404. Governor Colcler's History of the Five Indian Nations of Canada, i. 126. Colcler erroneously supposes the expedition against Quebec to have taken place in the following year.

† Philosophic observers have been struck with surprise at the contrast between the language and the conduct of the English Whigs in the Revolution of 1688. Their conduct in effecting the great change was liberal and manly. Their language, contracted and prejudiced, seemed intended to veil the audacity of their proceedings from the grossness of public view. They asserted indefeasible hereditary right with their tongues, while they violated it with their hands; and rancored the settlement of the crown in the very words of that act of settlement which they had so deliberately set aside—endeavoring, like the entail of an estate, to deprive their posterity of the liberty that they themselves had enjoyed and found it necessary to exercise. They seemed to have considered the Americans in some such light as they regarded their own posterity, and to have looked with very little favor on every exercise of liberty independent of themselves. While they studied to clothe their own conduct in the sanctification of precedent, they exacted a substantial adherence to precedent from their successors and their dependants.

studied to promote. Without determining the point, the council interrupted the discussion by a resolution, that the whole matter should be submitted to the king; and his majesty soon after signified his pleasure that the complaints of both parties should be dismissed.* Thus terminated the impeachment of Andros, in a manner very ill calculated to impress the people of Massachusetts with respect for the justice of the British government. They had soon after the mortification of seeing him add reward to impunity, and honored with the appointment of governor of Virginia.*

The deputies finding that the House of Commons, though at first disposed to annul the proceedings on the *quo warranto* against Massachusetts, had been persuaded by the arguments of Somers and the other lawyers who had seats in the house to depart from this purpose, and that the king was determined not to restore the old charter, employed every effort to obtain at least a restitution of the privileges it had contained. But William and his ministers, though deterred from imitating the tyrannical proceedings of the former reign, were heartily desirous of availing themselves of whatever acquisitions these proceedings might have made to the royal prerogative; and finding that the crown had acquired a legal pretext to exercise a much stronger authority over the colony than had been reserved in its original constitution, it was determined to take advantage of this pretext without regard to the tyrannical nature of the proceeding by which it had been obtained. The restoration of their ancient privilege of electing their own municipal officers was ardently desired by the people, and contended for by the deputies with a vehemence which the king would probably have resented as disrespectful to himself, if he had not felt himself bound to excuse the irritation excited by his own injustice. He adhered inflexibly to his determination of retaining, as far as possible, every advantage that fortune had put into his hands: and at length a new charter was framed, with changes that materially affected the ancient constitution of the colony, and transferred to the crown many valuable privileges that had originally belonged to the people. By this charter the territories of Massachusetts, Plymouth, and Maine, together with the conquered province of Acadia or Nova Scotia, were united together in one jurisdiction—an arrangement that was by no means satisfactory to the parties included in it; for Plymouth, which had earnestly solicited a separate establishment, was forcibly annexed to Massachusetts; and Hampshire, which had as earnestly petitioned to be included in this annexation, was erected into a separate jurisdiction.† The appointment of the governor, deputy governor, secretary, and all the officers of the admiralty, was reserved to the crown. Twenty-eight councillors were directed to be chosen by the House of Assembly, and presented to the governor for his approbation. The governor was empowered to convoke, adjourn, prorogue, and dissolve the assembly at pleasure; to nominate, exclusively, all military officers, and (with the consent of his council) all the judges and other officers of the law. To the governor was reserved a negative on the laws and acts of the general assembly and council; and all laws enacted by these bodies and approved by the governor were appointed to be transmitted to England for the royal approbation; and if disallowed within the space of three years, they were to be utterly void.

The innovations that were thus introduced into their ancient constitution, excited much discontent in the minds of the people of Massachusetts; the more so because the extension of royal authority was not attended with a proportional communication of the royal protection: and the king, at the very time when he appropriated the most valuable privileges of the people found himself constrained, by the urgency of his affairs in Europe, to refuse the assistance which the people had besought from him to repel the hostilities of the

Indians and of the French settlers in Canada. The situation of the states of Connecticut and Rhode Island, which were permitted to reassume all their ancient privileges, rendered the injustice with which Massachusetts was treated more flagrant and irritating. Though legal technicalities might seem to warrant the advantage which those states enjoyed, it was utterly repugnant to the enlarged views of justice and equity which ought to regulate the policy of a legislator. Only mistake on the one hand, or their own artifice on the other, could be supposed to entitle them to a distinction that made the treatment of Massachusetts more invidious; and a very dangerous lesson was taught to the colonies when they were thus given to understand that it was their own vigilant dexterity and successful intrigue, or the blunders of the parent state, that they were to rely on as the safeguards of their rights. The injustice of the policy of which Massachusetts now complained was rendered still more glaringly apparent by the very different treatment obtained by the powerful corporation of the city of London. The charter of this city, though assailed with the same solemnity, and on grounds as plausible, as the ancient charter of Massachusetts, was restored by a legislative act immediately after the revolution. Nor was any political advantage derived by the English government from this violation of just and equitable principles. The patronage that was wrested from the people and appropriated by the crown, was quite inadequate to the formation of a powerful royal party in the country. The appointment of the governor and other officers was regarded as a badge of dependence, instead of forming a bond of union. The popular assemblies retained sufficient influence over the governors to curb them in the enforcement of obnoxious measures, and sufficient power to restrain them from making any serious inroad on the constitution. It is a remarkable fact that the dissensions between the two countries, which afterwards terminated in the dissolution of the British empire in America, were in a great degree promoted by the pernicious counsels and erroneous information that the colonial governors of those provinces, in which the appointment to that office was exercised by the king, transmitted to the English ministry.

Aware of the dissatisfaction with which the new charter was regarded, the ministers of William judged it prudent to waive in the outset the full exercise of the invidious prerogative, and desired the deputies to name the person whom they considered most acceptable to their countrymen as governor of Massachusetts: and the deputies having concurred in the nomination of Sir William Phipps, the appointment to this office was bestowed on him accordingly. This act of courtesy was attended with a degree of success in mollifying the ill humor of the people, that strongly attests the high estimation in which Phipps was held: for on his arrival in Boston, [1692,] though some discontent was expressed, and several of the members of the general court loudly insisted that the new charter should be absolutely rejected,* yet the great body of the people received him with acclamations; and a large majority of the general court resolved that the charter should be thankfully accepted, and appointed a day of thanksgiving for the safe arrival of their worthy governor and Mr. Mather, whose services they acknowledged with grateful commemoration. The new governor hastened to approve himself worthy of the favorable regards of his countrymen. Having convoked a general assembly of the province, he addressed them in a short but characteristic speech, recommending to them the preparation of a body of good laws with all the expedition they could exert. "Gentlemen," said he, "you may make yourselves as easy as you will for ever. Consider what may have a tendency to your welfare, and you may be sure that whatever bills you offer to me, consistent with the honor and interest of the crown, I'll pass them readily. I do but seek opportunities to serve you. Had it not been for the sake of this thing, I had never accepted of this province. And whenever you have settled such a body of good laws, that no person coming

after me may make you uneasy, I shall desire not one day longer to continue in the government." His conduct simply corresponded with these professions.

The administration of Sir William Phipps, however, was neither long nor prosperous. Though he might give his sanction as governor to popular laws, it was not in his power to guard them from being rescinded by the crown; and this fate soon befel a law that was passed exempting the people from all taxes but such as should be imposed by their own assemblies, and declaring their right to share all the privileges of Magna Charta. He found the province involved in a distressing war with the French and Indians, and in the still more formidable calamity of that delusion which has been termed the *New England witchcraft*. When the Indians were informed of the appointment of Sir William Phipps to the office of governor of Massachusetts, they were struck with amazement at the fortunes of the man whose humble origin they perfectly well knew, and with whom they had familiarly associated but a few years before in the obscurity of his primitive condition. Impressed with a high opinion of his courage and resolution, and a superstitious dread of that fortune that seemed destined to surmount every obstacle and prevail over every disadvantage, they would willingly have made peace, but were induced to continue the war by the artifices and intrigues of the French. A few months after his arrival, the governor, at the head of a small army, marched to Pembaquid, on the Merrimack river, and there caused to be constructed a fort of considerable strength, and calculated by its situation to form a powerful barrier to the province, and to overawe the neighboring tribes of Indians and interrupt their mutual communication. The beneficial effect of this operation was experienced in the following year, [1693,] when the Indians sent ambassadors to the fort at Pembaquid, and there at length concluded with English commissioners a treaty of peace, by which they renounced for ever the interests of the French, and pledged themselves to perpetual amity with the inhabitants of New England. The colonists, who had suffered severely from the recent depredations of these savages,* and were still laboring under the burdens entailed on them by former wars, were not slow to embrace the first overtures of peace: and yet the utmost discontent was excited by the measure to which they were indebted for the deliverance they so ardently desired. The expense of building the fort and of maintaining its garrison and stores occasioned an addition to the existing taxes, which was borne with much impatience. The party who had opposed submission to the new charter, eagerly promoted every complaint against the administration of a system which they regarded with rooted aversion; and labored so successfully on this occasion to render the person and government of Sir William Phipps odious to his countrymen, that his popularity sustained a shock from which it never afterwards entirely recovered. The people were easily led to connect in their apprehension the increase of taxation with the abridgment of their political privileges, and to believe that if they had retained their ancient control over the officers of government, the administration of their affairs might have been more economically conducted. But another cause, to which I have already alluded, and which we must now proceed more fully to consider, rendered the minds of the people at this time unusually susceptible of gloomy impressions, and suspicious not less irritating than unreasonable.

The belief of witchcraft was at this period almost universal in christian countries; and the existence and criminality of the practice were recognised in the penal code of every civilized state. Persons suspected of being witches and wizards were frequently tried, condemned, and put to death by the authority of the most enlightened tribunals in Europe; and in particular, but a few years before this period, Sir Matthew Hale, a man highly and justly renowned for the strength of his understanding, the variety of his knowledge, and the eminent christian graces that adorned his character, had, after a long and anxious investigation, adjudged a number of persons to die for this offence, at an assize in Suffolk.† The reality of witchcraft, as yet, had never

* Randolph was not sent back to America. He received, however, an appointment in the West Indies, where he died, retaining, it is said, his dislike of the people of New England to the last. Eliot's Biographical Dictionary of New England, 402, 3. Cranfield, the tyrant of New Hampshire, was appointed collector of Barbadoes. He repented of his conduct in New England, and endeavored to atone for it by showing all the kindness in his power to the traders from that country. Belknap, i. 222.

† The union, so earnestly desired by the people of Massachusetts and New Hampshire, was overruled by the interest, and for the convenience, of Samuel Allen, a merchant in London, to whom Mason's heirs had sold their claim to the soil of New Hampshire. He was appointed the first governor of the province; and employing his authority in vexatious but unsuccessful attempts to efface his purchased claim, rendered himself extremely odious to the people. Belknap, i. cap. ix. and xi. He was superseded by Lord Bellamont in 1698.

* Mr. Mather and the other deputies, when they found it impossible to obtain an alteration of the new charter, proposed at first to reject it altogether, and to institute a process for trying the validity of the judgment pronounced on the *quo warranto*. They were deterred from this proceeding by the solemn assurance of Treby, Somers, and the two chief justices of England, that if the judgment were reversed, a new *quo warranto* would be issued, and undoubtedly followed by a judgment exempt from all ground of challenge. These learned persons assured the deputies that the colonists, by erecting judicatories, constituting a house of representatives, and incorporating colleges, had forfeited their charter, which gave no sanction to such acts of authority. Hutchinson, i. 415.

* The situation of the people of New Hampshire, in particular, had become so irksome and dangerous that at one time they appear to have adopted the resolution of abandoning the province. Belknap, i. 266.

† Howell's State Trials, vol. vi. p. 647. Even so late as the middle of the eighteenth century, the conviction of the witches of Warbol, in the reign of queen Elizabeth, was still commemorated in annual sermon at Huntington. Johnson's Works, Observations on the tragedy of Macbeth. The seeders in Scotland published an act of their associate presbytery at Edinburgh in 1743 (reprinted at Glasgow in 1766).

been questioned, nor were there any to whom it appeared unimportant or incredible, except those who regarded the spiritual world altogether as a mere speculation, vague, visionary and delusive. Among the number of those who every where believed in it, were some of the unfortunate beings who were put to death as witches. Instigated by fraud and cruelty, or possessed by demonical frenzy, some of these unhappy persons professed more or less openly to hold communication with the powers of darkness; and, by the administration of subtle poisons, by disturbing the imagination of their victims, or by an actual appropriation of that mysterious agency which scripture assures us did once exist, and which no equal authority has ever proved to be extinguished, they committed crimes and inflicted injuries which were punished, perhaps, under an erroneous name. The colonists of New England, participating in the general belief of this practice, regarded it with a degree of abhorrence and indignation becoming the piety for which they were so remarkably distinguished. Their experience in America had tended to strengthen the sentiments on this subject which they had brought with them from England; for they found the belief of witchcraft firmly rooted among the Indian tribes, and the practice (or what was so termed and esteemed) prevailing extensively, and with perfect impunity, among those people whom as heathens they justly regarded as the worshippers of demons. [13.] Their conviction of the reality of witchcraft must necessarily have been confirmed by this evidence of the universal assent of mankind; and their resentment of its enormity proportionately increased by the honor and acceptance which they saw it enjoy under the shelter of superstitions that denied and dishonored the true God. The first trials for witchcraft in New England occurred in the year 1645, when four persons charged with this crime were put to death in Massachusetts. Goffe, the regicide, in his diary, records the conviction of three others at Hartford, in Connecticut, in 1662, and remarks, that after one of them was hanged, the young woman who had been bewitched was restored to health. For more than twenty years after, we hear but little of any similar prosecutions. But in the year 1688, a woman was executed for witchcraft at Boston, after an investigation conducted with a degree of solemnity that made a deep impression on the minds of the people. An account of the whole transaction was published, and so generally were the wise and good persuaded of the justice of the proceeding, that Richard Baxter wrote a preface to the account, in which he scrupled not to declare every one who refused to believe it an obdurate Sadducee.* The attention of the people being thus strongly excited, and their suspicions thus powerfully awakened in this direction, the charges of witchcraft began gradually to multiply, till, at length, there commenced at Salem that dreadful tragedy which rendered New England for many months a scene of bloodshed, terror, and madness, and at one time seemed to threaten the subversion of civil society.

It was in the beginning of the year 1692 that this malady seemed to originate in an epidemic complaint resembling epilepsy, and which the physicians, finding themselves unable to explain or cure, ascribed very readily to supernatural inclination. Some young women, and among others the daughters and niece of Mr. Paris, the minister of Salem, were first attacked by this distemper, and induced by the declarations of their medical attendants to ascribe it to witchcraft. The delusion was encouraged by a perverted application of the means best fitted to strengthen and enlighten the understanding. Solemn fasts and assem-

blies for extraordinary prayer were held by the neighboring clergy; and the supposition of witchcraft, which in reality had been previously assumed, was thus confirmed and consecrated in the apprehension of the public. The fancy of the patients, perverted by disordered sensation, and inflamed by the contagious terror which their supposed malady excited, soon dictated accusations against particular individuals as the authors of their sufferings. The flame was now kindled, and finding ample nourishment in all the strongest passions and most inveterate weaknesses of human nature, carried havoc and destruction through the community. The bodily symptoms of the prevailing natural epidemic, frequently revolved by persons of weak mind and susceptible frame, were propagated with amazing rapidity, and having been once regarded as symptoms of witchcraft, were ever after referred to the same diabolical origin. The usual and well known contagion of nervous disorders was powerfully aided by the dread of the mysterious agency from which they were now supposed to arise; and this appalling dread, embecbling the reason of its victims, soon led them to confound the vicious of their disturbed apprehension with the realities of their experience. Symptoms before unheard of, and unusually terrific,* attended the cases of the sufferers, and were supposed to prove beyond a doubt that the disorder was supernatural, and no bodily ailment; while, in truth, they denoted nothing else than the extraordinary terror of the unhappy patients, who enhanced the malignity of their disease by the frightful agency to which they ascribed it. Every case of nervous derangement was now referred to this source, and every morbid affection of the spirits and fancy diverted into this dangerous channel. Accusations of particular individuals easily suggested themselves to the disordered minds of the sufferers, and were eagerly preferred by themselves and their relatives, in the hope of obtaining deliverance from the calamity, by the punishment of the guilty. These charges, however unsupported by proof, and however remote from probability, alighted with fatal influence wherever they fell. The supernatural intuition by which they were supposed to be communicated, supplied and excluded all ordinary proof; and when a patient, under the dominion of nervous affections, or in the intervals of epileptic paroxysms, declared that he had seen the apparition of a particular individual inflicting his sufferings, no consideration of previous character could screen the accused from a trial, which, if the patient persisted in the charge, invariably terminated in a conviction. The charges were frequently admitted without any other proof, for the very reason for which they should have been utterly rejected by human tribunals—that they were judged incapable of common proof, or of being known to any but the accuser and the accused. So powerful and universal was the belief in the reality of the supposed witchcraft, that none dared, even if they had been disposed, openly to deny it; and even the innocent victims of the charges were constrained to argue on the assumption that the apparitions of themselves, described by their accusers, had really been seen, and reduced to plead that their semblance had been assumed by an evil spirit that sought to screen his proper instruments and divert the public indignation upon unoffending persons. It was answered, however, most gratuitously, but, unhappily to the conviction of the public, that an evil spirit could assume only the appearance of such persons as had given up their bodies to him, and devoted themselves to his service. The semblance of legal proof, besides, was very soon added to the force of these charges, and seeming to establish them in some cases was thought to confirm them in all. Some of the accused persons, terrified by their danger, sought safety in avowing the charge, recanting their supposed impiety, and denouncing others as their tempters and associates. In order to beget favor and verify their recantation, they now declared themselves the victims of the witchcraft they had formerly practised, counterfeited the nervous affections of their accusers, and imputed their sufferings to the vengeance of their ancient accomplices. These artifices and the general delusion were promoted by the conduct of the magistrates, who, with a monstrous inversion of equity and sound policy, offered impunity to all who would confess the charges and betray their associates, while

denouncing the repeal of the penal laws against witchcraft as a national sin. Arnot's Criminal Trials in Scotland, 367.

In the year 1672 (sixty years before the act against witchcraft in England) Louis the Fourteenth issued an edict forbidding the French tribunals to receive accusations of witchcraft. But this edict was ineffectual. Voltaire's Age of Louis XIV. cap. 29.

The last executions for witchcraft in the British dominions were at Huntingdon in 1716, and in Sutherlandshire in 1722. Arnot.

* Cudworth declares that all who disbelieve witchcraft must be atheists. James the First caused a book that exposed the imposture of some pretended instances of witchcraft to be burned by the hands of the hangman—a favorite mode of reply with his majesty to the works of his adversaries. He had written a work on demonology, in which he thus described a part of the preparations for the invocation of evil spirits:—"Circles are made, triangular, quadrangular, round, double or single, according to the form of the apparition they crave." How the conjurers made triangular circles, he has omitted to explain. The famous Saverre, who told his hearers from the pulpit, that the divine right of kings, and the divine origin of christianity, "concur like parallel lines, meeting in one common centre," seems to have inherited the mathematics as well as the politics of this prince.

they inflexibly doomed to death every accused person who maintained his innocence. Thus, one accusation produced a multitude of others, the accused becoming accusers and witnesses, and hastening to escape from the danger by involving other persons in it. From Salem, where its main fury was exerted, the evil spread extensively over the province of Massachusetts; and wherever it was able to penetrate, it effectually subverted the happiness and security of life. The sword of the law was wrested from the hands of justice, and committed to the grasp of the wildest fear and fury. Suspense and alarm pervaded all ranks of society. The first and the favorite objects of accusation had been ill-favored old women, whose dismal aspect, exciting terror and aversion, instead of pity and kindness, was reckoned a proof of their guilt, and seemed to designate the proper agents of mysterious and unearthly wickedness. But the sphere of accusation was progressively enlarged to such a degree, that at length neither age nor sex, neither ignorance nor innocence, neither learning nor piety, neither reputation nor office, could afford the slightest safeguard against a charge of witchcraft. Even irrational creatures were involved in this fatal charge; and a dog belonging to a gentleman accused of witchcraft, was hanged as an accomplice of its master. Under the dominion of terror, all mutual confidence seemed to be destroyed, and the best feelings of human nature trampled under foot. The nearest relations became each other's accusers and one unhappy man, in particular, was condemned and executed on the testimony of his wife and daughter, who appear to have accused him merely for the sake of preserving themselves. Many respectable persons fled from the colony; others, maintaining their innocence, were capitally convicted, and died with a determined courage and piety that affected, but could not disabuse, the spectators. The accounts that have been preserved of the trials of these unfortunate persons, present a most revolting and humiliating picture of frenzy, folly, and injustice. There were received in evidence against the prisoners, accounts of losses and mishaps that had befallen the accusers or their cattle (in some cases, twenty years before the trial) recently after some meeting or some disagreement with the prisoners. Against others, it was deposed that they had performed greater feats of strength, and walked from one place to another in a shorter space of time than the accusers judged possible without diabolical assistance. But the main article of proof was the spectral apparitions of the persons of the supposed witches to the eyes of their accusers during the paroxysms of their malady. The accusers sometimes declared that they could not see the prisoners at the bar of the court; which was construed into a proof of the immediate exertion of Satanic influence in rendering their persons invisible to the eyes of those who were to testify against them. The bodies of the prisoners were commonly examined for the discovery of what were termed witch-marks; and as the examiners did not know what they were seeking for, and yet earnestly desired to find it, every little puncture or discoloration of the skin was easily believed to be the impress of diabolical touch. In general the accusers fell into fits, or complained of violent uneasiness at the sight of the prisoners. On the trial of Mr. Burroughs, a clergyman of the highest respectability, some of the witnesses being affected in this manner, the judges replied to his protestations of innocence, by asking if he would venture to deny that these persons were then under the influence of diabolical agency. He answered that he did not deny it, but that he denied having any concern with it. "If you were not a friend of the devil," replied the presiding judge, "he would not exert himself in this manner to prevent these persons from speaking against you." When a prisoner in his defence uttered any thing that seemed to move the audience in his favor, some of the accusers were ready to exclaim that they saw the devil standing by and putting the words in his mouth; and every feeling of humanity was chased away by such absurd and frantic exclamations.* Some fraud and malignity undoubtedly mixed with sincere misapprehension in stimulating these prosecutions. The

* It is impossible to read these trials as they are reported by Cotton Mather and Neal, without being struck with the resemblance they exhibit to the proceedings in England on the trials of the persons accused of participation in the Popish Plot. In both cases, the grand engine of injustice and destruction was the passion of fear; a passion which, when strongly excited, is capable of producing the most enormous excesses of fury and cruelty. In both countries a mixture of causes contributed to the production of the evil; but unquestionably there was a much greater degree of artifice employed to excite and maintain the popular panic in England and in America.

* Swelling of the throat, in particular, now well known as a hysterical symptom, was considered at this time a horrible prodigy. Medical science was still depraved by an admixture of gross superstition. The touch of a king was believed to be capable of curing some diseases, and astrology formed a part of the course of medical study, because the efficacy of drugs was believed to be promoted or impeded by planetary influence.

principle that was practically enforced in the courts of justice, that in cases of witchcraft, accusation was equivalent to conviction, presented the most subtle and powerful allurements to the expression of natural ferocity, and the indulgence of fantastic terror and suspicion; and there is but too much reason to believe that rapacity, malice and revenge were not vainly invited to seize this opportunity of satiating their appetites in confiscation and bloodshed. So strong meanwhile was the popular delusion, that even the detection of manifest perjury on one of the trials proved utterly insufficient to weaken the credit of the most unsupported accusation. Sir William Phipps the governor, and the most learned and eminent persons both among the clergy and laity of the province, partook and promoted the general infatuation. Nothing but an outrageous zeal against witchcraft seemed capable of assuring any individual of the safety of his life; and temptations that but too frequently overpowered human courage and virtue, arose from the conviction impressed on every person that he must make choice of the situation of the oppressed or the oppressor. The afflicted (as the accusers were termed) and their witnesses and partizans, began to form a numerous and united party in every community, which none dared to oppose, and which none who once joined or supported could forsake with impunity. A magistrate who had for some time taken an active part in examining and committing the supposed delinquents, beginning to suspect that these proceedings originated in some fatal mistake, showed an inclination to discourage them; and was instantly assailed with a charge of witchcraft against himself. A constable who had apprehended many of the accused, was struck with a similar suspicion, and hastily declared that he would meddle in this matter no farther. Instantly aware of the danger he had provoked, he attempted to fly the country, but was overtaken in his flight by the vengeance of the accusers, and, having been brought back to Salem, was tried for witchcraft, convicted and executed. Some persons whom self-preservation had induced to accuse their nearest relatives, being touched with remorse, proclaimed the wrong they had done, and retracted their testimony. They were convicted of relapse into witchcraft, and died the victims of their returning virtue.

The evil at length became too great to be borne. About fifteen months had elapsed since the malady had broke out, and so far from being extinguished or abated, it was growing every day more formidable. Of twenty-eight persons who had been capitally convicted, nineteen had been hanged;* and one, for refusing to plead, had been pressed to death—the only instance in which this English legal barbarity was ever inflicted in North America. The number of the accusers and pardoned witnesses multiplied with alarming rapidity. The sons of Governor Bradstreet, and other individuals of eminent station and character, had fled from a charge belied by the whole tenor of their lives. An hundred and fifty persons were in prison on the same charge, and complaints against no less than two hundred others had been presented to the magistrates. Men began to ask themselves, Where this would end! The constancy and piety with which the unfortunate victims had died, produced an impression on the minds of the people which, though counterbalanced at the time by the testimony of the pardoned witnesses, began to revive with the reflection that these witnesses had purchased their lives by their testimony, while the persons against whom they had borne evidence had sealed their own testimony with their blood. It was happy, perhaps, for the country, that while the minds of the people were awakening to reflections so favorable to returning moderation and humanity, some of the accusers carried the audacity of their arraignment to such a pitch, as to prefer charges of witchcraft against Lady Phipps, the governor's wife, and against some of the nearest relatives of Dr. Increase Mather, the most pious minister and popular citizen of Massachusetts. These charges at once opened the eyes of Sir William Phipps and Dr. Mather; so far, at least, as to induce a strong suspicion that many of the late proceedings had been rash and indefensible. They felt that they had dealt with others in a manner very different from that in which they were now reduced to desire that

others should deal with them. The same sentiment also beginning to prevail in the public mind, a resolute and successful attempt was made by a respectable citizen of Boston to stem the fury of these terrible prosecutions. Having been charged with witchcraft by some persons at Andover, he anticipated an arrest, by boldly arresting his accusers for defamation, and laid his damages at a thousand pounds. The effect of this vigorous proceeding surpassed his most sanguine expectations. It seemed as if a spell that had been cast over the people of Andover was dissolved by one bold touch; the frenzy vanished in a moment, and witchcraft was heard of in that town no more. The impression was rapidly propagated throughout the province; and the effect of it was seen at the very next court that was held for the trial of witchcraft, when, of fifty prisoners who were tried on such evidence as had been formerly deemed sufficient, the accusers could obtain the conviction of no more than three, who were immediately relieved by the governor. These acquittals were doubtless in part produced by a change which the public opinion underwent as to the sufficiency of what was denominated *spectral evidence* of witchcraft. An assembly of the most eminent divines of the province, convoked for the purpose by the governor, had, after due consideration, given it forth as their deliberate judgment, "That the apparitions of persons afflictting others, was no proof of their being witches," and that it was by no means inconsistent with scripture or reason that the devil should assume the shape of a good man, or even cause the real aspect of that man to produce impressions of pain on the bodies of persons bewitched. The ministers, nevertheless, united in strongly recommending to the government the vigorous prosecution of all persons still accused of witchcraft. But the judgment they had pronounced respecting the validity of the customary evidence, rendered it almost impossible to procure a conviction, and produced, at the same time, so complete a revolution in the public mind respecting the late executions, that charges of witchcraft were found to excite no other sentiments than disgust and suspicion of the parties who preferred them. The cloud that had so deeply overcast the prosperity and happiness of the colony vanished entirely away, and universal shame and remorse succeeded to the frenzy that had lately prevailed. Even those who continued to believe in the reality of the diabolical influence of which the accusers had complained, were satisfied that most, if not all, of the unfortunate convicts had been unjustly condemned, and that their accusers, in charging them, had been deluded by the same agency by which their sufferings were occasioned. Many of the witnesses now came forward and published the most solemn recantations of the testimony they had formerly given, both against themselves and others; apologizing for their perjury by a protestation, of which all were constrained to admit the force, that no other means of saving their lives had been left to them. These testimonies were not able to shake the opinion which was still retained by a considerable party both among the late accusers and the public at large, that much witchcraft had mixed with the late malady, whether the real culprits had yet been detected or not. This opinion was supported in treatises written at the time by Dr. Mather and other eminent divines. But it was found impossible ever after to revive prosecutions that excited such painful remembrances, and had been so lamentably perverted. Sir William Phipps, soon after he had relieved the three persons last convicted, ordered all who were in custody on charges of witchcraft to be released, and, in order to prevent the dissensions that might arise from the retributory proceedings against the accusers and their witnesses, he proclaimed a general pardon to all persons for any concernment they might have had with the prosecutions for witchcraft. The surviving victims of the delusion, however, and the relatives of those who had perished, were enabled to enjoy all the consolation they could derive from the sympathy of their countrymen and the earnest regret of their persecutors. The house of assembly appointed a general fast and prayer, "that God would pardon all the errors of his servants and people in a late tragedy raised among us by Satan and his instruments." One of the judges who had presided on the trials at Salem, stood up in his place in church on this occasion, and implored the prayers of the people that the errors he had been guilty of might not be visited by the judgments of an avenging God on the country, his family, or himself. Many of the jurymen subscribed and published a declaration lamenting and condemning the delusion to which they had yielded, and acknowledging that they had brought the reproach

of innocent blood on their native land. Mr. Paris, the clergyman who had instituted the first prosecutions, and promoted all the rest, found himself exposed to a resentment not loud or violent, but deep and general, and was at length universally shunned by his fellow citizens, and abandoned by his congregation. He appears, throughout the whole proceedings, to have acted with perfect sincerity, but to have been transported, by a vehement temper and a strong conviction of the righteousness of the ends he pursued, into the adoption of means for their attainment, inconsistent with truth, honor, or justice. While the delusion lasted, his violence was applauded as zeal in a righteous cause, and little heed was given to accusations of artifice and partiality in conducting what was believed to be a controversy with the devil. But when it appeared that all these efforts had in reality been directed to the shedding of innocent blood, his popularity gave place to universal odium and disgust. Sensible, at length, how dreadfully erroneous his conduct had been, [1694,] he hastened to make a public profession of repentance, and solemnly begged forgiveness of God and man. But the people declaring that they would never more attend the ministry of one who had been the instrument of misery and ruin to so many of their countrymen, he was obliged to resign his charge and depart from Salem.*

This terminated a scene of delusion and cruelty that justly excited the astonishment of the civilized world, and had exhibited a fearful picture of the weakness of human nature in the sudden transformation of a people renowned over all the earth for piety and virtue, into the slaves or associates, the terrific dupes or helpless prey, of a band of ferocious lunatics and assassins. Among the various evil consequences that resulted from these events, not the least important was the effect they produced on the minds of the Indian tribes, who began to conceive a very unfavorable opinion of the people that could inflict such barbarities on their own countrymen, and the religion that seemed to arm the hands of its professors for their mutual destruction. This impression was the more disadvantageous to the colonists, as there had existed for some time a competition between their missionaries and the priests of the French settlements, for the instruction and conversion of the Indians;† and it was always found that the tribes embraced the political interests of that people whose religious instructors were most popular among them. The French did not fail to improve to their own advantage, the odious spectacle that the late frenzy of the people of New England had exhibited; and to this end they labored with such diligence and success, that in the following year, when Sir William Phipps paid a visit to the tribes with whom he had concluded the treaty of Pennamquid, and endeavored to unite them in a solid and lasting friendship with the colonists, he found them more firmly wedded than ever to the interests of the French, and under the dominion of prepossessions unfavorable in the highest degree to the formation of friendly relations with the English. To his proposition of renewing the treaty of peace, they agreed very readily; but all his instances to prevail with them to desist from their intercourse with the French, proved utterly unavailing. They refused to listen to the missionaries who accompanied him; having learned from

* Mather, B. ii. Life of Sir William Phipps, Increase Mather's Cases of Conscience concerning Evil Spirits. Neal, ii. 496—541. Hutchinson, ii. 17—62. Calef's Wonders of the Invisible World. "I find these entries in the MS. Diary of Judge Sewall: 'Went to Salem, where, in the meeting-house, the persons accused of witchcraft were examined; a very great assembly. 'Twas awful to see how the afflicted persons were agitated.' But in the margin is written, in a tremulous hand, probably on a subsequent review, the lamenting Latin interjection, *Vae, vae, vae!*" Holmes, ii. 5, 6.

