About the Editor

Lawrence M. Salinger, Ph.D., is associate professor of criminology and sociology at Arkansas State University. He has earned degrees from the University of California, Irvine; Indiana University; and Washington State University. In addition, he attended the Counter-Terrorism Studies Executive Certificate program at the Interdisciplinary Center in Herzliya, Israel. His interest in the study of crime and criminals began at a very early age when, as a first grader, he read *The FBI* (1954) by Quentin Reynolds. Salinger's interests in criminology focus primarily on violent victimization and organizational crime. Organizational crime incorporates three types of criminality: white-collar and corporate crime, organized crime, and, terrorism. While to the average person these types of crime seem quite diverse, when looked at more closely, they actually have much in common with each other.

For example, all three types of crime revolve around hierarchical organizational structures, with defined roles for each type of actor within the organization. Each type of organization, be it a business, an organized crime family, or a terrorist network, has goals or objectives to strive for, although those goals may be different depending upon the type of organization. All three types of organizational crime involve both legal and illegal behaviors committed by the organizations, with both legal and illegal behaviors funding each other. Finally, all three types of crime impact people's lives in everyday society.

White-collar and corporate crime have been of interest to Salinger since he took his first course on the topic from Dr. John Braithwaite at the University of California, Irvine, in the 1970s, and was fueled by the likes of Drs. Gil Geis, Henry Pontell, Paul Jesilow, James F. Short, Jr., and Robert Meier. Salinger's doctoral dissertation, completed in 1992 at Washington State University, analyzed 98 years of antitrust price-fixing violations. While the findings were less than conclusive, some historical trends were noted. For example, the Sherman Antitrust Act was created to reduce restraint of trade and increase competition in the marketplace. However, during the first decade of its existence, the law was used exclusively to prosecute labor union organizers for strikes again corporations, rather than against crooked corporations themselves.

Another example of historical significance was that price-fixing charges against both U.S. and foreign corporations tended to increase in the two to three years before wars, but were then frozen at the request of the Department of Defense (or its predecessor, the War Department) because the companies were crucial to the war effort. After each war, the Department of Justice would drop charges against the American companies, while fully prosecuting the foreign companies.

Introduction

In the first two decades of the 2000s, white-collar crime has become a topic of almost daily news. The white-collar crime that caused the bankruptcy of Enron Corporation resulted in financial losses exceeding $66 billion to stockholders and likely helped lead to the recall of the governor of California. Massive violations of laws pertaining to improper investments in mutual funds and large banking firms in the United States have resulted in major losses to legitimate investors, whose losses are still being calculated. Under Bernard Madoff's $20 to $50 billion Ponzi scheme, dozens of investors lost their retirement funds, once-wealthy foundations were forced into bankruptcy, and one of Madoff's sons took his own life. The use of shareholders' assets to fund the lavish, private lifestyles of corporate chief executive officers, presidents, and chairs of the board of large corporations are becoming the fodder of the media.

For example, television viewers were treated to an edited version of a videotape of Tyco International Limited head Dennis Kozlowski and friends in a $2-million bacchanal celebrating his wife's birthday, all at the expense of the corporation. The WorldCom bankruptcy that resulted from white-collar crime caused billions of dollars in lost investments. The costs to ordinary stockholders are massive, but costs to employees, collateral business, communities, and society are incalculable. Human lives have been altered forever by the unlawful actions of a few whose insatiable need for power and profit resulted in illegal, unethical, and immoral acts. While one can conceive of the plausibility that the offenders did not define their behaviors as criminal, that in part could be possible because there is no clear definition of what is meant by the term *white-collar crime*.

The concept of white-collar crime was first conceived by Edward Alsworth Ross (1907), and approximately 30 years later, white-collar crime was born in the ideas of Edwin H. Sutherland (1939–40). Sutherland, in coining the term, defined white-collar crime as ". . . a crime committed by a person of respectability and high social status in the course of his occupation." For Sutherland, the white-collar category included "business managers and executives," although in his research he included corporations as offenders as well. He believed that a white-collar offense was a crime if it proved to be socially injurious and punishable. Therefore, an act of white-collar crime could be dealt with in a criminal, civil, or administrative manner (1945). Paul Tappan (1947), a lawyer and sociologist, disagreed with Sutherland's argument. Tappan believed that a behavior could only be considered a white-collar crime if the act was legally defined as a crime and if the offender had been convicted for the offense. That is, he rejected Sutherland's belief that a white-collar crime could be a violation of civil or administrative law without being condemned by criminal law.

Frank Hartung (1950) argued that while legal definitions were important in the general scheme of things, white-collar crimes represented a special case. Whereas in most instances it is possible to distinguish between criminal and civil violations, in the case of white-collar crime, the artificial distinction between civil and criminal laws was blurred and lacking in importance. In response to Hartung's statement, Ernest Burgess (1950) rejected a totally legal definition of crime, arguing for a labeling perspective definition requiring that persons could only be criminals if they perceived themselves as such. From the white-collar offender's perspective, Gilbert Geis' (1967) findings in his study of price fixing in the heavy electrical equipment industry would support Burgess' definition of crime. Geis found that white-collar criminals often do not perceive their acts as crime and therefore do not perceive themselves as criminals. Marshall Clinard and Richard Quinney (1973) replaced the term *white-collar crime* with two other classificatory categories: corporate crime and occupational crime. Corporate crime referred to the criminal behaviors of corporate entities, while occupational crime referred to the criminal behaviors of persons within their occupational status. Laura Schrager and James Short (1978) proposed the term *organizational crime*. They considered such crime in the context of the operative goals of the organization—the actual unstated goals of the organization—which often differ from its official goals. Clinard and Peter Yeager (1980) defined corporate crime as ". . . any act committed by corporations that is punishable by the state, regardless of whether it is punished under administrative, civil, or criminal law."

Albert Biderman and Albert Reiss (1980) withdrew the idea of status from the definition of white-collar crime. They argued that individuals other than those of upper-class status were capable of committing crimes in their occupational roles. As a result, they emphasized the importance of defining white-collar crime as a violation of a position of trust. For example, if a server inflates a customer's bill, the customer is likely to pay both the inflated amount as well as a larger tip without realizing that he or she has been victimized. The server not only profits personally but also violates the trust placed in him or her by the employer. James Coleman (1989) suggested that many of the attempts to redefine white-collar crime in other terms have undermined Sutherland's (1949) position since they "do not include many of the offenses covered in Sutherland's original definition" and/or "are best seen as varieties of white-collar crime." Clinard (1990) suggested replacing white-collar crime with the terms *corporate corruption* and *abuse of corporate power*.

These terms included both corporate and occupational crimes, regardless of whether they violate criminal, civil, or administrative laws. In addition, Clinard included behaviors that may not be explicitly defined as violations of law but that may be unethical and/or immoral in the corporate or occupational context. For example, a scientist who cheats on research by altering the findings of a study may not have violated a law or regulation, but instead has violated an ethical rule or norm of the scientific community. Under Clinard's hypothesis, that individual may have committed a white-collar offense because he or she engaged in an unethical and/or immoral behavior in the occupational context. For the purposes of this encyclopedia, white-collar crime can be defined as any behavior that occurs in a corporate and/or individual occupational context; is committed for personal and/or corporate gain and/or violates the trust associated with that individual and/or corporation's position and/or status; and is a violation of any criminal law, civil law, administrative law, rule, ruling, norm, or regulation condemning the behavior.

This definition is necessarily both sociological and legalistic in nature and therefore includes any behavior that may be socially defined as unethical or immoral, as well as behavior that is not legally defined as an offense. In addition, the definition does not include Sutherland's requisite that the violation be "committed by a person of respectability and high social status." This description was not included because white-collar crimes can be committed by persons who do not hold "high social status." Bank tellers do not usually enjoy high social status in our society; however, they are in a position of trust where they can engage in white-collar crime. Furthermore, John Hagan and Patricia Parker (1985) have suggested that those persons convicted of white-collar offenses are more likely to occupy middle management positions than the high prestige and social status group of the top managers in criminal corporations. Finally, punishability for an act is not an important issue. However, it may be assumed that if an act is a violation of some legal act, then it must be punishable as well. This broad definition of white-collar crime may bother some scholars in the field. However, given the diversity of the behaviors that come to be described as white-collar and corporate crime, it is difficult to create a succinct definition without necessarily excluding some of those behaviors.

History of White-Collar Crime

Laws against those behaviors that have come to be defined as white-collar crimes have existed since ancient times. Usually, such laws were developed in reaction to events in which there was a perception that something had occurred that challenged the moral sensibilities of society. Sharmaine Tapper and O. Oko Elechi's article on hoarding shows that in ancient times, laws were created to protect consumers and guarantee an adequate food supply for the people. While hoarding grain in order to reduce supply and provide large profits might make sense to many, hoarding could also lead to pubic unrest and the overthrow of governments that have chosen to do nothing to guarantee a reasonably priced supply of staple foods.

George Robb (1993) described the cyclical development and repeal of white-collar crime laws in response to specific acts of fraud and immorality in business that brought fortunes to some and ruin to many. Many of these laws were developed to deal with "stock touting," a practice that has existed as long as there have been stock markets and that continues to occur to this day. Stock touting involves creating companies and issuing stock in those companies based on false and/or misleading assets, information, or promises. For example, Robb wrote about persons who created companies to build railroads in far parts of Great Britain, claiming that they possessed government guarantees that when the railroad was built, stockholders would be instantly wealthy. The stock would sell quickly to speculators interested in making money, and the touts would quickly disappear, money in hand, with no railroad ever to be built. Such frauds aimed at unsuspecting speculators can be found in modern times as well. For example, the high-tech "bubble" of the 1990s resulted in the sale of stock in companies with much promise but little if any underlying market value. When the bubble burst, stockholders were left holding shares in companies that lacked any tangible assets.

Compounding the problem, many stockholders had borrowed money using their stockholdings as collateral, bankrupting those were unable to repay their debts and causing their lenders to take losses as well. Robb noted that touting laws were enacted in reaction to such losses and would be repeatedly repealed once the British Parliament decided that there was no longer a risk of such behaviors. Unfortunately, as soon as the laws were repealed, stock touts reappeared. New laws were created in response to their behaviors, and the cycle would continue over and over.

The Interstate Commerce Commission Act of 1887 was enacted in the United States in response to the behaviors of the robber barons in the railroad industry. The robber barons, who included so-called reputable business leaders and politicians such as Leland Stanford, Sr., and Jay Gould, built railroads connecting the east and west coasts of the United States—often without investing a cent of their own—and used their transportation monopoly to their own benefit. Before the passage of the Interstate Commerce Commission (ICC) Act, railroad owners were free to set their own prices for transporting goods, often raising prices to the point that western farmers and ranchers could not make a profit on their goods.

The ICC Act created a commission that was meant to regulate the cost of interstate transportation of goods to guarantee that railroads would receive a fair income for their services, while farmers and ranchers would still be able to profit from their labors and goods. The Sherman Antitrust Act of 1890 was enacted as a response to the growth of monopolies, which threatened to destroy competition in the marketplace. A monopoly occurs when a producer controls an entire market for a product, to the exclusion of other companies that would produce the product for a lesser cost. A monopoly allows the controlling producer to set any price for a product, with no fear of losing business due to competition from other producers. The Sherman Act was enacted because companies in various industry groups were attempting to eliminate their competition in the marketplace, thus hurting the economy. It is noteworthy, however, that for the first decade of its existence, the Sherman Act was used almost exclusively as a tool to harass and criminalize labor unions in their attempts to organize employees of those corporations the act was intended to regulate.

Other acts, such as the Clayton Antitrust Act of 1914, the Federal Trade Commission Act of 1914, the Robinson-Patman Act of 1936, the Celler-Kefauver Act of 1950, and the Hart-Scott-Rodino Act of 1976, furthered attempts to shape and regulate unethical behaviors of business. The Pure Food and Drug Act of 1906 served to rein in industries that produced products that might endanger the welfare of Americans. Prior to its enactment, there were no enforceable regulations over food production in the United States. Authors such as Upton Sinclair, in his 1906 novel *The Jungle,* exposed the abuses in the meatpacking industry. Also, prior to the passage of the act, potions sold as drugs and cosmetics often had little or no positive effect, while more likely having a significant negative effect on the health and safety of consumers. The Sarbanes-Oxley Act of 2002 is a more recent attempt to respond to corporate wrongdoing, requiring greater accountability for corporate boards of trustees for the unethical and illegal behaviors of their executives and corporations.

The academic study of white-collar crime behaviors did not begin until Sutherland used the term *white-collar crime* in his presidential address before the American Sociological Society in 1939. In his 1949 book *White-Collar Crime*, Sutherland presented the results of a study of white-collar offenses. During the next decade, the very limited amount of research on white-collar crime primarily involved the definitional issues discussed previously. It was not until the publication of studies of the descriptions of behaviors defined as white-collar or corporate crimes, or "modus operandi studies" as John Braithwaite called them in 1985, that academic researchers renewed their interest in the topic. These included studies such as Geis's research on the heavy electrical equipment scandal of the late 1950s and early 1960s and Quinney's 1963 study of prescription violations among pharmacists, which used Diane Vaughan's 1983 investigation of the Revco prescription fraud scandal. These and similar research probes have provided a basic description of diverse white-collar and corporate crimes.

The Encyclopedia

This reference is edited to incorporate information about a variety of white-collar crimes and provides examples of persons, statutes, companies, and convictions. It is acknowledged that it does not, and cannot, encompass all behaviors that may be defined as white-collar crimes. The articles have been written primarily for the college library, public library, and high school library markets. Postgraduate academics and law firms may find the reference useful to add to their libraries. As such, the articles focus on the introductory knowledge that students can utilize.

The authors of the articles come from a variety of social science disciplines, although nearly all are current or retired academicians. The articles on laws describe the specific elements of the laws in terms of what types of illegal acts to which they are meant to apply. Articles dealing with individuals give a brief biographical sketch of the individual but primarily focus on how that person relates to the study of white-collar crime.

Criminal events include descriptions of specific cases of white-collar crime, some very current and others that were studied in the past. Both are relevant to our knowledge of white-collar crime. Some of the articles also deal with white-collar crime in countries other than the United States in order to provide the perspective that white-collar and corporate crime is hardly an American phenomenon. As the definitions of white-collar and corporate crime remain somewhat fluid, we have included in this work other articles dealing with organized crime and prostitution, for example, which we acknowledge are not in themselves white-collar crimes but in some cases have been known to be contributory factors in the commission of such crimes. Moreover, elements of organized crime, prostitution, drug trafficking, and human trafficking (for example) are addressed in this encyclopedia, as these are criminal activities intertwined with white-collar crimes such as money laundering, bribery, and government corruption.

The Second Edition

The second edition of this *Encyclopedia of White-Collar and Corporate Crime* represents a major revision from the first edition. Of the almost 500 articles in the first edition, several have been removed for relevancy, and approximately 80 new articles have been added to the collection. Since it has been nine years since the first edition was published, the editors found it prudent to newly assign the articles in order to capture the most up-to-date information. It is truly a new edition and, moreover, a new encyclopedia. Since the first edition of this reference was published, the world has seen monumental economic changes that, in part, can be blamed on acts of white-collar and corporate criminality. To some extent, the severe downturn in the housing market can be tied to fraudulent mortgage practices that resulted in people purchasing homes they were financially unable to afford.

For example, "liar loans" are mortgages that are approved based on false mortgage applications that claim more assets and income than the applicant actually has. While approved for mortgages for high-dollar homes, the new homeowners rapidly find themselves unable to afford mortgage payments representing a larger than normal percentage of their incomes. This practice has resulted in millions of homes being foreclosed on by banks. Added to this financial disaster has been the sale of mortgage-backed securities, often falsely rated as high-quality mortgages, to unknowing investors who actually purchased junk securities.

As the mortgage crisis deepened, many lenders and investors found themselves mired in worthless assets, often purchased with money borrowed from other banks and investment brokers. The borrower banks and investors found themselves without income from the mortgage-backed securities while owing substantial payments to their creditors. Those creditors were in turn insured against losses by large insurers and reinsurers, as well as the government-sponsored enterprises known as Fannie Mae (Federal National Mortgage Association) and Freddie Mac (Federal Home Loan Mortgage Corporation). Faced with claims for losses by bank investors, these insurers and reinsurers collapsed because they did not have enough funds to pay the claims. Dozens of banks were forced to close, with their assets sold to other banks and their losses covered by the Federal Deposit Insurance Corporation (FDIC). Large banks such as Wachovia and Washington Mutual disappeared into the abyss.

Old investment houses such as Lehman Brothers and Merrill Lynch collapsed or were forced to merge with other securities firms. Other investment brokerages such as Morgan Stanley and Goldman Sachs were forced to reincorporate themselves as bank holding companies in order to qualify for federal bailout funds, which were made available only to banks, and be brought under the protection of the FDIC. The U.S. government, along with governments around the world, ended up lending trillions of dollars and euros to keep the economic system solvent. As individuals lost their homes and often their jobs, they lacked the funds to purchase cars and trucks, among other goods, and the automotive industry and associated businesses started to collapse. Daimler-Benz, which had previously purchased Chrysler, was itself purchased by Fiat.

General Motors was forced into bankruptcy, and through the assistance of the federal government it was able to recapitalize and rebuild itself as a new company. Thousands of autoworkers lost their jobs, contributing to the further collapse of housing markets. Much of this market collapse can be attributed to various white-collar and corporate crimes. Few of the perpetrators were ever arrested and prosecuted for their crimes. Some were held civilly liable, but through various legal maneuvers rarely had to pay their fines. The Dodd-Frank Wall Street Reform and Consumer Protection Act, enacted into law in 2010, created a broad new set of regulatory codes meant to prevent a reoccurrence of the illegal market behaviors that led to the collapse of the financial markets. The negative response of businesspeople and their political supporters to this set of regulatory reforms was strong and predictable. The 2012 presidential campaign brought promises to roll back these reforms in the interest of creating jobs, even though many jobs were lost prior to the passage of these new regulations.

In the midst of this financial carnage, Bernard Madoff, a respected investment broker and former president of the National Association of Securities Dealers Automated Quotations (NASDAQ), admitted to carrying out a decades-long

Ponzi scheme in which he stole an estimated $20 billion to $50 billion in lost principal and earnings—earnings that never existed in the first place—from his clients, allowing him and his family to live lives of extreme luxury at the expense of unknowing investors. When the scheme collapsed, dozens of formerly wealthy investors found themselves homeless and financially ruined. Holocaust survivor, author, philanthropist, and Nobel laureate Elie Wiesel lost his life savings, and substantially all of the assets of his charitable foundation, to Madoff. Madoff's two sons, allegedly innocent victims of their father's financial improprieties, lost their livelihoods in a legally operated corporation as well as all of their assets. One son was so broken that he committed suicide after his father was imprisoned for the rest of his life. This white-collar crime was allowed to flourish for decades in part because of the perceived prestige of Bernard Madoff as a titan of the industry and a philanthropist to boot.

The 2010 explosion of BP/Andarko's Deepwater Horizon oil drilling platform in the Gulf of Mexico proved to be both an environmental and financial disaster never before seen in the history of offshore oil drilling. Hundreds of miles of beaches were fouled with oil, and countless numbers of ocean wildlife and birds perished while desperate efforts were made to cap the well. The economies of the states of Florida, Louisiana, Mississippi, and Alabama suffered major losses as beaches were closed and tourist dollars disappeared from the local communities. All of the companies involved in drilling the well spent hundreds of thousands to millions of dollars accusing one another of negligence in the design, operation, and supervision of the drilling operation. The Deepwater Horizon disaster exposed a major failure of the federal agency empowered to regulate the oil drilling industry. Regulators, and employees of the companies they were meant to regulate, repeatedly engaged in parties and interpersonal relationships with each other, often resulting in a lack of actual regulation. Employees of the regulatory agency often moved through a revolving door, at times working for the agency while at other times working for the oil companies, beholden only to the highest-paying entity. In the end, the regulatory agency was broken up into several regulatory agencies with very narrowly defined roles and duties.

The second edition of this encyclopedia deals with all of these events and more. It is hoped that readers will gain a thorough knowledge of the issues involved and causes of white-collar and corporate crime and come to better understand the nature of these offenses as well as ways to combat them.

Dedication

The second edition of the *Encyclopedia of White-Collar and Corporate Crime* is dedicated to the memory of Dr. Gil Geis, professor emeritus at the University of California, Irvine, who died on Saturday, November 10, 2012. Gil (he hated to be called Gilbert) was my mentor, teacher, advisor, and friend. Gil guided my educational and professional career from the time I was a sophomore until his death. He was a wonderful teacher who made every student feel like he was teaching only to him or her, although he regularly espoused after class that he truly despised classroom teaching and could not wait to retire.

Gil was also an incredibly productive scholar who almost single-handedly restored the study of white-collar and corporate crime to the forefront of criminology. I feel honored that some of his last published works appear in this encyclopedia. After retirement, Gil spent 25 years teaching us, his colleagues, friends, and anyone he met about how to live our lives as teachers and scholars, but most important, as human beings. I am in my 26th year as a full-time college professor, and every day I hear his Brooklyn-accented voice gently guiding me as I interact with my students and colleagues, reminding me to live my life and treat everyone with the same level of respect and compassion as he did. Thanks, Gil.

Lawrence M. Salinger
Editor

Chronology

ca. 7th century B.C.E.: The first laws on hoarding food crops and cornering food markets are established in the Book of Deuteronomy.

1473: One of the first pieces of legislation relating to the crime of embezzlement is enacted in England based on a crime known as the Carrier's Case, which involved the theft of bales of wool by an agent who was transporting them to the coast.

1792: The U.S. Congress makes stealing mail a capital offense.

1863: Congress enacts the False Claims Act, designed to deter fraud against the federal government by authorizing private citizens to file charges against any party attempting to collect payment from the government through fraudulent claims.

1865: The U.S. Secret Service is created to detect counterfeit currency. Its responsibilities are broadened in 1867 to including detecting fraud against the government.

1872: The U.S. Congress passes the Mail Fraud Statute to combat the increasing number of crimes carried out through the postal service.

1873: The U.S. Congress passes the Postal Obscenity Statute, sometimes referred to as one of several Comstock Laws, named for Special Inspector Anthony Comstock. This statute prohibits sending materials judged as obscene through the postal service.

1878: Following an anti-Mafia campaign in Sicily, Italy, many Mafiosi emigrate to other countries, including the United States.

1880: The term *boycott* is originated, named after Charles Cunningham Boycott, whose ruthless evictions of tenants in Ireland provoked his employees so much that they refused to have any dealings with him.

1881: Looking to supplement a federal trademark law passed in 1870, Congress passes the Trademark Act, which allows a trademark holder to sue for infringement of a trademarked product.

1886: A U.S. Supreme Court ruling in *Santa Barbara v. California* declares that a corporation is a natural person; that is, a corporation is guaranteed the same civil liberties that a person has bestowed upon him or her.

1890: The Sherman Antitrust Act provides a working definition of corporate crime, stating the following:

> Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations, is declared to be illegal. Every person who shall make any contract or engage in any combination or conspiracy hereby declared to be illegal shall be guilty of a felony, and, on conviction thereof, shall be punished by fine not exceeding $10,000,000 if a corporation, or, if any other person, $350,000, or by imprisonment not exceeding three years, or by both said punishments, in the discretion of the court.

1898–1914: In the first five years following the enactment of the Sherman Antitrust Act, the U.S. Department of Justice files only nine cases relating to antitrust laws and only 16 in the first 12 years. Of the first 10 antitrust cases, the majority are filed against organized labor and labor organizer Samuel Gompers, alleging restraint of trade by organizing strikes and boycotts. This was not the legislative intent stated in the Sherman Antitrust Act.

1904: The International Agreement for the Suppression of White Slave Traffic comes into force; "white slave traffic" refers to white girls or women being forced into prostitution.

1906: The federal government files a lawsuit against Standard Oil Co. and John D. Rockefeller, claiming violation of the Sherman Antitrust Act. The case is debated all the way to the Supreme Court, and in 1911, Standard Oil is divided into 34 smaller companies.

1906: President Theodore Roosevelt coins the term *muckrakers*, referring to a group of journalists who were among the first to expose corruption in American big business. He said of them, "[they have] provided American journalism with what many regard as one of its finest hours."

1906: In response to Upton Sinclair's concerns about the safety of America's meat supply, documented in *The Jungle*, coupled with issues pertaining to the quality of drugs being manufactured and the highly exaggerated claims touted by the producers of health tonics, salves, and potions, Congress enacts the Meat Inspection Act and the Pure Food and Drug Act. The Meat Inspection Act specifies that any meat products sold in interstate commerce are to be inspected by federal regulators, and the Pure Food and Drug Act prohibits the interstate transportation and sale of adulterated food.

1907: Edward Alsworth Ross introduces the concept of economic or financial crimes without giving evidence of the immensity of the offenses that exist at the time.

1909: The Opium Exclusion Act prohibits the importation of smoking opium into the United States.

1914: The Federal Trade Commission Act is enacted. The act states that false advertising, which includes advertising statements that the advertiser has no reasonable basis to believe, regardless of future events that may prove the facts true, is an unfair and deceptive form of commerce.

1914: Because of the vague language in antitrust legislation, the U.S. Congress passes the Clayton Antitrust Act, supplementing and strengthening the Sherman Antitrust Act of 1890.

1915: The U.S. Secret Service is authorized to investigate espionage.

1915: William Sanger, husband of the birth control pioneer Margaret Sanger, is charged with violating the Comstock Laws by distributing information about contraception through the U.S. Postal Service.

1919: The so-called Black Sox scandal ensnares eight members of the Chicago White Sox baseball team, who are banned for life for their involvement in fixing Major League Baseball's 1919 World Series. The gangster Arnold Rothstein, although never indicted, is credited in popular culture with organizing the fix.

1920: The U.S. Congress passes the Truth in Fabric Act, which is designed to ensure that displays of fur or cloth accurately depict what the consumer is buying.

1920: Prohibition begins in the United States as the Eighteenth Amendment comes into effect, making it illegal to sell, manufacture, distribute, or transport alcoholic beverages. Many gangs that were formerly and primarily involved in violent crimes become involved in white-collar crimes related to Prohibition, such as running speakeasies (illegal bars) and distributing alcohol.

1922: The Federal Narcotics Control Board, Prohibition Unit, which is housed within the U.S. Treasury Department, is created. It is responsible for controlling narcotics and the treatment of narcotics addicts.

1922–1923: The Teapot Dome Scandal takes place during the presidency of Warren G. Harding. The scandal involves leasing federal oil fields to private companies without requiring them to go through a competitive bidding process.

1927: The definition of human trafficking, as defined by the Suppression of White Slave Traffic Act, is broadened to include all races as well as both women and children.

1929: Narcotics hospitals are created within federal prisons in Lexington, Kentucky, and Fort Worth, Texas, as part of the Porter Narcotic Farm Act of 1929.

1931: Notorious gangster Al Capone is convicted of income tax evasion, as the mafia boss—whose actual crimes extend far beyond the one he is imprisoned for—kept no record of his finances.

1932: The Uniform Narcotics Act of 1932 promotes collaboration between federal and state authorities in the effort to control narcotics, requiring the states to adopt federal narcotics laws.

1933: The repeal of Prohibition takes place, and with it the lucrative black market trade in illegal alcoholic beverages disappears.

1933: The Securities Act prohibits fraud in the securities market and requires that all relevant information be disclosed to investors.

1934: The U.S. Securities and Exchange Commission is created through the Securities Exchange Act and is granted broad powers to protect the interests of investors and ensure the integrity of U.S. financial markets.

1936: In *United States v. One Package of Japanese Pessaries*, a U.S. Court of Appeals rules that it is legal to mail contraceptive devices.

1937: The Marijuana Tax Act of 1937 effectively makes marijuana illegal by requiring sellers to pay a tax on sales. The American Medical Association opposes this law.

1938: The U.S. Congress passes The Federal Food, Drug, and Cosmetic Act, regulating cosmetics and therapeutic devices.

1939: Edwin H. Sutherland presents his presidential address to the American Sociological Society in Philadelphia, Pennsylvania. For the first time, Sutherland describes "white-collar crime," a term he coined to describe the criminal activities of the upper class and corporations.

1940: The U.S. Postal Service establishes its first forensic laboratory.

1940: The Investment Advisors Act stipulates that investment advisors must register with the U.S. Securities and Exchange Commission and obey its regulations.

1945: Dutch art forger Han Van Meegeren is charged with collaboration with the enemy for selling a supposed painting by Jan Vermeer to Hermann Göring. Van Meegeren admits the painting is a fake, and in 1947 he is convicted of fraud.

1946: The Lanham Act, which lays the groundwork for all future trademark legislation, defines a trademark as "any word, name, symbol, device, or any combination thereof adopted by a manufacturer or merchants to identify goods and distinguish them from those manufactured or sold by others."

1947: The first environmental law in the 20th century is passed. The Federal Insecticide, Fungicide, and Rodenticide Act requires companies to register pesticides used in interstate commerce.

1949: Edwin Sutherland publishes the first edition of *White-Collar Crime*, in which he details the criminal behaviors of the 70 largest U.S. corporations at the time. He does not mention the names of the corporations out of apparent fear of reprisal. (The 1983 third edition of the book, published 33 years after Sutherland's death, gives the names of these corporations that were studied for the first edition.) Sutherland also theorizes that white-collar crime can be explained best by his theory of differential association, which assumes that all behaviors are learned behaviors.

1949–56: Telephone company AT&T is accused of violating antitrust laws by the Federal Communications Commission (FCC). The FCC's intention is the removal of AT&T subsidiaries Western Electric and Bell Laboratories from the company's system. AT&T agrees to a consent decree that allows the company to retain control of the two subsidiaries but forbids it from expanding into other areas of communication.

1950: The Celler-Kefauver Act is passed, strengthening previous antitrust legislation by amending sections and adding provisions to the Clayton Antitrust Act of 1914.

1951: The Boggs Act establishes mandatory minimum sentences for drug offenders.

1956: Congress passes the Federal Water Pollution Control Act. The act creates the Federal Water Pollution Control Administration, which approves and regulates new water quality standards.

1956: Facing mounting lawsuits by thousands of women claiming their children had been born with birth defects, pharmaceutical manufacturer Merrell Dow discontinues the production of Bendectin, a prescription drug that is used to alleviate morning sickness and nausea in pregnant women.

1957–61: Multinational conglomerate General Electric (GE), Westinghouse, and other manufacturers of heavy electrical equipment are convicted of price fixing and other charges for selling electrical equipment valued at $1.74 billion per year. It is the largest price-fixing case in the history of the Sherman Antitrust Act to this date. This is the first time that individual white-collar criminals are jailed for their offenses. GE's $437,500 fine is equivalent to a person earning $175,000 per year having to pay a $3 parking ticket.

1959: The U.S. Senate begins committee hearings into allegations that the largest electrical equipment makers in the United States were conspiring to fix prices. Among the manufacturers were major providers General Electric and Westinghouse.

1960: Congress investigates the meatpacking industry. Investigations conclude that about 15 percent of all commercially slaughtered animals and about 25 percent of all commercially prepared meat products are not being examined by U.S. Department of Agriculture investigators because the meat was distributed only within the slaughtering and packing plant's state.

1960: The International Brotherhood of Teamsters Pension Fund managers loan money from the fund to organized criminals, usually through straw men, for casinos, hotels, and resorts. The recipients of the fund "proceeds" included such noteworthy establishments as Rancho La Costa, Circus Circus, Caesar's Palace, the Dunes, and the Sands.

1962: United States Steel Corp. is accused of violations of the Sherman Antitrust Act, issuing building loans stipulating that the builder/borrower must use materials purchased from the steel corporation at artificially high prices. The case is tried in the U.S. Supreme Court three times before a February 1977 ruling states that the corporation did not violate antitrust laws.

1962: The U.S. Congress passes the Kefauver-Harris Drug Amendments to the Federal Food, Drug, and Cosmetic Act, requiring that drug companies show evidence their products are safe to a relative degree.

1963: In a hearing before the U.S. Senate Subcommittee on Investigations, Joseph Valachi, a member of the Genovese crime family, reveals many details regarding the operation of organized crime in the United States. He brings the term *La Cosa Nostra* (the Mafia) into everyday vocabulary.

1965: The U.S. Congress passes the Federal Cigarette Labeling and Advertising Act of 1965, requiring cigarette packages to carry a label warning consumers that cigarettes are a health hazard.

1966: The U.S. Congress passes the National Traffic and Motor Vehicle Safety Act, mandating the incorporation of safety devices designed to prevent fatalities in automobile accidents. During the next six years, automobile accidents decline at an average rate of 3.5 percent annually. The act also establishes the National Highway Traffic Safety Administration under the U.S. Department of Transportation to oversee safety and consumer programs, including motor vehicle crash testing and automotive recalls.

1968: The U.S. Congress passes the Truth in Lending Act, designed to promote economic stability by protecting the credit rights of consumers. The act announces that consumers will no longer be subject to misleading or fine print on credit applications.

1968: Peter Maas publishes *The Valachi Papers*, based on interviews with convicted mobster Joseph Valachi.

1970: Ford Motor Co. unveils its new Pinto automobile, despite tests revealing that rear-end collisions often cause fuel line ruptures, setting the bulky vehicle aflame.

1970: The Bank Secrecy Act requires banks to report cash transactions of more than $10,000.

1970: In response to rising concerns about worker and workplace safety, the U.S. Congress passes the Occupational Safety and Health Act. Enacted under the federal government's constitutional right to regulate interstate commerce, the legislation aims to guarantee that U.S. workers have a workplace that is free from hazards like dangerous machinery and toxic chemicals.

1970: In response to growing concern for the environment, the Clean Air Act, first passed in 1970 and amended substantially in 1990, introduces a set of guidelines requiring states to regulate sources of air pollution to specific air quality requirements and have regulatory programs designed to attain improved levels of air quality.

1970: The Racketeer Influenced and Corrupt Organizations Act (RICO) comes into force. RICO is a tool to combat racketeering, allowing superiors to be held responsible for acts committed by an agent acting on their orders.

1971: The U.S. Congress bans all broadcast advertising related to cigarettes.

1971: U.S. President Richard Nixon declares a "war on drugs" and calls for a coordinated national and state effort to combat drug use, which he sees as a threat to the country.

1972: The Consumer Product Safety Act is enacted as a response to perceptions that product liability laws do not sufficiently protect consumers from unsafe products. To implement the act, the U.S. Consumer Product Safety Commission is created. The commission is deemed responsible for administering additional consumer protection laws, including the Federal Hazardous Substances Act and the Flammable Fabrics Act.

1973: U.S. President Richard Nixon creates the U.S. Drug Enforcement Administration to enforce federal drug laws and coordinate the work of other agencies in combating drug trafficking and drug use.

1975: Former head of the Teamsters Union Joseph Hoffa disappears. He is believed to have been murdered, but his body is never located.

1976: Amending the Clayton Act of 1914, Congress passes the Hart-Scott-Rodino Antitrust Improvements Act, requiring that certain proposed mergers of assets be approved beforehand by the Federal Trade Commission and the Antitrust Division of the U.S. Department of Justice.

1976: The Toxic Substances Control Act is signed into law by the U.S. Congress and directs the administrator of the U.S. Environmental

Protection Agency to establish testing procedures for toxic chemicals, publicize results of tests of chemicals that prove to be dangerous, and set guidelines for controlling toxic chemicals.

1976–85: A report by the U.S. General Accounting Office reveals that 51.5 percent of all drugs introduced on the market must be relabeled because of serious adverse reactions discovered after their release.

1977: Gambling is legalized in Atlantic City, a seaside town in New Jersey, through passage of the Casino Control Act.

1977–79: The Federal Bureau of Investigation conducts a sting operation in which agents pretend to be wealthy Arab sheiks seeking investment opportunities in the United States. Seven legislators, including a senator and six congressional representatives, are videotaped accepting bribes from these agents in return for political favors. The scandal comes to be known as ABSCAM, after the bogus Abdul Enterprise Company.

1979: The Medellín drug cartel begins transporting drugs from Colombia to the United States using small planes that refuel on an island in the Bahamas owned by cartel co-founder Carlos Lehder.

1980: Marshall Clinard's book *Corporate Crime* reveals that that between 1975 and 1976, the country's 582 largest corporations had violated the law a total of 1,553 times.

1980: The Equal Employment Opportunity Commission issues a set of guidelines detailing prohibited sexual behavior in the workplace, which applies to all federal agencies and private businesses with 15 or more employees.

1980–86: Teledyne Hydra-Power, a unit of Teledyne Industries, defrauds the U.S. Navy of $4.5 million on a helicopter contract by inflating the price of parts and hours worked.

1980–90: Legislation is enacted to curb redlining, a process by which real estate agents and insurance companies exclude members of certain socioeconomic groups and/or races from certain neighborhoods. Such acts include the Home Ownership Protection Act, the Community Reinvestment Act, and the Home Mortgage Disclosure Act.

1980–2003: Millions of Americans are affected by advance fee fraud, synonymous with African-based criminal groups. Advance free fraud involves a promise of a large amount of money to be given to the participant in exhanged for providing banking information to the foreign-based entity, which then steals money from the victim's account.

1981: Three General Electric executives are imprisoned for crimes involving a payment of $1.25 million to a Puerto Rican official to obtain contracts to a federally owned electrical plant.

1984: First Lady Nancy Reagan begins the "Just Say No" campaign intended to reduce drug use among children and young adults.

1984: Ten thousand workers and townspeople are killed after a Bhopal, India, industrial plant owned by multinational corporation Union Carbide releases liquid methyl isocyanate, a harmful gaseous chemical, after the company allows a number of the plant's components to rust and decay.

1984: A Louisiana hospital requires that all surgical patients use the services of one of four anesthesiologists. A competing anesthesiologist charges that this violates the Sherman Antitrust Act. The U.S. Supreme Court's decision that this case does not represent an illegal tying arrangement is based on the hospital's lack of dominant position; it houses only 30 percent of the area's hospitalized patients.

1985: Five local crime bosses are indicted in New York City: Gerald Langella, Anthony Corrallo, Philip Rastelli, Anthony Salerno, and Paul Castellano. The prosecution is led by Rudy Guiliani, U.S. attorney general for the Southern District of New York, a future mayor of New York City.

1986: The Money Laundering Control Act of 1986 makes money laundering a federal crime, introduces forfeiture for violations of the 1970

Bank Secrecy Act, and requires banks to monitor compliance with the requirements of the Bank Secrecy Act.

1986: The Anti-Drug Abuse Act of 1986 includes a provision penalizing offenses related to crack cocaine more severely than similar offenses regarding powder cocaine; this provision will later be cited frequently as a primary reason for the preponderance of poor and African American drug users serving time in prison.

1987: Ivan Boesky is sentenced to three years in jail, the longest sentence for insider trading to this date. He also pays $100 million in 1986 to settle civil charges related to insider trading.

1987: Carlos Lehder, a leader of the Medillín cocaine cartel in Colombia, is extradited to the United States and sentenced to life without parole plus 135 years.

1988: The Major Fraud Act is signed into law by President Ronald Reagan, significantly increasing the maximum penalties that can be assessed for certain economic frauds committed against the U.S. government.

1988: Congress updates the Lanham Act with the Trademark Law Revision Act, changing the period of trademark protection from 20 years to 10 years, with infinite renewals. The act also stipulates that after five years the trademark holder is required to file an affidavit showing that the trademark will continue to be used.

1988: The Anti-Drug Abuse Act requires identification of anyone purchasing monetary instruments worth more than $3,000 and requires many institutions besides banks (such as car dealers) to report large currency transactions.

1989: The U.S. government brings criminal charges against Charles Keating for fraud, racketeering, and conspiracy and takes control of Lincoln Savings and Loan.

1989: The U.S. Public Interest Research Group reports that Chevron Oil Co.'s operations in the Gulf of Mexico have had somewhat of a less than admirable safety record. The research firm reports that between 1956 and 1989, offshore rigs operated by Chevron had experienced 10 gas blowouts, 65 fires and explosions, 40 pollution incidents, and 5 pipeline breaks or leaks.

1989: A study by research firm Essential Information reports that between 1984 and 1989, Chevron had spilled a total of 2.8 million gallons of oil, making it the world's largest and most consistent spiller of oil.

1989: Talk show televangelist Jim Bakker is convicted of fraudulently raising more than $158 million. A 28-page indictment includes eight counts of mail fraud, 15 counts of wire fraud use of telephone and television, and one count of conspiracy to commit wire and mail fraud.

1989: U.S. multinational corporation Union Carbide settles out of court, for $480 million, with the families of victims involved in its 1984 chemical spill.

1990: The U.S. Congress passes the Nutrition Labeling and Education Act of 1990, requiring all packaged foods to carry labels with nutrition information.

1990: Problems involving General Electric, such as bribery and mispricing, become so pervasive that the Pentagon's Defense Contract Management Agency takes the unique step of setting up a special investigations office to look into it. The office secures 22 criminal indictments of the company, its subcontractors, and its employees and recovers $221.7 million.

1990: Panamanian General Manuel Noriega surrenders to the U.S. Drug Enforcement Administration following the U.S. invasion of Panama. Noriega is convicted in 1992 of drug trafficking, racketeering, and money laundering and is given a sentence of 40 years.

1990–2000: The Financial Action Task Force, an intergovernmental policymaking body headquartered in Paris, France, calculates that approximately $500 billion is used in money laundering around the world each year.

1990–2002: General Electric is involved in 63 court cases brought against it by the federal government. The sum of the settlements reaches $982 million.

1991: Twenty-five employees are killed in a fire in an Imperial Food Products Incorporated chicken processing plant. The employees are unable to escape the flames because the exit doors are locked for fear of employee theft.

1991: Investment company Solomon Smith Barney's telecom research analyst Jack Grubman falsifies company reports to make some companies appear healthier than they actually are, causing a number of investors to lose substantial sums of money.

1991: One hundred sixty-five members or associates of the Cali (Colombia) cartel and the Sicilian Cosa Nostra are arrested for money laundering and drug trafficking.

1991: The U.S. Postal Service helps crack an art fraud ring marketing forgeries passed of as paintings by master artists such as Pablo Picasso and Salvador Dali.

1992: A lagged time-series analysis of price-fixing offenses between 1890 and 1988, the only long-term longitudinal study of price fixing, finds no significant relationship between price-fixing enforcement and political and economic variables.

1992: The Annunzio-Wylie Anti-Money Laundering Act creates the Bank Secrecy Act Advisory Group, increases sanctions for violations of the 1970 Bank Secrecy Act, and requires recordkeeping and verification for wire transfers.

1992: Carlos Salinas de Gortari, the president of Mexico, issues a number of restrictions affecting U.S. Drug Enforcement Administration offices operating in Mexico. They include denying the agents diplomatic immunity, prohibiting them from carrying weapons, and limiting the number of agents allowed to operate in the country.

1993: Paulo Escobar, head of the Medellín cocaine cartel, is shot and killed in Colombia.

1995: Computer hacker Kevin Mitnick is arrested by the Federal Bureau of Investigation. He ultimately confesses to multiple cases of computer and wire fraud and serves five years in prison.

1995: The U.S. Congress overrides the recommendation of the U.S. Sentencing Commission that the sentencing disparities for offenses regarding crack cocaine and powder cocaine be reduced.

1997: Camel Cigarette Corp. drops its famous Joe Camel advertising campaign amidst mounting lawsuits that claimed the cigarette-smoking cartoon character featured on posters was marketed toward children, a demographic that could not legally purchase the product.

1998: The Money Laundering and Financial Crimes Strategy Act creates the High Intensity Money Laundering and Related Financial Crime Area task forces and requires banking agencies to develop anti-money laundering training.

1998: The designation of the crime of identity theft is created by the Identity Theft and Assumption Deterrence Act.

1999: David Smith launches the Melissa computer virus, which propagates through the e-mail accounts of infected government and private computers. Smith is arrested and sentenced to 20 months in jail and a $5,000 fine.

1999: The pharmaceutical manufacturer Merck introduces the painkiller Vioxx on the market. It is withdrawn in 2004 when studies reveal that Vioxx patients are at increased risk of strokes and heart attacks.

2000: Owens Corning, which sells industrial pipe insulation, is driven to bankruptcy by the settlement of over 243,000 asbestos-related claims.

2000: The Federal Bureau of Investigation and the National White Collar Crime Center create the Internet Fraud Complaint Center to collect complaints about fraud involving the Internet.

2000: Harry Markopolos, a financial analyst, informs financial regulators that the reported investment returns of Bernard Madoff are not possible; however, this warning is ignored.

2001: An Italian court acquits former chemical company managers of charges stemming from a 10-year period in which 150 workers died from exposure to a harmful chemical. The managers are acquitted because it is determined that the company was not aware of the harmful effects of the chemical until after the workers were contaminated.

2001: The Internet Fraud Complaint Center charges 90 individuals and companies with a variety of crimes, including fraud, money laundering, and violation of intellectual property rights.

2001: One hundred child pornographers are arrested in Operation Avalanche, an effort by over 30 federal task forces to identify people using the U.S. Postal Service and the Internet to exploit children.

2001: The Uniting and Strengthening America by Providing Appropriate Tools to Restrict, Intercept, and Obstruct Terrorism (USA PATRIOT) Act, a response to the terrorist attacks of September 11, 2001, includes many measures to prevent terrorism, increase domestic surveillance, strengthen border security, fight cyber attacks, and prevent money laundering.

2002: Two students from Brown University, Katherine Chon and Derek Ellerman, establish the Polaris Project to combat human trafficking after discovering a brothel near their university campus.

2002: The U.S. Securities and Exchange Commission files a lawsuit against former executives of Waste Management Inc., accusing them of inflating earnings by almost $2 million.

2002: John J. Rigas of Adelphia Communications, a cable company based in a small rural town, is accused by the federal government of concealing $2.3 billion in debt from investigators and shareholders.

2002: In response to the growing number of stock fraud cases, the U.S. Congress passes the Sarbanes-Oxley Act, creating a series of oversight measures, and expands and increases the sanctions for illicit white-collar actions.

2003: A study estimates that the common practice of price fixing may cost the American public as much as $78 billion per year.

2003: The Sapphire computer virus, also known as the SQL Slammer, causes an estimated $1 billion in damages and causes significant disruptions across the United States, including outages in emergency response service in Seattle.

2003: Microsoft Corp. offers a reward of $250,000 for information about the creators of the Sobig virus and MSBlast.A worm.

2004: Andrew Fastow, chief financial officer at Enron Corp., pleads guilty to fraud and receives a 10-year sentence, later reduced to four years.

2004: Ukrainian cybercriminal Roman Vega is extradited from his vacation spot in Cyprus to the United States, where he is charged with operating a Web site, www.boafactory.com, that deals in stolen credit cards.

2005: Identification data for over 32,000 students and staff at George Mason University in Fairfax County, Virginia, are compromised as the result of a hacker attack against the university's main ID server.

2005: Attorney General Alberto R. Gonzales establishes the Hurricane Katrina Fraud Task Force to investigate cases of fraud (including identity theft, charity fraud, insurance fraud, and government benefits fraud) related to the storm.

2005: The data aggregation company ChoicePoint admits that over 140,000 consumer records, including credit reports, were accessed by criminals posing as legitimate businesspeople.

2006: According to the Prieston Group, a risk management solutions provider, mortgage fraud in the United States creates about $4.6 billion in losses.

2006: U.S. authorities discover a tunnel between the United States and Mexico that stretches for half a mile and is used to smuggle drugs into the United States.

2006: Kenneth Lay, the chief executive officer of the bankrupt Enron Corp., is found guilty of multiple counts, including bank fraud and conspiracy. He dies before his sentencing.

2007: Federal agents receive over 11,000 reports of fraud connected with Hurricanes Rita and Katrina, which hit the Gulf Coast in 2005.

2008: The U.S. Secret Service reports making almost 29,000 criminal arrests for counterfeiting, financial crimes, and computer crimes over the past five years, and seizing over $295 million in counterfeit currency.

2008: Financier Bernard L. Madoff surrenders to authorities on December 11 and is charged with fraud, money laundering, and other crimes. He pleads guilty to 11 crimes on March 12, 2009, and is sentenced to 150 years on June 29, 2009.

2010: WikiLeaks begins releasing the text of cabled messages sent to the U.S. State Department from various embassies, consulates, and diplomatic missions.

2011: James "Whitey" Bulger, a noted organized crime figure and Federal Bureau of Investigation informant from Boston, is arrested after being a fugitive since 1994.

2011: The pharmaceutical manufacturer Merck enters into a civil agreement to pay $628 million for issuing false statements about the safety of Vioxx, a painkilling drug, and for off-label marketing of the drug.

2011: "House King" Angel Puentes is indicted in Florida on charges of wire and bank fraud involving straw homebuyers and inflated home values. The dollar value of his fraud is estimated at $10.5 million.

2011: Billionaire investor Raj Rajaratnam is convicted of fraud and conspiracy and given a $10 million fine and 11 years in prison. It is the longest sentence to date for anyone convicted of insider trading in the United States.

2012: Barclays Bank admits to fraud and collusion for its role in fixing the London Interbank Offered Rate (Libor), a figure used to establish many other interest rates.

2012: Jon Johnson, a New Orleans, Louisiana, city councilman, pleads guilty to misusing federal funds intended to help victims of Hurricane Katrina.

2013: In February, a report sponsored in part by Citigroup Inc. and Visa Inc. reports that about 5.3 percent of U.S. consumers were victims of identity theft in 2012, many due to data breaches involving social security numbers.

2013: In March, former Detroit, Michigan, mayor Kwame Kilpatrick is found guilty of 24 of 30 federal charges, including racketeering and extortion.

2013: In March, the U.S. Securities and Exchange Commission accuses the state of Illinois of securities fraud, claiming that the state had not properly funded retirement plans from 2005 to 2009, and had concealed this fact from investors.

2013: In April, Wikileaks publishes over 1.7 million U.S. diplomatic records covering 1973 to 1976, a collection of information that Julian Assange of Wikileaks dubs the Public Library of U.S. Diplomacy.

2013: In April, British cabinet minister Chloe Smith revels that the government faces about 33,000 cyber attacks monthly, coming from a variety of sources including criminals, hacktivists, and state-sponsored actors.

A

A. H. Robins Inc.

Albert Hartley Robins opened an apothecary shop in Richmond, Virginia, in 1866. His son Claiborne attended pharmacy school and opened an offshoot business selling the pharmaceuticals his father manufactured. Claiborne died young, and when Albert retired and closed the apothecary, Claiborne's widow continued to run the pharmaceutical business until her son, E. Claiborne, finished pharmacy school. E. Claiborne took the reins in 1936 and turned the small, three-employee A. H. Robins Company into a large corporation with its own manufacturing plants and international customers. The company's major successes in the 1940s and 1950s included the antirhumatic Pabalate, the digestant Entozyme, and Robitussin, a cough syrup still popular today. It soon acquired the ChapStick brand and expanded beyond pharmaceuticals into pet-care products and French perfume.

In 1970, the company acquired the Dalkon Shield contraceptive intrauterine device from the Dalkon Corporation, a small company that had been formed by the Shield's inventors Hugh Davis and Irwin Lerner to promote and sell the product. Problems with the Shield eventually led to the bankruptcy of the A. H. Robins Company. Later investigations found that A. H. Robins had been warned by researchers that Davis's design was unsound but the company went forward with marketing the birth control device with Davis's claims that its design guaranteed a lower rate of infection or expulsion. In reality, the design encouraged the development of pelvic infections because of the IUD's tailstring functioning as a wick, allowing bacteria from the vagina to enter the uterus—an organ vulnerable to bacteria and made more susceptible by the tissue trauma caused by the presence of the Shield.

The first Dalkon Shield lawsuit was filed in 1972, even as sales skyrocketed after an extensive marketing campaign. When the number of complaints increased, the company responded by discontinuing the Shield in the domestic market, although international sales continued. Mounting lawsuits damaged their bottom line and forced them to halt production completely. They were able to keep the Shield on the market for several years after its dangerous flaws were revealed, collecting as much profit as possible before recalling the product.

By 1985, Robins and its insurer, Aetna Life and Casualty Company, had already paid out $380 million in Shield-related lawsuits, and the number of complaints and actions filed was steadily increasing, including a class-action lawsuit that was filed on behalf of nearly 2,000 Shield users. In 1984, Robins reported its highest-ever earnings of $128 million, but the Shield-related lawsuits proved to be the downfall of the company. In March 1985, Robins set up a reserve fund to pay out Shield claims totaling $615 million, on top of the cost of the lawsuits already settled. The creation of the fund put Robins at a loss for the year. In order to protect the company, Robins filed for reorganization under Chapter 11 of the Bankruptcy Code in August 1985. This froze all monetary claims against the company and caused the company's stock to plummet. In 1989, the American Home Products Corporation acquired A. H. Robins as part of the reorganization plan from bankruptcy.

The bankruptcy reorganization also gave Robins immunity from any further Shield-related civil litigation, but American Home agreed to finance a court-ordered trust to fund Shield claimants. American Home Products put $2.3 billion into the trust, which was responsible for paying claimants against the Shield for the following 20 years. Women who claimed injury from the Shield submitted a claim to the trust, which then decided the amount of the settlement. Instead of Robins's shareholders losing money from the bankruptcy and reorganization, they earned large financial gains because they were now owners of American Home Products stock, which was worth four times the price of Robins' stock. American Home Products later changed its name to Wyeth. Wyeth put the manufacturing and marketing of the brand under its Whitehall-Robins Health Care division. Production was taken over by Pfizer when it acquired Wyeth in 2009.

ABSCAM

ABSCAM (shorthand for Arab Scam, or Abdul Scam) was the code name given to an undercover sting operation conducted by the New York office of the Federal Bureau of Investigation (FBI) in 1980. Agents working the case recruited a convicted con artist, Melvin Weinberg, to join them in posing as representatives of a fictitious Arab sheikh, called Kambir "Abdul" Rahman, who was in need of Washington political favors. They then offered financial inducements to members of Congress and other politicians and intermediaries for their specific promises of help. Meetings between the sheikh's "representatives" and the legislators were secretly videotaped. Seven members of Congress (six representatives and one senator) were convicted for accepting cash or stock as bribes for the promise to exercise favorable influence on the sheikh's behalf. Only one member of Congress, Senator Larry Presler of South Dakota, declined the bribe when it was offered. Those convicted were given fines and prison terms of various lengths. Senator Harrison A. Williams of New Jersey received a three-year prison term. The mayor of Camden, New Jersey, and New Jersey state senator Angelo Errichetti received the most severe sentences—six years in prison and a $40,000 fine.

The ploy behind ABSCAM was engineered by John Good, an FBI supervisor for the Eastern District Federal Task Force, and the convicted con man and swindler Weinberg. Weinberg was facing sentencing for fraud in a federal court in Pittsburgh. Like many defendants, he was looking to cut a deal with federal prosecutors. Good had been looking for white-collar defendants to help the New York office make criminal cases and offered Weinberg probation for his assistance. Weinberg took to the task with relish.

The scenario they devised involved a fake Arab sheikh, a dummy corporation he had created to funnel money out of his home country (Abdul Enterprises), and the explanation that the sheikh was looking for U.S. "investments" offering a high return because—in accordance with Muslim law—banks in his home country did not pay interest. When word of the sheikh's interest in obtaining political help for his enterprise hit the streets, a small wave of hustlers, middlemen, and influence peddlers descended on the ploy.

Congressman Richard Kelly, a former U.S. attorney and state circuit judge, was caught on a surveillance tape in a hotel room stuffing 250 $100 bills into his pockets during a sting. Kelly was convicted and served 13 months in federal prison.

Although the initial enthusiasm likely arose from the felonious dreams of these everyday scam artists, they were able to supply a steady stream of political figures willing to talk about and readily engage in offering specific promises of political influence for monetary rewards. Every major meeting of "Abdul's" representatives with the various figures offering access to political influence or political influence was videotaped by the FBI, including the final meetings where cash payoffs were made to national and state political figures. The suspects were led into rented motel rooms and were seated on a couch directly in front of the concealed camera, where they were then offered a straightforward proposition to violate the law. This setting produced some memorable footage, including Congressman Richard Kelly (R-Florida), a former U.S. attorney and state circuit judge, caught on tape stuffing 250 $100 bills into his pockets. Kelly was convicted and served 13 months in federal prison.

The defense most commonly raised in undercover law enforcement "stings" is entrapment. Entrapment was raised by many of the defendants caught by the ABSCAM ruse. As a legal matter, entrapment occurs when government agents act in a way that induces and encourages a crime by making false representations and employing methods that create a substantial likelihood that innocent persons will be persuaded to commit a crime that they would not otherwise contemplate.

Although the precise definition of entrapment varies according to state or federal law, as a practical matter, the defendant must generally show that (1) he or she had no predisposition to commit the crime and (2) it was the "creative activity" of law enforcement that supplied the motive force for the crime—a force so powerful that effectively no normal person could have withstood the temptation. Generally, a "totality of the evidence" approach is used to consider the facts supporting an entrapment defense. In ABSCAM, Senator Harrison Williams (D-New Jersey) contended that since he had rejected the initial offer to engage in political acts favorable to the (fake) sheikh for his monetary benefit, he had not shown any predisposition. However, the U.S. Court of Appeals concluded that Williams had demonstrated that he was "ready and willing" to commit a crime as soon as the opportunity first presented itself—even though he may have hesitated for a moment at the first actual invitation to violate the law.

ABSCAM was among the several U.S. political scandals of the late 20th century that lowered the public's trust in government. The Watergate break-in of 1972 resulted in President Richard Nixon's resignation as president in August 1974. It also produced a series of trials for members of his cabinet and lesser government officials that extended through the late 1970s. When ABSCAM broke in 1981, the unseemly involvement of seven members of Congress, among other conspirators, confirmed in the public's mind the unredeemed sordidness afoot in national political circles.

Academi

Following the attacks of September 11, 2001, the U.S. government outsourced a substantial amount of military and government work to contractors. Academi, formerly known as Blackwater and Xe Services, is the largest and most controversial of the security contractors used by the U.S. government for training, protection, and military support for armed conflicts and natural disasters. Academi became the primary facilitator of training and support services for the U.S. State Department following the 2000 terrorist attack on the USS *Cole*. Specializing in counterterrorism, urban warfare, threat protection, executive protection, weapons, and tactical driving, Academi has been awarded over $1 billion in government contracts since then.

Legal issues have plagued the company, with allegations of illegal shootings, negligence in the deaths of its contractors, money laundering, tax evasion, aviation accidents, and the selling and smuggling of arms to other countries. The company has facilities in North Carolina, California, and Connecticut, and a forward operating base in Kabul, Afghanistan. Academi has also been contracted to the Department of Homeland Security, where it was called to support relief efforts following Hurricane Katrina. The company has secured counter-narcotics enforcement contracts with the Drug Enforcement Administration (DEA), trained Azerbaijan naval commandoes, protected Japanese radar systems, and it was reportedly recruited to track down and kill al Qaeda operatives.

Founded by former Navy SEALs Erik Prince and Al Clark, who envisioned a state-of-the-art training center, Blackwater opened a 6,000-acre facility along the Virginia/North Carolina border in 1998 at a cost of $6.5 million. The company employed former special operations experts from the military, and it offered weapons, tactics, and advanced training to paying customers from the protective services industry. Following the terrorist attack on the USS *Cole* off the coast of Yemen, Blackwater was contracted to train Navy sailors. After the United States was attacked on September 11, 2001, Blackwater was recruited to protect Central Intelligence Agency (CIA) headquarters and other strategic installations of the U.S. government. As the global war on terrorism unfolded, Blackwater became a valued asset to provide training and security resources. Company leadership has come not only from special operations experts but also from high-level officials of the intelligence, justice, and military communities.

Iraq

The war in Iraq overwhelmed the resources of the government to provide protection for the large numbers of officials traveling and working in the region, and Blackwater was one of several companies selected to provide protection under contract to the U.S. State Department's Bureau of Diplomatic Security. In 2003, Blackwater received an almost $28 million contract to guard Paul Bremer, the administrator of the Coalition Provisional Authority in Iraq. In the same year, Blackwater created an aviation wing by procuring Aviation Worldwide Services and a fleet of fixed and rotary wing aircraft. Operators for Blackwater were heavily armed security with military and law enforcement backgrounds who were handpicked to protect high-value assets in fixed and mobile operations. By use of armored vehicles, helicopters, and heavy weapons, the contractors guarded buildings and persons, escorted convoys through Iraqi cities, and flew protective and transportation missions. As the primary protective force for high-risk targets, Blackwater contractors came under attack on many occasions. Since beginning operations overseas, the company has been involved in over 200 shooting incidents.

In 2004, insurgents aided by members of the Iraqi Civil Defense Corps ambushed Blackwater contractors as they drove through the streets of Fallujah. The contractors were killed, burned, and dragged through the streets, and two of their bodies were hung from a bridge over the Euphrates River. The company has dealt with allegations of a drunken Blackwater contractor shooting the Iraqi vice president's security guard, a standoff between Blackwater contractors and Iraqi Interior Ministry soldiers, and a Blackwater sniper killing three guards of the Iraqi Media Network. The most publicized incident outside the Fallujah ambush and hanging was a shooting in Nisour Square in September 2007, in which 17 Iraqis were allegedly killed by Blackwater contractors escorting a U.S. State Department convoy. Blackwater insisted that the contractors had been ambushed, but investigations by the U.S. State Department and U.S. military found Blackwater at fault—firing upon and killing Iraqi civilians without provocation. The FBI investigation concluded that 14 of the 17 deaths were unprovoked, but were unable to provide any ballistic matches to Blackwater weapons.

Legal Issues

Academi has been embroiled in legal issues for many years. The controversies over the company, its mission, and its methods have resulted in strained relations with Iraq's transitional government, criminal prosecution, civil litigation, and congressional hearings. One of the major reasons why the company has been so deeply involved in Iraq is the absence of clearly defined rules, oversight, and accountability. The United States entered largely uncharted territory in the Second Gulf War by using an unprecedented volume of private contract companies to accomplish its mission. Whereas in the First Gulf War, only one in 60 human assets were contractors, the number jumped to an estimated one in three during the Second Gulf War. The legal status and rules for contractors have never been clear, and as private contractors were not subject to military rules of engagement—rules that have often been suspected of contributing to deaths and injuries to U.S. forces—they were more prone to shoot first and deal with the fallout. Contractors were also more likely to be involved in protective details, with a higher risk of ambush than heavily armed military platoons and companies. One of the greatest difficulties facing the United States has been in controlling private companies doing the bidding of the government, and what protections, if any, are afforded private contractors.

Academi has been sued by the families of its contractors killed in Fallujah, families of contractors who died in aviation incidents, former employees, and Iraqi civilians over the shootings at Nisour Square. Outside of litigation involving deaths and injuries to Academi contractors and civilians, the company agreed in 2010 to pay $50 million in fines for violations of U.S. law, including arms smuggling. In 2011, a $60 million lawsuit was filed against Blackwater for mistreatment of employees and the denial of benefits by fraudulently misclassifying Blackwater contractors as independent contractors, rather than as employees of Blackwater, which allowed the company to avoid millions of dollars in taxes. In 2012, Academi settled several open lawsuits with unspecified amounts in an effort to move the company forward. The settlements included the killings at Nisour and the contractor deaths in Fallujah. Though advised that it would no longer be awarded contracts with the State Department, Academi has secured renewed contracts with the CIA and other agencies within the U.S. government, as well as with private companies and other foreign interests.

Accounting Fraud

Accounting fraud exists in many forms and is found under different categories. Fraud schemes and methods are varied, but knowledge by insiders and auditors of prior known fraud schemes and fraud risk factors can serve as deterrents. Particularly notable are the conditions of risk often associated with a "perfect storm" for an individual to perpetrate accounting fraud. This triple set of factors, known for decades as the "fraud triangle," was supplemented in the last decade to include a fourth factor, giving rise to the "fraud diamond" theory. Fraud is pervasive across the globe and exists in some form in most businesses, small and large, as well as in governments and nonprofit organizations. Tips such as those provided by whistleblowers are a useful tool in uncovering fraud.

Accounting fraud is found within the inclusive label created by the Association of Certified Fraud Examiners (ACFE): occupational fraud and abuse. In reality, accounting fraud can exist in any of the three ACFE general classifications of occupational fraud, collectively known as the "fraud tree," which has broad branches: corruption, asset misappropriation, and fraudulent statements. Corruption is defined broadly by the ACFE to include conflicts of interest, bribery, illegal gratuities, and economic extortion. Although conflicts of interest may include schemes related to purchasing and sales that may involve accountants and accounting documents, and bribery can take the form of kickbacks and bid rigging, these specific frauds are not generally included as accounting fraud per se. The categorization of accounting fraud can differ depending on the organization that is viewing it.

For example, according to the American Institute of Certified Public Accountants (AICPA), accounting fraud is generally defined as an intentional act that misstates the financial statements of an entity. Pursuant to the large-scale corporate frauds that occurred around the turn of the millennium, the AICPA revised its approach to fraud in 2002, with the Statement of Audit Standards 99 (SAS 99), an audit standard that more firmly identified auditor responsibilities related to fraud. When looking for accounting fraud, an auditor typically considers two kinds of financial statement misstatements: those related to fraudulent financial reporting and those represented by misappropriation of assets.

Fraudulent financial reporting tends to take the form of overstating net income (sometimes called the bottom line), either by overstating sales or by understating expenses; these techniques are referred to as earnings management or income smoothing. Earnings management is typically perpetrated by individuals at higher levels within an entity, in order to meet previously set targets that have been publicized, which will ensure that stock prices respond favorably. Another management incentive is to meet the threshold that will guarantee employee bonuses. However, there can be incentives in which an entity might want to understate net income; for example, to minimize income tax liability. Misappropriation of assets is more commonly referred to as stealing, theft, or defalcation. Although misappropriation of asset frauds (e.g., stealing inventory) are associated with personnel at lower levels within an entity, this is not always the case. Misappropriated asset schemes are common at higher levels where appropriate internal controls are lacking (e.g., segregation of duties, or a strong "tone at the top" of integrity and accountability). High-level individuals with the "capability" of fraud are also becoming common.

Cash and Related Internal Control Remedies

Typical asset types in asset misappropriation include cash, inventory for resale, and other assets (including such tangible assets as equipment or supplies). The legal term for stealing is larceny, which is an act of taking something unlawfully. Larceny can apply to any asset type, but cash larceny schemes abound. One larceny example is where an individual with occasional access to customers' checks or cash also has the responsibility to maintain accounts receivable. In this fraud-ripe situation, the individual can pocket the cash and record some kind of entry in the accounts receivable. The journal entry might either write off the account as uncollectible or credit the account for merchandise that was supposedly returned (but in reality was not returned). The customer's account would clear, so there is no report of impropriety. A useful control to prevent cash larceny is that a list of receipts be recorded immediately at the initial point of entry to an organization. This simple technique of using a cash prelist showing the cash that has come into the organization is helpful; it serves as the best deterrent when that same list is used monthly during bank reconciliations. A record of cash received should align closely with cash recorded in the bank.

A common example of cash larceny also related to accounts receivable responsibilities is known as "lapping" accounts receivable. In this case, the accounts receivable clerk (with inappropriate access to customers' cash or checks) pockets a portion of the payment received from a customer named Paul, while making a mental note to correct Paul's account in the next day or so. This scheme is sometimes referred to as "robbing Peter to pay Paul." The next day, when a different customer named Peter pays his account, the entry is actually made to Paul's account to bring it to the correct balance, but now Peter's account is pending. This scheme involves much extra effort and internal tracking to keep the fraud perpetuated, and many lapping schemes tend to escalate over time. Lapping schemes can be difficult to uncover, but perpetrators are caught if and when appropriate separations of duties are put in place, or the lapping window is shortened by unforeseen circumstances, such as an unexpected illness.

Larceny may involve situations where individuals using cash registers make fictitious void entries in order to keep cash for selected transactions. Excessive void entries may indicate theft of cash. Other schemes of larceny involve the use of manual cash receipt forms. A simple protective device from this kind of scheme is the appropriate use of prenumbered documents and the follow-up accountability of such documents. The sequence of manual forms must be accounted for, which is an important element of the prenumbering function. Without subsequent accountability, prenumbering is a moot internal control. Control over manual forms is applicable to the restaurant industry, where wait staff fill out the manual form to have the food prepared; subsequent accounting for the form numbers can uncover missing cash.

Misappropriated cash by a wait staff is also known as skimming, which means that the assets are taken prior to any entry on the books. Skimming cash receipts can be as simple as a cashier pocketing sales without recording them. Such off-the-book activities can make skimming difficult to catch. One example is the potential for skimming of cash by a courier who is assigned to pick up cash at several decentralized locations of the entity. Controls need to be in place in three areas, if they can be implemented in a cost-beneficial manner: control over the receipt of cash at pickup, control during the transfer of cash to the bank, and accounting for the record of cash later by each decentralized location.

Fraudulent disbursement schemes exist as a means to steal cash; disbursement schemes include payroll schemes, expense reimbursement padding, and billing schemes that involve nonexistent companies. Fortunately, information technology auditors use tools to match employee data with vendor data to detect such schemes. Other disbursement schemes include check tampering schemes, where either the maker or the payee names may be forged. Check kiting is a fraudulent activity that operates involving multiple banks and locations; an individual engaged in kiting is seeking to maximize the time element of "float" of in-transit items. Auditors who suspect kiting will prepare a schedule of interbank transfers to detect this irregularity.