† It was a very depraved edition of Christianity that was preached to the Indians by the French priests—a system that harmonized perfectly well with the passions and sentiments which true Christianity most strongly condemns. It substituted the rites and superstitious inventions of the Romish church in the place of their ancient witchcraft and idolatry; and stigmatizing their enemies as heretics, afforded additional sanction and incitement to hatred, fury, and cruelty. Neal has preserved (Vol. I. p. 266) a specimen of the French Missionary Catechism, containing a tissue of the most absurd and childish fictions gravely propounded as the articles of christian doctrine. The following anecdote is related by Governor Golden in his History of the Five Nations, Vol. I. p. 207. "About the time of the conclusion of the peace of Ryswick, Therouet, a noted Indian sachem, died at Montreal. The French gave him christian burial in a pompous manner: the priest that attended him at his death having declared that he died a true Christian. For (said the priest) while I explained to him the passion of our Saviour, whom the Jews crucified, he cried out, 'Oh! had I been there, I would have revenged his death, and brought away their scalps.' The French priests who ministered amongst the Indians were Jesuits: and their maxim, that it was unnecessary to keep faith with heretics, proved but too congenial to the savage ethics of their pupils.

* This is nothing to the slaughter that was inflicted in the regular course of justice or injustice in England. Howell, in two letters, one dated February 3, 1646, the other February 20, 1647, says that in two years there were indicted in Suffolk and Essex between 200 hundred and 300 witches, of whom more than half were executed. That this was accounted no very extraordinary number of executions in England, may be inferred from a variety of similar facts collected by Barrington, in his Observations on Stat. 20 Henry the Sixth.

the French priests to believe that the English were heretics, and enemies to the true religion of Christ. Some of them scrupled not to remark, that since they had received the instructions of the French, witchcraft had entirely disappeared from among them, and that they had no desire to revive it by communication with a people among whom it was reputed still to prevail more extensively than it had ever done with themselves.

Every thing, indeed, betokened the renewal of hostilities between the colonists and the Indians, which accordingly broke out very soon after, and was perhaps accelerated by the departure of Sir William Phipps from New England. The administration of this governor, though in the main highly and justly popular, had not escaped a considerable degree of reproach. The discontents excited by the taxation that had been imposed for the support of the fortification at Penmaquid, concurring with the resentments and enmities that the prosecutions for witchcraft had left behind, produced a party in the province who labored on every occasion to thwart the measures and traduce the character of the governor. Finding their exertions in Massachusetts insufficient to deprive him of the esteem of the great body of the people, these adversaries transmitted articles of impeachment against him to England, and petitioned the king and council for his recall and punishment. The king having declared that he would hear the cause himself, an order was transmitted to the governor to meet his accusers in the royal presence at Whitehall; in compliance with which, Sir William set sail for England, carrying with him an address of the assembly expressive of the strongest attachment to his person, and beseeching the king that they might not be deprived of the services of so able and meritorious an officer. On his appearance at court his accusers vanished, and their charges were withdrawn; and having rendered a satisfactory account of his administration to the king, he was preparing to return to his government, when a malignant fever put an end to his life. [1695.] He left behind him the reputation of a pious, upright, and honorable man. As a soldier, if not pre-eminently skilful, he was active and brave; as a civil ruler, faithful, magnanimous, and disinterested: it was remarked of him, as of Aristides, that "he was never seen the prouder for any honor that was done him by his countrymen;" and though the generous simplicity of his manners added lustre to the high rank he had attained, he was never ashamed to revert to the humility of the condition from which he had sprung. In the midst of a fleet that was conveying an armament which he commanded on a military expedition, he called to him some young soldiers and sailors who were standing on the deck of his vessel, and pointing to a particular spot on the shore, said, "Young men, it was upon that hill that I kept sheep a few years ago;—and since you see that Almighty God has brought me to something, do you learn to fear God and be honest, and you don't know what you may come to."

On the departure of Sir William Phipps, the supreme authority in Massachusetts devolved on Mr. Stoughton, the lieutenant-governor, who continued to exercise it during the three following years; the king being so much engrossed with his wars and negotiations on the continent of Europe, that it was not till after the peace of Ryswick that he found leisure even to nominate a successor to Sir William Phipps. During this period, the happiness of the people was much disturbed by internal dissension, and their prosperity invaded by the calamities of war. The passions bequeathed by the persecutions for witchcraft continued long to divide and agitate the people; and the factious opposition which they had promoted to the government of Sir William Phipps, continued to increase in vigor and virulence after his departure. The mutual animosities of the colonists had attained such a height, that they seemed to be ready to involve their country in a civil war; and the operations of the government were cramped and obstructed at the very time when the utmost vigor and unanimity were requisite to encounter the hostile enterprises of the French and the Indians. Incited by their French allies, the Indians recommenced the war with the usual suddenness and fury of their military operations. Wherever surprise or superior numbers enabled them to prevail over parties of the colonists, or detached plantations, their victory was signalled by the extremities of barbarous cruelty.† The colony of

Acadia, or Nova Scotia, now once more reverted to the dominion of France. It had been annexed, as we have seen, to the jurisdiction of Massachusetts, and governed hitherto by officers deputed from the seat of the supreme authority at Boston. But Port Royal (or Annapolis, as it was afterwards termed) having been now recaptured by a French armament, the whole settlement revolted, and re-annexed itself to the French dominions—a change that was ratified by the subsequent treaty of Ryswick. But a much more serious loss was sustained by Massachusetts in the following year; [1695.] when, in consequence of a combined attack of the French and Indians, the fort erected by Sir William Phipps at Penmaquid was compelled to surrender to their arms, and was levelled with the ground. This severe and unexpected blow excited the utmost dismay: and the alarming consciousness of the danger that might be apprehended from the loss of a barrier of such importance, rebuked in the strongest manner the factious discontent that had murmured at the expense of maintaining it. These apprehensions were but too well justified by the increased ravages of Indian warfare, and the increased insolence and fury with which this triumph inspired the Indian tribes. Mr. Stoughton and his council adopted the most vigorous measures to repair or retaliate the disaster, and despatched forces to attack the enemy both by land and sea; but miscarriage attended both these expeditions, and, at the close of the year, the colonial forces had been unable, by the slightest advantage, to check the assaults of the enemy, or to revive the drooping spirits of their countrymen. In the following year,* [1697.] the province, after being severely harassed by the incursions of the Indians, was alarmed by the intelligence of a formidable invasion which the French were preparing, with a view to its complete subjugation. The commander of a French squadron which was cruising on the northern coasts of America had concerted with the Count Frontignac, the governor of Quebec, a joint attack by sea and land, with the whole united force of the French and Indians on the colony of Massachusetts, and little doubt was entertained of the conquest of the people, or the complete destruction of their settlements. On the first intelligence of this design, the ancient spirit of New England seemed again to awake, and, partial animosities being swallowed up in a more generous passion, the people co-operated with the utmost vigor in the energetic measures by which Stoughton prepared to repel the coming danger. He caused the forts around Boston to be repaired, the whole militia of the province to be embodied and trained with the strictest discipline, and every other measure conducive to an effectual defence to be promptly adopted. In order to ascertain, and, if possible, anticipate the purposed operations of the enemy by land, he despatched a considerable force to scour the eastern frontiers of the province; and this body encountering a detachment of the Indians, who had assembled to join the French invaders, after a short engagement, gave them a complete defeat. This unexpected blow, though in itself of little importance, so deranged the plans of the French as to induce them to defer the invasion of Massachusetts by land till the fol-

penetrate, war was carried into the bosom of every family. The case of a Mrs. Dustan of Haverhill in Massachusetts is remarkable. She was made prisoner by a party of twelve Indians, and, with the infant of which she had been delivered but a week before, and the nurse who attended her, forced to accompany them on foot into the woods. Her infant's head was dashed to pieces on a tree before her eyes; and she and the nurse, after fatiguing marches in the depth of winter, found themselves at an Indian hut a hundred and fifty miles from their home. Here they were informed that they were to be made slaves for life, but were first to be conducted to a distant settlement, where they would be stripped, scourged, and forced to run the gauntlet naked between two files of the whole tribe to which their captors belonged. This intelligence determined Mrs. Dustan to make a desperate effort for her liberation. Early in the morning, having awakened her nurse and a young man, a fellow-prisoner, she got possession of an axe, and, with the assistance of the young man and the nurse, despatched no fewer than ten Indians in their sleep; the other two awoke and escaped. Mrs. Dustan returned in safety with her companions to Haverhill, and was liberally rewarded for her intrepidity by the legislature of Massachusetts. Dwight's Travels.

Whatever other cruelties the Indians might exercise on the bodies of their captives, it is observable that they never attempted to violate the chastity of women, and that they respected modesty in so far as was consistent with the infliction of torture. Belknap, i. 1287. They had a strong aversion to negroes, and generally killed them whenever they fell into their hands. 254.

* In the midst of these troubles died this year the venerable Simon Bradstreet, the last survivor of the original planters, for many years governor, and termed by his countrymen the Nestor of New England. He died in his ninety-fifth year; earnestly desiring to be dissolved, and enter into the rest of God, insomuch (says Cotton Mather) that it seemed as if death were conferred upon him, instead of life being taken from him.

lowing year; and the French admiral finding his fleet weakened by a storm, and apprised of the vigorous preparations for his reception, judged it prudent, in like manner, to abandon the projected naval invasion.

In the commencement of the following year, [1698.] intelligence was received in America of the treaty of Ryswick, by which peace had been concluded between Britain and France. By this treaty it was agreed that the two contracting powers should mutually restore to each other all conquests that had been made during the war, and that commissioners should be appointed to examine and determine the rights and pretensions of either monarch to the territories situated in Hudson's Bay. The evil consequences of thus leaving the boundaries of growing settlements unascertained, were sensibly experienced at no distant date.

Count Frontignac, the governor of Canada, on receiving intelligence of this treaty, summoned the chiefs of the Indian tribes together, and informing them that he could no longer support them in hostilities against the English, advised them to deliver up their captives, and make the best terms for themselves that they could obtain. The government of Massachusetts, on receiving their pacific overtures, sent two commissioners to Penobscot to meet with their principal sachems, who endeavored to apologise for their unprovoked hostilities by ascribing them to the artifice and instigation of the French jesuits. They expressed, at the same time, the highest esteem, and even a filial regard, for Count Frontignac, and an earnest desire that, in case of any future war between the French and English, the Indians might be permitted to observe a neutrality between the belligerent parties. After some conferences, a new treaty was concluded with them, in which they were made to acknowledge a more formal submission to the crown of England than they had ever before expressed.

On the settlement of his affairs in Europe, the king at length found leisure to direct some portion of his attention to America, and nominate a successor to the office that had been vacant since the death of Sir William Phipps. The Earl of Bellmont was appointed governor of New York, Massachusetts, and New Hampshire: and, having selected the former of these places for his own personal residence, he continued the immediate administration of the others in the hands of Mr. Stoughton as deputy governor.

Having traced the separate history of New England up to this period, we shall now leave this interesting province in the enjoyment (unhappily, too short-lived) of a peace, of which a long train of previous hostility and calamity had taught the inhabitants fully to appreciate the value. They were now more united than ever among themselves, and enriched with an ample stock of experience of both good and evil. When Lord Bellmont visited Massachusetts in the following year, the recent heats and animosities had entirely subsided, and general harmony and tranquillity appeared to prevail. [1699.] The virtue that had so signally distinguished the original settlers of New England was now seen to shine forth among their descendants with a lustre less dazzling, but with an influence in some respects more amiable, refined, and humane, than had attended its original display.

One of the causes that undoubtedly contributed to the restoration of harmony, and the revival of piety among the people, was the publication, about this period, of various histories* of the New England commonwealth, written with a spirit and fidelity well calculated to commend to the minds of the colonists the just results of their national experience. The subject was deeply interesting; and, happily, the treatment of it was undertaken by writers whose principal object was to render this interest subservient to the promotion of piety and virtue. Though the colony might be considered as yet in its infancy, it had passed through a great variety of fortune. It had been the adopted country of many of the most excellent men of the age in which it arose, and the native land of others who had inherited the character of their ancestors, and transmitted it to their successors in unimpaired vigor, and with added renown. The history of man never exhibited an effort of more vigorous and enterprising virtue than the original migration of the puritans to this distant and desolate region; nor did the annals of colonization as yet supply more than one other instance of the foundation of a commonwealth, and its advancement through a period of weakness and danger, in

* Hutchinson (ii. 81, 5) says that he was sued at London in an action of damages, but that it was withdrawn.

† Numerous cases are related by the colonial historians of the torture and slavery inflicted by the Indians on their captives, and of the desperate efforts of many of the colonists to defend themselves and their families, or to escape from the hands of their savage enemies. Wherever the Indians could

* Of these productions one of the earliest in point of composition was Governor Winthrop's Journal of Events in New England, from 1630 till 1644. But this Journal was not published till the year 1790. The continuation of it till the year 1649, was not published till 1826.

strength and security, in which the principal actors had left behind them a reputation at once so illustrious and unassailed, with fewer memorials calculated to pervert the moral sense, or awaken the regret of mankind. The relation of their achievements had a powerful tendency to excite hope, and animate perseverance; to impart courage to the virtuous, and to fortify the virtue of the brave. They could not indeed boast, like the founders of the settlement of Pennsylvania, that by a resolute profession of non-resistance of injuries, and a faithful adherence to that profession, they had so realized the Divine protection by an exclusive reliance on it, as to disarm the ferocity of barbarians, and conduct the establishment of their commonwealth without violence and bloodshed. But if they were involved in numerous wars, it was the singular and honorable characteristic of them all, that they were invariably the offspring of self-defence against the unprovoked malignity of their adversaries, and that not one of them was undertaken from motives of conquest or plunder. Though they considered these wars as necessary and justifiable, they deeply deplored them; and, more than once, the most distressing doubts were expressed, at the close of their hostilities, if it were lawful for christians to carry even the rights of self-defence to such fatal extremity. They behaved to the Indian tribes with as much good faith and justice as they could have shown to a powerful and civilized people,* and were incited by their inferiority to no other acts than a series of the most magnanimous and laudable endeavors to instruct their ignorance, and elevate their condition. If they fell short of the colonists of Pennsylvania in the exhibition of christian meekness, they unquestionably excelled them in the extent and activity of christian labor. The quakers succeeded in disarming the Indians; the puritans labored to convert them. The chief, if not the only fault, with which impartial history must ever reproach the conduct of these people, is the religious intolerance that they cherished, and the persecution which in more than one instance it prompted them to inflict. Happily for their own character, the provocation they received from the objects of their persecution, tended strongly to extenuate the blame: and happily, no less, for the legitimate influence of their character on the minds of their posterity, the fault itself, notwithstanding every extenuation, stood so manifestly contrasted and inconsistent with the very principles with which their own fame was for ever associated, that it was impossible for a writer of common integrity, not involved in the immediate heat of controversy, to render a just tribute to their excellence, without finding himself obliged to reprobate this signal departure from it. The histories that were now published were the composition of the friends, associates, and successors of the original colonists, and written with an energy of just encomium that elevated every man's ideas of his ancestors and his country, and of the duties which arose from these natural or patriotic relations, and excited universally a generous sympathy with the characters and sentiments of the fathers of New England. These writers, nevertheless, were too conscientious, and too enlightened, to confound the virtues with the defects of the character they described; and while they dwelt apologetically on the causes by which persecution had been provoked, they lamented the infirmity that (under any degree of provocation) had betrayed good men into so unchristian an extremity. Even Cotton Mather, the most encomiastic of the historians of New England, and who cherished very strong prejudices against the quakers and other persecuted sectaries, has expressed still stronger disapprobation of the severities they encountered from the objects of his encomium. These representations could not fail to produce a beneficial effect on the people of New England. They saw that the glory of their country was associated with principles that could never coalesce with or sanction intolerance: and that every instance of persecution with which their annals were stained, was a dereliction of these principles, and an impeachment of their country's cause. Inspired with the warmest attachment to the memory, and the highest respect for the virtue of their ancestors, they were powerfully reminded, by the errors into which they had fallen, to suspect and repress in themselves those infirmities from which even virtue of so high an order had been found to afford no exemption. From this time the religious zeal of the people of New England

was no longer perverted by intolerance, or disgraced by persecution; and the influence of Christianity in mitigating enmity, and promoting kindness and indulgence, derived a freer scope from the growing conviction, that the principles of the gospel were utterly irreconcilable with violence and severity; that, revealing to every man his own corruption much more clearly than that of any other human being, they were equally adverse to confidence in himself and to suspicion of others; and that a deep sense of entire dependence on Divine aid, must ever be the surest indication of the acceptance of human purpose and the efficacy of human endeavor to subserve the divine cause. Cotton Mather, who has recorded the errors of the first colonists, lived to witness the success of his representations in the charity and liberality of their descendants.*

New England having been colonised by men, not less eminent for learning than piety, was distinguished at a very early period by the labors of her scholars, and the dedication of her literature to the interests of religion. The theological works of Cotton, Hooker, the Mathers, and other New England divines, have always enjoyed a very high degree of esteem and popularity, not only in New England, but in every protestant country of Europe. The annals of the colony, and the biography of its founders and their immediate successors, were written by cotemporary historians with a minuteness which was very agreeable and interesting to the first generation of their readers, and to which they were prompted, in some measure at least, by the conviction they entertained that their country had been honored with the signal favor and more especial guidance and direction of Providence. This conviction, while it naturally betrayed the writers into the fault of prolixity, enforced by the strongest sanctions the accuracy and fidelity of their narrations. Recording what they considered the peculiar dealings of God with a people peculiarly his own, they presumed not to disguise the infirmities of their countrymen; nor did they desire to magnify the Divine grace in the infusion of human virtue, above the Divine patience in enduring human frailty and imperfection. The errors and failings of the illustrious men whose lives they related, gave additional weight to the impression which above all they desired to convey, that the colonization of New England was an extraordinary work of Heaven, that the counsel and the virtue by which it had been carried on were not of human origin, and that the glory of God had been displayed no less in imparting the strength and wisdom than in overruling the weakness and perversity of the instruments which he deigned to employ. The most considerable of these historical works, and the most interesting performance that the literature of New England has ever produced, is the "Magnalia Christi Americana," or History of New England by Cotton Mather. The arrangement of this work is exceedingly faulty, and its vast bulk will ever continue to render its exterior increasingly repulsive to modern readers. The continuity of the narrative is frequently broken by the introduction of long discourses, epistles, and theological reflections and dissertations; biography is intermixed with history, and events of trifling or merely local interest related with intolerable prolixity. It is not so properly a single or continuous historical narration, as a collection of separate works illustrative of the various portions of New England history, under the heads of "Remarkable Providences, Remarkable Trials," and numberless other subdivisions. A plentiful intermixture of puns, anagrams, and other barbarous conceits, exemplifies a peculiarity (the offspring, partly of bad taste, and partly of superstition) that was very

* A discourse which he published some years after this period, contains the following passage:—"In this capital city of Boston, there are ten assemblies of Christians of different persuasions, who live so lovingly and peaceably together, doing all the offices of neighbourhood for one another in such a manner, as may give a sensible rebuke to all the bigots of uniformity, and show them how consistent a variety of rites in religion may be with the tranquillity of human society; and may demonstrate to the world that persecution for conscientious dissent in religion is an abomination of desolation, a thing whereof all wise and just men will say, 'Cursed be its anger, for it is fierce; and its wrath, for it is cruel.'" Neal's Present State of New England, p. 611. The first episcopal society was formed in Massachusetts in 1696 (before the arrival of Andros) and the first episcopal chapel erected at Boston in 1698. Collections of the Mass. Hist. Soc. iii. 259. A quaker meeting-house was built at Boston in 1710. Ibid. 260.

† "If we look on the dark side, the human side, of this work, there is much of human weakness and imperfection lightly appeared in all that hath been done by man, as was acknowledged by our fathers before us. Neither was New England ever without some fatherly chastisements from God; showing that he is not fond of the formalities of any people upon earth, but expects the realities of practical godliness, according to our profession and engagement unto him." Higginson's Attestation, prefixed to Cotton Mather's History.

prevalent among the prose writers, and especially the theologians of that age. Notwithstanding these defects, the work will amply repay the labor of every reader. The biographical portions in particular possess the highest excellence, and are superior in dignity and interest to the compositions of Plutarch. Cotton Mather was the author of a great many other works,* many of which have been highly popular and eminently useful. One of them bears the title of "Essays to do Good" and contains a lively and forcible representation (conveyed with more than the author's usual brevity) of the opportunities which every rank and every relation of life will present to a devout mind, of promoting the glory of God and the good of mankind. The celebrated Dr. Franklin, in the latter years of his active and useful life, declared that all the good he had ever done to his country or his fellow-creatures, must be ascribed to the impression that had been produced on his mind by perusing that little work in his youth. It is curious to find an infidel philosopher thus ascribe all his practical wisdom to the lessons of a christian divine, and trace the stream of his beneficence to the fountain of the gospel.

A traveller who visited Boston in the year 1686, mentions a number of booksellers there who had already made fortunes by their trade. The learned and ingenious author of the History of Printing in America has given a catalogue of the works published by the first New England printers in the seventeenth century. Considering the circumstances and numbers of the people, the catalogue is amazingly copious. One of the printers of that age was an Indian, the son of one of the first Indian converts.

The education and habits of the people of New England prepared them to receive the full force of those impressions which their national literature was calculated to produce. In no country have the benefits of knowledge been ever more highly prized or more generally diffused. Institutions for the education of youth were coeval with the foundation of the first colonial community, and were propagated with every accession to the population and every extension of the settlements. Education was facilitated in this province by the peculiar manner in which its colonization was conducted. In many other parts of America, the planters dispersed themselves over the face of the country; each residing on his own farm, and placing his house in the situation most conducive to his own convenience as a planter. The advantages resulting from this mode of inhabitation were gained at the expense of such dispersion of dwellings as obstructed the erection of churches and schools, and the enjoyment of social intercourse. But the colonization of New England was conducted in a manner much more favorable to the improvement of human character and the refinement of human manners. All the original townships were settled in what is termed the village manner; the inhabitants having originally planted themselves in small communities, from regard to the ordinances of religion and the convenience of education. Every town containing fifty householders was obliged by law to provide a schoolmaster qualified to teach reading and writing; and every town containing a hundred householders, to maintain a grammar school. But the generous ardor of the people continually outstripped the provisions of this law. We have seen Harvard College established in Massachusetts but a few years after the foundation of the colony was laid. The other states, for some time after, were destitute of the wealth and population necessary to support similar establishments within their own territories; but they frequently assessed themselves in the most liberal contributions for the maintenance and enlargement of Harvard College. The contributions, even at a very early period, of Connecticut, Newhaven, and New Hampshire, have been particularly and deservedly noted for their liberality. The close of the same century was illustrated by the establishment of Yale College in Connecticut. So high was the repute that the province long continued to enjoy for the excellency and efficiency of its seminaries of education, that many respectable persons, not only in the other American states, but even in Great Britain, sent their children to be educated in New England.

A general appetite for knowledge, and universal

* His biographers have given us a catalogue of his works, amounting to no fewer than three hundred and eighty-two—many no doubt of small dimensions, but others of considerable bulk, and some voluminous. He was a singular economist of time, and at once the most voluminous and popular writer, and the most zealous and active minister of his age. Above his study door was inscribed this impressive admonition to his visitors, "Be short." He was the son of Dr. Increase Mather, born in 1663, and died in 1727.

* Not only were all the lands occupied by the colonists fairly purchased from their Indian owners, but, in some parts of the country, the lands were subject to quit-rents to the Indians, "which," says Belknap, in 1784, "are annually paid to their posterity." p. 74.

familiarity with letters, was thus maintained from the beginning among the people of this province. The general discouragement of frivolous amusements, and of every recreation that bordered upon vice, tended to devote their leisure hours to reading; and the sentiments and opinions derived through this avenue of knowledge, sunk deeply into vigorous and undissipated minds. The historical retrospections of this people were peculiarly calculated to exercise a favorable influence on their character and turn of thinking, by awakening a generous emulation and connecting them with a uniform and progressive course of manly, patient, and successful virtue.

Notwithstanding the general diffusion of knowledge among the people of New England, the lower classes were not entirely exempt from some of the prevalent delusions of the age. In particular, the notion, then generally received in the parent state, of the efficacy of the royal touch for the cure of the disorder called the king's evil, appears to have been imported into New England, to the great inconvenience of those who were so unhappy as to receive it. Belknap has transcribed from the records of the town of Portsmouth in New Hampshire, the petition of an inhabitant to the court of this province, in the year 1687, for assistance to undertake a journey to England, that he might be cured of his disease by coming in contact with a king; * a circumstance which Heaven (it may be hoped) has decreed should never be possible within the confines of North America.

The amount of the population of New England at this period has been very differently estimated by different writers. According to Sir William Petty, the number of inhabitants amounted, in the year 1691, to one hundred and fifty thousand. A much lower computation is adopted by Neal, and a much higher by a later historian. The population, it is certain, had been considerably augmented, both by the emigrations of dissenters from various of the European states, and by native propagation in circumstances so favorable to increase. Yet no quarter of North America has seen its own population so extensively drained by emigration as New England, which, from a very early period of its history, has never ceased to send swarms of hardy, industrious, and educated men to recruit and improve every successive settlement that has offered its resources to energy and virtue. The total restraint of licentious intercourse; the facility of acquiring property and maintaining a family; the discouragement of idleness and luxury; and the prevalence of industrious and frugal habits among all classes of people, concurred with powerful efficacy to render marriages both frequent and prolific in New England. Boston, the capital of Massachusetts, and the largest city in North America, appears to have contained a population of about 10,000 persons at the close of this century. In the year 1720, its inhabitants amounted to 20,000. Every inhabitant of the province was required by law to keep a stock of arms and ammunition in his house; and all males above sixteen years of age were enrolled in the militia, which was assembled for exercise four times every year.

The whole territory of New England was comprehended at this period in four jurisdictions, Massachusetts, New Hampshire, Connecticut, and Rhode Island. To Massachusetts there had been annexed the settlements of New Plymouth and Maine, and to Connecticut the settlement of Newhaven. The territories of these governments were divided into constituted districts called townships, each of which was represented by one or two deputies (according to the number of the freeholders) in the assembly of the state. Besides this elective franchise, the freeholders of each township enjoyed the right of appointing the municipal officers denominated select-men, by whom the local administration of the township was exercised. The qualification of a freeholder in Massachusetts was declared by its charter to be an estate of the value of forty shillings per annum, or the possession of personal property to the amount of fifty pounds; communion with the con-

gregational churches having ceased for many years to be requisite to the enjoyment of political privileges. In the other states of New England, the qualification was at this period nearly the same as in Massachusetts. The expenses of government had been defrayed originally by temporary assessments, to which every man was rated according to the value of his whole property; but since the year 1645, excises, imposts, and poll taxes had been in use. The judicial proceedings in all the provincial courts were conducted with great expedition, cheapness, and simplicity of procedure.

Massachusetts and New Hampshire, the one enjoying a chartered, the other an unchartered jurisdiction, were the only two states of New England in which the superior officers of government were appointed by the crown, and from the tribunals of which an appeal was admitted to the king in council. As New Hampshire was too inconsiderable to support the substance as well as the title of a separate establishment, it was the practice at this period, and for some time after, to appoint the same person to be governor of Massachusetts and New Hampshire. In Connecticut and Rhode Island, all the officers of government (excepting the members of the court of admiralty) were elected by the inhabitants; and so resolutely was this highly-valued privilege asserted, that when King William appointed Fletcher, the governor of New York, to command the Connecticut forces, the province refused to obey him. The laws of these states were not subject to the negative, nor the judgments of their tribunals to the review, of the king. But the validity of their laws was declared to depend on a very uncertain criterion—a conformity, as close as circumstances would admit, to the jurisprudence of England.* So perfectly democratic were the constitutions of Connecticut and Rhode Island, that in neither of them was the governor suffered to exercise a negative on the resolutions of the assembly. The spirit of liberty was not suppressed in Massachusetts by the encroachments of royal prerogative on the ancient privileges of the people, but was vigorously exerted through the remaining and important organ of the provincial assembly. All the patronage that was vested in the royal governor was never able to create a royalist party in this state. The functionaries whom he appointed, depended on the popular assembly for the emoluments of their offices; and it was not till after many unsuccessful efforts, that the British government were able to free the governor himself from the same dependence, and to prevail with the assembly to annex a fixed salary to his office. The people and the popular authorities of Massachusetts were always ready to set an example to the other colonies of a determined resistance to the encroachments of royal prerogative.

In all the colonies, and especially in the New England states, there existed at this period, and for a long time afterwards, a mixture of very opposite sentiments towards Great Britain. As the posterity of Englishmen, the colonists cherished a strong attachment to a land which they habitually termed the *Mother Country*, or *Home*,† and to a people whom, though contemporaries with themselves, they regarded as occupying an ancestral relation to them. As Americans, their liberty and happiness, and even their national existence, were associated with escape from royal persecution in Britain; and the jealous and unfriendly sentiments engendered by this consideration were preserved more particularly in Massachusetts by the privation of the privileges which had originally belonged to it, and which Connecticut and Rhode Island were still permitted to enjoy, and maintained in every one of the states by the oppressive commercial policy which Great Britain pur-

sued towards them, and of which their increasing resources rendered them increasingly seisable and proportionally impatient. The loyalty of Connecticut and Rhode Island was no way promoted by the preservation of their ancient charters—an advantage which they well knew had been conceded to them by the British government with the utmost reluctance, and of which numerous attempts to divest them by act of parliament were made by King William and his immediate successors. Even the new charter of Massachusetts was not exempted from such attacks; and the defensive spirit that was thus excited and kept alive by the aggressive policy of Britain contributed, no doubt, to influence, in a material degree, the future destinies of America.

In return for the articles which they required from Europe, and of which the English merchants monopolised the supply, the inhabitants of New England had no staple commodity which might not be obtained cheaper in Europe by their customers. They possessed, indeed, good mines of iron and copper, which might have been wrought with advantage; but they were restrained by the English legislature from manufacturing these metals either for home consumption or foreign exportation. The principal commodities exported from New England were the produce and refuse of their forests, or, as it was commonly termed, lumber, and the produce of their cod-fishery. In the beginning of the eighteenth century, the annual imports into the provinces from England were estimated by Neal at 100,000*l*. The exports by the English merchants consisted of a hundred thousand quintals (the quintal weighing 112 pounds) of dried cod-fish, which were sold in Europe for 80,000*l*. and of three thousand tons of naval stores. To the other American plantations, New England sent lumber, fish and other provisions, to the amount of 50,000*l*. annually. An extensive manufacture of linen cloth was established about this time in the province: this was an advantage for which New England was indebted to the migration of many thousands of Irish presbyterians to her shores about the beginning of the eighteenth century. Ship-building was from an early period carried on to a considerable extent at Boston and other sea-port towns. It was the practice of some merchants to freight their vessels as they built them, with cargoes of colonial produce, and to sell the vessels in the same ports in which the cargoes were disposed of. A great part of the trade of the other colonies was conducted by the shipping of New England. At this period, and for many years afterwards, specie was so scarce in the province, that paper money formed almost exclusively the circulating medium in use among the inhabitants. Bills, or notes, were circulated for sums as low as half a crown.

The soil of a great part of the district of Maine was erroneously supposed, by its first European colonists, to be unfavorable to agriculture, and incapable of yielding a sufficient supply of bread to its inhabitants. This notion produced the deficiency which it presupposed; and, injurious as it was to the increase and prosperity of the inhabitants, it prevailed even till the period of the American revolution. Prior to that event, the inhabitants traded almost exclusively in lumber, and the greater part of the bread they consumed was imported from the middle colonies. All the states of New England were long infested with wolves; and, at the close of the seventeenth century, laws were still enacted by the New England assemblies offering bounties for the destruction of these animals.

Except in Rhode Island, the doctrine and form of the congregational church that was established by the first colonists prevailed generally in the New England states. Every township was required by law to choose a minister, and to fix his salary by mutual agreement of the parties; in default of which a salary proportioned to the ability of the township was decreed to him by the justices of the peace. In case of the neglect of any township to appoint a minister within the period prescribed by the law, the right of appointment for the occasion devolved to the court of quarter sessions. By a special custom of the town of Boston, the salaries of its ministers were derived from the voluntary contributions of their respective congregations, collected every Sunday on their assembling for divine service; and it was remarked, that none of the ministers of New England were so liberally provided for as those whose emoluments, unaided by legal provision, thus represented the success of their labors and the attachment or conscientiousness of their people. In Rhode Island there was no legal provision for the observance of divine worship, or the maintenance of religious institutions. This colony was peopled by a mixed mul-

* Belknap, i. Append. No. 46. The following advertisement occurs in the London Gazette of the 29th of May, 1682.—“These are to give notice that the weather growing warm, his majesty will not touch any more for the evil till towards Michaelmas. And his majesty's chirurgeons desire, to prevent his majesty being detoured, that greater care be taken for the future in registering certificates given to such as come to be touched.” After the Restoration, such multitudes flocked to the palace to be touched that a number of people were crushed to death. Evelyn's Journal, ii. 571. This superstition (which it is said that Cromwell vainly tried to attach to his own person) survived in England till the reign of Queen Anne, who touched (among others) the infant frame of Dr. Johnson.

* There were no regular means of ascertaining this conformity; these states not being obliged, like Massachusetts, to transmit their laws to England. On a complaint from an inhabitant of Connecticut, aggrieved by the operation of a particular law, it was declared, by the king in council, “that their law concerning dividing land-inheritance of an intestate was contrary to the law of England, and void;” but the colony paid no regard to this declaration. Hist. of the British Dominions in North America, B. ii. cap. iii. § 1.

† They have left one indelible mark of their origin, and their kindly remembrance of it, in the British names which they transferred to American places. When New-London in Connecticut was founded in the year 1648, the assembly of the province assigned its name by an act commencing with the following preamble: “Whereas it hath been the commendable practice of the inhabitants of all the colonies of these parts, that as this country hath its denomination from our dear native country of England, and thence is called New England; so the planters, in their first settling of most new plantations, have given names to these plantations of some cities and towns in England, thereby intending to keep up and leave to posterity the memorial of several places of note there;” &c. “This court, considering that there hath yet no place in any of the colonies been named in memory of the city of London,” &c. Trumbull, i. 170.

titude of sectarians, who, having separated themselves from christian societies in other places, had continued in a broken and disunited state in their present habitation. In their political capacity, they admitted unbounded liberty of conscience, and disavowed all connexion between church and state. In their christian relations, they made no account of the virtue of mutual forbearance, and absolutely disowned the duty of submitting to one another on any point, whether essential or circumstantial. Few of them held regular assemblies for public worship; still fewer appear to have had stated places for such assemblage; and an aversion to every thing that savored of *restraint* or *formality* prevailed among them all. Notwithstanding the unlimited toleration that was professedly established in this settlement, it appears that the government, in the year 1665, passed an ordinance to outlaw quakers and confiscate their estates, because they would not bear arms. But the people, in general, resisted this regulation, and would not suffer it to be carried into effect. Cotton Mather declares, that, in 1655, "Rhode Island colony was a colluvies of antinomians, fatalists, anabaptists, antisabbatarians, Arminians, Socinians, quakers, ranters, and every thing but Roman catholics and true Christians; *bona terra, mala gens*." In the town of Providence, which was included in this colony, and was inhabited by the descendants of those schismatics who had accompanied Roger Williams and Mrs. Hutchinson in their exile from Massachusetts, the aversion to all establishments and every sort of subordination was carried to such an extreme that, at this period, the inhabitants had neither magistrates nor ministers among them. They entertained an invincible aversion to all rates and taxes, as the inventions of men to support *hirelings*, by which opprobrious term they designated all magistrates and ministers who refused to serve them for nothing. Yet they lived in great amity with their neighbors, and, though every man did whatever seemed right in his own eyes, it was rarely that any crime was committed among them; "which may be attributed," says the historian from whom this testimony is derived, "to their great veneration for the Holy Scriptures, which they all read from the least to the greatest."* Massachusetts and Connecticut, as they were the most considerable of the New England states, in respect of wealth and population, so were they the most distinguished for piety, morality, and the cultivation and diffusion of knowledge. At the close of the seventeenth century there were an hundred religious assemblies in Massachusetts, exclusive of the numerous congregations of christian Indians. The censorial discipline exercised by those societies over their members was eminently conducive to the preservation of good morals; and the efficacy of this and of every other incitement to virtue was enhanced by the thinly peopled state of the country, where none could screen his character or pursuits from the observation of the public eye.

Perhaps no country in the world was ever more distinguished than New England was at this time for the general prevalence of those sentiments and habits that render communities respectable and happy. Sobriety and industry pervaded all classes of the inhabitants. The laws against immoralities of every description were remarkably strict, and not less strictly executed; and

* Neal, ii. 593, 596. We have an account of the religious condition of Rhode Island, about thirty years after this period, from the pen of the great and good Bishop Berkeley, who resided some years in this colony. A general indifference to religion, and a great relaxation of morality, had become the characteristics of the majority of the people. Several churches, however, some on the congregational, and others on the episcopal model, had been established; and through their instrumentality, the blessings of religion were yet preserved in the colony. Berkeley's Work, vol. ii. p. 355, 456.

So late as the beginning of the nineteenth century, the legislature of Rhode Island discouraged the project of a turnpike road, alleging that turnpike duties and ecclesiastical establishments were English practices, and badges of slavery, from which their people were distinguished over all the other Americans by a happy exemption. It was not till the year 1805 that the advantages of turnpike roads prevailed over the imaginary dignity of this exemption. Dwight, vol. ii. Letter 52.

† Josselyn, who visited New England, for the first time in 1638, relates, that in the village of Boston there were then two licensed inns. "An officer visits them," he adds, "whenever a stranger goes into them; and if he calls for more drink than the officer thinks in his judgment he can soberly bear away, he countermands it, and appoints the proprietor, beyond which he cannot get one drop." Josselyn's Voyage, 173. In 1694, the select men of Massachusetts were ordered to hang up in every alehouse lists of all reputed tipplers and drunkards within their districts; and alehouse keepers were forbidden to supply liquor to any person whose name was thus posted. Holmes, ii. 18. The magistrates of some of the towns of Scotland appear to have exercised similar acts of authority. An instance occurred in the town of Rutherglen in 1668. Ure's Hist. of Rutherglen, p. 71.

being cordially supported by public opinion, they were able to render every vicious and profligate excess equally dangerous and infamous to the perpetrator. We are assured by a respectable writer, that at this period there was not a single beggar in the whole province. Labor was so valuable, land so cheap, and the elective franchise so extensive, that every industrious man might acquire a stake in the soil, and a voice in the civil administration of his country. The general diffusion of education caused the national advantages which were thus vigorously improved, to be justly appreciated; and an ardent and enlightened patriotism knit the hearts of the people to each other and to their country.

The state of society in New England, the circumstances and habits of the people, tended to form, among their leading men, a character more useful than brilliant;—not (as some have imagined) to discourage talent, but to repress its vain display, and train it to its legitimate and respectable end, of giving efficacy to wisdom and virtue. Yet this state of society was by no means inconsistent either with refinement of manners or with innocent hilarity. Lord Bellamont was agreeably surprised with the graceful and courteous demeanor of the gentlemen and clergy of Connecticut, and confessed that he found the aspect and address that were thought peculiar to nobility, in a land where this aristocratical distinction was unknown. From Dunton's account of his residence in Boston in 1686, it appears that the inhabitants of Massachusetts were at that time distinguished in a very high degree by the cheerfulness of their manners, their hospitality, and a courtesy the more estimable that it was indicative of real benevolence.*

In the historical and statistical accounts of the various states, we continually meet with instances of the beneficial influence exercised by superior minds on the virtue, industry, and happiness of particular districts and communities. In no country has the ascendancy of talent been greater or more advantageously exerted. The dangers of Indian invasion were encountered and repelled; the dejection and timidity produced by them, overcome; the feuds and contentions arising among settlers of various countries, habits, and opinions, composed; the temptations to slothful and degenerate modes of living, resisted; the self-denial requisite to the endowment of institutions for preaching the gospel and the education of youth, resolutely practised. In founding and conducting to maturity the settlements that from time to time extended themselves over the surface of the province, men of talent and virtue enjoyed a noble and arduous sphere of employment. They taught by action and example. They distinguished themselves from the rest of mankind by excelling them in their ordinary pursuits, and thinking better than they on the ordinary subjects of reflection and consideration. The impression they produced, if circumscribed in its limits, was intense in its efficacy: the fame they achieved, if neither noisy nor glaring, was lasting and refined. They propagated their own moral likeness around them, and rendered their wisdom and spirit immortal by engraving their own character on the minds of their fellow citizens. Mankind are more apt to copy characters than to practise precepts; and virtue is much more effectually recommended to their imitation and esteem by the life of zeal than by the weight of argument. Let the votaries of Fame remember that if a life thus spent circumscribe the diffusion of the patriot's name, it seems to enlarge his very being, and extend it to distant generations; and that if posthumous fame be any thing more than a splendid illusion, it is such distinction as this, from which the surest and most lasting satisfaction will be derived.

The esteem of the community was considered so valuable a part of the emoluments of office, that the salaries of all public officers, except those who were appointed by the crown, were, if not scanty, yet exceedingly moderate. In Connecticut, it was remarked, that the whole annual expenses of its public institutions (about 809*l.*) did not amount to the salary of a royal governor. The slender emoluments of public offices, and the tenure of popular pleasure by which they were held, tended very much to exempt the offices from the pretensions of unworthy candidates, and the officers from calumny and envy. Virtue and ability were fairly appreciated; and we frequently find the same men re-elected for a long series of years to the same offices,

* Dunton's Life and Errors, Stage iv. Dunton, who had sat at good men's feasts in London, was yet struck with the plenty and elegance of the entertainments he witnessed in Boston.

and on some occasions anteceded by their sons, where inheritance of merit recommended inheritance of place.* In more than one of the settlements, the first codes of law were the compositions of single persons; the people desiring an eminent leader to compose for them a body of law, and then legislating unanimously in conformity with his suggestions.

The most lasting, if not the most serious, evil with which New England has been afflicted, is the institution of slavery, which continued till a late period to pollute all its provinces, and even now lingers, though to a very slight extent, in the province of New Hampshire.† The practice, as we have seen, originated in the supposed necessity created by the Indian hostilities; but, once introduced, it was fatally calculated to perpetuate itself, and to derive accessions from various other sources. For some time, indeed, this was successfully resisted; and instances have been recorded of judicial interposition to restrain the evil within its original limits. In the year 1645, a negro fraudulently brought from Africa, and enslaved within the New England territory, was liberated and sent home by the general court. There was never any law expressly authorising slavery; and such was the influence of religious and moral feeling in New England, that, even while there was no law prohibiting its continuance, it was never able to prevail to any considerable extent. In the year 1704, the assembly of Massachusetts imposed a duty of 4*l.* on every negro imported into the province; and eight years after, passed an act prohibiting the importation of any more Indian servants or slaves. In Massachusetts, the slaves never exceeded the fiftieth part of the whole population; in Connecticut and Rhode Island, when slaves were most numerous (in the middle of the eighteenth century,) the proportion was nearly the same; and in the territory that afterwards received the name of Vermont, when the number of inhabitants amounted to nearly nine thousand, there were only sixteen persons in a state of slavery. The cruelties and vices that slavery tends to engender were repressed at once by this great preponderance of the sound over the unhealthy part of the body politic, and by the circumstances to which this preponderance was owing. The majority of the inhabitants were decidedly hostile to slavery; and numerous remonstrances were addressed to the British government against the encouragement she afforded to it by maintaining the slave trade.‡ When America effected her independence, the New England states (with the single exception of New Hampshire) adopted measures which, in the course of a few years, abolished every trace of this vile institution. In New Hampshire, it seems to have been rather a preposterous regard for liberty, and the sacredness of existing possessions, than a predilection for slavery, that prevented this practice from being formally abolished by the principles by which it has been essentially modified and substantially condemned.§

* I had intended here to have subjoined a list (extracted from the New England Journals) of persons in whose families the government of particular states and towns has been vested, with the consent of their fellow citizens, for considerable periods of time. But I find the list too long for insertion.

† The assembly of this province, as early as the reign of George the First, passed a law, enacting, that "if any man smite out the eye or tooth of his man or maid servant, or otherwise maim or disfigure them, he shall let him or her go free from his service, and shall allow such farther recompense as the court of quarter sessions shall adjudge;" and that "if any person kill his Indian or negro servant, he shall be punished with death." The slaves in this province are said to have been treated in all respects like white servants. Warden's United States, i. 398.

‡ Very different in this respect were (at one period) the conduct and sentiments of the Portuguese government and the colonists of Brazil, where the royal authority was endangered by the endeavors of the crown to second the policy of the results for extirpating or mitigating the evils of Indian and negro slavery. See Southern History of Brazil, Part ii.

§ There is a strange, I hope not a disingenuous, indistinctness in the statements of some writers respecting the negro slavery of New England. Winterbottom, writing in 1795, asserts, that "there are no slaves in Massachusetts." If he meant that a law had been passed which denounced, and was gradually extinguishing slavery, he was right; but the literal sense of his words is contradicted by Warden's Tables, which demonstrate that fifteen years after (the law not yet having produced its full effect) there were several thousand slaves in Massachusetts. Dwight relates his travels, in the end of the eighteenth and beginning of the nineteenth century, through every part of New England, without giving us the slightest reason to suppose that such beings as slaves existed in any one of its states, except when he stops to defend the legislature of Connecticut from an imputation on the manner in which her share of the abolition had been conducted. Warden himself says, in one page, that "slavery no longer exists in New England," even while, in another, he indicates and seeks to palliate the occurrence of its extrema vestigia in New Hampshire.

MARYLAND.

Charter of Maryland obtained from Charles the First by Lord Baltimore—Emigration of Roman Catholics to the Province—Friendly Treaty with the Indians—Generosity of Lord Baltimore—Opposition and Intrigues of Cleyborne—First Assembly of Maryland—Representative Government established—Early introduction of Negro Slavery—An Indian War—Cleyborne's Rebellion—Religious Toleration established in the Colony—Separate Establishment of the House of Burgesses—Cleyborne declares for Cromwell—and usurps the Administration—Toleration abolished—Distractions of the Colony—terminated by the Restoration—Establishment of a provincial Mint—Happy State of the Colony—Naturalization Acts—Death of the first Proprietary—Wise Government of his Son and Successor—Law against importing Felons—Establishment of the Church of England suggested—Dismemberment of the Delaware Territory from Maryland—Arbitrary Projects of James the Second—Alarm of the Colonists—Rumor of a Popish Plot—A Protestant Association is formed—and usurps the Administration—The Proprietary Government suspended by King William—Establishment of the Church of England, and Persecution of the Catholics—State of the Province—Manners—Laws.

FROM the history of Massachusetts and of the other New England states, which were the offspring of its colonization, we are now to proceed to consider the establishment of a colony which arose from the settlement of Virginia. In relating the history of this state, we have had occasion to notice, among the causes that disquieted its inhabitants during the government of Sir John Harvey, the diminution of their colonial territory by arbitrary grants from the crown, of large tracts of country situated within its limits. The most remarkable of these was the grant of Maryland to Lord Baltimore.

Sir George Calvert, afterwards Lord Baltimore, was Secretary of State to King James the First, and one of the original associates of the Virginian Company. Impressed with the value of colonial property, and the improvement that it seemed likely to derive from the progress of colonization, he employed his political influence to secure an ample share of it to himself and his family. He was a strenuous assertor of the supremacy of that authority from the exercise of which he expected to derive his own enrichment; [1620] and when a bill was introduced into the House of Commons for making the Newfoundland fishery free to all British subjects, he opposed it, on the plea that the American territory, having been acquired by conquest, was subject to the exclusive regulation of the royal prerogative. The first grant that he succeeded in obtaining was of a district in Newfoundland named Avalon, where, at a considerable expense, he formed the settlement of Ferryland; * [1622] but finding his expectations disappointed by the soil and climate of this inhospitable region, he paid a visit to Virginia, for the purpose of ascertaining if some part of its richer territory might not be rendered more subservient to his advantage. Observing that the Virginians had not yet formed any settlements to the northward of the river Potowmack, he determined to obtain a grant of territory in that quarter; and easily prevailed with Charles the First to bestow on him the investiture he desired. With the intention of promoting the aggrandisement of his own family, he combined the more generous design of founding a new state, and colonizing it with the persecuted votaries of the church of Rome, to which he had become a convert: but the design which he had facilitated by an act of injustice, he was not permitted himself to realize. His project, which was interrupted by his death, just when all was prepared for carrying it into effect, was resumed by his son and successor, Cecilius, Lord Baltimore, in whose favor the king completed and executed the charter [1632] that had been destined for his father.

If the charter which this monarch had granted a short time before to the puritan colonists of Massachusetts may be regarded as the exercise of policy, the investiture which he now bestowed on Lord Baltimore was not less manifestly the expression of favor. This nobleman, like his father, was a Roman catholic; and his avowed purpose was to people the territory with colonists of the same persuasion, and erect an asylum in America for the catholic faith. By the charter, it was declared that the grantee was actuated by a laudable

zeal for extending the christian religion, and the territories of the empire; and the district assigned to him and his heirs and successors was described as "that region bounded by a line drawn from Watkins' Point of Chesapeake Bay; thence to that part of the estuary of Delaware on the north which lies under the fortieth degree, where New England is terminated: thence in a right line, by the degree aforesaid, to the meridian of the fountain of Potowmack; thence following its course by the farther bank to its confluence." In honor of the queen, the province thus bestowed on a nobleman of the same faith with her majesty was denominated Maryland: and in honor, perhaps, of her majesty's faith, the endowment was accompanied with immunities more ample than any of the other colonial establishments possessed. The new province was declared to be separated from Virginia, and no longer subordinate to any other colony, but immediately subject to the crown of England, and dependant on the same for ever. Lord Baltimore was created the absolute proprietary of it; saving the allegiance and sovereign dominion due to the crown. He was empowered, with the assent of the freemen or their delegates, whom he was required to assemble for that purpose, to make laws for the province, not repugnant to the jurisprudence of England; and the acts of the assembly he was authorised to execute. For the population of the new colony, licence was given to all his Majesty's subjects to transport themselves thither; and they and their posterity were declared to be liegemen of the king and his successors, and entitled to the liberties of Englishmen, as if they had been born within the kingdom. Power was given to the proprietary, with assent of the people, to impose all just and proper subsidies, which were granted to him for ever; and it was covenanted on the part of the king, that neither he nor his successors should at any time impose, or cause to be imposed, any tallages on the colonists, or their goods and tenements, or on their commodities to be laden within the province. Thus was conferred on Maryland, in perpetuity, that exemption which had been granted to other colonies for a term of years. The territory was erected into a palatinate; and the proprietary was invested with all the royal rights of the palace, as fully as any bishop of Durham had ever enjoyed; and he was authorised to appoint officers, to repel invasions, and to suppress rebellions. The advowsons of those churches, which should be consecrated according to the ecclesiastical laws of England, were granted to him. The charter finally provided, that, in case any doubt should arise concerning its true meaning, the interpretation most favorable to the proprietary should be adopted; excluding, however, any construction derogatory to the christian religion, or to the allegiance due to the crown.

Though the sovereignty of the crown was thus reserved over the province, and a conformity enjoined between its legislation and the jurisprudence of England, no means were provided for the exercise of the royal dominion or the ascertainment of the stipulated conformity. The charter contained no special reservation of royal interference in the government of the province, and no obligation on the proprietary to transmit the acts of assembly for confirmation or disallowance by the king. In erecting the province into a palatinate, and vesting the hereditary government of it in the family of Lord Baltimore, the king exercised the highest attributes of the prerogative of a feudal sovereign. A similar trait of feudal prerogative appears in the perpetual exemption from royal taxation which was confirmed by the charter, and which, at a later period, gave rise to much intricate and elaborate controversy. It was maintained, when this provision became the subject of critical discussion, that it could never be construed to import an exemption from parliamentary taxation, since the king could not be supposed to intend to abridge the jurisdiction of the parliament, or to renounce a privilege that was not his own; * and that even if such construction had been intended, the immunity was illegal, and incapable of restraining the functions of the legislature. In addition to the general reasoning that has been employed to demonstrate this illegality, reference has been made to the authority of a parliamentary proceeding mentioned by Sir Edward Coke, who, in a debate on the royal prerogative in the year 1620, assured the Commons that a dispensation from subsidies

granted to certain individuals within the realm in the reign of Henry the Seventh, had been subsequently repealed by act of parliament. But to render this authority conclusive, it would be necessary to suppose, that every act of parliament that introduced a particular ordinance was also declaratory of the general law; and even then the application of this authority to the charter of Maryland may very fairly be questioned. Colonies, in that age, were regarded entirely as dependencies of the monarchical part of the government; the rule of their governance was the royal prerogative, except where it was specially limited or excluded by the terms of a royal charter; and the same power that gave a political being to the colony was considered adequate to determine the political privileges of its inhabitants. The colonists of Maryland undoubtedly conceived that their charter bestowed on them an exemption from all taxes but such as should be imposed by their own provincial assembly; for it discharged them for ever from the taxation of the only power that was considered competent to exercise this authority over them. Not the least remarkable peculiarity of this charter is, that it affords the first example of the dismemberment of a colony, and the creation of a new one within its limits, by the mere act of the crown.

Lord Baltimore having thus obtained the charter of Maryland, hastened to execute the design of colonizing the new province, of which he appointed his brother, Leonard Calvert, to be governor. The first body of emigrants, consisting of about two hundred gentlemen of considerable rank and fortune, chiefly of the Roman catholic persuasion, with a number of inferior adherents, sailed from England under the command of Calvert in November, 1632; and after a prosperous voyage, landed in Maryland, near the mouth of the river Potowmack, in the beginning of the following year. [1633.] The governor, as soon as he landed, erected a cross on the shore, and took possession of the country, *for our Saviour, and for our sovereign lord the king of England.* Aware that the first settlers of Virginia had given umbrage to the Indians by occupying their territory without demanding their permission, he determined to imitate the wiser and juster policy that had been pursued by the colonists of New England, and to unite the new with the ancient race of inhabitants by the reciprocal ties of equity and good-will. The Indian chief to whom he submitted his proposition of occupying a portion of the country answered at first with a sullen indifference, the result most probably of aversion to the measure and of conscious inability to resist it, that he would not bid the English go, neither would he bid them stay, but that he left them to their own discretion. The liberality and courtesy, however, of the governor's demeanor succeeded at length in conciliating his regard so powerfully, that he not only formed a friendly league between the colonists and his own people, but persuaded the other neighboring tribes to accede to the treaty, and warmly declared, *I love the English so well, that if they should go about to kill me, if I had so much breath as to speak, I would command the people not to revenge my death; for I know they would not do such a thing, except it were through my own fault.* Having purchased the rights of the aborigines at a price which gave them perfect satisfaction, the colonists obtained possession of a considerable district, including an Indian town which they immediately proceeded to occupy, and to which they gave the name of St. Mary's. It was not till their numbers had undergone a considerable increase, that they judged it necessary to enact legislative regulations, and establish their political constitution. They lived some time under the domestic regimen of a patriarchal family, and confined their attention to the providing of food and habitations for themselves and the associates by whom they expected to be reinforced. The lands which had been ceded to them were planted with facility, because they had already undergone the discipline of Indian tillage; and this circumstance, as well as the proximity of Virginia, which now afforded an abundant supply of the necessaries of life, enabled the colonists of Maryland to escape the ravages of that calamity, which had afflicted the infancy, and nearly proved fatal to the existence of every one of the other settlements of the English in America. The tidings of their safe and comfortable establishment in the province, concurring with the uneasiness experienced by the Roman catholics in England, induced considerable numbers of the professors of this faith to follow the original emigrants to Maryland; and no efforts of wisdom or generosity were spared by Lord Baltimore to facilitate the population and promote the happiness of the colony. The transportation of people, and of necessary stores and

* His colonial policy is thus contrasted by an old writer, with that of Chief Justice Popham, the promoter of the first attempts to Colonize New England: "Judge Popham and Sir George Calvert agreed not more unanimously in the public design of planting, than they differed in the private way of it: the first was for extirpating heathens, the second for converting them. He sent away the lowliest, the sowerest people: the one was for present profit, the other for a reasonable expectation"—the first set up a common stock, out of which the people should be provided by proportions; the second left every one to provide for himself." Lloyd's State Worthies, 751, 752.

* Yet at an after period, it was considered, that an exclusion of parliamentary taxation, whether effectually constituted, would be at least imported by such a clause; and in the Pennsylvania charter when an exemption of this description was conceded, it was qualified by an express "saving of the authority of the English parliament."

provisions, during the first two years, cost him upwards of forty thousand pounds. To every emigrant he assigned fifty acres of land in absolute fee; and with a liberality unparalleled in that age, and altogether surprising in a catholic, he united a general establishment of Christianity as the common law of the land, with an absolute exclusion of the political predominance or superiority of any one particular sect or denomination of Christians. This wise administration soon converted a dreary wilderness into a prosperous colony. It is a proof at once of the success of his policy, and the prosperity and happiness of the colonists, that a very few years after the first occupation of the province, they granted to their proprietary a considerable subsidy of tobacco, as a grateful acknowledgment of his liberality and beneficence. Similar tributes continued, from time to time, to attest the merit of the proprietary and the attachment of the people.

The wisdom and virtue by which the plantation of the new province was signalised, could not atone for the arbitrary injustice by which its territory had been wrested from the jurisdiction of Virginia; and while it is impossible not to regret the troubles which originated from this circumstance, there is something not altogether dissatisfactory to the moral eye, in beholding the inevitable fruits of usurpation. Such lessons are most agreeable, when the retribution which they represent is confined to the immediate perpetrators of wrong: but they are not least salutary when the admonition they convey is extended to the remote accessories, who are willing to avail themselves of the injustice of the principal delinquents. The king had commanded Sir John Harvey, the governor of Virginia, to render the utmost assistance and encouragement to Lord Baltimore, in establishing himself and his associates in Maryland. But though the governor and his council readily agreed, in humble submission to his majesty's pleasure, to observe a good correspondence with their unwelcome neighbors, they determined at the same time to maintain the rights of the prior settlement. The planters of Virginia presented a petition against the grant to Lord Baltimore: and both parties were admitted to discuss their respective pretensions before the Privy Council. After vainly endeavoring to promote an amicable adjustment, the council awarded that his lordship should retain his patent, and the petitioners their remedy at law—a remedy which probably had no existence, and to which the Virginians never thought proper to resort. For the preventing of farther differences, it was ordered by the council that free and mutual commerce should be permitted between the two colonies; that neither should receive fugitives from the other, or do any act that might provoke a war with the natives; and that both should on all occasions assist and befriend each other in a manner becoming fellow subjects of the same empire.

But although the Virginian planters were thus compelled to withdraw their opposition, and the Virginian government to recognise the independence of Maryland, the establishment of this colony encountered an obstinate resistance from interests much less entitled to respect; and the validity of Lord Baltimore's grant was vehemently opposed by the pretensions of a prior intruder. This competitor was William Cleyborne, a member of Sir John Harvey's council, and secretary of the province of Virginia; and the friendship between Harvey and this individual may perhaps account for a singularity in the conduct of that tyrannical governor, and explain why on one occasion at least he was disposed to maintain the interests of the Virginian planters in opposition to the arbitrary purposes of the king. About a year preceding the date of Lord Baltimore's charter, the king had granted to Cleyborne a licence under the sign manual to traffic in those parts of America not comprehended in any prior patent of exclusive trade: and for the enforcement of this licence Harvey had superadded to it a commission in similar terms under the seal of his own authority. The object of Cleyborne and his associates was to monopolise the trade of the Chesapeake; and with this view they had proceeded to establish a small trading settlement in the isle of Kent, which is situated in the very centre of Maryland, and which Cleyborne now persisted in claiming as his own, and refused to submit to the newly erected jurisdiction. The injustice of a plea which construed a licence to traffic into a grant of territory, did not prevent the government of Virginia from countenancing Cleyborne's opposition; and, encouraged by the approbation which they openly gave to his pretensions, he proceeded to enforce them by acts of profligate intrigue, and even sanguinary violence. He infused his own spirit into the inhabitants of the isle of

Kent, and scattered jealousies among the Indian tribes, some of whom he was able to persuade that the new settlers were Spaniards and enemies to the Virginians. [1634.] Lord Baltimore at length was sensible of the necessity of a vigorous defence of his rights: and orders were transmitted to the governor to vindicate the provincial jurisdiction, and enforce an entire subordination within its limits. Till this emergency, the colony had subsisted without enacting or realising its civil institutions; but the same emergency that now called forth the powers of government, tended also to develop its organisation. Accordingly, in the commencement of the following year, [1635.] was convened the first assembly of Maryland, consisting of the whole body of the freemen; and various regulations were enacted for the maintenance of good order in the province. One of the enactments of this assembly was, that all perpetrators of murder and other felonies should incur the same punishments that were awarded by the laws of England; an enactment which, besides its general utility, was necessary to pave the way to the judicial proceedings that were contemplated against Cleyborne. This individual, accordingly, still persisting in his outrages, was indicted soon after of murder, piracy, and sedition. Finding that those who had encouraged his pretensions left him unaided to defend his crimes, he fled from justice, and his estate was confiscated. Against these proceedings he appealed to the king; and petitioned at the same time for the renewal of his licence and the grant of an independent territory adjoining to the isle of Kent. By the assistance of powerful friends, and the dexterity of his representations, he very nearly obtained a complete triumph over his antagonists, and eventually prevailed so far as to involve Lord Baltimore and the colonists of Maryland in a controversy that was not terminated for several years. At length the lords commissioners of the colonies, to whom the matter had been referred, pronounced a final sentence, dismissing Cleyborne's appeal, and adjudging that the whole territory belonged to Lord Baltimore, and that no plantation or trade with the Indians should be established without his permission within the limits of his patent. Thus divested of every semblance of legal title, Cleyborne exchanged his hopes of victory for schemes of revenge; and watching every opportunity of hostile intrigue that the situation of the colony might present to him, he was unfortunately enabled, at a future period, to wreak the vengeance of disappointed rapacity upon his successful competitors.

The colony meanwhile continued to thrive, and the numbers of its inhabitants to be augmented by copious emigration from England. With the increase of the people, and the extension of the settlements to a greater distance from St. Mary's, the necessity of a legislative code became apparent: and Lord Baltimore having composed a body of laws for the province, transmitted them to his brother, with directions to propose them to the assembly of the freemen. The second assembly of Maryland was in consequence convoked by the governor, [1637.] with the expectation no doubt of an immediate ratification of the suggestions of the proprietary. But the colonists, with a cordial attachment to Lord Baltimore, cherished a just estimation of their own political rights; and while they made a liberal provision for the support of his government, they hesitated not a moment to reject the code that he tendered to their acceptance. In the place of it, they prepared for themselves a collection of regulations, which are creditable to their own good sense, and from which some insight may be derived into the state of the settlement at this period. The province was divided into baronies and manors, the privileges of which were now carefully defined. Bills were framed for securing the liberties of the people and the titles to landed property, and for regulating the course of intestate succession. A bill was passed for the support of the proprietary, and an act of attainder against Cleyborne. In almost all the laws where prices were stated or payments prescribed, tobacco, and not money, was made the measure of value. The colonists of Maryland appear to have devoted themselves as vehemently as the Virginians did at first to the cultivation of this valuable article. In their indiscriminate eagerness to enlarge their contributions to the market, and to obtain a price for the whole produce of their fields, they refused to accede to the regulations by which the planters of Virginia improved the quality by diminishing the quantity of their supply; and this collision was productive of much dispute and ill-humor between the colonies, and tended to keep alive the original disgust with which the establishment of Maryland had been regarded by Virginia.

The third assembly of Maryland, which was convoked two years afterwards, [1639], was rendered memorable by the introduction of a representative body into the constitution. The population of the province had derived so large an increase from recent emigrations, that it was impossible for the freeholders to continue any longer to exercise the privilege of legislation by personal attendance. A law was therefore passed for the introduction of representatives, and the modification of the house of assembly. It was declared by this act, that those who should be elected in pursuance of writs issued should be called burgesses, and should supply the place of the freemen who chose them, in the same manner as the representatives in the parliament of England, and, in conjunction with those called by the special writ of the proprietary, together with the governor and secretary, should constitute the general assembly. But though the election of representatives was thus established for the convenience of the people, they were not restricted to this mode of exercising their legislative rights; for, by a very singular clause, it was provided, that all freemen refraining from voting at the election of burgesses, were at liberty to take their seats in person in the assembly. The several branches of the legislature were appointed to sit in the same chamber, and all acts assented to by the united body were to be deemed of the same force as if the proprietary and freemen had been personally present. It was not long before the people were sensible of the advantage that the democratic part of the constitution would derive from the separate establishment of its peculiar organ; but although this innovation was suggested by the burgesses very shortly afterwards, the constitution that was now adopted continued to be retained by the legislature of Maryland till the year 1650. Various acts were passed in this assembly for the security of liberty, and the administration of justice according to the laws and customs of England. All the inhabitants were required to take the oath of allegiance to the king; the prerogatives of the proprietary were distinctly recognised; and the great charter of England was declared to be the measure of the liberties of the colonists. To obviate the inconveniences that began to be threatened by the almost exclusive attention of the people to the cultivation of tobacco, it was found necessary to enforce the planting of corn by law. A tax was imposed for the supply of a revenue to the proprietary. But notwithstanding this indication of prosperity, and the introduction of representative government, that the colonists were not yet either numerous or wealthy, may be strongly inferred from the imposition of a general assessment to erect a water-mill for the use of the colony. Slavery seems to have been established in Maryland from its earliest colonization: for an act of this assembly describes the people to consist of all christian inhabitants, *slaves only excepted*. That slavery should gain a footing in any community of professing Christians, will excite the regret of every one who knows what slavery and Christianity mean. Some surprise may mingle with our regret when we behold this baneful institution adopted in a colony of catholics, and of men who not only were themselves fugitives from persecution, but so much in earnest in the profession of their distinctive faith, as for its sake to incur exile from their native country. The unlawfulness of slavery had been solemnly announced by the pontiff, whom the catholics regard as the infallible head of their church. When the controversy on this subject was submitted to Leo the Tenth, he declared, that not only the christian religion, but nature herself, cried out against a state of slavery. But the good which an earthly potentate can effect, is far from being commensurate with his power of doing evil. When a pope divided the undiscovered parts of the world between Castile and Portugal, his arrogant division was held sacred; when another levelled his humane sentence against the lawfulness of slavery, his authority was contemned or disregarded.