Income-Smoothing Accounting Schemes

Prior fraud examples illustrate methods that management might use to inflate revenues. One example is known as "channel stuffing"; in which organizations send out their products to customers close to the end of the year, even though the customer has not ordered anything. Coca-Cola was charged with channel stuffing on several occasions; gallon pushing, as channel stuffing is known in Japan, involved SEC action from 1997 to 1999. Within North America, Coca-Cola reached separate settlements for similar charges. Krispy Kreme is another company that suffered accusations of channel stuffing. A variation on channel stuffing is to offer incentives to customers to accept excessive product, for example, unlimited rights to return the product. McAfee, within the software industry, was associated with such ploys, along with other software companies that are less well known. Some employees of businesses involving heavy durable goods admit to channel stuffing; the substantial costs of shipment were seen by those involved as a worthwhile cost. Inevitably, merchandise would be returned, but it would be weeks later, and it was thought that prior documentation of the shipment would satisfy auditor concerns of evidence of the revenue transaction. The incentive was to reach bonus thresholds.

Auditors today are becoming better trained to look for frauds involving overstatement of revenues, thanks to SAS 99, which advised auditors to presume that misstated revenues exist in an audit engagement. Auditors closely scrutinize year-end cutoffs to ensure that contracts and their stated contractual terms afford appropriate recognition of revenue, and that subsequent to the year's end, revenues are not recorded prior to an appropriate time. Company attempts to double book large year-end transactions are scrutinized; these could conceivably be explained away as honest errors, if detected. In addition to attention paid to revenue schemes, auditors must exercise caution in looking at inventory, since changes in inventory are a major expense category impacting the income statement (cost of goods sold). Other expenses of corporations that are closely reviewed include payroll that can be in error for ghost employees or understatement/underpayment of payroll taxes; understated expenses for rent, insurance, or supplies; and depreciation errors. There are literally millions of accounts in which fraud of some magnitude can be lurking.

Pervasiveness, Extent, and Cost of Fraud

Since 1996, the ACFE has reported on occupational fraud; the ACFE "2012 Global Fraud Report" summarized 1,388 cases as reported by the Certified Fraud Examiners between January 2010 and December 2011. The report included the investigation of frauds in 100 countries, and respondents provided an estimate: A typical organization loses 5 percent of its annual revenue to fraud. Using the 2011 gross world product, this estimate translates to more than $3.5 trillion, according to the report. Consistent with prior ACFE surveys, the industries that were hit hardest include banking and financial services, government, and the manufacturing sector.

Ernst and Young, a big-four CPA firm, released its largest-scale report to date in 2012, which utilized a global market research firm to interview 1,758 senior decision makers who have fraud-fighting responsibilities in a sample of large organizations across 43 countries. The report indicated the pressure of the economy in that 39 percent of respondents reported that corruption and bribery occurred frequently, and 5 percent of respondents (up from 3 percent in the prior report) indicated that they might misstate financial results.

Fraud Awareness Frameworks

Sociologist Donald Cressey's work on white-collar criminals (specifically embezzlers) in the 1940s is associated with the fraud triangle. In terms of identifying fraudulent activity, three risk factors are of general interest. The AICPA accepted this model when it incorporated Cressey's work into its Statement of Audit Standards in 2002 (SAS 99), and it discussed separately the factors of incentives/pressure, opportunity, and rationalization/attitudes. The idea is that if all three legs of the fraud triangle exist, a perfect storm exists for someone to perpetrate fraud.

The first factor was originally called a "nonsharable need" by Cressey, and the extent of what was nonsharable differed by individual; today, this risk factor is labeled as incentive/pressure. One example is earnings management, where the perpetrator or the organization stands to benefit. This incentive may take the form of pressure upon the individual from other individuals within the organization. However, this is not the only relevant source of pressure; pressure to perpetrate fraud can stem entirely from one's personal life, exerting intense personal pressure and possibly a sense of shame. Debts, impaired judgment, or a personal life including addiction, poor health, or a sick family member are examples.

Rationalization/attitudes are the second set of risk factors. The most common rationalization associated with misappropriated assets is "I am not stealing these assets; I am only borrowing them. I will repay this money . . . on payday. . . or . . . as soon as I possibly can." Other rationalizations can be the result of an employer that is not treating employees fairly or perpetrators who view themselves as underpaid, and thus entitled to the ill-gotten gains. Rationalization can ensue when a subordinate is instructed by his or her supervisor to make an inappropriate adjustment or journal entry to the financial statements; in such a case, the perpetrator says "I am just doing my job." Alternatively, the work environment could be such that it is the norm to practice aggressive and biased accounting estimates that favor the bottom line (i.e., net income). In such a case, over time, the perpetrators may eventually believe that "this is just the way things are done around here," or "it must be ok, because everyone else is doing it."

The third risk factor is opportunity, the most important one for management and auditors to be aware of, since they can have some control over this risk factor. Opportunity for fraud is heightened when internal controls within an organization are weak; thus, putting into place established internal controls is a strong and best-practice recommendation, so that opportunity exists at a minimum. Policies and procedures include separating duties among personnel so that one person does not have responsibility for asset handling or custody, authorization responsibility to approve transactions, and responsibility to record transactions. Keeping these three areas separate among different personnel strengthens internal control. A precaution is necessary, however; opportunity always exists, because of the possibility that individuals who have been separately assigned to functional areas may join forces and collude to perpetrate fraud. Individuals can be very creative and crafty to thwart even the strongest internal controls.

Building on Cressey's framework, the fraud triangle theory has been supplemented with a fourth dimension, capability, which has led some theorists to reference the fraud diamond. The capability characteristic includes a strong ego, confidence, and intelligence, or placement within the organization to allow the individual's knowledge of the system to exploit existing internal control vulnerabilities.

Combating Accounting Fraud

Accounting fraud fighters turn to several sources to inform themselves. Insights into behavioral cues emerge from theories of the fraud triangle or diamond. Research documenting the monetary costs and pervasive nature of fraud is ongoing by multiple organizations. Guidance of best practices provided by the Committee of Sponsoring Organizations of the Treadway Commission (COSO), the American Institute of Certified Public Accountants (AICPA), and the Association of Certified Fraud Examiners (ACFE) facilitates awareness and provides deterrents to accounting fraud. All of this knowledge is helpful in reducing accounting frauds and informs laws that further deter and punish accounting frauds. The ACFE's "2012 Global Fraud Report" indicated that 43 percent of frauds were detected pursuant to tips; just over 50 percent of the tips came from employees, with 22 percent coming from customers, and 12 percent were anonymous. The Dodd-Frank Act has continued to strengthen the whistleblowing provisions enacted in earlier legislation. It takes the persistent efforts of many to be effective in the battle against accounting fraud.

Adelphia Communications Corp.

Adelphia Communications Corporation was named for the word *adelphia*, which means "brothers" in Greek. It was founded in 1952 by

John Rigas and became the fifth-largest cable television company in the United States, based in Coudersport, Pennsylvania. The company went into a public offering in 1986 and further expanded during the 1990s. As the company grew, it also expanded into other fields of business. For example, it operated a telephone business (Adelphia Business Solutions), a sports radio station (WNSA-FM), a sports cable channel (Empire Network), and many other smaller subsidiaries. The firm stressed its social responsibility by giving free basic cable and Internet connections to educational institutions and by sponsoring cultural and sporting events.

Band of Illegal Brothers

From a high closing price of over $84 in May 1999, Adelphia's stock fell faster than the industry as a whole and reached about $22 on March 27, 2002, when Adelphia released its 2001 financial statements. Adelphia filed for bankruptcy in 2002 because of incidents of internal corruption, poor corporate governance, and illegitimate accounting policies.

On May 15, 2001, after long negotiations, John Rigas stepped down as chief executive officer in return for a severance package of $1.4 million a year for the next three years. Adelphia filing for bankruptcy according to Chapter 11 has been marked by extensive disputes over the distribution of proceeds. A reorganization plan was accepted on February 13, 2007; at that time, Time Warner Cable was allowed to distribute approximately $6 billion in shares to Adelphia stakeholders and succeed Adelphia as a publicly traded corporation. Consequently, Adelphia would not offer its services as a cable provider, whereas its strong clientele of 110,000 customers of telephone and long-distance services was sold to Pioneer Telephone for $1.2 million. Allegedly, the financial damage incurred to the creditors of Adelphia could very well exceed $150 million. Adelphia still retains 275 employers to handle pending bankruptcy obligations, given that it still exists as a corporate legal entity, settling litigation claims and settlements with the Securities and Exchange Commission (SEC) and the U.S. attorney.

In SEC Litigation Release No. 17627, the major charges against Adelphia included the fraudulent exclusion of billions of dollars in liabilities and the concealed rampant self-dealing by the Rigas family. In particular, between mid-1999 and the end of 2001, John J. Rigas, Timothy J. Rigas, Michael J. Rigas, James P. Rigas, and James R. Brown, with the assistance of Michael C. Mulcahey, caused Adelphia to fraudulently exclude from the company's annual and quarterly consolidated financial statements over $2.3 billion in bank debt by deliberately shifting those liabilities onto the books of Adelphia's off-balance sheet, unconsolidated affiliates. Failure to record this debt violated generally accepted accounting principles (GAAP) requirements and precipitated a series of misrepresentations about those liabilities by Adelphia and the defendants.

The other major accusation that the company faced was that the line of separation between corporate funds and family funds was simply nonexistent. There was a widespread pattern of self-dealing involving Adelphia and Rigas-controlled firms. Since at least 1998, Adelphia, through the Rigas family, made fraudulent misrepresentations and omissions of information. Federal prosecutors presented evidence demonstrating that the Rigases used a cash management system to distribute money around family-owned entities, leading to embezzlement of a total of $100 million. The allegations set forth by the SEC accused the defendants of violating antifraud, periodic reporting, recordkeeping, and internal controls provisions of federal securities laws. The commission requested both civil and criminal penalties.

Two out of the five officers indicted were found guilty—John Rigas and Timothy Rigas. On the other hand, Michael Rigas, who acted as executive vice president for operations, was not found guilty regarding the accusations of conspiracy and wire fraud in 2005. The jurors were deadlocked concerning some other counts, but Michael pleaded guilty to the count of manipulating a financial report, according to many published reports, before the second trial; the guilty plea led to a sentence of 10 months of home confinement and two years probation. Michael Mulcahey was acquitted of all criminal charges. John and Timothy Rigas have served their prison sentence since August 13, 2007. On March 3, 2008, the Supreme Court rejected the final appeal without comment. The case was *Rigas v. U.S.*, 07-494. John Rigas' original release date was September 4, 2020, but a federal judge reduced his sentence by three years, and his new release date is scheduled for January 23, 2018.

A noteworthy difference from other high-profile corporate scandals such as Enron and Worldcom is that the Rigas brothers did not sell their stock. They focused on hiding unpleasant accounting data, trying to buy time in order to rectify the problem in the process. This tactic may not have been aggressive in terms of a typical corporate fraud, but it was nevertheless illegal. Adelphia provides an example of what can happen when high leverage is mixed with an inadequate system of corporate governance.

Adulteration, Economically Motivated

Economically motivated adulteration (EMA), a subcategory of product fraud, is an offense that, while seemingly clearly a white-collar or corporate crime, often defies classification. There is evidence of this type of fraud back to Roman times. EMA covers adulteration and applies to all products. There is a wide range of product fraud, including food fraud, that leads to companies closing, industries on the verge of collapse, thousands of lost jobs, and severe public health threats. The awareness of the threat is growing in number of incidents and severity of impact. Although many of the perpetrators are individuals or small groups, links to transnational organized crime groups and even terrorist organizations have been identified. In addition, there are often rogue individuals or small groups within companies that blur the distinction from corporate crime. The distinction between white-collar crime and traditional crime is blurred because the planning and coordination is from afar, while the products are physically consumed by consumers. Regardless of the definition, the increased regulatory and enforcement focus is based on initiatives to protect product safety and intellectual property rights.

Definition

EMA was first formally defined in the federal register notice for the U.S. Food and Drug Administration (FDA) open meeting on the topic in 2009 as: "the fraudulent, intentional substitution or addition of a substance in a product for the purpose of increasing the apparent value of the product or reducing the cost of its production." Although often applied to food, the definition of EMA officially covers all FDA-regulated products. Also, EMA only covers adulteration as defined in the Federal Food, Drug, and Cosmetic Act. Product fraud concepts not included in EMA are misbranding, cargo theft, diversion, and tampering, which are defined in other FDA documents. These other concepts are considered in the broader food fraud category.

Adulteration of products has been going on since the start of recorded history. There is evidence of Roman wine diluted with French wine. Although the EMA term appears to have been first used in this context around 2000, mentions began in FDA literature in 2004, and the concept was formally defined by the FDA in 2009. Although there are no laws or regulations that explicitly address EMA, broader adulteration was the impetus for the first U.S. food and drug laws. Those laws were the Pure Food and Drug Act of 1906 and the Federal Food, Drug, and Cosmetic Act of 1938. Both acts included a significant focus on adulteration and misbranding. These early fraud statements set precedence for the FDA's recent use of the terms *fraud* and *fraudsters*. The Food Safety Modernization Act of 2011 is the update to the Federal Food, Drug, and Cosmetic Act, which includes 11 mentions of "intentional adulteration."

EMA and food fraud are receiving more regulatory and industry attention for a number of reasons. Advanced laboratory technology is allowing more precise identification of contaminants, traceability is allowing more identification back to a source, and global public health alert systems are more rapidly identifying outbreaks from fewer incidents. At the same time, globalization is expanding the supply chain and consolidating production—fewer suppliers shipping more products farther around the world, more quickly. These two concepts converge to create tremendous economic growth, but an unintended consequence is greater crime opportunity for fraudsters.

A political cartoon honors the U.S. Bureau of Chemistry's Harvey Wiley, who fought for a federal law prohibiting adulterated and misbranded food and drugs. President Theodore Roosevelt signed the effort into law in 1906 as the Pure Food and Drugs Act.

Although prevention is a cornerstone of public health and food safety, a strategic shift has occurred for prevention of intentional adulteration and EMA, with the focus including the behavioral sciences and criminology. Situational crime prevention and the "crime triangle" were included in a presentation at the first FDA open meeting on EMA. The literature applies criminology to EMA prevention in 2011 for food, and in 2012 for drugs. Holistic, all-encompassing, system-wide prevention strategies are common in more traditional food and drug areas, such as safety and quality. Proactive processes are mainstays of these industries, including the Six Sigma quality concept and the Hazard Analysis and Critical Control Point (HACCP) programs for food safety. The criminology theory provides a new frame for these types of systems to reduce the threat opportunity or vulnerability. Though the theories apply, the implementation is extremely complex. There are a near infinite number of fraudsters and a near infinite number of types of fraud. In addition, the white-collar or corporate criminals are clandestine, stealthy, and adept at avoiding detection.

The trend for EMA, as with food fraud, is that it will continue to grow in scope, scale, and threat. It is growing for a number of reasons, including the success of brands; the consumer desire for more specialized products; and globalization impacts of wider geographic distribution, consolidated manufacturing, and speed of transportation. The complexity of the products and the supply chains will increase the need for prevention, rather than just intervention. This prevention focus will continue to emphasize the importance of reducing the fraud opportunity through applying the criminology concepts of situational crime prevention and the crime triangle. Even though prevention is logical and supported by industry precedence, such as Six Sigma and HACCP, the shift to prevention will be challenging. Current industry management and agency enforcement have been focused on intervention and response.

Advance Fee Scam

Some of the most ubiquitous e-mails that a person can encounter involve efforts to embroil their recipients in an advance fee scam. The purpose of these scams is to trick and persuade prospective victims into voluntarily parting with their money, because they are supposedly to receive a substantial benefit in return. Most victims fall prey to advance fee scams because they expect a significant windfall in return for a moderate initial payment. This particular scam has been around for a long time—there were cases of these scams in the early 19th century. In contemporary times, these scams are known as Nigerian Advance Fee Scams or the Nigerian 419 Scam. These advance fee scams can have serious financial aftermaths for the victims: many lose their entire savings, and some even lose their lives in the process. Estimates of losses from advance fee scams typically range from about $17 to $54 million, and sometimes even as high as $262 million. One of the reasons why these estimates vary so much is that many victims do not report the crime to law enforcement out of fear of possible media coverage and ensuing shame. Another reason is that many victims initially buy into the scam, even when the mail appears to detail activity of questionable legality, and they may be worried about actually having abetted criminal activity.

Fertile Ground for Fraud

Research has suggested that the social and political background of Nigeria allowed fraudsters to come up with a somewhat credible context in order to ensnare their victims. Since Nigeria became an independent country in 1960, it has been ruled by a series of military dictatorships with periods of brief democratic governance. Many of the dictators were reputed to have amassed several billions of dollars from the national treasury, a major portion of which is still untraceable. This provides a convenient backdrop for sending out solicitations to gullible and naïve people. A typical letter suggests that there are funds in a particular country (e.g., Nigeria or Sierra Leone) that need to be transferred out of that country and into the country where the recipient resides (e.g., the United Kingdom or the United States). In order to obtain the recipients' help with transferring the money, he or she is promised a significant share in the spoils—the share is typically an enormous amount of money, to the tune of many millions. The victim then ends up having to pay an advance fee to secure the transferring of the funds, which the victim then ends up losing because the promised share never materializes.

The advance fee scam is also carried out by informing people that they have recently inherited money that was bequeathed to them. The victim ends up paying an advance fee in order to secure a nonexistent inheritance. Other methods entail victims receiving correspondence of contractual agreements with governmental or corporate agencies. The victims are again asked to supply their bank account details and money to pay legal fees, bribes, bank fees, or taxes. This leads to the victim suffering tremendous financial loss. Some victims suffer more than just financial losses—cases abound where victims traveled to the foreign country to try and recover their money and ended up kidnapped for ransom or murdered. There is also evidence that some victims are sent more solicitations, ostensibly from the authorities this time, informing them that their misplaced funds have been recovered. This sometimes leads to a further round of victimization. Some scholars have also documented that the people or syndicates involved in advance fee scams are tied to credit card fraud, identity theft, forgery, immigration fraud, and money laundering. In some instances, the victims of these scams end up committing illegal activities in order to obtain funds to send to the scammers. It is very hard to detect and prosecute advance fee scam perpetrators; however, advance fee scams can be better controlled through legislative harmonization, monitoring of cyber cafés, and cooperation with technological companies.

Advertising Fraud

Advertising fraud is generally defined as advertising that is misleading in any material respect, either explicitly or indirectly, through representations made in a statement or combination of statements, and any failure to reveal material facts. A statement or representation in an advertisement may also be “false” or “fraudulent” when it constitutes a half-truth. The legal definition is much stricter than common sense, which requires the element of “deception” in advertising to establish the illegality. According to Section 15 of the Federal Trade Commission Act of the United States, deceptive advertisements are “misleading in material respect,” and this has been interpreted by the courts to mean that the deceptive advertisement must affect the purchasing decisions of the customer.

Any form of commercial information or communication, the content of which is contrary, in whole or in part, to actual conditions or to the acquisition conditions of the goods and services offered, or using texts, dialogues, sounds, images, or descriptions that directly or indirectly, or even by omission of essential product information, could mislead, deceive, or confuse the consumer. All forms of fraudulent advertising or abusive advertising are prohibited, as are those leading to error in the choice of the goods or services that could affect the interests and rights of the consumer.

Many economists complain that the extensive and fraudulent use of advertising involves undue costs and is a bar to free competition, with a resultant adverse effect on the operation of the free price system. Experts in home economics charge that it is a poor guide to consumption. Criminologists and legal scholars have noted its far more serious consequences, including death and bodily harm caused by fraudulent advertising.

The history of corporations using blatantly fraudulent claims, as well as exaggerated claims, or puffery, is long. The roots of the tremendous growth in American advertising that took place after the Civil War were laid down over centuries of evolution in Western marketplaces. Ethical issues regarding advertising were seldom raised because advertising was considered merely a matter of announcing the availability of products. Even then, however, manufacturers devised and implemented skillful and boastful advertising to sell harmful drugs and other bad products. By the end of the 19th century, abuses in advertising flourished, along with consumers’ suspicions about advertised food. Pure food regulation, not advertising regulation, was introduced to deal with such a problem in the second half of the 19th century.

In the United States, heightened attention to advertising's credibility in the first decade of the 20th century foreshadowed the appearance around 1911 of an energetic truth in advertising movement, which initiated legislation and established organizations to combat dishonest advertising. However, the criminal nature of the sanction; the inclusion of requirements of intent, materiality, and other restrictive elements; and the failure to provide administrative machinery for enforcement severely limited the effectiveness of these statutes in suppressing false or misleading advertising. More generally, the advertising industry's desire for self-regulation has meant that prosecutions have been infrequent, and convictions rarer still. Private negotiation resolved most complaints.

Regulation

Federal and state laws and the new Federal Trade Commission (FTC) accompanied this self-regulation. In 1914, the Federal Trade Commission Act was enacted, stating that false advertising is a form of unfair and deceptive commerce. Under the act, the term *false advertising* extends well beyond untrue advertisements. It also includes advertisements that make representations that the advertiser has no reasonable basis to believe, even if the representations turn out to be true. An example would be an advertisement for a vehicle that states that the vehicle uses less petroleum than any comparable vehicle. The advertiser would have committed false advertising if it had no reasonable basis to believe the truth of this claim (e.g., through comparative tests), even if it turned out to be true.

Under the law, the government doesn't have to prove deceptive intentions at an administrative hearing or in court. The fact that a statement had a deceptive quality is sufficient. If the ad is deceptive in nature, the defendant faces legal problems, even if he or she has the best intentions. The fact that he or she did not know the information was false is irrelevant. Determining whether or not a statement is deceptive, however, is a much more complex process because one must examine not only the nature of the statement but also the potential effect on the customer.

The Federal Trade Commission Act created the FTC and gave it broad authority to regulate advertising. The FTC is the main federal agency that takes action against unlawful advertising. Under this broad mandate, the FTC has issued regulations prohibiting advertisements that could be misleading, even if they are true. A famous example involves Anacin, a brand of aspirin. The maker of Anacin ran ads claiming that clinical tests showed that Anacin delivered the same headache relief as the leading pain relief prescription. The ad did not mention that aspirin is the leading pain medicine. The FTC determined that the ad was misleading. The ad implied that Anacin was more effective than aspirin, when in fact, Anacin is really just aspirin.

Over the years, the FTC has taken enforcement actions against many businesses accused of engaging in false and deceptive advertising. A significant number of those administrative actions have been tested in court. For the most part, the FTC relies on consumers and competitors to report unlawful advertising. If FTC investigators are convinced that an ad violates the law, it usually tries to bring the violator into voluntary compliance through informal means. If that doesn't work, the FTC can issue a cease-and-desist order and bring a civil lawsuit on behalf of people who have been harmed.

The FTC can also seek an injunctive decree from the court to stop a questionable ad while an investigation is in progress. In addition, the FTC can require an advertiser to correct ads, that is, to state the correct facts and admit that an earlier ad was deceptive. For example, Listerine mouthwash was long touted as a cold and sore throat remedy. The FTC forced the manufacturer to run ads stating that Listerine would not cure colds or relieve sore throats.

The FTC has a further power, known as "fencing in." This enables the FTC to bar misleading ads with respect to a particular product and across all of a business's other unrelated product lines. For example, a testimonial constituting false advertising regarding product A could lead purchasers to believe that products B and C must also be great. In that case, the FTC could bar use of the ad for products A, B, and C.

Court decisions indicated that the judiciary would look favorably on commission action against dishonest advertising. By 1925, advertising cases accounted for three-quarters of the FTC's orders. In the 1920s and 1930s, a consumer movement attacked deceptive advertising. The efforts of the consumer groups generally reinforced earlier notions that truthful information was at the heart of consumers' needs. Consumer advocates in the interwar years showed little faith that advertising, even if regulated, could supply the truthful information that buyers required. Within the advertising industry, however, there were modest moves toward self-regulation, partly to stave off burdensome external controls, and partly to curb what advertising people themselves considered persistent abuses. The American Association of Advertising Agencies, for example, devised a code of ethics for its members in 1924, but it was vague and lacked even the threat of punishment.

Television and Consumerism

Despite the clarification of its authority to take action against deceptive advertising, the FTC in these years was hamstrung by bureaucratic inertia and a cumbersome legal process. A business journalist in 1957 described the FTC as "a headless, drifting agency which acted desultorily and seldom hurt anybody very much." The postwar years, however, saw changes in the nature of advertising and the appearance of new critiques of advertising and consumption. Advertising volume expanded along with the booming economy, but perhaps more crucially, it employed the new medium of television to reach its audiences.

By 1960, advertisers spent over $1.5 billion annually on television. The new medium's fusion of sight, sound, and motion in living rooms forced an expansion of the concept of truth in advertising. In 1970, for example, the FTC took action against Campbell Soup for a commercial for vegetable soup in which the photographers had put clear marbles at the bottom of a bowl to make the soup's ingredients rise to the top and appear more abundant. Campbell agreed in a consent order to discontinue the procedure.

These changes set the stage for a revival of consumerism and new efforts to control advertising during the 1960s. Consumerists had long complained that the FTC and other regulatory agencies shared a revolving door with regulated businesses. Although self-regulation and government control had recognized some of the new problems, the major challenge to policymakers was to find appropriate ways to curtail the fraudulent abuses in advertising.

Awakened from its postwar torpor by some sharp consumerist attacks, the FTC emerged by the early 1970s as a more energetic regulator of advertising practices. The FTC had broadened the definition of advertising fraud from the Progressive Era's fixation on literal truth. It began a program requiring advertisers to provide information substantiating the claims that they made in their publicity. Failure to supply adequate evidence, in the judgment of commission staff, could bring about a charge of deception or unfairness. The FTC articulated a principle stating that advertising claims that lacked a "reasonable basis" for belief were unfair practices.

However, it was nowhere near the solution to the problem because the FTC had not been given the legal instruments or the staff necessary to effectively administer and monitor advertising. Moreover, in many cases, the FTC relied heavily upon making deals with companies, in the form of consent orders, to halt misleading or false advertising. In 1971, consultation among advertisers, the agency, and media interests bore fruit in the creation of a new self-regulatory system. The scheme designated the National Advertising Division (NAD) of the Council of Better Business Bureaus as an investigating body, and it created a National Advertising Review Board (NARB) to evaluate complaints about advertising.

The purpose of the NARB is to "sustain high standards of truth and accuracy in national advertising." In reviewing advertisements, if a panel of the NARB decides that an advertisement is misleading or deceptive, it will request that the advertiser modify or withdraw the ad. If the advertiser "fails to respond or indicates his unwillingness to accept or comply with the decision, the panel will issue a Notice of Intent to the advertiser that the matter will be publicly referred to an appropriate agency of government." The NARB therefore serves as a self-regulatory agency, monitoring the activities of companies and agencies.

Advertising Growth

The use of advertising expanded rapidly after 1970. In 1973, advertising expenditures amounted to $25 billion, and by 2011, they had increased to about $150 billion in the United States. The Internet has recently become the biggest contributor of new ad dollars to the global market. Since the mid-1970s, however, pressure for deregulation has partially stymied governmental and industry efforts to regulate advertising. The FTC has been attentive to business protests against its actions, and hostile to governmental regulation against false advertising. The FTC was reluctant to pursue deceptive and unfair advertising cases during the Reagan years. Chairman James Miller of the FTC in the Ronald Reagan administration, for example, asked Congress to enact a restrictive definition of deceptive advertising. When Congress rejected this path, a majority of the commissioners voted to apply it anyway in FTC work. These standards required a showing of “likeliness to mislead” the “reasonable” consumer about “material” matters, rather than incidental ones.

On the other hand, consumers are becoming impatient with misleading and deceptive advertising, tired of being treated like pawns in a market-grid box and of being intellectually abused by a bombardment of inane and degrading advertisements. For almost every piece of merchandise a consumer buys, he or she is influenced consciously or unconsciously, directly or indirectly, by advertising. Some scholars declared that all advertising is deceptive because it is designed to manipulate. A major part of informative advertising is and always has been a campaign of exaggeration, half-truths, intended ambiguities, direct lies, and general deceptions. In a recent Gallup poll on the honesty and ethics of people in 32 professions, advertising and advertising practitioners ranked near the bottom. False nutritional claims and falsified demonstrations are just two illegal aspects of advertising and product promotion, which is a $100 billion a year business in the United States.

Lanham Act and State Laws

In addition to the FTC under the FTC Act, private parties, such as consumers or competitors, can also bring a legal action regarding false advertising under the Lanham Act. To establish a violation under the Lanham Act, consumers and competitors must prove the following: (1) the advertiser made false statements of fact about its product, (2) the false advertisements actually deceived or had the capacity to deceive a substantial segment of the target population, (3) the deception was material, (4) the falsely advertised product was sold in interstate commerce, and (5) the party bringing the lawsuit (known as the plaintiff) was injured as a result of the deception.

Actual loss is not required to show an injury. All that is needed is a reasonable basis for the belief that the plaintiff is likely to be damaged as a result of the advertising in question. An example of such damage would include ads that deceive consumers who are the target population of both the advertiser and the plaintiff. The penalties for a Lanham Act violation include the plaintiff’s lost profits, the additional profits to the advertiser resulting from the deceptive ad, treble damages, and attorneys’ fees.

In addition to the FTC Act and the Lanham Act, which are federal statutes, most states also have laws proscribing false advertising. For example, Illinois has enacted the Uniform Deceptive Trade Practices Act. Under the act, a “deceptive trade practice” includes such practices as “palming off,” misrepresentation, product disparagement, and bait-and-switch advertising.

Palming off occurs when an advertiser creates the impression that its goods or services are those that are furnished by a competitor. For example, this could occur if someone set up a hamburger stand that looked like a McDonald’s restaurant. Misrepresentation occurs when an advertiser makes false or misleading claims about its goods or services, as under the FTC Act and the Lanham Act. Product disparagement occurs when an advertiser intentionally makes false or misleading negative remarks about competing goods or services, causing its competitor to lose sales. Bait-and-switch advertising occurs when the advertised goods or services are withdrawn from the market, and substitute goods or services are instead offered for sale.

Most states have laws, usually in the form of consumer fraud or deceptive practices statutes that regulate advertising. Under these laws, state or local officials can seek injunctions against unlawful ads and take legal action to achieve restitution to consumers. Some laws provide for criminal penalties, such as fines and jail, but criminal proceedings for false advertising are rare unless fraud is involved.

Consumers often have the right to sue advertisers under state consumer protection laws. For example, someone who purchases a product or services in reliance on a false or deceptive ad might sue in small claims court for a refund, or join with others to sue for a huge sum in another court. A competitor harmed by unlawful advertising, or faced with the likelihood of such harm, generally has the right to seek an injunction and possibly an award of money (damages), although damages are often difficult to prove. Such cases are usually based on one of two legal theories: unfair competition or commercial disparagement.

Despite these laws that deal with advertising fraud, the most powerful tool in the United States is still the FTC Act. Some scholars noted that prosecutions of false advertising cases had proven difficult under the fraud laws because of the absence of major, highly motivated victims, as well as problems of proving intent and damage. Some argue that the FTC action against advertising fraud can be improved if the government facilitates the agency with more staff and resources, as well as political support.

The difficulty of proof and the trend of lenience toward advertising fraud cases can be found in many countries in the world. For example, in Canada, each year thousands of allegedly false, misleading, or deceptive advertisements are reported to the Department of Consumer and Corporate Affairs. However, only a small number of the cases have resulted in recommendations to the attorney general for criminal prosecution. There have been very few convictions against advertising fraud.

Age Discrimination

Age discrimination is the unfavorable treatment of people based on their age, and it usually affects the elderly or older population. The term is now used to describe differences in treatment for all age groups. A related concept is "ageism," which refers to a set of attitudes directed toward age groups, based on assumed shared characteristics. Ageism sets or influences the context for age discrimination. Over the last century, the vulnerability of older populations has been gradually recognized, principally in the safeguards provided for those of pensionable age. Similarly, there is recognition of the victimization of young people—especially evident in their exposure to criminogenic risk factors and various forms of abuse and threats to their potential. For both groups, unfavorable treatment is inherently structural, and it implicates corporations as well as governments.

Some countries, particularly the United States, western Europe, Australia, and New Zealand, have sought to provide some protection from age discrimination, originally focused on employment but increasingly applied to the provision of public services such as health and social services. The emphasis remains, however, on the alleviation of the harsh consequences of forced exclusion from the labor market—balancing well-being with the capitalist demand for a flexible, dynamic, and productive workforce.

In Western societies, commercial organizations are expected to be the main creators of jobs. With the rise of "new managerialism" or "new public management"—the adopting of corporate management styles and strategies to the public sector—government employees are increasingly subject to similar end-of-career (retirement and pension) regimes as their counterparts in the

Participants in the Self Help for the Elderly's John King Senior Center in San Francisco, California, train at a new federally funded computer lab that features touch-screen computers, large-type keyboards, and multiple-language programs. Computer training can help seniors—many of whom will work well into retirement—have access to Internet job listings and applications. The Older American Act obligates states to access federal funding to provide social care and community services for seniors.

private sector. Discrimination with respect to one's age, as lived experience, is most apparent in the context of employment. This is of added importance where large corporations dominate the employment prospects of large segments of the population. Age is an important social and economic marker in various forms of interaction and relationships, both personal and in business transactions. The young are associated with vitality, vigor, chaos, risk-taking, and crime. The old are associated with wisdom, maturity, responsibility, stability, slowness, and illness. Economic, social, and financial stability are deemed to reflect the age distribution in a given society and organization. On this basis, age discrimination is generally regarded as acceptable, except where the effects are egregious. Organizations and corporations, mindful of commercial imperatives, use age to inform recruitment, progression, redundancy, and retirement practices.

Age-Related Legislation

The rise of industry, commerce, and trade has been accompanied by specific demands from those of working age—good health, dynamism, longevity, and youthfulness. People over the age of 60 would be variously described as less able, slower, or even disabled, as the 1907 veterans' law in the United States declared. A combination of myths about the ideal working age, generic biology of aging, and a sense of duty to the elderly also shaped the notion of the pensionable age—usually for those aged between 60 and 65. In the United States, the Social Security Act of 1935 provided for a guaranteed pension and formalized the point at which people were considered too old to remain in the labor market. As an intended consequence, it provided the grounds for discrimination on the basis of age.

Official attention to age as a form of discrimination has been notable in the United States and

Britain since the 1920s and 1930s. However, it was not until the 1960s that appropriate laws appeared on the statute books in the United States. The Age Discrimination in Employment Act of 1967 (ADEA) made age discrimination in employment illegal and abolished mandatory retirement. The aim is to promote the interests of older people and encourage organizations to focus on individual ability, not on generalizations about particular age groups. It therefore prohibits arbitrary age discrimination and seeks to protect those considered middle aged (originally set at 45–65, and since expanded to 40–65). Failing or refusing to hire and differential treatment with respect to compensation or conditions of employment on the basis of age are prohibited by the act.

With the ADEA confined to employment, there are clear limitations: Wider systemic practices of age discrimination based on misperceptions of the elderly would go unchecked—poverty, loss of livelihood, dependency, marginalization, and social exclusion. The Older American Act, as amended in 2000, places a duty on each state to access federal funding to provide social care and community services (from meals to employment-related assistance) targeted at the older population. The issues tackled in this all-encompassing piece of legislation are related to structural inequalities that make the position of older people excluded from the labor market and state social support systems even worse.

European Union (EU) member states now have an obligation to provide protection from age discrimination under the Directive 2000/78/EC, the equal treatment directive. The focus is on employment, and age is listed among other bases for discrimination such as race, gender, and religion. This directive requires member states of the EU to adopt legislative programs to bring appropriate laws into force that add age as a ground for discrimination. The directive recognizes four ways in which discrimination may take place: direct discrimination, indirect discrimination, harassment, and victimization. Direct discrimination is explicit, unfavorable treatment relative to a comparable member of another group. A neutral policy or practice may amount to indirect discrimination if it has adverse effects on an identifiable group and does not meet the objective justification test. This test requires the relevant policy or practice to be a necessary and proportionate response to legitimate business aims. Harassment and victimization refer to the use of hostility, intimidation, or some action that violates a person's dignity because of one of the grounds listed in the directive. This often takes the form of threats to job security or harassment as a consequence of making complaints about discrimination or expressing some other grievance.

Since age discrimination legislation applies primarily to employment, the labor market, and the provision of goods and services, relevant provisions therefore affect a significant number of organizations and occupations, with considerable differences across different countries. In the United States and Spain, the emphasis is on labor; whereas other countries such as Australia, Canada, and Ireland include goods and services. The distinction between public and private sectors is also a notable difference among countries. In the United States, the emphasis has mainly been on the public sector and selected occupations. In others, given the possibly wider scope of goods and services provisions, that distinction is less significant; age discrimination can be invoked in most contexts of employment or public services.

Age discrimination has yet to be placed on the same level of seriousness as race, sex, or religious discrimination. These are more recognized grounds for discrimination claims and are generally more effective. Race discrimination provides the model through which to judge the robustness of age discrimination legislation. Age is not strictly divorceable from race and gender—the person who suffers from age discrimination may also be subject to either race or gender discrimination, or both. Across these forms of discrimination lie common characteristics among victims: poverty and social and economic exclusion.

Examples of Age Discrimination

Despite the use of law to give some level of protection, age discrimination remains pervasive. It is almost a normal feature of the fabric of society. Being old or young determines one's chances of gainful economic activity. Some fields of employment practice forms of discrimination considered necessary for the health of their profession or industry. The youthful image prevails for media and television, for finance and investment professionals working directly with discerning clients, and in fields such as law and medicine, where the structure of training presumes that the best point of entry is during the typical college age range of 18 to 25. At the same time, young people face discrimination in gaining access to the labor market and victimization more generally. The recent global economic recession has been accompanied by a significant rise in youth unemployment. In Britain, for example, the figure for young people not in education, employment, or training (NEET) was just over 1.4 million in 2011. For the EU, the rate of youth unemployment rose from 14.7 percent of the total population in 2008 to just over 20 percent in 2010. In the United States, the rate has increased by 18 percent, and in Spain by as much as 40 percent since 2008.

Discrimination that affects young people as an identifiable group is more complex. For the most part, this has to do with the absence of agency—the ability of young people to speak on their behalf and be taken seriously—and the association of youth with criminal behavior. Criminological literature generally accepts that the primary age of criminal behavior tapers off in the mid- to late 20s. It is also noted that young people are more likely to be victims of crime, abuse, and social and economic exclusion. Transition to adulthood requires appropriate socialization and the sharing of responsibility among parents or guardians and the state. However, this means that young people are treated differently from older, experienced, economically independent adults. Although age discrimination legislation may be used to address some of these issues, some states have limited the eligibility of claimants to those over 16 (New Zealand) and 18 (Ireland) years old.

Antidiscrimination activity has expanded in recent years to include age as a recognized ground on which claims may be brought. Differential treatment of younger versus older populations has social and economic implications. Whereas the legal mechanisms adopted by states focus on organizational policies and practices, social attitudes to age differences are less amenable to these measures. The level of intolerance to race or sex discrimination is not yet the same as for age discrimination. With this come challenges beyond the immediate and specific issues in employment contexts, or the even more complex problems faced by young people, despite the suggestions that they have less to worry about in the long term.

Agnew, Spiro

Spiro Theodore (Ted) Agnew (1918–96) is best known for serving as vice president of the United States under President Richard Nixon from 1969 to 1973. To date, Agnew is the only vice president in U.S. history to resign because of scandal regarding criminal charges of tax fraud, extortion, bribery, and conspiracy. Spiro Agnew was born in Maryland on November 9, 1918, to Margaret Akers and Greek immigrant Theodore Spiros Anagnostopoulos. He graduated from Johns Hopkins University and later graduated from the University of Baltimore Law School in 1947. Agnew served in the army during World War II, as well as the Korean conflict. He was awarded the Bronze Star Medal for this service in France and Germany. Raised a Democrat, he later switched parties and became a Republican because his law partners were all Republican. Agnew was elected as Baltimore County executive in 1962 and became governor of Maryland in 1966, serving for three years. Agnew went from his first election as county executive in Maryland to vice president of the United States in only six years. This was one of the fastest rises in U.S. political history, similar to that of President Richard Nixon, who became vice president after only four years in the House of Representatives and two years in the Senate.

In the summer of 1973, a scandal unfolded involving Agnew. The U.S. Attorney's Office in Baltimore, Maryland, was investigating allegations that while Agnew was serving as the Baltimore County executive in 1966, he solicited payoffs from contractors doing county business, and that as governor of Maryland, and later as vice president, he accepted kickbacks from engineers whose firms had received state contracts. It was alleged that Agnew had accepted $29,500 in bribes to push through a construction company's project during his tenure as governor. In October 1973, Agnew's lawyers and U.S. Justice Department attorneys cut a deal that would not involve any guilty admission on his part. Part of the bargain involved Agnew's resignation from office. On October 9, 1973, Agnew composed a letter to President Nixon and a formal letter of resignation. The resignation was effective the following day at 2:00 p.m., just as the former vice president entered the federal courtroom to plead *nolo contendere* ("no contest") to one charge of tax evasion for not declaring the bribe as income.

Thereafter, U.S. Attorney General Elliot Richardson read a lengthy statement outlining the government's evidence against Agnew but asking for a plea of leniency as part of the bargain negotiated the day before. The judge decided not to sentence Agnew to jail, pending good behavior for the next three years. He fined Agnew $10,000 for income tax evasion and three years probation. The $10,000 fine covered just the taxes and interest due on his "unreported income" from 1967. The plea bargain was later mocked by former Maryland Attorney General Stephen H. Sachs as "the greatest deal since the Lord spared Isaac on the mountaintop." As a result of his no-contest plea, Maryland disbarred Agnew. Agnew's resignation triggered the first use of the Twenty-Fifth Amendment of the Constitution, in which the president nominates a vice president to take office upon confirmation by a majority vote of Congress. President Nixon nominated House minority leader Gerald Ford as vice president of the United States. A few years later, in 1976, several George Washington University Law School students, under Professor John F. Banzhaf III, later found four residents in Maryland willing to put their names on the case and sought to have Agnew repay the state $268,482, which was the amount that he had allegedly taken in bribes. After two appeals by Agnew, he finally wrote a check for $268,482 to the state of Maryland in 1983 for the bribes plus interest. Agnew attempted to use this reimbursement as an income tax deduction while living in California but was unsuccessful. Agnew died on September 17, 1996.

Alien Tort Statute

The Alien Tort Statute (ATS), also sometimes called the Alien Tort Claims Act, is a U.S. law that was passed in 1789. It was rarely recognized or considered significant by scholars or lawyers until a 1980 court case recognized its significance. Today, the ATS allows any person, whether or not a U.S. citizen, to bring a court case in U.S. federal courts against any other person, who also may be a citizen of another country, for a violation of international law. It has been used to bring cases against numerous corporations and businesspeople for violations of contemporary international law that otherwise may have never come before a judicial body. A court of any country usually can hear a case only if it is brought by one of its country's nationals, filed against its country's nationals, deals with an action that occurred in its country's territory, or, at a minimum, has effects that occur within its country's territory. The ATS does away with such requirements; for a U.S. court to hear a case under the ATS, it must merely involve a violation of international law. In legal terms, this broad mandate means that the ATS grants "universal jurisdiction" over violations of contemporary international law. No other law in the United States or any other country grants universal jurisdiction besides the ATS.

Court Cases Involving the Statute

Since 1980, the ATS has been used in various court cases that otherwise could not come before U.S. courts. These claims include violations of international criminal and civil law, but the ATS treats all of them identically: as civil wrongs. Claims have been filed by or against nationals of countries such as Burma, Myanmar, Great Britain, Nigeria, Paraguay, the Netherlands, and the United States.

A number of these cases were quite prominent and were brought against powerful people and businesses. The accused perpetrators include Charles McArthur Emmanuel (Chuckie Taylor), the son of Charles Taylor, president of Liberia; Coca-Cola Company; Yahoo!; the militaries of multiple countries; and a number of oil companies, including Union Oil Company of California (Unocal) (and its parent company, Chevron Corporation), Talisman Energy Inc., and Royal Dutch Petroleum (commonly known as Shell Oil Company).

Many of the claims against corporations and businesspeople are based on conspiracy, facilitation, or other ways that they assisted in the violation. Because of the ATS, international jurisprudence often cites U.S. cases. Since the ATS is the only law that allows a domestic court to adjudicate on most issues of international law, very few other courts have done so. Since international tribunals are still rare and issue few rulings, U.S. courts have dealt with international issues that no other court has. On the other hand, any court case under the ATS must be based on either international treaties or an established custom of international courts.

In *Kiobel v. Royal Dutch Petroleum* (2012), the U.S. Supreme Court considered whether or not the ATS would continue to be such a prominent player in adjudicating violations of international law by corporations. Lower federal courts have disagreed upon whether corporations can be targeted by an ATS suit, and this case should decide the issue. Under traditional U.S. law, corporations can be the object of any suit, whether criminal or civil, but the ATS is at least partially based on international law. The question is whether U.S. or international law determines whether corporations are included, and if the latter, whether international law allows suits against corporations or not. The ruling was expected in 2013; oral arguments were heard in October 2012. In either case, the ATS should remain important in bringing lawsuits against individuals based on white-collar crimes and other violations of international law.

Allied Chemical Corp.

Allied Chemical Corp. is a major international chemical supplier headquartered in Hopewell, Virginia, that received global attention after it was discovered that it was knowingly discharging kepone into the James River. Kepone—a dangerous pesticide—is manufactured as a slightly off-white powder used to kill crop insects (especially on potatoes and bananas). Once discovered in the river, it would take a little over a decade to remediate all of the damage.

A Decade of Dumping

The main Allied Chemical plant in Hopewell had begun on a small plot of land before expanding as demand for its product grew. From 1966 to 1975, the plant contracted with its Allied Chemical subsidiary, Life Science Products Co., which manufactured only kepone and sold exclusively to Allied Chemical. In July 1975, the state health department closed the Life Science facility on the basis of concerns over worker safety. Between 1966 and the issuance of the shutdown, many workers had developed what are now commonly referred to as the kepone shakes, which are tremors associated with overexposure that can lead to both liver disease and sterility. As a result of what was witnessed at the plant, kepone was banned across the United States. The effects on the workers would later appear to be a minimal concern compared to other actions the company had been taking.

After shutting down the plant in Hopewell, the state learned that Allied Chemical had been illegally dumping waste (much of which contained kepone) into the James River, creating a biohazard never before seen in the region. By attempting to dispose of the waste into a sewage system that was not designed to handle toxic waste, Life Science was destroying the river. Although this would be dangerous in any circumstance, the fact that kepone grows in organic tissues made the matter even more serious. Fishing had to be banned in every area within 100 miles of the river because the government worried that ill effects could spread quickly to unknowing citizens. At its peak output, the factory produced approximately 4,500 pounds of kepone per day. However, due to the importance of the plant to the town's economic future, regulators from both federal and state levels appeared willing to overlook many of the safety concerns at the plant. Allied Chemical, too, was aware of the problems.

With fishing banned and the public fearing harm from eating any fish gathered near the St. James, the Virginia fishing industry found itself struggling to stay alive. In a political move designed to save the industry, Governor Mills Goodwin and lobbyists from a series of major chemical manufacturers asked the Environmental Protection Agency to increase the maximum permissible amount of kepone to be considered safe in fish. Ultimately, it was successful in increasing the permissible level from 0.1 parts per million kepone to 0.3 parts per million. Its argument was that research demonstrating a link between the chemical and cancer was methodologically flawed and unreliable.

As this was occurring politically, Allied Chemical was handling the first leg of its legal battle. The company chose to plead guilty to 940 counts of illegal dumping before U.S. District Court Judge Robert R. Merhige. In sentencing, Merhige ordered the company to pay a $13.2 million fine (a record amount at that time). Believing that the management team was actually made up of reasonable men, Merhige did lower the fine to $5 million if Allied Chemical would willingly create an $8 million fund for Virginia's environment.

The U.S. Securities and Exchange Commission (SEC), however, was not nearly as kind to or understanding of Allied Chemical as Judge Merhige. SEC officials believed there was grave indifference in the company's decision, early in its history, not to report to shareholders its decision to pollute. Only two months after Merhige ruled, the SEC charged Allied with failing to inform investors, consequently altering the company's financial risk outlook to potential investors. Allied Chemical—in an agreement with the SEC—vowed to never do so again. A few months later, the state of Virginia went after Allied Chemical for more than $5 million to compensate for the state's costs of cleaning up the environmental hazard left behind. With all of the legal action, it is not surprising that workers—who had been exposed for years—also made claims against the company. In the end, more than 50 workers and family members successfully garnered settlements.

The scandal, which consisted of both environmental and medical aspects, made national news.

Virginia is still trying to fully recover its fishing industry, but the actions of Allied Chemical have created more environmental ripples, both regionally and nationally. In the wake of the case, governments became less willing to turn a blind eye to long-term citizen welfare in exchange for short-term economic gains. Furthermore, the actions demonstrated both a thirst for corporate greed and blatant ignorance toward public health.

Allied Irish Banks

Allied Irish Banks is one of the Big Four banks in the Irish Republic (Eire). On February 4, 2002, it was discovered that John Rusnak, a U.S. currency trader with Allfirst Bank, then a part of the AIB Group, had lost $691 million, creating a major financial scandal. This came seven years after Nick Leeson left Barings Bank insolvent. The Allied Irish Banks Scandal, as it was called at the time, followed from another, unrelated problem after investigations for tax evasion that resulted in the bank settling with the Irish Republic's Revenue Commissioners in 2000. After a second legal settlement in 2006, also in connection with tax evasion, confidence in the bank was eroded when, in December 2010, the Irish government took a majority stake in the company. The Allied Irish Banks had been formed in 1966, with a new company acquiring three banks: the Provincial Bank of Ireland (est. 1825), the Royal Bank of Ireland (est. 1836), and the Munster and Leinster Bank (est. as the Munster Bank in 1864). The Munster Bank had been liquidated in 1885, having run up large losses through fraud and mismanagement, and was re-established as the Munster and Leinster Bank.

Betting on the Yen

In 1997, with the Irish economy booming, the Allied Irish Banks bought First Maryland Bankcorp, which was a holding company for the First National Bank of Maryland. Two years later, it merged with the Dauphin Deposit Corporation and formed Allfirst Financial. Born in 1964, and living in Baltimore, Maryland, John Rusnak started working for Allfirst in 1993. In 1997, he bought heavily into the yen, anticipating that the Japanese currency would recover. It was for the same reason that two years earlier, Nick Leeson in Singapore, expecting a rise in business confidence in Japan, bet on the Nikkei index, which crashed after the Kobe earthquake. Rusnak's losses in the yen two years later led to him faking options to falsely show that he had hedged his positions. Rusnak's moves were accepted by the hierarchy at the bank, and although Rusnak managed to make back some of his losses for a few months in 1999, the losses started to mount.

Two of the bank's executives, David Cronin and Robert Ray, accepted a scheme to make back these losses, allowing Rusnak to open brokerage accounts with both Citibank and the Bank of America. Rusnak then lost even more money, but he managed to hide this by adding several bogus trades. In January 2001, the bank suddenly realized that Rusnak was losing large amounts of money, and Robert Ray ordered Rusnak to limit his losses. This led the trader to start offering discounted currency options to other banks. Some people in the back office raised their concerns, but Rusnak threatened to have them dismissed, ensuring their silence. However, a supervisor spotted two transactions in late 2001 in which there were no confirmations attached. Rusnak then faked several confirmations, using his computer and saving the file as "fake docs." There were some telephone checks, and when these were unable to back up these confirmations, Allfirst became concerned and started investigations. On February 4, 2002, Rusnak, recognizing what had happened, did not turn up for work as investigators tried to assess the extent of the losses. On the following day, Rusnak sought legal help.

The news became public on February 6, 2001, with Rusnak going into hiding after the Federal Bureau of Investigation (FBI) began to search for him in connection with fraud. A number of Rusnak's work colleagues and supervisors lost their jobs for failure to notice his wrongdoings. At the time that the fraud was uncovered, Rusnak was 37 years old and married with two children, and he was described by neighbors as Mr. Middle America, although some of the press called him the Brogue Trader—Nick Leeson having been dubbed the Rogue Trader. The losses incurred by Rusnak were later confirmed at $691 million. He was later charged with fraud and, on January 17, 2003, was sentenced to 7.5 years in jail after pleading guilty to fraud. He was released on January 30, 2008. Although Rusnak caused the Allied Irish Banks to lose a large amount of money, less than two years later, the bank agreed to pay 90 million euros in the highest tax settlement in Irish history, having to pay more in March 2006. There was also a scandal in 2004 when the bank was caught having overcharged customers on foreign exchange transactions. The global financial crisis caused a major decline in the Irish economy, with the Irish government loaning 3.5 billion euros as part of the bank recapitalization scheme in 2009, then stepping in to prevent the loss of the bank, which employed some 24,000 people.

American Cyanamid Co.

American Cyanamid was a company formed in 1907 by engineer Frank Washburn. It was established to supply fertilizer to the agriculture sector. Washburn named his company after a newly formed compound, cyanamid, a product that combines carbide, lime, and nitrogen. After World War I, the demand for fertilizer decreased, but cyanide, which was used in the extraction of gold and silver from ores, was no longer being imported from Germany. American Cyanamid took this opportunity to manufacture cyanide from cyanamid, thus enabling the company to expand its distribution of chemicals and broaden its marketing base.

Later, the company began production of hydrocyanic acid, a component of rubber. American Cyanamid continued its production of chemical compounds for agriculture, such as herbicides and growth hormones for cattle, while expanding its development of drugs and plastics that were directed to consumers rather than industrial supply. As the company increased its resources and assets, its executives purchased pharmaceutical and surgical supply companies, thus further broadening American Cyanamid's scope within the chemical market. The extended range of the company's sales and acquisitions led to scrutiny, criticism, and labor problems. In 1942, the company was forced to pay a substantial fine for antitrust violations. In the 1950s, there were multiple strikes by workers, reflecting labor disputes between executives and chemical factory workers. In 1967, American Cyanamid, along with large pharmaceutical distributors Pfizer and Bristol-Meyers, was charged with monopolizing the distribution of a common antibiotic, tetracycline. The company paid $48.5 million in fines.

The 1970s proved particularly problematic for the company. In 1973, the state of Georgia ordered American Cyanamid to stop dumping its chemical waste, particularly sulfuric acid, into the Wilmington and Savannah Rivers. This practice had occurred for years and led to fish kills in both freshwater systems. In 1978, 1,300 employees in Bound Brook, New Jersey, went on strike to protest working conditions in which employees were exposed to carcinogens. The chemical plant manager, Eldon Knape, declared "we don't run a health spa" and ordered the employees back to work. In Willow Island, Virginia, it was discovered that the chemical plant emitted lead-based carcinogens that would substantially raise the risk of birth defects for pregnant women. The company responded by ordering women of childbearing age to quit, accept demotion, or become sterilized. American Cyanamid received particularly bad press when five of its employees admitted to becoming sterilized in order to keep their jobs.

On September 8, 1983, the Environmental Protection Agency (EPA) listed the American Cyanamid site in Bridgewater Township, New Jersey, as a Superfund site because a significant load of hazardous chemicals was found in the soil and groundwater. The Superfund site had a history of industrial pollution starting in 1915. For nearly 100 years, American Cyanamid manufactured chemicals and disposed of chemical wastes on the property. Currently, the soil and groundwater are contaminated with volatile organic compounds, metals, and other known carcinogens and toxins. According to the Centers for Disease Control, "Some industries use benzene to make other chemicals that are used to make plastics, resins, and nylon and synthetic fibers. Benzene is also used to make some types of lubricants, rubbers, dyes, detergents, drugs, and pesticides." All of these products were manufactured by American Cyanamid. Benzene causes disruption in cellular activity, particularly in blood cells and bone marrow; causes leukemia and stimulates other cancers.

The Superfund site is located next to the Raritan River and above the Brunswick Aquifer, the second-largest source for drinking water in New Jersey. In 2010, an onsite inspection of the property and groundwater revealed that both contained benzene, necessitating control of benzene seepage into the aquifer and river. The residents

American Cyanamid Company's Warner Plant in the Linden, New Jersey, industrial complex of metropolitan New York on the Arthur Kill River in 1974. At that time it was estimated that the company dumped, by permit, 3.5 million gallons of chemical wastes annually into the New York bight (the indentation along the coast) from the manufacture of chemicals, insecticides, and sulfuric acid.

of the area claim that the region has experienced significant releases of benzene into freshwater systems during floods and hurricanes because the manufacturing waste is located on a floodplain.

The EPA allowed for remediation to entail containment of the waste dumps, with the understanding that the contaminants would still be present. The residents want the toxins eliminated, not contained, because containment in the past has proven temporary. The cost of excavation is more than $1 billion, as opposed to capping contaminants in place, which would cost $10 million. According to Bill Wolfe, a resident of the area, "what happens here is that corporations privatize the profits and socialize the costs every single time. . . . If the down-river cumulative impacts of all of this have impacted all of the ecosystems down the river, including the human ecosystem, who's going to pay for that degradation?"

American Hospital Supply Corp.

American Hospital Supply Corporation (AHSC) started out as a hospital supply distributor in 1922 and was the major supplier of health care products in the United States for several decades. Foster G. McGaw (1897–1986), the founder of AHSC, developed an international production and distribution network. He was an entrepreneur and philanthropist who incorporated the hospital supply company in 1922 in Illinois and created one of the largest medical supply companies in Chicago.

McGaw also enhanced Northwestern University's campus with the construction of McGaw Memorial Hall and Alice Millar Chapel. In the 1930s and 1940s, AHSC dominated the industry and became the nation's largest manufacturer and distributor of medical products. The corporation produced a range of around 28,000 products and distributed to hospitals throughout the United States. Even though AHSC was involved in several legal disputes, the company still dominated the industry and was one of the largest distributors of medical equipment in the United States.

AHSC optimized the way that health care and hospital supplies were delivered. AHSC also distributed the supplies of other companies, such as Hospital Products Limited (HPL), to 19 hospitals across the United States. By 1956, AHSC sales had grown to about $65 million. Sales had increased to $135 million, and the company had about 6,200 employees 10 years later. By 1984, sales were about $3.45 billion, and about $3.6 billion a year later, using a network that could fulfill orders within 24 hours.

AHSC had merged with Hospital Corporation of America, creating the largest industry merger of its time. The new company created more cost-efficient care, managed 422 health care facilities, and distributed AHSC's 130,000 medical products. In 1985, AHSC received a $3.6 billion buyout offer from one of its competitors, Baxter Travenol Laboratories Inc. (BTLI). AHSC was acquired by BTLI, making BTLI both a health care products distributor and a developer of medical technologies.

Most corporations endure legal settlements, including AHSC. The company was sued by White & White Inc. (W&WI) and other competitors. AHSC had an agreement with several hospitals, and the plaintiffs claimed that this agreement was an attempt to monopolize and illegally restrain trade. The decision of the district court was in favor of W&WI, but the appellate court reversed the decision in favor of AHSC. The court found that AHSC was performing no unreasonable restraint of trade, with no attempt to monopolize. Later, AHSC filed before the district court, seeking the costs of trial and appeal from its opponents. The costs were calculated at over $126,000 for the original trial alone. The district court ordered each party to take control of its costs, with AHSC's appeal to be reimbursed by W&WI as the only exception.

Hospital Products, a small firm that manufactured reusable stapling systems for internal surgical procedures, entered into a three-year contract with AHSC. The contract stated that AHSC would act as HPL's only distributor in the United States, and that after three years, the initial agreement would go into automatic renewal for up to 10 one-year periods, unless HPL terminated the contract at least 90 days before the end of the first three-year term. On the final day of the three-year contract, Hospital Products asked AHSC whether the contract would be renewed, and the response was that since the contract was not terminated, the contract would be considered renewed. A day later, Hospital Products issued a statement to AHSC that it was going to consider the contract terminated. AHSC cited a breach of contract and obtained a preliminary injunction against HPL that forced Hospital Products to maintain its contract with AHSC. Hospital Products counterclaimed the preliminary injunction granted by the district court. After the injunction was affirmed, Hospital Products filed for bankruptcy. The preliminary injuction granted by the district court was affirmed for AHSC against Hospital Products, finding a breach of contract.

American International Group

On September 16, 2008, one of the largest insurance companies in the world, American International Group (AIG), suffered from a major loss in confidence after the global financial crisis, which resulted in a downturn in the stock market and U.S. housing prices. AIG was seen as overvaluing its assets after Joseph Cassano of AIG Financial Products, based in London, had written insurance policies as credit-default swaps, in which companies were able to insure $441 billion worth of securities that had been rated AAA, but after the global financial crisis were valued at far less than that. The company managed to restructure, and it recovered with the help of the Federal Reserve Bank of New York.

Founded in Shanghai, China, in 1919, as an insurance company, AIG was established by Cornelius Vander Starr (1892–1968), an American businessman from Chicago who had gone to work in Yokohama, Japan, and then to Shanghai, where he formed American Asiatic Underwriters—later American International Underwriters. Most of its work was in Asia, but it had business interests around the world. It was forced to move from Asia in 1949, when communists captured Shanghai and proclaimed the People's Republic of China, with Starr having moved the company headquarters to New York just before the city fell. This move to New York City saw the company diversify, with it seeking out new markets throughout the world, especially in Latin America, and later in Europe and the Middle East.

Joe Cassano

AIG gradually became one of the largest insurance companies in the world, going public in 1969. It established an excellent reputation for its financial dealings, with its massive headquarters at 180 Maiden Lane, New York City. From April 8, 2004, until just after the crash in September 2008, it was listed on the Dow Jones Industrial Average.

In spite of an impressive record and history, AIG was sent to the verge of bankruptcy in 2008, as the result of some reckless business deals, basically caused by one employee, Joseph J. Cassano.

Cassano was born on March 12, 1955, in Brooklyn, New York, the third child of a policeman, his family originally from Malta. After completing a degree in political science from Brooklyn College in 1977, he worked with Michael Milken at Drexel Burnham Lambert. This was during its period of issuing what became known as junk bonds. In 1987, when that company crashed—but before it formally went bankrupt—Cassano and some others from Drexel Burnham Lambert managed to find work with AIG, with Cassano establishing its Financial Products Division and becoming chief financial officer. This was based at Mayfair in London, with Cassano living in an $8 million house in London and maintaining a house in Westport, Connecticut.

In 1994, Cassano was promoted to head of the Transaction Development Group of AIG by Thomas R. Savage, and four years later, he decided to embark on credit-default swaps, by which AIG would, for a premium paid in advance, compensate a buyer in the event of a loan default or other credit event. The concept was developed by J. P. Morgan, and Cassano quickly started engaging in massive credit-default swaps. His main problem was that he did not have much in the way of funds as collateral. This was not a legal problem as a result of the Commodity Futures Modernization Act of 2000, which regulated the insurance industry. It was also not an important issue because the stock prices were steadily rising. This saw AIG make hundreds of millions of dollars of profits. Cassano was appointed the chief executive officer of AIG's Financial Products Unit in 2000.

There was a potential problem if house prices fell, but with the portfolio spread around the country, Cassano argued that it was impossible for all house prices across the entire country to fall at one time, pointing out that all the debt had been rated AA.

Lehman Brothers Collapse

The problem came about with the global financial crisis of 2008, which led to the bankruptcy of Lehman Brothers, the largest bankruptcy in U.S. history at that time. Lehman Brothers had held large amounts of stock and debt, valued on the company's balance sheets at precrash prices, but some of which had halved in value. Some analysts compared the stock held by Lehman Brothers and that held by other companies that were still, at that time, solvent. They found that AIG had some stock similar to that held by Lehman Brothers.

This investigation coincided with many companies wanting AIG to bail them out as the stock that they held fell in value. The credit-default swaps meant that they were insured against losses by AIG. By the time of the global financial crisis, it was discovered that Cassano had entered into credit-default swaps worth a total of $441 billion. At the time he did this, the securities were rated AAA. However, some $57.8 billion was in subprime loans.

Upon discovering this, AIG immediately announced on September 14, 2008, that it would sell the International Lease Finance Corporation that had been involved in aircraft leasing to raise money to cover the debt. AIG also received permission from New York regulators to borrow another $20 billion from its subsidiaries. The Federal Reserve became nervous, and it hired Morgan Stanley to investigate the serious possibility of systemic risks from a failure of AIG.

Federal Reserve Bank Rescue

On September 16, 2008, after news spread of a possible collapse at AIG, its stock fell 60 percent in value. Immediately, the credit ratings of AIG were downgraded by Moody's and Standard & Poor's to AA. There was the distinct possibility that AIG would have to file for bankruptcy protection on the following day; however, on the evening of September 16, the board of governors of the Federal Reserve Bank of New York (FRBNY) authorized a credit-liquidity facility for AIG that allowed it to draw on up to $85 billion over the next two years. The share price continued to crash and the company's stock was removed from the Dow Jones Industrial Average. On November 10, after the passage of the Troubled Asset Relief Program (TARP), the U.S. Treasury purchased $40 billion in AIG senior preferred stock, while FRBNY reduced AIG's facility to $60 billion, but extended the life to five years and reduced the interest rate by more than half. Before long, the U.S.Treasury owned more than 90 percent of the company.

Some of the money AIG received from the government was then paid to banks and other financial institutions to which AIG owed debts due to their purchase of credit default swaps; because some of these banks had also received TARP bailouts, many in the public expressed outrage. AIG's reputation had already been damaged by a $444,000 AIG employee retreat event held a week after the bailout and an $86,000 hunting trip for AIG executives held the following month. Both events had been scheduled far in advance but made the company an easy target. Perhaps even more damning were the bonuses paid to executives and employees of the financial services division, totaling nearly half a billion dollars. Such bonuses were exempt from the executive pay limits imposed by TARP bailouts. AIG defended them as contractual obligations.

In order to pay off its government loans, AIG began selling off its assets, beginning with the 2009 sales of subsidiaries Hartford Steam Boiler to Munich Re and 21st Century Insurance to Farmers Insurance Group. Other purchasers of AIG assets included Banco del Pichincha, MetLife Inc., Pacific Century Group, Fortress Investment Group, and Prudential. The U.S. Treasury gradually sold off its AIG shares, selling the last of them in December 2012 at a total profit of about $22.7 billion, and the company is again independent as a result.

American Motors Corp.

American Motors Corporation was an American automobile manufacturer based in Southfield, Michigan. The next largest car manufacturer after the Big Three (General Motors Corporation, Ford Motor Company, and Chrysler Corporation), American Motors often struggled to remain viable. During the 1980s, American Motors entered into a partnership with French automaker Renault S.A. in an effort to gain a supply of subcompact automobiles and raise the capital necessary for renovating its aging manufacturing operations. While many in France and the United States were critical of the partnership, Renault chairman Georges Besse continued to promote the partnership as important to the continued viability of both companies. After Besse's assassination in November 1986 by a militant extremist group, however, Renault lost interest in American Motors and the North American car manufacturer was ultimately merged with Chrysler Corporation, which coveted the Jeep line.

American Motors traced its roots to the 1954 merger between the Hudson Motor Car Company and Nash-Kelvinator Corporation, which at that time represented the largest corporate combination in U.S. history. While the newly formed company initially struggled to compete against the much larger Big Three automakers, which had much larger dealership networks and advertising budgets, beginning in the late 1950s, American Motors established itself as the maker of economy cars. Under the leadership of George W. Romney, who served as chairman and president of American Motors from 1954 until 1962, the Rambler was introduced and proved popular. During the mid-1960s, American Motors concentrated on manufacturing larger and more profitable automobiles; however, during the energy crisis of the 1970s, the car maker returned to emphasizing compact cars. During the 1970s, American Motors focused upon an all-compact line, introducing the Hornet, Gremlin, and Pacer. Although these automobiles featured unique designs and were initially popular, sales declined markedly a few years after each model's release. By the end of that decade, American Motors was focusing on its four-wheel-drive Eagle, introduced in 1979, and its popular Jeep line, which had been acquired from Kaiser Jeep Corporation in 1970.

Partnership With Renault

As American Motors struggled to invest in new models, it entered a partnership with Renault in 1980. This arrangement led to Renault increasing its investment in American Motors until it had assumed control by 1983. Under Renault's leadership, American Motors eliminated all models other than Eagles and Jeeps, and it introduced the Alliance, based on the Renault 9. After a $150 million overhaul of American Motors' Kenosha, Wisconsin, plant was completed, Alliances were produced there. The Alliance proved initially popular but quickly developed a reputation as unreliable and prone to breakdowns. These problems, coupled with declining fuel prices, led to deteriorating sales of the Alliance when consumers began looking for larger cars. Because American Motors had eliminated all of its larger model lines, the company seemed poised to continue losing money. Renault chairman Besse remained an advocate for American Motors, although his support was weakened because of the financial difficulties that Renault was experiencing.

By the mid-1980s, Renault insiders were questioning that company's continued involvement with American Motors. Through 1985, the partnership had produced few of the synergies that Renault had expected and had proven increasingly expensive to maintain. There was pressure from within the French automaker to declare American Motors bankrupt or to put the unit up for sale to another buyer. Besse opposed bankruptcy because that would cause Renault to lose its sizable investment, and he was against selling the American automaker because he felt that American Motors was undervalued. Instead, Besse was convinced that Renault's investment in American Motors was about to pay off. In addition to its investment in the Kenosha plant, American Motors had spent $250 million developing a new assembly line in Brampton, Ontario. The Canadian plant employed state-of-the-art technology and was specially designed to build the Premier, a joint effort of Renault and American Motors. Besse's support was persuasive, and the relationship between American Motors and Renault continued into 1986.