The discontent with which the establishment of the new colony had been regarded by the Virginians was heightened, no doubt, by the contrast between the liberty and happiness that the planters of Maryland were permitted to enjoy, and the tyranny that they themselves were exposed to from the government of Sir John Harvey. The arguments by which the Maryland charter had been successfully defended against them, tended to associate the loss of their liberties with the existence of this colony: for the complaint of dismemberment of their original territory had been encountered by the plea, that the designation of that territory had perished with the charter which contained it, and that by the dissolution of the company to which

the charter had belonged, all the dominion it could claim over unoccupied territory had reverted to the crown. From the company, or at least during its existence, the Virginians had obtained the liberties which had been wrested from them at the time of its dissolution; and hence their ardent wishes for the restoration of their liberties were naturally connected with the re-establishment of a corporation, whose patent, if revived, would annul the charter of Maryland. It was fortunate for both the colonies that the liberties of Virginia were restored by the king without the appendage of the ancient corporation; and that the Virginians, justly appreciating the advantages they possessed, now regarded with aversion the revival of the patent, and were sensible that their interests would be rather impaired than promoted by the event that would enable them to re-annex Maryland to their territory. Had the change of circumstances and interests been deferred but a short time, the most injurious consequences might have resulted to both the colonies; [1640] for the assembling of the Long Parliament, and the encouragement which every complaint of royal misgovernment received from that assembly, inspired the proprietors of the Virginia company with the hope of obtaining a restitution of their patent. Fortified by the opinion of eminent lawyers whom they consulted, and who scrupled not to assure them that the ancient patents of Virginia still remained in force,* and that the grant of Maryland, as derogatory to them, was utterly void, they presented an application to the parliament complaining of the unjust invasion that their privileges had undergone, and demanding that the government of Virginia should be restored to them. This application would undoubtedly have prevailed, if it had been seconded by the colony. Its failure was mainly occasioned by the vigorous opposition of the assembly of Virginia.

Under the constitution which was thus preserved to them by the efforts of its ancient antagonists, the colonists of Maryland continued to enjoy a great degree of happiness and prosperity, [1641.] and to evince, by their unabated gratitude to the proprietary, that the spirit of liberty rather enhances than impairs the attachment of a free people to its rulers, and that a just sense of the rights of men is no way incompatible with a lively impression of their duties. The wise and friendly policy which the governor continued to pursue towards the Indians, had hitherto preserved a peace which had proved highly beneficial to the infancy of the colony. But unfortunately the intrigues of Cleyborne had infected the minds of these savages with a jealous suspicion, which the increasing power of the colony had no tendency to mitigate, and which the immoderate avidity of some of the planters tended powerfully to inflame. The rapid multiplication of the strangers seemed to threaten their extinction as a people; and the augmented value which the territory they sold to the colonists had subsequently derived from the industry and skill of its new proprietors, easily suggested to their envy and ignorance the angry surmise, that they had been defrauded in the original vendition. This injurious suspicion was confirmed by the conduct of various individuals among the planters, who procured additional grants of land from the Indians without the authority of government, for considerations which were extremely inadequate, and which, upon reflection, filled them with anger and discontent.† These causes at length produced the calamity which the governor had labored so earnestly to avert. An Indian war broke out in the beginning of the year 1642, and continued for several years after to administer its accustomed evils, without the occurrence of any decisive issue, or the attainment of any considerable advantage by either party. Peace having been with some difficulty re-established, [1644.] the assembly proceeded to enact laws for the prevention of the more obvious causes of complaint and animosity. All acquisitions of land from the aborigines, without the consent of the proprietary, were declared derogatory no less to his dignity and rights, than to the safety of the community, and therefore void and illegal. It was made a capital felony to sell or kidnap any

friendly Indians; and a high misdemeanor to supply them with spirituous liquors, or to put them in possession of arms or ammunition. Partly by these regulations, and more by the humane and prudent conduct of the proprietary government, the peace that was now concluded between the colony and the Indians subsisted, without interruption, for a considerable period of time.

But the colony was not long permitted to enjoy the restoration of its tranquillity. Scarcely had the Indian war been concluded, when the intrigues of Cleyborne exploded in mischiefs of far greater magnitude, and more lasting malignity. The activity of this enterprising and vindictive spirit had been curbed hitherto by the deference which he deemed it expedient to profess to the pleasure of the British court, at which he had continued to cultivate his interest so successfully, that, in the year 1642, he had received from the king the appointment of treasurer of Virginia for life. But the civil wars which had now broke out in England, leaving him no longer any thing to hope from royal patronage, he made no scruple to declare himself a partizan of the popular cause, and to espouse the fortunes of a party from whose predominance he might expect at once the gratification of his ambition, and the indulgence of his revenge. In conjunction with his ancient associates in the isle of Kent, and aided by the contagious fervor of the times, he raised a rebellion in Maryland in the beginning of the year 1645. Calvert, unprepared at first with a force suitable to this emergency, was constrained to fly into Virginia for protection; and the vacant government was instantly appropriated by the insurgents, and exercised with a violence characteristic of the ascendancy of an unpopular minority. Notwithstanding the most vigorous exertions of the governor, seconded by the well-affected part of the community, the revolt was not suppressed till the autumn of the following year [1646]. The afflictions of that calamitous period are indicated by a statute of the assembly, which recites "that the province had been wasted by a miserable dissension and unhappy war, which had been closed by the joyful restitution of a blessed peace." To promote the restoration of tranquillity and mutual confidence, an act of general pardon and oblivion was passed, from the benefits of which only a few leading characters were excepted; and all actions were discharged for wrongs that might have been perpetrated during the revolt. But the additional burdens which it was found necessary to impose upon the people, were consequences of the insurrection that did not so soon pass away: and, three years afterwards, [1649] a temporary duty of ten shillings on every hundred weight of tobacco exported in Dutch bottoms was granted to the proprietary; the one half of which was expressly appropriated to satisfy claims produced by the recovery and defence of the province; and the other was declared to be conferred on him for the purpose of enabling him the better to provide for its safety in time to come.

In the assembly by which the imposition of this duty was enacted, a magnanimous attempt was made to preserve the peace of the colony by suppressing one of the most fertile sources of human contention and animosity. It had been declared by the proprietary, at a very early period, that religious toleration should constitute one of the fundamental principles of the social union over which he presided; and the assembly of the province, composed chiefly of Roman Catholics, now proceeded, by a memorable *Act concerning Religion*, to interweave this noble principle into its legislative institutions. This statute commenced with a preamble, declaring that the enforcement of the conscience had been of dangerous consequence in those countries wherein it had been practised; and thereafter enacted, that no persons professing to believe in Jesus Christ should be molested in respect of their religion, or in the free exercise thereof, or be compelled to the belief or exercise of any other religion against their consent; so that they be not unfaithful to the proprietary, or conspire against the civil government; That persons molesting any other in respect of his religious tenets should pay treble damages to the party aggrieved, and twenty shillings to the proprietary: That those who should reproach their neighbors with opprobrious names of religious distinction, should forfeit ten shillings to the persons so insulted: That any one speaking reproachfully against the blessed Virgin or the apostles, should forfeit five pounds; but that blasphemy against God should be punished with death. By the enactment of this statute, the catholic planters of Maryland procured to their adopted country the distinguished praise of being the first of the American states in which toleration was

established by law;* and graced their peculiar faith with the signal and unwonted merit of protecting that religious freedom which all other christian associations were conspiring to overthrow. It is a striking and instructive spectacle to behold at this period the puritans persecuting their protestant brethren in New England; the episcopalians retorting the same severity on the puritans in Virginia; and the catholics, against whom all the others were combined, forming in Maryland a sanctuary where all might worship and none might oppress, and where even protestants sought refuge from protestant intolerance. If the dangers to which the Maryland Catholics must have felt themselves exposed from the disfavor with which they were regarded by all the other communities of their countrymen, and from the ascendancy which their most zealous adversaries the presbyterians were acquiring in the councils of the parent state, may be supposed to account in some degree for their enforcement of a principle of which they manifestly needed the protection, the sunnise will detract very little from the merit of the authors of this excellent law. The moderation of mankind has ever needed adventitious support; and it is no depreciation of christian sentiment, that it is capable of deriving an accession to its purity from the experience of persecution. It is by divine grace alone that the fire of persecution thus sometimes tends to refine virtue and consume the dross that may have adhered to it; and the progress of this history is destined to show, that without such overruling agency, the commission of injustice naturally tends to its own reproduction, and that the experience of it engenders a much stronger disposition to retaliate its severities than to sympathise with its victims. It had been happy for the credit of the protestants, whose hostility perhaps enforced the moderation of the catholics of Maryland, if they had imitated the virtue which their own apprehended violence may have tended to elicit. But, unfortunately, a great proportion even of those who were constrained to seek refuge among the catholics from the persecutions of their own protestant brethren, carried with them into exile the same intolerance of which themselves had been the victims; and the presbyterians and other dissenters who now began to flock in considerable numbers from Virginia to Maryland, gradually formed a protestant confederacy against the interests of the original settlers; and, with ingratitude still more odious than their injustice, projected the abrogation not only of the catholic worship, but of every part of that system of toleration, under whose shelter they were enabled to conspire its downfall. But though the catholics were thus ill requited by their protestant guests, it would be a mistake to suppose that the calamities that subsequently desolated the province were produced by the toleration which her assembly now established, or that the catholics were really losers by this act of justice and liberality. From the disposition of the prevailing party in England, and the state of the other colonial settlements, the catastrophe that overtook the liberties of the Maryland catholics could not possibly have been evaded: and if the virtue they now displayed was unable to avert their fate, it emptied them at least from the reproach of deserving it; it redoubled the guilt and scandal incurred by their adversaries, and achieved for themselves a reputation more lasting and honorable than political triumph or temporal elevation. What Christian, however sensible of the errors of catholic doctrine, would not rather be the descendant of the catholics who established toleration in Maryland, than of the protestants who overthrew it?

From the establishment of religious freedom, the assembly of Maryland proceeded to the improvement of political liberty; and in the following year [1650] the constitution of this province received that structure which, with some interruptions, it continued to retain for more than a century after. So early as the year 1642, the burgesses who had been elected to the existing assembly, whether actuated by the spirit natural to representatives, or animated by the example of the commons of England, had expressed a desire "that they might be separated, and sit by themselves, and have a negative." Their desire was disallowed at that time; but now, in conformity with it, a law was passed, enacting that members called to the assembly by special writ should form the upper house: that those who were chosen by the hundreds should form the lower

* This seems to corroborate the supposition that the quo warranto against the Virginia company was not prosecuted to a judicial issue.

† Similar causes of offence undoubtedly begot or promoted many of the wars between the Indians and the other colonies. "Such things," says the historian of New Hampshire, "were indeed disallowed by the government, and would always have been punished, if the Indians had made complaint; but they knew only the law of retaliation, and when an injury was inflicted, it was never forgotten till revenged." The fraud, or supposed fraud, of an individual, might, at the distance of many years from its perpetration, involve the whole colony to which he belonged in an Indian war. Belknap, l. 128.

* Rhode Island was at this time the only one of the protestant settlements in which the principle of toleration was recognized: and even there, Roman catholics were excluded from participating in the political rights that were enjoyed by the rest of the community.

house; and that all bills which should be assented to by the two branches of the legislature, and ratified by the governor, should be deemed the laws of the province. An act of recognition of the undoubted right of Lord Baltimore to the proprietorship of the province, was passed in the same session. The assembly declared itself bound by the laws both of God and man, to acknowledge his just title by virtue of the grant of the late king Charles of England; it submitted to his authority, and obliged its constituents and their posterity for ever to defend him and his heirs in his royal rights and pre-eminences, so far as they do not infringe the just liberties of the free-born subjects of England: and it besought him to accept this act as a testimony to his posterity, of its fidelity and thankfulness for the manifold benefits which the colony had derived from him. Blending a due regard to the rights of the people with a just gratitude to the proprietary, the assembly at the same time enacted a law prohibiting the imposition of taxes without the consent of the freemen, and declaring in its preamble, "that as the proprietary's strength doth consist in the affections of his people; on them he doth rely for his supplies, not doubting of their duty and assistance on all just occasions." Perhaps it is only under such patriarchal administration as Maryland yet retained an admixture of in her constitution, and under such patriarchs as Lord Baltimore, that we can ever hope to find the realization of the political philosopher's dream of a system that incorporates into politics the sentiments that embellish social intercourse, and the affections that sweeten domestic life. In prosecution of its patriotic labors, the assembly proceeded to enact laws for the relief of the poor, and the encouragement of agriculture and commerce; and a short gleam of tranquil prosperity preceded the calamities which the province was fated again to experience from the evil genius of Cleyborne, and the interposition of the parent state.

The parliament having now established its supremacy in England, had leisure to extend its views beyond the Atlantic; and if the people of Virginia were exposed by their political sentiments to a collision with this formidable power, the inhabitants of Maryland were not less obnoxious to its bigotry from their religious tenets. This latter province was not denounced by the parliamentary ordinance of 1650 as in a state of rebellion, like Virginia; but it was comprehended in that part of the ordinance which declared that the plantations were, and of right ought to be, dependent on England, and subject to its laws. In prosecution of the views and purposes of this ordinance, certain commissioners, of whom Cleyborne was one, [1651.] were appointed to reduce and govern the colonies within the bay of Chesapeake. In Virginia, where resistance was attempted, the existing administration was instantly suppressed; but as the proprietary of Maryland expressed his willingness to acknowledge the parliamentary jurisdiction, the commissioners were instructed to respect his rights: [1652.] and he was suffered to rule the province as formerly, though in the name of the keepers of the liberties of England.* But Cleyborne was not to be so easily deterred from availing himself of an opportunity so favorable for satiating his malignity; and unfortunately his designs were favored by the distractions in England that preceded the elevation of Cromwell to the protectorate, and by the disunion which began to prevail in the province from the pretensions of the protestant exiles who had recently united themselves to its population. Ever the ally of the strongest party, Cleyborne hastened to espouse the fortunes of Cromwell, whose triumph he easily foresaw; [1653.] and inflamed the dissensions of the province, by encouraging the protestants to unite the pursuit of their own ascendancy with the establishment of the protectoral government. The contentions of the two parties were at length exasperated to the extremity of civil war; and after various skirmishes, which were fought with alternate success, the catholics and the other partizans of the proprietary government were defeated in a decisive engagement, [1654.] the governor deposed, and the administration usurped by Cleyborne and his associates.

Although the victorious party did not consider themselves warranted expressly to disclaim the title of the proprietary, they made haste to signalize their triumph by abolishing his institutions. Fuller and Preston, whom Cleyborne had appointed commissioners for directing the affairs of Maryland under his highness the lord protector, proceeded to convoke an assembly of the province; and some of the persons who were elected burgesses having refused to serve in a capacity which they deemed inconsistent with their obligations

to Lord Baltimore, the legislative power was the more unreservedly appropriated by the partizans of innovation. The assembly having, as a preliminary measure, passed an act of recognition of Cromwell's just title and authority, proceeded to frame a law concerning religion, which derogated not less signally from the credit of the protestant cause, than from the justice of the protector's administration.* By this law it was declared, that none who professed the doctrines of the Romish church could be protected in this province by the laws of England formerly established, and yet unrepelled, or by the government of the commonwealth: That such as professed faith in God by Jesus Christ, though differing in judgment from the doctrine and discipline publicly held forth, should not be restrained from the exercise of their religion; "provided such liberty be not extended to popery or prelacy; or to such as, under the profession of Christianity, practise licentiousness." Thus the Roman catholics were deprived of the protection of law in the community which their own industry and virtue had collected, and by those protestants to whom their humanity had granted a country and a home. This unworthy triumph was hailed by the zealots against popery in London, where a book was published soon after under the title of "Babylon's Fall in Maryland." But the catholics were not the only parties who experienced the severity of the new government. The protestant episcopalians were equally excluded from the protection of law; and a number of quakers having resorted soon after to the province, and begun to preach against judicial oaths and military pursuits, were denounced by the government as heretical vagabonds, and subjected to the punishment of flogging and imprisonment.

As Lord Baltimore's right to the proprietorship of the province was still outwardly recognised, the commissioners, either deeming it requisite to the formality of their proceedings, or more probably with the hope of embroiling him with the protector, demanded his assent to the changes which had been thus introduced. But he firmly refused to sanction either the deposition of his governor, or any one of the recent proceedings of the commissioners and their adherents; and declared in particular, that he never would assent to the repeal of a law which protected the most sacred rights of mankind. The commissioners did not fail to complain of his contumacy to Cromwell, to whom they continued from time to time to transmit the most elaborate representations of the tyranny, bigotry, and royalist predilections of Lord Baltimore, and the expediency of depriving him of the proprietorship of the province.* [1655.] But all their representations were ineffectual. Lord Baltimore was allowed by Cromwell to retain the rights which he was practically debarred from exercising; and the commissioners remained in the province to enact the tyranny and bigotry of which they had falsely accused him. Their proceedings, as intemperate as their councils, could neither preserve internal tranquillity in the colony, nor insure their own repose. The people, lately so tranquil and happy, were now a prey to all those disorders which never fail to result from religious persecution embittered by the triumph of party in civil contention. In this situation an insurrection was easily raised by Josias Fendal, [1656.] a restless and profligate adventurer, destined by his intrigues to become the Cleyborne of the next generation, and who now sought occasion to gratify his natural turbulence under pretence of asserting the rights of the proprietary and the ancient liberties of the province. This insurrection proved eminently unfortunate to the colony. It induced Lord Baltimore to repose a very ill grounded confidence in Fendal; and its suppression

* Cromwell is at least obnoxious to the charge of having suffered the triumph of his own and of the protestant cause to be signalized by the suppression of a toleration established by Roman catholics. That he incited, or even approved this proceeding, is by no means apparent. In the records of this province, there is a letter from him to his commissioners, desiring them not to busy themselves about religion, but to settle the civil government. Chalmers, 226. But the protector was much more distinguished by the vigor of his conduct than the perspicuity of his dictation; and his correspondents were sometimes unable to discover the meaning of his letters. It appears that, during the distractions of this period, Virginia evinced a disposition to resume her lost authority over Maryland. This design was instantly checked by Cromwell; and in one of his letters to the commissioners on this subject, we find him reprehending them for not having understood his former communications. Chalmers, 223, 224. Hazard, 594. He seems, on many occasions, to have studied an ambiguity of language that left him free to approve or disapprove the proceedings of his officers, according to the success that might attend them.

† Langford's Refutation of a scandalous pamphlet, named *Babylon's Fall in Maryland*. Chalmers, p. 221. Hazard, p. 620, 621, 623, 628. The only copy of Langford's Tract that I have ever met with is in the library of Mr. Chalmers.

was attended with increased severities from the commissioners and additional impositions on the people.

The affairs of the colony continued for two years longer in this distracted condition; when at length the commissioners, disgusted with the disorders which they had contributed to produce, but were unable to compose, and finding all their efforts unavailing to procure the abrogation of Lord Baltimore's title, to which they ascribed the unappeasable discontent of a great part of the population, surrendered the administration of the province into the hands of Fendal, who had been appointed* governor by the proprietary. [1658.] But this measure, so far from restoring the public quiet, contributed to aggravate the mischiefs which had so long infested the province by giving scope to the machinations of that unprincipled agitator, whose habitual restlessness and impetuosity had been mistaken for attachment to the proprietary government.† No sooner had he called together an assembly, [1659.] than with unblushing treachery he surrendered into the hands of the burgesses the trust which Lord Baltimore had committed to him, and accepted from them a new commission as governor; and the burgesses, by his instigation, dissolved the upper house, and assumed to themselves the whole legislative power of the state. Fendal and his associates were probably encouraged to pursue this lawless career by the distractions of the English commonwealth that followed the death of the protector. Their administration, which was chiefly distinguished by the imposition of heavy taxes, and the persecution of the quakers, was happily soon terminated by the restoration of Charles the Second; [1669.] and Philip Calvert producing a commission to himself from the proprietary, and a letter from the king commanding all officers, and others his subjects in Maryland, to assist in the re-establishment of Lord Baltimore's jurisdiction, found his authority universally recognised and peaceably submitted to. Fendal was now tried for high treason, and found guilty; but the clemency of the proprietary prevailed over his resentments, and he granted him a pardon on condition of a moderate fine, and under declaration of perpetual incapacity of public trust. This lenity was very ill requited by its worthless object, who was reserved by farther intrigues and treachery to disturb at an after period the repose of the province. [1661.] His accomplices, upon a timely submission, were fully pardoned without prosecution. The recent usurpations were passed over in wise silence, and buried in a generous oblivion; toleration was forthwith restored; and the inhabitants of Maryland once more experienced the blessings of a mild government and internal tranquillity.

Happily for mankind, amidst the contentions of parties and the revolutions of government, there is a strong under-current of peaceful and industrious life, which often pursues its course with very little disturbance from the tempests that agitate the surface of society. Notwithstanding the disorders to which Maryland had so long been a prey, the province had continued to increase in population, industry, and wealth; and at the epoch of the Restoration, it appears to have contained about twelve thousand inhabitants. The re-establishment of a humane government and general subordination, however, had manifestly the effect of quickening the march of prosperity; and, accordingly, about five years after this period, we find the population increased to sixteen thousand persons. At this latter period, the number of ships trading from England and other parts of the British dominions to Maryland, was computed at an hundred. So great was the demand for labor in the colony, and so liberal its reward, that even the introduction of negro slavery had not been able to degrade it in public esteem. Industry, amply recompensed, was animated and cheerful, and, closely connected with independence and improvement of condition, was the object of general respect. Every young person was trained to useful labor; and though a legal provision was made for the support of the poor, pauperism and beggary were unknown in the colony, and the public bounty, though sometimes delicately conveyed to the necessities of proud poverty or modest misfortune, was never known to be openly solicited.‡ An account of the condition of Maryland was published at London in the year 1666, by George Alsop, who had resided in the province both prior and subsequent to the Restoration. From his representation it appears that a great

* Winterbotham erroneously ascribes this appointment to Cromwell.

† Alsop's Maryland, 15, 16. The English civil war appeared to have produced a considerable improvement in the condition of laborers in North America, by interrupting the emigration of additional competitors for employment. Winthrop's New England, ii. 219.

deal of the labor of the colony was performed by indentured servants; and that the treatment of those persons was so humane, and the allotment of land and stock which they received from their masters at the end of their quadriennial servitude so ample, that the author, who himself had served in this capacity, declares he was much happier as an indentured servant in Maryland than as an apprentice in London. It was common for ruined tradesmen and indigent laborers in England to adopt this resource for retrieving or improving their condition; though many were deterred by the misrepresentations circulated by weak politicians who dreaded the depopulation of the realm, or by interested employers who apprehended an augmentation of the wages of labor. No emigrants, says Alsop, were more successful in bettering their condition than female servants; they invariably obtained an immediate and respectable establishment in marriage. Money appears to have been very scarce in the colony, and quite unknown in its domestic transactions; tobacco being the universal medium of exchange, the remuneration of all services, civil, military, and ecclesiastical, and the measure of all penal amercements. This author, when he has occasion to mention the troubles that preceded the Restoration, alludes to them merely as affairs of state, and events of very inconsiderable importance. Of some of the personages who were culpably implicated in them, it was his opinion, "that their thoughts were not so bad at first, as their actions would have led them into in process of time."*

A great proportion of the inhabitants of Maryland, and, in particular, all the catholic part of the population, were sincerely attached to the royal government;† and the gratification they derived from the restoration of the king enhanced the satisfaction with which they returned to the patriarchal sway of their benevolent proprietary. During the general festivity that prevailed in the province, the house of assembly was convoked by the governor. One of the first measures adopted by this body was an attempt to provide a remedy for the scarcity of money, which, it was declared, formed a serious obstruction to the advancement of trade. For this purpose they besought the proprietary to establish a mint in the province; and enacted that the money to be coined should be of as good silver as English sterling, and that the proprietary should accept of it in payment of his rents and other debts. This act, and the New England ordinance in 1652, are the only instances of the assertion of a right to coin money that occur in the colonial jurisprudence. A coinage accordingly took place in Maryland; and the measure seems neither to have offended the British government, nor to have disappointed the colony, for the law was confirmed and declared perpetual by the assembly in the year 1676. Yet, in consequence perhaps of the blame that Massachusetts incurred for a similar proceeding, the practice of coining soon after fell into disuse, and the acts that had introduced it were repealed. In the same session there was passed an act for the imposition of port duties, which conferred on the proprietary half a pound of powder and three pounds of shot for every ton of the burden of vessels not belonging to the province. This act, as we shall afterwards find, gave rise to some political controversy at the period of the British Revolution.

The happiness and prosperity of the colony were promoted by the arrival, in the following year, [1662,] of Charles Calvert, the eldest son of the proprietary, whom his father appointed the resident governor of Maryland, for the purpose of enabling him to form acquaintance with the people over whom he was destined to maintain the hereditary jurisdiction. From the various *acts of gratitude* (as they were termed) that were passed by the assembly during his administration, Charles Calvert appears to have followed, with successful virtue, the wise and generous policy of his father; and his administration, both as governor, and afterwards as proprietary, proved no less honorable to himself than beneficial to the province. Legislation continued for a considerable period to be the only public proceeding in which the people were called to share; and various laws were enacted by the assembly for the ascertainment of public and private right, the promotion of commerce, and the encouragement of agricultural and manufacturing industry. Acts were passed for engraving more perfectly the English statute

law on the jurisprudence of the colony; for securing the stability of possessions, and the observance of contracts; and for the encouragement of the sowing of English grain, and the rearing and manufactory of hemp and flax. [1666.] As the agitations of the parent state had ever been found to diffuse their influence through the colonial territories, and the perturbing spirit of rumor to gain force and falsehood proportioned to the distance from which it was wafted, it was attempted to protect the quiet of the colony by an act against the divulgers of false news; but this desirable object was much more respectably as well as effectually promoted by the excellence and popularity of the governor's administration. The public tranquillity was threatened with some disturbance from the encroachments of the Dutch on the western banks of the Delaware, and from the hostile incursions of a distant tribe of Indians. But the vigorous remonstrances of Calvert obliged the Hollanders to desert the whole country around Cape Henlopen, of which he instantly took possession;‡ and his prudence, seconded by the friendly demonstrations of the Indians who were in alliance with the province, restored peace with the hostile tribe by a treaty, which was confirmed by act of assembly. The fidelity of the Indian allies was rewarded by settling on them and their descendants a considerable territory, which, being assured to them on various occasions by successive acts of the assembly, continued in their possession for near a century after. All the Indian tribes within the limits of the province now declared themselves subject to the proprietary government, and in testimony of this subjection, the inferior chiefs or princes, on the death of their principal sachem, refused to acknowledge the sway of his successor, till his pretension to this dignity had been recognised by governor Calvert. The removal of the Dutch from Cape Henlopen induced many of these settlers to unite themselves to the colony of Maryland, where they were received with the utmost kindness; and, in the year 1666, the assembly passed in their favor the first act that occurs of any colonial legislature for the naturalization of aliens. Many similar laws were enacted in every subsequent session, till the British Revolution; and, during that period, great numbers of foreigners transported themselves to this province, and became completely incorporated with the ancient inhabitants.

The principal, if not the only, inconvenience of which the people of Maryland were sensible at this period, was that which they shared with all the other colonies, and which was inflicted by the parliamentary acts of navigation. In Virginia, where the pressure of these restrictions was sooner and more severely felt, an attempt was made to enhance the price of the staple commodity, by prohibiting the growth of tobacco for a limited time; but, as Maryland refused to concur in this proceeding, its efficacy was defeated, and the ancient animosity of the Virginians against the inhabitants of the neighboring colony unhappily revived. To this animosity we must ascribe the various complaints against the colonists of Maryland which Virginia continued from time to time to address to the king; all of which, upon examination, proved to be utterly unfounded.† As the inconvenience arising from the navigation laws began to be more sensibly experienced in Maryland, the policy that had been ineffectually suggested by Virginia was more favorably regarded; and at length a prohibitory act, suspending the growth of tobacco, was passed this year by the assembly; but the dissent of the proprietary and governor, who apprehended that it might prove injurious to the poorer class of planters, as well as detrimental to the royal customs, prevented this regulation from being carried into effect. The popularity of Lord Baltimore and his son appears to have sustained no abatement from this opposition to the project of the assembly. Though averse to impose any direct restraint on the cultivation of tobacco, they willingly concurred in giving every encouragement that was desired to other branches of industry; and their efforts to alleviate the public inconvenience were justly appreciated, as well as actively seconded, by a people

more attentive to improve the remaining advantages of their situation, than to resent the injustice by which these advantages had been circumscribed. While Virginia was a prey to discontent and insurrection, Maryland continued to enjoy the blessings of peace and prosperity, and to acknowledge the patriotic superintendence of its generous proprietary. By an act passed in the year 1671,* the assembly imposed a duty of two shillings sterling on every hogshead of tobacco exported: the one-half of which was to be applied in maintaining a magazine of arms, and discharging the necessary expenses of government; and the other half was settled on the proprietary, in consideration of his receiving merchantable tobacco for his rents and alienation fines, at twopence a pound. This provision was soon after continued during the life of the heir of the proprietary, by "An act of gratitude," [1674,] as the assembly termed their ordinance, "to Charles Calvert, the governor."

Cecilus, Lord Baltimore, the father of the province, having lived to reap these happy and honorable fruits of the plantation which he had founded and reared with so much wisdom and virtue, died in the forty-fourth year of his supremacy, [1676,] crowned with venerable age and unsullied reputation. It was his constant maxim, which he often recommended to the legislative assembly, "that by concord a small colony may grow into a great and renowned nation; but that by dissension, mighty and glorious kingdoms have declined and fallen into nothing." Some observations on the state of the province at the period of his death occur in a letter written in the same year by a clergyman of the church of England, resident there, to the archbishop of Canterbury. Maryland, it appears, had been then divided into ten counties, and contained upwards of twenty thousand inhabitants. The catholics, says this writer, had provided for their priests; and the quakers maintained their speakers; but no care was taken to build up a protestant church. There were but three or four ministers of the church of England in Maryland; and from the want of a public establishment for them the colony, he declares, had fallen into a most deplorable condition, having become a *pest-house of iniquity*, in which the Lord's day was openly profaned. As a remedy for this evil, he suggests an endowment of the church of England at the public expense.‡ The remedy discredits the representation, which, besides, is totally unconfirmed by any other account: and it seems neither uncharitable nor unreasonable to suppose, that this writer contemplated the existing condition of society, through the inverted medium of the same opinion that represented to him the future advancement of the spiritual interests of the laity, originating from the promotion of the temporal interests of the clergy. The brightness of distant hope tends to darken the realities of present experience; and the associations that serve to dignify and illustrate the one, are able to degrade and obscure the other. The protestant part of the population of Maryland was less distinguished by that christian zeal which leads men to impose sacrifices on themselves, than by that ecclesiastical zeal which prompts them to exact sacrifices from others; they were probably less wealthy from having been more recently established in the province, than the catholics; and the erection of their churches had been farther retarded by the state of dispersion in which the inhabitants generally lived. The church of England ministers, like the clergy of every other order, depended on the professors of their own particular tenets for support; and it is not easy to see the force of the reasoning that assigns the liberality of other sectarians to their clergymen, as an argument for burdening them with the support of the church of England ministers also,—or the existing incompetency of these ministers to control the immoralities of their people, as an argument for endowing them with a provision that would render them independent of the discharge of their duty. This logic,

* Bacon's Laws, 1671, cap. 11. "Reflecting with gratitude," says the preamble of this enactment, "on the unwearied care of the proprietary, and the vast expense that he has been put to in preserving the inhabitants in the enjoyment of their lives and liberties, and the increase and improvement of their estates." History should delight to record the expressions of popular gratitude for conspicuous service—the public honors rendered to wisdom and virtue.

The same year there was passed an act "for encouraging the importation of negroes and slaves."

† Chalmers, p. 362, 363. Yeo, apud Chalmers, p. 375. This representation is as incredible as the statement that was published about twelve years after by the protestant association of Maryland of the daily murders and persecutions incited by the proprietary and committed by the papists. No reliance can be placed on the accounts that men give of the character and conduct of those whom they are preparing or longing to plunder.

* Alsop's Maryland, 31, 33, 37, 38, 101, 102. The Advocates' Library of Edinburgh contains a copy of this little work.

† It was one of the charges preferred against the proprietary by Cromwell's commissioners, that Charles the Second had been proclaimed by the people of Maryland, without any signification of displeasure from Lord Baltimore. Hazard, 628, 629.

however, proved quite satisfactory to the primate of England, who eagerly undertook to reform the morals of the people of Maryland, by obtaining a legal establishment and wealthy endowment to a protestant episcopal church in the province.

The deceased proprietary was succeeded by his son Charles, Lord Baltimore, who had governed the province for fourteen years with a high reputation for virtue and ability. With the religious tenets, he inherited the tolerant principles of his father; and one of the first acts of his administration was to confirm the remarkable law of 1649, which established an absolute political equality among all denominations of Christians. Having convoked an assembly, in which he presided in person, he performed, with their assistance, what has often been recommended to other legislatures, but rarely executed by any—a diligent revision of the whole code of provincial laws; repealing those that were judged superfluous or inexpedient, confirming the salutary, and explaining the obscure. In this assembly, an attempt was made to stem the progress of an existing evil, by a regulation more wisely, perhaps, than constitutionally opposed to the policy of the mother country. The morals of the colonists were much more seriously endangered by the transportation of felons to Maryland, than by the want of a legislative endowment in the province to the clergy of the English national church. To the common law of England, this punishment of transportation was quite unknown; though in some cases it permitted the felon who chose rather to lose his country than his life to abjure the realm. It was a statute of Elizabeth which first inflicted banishment on dangerous rogues; and it was James the First who, without any regard to this law, but in the plenitude of his royal prerogative, adopted the measure of ordering dissolute persons to be sent to Virginia. He was indebted for the suggestion to Chief-justice Popham, who being a proprietor of colonial territory, as well as a judge, conceived the project of rendering the administration of justice subservient to his colonial designs, and had destined New England in particular to anticipate the uses of Botany Bay. The practice of transporting felons to the colonies was resumed soon after the Restoration, and received so far the countenance of the legislature, that an act of parliament authorised the king to inflict this punishment on convicted quakers. The effects of it proved so disagreeable to the people of Maryland, that a law was now framed against the importation of convicts into the province, and afterwards re-enacted at various subsequent periods till towards the commencement of the reign of Queen Anne. Whether any notice was taken of this declaration of resistance to a measure of the British government or what were the effects of it, I am unable to discover. It is certain that at a later period, the evil was continued and increased in spite of the remonstrances of all the respectable inhabitants; and shortly prior to the American revolution, no fewer than three hundred and fifty felons were annually imported into Maryland from the parent state.

At the conclusion of the session, the proprietary having announced his intention of visiting England, the assembly, in acknowledgment of the many signal favors he had rendered to the people, and as a token of their love and respect, unanimously desired his acceptance of all the public tobacco which remained unappropriated in the stores of the province. Lord Baltimore was undoubtedly worthy of these demonstrations of regard; and the experience of his own, together with the remembrance of his father's merits, might have been expected to recommend the system of proprietary government to the lasting approbation of the colonists. But this species of magistracy was destined to enjoy a very brief popularity in America. Allied to no similar institution, and surrounded by no kindred order in the provincial establishments, it stood wholly unsheltered from envy, a solitary specimen of hereditary grandeur; and its objectionable features were exhibited in the most offensive light, when, in the progress of succession, exclusive dignity became the instrument of worthlessness, or the portion of incapacity. These considerations, it must be acknowledged, afford no explanation of the sudden decline which Lord Baltimore's popularity was destined to experience; and we must seek elsewhere for the causes of that revolution of public opinion in which his merits were so ungratefully depreciated or forgotten. If he had lived in an age less subject to jealousy and alarm, or presided in a colony composed entirely of catholics, he would probably have enjoyed a larger harvest of popular gratitude. But the toleration which his father had established, and the naturalization of foreigners which he himself had introduced, had at-

tracted into the province a multitude of protestants both of French and of English extraction. The tolerating principles of the proprietary were not able to disarm the French protestants of their enmity against a faith whose perfidy and persecution they had so severely experienced; and the English protestants, impressed with the opinion which their friends in the mother country had derived from the policy of the king, regarded toleration but as a cloak under which popish bigotry disguised the most dangerous designs. These unhappy impressions were deeply confirmed by the alarms and intrigues of which the ensuing period of English history was abundantly prolific, and which invariably extended their influence to the minds of the people of Maryland; where a mixture of opinions unknown in any other of the provinces gave a peculiar interest to the conflict of the same opinions that was carried on in the parent state.

On his arrival in England, [1677.]* Lord Baltimore was assailed with complaints preferred against him to the Committee of Plantations, by the colony of Virginia and the prelates of England. The accusations of Virginia, which related to boundaries and Indian treaties, were easily repelled; but the controversy with the prelates was not so satisfactorily adjusted. Compton, bishop of London, to whom the primate had imparted his ecclesiastical project for the colony, represented to the committee that religion was deplorably neglected in Maryland; that while the Roman catholic priests were enriched with valuable possessions, the protestant ministers of the church of England were utterly destitute of support; and that an universal immorality had consequently overspread the province. Lord Baltimore, in justification of himself and the colonial legislature, exhibited the act of 1649, together with the recent confirmation of it, which gave freedom and protection to every sect of Christians, but special privileges to none. He stated that four ministers of the church of England were in possession of plantations which afforded them a decent subsistence; but that from the variety of religious opinions that prevailed in the assembly, it would be extremely difficult, if not impossible, to induce this body to consent to a law that should oblige any sect to maintain other ministers than its own. Satisfactory as this answer ought to have been, the impartial policy of the proprietary did not meet with perfect acquiescence. The committee declared that they thought fit there should be a public maintenance assigned to the church of England, and that the proprietary ought to propose some means for the support of a competent number of her clergy. The king's ministers at the same time signified to him the royal pleasure that immorality should be discouraged, and the laws against vice punctually executed in Maryland.

This last, and probably the least seriously moant of the injunctions communicated to Lord Baltimore in England, was the only one of them that received any attention from the colonial government. [1678.] A law was passed by the assembly for the more strict observance of Sunday; and after the return of the proprietary, [1681.] new regulations were enacted for the more speedy prosecution of offences, and the stricter definition of punishments. As the more rigid enforcement of the navigation act began now to occasion an increased depreciation of the staple produce of the colony, numerous attempts were made by the proprietary and assembly during the two following years to counteract or diminish this inconvenience, by giving additional encouragement to provincial productions and colonial commerce. Laws were enacted for promoting tillage and raising provisions for exportation; for restraining the export of leather and hides; for the support of tanners and shoemakers; and for encouraging the making of linen and woollen cloth. Thus early did the legislature endeavor to introduce manufactures into the province; but the attempt was premature; and though domestic industry was able to supply some articles for domestic uses, it was found impracticable even at a much later period to render Maryland a manufacturing country. For the encouragement of trade, various ports were erected, where merchants were enjoined to reside, and commercial dealings to be carried on, and where all trading vessels were required to unlade the commodities of Europe, and take on board the productions of the province. But from the situation

* Three or four of the inhabitants of Maryland were murdered this year by a tribe of Indians who were at war with the colonists of Virginia, and a great deal of alarm was created in the province. But the Indians soon perceived that they had too hastily supposed that the Marylanders were their enemies, and made satisfaction for the outrage. Oldmixon, i. 192.

of the country, abounding with navigable rivers, and from the great variety of ports that were erected in conformity with the wishes of the planters, every one of whom desired to have a port on his own plantation, this regulation was attended with very little effect. It was during this interval, that there occurred the last instance of the expression of that reciprocal regard which had done so much honor to the proprietary and the people. By a vote of the assembly in the year 1682, this body "to demonstrate its gratitude, duty, and affection to the proprietary," desired his acceptance of a liberal contribution: which he acknowledged with many thanks, but declined to accept on account of the straitened circumstances of the colony.

But, amidst all this seeming cordiality, and the mutual endeavors of the proprietary and the people to promote the general interest, there lurked in the province the seeds of present discontent and of future insurrection. The fiction of the popish plot extended its baneful influence to Maryland, and was by some profligate politicians within the colony made the corner stone of projects similar to those in which it originated in England. The insurrections that had been provoked by the oppression of the covenants in Scotland; the discontents in England; the vehement disputes with regard to the exclusion of the Duke of York from the throne; the continued disagreement between the king and parliament; all transmitted through the magnifying and uncertain medium of rumor to a country so remote from the opportunity of just information, seemed to forebode a renewal of the convulsions of the preceding reign. A general ferment was excited in men's minds; and in the strong expectation that prevailed of some great change, parties and individuals prepared with anxiety to defend their interests; or intrigued with eagerness for the enlargement of their advantages. The absence of the proprietary from the province during his visit to England probably served to promote the designs of the factions, which, however, received a seasonable check from his return. Fendal, who had raised insurrection against the administration of Cromwell, and afterwards betrayed and resisted the government of the proprietary, now availed himself of the lenity he had experienced, to excite a renewal of commotions in Maryland. He seems to have had no other view than to scramble for property and power amidst the confusion that he expected to ensue; and he encouraged his partisans with the assurance, that, during the approaching civil wars of England, they might easily possess themselves of whatever plantations they pleased to appropriate. But Lord Baltimore, partly by a steady application of the laws, and partly by the influence of the tidings of the king's triumph over his opponents at the dissolution of the Oxford Parliament, was able as yet to preserve, even without a struggle, the tranquillity of the province. Fendal was tried for his seditious practices in the year 1681; and though the acts of the assembly had annexed the penalty of death to the offence of which he was convicted, he was now only fined, and banished from the province for ever. But unfortunately his influence was not banished with his person: and one of his associates, John Coode, who was tried along with him but acquitted, remained behind, to effect, at a fitter season, those designs which were dissipated for the present by the last ray of success that attended the proprietary's administration. A few others of the less guilty associates of Fendal and Coode were convicted of sedition, and punished by fine.

The last years of the proprietary government were embittered by the retribution of that injustice in which it began; and the wrong that had been done so long before to Virginia, was now avenged by the abscission of a considerable portion of the territory that had been allotted to Maryland. If the historian of this transaction were permitted to adapt the particulars of it to his own wishes and conceptions of moral consistency, he would ascribe the requital of the Maryland usurpation to other instrumentality than that of the venerable patriarch of Pennsylvania. Such, however, was the mode of this occurrence; and as the founder of American toleration committed the encroachment on Virginia, so another distinguished friend of the rights of conscience effected the retributory partition of Maryland. On the arrival of William Penn in America, a meeting took place between him and Lord Baltimore (two of the most prudent and virtuous persons that have ever ruled over mankind), in the hope of effecting an amicable adjustment of the boundaries of their respective territorial grants. Penn was received by Lord Baltimore with that distinguished respect due to illustrious character, and becoming christian courtesy; and

we may suppose that he entertained corresponding regards for a legislator whose institutions had long afforded a peaceful asylum for persecuted quakers. But the pretensions of the parties were so completely inconsistent with each other, that it proved impossible at the time to adjust them in a manner satisfactory to both. Penn had been authorised to appropriate, among other districts, the whole of the peninsula lying between the bays of Chesapeake and Delaware, which formed a considerable part of the territory included within the charter of Maryland, and part of which had been colonized by Dutch and Swedish settlers before the state of Maryland was formed. Lord Baltimore's was certainly the more equitable claim; but Penn appears to have been encouraged to persist in his counter pretension by the declaration of the Committee of Plantations, that it had never been intended to grant to Lord Baltimore any territory except such as was inhabited at the time by savages, and that the tract which he now claimed having been planted by Christians antecedent to his grant, was plainly excluded from its intentment, though it might be embraced by its literal construction. The controversy between these two distinguished men was conducted with a greater conformity to the general principles of human nature than I find it pleasant to record. While the conflicting claims were yet unsettled, Penn proceeded to appropriate the disputed territory; and as Lord Baltimore insisted that the inhabitants should either acknowledge the jurisdiction of Maryland or abandon their dwellings, mutual proclamations were exchanged by the two proprietary governments against each other's proceedings. A recent and deservedly esteemed biographer of Penn, whose partial acquaintance with the grounds of the dispute explains without excusing his partial judgment on the merits of the parties, has termed Lord Baltimore's assertion of his rights an outrage, and characterized the counter proclamation of Penn as a lenient remedy by which christian patience encountered lawless violence. But Penn did not content himself with this remedy. He complained to the English government, and by his interest at court procured it to be adjudged that the debatable territory should be divided into two equal parts, one of which was appropriated to himself, and the other to Lord Baltimore. This adjudication was carried into effect; and the territory which now composes the state of Delaware was thus dismembered from the provincial limits of Maryland.* [1635.]

Meanwhile, the late proceedings against Fendal and his associates were made the foundation, in England, of fresh complaints against Lord Baltimore for partiality to papists. It was in vain for him to represent that the laws of his province gave equal encouragement to Christians of every sect, without dispensing peculiar favor to any; that in order to conform his administration to the principles of the constitution, he had always endeavored to divide the offices of government as equally as possible among protestants and catholics; and that to allay the jealousy that had taken possession of the protestants, he had latterly suffered them to engross nearly the whole command of the militia, and the custody of the arms and military stores of the province. From the record of Fendal's trial, he showed that the proceedings against this individual had been perfectly fair; nay, so indulgent, that he had been allowed to except against all Roman catholics as jurymen. Notwithstanding the satisfactoriness of this explanation, the ministers of the king, less desirous of doing justice to others than of shifting the imputation of popery from themselves, commanded that all the offices of government should in future be committed exclusively to the hands of protestants; and thus meanly sanctioned the unjust suspicions under which the proprietary government was already laboring. It was less easy for Lord Baltimore to defend himself against another charge which was now preferred against him, and which, having some foundation in truth, involved him in considerable difficulty. He was accused of obstructing the custom-house officers in the collection of the parliamentary duties; and it did certainly appear that, biassed perhaps by the desire of alleviating as far as possible the pressure of the commercial restrictions, he had construed them in some points in a manner too favorable to the freedom and

wishes of the colonists. While he endeavored unsuccessfully to maintain the legitimacy of his interpretation, he strongly charged the collectors of the revenue with wilfully disturbing the trade and peace of the colony by wanton interference and groundless complaint. It would appear that this recrimination was well founded, and that the revenue officers, provoked to find that the unpopularity of their duties prevailed over the respect they conceived due to their office, had labored to convert their own private disagreements with individuals into the occasion of national dispute: for when a new surveyor-general of the customs in Maryland was appointed shortly after, he had the justice to report that the province had been greatly misrepresented with regard to its opposition to the acts of trade. The proprietary, however, incurred a severe rebuke from the king for his erroneous construction of the law. Charles latterly complained that he should obstruct his service and discourage his officers, after the many favors that had been heaped upon him and his father, and even threatened him with the visitation of a writ of *quo warranto*. It seems never to have occurred to the English government, nor did Lord Baltimore presume to urge, that the king, in proceeding to exact imposts in Maryland, violated the most express provisions of the royal charter, and appropriated to himself what truly belonged to the proprietary.

On the accession of James the Second to the throne of his brother, he transmitted to the colonies a proclamation of this event, which was published in Maryland with lively and unaffected demonstrations of joy. The Committee of Plantations had taken so much pains during the preceding reign to obtain accurate information of the affairs of the colonies and the temper of their inhabitants, that it was perfectly well known how much they were affected by reports from England, and what disturbances the prospect of confusion in the mother country was apt to engender. On the invasions of Monmouth and Argyle, the king transmitted accounts of these occurrences to the proprietary; assigning as the reason for this communication, the prevention of any false rumors which might be spread among his people in that distant province of the empire, by the malicious insinuations of evil disposed men. He informed him at the same time with marks of peculiar exultation, that the parliament had cheerfully granted him an aid, to be levied on the importation of sugars and tobacco, which he hoped would not be burdensome to the inhabitants of Maryland, as the imposition was not laid on the planter, but on the retailers and consumers. But the imposition could not be disarmed of its injurious influence by such royal logic and barren good wishes; and both in Virginia and in Maryland it served to augment the burdens and cool the loyalty of the people. As the other impediments of commerce were found to be aggravated in Maryland by the continued prevalence of a scarcity of money, [1686,] an attempt was now made to remedy this evil by a law for the *advancement of coins*. French crowns, pieces of eight, and six dollars were appointed to be received in all payments at six shillings each; all other coins at an advance of threepence in the shilling; and the sixpences and shillings of New England, according to their denominations, as sterling. As all accounts at that time were kept in tobacco, and in all contracts it was employed as the admeasure of value, the coins thus advanced were adjudged to be taken at the rate of six shillings for every hundred weight of that commodity. This law first gave rise in Maryland to the peculiarity of colonial currency, in contradistinction to sterling money.

At the same time that the king resolved to subvert the constitution of England, he determined to overthrow the proprietary governments of the colonies. It was, he declared, a great and growing prejudice to his affairs, both domestic and colonial, that such independent administrations should be maintained; and it was due no less to his interest than his dignity, to reduce them to more immediate subjection to the crown. Alarmed by the communication of this arbitrary purpose, the proprietary of Maryland again proceeded to England, and vainly represented to the inflexible despot that the administration of his province had been at all times conducted in conformity with the terms of his charter; that he had never knowingly failed in his duty to his sovereign; and that neither he nor his father had committed a single act which could infer the forfeiture of a patent which they had dearly purchased, in adding, at their own great expense, a considerable province to the empire. [1687.] These remonstrances were disregarded by the king; and the attorney-general received orders to issue a writ of *quo*

warranto against Lord Baltimore's charter. The writ was issued accordingly; but from the dilatory pace of the requisite legal procedure, and the important events that soon after diverted the monarch's attention to nearer concerns, no judgment upon it was ever pronounced. Thus, with impartial tyranny, which even the predilections of the bigot were unable to control, James, disregarding equally the feelings of the puritans of Massachusetts and the catholics of Maryland, involved both in the same undistinguishing project of oppression and degradation. Whether the singular friendship which, in this monarch and William Penn, seemed to unite the two extremes of human nature, might have suspended for a while the destruction of the constitutions of Pennsylvania, this consummation would have infallibly followed in due time; and the royal regards that Penn shared with Judge Jeffries and Colonel Kirke would have procured him no other advantage than that of being, perhaps, the last of the American proprietaries that was sacrificed. Fortunately for the interests of mankind, bigotry, infatuated by tyranny, at length obtained the ascendancy over the king's mind; and depriving the bigot of the adherents of the tyrant, involved even Jeffries in disgrace, and constrained even the prelates of England to seek protection in the principles of liberty.

[1688.] The birth of a son to James the Second, which was regarded with mingled scepticism and disappointment by his English subjects, and contributed to hasten the Revolution, was no sooner communicated by the proprietary (who was still in England,) to his officers in Maryland, than it excited general joy throughout the province. In the assembly which was convoked on this occasion, a law was passed for a perpetual commemoration and thanksgiving, every tenth day of June, for the birth of the prince. If this proceeding seem to indicate the prevalence of a feeling that may be supposed peculiar to the catholics, other parts of the conduct of this assembly strongly evinced the existence of those jealousies with which the protestants were infected, which the mean injustice of the late king's ministers had sanctioned, and which the unfortunate absence of Lord Baltimore now contributed to promote. The burgesses at first demurred to take the oath of fidelity to the proprietary; and afterwards exhibited to the deputy-governors a list of pretended grievances that indicated nothing so strongly as the ill-humor and alarm of the parties who declared themselves aggrieved; for the articles are all so vague and so frivolous, and, if true, related only to such petty and easily remediable violations of law and usage, that it is impossible to peruse them without perceiving that the complainers either sought a cause of quarrel, or had already found one which they were backward to avow. A courteous and obliging answer was returned to the list of grievances, by the deputy-governors; and, as the malcontents were not yet transported by passion beyond the limits of reason and common sense, they returned thanks for this issue, [14] and the flame of discontent and suspicion seemed to be extinguished. But the embers remained, and waited only the influence of the coming events to show what a conflagration they were capable of producing. The spirit of party in the province, excited and preserved by religious differences, in an age in which to differ was to dislike and suspect, had been hitherto moderated by the liberal spirit of the laws, and the prudent administration of the proprietary. But no sooner were the tidings of the Revolution in England conveyed to the province, than these latent dissections, inflamed by fresh incentives, burst forth in a blaze of insurrectionary violence; and those who had long been sowing discontent in the minds of their fellow citizens, now prepared to reap an abundant harvest from the prevalence of public disorder. [1689.]

When the deputy-governors were first informed of the invasion of England by the Prince of Orange, they hastened to take measures for preserving the tranquility of the province, where as yet none could foresee, and none had been informed, of the extraordinary use that was to be made of that memorable achievement. They proceeded to collect the public arms that were dispersed in the various counties, and apprehended several persons who were accused of attempts to disturb the public peace. But these measures were completely frustrated by the rumour of a *popish plot*, which suddenly and rapidly disseminated the alarming intelligence that the deputy-governors and the catholics had formed a league with the Indians, for the massacre of all the protestants in the province. Confusion, dismay, and indignation, instantly laid hold of the minds of the people, and every exertion that was made to demonstrate the folly and absurdity of the report proved

* Chalmers, 647, 648, 650, 651, 661-666. Clarkson's Life of Penn. i. 336, 337, 408, 409. Mr. Clarkson's account of this dispute is very defective, and tends to create an impression of the conduct of Lord Baltimore not less unfavorable than erroneous. If he considered the merits of the respective pleas too uninteresting to deserve his inquiry, he should have refrained from pronouncing or insinuating any judgment on the comparative merits of the parties. The controversy between Lord Baltimore and Penn is resumed and further illustrated in the history of Pennsylvania, post, B. vii cap. I.

ineffectual. Like the kindred fiction in England, the tale was corroborated by various unlucky circumstances, that tended wonderfully to support the general delusion. Though Lord Baltimore received orders to proclaim William and Mary, which he readily promised and prepared to obey, yet some fatal accident intercepted the commands which he transmitted to his deputies for that purpose; and they still awaited official orders respecting this delicate and important transaction, long after the corresponding proclamation had been published in Virginia. It happened unfortunately too, that, at the same conjuncture, they had to repeat the annual confirmation of the existing treaty of peace with the Indians. These occurrences, distorted by the arts of the factious, and the credulity of the timid, increased the prevailing panic, and accelerated the explosion it had long threatened to produce. A protestant association was formed by John Coode, the former accomplice of Fendal, and being soon strengthened by the accession of numerous adherents, took arms under this worthless leader for the defence of the protestant faith, and the assertion of the royal title of William and Mary. A declaration or manifesto was published by the associators, replete with charges against the proprietary, that reflect the utmost dishonor on their own cause. The reproaches of tyranny and wickedness, of murder, torture, and pillage, with which Lord Baltimore is loaded in this production, are refuted not only by the gross inconsistency between such heinous enormities and the recent limitation of the public grievances to the frivolous complaints exhibited to the deputy-governors, but by the utter inability of the associators to establish by evidence any one of their charges, even when the whole power and influence of the provincial government was in their hands. With matchless impudence and absurdity, the affronts that had been formerly complained of by the custom-house officers were now cited as an injury done to the province of Lord Baltimore, who, if he had ever participated in them at all, must have been induced to do so by resentment of the real grievances with which the province was afflicted. A charge of this description, however artfully calculated to recommend the cause of the associators to the favor of the British government, would never have suggested itself to a passionate multitude; and it is probable that the whole composition was the work of Coode, whose subsequent conduct showed how little he participated in the popular feelings which he was able to excite and direct with such energy and success. The deputies of Lord Baltimore endeavored at first to oppose by force the designs of the associators; but as the catholics were afraid to justify the prevalent rumours against themselves by taking arms, and as the well-affected protestants showed no eagerness to support a falling authority, they were compelled to deliver up the fort, and surrender the powers of government by capitulation. The king, apprised of these proceedings, hastened to express his approbation of them, and authorised the leaders of the insurgents to exercise in his name the power they had acquired, until he should have leisure to effect a permanent settlement of the administration. Armed with this commission, the associators continued for three years after to administer the government of Maryland, with a tyrannical insolence that exemplified the grievances they had falsely imputed to the proprietary, and produced loud and numerous complaints from both the protestant and catholic inhabitants of the province.

King William, meanwhile endeavored to derive the same advantage to the royal authority in Maryland, that the tyranny of his predecessor bequeathed to him in Massachusetts. But, to persist in the iniquitous process of *quo warranto*, was no longer practicable; and no other proceeding was left, but to summon Lord Baltimore to answer before the Privy Council the complaints expressed in the declaration of the associators. After a tedious investigation, which involved this nobleman in a heavy expense, it was found impossible to convict him of any other charge than that of holding a different faith from the men by whom he had been so ungratefully persecuted and so calumniously traduced. He was accordingly suffered to retain the patrimonial interest attached by his charter to the office of proprietary, but deprived by an act of council of the political administration of the province, of which Sir Edmund Andros was at the same time appointed governor by the king.* [1692.] The unmerited eleva-

tion of this worthless man was no less disgraceful than the unjust deposition of the proprietary. Lord Baltimore having exercised his power with a liberal regard to the freedom of other men's consciences, now parted with it from a pious regard to the sanctity of his own. Andrus, who had formerly acquired promotion by active subservency to a catholic despot, now purchased its continuance by becoming the no less active abettor of protestant intolerance.

Thus fell the proprietary government of Maryland, after an endurance of fifty-six years, during which it had been administered with unexampled mildness, and with a regard to the liberty and welfare of the people, that deserved a very different requital from that which I have had the pain of recording. The slight notice which the policy of this catholic legislator has received from the philosophic encomiasts of liberal institutions strongly attests the capricious distribution of fame, and may probably have proceeded from dislike of his religious tenets, which, it was feared, would share the commendation bestowed on their votary. It was apprehended perhaps, that the charge of intolerance so strongly preferred against catholic potentates and the Romish church, would be weakened by the praise of a toleration which catholics established and protestants overthrew. But in truth every deduction that is made from the liberality of catholics in general, and every imputation that is thrown on the usual influence of their tenets in contracting the mind, ought to magnify the merit of Lord Baltimore's institutions, and enhance the praise by demonstrating the rarity of his virtue. One of the most respectable features of the proprietary administration was the constant regard that was had to justice, and to the exercise and cultivation of benevolence, in all transactions and intercourse with the Indians. But though this colony was more successful than the New England states (who conducted themselves no less unexceptionably to the Indians) in avoiding war with its savage neighbors, yet we have seen that it was not always able to avert this extremity. In both these cases, no doubt, the pacific endeavors of the colonists were counteracted, not only by the natural ferocity of the Indians, but by the hostilities of other Europeans, by which that ferocity was additionally inflamed. Yet the quakers of Pennsylvania who were exposed to the same disadvantage, escaped its evil consequences, and were never attacked by the Indians. Relying implicitly and entirely on the protection of God, they renounced every act or indication of self-defence that could provoke the antagonism of human nature, or excite apprehensive jealousy, by showing the power to injure. But the puritan and the catholic colonists of New England and Maryland, while they professed and exercised good-will to the Indians, adopted the hostile precaution of showing their power to repel violence. They displayed arms and erected forts, and thus suggested the suspicion they expressed, and invited the injury they anticipated.

Before toleration was defended by Locke, it was realised by Lord Baltimore; and in the attempts which both of these eminent persons made to establish the model of a wise and liberal government in America, it must be acknowledged that the protestant philosopher was greatly excelled by the catholic nobleman.* The constitutions of William Penn have been the theme of panegyric no less just than general; but of those who have commended them, how few have been willing to notice the prior establishment of similar institutions by Lord Baltimore. Assimilated in their maxims of government, these two proprietaries were assimilated in their political fortunes; both having witnessed an eclipse of their popularity in America, and both being dispossessed of their governments by King William. Penn, indeed, was restored a few years

after: but Lord Baltimore's deprivation continued during his life. On his death in 1716, his successor being a protestant, was restored to the enjoyment of proprietary powers. These powers, however, had in the interim sustained some abatement from an act of the English parliament,* which applied not only to this but to all the other feudatory principalities in North America, and rendered the royal sanction necessary to confirm the nomination of the proprietary governors.

Immediately after his appointment to the office of governor, Sir Edmund Andros proceeded to Maryland, where he convoked an assembly, in which the title of William and Mary was recognised by a legislative enactment. In this assembly an attempt was made to divest the proprietary of the port-duties that had been settled on his family in the year 1661. The assembly now made a tender of the produce of this tax to the king, alleging, that although the provision had been granted generally to the proprietary, the true intention of the legislature had been to confer it merely as a trust for the uses of the public. The king however declined to accept the offer, or sanction the assembly's construction of the grant; Sir John Somers, to whom the legitimacy of the proceeding was referred, having given it as his opinion that the duty truly belonged to Lord Baltimore, and was intended for his own use, and that it would be of dangerous consequence to receive parole proof of an intention in the legislature different from the plain meaning of the words of the law. The ingratitude which was thus evinced towards the proprietary met with a just retribution from the administration of Andros, who, though he is said to have approved himself a good governor in Virginia, appears to have exercised no little severity and rapacity in Maryland. Not the least offensive part of his conduct was, that he protected Coode against the complaints he had provoked, and enabled this profligate hypocrite a little longer to protract the period of his impunity. But Coode's fortunes soon became more suitable to his dea-

after: but Lord Baltimore's deprivation continued during his life. On his death in 1716, his successor being a protestant, was restored to the enjoyment of proprietary powers. These powers, however, had in the interim sustained some abatement from an act of the English parliament,* which applied not only to this but to all the other feudatory principalities in North America, and rendered the royal sanction necessary to confirm the nomination of the proprietary governors.

Immediately after his appointment to the office of governor, Sir Edmund Andros proceeded to Maryland, where he convoked an assembly, in which the title of William and Mary was recognised by a legislative enactment. In this assembly an attempt was made to divest the proprietary of the port-duties that had been settled on his family in the year 1661. The assembly now made a tender of the produce of this tax to the king, alleging, that although the provision had been granted generally to the proprietary, the true intention of the legislature had been to confer it merely as a trust for the uses of the public. The king however declined to accept the offer, or sanction the assembly's construction of the grant; Sir John Somers, to whom the legitimacy of the proceeding was referred, having given it as his opinion that the duty truly belonged to Lord Baltimore, and was intended for his own use, and that it would be of dangerous consequence to receive parole proof of an intention in the legislature different from the plain meaning of the words of the law. The ingratitude which was thus evinced towards the proprietary met with a just retribution from the administration of Andros, who, though he is said to have approved himself a good governor in Virginia, appears to have exercised no little severity and rapacity in Maryland. Not the least offensive part of his conduct was, that he protected Coode against the complaints he had provoked, and enabled this profligate hypocrite a little longer to protract the period of his impunity. But Coode's fortunes soon became more suitable to his dea-

aerts. Finding himself neglected by Colonel Nicholson, the successor of Andros, he began to practise against the royal government the same treacherous intrigues that he had employed with so much success against the proprietary administration. Inferior in talent to Bacon, the disturber of Virginia, and far inferior in sincerity to Leisler, the contemporary agitator of New York, he was chiefly indebted for his success to the daring reliance which he placed on the influence of panic, and the extent of popular credulity. He had an unbounded confidence in the power of patient and persevering calumny, and endeavored to impress it as a maxim on his confederates, that "if plenty of mud be thrown, some of it will undoubtedly stick." In 1695, this president of the protestant association of Maryland was indicted for treason and blasphemy; and, justly apprehending that he would be treated with less lenity under the protestant, than he had formerly experienced under the catholic administration, he declined to stand a trial, and fled for ever from the province which he had contributed so signally to dishonor.†

The suspension of the proprietary government was accompanied with a total subversion of the principles on which its administration had been uniformly conducted. The political equality of religious sects was subverted, and the universal toleration of every form of christian worship abolished. The church of England was declared to be the established ecclesiastical constitution of the state; and an act passed in the year 1692 having divided the several counties into parishes, a legal maintenance was assigned to a minister of this communion in every one of these parishes, consisting of a glebe, and of an annual tribute of forty pounds of tobacco from every christian male, and every male or female negro above sixteen years of age. The appoint-

ment of a minister in the same statute, it was enacted, "that on no pretence whatever any kind of goods from the English American plantations shall hereafter be put on shore either in the kingdoms of Ireland or Scotland, without being first landed in England, and having also paid the duties there, under the penalty of a forfeiture of the ship and cargo." The Union in 1706 rendered this restriction void, in so far as related to Scotland.

† Oldmixon, vol. i. p. 193. Chalmers, p. 243. 374. 383, 384. Among other expressions of Coode's indictment laid to his charge, under the count of blasphemy, he was accused of having said "that there was no religion but what was in Tully's Offices." To make these words the more intelligible, the indictment illustrated them by this innuendo, "that they were spoken of one Tully, a Roman orator, meaning."

* Oldmixon, vol. i. p. 193. "I know not how it happened, but so it was, that in King William's reign, Queen Anne's, &c. there were periods when the friends or tools of the abdicated king were more hearkened to than the instruments of the revolution." Ibid (2d edition) i. p. 244. It is to the first edition

ment of the ministers was vested in the governor, and the management of parochial affairs in vestries elected by the protestant inhabitants. For the better instruction of the people, free-schools and public libraries were established by law in all the parishes, and an ample collection of books was presented to the libraries as a commencement of their literary stock, by the bishop of London. But notwithstanding all these encouragements to the cultivation of knowledge, and the rapid increase of her wealth and population, it was not till after her separation from the parent state, that any considerable academy or college was formed in Maryland. All protestant dissenters were declared to be entitled to the full benefit of the act of toleration passed in the commencement of William and Mary's reign by the English parliament. But this grace was strictly withheld from the Roman catholics; and the protestants who thus enacted toleration to themselves, with the most impudent injustice and unchristian cruelty, denied it to the men by whose toleration they themselves had been permitted to gain an establishment in the province. Sanctioned by the authority, and instructed by the example of the British government, the legislature of Maryland proceeded, by the most tyrannical persecution of the catholics, to fortify and disgrace the protestant ascendancy. Not only were these unfortunate victims of a conscience, which the actions of their opponents contributed additionally to mislead, excluded from all participation in political privileges, but they were debarred from the exercise of their worship and the advantages of education. By an act passed in the year 1704, and renewed in the year 1715, it was provided that any catholic priest attempting to convert a protestant, should be punished with fine and imprisonment; and that the celebration of mass, or the education of youth by a papist, should be punished by transportation of the offending priest or teacher to England, that he might there undergo the penalties which the English statutes inflicted on such actions. Thus in their eagerness to deprive others of their liberty, the protestants of Maryland truly subverted their own pretensions to independent legislation. They maintained that the statutes of the English parliament did not necessarily extend to Maryland; and in conformity with this supposition, we find an act of assembly in the year 1706, giving to certain English acts of parliament the force of law within the province. But it was manifestly inconsistent with this pretended independence, to declare any of the colonists amenable to the peculiar jurisprudence of England, for actions committed in the province and not punishable there. Though laws thus unjust and oppressive were enacted, it was found impossible to carry them into complete execution. Shortly after the act of 1704 was passed, the assembly judged it expedient to suspend its enforcement so far as to admit of catholic priests performing their functions in private houses; and the act of 1714 was suspended in a similar manner, in consequence of an express mandate to the assembly from Queen Anne.