As chief executive officer of Renault, Besse held a prominent role in French society and was often quoted in the press on matters pertaining to business and the economy. Before joining Renault, Besse had also served as chairman of the European Gaseous Diffusion Uranium Consortium (Eurodif), a concern that provided fuel to 40 nuclear reactors. For this reason, he was targeted by members of Action Directe (AD), an anarchist group that used military methods to achieve its political goals. On November 17, 1986, members of AD approached Besse's chauffeur-driven automobile by motorcycle as it dropped him off outside his Paris home. As Besse left the car, AD members shot him in the head and chest, killing him. Nathalie Menigon and Joelle Aubron, two members of AD, were convicted of killing Besse in 1987 and were sentenced to life imprisonment. Jean-Marc Rouillan and Georges Cipriani, two other members of AD, were convicted as accessories to Besse's murder and were also sentenced to life imprisonment.

After Besse's death, the new Renault president, Raymond Levy, sought to curtail his firm's involvement with American Motors. To that end, Renault sold its controlling shares in American Motors to Chrysler Corporation in 1987. This acquisition allowed Chrysler to obtain the Jeep, which it wanted to compete with General Motors and Ford.

Amerifunding

Amerifunding/Amerimax Realty Inc. was the Westminster, Colorado, mortgage brokerage used to conduct bank fraud and identity fraud, beginning in 2002, by a group of conspirators that included owner Gerald Small; his wife, Kelli Small; Chad Heinrich; Charles Winnett; Robert Bichon; and Robert Sigg. The conspirators were indicted in 2004 on multiple charges of false or fraudulent claims, bank fraud, fraud by wire, false statements to a financial institution, fraudulent loan and credit applications, and criminal forfeiture. Matthew T. Kirsch of the U.S. Attorney's Office in Denver prosecuted. Several of the conspirators were known to operate under aliases; authorities identified Gerald A. Spence and Kris Kaas as Gerald Small aliases, and Kelli S. Burkhalter as a Kelli Small alias. Small also controlled a Denver company, 20th Century Mortgage Inc., which was used in some of the fraudulent actions. The conspirators were discovered through a joint investigation by the Internal Revenue Service and the FBI, believed to have begun when identity theft victims reported that mortgages and other loans had been taken out in their names. The FBI investigation was part of a broader initiative called Operation Continued Action, a nationwide enforcement operation targeting financial institution fraud.

Kelli Small pleaded guilty to one count of income tax fraud, receiving probation and community service in return for testifying against her husband. Gerald Small was sentenced to 101 months in prison and was ordered to pay $37 million in restitution. Bichon was sentenced to 35 months in prison and ordered to pay $2.3 million in restitution. Sigg was sentenced to time served and was ordered to pay $141,163 in restitution, which was later reduced to $12,000. Winnett was sentenced to 51 months in prison and was ordered to pay $35 million in restitution. Heinrich was sentenced to 28 months in prison and was ordered to pay $35 million in restitution. The various restitution orders directed payments to be made to Washington Mutual, Flag Star Bank, Impac Warehouse Lending Group, and other victims. A seventh person, Harry Lou Gayle, was arrested and convicted of filing a false tax return for 2002. His involvement in the conspiracy seems to have been limited to signing four false loan applications for Amerifunding.

The Amerifunding scheme obtained millions of dollars in mortgages and lines of credit through an organized identity theft conspiracy. Personal information was obtained from people who believed that they were applying for Amerifunding jobs. The conspirators harvested that information in order to obtain credit under those stolen identities, as well as manufacturing false loan applications, forged employment verifications, and falsified financial documents. False job postings, both online and in newspaper help wanted sections, have been a means of obtaining personal information for the purposes of identity theft and credit fraud for a long time, but they have been a subject of particular concern in the 21st century as identity theft has become more prevalent. Amerifunding applicants were asked to provide copies of their driver's licenses and Social Security cards; some declined to provide one or both. At least one ad, published in the *Denver Post* job listings section, offered a six-figure salary—most likely a means by which the Amerifunding conspirators attempted to target upper-middle-class victims with high credit limits. At least 47 identities were stolen and successfully used to obtain fraudulent loans and lines of credit.

Loans fraudulently obtained were used to buy properties in Conifer, Colorado, and Las Vegas and Henderson, Nevada, as well as a 2004 Jaguar XJR, a 2003 Lexus, and two private jets. About $8 million in cash and bank accounts was seized. Much of the money was never recovered.

In February 2006, Flagstar Bank FSB and Impac Warehouse Lending Group Inc. filed a civil lawsuit against First Collateral Services in Denver district court, over the losses Flagstar and FCS suffered as a result of Amerifunding's fraud. According to Flagstar and Impac's allegations, FCS misrepresented Amerifunding's financial condition and legitimacy in order to obtain repayment of the mortgage warehouse line, and it actively assisted the Amerifunding conspirators in obtaining funding in order to repay its debt to FCS.

Conspirator Robert Sigg went on to face arrests for numerous subsequent crimes throughout Colorado, including first-degree burglary and assault in Jefferson County, driving under the influence in Evans, distribution of illegal drugs in Weld County, assault and battery in Aurora, domestic violence in Parker, habitual traffic offenses in Thornton, and disturbing the peace and resisting arrest in Denver. His son, Austin, was arrested in 2012 at the age of 17 for the kidnapping and murder of 10-year-old Jessica Ridgeway and the kidnapping and assault of an adult woman. He was tried as an adult and charged with four counts of murder, two counts of kidnapping, sexual assault of a child, robbery, attempted murder, attempted sexual assault, and attempted second-degree kidnapping.

Anderson, Jack

Jack Northman Anderson (1922–2005) was a muckraker, columnist, and broadcast correspondent, generally credited with revitalizing the field of investigative journalism and inspiring a generation of skeptical reporters. Anderson's career ranged across a wide spectrum of American politics and business for over half a century, and it included such stories as the assassination of President John F. Kennedy and the Watergate scandal. Anderson started his career as a correspondent for *Stars and Stripes* (the wartime military newspaper) and as a war correspondent. His job became a profession and truly blossomed as the result of hiring on as an investigator with longtime columnist Drew Pearson. Anderson rose from the ranks and became Pearson's partner in the late 1950s. Whereas Pearson was widely seen as a "left-ish" journalist, Anderson had the point of view that pretty much anyone—left or right—was fair game for his investigations. One of Anderson's earliest splashes was a series of articles co-written with Pearson on the personal and political failings of Senator Joseph McCarthy, famed "commie hunter" during the Red Scare of the 1950s. Anderson had a lifelong proclivity for going after the most powerful people in American political life, including such "untouchables" as J. Edgar Hoover (head of the Federal Bureau of Investigation [FBI]), Thomas Dodd (a powerful senator from Connecticut), and President Richard Nixon (who included him on several White House Enemies lists).

During his years in Washington, Anderson developed a wide-ranging pool of sources. In 1971, a White House investigator wrote in an internal memo that "Anderson . . . has access to intelligence digests . . . [and] private Presidential memoranda." In the memo, the anonymous writer cited as sources the Office of Management and Budget, Senator Hugh Scott, and agencies associated with the internal memos and briefings. The memo shows that the writer believed that there was also a highly placed source or sources in the White House that had been compromised and developed by the Anderson investigative staff. Anderson's investigation did not avoid backlash from the powerful. Hoover was quick to investigate Anderson in return, and the Nixon White House staff grappled with Anderson's investigative street fighters via wiretaps, FBI investigations, Internal Revenue Service (IRS) inquiries, and at least one alleged murder plot that was cooked up by G. Gordon Liddy. Anderson was squeaky clean in his private life, careful to the point of paranoia with money, and methodical in rooting out and publicly refuting unsubstantiated attacks on his methods or person.

International Telephone and Telegraph

Perhaps Anderson's greatest coup in the area of true white-collar crime was the investigation and exposure of dirty dealing within the ranks of International Telephone and Telegraph (ITT). In 1971, ITT had acquired Hartford Fire Insurance Company, drawing the attention of both the U.S. Securities and Exchange Commission (SEC) and Jack Anderson. What initially tipped off Anderson was the procurement of an internal SEC memo raising the issue of undue interference on the part of Connecticut Insurance Commissioner William Cotter, who had first disapproved the merger, then reversed his stand. The Nixon Justice Department merrily followed suit in approving the merger (a peculiar circumstance, because the U.S. Department of Justice (DOJ) had only recently dropped three antitrust suits against the company). However, some odd peculiarities in the narrative began to emerge, including allegations that ITT would be willing to foot the bill (to the tune of $400,000) for the Republican National Convention in San Diego.

ITT had been under the scrutiny of a number of investigators over the past decade. As the year went on, however, DOJ investigations mysteriously dried up, Cotter cleared the way at the state level, and ITT began to look as though it would not only avoid any legal difficulties for its lobbying techniques but also make the marriage with Hartford. ITT, the White House, and even the SEC stonewalled Anderson, needed information suddenly become unobtainable, and the entire affair seemed poised to drop into a journalistic vacuum. On February 22, Anderson procured what became known as the "Dita Beard memo," a document that instantly exposed a welter of darkly criminal activities within the corporation. The Beard memo revealed direct links between ITT, the Republican Party, and the White House for favorable treatment by the Department of Justice for money handed over for the Republican National Convention. The memo named names, including White House staffer Bob Haldeman, Attorney General John Mitchell, and President Nixon—all of whom were becoming widely known as participants in the Watergate affair. Eventually, the ITT Affair was subsumed by the larger and more critical investigation into the "high crimes and misdemeanors" committed by the Nixon administration. Jack Anderson died of Parkinson's disease in 2005, after a life of uncovering and airing the slimy underside of American politics.

Anheuser-Busch InBev

The Anheuser-Busch company is one of the most enduring business ventures in the history of the

United States. The marriage between two businesses—Eberhard Anheuser's Bavarian Brewery and Adolphus Busch's brewing goods supply—would become the largest and most profitable beer company on Earth. When the family finally lost control of the business in 1998, the venture had spanned five generations of the Busch family, with a near-perfect record of profitable expansion. Beer may have run in their veins, but they generated an almost unalloyed record of sober progress. As the business grew, it proved capable of both diversity and adaptability to changing—sometimes critically reversing—business climates. From the start, the Busch managers were inventive, pasteurizing their product in order to transport it across long distances and manufacturing and employing refrigerated cars to keep the beer cool. When Prohibition hit breweries hard, Busch began to sell brewer's yeast, which experienced record sales to thirsty home brewers.

The Miller Wars

One of the ugliest conflicts in the modern era for Anheuser-Busch was its no-holds-barred battle against upstart Miller brewing. In 1970, Miller had been acquired by cigarette giant combine Phillip Morris, which was determined to rejuvenate the flagging company. It did so in a gamble on a new product: Miller introduced Miller Lite shortly after acquisition, and Phillip Morris poured millions into its high profile campaign to promote the beer. Anheuser-Busch was undergoing one of its periodic generational changes in command, bringing to the fore August Busch III. "Auggie" Busch, as head of the company, was an unremitting workaholic, known well for his "perform or leave" attitude toward business associates, 12-hour days, and unrelenting pursuit of the profitable bottom line. Auggie viewed the advent of the new Miller effort as a direct assault on Anheuser-Busch and its signature brand, Budweiser.

The public advertising war between the brewers told only half the story. Miller brewing attacked Busch's brand via the Federal Trade Commission (FTC), using the argument that Anheuser-Busch was falsely advertising its beers as "naturally produced" because it used tannic acid, a chemical product, in the brewing process. Busch fought back, also through the FTC, by going after Miller's Euro-brand Lowenbrau, which Miller claimed was brewed according to an original German recipe—it was not, Busch claimed, and the FTC agreed. In the midst of the lawsuits, the commercial wars, and the general atmosphere of brutal battle on both sides, a dirtier battle was fought in the trenches of the ground war. Distributors were battling for sales with wholesalers, account wars raged, and millions of dollars were spent.

The Miller War, as it became known, set in motion a corporate culture of massive spending—particularly on advertising. When Auggie Busch first came on board as the Beer King, he brought with him a horde of financial whiz kids and holders of master of business administration degrees (MBAs), along with others almost unknown to the Busch empire of earlier eras to modernize and streamline the company. Auggie tended to attract like-minded types to management. Unfortunately, this brought people of a less savory character. As millions of dollars flowed into advertising, a number of high-level executives at Anheuser-Busch decided that there was no reason why they should not dip into those funds for personal gain. In 1988, as a product of an internal investigation at Anheuser-Busch, two Anheuser-Busch executives, Joseph E. Martino and Michael A. Orloff, along with Mark L. Shyres, an executive at Bingham (Advertising) Group, were hauled into federal court to answer for a kickback scheme that blossomed into outright fraud from the St. Louis advertising group for a bit of extra business. Orloff (vice president of wholesale operations) and Martino (vice president of sales) faked inflated Anheuser-Busch invoices for thousands of dollars, as well as "gifts" of clothing, airline tickets, auto repairs, and club memberships over a five-year period. All three were convicted and were sentenced to three-year terms and large fines.

Though the issues at trial were of note, perhaps the more interesting aspect of the case was the testimony of unindicted Busch executives called to the stand by the defense, revealing the type and kind of gifts that floated on the wave of business that Anheuser-Busch generated with contractors of one sort or another. Martino (hardly an "uninterested party") asserted that the kind of activity that they were convicted of was de rigueur at Anheuser-Busch and had been so for years. August Busch III thoroughly cleaned house after the scandal, firing a number of upper- and middle-management executives, whether touched by the scandal or not. Despite the accusations and cross-accusations, Auggie was never accused of any wrongdoing, or of encouraging such activity—the fraud was uncovered by an internal investigation undertaken at his direction.

Anheuser-Busch was acquired by Belgian-Brazilian brewer InBev in 2008, becoming a wholly owned subsidiary of Anheuser-Busch InBev. New cost-cutting initiatives led to widespread layoffs, new budgeting procedures, reductions in benefits like severance packages and tuition reimbursement, and the cessation of other perks. In 2013 it pursued a plan to merge with Mexican brewer Grupo Modelo.

Antiquities Fraud

Intentionally creating or manipulating an object to make it look like an ancient artifact from a past civilization, and then selling that fake artifact to a museum, auction house, or private collector, is a form of criminal fraud. Those who purchase fraudulent fake antiquities, such as auction houses, museums, and private collectors, often do so unknowingly, and the intentional misrepresentation and sale of a fake antiquity is a criminally punishable act in most countries, including the United States. Making an exact copy of an antiquity is not a criminal act; the criminality of fake antiquities fraud occurs once such a fabrication is sold under false pretenses as a legitimate cultural relic. The criminal industry is estimated to make billions of dollars annually. Most fraudulent antiquities are passed off as true remnants of ancient Greek, Roman, Egyptian, Chinese, and Japanese cultures; additionally, a significant number of faked antiquities are created to reflect ties to important time periods and events within the Christian, Judaic, and Islamic faiths. Fraudulent antiquities may include everything from fake bronze ceremonial masks to replica Ming Dynasty Chinese porcelain dishes to forged papyrus scrolls.

Art Crimes

Fake antiquities fraud is one element of a larger category of crimes related to art and antiques known as art crimes, which include art fraud, art vandalism, theft of art and antiquities, and archaeological site looting and destruction. Fake antiquities fraud, like other art crimes, is often transnational in scope. Usually, fake artifacts are created in one country and then sold to an auction house, museum, or collector in another country, with this process potentially repeating many times. Sophisticated groups, attracted to fake antiquities fraud by the trade's potentially large profits, also play a role in furthering the production and sale of fake antiquities around the world. The potential profits from selling fake antiquities acts as a corruptive force, capable of influencing individuals and institutions, who would otherwise appear legitimate, to engage in the trade. The corruptive power of the fake antiquities trade thus results in the formulation of complex criminal conspiracies that are focused on profiting from the sale or display of fake cultural artifacts.

The true extent of fake antiquities fraud is difficult to determine for several reasons. First, fake antiquities are difficult to detect. For example, highly skilled fraudsters working in China and other southeast Asian countries produce fake Ming Dynasty Chinese pottery, using a glazing and clay firing technique that produces microscopic cracks in the finished porcelain surface that look almost identical to the cracks found in legitimately ancient plates, bowls, and vases. In many instances, the fake item is so well produced that detection of the fraud is almost impossible, and

The James ossuary, here on display at the Royal Ontario Museum from November 15, 2002, to January 5, 2003, is one of the most contentious pieces in antiquities. For nine years, it was the focus of the Israel Antiquities Authority's campaign against forgers and smugglers, but its authenticity is still vigorously debated. The small stone box is unquestionably 2,000 years old, but its inscription—"James, son of Joseph, brother of Jesus"—is the point of contention. The piece now awaits a verdict in a warehouse near Jerusalem.

many years or decades may pass before the fraud is detected, if it ever. The reluctance of museums, auction houses, and collectors to reveal that they were duped into purchasing a fake antiquity, either because of embarrassment or out of fear that such a revelation may negatively affect their reputation and client confidence, also plays a large role in obscuring the true extent of fake antiquities fraud.

Oscar White Muscarella, an archaeologist specializing in the detection of forged and faked antiquities, published a catalogue detailing the fake antiquities he discovered on display at major museums throughout the world. Muscarella identified over 1,200 fraudulent antiquities, including some purported to be over 4,000 years old. Muscarella noted that the famed Louvre in Paris and the Metropolitan Museum of Art in New York City held over 80 fake antiquities between them. The fakes Muscarella discovered were deemed authentic by curators and other experts when they were first purchased, often for millions of dollars. Muscarella's report is important for several reasons. First, Muscarella noted in his survey of museum artifacts that his was by no means a comprehensive listing of all the fake artifacts in existence, making it likely that the total number of fake antiquities held in museum and private collections was significantly more extensive. Second, the fact that experts originally verified the authenticity of the fake antiquities that Muscarella discovered highlights an important aspect of fake antiquities fraud: Experts sometimes do not agree on what is "real" and what is not.

Other archaeologists and scholars eventually verified Muscarella's findings, but that is not always the case. For example, in 2005, a team of Israeli scientists concluded that a carved ivory pomegranate and a stone ossuary (i.e., burial box) with an inscription that purported to show that the box had contained the remains of Jesus Christ's brother Joseph were both fake. Criminal prosecutions of those involved in the fraudulent conspiracy resulted, but debate among experts about whether or not the objects were truly fakes remains, demonstrating not only how difficult it is to reach any concrete conclusions regarding the nature and extent of fake antiquities fraud, but also how human desires for profit and confirmation of their personal beliefs may cloud their judgment about the authenticity of an ancient artifact.

Antiquities Theft

Few people are aware that the illegal trafficking of stolen antiquities provides financing for criminal and even terrorist operations. By purchasing stolen antiquities, some buyers unwittingly or indifferently help meet the financial needs of countries with which they may even be at war. For example, it is quite possible, if not likely, that the cash used by an American or allied buyer to purchase illegally excavated antiquities is funding the cause of insurgent groups in the Middle East. The buyers do so by participating in the world's black market for unprovenanced (not having proper legal documentation) antiquities, stolen from Middle Eastern countries and smuggled into Europe, America, and other wealthy nations. The international sale of treasures, stolen by grave robbers and archaeological site looters and trafficked through reputable museums and brokerage firms, may exceed $3 billion per year, according to one Interpol analyst. Other estimates place it as high as $5 billion annually. Private collectors of ancient archaeological treasures represent an overwhelming majority of the illegal purchases of humankind's historic iconology. However, over the past decade, some of the world's most reputable museums and brokerage firms have also been found to traffic in stolen antiquities.

Few countries are exempt from this illegal activity, despite a spate of new domestic and international laws designed to curb these practices, referred to as cultural property crimes. The practice of looting, smuggling, and selling ancient antiquities will likely continue as long as there is a market in which they can be sold. People involved in the purchase of unprovenanced artifacts are among the wealthy and powerful within the subject nations. They can both afford the escalated price of the stolen goods and purchase the necessary protection from prosecution because of personal relationships at high levels of government.

Middle Eastern Antiquities Theft

The National Museum of Iraq, in Baghdad, was ransacked after the 2003 Gulf War. Because the United States led the coalition of countries that deposed Saddam Hussein, it also absorbed much of the world's criticism for being unable to prevent the theft of over 25,000 artifacts during the fighting, many representing the oldest and most valuable of their type. The United States has been funding the recovery of these treasures and the rebuilding operations of the Iraqi Museum since the Second Gulf War.

Grave robbing, archaeological site looting, and major thefts of valuable artifacts continue within the borders of several Middle Eastern nations. The sale and resale of ancient treasures, through numerous levels of criminal activity, often leads to an exorbitant price paid by the most recent purchasers. Often, an Iron Age water jar or Byzantine ceremonial vessel can reach a price of tens of thousands of dollars. Because the practice of grave robbing and site looting is so widely practiced in the Middle East, aggregate sums of money exchanging hands in the criminal world are significant.

Pothunters, people who illicitly excavate treasures from graves and other archaeological sites, are often among the poorest people in their regions. A recent study of the population of southern Jordan indicates that many within the first level of artifact thieves are only subsistence looters. These are men and boys who illegally dig treasures for a few dollars in order to feed or support their burgeoning families. Few alternative opportunities are available in the form of adequate jobs, pensions, or even arable land to farm. Bedouin societies of southern Jordan, together with local clans, have resorted to trafficking in stolen artifacts in order to monetize their economies and buy food, shelter, and the basic amenities of life. Without the harvesting of these treasures from the earth, starvation would remain the future of many of these families.

The cycle of looting and smuggling of ancient treasures is deeply embedded in the heritage of desert-dwelling people. The trade is transgenerational, and many young boys are proficient at grave robbing by the time they are in their early teens. Within the multiple small villages in Jordan's southern desert and the remnant cities of the north, looting is a trade practiced by a large percentage of entire villages. As many as one-third of all village families participate in grave robbing and site looting within the area designated as the Five Cities of the Plains, just south of the Dead Sea. It is so widespread that in most villages and small towns, it is a principal source of financing for the town's survival.

Local residents often participate in the looting of ancient artifacts in small groups, as well as individually. National laws, which carry stiff prison sentences as a deterrent, have forced the diggers to ply their trade only at night. While some excavate 3,000-year-old graves, others sweep their eyes across the desert for signs of police or military lights that might mean danger. Guardians of the desert, paid by the local government to mitigate looting, are often bribed by the looters. This is often done by sharing the bounty of a successful grave robbing with the desert guardians. Payment is made to someone, as a matter of doing business, at each level of the antiquities trade.

One particular area of the Levant, at the southern end of the Dead Sea, contains one of the largest concentrations of graves in the entire Middle East. With names like Bab ed-Dhra, Numiera, and Ghor al-Safi, they are the remnants of famous Old Testament cities from the Bible. Many archaeologists now believe that Bab ed-Dhra and Numiera are the ancient ruins of the infamous cities of Sodom and Gomorrah, respectively. Both are found within viewing distance from the Prophet Lot's ancient cave dwelling, high upon the mountain, overlooking the Dead Sea. At Bab ed-Dhra, locally called the City of Bones, there are an estimated 20,000 to 50,000 graves accommodating nearly a half-million bodies from the Iron Age (3800 B.C.E.) to the era of the Byzantines (325 C.E.). Counting these and graves at other local cemeteries, the region may hold well over a million burial sites. A large number of these sites hold ancient pottery, jewelry, coins, precious stones, icons, statues, mosaics, ancient glass, and even toys that will bring tens of thousands of dollars each on the open black market.

Poverty as Motivation

For the locals who risk their freedom to unearth these treasures, the work is hard and the payoff is very small. Local residents who dig for these treasures, in violation of national laws, will be rewarded with only a few dollars. Selling a Hellenistic or Roman coin more than 2,000 years old may bring only enough for a few days' food. However, after changing hands several times between its origin and the world market, these treasures may bring their brokers tens of thousands of dollars. These rare antiquities are readily sold to private collectors, museums, brokerage houses, universities, and other buyers in Europe and America. Private collectors seeking to purchase especially important pieces are known to pay millions of dollars for items representing the ancient development of humankind's genius. These items are then removed from the sight of the rest of the world. Middlemen who broker these artifacts often share with, or represent, organized criminal groups. Occasionally, they may also represent terrorist or insurgent groups, who use the money to pursue even worse crimes against humanity, including the funding of terrorism, human slavery, and other forms of international crime.

Looting archaeological sites not only causes the loss of treasures but also destroys the context within which they are found. Their surroundings often tell the story of how, when, where, and why an artifact was used or developed. When the context of a treasure is destroyed, such stories are permanently lost. Looters of historic artifacts are the greatest purveyors of site destruction and despoliation of archaeological sites. Large-scale looting occurs mostly in third world countries that contain most of the early history of humankind and that can least afford to protect it.

Since the Hague Convention of 1954, nations have agreed to and signed treaties designed to mitigate cultural property crimes and the loss of humankind's historic treasures. Despite historic efforts, little success has been achieved. The answers to questions of how to stop wholesale theft from historic archaeological sites are available; however, governments are hesitant to implement the necessary laws, even if they have already been enacted. Often, this is because of the relationships forged between the wealthy who finance the crimes and the officials responsible for enactment and enforcement of the laws.

If the world's markets for illegally dug antiquities were eliminated, there would be no opportunity to sell them, thereby reduce illegal excavation and grave robbing. By making the ownership of unprovenanced antiquities of foreign countries socially unattractive, as well as a crime, society can mitigate much of the illegal digging. This can be accomplished over time with a strong baseline education program, coupled with the political will to enforce laws against illegal black-market activities.

Subsistence looting of ancient treasures is prevalent in third world and impoverished countries. A root cause is severe imbalances of socioeconomic opportunities. Looting also is a means of supplementing agricultural shortfalls within the region's most arid zones. Both of these economic weaknesses exist in south Jordan, where nearly 85,000 people compete for only a few thousand jobs. The lack of adequate wage-paying jobs in archaeologically rich areas, like southern Jordan, spurs locals to become looters in support of an internationally growing demand for Middle Eastern antiquities. Combinations of population pressures, minimal agriculture, and the absence of mechanization, technology, and education result in aboriginal subsistence behavior. Local needs must be met by national or international assistance in order to eliminate the root causes of archaeological theft.

Alternatives to subsistence grave robbing and archaeological site looting must be provided to economically poor populations in culturally rich areas; otherwise, the looting, smuggling, and private sale of the world's historical artifacts will continue, and more of humankind's history will be lost. At least the criminal process of international black market sales of these treasures must be stopped in order to impede the financing of organized criminal activities, insurgencies, and terrorism. When it is understood that Americans who purchase untitled and unprovenanced antiquities are likely funding some of America's staunchest enemies, such purchases finally become socially unacceptable and illegal. Restricting adversaries' ability to finance their criminal and terrorist activities may not only save humankind's history but also save lives.

Antitrust, Federal Trade Commission

Protecting economic freedom and opportunity by promoting free and fair competition in the marketplace has long been a priority of the U.S. federal government. Since the beginning of the 20th century, the Federal Trade Commission (FTC), an independent government agency, has sought to prevent anticompetitive business practices. Within the FTC, the specialized Bureau of Competition oversees the agency's antitrust activities. Working in conjunction with the U.S. Department of Justice's (DOJ) Antitrust Division, the Bureau of Competition fulfills its mission through civil litigation, with mixed results. Unlike the DOJ's Antitrust Division, the FTC's Bureau of Competition may not initiate criminal suits against firms suspected of violating U.S. antitrust law. Thus, the FTC is often seen as a manager, rather than an enforcer.

Legislative Framework

The FTC's creation resulted from early setbacks in the federal government's attempts to prevent uncompetitive behavior in the marketplace. The 1890 Sherman Antitrust Act established the initial legal framework for the federal government's antitrust activity. However, early experience revealed that the courts were uncertain allies in antitrust enforcement. Between 1895 and 1899, a series of Supreme Court decisions (e.g., *U.S. v. E.C. Knight Co.*, 1895; *U.S. v. Trans-Missouri Freight Association*, 1897) seemingly undermined federal antitrust enforcement. Increasing public concern about the corrupting power of large corporations caused progressive reformer President Theodore Roosevelt (1901–09) to increase direct government action against anticompetitive business practices. In addition to instructing his attorney general, Philander C. Knox, to launch lawsuits against large firms such as John Pierpont Morgan's Northern Securities Company and John D. Rockefeller's Standard Oil Trust, Roosevelt expanded the federal government's antitrust administrative machinery. In 1903, he secured congressional approval to establish the short-lived Department of Commerce and Labor. Located within that department was the Bureau of Corporations, the FTC's predecessor. During its 11-year lifespan, the Bureau of Corporations functioned as an information-gathering agency, collecting and distributing detailed analyses of important economic sectors such as petroleum, steel, and labor. However, the bureau had no direct regulatory power.

The election in 1912 of Woodrow Wilson as president of the United States (1913–21) marked a distinct shift in antitrust policy, at least initially. Unlike Roosevelt and his immediate predecessor, President William Taft, Wilson was less willing to confront large corporations, for fear of threatening the business community's confidence. At first, he advocated refining the Sherman Act and making the Bureau of Corporations independent of presidential control as the best means to address public concern about the power of giant corporations. However, domestic political considerations caused Wilson to embrace a new, two-pronged strategy. In addition to supporting congressional efforts to clarify the definition of anticompetitive business practices (which it did with passage of the 1914 Clayton Antitrust Act), Wilson pressed for the creation of an independent investigative body to observe corporate activity and gather information for legislative initiatives. Wilson's call for an independent agency was fulfilled in 1914, with the passage of the Federal Trade Commission Act, introduced by Oklahoma Representative Dick Thompson Morgan, often called the Father of Antitrust.

The agency's duties and authority to fulfill them were enumerated in Sections 5 and 6 of the act. In broad terms, the FTC was charged with preventing "unfair methods of competition in commerce" by gathering information, holding public hearings, filing administrative complaints, and initiating federal litigation. The act also gave the FTC rule-making power (e.g., promulgating regulations) to address concerns regarding industry-wide practices. Subsequent legislation—including the 1950 Celler-Kefauver Act, 1975 Federal Trade Commission Improvement Act, and 1976 Hart-Scott-Rodino Act—clarified and broadened the agency's powers and scope.

Currently, the FTC fulfills its mission by investigating issues raised by consumers and businesses, premerger notification filings, congressional inquiries, or media reports. The agency's records show that most issues it investigates require no official action. When official action is required, the FTC first seeks voluntary compliance from the offending firm by issuing a consent order—a binding judgment detailing a voluntary agreement to modify or stop behavior. Other options include filing an administrative complaint or initiating federal litigation. Administrative complaints are heard in front of administrative law judges, who are increasingly former FTC commissioners. Judgments are reviewed by the full commission and are subject to the regular appellate process, including review by the U.S. Supreme Court. The agency may also address concerns regarding industry-wide practices by issuing legally binding trade rules.

Organization

Five commissioners lead the FTC, all of whom are appointed by the president and confirmed by the Senate. Ideally, commissioners are selected on a nonpartisan basis. In no case, however, may more than three commissioners be selected from the same political party. Commissioners serve seven-year terms, which are staggered to ensure that no more than one term expires each year. However, resignations may result in more than one appointment each year. While serving their term, commissioners may not engage in another business or vocation.

Supporting the commissioners' work is a sizable staff (roughly 1,100) organized into 11 offices and three bureaus. As of the agency's reorganization in 1970, the latter includes the Bureaus of Consumer Protection, Economics, and Competition. The Bureau of Competition's 300 employees are organized by economic sector, function, and geography. Four units focus on mergers; three oversee the FTC's operations throughout the country; four are responsible for anticompetitive practices, compliance, policy coordination, and operations; and one is devoted specifically to health care issues. Working in conjunction with the Antitrust Division of the DOJ and, when appropriate, foreign competition agencies, these units investigate potential law violations and seek legal remedies as required. The Bureau of Competition, as with the agency as a whole, also serves as a resource for U.S. policymakers.

Historical Evolution

The Federal Trade Commission's central mission is identifying and preventing business practices that restrict trade, defraud customers, inflate prices for consumers, or that lead to diminished product and service quality. The FTC's success in fulfilling this mission has varied since its establishment in 1915.

For much of its early existence, the FTC found itself unwilling or unable to contribute much to antitrust enforcement, and until the late 1960s, the agency played a minor role in federal antitrust activities. This early ineffectiveness stemmed in large part from politicized commissioner appointments and subsequent poor leadership. The judiciary, too, hampered the agency's work, as several decisions in the 1920s narrowly interpreted the FTC's mandate and information-gathering powers. In the 1927 *Federal Trade Commission v. Eastman Kodak Company* decision, for example, the Supreme Court rejected the agency's assertion that it had the power to order a firm to divest its holdings to undo anticompetitive asset acquisitions.

The economically tumultuous 1930s were also marked by considerable ambiguity regarding the FTC's work. At the beginning of the decade, the agency was placed in the awkward position of challenging the anticompetitive policies of President Franklin D. Roosevelt's (1933–45) National Recovery Administration. A promising new role for the FTC as enforcer of the 1933 Securities Act—the first major effort to regulate the offer and sale of securities—was cut short in 1934 with the creation of the Securities and Exchange Commission. Further hampering the agency's work during this time was high turnover among commissioners before and during World War II.

However, not all developments during this decade were detrimental. The 1938 Wheeler-Lea Act established civil penalties for violations of the FTC act, and it included "unfair or deceptive acts or practices" as well as "unfair methods of competition" as proscribed activities, thus eliminating the need to show harm to competitors. Notable FTC cases during this period include its victory in 1930 against Famous Players-Lasky (the forerunner to Paramount Pictures) and nine other Hollywood studios for anticompetitive behavior. However, the 1930 Supreme Court decision that resulted from the FTC's action was never enforced because of presidential intervention.

During the 1950s and 1960s, the agency still struggled to define and execute its role in policing anticompetitive behavior. This era started promisingly with two key developments—one legal and one administrative—that provided the foundation for the modern agency. Legally, the

1950 Celler-Kefauver Act reformed and strengthened the 1914 Clayton Antitrust Act by closing loopholes regarding asset acquisitions and acquisitions involving firms that were not direct competitors, thus enhancing the government's ability to prevent vertical and conglomerate mergers. Equally important was President Harry S. Truman's (1945–53) decision in 1949 to fundamentally alter the FTC's chairpersonship. Until Truman's reorganization, the position of FTC chair was rotated annually, and its holder enjoyed no special administrative responsibilities. From 1950 onward, the FTC chair was designated by the president and functioned as the agency's executive and administrative head. These promising developments and important victories in consumer protection notwithstanding, the FTC was generally seen as ineffective, with groups ranging from the American Bar Association to blue-ribbon presidential commissions critical of its narrow focus, misallocated resources, and what was perceived as mediocre personnel.

The consumer protection movement that peaked in the 1970s affected the FTC favorably. During this period, the agency conducted over 800 official antitrust investigations. The firms scrutinized represented a wide range of economic sectors, from textiles and food distribution to automobile manufacturers and computer companies, and included icons of American business such as Beatrice Foods Company and the United Fruit Company (1970); Georgia-Pacific and Xerox (1973); Exxon and the Kellogg Company (1974); the Avis, Hertz, and National car rental companies (1975); General Motors Corporation and Levi Strauss & Co. (1976); Boise Cascade (1978); and Eli Lilly and Company (1979).

The agency's agenda during the 1970s was ambitious, controversial, and by the end of the decade, increasingly at odds with economic, legal, and public opinion. The ascendency in the 1970s of the theories advanced by the Chicago School called into question the economic basis of the U.S. government's antitrust policies, while a new generation of judicial appointments embraced comparatively narrow preferences for antitrust intervention. President Ronald W. Reagan's administration (1981–89) marked a return of government apathy toward regulation. For the FTC, the 1980s were marked by retrenchment. As the agency's 1981 annual report notes, focus shifted from industry-wide projects to more precisely defined investigations, the resolution of which would result in concrete benefits. This shift was reflected in the issuance of new DOJ merger guidelines in 1982 that laid the foundation for the agency's "fact intensive" approach toward examining potential antitrust violations. The agency's dramatically reduced budget and staff from 1980 to 1992 reflected its declining importance.

Since the mid-1980s, the FTC has pursued a "middle ground" approach toward antitrust enforcement, based on fundamental priorities that include prioritizing the welfare of consumers over that of shareholders of corporations or competitors, accepting as essential the role of economic analysis to inform the design and application of legal rules, and focusing on horizontal rather than vertical mergers. Important cases from 1982 onward, such as those against General Motors Corporation (settled in 1984), Cardinal Health (settled in 1988), the office supply superstore Staples (settled in 1997), Toys "R" Us Inc. (settled in 2000), Bristol-Myers Squibb (settled in 2009), Coca-Cola (settled in 2010), the computer-chip manufacturer Intel (settled in 2010), and the computer hardware manufacturer Western Digital Corporation, embody this middle-ground philosophy.

Antitrust, U.S. Department of Justice

Since the end of the 19th century, the U.S. federal government has sought to protect economic freedom and opportunity by promoting free and fair competition in the marketplace. Legislatively, the framework for the federal government's antitrust activities was established in the late 19th and early 20th centuries. Administratively, this antitrust mission has resulted in the creation of a specialized unit within the U.S. Department of Justice (DOJ), the Antitrust Division. The division uses criminal suits and civil litigation to fulfill its mission, with mixed results. Early uneven, and often unsuccessful, efforts to thwart collusion within the marketplace evolved into more clearly defined and effective activity by the mid-20th century.

Legislative Framework

In the late 19th century, concentration in the U.S. petroleum, railroad, and steel industries had produced widespread consumer abuse, including open collusion among companies and price fixing. Public frustration with railroad and petroleum trusts caused the passage of the 1890 Sherman Antitrust Act. Articles one and two of the act declared illegal all contracts "in restraint of trade" (i.e., monopolistic practices), including agreements made between U.S. and overseas corporations. Articles six and seven of the act outlined the federal government's main enforcement mechanisms: the power of the U.S. circuit courts to seize property illegally acquired through collusion, and civil litigation.

Two decades of subsequent litigation revealed the need for additional antitrust legislation. While the 1890 Sherman Act left to the courts the task of interpreting and defining illegal behavior, the 1914 Clayton Antitrust Act was more explicit. Designed to prevent anticompetitive practices in their infancy, the act specified prohibited conduct (such as price fixing), provided a specific enforcement scheme, and detailed exceptions to and remedial measures for the federal government's antitrust activities. Subsequent legislation (the 1936 Robinson-Patman and 1976 Hart-Scott-Rodino Antitrust acts) amended, but did not substantially change, the general provisions of the act.

Organization

From humble origins, the DOJ's antitrust operations have increased in size and complexity. Initially, the U.S. attorney general oversaw antitrust actions. In 1903, as a result of President Theodore Roosevelt's emphasis on government regulation as a means to curb abusive business practices, the office of the assistant to the attorney general was created. Until 1933, the assistant to the attorney general handled all antitrust matters. In 1933, President Franklin Roosevelt created the foundation of the current DOJ antitrust administrative structure by establishing the Antitrust Division.

An assistant attorney general heads the Antitrust Division and is assisted by five deputies. The division's antitrust work is divided between 14 litigating and seven specialized components. Seven Washington, D.C.-based sections are responsible for the bulk of the division's civil and criminal investigative activity and litigation, and include the National Criminal Enforcement Section; the Economic Analysis Group; enforcement sections for networks, technology, telecommunications, and media; and a section devoted to transportation, energy, and agriculture. Of the seven current field offices, only three—Chicago, New York, and San Francisco—were to remain open past 2013. The division's specialized components include an Appellate Section, the representatives of which handle all legal appeals, and sections for foreign commerce and legal policy.

Early History

The DOJ's early attempts to prevent multi-firm anticompetitive conduct produced mixed results, in large part because of the Sherman Act's narrow language. For example, in 1892, the American Sugar Refining Company threatened to monopolize the U.S. sugar industry through a merger with the E. C. Knight Company and several sugar firms. Citing the fact that the merger would allow the company to gain control of 98 percent of the U.S. sugar market, President Grover Cleveland directed the DOJ to sue to prevent the acquisition. At issue was whether the federal government could suppress a monopoly in the manufacture of a good, as well as its distribution. In 1894, the U.S. Supreme Court took up the Sugar Trust Case, and it issued a resounding defeat for the government in January 1895. The Court concluded that it was the responsibility of individual states to take action against manufacturing monopolies, not the federal government. The ruling prevailed until the end of the 1930s, when the Court shifted its position on the federal government's power to regulate the economy.

Although the 1895 Sugar Trust Case limited the DOJ's ability to prosecute out-of-state manufacturing monopolies, subsequent antitrust cases challenged this view. The cases of *U.S. v. Trans-Missouri Freight Association* (1897) and *Addyston Pipe and Steel Company v. U.S.* (1899) introduced the idea that the Sherman Act was enforceable whenever a firm's goods crossed state lines. The Court's 1905 decision in *Swift v. United States* confirmed this opinion. In 1902, the DOJ filed charges of restraint of trade against Swift & Company for using artificial bids to inflate meat prices. The company's arguments centered on the fact that its plants operated wholly in three states (Missouri, Nebraska, and Minnesota), and thus were not subject to the Sherman Act. The Court rejected this argument. Even though meatpackers' activities were geographically local, the Court concluded that they had an important effect on the "culture of commerce" because their products shipped across state lines and thus were subject to federal regulation.

The DOJ met with greater success in its early efforts to prevent the creation of potential, or dismantle existing, monopolies. A series of high-profile cases confirmed the federal government's power to prevent one company from acquiring numerous others, even if the company had used legal means to do so. In *Standard Oil Co. of New Jersey v. U.S.* (1911), the Court stated and applied its doctrine of the Rule of Reason, which stated that multi-firm action that unreasonably restrained trade was subject to action under antitrust law, but that possession of monopoly power was not inherently illegal. In the same session, the Court further clarified the scope of the DOJ's authority in *U.S. v. American Tobacco Co.*, deciding that the mere possession of a monopoly was not illegal, but that its unreasonable acquisition and maintenance was.

A final watershed case taken up by the DOJ before the twin crises of the Great Depression and World War II was that of the Appalachian Coal Company, a consortium of more than 100 firms that the DOJ accused of conspiring to fix prices among coal producers in four states. The key point to the case was the fact that the government sought to prevent the consortium's formation, arguing that its creation would reduce or eliminate competition between companies at the expense of the consumer. In its 1933 decision, the Supreme Court checked the DOJ's authority to take preemptive action, ruling that the government had not provided sufficient evidence of detrimental impact on the market. In doing so, the Court reconfirmed its position that the federal government need to demonstrate "a definite factual showing of illegality."

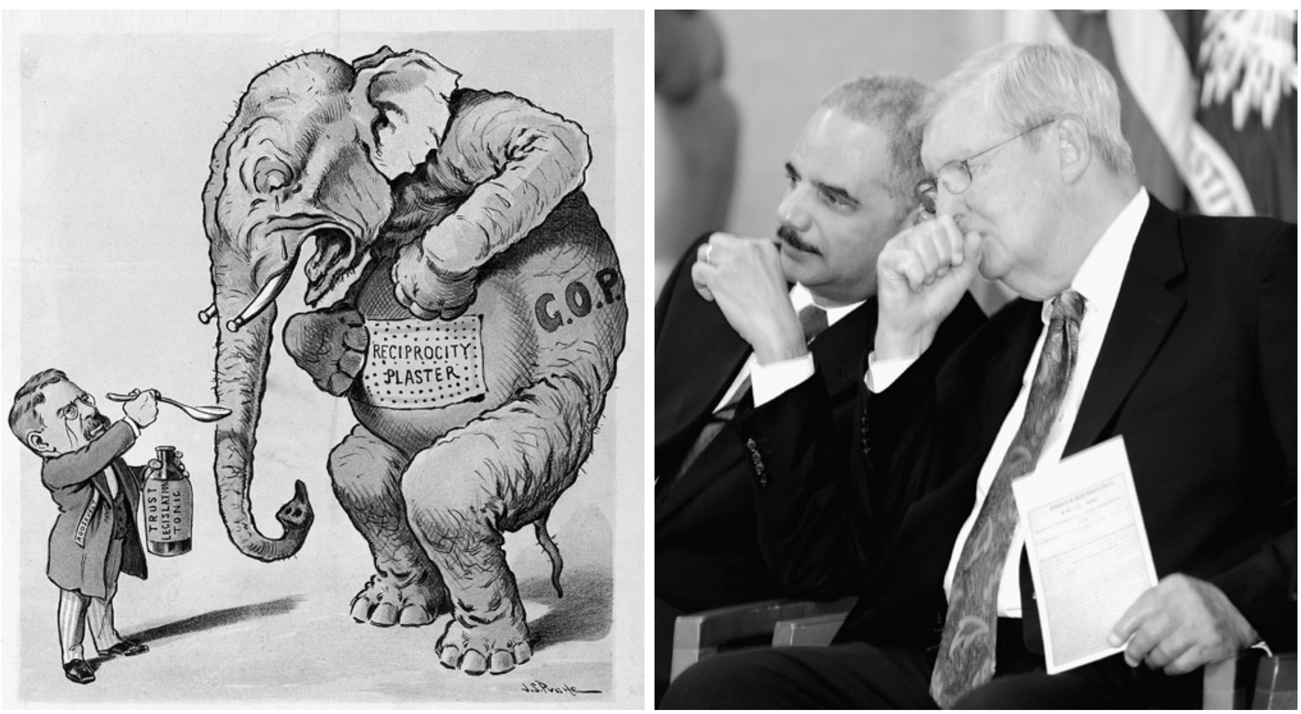
Greater Antitrust Enforcement

After a lull that included most of the 1950s, the DOJ increased its antitrust enforcement in the 1960s and 1970s. The result was a series of high-profile cases in which it brought antitrust action against some of the icons of American business. Among the earliest actions was the 1961 Heavy Electric Antitrust Case, considered the most serious violation of antitrust laws since the Sherman Act's inception. The DOJ's litigation stemmed from the discovery in 1959 of evidence that manufacturers of heavy electrical equipment, including General Electric and Westinghouse, had conspired to fix prices, rig bids, and divide markets on the sale of equipment to the Tennessee Valley Authority, the largest supplier of electricity in the United States at the time. Eventually, the DOJ indicted 45 defendants from 29 corporations on criminal charges, all of whom pleaded guilty or no contest. Sensational at the time, the case nonetheless highlighted the practical limitations that the DOJ faced. Contravening the Sherman Act was deemed a misdemeanor offense, which meant that the legal sanctions for doing so were relatively minor. Moreover, in subsequent congressional testimony, industry executives demonstrated the widespread belief that their actions were not criminal. It was not until the mid-1970s that Sherman Act violations were reclassified as felonies.

The mid-1970s and early 1980s witnessed the high watermark of the DOJ's post-1945 antitrust litigation, as exemplified by its cases against the telephone giant American Telephone and Telegraph (AT&T) and equally iconic International Business Machines (IBM). The filing in 1974 of an antitrust lawsuit against AT&T culminated eight years later in a settlement that resulted in the largest divesture in history, the Bell System divestiture. The result was a fundamental transformation in the nation's telephone services. However, the Justice Department's victory against AT&T proved to be its last substantial victory for nearly two decades. During the administrations of Presidents Ronald Reagan and George H. W. Bush, resources for antitrust enforcement remained static, and the Antitrust Division's workload declined from 377 cases in 1980 to 176 in 1992. This period's political conservatism in federal enforcement was exemplified by the Justice Department's decision in 1988 to drop its 13-year suit against IBM. Faced with limited resources, little political support, and a noninterventionist Supreme Court, the Justice Department spent most of the decade prosecuting large horizontal mergers (firms within the same industry and at the same level of production), while ignoring the greatest increase in corporate acquisitions in U.S. history.

Modern Policies

Vigorous antitrust enforcement resumed in the mid-1990s, but major victories eluded the Justice Department's attempts to revitalize its reputation through high-visibility cases, as the litigation against the General Electric Company (GE) and Microsoft demonstrates. In 1994, the case against GE for conspiring to fix the world price of industrial diamonds was dismissed for lack of evidence. Although the Justice Department's prosecution of the software giant Microsoft resulted in a legal



Antitrust enforcement at the U.S. Department of Justice, then and now: An illustration in the March 4, 1903, issue of Puck *(left) depicts President Theodore Roosevelt giving the Republican elephant a spoonful of "trust legislation tonic." That year, the president's emphasis on government regulation to curb corporate abuse led to the creation of the office of the assistant to the attorney general. At the Sherman Award Ceremony on April 10, 2012 (right), U.S. Attorney General Eric Holder talks with award recipient James F. Rill, a high-profile antitrust attorney who has served as assistant attorney general in charge of the Department of Justice's Antitrust Division.*

victory of sorts, its settlement with the company was criticized by 9 of the 20 states that joined the suit as not going far enough to curb the company's anticompetitive business practices.

The "hands-off" (i.e., antiregulatory) policies of the George W. Bush administration marked a substantial decline in the Justice Department's antitrust activities. From a high of 63 in 2000, the Justice Department filed an average of 39 criminal cases from 2002 to 2009. Major mergers, such as that of Whirlpool and Maytag (with a combined market share of 70 percent) in 2006, went unchallenged. In the rare instances when the Bush administration challenged mergers, such as that between the software companies Oracle and PeopleSoft in 2004, federal courts rejected the efforts. The administration's hands-off approach culminated in 2008 with the Justice Department's publication of official guidelines that detailed its rationale for minimal antitrust enforcement. Anticompetitive conduct was too difficult to distinguish from lawful conduct, according to the guidelines, and enforcement would result in over-deterrence. The single important exception to the administration's reluctance to prevent uncompetitive behavior was its vigorous anticartel enforcement.

Since 2009, the scale and scope of the Justice Department's antitrust activities have increased once again. From a low of 32 in 2005, the department filed an average of 74 criminal cases annually during the first three years of President Barack Obama's administration. Criminal and civil cases have been brought in a range of important industries and high-profile firms, such as air transportation (Air France, KLM Royal Dutch Airlines, EL AL), airline mergers (United Airlines and Continental Airlines), electronics (LG Display Company, Sharp Corporation, and Epson Imagining Devices Corporation), banking and finance (Bank of America, American Express, MasterCard, and Visa), telecommunications (Comcast Corporation and Verizon Communications Corporation), and health care (Blue Cross and Blue Shield of Michigan and New West Health Services Inc). More rigorous enforcement has resulted in dramatic increases in the duration of prison sentences given and amount of fines levied.

Arbitrage

Arbitrage is a market-based strategy that relies on imbalances between markets to create profit. Most transactions rely on changes in underlying value to create profit. A traditional buy-and-hold strategy relies on growth in the value of the underlying asset, such as a stock or commodity. This exposes the investor to the risk that market value will drop and rewards the investor if the market price rises. Another classic investment strategy is to buy goods in one market and transport them to another market with better prices. A colonial mercantile system exemplifies this strategy. On each leg of the trade, the merchant accepts risks, such as of market change, natural disaster, or government intervention. Most significantly, the merchant physically moves goods from a location of surplus to a location of scarcity. In these cases, the acceptance of risk is necessary for the reward of profit. In the latter case, the investor also adds value through transportation. Arbitrage strategies involve transactions between imbalanced markets to generate profit based on market inefficiencies, rather than underlying value or relative scarcity. True arbitrage involves zero-risk transactions that are structured in a way that does not expose the arbitrageur to market fluctuations during the transaction period.

A true arbitrage strategy can be used on any financial market from currency exchange to stock exchange to sports betting. Consider the following simplified currency triangle arbitrage. A trader with an initial position of $1 million sees an arbitrage condition in the pricing of dollars, euros, and yen in three different currency markets. The exchange rate in the first transaction of dollars to euros is 0.7998, giving a new position of 799,800 euros. The exchange rate in the second transaction of euros to yen is 98.5392, giving a new position of 78,804,454 yen. In the final transaction, the trader converts the purchased yen back to dollars at a rate of 0.0137, giving a final position of $1,000,817. This is a relatively small basis point (BP) increase of 0.817 BPs. Frictional fees imposed by currency exchanges or governments could easily erase this gain; however, in this case, these fees have been built into the exchange rate. Still, even minor market fluctuations during the transaction can produce disproportionate risk to the arbitrageur. The absence of planned risk and simultaneous or nearly simultaneous transactions are chief tenets of true arbitrage.

Risks of Arbitrage

Arbitrage is not illegal; however, it is particularly vulnerable to insider trading because it emphasizes short-term, low-risk transactions. The Securities Exchange Act prohibits covered persons (e.g., directors, corporate officers, and shareholders) from profiting from arbitrage transactions on short-swing speculation. The Securities and Exchange Commission (SEC) defines insider information as “material, non-public information.” The use of such information in covered transactions is illegal under various laws, rules, and SEC regulations. Since the nature of arbitrage is to act in more than one market, market rules—and even single-jurisdiction laws—do not control the activity well. Even informal controls do not restrain arbitrage. Profit without risk is the goal of agents in the market. Actors in the market attempt to make profit without risk and consequently defend arbitrage as a functional part of the market that keeps imbalances to a minimum while richly rewarding the innovators that fulfill the function.

With this is mind, arbitrage is a legitimate goal, infrequently attained through illegitimate means. In his strain theory, Robert Merton defined this convergence as “innovation.” The business world generally agrees with this assessment. It is only the flagrant violations of business norms, or the relatively few clear violations of law like insider trading or illegal schemes used to fund an arbitrage strategy, that are considered white-collar crime.

It is common for business “innovations” to become increasingly regulated as the perception of imbalance or unfairness increase. Until the 1980s, insider-trading rules were rarely enforced. Financier Ivan Boesky was a famous proponent of arbitrage strategies at this time. His basic technique is now called risk arbitrage but is more properly a type of risk arbitrage termed “mergers and acquisitions arbitrage.” He was eventually convicted of insider trading for using tips from sources within the merging companies.

Michael Milken, another well-known financial innovator of the 1980s, pioneered high-yield bonds, also known as “junk bonds,” which proved a successful source of funding for aggressive takeovers of large companies not normally seen as targets for takeover. Milken was implicated in Boesky’s merger arbitrage insider-trading scandal but was eventually convicted of securities and tax violations. Neither Boesky nor Milken was ever convicted for benefiting from arbitrage; rather, they were convicted of crimes facilitating a new, unregulated innovation: arbitrage. Boesky’s innovations allowed a wider domain for arbitrage but allowed risk not previously accepted in arbitrage because in classic arbitrage strategies, risk is held to a minimum. The lesson taken from Boesky’s conviction was to be more careful about information sourcing when planning arbitrage. It was not seen to indicate that innovations like risk arbitrage were wrong.

Types of Arbitrage

Arbitrage manifests itself in many applications, with varying degrees of risk. There are too many examples to enumerate, and it can be difficult to distinguish investment from arbitrage, but a few examples in common use can help establish the range of arbitrage. Time-based or “event-based” arbitrage violates basic arbitrage tenets about nearly simultaneous transactions and brings substantial risk from historical events. Risk arbitrage violates basic tenets about risk to expand the pool of arbitrage conditions. From true arbitrage to the various subtypes, arbitrage stresses rapid exploitation of what are often transient imbalances in markets. Even though true arbitrage is often defined as having no risk, some general risks apply to most arbitrage strategies. Risk can enter before arbitrage begins. Potential arbitrageurs may make incorrect assumptions about the transferability or equivalency of assets between markets. Commodities like coffee may be materially different between markets and not exchangeable. Similarly, bonds and other securities may not be completely equivalent; what appears to be a favorable arbitrage situation may actually be a market-balanced relationship between nearly equivalent items.

Because of arbitrage's inherent risks, arbitrageurs have again innovated and sought synthetic assets rather than stocks, commodities, or simple financial instruments. Synthetic investment instruments are fungible and have determined properties combined with potentially rapid profits. The use of hedging strategies like credit default swaps and short positions is a common risk-mitigation strategy in the trade of synthetic assets, but it exposes the arbitrageur to counterparty risk, the risk that the other side of the deal will default on the deal. Examples include an uncovered margin call, failure to deliver a security, or default on one of the synthetic assets traded or used as a hedge, like a credit default swap.

In one case, Bear Stearns was a highly leveraged investment bank and securities trading company that accepted government bailout funds and was eventually sold to J. P. Morgan Chase because of the systemic shocks. Even hedged risk can actualize during a systemic event. Hedging naturally violates the requirement of nearly simultaneous transactions because a hedge requires failure and a response. This exposes a potential arbitrage transaction to event-based risk, as happened to Bear Stearns, and to counterparty risk.

Given greater risk, the financial markets may lose confidence in an arbitrage opportunity, forcing margin calls or restricting access to capital. There is increasing interest from Congress and the SEC to regulate complex financial instruments and some of the more abusive strategies like naked short selling.

The relatively small margins in arbitrage often necessitate high-volume transactions, which magnify counterparty risk. A counterparty with many transactions pending may face too much risk. If too many credit defaults become due, the counterparty may have no choice but to default. Such a default may leave an arbitrageur with an un-hedged risk, or with an investment stranded on one leg of a triangle trade. This makes systemic shocks particularly risky to arbitrageurs. Systemic shocks can destabilize large players in financial markets. For example, large retirement funds like the California Public Employees' Retirement System (CalPERS) may lend securities to short sellers. Short selling may be part of an arbitrage strategy. If CalPERS decided to change its normally stable position in response to a systemic shock, it could disrupt the ability of an arbitrageur to hedge against certain risks. This may again lead to an arbitrage failure because of margin calls, delivery demand, or restricted access to capital. Another risk faced in arbitrage is simple delay. Again, the high volumes at work magnify this danger. An arbitrageur in a perfectly functional arbitrage deal, with a clear expectation of profit, may be affected by a lack of liquidity or lack of capital. A large arbitrage deal may face delays that leave the arbitrageur unable to make a margin call on a relatively small or temporary price fluctuation.

Risk and Regulatory Arbitrage

The concept of arbitrage has been broadened in common use to include any strategy based on imbalanced markets or financial conditions. This is sometimes called risk arbitrage. The terminology of arbitrage changes rapidly and is often imprecise in common usage. Subtypes of arbitrage are defined by the markets to which they are applied and the types of risk incurred. Merger arbitrage involves balancing the difference between a proposed cash offer for the stock of a target company and the current market price. In a cash acquisition, an offer is made by the acquiring interest. This offer is usually in excess of the current market price. This price differential creates arbitrage opportunities, but the opportunities carry risk. In terms of pure price, it is arbitrage, but events may change the character of the financial transactions. For example, a company with a stock trading at $7.50 is targeted for a cash acquisition. The initial offer price is given at $10. An arbitrageur can purchase stock available at the lower price and realize a profit when the higher price goes into effect. Events surrounding the merger may influence the course of this transaction. If the merger fails, the price may drop or fail to increase. In this case, risk can be reduced through hedging, and even short sale strategies, but risk still applies, making true arbitrage impossible.

The concept of arbitrage has also been popularly broadened to include imbalances in practice or under the law or regulation. In heavily regulated industries, the concept of arbitrage has been applied to practices used to balance resources controlled by regulation. It can also be a euphemism for avoidance of regulation. Regulatory arbitrage is most commonly associated with questionable, but legal, practices used to circumvent capital reserve requirements placed on banks. The nature of the capital reserve (e.g., cash reserves or securities) determines the ratio of reserve requirements, but 10 percent is a good simplification. Banks can both receive deposits and lend money. Regulations require banks to reserve 10 percent of their assets (including deposits). These reserves cannot be lent, which limits the multiplier effect. At 10 percent reserves, a bank can increase the total money supply by 10 times. Starting with a deposit of $100, 10 percent is reserved, but $90 can be loaned out for profit. At some point, that $90 is deposited back into the banking system (any bank, but it is convenient to assume placement back in the same bank). After nearly 100 transactions of this nature, progressively increasing the reserve to the full $100, the amount of capital operating in the financial system has gone from $100 to $1,000. Even small amounts of increases in the bank's initial capital may greatly increase the opportunity to lend.

A bank may move its internal assets into other financial structures through sale or contract to bolster its "reserve assets." This allows the bank to profitably lend the cash equivalent of the asset/security. Regulatory arbitrage also explains the paradoxical actions of outsourcing in some major banks. By selling a division and contracting that same division at a greater amount than was previously paid, a bank creates internal reserves but pays out operating expenses. The result is a greater sum eligible for lending at a potentially higher profit. The reduction of default risk reserve requirements through credit default swaps and structuring bank assets into more favorable categories does not currently violate regulations, but it does increase systemic risk. Default risk reserves are designed to add a buffer against bad loans; regulatory arbitrage often increases systemic risk by spreading risk beyond the balance sheet of the bank.

Archer Daniels Midland Co.

The Archer Daniels Midland (ADM) Company was formed in 1923 after the Archer Daniels Linseed Company (founded in 1902 by George A. Archer and John W. Daniels) acquired Midland Linseed Products Company. Based in Decatur, Illinois, the company has become one of the leading food processing companies, primarily producing ingredients used in the food, beverage, and animal feed industries, including cocoa products, corn products like starch and syrup, processed sugars, and oils and oil meal. In 2007, it allocated resources to enter the biofuel industry as that market expanded rapidly.

Price-Fixing Investigation

In 1996, ADM was the subject of the largest price-fixing investigation in history. ADM operated several price-fixing schemes that cost consumers millions of dollars through inflated prices for products such as soft drinks, detergents, and poultry. Senior executives were indicted on criminal charges of price fixing in the international lysine market. Lysine is one of the 20 amino acids normally found in proteins. It is an essential amino acid. Lysine is one of the most widely used feed supplements worldwide.

ADM and four other companies, two each from Japan (Kyowa Hakko and Ajinomoto) and Korea (Sewon and Cheil Jedang Ltd.), produced lysine for the global market. Instead of competing with each other, two executives at ADM talked competitors into forming an "amino acids association." The five companies agreed on how much to charge their customers for lysine and how much each producer was permitted to sell annually, therefore engaging in an extremely lucrative, yet criminal, price-fixing scheme. The businessmen knew that what they were doing was criminal but did not seem to care. The executives involved in the alliance made a rational choice to commit the crimes after analyzing the strategy and circumstances relating to the costs and benefits of their actions. Their meetings were often held at hotels outside of the United States, and company phones were never used to discuss the scheme. They did everything possible to keep the price-fixing conversations and meetings secret until a former president of ADM's bioproducts division, Mark Whitacre, became an informant for the Federal Bureau of Investigation.

Whitacre secretly made audio and video tapes of ADM meetings over the course of two and a half years. Whitacre was arrogant and committed other criminal acts, including embezzlement and fraud, yet refused to accept a plea bargain that would have given him a sentence of only six months. He was sentenced to nine years in prison and had to pay $11.4 million in restitution to ADM. He was also sentenced to serve 30 months for price fixing, on top of his nine-year sentence for fraud. Michael Andreas, vice-chairman; Terrance Wilson, ADM executive; and Mark Whitacre were each fined $350,000. Andreas was sentenced to three years in prison, and Wilson received a 30-month sentence. ADM was fined $100 million, the largest antitrust fine ever at the time. ADM also paid $400 million to settle a class-action antitrust suit. Neither the chief executive officer (CEO) nor the president of ADM was pursued criminally. Even though it was ruled that Whitacre was in charge of the price-fixing conspiracy, the government's investigation identified over 49 executives who had participated. The Japanese and Korean corporations were sentenced to pay fines ranging from $1.25 to $10 million. Three executives from the Japanese and Korean corporations were sentenced to pay fines ranging from $50,000 to $75,000.

On the Rebound

ADM was subsequently the defendant in multiple federal air-pollution lawsuits and has been criticized as being one of the leading commodities traders profiting from rainforest deforestation. In 2003, after government complaints about ADM's attempts to avoid several requirements of the Clean Air Act, the company paid out about $11 million in penalties and environmental donations, while agreeing to a significant overhaul of 42 of its plants. It has since studied the possibility of underground carbon dioxide disposal.

ADM has been criticized for lobbying very aggressively for corporate welfare in the form of price supports and agricultural subsidies, especially for grain, corn, ethanol, and sugar. Its biofuel venture has also been criticized: the fuel may have as much of an environmental impact as fossil fuels, which is only more price-stable than gasoline because of tax subsidies for production.

The company has prospered since the price-fixing case. According to *Fortune's* 2009, 2010, and 2011 lists of most admired companies, ADM is the most admired company in the food production industry. Each year, ADM contributes millions of dollars to various civic and charitable causes, including groups working to eradicate hunger and improve education and relief services in operating communities worldwide. Even Mark Whitacre, the ex-chief executive officer and convicted fraudster, has moved on with his life, holding the position of chief operating officer and president of operations at Cypress Systems Inc., a producer of high-selenium yeast since 1979. His story was the inspiration for the 2009 movie *The Informant* starring Matt Damon.

Art Fraud

Art fraud is a unique type of forgery, usually defined as the creation and attempted sale of an object falsely purporting to have the history of production requisite for the origin of the work. It is considered the creation of works of art that are falsely attributed to other, usually more famous, artists. Three distinct types of fraudsters are the creator, the medium, and the buyer who is aware of a work's lack of authenticity but fails to make this known. Incidents of artistic imitation have been recorded since the classical period, but the pattern has not been replicated to the same extent or at the same frequency across the centuries. Its motives and methods of execution have evolved. Art fraud can be lucrative; however, modern dating and analysis techniques have rendered the potential identification of forged artwork much simpler.

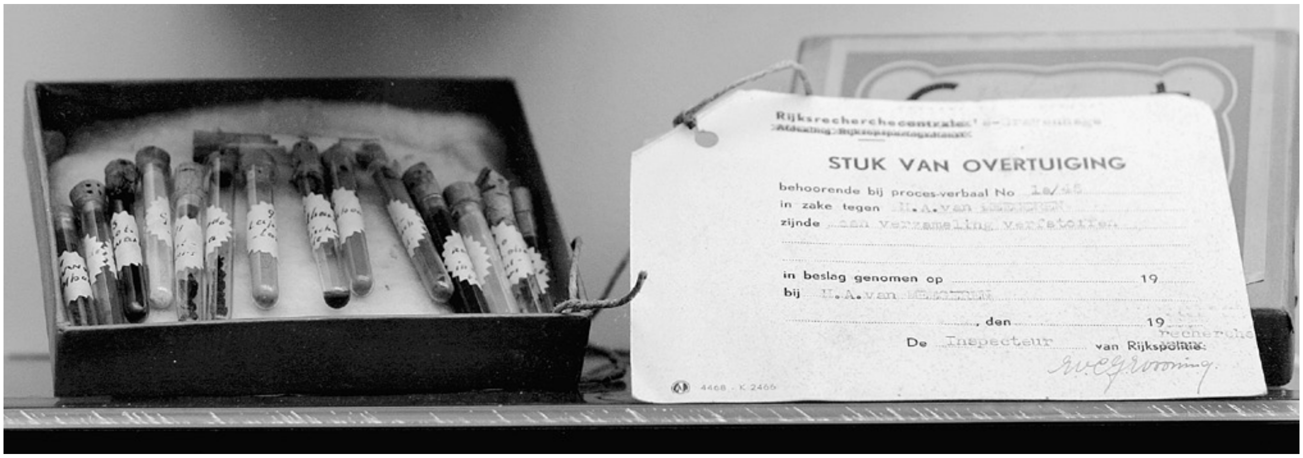
History of Art Fraud

Initially, Romans created bronze and marble copies of famous Greek sculptures, which were in high demand during the 2nd century C.E. The form of this phenomenon as recorded was not to deceive regarding the creator of the item, but rather to admire his creations. During the classical period, art was created for historical reference, religious inspiration, or, more simply, aesthetic enjoyment. Consequently, the identity of the artist was often of little importance to the buyer. The Renaissance led to what is today known as the cultural commodity, through the market's rules of supply and demand. The economies of scale created the first competitive markets, where the authenticity and the uniqueness of the item increased its price. During this period, painters took on apprentices who studied painting techniques by copying the works and style of the master. The master would then sell these paintings as a form of payment for the tutoring, which was perceived as a tribute and an aspect of artistic education.

The world's wealth was greatly redistributed following the Renaissance; this created a fierce demand for art among the prosperous, emerging middle class. At the end of the 14th century, Roman statues were unearthed in Italy, which intensified the populace's interest in antiquities and led to a vast increase in the value of these objects. Through the transformation of art into a commercial commodity, bound by the fundamental economic principles of scarcity and desirability, the monetary value of an item became dependent on the artist's identity. These new conditions required that the artists mark their items, and these marks later evolved into signatures of the items. Consequently, the artist's signature became a crucial mark of authenticity and value.

Present Form and Means of Detection

Allegations regarding the involvement of dealers in incidents of art fraud mention that art dealers and auction houses have been extremely eager to accept forgeries as genuine, then sell them quickly in order to turn a substantial profit. If a dealer finds that the work is a forgery, he may quietly withdraw the piece and return it to its previous owner, giving the forger an opportunity to sell it elsewhere. Forged art may constitute up to 40 percent of the art market. The scale of traffic in looted antiquities is considered second only to that of drug smuggling in terms of annual turnover. Moreover, antiquities are at present relatively easy to market—they are highly fungible assets, and hence are very suitable as a medium for money laundering. The appropriate legal remedies include the United Nations Educational, Scientific and Cultural Organization (UNESCO) Convention of 1970 on the means of prohibiting and preventing the illicit import, export, and transfer of ownership



The Museum Boijmans van Beuningen, Rotterdam, the Netherlands, displays evidence—including a collection of pigments—used against Han van Meegeren in his 1947 trial. During the trial, in which he was charged with creating and selling forged Johannes Vermeer paintings, he spent six weeks forging an original Vermeer under the surveillance of journalists and court-appointed witnesses. Van Meegeren's "Vermeers," worth a total of $60 million, became valuable in their own right and in turn attracted other forgers.

of cultural property. At least it provides a framework whereby the government of the country of origin can request the return of looted antiquities.

Forgers are usually proficient in the type of art that they are trying to imitate. Many forgers used to be fledging artists who did not succeed in the market and ended up in forgery. Another common method of forgery is to borrow an original item in order to create a copy, and later return the copy to the owner, keeping the original. A last category of forgers includes the ideologists who wish to demonstrate the fake images that are dominant in the art world. These artists deny that they have performed a criminal act, and they usually define it as a hoax. One theory contemplates that the fact that art crimes are difficult and costly to prosecute means that potential fraudsters will be further encouraged to commit the crime; if one acts as if bound by the rational choice theory regime, it would be irrational not to commit this type of crime.