Thus were the catholics of Maryland, under the pretence of vices which none realized more completely than their persecutors, deprived of those privileges, which for more than half a century they had enjoyed with unparalleled moderation. In addition to the other odious features of the treatment they experienced, there was a shameful violation of national faith in suffering protestant persecution to follow them into the asylum from its severity which they had been encouraged to seek, and with laborious virtue had established. Sensible of this injustice, or rather perhaps willing to induce the catholics whom they were determined not to tolerate at home to expatriate to Maryland, the British government continued from time to time to set bounds to the exercise of that colonial bigotry which its own example had excited, and its own authority still maintained.

Before the overthrow of the catholic church in Maryland, its clergy had signalized themselves by some attempts to convert the Indians to the christian faith; but their endeavors are represented as having been neither judicious nor successful. Eager to prevail on the savages to receive the formalities, before they were impressed with the substance of christian doctrine, they are said to have administered the rite of baptism to persons who understood it so little, that they considered their acceptance of it as a favor they had done to the missionaries in return for the presents they received from them, and used to threaten to renounce their baptism unless these presents were repeated. But if the catholics of Maryland were chargeable with a superstitious forwardness to administer this rite, some of their protestant fellow-colonists evinced a sentiment

tenfold more inexcusable, in their determination to withhold it. An act of assembly passed in the year 1715 declared that many people refused to permit their slaves to be baptized, in consequence of an apprehension that baptism would entitle them to their freedom; and accordingly, to overcome their reluctance, enacted that no negro receiving the holy sacrament of baptism, should derive therefrom any right or claim to be made free. It was the peculiar unhappiness of the lot of the Maryland protestants, that it surrounded them at once with catholics, whom they were incited to persecute, and with slaves whom they were enabled to oppress; and it was not till some time after the Revolution of 1688, that they began to show more genuine fruits of the tenets they professed, than the persecution of those who differed from them in religious opinion.

At the close of the seventeenth century, the population of Maryland amounted to thirty thousand persons; and whether from superiority of soil or industry, or from the absence of laws restrictive of cultivation, this province is said to have exported at least as much tobacco as the older and more populous province of Virginia. At a later period, a law was passed, prohibiting the cultivation on any estate of a greater quantity than six thousand plants of tobacco for every taxable individual upon the estate. Maryland was the first of the provinces in which the right of private property was from the beginning recognised in its fullest extent; and community of possessions had never even a temporary establishment. This peculiarity, it is probable, contributed to promote the peculiar industry by which this people have been distinguished. In the year 1699, Annapolis was substituted for St. Mary's as the capital of the province; but the same causes that prevented the growth of towns in Virginia, also repressed them in Maryland. There were few merchants or shop-keepers who were not also planters; and it was the custom for every man to maintain on his plantation a store for supplying the usual accommodations of shops to his family, servants, and slaves. Living dispersed over the province, and remote from each other, the effects of their comparative solitude are said to have been visible in the countenance, manners, and apparel of the great body of the planters; their aspect expressing less cheerfulness, their demeanor less vivacity, their dress less attention to neatness, and their whole exterior less urbanity, than were found in those colonies where cities engendered and diffused the elegant virtue to which they have given a name. But even those who have reproached them with this defect have not failed to recognize a more respectable characteristic of their situation, in that hospitality by which they were universally distinguished.* At a later period, the towns of Maryland seemed to acquire a sudden principle of increase; and Baltimore, in particular, has grown with a rapidity unexampled even in the United States. In none of the provinces, have the effects of a wise or illiberal system of government been more plainly apparent than in Maryland. For nearly a century after the British Revolution, difference in religious opinion was made the source of animosity and oppression; and during all that period not one considerable seminary of learning arose in the province. Within a few years after the return of equal laws and universal toleration, with the establishment of American independence, the varieties of doctrinal opinion among the people served but to illustrate religious charity; numerous colleges and academies were founded; and the same people among whom persecution had lingered longest, became distinguished for a remarkable degree of courteous kindness and generous compassion.

During the suspension of the proprietary government, the legislature of the province consisted of three branches; after its revival, of four: the proprietary, the governor, the council, and the burgesses. The proprietary, besides a large domain cultivated by himself, enjoyed a quit rent of two shillings sterling yearly for every hundred acres of appropriated land. This was increased at an after period to four shillings in some districts; and an unsuccessful attempt was made to raise it as high as ten shillings. The proprietaries had received but too little encouragement to rely on the stability of that gratitude which had been acquired by their original moderation. The salaries of the governor and deputy-governor consisted of official fees, and a tax on exported tobacco, enacted to them successively on their appointment to office, and propor-

* Winterbottom's America, vol. iii. p. 42. "That pride which grows on slavery, and is habitual to those who from their infancy are taught to believe and feel their superiority, is a visible characteristic of the inhabitants of Maryland." Ibid.

tioned to their popularity. The council consisted of twelve persons, appointed by the proprietary, and during the abeyance of his political rights, by the royal governor; each of whom received, during the session of the assembly, an allowance of one hundred and eighty pounds of tobacco daily from the province. The house of representatives or burgesses consisted of four members from each of the counties, and two from the capital; the daily allowance to each of them being one hundred and sixty pounds of tobacco. From the decisions of the provincial courts, in all cases involving property to the amount of three hundred pounds, an appeal was admitted to the king in council. The office of the select men in New England was performed in Maryland by the parochial vestries, which engrossed the management of all the public affairs of their districts, and soon underwent a remarkable abatement of the popular form of their original constitution; for though at first elected by the inhabitants, they held their office for life, and very early assumed the privilege of supplying vacancies in their own number by the election of the survivors. In the year 1704, it was provided by "An act for the advancement of the natives and residents of this province," that no office of trust, except those that were conferred by immediate commission from the crown, could be held by any person who had not previously resided three years in the colony."

The situation of slaves and of indentured servants appears to have been very much the same in Maryland as in Virginia. Any white woman, whether a servant or free, becoming pregnant from the embrace of a negro, whether a slave or free, was punished with a servitude of seven years; and the children of "such unnatural and inordinate connexions," were doomed to servitude till they should attain the age of thirty-one. A white man begetting a child by a negress, was subjected to the same penalty as a white woman committing the corresponding offence. An indentured servant, at the expiration of his servitude, was entitled to demand a liberal allowance of various useful commodities from his master, some of which he was prohibited, under a penalty, from selling for twelve months after his liberation. A tax was imposed on the importation of servants from Ireland, "to prevent the importing too great a number of Irish papists into this province."

To prevent the evasion of provincial debts or other obligations by flight to England, or to the other American states, all persons preparing to leave the colony were required to give public intimation of their departure, and obtain a formal passport from the municipal authorities. An act was passed in the year 1698, investing a large tract of land in Dorchester county, in two Indian kings, who, with their subjects, were to hold it as a fief from the proprietary, and to pay for it a yearly rent of one bear skin. In common with the other colonies, Maryland was much infested by wolves; and so late as the year 1715, a former act was renewed, offering "the sum of three hundred pounds of tobacco" as a reward for every wolf's head that should be brought by any colonist or Indian to a justice of the peace. An act proposing a similar recompense had been passed in Virginia; but it was repealed in the year 1666.

BOOK IV. NORTH AND SOUTH CAROLINA. CHAPTER I.

Early Attempts of the Spaniards and the French to colonize this territory—First Charter of Carolina granted by Charles the Second to Lord Clarendon and others—Formation of Albemarle Settlement in North Carolina—Settlement of Ashley River in South Carolina—Second Charter of the whole United Province—Proceedings at Albemarle—The Proprietaries enact the fundamental Constitutions of Carolina—Expedition of Emigrants to South Carolina—John Locke created a Landgrave—Hostilities with the Spaniards in Florida, and with the Indians—Disputes between the Proprietaries and the Colonists—Culpepper's Insurrection in North Carolina—He is tried in England, and acquitted—Discord among the colonists—Sothel's tyrannical administration—He is deposed.

WE have seen New England colonized by puritans exiled by royal and episcopal tyranny; Virginia replenished by cavalier and episcopal fugitives from republican triumph and puritan ascendancy; and Maryland founded by catholics retiring from protestant intolerance. By a singular coincidence, the settlement whose history we now proceed to examine, originally seemed to have been destined to complete this series of revolutionary persecution: and if the first colonists who were planted in it had been able to maintain their establishment, Carolina would have been peopled by Hugonots flying from catholic bigotry.*

* At a later period we have seen the descendants of one of

This territory has been the subject of a variety of pretensions, and distinguished at successive periods by a variety of names. The claim of England to the first discovery of it was disputed by the Spaniards, who maintained that Cabot never proceeded so far to the south, and that it had been yet unvisited by any European, when Ponce de Leon, the Spanish governor of Porto Rico, arrived on its shores, [1512], as he was sailing in quest of a land which was reported to contain a fountain endowed with the miraculous power of restoring the bloom and vigor of youth to age and decrepitude. Believing that he had now attained the favored region, he hastened to take possession, in his sovereign's name, of so rare and valuable an acquisition. He bestowed on it the name of Florida, either on account of the vernal beauty that adorned its surface, or because he discovered it on the Sunday before Easter, which the Spaniards call Pasqua de Flores; but though he chilled his aged frame by bathing in every stream or fountain that he could find, he had the mortification of returning an older instead of a younger man to Porto Rico. A few years afterwards, another Spanish officer, who was sent to make a more minute inspection of the territory supposed to have been thus newly discovered, performed an exploit but too congenial with the contemporary achievements of his countrymen, in kidnapping a considerable body of the natives, whom he carried away into bondage. Some researches for gold and silver, undertaken shortly after by succeeding adventurers of the same nation, having terminated unsuccessfully, the Spaniards appeared to have renounced the intention of any immediate settlement in this region, and left it to repose under the shadow of the name they had bestowed, and to remember its titular owners by their cupidity and injustice. The whole of this coast was subsequently explored [1523—1525] with considerable accuracy by Verazzan, an Italian navigator, in the service of the French, and whom Francis the First* had commissioned to attempt the discovery of new territories in America for the benefit of the crown. But the colonial designs of the French government were suspended during the remainder of this reign, by the favorite game of kings, which was played with such eager and obstinate rivalry between Francis and the Emperor Charles the Fifth†. During succeeding reigns, they were impeded by still more fatal obstructions; and all the advantages that France might have derived from the territory explored by Verazzan and neglected by the Spaniards, was postponed to the indulgence of royal and papal bigotry in a war of extermination against the Huguenots. The advantages, however, thus neglected by the French court, were not overlooked by the objects of its persecution; and at length the determination of appropriating a part of this territory as a retreat for the French protestants, was embraced by one of their leaders, the Admiral Coligni. Two vessels which he equipped for this purpose were accordingly despatched with a body of protestant emigrants to America, who landed at the mouth of Albemarle river, and in honor of their sovereign (Charles the Ninth), gave the country the name of Carolina; a name which, by a singular coincidence, the English, after obliterating, were destined to revive. Though these colonists had only to announce themselves as strangers to the faith and the name of the Spaniards, in order to secure the most friendly reception from the Indians, they suffered so many privations in their new settlement, from the inability of the admiral to furnish them with adequate supplies, that, after a short residence in America, they were compelled to return to France. A treacherous pacification having been effected, meanwhile, between the French court and the

the most illustrious people of antiquity seeking a refuge in America from Turkish oppression. In the latter part of the eighteenth century, Sir William Duncan, an eminent English physician, conceived the project of founding a Grecian colony in North America, and actually transported, for this purpose, several hundred Greeks to East Florida. Galt's Letters from the Levant, p. 318.

* The kings of Spain and Portugal remonstrated against the projects of Francis as a direct impugnation of ecclesiastical authority. To this remonstrance the monarch is said to have pleasantly replied, "I should be glad to see the clause in Adam's will, which makes that continent their exclusive inheritance." Raval.

† A slight demonstration was made by Francis in the year 1540 of an intention to colonize a different quarter of America, by the letters patent which he then granted to Jacques Quartier for the establishment of a colony in Canada. But the French made no permanent settlement even there till the reign of Henry the Fourth. Escarbot's Hist. of New France, p. 307. Champlain's Voyage, part i. In the commission to Quartier, the territory is described as "possessed by savages, living without the knowledge of God or the use of reason." Yet Pope Paul the Third had previously by a Bull declared the American Indians to be rational creatures, possessing the nature, and entitled to the rights of men.

protestants, Coligni employed the interval of repose, and the unwonted favor that he seemingly enjoyed with the king, in providing a refuge for his party from that tempest, which, though unhappily for himself, he did not clearly foresee, his experience and sagacity yet induced him to anticipate. Three ships, equipped by the king, and carrying out another detachment of Huguenots, [1564] were again despatched to Carolina, and followed soon after by a more numerous fleet with additional settlers, and an ample supply of arms and provisions. The assistance which the king of France thus vouchsafed to the Huguenots, reminds us of the similar policy by which Charles the First promoted, in the following century, the departure of the puritans from England. The French monarch was a little more liberal than the English, in the aid which he granted; but he was infinitely more perfidious and cruel in the designs which he truly entertained. Befriended by the Indians, and vigorously applying themselves to the cultivation of their territory, the colonists had begun to enjoy the prospect of a permanent and happy establishment in Carolina, when they were suddenly attacked by a force despatched against them by the king of Spain. The commander of the Spanish troops having first induced them to surrender as Frenchmen, put them all to the sword as heretics; announcing by a placard, erected at the place of execution, that this butchery "was not inflicted on them as subjects of France but as followers of Luther." Nearly a thousand French protestants were involved in this massacre; and only one soldier escaped to carry tidings to France, which charity does not oblige us to believe communicated any surprise to the projectors of the league of Bayonne and the massacre of St. Bartholomew. Though the colony had been planted with the approbation of the French court, and peace subsisted at the time between France and Spain, the assault and extirpation of the colonists produced no demonstration of resentment from the French government, and would have been totally unavenged in this world, if De Gorgues, a French nobleman, incensed by such wickedness, had not determined to vindicate the cause of justice and the honor of his country. [1567.] Having fitted out three ships at his own expense, he set sail for Carolina, where the Spaniards, in careless security, possessed the fort and settlement which they had acquired by the murder of his countrymen. He easily obtained the zealous co-operation of the Indians, and with their assistance overpowered and slew all the Spaniards who resisted his enterprise, and hanged all whom he made prisoners on the nearest trees; erecting, in his turn, a placard which announced, that this execution "was not inflicted on them as Spaniards but as murderers and robbers." Having thus accomplished his purposed vengeance, he returned to France; first destroying every trace of the settlement which neither Frenchmen nor Spaniards were destined ever again to occupy.* Religious disputes excited a much greater degree of mutual hatred and of public confusion in France than in England, and were proportionally unfavorable to French colonization. Canada, which was the first permanent occupation of the French in America, was not colonized till six years after Henry the Fourth had issued the celebrated edict of Nantes.

About eighteen years after the expulsion of the French colony of Coligni, there was settled in the isle of Roanoke, in the same territory, the first plantation effected by Raleigh, of whose enterprises I have given an account in the history of Virginia. There was an analogy between the fortunes of their colonial settlements, as well as between the personal destinies of Coligni and Raleigh; and transient as it proved, it was still the most lasting trace of his exertions witnessed by Raleigh, that the name of the country was changed by the English from Carolina to Virginia—a name of which we have already traced the final application and peculiar history.† Even the subsequent colonial efforts of England

* L'Escarbot's Hist. of New France, 225. 401. Oldmixon, i. 327—329. Hewitt's Account of South Carolina and Georgia, i. 18—20. Williamson's History of North Carolina, cap. i. The French, however, retained their pretensions to the country. D'Aubigny, the father of Madame Maintenon, having formed the purpose of establishing himself in Carolina, found he had incurred the serious displeasure of the French court for having solicited a grant from the English government. Voltaire's Age of Louis the Fourteenth, cap. 26. Voltaire is mistaken in supposing that the future queen of France received her early education in Carolina, where as yet there were none but savage inhabitants. It was to Marlinque that her father actually removed himself and his family, and whence, at the age of twelve years, this extraordinary woman returned to become the queen of a country where she had been born in a prison. Memoires et Lettres de Maintenon, vol. i. Vie de M. Maintenon, 13.

† The denomination which he had bestowed in honor of

did not extend to this territory, till the year 1622, when several English families, flying from the massacres of the Indians in Virginia and New England, sought refuge within its limits, and are said to have acted the noble part of christian missionaries, with such success, that one of the Indian princes was converted from idolatry to the gospel. They suffered extreme hardship from scarcity of provisions, and were preserved from perishing by the generous contribution they received from the government of Massachusetts, whose assistance they had implored. An attempt was made to assume a jurisdiction over them by Sir Robert Heath, attorney-general to Charles the First, who obtained from his master a patent of the whole of this region by the name of Carolina. But as he made no attempt to execute the powers conferred on him, the patent was afterwards declared to have become void, because the conditions on which it had been granted had not been fulfilled.* Much collision and dispute between claimants and occupiers of colonial territory would have been prevented, if the principle of this adjudication had been more generally extended, and more steadily applied.

The country which so many unsuccessful attempts had been made to colonize, was indebted for its final settlement to a project formed by certain courtiers of Charles the Second for their own enrichment, but which they were pleased to ascribe to a generous desire of propagating the blessings of religion and civility in a barbarous land. An application, couched in these terms, having been presented to the king by eight of the most eminent persons, whose fidelity he had experienced in his exile, or whose treachery had contributed to his restoration,† easily procured for them a grant of that extensive region, situated on the Atlantic ocean, between the thirty-sixth degree of North latitude and the river Saint Matheo. [1663] This territory was accordingly erected into a province, by the name of Carolina, and conferred on the Lord Chancellor Clarendon, Monk Duke of Albemarle, Lord Craven, Lord Berkeley, Lord Ashley (afterwards Earl of Shaftesbury), Sir George Carteret, Sir John Colleton, and Sir William Berkeley, the governor of Virginia; "who (as the charter set forth), being excited with a laudible and pious zeal for the propagation of the gospel, begged a certain country in the parts of America not yet cultivated and planted, and only inhabited by some barbarous people who had no knowledge of God." The territory was bestowed on these personages, and their heirs and assigns, as absolute lord proprietaries for ever, saving the sovereign allegiance due to the crown; and they were invested with as ample rights and jurisdictions within their American palatinate, as any bishop of Durham enjoyed within his diocese. This charter, doubtless, composed by the parties themselves who received it, seems to have been copied from the prior charter of Maryland, the most liberal in the communication of privileges and powers that had ever yet been granted.

A meeting of such of the proprietaries as were in England having been held soon after, for the purpose of concerting measures for carrying the purposes of their charter into effect, a joint stock was formed by general contribution for transporting emigrants, and defraying other necessary expenses. At the desire of the New England settlers, who already inhabited the province, and had stationed themselves in the vicinity of Cape Fear, they published, at the same time, a docu-

himself on a projected town (see ante, B. I. cap. I.) was revived and bestowed upon an actual city, more than two hundred years after; when, by an ordinance of the legislature of North Carolina, the name of Raleigh was given to the seat of government of this province.

* Cox's Description of Carolina, Append. 109—112. Hutchinson's Hist. of Massachusetts, i. 226. Oldmixon, i. 329. Chalmers, 515. Heath had previously sold his patent to the Earl of Arundel and Surrey, who is said to have made expensive preparations for founding a colony, but was diverted from his design by a domestic calamity. Daniel Cox, a physician in London, who, at the close of the seventeenth century, became an extensive purchaser of proprietary rights in North America, contrived, among other acquisitions, to obtain an assignation to Sir Robert Heath's patent; and maintained, with the approbation of King William's ministers, that this patent was still a valid and subsisting title, in so far as it embraced territory occupied by the Spaniards, and not included in any posterior English patent. His son (the author of the Description) resumed his father's claims, and made various unsuccessful attempts to colonize the territory which he persisted in denominating Carolina. Cox, Preface, p. 30, and Append. p. 113—121.

† The two persons to whom this least reputable claim of merit chiefly belonged were Shaftesbury and Monk. It proved more available to them than the more honorable services of the others. Much more than his due share of it has been ascribed to Monk, whose great service was not that he contributed signally to effect the Restoration (which, in truth, he withstood as long as he could,) but that, by his artifices, the Restoration was effected without the constitutional precaution of imposing conditions on the king.

ment under the title of "Proposals to all that will plant in Carolina." They proclaimed that all persons settling on Charles river to the southward of Cape Fear, and consenting to take the oath of allegiance to the king, and to recognise the proprietary government, should be entitled to continue the occupation they had assumed, and to fortify their settlement; that the settlers should present to the proprietaries a list of thirteen persons, in order that they might select from them a governor and council of six, to be appointed for three years; that an assembly, composed of the governor, council, and delegates of the freemen, should be called as soon as the circumstances of the colony would allow, with power to make laws which should be neither contrary to the laws of England, nor of any validity after the publication of the dissent of the proprietaries; that every person should enjoy the most perfect freedom in religion; that during five years every freeman should be allowed an hundred acres of land for himself and fifty for a servant, paying only a half-penny for every acre; and that the same freedom from customs which had been conferred by the royal charter should be extended to all classes of the inhabitants. Such were the original conditions on which Carolina was planted; and surely it must strike every reflecting mind with surprise, to behold a regular system of civil and religious freedom thus enacted as the basis of the colonial institutions by the same statesmen, who, in the parent country, had framed the intolerant act of uniformity, and were enforcing it with the most relentless severity. While they silenced such teachers as John Owen, and filled the prisons of England with such victims as Baxter, Banyan, and Alleine, they offered freedom and encouragement to every variety of opinion in Carolina; thus forcibly impeaching the wisdom and good faith of their domestic administration by the avowal which their colonial policy manifestly implies, that diversities of opinion and worship may peaceably co-exist in the same society, and that implicit toleration is the surest political means of making a commonwealth flourish, and a country appear desirable to its inhabitants. It is humiliating to observe a man like Lord Clarendon realize, in conformity with his private interest, the truth which his large experience and powerful understanding were insufficient to induce him, as an English statesman, to embrace.

Besides the settlers from New England who were seated at Cape Fear, there was another small body of inhabitants already established in a different quarter of the proprietary domains. In the history of Virginia, we have seen that, as early as the year 1609 Captain Smith judged it expedient, for political reasons, to remove a portion of the Virginian colonists to a distance from the main body at James Town. With this view he despatched a small party to form a plantation at Nansemond, the most southern settlement of Virginia, where, notwithstanding the formidable obstructions they encountered from the hostility of the natives, they succeeded in maintaining and extending their establishment. As the Indians receded from the vicinity of these intruders, the planters naturally followed their tracks, extending their plantations into the bosom of the wilderness and as their numbers increased, and the most eligible situations were occupied, they traversed the forests in quest of others, till they reached the streams, which, instead of discharging their waters into the Chesapeake, pursued a south-eastern course, and flowed into the ocean. Their numbers are said to have been augmented, and their progress impelled by the intolerant laws that were enacted in Virginia against sectarians of every denomination. At the epoch of the Carolina charter of 1663, a small plantation had been accordingly for some years established within its boundaries, on the north-eastern shores of the river Chowan, which now received the name of Albemarle, in compliment to the title by which General Monk's services had been rewarded. Notwithstanding the opinion of an intelligent historian of North Carolina, I can see no reason to believe that the planters of Albemarle were composed entirely or even generally of exiles for conscience sake: yet that a number of conscientious men had mingled with them may be inferred from the fact, that they purchased their lands at an equitable price from the aboriginal inhabitants. Remote from the seat of the Virginian government, they yielded little obedience to its authority, and for some time had lived without any perceivable rule; when at length the governor of Virginia assumed, in a new capacity, a stricter and more legitimate superintendence of their affairs. In September, 1663, Sir William Berkeley was empowered by the other proprietaries to nominate a governor and a council of six, who were authorised to rule this

little community according to the powers granted by the royal charter; to confirm former possessions, and to grant lands to every one, allowing them three years to pay the quit rents; to make laws, with the consent of the delegates of the freemen, transmitting them for the approbation of the proprietaries. Berkeley was requested to visit the colony, and to employ skilful persons to explore its bays, rivers, and shores; a duty which he performed in the following year. [1661.] Having confirmed and granted lands to the settlers, in conformity with his instructions, he appointed Drummond, a man of sufficient prudence and abilities, their first governor, and then returned to Virginia, leaving them all to follow their various pursuits in peace. The colonists for some time continued perfectly satisfied with an arrangement that seemed rather to secure than impair the advantages of their former condition; but as the day approached when the payment of quit-rents was to commence, they began to manifest no small dissatisfaction with the tenures by which they held their lands. In the year 1666 they constituted an assembly, probably the first that was ever held in Carolina, and from this body a petition was transmitted to the proprietaries, desiring that the people of Albemarle might hold their possessions on the same terms that were enjoyed by the people of Virginia. The proprietaries, who were exceedingly solicitous to promote the population of the province, and to avoid every proceeding that might discourage the resort of settlers, readily acceded to this request, and commanded the governor in future to grant the lands on the terms that had been prescribed by the colonists themselves. Notwithstanding the apostolical views which the proprietaries had professed, not the slightest attempt was made to provide for the spiritual instruction of the colonists, or the conversion of the Indians; and the colony continued for a series of years to be conducted without even the semblance of religious worship.

The proprietaries having thus endeavored to rear and organise the feeble settlement of Albemarle, directed their chief regard to the finer region that extends along the more southerly coast. Having caused a survey to be made of these shores, by a vessel which they despatched from Virginia, for the purpose of ascertaining what rivers and countries were the most proper for habitation, they proposed, among other projected settlements, to establish a new colony to the southward of Cape Fear, along the banks of the river Charles, in the district which was now denominated the county of Clarendon. Several gentlemen of Barbadoes, dissatisfied with their present condition, and desiring to become the heads of a less considerable establishment, had for some time projected to remove themselves to this region, and now submitted a proposition to that effect to the proprietaries: and though their first demands of being invested with a district thirty-two miles square, and all the powers of a corporation within themselves, were refused by the proprietaries, their application, on the whole received so much encouragement as determined them to undertake the migration. [1635.] In furtherance of a project so agreeable to their wishes, the proprietaries bestowed on John Yeamans, a respectable planter of Barbadoes, and the son of a man who had lost his life in the king's service during the civil wars, the appointment of commander-in-chief of Clarendon county, stretching from Cape Fear to the river Saint Matheo, and obtained for him, at the same time, the rank of a baronet, and partly in recompense of the loyalty of his family, and partly in order to give weight to his station, and some appearance of splendor to the colonial establishment. The same powers were now conferred, and the same constitution established, as those which had given contentment to the inhabitants of Albemarle: and Yeamans was particularly directed to "make every thing easy to the people of New England," from which the proprietaries declared that they expected more copious emigrations to Carolina than from any of the other colonies. This expectation, more creditable to their discernment than to their integrity, was obviously derived from the intolerance which yet lingered in New England, and the effects of which were thus distinctly recognised, and deliberately anticipated, by the same persons who indulged in it so unreservedly in the parent state. An order was made at the same time by the proprietaries, that the commission of Yeamans should not prevent the appointment of another governor, for a new settlement which was projected in a district to the southward of Cape Roanoke, and which acquired soon after the name of Carteret. The policy which the proprietaries were thus pursuing, in the establishment of a variety of separate and independent colonies in Carolina, each of which

had its own distinct assembly, customs, and laws, supplied them at a future period with ample cause of regret, and contributed to the prolonged feebleness and distractions by which this province was unhappily distinguished. Meanwhile, however, their proceedings were regarded with approbation by the king, who presented them with twelve pieces of ordnance, which were despatched to Charles River, along with a considerable quantity of military stores.

Having now obtained the most minute information of the whole coast of Carolina, and discovered, on both extremes of their territory, considerable tracts of land that would form very desirable accessions to it, the proprietaries easily obtained from their sovereign a gift of these additional possessions. A second charter, which was accordingly executed in their favor, recited and confirmed the former grant, and gave renewed assurance and commendation of "the pious and noble purpose" under which these insatiable courtiers judged it decent to cloak their ambition or rapacity. It granted, to the same patentees, that province situated within the king's dominions in America extending north-eastward to Carabuke-inlet, and thence in a straight line to Wyonoke, which lies under the 36th degree and 30th minute of north latitude, south-westward to the 29th degree; and from the ocean to the South Seas. They were vested with all the rights, jurisdictions, and royalties, which the bishop of Durham ever possessed, and were to hold the territory as a feudal dependance of the manor of East Greenwich, paying a rent of twenty marks, and one-fourth of the gold and silver that should be found within it. All persons, except those who should be specially forbidden, were allowed to transport themselves to Carolina; and they and their children were declared to be denizens of England, who should always be considered as the same people, and possess the same privileges, as those dwelling within the realm. They were empowered to trade in all commodities which were not prohibited by the statutes of England. They were authorised to lade the productions of the province, and to bring them into England, Scotland, or Ireland; paying the same duties as other subjects: And they were exempted, for seven years, from the payment of customs, on the importation, into any of the dominions of the crown, of wines and other enumerated products of the colony. The proprietaries were enabled to make laws for the province, with the consent of the freemen or their delegates; under the general condition that they should be reasonable, and as nearly conformed as might be to the jurisprudence of England. They were empowered to erect ports for the convenience of commerce, and to appropriate such customs as should be imposed by the assembly. They were allowed to create an order of nobility, by conferring titles of honor, differing, however, in style, from the titles conferred on the people of England. Carolina was declared independent of any other province, but subject immediately to the crown; and the inhabitants were not compellable to answer to any cause or suit in any other part of his majesty's dominions, except within the realm. The proprietaries were authorised to grant indulgences to those who might be prevented by conscientious scruples from conforming to the Church of England; to the end that all persons might have liberty to enjoy their own judgments and consciences in religious concerns, provided they disturbed not the civil order and peace of the province.* Such is the tenor of the last of the Carolina charters, which conferred on the noble grantees a territory of vast extent, and rights which it is not easy to discriminate from royalty. By a strange anomaly, the king, in divesting himself, as it were, of a part of his dominions, in behalf of a junto of his ministers, was made to recommend to their observance a system of ecclesiastical policy diametrically opposite to the intolerance which, at the very time, the counsels of these persons were breathing into his own administration. As Clarendon still held the office of Lord Chancellor, this charter, as well as the former, in favor of himself and his colleagues, was sealed by his own hands: and when we consider how liberally it endowed the proprietaries with privileges, at the expense of the prerogative of the crown, it seems the less surprising that he should not have suggested a similar objection to the charters which Connecticut and Rhode

* Lawson's Hist. of Carolina, 239—254. Williamson, i. 230, &c. The second charter of Carolina is printed in both these works at full length. Of the first, the only complete transcript I have seen occurs in a small collection of Carolina papers printed at London, without any date, but apparently about the end of the seventeenth century. There are copies of it in the British Museum, in the library of Gottingen, and in the library of the late George Chalmers.

Island obtained while the great seal was in his keeping. The arbitrary commission for Massachusetts, which we have seen him defend, shows that he entertained no general design of abridging the royal prerogative in the colonial dominions.

Animated by this fresh acquisition, the proprietaries exerted themselves, for several years, to attract adventurers from Scotland, Ireland, the West Indies, and the northern colonies; but notwithstanding all their endeavors, their province, partly from the unhealthiness of the climate, but chiefly from the state of dispersion in which the settlers chose to live, advanced but slowly in population and power. In the autumn of this year, the emigrants from Barbadoes, conducted by Sir John Yeomans, arrived at length at their place of destination, on the southern bank of the river of Cape Fear, where they had previously fortified their legal title from the proprietaries by an equitable purchase of the territory from the neighboring Indians. While they were employed in the first rude toils that were requisite for their establishment in the wilderness which they had undertaken to subdue, their leader ruled them with the gentleness of a parent, and cultivated the good will of the aborigines so successfully, that for some years they were enabled to prosecute their labors without danger or distraction. While the planters opened the forest, to make room for the operations of tillage, they necessarily prepared timber for the uses of the cooper and builder, which they transmitted to the colony whence they had emigrated; a commencement of a commerce which, however feeble, served to kindle their hopes and sustain their industry.