Depending on the expertise and the talent of the forger, various techniques might be employed in order to detect the fraud committed. The most traditional way to confirm the authenticity (and value) of a work was the artist's *catalogue raisonné* (methodical catalog of the artist's work). Omission from an artist's catalogue raisonné could severely damage the proof of authenticity. The fact that experts do not always agree on the authenticity of a particular item makes the matter of provenance more complex. Some artists have even accepted copies as their work, whereas sometimes work previously declared a forgery is later accepted as genuine. Restoration of items may also be so extensive through the supplement of new materials that the identification of work can be more difficult. Technological means are now used to detect fraudulent items more efficiently. A thorough examination—or Morellian analysis—often reveals various inconsistencies when compared to the original work. Forensic authentication is also used, through X-ray images that reveal any other images underneath the primary surface of the painting, or it may show that particular colors or techniques that were not used in the particular artist's era were used in the painting. Other detection techniques include carbon dating, ultraviolet fluorescence, infrared analysis, atomic absorption spectrophotometry (AAS), inductively coupled plasma mass spectrometry (ICP-MS), and digital authentication.

Famous Case Studies

A famous historical case of this crime is the *Dio d'amore dormente,* or "sleeping cupid," which involved Michelangelo carving a life-size cherubic figure in 1496 and treating it with acidic earth to achieve an ancient result. It was sold to Baldassare del Milanese, who sold it to Cardinal Riario of San Giorgio, who became aware of the fraud and demanded his money back. Another example includes the 16th-century imitators of Albrecht Durer, who copied his style of printmaking in order to increase the value of their prints. In his engraving of the Virgin, Durer added the inscription "Be cursed, plunderers and imitators of the work and talent of others."

Possibly the most famous forger of the 20th century was Han van Meegeren, a Dutch painter who sold what he said was a previously undiscovered Johannes Vermeer painting to Herman Göring. After the end of World War II, van Meegeren was tracked down by the Allied Art Commission. Van Meegeren's initial charge, of which he was innocent, was far worse than that of which he was eventually found guilty, because treason meant possible execution, whereas being guilty of obtaining money by deception incurred a single year of imprisonment. In reality, van Meegeren had forged a total of six additional "Vermeers" worth $60 million. No one believed his works were fakes, which resulted in him spending six weeks forging a painting of an original Vermeer under the surveillance of journalists and court-appointed witnesses. Van Meegeren's work became valuable as well, which attracted other forgers.

In May 1992, a conference was held in Athens to determine the authenticity of the Getty *kouros*. It was originally bought by the J. Paul Getty Museum in California in 1983; the assumed origin of the 6th century was pending verification. The main doubts were that it has no known provenance, and that it was the only piece of its kind that came from the island of Thasos that was made from marble. Eventually, scientific analysis of the marble proved that it originated from the right place; however, the conference failed to solve the problem. Although most art historians and archaeologists denounced it, the scientists present believed the statue to be authentic.

Art fraud greatly evolved during the 20th century, favoring artists such as Salvador Dali, Pablo Picasso, Paul Klee, and Henri Matisse, who were often targets of forgery. A recent case occurred on October 27, 2011, when a group of four German art forgers was sentenced to 15 years in prison. The group was accused of selling 44 fake paintings by Max Ernst and Andre Derain, for a total of 16 million euros over the past decade. Many dealers, museums, and art collectors were deceived, believing that the previously unknown masterpieces had been hidden for years by two Cologne collectors and survived through the Nazis.

Arthur Andersen LLP

Arthur Andersen LLP was one of the Big Five accounting firms before going out of business in 2002 because of a criminal conviction for obstruction of justice in an investigation of its client, energy company Enron. Arthur Andersen's history of integrity ended in the 1990s with numerous legal settlements for auditing companies engaged in large-scale financial impropriety. In one such case, a court permanently enjoined (prohibited) Arthur Andersen from engaging in misleading or fraudulent audits. In spite of this background, the obstruction case is sometimes seen as controversial because it led to the layoff of 85,000 employees worldwide. The conviction was later overturned by the Supreme Court because of the wording of jury instructions, a decision people wrongly interpret as evidence that Arthur Andersen was innocent.

Shady Clients, Tainted Reputation

Arthur Andersen began as an accounting firm in 1913. The firm's mantra "think straight and talk straight" reflected Andersen's belief in honest accounting and duties to the investing public, rather than to company management. After Andersen's death in 1947, the firm started to change and expand more rapidly, to the detriment of training and adherence to the founder's values. Later changes in the business environment diminished the importance of auditing relative to consulting, which is more focused on client service than on the public interest. Consultants are more willing to go along with client demands in order to retain the lucrative consulting income.

Although all big accounting firms have participated in legal settlements, Arthur Andersen stands out in both the number of settlements and the scope of its clients' wrongdoing. They generally denied wrongdoing while agreeing to the settlements. Benjamin Franklin Savings, a Houston savings and loan (S&L), closed in 1989 at a cost of nearly $1 billion to taxpayers. The government said that Andersen's role involved "extensive malpractice and negligence" in hiding the bank's troubled financial condition. Andersen agreed to a $65 million settlement and an additional $17 million to settle charges of negligent auditing in the collapse of California-based Lincoln Savings. It was the largest S&L failure and cost taxpayers $2.6 million. California's auditing board unsuccessfully moved to revoke Arthur Andersen's public accounting license. Andersen's settlement also resolved claims in three other unnamed failed institutions. The total settlement for these cases, which included 10,000 hours of community service, was the second-largest obtained from an accounting firm in an S&L case.

Colonial Realty declared bankruptcy in 1990 after systematic fraud that enriched the owners. Andersen employees took cash and gifts while approving exaggerated financial projections for investors. The $3.5 million settlement with Connecticut was the largest penalty of a public accounting firm in the state's history, and Andersen paid another $10.3 million to investors. Waste Management overstated its pretax income by $1.4 billion and hid certain expenses from 1993 to 1996 to make the company look more profitable. The $7 million fine was the largest ever against an accounting firm; in 2001, Andersen agreed to the court enjoining it from further misleading audits and U.S. Securities and Exchange Commission (SEC) censure. Sunbeam's executives engaged in fraudulent accounting from 1996 to 1998 and declared bankruptcy in 2001. Andersen agreed to a $110 million settlement with shareholders. The Baptist Foundation of Arizona, a religious investment entity, filed the largest ever bankruptcy of a nonprofit in 1999, costing investors $600 million. For its role in auditing what was a vast Ponzi scheme, Andersen paid a $217 million settlement, the largest in a nonprofit case. Telecommunications firm Global Crossing filed for bankruptcy in 2002 amid charges of manipulating earnings to make the company appear more profitable. Arthur Andersen paid $25 million to shareholders.

The Enron Misfortune

Enron declared the largest corporate bankruptcy up to that time in 2001, restating earnings for 1997 to 2001 to add $2.6 billion in debt and causing investor losses of $60 billion. It had been a lucrative client, and Andersen expected about $100 million in annual fees in upcoming years. Enron's use of more than 3,000 special-purpose entities to keep liabilities off its books created substantial work for Arthur Andersen and triggered an SEC investigation into its misuse.

Before the SEC investigation started, an Andersen lawyer sent an e-mail to the head of Andersen's Enron audit team that suggested deleting the term "misleading" from a memo written to raise concern about Enron's characterization of certain losses. Auditors are required to report any objections to their clients' characterizations, and the deletion would remove evidence of an objection Anderson should have reported. A subsequent e-mail by the same lawyer, also before the SEC investigation, reminded the Houston office (where Enron was based) to comply with document retention policies, which required the destruction of non-audit-related work papers. Andersen engaged in massive document destruction and electronic records deletion until the SEC told it to stop.

When Andersen was charged with obstruction of justice, its clients began to leave. The jury convicted Anderson based on the deletion of the term "misleading" and instructions that impeding an investigation without dishonest intent allowed a conviction under the term corruptly persuading." The conviction ended the firm's license to conduct public audits. In 2005, the Supreme Court overturned the conviction because the statute required "knowing" corruption of an investigation. Even if a retrial under new instructions acquitted Andersen, clients would not return because many cases were in the news. Andersen was also the auditor for WorldCom, which in 2005 declared bankruptcy and took the record of the largest bankruptcy from Enron.

Asbestos

A group of naturally occurring minerals resistant to heat and corrosion, with high tensile strength, asbestos has been mined and used in commercial applications in the United States since the late 1800s. With its ideal properties, asbestos was lauded as a "magic mineral" for the products of the Industrial Revolution. However, throughout the 20th century, the health hazards of asbestos exposure were evidenced by both scientists and the asbestos-related diseases that ravished mine workers. The dangers of asbestos were fully realized in Libby, Montana, near the site of a vermiculite mining operation, where an entire community was devastated by the health effects of the perilous mineral. Although asbestos is not banned in the United States, it is regulated by a number of governmental agencies and has been the subject of numerous court battles.

The fibrous mineral asbestos has two types: serpentine and amphibole. The serpentine group includes chrysotile, identified by long, curly fibers that appear like small bundles, and is most widely used in commercial applications. Varieties of the amphibole asbestos are marked by straight, needle-like, brittle fibers. Asbestos is typically mined from open pits, then sent to mills for processing. To preserve the structure of the mineral, the milling is done without liquids through a recumbent process of crushing and sorting, which generates significant amounts of dust. Deconstructed asbestos fibers are strong, thin, and resistant to fire, heat, and chemicals, and they do not conduct electricity. Asbestos fibers can disassemble into microscopic particles that are hard to see but easy to inhale. Workers often did not receive sufficient respiratory protection, nor did they have protective coveralls. Ventilation systems to remove dust were cost-prohibitive to install. At the end of the shift, laborers took asbestos dust home with them in their clothing, in their shoes, and on their skin.

Commercial Uses

Despite the hazard to workers, the properties of asbestos make it ideal for commercial applications, particularly to strengthen and fireproof products. By some estimates, over 3,000 different types of consumer products contain asbestos. The most common product categories are commercial, corrugated, and specialty paper; floor tile; shingles; pipe; pipeline wraps; clutch facings; disc brake pads; drum brake linings; flooring and roofing felt; ceiling and floor tiles; and paints, coatings, sealants, and adhesives. Asbestos has also been used in garden products that contain vermiculite. In the mid-20th century, toothpaste, tampons, talcum powder, and condoms contained asbestos fibers. Asbestos and asbestos-containing materials were frequently used in the construction of schools and other public buildings from the 1940s through the 1970s. Exposure to asbestos fibers through products is likely only if the asbestos-containing materials are damaged, disturbed, or removed and the fibers become airborne. Asbestos in nonfriable material, such as siding, tiles, and roofing, is less likely to become airborne and to present an inhalation risk.

Health Effects

Asbestos can produce asbestosis, lung cancer, or mesothelioma even years after exposure. Microscopic asbestos fibers can be inhaled and create asbestosis, a gathering of scar-like tissue in the lungs that impairs the ability of oxygen to reach the bloodstream, and can lead to disability and death. Asbestos is also a carcinogen, causing cancer of the lung. Exposure to asbestos can also cause mesothelioma, a rare and insidious form of cancer found in the thin tissue lining of the lungs, chest, abdomen, and heart that usually causes death within 18 months of first diagnosis. Asbestos is the only known cause of mesothelioma, and even a short exposure to the mineral can trigger the disease, as long as 60 years after the exposure. Other cancers, such as gastrointestinal tumors, have also been linked to exposure to the mineral.

The perilous effects of asbestos exposure were first noted in the late 1800s by factory inspectors in the United Kingdom (UK). In 1924, asbestosis was first identified in the medical literature, and seven years later, the UK government instituted regulations to control dust in the asbestos industry. Researchers in the 1940s uncovered a link between asbestos and lung cancer, and in the 1950s, pathologists in South Africa identified a cluster of mesothelioma cases near a Cape Province asbestos mine. While former mine workers are most likely to be afflicted with asbestos-related illnesses, these diseases do not just affect mine employees; community members living near mines suffer alarming rates of asbestosis, cancer, and mesothelioma.

Libby, Montana's Toxic Legacy

In 1881, miners discovered vermiculite while prospecting for gold near Libby, Montana, a small town in the northwest corner of the state. By the 1920s, the Zonolite Company formed to mine the vermiculite, and in 1963, W. R. Grace purchased the mining operation. It managed the mine until it closed in 1990. The Environmental Protection Agency (EPA) estimates that 70 to 80 percent of the world's vermiculite was produced in Libby while the mine was online. Vermiculite, a harmless mineral, can be used as lightweight insulation or fireproofing and is a common ingredient in potting soil. However, the vermiculite deposit at the Libby site was infused with a dangerous form of asbestos.

In response to community concerns leading to a series of articles in the *Seattle Post-Intelligencer*, an EPA Emergency Response Team traveled to Libby in 1999 and began collecting and testing samples from both home and business air, soil, insulation, and dust. The team also investigated the asbestos-related health effects of community members. Jock McCulloch and Geoffrey Tweedale report that when 6,000 Libby residents were screened, only some of whom were previously employed by Grace, nearly 20 percent had lung abnormalities explained by asbestos exposure. Furthermore, 1,500 properties in the town had evidence of unsafe asbestos fiber levels. Documents reveal that the company knew the health hazards of asbestos exposure and the high incidence of lung disease among employees, but kept the information confidential. Faced with billions of dollars of legal claims, government fines, and cleanup costs, Grace's construction division declared bankruptcy in 2001. In 2008, in the largest civil settlement in Superfund history, W. R. Grace paid $250 million to fund cleanup activities. In 2009, the EPA declared a public health emergency under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also known as the Superfund.

Regulations and Lawsuits

Despite the known health risks and evidence of devastated communities like Libby, Montana, the federal government has been only marginally successful in regulating asbestos. Authors Jock McCulloch and Geoffrey Tweedale argue that the asbestos industry was successful in minimizing and at times hiding the potential health effects of the mineral. The industry was aided by cozy relationships with government officials and lawmakers, and it defended asbestos, asserting that the mineral was safe with controlled usage. The EPA attempted to ban asbestos in 1989 with the publication of "Asbestos: Manufacture, Importation, Processing, and Distribution in Commerce Prohibitions; Final Rule," but the U.S. Court of Appeals, Fifth Circuit, vacated most of the rule in 1991. The ban on new uses of asbestos in products that have not historically contained the mineral, as well as the ban on asbestos in flooring felt, roll board, and corrugated, commercial, or specialty paper, however, was upheld.

Additionally, the Toxic Substances Control Act (TSCA) of 1979 gives the EPA authority to require recordkeeping, reporting, and testing of certain dangerous substances, including asbestos, at the production, use, and disposal stages.

Title II of the TSCA, the Asbestos Hazard Emergency Response Act, requires inspection of school buildings for asbestos and specifies that personnel working on asbestos abatement projects be certified. Under the Clean Air Act, the EPA set emission standards for asbestos as a hazardous air pollutant. The Occupational Health and Safety Administration (OSHA) outlines rules for asbestos exposure in the construction industry, general industry, and shipyard industry to reduce risk to employees by providing monitoring, training, and protective equipment. Some states have additional guidelines in place. Meanwhile, billions of dollars have been paid by the asbestos industry as a consequence of lost lawsuits and civil settlements resulting from scores of claims of asbestos contamination and asbestos-related diseases.

Though the United States, Britain, and Canada have protection for workers and communities, much of asbestos mining and manufacturing has moved to countries with sparse government regulations, such as Kazakhstan, South Korea, India, and Brazil. These countries will likely experience a spate of asbestos-related diseases unless they move quickly to provide protection to workers and others exposed to the dangerous mineral.

AT&T

American Telephone & Telegraph (AT&T) was founded after Alexander Graham Bell's invention of the telephone in 1876. The Bell Telephone Company was the first predecessor of companies that would eventually become AT&T. It was not until 1885 that American Bell Telephone Company formed AT&T as a daughter company in order to operate its long-distance network known as the Long Lines division. AT&T became the parent company of the Bell System in 1899, after the company acquired the assets of American Bell Telephone, thus becoming AT&T Inc. Theodore N. Vail became the manager of American Bell Telephone in 1878; he resigned in 1885 to become the first president of AT&T once the company was established. Vail resigned two years later, when a dispute with the board of directors took place. He returned in 1907 to begin a second term as president of AT&T when J. P. Morgan, who had controlling stock in the company, asked him to return. During his second presidency of the company, Vail developed a philosophy, strategy, and structure that would be the basis for the company for several years. Vail's philosophy and universal goal fostered AT&T into a national monopoly through the purchase of the company's competitors.

The Government Is Watching

The Sherman Antitrust Act was created in 1890 in response to concerns over price-fixing abuses of monopolies. This antitrust act gave the government the power to regulate monopolies. Telephone regulations began with the emergence of the Interstate Commerce Commission (ICC), which was established with the Mann-Elkins Act of 1910. AT&T initially was not greatly affected by these regulations. However, when AT&T showed interest in purchasing Western Union, the government began watching AT&T closely. To avoid antitrust action, the vice president of AT&T, Nathan Kingsbury, wrote a letter to the attorney general to end its controlling interest in Western Union. Vail agreed to the Kingsbury Commitment of 1913, which was an out-of-court settlement with the government that established AT&T as a government-regulated monopoly. The commitment prohibited AT&T from purchasing competitor phone companies without Interstate Commerce Commission approval. AT&T also agreed to allow noncompeting local independent phone companies to connect to its long-distance service.

In 1921, AT&T was established as a natural monopoly. With the passage of the Willis Graham Act, telephone companies were exempt from antitrust laws in order to build an infrastructure that would allow companies to deliver low-cost services to its customers. This act made it possible for universal service by merging competing telephone companies.

From the time the act was established until 1934, AT&T had been approved by the ICC to acquire 223 of the 234 independent telephone companies. The Federal Communications Commission (FCC), which resulted from the Communications Act of 1934, took over regulation of wire communication from the ICC and began to regulate telephone services and to control the rates charged by AT&T. The FTC began investigations into the telephone monopoly, and in 1949, it filed an antitrust suit against AT&T that led to a consent decree signed in 1956 by AT&T and the U.S. Department of Justice (DOJ) in which AT&T agreed to restrict its activities to those concerning the national telephone system and projects for the government.

With the advancement of new technologies from the 1940s to the 1970s, the FTC allowed competitors of AT&T to provide long-distance telephone services. The changes in technologies and telecommunications led to the FCC filing another antitrust suit against AT&T, which stated that AT&T had monopolized and conspired to monopolize additional telecommunication markets. The FCC believed that AT&T should eliminate affiliation with Western Electric, and that Western Electric should be divided into several companies. It should also felt that the Bell Operating Companies should be isolated from AT&T Long Lines. This antitrust suit lasted until 1982, primarily because AT&T disputed the suit with the Consumer Communications Reform Act, also known as the Bell Bill, and because of legal tactics. The suit was settled in 1982 when AT&T agreed to sever ties with Bell operating companies that provided local services. In addition, the DOJ agreed to lift the constraints of the 1956 Consent Decree. In 1984, AT&T closed connections with the Bell System, and the Bell System ceased to exist. As a result, seven Regional Bell Operating Companies (known as Baby Bells) and a new AT&T were formed, continuing the parts of the company still valid from the natural monopoly argument, where competition was applicable.

AT&T is organized into AT&T Communications and AT&T Technologies. In 1991, AT&T ceased offering telegraph services to customers and purchased NCR Corporation (National Cash Register), attempting success at computer network markets. The Telecommunications Act of 1996, signed by President Bill Clinton, the bill attempted to promote competition between local, long-distance, and cable companies by eliminating some of the regulatory barriers between the communications industries. AT&T Wireless was created after AT&T purchased McCaw Cellular in 1993. In 1995, AT&T voluntarily restructured into three companies: a service company, AT&T Corporation; a products company, Lucent Technologies; and a computer company, NCR Corporation.

Into the Cable Market

In 1999, AT&T acquired Tele-Communications Inc. (TCI) and Media-One Inc., making AT&T the largest operator of cable television. However, after AT&T outbid Comcast in 1999 for Media-One, Comcast purchased AT&T Broadband. In 2000, the DOJ required AT&T to divest Media-One's interest in Road Runner Broadband, which was owned by Media-One, Time Warner Inc., Microsoft, and Compaq, because acquisition of Road Runner would lessen competition in broadband services. In 2004, AT&T Wireless was sold to Cingular Wireless. In 2005, the FTC approved the merger with Southwestern Bell Corp., and AT&T and Southwestern Bell Corp. adopted the branding and changed the name to AT&T Inc. Upon AT&T's acquisition of BellSouth in 2006, Attorney General Thomas O. Barnett issued a statement claiming that the transaction was not likely to reduce competition. In 2007, the DOJ announced that AT&T must sell assets from Dobson Communication in order to maintain competition in markets where there could be a loss of competition.

The DOJ began looking into telecommunication companies AT&T Inc. and Verizon Communications Inc. in 2009, to determine if the companies were abusing market power and hurting smaller rivals through agreements with handset makers. In March 2012, the United States filed a lawsuit against AT&T under the False Claims Act for allowing international callers who were not eligible to receive the service to use the Internet Protocol (IP) relay and accepting federal payment for its use. The complaint also stated that AT&T utilized this system knowing that it was used by fraudulent international callers, which accounted for a large percentage of AT&T's call volume. On August 2011, the DOJ filed an antitrust lawsuit to block AT&T's acquisition of T-Mobile. Deputy Attorney General James M. Cole stated that if the merger took place, tens of millions of consumers would face higher prices on wireless mobile products when they would normally benefit from competition among carriers. In December 2011, AT&T announced that it would abandon the proposed merger with T-Mobile.

Automobiles

When asked why he robbed banks, Willy Sutton is reported to have explained, "Because that is where the money is."

Automobiles are, for most people, the second-most expensive purchase in their lives, so they always have been—in a similar vein to Willy Sutton's—and always will be a natural outlet for the work of white-collar criminals. Some of the criminality involved with vehicles, such as straightforward single theft and "car jacking," can be dismissed as "simple" varieties of theft and robbery. Many other issues involving automobiles bear the hallmarks of white-collar crime, with their reliance on brains, rather than brawn, to achieve the criminal purpose. In these cases, abuse of paperwork and other documentation is often involved. To steal one car may be ordinary theft, albeit nonviolent. To be involved with a car theft ring, often transcending national borders in the 21st century, requires an organization associated with white-collar criminals. While an important part of Edwin Sutherland's original presentation of the concept of white-collar crime involved offenders of high prestige, these crimes also involve financial gain on the part of the criminal without an immediate resort to violence.

Chop Shops and Documentation Laundering

The familiar white-collar crimes concerning cars include various false pretenses with regard to their sale, purchase, repair, and maintenance. This can involve the manipulation of the readings of odometers. The lower the mileage on the odometer, the greater the value of the car. Additional forms of documentary false pretenses include the representation of cars as ordinary used or secondhand, when they are in fact rebuilt wrecks, or cars repaired and rebuilt after having been salvaged from events such as fires and floods. The recycling of cars ruined by the floodwaters of Hurricane Katrina to innocent purchasers is a textbook example.

Closely connected to this is the concept of a "chop shop," where cars are chopped up. Then, parts of various cars can be reassembled to create a car that is a fabrication in the strictest and worst sense of the word. The cars thus re-created often involve the substitution of inferior parts for legitimate ones. Considerable expense and craftsmanship is required to rebuild a wreck to the quality of a new car, but those involved in fraud will save money, and further increase their profit, by not adhering to these high standards. Sometimes this has fatal results, when shoddily rebuilt cars have literally fallen apart on the highway.

For rebuilt wrecks and cars with fraudulently manipulated "salvage titles," it is necessary to forge or otherwise manipulate the supporting documentation known as the title, inspection, and pollution control stickers, and other identifying details such as the vehicle's unique identifier, the vehicle identification number (VIN). Because the United States does not have a national system of assigning titles to cars, there is considerable variety between the states as to the ease with which a car can be titled and otherwise documented with supplementary requirements, such as valid inspection stickers. In recent decades, this documentation has added issues such as pollution control, and thus involves matters of public health beyond any concern of the driver of the car in question.

Crooks take advantage of this lack of complete uniformity by laundering the paperwork through states with reputations as places with documentary standards for titling cars that are more lax than others, places often implicated in crimes involving the titles to cars. For example, in Vermont, a state with otherwise very good, strict regulations, a valid title is not required in the resale of a car manufactured before 1995. This would seem to add an element of risk to someone, for example, buying a choice, low-mileage 1958 Thunderbird.

Other documents that are subject to fraud include driver's licenses, registrations and license plates, and the insurance documents protecting everyone involved in the use of cars. Modern printing technology, available at relatively low cost to any individual, now allows for the production of fraudulent documents of the highest quality, able to fool all but the trained eye. This has led to an automotive "arms race," as the states make it more difficult to create fraudulent items—such as the holograms now seen on driver's licenses and the car's license plates. Crooks try to cope with these developments.

Even old cars, which domestically may not seem to have much dollar value for car-related crooks, are not immune from (organized) car theft. The ironic consequences of the decades-long sanctions and lack of commerce with Cuba have led to cars that would not normally be at risk of being stolen in the United States for the value of their parts. Something as modest in value in the United States as an ordinary nonluxury car, such as the timeless 1958 Chevy, can be worth a small fortune in parts to a service station in Havana. Organization well beyond the ordinary car thief is required to transport the car there.

The Ford Pinto

Beyond the major threat presented by chop shops and unscrupulous repair facilities, an even more perverse form of automobile white-collar crime involves the knowing manufacture and sale of cars that are known to be dangerous from the outset, risking life and limb by the users. The Ford Pinto accidents and court cases that developed in the 1970s are now a subject of textbook analysis and a window into the challenges of successful prosecution through to conviction against a major corporation. The fact that Ford was not convicted on the criminal charges that were filed against it is a window opening into the challenges faced by prosecutors, who may have no more than the limited resources available to them in their county, up against all the legal resources of a major corporation.

The saga of the Ford Pinto involves that small American car, which was built between 1971 and 1980. The Pinto was Ford's entry-level vehicle, with no pretense to quality in any part. Every piece of it was cheap. It was involved in several crashes, with resultant fatalities caused by the car bursting into flames as the result of a comparatively minor rear impact. It became apparent that there was a design defect, one that would have cost Ford very little to fix.

One such accident, in 1972, led to *Grimshaw v. Ford Motor Company*, in which the California court of appeal, for its Fourth Appellate District, upheld compensatory damages of $2.5 million and punitive damages of $3.5 million against Ford. This was in part because of proof, satisfactory to the balance of probabilities probative burden in civil court, that Ford had been aware of the design defects before production began, but had nonetheless decided not to change the design to

The Ford Pinto is a famous example of the willful manufacture and sale of a vehicle that was known to be dangerous from the outset. Now used for textbook analysis, the case of the Ford Pinto involved the sale of a small economy car built between 1971 and 1980 by the Ford Motor Company. Unequivocally cheap and shoddily built, it was subject to bursting into flames during even minor rear-impact collisions. Ford was aware of the design defects before production but opted to ride out any potential lawsuits rather than fix the flaws.

correct the problem. It was shown that Ford considered the balance sheet and concluded that it would be cheaper to settle the occasional lawsuit than to fix the car.

Punitive damages are as close as can be to the idea of a criminal fine, especially in a case against a corporation, where personal liability on the part of individuals, and the possible exposure of those people to prison sentences, is not easily established. In 1978, Michael Cosentino, the Elkhart County, Indiana, prosecutor, convened a grand jury to consider charging Ford with three counts of reckless homicide. Three teenage girls had been killed when their 1973 Ford Pinto caught fire after it was rear-ended and they were immolated. Ford was duly indicted in September 1978. After trial, a Pulaski County petty jury acquitted Ford in March 1980.

Although Ford was able to avoid the enormous expense of a government-ordered recall for the car, it did choose later to correct the problem with the simple fix of a gasket.

The discussion of the Ford Pinto case must remain part of the criminological literature because it epitomizes the challenge of convicting a corporation and imposing an effective sentence on it. It has implications far beyond the specific reference to cars. With no disrespect to his legal skills, Prosecutor Cosentino was over-matched in competition with the world-class, money-no-object defense lawyers on whom Ford could rely. To the extent that the 2010 decision of the United States Supreme Court in *Citizens' United v. Federal Election Commission* appears to have given with corporations more personhood than they had before, it remains to be seen whether this case will inspire a prosecution by an intellectual follower of Mr. Cosentino, one that may prove successful on the issue of personhood that was the back story in the Pinto case.

Volkswagen and De Lorean

In a perfect mimic of the Rochester studies, which posit in victimological theory that there is often little difference between offender and victim, the automobile industry provides more than one example. In 1994, Volkswagen (VW) was accused of industrial espionage by General Motors (GM) through the actions of one of its top executives, Jose Ignacio Lopez, and some colleagues, who had moved from GM to VW, allegedly taking important designs with them. It must seem as if turnabout is fair play in view of the claims in 2012, by Volkswagen, that its Chinese joint venture partner, FAW, has stolen engine designs from it. There is enormous pressure on the automobile industry to keep coming up with new designs. Combined with no great organizational loyalty among the industry's top executives, given the fabulous salaries that can be used to lure one away from a competing company, the automobile industry is prone to industrial espionage and related mischief. A new context is given to corporate crime when corporations are committing criminal acts against each other.

In 1975, John De Lorean, famed for being GM's youngest executive, left to found a company that was to produce one iconic model, the DMC/DMC-12. A persuasive pitchman as well as a brilliant, innovative engineer, De Lorean was able to attract venture capital from a wide variety of sources, both institutional and personal. The British government also showed interest because it hoped to create industrial jobs in Northern Ireland as one way to reduce the sectarian violence that had been plaguing that part of the United Kingdom.

De Lorean somehow became the target of a sting operation, coordinated by the Drug Enforcement Administration (DEA) and Federal Bureau of Investigation (FBI), aimed at drug trafficking. De Lorean was duly tried and acquitted on those charges, after the successful use of an entrapment defense. Even though he was cleared of the charges, De Lorean's reputation as a car manufacturer was ruined, and his personal bankruptcy was to follow that of the company. There is still conjecture that the drug sting and prosecution of De Lorean were in some manner a means for the British government to save some face after an unsuccessful business deal had gone sour for it. It is debatable whether this sting would ever have taken place if De Lorean had not been a high-profile, lightning-rod personality, involved with a car that could have proven a challenge to the established manufacturers and their competing models.

Honda

Without fuel, a car is an expensive ornament in the driveway. With the constant need to refill the tank, the price of fuel is a constant topic of conversation, particularly in the face of sudden and significant price increases that may not seem justified by the economics of fuel supply. It is a small step from that observation to thoughts of conspiracy by way of (collective) price fixing on the part of the producers and retailers. It seems that all the filling stations in town raise their prices within minutes of each other, without being instantaneously subject to the same price increases. This activity has sometimes led to prosecutions, with the most notable the case against Mobil/Exxon. The international nature of the fuel supply, even more than the production of cars, makes this an international problem, further complicating any prosecutions.

While the demand for fuel is relatively inelastic, with most consumers driven by price, the opportunity for mischief by producers and distributors is the classic collective behavior that can be prosecuted as price fixing caused by a conspiracy. By contrast, the purchase of a car can lead to the misbehavior that could be considered a different, yet equally unacceptable form of price adjustment. The competitive nature of the retailing of vehicles, especially cars, is such that retailers fight with each other for customers.

True mischief is shown in those situations, usually quite rare, where a car is, for some reason, so attractive to the consumer that the retailer can charge more than its retail price, and consumers will still queue up to buy it.

In a case of enduring testimony to the quality and attractiveness of Honda's cars, 18 executives of Honda USA were convicted in the mid-1990s for bribery and kickbacks in a scheme concerning (new) dealerships and the allocation of these hard-to-get cars that had gone on since the 1970s. One of the kickbacks was a car—from a different manufacturer, BMW.

The usual problem with corporate criminality is the difficulty of identifying exactly who is responsible for the crimes that have taken place. It is one reason why a fine is so often the most convenient and only criminal penalty against a corporation. The Honda kickbacks case was distinctive in that individuals were convicted and sentenced. Stanley Cardiges, the senior vice president for sales for

Honda USA, was sentenced to 5 years in prison and fined over $300,000. Even this was considerably less than the 35 years in prison and the $1 million in fines that he could have faced. The financial sanction hints at the amount of money he likely made from the illegal behavior. Prosecutors estimated that the amount of bribes and kickbacks paid to Honda executives topped $15 million.

Honda USA's corporate statement at the end of the trial, in August 1995, noted the following:

> The sentencing of these former employees who have admitted to defrauding our company helps bring closure to a difficult period in our history. We maintain confidence in our thousands of loyal and honest dealers and employees.

Such is the law of supply and demand that, for many years prior to the prosecution, consumers were perfectly legally paying far over market value for Honda's products. According to Honda, the corporation was an innocent victim of a behavior that is unacceptable in a country that does not tolerate bribery and other forms of corruption in the marketplace as legitimate means of doing business. It is difficult to believe that the board of directors was not in any way aware of what was going on in the company that they were supposed to give guidance to and watch over.

Joseph R. (Rick) Hendrick, whose name is synonymous with the success of NASCAR racing, was one of the Honda dealers involved in the scheme. In 2007, Hendrick was sentenced to one year of home confinement and was fined $250,000 for his part in the scheme. Hendrick was fighting myelogenous leukemia, which was diagnosed at about the same time that he was indicted. His defense lawyer suggested that he had been punished by a higher authority.

B

B. F. Goodrich Co.

Benjamin Franklin Goodrich (1841–1888) established the B. F. Goodrich Company in Akron, Ohio, in 1870. He accepted an offer from the town to open a rubber and tire manufacturer after he had purchased the Hudson River Rubber Company the previous year with the returns from his real estate investments.

The factory provided Akron with needed jobs and the company expanded into various rubber products during Goodrich's life, including bicycle and buggy tires, freeze-proof rubber hoses, and water hoses for home gardeners. It was after its founder's death that the company began making automobile tires, the product with which it would be most associated. Over time Goodrich became one of the largest tire manufacturers in the world, while diversifying in other areas, including aerospace and space-suit technology, electrical power systems, and aircraft surveillance systems. The B. F. Goodrich tire brand has since been sold to Michelin in 1988, at which point the company exited the tire business, and after mergers, the original B. F. Goodrich Company became the Goodrich Corporation, which was acquired by United Technologies Corporation in 2012.

Having pioneered automobile tires by developing designs that could withstand the forces exerted on rubber by high-speed travel, Goodrich was well-positioned to take advantage of the growing market for aircraft wheels, landing gear, brakes, and other systems as the commercial aviation industry developed. In the 1960s, the company was contracted to supply wheels and brakes for a new lightweight aircraft for the U.S. Air Force, and its poor handling of a bungled design led to a national scandal.

The contract was awarded on June 18, 1967, to a division of the company—the B. F. Goodrich Wheel and Brake Plant—located in Troy, Ohio. Goodrich's bid was accepted in part because of the design they intended to use. The proposed brake design was lighter in weight and used four rotors instead of the traditional five-disc brake mechanism. John Warren was responsible for the design, while recent hire Searle Lawson oversaw production. In the first round of tests, the linings of the prototypes disintegrated as the brakes reached temperatures as high as 1500 degrees Fahrenheit. Changes to the lining failed to resolve the problem, which led to an internal dispute in the company.

While Lawson believed that the design was fundamentally faulty, Warren stood by it and insisted that only the lining needed to be changed. Company leadership (especially Robert Sink, who was in charge of the project) favored Warren, believing that the designer of the brake had the best informed about the situation. Each of 12 tests on different linings resulted in failure, and with 70 days remaining until the Air Force's flight test, a conspiracy to falsify data was born. Sink failed to report Lawson's concerns to upper management and had instead told them that the testing was going smoothly. Even the changes to the linings had caused delays. Redesigning the entire brake could mean missing the Air Force's test date, and would make the company look bad given the promises they had made regarding the four-rotor design. Those involved began to alter the data of the tests and to adjust the testing conditions in order to produce different results, rather than backing off of the four-rotor design and admitting defeat.

These later rounds of tests were "nursed," meaning that testing conditions were manipulated in order to help the brake achieve the performance that was promised. Fans were set up in order to cool the brakes, preventing the overheating that led to disintegration. According to later investigations, Sink explicitly told Lawson to make sure the brake passed the tests, regardless of any design flaws. Kermit Vandivier, a B. F. Goodrich employee, began to point out irregularities he discovered in the test reports in April 1968, and at the end of May, Vandivier produced a qualification report under duress, after initially refusing to do so.

Vandivier became the whistleblower in a case of conspiracy to defraud the U.S. government. Goodrich claimed that what Vandivier and the government saw as conspiracy was a case of different engineers having different interpretations of results. Vandivier resigned in October, giving six weeks notice, and was dismissed a week later for disloyalty. Lawson resigned as well, and Goodrich recalled the four-rotor brake, providing the Air Force with a five-rotor brake of a more traditional design, without additional charge.

By the following spring, though, word of the falsified and "nursed" tests had reached Senator William Proxmire, who requested an investigation by the Government Accounting Office (GAO). The GAO prepared and submitted a report finding that the Goodrich tests did not comport to federal standards, which was confirmed in a Senate hearing chaired by Proxmire in summer 1969. Much of the case's infamy stems from an article published by Vandivier in 1972, "Why Should My Conscience Bother Me?" which was republished as "The Aircraft Brake Scandal" in the April 1972 issue of *Harpers*.

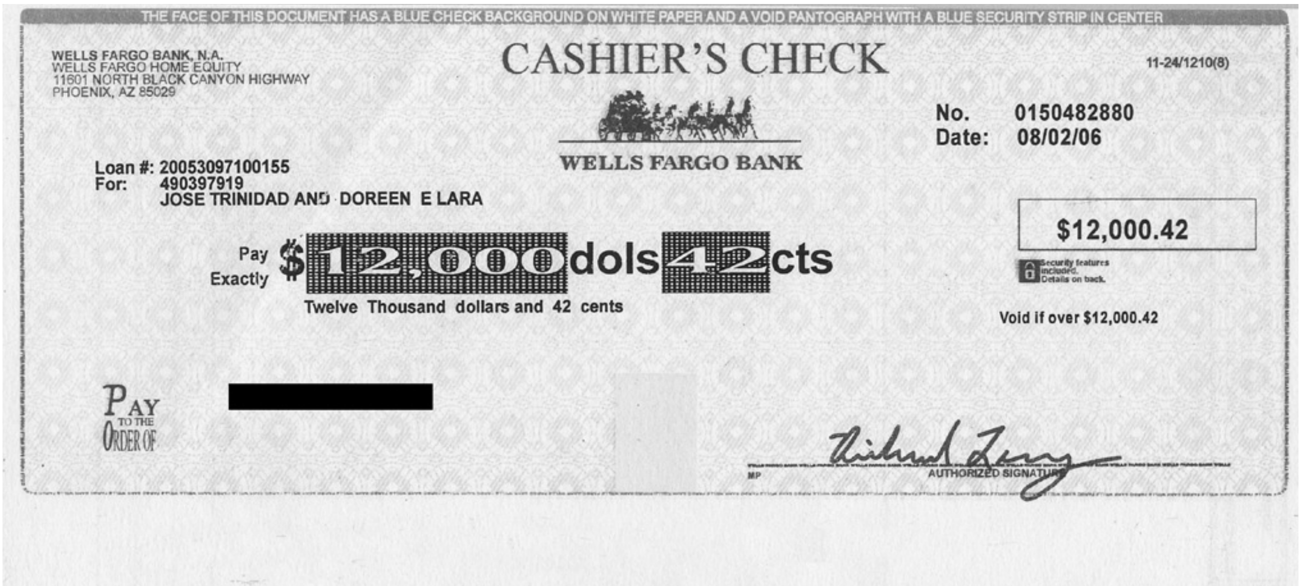
Bad Checks

A bad check, also known as a bounced check or a nonsufficient funds (NSF) check, is a check drawn on a nonexistent account or on an account with insufficient funds to honor the check when presented. There is a presumption by the acceptors of checks that an account is open and that there are sufficient funds available to cover the checks. If the account is closed or nonexistent, or funds are not available to cover the check, the check "bounces."

Passing bad checks is illegal, and the crime can range from a misdemeanor to a felony, depending on the amounts involved and whether the activity involved crossing state lines. It is considered a white-collar crime because of the type of offense



A scan of a counterfeit cashier's check that is made to appear to be issued by Wells Fargo Bank. Some personal information regarding the recipient has been blacked out. According to the Federal Deposit Insurance Corporation, there has been explosive growth in all forms of counterfeit checks, including cashier's checks, as consumers tend to trust cashier's checks, money orders, and other "official" looking checks. The bank on which the check is drawn can confirm that the check is legitimate, either by phone or at a bank branch.

it involves and the economic harm caused. The party who initially wrote and signed the check normally carries primary criminal liability, but liability can also be imposed on the person who fraudulently endorsed the check and passed it on to another.

False Pretenses

The modern crime of passing a bad check is related to the common law offense of false pretenses. At common law, false pretenses required proof of false representations of material past or present facts, known by the wrongdoer to be false, and made with the intent to defraud a victim into passing title in property to the wrongdoer. In the typical bad check situation, the author of the check (known as the "drawer") makes an express or implied representation that the account is open and contains sufficient funds, and the merchant or other property owner releases property or merchandise based upon this representation. In most jurisdictions, the statutory crime of passing a bad check requires proof of intent to defraud. In most jurisdictions, there is a presumption of inaccurate accounting by the check writer, and the check writer is given a prescribed time period to "make the check good" by paying both the face value of the check and a processing fee. If the check is not made whole within the relevant time period, the intent to defraud is established by an evidentiary presumption, and criminal charges become ripe. In the majority of states, the crime is initially classified as a misdemeanor. In states that make a distinction regarding a felony or misdemeanor, the amount of the check and an existing record of one or more prior offenses may determine if the crime is a misdemeanor or a felony. Most jurisdictions treat writing checks on a closed or nonexistent account as a felony, regardless of the amount of the check.

Counterfeiting

Other examples of bad checks include counterfeit checks, altered checks, and "kited" checks. In many cases, these crimes begin with the theft of a financial document. It can be perpetrated as easily as someone stealing a blank check from a home or vehicle during a burglary, searching for a canceled or old check in the garbage, or removing a check that has been mailed to pay a bill from the mailbox. With the advancement of computer technology, it is increasingly easy for criminals to manipulate checks to deceive innocent victims expecting value in exchange for their money. A significant amount of check fraud is because of counterfeiting through desktop publishing and copying to create or duplicate an actual financial document. Alteration primarily refers to using chemicals and solvents such as acetone, brake fluid, and bleach to remove or modify handwriting and information on the check. When performed on specific locations on the check, such as the payee's name or amount, it is called spot alteration; when an attempt to erase information from the entire check is made, it is called check washing. Check kiting occurs when checking accounts at two or more institutions are used to artificially inflate actual balances by using the "float time" of available funds to create fraudulent balances. This fraud has become easier in recent years because of new regulations requiring banks to make funds available sooner, combined with increasingly competitive banking practices.

In some states, there is a criminal offense only when the bad check is given in exchange for property or for present consideration These jurisdictions hold that the giving of a bad check in payment of a preexisting debt does not fall within the purview of the bad check law. Since the debt is preexisting, the maker of the check did not deprive the payee of any right, procure anything of value from the payee, or wrongfully appropriate anything belonging to the payee. In many states, the criminal provisions regarding bad checks do not apply to postdated checks. Section 3-104(2)(b) of the Uniform Commercial Code (UCC) defines a check as "a draft drawn on a bank and payable on demand." A postdated check, since it is not payable on demand, does not satisfy this definition. Consequently, the giving of a postdated check generally does not constitute present fraud, nor is it within the scope of the bad check laws.

Fewer Checks in Circulation

There is a recent downward trend in the number of paper checks processed in the economy. In 2011, the number of checks processed by the Federal Reserve fell at its steepest rate yet, down 17 percent to an average 23.5 million a day, which is one-third of the volume processed 20 years previously. Despite this downward trend, the retail industry loses over $10 billion annually to bad checks. Business owners in the restaurant and hospitality industries run a higher-than-average risk of check fraud. Merchants operating in industries where stolen goods, such as electronics, can easily be resold also run a higher risk of check fraud. The frequency of bad checks accepted as payment by business operations can be reduced through the implementation of various secondary internal control policies. Payment by check is a privilege, not a right; businesses are not required to accept checks. Additional protective policies include the requirement of valid identification, use of check-validation systems (a private service that tracks bad checks), and local registries of formerly received bad checks. Other policies include dollar limits, management approval, verification with a local bank branch, and inkless thumbprints.

Difficulties Collecting

Collecting on bad checks can be difficult. Nationally, fewer than one-third of checks returned for insufficient funds are ever paid in full. However, collection efforts are far more successful if the merchant acts quickly to seek payment. The recipient of a bad check must normally supply proof of notification to the check writer (certified mail with signed receipt) of the failure of the check to originally clear (a statement of nonpayment), or, in the case of a closed account, proof that the account is closed, usually indicated on the check by the bank that refused to honor the instrument. Most local prosecutors' offices have bad check restitution units, and collection rates have improved in recent years. In addition to criminal penalties, most states provide for civil remedies for collection of bad checks. In some states, rules permit recipients to collect double or triple the face amount of the check.

Bait and Switch

Bait and switch is a form of fraudulent inducement to buy a particular item at a particular price, followed by a manipulative "switch" in which the seller offers (and pressures the customer to buy) a different item, typically at a higher price. This form of fraud is most commonly used in retail sales.

In the classic bait and switch scheme, the "bait" is an item that appears to be offered legitimately for sale at an unbeatable price. The fraud occurs when the customer attempts to buy the product. At that point, the seller exercises one of several maneuvers to avoid selling the item. For example, the seller may tell the customer that there is no more of the advertised product available because the production line cannot keep up with demand, and none is expected for several weeks. Alternatively, the seller may disparage the product, pointing out that the low price is an indication that this is simply not the quality of product that the consumer wants. Other, similar maneuvers intended to discourage purchase of the advertised item may be used. Then comes the switch: the seller will suggest that a different product is available (and/or is one that will suit the customer's needs better) and attempt to sell the higher profit-margin product. Thus, the misrepresentation is intended to benefit the seller at the expense of the customer.

Historically, bait and switch has not always been perceived as unlawful. In the 19th century, advocates of unbridled free-market American capitalism successfully persuaded many that a vigorous economy depended on unregulated competition in the marketplace. These proponents of free enterprise suggested that the burden of constraining unscrupulous competitors lay with the consumer. This position was succinctly summarized in the Latin admonition *caveat emptor,* or "let the buyer beware." This approach meant that the consumer should understand that the goal of all market activity in a capitalist economy is to make a profit and be on his or her guard against poor quality, exaggerated pricing, and other efforts to separate the buyer from his or her money. Moreover, many of the sales techniques that are collectively mustered to offer the bait are quite legal, making it seem that the bait and switch scenario is hardly more than routine business activity. Thus, it is not unlawful for a store to offer items at below market price to encourage customers to shop at that store in the hope (or knowledge) that once inside, the customer will purchase something in addition to the item advertised. This form of inducement is called a loss leader and remains a common (lawful) practice in merchandising. Similarly, it is not unlawful—and is anticipated by the law—that advertising will exaggerate the positive, beneficial, and/or attractive qualities of any product or service in an effort to sell it. Thus, ads that proclaim to the buyer that "you can't beat this price" or "best quality that money can buy" are deemed permissible by the law, even though one should not (and typically cannot) take the claims as literally true. This is called puffery or touting.

Case Studies of Bait and Switch

Perhaps the best way to appreciate the contemporary attitude of the law toward bait and switch schemes is to examine cases. In one New York case, Electrolux Corporation, a manufacturer of vacuum cleaners, sought to enjoin several companies owned by a single entrepreneur from refurbishing Electrolux machines and using them as lures in a bait and switch scheme. The retailer would re-]build used Electrolux vacuum cleaners, often using parts not manufactured by Electrolux Corporation, and advertise them at a price under cost. The retailer did so in order to sell new vacuum cleaners and strictly ordered its sales personnel to "not let the rebuilt models out of your hands."

In another case, a retailer known as the New York Jewelry Company (NYJC), which served a low-income clientele who made about 85 percent of their purchases on credit, offered eyeglasses "from $7.50 complete." NYJC would sell eyeglasses at that price only if the customer had a prescription; otherwise, it offered prescription services for a price (the switch). Company records showed that of 1,400 pairs sold, only 10 were sales without the added cost of a prescription, and only 9 pairs of the $7.50 eyeglasses were sold.

Banco Ambrosiano

Banco Ambrosiano, Italy's second-largest private bank, collapsed in 1982 when it became unable to collect approximately $1.3 billion in loans to foreign shell companies with ties to the Vatican Bank. The scandal disrupted financial markets, damaged the Vatican's reputation, and led to the downfall of the bank's chair, Roberto Calvi, and other senior business and government leaders.

In 1896, Giuseppe Tovini from Valle Camonica in eastern Lombardy founded Banco Ambrosiano in Milan under the patronage of Saint Ambrose, the 4th-century archbishop of the city. Its mission was to offer a Catholic alternative to secular banking by focusing on stakeholders with religious, charitable, and other social missions. Its leadership maintained close ties with the Catholic Church. By the mid-20th century, the bank had expanded internationally, including the establishment in 1963 of Banco Ambrosiano Holding in Luxembourg under senior manager (and later chair) Carlo Canesi. Canesi recruited Calvi into bank leadership in 1967. Four years later, Calvi rose to general manager, and in 1975 he became chair. Calvi continued the bank's global expansion, including companies in the Bahamas and South America, a controlling interest in the Banca Cattolica del Veneto, and financing for Rizzoli Publishing. Calvi also did business with the Vatican's Institute for Religious Works (Vatican Bank) and was close to its chair, American Archbishop Paul Marcinkus. He also involved the bank in politics, funding parties in Italy and Nicaragua. There were also rumors that the bank helped finance the Polish Solidarity Trade Union for Pope John Paul II.

Calvi used Banco Ambrosiano to effect illicit capital flows from Italy, inflate the bank's stock price, and conclude large unsecured loans. The Bank of Italy warned in 1978 about fraud risk in the bank's operations, and this precipitated criminal investigations. However, terrorists killed the investigating magistrate, and the Bank of Italy official who had called for the investigation temporarily went to prison for unrelated reasons. The death of Pope John Paul I that September, after a pontificate of only 33 days, spawned rumors of complicity by Calvi and others to forestall financial and other reforms that the pope had planned.

On March 17, 1981, police raided the villa of Italian financier Licio Gelli and discovered his role in an illicit Masonic lodge, Propaganda Due (P2), along with information about the involvement of almost 1,000 other prominent Italians, including Calvi. Although Calvi received a four-year prison sentence for financial corruption, he gained release pending appeal and retained his position. Carlo de Benedetti, the chief executive of Olivetti, purchased two percent of Banco Ambrosiano later that year and became deputy chair, but he departed after 61 days because of Mafia threats and friction with Calvi. While investigations cleared him of extortion for threatening to expose fraud in exchange for preferential sales terms for his stock, a Milan court convicted him and 32 others in April 1992 for fraud regarding the bankruptcy. The Court of Cassation overturned this in April 1998.

In 1982, the bank became unable to collect $1.287 billion from 10 offshore affiliates in Panama and Luxembourg. On June 10, 1982, Calvi fled Italy with a counterfeit passport, and

Deputy Chair Roberto Rosone moved to transfer control to the Bank of Italy. On June 17, he ousted Calvi. That same day, authorities found the body of Calvi's personal secretary, Graziella Corrocher, beneath her fifth-floor window, and a note from her denouncing Calvi. Despite the suspicious circumstances, authorities ruled it a suicide. The next day, a letter carrier in London discovered Calvi's body hanging from Blackfriars Bridge. During July 1982, the bank cut off funds to the offshore interests, and they collapsed. In August, the Nuovo Banco Ambrosiano succeeded to the bank's assets under Giovanni Bazoli. The Vatican, Banco Ambrosiano's largest shareholder, agreed in 1984 to pay $250 million as part of the bankruptcy settlement but denied responsibility. In 1998, an Italian court held that a treaty between Italy and the Vatican prevented the prosecution of Marcinkus and other Vatican Bank officials for the collapse. Marcinkus retired in 1990 and died in 2006.

In 1994, former prime minister Bettino Craxi came under indictment in the case, along with Gelli. However, Craxi fled to Tunisia, and the judge declined to issue an international arrest warrant. In April 1998, the Court of Cassation affirmed a 12-year sentence for Gelli for the bankruptcy. Craxi died in Tunisia in 2000. The first two investigations into Calvi's death concluded suicide and indeterminate cause of death, respectively. After Calvi's exhumation in 1998, an independent forensic report in 2002 concluded that it was murder, likely because of losses the Mafia and P2 had suffered from the failure of the bank (which had been laundering money for them). On June 6, 2007, an Italian judge ruled that it was murder but that five defendants were not guilty. Appellate courts affirmed the acquittals in 2010 and 2011.

Bank Fraud

A set of white-collar crimes, bank fraud is the use of fraudulent means to obtain money or other assets owned or held by a financial institution, or to obtain money directly from depositors or credit card holders by fraudulently representing to be a financial institution or employee. The term *bank fraud* applies to actions that employ a scheme or artifice, as opposed to bank robbery or theft. In criminal and civil law, a fraud is an intentional deception for the purpose of personal gain or to damage another person or entity. A hoax involves deception without intention of such gain or damage. Fraud can occur through all kinds of media, including the Internet, mail, phone, and wire. Fraudsters may be insiders, depositors, or borrowers, operating through theft, embezzlement, deception, misrepresentation, identity theft, or impersonation.

Bank fraud affects every financial institution; fraud costs are ultimately passed on to consumers. Estimates of bank fraud costs are scattered because of the considerable variety of possibilities, and they are difficult to verify. Bank fraud globally must amount, however, to billions of dollars annually. Banks are typical credit card issuers. One estimate in 2010 of credit card fraud in the United States was about $8.6 billion, perhaps 0.4 percent of some $2.1 trillion in annual credit card dollar volume. The high cost of technology fixes tends to permit such low-proportion fraud to persist.

U.S. Bank Fraud Statute

Each country regulates bank fraud within its jurisdiction. In the United States, there are state and federally chartered financial institutions. Bank fraud in the United States is defined and criminalized by the Bank Fraud Statute, 18 U.S.C. § 1344, effective on October 12, 1984. This federal statute is a reasonable guide to bank fraud criminality generally. An intentional scheme or scheme to defraud a federally chartered or insured financial institution or to obtain the institution's moneys, funds, credits, assets, securities, or other property by false or fraudulent pretenses, representations, or promises can be fined up to $1 million or imprisoned up to 30 years, or both. One may commit bank fraud under either of two subsections of the statute, through defrauding or through false representations. Legislative history asserts explicit congressional intention of extra-territorial reach to handle victimization of an insured financial institution by use of shell or bogus offshore banks. Prosecutions under Section 1344 are analogous to the traditional use of the mail fraud statute to prosecute fraudulent conduct not otherwise the subject of specific criminal statutes.

The U.S. Congress adopted the statute after the U.S. Supreme Court held in *Williams v. United States*, 458 U.S. 279 (1982), that check-kiting schemes did not constitute making false statements under 18 U.S.C. § 1014. Section 1344 criminalized check kiting, check forging, nondisclosure on loan applications, diversion of funds, unauthorized use of automated teller machines (ATMs), credit card fraud, and other similar offenses. Section 1344 was strengthened by the Financial Institutions Reform, Recovery and Enforcement Act (FIRREA) of 1989, following the savings and loan crisis of the 1980s.

Other provisions of law address money laundering, bribery, and passing bad checks. Money laundering is any scheme by which the true origin of funds is hidden or concealed. Money laundering is committed by criminals or terrorists in order to separate funds from the original criminal activity or ultimate purpose. The crime often occurs in combination with some bank fraud, as are bribery and passing bad checks. The scope of bank fraud is therefore quite broad.

A U.S. federal indictment for bank fraud is typically based on theft or embezzlement by a bank employee, or a scheme to defraud based upon false statements, such as an overvaluation of property or securities. Federal prosecutors will seek an indictment for bank fraud based upon a scheme to defraud, such as false loan applications, and misuses of loaned monies, or nonexistent collateral. The violation of making a false statement to a financial institution is also a commonly used prosecution for making misrepresentations to a bank, including overvaluing property. The crime of making a false statement, under 18 U.S.C. § 1014, is often applied when federal prosecutors are investigating a person for bank fraud or violations concerning a financial institution. The fine ($1 million) and prison sentence (30 years), or both, are the same as under § 1344.

Depositors and Credit Card Users

Bank fraud can be considered to include schemes practiced directly against depositors, because at some point deposits are in bank custody, and against credit card users, because credit cards are frequently issued by banks. There are various schemes and devices for practicing fraud against depositors and credit card users, and those approaches may be used more broadly in other criminal activities.

Impersonation and identity theft are increasing problems. A fraudster obtains information about an individual, then uses that information to apply for identity cards, financial accounts, loans, credit cards, social security benefits, or tax refunds in that person's stolen name. The practice is sufficiently widespread that insurance companies sell coverage against it. Obtaining a birth certificate in the United States may require as little information as name, parents' names, and date and place of birth; these certificates are issued by local jurisdictions. Insiders, such as dishonest bank employees or government employees, may be participants in such schemes.

Internet fraud is a widespread problem. Stolen information is used in other frauds, such as theft of identity and online auction fraud. There are two basic forms. Trojan Horse programs spy on Internet users while online, capturing keystrokes or confidential data, which is sent forward to outside sites. Phishing involves sending forged e-mail that may impersonate an online bank, auction, or payment site. The e-mail redirects the victim to a forged Web site that is designed to look like the login to a legitimate site but that requires that the user to update personal information, including passwords and PINs.

Prime bank guarantee schemes offer extremely high yields in short periods of time. The fraudsters may claim to have access to bank guarantees that they can buy at a discount and sell at a premium. By reselling bank guarantees several times in a "roll program," fraudsters claim to be able to produce exceptional investment returns. The fraudsters often refer to guarantees as issued by the world's prime banks, a term having no real meaning. If a victim sends money to a foreign bank, the fraudster diverts the money to a different account, and the money is stolen.

Fraudsters may impersonate financial institutions or bank employees. They may set up companies with names sounding similar to existing banks or other institutions, or falsely assume employee titles, and then abscond with deposited funds. Sometimes the bank turns out to be uninsured or not licensed to operate at all. There can be offers to sell stock representing ownership of the bank. In an old bank inspector scam, a person claims that the bank suspects employee theft and asks for help from a depositor, who is then bilked or robbed. Other variants include claiming to be a prospective business partner with an investment opportunity or a person in another country holding money in cash who asks for help in transferring funds.

In the United Kingdom (UK), in June 2012, 10 individuals pleaded guilty to defrauding pensioners of over £125,000 by posing as bank employees and couriers. They persuaded elderly victims to turn over bank cards and PIN numbers, committing fraud by false representation.

Fraud Against Financial Institutions

Common techniques practiced against financial institutions include accounting fraud or false businesses, check fraud in several forms, and criminal overdrafts.

A genuine business may use fraudulent bookkeeping to misrepresent sales, assets, and income. False records and documents are used to solicit investment in bond or security issues, or to make fraudulent loan applications to financial institutions. Sometimes, the borrower is a business entity controlled by a dishonest bank employee or accomplice. The borrower may be a nonexistent entity, so that a loan is actually a concealment of theft from the bank. A fraudster may use a company to appear to be a genuine, profitable customer. The company uses the bank to appear to get payments from one or more of its customers. These pretend customers, however, are part of the fraud. Eventually, the company asks the bank to settle its balance with the company before it bills the customers further.

Individuals may steal checks, kite checks, or forge and alter checks. Some fraudsters obtain access to a facility handling large numbers of checks, such as a mailroom, post office, the office of a tax authority or a corporate payroll, or a social or veterans' benefit office. Some checks are stolen; bank accounts are opened under assumed names, and stolen checks are deposited so that money can then be withdrawn. Stolen blank checks are of value to forgers. Check kiting occurs when a check is deposited to a bank account, and the money is made available immediately, even though it should not be removed from the account on which the check is drawn until the check actually clears. A check kiter may exploit several checking accounts at different banks in this way. Most financial institutions now place holds on funds for at least five days, thus allowing enough time for the checks to complete the clearing process. Counterfeit checks are a huge problem. Forged documents are similarly a major problem for the banking industry. Falsified documents may conceal bad credit history and unpaid loans.

A criminal overdraft occurs when a depositor makes a worthless or falsified deposit at an automated teller machine (ATM). The individual withdraws more cash than the actual account holds. One scheme is to deposit an empty envelope. Another scheme is to try to prevent a check from being returned for nonsufficient funds (NSF). Generally, in the United States, the first $100 requested at an ATM is immediately available, without a review of the sufficiency of funds for the withdrawal. Variants include using another person's account or a counterfeit ATM card, or an account opened under another person's name obtained by identity theft. Advanced ATM technology can scan currency and checks without requiring a deposit envelope.

Embezzlement and accounting fraud by financial institution officers or other employees are closely related. In June 2012, a former Citigroup vice president, who had pleaded guilty, was sentenced to eight years for embezzling $22 million transferred to his personal account at another bank. In April 2012, an individual pleaded guilty to a $41 million bank fraud scheme that contributed to the failure of the Bank of the Commonwealth, in Virginia. The bank had applied for Troubled Asset Relief Program (TARP) funds. The scheme helped bank insiders fraudulently conceal nonperforming assets; the individual and a business partner owed the $41 million to the bank. The individual also pleaded guilty to a separate fraud involving a tax credit scheme affecting federal and state governments and investors.

In demand draft fraud, dishonest bank employees remove a few demand draft pages or books from the bank's stock and write them like regular demand drafts. These demand drafts are issued payable at distant locations without debiting an account, so that branch reconciliation may be required to discover the problem.

Wire transfer networks, such as the international SWIFT interbank fund transfer system, may be used in illegal transactions. These networks are used by banks to settle accounts with each other, and rapid wire transfers of large amounts of money are common. Insiders may figure out ways around checks and balances.

A Barclays Bank branch in London, England, at the corner of Fleet Street and Salisbury Court. In 2012, Barclays Bank, which operates globally, agreed to pay a $450 million fine on charges of having manipulated the London Interbank Offered Rate.

Rogue Traders

A rogue trader is an employee authorized to trade on behalf of an employer, such as a financial institution, who makes unauthorized trades. The term is most often applied to financial trading and thus typically describes professional traders who make unauthorized financial transactions. In the most common instances, a rogue trader secretly makes progressively more aggressive and risky investments using the bank's money. The trades are thus basically speculation. When an investment loses money, the rogue trader engages in further market speculation in the hope of a quick profit that would hide or cover the loss. Recent research at the University of Cambridge suggests the possibility of traders overreacting in competition and engaging in pathological risk taking.

Nick Leeson's $1.3 billion in losses bankrupted Barings Bank in 1995, following his unauthorized investments in Nikkei index futures. He received 6.5 years in prison. A 1995 case in Japan caused Resona Holdings a $1.1 billion loss in U.S. Treasury bonds and earned the individual involved four years in prison. The next year, Sumitomo Corporation in Japan suffered a $2.6 billion loss in copper trading, and the individual involved received eight years in prison. In 2002, John Rusnak, in the United States, caused a $691 million loss for Allied Irish Banks in foreign exchange options; he received 7.5 years in prison. A similar foreign exchange options loss in late 2003, involving several individuals receiving varying prison sentences, affected the National Australia Bank. Jérôme Kerviel, during the period from 2006 to 2008, lost about 4.9 billion euros for Société Générale, trading European stock index futures, and he received five years in prison. In 2011, a trader for UBS allegedly lost an estimated

$2.3 billion in S&P 500, DAX, and EuroStoxx index futures. China has reportedly executed some bankers for fraudulent activity.

The May 2012 multibillion-dollar losses reported by JPMorgan Chase appear to have been a failed proprietary trading operation, intended to be a hedging activity using the bank's money. Rogue trading requires unauthorized trading, which does not seem to have been the case in this instance.

Bank Involvement in Ponzi Schemes

Ponzi operators frequently need banks to hold deposits of large sums. Banks could be unwitting participants or legally complicit in some way. There are two basic variants.

Bernard L. Madoff, for instance, had deposits with JPMorgan Chase estimated as high as $5.5 billion in 2008. The Chase account reportedly was the largest deposit location of the Ponzi scheme funds. In November 2011, a U.S. district court dismissed lawsuits against JPMorgan and UBS, for some $21 billion in claims (mostly against JP Morgan), on grounds that the court-appointed receiver, Irving Picard, did not have legal authority to file the cases as presented. Another U.S. district court dismissed in July 2011 a similar filing against HSBC Holdings Plc and other defendants. One study estimates that JPMorgan generated $435 million in after-tax profits from the Madoff account over a period of 16 years. The Madoff customers subsequently filed a class-action lawsuit against JPMorgan. The lawsuit alleges bank complicity in concealing the Madoff Ponzi scheme.

In another reported case, Boston Private Financial Holdings (BPFH) sold a private bank subsidiary, Gibraltar Private Bank & Trust, based in Coral Gables, Florida, in September 2009. Just before the end of October 2009, Scott Rothstein fled on a private jet to Morocco, then turned himself in to authorities. Rothstein later pleaded guilty to a $1.2 billion Ponzi scheme operated over about four years. Important deposits of the scheme were reportedly held at Gibraltar Bank. It turned out that Rothstein held a relatively small equity share in the investor group that purchased Gibraltar Bank from BPFH in September. A study reports that the one-day return upon release of news of the Gibraltar Bank sale was 27 percent, or about $100 million of market value increase. As with the Madoff Ponzi scheme, the issue arises of whether BPFH has legal liability in some form for the Rothstein Ponzi scheme.

R(obert) Allen Stanford, a former head of privately held Stanford Financial Group of Houston, was sentenced in June 2012 to 110 years in prison for bilking investors out of more than $7 billion over 20 years in one of the largest Ponzi schemes in history. A jury convicted Stanford on 13 of 14 counts of conspiracy and wire and mail fraud. Although Stanford was a billionaire, the federal government seized his assets after arrest, and he had court-appointed attorneys. The essential scheme was diversion of funds from certificates of deposit (CDs) purchased by investors from a Stanford bank on the Caribbean island nation of Antigua. Stanford allegedly funded failed businesses, bribed regulators, and financed a lavish lifestyle of yachts, private jets, and cricket tournament sponsorships. It may be years before thousands of bilked investors recover perhaps a fraction of the losses. A federal district court ruled in July 2012 that investors were not eligible for payments reimbursement from the Securities Investor Protection Corp. (SIPC), despite an order in 2011 by the U.S. Securities and Exchange Commission (SEC). The SIPC refused to comply and argued that Stanford payments, in addition to Madoff and MF Global liabilities, would bankrupt the fund and increase brokerage costs. A former Antigua financial regulator was indicted and awaiting extradition to the United States. Three other former Stanford executives were indicted. There is an SEC lawsuit against defendants for fraud.

Barclays Bank Libor Manipulation

In summer 2012, Barclays Bank, headquartered in London, operating globally, and tracing its origin to 1690, agreed to pay a $450 million fine to settle charges of having manipulated the London Interbank Offered Rate (Libor). Barclays reported a 2011 profit of nearly $4 billion. Libor is essentially a measure of how much banks charge one another for interbank loans. Libor thus affects many other interest rates and ultimately consumer borrowing costs through credit cards and adjustable-rate mortgages. Libor is set daily by a survey of 16 London banks, just before noon, by the British Bankers Association. The highest and lowest reported rates are dropped, and the remaining rates are averaged to set Libor for the day. In effect, Barclays was falsifying the reported borrowing costs in a way that skewed Libor and it allegedly benefited from this skewing. Released e-mails suggested that derivatives traders may have routinely asked for daily rate changes.

Three top executives, including Chief Executive Officer Robert Diamond, resigned. On July 4, 2012, Diamond testified before the UK Parliament's Treasury Select Committee. Reportedly, 14 traders at Barclays had manipulated global interest rate benchmarks. In his testimony, Diamond partly blamed regulators, including the Bank of England (the UK central bank). He reported that Barclays had on multiple occasions raised concerns with U.S. and UK regulators about how Libor was set. The bank was apparently not told to stop its practices. There may have been some internal miscommunication at Barclays. A Bank of England official reportedly expressed concern in October 2008 that Barclays had been submitting rates higher than those of competitors. It appears that employees were instructed, on some basis, to keep rate submissions lower, or in line with competitors. The U.S. Commodities Futures Trading Commission (CFTC) has reportedly been leading a multicountry investigation of at least 15 banks. Following Diamond's testimony, the UK Serious Fraud Office opened a formal criminal investigation of the Barclays matter.

Bank of America Corp.

In 1904, Amadeo Giannini opened the doors to the Bank of Italy, located in San Francisco, California. From this initial opening, his Bank of Italy has grown to become the Bank of America—one of the largest commercial banking instiutions in the world. Giannini's original intent was to ensure that immigrants to the United States had a bank that would be willing to assist them given the reluctance of existing institutions. As a result, he had a loyal support base of customers and grew as quickly as the immigrant population did. After a little more than two decades, Giannini merged with Los Angeles' Bank of America and began operating under that name. Bank of America has more than 5,000 branches in 150 countries worldwide. Of the current Fortune 500 companies, over 99 percent have a relationship with Bank of America.

In terms of revenue, Bank of America is the fifth-largest company in the United States. After being acquired by Merrill Lynch in 2008, Bank of America became responsible for more than 10 percent of all bank deposits made in the United States.

Controversies Escalate

This huge corporation has had a series of controversies throughout its history. In the past decade, however, there has been an unusually high number of serious accusations leveled against Bank of America, which raises numerous questions about the company's structures and practices. The controversies have occurred at a poor time for the company, given its highly publicized acquisitions of Countrywide Financial Corp. (which was at the center of the mortgage collapse) and Merrill Lynch. Initially, Bank of America received \$25 billion from the federal government in the fall of 2008 to prevent significant distress on the national economy. Later, the company received \$20 billion from the federal government as part of the Troubled Asset Relief Program in January 2009. It also received a guarantee of almost \$120 billion against possible losses. When the hangover from allocating so much money to Bank of America began, many members of Congress voiced concerns regarding how the money had been spent.

The first Bank of America controversy centered on Parmalat SpA, an Italian dairy and food corporation that went through bankruptcy in 2003. The company sued Bank of America for \$10 billion, claiming that the bank knew of Parmalat's financial problems and used the information to turn a profit. Although it never received anything approaching \$10 billion, a settlement was reached in 2009 for just under \$100 million. On an attached note, in 2011, Bank of America was acquitted in an Italian court of assisting Parmalat with concealing the fraud that led to the need to file for bankruptcy in the first place.

In early 2008, Bank of America began a practice that would put it in trouble with the public and its shareholders. The company began notifying customers who had no payment problems that their interest rates were being doubled, without giving cause or reason. For some individuals, this hiked interest rates up to almost 30 percent, despite the fact that they had never been late on a payment. Most important, Bank of America refused to explain its justification for choosing to increase the rates. In the fall of 2009, Ann Minch, a credit card customer of the bank, went to YouTube to voice her displeasure. She posted a video criticizing the decision of Bank of America to double her rate after years of loyalty and on-time payments. The video went viral, and Minch was called by a bank representative, who helped fix the situation. This action did not prevent the same insult from happening to thousands of other Bank of America customers.

Also in the fall of 2009, Julian Assange, of WikiLeaks fame, claimed that his organization had come to possess a hard drive formerly belonging to a Bank of America executive and intended to publish it for the world to see. Assange announced a year later that he planned to publish information that could destroy a large American bank with international power; Bank of America stock dropped over 3 percent in response. After Assange's announcement, the company stated that it would not be able to service money transfers to or from WikiLeaks. Bank of America then purchased hundreds of domain names in an effort to mitigate the potential release of information from WikiLeaks. Any domain that involved the name of top executives at Bank of America and potential derogatory responses were purchased. To date, Assange has not come out with the information, yet Bank of America has still suffered from his announcement.

Bank of America continued to be haunted in cyberspace. In March 2011, members of Anonymous, a decentralized group of hacker activists whose goals revolve around mass awareness of corrupt entities while seeking anonymity, began releasing e-mail communications it claimed were taken from Bank of America's servers. According to statements from Anonymous, the e-mails demonstrate intentional fraud related to improper foreclosures on homes mortgaged through Bank of America. This was not the first time this issue had been raised. Arizona previously launched an investigation into the company's practices for giving incorrect information to individuals seeking to refinance or modify their loans. As a response, Bank of America chose to modify the mortgages of impacted individuals in exchange for their agreement to a gag order regarding the issue.

Foreclosure Troubles and the Libor Scandal

The bank has also been publicly criticized for false foreclosures during the mortgage crisis. In several cases, Bank of America seized properties upon which it had no ownership claims, as the result of incorrect information on internal legal documents. For example, In 2010, Christopher Hamby of Wheelwright, Kentucky, filed a lawsuit against Bank of America, with whom he had no relationship and no mortgage agreement, for repossessing his home by mistake and refusing to compensate for damages—except for replacing the locks. Also in 2010, Jason Grodensky lost his home to a Bank of America foreclosure, even though he had paid cash for the house and had no mortgage. Bank of America acknowledged the error and claimed it would pay to correct it. In 2011, a Sacramento, California, homeowner almost lost his house in a foreclosure auction, despite the fact that he, like many others, had also paid cash for the house. Bank of America attributed the confusion to a "data entry error." Again, public outrage ensued and forced another internal audit of Bank of America records.

In early January 2013, Bank of America was one of 10 major lenders named in an $8.5 billion settlement. The lawsuit, initiated by the federal government, attempted to resolve foreclosure abuse claims spawned by flawed paperwork and bungled loan modifications. Eligible homeowners could get up to $125,000 in compensation.

Most recently—and perhaps most seriously—Bank of America has been questioned regarding the Libor scandal, which is a series of fraud cases involving the London Interbank Offered Rate (LIBOR). This rate is an average interest rate calculated among a series of London-based banking institutions. On June 27, 2012, the scandal broke when London-based Barclays disclosed that it had been fined a record £290 million for rigging Libor between 2005 and 2009, and regulators warned that other banks may have been involved. The involved banks artificially altered their rates to guarantee a higher profit from trade and to demonstrate a higher level of creditworthiness than they actually possessed. Although this would create a problem for international markets, Libor is utilized within the derivative market in the United States; consequently, any company reporting fraudulent numbers is breaking an American law. During an era in which U.S. consumers are facing numerous hurdles in a turbulent economy, fraudulent reports to Libor potentially impact mortgages, student loans, and all other derivative markets in the country. The U.S. Department of Justice, the U.S. Commodity Futures Trading Commission, and U.K. Financial Services Authority served Bank of America with subpoenas and information requests in August 2012. Although the inquiries have not unveiled anything incriminating, a small New York bank filed a lawsuit in July 2012 against 21 banks—including Bank of America—claiming it was owed money as a result of the false Libor rates.

This controversial trend for Bank of America remains problematic, especially given the amount of assistance the corporation has received from the U.S. government in recent years.

Bank of Credit and Commerce International

The Bank of Credit and Commerce International (BCCI) was an international bank built on securities fraud, money laundering, government corruption, and financing terrorism and illegal arms deals, gaining it the nickname "The Bank of Crooks and Criminals." BCCI was incorporated in Luxembourg in 1972 by Agha Hasan Abedi and originally promised to serve the financial needs of developing nations, a goal that attracted support from world leaders including President Jimmy Carter. Abedi had considerable banking experience when the government of Pakistan nationalized banks, and he started BCCI in response. A bank was needed to assist Pakistani expatriates in sending money home. Initially, this service allowed BCCI to take advantage of the "float," the time it took checks to clear. Today, checks clear instantly through electronic transmittals. Holding funds from Pakistanis working abroad for a couple of days kept millions of dollars in the bank on any given day.

Fraudulent Loans

BCCI's frauds started early. To be qualified as an international bank, BCCI needed deposits and a global reputation. Abedi sought support from leaders and prominent families in Middle Eastern nations to increase the bank's reputation. However, getting anyone to invest in a new bank with little capital was difficult. To give the appearance of oil-wealthy backers, Abedi put false loans on BCCI books in their names. None asked to borrow or invest in the bank, nor were they expected to repay. BCCI issued stock in their name based on the loans. If BCCI could claim that prominent leaders in Abu Dhabi, Saudi Arabia, and other oil-rich nations were shareholders, it was thought, everyone would want to do business with the bank. BCCI offered fake loans as bribes whenever help was needed from influential officials around the world, including the United States. Each was backed by letters of credit from BCCI subsidiaries, giving the appearance of extensive (but nonexistent) assets because repayment was not required.

BCCI and the U.S. Banking System

Abedi spread BCCI operations over many countries, with main operations in the Cayman Islands, Luxembourg, and places with minimal banking laws, so it was virtually unregulated. BCCI needed access to the U.S. banking system to make transactions in U.S. dollars and to trade oil. Bank regulators objected to an unregulated international bank conducting business in the United States, but BCCI desperately needed the privilege. Regulators blocked Abedi's first effort, to secure the Chelsea National Bank of New York. Realizing that he needed help, Abedi approached T. Bertram "Bert" Lance, the budget director for President Jimmy Carter.

Lance was chief executive officer of the National Bank of Georgia, which financed Carter's farming enterprises, and he was also Carter's personal friend. Lance resigned as budget director as a "bent banker" soon after Carter took office as president. Lance had loaned himself $2.6 million without collateral, to purchase National Bank of Georgia stock, which he used as collateral for two more loans. Abedi discovered that Lance was millions of dollars in debt and that he had direct access to the U.S. president. Ghaith Pharaon, working for Abedi, bought the National Bank of Georgia, purchasing Lance's shares at a good profit for Lance. As a gift from BCCI, Lance's $3.4 million loan from the First National Bank of Chicago was paid in full, and he was made a BCCI consultant at a salary of $100,000 per year. These efforts secured BCCI's access to the U.S. banking system and the U.S. president.

BCCI's Capital Flight Operations

To increase BCCI's global outreach, Abedi did banking favors for world leaders with no questions asked. Promoted as a development bank, BCCI positioned itself to loot billions of dollars in government assets from poor nations. Using bribery and fake loans to government officials, BCCI convinced them to turn over government payment transactions to the bank. Once in control of a country's payments, BCCI placed itself between the country and its suppliers. Capital flight into BCCI accounts occurred rapidly once authority to handle payments was obtained. Corrupt officials who granted BCCI the authority got their share. BCCI fudged invoices for everything a government bought. If a truck cost $50,000, BCCI transferred $75,000, paying the truck manufacturer $50,000 and putting $25,000 in its account. Likewise, everything coming into a country was under-invoiced. If an American oil company ordered 10 million barrels of oil at $30 per barrel for $30 million, BCCI stated that 5 million barrels were ordered. The oil-exporting country was paid $15 million, and $15 million went into BCCI accounts. The country supplied 10 million barrels but was paid for 5 million.

Money Laundering

Money laundering was BCCI's specialty. BCCI paid anyone, anywhere in the world, in the currency of their choice, without question. Noted BCCI money laundering transactions assisted the president of Panama, Manuel Noriega, and Colombian drug cartels. Noriega put Panama National Guard funds in his BCCI bank account. The Central Intelligence Agency was aware that BCCI laundered drug money. Undercover operations against money laundering in the United States revealed that BCCI transactions sent funds out of the United States to drug cartels through its branch banks in Florida. In 1987, the Federal Bureau of Investigation raided the BCCI office in Tampa, Florida, arresting 90 people; among them were 11 bank officers. The arrests exposed it as the largest money launderer in the world.

Money laundering techniques were simple. A massive pile of cash from drug sales was deposited in a BCCI account at a branch office. On the other end, a loan was given to whoever was supposed to receive the money, minus the bank's fee. In effect, drug dealers borrowed their own money, but it transferred out of the United States. Once funds were delivered, the loan was marked repaid. BCCI claimed that only its Tampa office laundered money, and it paid $20 million in legal defense fees to Clark Clifford and Robert Altman, who were Lance and Carter's friends. Senior BCCI officers got off, and the fall guys received 20-year prison sentences. The Medellín drug cartel withdrew its funds before U.S. officials terminated BCCI's banking privileges.

Additional Losses

For much of its existence, BCCI was accepted as a legitimate bank that made many charitable donations. When its criminal operations were revealed, everyone with a legitimate account lost everything, most of it taken by employees who knew that the bank would soon collapse. BCCI had approximately 14,000 employees around the world who lost their jobs. Only those near the top knew of its massive involvement in white-collar crime on a global scale. In January 1990, BCCI officials pleaded guilty to money laundering, and the bank failed.

Bank Secrecy Act

The Currency and Foreign Transactions Reporting Act of 1970 (Bank Secrecy Act, or BSA) is a federal law that requires financial institutions to help the U.S. government prevent, detect, and respond to money laundering. The Money Laundering Control Act of 1986 amended the BSA by criminalizing money laundering. Section 1956 prohibits financial transactions with proceeds from "specified unlawful activities" (SUAs). Elements include intent to conceal the source, ownership, or control of funds, but not a threshold value or success in laundering them. Section 1957 prohibits transactions over $10,000 from an SUA, regardless of intent. The penalty is lower for money laundering, which requires that the money go through a financial institution.

The USA PATRIOT Act of 2001 also amended the BSA and Money Laundering Control Acts. Title III (International Money Laundering Abatement and Financial Anti-Terrorism Act of 2001) enables prevention, detection, and prosecution of international money laundering and terrorist financing by (1) strengthening banking rules against money laundering, particularly internationally; (2) enhancing communication between law enforcement and financial institutions, and broadening requirements for record keeping and reporting; and (3) fighting currency smuggling and counterfeiting, with quadruple the highest penalty for counterfeiting foreign currency.

The American approach to specified unlawful activities became controversial because of the limited set of predicate offenses that could trigger money laundering violations. Loopholes allowed those involved in human trafficking and other illegal activities to transfer money into the United States. On October 18, 2011, Senators Charles Grassley and Dianne Feinstein introduced the Combating Money Laundering, Terrorist Financing, and Counterfeiting Act, which, in part, defined

Juan Carlos Ramirez-Abadia (center), one of the leaders of Colombia's most powerful cartel, known as the Norte Valle, is taken by U.S. agents on August 25, 2008, during his extradition to face federal charges of murder, drug trafficking, racketeering, and money laundering. At least $881 million in drug trafficking proceeds, in part generated by the Norte Valle, were made possible by the failure of HSBC Bank USA to maintain anti-money laundering efforts and conduct appropriate due diligence, as required by the Bank Secrecy Act.

predicate offenses through blanket designation of felonies, without regard to location. The BSA requires financial institutions to compile records and file reports with the Department of the Treasury regarding transactions that could indicate money laundering, tax evasion, or other criminal activities. Some of these reports go to the Financial Crimes Enforcement Network (FinCEN), an interagency task force within the department that cooperates with various law enforcement agencies. The principal reports that financial institutions must file include the following:

1. FinCEN Form 104, Currency Transaction Report: A financial institution must file for each deposit, withdrawal, exchange of currency, or other payment or transfer that it handles involving currency greater than $10,000; it must treat multiple transactions as one if it knows that they are by or on behalf of the same person; and they result in cash receipts or disbursements by the institution of more than $10,000. Attempting to evade this requirement by breaking up transactions constitutes the distinct legal violation of "structuring."
2. FinCEN Form 105, Report of International Transportation of Currency or Monetary Instruments: Each person who physically transports, mails, ships, or receives (or causes others to do so) currency, traveler's checks, and certain other monetary instruments exceeding $10,000 into or out of the United States must file.
3. Department of the Treasury Form 90-22.1, Report of Foreign Bank and Financial Accounts: Each person subject to U.S. personal jurisdiction and having an interest in, signature, or other authority over one or more bank, securities, or other financial accounts in a foreign country must file if the aggregate value of such accounts exceeds $10,000 during the calendar year.
4. Treasury Department Form 90-22.47, Suspicious Activity Report: Banks must file for a suspicious transaction relevant to a possible violation of law or regulation.
5. FinCEN Form 110, Designation of Exempt Person: Banks must file this form to designate an exempt customer for the purpose of Form 104; banks biennially can renew exemptions for eligible nonlisted business and payroll customers.

On July 1, 2012, FinCEN put into effect a rule requiring virtually all of these filings to be electronic and instituted a more elaborate version of the Suspicious Activity Report, effective for March 2013.

Bankers Trust Co.

Established by a group of major U.S. banks in 1903, Bankers Trust Co. changed its business focus several times over its almost century in operation. Bankers Trust began life as a trust company, then evolved into a wholesale financial services company, changed into a retail banking supermarket, and then returned to wholesale banking. Although smaller than other Wall Street financial firms such as J. P. Morgan, Bankers Trust built a reputation upon its trading expertise, outstanding research, and innovative financial products. In the early 1990s, however, a series of complex derivative transactions resulted in heavy losses for a group of powerful and influential corporate clients. Bankers Trust was never able to recover, and it was acquired by Deutsche Bank AG in 1998.

Background

At the dawn of the 20th century, federal banking laws prohibited those banks with national charters from operating domestic or overseas branches. National banks also had to satisfy strict capital and reserve requirements, and they had no trust powers. Trust services include the institution's ability to act as a trustee that administers financial assets on behalf of another person or organization. As such, a trust department can manage assets and investments, pay bills, make charitable gifts, manage and distribute inheritances, and make other distributions of income or principal. Many national banks felt that the inability to offer trust services placed them at a competitive disadvantage to state-chartered trust companies and other financial institutions. To that end, a group of New York banks formed Bankers Trust to provide a variety of trust services to customers around the United States. The banks were confident in referring customers to Bankers Trust because it was unable to offer interest-bearing deposit accounts, unlike trust companies that were chartered pursuant to state law.

Bankers Trust grew quickly after its founding. Its first president was well-known financier Edmund C. Converse, and its primary shareholder was J. P. Morgan. Bankers Trust's stability during the 1907 bank panic burnished its reputation, and the company soon established an overseas department, began to offer traveler's checks, and increased its deposit base to above $165 million through a series of mergers with Mercantile Trust Company and Manhattan Trust Company. After World War I, under the leadership of Seward Prosser, Bankers Trust became a member of the Federal Reserve System, acquired Astor Trust Company, began retail banking, and became a commercial bank. Services added during this time included a bond department, wire service offices, and a wholly owned subsidiary, the Bankers Company, to underwrite and distribute securities. It grew rapidly before and after World War II, and during the 1960s, it embarked upon a policy of expansion and diversification. The company doubled its number of retail branches, began offering credit cards, and expanded into real estate, international, and construction lending. After it was rocked by the 1970s recession, Bankers Trust again returned to its core businesses of wholesale and merchant banking. This proved advantageous, and by the mid-1980s, Bankers Trust was among the most profitable of U.S. banks.

Derivatives Problems

Having forsaken traditional lending, Bankers Trust became a leader in risk management and trading. Lacking the connections of some of its rivals, the firm developed market data distribution systems and became known for the quality of its research, trading acumen, and product innovation. Bankers Trust was heavily involved in the trading of derivatives, which are used by investors for a variety of investment goals. Derivatives help investors to hedge risk in underlying contracts in the event that value moves in the opposite direction of their underlying position, to provide leverage so that movement in the underlying value can cause a large difference in the derivative's value, to speculate regarding the value of the underlying asset, or to create option ability where the derivative's value is linked to a specific event or condition. Because most of its clients were large corporations, Bankers Trust in theory was involved in derivatives to help them mitigate the risk that certain commodities would increase in value.

In 1994, Bankers Trust was involved in several derivative transactions that caused large losses for four clients: Air Products and Chemical Corporation, Federal Paper Board Company, Gibson Greetings, and Proctor & Gamble Company. After discovering this, all four clients sued Bankers trust, alleging that they had been misled by the bank regarding the riskiness and value of the derivatives that they had purchased. Although Bankers Trust was able to settle all four lawsuits for total payouts of $171 million, the real damage was to the bank's reputation. In what is now considered a classic case of poor stakeholder management, Bankers Trust was seen as having breached its fiduciary duty to its clients to pursue short-term profits at their expense. Regardless of whether Bankers Trust engaged in illegal or dishonest behavior, its reputation with other clients was deeply wounded. In 1997, in an effort to grow its investment business, Bankers Trust purchased Alex Brown & Sons, a venerable investment bank founded in 1800. Unfortunately, this was not enough to rebuild Bankers Trust's reputation, especially after several of its employees were charged with failing to turn abandoned accounts over to state authorities as required by law. After pleading guilty to this crime, a felony, Bankers Trust was no longer able to conduct business with most municipalities and many companies whose charters barred them from dealing with convicted felons. In 1998, Bankers Trust was acquired by Deutsche Bank for $10.1 billion and ceased to exist as a separate company.

Bankruptcy Fraud

Bankruptcy provides for the distribution of a debtor's estate to his or her creditors and discharges the debtor's debt, allowing the debtor to have a fresh start financially. The discharge of debt, however, is not permitted for the dishonest debtor. The dishonest, or fraudulent, debtor is one who attempts to improperly shield assets from the creditors' reach. Bankruptcy fraud has been in existence in the United States since the first Bankruptcy Act of 1800, and it undermines the integrity of the bankruptcy system.

The Bankruptcy Fraud Statute (18 U.S.C. §§151-158) enumerates the fraudulent acts that constitute cause for filing criminal charges against the debtor. Under this statute, bankruptcy fraud includes such acts as concealment of a debtor's assets; lying about a case filed under the Bankruptcy Act, making a false claim against the debtor's estate, fraudulently receiving property from the debtor after filing a Title 11 bankruptcy, transfer or concealment of property in contemplation of a Title 11 bankruptcy filing, or bribery or solicitation of bribery in connection with a Title 11 bankruptcy case.

Prosecuting Bankruptcy Fraud

Prosecuting bankruptcy fraud has become a national enforcement priority for the Internal Revenue Service and the Department of Justice because of the dramatic increase in the number of bankruptcy petitions. Since 1996, over 1 million individuals have filed for bankruptcy annually, with over 90 percent of all bankruptcy petitions representing individual consumer debtors. The Department of Justice estimates that approximately 10 percent of all civil bankruptcy cases are fraudulent. Using the estimated percentage offered by the Department of Justice, there are approximately 100,000 separate acts of bankruptcy fraud each year, totaling about 1.5 million cases of bankruptcy fraud since 1996. This level of fraud translates into a cost to creditors and the government of approximately $1 billion a year.

Bankruptcy fraud can be either federally criminally prosecuted in a U.S. District Court or brought to the federal bankruptcy court for a civil hearing. If the dishonest debtor is criminally prosecuted, he or she can be punished by a fine or by imprisonment for up to five years, or both. Additionally, the Victim and Witness Protection Act (18 U.S.C. § 3663) provides federal courts with the ability to award monetary compensation as a condition of probation, or as a condition of supervised release, in addition to a prison sentence. Moreover, federal sentencing guidelines are increasingly applied to bankruptcy fraud, with sentence enhancement for the more egregious cases.

However, creditors typically seek a civil resolution to bankruptcy fraud in order to recoup at least some of the assets. There are two remedies that can be sought in bankruptcy court. The first is the dismissal of the bankruptcy case, and the second is to object to the debtor's discharge. The elements to prove bankruptcy fraud in civil court and therefore receive a judgment of nondischargeability are that there is a written statement pertaining to the financial condition of the debtor, that is materially false and on which the creditor reasonability relied, and that the debtor published the false statement to the creditor with the intent to deceive. The burden of proof is preponderance of the evidence.

The potential for abuse is great because there is no mechanism that the bankruptcy trustee or the court can use to check the accuracy of the information provided by the debtor on the bankruptcy petition. As a result, in order to protect themselves from bankruptcy fraud, creditors have been developing improved detection methods. For example, creditors are increasingly seeking the assistance of forensic accountants to examine financial data to detect patterns of fraud and asset concealment. Some of the red flags that reveal debtor fraud include poor recordkeeping, heavily revised information, and a spike in insider transactions. However, the civil penalty of a denial of discharge leaves the debtor in no worse position than prior to the filing. Moreover, the creditors are left with collecting the debt from the debtor.

The U.S. Trustee Program is the agency charged with protecting the integrity of the bankruptcy system. The U.S. Trustee Program relies on information from a variety of sources, especially from panel trustees, to detect and refer cases for criminal prosecution. For example, Operation Total Disclosure was a multiagency task force focused on increasing the number and quality of referrals. The result was 134 defendants charged with bankruptcy fraud. The trustees are the first line of defense in protecting the integrity of the bankruptcy system. The dollar amount of the fraud does not determine whether a referral is made.

Concealment of Assets

Debtors who fail to list assets on their bankruptcy petition commit the crime of concealment of assets and false assets. Asset concealment and related false statements constitute more than 70 percent of all bankruptcy crimes. Concealment of assets occurs by omission of the asset from the schedules to gross undervaluation of a listed asset. Common assets that are concealed include personal injury lawsuits and inheritances. Warning signs that a debtor is concealing assets include large medical bill claims, recent job changes, or extended periods of unemployment. Once the assets are discovered, the debtor's strategy is to convert the bankruptcy petition from a Chapter 7 bankruptcy to a Chapter 13 bankruptcy or to dismiss the case in an attempt to remove the discovered asset from creditor control.

A recent example of a case of bankruptcy fraud is the former New York Mets baseball player Lenny Dykstra, who pleaded guilty to three counts of bankruptcy fraud in June 2012. Dykstra had bought a mansion, filed for bankruptcy, and claimed to have owed more than $31 million while only holding $50,000 in assets. The U.S. Attorney's Office found evidence that Dykstra hid, sold, or destroyed more than $400,000 worth of assets after filing for bankruptcy. Dykstra hid baseball gloves, balls, bats, and other memorabilia from the bankruptcy court, and creditors sold them for $15,000. Dykstra was sentenced to six and a half months in federal prison, required to complete 500 hours of community service, and ordered to pay $200,000 in restitution.

Bustout Schemes

Bustout schemes involve acquiring control of a business to establish a favorable credit rating through bribery of credit rating agencies or false financial statements vastly overstating the business's assets and net worth. The business will establish credit and purchase a considerable amount of merchandise, such as diapers, cigarettes, candy, and paper goods, while having no intention of paying for them. These types of goods are easy to sell and difficult to trace. The company will then begin selling the merchandise at substantial discounts, with the proceeds funneled to its owners through intermediary companies owned or controlled by them. They then "bust out" of the business by filing for bankruptcy, leaving the creditors with an assetless business. Common red flags that indicate a bustout scheme include low inventory levels, false credit references, a lack of bank accounts and receivables, and a disproportionate liability-to-asset ratio. There are variations of the bustout scheme such as tax, travel agency, and credit card bustouts. For example, in a credit card bustout, individuals charge large amounts of consumer purchases and take cash advances in contemplation of bankruptcy. The credit is acquired by making false statements on both the credit card application and the petition for bankruptcy.

Other Bankruptcy Schemes

A bleedout scheme is when a company disposes of assets over a long period of time by shifting them to insiders; hence, the bleeding of failing corporations. Bleedout schemes are typically discovered when excessive loan payments are made to corporate officers, employee funds for health care and pension funds are diverted by the debtor, corporate officers receive excessive salaries and bonuses, individuals no longer affiliated with the company receive money prior to the bankruptcy filing, and inventory and other assets are sold prior to the filing of bankruptcy. Serial filers are debtors who petition for numerous Chapter 7 and Chapter 13 bankruptcies for the benefit of the automatic stay. On the petitions for bankruptcy, the debtor fails to disclose the previous filings, uses a false social security number, or uses a variety of names. Detection of this type of fraud is dependent upon collecting information from a variety of sources, including creditors. Credit card bankruptcy occurs when a debtor obtains numerous credit cards in another person's name, running up thousands of dollars in debt. The fraud is both in obtaining the credit and in running up debt with no intention of repayment.

Barings Bank

Barings Bank operated from 1762 as the most senior merchant agent acting as a bank in London. Its downfall occurred in 1995 when an investment made by an employee, Nick Leeson, of a total value of $1.3 billion was lost. The first name by which the bank became known was the John and Francis Baring Company, by the homonymous brothers. Its trading activity was not limited only to wool as was the custom at that time but rather extended to a wide range of goods and financial services. By the end of the 19th century, it was the leading bank in the sector.

Barings was rescued by the Bank of England when it became overly exposed to Argentine and Uruguayan debt during the Panic of 1890. After these incidents, the reputation of Barings was irrevocably harmed, and it did not regain its dominant position; a limited liability company was formed, the Baring Brothers & Co. Ltd., into which the viable part of the previous company was transferred. During World War II, Barings liquidated assets in the United States on behalf of the British government in order to finance the ongoing war. This was the last influential period in Barings' history; after that, it remained in the shadow of other banking houses until its collapse in 1995.

Two world wars and the Great Depression did not lead to the cease of operations for Barings Bank; this came in 1995, when the bank was accused of repetitive incidents involving unauthorized trading. Leeson was supposed to arbitrage in order to seek profits emerging through differences in prices of Nikkei 225 futures contracts listed on the Osaka Securities Exchange in Japan and the Singapore International Monetary Exchange. Arbitrage at this level involves buying commodities at a desirable price and reselling them in other markets, generating profits through this transaction. The limits of profit in arbitrage are usually thin, given the low risk involved in this kind of transaction; therefore, large amounts of money must be invested in order to produce the desired profit. Given the low risk and consequently low profit involved in these transactions, Leeson invested in the future direction of the Nikkei market, a much riskier technique that could yield substantially more money. A domino of unfortunate internal and external effects led to an escalation of the losses that were not repairable for the company.

Auditing Failure

A defective internal auditing system was the main systemic flaw in the control environment of the company. Leeson was both the floor manager for Barings' trading on the Singapore International Monetary Exchange and head of settlement operations. This conflict of interest allowed him to audit the losses that he had caused and hide a great part of them. The lack of supervision from London was fatal to the reliability of the internal control and effective management of the bank. The main technique used by Leeson was manipulating the accounting sheets; he created a secret location where the central office in London had no access and redirected all the losses there. He then reported various losses as profit; this extremely negligent and criminally liable act went undiscovered, given the lack of transparent auditing procedure. By December 1994, Leeson had lost 200 million pounds sterling, whereas he had reported a profit of 102 million pounds sterling to the British tax authorities.

The last hit was the Kobe earthquake, which led to a financial crisis of the Asian market; Leeson had bet on a quick recovery, but he was mistaken, and his losses were soon discovered. Leeson confessed with a note to Barings' chairman, Peter Baring, and almost simultaneously the auditors traced the money's direction. At that stage, the losses of $1.3 billion amounted to twice the bank's available trading capital. The bank declared insolvency by February 26, 1995. The Board of Banking Supervision of the Bank of England held an investigation that led to the conclusion that Barings' collapse was the result of the negligent acts of an individual (Leeson) combined with the failure of management to enforce efficient auditing mechanisms.

Eventually, Barings Bank was bought out by ING (a Dutch bank) for 1 pound sterling along with all pending liabilities. The U.S.-based operations were subsequently sold to ABN Amro for a nominal amount of $275 million and ING's European banking division absorbed the rest of the bank. Leeson's effort to extradite himself to the United Kingdom failed and his trial was therefore held in Singapore. His final sentence was six and a half years imprisonment but he was released early in 1999 due to severe health problems. He nevertheless overcame his problems and was appointed chief executive officer of Galway United FC in 2006.

BASF Corp.

Badische Anilin- und Soda-Fabrik Corp. (BASF) is the largest diversified chemical company in the world. Founded in 1865 as a producer of commercial dyes, BASF now produces a wide range of chemicals, plastics, functional solutions, and agricultural products. It also explores for and produces oil and gas. The BASF Group holds subsidiaries and joint ventures in more than 80 countries, operating almost 400 production sites with a presence on every continent except Antarctica, and employs almost 110,000 people. Its income in 2010 was approximately 63.87 billion euros.

BASF has a long history of harming people and the environment. Its earliest chemical plant was built across the Rhine River because of fears that the air pollution from the plant would negatively impact the inhabitants of the town of Mannheim. On September 21, 1921, an explosion occurred at the fertilizer plant in Oppau, killing 565 people. This was the largest industrial catastrophe in German history.

War Crimes

In 1925, the chemical company was one of the founding companies (with Bayer, Hoechst, and three smaller companies) of IG Farbenindustrie AG (IG Farben). During Nazi rule, from 1933 to 1945, IG Farben played a central role in German industry and the economy more broadly. From the appointment of Adolf Hitler as chancellor in 1933, IG Farben collaborated with the Nazi regime, profiting from guaranteed volumes and prices as well as from slave labor from concentration camps. During World War II, IG Farben constructed a synthetic rubber and oil plant complex, Monowitz, near the Auschwitz concentration camp. Inmates were forced to work as slave labor for IG Farben and were killed in the gas chambers when they became unable to work. IG Farben was also the manufacturer of Zyklon-B, the gas used in the extermination camps.

It has been suggested that the company was heavily involved in the planning, preparation, and implementation of World War II. Because of the close connections between IG Farben and the Nazi government, the Allies ordered the company dissolved in 1945. Following the war, the International War Crimes Tribunal pronounced the company guilty for its responsibility for the war and for participation in the crimes of the Nazi regime. On July 29, 1948, at Nuremberg, 12 IG Farben executives were sentenced for mass murder and slavery. The longest sentence was only seven years, for Dr. Fritz ter Meer, an executive and scientist on the IG Farben board. The postwar period did not start without incident for the separated BASF. On July 28, 1948, an explosion at a plant in Ludwigshafen killed 207 people. BASF was reformed under the same name in 1952. Spurred by the expanding demand for plastics and consumer chemicals in the 1960s, BASF experienced massive growth with moves into North America. BASF has recently made expansion into Asia a corporate priority.

Acquiring and developing businesses producing consumer products, BASF developed a broad but vertically integrated corporate structure. Charges of price fixing against the company quickly emerged, and BASF became a prime target of antitrust authorities in various countries through the 2000s. This would come to a head in numerous antitrust cases involving BASF in the United States during the 1990s. As the decade drew to a close, U.S. antitrust investigators revealed the existence of cartels headed by the two largest vitamin producers in the world, Hoffman La Roche and BASF, organized to fix vitamin prices. In May 1990, the firms pleaded guilty to charges that they were involved in a leading role in a global scheme to raise and fix vitamin prices and distribute market shares for certain vitamins throughout the

The 1920s dye collection from Badische Anilin- & Soda-Fabrik Ludwigshafen (BASF), on display at the Technical University Dresden, Germany. BASF was founded in 1865 as a producer of commercial dyes; today, it produces a wide range of products.

1990s. BASF agreed to pay fines of $22.5 million. The U.S. investigations were followed by antitrust investigations in Australia, Canada, and Europe. Investigations in the European Union led to BASF being fined $296 million for its involvement in a dozen distinct cartels. By the end of the 1990s, BASF had shed all of its consumer product lines.

Environmental concerns have persisted around various BASF production sites, given the nature of chemicals and plastics production. In 2006, for example, BASF reported its emissions at 1.50 million metric tons of waste, a very high level. In May 2009, a discharge of chromium from a BASF Plant in Hannibal, Missouri, into the Mississippi River raised fears that drinking water had been contaminated. The local Department of Natural Resources did not react promptly to properly test the chromium levels. Later tests conducted in December 2009 showed the presence of chromium, but at levels that did not exceed regulatory safety limits. BASF has since worked with the Missouri Department of Natural Resources to address issues concerning elevated levels of hexavalent chromium detected in an outfall into the Mississippi River.

Environmentalists have also raised concerns about BASF plans to test genetically modified potatoes. BASF Plant Science, a subsidiary of BASF, focuses on genetically modified organisms (GMOs). BASF Plant Science produces the Amflora genetically modified potato. BASF has also entered into collaboration with Monsanto, a pioneer of GMO development. In 2012, BASF funded opposition to Ballot Proposition 37 in California, a ballot initiative that would have required clear labels informing consumers whether or not foods are genetically modified. Together, the "big six" pesticide firms—Monsanto, Dow, BASF, Bayer, Syngenta, and DuPont—provided about $21.5 million of the approximately $46 million deployed against the failed ballot proposition. Proponents were only able to raise about $9 million. Prop 37 was defeated by 51.41 percent to 48.59 percent in the November elections.

Baycol Case

Baycol is a medication released in 1997 by Bayer Pharmaceutical Division. It was part of a group of medications called statins that work to lower cholesterol levels. One of the side effects of the use of statins is rhabdomyolosis, which causes the breakdown of muscle tissue; among other drugs, Baycol had the highest incidence of rhabdomyolosis. The company was aware of this but delayed in withdrawing the drug from the market. Rhabdomyolosis was present with all the other statins only on rare occasions, and only in higher dosages.

Concealing Information

Bayer's approaches to dealing with the adverse side effects of this drug are what brought it to the attention of the civil and criminal litigation arena. It delayed releasing important adverse effect findings to ensure that a stronger dose of the drug was approved by the Food and Drug Administration. It also delayed releasing information showing that the combination of Baycol and another drug, gemfibrozil, increased the likelihood of rhabdomyolosis, especially at the higher doses of Baycol. The delay was motivated by profit because the drug generated high revenues, and withdrawing the medication would affect Bayer's profit margin significantly.

In 1997, the U.S. Food and Drug Administration approved Baycol, which was subsequently released onto the market. In 2001, Bayer withdrew Baycol from the market after patients who took the drug, especially in combination with gemfibrozil, experienced extreme side effects, and in some cases death. At this point, several thousand patients who had taken Baycol filed lawsuits against Bayer. According to a lawsuit filed by Laurie Simpson, a former Bayer strategic research analysis, Bayer used marketing practices that inflated Baycol's effectiveness and did not release information that would have warned the patients and their physicians of the dangers to a patient's health. Simpson uncovered this information while employed at Bayer but was instructed to conceal it. According to her lawsuit, Bayer was aware one year prior to its release that the drug was dangerous and continually received information for three years that outlined the dangers while it was on the market. Bayer ignored the warnings and provided incentives to physicians to prescribe the medication, and (according to the information ascertained from the lawsuit) had fictitious research published in many prominent medical journals that downplayed adverse effects and showed the many advantages of prescribing the medication.

Class-Action Suit

At the time of the recall, 416 cases of rhabdomyolosis had been reported, with 31 of them resulting in death in the United States (52 worldwide). Bayer fought a class-action lawsuit from the start, stating that the lawsuit would be at an "unmanageable size." Numerous plaintiffs were consolidated in a class-action lawsuit by a judicial panel on multi-district litigation, transferring them to a single district court judge in Minnesota. The process of this transfer to the class-action group ultimately was heard before the Supreme Court when discrepancies were encountered within jurisdictions. In West Virginia, two cases (*McCollins v. Bayer Corp*. and *Smith et al. v. Bayer Corp*.) were moving through the courts at the same time but were unknown to each other. The cases were pursued as a violation of consumer protection laws in West Virginia. In 2008, the *McCollins* case tried to group purchasers of the drug in class-action status, and they were denied access. The federal district court stated that the *McCollins* group had failed to show that Baycol was more than they had bargained for; it was exactly what they had thought they were purchasing because the medication worked for McCollins. The *McCollins* group chose not to appeal.

The *Smith* case remained in the West Virginia state courts because it had sued not only Bayer, but other entities as well, and it was argued that they lacked diversity. The cases reached their respective court proceedings at about the same time. The district court ruling was reached prior to the *Smith* case, and *Smith* was dismissed because it was assumed that the cases were equal in merit based on the arguments by Bayer that the litigants had not sustained physical injury.

The Court of Appeals of the Eighth District affirmed the ruling. The Supreme Court granted certiorari because of a violation of the Anti-Injunction Act that prohibits federal courts from enjoining state court proceedings. The Court ultimately found for the *Smith* group, thus allowing them, and other groups like them, to proceed as part of the class-action suit. Bayer has paid $1.17 billion to resolve 3,144 claims of rhabdomyolosis and has continued litigation of all other claims, including cases seeking economic recovery for plaintiffs, such as some of those in *McCollins* and *Smith,* who did not experience physical injury from Baycol. Of the approximately 40,000 plaintiffs who filed cases in relation to the medication Baycol (22,500 in federal court, and 17,500 in state court), only a small number are still pending.

Beech Aircraft Corp.

Beech Aircraft Corporation had worked as a small plane manufacturer for many years and seized the opportunity to begin his own enterprise. It took only 12 years before the company created a popular success—the Beech 35 Bonanza. The Bonanza quickly became regarded as the top small plane on the market, with a plush, luxury interior and advanced external design. The most important element of the new plane was the addition of an innovative V-tail system. Traditionally, planes relied on a T-shaped tail, in which a rudder sat on the vertical portion with two elevators on the horizontal portions. Instead, the new Bonanza design connected the rudder and elevators on two surfaces that extended at 45-degree angles to the remainder of the plane body.

The model 35 Bonanza was designed by Ralph Harmon and was innovative for its speed and low wings. It also had numerous design benefits, including retractable landing gear. Tthe design looked different and made the Bonanza easily identifiable, and it also proved cost-effective. With the combination of a large engine, an aerodynamic design, and the V-tail reducing drag, the Bonanza could reach much higher air speeds than any competition aircraft on the market. The design led Beech to become the main producer of small planes.

Problems Surface

Only three years after the Bonanza entered the market, many pilots reported that the plane had a tendency to murmur during flight, potentially causing disorientation for pilots. It simply did not fly as smoothly as predicted. More important, this irregular movement was likely leading to excessive wear on the tail—a potentially serious hazard. Although the disorientation was a concern, the Civil Aeronautics Board received numerous cases in which the Bonanza broke apart in midair. The Federal Aviation Administration (FAA) took until 1964 to make a ruling on the safety of the Bonanza. In the report, the FAA stated that there was a high incidence of breakup in the model, but it opted not to penalize Beech Aircraft. Many were shocked, while others simply believed that the data were correct: most of the midair breakups occurred during periods of bad weather and were attributed to pilot error. Because of how the Bonanza was designed, it was possible for pilots—particularly novice ones—to exceed the performance standards of the plane during bad weather, leading to catastrophe. Most of the breakups, however, began near the V-tail. Further, a poorly designed baffle system within the wing tanks was leading to fuel sloshing back and forth and stalling the plane—leading to planes possibly falling from the sky.

Despite the FAA not coming down hard on Beech, the company spent much time and energy in efforts to redesign the Bonanza in order to make the plane more structurally sound. In particular, energy was focused on the tail and wings. The company first introduced the Beech 33 Debonair/Bonanza in 1960. This plane was essentially the same as the Beech 35 Bonanza, except it had a straight tail instead of the V-tail. A few years later, Beech rolled out the Beech 36 Bonanza, which was a stretched out version of the 35 Bonanza, with a straight tail instead of the V-tail. With two straight tail models now on the market, consumers saw what impact the V-tail actually had on safety. In 1978, the FAA asked for a study to be conducted examining the safety of the 35 Bonanza because the V-tail continued to fail over the years. The results stated that the Bonanza was overall one of the safest planes in the air, but the V-tail model was 24 times more likely to experience a midair structural failure than the straight-tail Bonanza models. Consumers believed that the V-tail was unsafe, and Beech Aircraft needed to win back consumer confidence if sales were ever to rebound.

The efforts of Beech were too late, however, and in 1982, the company halted production of V-tail model planes. With hundreds of additional reported midair failures, Beech agreed to cooperate with the U.S. Department of Transportation to determine what could have caused the over 200 midair breakups of 35 Bonanzas over the history of the plane. What emerged was bad news for Beech Aircraft. The results found structural design flaws that made it likely that the V-tail could fail during specific maneuvers at high speeds. Since Beech had marketed the plane as having the fastest air speeds at the time, it knew that it could not simply ask pilots to go slower. Beech Aircraft instead created a tail-brace kit for all owners that dramatically decreased the number of 35 Bonanza incidents.

Many have wondered why Beech allowed the 35 Bonanza to continue to be produced, despite the significant incident numbers, or why the federal government continued to allow it. From the Beech perspective, it was well aware that a key selling point of the 35 Bonanza was the unique look that the V-tail gave the plane. Further, if it had admitted to a design fault, the company would have lost everything from the subsequent lawsuits. According to the government, potential buyers were well aware of the safety concerns of the 35 Bonanza if they chose to purchase it.

Beech-Nut Nutrition Corp.

Crimes against consumers are some of the largest forms of white-collar crime in the United States, affecting millions of individuals each year. Crimes against consumers negatively impact quality of life and the credibility of government. One major type of crimes against consumers is consumer fraud. Consumer fraud is generally defined as the use of deceit, lies, or misrepresentations that influence customers to purchase goods and services. False advertising is a common form of consumer fraud. Advertising in the United States is a multi-billion dollar industry, regulated by the Federal Trade Commission (FTC). Some companies engage in the illegal practice of false advertising—more specifically, deceptive ads that contain misleading and untrue statements—in an attempt to sell more products and services to consumers. Over the years, consumers have been duped into spending billions of dollars for goods and services that do not deliver the claims of advertisers. One such case of false advertising involves Beech-Nut Nutrition Corporation.

Phony Juice

During the 1970s and 1980s, Beech-Nut was the second-largest manufacturer of baby foods in the United States. Beech-Nut Company had developed a reputation of providing high-quality products that were pure, nutritious, and natural. In the face of financial difficulty, Beech-Nut began purchasing apple juice concentrate from Interjuice Trading Corporation (a company that would be later known as Universal Juice). Interjuice was able to sell the concentrate well below market price, thereby providing significant cost savings to Beech-Nut. Beech-Nut Nutrition Corporation marketed the apple juice product as baby food and as a children's drink with the following qualities: "100% fruit juice," "100% pure," "all natural," and with no sugar added.

All product statements were completely false. The juice was loaded with sugar and contained little to no real apple juice. The cheap concentrate was mostly a mixture of corn syrup, cane sugar, beet sugar, and artificial flavors and colors. Millions of bottles of the juiceless juice were sold around the world to unsuspecting customers. Most of the consumers of this product were babies and children. It is estimated that over a 10-year period, Beech-Nut revenues for this fraudulent product were $60 million. Not only was the intentional false advertising and sale of this adulterated juice concentrate dishonest and illegal, causing considerable financial loss to customers, but the phony apple concentrate also caused physical harm to some consumers (e.g., diabetic babies and children).

In 1978, shortly after Beech-Nut began purchasing apple juice concentrate from Interjuice, Jerome LiCari, Beech-Nut's director of research and development, began testing the Interjuice product for quality and purity. At the time, no conclusive tests for apple juice purity existed. However, chemists used other available procedures that detected impurities such as corn sugar. Results from these initial tests indicated that the apple juice concentrate was in all probability adulterated. Two Beech-Nut employees were then sent to inspect the blending facility where the juice concentrate was produced. Beech-Nut employees were denied access to the Universal Juice Company factory. The Beech-Nut research and development team informed managers Operations Vice President John Lavery and President Neils Hoyvald that Universal Juice Company was an unreliable supplier.

Ignoring Evidence, Advice, and Orders

Rather than return the phony apple concentrate, which would significantly decrease Beech-Nut profits from the apple juice product, Lavery required the owner of Universal Juice Company, Zeev Kaplansky, to sign a "hold-harmless agreement." This agreement simply transferred the financial liability from any consumer complaints or product lawsuits to the supplier, Universal Juice Company. In April and July 1979, LiCari sent samples of the concentrate to an outside laboratory. Although the April tests indicated adulteration, the July tests did not. LiCari concluded that Kaplansky most likely replaced the corn syrup ingredient with beet sugar, an adulterant that current technology was unable to detect. Again, LiCari notified Lavery of his findings, recommending the purchase of a different concentrate, regardless of the cost. Lavery did not follow this advice; rather, he decided that the apple concentrate would be used in other Beech-Nut mixed juices. Blending the fraudulent apple concentrate with other juices made testing for adulteration much more difficult.

Finally, in 1982, the Food and Drug Administration (FDA) began investigating the phony apple juice. Despite warnings from the FDA that adulterations were present, Beech-Nut continued to sell products containing the apple concentrate through 1983. Facing pressure from the FDA, the company eventually agreed to destroy the product to avoid legal action from the government. With approximately $3.5 million of inventory, Beech-Nut officials made a profit-driven decision to ship and sell (rather than recall and destroy) the remaining 26,000 cases of phony apple juice to other countries (i.e., in the Caribbean, Puerto Rico, and the Dominican Republic). This is known as "dumping." Federal and state officials exposed the details of the Beech-Nut apple juice conspiracy, and in 1986, charges were filed against Beech-Nut for selling an adulterated and misbranded product. After several years in court, the company was fined over $2 million. Additionally, Beech-Nut's president and vice president were convicted of violating federal food and drug laws.

In conclusion, the Beech-Nut Nutrition apple juice scandal is a classic example of corporate greed and disregard toward consumers, causing both financial and physical harm. Beech-Nut officials ignored the problem for years, claiming that adulterated juice was common and not harmful to consumers. Profit-maximizing behavior affected Beech-Nut's ability to offer quality and honest products to its customers.

Bendectin Case

First manufactured by Merrell Dow Pharmaceuticals in 1956, Bendectin was a prescription drug used to alleviate nausea and morning sickness associated with pregnancy. Over 33 million pregnant women worldwide were taking the drug when Betty Mekdeci, a woman determined to find the cause of her son's severe birth defects, linked the defects to the Bendectin she took during pregnancy. The story broke in the *National Enquirer* in October 1979, implicating Bendectin as the cause of birth defects in thousands of newborns in the United States. Women taking the drug panicked; some had unnecessary abortions, and thousands more sued Merrell Dow Pharmaceuticals. At one point, the company was faced with more than 1,800 lawsuits from women whose babies were born with defects. The list of defects included limb and skeletal deformities, brain damage, blood disorders, cancer, and deformities involving different organs such as the lungs, intestines, bladder, and heart. This list was questioned by the scientific community because there are no known agents (teratogens) that cause such a wide range of birth defects. The cost of litigation and insurance premiums exceeded the profit from the drug, and in 1983, Merrell Dow voluntarily stopped manufacturing Bendectin.

Merrell Dow's problem during litigation was a lack of scientific evidence. Specifically manufactured in 1956 for pregnant women, the three ingredients in Bendectin never underwent any reproductive toxicity tests. The only study to look at the teratogenic effects of the drug was performed by Merrell Dow researchers in the mid-1970s, and it was of such poor quality that it did not hold up in court. One of the Bendectin cases, *Daubert v. Merrell Dow*, actually led the U.S. Supreme Court to set guidelines for the admissibility of scientific expert testimony. Another problem was that Merrell Dow also neglected to mention the possibility of birth defects on Bendectin's label until 1981, after it was on the market for 25 years. However, Bendectin is a relatively safe drug; over 30 studies have found that it is not statistically related to birth defects. In fact, the Food and Drug Administration (FDA) continues to call the drug safe and has listed the drug as "discontinued" for reasons other than safety. The Centers for Disease Control also reports no change in the incidence of birth defects in the United States after Bendectin was taken off the market. On the other hand, the number of pregnant women hospitalized for severe nausea has doubled since the drug was discontinued.

Drugs similar to Bendectin are still manufactured and sold by other pharmaceutical companies throughout the world. Duchesnay Inc., a pharmaceutical company in Canada, has continued to manufacture and distribute Diclectin, a drug identical to Bendectin. Duchesnay is currently petitioning the FDA to sell the drug in the United States. The National Institute of Health sponsored a clinical trial for the use of Diclectin in the United States in January 2008–January 2009. Final results, reported in 2010, found the drug effective at reducing nausea, but did not mention the incidence of birth defects. As of 2012, drugs such as Diclectin are still unavailable in the United States. Two of the three ingredients that make up Bendectin are available without a prescription, vitamin B-6 and doxyalmine, an antihistamine found in Unisom. Many doctors have been instructing pregnant women suffering from extreme nausea to find relief by combining specific amounts of these two ingredients.

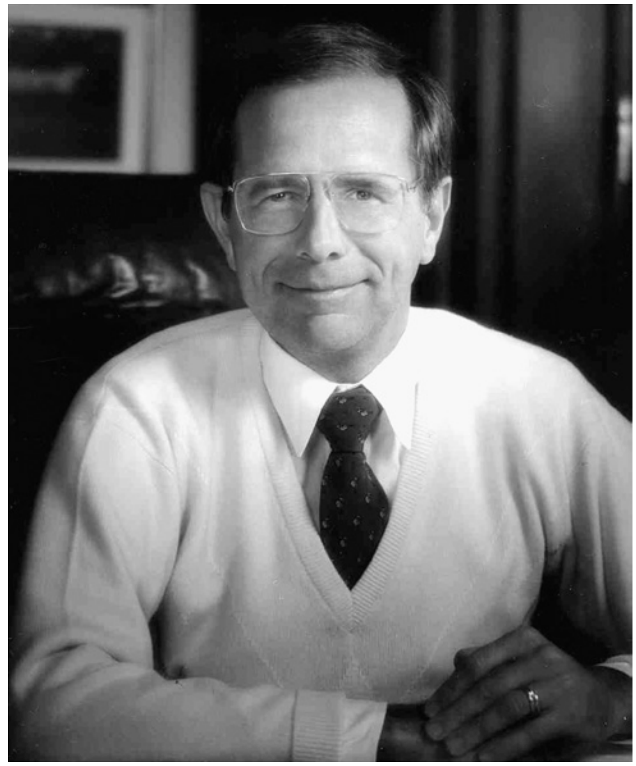
Bendix Corp.

In what turned out to be an epic hostile takeover attempt in the 1980s, Bendix Corporation chief executive officer (CEO) William Agee seemingly misjudged the Martin Marietta Corporation and its top executive Tom Pownall by thinking it could purchase Marietta without permission or resistance. The strategic maneuvers between the key players in this historic acquisition and merger battle left one company standing strong and independent—despite the odds—and the other defeated.

Attempted Takeover

Inventor, manufacturer, and industrialist Vincent Bendix began his career with a series of patents and manufacturing businesses for automobile and aviation engine parts, fueling systems, and (later) home electronics. His entrepreneurial businesses culminated in the founding of the Bendix Corporation, which went on to pioneer myriad products for 60 years (1924–83), until it was absorbed by a corporation in a historic acquisition and merger case.

In 1976, William Agee became president of the Bendix Corporation. Three years later, Mary Cunningham joined Bendix. Soon, reports of Bill Agee favoring Mary Cunningham began to surface, with the Bendix board questioning Agee's professional and personal decisions. Cunningham increasingly became Agee's primary advisor, strategist, and partner. The resulting conflicts between the board of directors, Agee, and Cunningham culminated in her forced departure, the resignation of several key board members, and a more dubiously individualistic role for Agee as the head of Bendix. In the spring of 1982, Agee began to set the stage for an attempted hostile takeover bid for a construction materials and aerospace firm slightly smaller-than-Bendix known then as Martin Marietta (Martin Marietta merged with Lockheed Corporation in 1995 to become Lockheed Martin). Marietta's president and CEO at the time was navy veteran Thomas G. Pownall. Bendix started the war by using its $500 million business divesting monies to begin covertly purchasing Marietta's then-inexpensive stock through Wall Street investment bankers. Agee paused long enough in June 1982 to marry the now-ousted, yet still strongly influential, Mary Cunningham. By late August, the rumors hinting at the Bendix interest in Marietta proved true: Bendix publicly announced its offering for Marietta. While they seemed similar on paper, the respective philosophies, goals, approaches, and CEOs of Bendix and Marietta were at opposite ends of the spectrum. Martin Marietta decided to fight against the Bendix takeover.



William Joseph "Bill" Agee (in 1990, top) became president of Bendix Corp. in 1976. Three years later, Mary Cunningham (photo undated) joined Bendix, and her increased involvement and influence with Agee created conflicts with the Bendix board.

Initially, two significant problems surfaced for Bendix. First, Martin Marietta, in an attempt to rebuff the takeover, countered by attempting to take over Bendix. Second, Bendix was put in a disadvantageous position from this counteroffer because it led the way for Marietta to utilize what became known as the first "Pac-Man" (eat-or-be-eaten) defense strategy. Bendix was not prepared for that move. Bendix did not have a "shark-repellant" armor in place with which it could strategically thwart a rival takeover. On a different playing field, the personalities of Bendix directors and its key takeover players at the Salomon investment firm team were not quite as unified as Martin Marietta and its primary players in the game. Martin Marietta had preempted any strikes by establishing a good rapport with its lender banks and creating the ability to receive credit on short notice (Marietta secured $930 million in bank credit in just one weekend). Marietta also had solid relationships between its executives and key players at the Kidder, Peabody & Co. investment firm (although Martin Seigel of Kidder is believed to have divulged strategic details of the takeover plans to an arbitrageur, Ivan Boesky, who reportedly profited from the inside information). Marietta's preplanning strategies also included the ability to offer "golden parachutes" on short notice to its management members, if necessary.

While Marietta was attempting to obtain a needed 11.9 million shares of Bendix stock through the Salaried Employees Savings and Stock Ownership Plan (SESSOP), Bendix succeeded in convincing a third (larger) company, the Allied Corporation, to act on its behalf as its "white knight." The takeover culminated in Allied acquiring Marietta's holdings of Bendix as long as Bendix agreed to give up its bid for Marietta. By all appearances, Bendix had purchased control of Marietta in September 1982. Yet, Marietta had also found a "white knight," one that could attack the attacker. Marietta's Tom Pownall invited his colleague Harry Gray—of the giant, powerful United Technologies—to step into the fray and come to Marietta's defense.

The chess game between Bendix, Marietta, Allied, and United Technologies resulted in complicated, entangled, back-and-forth maneuvers that, at one point, would see Marietta sacrificing itself in order to keep from being swallowed by Bendix. In the end, though, a small opening through securities laws allowed Marietta enough time to purchase Bendix stock between midnight and 12:01 A.M. on September 22, 1982. There was not enough time for Bendix or Allied to block the transaction. Although Martin Marietta went into debt by billions of dollars in an effort to fend off Bendix, it recovered and began to stabilize financially several years later. In the end, Bill Agee and the Bendix Corporation had misjudged Martin Marietta and its CEO, Tom Pownall. Speculating that Marietta was not in a financial position to refuse its offer, Bendix held firm to the idea that it could purchase Marietta without much resistance. Agee was proven wrong. The mind-set of Pownall and his principled belief in Marietta as the best contractor for the U.S. defense and aerospace business compelled him to refuse to surrender to the Bendix/Agee antagonists. Martin Marietta won the battle and retained its independence.

Benson, Michael

Michael Benson was born in Flint, Michigan, in 1950. He earned his B.A. and M.A. degrees in sociology at Central Michigan University in 1972 and 1976, respectively. He earned a Ph.D. in sociology from the University of Illinois in 1982. After brief employment at Indiana University–Purdue University at Fort Wayne, Benson joined the faculty in the Department of Sociology at the University of Tennessee (UT) in 1986, where he served until 2001. While at UT, Benson was promoted to associate professor in 1989, then to professor in 2000, and served as department head from 1991 to 1998. In 2001, he joined the faculty in the School of Criminal Justice at the University of Cincinnati (UC), where he currently serves as professor. Benson's research agenda from the start focused on understanding the contours of white-collar crime, including issues related to offenders, victims, prosecution, and incarceration.

His first major works involved in-depth interviews with white-collar offenders regarding the motivations, identities, and rationalizations associated with their crimes and regulatory violations. The resulting articles were "The Fall From Grace" in 1984 and "Denying the Guilty Mind" in 1985, both of which were published in the journal *Criminology*. These are two of the most widely cited white-collar crime articles, nearly 30 years after their initial publication.

Following these significant qualitative studies, Benson conducted a quantitative study of how white-collar offenders are sentenced (with Esteban Walker). This study was published in 1988 in *American Sociological Review*. Sentencing of white-collar offenders was just beginning to receive scholarly attention at this time, following passage of new federal sentencing guidelines via the Sentencing Reform Act of 1984. In an effort to make his research on white-collar crime even more comprehensive, Benson studied local prosecutors assigned to white-collar crime cases. This research culminated in the book *Combating Corporate Crime: Local Prosecutors at Work* (with Frank Cullen). This book was published in 1998 and received the Outstanding Scholarship Award from the Society for the Study of Social Problems.

Although Benson would continue to conduct research on white-collar crime, his move to the University of Cincinnati (UC) in 2001 represented a transition toward a life-course approach to understanding white-collar crime and other crime types. Soon after arriving at UC, Benson completed a book on life-course criminology. This book included an entire chapter on understanding white-collar offenders from a life-course perspective. He also articulated the connection between white-collar crime and life-course criminology (with Kent Kerley) in a collection of essays written in honor of Gil Geis. In 2006, he published his second white-collar crime book. This work focused on the criminalization and prosecution of white-collar crimes (with Frank Cullen, Gray Cavender, and William Maakestad). In 2009, Benson published his third book on white-collar crime (with Sally Simpson). This book was not simply an overview or summary of empirical research, but instead used opportunity theories as a heuristic device for understanding all white-collar crimes. Benson is regarded as one of only a few scholars to produce top-notch quantitative and qualitative research on white-collar crime. His research on elder abuse, intimate partner violence, and life-course criminology has distinguished him in the fields of criminology and sociology.

Bernard L. Madoff Investment Securities LLC

Bernard (Bernie) Lawrence Madoff borrowed $50,000 from his wife Ruth's parents to open Bernard L. Madoff Investment Securities LLC (BLMIS) in November 1960, a year after the marriage began. Bernie's brother Peter B. Madoff joined the company as its legal and compliance officer after graduating from Fordham Law School in 1970. BLMIS was a broker-dealer registered with the U.S. Securities and Exchange Commission (SEC). As a broker, BLMIS would fill orders to buy and sell stock shares and options for clients, many of which were large investment firms such as Fidelity and Bear Stearns.

A dealer trades on its own account, which may include employees with proprietary profit and loss, or "prop" accounts. Bernie would allow some employees to have prop accounts, as long as they showed a profit. Sometime after 1986, BLMIS moved its broker-dealer offices to the 18th and 19th floors of the Lipstick Building in midtown Manhattan, 885 Third Avenue between East 53rd and 54th Streets. The investment advisory business, unregistered for decades until 2006, used half of the 17th floor and had fewer than two dozen employees. The 17th floor generated phony account statements and false stock trade documentation.

BLMIS earned substantial profits by paying buyers and sellers one cent per share for order flow, a legal kickback. On each share, BLMIS was grossing at least $1/8, or 12.5 cents. After payments, the firm netted 10.5 cents per share. Back in the years when bids (buying price) and offers (selling price) had to be phoned in, written down, and taken to the floor of the New York Stock Exchange (NYSE) or American Stock Exchange (AMEX) for an auction, BLMIS's competitive advantage was speed. Peter directed the writing of computer software that automated the buying and selling of shares, bypassing the traditional exchanges. BLMIS was not a member of the NYSE or AMEX; it was a broker that created a "third market" for stocks.

Starting in 1971, the National Association of Securities Dealers (NASD) created its Automated Quotation system, abbreviated NASDAQ. It listed over-the-counter (OTC) companies with shares that were not listed on the larger exchanges, and BLMIS also traded in those shares. Eventually, the Madoffs and some partners bought the regional Cincinnati Stock Exchange, automated it completely in 1980, and renamed it the National Stock Exchange (NSX). NSX competed successfully with the NYSE and AMEX for trading volume. BLMIS was said to trade nine percent of the volume in NYSE shares. Bernie became NASDAQ chairman in 1990, and he was instrumental in preserving payment for order flow. On August 28, 2000, the NYSE began trading some stocks in decimal price increments, not one-eighths, and eventually all stock quotations were decimalized. Broker profits were reduced to one cent a share, but BLMIS was still paying that much for order flow. Authorities estimate that Bernie used hundreds of millions of dollars from investors to subsidize BLMIS operations.

Ponzi Scheme Detected

Bernie's father-in-law, accountant Sol Alpern, started raising money from friends and family for him to invest, beginning in the early 1960s. This continued into Sol's retirement in Florida in the 1980s. In 1987, he turned his Madoff investment account over to his former accounting partners, Frank J. Avellino and Michael S. Bienes. The accounting firm of Avellino and Bienes proceeded to raise funds by issuing "notes" with guaranteed returns to investors, then funneling the money to Bernie on the promise of even higher returns. On November 17, 1992, the SEC brought civil enforcement proceedings against Avellino and Bienes, fearing the unregistered investment brokers were running a Ponzi scheme where earlier investors were paid off with money from later investors. Although Bernie had to redeem some of the $441 million in "notes," most of the investors chose to reopen their accounts directly with BLMIS.

In actuality, no client investment accounts existed, nor did BLMIS trade stocks or options on any investments. Bernie and Peter Madoff deposited all the checks and wire transfers into Bernie's account at Chase Manhattan Bank, later JPMorgan Chase. Bernie's payments to fund raisers and redemptions to investors also came out of this bank account. In 2008, when JPMorgan Chase acquired Bear Stearns, the bank figured out that Bernie was not running a legitimate hedge fund; in September, the bank secretly withdrew its $250 million from Fairfield Greenwich Group's Sentry Fund, a Madoff feeder of $6.6 billion. BLMIS chose its internal auditor, the accounting firm Friehling & Horowitz. This was a red flag, as it had a small strip-mall office in New City, New York, and no other clients. Partner Jerome Horowitz was retired, so the firm had accountant David Friehling and an administrative assistant.

After Bernie Madoff turned himself in, six other BLMIS employees pleaded guilty to various crimes, including a trader (conspiracy to defraud customers), the controller (falsifying BLMIS records and regulatory filings), and second-in-command Peter Madoff. Peter pleaded guilty on June 29, 2012, to conspiracy to commit securities and mail fraud and submitting false filings to the SEC in exchange for a 10-year prison sentence and forfeiture of all his assets. Bernie's sons, Mark and Andy Madoff, were longtime BLMIS employees. Mark worked at BLMIS from 1986 and directed the broker-dealer side in 2008; he committed suicide on December 11, 2010, exactly two years after his father's arrest. Andy worked at BLMIS from 1988 and directed NASDAQ trading, but after a bout with cancer, he worked on an energy trading project. Peter's daughter, Shana Madoff, also graduated from Fordham Law School, and from 1995 she was BLMIS inside counsel and stockbroker rules compliance lawyer. Ruth Madoff had an office near Bernie's on the 19th floor, where she did some basic accounting.

Better Business Bureaus

The Better Business Bureau (BBB) is a nonprofit organization dedicated to offering impartial sources of information on the trustworthiness of local businesses and charitable organizations. The BBB consists of 116 local, independently incorporated BBBs across the United States and Canada, operating under the auspices of their umbrella organization, the Council of Better Business Bureaus (CBBB), which is headquartered in Washington, D.C. Each bureau, governed by a board of directors, is charged with collecting and disseminating information on all businesses, accredited or not, within their designated service area; processing consumer complaints against companies; and maintaining a regional membership. Each BBB is operated locally and independently, and must meet 23 established criteria to be considered a part of the BBB system. As nonprofit organizations, BBBs are financially supported almost entirely by member dues and national corporate partnerships. The bureaus collect information on millions of organizations—public, private, nonprofit, online, and traditional—and publish the data in the form of business reviews, formerly called reliability reports, in the belief that better-informed consumers are more likely to make wise marketplace decisions.

Origins of Better Business Bureaus

The origins of present-day BBBs can be traced back to 1906, when in response to a government-initiated lawsuit against Coca-Cola, Samuel Candler Dobbs, a Coca-Cola Company sales manager and later president, began lobbying for the elimination of abuse in advertising and the establishment of standards that would require complete truth in advertising. In 1909, Dobbs became president of the Associated Advertising Clubs of America, which is now the American Advertising Federation (AAF). In 1911, he was involved in the adoption of the Ten Commandments of Advertising, one of the first codes of advertising, developed by groups of advertising firms and individual businesses. In 1912, the National Vigilance Committee was formed by Boston advertising executive George Coleman. This self-governing trade organization, charged with identifying and correcting misleading ads, would eventually evolve to become what is now the BBB. This is considered the origination of the modern BBB, and the organization celebrated its centennial in 2012.

Accreditation

Application for BBB accreditation of a company or charity is strictly voluntary, but generally the organization must have been in business in the local area for at least a year in order to be eligible for consideration. Businesses typically apply for BBB accreditation as a manner of demonstrating that they ascribe to rigorous business standards and ethical practices. Businesses may obtain BBB accreditation if they meet and adhere to the eight BBB Standards for Trust. These standards address specific issues that the BBB considers imperative to manage for the formation of an ethical marketplace, where buyers and sellers can trust one another. The doctrine includes, among others, principles for consumer privacy protection, truth in advertising, and overall honesty and integrity.

Companies seeking BBB accreditation must pay an initial fee for accreditation review/monitoring, and then pay annual monetary dues to maintain their accreditation status, varying in amount depending on the size and nature of the organization. Once an organization is accredited by the BBB, it is considered a "BBB accredited business" of the local BBB, a designation that the Council of Better Business Bureaus (CBBB) officially changed from "member" in 2007. In accordance with their ethical ideological philosophy, BBBs forbid businesses or charitable organizations from advertising their accreditation status in order to avoid a mistaken public conclusion that the advertisement indicates a BBB endorsement of the accredited business. Additionally, BBB membership dues are not federally tax deductible, though they may be tax deductible as an ordinary and necessary business expense. In 2011, there were nearly 400,000 businesses accredited through BBBs.

Better Business Bureaus do not advocate for one company over another, but collect and disseminate information about all businesses and charities, regardless of accreditation status, to consumers. Each business is evaluated, based on information in the BBB files, and assigned an A$^+$ through F letter grade. The determination of a grade is dependent on 16 different elements such as consumer satisfaction, response to complaints, longevity of operation, and issues related to licensing and advertising. BBB reviews also generally include an explanation of which grading points contributed significantly to the assignation of a business grade.

In addition, the BBB may assign a Not Rated (NR) designation to an organization that fails to provide basic information, or if there hasn't been sufficient time to assess the organization. In the grading system's original format, there was an additional factor that rewarded businesses for BBB membership. That process was altered in November 2010 in response to criticism from Connecticut Attorney General Richard Blumenthal, who accused the BBB of offering, or appearing to offer, an unfair privilege to organizations that financially subsidized the BBB. Further criticism of BBBs evolved in 2010 from contentions leveled by popular media sources, claiming that the BBB ratings system contained irregularities that favored businesses paying BBB fees over businesses that chose not to pay the fees. In response to the allegations, the BBB's executive committee, in addition to revising the rating system, implemented a system to handle complaints about BBB sales practices. Further, after conducting a review of the accreditation process, the CBBB modified it, making the process stricter and more uniform.

Information Service

The Better Business Bureau's most widely used service is its inquiry and information service. In using this free service, individuals may request business reviews, available online, that offer information about businesses that is updated on a daily basis. The BBB business reviews allow businesses to post details about their company and services online and offer details into any consumer complaints against the business. Consumers are likewise offered an opportunity to provide an immediate reaction, request quotes for service, or connect with a business through a social media platform. Consumers contacted BBBs more than 103 million times in 2011 with requests for information on businesses and charities, the majority of which were fielded through the BBB Web site, which was accessed more than 6 million times per month in 2011. Consumers may also contact BBBs through more traditional means of communication.

Dispute Resolution

Other services offered by BBBs include a dispute resolution service that provides consumers with an efficient, cost-effective means of resolving disputes against a business, without the need for litigation. This service, facilitated by the BBB, allows consumer–business disputes to be resolved through mediation or arbitration, with the BBB acting as a neutral party. Upon receipt of a consumer dispute and verification of its validity, the BBB will contact the business in question and offer to mediate the dispute. This service is offered free of charge to both the consumer and the business, regardless of accreditation status. Using this process, local BBBs aided in resolving nearly one million disputes in 2011. The BBB Auto Line, which is the largest and longest-running dispute-resolution program, is a national service designed to help businesses and consumers resolve automotive warranty or lemon law disputes in a manner that complies with all applicable laws and regulations. The CBBB has contracts with more than 29 automotive companies to provide dispute resolution services through this program.

Self-Regulation

The CBBB also continues to administer multiple advertising self-regulation programs through its participation on the National Advertising Review Council (NARC), its National Advertising Division (NAD), the Electronic Retailing Self-Regulation Program (ERSP), the National Advertising Review Board (NARB), and, most recently, the Children's Food and Beverage Advertising Initiative (CFBAI). Launched in 2007, the CFBAI is a voluntary self-regulation program intended to respond to concerns about food advertising's effect on childhood obesity. This initiative complements another BBB program, the Children's Advertising Review Unit (CARU), which focuses on how all products, including foods, are advertised to children. Additional BBB services address increasing consumer apprehension concerning online purchasing activity. The Online Interest-Based Advertising Accountability Program (the Accountability Program) was implemented in an effort to build consumer trust online by ensuring that companies engage in online behavioral advertising (OBA) in a manner compliant with the Self-Regulatory Principles for Online Behavioral Advertising (OBA Principles), developed in 2009 by a coalition of associations and the CBBB.

Self-regulation remains an essential element in BBB doctrine because the organization believes that self-regulation is more efficient, more effective, and less expensive than either litigation or governmental intervention. In fact, Better Business Bureaus will generally refuse to manage disputes that are in any stage of the litigation process or those involving legal issues, such as employment practices, discrimination, or debt collection, or cases that have involved previous litigation. Better Business Bureaus claim to treat all parties equally in disputes and complaint investigations, regardless of accreditation status of the business or consumers. According to the CBBB, its neutrality in the process is what makes it such an effective arbitrator.

Bid Rigging

Bid rigging is a form of collusion in which conspirators agree to offer bids for goods or services at higher prices than they would offer if they were competing for bids in a normal, open way. These secret agreements usually involve one bidder who is the designated winner, under the assumptions that others will be the winners in future bidding rounds, or that others will be given perks (such as subcontracts), or that the other conspirators will benefit in some way at some future time for their collusion. Since the bids are set at these artificially higher prices, the purchasers end up paying more out, and the winning bidders end up taking more profits in, than they would under normal competitive market conditions. In the most common scenario, when the solicitors are local, state, or federal governments looking to purchase public goods or services, this means that taxpaying citizens become the victims because they end up paying more than they otherwise would. These fraudulent practices have been prohibited as criminal offenses in the United States since 1890, under Section 1 of the Sherman Antitrust Act.

Bid rigging may manifest itself in at least five different forms. In the most frequent form, called complementary bidding (or cover, courtesy, symbolic, or token bidding), the designated nonwinners submit bids that are too high, or that contain conditions they know to be unacceptable to the purchasers, to ensure that the predetermined bidder will be chosen. These token losing bids thus give the appearance that the purchasers made their choice from a fair range of competitive options and bidders.

In another form called bid suppression, the conspirators agree to refrain from bidding, or withdraw a bid that they gestured as offering in good faith earlier. Another form termed subcontract bid rigging ensures that those who agree not to win the main bid nevertheless end up with a subcontract or lucrative alternative deal.

With the form called bid rotation, the conspiring bidders agree to take turns winning the same type of contract (when these are repeated at regular intervals) or agree to divide up related or mutually dependent types of contracts.

Similarly, market allocation (or market division) bid rigging occurs when the conspirators agree to divide and win certain types of customers, market shares, or geographic regions in a prearranged way.

These forms of bid rigging thrive more in environments harboring certain conditions: the industry is narrow (when only a small number of businesses are able to provide the goods or services in question); the businesses have tight industry associations (with ample opportunities and forums for their chairpersons and officials to discuss and negotiate the terms of their bids and "competition"); there is regular, periodic demand for the goods and services, which are homogeneous or offer little room for variety or innovation; and similarly, when the purchasers have few alternative products or few alternative ways to meet their needs.

Such conditions formed the backdrop for the greatest bid-rigging scandals of the last half century, such as the Great Electrical Conspiracy that ranged from the 1940s to 1960. In this case, leaders in the electrical industry, notably General Electric and Westinghouse, colluded to rig prices, bids, and the winning bidders in transactions with the Tennessee Valley Authority (TVA). As Gilbert Geis documented in 1967, this collusion ended up costing the TVA and the taxpayers who received electricity through it many millions of dollars beyond what they would have otherwise paid (if the prices had been set under truly competitive, transparent conditions). Since this time and despite such exposés, however, other industries—especially in construction (e.g., infrastructure construction in rebuilding countries like Iraq) and the provision of municipal services—have continued to be mired with such bid rigging schemes.

The most recent and wide-ranging of these scandals has involved a coterie of major banks (UBS, Bank of America, JPMorgan Chase, and Wells Fargo, working under the aegis of GE Capital) that rigged bonds to various municipalities. As the *U.S. v. Carollo, Goldberg and Grimm* case (2011) revealed, these banks colluded in rigging the interest rates on these municipal bonds, causing the munis to lose billions of dollars. Montgomery County, Alabama, for example, is purported to have lost up to $3 trillion (including future debt incurred) for bonds for its sewer system that were manipulated by Chase. While the federal government received a settlement from Chase for $228 million, the aforementioned banks together paid $673 million in restitution on the heels of *Carollo*. On one hand, fines like this may seem extensive; on the other hand, as Geis and others have argued, recidivist businesses like Chase and GE, which take in untold billions in profit from the combination of their bid rigging deals and legitimate transactions, may pay them with impunity, as a cost of doing business.

Board of Directors

A corporation's shareholders elect individuals, usually at an annual meeting, to serve on the board of directors. This group holds authority over the firm and its managers. It determines long-term strategy for growth and risk management within the firm. It is also empowered to advise, monitor, and, if necessary, replace the corporation's top executives. Additionally, depending on the corporation's charter and the jurisdiction's law, a board may act to approve bylaw amendments, issue or repurchase stock, set dividends, and recommend to the shareholders significant actions, including a merger or dissolution. In all of their tasks, the board's directors are bound by their fiduciary duties to the shareholders. Nonetheless, corporate boards or their members are at times implicated in a wide range of problematic, or even illicit, corporate activities.

A corporation is required by law to have a board of directors, which can act on behalf of the body of shareholders, many of whom are likely to be dispersed, removed from the firm's operation, and thus generally passive in oversight. Some states—including Delaware, the leading corporate law jurisdiction in the United States—require that the body have only one individual. In other areas, three directors is the minimum requirement. Regardless, most established firms have between eight and 13 board members. In recent years, with increased attention to good corporate governance in the wake of the corporate collapses of the early 2000s, there has been a trend toward having smaller but more engaged boards.

Functions of the Board of Directors

A board of directors has two primary objectives. First, it exists to provide stability and continuity for the corporation and to help develop long-term strategy within it. Second, it advises, supports, evaluates, and compensates the corporation's managers as those individuals lead the firm according to the board's principles and goals. In its normal execution of these efforts, the typical board does little active policymaking. Instead, the board is often occupied with collecting and reviewing reports on the corporation's current operations, and with discussing the potential risks and opportunities ahead of it. Additionally, directors often use meetings to question and critique management's actions or to provide guidance on a new proposal.

A corporate board can take formal action only at its full meetings, which are held an average of eight times a year. However, it is common for many corporations to delegate certain board functions to committees of directors. This is especially true in larger enterprises. Different securities regulators require publicly traded corporations to maintain a nominating committee (to recommend candidates for open board positions), a compensation committee (to consider management pay levels), and an audit committee (to oversee the company's financial reporting and disclosure). Boards might institute other committees to address additional issues, including management succession planning, finance, corporate social responsibility, risk management, and shareholder relations.

Eric E. Schmidt, chairman and chief executive officer of Google Inc., is also a member of the board of directors of Apple Computer. An affiliated director is an outside director with some kind of additional connection to, or interest in, the corporation.

Types of Directors

Historically, the first boards of directors consisted primarily of a firm's significant investors (i.e, its owners). Today, in part because corporate boards are likely to have authority over a much wider range of complex issues, they often include a variety of members. There are three primary types of corporate directors: inside directors, affiliated (or "gray") directors, and independent directors. Inside directors are drawn from among the corporation's current executives. The chief executive officer is most likely to have a full seat on the board, but the chief operating officer or others might as well. A board might include these individuals to have more thorough and current perspective on the corporation's inner workings and day-to-day operations. However, current executives have certain inherent conflicts of interest as directors, and thus may be prohibited from participating in some areas of board business. For instance, securities regulations prevent executives in publicly traded corporations from serving on the board's nominating, compensation, or audit committees. Even absent regulation, corporations are increasingly attentive to insiders' roles on the board. In the past, many boards allowed their chief executive officers to lead the group as chair, a position that afforded them much additional power and influence in developing the board's agenda and pursuing its business. Although many firms still adhere to this practice, many others, particularly large, publicly traded enterprises, have split the powerful positions to provide more checks, balances, and accountability in the boardroom.

An affiliated (or "gray") director is an outside director but has some kind of additional connection to, or interest in, the corporation. This category might include the corporation's former executives, founders' or executives' family members, representatives of the corporation's professional service providers, or executives from the corporation's most significant business partners. These individuals are often valued for their intimate understanding of the corporation, its operations, or its market. They might also be recruited so that the board can build stronger ties with another firm, such as a key bank, supplier, or customer that is of strategic importance to it. Still, affiliated directors might also present challenges to effective governance because they are in some ways less likely to be disinterested, objective, and active in their monitoring of the corporation and its management. Securities regulators recognize this fact. In recent years, the Securities and Exchange Commission, the New York Stock Exchange, and other bodies have adopted rules to prevent affiliated directors, like full insiders, from serving on some board committees that handle particularly sensitive issues.

An independent director is an outside director without any other material or familial relationship with the firm. These individuals are most often current executives at other noncompeting corporations. However, they might also be drawn from the ranks of community leaders, government officials, academics, or other professionals. Independent directors still might be connected to the corporation or its leadership in significant ways. However, they are generally less interested in overseeing the corporation.

Corporate Guidance Role

While there are few, if any, strict prerequisites for serving as a director, boards tend to nominate and shareholders tend to support individuals who might be most valuable to the firm. In general, boards recruit executives or other individuals with strong business experience and the potential to provide helpful guidance and questions. In recent years, many boards have put more emphasis on recruiting technically competent directors. Securities regulators have also moved in this direction, as they now require directors in certain roles to have a base level of financial expertise. But boards might also recruit directors for their prestige, relationships, or other attributes, in order to address key firm needs. For instance, a pharmaceutical company subject to heavy government oversight might recruit a former Food and Drug Administration regulator to the board, specifically for his or her knowledge and connections in that realm. Likewise, a computer manufacturer planning to open retail outlets might benefit from the perspective and expertise of a successful chain-store company executive. Similarly, a corporation might seek outside female or minority executives to bolster its public image or diversity efforts.

In return for their service to the corporation, directors receive a range of benefits. Many of these are intangible. For instance, as a director, an individual might attain new prestige or status, build useful business relationships, or develop new perspectives or skills for management. Other benefits are more direct. The directors of most corporations receive annual fees in the tens of thousands of dollars, as well as additional fees for each board meeting they attend. They might receive further compensation for serving as members or chairs of board committees. Furthermore, it is common for corporations to grant their directors stock shares or options to better ensure that their interests align with those of the value-seeking shareholders whom they are elected to represent.

Directors are required to pursue shareholder interests, regardless of whatever personal pecuniary benefit they might derive from doing so. In managing corporate affairs, all board members, insiders and outsiders, are subject to a general fiduciary duty of loyalty, meaning that they are legally obligated to act in service of the shareholders' and the corporation's interests, instead of their personal interest. They also have a duty of care, meaning that they are compelled to act in good faith, in a reasonably informed and prudent manner. If an individual is alleged to have breached either of these duties in his or her capacity as a director, a shareholder may file suit against him or her. However, courts often grant directors much latitude in their corporate affairs, and may be reluctant to rule against them, absent evidence of fraud, clear conflicts of interest, unreasonable action, or the like. Even if they are found liable, directors may be able to escape personal liability in some situations if the firm carries directors' and officers' insurance.

The more common risk is not that directors will act deceitfully or criminally; it is that they will simply be ineffectual as corporate monitors. If directors are ill-prepared for their position, or only partly committed to their work, a corporation may be mismanaged; likewise if they are too permissive with executives. Such conditions have contributed to poor risk assessment, irresponsible management, shoddy financial reporting, and even outright collapse in some corporations in recent years. For these reasons, the U.S. federal government and other securities regulators have taken a more active role in reviewing governance practices. Also, many investors and activists have pressured corporations to be more attentive to and proactive on these issues.

Boesky, Ivan

Ivan Boesky (1937–) was considered Wall Street's leading speculator during the 1980s. Boesky is the son of a Russian immigrant who ran a number of seedy bars around Detroit. He graduated from the Detroit College of Law and bounced from one job to another until 1966, when he was employed on Wall Street as a stock analyst. His father-in-law had made a fortune in real estate and helped Boesky launch an arbitrage firm in 1975. Arbitrage is defined as a transaction that generates a risk-free profit or a leveraged speculative transaction.

In the high-stakes, fast-paced world of Wall Street, Boesky's specialty was trading stock in companies targeted for takeover. This is a legal enterprise as long as the trades are based on public knowledge of imminent acquisitions. If the transactions are done without public knowledge, then this is the crime of insider trading. Boesky would eventually be investigated by the U.S. Securities and Exchange Commission (SEC) for making investments based on tips received from corporate insiders.

Friends in Low Places

Boesky became a close associate of Michael Milken and Dennis Levine, and the three men would go on to make a fortune together. Milken had recapitalized Boesky following a significant loss. Boesky dealt with Milken as a client because of Milken's financial prowess. Levine was an ambitious young man who was no financial genius but who had ready access to inside information from Drexel Burnham Lambert, a successful brokerage firm. As head of the bond-trading department at Drexel Burnham Lambert, Milken was able to raise billions though the sale of junk bonds. He then used the cash to provide financing to entrepreneurs. Milken used Boesky as a front to trade stocks in companies in which Drexel had a confidential interest, thus earning millions for both men and their respective companies. In turn, Boesky was influential in helping Milken earn $1 billion in three years.

By 1986, Boesky had become an arbitrageur who had amassed a fortune of about $200 million by betting on corporate takeovers. These stock acquisitions were sometimes brazen and were clear examples of insider trading because many of the massive purchases occurred only a few days before a corporation announced a takeover. Using an arbitrage fund of capital provided by limited partners, Boesky would pay more than the current trading price for a company's shares, with the expectation of selling them at a higher price once the acquisition was publicly announced. For example, Boesky and others bought a large block of shares in Gulf Western before rumors of a takeover bid drove up the price of that stock. Three days before Maxxam Group officially tendered an $800 million offer for Pacific Lumber, and before this was publicly announced, Boesky bought 10,000 shares of Pacific Lumber stock. Although insider trading of this kind was illegal, laws prohibiting it were rarely enforced until Boesky was prosecuted.

Insider trading prosecutions were rare enough that the conspirators must have felt fairly safe. Indeed, when the prosecutions did come, others in the industry and the financial press accused the prosecutors of being too zealous. Boesky became the public face of insider trading, and his condemnation in the public square was as much an indictment of the culture that had pervaded Wall Street as of the man himself. The government's case against him revealed his agreement with Drexel Burnham Lambert, in which he was contracted as a highly paid consultant in exchange for collaborating on numerous securities violations, including stock price manipulation, illegal trades predicated on inside information, and the destruction of documents in order to hide their tracks. Boesky's capture soon led to indictments of his co-conspirators.

On November 14, 1986, the SEC charged Boesky with illegal stock manipulation based on insider information. Boesky was sentenced to prison, barred from dealing in securities, and ordered to pay $100 million in penalties, the largest amount ever levied by the SEC at the time. Boesky pleaded nolo contendre to civil charges brought against him by the SEC. He also pleaded guilty to one count of insider trading, for which he received a three-year prison sentence. Boesky's plea bargain involved his being wired to help the government indict other Wall Street insiders, including Michael Milken and the Drexel Burnham Lambert investment firm. Boesky handed Milken over to the SEC, but it was Dennis Levine who gave Boesky to the SEC.

The fallout from the these cases, among many others, has shaped many changes in the world of business. Many major securities firms and banks now have new rules of conduct for their employees. Several laws have been implemented to tighten securities laws and curb corporate takeovers. The issue of business ethics, or lack thereof, has sparked much debate and changes in the business environment and curriculum at business schools across the nation.

Boesky's commencement address at the University of California, Berkeley, on May 18, 1986, was delivered shortly before his indictment, and has become one of the most famous speeches of the 1980s. "I think greed is healthy," he said. "You can be greedy and still feel good about yourself." The speech inspired some of Michael Douglas's dialogue as Gordon Gecko in *Wall Street*, the Oliver Stone movie inspired by the financial scandals of the day. Boesky was released from prison in 1989 and in 2012 was living in La Jolla, California.

Boland Amendments

The three Boland amendments sought to limit the military or paramilitary assistance offered by U.S. governmental agencies to the rebels of Nicaragua—the Contras—in overthrowing the left-leaning Sandinista government. The first attempted to prevent a possible war between Nicaragua and Honduras. Additional amendments were ultimately required to constrain U.S. governmental activities supporting the Contras. Ultimately, because of the Boland amendments, illegal actions were taken by high-ranking U.S. governmental officials to overcome the restrictions of these amendments, and these illegal activities were linked to the Iran-Contra affair. Shortly after President Ronald Reagan took office, he signed an order authorizing the Central Intelligence Agency (CIA) to engage in covert actions supporting the Contras in restricting aid to leftist rebels in El Salvador. However, some members of Congress were concerned that such activities might lead to military hostilities between Nicaragua and Honduras. To prevent this possibility, the first Boland amendment prevented both the CIA and the Department of Defense from using any of their appropriated monies for fiscal year 1983 for military activities (e.g., training, equipment, or advice) to an individual or group interested in overthrowing the government of Nicaragua or that might lead to a war between Nicaragua and Honduras. Congress attempted to prevent, or at least severely curtail, the Reagan administration's support of the Contras in their effort to overthrow the Nicaraguan government.

Despite the fact the first Boland amendment was the law of the land, it failed to have the intended effect. Soon, it became clear that the U.S. government was still engaged in covert activities supporting the Contras. Numerous newspaper accounts discussed the covert support of the Contras by the U.S. government. Moreover, in mid-1983, a U.S. House of Representatives committee found that the first Boland amendment was ineffective in preventing U.S. support for the Contras and their expressed goal of overthrowing the Nicaraguan government. Then, in early 1984, Congress learned that the CIA had mined the territorial waters of Nicaragua. However, Congress learned that these activities were funded using monies other than those prohibited by the first Boland amendment. Congress then passed the second Boland amendment in an attempt to further curtail U.S. support for the Contras.

The second amendment used language expressly preventing the Reagan administration from spending any monies appropriated by Congress, in the past or in the future, for mining the waters of Nicaragua. The goal of this second amendment was to cut off any further covert actions supporting the Contras. The Reagan administration, however, then transferred operational control of these efforts to the National Security Council (NSC). The shift was justified by a legal opinion from within the Reagan administration. This legal opinion posited that the NSC was not an intelligence agency, and therefore the Boland amendments did not apply. Following this opinion, the NSC could secure alternative funds to support the Contras. Some monies came from reserve funds, and others came from foreign governments, private individuals, and profits from the sale of weapons to Iran. The effect of these NSC activities was to skirt the spirit of the first two Boland amendments by supporting the Contras with monies not explicitly prohibited by Congress. After learning of some of these activities, Congress passed the third and final Boland amendment to limit U.S. governmental support for the Contras.

The final Boland amendment took a different approach to limiting the administration's support for the Contras. Here, Congress placed an absolute limit on the amount of money, from any source, in support of the Contras at $24 million. Moreover, Congress sought to prevent further attempts to circumvent the intent of the law by broadening who or what was covered by the amendment. The final amendment prevented any nation, group, organization, movement, or individual from providing support for any activities that would support, directly or indirectly, any military or paramilitary activities within Nicaragua. Ultimately, this final amendment was designed to prevent additional covert support of the Contras, beyond the $24 million limit established by Congress.

The Boland amendments are important because they are linked to the Iran-Contra affair. In response to congressional action limiting the funds supporting the Contras, senior NSC and Reagan administration officials devised alternative avenues to fund the Contras in ways not explicitly prohibited by the Boland amendments. At approximately the same time, the United States was attempting to secure the release of American hostages from a group with ties to Iran. Sales of weapons were coordinated by Reagan administration officials to a second group within Iran that promised to attempt to facilitate the hostages' release in exchange for the weapons. However, the sale of the weapons was problematic for two reasons. First, the sale of weapons to any Iranians was prohibited. Second, despite the illegality, profits from these sales were diverted to support the Contras. When these arms dealings became public, it led to the Iran-Contra affair.

Bond Fraud

Bonds are financial instruments creating a debt from the issuer to the bondholder. The terms of the bond determine when the principal is repaid (when the bond matures) and whether the issuer pays the bondholder interest. Negotiable bonds can be bought and sold on the secondary market; a bearer bonds not only is negotiable, it also is owned by whoever is in possession of it, rather than being registered to a specific owner. Bonds are long-term instruments, designed to raise capital to finance long-term investments or (especially in the case of government bonds) current expenses; certificates of deposit are similar short-term instruments. Unlike stocks, bonds have a defined term (unless they are irredeemable bonds with no maturity) and represent a creditor stake, whereas stock shares confer an equity stake: shareholders are owners of a company, whereas bondholders are lenders to the company.

Bonds can be classified according to coupon (the interest paid) or other factors but are most commonly discussed in terms of their issuer: corporate bonds are issued by corporations to raise money for business expansion and have the highest risk of default; government bonds are issued by national governments and are considered risk-free since a government has the capacity to generate revenue through taxation or mint additional currency in order to redeem bonds (though Russia defaulted on its domestic debt in 1998); and municipal bonds are issued by local governments and government agencies, including public utilities and school districts. The income provided by municipal bonds is often exempt from taxation.

Bond fraud falls generally into two categories: the circulation of forged or useless bond certificates and the fraudulent manipulation of the bond market.

Historical Bond Fraud

The Treasury Department has warned that historical bond fraud is on the rise. Historical bond fraud uses genuine bonds that are worthless, except as collector's items, usually because they were issued by companies—especially railroads—that no longer exist to honor them. Bonds issued by the Chicago, Saginaw, and Canada Railroad Company; the East Alabama and Cincinnati Railroad Company; the Mad River and Lake Erie Railroad Company; the Galveston, Houston, and Henderson Railroad Company; and the Richmond and York River Railroad Company have all been used in frauds, as have bonds issued by long-defunct mining companies. The debts owed by these companies, including those represented by bonds, were resolved as part of bankruptcy proceedings decades ago, often more than a century ago.

In the past, these bonds would simply have been sold off, as is, to an unsuspecting buyer who would discover upon attempting to redeem them that the company no longer exists. In the age of Internet search engines, it is easy for potential buyers to discover the fate of these long-gone railroads, so the sales pitch is packed with a narrative of lies: some con men claim that older bonds, dating from an earlier age of the American currency system, are redeemable in gold; others, that the Treasury Department or the successor railroads will honor the bonds; others, that the Treasury Department maintains a sinking fund to buy and retire historical bonds. Sometimes, the lie is more involved: many scams have falsely claimed that high-yield trading programs exist, sponsored by federal and international entities like the Treasury Department, the Federal Reserve, the World Bank, the International Monetary Fund, the International Chamber of Commerce, or the United Nations. They've further claimed that the trading programs help fund humanitarian missions, to explain these institutions' involvement. Other historical bonds have been sold, coupled with the claim that they are honored by, or may be traded in a program operated by, European banks. This latter variation is an example of the "prime bank scheme," which has circulated for years and relies on claims discredited in numerous 1990s court cases.

Historical bonds are also often sold as collector's items, but with bogus third-party authentications attesting to a value far higher than they could possibly command, with some victims paying $150,000 for $25 bonds.

Redemption Scheme

Another fraudulent bond scheme that the Treasury Department and the Federal Bureau of Investigation (FBI) have warned about is often called the redemption scheme, but is also known by terms such as the straw man, acceptance for value, or offset bond scheme. The central claim of the con is that the Treasury Department controls bank accounts with money accessible by any American citizen who submits the proper paperwork to state and federal authorities. These fictitious accounts are sometimes called U.S. Treasury Direct Accounts. Victims of the scheme are given fake financial documents referred to as offset bonds, indemnity bonds, bills of exchange, sight drafts, or other terms. Victims may also be provided with genuine documents that have no applicability in this circumstance. IRS forms 1099, 1099-OID, and 8300 have all been used for this purpose.

Often, the way that this scheme works is that "kits" are sold to victims to help them claim funds from these fictitious Treasury Direct Accounts, consisting of bonds worth a certain purported amount and the paperwork necessary to redeem them. Failure to redeem the bonds is attributed to the victim not following instructions correctly. This particular fraud has become common in similar circles to the Sovereign Citizen Movement, with which its victims may be politically aligned; there are similar urban legends that writing "acceptance for value" on a document will resolve traffic tickets, tax bills, and other documents requiring payment to the government.

Ponzi schemes and similar frauds often promise the purchase of bonds, while actually depositing the money in the schemer's accounts. In 2012, the Securities and Exchange Commission (SEC) charged Michael Anthony Gonzalez with running such a scheme, having raised $1 million for the purpose of investing in tax-exempt municipal bonds that he never purchased. In other cases, bonds may be purchased and may be legitimate, but the brokerage misstates the risk associated with them and misrepresents the true cost of the bond.

Misstatement of Bond Value and Bid Rigging

Frauds involving legitimate bonds often involve misstating the value of those bonds. In 2012, Credit Suisse trader Kareem Serageldin was charged by the SEC with numerous counts of securities fraud for falsely valuing bonds during the 2008 global financial crisis in order to conceal losses. When Credit Suisse eventually corrected the value of the mortgage-backed securities in question, they had been overvalued by $540 million. Serageldin faced multiple criminal charges as well as a civil action. The two Credit Suisse traders collaborating with him, David Higgs and Salmaan Siddiqui, pleaded guilty earlier in the year. There were numerous similar cases; the same month that Serageldin's extradition hearing began, the SEC charged the Baton Rouge–based hedge fund Commonwealth Advisors with creating phony internal documents to misrepresent the value of bonds held by the fund by $32 million.

Bid rigging is also a common tactic in bond fraud. In bid rigging, a form of price fixing, the parties collude to ensure that the sale goes to a predetermined seller, despite the appearance of a public auction. In 2012, federal prosecutors made public details from a 10-year investigation into bid rigging involving most of the major American finance institutions, including JPMorgan Chase, Bank of America, UBS, Lehman Brothers, Bear Stearns, Wachovia, and GE Capital, the finance arm of General Electric. Representatives of the banks colluded to rig bids on $3.7 trillion worth of municipal bonds, systematically reducing the interest rates the issuing municipalities—and school districts, hospitals, and libraries—earned on those bonds. It was not the bonds themselves that the banks bid on here, which were purchased by the public, but the investment contracts funded by the sale of those bonds. Reducing the interest thus reduced the worth of the purchase made by those bondholders. The case, *USA v. Carollo* (Dominick Carollo, one of three GE Capital employees named as defendant), revealed an elaborate Wall Street cartel, with wiretaps recording conversations peppered with code phrases referring to municipal bond interest rate manipulation. The anticompetitive behavior went beyond bid rigging, with JPMorgan Chase giving Goldman Sachs $3 million to let Chase win a contract with Birmingham, Alabama, rather than underbid one another.

Over a dozen executives pleaded guilty. Bank of America turned itself in, reporting illegal activity to the Justice Department in 2008 and cooperating with prosecutors from that point on, after paying kickbacks to bid on investment contracts with municipal bond issuers. Money for kickbacks was kept in a "kitty," a slush fund of cash used for bribes and other purposes in order to ensure that investment contracts for municipal bonds could be purchased at below-market rates. In some cases, the global financial crisis of 2008 and onward was blamed for the low rates.

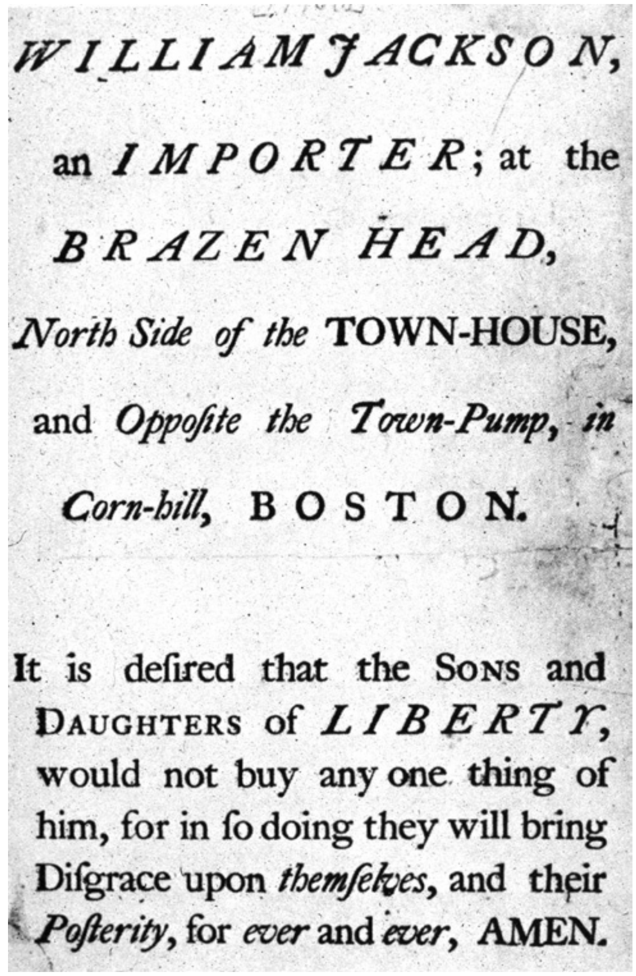
Boycott

A boycott is a tactic involving workers, consumers, and/or suppliers of specific organizations or individuals, typically businesses big or small, refusing to maintain regular or customary social or commercial relations with those organizations or individuals. The boycott usually arises from a specific grievance or grievances, such as unfair or unsafe labor practices, pollution, or injustices such as racial, gender, or sexual discrimination associated with the targeted organization or individual. The boycott is associated with a set of demands presented to the boycott target and is maintained, ideally, until those demands are met.

Advocates of boycotts point to the potential power of moral suasion as a vehicle for social change without coercion. They are particularly popular among those who promote anarchism, libertarianism, and nonviolent direct action, and generally reject the use of force, especially government force to influence society or end social harms. The boycott is a means of eliminating destructive practices from society, largely through the withdrawal of participation, or implied consent, with organizations engaged in or responsible for those harmful or improper activities. The boycott involves both an active withdrawal of participation and the communication with others to explain and expand the boycott. It is a matter of personal principle and communicative engagement, involving discourse and action.

For a boycott to be effective, it must involve people who are actual interlocutors (workers, consumers, or suppliers) with the targeted organization or individual. Those involved in the boycott must also actively communicate to the target of the boycott that they have withdrawn their interaction (labor, purchase, or supply) because of specific stated reasons, and that they will not resume interaction until the specific demands of the boycott are met. A boycott is not simply the act of people who do not interact with the target of the boycott continuing not to interact. For



WILLIAM JACKSON,

It is deſired that the SONS and DAUGHTERS of *LIBERTY*, would not buy any one thing of him, for in ſo doing they will bring Diſgrace upon *themſelves*, and their *Poſterity*, for *ever* and *ever*, AMEN.

The term boycott *originated in the 1880s, but similar actions were taken far earlier: A 1770s broadside (top) urges the boycott of merchant William Jackson, who continued to stock English goods at his business on Corn-Hill, Boston, Massachusetts. Still in fashion 200 years later, a boycott is under way outside a KFC restaurant in Royal Oak, Michigan, May 5, 2007.*

example, it is not a boycott if vegetarians or vegans who do not eat meat or meat products avoid Kentucky Fried Chicken or Arby's.

Origins of the Boycott

The term *boycott* emerges from a campaign in Ireland waged in the 1880s against Captain Charles Cunningham Boycott, a much-despised land overseer for an absentee landlord, Lord Erne, in County Mayo. The coinage of the term is attributed to Irish Home Rule leader Charles Stewart Parnell, who along with Michael Davitt, founded the Irish Land League to oppose land control and exploitation by England. The stated goals of the league were known as the three "Fs:" fair rent, free sale, and fixity of tenure. The tactic arose after Boycott refused demands to lower rents for tenants. In response, servants refused to work in his house, stores refused to sell to him, delivery of mail stopped, and farm laborers refused to bring in the harvest. In response, Boycott imported politically supportive Protestant laborers from Ulster County to serve as replacement workers but was overwhelmed by the expenses of this maneuver. Humiliated by this disastrous attempt to break the boycott, Boycott was forced to leave Ireland.

The tactic quickly developed as a regular and effective weapon deployed in the struggle against English landlords. Even further, landlords who evicted tenants typically found that no other family would move into the vacated home. The campaign against Captain Boycott would serve as the league's most notable early victory. The actions of the league developed beyond the initial tactics into a widespread and successful peasant rebellion, what would become the first peaceful mass uprising in Irish history.

Examples of Boycotts

Throughout recent history, there have been numerous examples of, often successful, boycott campaigns waged at local, national, and international levels. Some of these include the boycotts of British goods in India organized by Mohandas Gandhi, the boycotts of goods from Nazi Germany, boycotts of goods from Chile under the dictator Augusto Pinochet, and recent boycotts against goods from Sudan. Perhaps the most notable recent international boycott involves the campaign of boycott and divestment against the apartheid regime in South Africa, which gained global momentum during the 1980s. The boycott against South Africa was conjoined with a movement for divestment. The divestment campaign involved efforts to persuade state, county, and municipal governments, as well as public institutions such as universities and colleges, to sell their stock in companies that had a presence in South Africa. Labor organizations also moved to divest pension fund monies in companies with connections to South Africa. Several states and municipalities passed legislation ordering the sale of such securities, most notably the city of San Francisco. Prominent conservatives, including President Ronald Reagan, opposed the campaign.

In the United States, notable examples of the use of boycott tactics have been deployed within the labor movement and the civil rights movement. Examples of labor boycotts include the United Farm Workers union boycott of grapes and lettuce in defense of migrant workers and against their exploitation. Within the civil rights movement, examples of boycotts include those against companies that practiced segregation or that excluded African Americans, such as the boycotts against restaurants and stores. A recent highly successful labor boycott involved the Coalition of Immokalee Workers' boycott of Taco Bell over pay and working conditions in the fields supplying produce for the fast-food chain. That campaign was launched in 2001, and in 2005, Yum! Brands Inc., the parent company of Taco Bell, agreed to all of the workers' demands. These included (1) the first-ever direct, ongoing payment by a fast-food industry leader to farm workers in its supply chain and (2) the first-ever enforceable code of conduct for agricultural suppliers in the fast-food industry (which includes the coalition as part of the investigative body for monitoring worker complaints).

The most influential boycott of the civil rights movement was the Montgomery Bus Boycott. The boycott was part of a broad social and political protest against policies and practices of racial segregation of the public transit system in Montgomery, Alabama. Under Birmingham's segregation practices, white riders filled the bus from the front backward, while African American riders sat at the back, filling the final few rows. The flash point for the campaign was the arrest of Rosa Parks, a working-class African American woman, active with the

National Association for the Advancement of Colored People (NAACP), who refused to surrender her bus seat to a white man on December 1, 1955. It lasted until December 20, 1956, when a federal ruling, *Browder v. Gayle,* was instituted, leading to a U.S. Supreme Court decision that finally declared as unconstitutional the Alabama and Montgomery laws requiring segregated buses. Solidarity was crucial for the boycott to succeed. In support of the boycott, African American taxi drivers charged 10 cents per ride, a fare that equaled the cost to ride the bus. City officials passed an order to fine any cab driver who charged a rider less than 45 cents in an effort to break this solidarity action. Fund raising efforts across the country and in Birmingham raised money for the campaign, and donations of shoes were made for African Americans who chose to walk rather than bus.

A recent international boycott campaign targets the state of Israel under the banner of Boycott, Divestment, Sanctions (BDS). The campaign emerged on July 9, 2005, when 171 Palestinian nongovernmental organizations put out a call for an international economic campaign against the state of Israel. The campaign has put forward the following demands: (1) ending Israel's occupation and colonization of all Arab lands and dismantling the wall; (2) recognizing the fundamental rights and full equality of the Arab-Palestinian citizens of Israel; and (3) respecting, protecting, and promoting the rights of Palestinian refugees to return to their homes and properties as stipulated in UN Resolution 194 (1948).

In 2011, the Unified Workers' Central (CUT), the main national trade union in Brazil, representing over 20 million workers, endorsed the BDS movement. In May 2010, the Congress of the British University and College Union (UCU) voted to support the BDS campaign and to sever all ties with the Histadrut, Israel's federation of trade unions. The British Trades Union Congress has launched a campaign to implement a boycott of Israeli goods and services. It has signaled plans to develop a more comprehensive boycott campaign against Israel. In Canada, the Canadian Union of Public Employees (CUPE), the largest union in the country, endorsed the campaign.

BP PLC

BP PLC, formerly British Petroleum Exploration and Oil Company Inc., is a multinational oil and gas company based in London, but it has operations in more than 80 countries; its largest subdivision, BP America, is based in Houston, Texas. Following early oil exploration in Persia, which eventually came to fruition on May 26, 1908, the founder of the Anglo-Persian Oil Company, William D'Arcy, narrowly saved himself from financial ruin. The name British Petroleum was actually created by a German firm in order to market products in the United Kingdom (UK) and was acquired through the seizure of assets at the end of World War I. In 1987, BP was fully privatized by the British government, and that same year BP America was founded, following the acquisition of Standard Oil of Ohio. Later takeovers of Amoco, ARCO, and Castrol would establish BP as one of the world's largest energy companies, able to compete in the search for new reserves in remote locations, including Russia, Azerbaijan, Indonesia, and the Gulf of Mexico. During the construction of the trans-Alaska pipeline in the 1970s, the peak workforce exceeded 28,000 people worldwide. By revenue, it was ranked as the third-largest energy company and fourth-largest overall in the world in July 2011.

Despite its long legacy, BP has been involved in a number of major industrial incidents. The explosion at BP's Texas City refinery in 2005 resulted in the death of 15 and injury to 180 people. Alleged mismanagement of the plant led the U.S. Chemical Safety and Hazard Investigation Board to conclude that "organizational and safety deficiencies [were present] at all levels of the BP Corporation." BP was later fined $87 million for failing to address the safety issues identified by safety experts following the explosion. In 2006, BP's flagship trans-Alaska pipeline encountered problems that led to the shutdown of the Prudhoe Bay oil field. An estimated 5,000 barrels of oil were released into the tundra following corrosion to the pipes. In 2007, a major spill of ethanol was reported by the Alaska Department of Environmental Conservation, and the pipeline has been tampered with by saboteurs and damaged by earthquakes. A much earlier incident in the North Sea led to the death of 13 crew members after a portable drilling rig—the Sea Gen—capsized. Another incident at Texas City in April 2010 resulted in the release of carcinogenic gas (benzene) and other toxic chemicals.

Deepwater Horizon

The most recent and by far the most serious industrial accident involved the Deepwater Horizon drilling rig in the Gulf of Mexico. On April 20, 2010, an explosion in the Macondo prospect led to the spilling of an estimated 50,000 barrels of oil per day until mid-July; the resulting oil slick covered an area of 2,500 square miles and was visible on satellite images. A total of 11 people lost their lives in the initial explosion, and the environmental and economic damage to the Gulf Coast region was considerable. Although a number of companies were involved in the Deepwater Horizon incident—including the rig's owners and operators, Transocean—the U.S. government named BP (the majority shareholder) as having overall responsibility for both the blowout and the subsequent cleanup operation.

Alongside these incidents, the wider environmental damages resulting from the search for fossil fuels have meant that BP has also been challenged over its corporate responsibility. The documented industrial accidents only partially explain the main activities where BP has been called into account. Despite investing relatively large sums in renewable energy research ($5 billion from 2005 to 2010), BP has been at the center of a number of debates regarding its impact and commitment to climate change. In 2005, BP was named as one of the United States' most polluting companies, and the company has also been implicated (but later cleared) of human rights abuses committed by Colombian military personnel against civilians at its Casanare oilfield. BP was also a founding sponsor of the Climate Research Unit at the University of East Anglia, where it was alleged some years later that research supporting the presence of climate change was deliberately denied publication in leading journals.

More recently, environmental groups have challenged some of the developing projects involving BP (among others), including the Mist Mountain and Canadian Sands projects. However, the demand for and reliance on fossil fuels has meant that many governments are willing to push the frontiers of oil and gas exploration. The safety culture (or lack of) highlighted in the Deepwater Horizon spill only goes some way toward addressing the potentially wider environmental implications of these activities, and this is somewhat endemic of the industry as a whole. However, as a company, BP has been involved in a number of safety and environmental incidents that continue to cloud the overall integrity of the corporation as a key player in the energy supply business.

Braithwaite, John

John Braithwaite is a criminologist whose primary interests include corruption in the pharmaceutical industry and the use of shaming practices and restorative justice as they relate to crime and crime prevention, including white-collar crime. His work has contributed tremendously to our understanding of white-collar crime in a specific industry; Braithwaite has also helped us reimagine alternatives to our current criminal justice system.

Braithwaite's central contribution to the study of white-collar crime comes from a case study of a single industry, pharmaceuticals, in which a range of corporate crimes occur. Drawing from in-depth interviews with over 130 executives from the world's leading pharmaceutical firms, Braithwaite provides detailed examples of white-collar offenses, illustrating the depth and severity of corruption within this industry.

The pharmaceutical industry's record of international bribery and corruption is worse than any other industry; it also has a history of fraud in safety testing of drugs and in the unsafe manufacture of drugs. Through his analysis of the pharmaceutical industry, Braithwaite advances understanding of corporate crime as a social phenomenon, socially constructed by actors within a given organization. Braithwaite contends that rather than conceiving of corporate actors as individual personalities, they should be regarded as actors who assume roles within corporations.

From his study of the pharmaceutical industry, Braithwaite argues that corruption can be reduced via the law. He recommends the following strategies: a focus on deterrence (white-collar criminals tend to have more at stake, and more to lose than blue-collar), rehabilitation for corporate offenders, and restitution to victims of corporate crime and reparation to the community. Even more important, Braithwaite insists, are changes to the structural preconditions that allow such crimes to occur in the first place. Another significant contribution Braithwaite makes to the field of criminology is his work on shaming practices and restorative justice.

According to Braithwaite, shaming practices involve a community expression of social disapproval that is intended to invoke remorse on the part of the offender. There are two primary types of shaming: disintegrative and reintegrative. Disintegrative shaming consists of punishing the offender in such a way that he or she is stigmatized by, or rejected and ostracized from, conventional society. Reintegrative shaming consists of the offender experiencing feelings of guilt, while others offer them understanding, forgiveness, and respect. Reintegrative shaming seeks to reintegrate the offender into mainstream society; it is more common in communitarian societies (e.g., Japan), whereas disintegrative shaming is more common in individualistic societies (e.g., the United States). Braithwaite argues that the United States can reduce crime if it emphasizes reintegrative shaming over disintegrative shaming.

Braithwaite suggests that Americans rethink the current dominant system of jurisprudence and consider the alternative of restorative justice for white-collar and street criminals alike. Restorative justice is an alternative to both retribution and rehabilitation, a third option that expands the dichotomous traditional model. The most widely accepted definition of restorative justice, set forth by Tony Marshall, is a process whereby all the parties with a stake in a particular offense come together to resolve collectively how to deal with the aftermath of the offense and its implications for the future. However, Braithwaite notes that this definition is limited in that it does not identify who or what is to be restored, nor does it address the core values of restorative justice that include healing, rather than hurting; moral learning; community participation and caring; respectful dialogue; forgiveness; responsibility; apology; and making amends. To the issue of who is to be restored, Braithwaite contends that restorative justice is about restoring victims, offenders, and communities. To the issue of what is to be restored, Braithwaite contends that whatever aspects of restoration are important to victims, offenders, and communities should be restored.

Breast Implants

The Chinese philosopher Confucius once said "Everything has its beauty but not everyone sees it." External beauty is an objective for many and an obsession for some. Hence, the number of Americans having plastic surgery procedures has steadily increased since the mid-20th century. Designed to ensure safety and fairness in the conduct of business, regulatory offenses are one category of white-collar crimes. Additionally, one specific type of regulatory offense is a manufacturing violation. Sometimes, these violations are lethal. The Food and Drug Administration (FDA) makes and enforces the regulations regarding the safety of medical devices. Dow-Corning was the largest manufacturer of silicone implants before it stopped manufacturing them in 1992. Simply stated, in cases involving silicone breast implants, plaintiffs claimed that manufacturers, such as Dow-Corning, produced an unsafe product that caused a variety of autoimmune diseases and disorders. In these cases, autoimmune diseases or disorders became an umbrella term encompassing a variety of diseases such as lupus, scleroderma, rheumatoid arthritis, Sjogren's syndrome, fibromyalgia, and Raynaud's disease.

Product liability lawsuits are filed by individuals alleging that they suffered injuries after using a product that was unsafe as the result of a product defect. There are three categories of product defects that may result in liability for manufacturers, including design defects, manufacturing defects, and defects in marketing. Product liability claims are usually considered a strict liability offense. Thus, the plaintiff only has to prove that there is a defect in the product. However, this may be a difficult and require expert testimony, as was the case with the litigation involving silicone breast implants. However, after proving this by a preponderance of the evidence, the manufacturer or supplier responsible for causing the damages is 100 percent liable regardless of any degree of caution on their part or any lack of caution by the consumer.

Silicone implants were first used on a patient in 1962. By 1976, the FDA had acquired the authority to evaluate and approve both the safety and usefulness data of all new medical devices. However, silicone implants were exempt because they had been on the market for well over a decade. The first lawsuit alleging health problems caused from silicone breast implants was filed in the late 1970s. In the end, the manufacturer of the implants settled for well under a million dollars. This settlement received little attention. However, retrospectively, this case was just the first of many of litigation battles involving silicone breast implants. By the mid-1990s thousands of lawsuits were filed and juries had awarded millions of dollars in damages. Specifically, in the majority of the lawsuits, plaintiffs alleged that the implants caused pain and suffering; resulted in the need for multiple operations; and a link between certain autoimmune diseases and silicone breast implants.

By the early 1980s, plaintiffs wanted to sue manufactures such as Dow Corning and Baxter/Heyer-Shulte for manufacturing a defective product. In early 1982, the FDA proposed to classify silicone breast implants into a Class III category. Thus, manufacturers would be required to prove the safety of these devices to keep them on the market. In 1984, during discovery in *Stern v. Dow Corning*, the defendant, a subsidiary of Dow Chemical, was ordered to grant access to certain internal documents and the supposed connection between autoimmune disorders and silicone implants was introduced in the case. Specifically, memos were discovered that sought approval to look into the long-term health effects of silicone gel in the human body. Other memos stated that no valid long-term implant data existed to substantiate the safety of silicone gels implanted in humans. Moreover, documents were uncovered that revealed a controversy within Dow Corning over such side effects related to saline implants. Corning contended that the documents represented an ongoing internal debate and that the majority of science supported the notion that silicone gel implants were safe. The plaintiff prevailed in this case *Stern* *v. Dow Corning*. However, all evidence in *Stern v. Dow Corning*, was sealed via a court order.

After investigating medical complications related to saline implants, the FDA re-classified breast implants as a Class III medical device in 1988. Thus, the FDA demanded that the manufacturers such as Dow produce evidence proving the efficacy and safety of their products. Therefore, premarket approval applications (PAAs) from silicone breast implant manufacturers were due to the FDA by the summer of 1991. Specifically, The PAAs needed to affirmatively show via valid scientific data, evaluated by the FDA, that their devices were safe and effective. Following the submission of the PAA's by the manufacturers, the FDA had 180 days to assess the safety data.

Breast Implant Litigation

With public concern intensifying in the early 1990s, breast implant litigation began to receive far more attention from major news outlets, and the stage was set for a major influx of silicone implant litigation. In one case from the early 1990s, a plaintiff who claimed her implants had made her ill was awarded $7.3 million from Dow Corning, of which $6.5 million was in punitive damages. By the early 1990s, the media began to focus more attention on the safety of breast implants. In late 1990, Congress conducted a hearing on the safety of silicone breast implants. At the hearing, the ramifications of the court order from the *Stern* verdict were discussed. More precisely, it was acknowledged that the court order limited public scrutiny about what information the manufacturers had at their disposal. In 1991, an Alabama jury awarded a plaintiff exhibiting just preliminary symptoms of systemic autoimmune problems over $5 million from Baxter/Heyer-Shulte, the manufacturer of her implants, because according to the plaintiffs' witnesses, she had silicone in her lymphatic system. As a result, the plaintiff's counsel argued that she had an increased risk of developing autoimmune diseases.

During the summer of 1991, Dow Corning released in excess of 300 studies to the FDA. However, the FDA was unsatisfied and asked for more information by early fall. The agency felt that the data failed to convincingly show either the danger or safety of saline implants. In November 1991, the FDA brought together its General and Plastic Surgery Devices Panel (GPSDP), made up of a broad range of experts, including representatives from the fields of plastic surgery, oncology, epidemiology, internal medicine, immunology, radiology, pathology, gynecology, toxicology, and biomaterials, as well as individuals from private industry and consumer groups. The diverse panel's task was to study all of the safety data from the manufacturers' PMAs. The GPSDP's purpose was to instruct the FDA as to what it could say to the public regarding the effectiveness and safety of the silicone breast implants. The panel concluded that there was not enough data concerning the dangers and benefits of the implants. Hence, the GPSDP recommended that the devices remain on the market, but with limited availability. Additionally, the panel stated that there was a need for more safety data. In December 1991, several documents, including internal memos and studies from the *Stern* lawsuit and new studies recently obtained from Dow Corning, were turned over to the FDA. By the end of 1991, over 100 lawsuits had been filed against Dow Corning alone. During this period, certain segments of the scientific community questioned the allegations regarding the efficacy and safety of silicone implants. These individuals argued that irrational decisions were being made based on hysteria, not science, and that evidence was absent on both sides of the debate. Additionally, in early 1992, a class-action lawsuit was filed to compensate plaintiffs more quickly.

In early 1992, the FDA commissioner asked that manufacturers voluntarily halt the distribution of silicone breast implants, until the FDA and the advisory panel had a chance to evaluate recently obtained data. The manufacturers agreed. By February 1992, the GPSDP met again to assess the new information regarding the safety of saline implants and recommended that the further use of implants be restricted to only breast reconstruction. Additionally, the panel stipulated that individuals receiving the implants participate in scientific protocols and that epidemiologic studies be undertaken to evaluate the dangers of autoimmune disease. The panel stated that no causal link had been established between autoimmune disease and silicone breast implants. That same month, many of the internal Dow documents were released publicly. That April, the FDA lifted the moratorium on silicone breast implants, but with restrictions. The only individuals permitted to receive silicone implants were those having breast reconstruction, and all of these individuals were mandated to participate in a scientific protocol.

By late 1993, over 12,000 cases had been filed against Corning, and by the end of 1994, that number would swell to almost 20,000. As the class-action suit moved forward, damages in one case amounted to $5 million in actual damages, and $20 million in punitive damages. Unlike actual damages, which compensate a plaintiff for the losses suffered because of the harm caused by the defendant, punitive damages are different. Punitive damages are monetary compensation awarded to a plaintiff in excess of that which is necessary to compensate the plaintiff for losses. These damages are awarded by the jury, intended to punish the defendant for outrageous misconduct, and are designed to discourage the defendant and others from similar misbehavior in the future. These damages are based on the theory that the interests of society and the individual harmed can be met by imposing additional damages on the defendant.

The nature of the wrongdoing that justifies punitive damages is not an explicit stipulation under the law. Rather, the usual terms that characterize conduct justifying punitive damages include fraud; malice; oppression; outrageous, wanton, or reckless behavior; and bad faith. These aggravating circumstances usually refer to situations in which the defendant acted with malice, intent, and/or with total disregard for the rights and interests of the plaintiff. Unless otherwise required by statute, the award of punitive damages is left to the discretion of the jury. In early 1994, a jury awarded three women who claimed that they were suffering from atypical lupus, neurological impairment, and autoimmune problems related to silicone exposure a total of $27.9 million. The damages were awarded as follows: $15 million in punitive damages and $12 million in compensatory damages for illness. In 1994, the major breast implant manufacturers, including Corning and Bristol-Meyers Squibb/MEC, settled the class-action litigation for $3.4 billion. At the time, it was the largest class-action lawsuit in history. By 1995, Dow Corning, facing close to 20,000 lawsuits, filed for bankruptcy.

The manufacturers and certain segments in the scientific community attacked the expert witnesses utilized by plaintiffs as well as the methodology that they relied upon and the causal conclusions that they reached. These individuals argued that the evidence was circumstantial and failed to show that the implants caused the autoimmune disorders. In June 1994, the *New England Journal of Medicine* published a study conducted by the Mayo Clinic that found no increased risk of certain autoimmune diseases in women with silicone implants. Moreover, the American College of Rheumatology made a powerful public statement in 1995 that silicone implants did not cause systemic disease.

By early 1996, more than 20 abstracts and (non–case report) studies had come out in the United States and internationally. Every one failed to sustain a causal relationship between autoimmune diseases and silicone implants. By this time, the judiciary was also refining the permissible scientific standards utilized in this type of litigation, which hindered plaintiffs. Specifically, several federal judges appointed unbiased, expert panels to evaluate the scientific issues involved in breast implant lawsuits. In the late 1990s, several judges ruled that the cases could not proceed because they lacked valid scientific evidence. In 2006, the FDA conditionally lifted its restrictions for two corporations to use silicone-gel breast implants for breast reconstruction and augmentation mammoplasty.

Bre-X Minerals Ltd.

Bre-X Minerals Ltd. was a small Canadian gold exploration company that committed the world's biggest mineral stock fraud in history. Bre-X became the star of investors in the gold industry after it announced a major gold deposit discovery—perhaps the largest ever discovered—in properties it was mining in the Busang area on the island of Borneo in East Kalimantan, Indonesia. It was later discovered that little, if any, gold was actually found on these properties. Some people, including insiders, became quite wealthy from the stock play. The Bre-X fraud has been the subject of at least six books published about the scandal.

Fool's Gold: A Tale of Deception

Early in 1988, David Walsh, a volatile penny stock promoter, founded Bre-X Minerals Ltd. and listed it on the Alberta Stock Exchange at 30 cents per share in 1989. In 1993, in desperate need of raising money, Walsh flew to Indonesia and met John B. Felderhof, a Jakarta-based mining consultant, who recommended exploration of gold at the Busang Creek in Indonesia. Walsh appointed Felderhof as Bre-x'S chief geologist and general manager, who later hired his friend Michael de Guzman as the project manager. In August 1993, Bre-X started its gold exploration in Busang and soon claimed promising results.

Bre-X kept raising the amount in the potential deposit each year. By 1995, the company was claiming that the deposit could contain more than 30 million ounces of gold. By early 1997, it claimed to have proven the existence of 71 million ounces of gold, worth about CAD$25 billion, and estimated that there were at least 200 million ounces present at Busang. On the basis of these claims, Bre-X stock increased in value from a worthless penny stock to CAD$28 per share (CAD$280 presplit of 10-for-1) by May 1996. At its peak, the company had a net market worth of over $6 billion. To produce such a huge deposit, the Indonesian government required that Bre-X share some of the excess with the people of Indonesia and with Barrick, a firm tied to President Suharto's ambitious daughter, Siti Rukmana. In February 1997, with Suharto's close confidant Mohamad "Bob" Hasan stepping into the deal, the American firm Freeport-McMoRan Copper & Gold was eventually selected as Bre-X's partner in the Busang project. Under the agreement, Bre-X was allocated 45 percent, Freeport 15 percent, and the Indonesian government and well-connected private Indonesian interests the other 40 percent.

In March 1997, Freeport first undertook its due-diligence drilling and reported that its analyses of seven core samples "indicate insignificant amounts of gold." That news came one week after the announced death of Bre-X's geologist Michael de Guzman, who reportedly fell to his death from a helicopter while traveling to Busang to meet with Freeport's due diligence team to discuss Freeport's assay results. Forensic Investigative Associates was hired by Bre-X to conduct an independent investigation into the salting scam and concluded that de Guzman and a fellow Filipino, Cesar Puspos, had salted the samples from the time they were collected until they were turned over to a downriver lab for analysis. The next day, the CAD$6 billion Bre-X stock lost almost all of its value. Investors lost about CAD$3 billion; some Canadian pension funds were out tens of millions of dollars.

An independent company, Strathcona Mineral Consultants, was also commissioned to conduct an independent study of the situation. On May 4, 1997, Strathcona concluded in its report that "an economic gold deposit has not been identified in the South East Zone of the Busang property, and is unlikely to be." Strathcona confirmed that the samples had been salted with gold from other parts of the world. Walsh died in 1998 from a brain aneurysm in a Bahamas hospital. In 1999, the Ontario Securities Commission (OSC) accused Felderhof of four counts of illegal insider trading and four counts of authorizing misleading news releases. The Royal Canadian Mounted Police decided not to charge Felderhof because of its difficulty in finding evidence. Felderhof's trial began in October 2000 but faced lengthy delays because of legal battles. Felderhof's lawyer argued that the former chief geologist was unaware that the core samples had been salted, whereas the OSC stated that Felderhof ignored many signs of problems at the Busang site.

On July 31, 2007, Felderhof was found not guilty of insider trading and misleading investors. Judge Peter Hryn ruled that the "red flags" were not obvious to Felderhof and the evidence was not strong enough to convict him. The OSC decided not to appeal this decision. Although the scandal is over in criminal and quasi-criminal proceedings, investors are not satisfied by the ruling and keep pursuing civil litigation. Two lawsuits are making their slow way through the courts in Canada, while another class-action suit in Texas was dropped in 2005. The Bre-X saga has caused a massive shattering of investor confidence and has tarnished the reputation of Canada's mining industry and securities market.

Bribery

Bribery is one of the most ancient and well-established of white-collar crimes. Prohibitions on bribery can be found in the Bible and in virtually every criminal code that has been enacted since; it is hard to imagine a modern judicial, legislative, or other governmental system in which bribery is not criminalized. The offense reflects many of the key factors that tend to characterize white-collar criminality: Its perpetrators (whether those who give bribes or take them) are typically upper-income professionals, and bribery is normally committed in the context of sophisticated governmental or commercial activities. At the same time, bribery's harms are subtle and often attenuated, its victims are difficult to detect, and it can be difficult to distinguish from lawful gifts, campaign contributions, "rent seeking," and political horse trading. Bribery norms also differ significantly from society to society: What may be considered deviant or criminal in the West may be regarded as common practice in Russia or Africa, essential for "getting things done." Although bribery has traditionally been restricted to cases in which money or other things of value were given in return for official government acts, there is a significant modern trend toward criminalizing commercial bribery.

The precise definition of bribery varies from jurisdiction to jurisdiction. A loose characterization suggests that bribery, or corruption more generally, involves the abuse of public office (or perhaps commercial position) for personal gain. A more precise working definition can be offered, so that *X* (a bribee) is bribed by *Y* (a briber) if and only if (1) *X* accepts, or agrees to accept, something of value from *Y*; (2) in exchange for *X*'s acting, or agreeing to act, in furtherance of some interest of *Y*'s; (3) by violating some duty of loyalty owed by *X,* arising out of *X*'s office, position, or involvement in some practice.

Commentators have frequently noted the practical difficulty of distinguishing bribes from gifts, tips, rewards, and campaign contributions. In theory, the distinction is clear. Bribes involve an agreement to exchange something of value in return for influence. Gifts, tips, rewards, and donations are unilateral; they are given without any agreement to reciprocate. This is not to deny that gifts are also often given in return for some service that has already been rendered (as in the case of tips or rewards), or in expectation of receiving something in return (as in the "exchange" of family gifts at holiday time). Bribes should also be distinguished from extortion and blackmail. Bribes involve an "offer" in which the bribee is given an inducement to action: If the bribee accepts the offer, the briber will be made better off in relation to a baseline position (e.g., what the briber "deserves"). This is in contrast to extortion and blackmail, which involve a coercive threat to make a victim worse off in relation to the relevant baseline, if the proposal is not accepted.

Bribery Under American Law

The American law of bribery consists of a complex web of often overlapping statutory and regulatory provisions at both the federal and state levels. The most venerable federal bribery statute is 18 U.S.C. § 201, originally enacted in 1962, to consolidate several separate provisions. There are two separate offenses contained in Section 201: Section 201(b) covers bribery proper (punishable by up to 15 years in prison), whereas Section 201(c) covers the lesser offense of illegal gratuities (punishable by up to two years' imprisonment). To prove bribery under subsection (b), the government must show that (1) a thing of value was offered or given to, or solicited or accepted by, (2) a public official, (3) for an "official act," (4) with corrupt intent or intent to influence (or be influenced). The term *thing of value* has been read broadly to refer to a wide range of things both tangible and intangible, such as offers of future employment, unsecured short-term (and subsequently repaid) loans, restaurant meals and tickets for athletic events, ostensibly valuable (but actually worthless) stock certificates, and even sexual favors.

Another major federal antibribery statute is the Hobbs Act, 18 U.S.C. § 1951, originally enacted in 1946. The act criminalizes three distinct forms of criminal conduct: (1) robbery; (2) extortion by force, threat, or fear; and (3) extortion under color of official right. Only the third is relevant here. Extortion under color of official right constitutes the defendant's use of his or her official position to extract something of a value from the alleged victim—understood as the taking of a bribe. It is punishable by up to 20 years in prison. The most significant difference between Section 201 and the Hobbs Act is that the former applies only to bribery and gratuities involving federal officials and others exercising federal responsibilities or dealing with federal funds. Thus, a local mayor or state legislator who received a bribe not involving federal funds would not be liable under Section 201 but could be prosecuted under the Hobbs Act.

A third major federal antibribery provision is the Foreign Corrupt Practices Act (FCPA), codified in various provisions of 15 U.S.C. §§ 78m, 78dd, and 78ff. It was originally enacted in 1977, in the wake of post-Watergate efforts at government reform. The act makes it a crime to bribe foreign public officials for business reasons, and further mandates corporate recordkeeping that would reveal the payment of bribes. The statute contains both civil and criminal penalties (with a maximum penalty of 20 years in prison). In addition to these federal statutes, there is extensive state law making it a crime to offer, give, solicit, or receive bribes. As in the federal system, the main focus of state bribery enforcement is on bribes taken by governmental officials, including judges, legislators, and executive officers. State bribery law is exemplified by (and often modeled on) Section 240.1 of the Model Penal Code. The precise formulation of these laws varies significantly, as do the sentences authorized, from a maximum of up to 25 years in New York to as little as one year for misdemeanor bribery in California.

Commercial Bribery

In addition to all of the provisions criminalizing payments to government officials made in return for what are termed "official acts," recent years have also seen a trend toward broader criminalization of commercial bribery, in which payments are made to employees of private firms. Such broadening has occurred at both the federal and state levels, as well as internationally. Under federal law, the practice has been to criminalize commercial bribery only in particular industries—such as those involving subcontractors, investment advisors, television quiz shows, bank employees, alcoholic beverages, labor union officials, railroad employees, and radio disc jockeys. The practice is generally the same in the states, though there are some exceptions, most notably in New York and Texas, both of which have broad-reaching provisions that make it a crime for any employee, manager, or fiduciary to accept a benefit with the understanding that such benefit will influence the person's conduct in his place of employment.

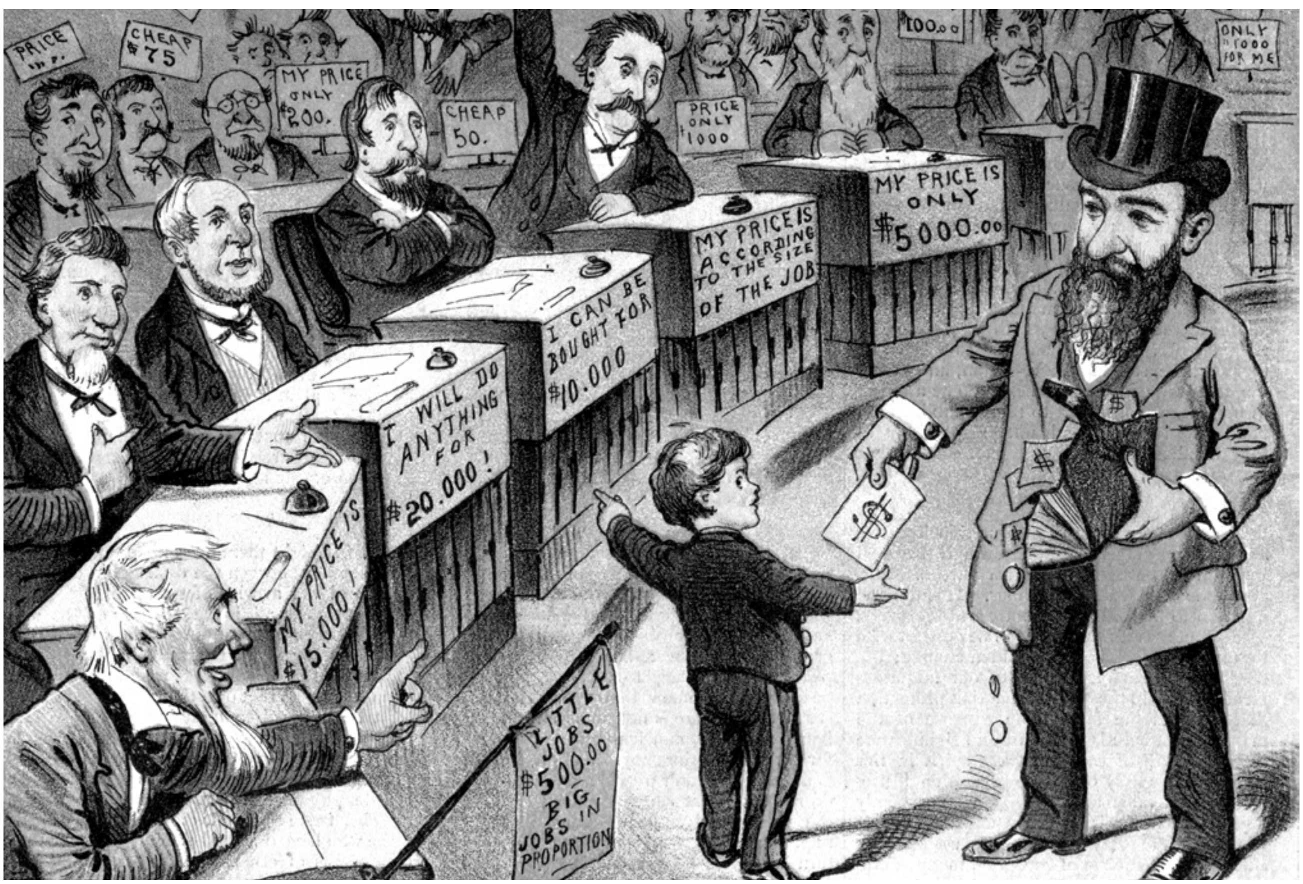
As a recent study by the International Chamber of Commerce demonstrates, commercial bribery provisions have also become more common outside the United States. The most far-reaching such statute is the U.K. Bribery Act 2010, which in referring to the various "functions and activities" within which bribery can occur, makes mention not only of functions of a "public nature," but also of activities "connected with a business" (a term defined to include trades and professions), "performed in the course of a person's employment," or "performed by or on behalf of a body of persons (whether corporate or unincorporate)." As yet, there are no reported case laws interpreting these provisions, but they would apply to a broad range of cases of what has traditionally been understood as commercial bribery.

The trend toward criminalizing commercial bribery turns on a blurring of public and private functions that has occurred in recent years. Functions that were once thought of as exclusively governmental—such as operating prisons, schools, the post office, and various utilities—have increasingly been taken over by private entities. Meanwhile, functions once viewed as exclusively private—such as banking and insurance—have in many instances become "nationalized," or at least subject to extensive government involvement. Without a genuine distinction between public and private spheres, a sharp distinction between official and commercial bribery would be unsupportable.

Harms of Bribery

Bribery is said to "corrupt" political and commercial life by inviting inappropriate grounds for decision making. It makes the decision maker unable or unwilling to determine what is in the best interest of his or her principal. Bribery creates political instability, distorts markets, undermines legitimacy, retards development, wastes resources, creates cynicism, undercuts confidence in decision-making institutions, and potentially leads to injustice, unfairness, and inefficiency. The precise nature of the harm that a given act of bribery causes will vary depending on the bribee's office, the nature of the official act that is compromised, and the constituency affected.