The inhabitants of Albemarle continued, meanwhile, to pursue their original employments in peace, and from the cultivation of tobacco and Indian corn, obtained the materials of an inconsiderable traffic with the merchant vessels of New England. About two years after the acquisition of their second charter, [1667.] the proprietaries appointed Samuel Stevens, a man whose virtues and abilities were judged equal to the trust, to succeed Drummond as governor of Albemarle; and at the same time bestowed on this settlement a constitution which, had it been faithfully maintained, would have greatly promoted the contentment and prosperity of the people. Stevens was commanded to act altogether by the advice of a council of twelve, the one half of which he was himself to appoint, and the other six to be chosen by the assembly. This was an approach to a principle disallowed entirely in Virginia and Maryland, but realized still more perfectly in the New England governments, and by which the democracy were admitted to a share in composing and controlling that body, which in the colonial constitutions formed equally the senatorial or aristocratical branch of the legislature, the privy council of the supreme magistrate, and the court of appeals. The assembly was to be composed of the governor, the council, and a body of delegates, annually chosen by the free-holders. The legislature, in which democratic interests were admitted thus strongly to preponderate, was invested not only with the power of making laws, but with a considerable share of the executive authority; with the right of convoking and adjourning itself, of appointing officers, and of presenting to churches. Various regulations provided for the security of property; and in particular it was announced that no taxes should be imposed without the consent of the assembly; and the lands were confirmed and granted as now holden by the free tenure of socage. Perfect freedom in religion was offered to a people who were very willing to accept the freedom without concerning themselves in any way about religion; and all men were declared to be entitled to equal privileges, upon taking the oath of allegiance to the king, and of fidelity to the proprietaries. As we have but too much reason to suppose that the proprietaries had no sincere intention of preserving the constitution which they thus offered to establish, it is due to the character of Lord Clarendon to remark, that he had no share whatever in this transaction; his impeachment and exile having previously sequestered him from all farther concern with the government of Carolina. The system, however, which was now tendered to their acceptance, was received by the inhabitants of Albemarle with perfect satisfaction: gratitude, perhaps, it would have been unreasonable to expect towards proprietaries who had no way contributed to their establishment in the province, but had followed them into the desert with the obvious intent of reaping where they had not sown, and congregating a scattered flock in order to shear it the more effectually. It was not till two years after, [1669.] that an assembly constituted on this new model was convened to

enact laws for men, who being yet few in number seem to have been governed chiefly by the customs they had brought with them from their ancient establishment. Their first efforts in legislation were strongly marked with the character of persons who had been long accustomed to live remote from the energy of government, and to shift their residence whenever it became disagreeable, instead of seeking to alter and improve its circumstance. From the numbers of persons of broken fortunes who resorted to the colonies, and from the conviction that was early and most justly entertained by the colonists, that their industry was fettered, and their profits impaired, by the legislature of England, for the benefit of her own resident subjects, a defensive, or perhaps retributory spirit, was too readily adopted by the colonial legislatures; and if not an universal, it was at least a general principle of their policy to obstruct the recovery of debts. Of this disposition we have already seen some traces, about this period of time, in the legislation of Virginia. By the assembly that was now convened at Albemarle, it was declared that sufficient encouragement had not yet been afforded to the resort of settlers and the peopling of the province; and to supply this defect it was now enacted that none should be sued during five years after his arrival in the country for any cause of action arising beyond its limits; and that none of the inhabitants should accept a power of attorney to recover debts contracted abroad.* These complaints of fewness of people continued long to be reiterated by the settlers of Carolina; though it was afterwards very justly re-estimated upon them by the proprietaries, that the inconvenience they complained of was promoted by their own aversion to settle in towns, and by the lazy rapacity with which each desired to surround himself with a large expanse of property, over the greater part of which he could exercise no other act of ownership than that of excluding the occupants by whom it might be advantageously cultivated. The remedy, too, seems to be defective in policy, no less than in justice. If industry might be expected to derive some encouragement, from the assurance that its gains were not to be carried off by former creditors in a distant colony, the nature of this encouragement, as well as its temporary endurance, tended to attract neither a respectable nor a staple population: and accordingly this colony was long considered as the refuge of the criminal and the asylum of the fugitive debtor. But a more proper and natural mode of promoting population was at the same time established, by an act concerning marriage; by which it was provided that as people might wish to marry, and as yet there were no ministers in the colony, in order that none might be hindered from a work so necessary to the preservation of mankind, any two persons carrying before the governor and council a few of their neighbors, and declaring their mutual purpose to unite in matrimony, should be deemed husband and wife. The circumstances indicated by this law forcibly suggest the wide distinction between the sentiments and habits of the northern and the southern colonists of America. While all the colonial establishments of New England were conducted by clergymen, who long directed with almost equal authority in temporal and in spiritual concerns; not a trace of the existence of such an order of men is to be found in the laws of Carolina, during the first twenty years of its history; and it was not till the dissenters had emigrated thither in considerable numbers, that we hear of religious controversy, or indeed of any thing connected with religion in the province. Other regulations besides those which we have already noticed were adopted by this assembly. New settlers were exempted from taxes for a year; and every one was restrained from transferring his lands for two years. The first of these laws was intended to invite settlers; the second appears to have been a politic device to detain them. A duty of thirty pounds of tobacco was imposed on every lawsuit,† in order to

* The same policy was pursued to a much greater extent by the ancient Romans, of whom Plutarch informs us that "not long after the first foundation of the city, they opened a sanctuary of refuge for all fugitives, which they called the temple of the god Asylus; where they received and protected all, delivering back neither the servant to his master, the debtor to his creditors, nor the murderer into the hands of the magistrate." *Life of Romulus*.

† It is remarkable that the Carolinians, who thus obstructed by a tax the legal adjustment of disputes, have always been more addicted to dueling than the inhabitants of any of the other states. In Connecticut, according to the representation of Dr. Morse, there is more litigation than in any other quarter of North America: but a duel was never known to occur in Connecticut. *Warden*, vol. ii. p. 11. In most of the provinces, legal controversy was promoted by the uncertainty of the law; for although a substantial conformity was prescribed between the colonial jurisprudence, and the common

provide the funds requisite for the expenses of the governor and council during the sitting of assemblies; no course having yet been taken (says the act) for defraying their charges. These laws, which proclaim the weakness, and illustrate the early policy of this inconsiderable settlement, were ratified in the following year by the proprietaries. As the colonists received little augmentation from abroad, their numbers increased but slowly; and it was not till sometime after this period, that they extended their plantations to the southern bank of the river Albemarle.

But although the proprietaries were willing to tender every concession, and encourage every hope that seemed calculated to fix or augment the inhabitants of Carolina, it was not for the purpose of founding and superintending institutions so homely and popular, that they had solicited the extraordinary privileges which their charters conferred. Their ambition aimed at making Carolina a theatre for the exercise of all that grandeur, and the display of all those distinctions, that have ever been known to co-exist with the forms of liberty; and the plumage which they had stripped from the royal prerogative, it was their intention to employ for the illustration of their own dignity, and the decoration of their provincial organs and institutions. With this view, about a year before they ratified the enactments of the assembly of Albemarle, [March 1st] they had subscribed that memorable instrument which bears the name of "the fundamental constitutions of Carolina," and the preamble of which assigns as the reason for its adoption, "that the government of this province may be made most agreeable to the monarchy under which we live; and that we may avoid erecting a numerous democracy." The task of composing this political frame was devolved upon Shaftesbury by the unanimous consent of his colleagues, all of whom were strongly impressed with the resources of his capacity and the depth of his penetration, and some of whom had experienced, in the intrigues that preceded the Restoration, with what consummate dexterity he could effect his own purpose, and appropriate the instrumentality even of those who were not less able than interested to resist it. The instrument, indeed, was at first believed to have been actually the production of Shaftesbury,† but is now recognised as the composition of the illustrious John Locke, whom he had had the sagacity to appreciate and the honor to patronize, and who was united to him by a friendship more creditable than beneficial to the statesman, and in no way advantageous either to the character or the fortunes of the philosopher. [15] The constitutions of Carolina contain a mixture as discordant as the characters of these men; though in what proportions they represent the peculiar sentiments of either, it is not easy to guess, or possible to determine. It has been said (whether conjecturally or authoritatively) that Shaftesbury, smitten alike with reverence for antiquity and admiration of Locke, desired to revive in his person the alliance that once subsisted between philosophy and legislation; to restore the practice of that age when communities accepted their constitutions more willingly from the disciples of Pythagoras than from the descendants of kings. It is certain, however, that Shaftesbury, along with a very high value for the genius and talents of Locke, entertained implicit confidence in his own ability to excite the full vigor of Locke's understanding, and yet inject into it regulating views that would enable himself securely to anticipate and define the results of its application. What instructions were communicated to Locke by his patron, cannot now be known: but it must be admitted that the philosopher was indulged with so much liberty that he afterwards represented the constitution as his own performance, and himself as a competitor with William Penn in the science of legis-

lation and statute law of England, the ascertainment of the precise extent of this conformity in every case was committed to the discretion of the Judges. *Smith's New York*, p. 316 317.

* This is the date assigned to the instrument by Oldmixon, by Williamson, and by the anonymous author of the *History of the British Dominions in North America*. It is the date also attached to the 130th article of the constitutions in the copy of them inserted in Locke's works. Chalmers dates the instrument in July of the same year; but it appears from the illustrations appended to this portion of his work, that there were two editions of the instrument; and I suppose he has referred, in his notation of the date, to the second edition, in which the proprietaries are reproached with having introduced some changes derogatory to the liberties desired in the first.

† It is so represented by Oldmixon, whose history was published in 1794, p. 332. But it was afterwards inserted in the collection published in 1719 by Des Maiseaux, of the anonymous and unprinted pieces of Locke, from a copy corrected by his own hand, and which he had presented to a friend as one of his own works. *Locke, folio edit.* tit. 622

lation; and hence this instrument, whatever may be thought of its intrinsic merits, must ever be regarded with interest, as the link that connects the genius of Locke with the history of America.

By these constitutions it was declared that the eldest of the eight proprietaries should be palatine of the province during his life, and that his successor should always be the eldest of the survivors. Seven other of the chief offices of state, namely, the offices of admiral, chamberlain,* chancellor, constable,† chief-justice, high steward, and treasurer, were appropriated exclusively to the other seven proprietaries; and these, as well as the office of palatine, might be executed by deputies within the province. Corresponding to these offices there were to be (besides the ordinary courts of every county) eight supreme courts, to each of which was annexed a college of twelve assistants. The palatine was to preside in the palatine court, of which he and three others of the proprietaries made a quorum; and this court represented the king, ratified or negatived the enactments of the legislature, and, in general, was vested with the administration of all the powers conferred by the royal charter, except in so far as limited by these fundamental constitutions. By a complicated frame-work of counties, signories, baronies, precincts, and colonies, the whole land of the province was divided into five equal portions, one of which was assigned to the proprietaries, another to the nobility, and the remaining three were left to the people. Two classes of hereditary nobility, with possessions proportioned to their respective dignities, and for ever unalienable and indivisible, were to be created by the proprietaries, under the titles of landgraves and caciques; and these, together with the deputies of the proprietaries, and representatives chosen by the freemen, constituted the parliament of the province, which was appointed to be biennially convoked, and when assembled, to form one deliberative body, and occupy the same chamber. No matter or measure could be proposed to the parliament that had not been previously prepared and approved by the grand council of the province, a body resembling the lords of the articles in the ancient constitution of Scotland and consisting almost entirely of the proprietaries' officers and the nobility. No man was eligible to any office unless he possessed a certain definite extent of land, larger or smaller according to the dignity or meanness of the office. Trial by jury was established in each of the courts throughout the whole of the lengthened ramifications of jurisdiction; but the office of hired or professional pleaders was denounced as a base and sordid occupation; and no man was allowed to plead the cause of another without previously depositing on oath that he neither had received nor would accept the slightest remuneration for his services. To avoid the confusion arising from a multiplicity of laws, all acts of the parliament were appointed to endure only one hundred years, after which they ceased and determined of themselves without the formality of an express repeal: and to avoid the perplexity created by a multiplicity of commentators, all comments whatever on the fundamental constitutions, or on any part of the common or statute law of Carolina were absolutely prohibited. Every freeholder was required to pay a yearly rent of a penny for each acre of his land to the proprietaries; and all the inhabitants above seventeen and under sixty years of age were obliged to bear arms, and serve as soldiers, whenever they should receive a summons to that effect from the grand council. Every freeman of Carolina was declared to possess absolute power and authority over his negro slaves, of what opinion or religion soever.‡ The policy that most readily suggests itself for such a regulation, is

excluded by the fact, that at this time, and long after, there were no negroes in the province, except a very small number whom Sir John Yeomans and his followers had brought with them from Barbadoes.

A series of regulations that not only import the most ample toleration in religion, but manifestly infer the political equality of all religious sects and systems whatever, was ushered by this remarkable article:—"Since the natives of the place who will be concerned in our plantation are utterly strangers to Christianity, whose idolatry, ignorance or mistake, gives us no right to expel or use them ill; and those who remove from other parts to plant there, will unavoidably be of different opinions concerning matters of religion, the liberty whereof they will expect to have allowed them, and it will not be reasonable for us on this account to keep them out; that civil peace may be maintained amidst the diversity of opinions, and our agreement and compact with all men may be duly and faithfully observed; violation whereof, upon what pretence soever, cannot be without great offence to Almighty God, and great scandal to the true religion which we profess; and also to that Jews, heathens, and other dissenters from the purity of christian religion, may not be scared and kept at a distance from it, but by having an opportunity of acquainting themselves with the truth and reasonableness of its doctrines, and the peaceableness and inoffensiveness of its professors, may by good usage and persuasion, and all those convincing methods of gentleness and meekness suitable to the rules and design of the gospel, be won over to embrace and unfeignedly receive the truth; therefore any seven or more persons agreeing in any religion, shall constitute a church or profession, to which they shall give some name to distinguish it from others." In the terms of communion of every such church or profession it was required that the three following articles should expressly appear; that there is a God; that God is publicly to be worshipped; and that it is the duty of every man when called upon by the magistrate, to give evidence to the truth, with some ceremonial or form of words, indicating a recognition of the presence of God. No person who was not joined as a member to some church or profession of this description was to be permitted to be a freeman of Carolina, or to have any estate or habitation within the province; and all persons were forbidden to revile, disturb, or in any way persecute the members of any of the religious associations thus recognised by law. What was enjoined upon freemen was permitted to slaves, by an article which declared that, "since charity obliges us to wish well to the souls of all men, and religion ought to alter nothing in any man's civil estate or right, it shall be lawful for slaves as well as others, to enter themselves, and be of what church or profession any of them shall think best, and thereof be as fully members as any freemen." But the hope of political equality that sectarians might derive from these provisions was completely subverted, and even the security of a naked tolerance was menaced by an article, which, though introduced into these constitutions was neither composed nor approved by Locke, and by which it was provided, that when the country should have been sufficiently peopled and planted, it should belong to the colonial parliament to take care for the building of churches and the public maintenance of divines, to be employed in the exercise of religion, according to the canons of the church of England; "which being the only true and orthodox, and the national religion of all the king's dominions, is so also of Carolina; and therefore it alone shall be allowed to receive public maintenance by grant of parliament." Finally, it was declared that these fundamental constitutions (consisting of an hundred and twenty articles, and forming a vast labyrinth of perplexing regulations) should be the sacred and unalterable form and rule of government of Carolina for ever.

The defects of this system are so numerous, that to particularize them would be a tedious labor; and they are at the same time so gross and palpable, that they must readily manifest themselves to every reader without any auxiliary indication. It may be remarked, however, in general, that the author of it, in collecting materials for his composition, seems to have looked every where but to the actual situation and habits of

the people for whom he legislated. Legislators, who derive their office from any other source than the appointment of the people, are so little accustomed in the exercise of it to consider themselves obliged to do to others as they would have others do to them, that the partiality and illiberality of these institutions would scarcely merit notice if Locke had not been their author. It was a reproach more exclusively due to the proprietaries, that good faith was violated, and existing rights disregarded. For a number of inhabitants had already settled in the province, on conditions which their rulers had no longer the power to qualify or abrogate; and forms of government having been actually established, the people had acquired an interest in them, which, without their own consent, could not be sacrificed to these innovating regulations. The proprietaries might perhaps have been led to doubt the soundness of their expectations, if not the equity of their purposes, had they fairly considered the motives which retained themselves in England and anticipated the probable operation of similar sentiments on the minds of the inhabitants of Carolina. It is reported of some ancient legislators, that they sacrificed their own lives in order to secure the reception or the perpetuity of their constitutions. But while these proprietaries could not prevail on themselves to resign the comforts and luxuries of England, and even deliberately anticipated their non-residence, by providing for the vicarious discharge of their functions, they expected that an infant colony of independent woodsmen and rough tobacco-growers should at once renounce their manners and their habits of life, enchain their liberties, abridge their gains, and nearly metamorphose themselves into a new order of beings, for the sake of accumulating dignity on persons whom even the enjoyment of such dignity could not induce to live in the country. It is hard to say whether there was a greater injustice or absurdity in projecting a state of society where such overweening concern was admitted in the rulers, and such utter disregard supposed in the people, of their own respective interests; where the multitude were expected to sacrifice their liberty and prosperity, in order to enhance the advantages of certain conspicuous stations, which those for whom they were reserved judged unworthy of their occupation. It is remarkable that Shaftesbury was at the head of the anti-catholic party in England, and that Locke assisted with his pen to propagate the suspicions which his patron professed to entertain of the designs of the catholics against religious and political freedom. Yet if we compare the constitutions of Maryland and Carolina, we cannot hesitate to prefer the labors of the catholic legislator to those of the protestant philosopher and politician; and to acknowledge that the best interests of mankind were far more wisely and effectually promoted by the plain unvaunted capacity of Lord Baltimore, than by the united labors of Locke's elevated and comprehensive mind, and of Shaftesbury's vigorous, sagacious, and experienced understanding.

The proprietaries, however, were so highly satisfied with the fundamental constitutions, that they resolved, without delay, to attempt their realization; and, as a preliminary step, exerted themselves to the utmost of their ability to promote the transportation of additional inhabitants to the province. The Duke of Albemarle was installed into the office of palatine, and the sum of twelve thousand pounds expended on the equipment of a fleet, which set sail in the beginning of the following year [1670.] with a considerable body of emigrants. This expedition, which was destined to found a colony at Port Royal, was conducted by Colonel William Sayle, an experienced officer, who received the appointment of governor of that part of the coast lying south-westward of Cape Carteret. As these emigrants appear to have consisted chiefly of dissenters, it is probable that religious toleration was the object they had principally in view; and that they had not been made acquainted with that article of the constitutions by which the security of this important blessing was so seriously endangered. Indeed at a subsequent period the colonists bitterly complained that the fundamental constitutions had been interpolated, and some of their provisions disingenuously warped to the prejudice of public liberty. Sayle was accompanied by Joseph West, who for upwards of twenty years bore the chief sway in Carolina, and was now intrusted with the management of the commercial affairs of the proprietaries, on whom the colonists continued for several years to depend exclusively for their foreign supplies. On the arrival of the settlers at their place of destination, they prepared with more good faith than good sense to realise the political system to which

§ Art. 96. "This article was not drawn up by Mr. Locke but inserted by some of the chief of the proprietors, against his judgment; as Mr. Locke himself informed one of his friends to whom he presented a copy of these constitutions." Locke, vol. iii. p. 676. note. It was probably devised by Lord Cornbury (Clarendon's sons,) who inherited his father's bigotry for the church of England, and appears to have signed the fundamental constitutions. Oldmixon, vol. i. p. 332.

* The Chamberlain's court had the care of "all ceremonies, precedence, heraldry, and pedigrees," &c. and also "power to regulate all fashions, habits, badges, games, and sports." Art. 45. If the functions of this body resemble the ceremonial academy of China, the title at least of another body of functionaries recalls the institutions of old Rome. The assistants of the admiral bore the title of proconsuls. Art. 41.

† This was a military office, and the members of its relative college of assistants were termed lieutenant-generals. Art. 39.

‡ It is humiliating to reflect that this regulation was composed by the hand that wrote the Essay on the Human Understanding. At a later period of his life, when the English Revolution and the controversies it engendered had enlightened Locke's ideas of the rights of men, we find him thus pronouncing his own condemnation, while he exposes, and confutes the servile sophistry of Sir Robert Filmer "Slavery is so vile and miserable an estate of man, and so directly opposite to the generous temper and courage of our nation, that 'tis hardly to be conceived that an Englishman, much less a gentleman, should plead for it." "The perfect condition of slavery," he afterwards defines to be, "the state of war continued between a lawful conqueror and a captive." Locke, i. 106, 173.

they were required to conform; but, to their great surprise, the first glance at their actual situation convinced them that this design was perfectly impracticable; and that the offices which were appointed to be established were no less unsuitable to the numbers than to the occupations of the people. A wide scene of rough labor lay before them, and it was obvious that for many years a pressing demand for laborers must be experienced; a state of things totally incompatible with the avocations of official dignitaries, and the pompous idleness of an order of nobility. Neither land-graves nor caciques had yet been appointed by the proprietaries; and to have peopled even the subordinate institutions, would have been to employ all the inhabitants of the colony in performing a political drama, instead of providing the means of subsistence. Yet although the colonists found themselves constrained at once to declare that it was impossible to execute the *grand model*, they steadily persisted in their adherence to it and expressed their determination to come as nigh to it as possible. Writs were therefore immediately issued, requiring the freeholders to elect five persons, who with five others chosen by the proprietaries, were to form the grand council, without whose assent the governor could not perform the functions of his office. A parliament, composed of these functionaries, and of twenty delegates, chosen by the same electors, was invested with legislative power. So great were the difficulties attending the first occupation of the settlement, that, only a few months after their arrival, the colonists were relieved from the extremities of distress by a seasonable supply of provisions, transmitted to them by the proprietaries. Along with this supply, there were forwarded to the governor twenty-three articles of instruction, called *temporary agrarian laws*, relative to the distribution of land, and the plan of a magnificent town, which he was desired to build with all convenient despatch, and to denominate Charles-town, in honor of the king. To encourage the resort of settlers to Port-Royal, an hundred and fifty acres of land were allotted to every emigrant, at a small quit-rent, and clothes and provisions were distributed, from the store of the proprietaries, to those who were unable to provide for themselves. The good will of the neighboring Indians was purchased by considerable presents to the native caciques, who thus performed the only service which that description of dignitaries was destined ever to render to the colony. While the colonists were toiling to lay the foundation of civil society in the province, the proprietaries were proceeding very unreasonably to erect the superstructure of those aristocratical institutions which they designed to establish. The Duke of Albemarle having died in the course of this year, was succeeded in the dignity of palatine by Lord Craven; and shortly afterwards John Locke was created a landgrave, in recompense of his services; and the same elevation was bestowed on Sir John Yeomans, and on James Carteret, a relative of one of the proprietaries. Perhaps it may excite some elation in the mind of an American citizen, that while the order of nobility, thus imported into his country, continued to enjoy, even a nominal subsistence, John Locke was one of its members; and that when he was expelled from Oxford, and a fugitive from England, he continued to be acknowledged as a nobleman in Carolina. But it is disagreeable to behold this distinguished philosopher, and truly estimable man, accept a title of nobility to himself in the society where he had contributed to sanction and introduce the degrading institution of negro slavery. Happily for the country with which he was thus connected, and for his own credit with mankind, the race of Carolinian nobles was exceedingly short-lived; and the attempt to engraft feudal nobility on the institutions of North America proved utterly abortive.

Sayle had scarcely established the people in their new settlement when he fell a victim to the unwholeness of the climate. On his death, Sir John Yeomans claimed the administration of the vacant authority, as due to the rank of landgrave, which no other inhabitant of the province, except himself, enjoyed. But the council, who were empowered to elect a governor in such circumstances, preferred to appoint Joseph West, a popular man much esteemed among the colonists for his activity, courage, and prudence, until a special commission should arrive from England. West's administration was but short-lived; for, notwithstanding this indication of his acceptableness to the colonists, the proprietaries, desirous of promoting the respectability of their nobles, and highly satisfied with the prudence and propriety that had characterised Yeomans' government of the plantation around Cape Fear, [1671,]

judged it expedient to extend his command over the new settlement lying south-westward of Cape Carteret. The shores, the streams, and the interior of the country, being now perfectly well known, in consequence of the accurate surveys they had undergone, the planters from Clarendon on the north, and from Port Royal on the south, began about this period to resort to the convenient banks of Ashley-river: And here was laid, during the same year, the foundation of *Old Charles-town*, which became, for some time, the capital of the southern settlements. The proprietaries, meanwhile, with the spirit that had characterised their former proceedings, promulgated *temporary laws* which they appointed to be observed, till by a sufficient increase of inhabitants, the government could be administered according to the fundamental constitutions. One of these laws, with equal policy and humanity, enjoined the colonists to observe the utmost equity and courtesy in their intercourse with the Indians: to afford them prompt and ample redress on any wrongs they might happen to sustain; and on no pretence whatever to enslave or send any of them out of the country. The object of this regulation was unfortunately defeated, very soon after, by the intrigues of the Spaniards: and the other temporary laws received very little attention or respect from the colonists, who were by no means disposed to acquiesce in such arbitrary and irregular government; and who very justly thought, that if the establishment of permanent laws was obstructed by the circumstances of their present condition, the temporary arrangements by which such laws were to be supplied ought to originate with themselves, to whom alone the exact nature of the circumstances which were to be consulted was experimentally known.

The proprietaries were more successful in their efforts to increase the numbers of the colonists of Ashley-river, than in their experiments in the science of legislation. To the puritans, persecuted in England by the existing laws, and ridiculed and insulted by the cavaliers, they offered a secure asylum and ample grants of land in Carolina, on condition of their transporting themselves and their families to this province. Even the most bigoted churchmen in the king's council are reported to have co-operated with great eagerness to promote this project: considering severe labor a powerful remedy for enthusiasm, and enthusiasm an excellent stimulus to novel and hazardous undertakings; and judging it expedient to diminish, by every means, the farther accumulation of puritan sentiments and habits in Massachusetts. And although it was to this favourite scene that the strictest and the most numerous portion of the puritan emigrants still resorted, yet a considerable number were tempted by the flattering offers of the proprietaries to try their fortunes in Carolina. Unfortunately for the peace of the province, the invitations and encouragements to emigrate thither were tendered indiscriminately to men of the most discordant characters and principles. Rakes and gamblers, who had wasted their substance in riot and vice, and cavaliers who had been ruined by the civil wars, were sent out in considerable numbers, to associate with disgusted puritans, and to a scene where only severe labor, and the strictest temperance and frugality, could save them from perishing with hunger. To the impoverished officers, and other unfortunate adherents of the royalist party, for whom no recompense was provided in England, the proprietaries and the other ministers of the king offered estates in Carolina, which many of them were fain to embrace as a refuge from beggary. The conjunction between these cavaliers, who ascribed their ruin to the puritans, and the puritan emigrants, who imputed their exile to the cavaliers, could not reasonably be expected to produce harmony or tranquility; and the feuds and distractions that afterwards sprung up from the seeds of division thus unseasonably imported into the infant province, indicted a merited retribution on the proprietaries for the senselessness and absurdity of the policy they had pursued. The dangers and hardships, indeed, in which the emigrants found themselves involved on their arrival in the province, contributed for a time to repress the growth of civil and religious dissension: but, on the other hand, the same circumstances tended to develop the evil consequences of settling worthless men, whose habits were already completely fixed and corrupted, to a scene where only vigorous virtue was calculated to thrive. Accordingly, it was the effects of this part of their policy that afforded to the proprietaries the earliest matter of repentance. Of the extent to which disappointment and discontent prevailed among the settlers, we may judge from this circumstance, that one of their earliest laws was an ordinance that no per-

son should be permitted to abandon the colony. [1762] The distress which unavoidably attended the first efforts of the colonists was severely aggravated by the hostile intrigues and assaults of the Spaniards, who had established a garrison at Augustine, in the territory to which the appellation of Florida was now restricted from its original comprehensiveness. These proceedings of the Spaniards, which even their original pretensions would by no means have warranted, were adopted in manifest violation of a treaty by which such pretensions had been expressly renounced. Prior to the year 1667, no mention had been made of America in any treaty between Spain and England; the former being contented to retain her ancient claims to the whole country, and the other careful to preserve and improve the footing she had already attained in it. At that epoch, however, which was but a few years posterior to the occupation of Carolina, Sir William Godolphin, concluded a treaty with Spain, in which, among other articles, it was agreed, "That the king of Great Britain should always possess in full right of sovereignty and property, all the countries, islands, and colonies, lying and situated in the West Indies, or any part of America, which he and his subjects then held and possessed, inasmuch that they neither can nor ought to be contested on any account whatsoever. It was stipulated at the same time, that the British government should withdraw its protection from the buccaneers, who had for many years infested the Spanish dominions in America; and accordingly all the commissions that had been formerly granted to these pirates were recalled and annulled. By the same treaty, the right of both nations to navigate the American seas was formally recognised; and it was declared that all ships in distress, whether from storms, or the pursuit of enemies and pirates, and taking refuge in places belonging either to Britain or Spain, should receive protection and assistance and be permitted to depart without molestation.

But notwithstanding this treaty, a certain religious society in Spain continued to assert a claim to the whole territory to which the name of Florida had been originally applied, not only on the footing of prior discovery, but by virtue of a special grant from the pope: and the garrison that was maintained at Augustine, regarding the British settlement as an encroachment on their possessions, endeavored by every act of insidions, and even violent molestation, to compel the colonists to relinquish the country. They sent emissaries among the settlers at Ashley river, in the hope of moving them to revolt; they encouraged indentured servants to abandon their masters, and fly to the Spanish territory; and they labored so successfully to instil into the savage tribes the most unfavorable notions of British heretics, that these deluded Indians, at the instigation of a people, whose treachery and injustice they had so sensibly experienced, took arms to extirpate a race who had never injured them, and whose whole demeanor, as well as the express instructions of their rulers, indicated a desire to cultivate friendly relations with them. The colonists were now involved in a scene of labor, danger, and misery, which it is impossible to contemplate without admiring the energy and endurance which human beings are capable of exerting. Except a very few negroes, who had been imported by Yeomans and his followers from Barbadoes, there were no other laborers but Europeans in the colony; the brute creation could not partake or supply human labor till the ground had been disencumbered of wood; and the weak arm of man alone had to encounter the hardship of clearing a forest, whose thickness seemed to bid defiance to his utmost strength. The toil of felling the large and lofty trees, by which they were surrounded, was performed by the colonists under the dissolving heat of a climate to which their bodies were totally accustomed, and amidst the terrors of barbarous enemies, whose silent approaches and abrupt assaults they could not otherwise repel, than by keeping a part of their own number under arms, to protect the remainder who were working in the forest, or cultivating the spaces that had been cleared. The

* Hewitt, i. 54—56. 60. Hewitt's work was published without his name, which some writers have spelt Hewit, and others Howat. Others have concluded, from this variation, that there were two writers whose names were nearly the same, and both of whom wrote histories of South Carolina. Warden carries this mistake still farther, and in his catalogue of works relative to this state, enumerates three histories bearing the same title, one by Hewitt, one by Howat, and a third by an anonymous author. Nor is this a solitary, or even a rare specimen of the inaccuracy of his literary catalogues. Indeed nothing can be more slovenly or perplexing than the manner in which authorities have been cited in almost all the works of that treat of American history. Even the most correct of them never scruple to cite the same author, in one passage by his name, and in another by the title which his work shares with a host of other performances.

provisions obtained by dint of such hardships were frequently devoured or destroyed by their enemies; and the recompense of a whole year's toil defeated in one night by the vigor and celerity of Indian depredation. These distresses were aggravated by the feebleness, helplessness, and ill-humor, of some of the recently arrived emigrants, and by the mistakes and disappointments arising from ignorance of the peculiar culture and produce appropriate to the soil of Carolina, to which European grain and tillage proved utterly unsuitable. So much discontent and insubordination was produced by these calamities, that it was with the utmost difficulty that the governor could prevent the people from abandoning the settlement. An insurrection was even excited by Culpepper, one of the provincial officers, but it was easily suppressed by the governor; and the guilty were either mildly punished or humanely forgiven in consideration of the misery to which their violence was imputed. While Yeamans was exerting himself to compose these disorders, the Spanish garrison at Augustine, receiving information from some fugitive servants of the colonists, of the state of their affairs, judged this a proper opportunity to strike a decisive blow; and accordingly despatched a party, who advanced as far as the island of St. Helena, with the purpose of dislodging or destroying the inhabitants of Ashley river. But either their courage was disproportioned to their animosity, or they had overrated the divisions among the English colonists; for being joined by only one traitor of the name of Fitzpatrick, and learning that Yeamans was not only prepared to receive them, but had sent Colonel Godfrey with a party of fifty volunteers to attack them in St. Helena, they did not wait the encounter, but evacuating the island retreated to their quarters at Augustine. The more formidable hostilities of the Indians were quelled for a time, partly by the address and conciliation of Yeamans, but chiefly by a war which broke out between two of their own principal tribes, the Westoes and the Serenas, and which was carried on with such destructive fury, that in the end it proved fatal to them both.