Cross-cultural surveys, such as those that make up Transparency International's Corruption Perceptions Index, suggest that different cultures practice and tolerate bribery and other forms of corruption to widely differing extents. There are a number of factors at work here. In some



In this illustration from the January 9, 1884, issue of Puck*, a man hands money to a congressional page to purchase the legislative services of a member of the House or Senate chamber. Congressmen display signs advertising their prices, such as, "I will do anything for $20,000," "I can be bought for $10,000," "My price is according to the size of the job," and "My price is only $5,000." Today, American bribery law, both federal and state, consists of a complex web of often overlapping statutory and regulatory provisions.*

countries, public employees are so poorly compensated that accepting bribes may be the only way for them to make a living wage. Attitudes about what is necessary to "get things done" also vary widely. For example, there are communities in which the only way to ensure police or fire protection, or to see that roads are paved, is to pay bribes to the responsible officials. One of the major goals of legislation such as the FCPA and the Organisation for Economic Co-operation and Development's (OECD) Anti-Bribery Convention is to encourage the proliferation of antibribery norms that will apply universally.

Brown Lung

Brown lung, or byssinosis, is a form of pneumoconiosis that develops from inhalation of cotton dust. Other forms of pneumoconiosis include black lung (from coal dust), silicosis (from crystalline silica dust), and asbestosis (from asbestos fibers). Although brown lung typically results from inhalation of cotton fibers, it may also result from inhalation of flax, hemp, jute, sisal, or other plant dust fibers. In many textile factories, the fibers may also be mixed with other airborne particles such as pesticides, fungi, and bacteria. Brown lung is known by a number of other names, including occupational asthma, mill fever, Monday fever, cotton workers lung, or bract disease. Because symptoms can be similar, it is often confused with other lung diseases such as chronic obstructive pulmonary disease, asthma, or bronchitis. Symptoms include difficulty breathing, wheezing, coughing, pain, and tightness in the chest. In the early stages of the disease, workers experience mild symptoms, such as tightness in the chest on the first day back to work after a weekend, hence the name Monday fever. Increased exposure during the week results in the symptoms becoming more severe by the end of the week.

Repeated exposure over a number of years causes brown lung to become irreversible. When the disease reaches its advanced stage, the worker will be unable to perform any physical activity without experiencing acute breathing difficulties. Diagnosis is usually confirmed via X rays and by wearing pulmonary testing apparatus during the workday. The specific cause of brown lung among cotton workers is not known with certainty, but bacterial endotoxins found in cotton bract at the base of the cotton boll is the most likely cause, hence the name bract disease. Treatment usually involves eliminating exposure to cotton dust and drug therapies similar to those used to treat asthma, including antihistamines, bronchodilators, corticosteroids, nebulizers, and home oxygen therapy. Reducing exposure may lead to full recovery, provided that the disease is diagnosed before permanent damage occurs. The effects of inhaling cotton fibers have been known since the 17th century.

By 1830, medical researchers observed that textile workers were suffering from a respiratory illness that was similar to, but different from, other lung diseases like bronchitis. By the mid-1800s, medical researchers recorded unusually high death rates among textile workers. Researchers in France were calling the disease "Monday feeling" as early as 1845. By 1908, the medical evidence was mounting, although it was still referred to as cotton dust bronchitis or pneumonia.

Medical Studies

During most of this time, the textile industry strongly opposed recognition of the disease as an occupationally related illness. The condition was often attributed to tobacco smoking among workers. By 1930, other forms of occupationally related lung diseases were recognized by both the medical profession and the law. Both silicosis in 1918 and asbestosis in 1930 were recognized under the Workmen's Compensation Act in Britain as compensable occupational illnesses. In the years that followed, labor unions in Britain lobbied the British government to make brown lung a compensable occupational illness. They were emboldened by the release of two British government-sponsored Medical Research Council studies released in 1930 and 1932, showing a connection between cotton dust and brown lung. The British government resisted adding brown lung to the list of compensable diseases under the act because it feared that the Great Depression left it unable to spend public money on compensation for a disease that could not be shown to be a result of any on-the-job accident. After yet another study in 1939, the British government made brown lung a compensable illness under the Worker's Compensation Act.

In the United States, public health officials campaigned in the 1930s in Georgia and North Carolina to expose unsafe working conditions in textile factories. Their efforts were unsuccessful when they failed to gain entry to the factories to collect evidence. Despite the efforts of medical researchers and union campaigners from the 1930s onward, brown lung did not became a compensable occupational illness in the United States until 1977. The person most responsible for creating a climate to reform the law was social reformer and activist Ralph Nader. Nader is also credited with coining the name *brown lung*. Relying upon evidence compiled by U.S. medical researchers, Nader began a campaign in 1969 to create concern about brown lung.

The campaign met with strong resistance from the textile industry, which argued that the medical evidence linking cotton dust to brown lung was still inconclusive. The industry said that the disease was attributable to other causes, including smoking. During the 1970s, the textile industry contested almost 60 percent of all workers' compensation claims, and almost 90 percent of claims were dust-related. One exception to this trend was Burlington Industries. Burlington Industries cooperated with researchers, enabling research to establish a clearer link between cotton dust and brown lung, and to find more effective ways to reduce the dust hazard. With growing medical knowledge and greater pressure from the labor movement, the federal Occupational Safety and Health Act was amended in 1978, making brown lung compensable. Several states, including North Carolina in 1979, soon followed.

Reduction in the United States

The 1980s saw a dramatic reduction in new cases of brown lung in the United States. Even more dramatic reductions were seen in the 1990s. In 1990, the National Institute for Occupational Safety and Health reported that there were 36 U.S. deaths in which byssinois was a contributing factor or major cause of death. By 1999, the number had declined to 14. Overall mortality rates for deaths caused at least in part by byssinosis also dropped in 1999 to one-third of the rate in 1990. The legal battle for recognition of brown lung as an occupational disease did not end with the passage of these laws. In both Britain and the United States, the cotton industry continues resistance to the law. Brown lung also continues to be a problem in countries such as India, China, and Pakistan, where compensation is rare. Despite the mounting evidence linking cotton bract to brown lung, the Philippines Department of Agriculture advocates that rather than burning cotton bract after they harvest the cotton, cotton farmers should harvest and sell it to increase their incomes. Cotton workers still sometimes find it necessary to take companies to court in order to get compensation, and the fight continues to be an irritant, as are the small payments that they receive as compensation for their illnesses.

Buffalo Creek Disaster

In late February 1972, a coal waste impoundment dam along Buffalo Creek in Logan County, West Virginia, collapsed. The resulting flood killed 125 people and caused over $50 million in damage. The disaster at Buffalo Creek remains one of America's most costly and deadly mining-related catastrophes. Following the Buffalo Creek flood, three separate investigative commissions were established. The investigations revealed that Pittson Coal Company—owners of the Buffalo Creek mine—improperly constructed the impoundment dam, known as Dam No. 3, and willfully disregarded safety concerns about Dam No. 3 and two smaller dams. The commission reports noted that West Virginia's lax regulations, inspection policies, and penalties for mine safety violators contributed to the Buffalo Creek disaster. Although Pittson Coal avoided criminal charges, three civil lawsuits filed by the flood survivors were successful. The Buffalo Creek flood led to the development of more rigorous state and federal mine safety regulations.

Coal mining was a staple in Logan County, West Virginia. The Lorado Coal Company opened the coal mine on the middle fork of Buffalo Creek in 1945. Standard practice for coal mine operations was to dispose of mine refuse, excess water, and other debris wherever was most convenient. Thus, Lorado Coal constructed a single dam, Dam No. 1, across the middle fork of Buffalo Creek to contain the wastewater, sludge, and refuse from their mining operation. In 1965, Lorado Coal sold the Buffalo Creek mine to the Buffalo Mining Company. A year later, Buffalo Mining constructed a second dam, Dam No. 2, behind Dam No. 1 to hold back additional wastewater and refuse. Investigations and complaints in the late 1960s revealed that Dam No. 1 and Dam No. 2 were both constructed without permits. However, West Virginia authorities did not shut down the mining operation. In 1970, Buffalo Mining was sold to the Pittson Coal Company, which took over the Buffalo Creek mine. Pittson Coal set to work building a larger dam, Dam No. 3, upstream from the previous two. Upon completion, Dam No. 3 stood 50 feet high and was over 450 feet across. Partial dam failures during Pittson Coal's ownership of the Buffalo Creek mine occurred in 1971 and 1972; however, the mine remained open.

The Dam Breaks

Around 8 A.M. on February 26, 1972, after several wet winter days, Dam No. 3 collapsed, releasing 132 million gallons of water, coal waste, silt, and other debris. The torrent of sludgy water destroyed Dams No. 1 and 2 and obliterated the small town of Saunders, West Virginia, located just south of the mining site. The floodwater funneled downhill through the narrow Buffalo Creek Valley, causing massive destruction to 15 additional towns before eventually emptying into the Guyandotte River, three hours and 17 miles later. In the wake of the flood, 125 people were dead or missing, including entire families; 4,000 people were injured or homeless; and over $50 million in damage had been caused. Seven people, including six children—the youngest of whom was only 3 months old when the flood occurred—were never found.

Tempers and public outrage increased following the flood, when officials from Pittson Coal deflected responsibility for the flood, deeming it an "act of God." As a result, three commissions—federal, state, and citizen—were organized to determine the cause of the dam collapse. The commissions arrived at similar conclusions: The Buffalo Creek flood was not an act of God, but was a preventable human-made disaster. The commissions determined that Pittson Coal utilized improper dam engineering and construction techniques, and failed to adequately inspect or maintain the three dams along Buffalo Creek. The commissions also determined that mining safety regulations and enforcement at the state level were lacking, likely contributing to the disastrous flood.

A West Virginia grand jury failed to criminally indict Pittson Coal. Nevertheless, two civil lawsuits filed against Pittson by flood survivors yielded favorable verdicts and damage awards of $13.8 million and $4.8 million, respectively. A third civil suit, *State of West Virginia v. Pittson Coal Company,* sought $100 million in damages on behalf of the citizens of the Buffalo Creek Valley and the state, hoping to recoup funds spent on recovery efforts following the flood. However, three days before leaving office, Governor Arch Moore, who had close ties to the coal industry within the state, agreed to an out-of-court settlement with Pittson Coal for just $1 million. The Buffalo Creek disaster encouraged the state of West Virginia to bolster oversight and mine safety regulations, culminating in passage of the Dam Control Act. Following the Buffalo Creek flood, nationwide inspections of similar waste impoundment dams were conducted. Federal mining regulations and inspections were strengthened, as were the penalties for safety violations.

Bureau of Consumer Financial Protection, U.S.

The Bureau of Consumer Financial Protection is an agency within the Federal Reserve System that safeguards consumers who use financial services through education, enforcement, and research. The Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010, Title X (Consumer Financial Protection Act of 2010) established the bureau on July 21, 2010; its enforcement powers commenced one year later. To distinguish itself from its legislative designation, it adopted the name Consumer Financial Protection Bureau (CFPB). The bureau consolidated duties from the Federal Reserve, Federal Trade Commission, Federal Deposit Insurance Corporation, Department of Housing and Urban Development, and elsewhere to focus on consumers, rather than financial institutions and macroeconomic policy. Although independent within the Federal Reserve, the CFPB takes its funding from that entity rather than congressional appropriations.

Challenges to the Bureau

The CFPB concept came from Harvard law professor Elizabeth Warren, and expectations were that the president would appoint her as its first director. However, many Republican senators disapproved because of perceptions about her political views and objections to the CFPB's centralized governance structure, without the board oversight typical of other agencies. When her appointment became untenable, President Barack Obama named her a special advisor for the bureau and, on July 17, 2011, nominated former Ohio Attorney General Richard Cordray as its first director. Cordray's nomination failed under filibuster on December 8, largely along party lines and because of similar objections. President Barack Obama then made a controversial recess appointment of Cordray on January 4, 2012. Republican members of Congress attempted legislatively to limit the scale and scope for the CFPB's operations, without success. On June 22, 2012, the State National Bank of Big Spring, Texas; the Competitive Enterprise Institute; and the 60 Plus Association filed suit against the CFPB to challenge the constitutionality of Cordray's appointment and the regulatory authority and funding for the bureau, on grounds of separation of powers.

The CFPB's mission is to safeguard consumer interests in using financial services by educating, enforcing, and studying issues relating to this sector. These roles promote transparent, fair, and functional markets for such services by engaging efficient and effective pricing mechanisms and safeguarding consumer autonomy. The director serves for a five-year term. Six main divisions report to him or her: the Office of the Chief Operating Officer; Consumer Education and Engagement; Research, Markets, and Regulations; Supervision, Enforcement, Fair Lending, and Equal Opportunity; General Counsel; and External Affairs. There also is an advisory board that assists in researching emerging market trends. Jurisdiction extends to banks, credit unions, securities firms, payday lenders, mortgage-service companies, foreclosure relief services, debt collectors, and other financial companies, but not to auto dealers.

The CFPB's core functions include making rules for, supervising, and enforcing federal consumer financial protection laws; restricting unfair, deceptive, or abusive practices; receiving and tracking consumer complaints and whistleblower reports; promoting education about consumer financial services; researching consumer behavior; monitoring consumer financial markets for new risks; and enforcing laws against discrimination and other unfair practices in consumer financial services. The CFPB is subject to audit by the Government Accountability Office, and jurisdiction of the Senate Banking Committee and House Financial Services Subcommittee. Its directives are subject to (an appealable) stay by a two-thirds vote of the Financial Stability Oversight Council.

Bureau of Ocean Energy Management, Regulation, and Enforcement, U.S.

Inaugurated in October 2011, the Bureau of Ocean Energy Management (BOEM) is responsible for the safe and responsible exploration and development of the United States' offshore resources. It seeks to use scientifically based decision making to balance economic and environmental concerns regarding conventional and renewable energy activities on the Outer Continental Shelf (OCS).

Interior Secretary Ken Salazar signed a secretarial order in May 2010 to split the Minerals Management Service (MMS) into three independent organizations: the BOEM, the Bureau of Safety and Environmental Enforcement, and the Office of Natural Resources Revenue. Before the division, the MMS oversaw the functions of the newly created BOEM. Critics claimed that the MMS was unable to sufficiently fulfill its mission to protect natural resources because of close ties to industry and pressure to generate and collect revenue from offshore drilling and development activities. Criticism increased after the tragic 2010 BP Gulf oil spill in the Gulf of Mexico created unprecedented environmental damage and disruption to economic activities on the coast. Given pressure to maximize revenue from offshore leases, critics argued, the MMS failed to adequately fulfill its duties to promote safety and protect the environment. With three independent bureaus, the competing missions would no longer be housed, and possibly undermined, in a single agency.

The BOEM reviews oil and class exploration and development plans, conducts auctions for offshore leases, conducts environmental studies, and supports the New Energy Frontier initiative to promote the use of renewable energy resources and decrease the country's dependence on foreign oil supplies. Additionally, the bureau performs National Environmental Policy Act (NEPA) analysis. Three primary divisions constitute the BOEM: the Office of Strategic Resources, Office of Renewable Energy Programs, and Office of Environmental Programs. The Office of Strategic Resources tracks inventories of oil and gas reserves, determines resource potential, and develops leases and permits for geological and geophysical activity. These functions help provide the country access to energy and necessary resources and ensure that developers provide fair compensation for access to OCS resources.

The Office of Renewable Energy Programs promotes environmentally friendly energy resources, such as wind farms off the Atlantic Coast, and facilitates the development of new renewable energy activities. The Office of Environmental Programs, led by the Chief Environmental Officer, conducts and oversees environmental impact assessments to ensure that renewable and conventional resource development is conducted in an environmentally responsible manner. Three regional offices, in New Orleans, Louisiana; Camarillo, California; and Anchorage, Alaska, support the work conducted by the BOEM in Washington, D.C., its primary headquarters. Although the BOEM and BSEE are independent, they carefully coordinate their operations and share some administrative functions to ensure efficiencies and reduce costs.

Although the nascent bureau is still establishing its scope, Director Tommy P. Beaudreau anticipates that the BOEM will continue to focus on three priority areas: managing the OCS Oil and Gas Leasing Program, which provides new offshore areas for exploration and development; increasing the rigor of scientific and environmental analysis; and reducing the use of categorical exclusions. These categorical exclusions allowed offshore sites exemption from post-lease environmental assessments. The bureau also ensures that U.S. taxpayers receive a fair return for the exploration and development of OCS areas. It has reviewed and increased bid rates for leases and has created incentives for timely drilling, as well as provisions for early relinquishment of leases if the lessee is unlikely to undergo development of the area. The BOEM also reviews exploration and development plans rigorously, efficiently, and transparently while maintaining strong standards. Furthermore, the bureau intends to focus on greater leasing and development for renewable energy resources. Focus on these primary areas, the BOEM contends, will allow it to successfully promote development of the OCS while protecting the ocean environment, marine life, and the coast.

Bureau of Safety and Environmental Enforcement, U.S.

An agency of the Department of the Interior, the Bureau of Safety and Environmental Enforcement (BSEE) is mandated to foster safety, safeguard the environment, and conserve resources in the exploration and development of energy activities on the U.S. Outer Continental Shelf. It has regulatory and enforcement authority that outlines the legal expectations for companies operating offshore, and it imposes civil and criminal penalties for violations. The BSEE was created in 2010 by Ken Salazar's Secretarial Order 3299 in response to the tragic explosion at BP's Deepwater Horizon drilling platform that killed 11 men working on the rig and injured 17 others. In addition to the human cost, the explosion caused the largest oil spill in U.S. history, a leak of almost 200 million gallons of oil in the Gulf of Mexico, creating an unprecedented environmental catastrophe that affected marine life and industries along the coast, the consequences of which were still unfolding more than two years later.

Prior to Salazar's order, the Minerals Management Service (MMS) had responsibility not only for offshore safety and environmental protection, but also for energy development and royalty and revenue collections. Critics of the MMS observed that the three distinct missions of the agency conflicted and compromised its ability to create and enforce safety and environmental standards. An *ABC News* audit of federal records showed an alarming record of worker injuries and deaths, as well as violations of safety protocols with little to no punishment levied on the oil companies involved in the transgressions. When fines were imposed by the MMS, the amounts were so small that they had little punitive affect, and often it took the agency years to collect them. The *New York Times* reports that the MMS allowed oil companies to drill offshore without the necessary permits from the National Oceanic and Atmospheric Administration that assess the impact of drilling on endangered species and marine mammals. Furthermore, agency scientists who expressed concern about drilling activities were overruled by agency officials. Observers noted that the demand to generate and collect revenue through energy development activities undermined the agency's ability to effectively and vigorously regulate safety, health, and environmental standards.

To correct these deficiencies, the reorganization of MMS outlined in Secretarial Order 3299 created three independent agencies with separate, distinct missions. In addition to the BSEE, the order established the Bureau of Ocean Energy Management, which is responsible for resource evaluation, planning, and other leasing-related activities; and the Office of Natural Resources Revenue, which is responsible for all royalty and revenue management, including collection and distribution of revenue, auditing and compliance, and asset management. With independent charges, each of the three new agencies has a clear focus with consistent responsibilities.

A worker cleans up oily waste on Elmer's Island, just west of Grand Isle, Louisiana, May 21, 2010, after the blowout of the Deepwater Horizon oil rig a month earlier. The U.S. Bureau of Safety and Environmental Enforcement was created in response.

The BSEE, charged with safety and enforcement, provides oversight of safety and environmental protection in all offshore energy activities through several key programs. The Offshore Regulatory Program develops standards and regulations in offshore exploration and development of oil and natural gas; the Oil Response Division creates guidelines for oil spill response plans, helps produce and review the agency's oil spill response activities, and oversees oil spill drills; and the Environmental Compliance Division provides oversight and ensures that operators on the Outer Continental Shelf comply with regulations and specifications outlined in leasing permits. Finally, the National Training Center offers training for new inspectors and continuing education for experienced personnel. Regional BSEE offices are housed in New Orleans, Louisiana; Camarillo, California; and Anchorage, Alaska, and these offices review permits to drill, confirm that operators comply with safety requirements, conduct inspections with the authority to issue fines for any regulatory infractions, and investigate accidents related to offshore energy activities.

Since BSEE was formed, it has issued new regulations, conducted announced and unannounced drills, and hosted forums with representatives from government agencies, the oil industry, consultants, trainers, and equipment manufacturers to share knowledge and best practices. The agency is particularly concerned with instituting procedures and promoting practices that will prevent or contain future oil spills like the disaster in the Gulf of Mexico. Many of its exercises and activities contribute toward this goal. However, the agency has also been criticized for issuing controversial permits, such as those that allow Shell Oil Company to drill in the ecologically fragile region off the coast of Alaska.

Bush, George H. W.

George Herbert Walker Bush (1924–) rose to the presidency through the ranks of American national government. After he served as a U.S. Navy pilot during World War II, Bush soon embarked on a sterling career in national politics spanning some 25 years. He started as a Republican in the late 1960s, culminating in his election in 1988 as the 41st president of the United States. However, Bush's alleged involvement in some white-collar criminal activities during the latter part of his career stirred some controversy regarding his service in government. Bush attended Yale University, like his father Prescott, and was a member of the secret society Skull and Bones. Bush's first foray into national politics was as a U.S. congressman from Texas, serving two terms. From there, he went on to become ambassador to the United Nations (UN), chair of the Republican National Committee during the Watergate scandal, an unofficial ambassador to China, director of the Central Intelligence Agency (CIA), vice president under Ronald Reagan, and president of the United States.

Bush's public record vis-à-vis white-collar crime, particularly his alleged involvement, stems in many ways from his unique background and his ability to avoid responsibility. For instance, when Bush was director of the CIA, the agency engaged in drug trafficking and political assassination. When a Chilean dissident leader was killed by a car bomb in Washington, D.C., in 1976, the CIA—under Bush—prepared a false report that intentionally misled an investigation by the Federal Bureau of Investigation (FBI). In 2000, a report to Congress found the architect of the assassination to be a Chilean intelligence chief who was on the CIA payroll during Bush's directorship. Upon Bush's election to the vice presidency in 1980, he began receiving intelligence reports and participated in President Reagan's daily briefings and cabinet meetings. Such a central role, however, did not bode well for Bush once the Iran-Contra scandal unfolded in 1986. This scandal concerned illegal funding of anticommunist rebels in Nicaragua, but an ensuing investigation was unable to unearth enough evidence to indict Bush. His ability to impede the investigation and disregard certain unenforceable laws helped shield him from prosecution.

After the fall of the Berlin Wall in 1989, a summit was held in 1991, at which Bush and Mikhail Gorbachev signed the Strategic Arms Reduction Treaty (START I). The treaty, which took nine years to formulate, reduced both countries' strategic nuclear weapons as well as the Soviets' land-based intercontinental ballistic missiles. Once the Soviet Union dissolved in 1991, Bush and Gorbachev affirmed a strategic partnership between their respective countries, capping an end to the Cold War. At about the same time that the Berlin Wall came down in late 1989, Bush ordered an invasion of Panama to depose its leader, General Manuel Noriega. A dictator and a drug trafficker, Noriega had a history of ties to the U.S. government. As vice president in the 1980s, Bush had worked with Noriega, who was on the CIA payroll—being paid more than $100,000 a year—during the Iran-Contra scandal for use of his drug trade in order to provide arms to the U.S.-backed Contras. Disclosure of Bush's criminal ties to Noriega played a key role in the decision to invade Panama. Once Noriega surrendered, he was tried and convicted in 1992 on racketeering and drug trafficking charges.

In August 1990, another dictator, named Saddam Hussein, invaded his oil-rich neighbor, Kuwait. Bush condemned the invasion, forming a broad coalition of over 30 countries in opposition to Iraq. With the UN Security Council opposed to Iraq's aggression, Congress authorized the use of military force. Coalition forces began a four-week aerial assault in January 1991, followed by a ground offensive (led by General Norman Schwarzkopf) that Bush stopped after a mere 100 hours. Before leaving office after his defeat to Bill Clinton in the 1992 presidential election, Bush pardoned seven high-ranking government officials who were all involved in the Iran-Contra scandal. Four of the officials were pardoned after they were convicted of felony and misdemeanor counts of crimes ranging from perjury to obstruction of a congressional grand jury investigation. Two others had been indicted and were awaiting trial when they were granted rare pretrial pardons from Bush. A final official was indicted but protected from prosecution because of Bush's refusal to release classified information regarding the official's involvement in the scandal, leading to dismissal of the case.

Bush, George W.

George Walker Bush (1946–) was the 43rd president of the United States, from 2001 to 2009, and the 46th governor of Texas, from 1995 to 2000. He is the second president to have been the son of a former president, the first being John Quincy Adams. Bush was elected president in 2000 in a close and controversial election, becoming the fourth president to be elected while receiving fewer popular votes nationwide than his opponent. He received 543,895 fewer individual votes than opponent Al Gore nationwide but won the election by receiving 271 electoral votes to Gore's 266. In 2004, Bush commanded broad support in the Republican

Party and did not encounter a primary challenge. In the election, Bush carried 31 of 50 states against John Kerry, receiving a total of 286 electoral votes. He won an outright majority of the popular vote (50.7 percent to his opponent's 48.3 percent). The last previous president to win an outright majority of the popular vote was Bush's father, in the 1988 election. Bush's 2.5 percent margin of victory was the narrowest ever for a victorious incumbent president, breaking Woodrow Wilson's 3.1 percent margin of victory against Charles Evans Hughes in the election of 1916. Bush set out to be the "enforcer" against white-collar crime during his time in the White House. During Bush's terms, the Corporate Fraud Task Force was created, and the Sarbanes-Oxley Act was passed. Despite these efforts aimed at combating white-collar crime, many of Bush's opponents still accused him of letting the "big fish" of corporate crime go free.

Heightened Interest in White-Collar Crime

Public interest in white-collar crime increased astronomically following the 2001 exposure of Enron executives' illegal activities. Increased public awareness of white-collar crime acted as a catalyst for action in Washington. Bush led the attack against white-collar crime with the creation of the Corporate Fraud Task Force. Corporate fraud is defined by the U.S. Department of Justice as including criminal and civil violations relating to securities and commodities fraud, financial institution (bank) fraud, money laundering, tax offenses, and bribery of foreign officials. Officially established through the issuance of Executive Order 13271 of July 9, 2002, the Corporate Fraud Task Force created a union between a wide array of agencies, including the Department of Labor, the Commodities Futures Trading Commission, and the Federal Reserve, with the goal of using the full weight of the law to expose and root out corruption. According to Department of Justice records, the Corporate Fraud Task Force obtained 1,236 corporate fraud convictions, including those of 214 chief executive officers/presidents, 53 chief financial officers, 23 corporate counsels, and 129 vice presidents.

Bush also supported passage of the Sarbanes-Oxley Act (also known as the Public Company Accounting Reform and Investor Protection Act in the Senate and Corporate and Auditing Accountability and Responsibility Act in the House) in July 2002, which created new offenses, mandated severe penalties for criminal offenses, and held corporate executives criminally responsible for their companies' accounting. The new guidelines from the Sarbanes-Oxley Act immediately reduced the possibility of probationary sentences, increased prison time, and decreased judges' discretion during sentencing. The Sarbanes-Oxley Act and the Corporate Fraud Task Force are valued by many as effective tools in the attack against white-collar crime.

Republican administrations have long been accused of being lenient toward corporate crime. Though the creation of the Corporate Fraud Task Force and the passage of the Sarbanes-Oxley Act were both steps in the direction of accountability, both have their critics. The Corporate Fraud Task Force was criticized of being merely a think tank, not able to take action. The Sarbanes-Oxley Act added stronger punishments for those convicted but also faced the issue of enforcement. States have highlighted this fact by beating the federal government to prosecution because of the federal government's lack of manpower. Detractors of the Sarbanes-Oxley Act have also contended that it was an unnecessary and costly government intrusion into corporate management that places U.S. corporations at a competitive disadvantage with respect to foreign firms, driving businesses out of the United States. The Bush administration's struggles with prosecution left many questioning whether the Corporate Fraud Task Force and the Sarbanes-Oxley Act had any effect on white-collar crime.

On the flip side of Bush's desire to be an enforcer against white-collar crime was his potential involvement in certain political controversies. The passage of the USA PATRIOT Act (Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism) following the terrorist attacks of September 11, 2001, had been plagued with controversy from the start. Opponents of the act were vocal in asserting that it was passed opportunistically after the 9/11 attacks. Provisions of the act, opponents say, violated many of the basic rights guaranteed under the Constitution—namely, the protection under the Fourth Amendment against unreasonable search and seizure. There was particular consternation about this with regard to National Security Letters, which allowed the Federal Bureau of Investigation to search telephone, e-mail, and financial records, without a court order. Another controversy that plagued the Bush administration was the government response to Hurricane Katrina. Although President Bush was criticized for not returning directly to Washington, D.C., after Katrina hit, the main criticisms the administration faced were about the Federal Emergency Management Agency (FEMA). FEMA was heavily criticized from both sides of the aisle, primarily for its slow response and inability to coordinate efforts with other federal agencies and relief organizations. FEMA was accused of deliberately slowing down the relief effort to ensure that all assistance and relief workers were coordinated properly. For example, warehouses in New Orleans burned while firefighters were diverted to Atlanta for FEMA training sessions on community relations and sexual harassment, and water trucks languished for days at FEMA's staging area because the drivers lacked the proper paperwork.

Butcher Brothers

Brothers Jake (1936–) and C. H. Butcher (1939–2002) became well known in the late 20th century for perpetuating massive bank fraud in their home state of Tennessee and in the neighboring state of Kentucky, ultimately leading to the failure of 12 banks, forced sales of other banks, prison terms, and destroyed lives and fortunes.

Rags to Riches

The brothers grew up in Dotson's Creek. Their father, Cecil H. Butcher, Sr., served as president of the Union County Bank and managed a general store. Their early years were spent on a farm that had no indoor plumbing, and Jake Butcher later blamed that experience for his desire for a lavish lifestyle. The more flamboyant and older of the brothers, Jake was a prominent figure in Knoxville and in Tennessee more generally. As the chair of the board of the Knoxville International Energy Exposition, he was the key figure behind the World's Fair held in the city in 1982. He was also a major figure in state political circles and unsuccessfully ran for governor in 1978. He was accused of trying to buy the election, spending $2.5 million in the primary. He flaunted his wealth, and his supporters sported T-shirts proclaiming "IT'S NO SIN TO BE RICH." Much was made of his close ties to key Democrats such as Jimmy Carter of Georgia even before Carter became president of the United States.

After attending the University of Tennessee and Hiawassee College and serving in the Marines, Jake Butcher returned to Tennessee, where he founded the Bull Run Oil Company and engaged in commercial farming before going into the banking business. He married actress Sonya Wilde in 1962 and had four children. As head of United American Bank (UAB), he eventually owned 39 percent of all banking reserves in Knoxville, and half of all business loans in Knoxville were financed through UAB, which had taken over the Hamilton National Bank, the largest bank in Knoxville, in 1974. The Butchers created a $3 billion banking empire that exsisted chiefly on paper. Jake Butcher built the 27-story United American Plaza, which is still the highest building in Knoxville. C. H. erected the 23-story Riverview Tower to house his City and County Bank.

Riches to Rags

The Butcher brothers' banking empire began to crumble as the World's Fair ended its successful six-month run. On November 1, 1982, 100 federal regulators simultaneously descended on 29 banks and branches owned by the brothers, who had previously avoided detection by transferring loans from one bank to another just ahead of upcoming audits. The simultaneous investigations prevented the practice, and examiners uncovered entrenched patterns of fraud involving unsecured loans, forged documents, and paper corporations. Jake Butcher was accused of channeling $11.5 million in loans to himself, his brother, and their associates, and of lying to his creditors. By February, Jake Butcher's UAB had failed, and other Butcher banks followed. Losses were estimated at $382.6 billion. Jake Butcher was also bankrupt, reporting liabilities of $32.5 million and only $11.9 million in assets. Those assets including his beloved mansion, Whirlwind, were sold at public auction to offset his liabilities. Both brothers were ordered to continue paying restitution for the rest of their lives.

After pleading guilty to bank fraud in 1985, both Jake and C. H. Butcher were sentenced to 20 years in a federal penitentiary. C. H.'s wife, Shirley, was sentenced to three years for bankruptcy fraud, but served only three months. Jake Butcher served seven years before returning to Tennessee and making his home in the Chattanooga area, working for a friend at a Toyota dealership and developing real estate. C. H. Butcher was paroled in 1993. Attempting to maintain a low profile, he moved to Canton, a city north of Atlanta, where he worked in a law firm. He died in 2002 after a fall at his home. In addition to wiping out the Butcher brothers' business and personal assets and sending the brothers to jail, the scandal had major repercussions in Tennessee and Kentucky, destroying the lives and fortunes of a number of people and sending several of their confederates to prison. Those indicted included Tennessee congressman Harold Ford, who was later acquitted, and prominent attorney Karl A. Schledwitz, who was convicted of mail fraud. Several individuals committed suicide as their lives unraveled in the wake of the scandal. The scandal continues to draw public attention.

Campaign Finance

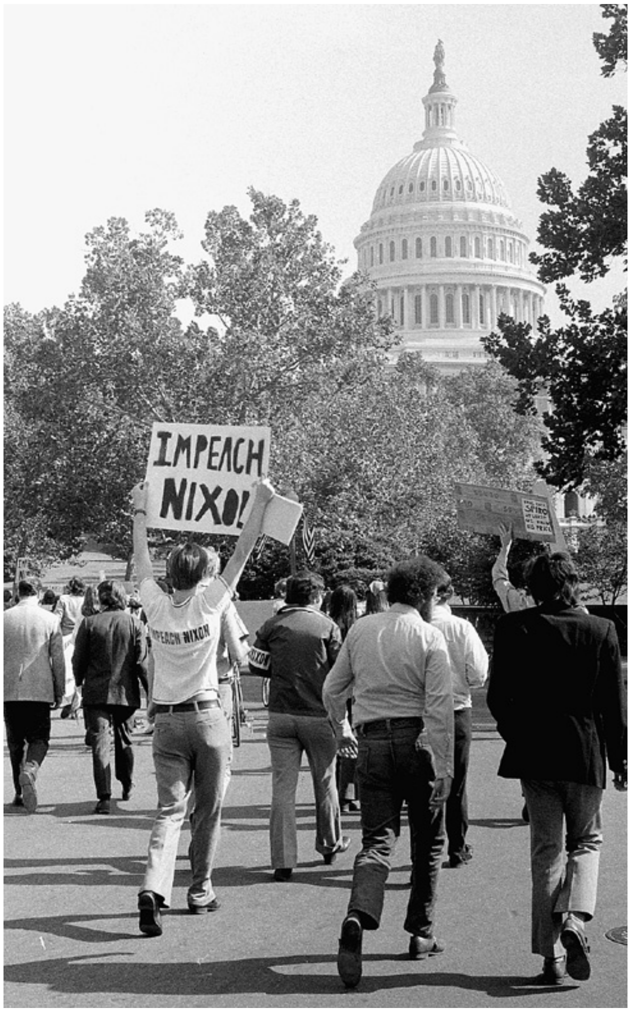
Campaign finance encompasses the process whereby campaign contributions are raised and spent to support or oppose candidates for political office, as well as particular issue positions. Campaign finance, which is integral to the democratic process, has undergone a series of reforms throughout history.

Beginning in the mid-19th century, various political figures have spoken openly about the potential for money to corrupt the political process and have set out to tackle the problem. The earliest federal campaign reform occurred in 1867, with the passage of the Naval Appropriations Bill. A provision in this bill prohibited government workers from asking naval yard employees for campaign donations. Subsequently, restrictions were placed on the types of entities that could contribute to political campaigns. The Civil Service Reform Act of 1883 set out to ease the pressure on federal civil servants to contribute to campaigns, and the Tillman Act of 1907 stated that corporations and interstate banks could not make direct contributions to federal candidates. In 1943, the Smith-Connally Act expanded the scope of the Tillman Act to include labor unions. In 1947, these restrictions were expanded to encompass contributions made during the primary season, as opposed to just the general election.

Federal Election Campaign Act

The Federal Election Campaign Act (FECA) became law in 1971 and was amended in 1974, 1976, and 1979. The act had a number of far-reaching goals, ranging from the public disclosure of campaign finance records to establishing the use of public funds in campaigns. The original act of 1971 limited the amount of money that candidates and the family members of candidates could infuse into their campaign coffers. The act also made it legal for labor unions and corporations to establish political action committees that could be used to raise and spend funds on candidates running for office. However, these organizations were still prohibited from using funds in their general treasuries for the same purpose. In the same year as FECA was passed, the Revenue Act established a public campaign fund whereby taxpayers could voluntarily check a box on their federal income tax returns in order to make a contribution toward eligible presidential candidates.

Subsequent amendments to FECA were generated in reaction to the Watergate scandal, which involved the misuse of funds from Richard Nixon's Committee to Re-Elect the President, and in response to the U.S. Supreme Court ruling in *Buckley v. Valeo* in 1976. These amendments established contribution limits on individual donors and political action committees. In addition, public funds were made available for



A demonstrator in Washington, D.C., holds up an "Impeach Nixon" sign, October 22, 1973. President Nixon's misuse of campaign funds was one major impetus for the subsequent amendments to the Federal Election Campaign Act.

presidential nominating conventions, as well as the primaries and general election. However, candidates who agreed to accept these public funds also had to accept spending limits during the campaign process. A six-person bipartisan Federal Election Commission was established to enforce the various restrictions and provisions.

Bipartisan Campaign Reform Act

Following the passage of FECA, the next major campaign finance reform was the Bipartisan Campaign Reform Act (BCRA). This act was passed by Congress in 2002 and is often referred to as the McCain-Feingold law for the two senators, John McCain (R-Arizona) and Russ Feingold (D-Wisconsin), who sponsored the legislation. This act prevented national party committees and federal candidates from soliciting soft-money contributions. The BCRA also restricted state and local party committees and candidates from using soft money on campaign communications that support or oppose political candidates. The act raised federal contribution limits to candidates and parties in an effort to offset the loss of soft-money funds. These reforms came in the wake of political parties increasingly directing soft-money funds away from voter mobilization and voter registration efforts, and toward issue advertisements that promoted party positions and implied support for particular political candidates. These reforms were intended to regulate this practice and were largely upheld in *McConnell v. Federal Election Commission* in 2003.

Recent Judicial Rulings

In 2009, the U.S. Supreme Court heard oral arguments in the case *Citizens United v. Federal Election Commission.* In this case, Citizens United, a nonprofit organization, produced a documentary film titled *Hillary: The Movie* that portrayed Hillary Clinton's record and character in a negative light. The group intended to use funds from its general treasury to pay for advertisements promoting the film during the presidential primaries. The case reached the U.S. Supreme Court on appeal from a 2008 lower-court ruling that declared this promotion a violation of the Bipartisan Campaign Reform Act. The lower court held that these advertisements were electioneering communications. Electioneering communications are defined as broadcast communications that occur within 30 days of a primary election or 60 days of a general election and discuss a candidate for federal office. In a reversal of earlier Supreme Court precedents and the lower-court ruling, justices of the Supreme Court ruled 5–4 that prohibiting these expenditures was a violation of the First Amendment right to free speech. This ruling gave corporations and labor unions the same political speech rights as individuals. As a result of this ruling, labor unions and corporations can now use their general treasuries to fund these advertisements, whereas earlier, they were limited to using their organizations' political action committees. In addition, nonprofit organizations can now use corporate or union funds to air electioneering communications, whereas earlier this was prohibited.

Another major change to the campaign finance landscape involves the creation of Super PACs, or independent expenditure-only committees. This development stems from a ruling by the federal court of appeals for the District of Columbia circuit in 2010. In *SpeechNow.org v. Federal Election Commission*, SpeechNow.org, an unincorporated association, wanted to create advertisements that would call for the election or defeat of candidates for federal office. In addition, SpeechNow.org also wanted to be granted the power to raise unlimited donations from individual donors to fund these communications. The appeals court ruled that limiting contributions to these groups was a violation of the First Amendment. Following these rulings, a new type of political action committee was created, known as a Super PAC. A Super PAC can raise and spend unlimited amounts in order to fund materials that advocate for or against a candidate. However, these groups cannot donate money directly to nor communicate directly with a political candidate. At the inception of these organizations, 80 Super PACs were formed, and by 2012, the number of registered groups had grown to just over 800.

Questionable Campaign Finance Practices

A number of political candidates and officeholders have been embroiled in controversy over dubious campaign finance practices. In some cases, former candidates have been brought to trial or charged with campaign finance violations. For instance, Tom DeLay, the former U.S. House majority leader, was charged with money laundering for using a political action committee to illegally guide corporate contributions to state house candidates in Texas.

The last three U.S. presidents, Bill Clinton, George W. Bush, and Barack Obama, all returned contributions when it was revealed that some of their total campaign receipts came from donors who had criminal backgrounds or questionable business practices. In addition, each of these presidents received a great deal of negative press for rewarding campaign contributors with access to state dinners and coffee meetings, trips to Camp David, and overnight visits to the White House. In addition, major campaign contributors and campaign workers historically have been appointed to positions of influence within the executive branch when their candidate was successfully elected to office. These practices have led some to decry the influence of money in politics and to push for a new series of reforms.

Opposition and Support for Reform

Opponents of campaign finance reform argue that campaign donations are a form of political speech and that they give individuals, corporations, labor unions, and other donors an opportunity to express their preferences and to become more politically involved. They argue that this involvement might be manifested in two ways. First, if political donations are concentrated on efforts to get out the vote, turnout rates may increase, leading to higher levels of citizen participation in the democratic system. Second, when money is used to communicate ideas and information about policies and candidates, citizens may become better informed and more capable of voting in a manner that is consistent with their beliefs. On the other hand, proponents support reforms to the system of campaign finance because they feel that money distorts the democratic process in a number of ways. Proponents argue that campaign finance has become too central to the campaign process and officeholding. The need to raise money may distract politicians from other tasks, such as the creation of good public policy. Proponents are also concerned that the increasing centrality of money in campaigns has created a climate of political inequality. They argue that candidates who lack financial resources are at a genuine disadvantage in the electoral process and that donors with greater financial resources may be able to provide undue influence on election outcomes. Thus, proponents advocate greater reform in the hope of eliminating loopholes and reducing the appearance of corruption.

Canadian Mining Scandals

Canada has one of the world's largest mining industries, and mining is a significant component of the country's economy, contributing almost $40 billion to the country's gross domestic product. Canada is the world's largest producer and exporter of potash and uranium, and one company, Barrick Gold Corporation, is the world's largest gold producer. The Canadian mining industry is also among the world's leading producers of aluminum, asbestos, cadmium, coal, cobalt, gypsum, nickel, titanium, and zinc.

However, this international dominance in the industry has come at great environmental, social, and human costs, both domestically and internationally. Although it generates great wealth for a relatively small number of people, the Canadian mining industry causes considerable hardship and suffering for many people through financial crime, corporate crime, environmental crime, state-facilitated and state-initiated corporate crime, and human and labor rights abuses. An industry that was built on the exploitation of child labor in the 19th century has continued the legacy of crime into the 21st century through deadly corporate violence, financial wrongdoing, and environmental degradation.

Workplace or industrial "accidents" are perhaps better understood criminologically as a form of corporate violence. Deaths at work, or as a result of work, are often not accidents but rather the predictable outcomes of unsafe and/or unhealthy work environments resulting from dangerous conditions, insufficient or nonexistent safety precautions, or improperly maintained equipment. Mining involves some of the most dangerous jobs in Canada. The mining industry's fatality rate of 46.9 per 100,000 workers ranks above that of other industries, such as forestry (33.3), construction (20.2) and transportation (16), and is considerably higher than the national average of 5.8. The greatest loss of life in a single Canadian mine occurred as a result of an explosion on June 19, 1914, at Hillcrest Mines in Alberta, in which 189 miners, almost half of the company's employees, were killed. In 1956, 39 miners were killed in an explosion, and in 1958, an additional 74 died as a result of a series of collapses in the mines of Springhill, Nova Scotia.

Death, Financial Scandals, and Pollution

The worst loss of life in the modern era of mining occurred at Westray Mine in Plymouth, Nova Scotia. On May 9, 1992, less than a year after it began operation, an explosion killed all 26 miners. Notorious for its disregard of safety procedures and equipment, the company was frequently cited for safety violations, some less than a month before the explosion. As a result of the deaths, the company was charged with over 50 counts of operating an unsafe mine, and two managers each faced 26 counts of manslaughter and criminal negligence causing death. Although neither the company's executives nor the managers were criminally convicted, these acts of corporate violence resulted in subsequent amendments to Canada's Criminal Code in 2003 that strengthened the requirements of corporate liability. However, this law does not apply to instances in which Canadian companies operate mines outside Canada.

The Canadian Mining industry's greatest financial scandal resulted from stock manipulation involving Bre-X Minerals Ltd. Bre-X was incorporated in 1989 as a subsidiary of Bresea Resources Ltd., and by early 1993, it had purchased a site in East Kalimantan, Indonesia, on the Busang River. By the end of 1995, it announced the discovery of significant gold deposits, driving its share price up from less than $1 to more than $50. The stock peaked at over $200 by early summer 2006, following reports in *Fortune* magazine that the Busang site was the largest gold discovery ever made. The suspicious death of Bre-X's chief Busang geologist, Michael de Guzman, in March 1997, following controversy over a core sample result, led to widespread suspicion regarding the veracity of the company's reports on its gold reserves. Later that year, it was revealed that Bre-X's gold samples were a fraud—salted with placer gold. Bre-X thereafter collapsed; its stock worthless. The revelations rocked the Canadian and global business communities as investors lost billions of dollars in not only the biggest stock manipulation in Canadian history but also one of the biggest scandals in mining history.

The mining industry is a notorious environmental polluter. In some instances, the substance that the mining company extracts is hazardous, such as chrysotile asbestos. Canada is the world's largest producer of this substance, a known carcinogen. The extraction, processing, and export of chrysotile asbestos puts populations at risk for pleural abnormalities, lung cancer, and other diseases. Because it is a highly profitable export, industry groups have pressured the Canadian government to obstruct the inclusion of chrysotile asbestos to the United Nations Rotterdam Convention's list of hazardous substances.

Waste produced in mining is an even more significant factor in pollution. Mine waste, known as "tailings," contains many dangerous chemicals, including acids, arsenic, cyanide, lead, and mercury that contaminate the air, soil, and water. Water pollution is the single biggest environmental casualty of the mining industry, with mining companies "disposing" of millions of tons of waste in rivers, lakes, and oceans. For example, dumping by Canadian companies such as Barrick Gold and Placer Dome in Papua New Guinea has poisoned rivers and destabilized the foundations of local homes. While much of this dumping by Canadian companies occurs in least developed and developing nations, it also occurs at home. For example, the Iron Ore Company of Canada is responsible for considerable pollution in Wabush, Labrador, and there are at least 250 de facto toxic waste sites among the abandoned mines in Ontario, leaching contaminated drainage into water courses and aquifers.

Mining is one of Canada's most profitable industries. However, this financial windfall for executives and shareholders comes at a great price to workers, residents of the communities located near mines, and the environment. Although numerous government bodies are said to have jurisdiction over certain aspects of the mining industry, the regulations are weak, enforcement is lax, and the penalties are financially minimal and rarely criminal. The result is that private profits come at a great social cost. Mining is one of Canada's most scandalous, quasi-criminal industries.

Capitalism

Capitalism is an economic system of relatively free markets in which the means of production and distribution are privately owned and operated for profit by the owners of capital (i.e., capitalists). There is no such thing as completely free (laissez-faire) markets. Although the theory of capitalism predicts producer responsiveness to consumer demand, there can be serious market failures because of externalities requiring public provision or regulation.

Monopolization, dishonesty, fraud, and other forms of misconduct undermine market efficiency. The neoclassical economic theory of capitalism focuses on resource-allocation efficiency, not on distributive equity. The relative freedom of markets, size of the government, roles of state-owned enterprises, and approach to public regulation define varieties of capitalism. The United States, Germany, Japan, and the United Kingdom (UK) are different national constellations of these elements.

The essential feature of capitalism is relatively free mobility of capital to move to the highest available return on investment. Such mobility improves the efficiency of resource allocation in an economy. Capital is defined as an existing stock of wealth, from which the owner seeks to derive an income (an increase in wealth). Income is defined as a set of services derived from wealth. Capital is a resource not found in nature (e.g., unimproved land or raw minerals), other than labor or knowledge. Capital may thus be financial or physical (e.g., plants and equipment). A business combines capital, labor, knowledge, and natural resources in producing goods and services for sale. Capital may be specialized. Banking, industrial, and service firms deploy different combinations of capital assets and knowledge.

In the classical liberalism of western Europe and North America, capitalism is strongly linked with individualism, free markets, private property, and political democracy. In direct contrast, socialism advocates that government (the state) owns, or at least dominates, those means of production and distribution in the collective interest. In Marxism, socialism is strongly linked with collectivism, central planning, and command economies. Socialists advocate nationalization of privately owned means of production and distribution.

In 1776, Adam Smith published the first systematic exposition of capitalism and the market system. His work, *The Wealth of Nations,* criticized the then prevailing mercantilist theory of economic nationalism and protectionism that evolved with the rise of European nation-state monarchies and overseas imperialism from the 16th century through the 18th century. Mercantilism was a set of crown policies based on an assumption that national prosperity depended on increasing the nation's holdings of bullion. This mercantilist theory advocated government accumulation of bullion by combining a positive foreign trade balance of exports minus imports and tariff protection against imports. The mercantile system had succeeded medieval feudalism in western Europe. Mercantilism was associated with royally chartered monopolies, reflecting increasing crown control of the economy. Such monopolies were economically inefficient. Smith expounded the national benefits of relatively free trade and mobility of resources. These benefits included more goods and services, more employment, and higher wages and profits.

Capitalism Versus Socialism

In the 19th century, Marxist socialism grew in importance and popularity as a critique of capitalism and a political reaction to its negative effects and excesses. Industrialization and urbanization had profoundly disruptive effects on what had been agrarian and commercial economies. What had been absolute monarchies became constitutional governments. There was considerable violence associated with the long struggle after 1865—during what were known in the United States as the Gilded Age and the Progressive Era—to develop labor unions, obtain workers' rights, and establish democratic welfare states.

Prominent among defenders of capitalism were the 20th-century Austrian economists Friedrich A. Hayek, Ludwig von Mises, and Joseph Schumpeter. Hayek emphasized the impossibility of effective central planning. A decentralized market economy requires millions of choices daily by buyers and sellers, based on detailed local information. No central planning system can possibly duplicate, or even approximate, this complicated set of choices and details. Schumpeter emphasized the role of entrepreneurial innovation in capitalist economic development.

The collapse of communist command economies by the 1990s is impressive evidence of the functional superiority of capitalist market economies. Even well before the crisis of the 1990s, some countries in eastern Europe, led by Hungary and Yugoslavia, had moved toward market socialism, in which the state-owned economy operates as much as possible in accordance with market principles. However, socialism is far from dead as a competing ideology. China is experimenting with retaining communist control of a decentralizing market economy in a large-population country. Venezuela and Bolivia have moved toward socialism and an executive branch with a strong role in economic policy. Russia's two-term president

Vladimir Putin reasserted the Russian government's control of its natural resources, such as oil and gas. The Russian government has not, however, reinstituted central planning.

Varieties of Modern Capitalism

These historical developments have resulted in quite different outcomes by country. It is conventional to distinguish among at least three varieties of modern capitalism.

One variety, most closely associated with Adam Smith's original conception, is Anglo American market capitalism, although there are significant differences between the United States and the UK. This pattern most strongly emphasizes relatively free markets, private property, investors, and consumers. The United States has been the prototype country and is arguably the world's most strongly capitalist market economy. In recent years, some evidence suggests that inequalities are widening in the United States and that real income for many Americans may be declining, or at least not making gains. Post-1945 Labour governments in the UK instituted major elements of socialism in the form of nationalization of certain key industries (e.g., steel, coal, and transportation) and a National Health Service. However, there was no central planning, and most property ownership remained in private hands. The UK in recent decades has been moving back toward the American market model while retaining aspects of the European welfare state, such as its National Health Service.

A second variety, found in much of the rest of western Europe, is European welfare-state capitalism. Pioneered by Chancellor Otto von Bismarck in Germany, who introduced social insurance programs in the 1880s (e.g., old age pensions, accident insurance, health care access, and unemployment insurance) as measures politically intended to blunt the appeal of socialism, this pattern assigns a stronger role to the state and emphasizes worker-oriented social welfare policies. The pattern is most strongly established in Scandinavia, the Low Countries, and Germany. In Anglo American capitalism, corporate governance is effectively exercised by an investor-elected board of directors. In the German approach, there are dual boards: a management board operates the company, and a supervisory board represents investors and workers. Government regulation and the welfare state, while forms of collectivism, help mitigate the harsher effects of the market mechanism operated by economic self-interest, and thus promote the perceived legitimacy and popular acceptance of capitalism.

The third variety, found in east Asia and differing by country, may involve state-led capitalism or family-controlled enterprises. Since 1945, Japan has had a capitalist market economy, but there are key differences from Anglo American or European welfare-state capitalism. The Japanese government has had a strong role in guidance of private companies. Japan's unions tend to be organized on the basis of the employer, rather than craft oriented, and Japanese companies in the post-1945 era practiced lifetime employment until quite recently. Family firms are important in South Korea and some other east Asian countries.

It is an open question whether these varieties of capitalism will continue to diverge or converge over time. The evidence tends to suggest that relatively free markets outperform welfare models, but the performance differences may not be great enough to conclude categorically that the latter will disappear. European societies tend to have views of capitalism that are more oriented toward corporate social responsibility, ecological sustainability, and stakeholder participation than the views held in countries adhering to the Anglo American pattern. During the recession beginning in 2008, the United States and western Europe were in serious disagreement over the proper balance of regulatory reform and direct stimulus. European countries favored the former, the United States the latter.

Capitalism, meaning the privately owned market economy, and political democracy are closely intertwined. In 2007, Benjamin Friedman estimated that the count of politically free countries was about 90. The December 1991 disintegration of the Soviet Union demarcated the failure of socialist central planning intertwined with totalitarian communist rule. Privatization of state-owned assets and deregulation of market economies was an important movement of the 1980s and 1990s. The standard of living in South Korea, according to Friedman, is now more than half that of the United States, and is more than double that of Russia. The historical record of the last 200 years demonstrates that, as predicted by

Adam Smith, relatively free markets permitting mobility of capital and other resources work better than alternative economic systems at increasing aggregate material wealth.

Corporate Social Performance

Capitalism presumes that capital is the key organizing element on the supply side of the market economy. Businesses deploy equity and debt capital in response to or anticipation of consumer demand, in order to increase their rates of return on investments. A key continuing debate is about the social performance of corporations and the role of stakeholders other than investors and managers. Corporate social performance is the broad set of effects of business activities on societies. One question is whether, in the aggregate (net), this set of effects is positive. Relatively free markets tend to increase total material wealth, but the equitable or just distribution of this total wealth is a different matter. Not everyone automatically gains when an economic system's wealth overall increases. There may be costs of growth, such as ecological deterioration, that are properly accounted for in defining and measuring corporate social performance. Some stakeholders of a corporation may gain, while other stakeholders of the corporation may lose, as a result of specific business decisions and strategies. On the whole, today's market economies arguably tend to shift relative power from employees toward investors and consumers.

At issue are the relative roles of business profit, community benefit, corporate social responsibility, ecological sustainability, and stakeholder participation. One movement in the United States has aimed at increasing economic or workplace democracy, as discussed by Robert Dahl. The essence of the movement is that employees should own businesses in which they work. A variant of this argument is that modern businesses are more dependent on knowledge than on capital. Since knowledge is embedded in people, compensation and corporate governance arrangements should reflect the reality of knowledge-based, rather than capital-based, firms. One theory is that knowledge workers should receive nonvoting shares in the firm. A capital-based firm emphasizes physical and financial assets as the source of profits. A knowledge-based firm emphasizes people and their skills as the source of profits. A theory based on this distinction argues that "ownership" and "compensation" concepts should reflect the reality of how the specific firm makes its profits. The basic argument is that knowledge is more valuable than financial capital.

Global Capitalism in the 21st Century

Capitalism and democracy have assumed both an intellectual and a real-world ascendancy since 1991, as socialism and central planning have tended to collapse virtually everywhere. The emergence of global capitalism reinforces the importance of older questions concerning capitalism and raises new questions. Capitalism is spreading to societies where there is no foundation of constitutional democracy and rule of law. One scenario is that successful markets will tend to stabilize those societies. In the transition economies of the old communist bloc, reformers have emphasized rapid movement to markets to ensure democratic government. An alternate scenario is that economic transition may worsen social conditions. The resulting turmoil may result in the return of oligarchs in new clothing as in Russia, Belarus, and Turkmenistan.

Amy Chua has argued that free market democracy may tend to generate ethnic conflict, other forms of conflict, and global instability. The reason is that a free market, dominated by multinational corporations from abroad, may disrupt traditional economies, and democracy may tend to promote corruption, demagoguery, and strongman rule. Although her work has its critics, and conflicts are multidimensional phenomena, Chua's basic thesis is that free-market democracy can exacerbate backlash against wealthy ethnic minorities. The much poorer majority in a country may feel envy and bitterness toward successful minorities. Political demagogues can capitalize on this hostility. Chua cites, for example, the Chinese engaged in commercial activities throughout southeast Asia, where they are regarded as outsiders. In the 21st century, religious fundamentalism is growing in importance. One dimension of this growing fundamentalism is likely a reaction to modernism and liberal democracy. The United States, the hallmark of free-market democracy, may be regarded in various countries as a global minority seeking to dominate other cultures, as Chua points out.

The moral status and responsibility of capitalism is a continuing debate. One view is that the marketplace is an amoral mechanism. Adam Smith was concerned not with motives but with outcomes (or consequences). If relatively free markets tend to alleviate poverty more efficiently and effectively than alternative economic systems—such as socialism or state capitalism—then the outcome justifies the mechanism. The alleviation of poverty and want is a profoundly moral outcome. At the same time, Smith expected that rising material wealth would liberate the natural sympathies of people for the plight of others less fortunate.

Another view holds that businesses can and should practice corporate citizenship and social responsibility. Although globalization is often regarded as a morally neutral process at work, international business scholar John H. Dunning advocated "responsible global capitalism" as a process of defining moral standards for participants in the marketplace. The drivers of this process are likely to be a combination of enlightened self-interest, an emerging universal consensus on global business ethics, and a variety of religious faiths, which tend to overlap on certain essential moral considerations. In this view, capitalism in practice rests on certain virtues and values of business managers, which can provide an enlightened self-interest with a positive moral content. These virtues include creativity, cooperation, and compassion for others. Advocacy, example, and education can help improve moral standards for business conduct over time. Other scholars take a very dim view of business citizenship or responsibility, and urge reliance on relatively free markets. The available empirical evidence does not strongly support either position. That circumstance, however, would seem to give moral discretion to business managers to decide what they believe is right and good.

In the 21st century, capitalism has become the dominant economic ideology and the dominant economic system in the world, and evidence suggests that it is spreading globally. In North America and western Europe, capitalism and democracy occur in combination. The key questions concerning capitalism in the 21st century, in addition to the costs that economic growth impose on ecological sustainability and the distributive equity of wealth creation, are the roles of corporate social responsibility and citizenship. There are defects in capitalism because the marketplace is basically an amoral machinery of demand and supply interactions. One school of thought advocates letting relatively free markets operate because they are superior in economic performance relative to government interventions. Another school of thought contends that businesses should operate in accordance with some morally informed conception of enlightened self-interest. This conception should take some account of stakeholders other than managers, investors, and consumers, and of the relationship between business profit and community benefits.

Carl Karcher Enterprises

Carl Karcher Enterprises is named for founder Carl Karcher, who began his career in restaurants with just a hot dog cart before opening Carl's Drive-In Barbecue in 1945. By the time his enterprise reached its peak, he controlled over 2,000 restaurants that returned almost $3 billion per year. Although Karcher was long rumored to be involved with the Ku Klux Klan, his true crimes were more of the financial variety. In 1984, Carl Karcher Enterprises (CKE) began offering franchises, which led to the development of many restaurants in Texas. From the beginning, however, the Texas franchisees failed to turn the expected profits. Carl and his brother Don (who was running day-to-day operations for CKE at the time) saw internal reports and told family members what was happening. In response, the family members sold their shares in the company. The decision saved them from losing over $300,000 but was entirely illegal under insider trading statutes.

Insider Trading and Other Legal Battles

In 1988, during the height of the Wall Street insider-trading scandal, the Securities and Exchange Commission turned its attention to the Karcher family and ultimately convinced its members to pay $664,000 in fines and reparations. Most important, however, was that no one had to admit guilt. Money was paid both to the government and to shareholders who were damaged as a result of the family's decision to sell before the share values tanked. By not admitting guilt, the family avoided being charged criminally. Civil cases that had already been filed were dropped, and criminal charges were largely undermined by effective defense counsel strategies (such as portraying the CKE attorney as being too unorganized to successfully commit fraud).

Although they survived this insider-trading incident, a later expansion into Arizona led to further battles. In this case, Wendy's—a chief rival to CKE's Carl's Jr.—brought legal action over what were described as unfair business practices. In Arizona, Carl's Jr. stores were experiencing millions of dollars in losses annually. In response, CKE bought 10 Wendy's locations from a franchisee with the sole intent of shutting them down and eliminating the competition. Wendy's responded by suing CKE and the franchisee for over $100 million, claiming that the sale was made without their consent. Eventually, the case was settled for an undisclosed amount. The Karcher family members turned on one another. Frank Karcher sued his older brother for $10 million, stating that CKE had used deep discounts to artificially increase sales and profits of 12 stores in Arizona before he agreed to purchase them as a franchisee.

By 1993, Carl Karcher was no longer in charge of running CKE. He had made a series of poor decisions in previous years, and they had finally caught up to him. First, he tried to privatize the company, which left him nearly bankrupt. He then tried to remove his board of directors as a result of their decision to reject a proposal to share marketing budgets and outputs with Green Burrito, a Mexican fast-food restaurant. The problem with the proposal was that percentages were written to benefit the Karcher family, but they would harm shareholders. In 1995, Green Burrito became CKE's next legal hurdle when it sued for $100 million. After opening a series of Carl's Jr.–Green Burrito restaurants, CKE authorized opening a Carl's Jr.–Picante Grill. Green Burrito believed that it had rights to the concept and sued CKE for using it with another company. After working through the suit, CKE bought the parent company of Green Burrito in 2002. CKE believed that the partnership would help carry both companies forward.

Legal trouble still followed the company, however. Managers successfully sued after they were deprived overtime pay. A class-action lawsuit emerged after litigators began working through the company's annual reports. It took until 2003 for CKE to return to profitability. It appeared that it achieved this by moving toward premium menu products designed to attract a higher-end clientele than most fast-food restaurants.

Carl Karcher and CKE grew even more estranged in the years before his death when Carl's Jr. launched a series of ads featuring direct sexual overtones (and starred celebrities such as Paris Hilton and Hugh Hefner). The goal to attract a younger male clientele ultimately was not met.

Harassed Over Politics

Although his political beliefs were not criminal, Karcher was boycotted for them nonetheless. In 1978, he contributed $1 million to California's

Proposition 6 initiative, a ballot measure that aimed to prohibit gays and lesbians from employment in public schools. However, the measure was defeated by over 1 million votes. Because of his support, his hamburgers were dubbed "bigot burgers." Karcher also supported candidates who belonged to the conservative John Birch Society. He was viewed negatively by supporters of abortion rights because of his donation history and his personal story about how he once talked an employee out of having an abortion. Karcher died in 2008 from Parkinson's disease. In February 2010, CKE accepted a $693.9 million takeover by Apollo Management.

Although Karcher is well regarded in the restaurant industry for his rags-to-riches story, legally he is better remembered for insider trading and his removal as chief executive officer of his company after feuding with the board of directors.

Carnegie, Andrew

Andrew Carnegie once said "Do not look for approval except for the consciousness of doing your best." Carnegie's story personifies the capitalist ideal of the individual rising above the masses to profit from their perceived deficiencies. Often regarded as one of the richest men in history, Andrew Carnegie was born on November 25, 1835, in Scotland, Carnegie's father owned and operated a handloom business. After his father's business began to falter, the family immigrated to the United States in 1848. Upon arrival, they settled in Allegheny, Pennsylvania, and Carnegie, at age 13, got his first job in a cotton factory. Mostly self-educated by reading books, Carnegie next worked as a Western Union messenger boy. From this position, he was hired as a telegraph operator, then took a series of positions that resulted in his eventually becoming the superintendent of the Western Division of the Pennsylvania Railroad. During this time, Carnegie invested in a new company manufacturing goods such as railway sleeping cars. After a time, he expanded his business ventures to include the construction of locomotives, rails, and bridges.

Carnegie created his first company the Keystone Bridge Company in 1865, but Carnegie earned most of his fortune in the steel industry. By 1873, he entered this industry, founding the Carnegie Steel Company. Over the next decade Carnegie Steel continued to grow. Carnegie utilized business practices that transformed the production of steel. Specifically, Carnegie's produced steel more cheaply and efficiently than his competition through new technologies and vertically integrating the supply of raw materials needed for steel production. By the 1890s, the company was the largest and most profitable industrial enterprise in the world.

In 1892, Carnegie and his business colleague, Henry Clay Frick, found themselves enmeshed in a labor dispute that would leave 10 individuals dead. This dispute involved Carnegie Steel's main plant, located in Homestead, Pennsylvania. Specifically, a disagreement between the National Amalgamated Association of Iron and Steel Workers of the United States and the Carnegie Steel Company over how much the workers' pay should increase in relation to the company's profits morphed into the Homestead strike. Lasting almost five months, this labor dispute was one of the most intense in U.S. history. Some of the workers demanded that their individual pay increase by the same percentage that overall profits had increased. In response, the management at Carnegie Steel locked the union out. Thus, the union workers viewed this not as a strike, but as a lockout. At this time, the labor movement was gaining momentum in the United States. The workers protested. Frick brought in thousands of strikebreakers to replace the protesting workers and used Pinkerton for security purposes. Before heading to Scotland for a trip, Carnegie put his business associate and partner in charge of negotiating with the workers. Henry Clay Frick was not particularly empathetic to the workers' concerns. On July 6, 1892, a fight between Pinkerton agents and strikers resulted in hundreds being injured and several strikers, as well as three Pinkerton agents dying. After events in Homestead stabilized, Carnegie returned to the United States. Although Carnegie helped create a pension fund for former employees, his reputation was tarnished because of the events surrounding the Homestead strike.

Carnegie sold Carnegie Steel to J. P. Morgan in 1901. Carnegie's company was merged with several other steel companies to create U.S. Steel, which still exists. Carnegie Steel was then valued at more than $400 million. Carnegie wrote numerous articles on various issues including philanthropy, class, and labor. In an article titled the "Gospel of Wealth," Carnegie argued against attempts by the government to recirculate wealth and the need for philanthropic giving. Later in life, Carnegie married and fathered a daughter, Margaret. Carnegie donated large sums of money to many philanthropic causes. He donated money to establish many libraries and educational institutions such as the Carnegie Institution of Washington, Carnegie Corporation of New York, Carnegie Endowment for International Peace, the Carnegie Museums of Pittsburgh, and the world renowned Carnegie Mellon University.

Carson, Rachel

Rachel Carson (1907–64) was born in Springdale, Pennsylvania. She was a biologist who obtained her education at the Pennsylvania College for Women (Chatham University). She earned a master's degree in zoology from Johns Hopkins in June 1932. After earning her degree, she took a temporary position at the U.S. Bureau of Fisheries (now the U.S. Fish and Wildlife Service). As part of her duties, she wrote several publications on marine life as well as a series of weekly educational broadcasts. She eventually took the civil service exam, outscoring all other applicants, and became the second woman hired full time as a junior aquatic biologist. She worked for the agency for 17 years.

Through her work as a governmental biologist, she studied fish and wildlife, and she became very knowledgeable about the environmental impacts of pesticides on animal populations. Carson's main responsibilities were to analyze and report field data on fish populations. Given her success with previous publications, she was also responsible for writing brochures for the public. Carson's first book, *Under the Sea-Wind,* was published in 1941 by Simon & Schuster. Her second book, *The Sea Around Us,* was published in 1951 by Oxford University Press. It remained on the *New York Times* bestseller list for 86 weeks. It was later abridged for *Reader's Digest* and won many awards. Carson was awarded two honorary doctorates and made the book into a documentary. In 1952, Carson quit her job at the Fish and Wildlife Service to write full time. Her third book, *The Edge of the Sea,* was published by Houghton Mifflin in 1955.

DDT and *Silent Spring*

Carson was particularly interested in the effects of dichlorodiphenyltrichloroethane (DDT) on the environment. Through her biological and zoological background and negative reports about DDT and other chlorinated hydrocarbons, she began researching and writing her fourth book, *Silent Spring*. DDT was first used as an insecticide in 1939. It was highly effective in eradicating colonies of mosquitoes and their eggs. During World War II, DDT was used by B-25 bombers, which sprayed areas of the Pacific prior to invasions. It was effective in eliminating malaria. It was widely used across the United States to kill mosquitoes,

Author and researcher Rachel Carson and national wildlife artist Bob Hines, circa 1955, search in the Florida Keys for marine specimens for Hines to illustrate in Carson's third book, The Edge of the Sea. *Carson's book* Silent Spring *(1962) alerted the public, upset the pesticide industry, and invited criticism, and ultimately inspired a movement.*

beetles, caterpillars, and moths. The problem with DDT was not its effectiveness but its indiscriminate effectiveness; it killed everything that it came into contact with. This was especially disturbing to Carson because DDT was killing wildlife and negatively affecting ecosystems.

Carson's book, *Silent Spring*, was published by Houghton Mifflin in 1962, and created an open debate between the public and the pesticide industry. This book helped educate the public on the potential dangers and effects of pesticides on humans and wildlife. The public started to question the use of pesticides, their effect on the environment, and became more critical of the industry and the government. Yet, not everyone was convinced of the veracity of Carson's claims, especially those in the pesticide industry. Many in the industry criticized her book and attempted to discredit her knowledge of science. This was done in a very public manner. She was criticized because she did not have a Ph.D. and she was a woman. These two factors alone were used against her. Carson did not advocate a complete ban on pesticides, but wanted them to be used in a responsible manner that would not negatively influence entire ecosystems. Soon after the book was published, President John F. Kennedy formed a government group to investigate the dangers of pesticides.

In 1963, the president's Science Advisory Committee announced that the claims made by Carson's *Silent Spring* were correct. Her work helped promote an environmental movement and was influential in the creation of the Environmental Protection Agency. In 1972, DDT was banned from sale in the United States. Carson died of breast cancer in 1964 and was never able to see the outcome of her efforts in relation to the banning of DDT. Although her life was cut short, she is credited for starting the modern environmental movement. *Silent Spring* has been called one of the most influential books of the 20th century. Former Vice President Al Gore, in the introduction to a 1994 reprint of it, wrote “Without this book the environmental movement might have long been delayed or never have developed at all.”

Carter, Jimmy

A peanut farmer and former governor of Georgia, Jimmy Carter (1924–) won the presidency in 1976 by defeating Republican Gerald Ford, Richard Nixon’s former vice president. Ford had succeeded to the presidency in 1974 upon Nixon’s resignation, in light of the Watergate scandal. Carter, who campaigned as an outsider—untainted by Washington politics—with a strong moral reputation, pursued ethics in government laws and ramped up white-collar criminal prosecutions once in office. With an ambitious domestic and foreign policy agenda, Carter, however, faced huge obstacles—a poor economy, high energy prices, a hostage crisis in Iran, and incursions by the Soviet Union—that served to define much of his presidency. Carter’s status as an outsider served him well in the presidential election, but once president, this became problematic because he did not engage in the political gameship often required of an effective executive. Thus, he received pushback from his party, which controlled Congress, on a number of his initiatives. In addition, attempts to set up amicable relations between congressional members and his staff went nowhere, and Carter’s disdain for earmarks did not sit well with many members of Congress. In the aftermath of the Watergate scandal, Carter’s Justice Department aggressively monitored ethical activities on the part of government agencies and departments. Carter’s attorney general also revamped and depoliticized the Department of Justice to avoid any perceptions of potential abuse by the president for political purposes, as happened under Nixon. The attorney general also coordinated with the Federal Bureau of Investigation and the Central Intelligence Agency in order to enhance endeavors in pursuing white-collar criminals for a variety of crimes, including money laundering and securities fraud.

Carter also sought early on to streamline government and cut back on waste through a reorganization of the bureaucracy. Such efforts led to mixed results, and Carter’s attempts to control inflation fared even worse. His set of anti-inflation programs involving cutbacks in spending and regulatory reform accomplished little, and inflation—along with the deficit—rose considerably. In a subsequent bill submitted to Congress, Carter sought conservation efforts for gasoline, wage and price controls, and a balanced budget. Carter’s efforts to make government more efficient and to control inflation represented only the start of his litany of domestic initiatives. Other measures included welfare reform, greater focus on education, and ethics in government laws. In addition, Carter made energy policy his top domestic concern, eliciting from Congress two pieces of energy legislation and a new Department of Energy. Other energy measures included synthetic fuel development, solar power, and gasoline rationing procedures.

Carter viewed his election as an important step toward relieving the public of the nightmare of Watergate. In a similar fashion, he sought to mend wounds from the Vietnam War by granting amnesty to those who had eluded the draft. Such compassionate policies also informed Carter’s worldview, where he placed greater emphasis on human rights in U.S. foreign policy than any previous administration. His international reputation for pursuing peaceful relations helped facilitate the Camp David Peace Accords in 1978. This peace agreement—which is still in place—between two former Middle East foes, Israel and Egypt, led to the awarding of the Nobel Peace Prize to Carter in 2002 for this and other international peace efforts since his presidency. Carter also pursued reductions in nuclear weapons, leading the way in negotiations of the SALT II Treaty, signed in 1979 by the United States and the Soviet Union. However, the Soviet invasion of Afghanistan later that year cut short the agreement between the countries (the treaty was never ratified), leading to a decision by Carter to employ economic sanctions against the Soviets and to boycott the 1980 Winter Olympics in Moscow.

Iranian Hostage Crisis

Another foreign policy setback for Carter in late 1979 was the Iranian hostage crisis, when 65 U.S. embassy officials were taken hostage. This led Carter to impose an oil embargo on Iran, which worsened the energy shortage in the United States—gasoline supplies decreased nearly 15 percent—and further enraged the populace (an accident in a reactor at Three Mile Island earlier that year had already decreased public confidence in nuclear energy). Media attention on the plight of the hostages served to reinforce public perceptions of a powerless president who was unable to rescue the embassy officials. TV news relentlessly relayed the number of captive days night after night, dropping Carter's approval ratings to a historic low of 21 percent. The hostages, held captive for 444 days, were finally released just minutes after Ronald Reagan was sworn in as president. The perceived failures of Carter's domestic and foreign policies contributed to his defeat in the 1980 presidential elections.

Caveat Emptor

The doctrine of caveat emptor is a property law doctrine to indicate the recourses of a buyer of a piece of real property after the sale. Caveat emptor is part of the larger phrase, "let the buyer beware, who ought not to be ignorant of the amount and nature of the interest he is about to buy, exercise caution." The doctrine was used in 16th-century England (and adopted into American common law) for real property sales that were mostly agrarian, with only simple structures. The doctrine worked because buyers and sellers had equal access to a physical inspection and typically had the same skill sets to determine the land's value. Defects were easy to discover. Today, caveat emptor is all but abolished (in real estate transactions) because property is much more complex, buyers cannot easily discover defects, the parties do not have equal access to information, and the doctrine is riddled with exceptions (by statute, caselaw, and contract) that require specific disclosures by and guarantees from sellers.

When considering caveat emptor, a few assumptions occur. The first is that both parties in the exchange or the sale of real property are autonomous, competent individuals. Under current U.S. law, one assumes autonomy and reaches the age of majority at the age of 18. Therefore, those under the age of 18 are not considered autonomous, competent individuals and cannot be held under the strict property law of caveat emptor because they do not have the capacity to make a contract. Other individuals who may not be recognized as autonomous individuals in the eyes of the law are the mentally challenged and the elderly. The individuals completing a transaction of real property are assumed to be on equal mental footing. Skills of selling and buying and education are not considered under the doctrine, whereas mental competency is. Second, caveat emptor assumes that information about the product has been disclosed or, at the least, the seller will respond truthfully when asked about the product by the buyer. For instance, when selling a motor vehicle "as is," the buyer can ask questions such as, "Does it run?" and the seller must respond truthfully with a simple "yes" or "no." The buyer should also have an opportunity to drive the vehicle. If the buyer does not drive the vehicle, buys the vehicle, and the vehicle does not work, the buyer could then state that the seller was lying in legal redress for fraud if the seller had stated before the transaction, "Yes, it runs."

The doctrine of caveat emptor occurred before the Internet made purchasing of products more convenient than face-to-face shopping. Therefore, to put the buyer and seller on nearly equal footing, the Uniform Commercial Code (1952) was developed as a "model code" that would govern the sale of goods and property, including property that may or may not have been seen or handled. All 50 states have adapted some or all of the Uniform Commercial Code to provide a uniform system of information disclosure and legal redress. Purchasing items on the Internet poses particular problems for the buyer regarding personal information and identification. Information provided to the seller to complete the transaction on the Internet is far more detailed than a simple exchange of goods or sale of goods when conducted face-to-face under caveat emptor. The buyer must read and understand the future use of his or her information before approving the sale. Under the caveat emptor doctrine, if the seller has disclosed all pertinent information, the buyer must take care to conduct second-order thinking. The buyer must determine whether he or she can afford the item for sale, and what a fair price for the item is. Also, the buyer and the seller must determine (along with the UCC) what implied warranties go along with the sale of the merchandise, or whether the item is for sale "as is."

Celler-Kefauver Act

The Celler-Kefauver Act of 1950 sought to plug loopholes in the 1914 Clayton Antitrust Act, which aimed at shoring up the pioneering 1890 Sherman Antitrust Act, which was designed to halt the expanding number of business monopolies gouging customers. The measure, sponsored by two Democrats—Emanuel Celler of New York and Estes Kefauver of Tennessee—expanded the definition of antitrust violations to include vertical acquisitions, such as the purchase of a supplier who was essential to the acquiring business and/or its competitors. It also prohibited obtaining the assets of a competitor or a supplier in lieu of absorbing its business by purchasing its stock.

The impetus for the Celler-Kefauver Act was expressed by Chief Justice Earl Warren of the U.S. Supreme Court in *Brown Shoes v. United States*. "The dominant theme pervading Congressional consideration of the 1950 amendments," Warren wrote, "was a fear of what was considered to be a rising tide of concentration in the American economy." Such fear had been reinforced by a Federal Trade Commission report that offered evidence of dangers to the American economy in unchecked corporate expansion through anticompetitive maneuvers. The report noted that corporate acquisitions between 1940 and 1947 had led to the disappearance of 2,500 business enterprises, with assets that equaled 5.5 percent of all manufacturers in the United States.

Chief Justice Warren pointed out that the law stated that purchase or amalgamation was illegal if it "may . . . substantially" lessen competition. Warren noted that the absence of a clear statutory guideline indicated that the law was not intended to deal with "ephemeral possibilities." A further consideration that underlay the Celler-Kefauver Act was the desire of members of Congress to protect local businesses from going out of business because of the emerging giant corporations. Justice Learned Hand, an eminent jurisprudent, offered a romantic vision of the goal of antitrust measures in the case of *United States v. Aluminum Corporation of America.* "Throughout history," Justice Hand wrote, "it has been constantly assumed that one of the purposes [of antitrust laws] was to perpetuate and preserve, for its own sake and in spite of possible cost, an organization of industry in small units which can effectively compete with each other."

The holes in the Clayton Act that prompted the remedial congressional effort had been pointed out for almost four decades. Between 1943 and 1949, for instance, 16 bills seeking to amend §7 of the Clayton Act failed enactment, despite public hearings in 1945, 1947, and 1949. The roadblock was Howard W. Smith, a conservative Democrat from Virginia, who ruled the House Rules Committee as if it were his fiefdom. In 1948, however, the Democrats went from being a minority by 57 seats to holding a majority of 92 seats in the House. This led Celler to bypass the Rules Committee and bring the bill to a floor vote, where it needed a readily acquired two-thirds vote for passage.

The Celler-Kefauver Act led Harvard law professor Derek C. Bok to consider the implications of the antitrust movement for the relationship between law and economics. Bok noted that enforcement of antitrust legislation (law) could muddle along without relying on empirical contributions from economists, but only teamwork between the two disciplines would allow what had been proscribed to come to pass. The key difficulty that Bok observed then, and that makes antitrust enforcement often highly contentious today, is that economists and lawyers lack the knowledge to make predictions concerning the probable consequences of many mergers. The Celler-Kefauver Act made a considerable difference in the Federal Trade Commission's campaign against antitrust offenses. The pace of enforcement was slow at first but then became a priority item. In an analysis of the first 27 years of Celler-Kefauver, economist Willard Mueller tallied 427 cases that were filed under the act. His conclusion at the time applies today: "Nonetheless, the great majority of mergers, even large ones, have gone unchallenged."

Cendant Corp.

Cendant Corp. is a provider of business and consumer services, primarily within the real estate and travel industries. Cendant provided shopping, dining, travel, mortgage, and real estate brokerage services and was the owner of several hotel franchises. In 1997, Cendant was formed by a merger between Hospitality Franchise Systems and CUC International Inc. The company was based in New York City. Henry Silverman led Hospitality Franchise Systems before the merger and was the last chief executive officer (CEO) of Cendant. After the merger between Hospitality Franchise Systems and CUC International, an accounting scandal occurred because CUC International's revenue had been artificially inflated. The accounting scandal led to the settlement of a class-action shareholder lawsuit, with what was the largest recovery awarded in a securities class-action case at that time. However, after the accounting fraud, Cendant bounced back under Silverman's leadership by the early 2000s. As one of the largest hotel franchisers during this time, Cendant acquired several franchises, allowing it to become a leading corporation once again. In 2005, Cendant split into four independent companies.

Accounting Fraud

Henry Silverman, the last CEO of Cendant, was a business executive and an investor. He established Hospitality Franchise Systems, which was among the fastest growing companies in the 1990s. Cendant was created through the merger between Hospitality Franchise Systems and CUC International, a marketing company. After the merger, accounting improprieties at CUC International started to appear. A report describing the accounting fraud at CUC International was released to the public, causing damage to the market value of the company. The report established that CUC International's revenue was overstated over a period of three years. By the early 2000s, Silverman re-established Cendant as a leading consumer services firm. Later, Cendant split into four independent companies. The four categories of business were real estate, travel distribution, hospitality, and vehicle rental, each led by senior leadership from Cendant.

Cendant was associated with a class-action shareholder lawsuit, the result of CUC International's revenue being artificially inflated. In 1998, Cendant filed an annual report that included its 1997 financial statements. A month later, Cendant announced that it had discovered accounting irregularities in the former CUC business. Cendant announced that the annual and quarterly financial statements for 1997 would be corrected, as well as financial statements from earlier periods. This announcement caused the company's stock to plummet. In 1998, the audit committee of Cendant's board of directors hired the law firm of Willkie Farr & Gallagher to conduct an independent investigation into the irregularities. Willkie Farr & Gallagher hired accounting firm Arthur Andersen LLP to assist in the investigation. In December of the same year, a comprehensive consolidated class action on behalf of purchasers and acquirers of all Cendant and CUC publicly traded securities was filed. A motion for partial summary judgment seeking a liability against Cendant for the false statements made in the registration statement for the merger was also filed. After this, Cendant announced that the financial statements of CUC International for 1995 and 1996 would be restated. Following this announcement, the company's stock fell even more.

Cendant filed a report prepared by Willkie Farr & Gallagher, which stated that the financial statements reported by CUC International during the previous three years before the merger with Hospitality Franchise Systems were misleading. Shareholders filed a suit against Cendant for accounting fraud. By 1999, Cendant reached a settlement in the shareholder class-action lawsuit. The settlement stipulated for the shareholders to receive one-half of any net recovery if any settlement occurred from Ernst & Young (accounting firm) and Cendant. Cendant filed a suit against Ernst & Young, and later an agreement was reached. The agreement stated that Ernst & Young would make a payment to Cendant The other feature of the Cendant settlement required Cendant to institute corporate governance structural changes. The largest accounting fraud of the 1990s was led by former chairman of Cendant Walter Forbes.

Centennial Savings and Loan

Centennial Savings and Loan is a classic example of fraud and all that went wrong during the savings and loan crisis of the 1980s. The combination of deregulation and inflation opened the door for fraud on an unprecedented scale. Many saw opportunities for illicit gain, whereas honest executives were the victims of economic circumstances. Not all institutions that failed did so because of fraud. Many became insolvent after making bad investments, and because of rising interest rates, virtually every savings and loan was insolvent by the early 1980s. However, criminologists emphasize fraud as a major factor in the crisis. Centennial represents an extreme in terms of fraudulent actions and the extent to which they were carried out. By the early 1990s, the crisis in the savings and loan industry had cost the Federal Savings and Loan Insurance Corporation (FSLIC) at least $150 billion. The financial disaster was the result of many economic factors that put all savings and loans in a precarious position in terms of survival. To cope with the primary problem of inflation, the thrift industry was deregulated, allowing thrifts to operate more like banks. Since the 1930s, savings and loans had been tightly regulated and confined to making local, low-interest home loans. Deposits were safe and backed by the FSLIC.

Into the 1960s, the savings and loan industry fulfilled its primary purpose of increasing owner-occupied housing by extending long-term, usually 30-year, low-interest loans, while keeping depositors' money very safe. By the late 1970s, double-digit inflation had drastically impacted savings and loans, which had virtually all assets tied up in single-digit-interest, long-term loans. Depositors quickly withdrew savings, seeking better returns. Thrift assets fell by billions of dollars because thrifts could not call in the long term loans. Even if they could, they could invest only in owner-occupied real estate. Thrift industry deregulation by the Garn-St. Germain Act of 1982 eliminated decades of conservative regulations that had kept savings and loans conservative, solvent fiscal institutions. It opened the door for massive fraud. Deregulation allowed very small savings and loans to rise within months to institutions controlling billions of dollars. Many dishonest savings and loan executives totally ignored fiscal duties to shareholders and depositors and looted their institutions for personal gain. Centennial was a leader.

Assets in Centennial Savings and Loan of Guerneville, California, rose from $43 million to nearly $500 million within months after deregulation. This was accomplished through brokered deposits. Because of constantly rising inflation, thrift institutions had to offer ever-higher interest rates to attract deposits. Brokered deposits were pools of funds with managers who sought high interest rates for depositors. Savings and loans competed intensely for them. Centennial attracted large brokered deposits by advertising in eastern newspapers, offering higher interest rates than others. In addition, money from pension funds and government reserves flowed in. Instead of investing brokered deposit funds, Centennial executives squandered them on exorbitant executive salaries, parties, and perks for executives and employees, including limousines and plush offices, a private jet, and expensive items for personal use. Centennial executives mastered frauds to increase personal wealth.

In addition to already high salaries, which regulators noted were many times those of other savings and loan executives, they had bonus clauses in their contracts entitling them to immediate bonuses on profits. Centennial executives would assist with the purchase of a small company at an inflated price. The buyer, usually a friend or associate of someone at Centennial, made a very small down payment, and Centennial financed the rest with a large loan. Interest on the loan was immediately booked as profit, even though it would be years before it was collected. Executives got their bonus immediately on a purely paper profit. Regulations forbade savings and loans from making loans to employees over $100,000. To work around this, Centennial executives partnered with executives at other savings and loans who also wanted large loans. Centennial granted them loans far in excess of $100,000, and they returned the favor. Land flips bilked lenders out of millions of dollars. Centennial purchased pieces of next-to-worthless real estate. It then sold them at higher prices to other savings and loans, which in turn sold them back to Centennial at even higher prices. After the value of the real estate on paper was inflated, it was used as collateral for a large loan that was never paid back. Centennial attracted the attention of regulators, and reporters were aware of its illegal transactions. To keep them at bay, Centennial hired regulators at double their government salaries to keep others away.

Challenger Disaster

The space shuttle *Challenger* exploded midair on January 28, 1986, killing its crew of seven after a rubber O-ring seal in a solid rocket booster joint failed. Investigations revealed how design flaws and organizational conflicts contributed to the disaster. In January 1985, scientist Roger Boisjoly and shuttle contractor Morton Thiokol inspected *Discovery*'s solid rocket boosters, noting that combustion "blow-by" during liftoff had compromised at least two rubber O-ring seals, blackening the joint. Boisjoly hypothesized that the cause was the unseasonably cold temperature at launch, 53 degrees F. Boisjoly, an accomplished engineer with high-profile service in many aerospace companies and the leading authority on O-rings, reported this to superiors and the National Aeronautics and Space Administration (NASA). The latter asked him to participate in the flight readiness review (FRR) on February 12, 1985, for the next launch. He faced skepticism regarding his hypothesis and worked with colleagues to gather additional evidence before the next FRR on July 1, 1985, which he presented to engineers and management at Morton Thiokol and NASA.

Morton Thiokol established a task force to research the issue, but little happened, and Boisjoly expressed disappointment. In a July 31, 1985, memo to Morton Thiokol Vice President of Engineering Robert Lund, Boisjoly expressed fear for loss of a shuttle, crew, and launch facilities. At NASA's request, Boisjoly solicited suggestions for improving the O-ring seals at an engineering conference, to little effect. A launch in 75 degrees F on October 30, 1985, resulted in incremental blow-by consistent with Boisoly's hypothesis, but his superiors interpreted this to mean that temperature was irrelevant. With no substantive response to the problem, preparations proceeded for the launch of *Challenger* on January 28, 1986. Leadership at NASA eagerly anticipated this flight to renew public support for the space program through inclusion of civilian crew member Christa McAuliffe, a teacher.

The day before, the forecast for an overnight freeze set off communications between Boisjoly and his colleagues and superiors at Morton Thiokol and NASA officials. Boisjoly and his colleagues strongly pressed the case against launching in an evening conference call, and Morton Thiokol management at first stood with them. NASA officials were displeased. When Boisjoly persisted, Morton Thiokol Vice President of Space Booster Programs Joseph Kilminster requested a caucus. The tone of

Morton Thiokol management changed in this private conversation, with Senior Vice President Jerry Mason counseling Lund to "take off his engineering hat and put on his management hat." Attempts by Boisjoly and colleagues to counter the shifting sentiment met with abusive statements that eventually silenced them, and the executives then unanimously agreed to launch. Instead of following precedent of proving that launching was safe, they impeached objections that it was unsafe. They communicated their approval to NASA. No other parties participated in these deliberations and decisions, including the astronauts, who perished the next day when the shuttle exploded similarly to Boisjoly's predictions (not on the launch pad, but 73 seconds into flight).

President Ronald Reagan appointed a 14-member commission under former Secretary of State William Rogers to investigate and recommend changes. Members included Neil Armstrong, Richard Feynman, Sally Ride, and Charles Yeager. Tension emerged between Feynman and other commissioners over his independent testing of seals for sensitivity to cold, with hints from contractors and/or NASA. Feynman became critical of the O-ring design, NASA's low estimates of risk of failure, and poor communication within and among NASA and contractors, including in launch preparations. He dissented from other commissioners by recommending suspension of launches, pending dramatic changes to NASA culture and safety procedures. During testimony before the commission, Boisjoly shared his memo of July 31, 1985, and other documents to reveal the extent of his research and concerns. The commission made nine recommendations to improve safety, and President Reagan required NASA's response within 30 days. The agency redesigned the solid rocket boosters under independent oversight, established an office of safety, replaced the *Challenger* with the *Endeavour,* discontinued launches of commercial satellites, and modified the schedule to reduce the risk of accidents. Boisjoly believed that the modifications to the seal joints made no appreciable improvement in safety. The 2003 *Columbia* Accident Investigation Board determined that cultural and procedural dysfunctions within NASA persisted, including safety processes.

Exhaust plumes from the space shuttle Challenger*'s main engines and solid rocket booster entwine around a ball of gas from the external tank a few seconds after the accident, January 28, 1986. An O-ring had ruptured in the right solid rocket booster.*

The *Challenger* case has focused on the meaning of responsibility and ethical duties of members of professions to challenge superiors when significant risks to life, health, and property loom. There has been debate about framing the analysis in terms of responsibility of individual decision makers within Morton Thiokol and NASA, or a complex array of routine systems susceptible to communication and execution failures because of human factors. Under either analysis, the lack of informed consent from the astronauts and others was problematic and made it difficult to defend the process or results. Boisjoly was not a traditional prospective whistleblower; rather, he spoke up retrospectively to avoid a deceptive official record. This case has figured in analysis of whistleblowing as avoidance of complicity rather than mere avoidance of harm.

Charity Fraud

Each year, billions of dollars are donated to charities across the United States by individuals who desire to make a difference. These funds are used to provide for causes as diverse as assisting the poor, underwriting the fine arts, and contributing to learning. Despite these benefits, billions of donations are lost through charity fraud. Although fraudulent acts directed toward charitable organizations or the public hoping to support them have always taken place, improvements in mass media and technology have greatly increased public awareness of such misdeeds over the past three decades. Charity fraud not only deprives worthy organizations of much-needed funds but also discourages the public from giving to legitimate charities as they become more skeptical regarding the use of their donations. For this reason, federal, state, and municipal regulatory agencies, as well as legitimate charities, work to make the public aware of the risks of charity fraud. Law enforcement agencies also work to respond to consumer complaints and proactively stop fraudulent activity. Despite these efforts, charity fraud continues to grow, depriving many worthy causes of needed financial support.

Background

Fraud has been defined as those acts, concealments, expressions, or omissions that are intended to deceive another. The deception can disadvantage the intended victim as well as affecting other third parties, such as charitable organizations that are the supposed beneficiaries of the defrauded individual's largess. Fraud can be directed toward an individual or an organization, toward one's employer, toward a third-party entity with which one has a relationship (i.e., an insurance company), or toward a government agency (i.e., social security fraud). Charity fraud generally consists of one party with no connection to a charity collecting funds from the public, ostensibly on the charity's behalf; or actions by one party working for or associated with a charity that diverts funds in an unauthorized manner.

Pursuant to common law and statutes to prevent consumer and charitable deception, four separate elements are necessary to initiate a charge involving fraud. These four elements include the following:

1. A materially false statement is made;
2. The statement is made with knowledge of its falsity;
3. The statement is relied upon by the victim; and
4. The victim suffers damages as the direct result of relying on the false statement.

In the event of charity fraud, the perpetrator of the fraud must have made statements to a third party that caused that individual to turn over funds believing they were to go to a legitimate charity when they did not do so, or funds must be taken from a charitable organization with the false understanding that they were to be used for a legitimate purpose.

In most aspects, charity fraud differs in very few ways from fraud perpetrated against private individuals or for-profit organizations. As fraud in the for-profit sector has increased over the past three decades, so too has fraud against charitable organizations and other nonprofits. Although steps to prevent such fraud have intensified, these attempts have been insufficient. A variety of law enforcement and government agencies work to prevent charity fraud, including state and local police departments, the Federal Bureau of Investigation, and the Federal Trade Commission. Private organizations, such as the Better Business

Bureau and the American Institute of Philanthropy, also work to prevent money from being diverted from charities, establishing public information campaigns, Web sites, and other resources to help protect consumers. To combat internal fraud, many charitable organizations use their accountants, lawyers, and other internal controls that are helpful in combating illegal behavior.

Types of Fraud

The simplest form of charity fraud involves an individual or group of individuals (con artists) soliciting funds on behalf of a real or fictional nonprofit organization, with the con artists having no intention of turning over the donations. Such fraudulent solicitations may take place face-to-face, over the telephone, online, or as the result of advertisements for submissions. Over 75 percent of charity fraud is believed to take this form. In addition, fees collected from charities by solicitors, which can often be larger than the amount funneled to the nonprofit organization but reported as program expenses, can also be considered charity fraud. Many organizations also report less fundraising on their federal Form 990s than they do on their audited financial statements, suggesting that they are spending more on overhead than they are indicating to the public. Although such a discrepancy may seem inconsequential, such behavior is an intentional deception of the public, who often select charitable organizations based on the percentage of revenue that is directly applied to charitable purposes.

Finally, theft or embezzlement from a charity or nonprofit by employees or other trusted insiders such as officers or directors also deprives organizations of funds. Many organizations also report less fundraising on their federal Form 990s than they do on their audited financial statements, suggesting that they are spending more on overhead than they are indicating to the public. While such a discrepancy may seem inconsequential, such behavior is an intentional deception of the public, who often select charitable organizations based on the percentage of revenue that is directly applied to charitable purposes.

Details are often incomplete regarding schemes that solicit funds for a fraudulent charity or collect money for a legitimate nonprofit with no intention of turning over the assets. It is easier to determine the frequency and scope of frauds committed by an organization's officers or directors. The scale of this type of fraud has increased. In the five-year span from 1998 to 2002, for example, over 125 cases of fraud were executed by officers or directors, with the median losses in excess of $130,000. The following year, however, 32 published accounts of charity fraud were reported, with the average loss totaling nearly $220,000.

The scope of charity fraud in the United States is believed to be enormous. The Association of Certified Fraud Examiners (ACFE) "Report to the Nation on Occupational Fraud and Abuse" study for 2008 applied the total losses in the 959 cases of fraud to the 2008 U.S gross domestic product (GDP), resulting in a whopping $994 billion in GDP that is lost to fraud. Since nonprofits typically account for about 8.5 percent of the GDP, therefore, it is assumed that as much as $84 billion was lost to nonprofit fraud in 2008, with a median loss of $109,000 per incident. Because smaller charities have fewer internal accounting systems to prevent fraud, it is also estimated that they suffer a disproportionate share of this loss.

Examples of Charity Fraud

Charity fraud is not a recent phenomenon. In 1918, for example, George Ryder, the secretary of the Cripples' Welfare Society, was convicted of defrauding that group for his personal gain. Specifically, Ryder was convicted of using "mite boxes" (collection boxes left in stores, post offices, and other public spaces) and the U.S. Mail to make heartrending appeals on behalf of disabled children. Rather than turning the collected money over to the Cripples' Welfare Society, however, Ryder appropriated the funds for his own personal use. As a result, he was charged with using the mails to defraud the public, to which he pleaded guilty.

A Ponzi scheme represents a financial operation in which investors are paid "returns" from their own investments, or the investments of investors who come to the operation at a later date, rather than from funds generated by the legitimate operation of the organization. In the 1990s, an organization known as Greater Ministries International (GMI), a church ministry headquartered in Tampa, Florida, was involved in a Ponzi scheme that defrauded 18,000 individuals of approximately $500 million. Led by Gerald Payne, GMI bribed church leaders across the United States to allow it to raise “donations” from members of various congregations. Donors were cited biblical scripture and promised that they would receive double their donations in return for their current contributions. The collections were used by GMI to finance its leaders’ lavish lifestyles, a newspaper, the Greater Bible College, and a line of herbal supplements branded Greater Live. As a result, almost all of the funds collected were lost. Once this fraud was discovered, GMI leaders were convicted of fraud and sentenced to prison.

Many successful charity frauds are able to flourish from connections that permit their leaders to appear to be engaged in legitimate activities and instill confidence in the public. During the 1980s, for example, the scale of the failure of Banco Ambrosiano was in part the result of the connections enjoyed by the bank’s leadership. An Italian bank, Banco Ambrosiano had as its largest shareholder the Vatican, and its general manager, Roberto Calvi, was often termed “God’s banker.” Through a series of offshore transactions, unsecured loans, and other questionable transactions, Banco Ambrosiano was ultimately unable to account for approximately $1.3 billion, causing its failure. Calvi fled Italy using a false passport and was later found hanging from London’s Blackfriars Bridge under mysterious circumstances in 1982. The great losses are believed to have been partially the result of the trust that investors put into the bank, a result of its connections with the Vatican and Italian political parties.

Preventing Charity Fraud

Although a variety of government and private-sector organizations work to prevent charity fraud, experts agree that the best prevention is for prospective donors to take steps to protect their gifts. First, donors should be proactive in their giving, directly contacting organizations that they are interested in helping rather than responding to telephone, mail, or personal solicitations. Next, donors should discourage telemarketers, as even legitimate ones are often third-party contractors. All donors should be wary of sound-alike names, as many disreputable organizations will devise a name that is similar to that of a legitimate charity. Confirming a charity’s 501(c)(3) status is helpful, as is investigating an organization’s dedication to accountability and transparency, perhaps through groups such as Charity Navigator or GuideStar. Information on the capability of an organization, ensuring that overhead costs and executive compensation are not excessive, can often be gleaned through copies of financial records. Finally, making a stronger commitment to an organization and giving one’s time as well as money helps ensure that a charity’s goals and objectives are what they appear to be.

To prevent embezzlement or misuse of funds by a charity’s employees, directors, or officers, it is wise to have certain systems in place. All new employees should have their references checked, including a criminal background check. Conduct guidelines should be communicated early and often, giving employees a chance to ask questions when they are unsure of proper procedures. Regular audits and strong accounting systems will also help prevent fraud, especially if they are communicated organization-wide. Finally, establishing a businesslike environment where combating and preventing fraud is a priority that is taken seriously will assist in establishing an environment where such actions are less likely to occur. Although it imay be impossible to prevent or eliminate all charity fraud, taking a few conscious steps to protect an organization will greatly reduce its likelihood.

Check Kiting

Check kiting is a type of fraud that involves the circulation of worthless checks between two or more financial institutions. This type of fraud is typically perpetrated on an array of financial institutions, including banks and credit unions, amounting to millions of dollars of losses annually. According to the American Bankers Association, check fraud accounted for $893 million in losses for 2010. Check kiting is distinguishable from writing bad checks in that there is an intent element to the white-collar crime of check kiting that may be prosecuted under federal statute. Bouncing a check, or writing a check from an account with insufficient funds, may occur as an error in balancing checking accounts, whereas check kiting is an intentional act by the check kiter to defraud the bank, which results in a crime. Issuing bad checks may also constitute a crime, but prosecution varies by state, and the crime may be difficult to prove without intent. Investigation and prosecution for check kiting often involves law enforcement from several federal agencies, including the U.S. Federal Bureau of Investigation, the Secret Service, the Department of Justice, and the Department of the Treasury.

Check kiting comes in different varieties. Circular check kiting occurs when checks are written back and forth between several checking accounts controlled by the perpetrator, usually at different banks, to cover withdrawn amounts at each corresponding financial institution. The continuous loop created in depositing checks, withdrawing the amount credited, and then depositing more checks to cover the withdrawals to prevent an overdraft and artificially inflate account balances creates an interest-free line of credit. The check kite may be sustained for years as checks go back and forth between accounts, typically at unrelated financial institutions to evade detection. Retail check kiting occurs when a check is issued for a larger amount than a purchase with a retailer that permits customers to receive cash back when the account that the check is drawn from actually has sufficient funds at the time of purchase to cover the entire amount of the purchase and advance. Corporate check citing occurs when large amounts of money are strategically transferred between corporate accounts to unfairly benefit the business entity in earning more interest or obtaining increased credit, unknown to the financial institution that maintains the corporate account. Check kiting may also be referred to as paper hanging, a situation in which the offender writes a check with no intention of eventually replenishing the account.

Check kiting may be perpetrated against two or more financial institutions to obtain unauthorized payday loans, lines of credit, or interest-free loans. Check kiting may also be manipulatively used to earn unjustified interest on accounts or increase the appearance of liquidity. By artificially inflating bank account balances in exchanging one bad check for another, check kiters may abscond with millions of dollars over a relatively short period of time before the check kite crashes. When the check kiting scheme collapses, banks often suffer the loss. The risk of loss from check kiting is generally placed on the banks, while the offender may escape with illegally obtained funds. Check kiters may be held civilly liable and are criminally prosecuted, resulting in imprisonment and restitution. Remaining losses accrued from check kiting are generally absorbed by the bank, and eventually the cost is borne by all customers in the form of increased bank fees.

Check Processing Regulations

Check kiting exploits the check float time between when a check is issued and when it clears, a time gap that is inherent in the check collection process. Prior to the enactment of the Expedited Funds Availability Act in 1987, banks exercised discretion as to the clearance of checks. After the enactment of the Expedited Funds Availability Act, banks were on a federally mandated timeline of when funds from checks had to be made available. Regulation CC of the Code of Federal Regulations issued by the Board of Governors of the Federal Reserve System provided a detailed time schedule for banks to make funds available from checks deposited by their customers, ranging from next-day availability for low-risk items such as government checks and cashier's checks, to several business days depending on the amount of the check, type of deposit, and method of withdrawal. Under Regulation CC, there are exceptions to the funds availability schedule that permit banks to hold customer funds longer as protection from potential losses. Banks may legally extend the funds' availability schedule under Regulation CC for new accounts, large deposits, redeposited checks, repeated overdrafts, emergency conditions, and reasonable cause to doubt collectibility.

The tight deadlines implemented by Regulation CC pressured banks to clear checks sooner. In many instances, the Regulation CC funds availability guidelines provided adequate time for depositary banks to ensure that checks cleared before releasing the funds to customers. Financial institutions are permitted to maximize the legal time frame for clearing checks, without offering customers a provisional credit on checks deposited prior to clearance. With increasing bank competition, some financial institutions make funds available immediately and allow customers to withdraw money faster than the deadline required under the federal guidelines. To satisfy customers, banks may permit customers to withdraw cash from a deposited check immediately, thereby increasing bank vulnerability to check fraud schemes.

A quick turnaround between deposit and withdrawal, without receiving verification that checks have cleared, places banks in a precarious situation. Traditional check collection involved several checks and balances over the course of several days in the check clearing process, where a depositary bank generally utilized intermediaries such as clearinghouses to transfer and present the check to the payor bank, which ultimately decided whether to honor the check within deadlines articulated in the Uniform Commercial Code. Such procedures were truncated by the enactment of the Check Clearing for the 21st Century Act, or the Check 21 Act.

The Check 21 Act, enacted in 2003 and effective in 2004, reduced the time it took to clear checks. In truncating and using substitute checks, banks could clear checks instantaneously by electronic means. This capability minimized the float time, thereby requiring sufficient account funds at the time of issuance. Bank customers no longer have two or more days to deposit additional funds to cover a potential shortage before it results in a bounced check.

Safeguarding Against Check Kiting

The crime of check kiting, which thrives on intentionally exploiting the float time for monetary gain, has greatly decreased in number of occurrences. However, check kiting still persists where financial institutions do not safeguard systems to detect this type of bank fraud.

Credit unions and smaller community banks may lack capable security devices and procedures to track and prevent check kiting. Larger banks tend to utilize complex and sophisticated systems and software to detect check kiting patterns to prevent or lessen losses. Warning signs of a check kiting scheme may be detected by bank employees in examining accounts with high deposits but low average daily balances and reviewing large dollar amount checks frequently deposited from multiple accounts of the same customer at different banks.

The declining use of checks as a result of the proliferation of debit cards has dramatically reduced the number of check fraud cases. As technology continues to develop, bank employees are trained to recognize suspicious activity, banks implement tighter internal controls, and check cards become more mainstream, check kiting may become less of an issue. Check kiting continues to exist, as credit crunches and financial hardship experienced in an economic recession may perpetuate the prevalence of bank fraud. Insurance may be available to protect financial institutions from bank fraud. A check kiting fraud rider may be included in a financial institution bond to insure banks against losses and limit their liability.

Chem-Bio Corp.

Chem-Bio Corp. was founded in the 1980s to develop products used in medical diagnostic labs. In 1995, the company provided laboratory services to the Family Health Plan, a health maintenance organization (HMO) based in Wisconsin. Chem-Bio Corp. was prosecuted and found guilty of reckless manslaughter in cases involving the deaths of two Family Health Plan enrollees, Karin Smith and Delores Geary. The company is the first HMO convicted of a criminal homicide in connection with a case involving the death of a medical patient. The criminal case *Wisconsin v. Chem-Bio* involved specific charges that related to the laboratory's repeated failure to detect abnormalities in the Pap smears of both Smith and Geary. Smith, for example, had suffered for years from severe vaginal bleeding. She had seen her HMO doctor 15 times and underwent three separate Pap smears under the direction of her doctor in an attempt to discover the cause of her chronic vaginal bleeding. Chem-Bio's diagnostic lab screened each Pap smear and reported normal test results. Smith eventually elected to pursue a second opinion from a provider not affiliated with her HMO, and doctors detected that she had advanced cervical cancer. The cancer eventually led to her death, and medical experts testified at trial that Smith would have had a 90 to 95 percent chance of a full recovery had the cancer been detected earlier by the lab operated by Chem-Bio.

A criminal inquest recommended a prosecution against Smith's doctor; however, the district attorney elected to charge Chem-Bio, as a criminal, with reckless homicide. At trial, the state argued that Chem-Bio operated the lab in a manner that contributed to Smith's death. More specifically, the company was characterized by prosecutors as the "Family Death Plan" because it paid technicians on a per-slide basis that encouraged shoddy lab reviews. The company was convicted of reckless manslaughter for the deaths of patients Smith and Geary. The maximum penalty of a $10,000 fine for each death was imposed. The violent victimization of medical patients resulting from reckless or negligent physician care has traditionally remained beyond the reach of the criminal law, and a criminal prosecution against an HMO associated with negligent care had not occurred prior to the Chem-Bio case. Scholars have argued that the Chem-Bio case and a handful of other criminal prosecutions against doctors beginning in the late 1980s represent a shift in the social control of medical practice. The professional nature of the doctor–patient relationship and the existence of civil and peer-initiated sanctions within the medical domain have traditionally insulated doctors from criminal prosecutions in cases of medical negligence.

The criminal prosecution of Chem-Bio is indicative of one of the socio-legal factors that have altered the social control of medical practice and have made criminal prosecutions of doctors more likely in cases of negligent or reckless medical care. Since the 1980s, health care has become increasingly corporatized with the advent of HMOs. These large-scale bureaucratic networks have gained wider control over the manner in which doctors practice medicine. Doctors and patients have been replaced by "providers" and "enrollees" in the new managed care environment. Physicians must now divide their loyalties between the patient and the corporate interests of the HMO, with the patient sometimes assuming a secondary role. Doctors report diminished gratification from patient relationships, and they see patients as more critical and adversarial. HMOs have worked to depersonalize the doctor–patient relationship that has traditionally helped insulate doctors from criminal prosecution in cases of medical negligence or recklessness. The HMO movement ties the medical profession more clearly to money and has led to public outcries and debates about the rights of medical patients. HMOs employ a variety of procedures designed to increase the economic productivity of physicians, including incentives to reduce costs, limiting access to specialized care, and mandatory case reviews by nonphysicians. The use of financial incentives by some HMOs has been found to significantly alter physician treatment decisions. The Chem-Bio case illustrates the limits of corporatized medicine and the possibility of criminal charges against companies operating within the medical field that have balanced fiduciary concerns against the cost of human lives.

Chevron Oil Co.

Chevron Oil Company is based in San Francisco. It began on September 10, 1879, as the Pacific Coast Oil Company. Discovery of oil at Pico Canyon north of Los Angeles provided the incentive for organizing the company. In 1900, Pacific Coast was purchased by John D. Rockefeller's Standard Oil Company and Trust. In 1906, Pacific Coast's operations were combined with the west coast operation of Standard Oil. However, in 1911, the U.S. Supreme Court ruled that Standard Oil Company and Trust had violated the Sherman Antitrust Act. The decision convicted the company (and thereby its subsidiaries) of four illegal activities: discriminatory freight rates, discriminatory treatment for private tank cars, discriminatory classification and rules for shipment, and secret and semi-secret railroad rates. The decision made Standard Oil of California a guilty party to the decision for its unreasonable monopoly practices. Standard Oil Company and Trust (New Jersey) was broken into 34 small corporations; Standard Oil of California was one of the new companies.

By 1926, Standard Oil Company of California was called SoCal. It began overseas oil exploration after World War I. In the 1920s, it sought oil in the Philippines, Alaska, and Colombia, with little success. Its first discoveries began in 1932, on the Persian Gulf island of Bahrain. In 1933, it gained a 60-year concession to explore for oil from Saudi Arabia's King 'Abd Al-'Aziz. A major find in 1938 opened the Saudi oil fields that would become the source of "black gold" after World War II.

To market its growing oil resources, SoCal joined with Texaco to form the California Texas Oil Company (CalTex), which had extensive marketing operations. During World War II, SoCal was a major oil supplier to the Allied war effort while thousands of its employees served in the military or in other capacities. It was also aided by the lend-lease aid that President Franklin D. Roosevelt sent to King Saud to keep him on the Allied side. In the postwar years, the establishment of the state of Israel with the aid of President Harry Truman concerned SoCal enough that it invited Exxon and Mobil to join it in order to increase the economic and political strength of the company. In 1948, SoCal discovered the enormous Ghawar oil field in Saudi Arabia. Its Saudi Arabian resources were joined by Texaco in the new company, ARAMCO. It also entered markets and joint exploration ventures in the United States, Canada, and Indonesia. The California-Arabian Standard Oil Company grew into the Arabian American Oil Company (ARAMCO). Faced with King Saud's continuing demands for money, the U.S. State Department and ARAMCO agreed in 1950 to allow the money that ARAMCO gave King Saud to be deducted from the company's tax bill. This scheme deprived the U.S. Treasury of $50 million or more in taxes each year.

Following the Arab-Israeli War of 1973, the Saudi government began purchasing shares of ARAMCO, using its enormous profits gained from price hikes through the cartel practices of the Organization of the Petroleum Exporting Countries (OPEC). By 1980, the company was owned entirely by the Saudis, who changed the name to the Saudi Arabian Oil Company. Between the 1920s and the 1950s, automakers in the United States quietly worked to eliminate electric public transportation. E. J. Quinby, president of the Electric Railroaders' Association, charged General Motors, some tire manufacturers, and oil companies including SoCal with conspiracy in restraint of trade. Eventually, the automotive forces were able to eliminate most railroad streetcars in the United States, replacing them with gasoline-operated buses. SoCal changed its name to Chevron in 1984, after it acquired Gulf Oil Company. In 2001, it acquired Texaco, and in 2005, Unocal Corporation. The acquisition saved Gulf Oil from a greenmail scheme.

Through the decades, Chevron has engaged in legal battles involving business disputes. Some cases involve criminal actions, such as the 2011 judgment of an Ecuadorian judge who ordered Chevron to pay billions in damages and cleanup costs for polluting an area of the Amazon jungle. Among the controversial issues surrounding the suit is the charge that Chevron tried to bribe Ecuadorian officials. Whether that case involved a bribe or an Ecuadorian shakedown, Chevron has had to deal with corruption in foreign countries where bribery is acceptable and with the Foreign Corrupt Practices Act, which makes it a crime to engage in bribery. Allegations in such cases, where private accusers can get up to 30 percent of an awarded judgment, are difficult to prove and defend against. In Indonesia, employees of a Chevron subsidiary were accused of fraud involving a green project that may have been fictitious. The charges amounted to $270 million in damages.

Cigarette Advertising

On June 11, 2009, Congress passed the Food and Drug Administration's (FDA) Family Smoking Prevention and Tobacco Control Act (FSPTCA), which provides the federal government with expanded power to regulate tobacco products. This legislation granted the most expansive authority over the industry to date. It gave the FDA powers to control ingredients and overrule new products. Most

A Camel cigarette billboard features a soldier confidently puffing away over Times Square in New York City, February 1943. Major tobacco companies, ostensibly in an act of kindness, actually germinated a postwar crop of customers by giving away free cigarettes to U.S. soldiers during World War II. As market competition built up to its heyday in the 1950s, endorsements were drawn from every possible source, including babies, doctors, athletes, and dentists. Cigarette makers even sponsored television shows like Gunsmoke.

important, from an advertising angle, the legislation eliminated misleading labels (including "light" and "mild") and increased the size of warning labels on packaging. No strangers to regulation due to its affiliation with the tobacco industry, cigarette manufacturers have spent the better part of eight decades having to regularly reinvent marketing strategies to avoid violating various restrictions.

Background

Prior to public realization of the hazardous health effects of cigarettes, companies were able to advertise without any regulations. In 1789, the first advertisement appeared in a New York newspaper. The ad, for snuff, was run by what today is the Lorillard Tobacco Company. Because of manufacturing and transportation constraints, branding was not a strong possibility at the time, which limited advertising. If the market was just local, most advertising was seen as unnecessary. It took until the end of the Civil War for a national brand to emerge, and even this came about accidentally. As Union and Confederate troops waited for the surrender to be complete, they raided a North Carolina tobacco farm. Once the war ended, they continually asked that farmer for more of his product. This led to the establishment of the Bull Durham Tobacco Company.

Toward the turn of the 20th century, new innovations helped further the national prominence of cigarettes. First, manufacturers launched a cigarette-making machine that increased production exponentially. Output went from roughly 40,000 cigarettes to 4 million cigarettes per day. From the advertising perspective, the greater development was color lithography, invented in the late 1870s. Through this invention, companies were able to do more with advertising and packaging—creating a push for stronger brands. Cards were included in packages as premiums. The cards depicted everything imaginable; athletes and movie stars were the most popular.

At the onset of World War II, soldiers were given free cigarettes, courtesy of major tobacco companies. Originally seen as an act of kindness, the giveaway ended up being a boon for manufacturers. By the time soldiers returned home, many were addicted to nicotine and looking for cigarettes to purchase to feed their habit. The 1950s were the heyday of cigarette advertising, as companies worked to stand out from their competitors. Popular slogans were used by companies like Winston, Lucky, and Camel. Cigarette makers began to sponsor television shows. During the show *Gunsmoke*, Winston's ad went as far as to replace the word *cigarette* in its ad with the sound of two gunshots. Ads featured endorsements from everyone imaginable: athletes, doctors, babies, and dentists all sang the praises of cigarettes. However, trouble was brewing, as growing evidence of health concerns would eventually decimate the cigarette industry. As evidence became clearer linking smoking to lung cancer, manufacturers were forced to introduce filters. Even when testing showed that filters made no difference for safety, ads continued to claim filtered versions they were lower in tar and nicotine.

In 1964, U.S. Surgeon General Luther Terry released the "Advisory Committee Report on Smoking and Health." The report was based on over 7,000 scientific studies that linked smoking with lung cancer, emphysema, and a host of other diseases. In response to the report, there was an immediate growth in regulatory legislation aimed at protecting the general public. Companies were forced to include warning labels on packages and were no longer permitted to advertise on television or radio. While the legislation was well-intentioned, the unintended consequences were quite dramatic. Tobacco companies began targeting younger markets, using candy cigarettes and cartoon characters. One 1991 study found that more 5- and 6-year-olds could identify Joe Camel than Mickey Mouse.

New Federal Powers Over Tobacco

In 1996, the FDA labeled cigarettes an addictive drug and attempted to gain even more control over the industry. President Bill Clinton supported its efforts, but the Supreme Court ultimately ruled against the FDA because it had never been given authority by Congress to serve as the regulator of tobacco. A 2009 bill signed by President Barack Obama gave the FDA the official regulatory power it had previously lacked. It enacted a tobacco advertising ban within 1,000 feet of schools and playgrounds. Further, warning labels were to cover more than half of the front and back of cigarette packages. The law also prohibited flavored and sweetened cigarettes. Backed strongly by President Obama, the legislation was expected to dramatically alter the potential for success of cigarette companies in advertising their products.

On August 31, 2009, Commonwealth Brands introduced a lawsuit against the federal government and the FDA. The justification for the suit was that advertising restrictions were unconstitutionally infringing on First Amendment rights. The different requirements included dictating the appearance of text on packaging, the products that could or could not be advertised, the locations where advertising could be placed, and the ability to sponsor major events, alongside a ban on providing free sample cigarettes. In 2011, four major producers (Liggett Group, Commonwealth Brands, R.J. Reynolds, and Lorillard) filed a separate lawsuit against the FDA regarding the same string of issues. On February 29, 2012, U.S. District Judge Richard Leon, in *R.J. Reynolds et al. v. FDA et al.*, granted the plaintiffs' motion for summary judgment and held that the FDA's regulations violated the First Amendment, granting a temporary injunction that delayed the implementation of the new rules. On August 24, 2012, a three-judge panel of the D.C. Circuit affirmed, noting that the FDA's regulation and authorizing statute might not be constitutional, as follows:

> [H]ow much leeway should this Court grant the government when it seeks to compel a product's manufacturer to convey the state's subjective—and perhaps ideological—view that consumers should reject this otherwise legal, but disfavored, product?

The packaging rules therefore unfairly stacked the deck against tobacco companies. If the FDA had simply tried to force companies to disseminate factual information, the restrictions likely would have been upheld. However, the judge ruled that the motive went beyond that. It is believed that the issue will ultimately be decided by the Supreme Court in the coming years.

Civil Forfeiture

Originating under the ancient fiction that the property involved in an illegal activity has violated the law, civil forfeiture proceedings advance *in rem;* that is, against any property that is employed as an instrumentality of crime, or that is engaged in facilitating criminal behavior, or that results from criminal activity. Today, although property is designated the defendant, the in rem construction of civil forfeiture proceedings is a matter of prosecutorial and administrative expediency. Casting proceedings in rem, and so civil in nature, allows asset seizure, regardless of a criminal conviction or even a criminal charge, according to *The Palmyra, Escurra, Master,* 25 U.S. (12 Wheat) 1 (1827). Other advantages of civil forfeiture as a prosecutorial device include proof by a "preponderance of the evidence" or "clear and convincing" evidence, depending on the jurisdiction, resort to discovery, the deposition of those with an ostensible interest in the subject property, and the compelled disclosure of personal records.

Although the Fifth Amendment may be asserted, those claiming property interests while criminal charges are pending against them may be compelled, by threat of contempt, to reveal incriminating evidence. Regardless of whether criminal charges are pending, discovery is likely to provide useful information for impeachment, should a property claimant testify at forfeiture proceedings. Consequently, such proceedings often go uncontested, regardless of the weight of proof available to the government. Additionally, double jeopardy defenses may be precluded if the forfeiture proceedings can be shown to be "solely remedial," as in *Austin v. United States*, 509 U.S. 602, 609-10 (1993), and the court may order the forfeiture of third-party property involved in the offense, subject only to the statutory "innocent owner" defense. Administratively, proceedings in rem obviate separate civil actions against every individual and entity possessing actual and potential property interests of various kinds in the subject property. Indicating the real and personal property subject to forfeiture and the grounds for the proceeding against the property provides an opportunity to everyone with a property interest to come forward at one time and contest the forfeiture action, as ruled in *United States v. Ursery*, 518 U.S. 267.

Goals of Civil Forfeiture

The goals of civil forfeiture are equitable, deterrent, preventive, protective, and compensatory. It is meant to deprive wrongdoers of the benefits of their crime, to alter the calculation of potential wrongdoers as to whether the crime is worth their capture, to remove criminals from the sources of their economic power, to remove corrupt influences from the channels of commerce, and to compensate victims (U.S.C. § 981(e)(6)). Toward these ends, civil forfeiture proves effective against organized crime because the heads of crime syndicates employ their resources to preclude direct involvement in the crime they control and to conceal the criminal origins of their assets. Consequently, economic resources derived from criminal activity are often effectively beyond the reach of traditional criminal proceedings, and remain available to finance ongoing and future criminal enterprises. For these reasons, criminal forfeiture regimes, such as the criminal forfeiture provisions of the Racketeer Influenced and Corrupt Organizations Act (18 U.S.C. 1963), often prove inadequate. The Civil Forfeiture Reform Act also includes a provision authorizing criminal forfeiture for any offense for which Congress has authorized civil forfeiture (Section 16, 28 USC 2461[c]).

Civil forfeiture proceedings require that the government demonstrate three things. First, the property must be shown to be subject to forfeit either as the proceeds of criminal activity, or as property employed substantially in the facilitation of a crime, or property employed as an instrumentality of crime (18 U.S.C. §981[2006]). This may include unlawful goods and services, lawful goods and services provided in an illegal manner, and fraud in the process of obtaining loan or extensions of credit. Second, the government must demonstrate that the law allows forfeiture. At the federal level, a plethora of statutes comes into play toward this end, including the civil forfeiture provisions of the Federal Food, Drug, and Cosmetic Act (21 U.S.C 301); the Trading With the Enemy Act (50 U.S.C. App. 1); the Neutrality Act of June 15, 1917 (22 SC 401); the Civil Asset Forfeiture Reform Act (CAFRA); and a host of others. Third, the government must show that the forfeiture does not constitute an excessive fine in violation of the Eighth Amendment's prohibition against cruel and unusual punishment, as ruled in *United States v. Bajakajian*, 524 U.S. 321, 330-34 (1998).

Concerns persist over civil asset forfeiture's reduced procedural safeguards, reduced standards of proof, reverse onus, and tendency to encourage abuse where state and federal law permits enforcement agencies to fund their operations from the proceeds of seized assets. In many cases, police seize property with little to no oversight. While the federal Civil Asset Forfeiture Reform Act provides some procedural safeguards, it does little to address the lack of agency accountability that might be secured were it subject to review through the budgetary process. Exacerbating concerns is the fact that states have expanded the use of the procedure to deal with local concerns including unsafe housing, prostitution, and drunk driving.

Class-Action Lawsuits

Class-action lawsuits were developed in the United States as a means of permitting a group of plaintiffs to collectively bring a claim to court, and also to allow an assemblage of similar defendants to be sued together. Although class actions were made possible in 1938, only recently have such lawsuits become common. Class actions provide a means for aggregating a large number of claims into a single lawsuit, lowering the costs of litigation. These lawsuits also permit recovery in situations where an individual suit would be financially unviable and can change the behaviors of defendants, allow all plaintiffs to receive relief, and promote consistent standards of conduct for defendants. Critics of class-action lawsuits suggest that class members frequently do not receive any benefit from participating, with most monetary benefit going to the attorneys who bring the cases. Courts and legislative bodies have worked to ensure that class-action lawsuits that are settled are done so equitably, and without harming those not present in the courtroom.

Background

From about 1200 onward, courts in England had a type of group litigation that involved groups of individuals suing or being sued under the common law. The groups most often comprised accepted societal structures such as guilds, parishes, towns, and villages. The issue of standing, or whether a party has sufficient connection to the case before the court to bring an action, never arose in medieval courts. The common law courts' willingness to allow group litigation to proceed was probably a tacit acknowledgment of poor transportation, abysmal communications, and administrative shortcomings that made this easier than concentrating on individuals. Since the crown imposed judicial obligations through the use of force, it was simpler and less problematic to turn this effort upon groups rather than individuals. The group-oriented society in which most medieval lawyers and judges operated also reinforced the efficacy of permitting group litigation.

Over time, the development of better transportation systems, communication networks, and administrative processes made group litigation less desirable. By 1700, group litigation had disappeared in the common law courts, although chancery cases were still heard. By 1850, the British Parliament had enacted statutes dealing with issues regularly facing particular categories of organizations, such as partnerships or joint stock companies, and group litigation disappeared. In the United States, the case of *West v. Randall*, 29 F. Cas. 718 (1820), written by U.S. Supreme Court Justice Joseph Story sitting on the U.S. Court of Appeals for the First Circuit, held that class actions could exist as a matter of equity. This right to proceed as a class action was later promulgated under the Supreme Court's Equity Rule 48, which later became Equity Rule 38. When the federal courts combined equity and law in 1938, this became Rule 23 of the Federal Rules of Civil Procedure (FRCP).

FRCP Rule 23 delineates the procedure for class-action lawsuits. Pursuant to Rule 23, one plaintiff, or a group of plaintiffs, is able to proceed with litigation on behalf of an entire class of plaintiffs constituted of those allegedly harmed by the defendant's actions. For a lawsuit to proceed, the U.S. District Court judge before whom the case appears must certify the class. This certification is required to protect potential members of the class, whose rights will be subsumed in the proceedings of the class action. Multiple state statutes also allow for class-action lawsuits under state law. In 1966, a major revision of the FRCP took place, and Rule 23 added what has since been referred to as the "opt-out clause." Until 1966, many federal courts had been reluctant to certify a class because of the severe consequences for members of the class—all members of the class were bound by the decision. The 1966 revision of Rule 23 permitted potential members of a class who objected to proceed to appear in court and opt out of membership in the class. This change greatly expanded the use of class-action lawsuits.

Uses of Class-Action Lawsuits

Certain 20th-century developments led to the expansion and growing popularity of class-action litigation. After the Great Depression, many understood the value of government regulation of corporations, banks, and other financial institutions. Such regulation, however, was expensive insofar as it required government employees to monitor the corporations, banks, and other financial institutions; and bringing the lawsuit necessitated the use of lawyers. Using class actions to advocate for and protect consumers' and shareholders' rights, however, could accomplish many of these goals, without any added expense for taxpayers. Additionally, changes embraced by many during the 1960s, such as those involved in the civil rights movement, consumer advocacy, and environmentalism, made class-action lawsuits more appealing. Those interested in civil rights, consumerism, or environmental activism increasingly used class-action lawsuits as a means of achieving their goals.

For a class-action lawsuit to be recognized by a court, specific procedures must be followed. First, an individual plaintiff or small group of plaintiffs must be found who have suffered a common injury as a result of a defendant's actions or negligence. The individual or small group must have suffered injuries that are representative of the proposed class. The injury or injuries often result from the action of a business, such as an oil leak; or from a product's design, such as a toy with small pieces that resulted in a child choking. Then, a complaint is drafted and filed with the court and served on the defendants in the case. Next, the attorneys for the plaintiffs must make a motion with the court to have the class certified. Since a class-action lawsuit may results from product defects or damages that can be dealt with in a similar manner, the plaintiffs' attorneys must show the expected size of the class, and whether it will meet the standards set forth for class certification. When defendants object to class certification, it is often on the grounds that there is a lack of commonality in the plaintiffs' factual or legal claims, that the named plaintiffs are not sufficiently representative of the class as a whole, that the number of potential plaintiffs is not so large that individual suits are unfeasible, or that the named plaintiffs have an inappropriate relationship with the attorneys handling their case.

Independently, the court will also consider the adequacy of the attorneys' ability to prosecute the plaintiffs' claim, and whether the firm seems to have adequate resources for a class-action lawsuit. If a class is certified, the court next requires that the plaintiffs' attorneys provide notice of the class action. This notice must be disseminated, published, sent, or broadcast in such a manner that class members are reasonably able to receive it, and then are provided a chance to opt out of the class if they desire to proceed with a personal lawsuit. For an individual to opt out, he or she must provide timely notice of this intent to the court or the plaintiffs' attorneys. If a settlement between the parties is proposed before the case goes to trial, the court will also require plaintiffs' attorneys to promulgate this to all members of the class and inform them of the details of the proposed settlement.

Class-action lawsuits theoretically provide parties and the courts a variety of benefits. Aggregating a large number of individual claims into a single, representative action increases the efficiency of the legal process and theoretically lowers the cost of litigation for plaintiffs and defendants. In cases resulting from a common set of facts and similar questions of law, a class-action lawsuit frequently circumvents the need for repeated testimony from the same witnesses regarding identical questions, exhibits, and issues. Class actions also make viable an incentive that otherwise would not exist for claims where individual damages are negligible but damages for the class as a whole are significant. Millions of customers of a utility company who are overcharged by a dollar, for example, have little individual incentive to pursue a claim, although the total amount at issue is significant. This economic consideration is especially important for plaintiffs' attorneys, who often work for a percentage of the total amount recovered—a claim that would be impracticable to pursue on behalf of an individual often makes economic sense when taken up for a class.

In the event that potential damages may be greater than a defendant's ability to pay, class actions also allow a fair and reasoned distribution of assets. Rather than permitting plaintiffs who bring their claims first to receive compensation while those who come forward later get nothing, class-action lawsuits allow all to be recompensed for their losses in an equitable and orderly manner. Class actions also prevent the unseemly result of different outcomes for plaintiffs and inconsistent standards of conduct for defendants where a group of claims all stem from the same set of facts. Finally, class-action lawsuits are believed to be useful in situations where plaintiffs seek to change the behavior of a class of defendants through the threat of actions being brought seeking damages. This sort of persuasive benefit augments criminal sanctions insofar as it quickly attracts the attention of corporate leaders.

Critics of class actions assert that when improperly brought, this type of lawsuit can harm both legitimate plaintiffs and defendants who have not engaged in wrongdoing. Many class-action lawsuits are settled in a manner that results in large fees being paid to the attorneys who brought the suit, but only coupons or very small checks for members of the class. Such lawsuits also may impede interstate commerce, as corporations become more interested in avoiding and averting class actions than in focusing on developing and delivering products or services. Finally, questionable class-action lawsuits tend to sully the nation's judiciary and legal system; as costly litigation that enriches a few at the expense of others undermines the public's respect.

Class Action Fairness Act of 2005

In an effort to address some of these concerns, the U.S. Congress passed the Class Action Fairness Act of 2005 (CAFA). CAFA expanded federal jurisdiction over many of the class-action lawsuits that had been filed in state courts up until that point. The first major piece of legislation passed during the second term of President George W. Bush, CAFA had the strong support of members of Congress who favored tort reform. CAFA, which eased the process by which defendants could remove an action originally filed in state court, was seen as helping prevent some of the abuses of class-action lawsuits that had occurred previously to its passage. CAFA was touted by its supporters as a means to prevent forum shopping (i.e., the process by which plaintiffs seek the judicial system most likely to give them a favorable verdict). CAFA was also intended to reduce the number of "coupon settlements" (i.e., class actions that are settled with defendants paying plaintiffs' attorney fees and providing coupons to the class) by having all class-action settlements require approval from the judge to ensure that all class members benefit from the proposed resolution.

CAFA gives the federal courts jurisdiction over class-action lawsuits where the amount in controversy exceeds $5 million, and where any member of the class of plaintiffs resides in a different state from any defendant, except in those situations where at least two-thirds of all plaintiffs and defendants are residents of the same state. This change greatly reduced the ability of plaintiffs' attorneys to bring class-action lawsuits in forums that had traditionally been friendly to certain types of cases, such as Madison County, Illinois; or Atlantic County, New Jersey, as defense counsel can remove these cases to federal court. Although CAFA was harshly criticized at the time of its passage for impeding upon plaintiffs' rights, since its passage, more class-action lawsuits have been filed in or removed to federal courts, although much of this increase is because of plaintiffs' filing in federal courts rather than defendants' removal actions.

Consequences of Class-Action Lawsuits

Class-action lawsuits have the potential to protect the rights of consumers and can even prevent white-collar crime by making certain actions so costly for defendants that they decline to engage in such behavior. In response to the variety of high-profile corporate scandals that have occurred over the past 10 years, for example, prosecutors and plaintiffs' lawyers have sometimes worked together to obtain restitution for those harmed by malicious behavior. This has permitted collection of billions of dollars for a range of crimes, including consumer scams, environmental disasters, and financial fraud. Coupling criminal prosecutions with class-action lawsuits has several advantages for prosecutors and the public. First, the class-action system includes important protections for victims entitled to compensation, safeguards that the criminal system lacks. Second, a class-action lawsuit provides the means to coordinate multiple lawsuits, to hear victims' claims, and to divide an award between multiple injured parties. Third, permitting plaintiffs' attorneys to focus on compensation allows professionals skilled at this process to focus on recovery rather than having prosecutors struggle to cobble together a settlement. Fourth, the class-action process permits an equitable division of any award among a variety of victims. Finally, class-action lawsuits provide opportunities for more judicial oversight of settlements and provide for reviews of potential conflicts of interest.

When alleged white-collar crimes are committed by government agents, class-action lawsuits also provide an avenue for addressing wrongs that might otherwise go unpunished. During the 2010 U.S. census, for example, the U.S. Census Bureau hired over one million temporary workers to gather information. Census Bureau policy barred any applicant with an arrest record of any type from employment as part of this process. A group of individuals with arrest records for minor infractions filed a class-action lawsuit against the Census Bureau, alleging that the hiring policy unfairly discriminated against African Americans, Latinos, and American Indians, and sought to have the guidelines revised or set aside. As this example illustrates, class-action lawsuits provide an avenue for addressing problems facing groups that would otherwise be left without remedy. As complex situations involving the rights of large groups continue to evolve, class-action lawsuits will continue to alleviate injured parties' suffering.

Clayton Antitrust Act

The Clayton Antitrust Act, or An Act to Supplement Existing Laws Against Unlawful Restraints and Monopolies, and for Other Purposes, became law in 1914 in an effort to strengthen the existing Sherman Antitrust Act of 1890. It is a civil statute that focuses on price discrimination, condition of sales, mergers and acquisitions, and multiple directorships. After the *Standard Oil of New Jersey v. United States* (1911) decision resulted in the breakup of the company into smaller companies, it became apparent that the existing antitrust law needed to be updated. Alabama's Congressman Henry De Lamar Clayton, Jr., introduced the legislation in the House of Representatives, and a joint version containing modifications by the House and Senate passed into law on October 5 and 8, 1914, respectively. President Woodrow Wilson signed the bill into law on October 15, 1914, making it Public Law 63-212. The act sought to improve on the existing Sherman Antitrust Act of 1890, which could not meet all of the antitrust situations that might occur in the industry. The Clayton Act allowed for federal government intervention in company mergers before a monopoly was created.

Section 2 of the act discusses price discrimination and its prohibition in transactions with different purchasers of the same commodity, in the event that the discrimination could be in an attempt to lessen competition. Section 3 sets

Virginia's Congressman John W. Davis (left) worked with Alabama's Congressman Henry De Lamar Clayton (right) to pass the Clayton Antitrust Act of 1914, which allowed for federal government intervention in company mergers to prevent a monopoly.

conditions on the limits of sales and leases that could impact and lessen competition in an industry. A person whose business has been impacted by business practices that qualify as antitrust violations has the right to sue in district court. The law also indicates settlement guidelines entitling the suing party to three times the damages, court costs, and attorney's fees. Section 5 of the act discusses the settlements in cases brought by the United States and the statute of limitations. The act, however, does not restrict the existence of organized labor and unions related to industry. These are not impacted by antitrust laws. However, the law does restrict a person from being the director of two companies that deal with the same commodities. The law also limits a person from serving on the boards or as an employee of two financial institutions in a community that is smaller than 200,000 persons.

Under this act, mergers and acquisitions that can lessen competition in an industry are illegal. The government can step in and stop the merger before it happens, if there is a possibility of price increases to consumers. Companies that intend to merge are required to file with the Antitrust Division and the Federal Trade Commission. The act requires that information be filed with the Interstate Commerce Commission when bidding is done. An investigation is conducted and a decision is made regarding the merger. The Clayton Act was amended in 1936 by the Robinson-Patman Act, which makes anticompetitive practices by producers illegal. The amended Clayton Act required that items be offered to customers at the same price for which the sellers purchased it. In 1948, the Supreme Court ruled against Morton Salt in its decision *FTC v. Morton Salt* because the company made its Blue Label salt available to five national chain stores at a quantity discount that only they could receive, thus leaving out smaller stores. A similar decision concerning price discrimination occurred in 1990 when Texaco retailers sued because some retailers were getting gasoline at wholesale prices.

Further amendments were added in 1976 under the Hart-Scott-