[1673.] During the administration of Sir John Yeamans, the colony received a great addition to its strength from the Dutch settlement of Nova Belgia, which had been conquered by Colonel Nichols, and made subject to England. Charles the Second bestowed it on his brother James, who changed its name to New York; and by the prudence and mildness of the first governor whom he appointed, succeeded for a while in reconciling the inhabitants to the change of empire. But various circumstances had subsequently occurred to render the Dutch discontented with their altered situation, and many of them had formed the intention of removing to some other province; when the proprietaries of Carolina, understanding, or anticipating their design, and ever on the watch to promote emigration to their own palmettate, prevailed with them by encouraging offers to direct their course thither, and sent two of their own vessels, which conveyed a number of Dutch families to Charlestown. Stephen Bull, the surveyor-general of the colony, had instructions to allocate lands on the south-west side of Ashley-river for their accommodation; and here the Dutch emigrants, having drawn lots for their possessions, formed a town, which was called Jamestown. This first resort of Dutch settlers to Carolina, opened a copious flow of emigration to the province; for, having surmounted incredible hardships by their patience and industry, the successful establishment which they obtained, induced many of their countrymen in ancient Belgia, at a subsequent period, to follow them to the western world. The inhabitants of Jamestown, at length finding its precincts too narrow for their growing numbers, began to spread themselves over the province, till the town by degrees was entirely deserted.

The proprietaries had hitherto supplied the wants of the colonists with an unsparing hand; inasmuch that it was by their ample and seasonable consignments of provisions and other stores, that the settlement had more than once been snatched from the brink of destruction. But their patience was not proportioned to their liberality; in the expectations they formed, of speedy emolument and grateful regard, they omitted to consider the circumstances for which they had so liberally provided; and totally forgetting the injustice and imprudence with which they had hurried off great numbers of helpless shiftless men, to a scene where they could only encounter, disturb, and encourage the more useful members of the community, they were strongly and exclusively impressed with the largeness of their own pecuniary sacrifices, which seemed to give them full assurance that the colonists had no

cause whatever of complaint against them. Before the end of the year 1673, a debt of many thousand pounds had been incurred in this manner, by the colonists to the proprietaries; and yet they solicited fresh supplies, without being able to show how the late or the future expenses were ever to be reimbursed; and in alluding to the severity of the hardships they had undergone, they complained of neglect, and insinuated reproach. The proprietaries were exceedingly provoked and disgusted with this result; and their disappointment, concurring with the Dutch war, rendered their correspondence with the colony much less frequent than before. Willing however to encourage the settlers who had lately emigrated from New York, [1674.] they sent another supply, and promised an annual one; but withal warned the planters to consider how these advances were to be repaid, since they were now determined, they declared, to make no more desperate debts. "It must be a bad soil," they observed, "that will not maintain industrious men, or we must be very silly that would maintain the idle." They transmitted at the same time a large assortment of vines and other useful plants, and sent out a number of men who were acquainted with the management of them; but they refused an application for a stock of cattle, observing that they wished not to encourage graziers but planters; and they strongly recommended the cultivation of tobacco, till more beneficial staples could be introduced. Mutual jealousy and dissatisfaction began now to arise between the proprietaries and the colonists, and embittered the whole of their future intercourse. But a useful lesson was conveyed to the people by the circumstances which thus diminished their reliance on foreign support, and enforced their dependence on their own unassisted exertions. The proprietaries ascribed the unproductiveness of the colony, and the poverty of its inhabitants, to the misgovernment of Sir John Yeamans, who in the commencement of this year had been forced by ill health to resign his command, and try to repair his constitution in Barbadoes, where he quickly found a grave. The factions and confusion in which the colony was shortly after involved, have rendered the annals of this period extremely perplexing and inconsistent, and obscured, with an almost impenetrable cloud, the real characters of men, and the connection of events. Yet amidst conflicting testimonies, I am strongly inclined to believe that these charges of the proprietaries against Sir John Yeamans were unjust, and either the effusions of spleen and disappointment, or (more probably) the artful suggestion of an apology for the body of the colonists, with whom it was not convenient for them to quarrel irreconcilably. The real offence of Yeamans seems to have been his eagerness to procure ample supplies from the proprietaries to the colonists; a policy which, while the proprietaries were determined to discourage, they were naturally interested to view and represent as the consequence of his own mal-administration. When he abdicated his office, the council again appointed Joseph West his successor; and on this occasion the palatine thought proper to confirm the popular choice, with many compliments to the object of it, which, however gratuitous at the time, were amply justified by the prudence and success of his administration.

From the affairs of the southern colony, we must now transfer our attention for a little to the northern settlement of Albemarle. The same instructions which had been communicated to Sayle, in the year 1679, were transmitted to Stevens, the governor of Albemarle, at the same period; but a system, pregnant with innovations so unfavourable to the interests of freedom, was received with disgust and even derision, by a people who were no more disposed to give their consent to the fundamental constitutions than the proprietaries had been to demand it. The promulgation of this instrument produced no other effect than to excite the most inveterate jealousy of the designs of the proprietaries; till, in process of time, it came to be reported and believed, that they had formed the purpose of partitioning the province, and bestowing Albemarle on Sir William Berkeley as his portion of the whole. This apprehension, though perfectly groundless, prevailed so strongly, [1675,] that at length the assembly of Albemarle presented a remonstrance to the proprietaries against a measure which they declared to be no less injurious to individuals than degrading to the country. Though this remonstrance was answered in a conciliating manner by the proprietaries, who graciously confessed that they had been wanting in attention to the people of Albemarle, and solemnly promised to preserve the integrity of the province, the discontents of the colonists were too deeply rooted to be thus easily

removed. Little satisfaction was derived from the expectation of more frequent attentions from those whose policy had become the object of incurable suspicion; and a jealous and refractory spirit, taking possession of the minds of the people, was at length exasperated into sentiments as hostile to subordination, as the policy of the proprietaries was repugnant to liberty. From this period the history of the northern province, for a series of years, is involved in such confusion and contradiction, that it is impossible to render it interesting, and difficult to make it even intelligible. Chalmers, the most accurate of its historians, has been enabled, by his access to the most authentic sources of information, to rectify the mistakes of other writers respecting the nature and orders of the following events; but has found it utterly impracticable to account for them. "Unhappily they have been involved in the deeper confusion, from being connected in some degree, with the violent but unsteady and mysterious politics of Lord Shaftesbury."

Shortly after the remonstrance by the assembly of Albemarle, Miller, a person of some consideration in the province, was accused of sedition; and having been acquitted, notwithstanding the grossest irregularity and injustice in conducting his trial, he proceeded to England to complain to the proprietaries of the treatment he had undergone. Stephens the governor died soon after; and the assembly made choice of Cartwright to succeed him till orders should be received from England; but this man, after a short attempt to conduct the administration, was so disgusted with the distractions that prevailed around him, that he abandoned the colony altogether and returned to England, [1676,] whither he was accompanied by Eastchurch, a man whose address and abilities had raised him to the dignity of speaker of the assembly, and who was deputed to represent to the proprietaries the existing state of the province. The proprietaries conceiving a favourable opinion of Eastchurch, appointed him governor of Albemarle; and strongly disapproving the treatment that Miller had received, gave him as a compensation the office of secretary, to which Lord Shaftesbury added a deputation of his proprietary functions. The commissioners of the customs appointed Miller, at the same time, the first collector of these duties in the province. The proprietaries had observed with dissatisfaction how little their designs had been promoted, or their instructions respected by the provincial government. They had signified their desire to have settlements formed to the southward of Albemarle sound, and a communication by land established with the southern colony. But this scheme had been obstructed by the governor and council of Albemarle, who had engrossed nearly the whole of the trade with the neighboring Indians, and justly apprehended that the extension of the settlements would divert this profitable traffic into other hands. The proprietaries had no less vainly endeavored to alter the channel of the foreign trade of the colonists, and to substitute a direct intercourse with Britain for the disadvantageous commerce to which they had restricted themselves with New England, whose traders, penetrating into the interior of the province, and bringing their goods to every man's door, had obtained a monopoly of the produce of Albemarle, and habituated the planters to a traffic which they preferred, on account of its ease and simplicity, to the superior emolument of more distant commercial transactions. It was hoped by the proprietaries that an important alteration in both these particulars would be effected by the instructions which they now communicated to Eastchurch and Miller. [1677.] These officers departed to take possession of their respective offices; but Eastchurch, finding an opportunity of making a wealthy marriage in the West Indies, thought it prudent to remain there till his object was accomplished, and despatched his companion with directions to govern the colony as president till he himself should arrive.

As chief magistrate and collector of the royal customs, Miller was received with a hollow civility and treacherous acquiescence, of which he became the dupe and the victim. Not aware how unacceptable his authority was to a considerable party among the settlers,

* "Such," says this writer, "is the early history of North Carolina, which is probably as important and instructive as the annals of the most renowned states of antiquity, if we deduct from them the agreeable fables with which their eloquent authors have adorned them." P. 520. Hewitt declares that the transactions of commonwealths in their infancy are as interesting to the moralist as the vegetation of plants in spring is to the natural philosopher; a sentiment which, whatever justice it may be thought to possess, is totally inapplicable to the annals of a period disturbed by civil commotions, destitute of letters, and obscured by inconsistent traditions, the offspring of contending factions and reciprocal rancor.

he at once promulgated purposes and commenced innovations that gave offence and alarm to all. He found the colony to consist of a few insignificant plantations dispersed along the north-eastern bank of the river Albemarle, and divided into four districts. The colonists were yet but an inconsiderable body; the *titheables*, under which description were comprehended all the working hands from sixteen to sixty years of age, amounting only to fourteen hundred; and one third of these being composed of Indians, negroes, and women. Exclusive of the cattle and Indian corn, eight hundred thousand pounds of tobacco was the annual produce of their labor, and formed the basis of an inconsiderable commerce, which was carried on almost entirely by the traders from New England, who enjoyed unbounded influence in the colony. Remote from society, and utterly destitute of instructions, the planters were remarkable for ignorance and credulity, and were implicitly directed by the counsels of these traders, who regarded with the utmost jealousy the commercial designs which Miller had been instructed by the proprietaries to pursue. Unsupported by any effectual power, and possessing neither the reputation of eminent ability nor the advantage of popularity, this man commenced the work of reformation with a headlong and impetuous zeal that provoked universal displeasure. He was reproached, and perhaps justly, with some arbitrary exertions of power; but the rock on which his authority finally split was an attempt to promote a more direct trade with Britain and with the other colonies,* in order to destroy the monopoly enjoyed by the traders of New England, whom the proprietaries regarded as insidious rivals, and dangerous associates of the people of Carolina. At length, on the arrestment of a New England trader who was accused of smuggling, an insurrection† broke forth among the settlers of Pasquetanke, one of the districts of Albemarle; and the flame quickly spread through the whole colony. The insurgents were chiefly conducted by Culpepper, who had formerly excited commotions in the settlement of Ashley-river, and whose experience, in some enterprises, seems to have formed his sole recommendation to the regards of his present associates. As the government possessed no power capable of withstanding them, they soon acquired undisputed possession of the country; and having deposed the president, who was the chief object of their indignation, they committed him and seven of the proprietary deputies to prison. They seized the royal revenue, amounting to three thousand pounds, which they appropriated to the support of the revolt; they established courts of justice, appointed officers, convoked a parliament, inflicted punishments on all who presumed to oppose them, and, for several years, exercised the authority of an independent government. As there had been no example of a revolt unaccompanied by a manifesto, the inhabitants of Pasquetanke, in conformity with this usage, had commenced their insurrectionary proceedings, by publishing a feeble frivolous composition, entitled *A remonstrance to the people of Albemarle*, in which they complained of many oppressions, which they imputed to Miller, and declared the object they had in view to be the assembling of a free parliament, through whose instrumentality the grievances of the country might be represented to the proprietaries. The subsequent conduct of the insurgents, however, demonstrated very clearly, how little of real deference the proprietaries enjoyed with them; for, on the arrival of Eastchurch, [1678,] to whose commission and conduct no objection could be made, they derided his authority, and denied him obedience. He applied for assistance to the government of Virginia; but died of vexation before a force sufficient for his purpose could be assembled.

After two years of successful revolt, the insurgents apprehensive of an invasion from Virginia, despatched Culpepper and Holden to England, [1679,] to offer submission to the proprietaries, on condition of their past proceedings being ratified, and Miller declared and treated as a delinquent. This unfortunate president,

* Virginia, from her situation, might have absorbed the whole of this traffic of which she then enjoyed only a very inconsiderable portion. But so narrow were the commercial views by which she was governed, that two years after this period she passed an act prohibiting "the importation of tobacco from Carolina; as it had been found very prejudicial." *Laws of Virginia*, p. 127. In the year 1681, the governor of Virginia, writing to the English committee of colonies, declares that "Carolina (I mean the north part of it) always was and is the sink of America, the refuge of our renegadoes, and till in better order, dangerous to us." *State Papers*, apud Chalmers, 356.

† This insurrection, it will be remarked, broke out but a few months after the suppression of Bacon's rebellion in Virginia. But no connection has been ever supposed between these two events.

the and other officers, who had languished, meanwhile, in imprisonment, having found means to escape, appeared in England at the same time, [1680,] and filled the courts and the nation with complaints of their own sufferings, and accusations of their persecutors. If the proprietaries could have ventured to act with decision, and in conformity with their own notions of right, it was the complaint of this latter party that would doubtless have prevailed with them. But while they hesitated to embroil themselves irreconcilably with the colonists, their perplexity was increased by the encouragement which Shaftesbury thought proper to extend, in the most open manner, to Culpepper. This enterprising politician, who was now deeply engaged in his last revolutionary projects, and whose resentful espousal of the popular cause in England had placed him at variance with some of the brother proprietaries, plainly saw that Culpepper possessing the confidence of the people of Albemarle, was capable of becoming an useful instrument in the province, and that Miller, his ancient deputy, was utterly unfit to lend him any assistance. Culpepper, thus powerfully countenanced, seemed to have prevailed over his opponents, and was preparing to return to Carolina, when he was accused by the commissioners of the customs (at the private instigation, most probably, of the palatine, and others of the proprietaries,) of the offences of acting as collector without their authority, and of embezzling the king's revenue. He was seized on board a vessel in the Downs, under a warrant from the privy council; and his case being referred to the committee of plantations, the proprietaries no longer scrupled, nor indeed could in decency refuse, to come forward as his accusers; in consequence of which, the report of the committee impeached him not only of embezzlement of the customs, but of having promoted a rebellion in the province. It was in vain for him to acknowledge the facts, and beg for mercy, or at least that he might be sent for trial to Carolina, where the offences had been committed; his powerful accusers were determined to wreak the uttermost vengeance on so daring an opponent of legitimate authority; and by virtue of a statute of Henry the Eighth, which enacted that foreign treasons might be tried in England, he was brought to trial in the court of King's Bench, on an indictment of high treason committed without the realm. There is no defect of justice in requiring a colonial governor or other public officer delegated by the parent state, to answer before her domestic tribunals, for betraying the trust, or perverting the power which he derived from her appointment. But Culpepper had not been an officer of the British government; and, however consonant with the statute law of Henry the Eighth, it was plainly repugnant to the spirit of the English common law, as well as to the principles of equity, to compel him to take his trial at such a distance from his witnesses, and in a community where the witnesses on both sides were unknown, and conflicting testimony could not probably be adjusted. It must be confessed, however, that from the actual state of the province, the British government was reduced to the alternative of either trying him in England, or not trying him at all. His destruction at first appeared inevitable; for the judges pronounced, that to take up arms against the proprietary government was treason against the king; and the simplest evidence was produced of every circumstance requisite to constitute the crime. But Shaftesbury, who was then in the meridian of his popularity, appearing in behalf of the prisoner, and representing, contrary to the most undoubted facts, that there had never been any regular government in Albemarle, and that its disorders were mere feuds between the planters, which at worst could amount to no higher offence than a riot easily prevailed with the jury to return a verdict of acquittal. This was the last act by which Shaftesbury signalled his participation in the government of Carolina. His attention, thenceforward, was absorbed by the daring cabals that preceded his exile; and, about three years afterwards, having ruined or dishonored every party with which he had been connected, he was obliged to fly from England, and implore the hospitality and protection of the Dutch, whom he had formerly exhorted the English parliament to extirpate from the face of the earth. The ruin of this ablest of the proprietaries extended its influence to the fortunes of the most distinguished of the landgraves. Locke had been so intimately connected with Shaftesbury, that he deemed it prudent to abandon England at the same time; but so remote was he from any accession to the guilt of his patron, that when William Penn afterwards prevailed on James the Second to consent to the pardon and recall of Locke, the philosopher resolutely refused to accept a pardon,

declaring that he had done nothing that required it.* Meanwhile the palatine, and the majority of the proprietaries, reduced to their former perplexity by the acquittal of Culpepper, pursued a temporising policy, that degraded their own authority; and cherished the factions and ferment of the colonists. Fluctuating between their resentments and their apprehensions, they alternately threatened the insurgents and blamed their own partisans. The inevitable consequences of this policy was, that they further exasperated all parties in the colony against each other, without attaching any to themselves, and at length found it too late either to overawe the insurgents by vigor, or to conciliate them by lenity. [1681] They are said to have resolved at last to abandon a hopeless vindication of their insulted authority, and to govern in future according to whatever portion of obedience the colonists might be disposed to yield to them. Having established a temporary administration, at the head of which they placed one Harvey as president, they announced, immediately after, their intention to send out Seth Sothel, who had purchased Lord Clarendon's share of the province, and whose interest and authority, they hoped, would powerfully conduce to the restitution of good order and tranquillity. These measures, however, were productive only of additional disappointment. Little regard was paid to the rule of Harvey, by men who were already apprised that his government would have but a short duration; and the proprietaries, along with the tidings of his inefficiency, received intelligence of the capture of Sothel on his voyage by the Algerines. Undismayed by so many disappointments, the proprietaries, having now resolutely adopted a lenient and conciliating policy, pursued it with a commendable perseverance; and Henry Wilkinson, a man from whose prudence the most happy results were expected, was appointed governor of the whole of that portion of Carolina stretching from Virginia to the river Pemlico, and five miles beyond it. The most earnest endeavors were now employed by the proprietaries to heal the former disorders. To the governor and council, they recommended, in persuasive language, the enforcement and exemplification of mutual forbearance and indulgence; and, in compliance with their desire, an act of oblivion was passed by the assembly of Albemarle in favor of the late insurgents, on condition of their restoring the money of which they had plundered the royal revenue. But it was found easier to enforce topics of conciliation on the parties who had suffered wrong, than on those who had done the injury; and the late insurgents, who were still the strongest party, not only condemned the conditions of an act which they felt to be quite unnecessary to their security, but, acquiring the command of the assembly, proceeded, with triumphant insolence and injustice, to denounce and punish the party which had so far mistaken its situation, as to proffer terms of pardon and forbearance to them. They inflicted heavy fines, and severe imprisonment on their opponents, who were forced to fly to Virginia for protection; and with whom every trace of justice and freedom took a long leave of this unhappy colony. The lamentable scene of violence and anarchy that thus ensued was no way changed, nor was the condition of the colony in any degree meliorated, by the arrival of Sothel, the governor, in the year 1683. The dangerous character of this man was displayed in the first acts of his administration. Though required by the proprietaries to expel from the council all those who had been concerned in the late disorders; to establish a court of the most impartial of the inhabitants, for the redress of wrongs committed during the distraction of the times; and to assist the officers of the customs in collecting the royal revenue, and executing the acts of navigation, he declined to comply with any of these mandates; and, seeking only his own immediate enrichment, he disregarded equally the happiness of the people, the interest of his colleagues, and the deep stake which he himself possessed in the future welfare of the colony. Newly escaped from captivity on the coast of Barbary, he was so far from enlarging his own humanity, or fortifying his sense of equity, by the experience of hardship and injustice, that he seemed to have adopted the policy of his late captors as the model of his own government; nor have the annals of colonial oppression recorded a name that deserves to be transmitted to posterity with

* Life of Locke. Clarkson's Life of Penn. Though Locke refused to avail himself of Penn's good offices, he was not regardless or unmindful of them; and after the Revolution in Eng. and found an opportunity of amply repaying them. Post. B. VII. cap. 2.

† Some of these unfortunate persons appear to have transmitted addresses and complaints to Charles the Second, and vainly implored his protection. Chalmers, p. 563.

greater infamy than his. Rapacity, cruelty, and treachery, appear to have been the prominent traits of his administration, which, after afflicting the colony for a period of five years, at length exhausted the patience of all parties, and produced at least one good effect, in uniting the divided people by a sense of common suffering and danger. Driven almost to despair, the inhabitants universally took arms against the government in 1683, and having deposed and imprisoned him, were preparing to send him to England for trial, when, descending to the most abject supplications, he entreated to be judged rather by the provincial assembly, whose sentence he declared himself willing to abide. If the colonists, in granting this request, arrogated a power that did not constitutionally belong to them, they at least exercised it with a moderation that reflects honor on themselves, and aggravates the guilt of the tyrannical governor. The assembly declared him guilty of all the crimes laid to his charge, and ordained that he should abjure the country for twelve months, and the government for ever. When the proprietaries received intelligence of these proceedings, they deemed it proper to signify that they did not altogether approve the irregular justice of the colonists; but they expressed the deepest regret for their sufferings, and the utmost astonishment and indignation at the conduct of the governor. They summoned him still to answer for his crimes before the palatine's court in England; and they protested to the people, that, if they would render a dutiful obedience to legal authority, no governor should in future be suffered to enrich himself with their spoils.* Such was the condition to which North Carolina was reduced at the epoch of the British Revolution.

CHAPTER II.

Affairs of South Carolina.—Indian War.—Practice of kidnapping Indians.—Emigrants from Ireland—Scotland—and England.—Pirates uncertain in the colony.—Emigration of French Protestants to Carolina.—Disputes created by the Navigation Laws.—Progress of Discontent in the Colony.—Sothel usurps the government.—Endeavors of the Proprietaries to restore good order.—Naturalization of French Refugees resisted by the Colonists.—The Fundamental Constitutions abolished.—Wise Administration of Archdale.—Restoration of general Tranquility.—Ecclesiastical Condition of the Province.—Intolerant Proceedings of the Proprietaries.—State of the People.—Manners, Trade, &c.

WE now resume the progress of the southern province of Carolina, which, under the prudent administration of Joseph West, whom we have seen appointed governor in 1674, enjoyed a much larger share of prosperity than fell to the lot of the settlers of Albemarle. The governor has been highly celebrated for his courage, wisdom, and moderation: and the state of the province over which he was called to preside, gave ample occasion to the exercise of these qualities. Strong symptoms of mutual jealousy and dislike began to manifest themselves between the dissenters and puritans, who were the most numerous party in the colony, and the cavaliers and episcopals who were favored by the proprietaries in the distribution of property and appointment to offices of trust: and although the firmness and good sense of West prevented the discord of these parties from ripening into strife and confusion, it was beyond his power to eradicate the evil, or to prevent his own council, which was composed of the leading cavaliers, from treating the puritans with insolence and contempt. The cavalier party was reinforced by all those persons whom loose manners and dissipated habits had carried to the province, [1674—1677] not for a cure but a shelter of their vices, and who regarded the rigid manners of the puritans with as much dislike as the cavaliers entertained for their political principles. The adversaries of the puritans, finding that it was in their power to shock and offend them by exhibition of manners opposed to their own, affected an extreme of gay license and jollity. Each party considering its manners as the test of

its principles, emulously exaggerated the distinctive features of the demeanor it embraced; and a competition of manners and habits ensued, in which the ruling party gave countenance and encouragement to practices very unfavourable to the prevalence of industry and acquisition of wealth. The proprietaries, whose imprudence had begotten these divisions, were the first sufferers from their evil consequences, and found all their efforts unavailing to obtain repayment of the large advances which they had made for the settlement. The colonists who had undertaken to pay the small salary of 100*l.* a year allotted to the governor, found themselves unable to discharge even this obligation; and the proprietaries found it necessary, in April, 1677, to assign to him the whole stock of their merchandises and debts in Carolina, in liquidation of his claims. This transaction gave rise to the remark that West was perhaps the only factor, who, at the end of ten years of confessedly prudent management, received, without any impeachment of his morals, the whole product of his traffic as the reward of his services. Meanwhile the population of the province received considerable accessions from the continued resort of English dissenters, and of protestant emigrants from the catholic states of Europe. In the year 1679, the king, willing to gratify the proprietaries, and hoping, perhaps, to divert the tide of emigration from Massachusetts, ordered two small vessels to be provided at his own expense, to convey a detachment of foreign protestants to Carolina, who proposed to add wine, oil, and silk, to the other produce of the territory; and he granted to the colonists an exemption for a limited time from the payment of taxes on these commodities, in spite of the earnest remonstrances of the commissioners of customs, who represented that England would be ruined and depopulated if the colonies were rendered a more desirable residence. Although these new settlers were not able to enrich the province with the valuable commodities which they had so confidently promised, they preserved their settlement in it, and formed a useful and respectable addition to its population. The proprietaries having learned that the agreeable district called Oyster-point, formed by the confluence of the rivers Ashley and Cooper, enjoyed greater convenience than the station that the first settlers had chosen, encouraged the inclination of the people, who began to remove thither about this time: and here, in 1680, was laid the foundation of the modern Charlestown, a city which in the next century claimed the highest consideration for the elegance of its streets, the extent of its commerce, and the refinement of its society. It was instantly declared the port of the province for the various purposes of trade, and the capital for the general administration of government. For sometime, however, it proved extremely unhealthful; inasmuch that from the month of June till October, the courts of justice were annually shut; and during that interval no public business was transacted; and men fled from the pestilential atmosphere of the place. The inconvenience at length was found to be so great, that orders were given to inquire for situations more friendly to health. But happily (in consequence, it has been supposed, of the purification of the noxious vapor by the smoke of numerous culinary fires) the climate gradually underwent a favorable change, and finally evinced so complete a revolution, that Charlestown was considered to enjoy the most salubrious air of Carolina.

Notwithstanding the earnest desire of the proprietaries, that the colonists should cultivate the good will of the Indians, a war that proved very detrimental to the settlement broke out in the year 1680, with a powerful tribe that inhabited the southern boundary. The war seems to have originated, partly from the insolence with which the idle and licentious emigrants behaved to the Indians, and partly from the depredations of straggling parties of Indians, who being accustomed to the practice of killing whatever animals they found at large, accounted the planters' hogs, turkeys, and geese, lawful game, and freely preyed upon them. The planters as freely made use of their arms in defence of their property, and several Indians having been killed, the vengeance of their kindred tribe burst forth abruptly in general hostilities, which for some time threatened the most serious consequences to the colony. So divided were the colonists among themselves, that the governor found it difficult to unite them in measures requisite even for their common safety, or to persuade any to undertake an effort that did not promise to be attended with advantage immediately and exclusively their own. That he might address himself effectually to their selfish disposition, he offered a price for every Indian who should be taken prisoner and brought to Charlestown;

and raised the necessary funds by disposing of the captives to the traders who frequented the colonies, and who sold them for slaves in the West Indies. This policy was productive of so much profit, and of enterprises so agreeable to the temper and habits of some of the planters, that the war was carried on with a vigor that soon enabled the government to dictate a treaty of peace with the Indians. [1681.] The proprietaries, desiring that this pacification should rest on a lasting and equitable basis, appointed commissioners who were empowered to decide all complaints between the contending parties in future, and declared that all the tribes within four hundred miles of Charlestown were under their protection. But the practices that had been introduced during the war had established themselves too strongly to be thus easily eradicated. Many of the colonists found it more profitable, as well as more agreeable, to traffic in the persons of the Indians, than to clear the forests or till the ground: and not only the principal inhabitants, but the officers of government, fomented the spirit of discord that prevailed among the savage tribes and promoted their mutual wars, with the design of procuring to themselves the captives whom they purchased as slaves. It was in vain for the governor and council to plead in justification of this inhuman policy, that by occupying the tribes, and causing them to expend their force in mutual hostilities, they secured the colony against their attacks; and that humanity sanctioned the purchase of prisoners who would otherwise have been put to death. The proprietaries were by no means satisfied with these reasons; and strongly declaring their conviction that it was a sordid thirst for private gain, and not a generous concern for the public safety, that engendered a policy so dastardly and dishonest, they ceased not to insist for its entire abandonment. But their humane interference was long unavailing; and it was not till after the most persevering and vehement remonstrances, that they were able to procure the enactment of a law to regulate, and at length utterly prohibit, this profligate and ignoble practice. Its continuance was attended with consequences both immediately and lastingly injurious. The traders who carried the captives to the West Indies imported rum in exchange for them; and a destructive habit of indulging to excess in this beverage depraved the manners and relaxed the industry of many of the colonists. A deep and mutual dislike was formed between them and the victims of their injustice, which the lapse of many years was unable to allay; and in after times the Indians inflicted a severe retribution on the posterity of those who had been the authors of their wrongs and the insidious abettors of their ferocity.

Governor West held a parliament at Charlestown in the close of the following year; [1682.] when laws were enacted for settling a militia, which the late war had shown to be necessary; for making ways through the boundless forest that every where surrounded the capital; for repressing drunkenness and profanity, and otherwise promoting the morality of a people who did not enjoy the instruction of a public ministry. [1683.] Shortly after this proceeding, West, who had incurred the displeasure of the proprietaries by introducing the traffic in Indians, and by curbing the excesses of the cavaliers, who were accounted the proprietary party, was removed from his command; and the government of the colony was committed, by Lord Craven, to Joseph Moreton, who had been recently created a landgrave of Carolina. This was the commencement of a course of rapid succession of governors, and all the other public officers in the colony: a system arising partly from unexpected casualties, and partly from defective policy; and which did not fail to produce the consequences with which it has been invariably attended, in the degradation of government, and the promotion of party spirit and cabals. But, however much the policy of the proprietaries might fluctuate in other respects, it continued long to be steadily and strenuously directed to the encouragement of emigration. At the desire of several wealthy persons, who proposed to emigrate to the province, they once more revised their fundamental constitutions, which, at the time of their first enactment, had been declared unalterable; now again promulgating a similar declaration of their future inviolability. The object of the present alteration was to relax somewhat in favor of liberty, the rigor of the original constitutions: but it is the less necessary to particularize them, as they were never acknowledged or received by the people of Carolina, who were more jealous of the power assumed to introduce such alterations, than gratified with the particular advantages now tendered to their acceptance. The alterations, however, proving satisfactory to the parties who had soli-

* Williamson, i. 130—141. Chalmers, 538—540. Hewitt, i. 103, 104. Hewitt has related these proceedings against Sothel, as having occurred in South Carolina. Nor is this the only error with which he is chargeable. He perpetually combines events that are totally unconnected with each other. His notation of dates is extremely scanty, and sometimes very inaccurate. While he abstains from the difficult task of relating the history of North Carolina, he selects the most interesting features of its annals, and transfers them to the history of the southern province. His errors, though hardly honest, were probably not the fruit of deliberate misrepresentation. Almost all the prior historians of America have been betrayed into similar inaccuracies with respect to the provinces of Carolina. Even that laborious and generally accurate writer Jedediah Morse has been so far misled by defective materials as to assert (American Gazetteer, second edit. 1795, p. 381) that the first permanent settlement in North Carolina was effected by certain German refugees in 1710.

cited them, one Ferguson soon after conducted to the colony an emigration from Ireland, which instantly mingled with the mass of the inhabitants. Lord Cardross, a Scottish nobleman, also led out a colony from his native country (then groaning under the barbarous administration of the Duke of Lauderdale,) which settled on Port Royal island, and in pursuance of some agreement or understanding with the proprietaries, claimed for itself co-ordinate authority with the governor and grand council of Charlestown. This claim, however, was disallowed by the colonial government; and the new occupants of Port Royal having been compelled to acknowledge submission, Lord Cardross, whether disappointed with this result, or satisfied with what he had already accomplished, forsook the settlement and returned to Britain. The settlers whom he left behind, were sometime after dislodged from their advantageous situation by an expedition despatched against them by the Spaniards at Augustine, whom they had wantonly provoked by inciting the Indians to make an irruption into the Spanish territory. But the most valuable addition to its numbers which the colony at this time received, arose from the emigration of a considerable body of pious and respectable dissenters, from Somersetshire in England. This body was conducted by Joseph Blake, the brother and heir of the renowned Admiral Blake, and who now devoted the moderate fortune which his disinterested brother had bequeathed to him, to facilitate the retirement of a number of dissenters, with whom he was connected, from the persecutions they endured in England, and the greater calamities they apprehended under the reign of the popish successor of the king. Several persons of similar principles, and considerable substance, united themselves to this emigration; and the arrival of these people served to strengthen the hands of the puritan or sober party in the colony, and to counteract, in a salutary manner, the influence of circumstances unfavorable to the character and manners of the planters. From the exertions of the proprietaries, and the condition of England at this period, there is little doubt that the colony would have received a much larger accession to its inhabitants, if the recent colonization of Pennsylvania had not presented an asylum more generally attractive to mankind. The liberality of William Penn's institutions; the friendly sentiments with which the Indians returned his kind and pacific demeanor; the greater salubrity of the climate of Pennsylvania, and superior adaptation of its soil to the cultivation of British grain, powerfully enforced the claim of this province to the preference of emigrants; and such multitudes resorted to it, both from England and the other states of Europe, as soon enabled it to outstrip the older settlement of Carolina, both in wealth and in population.
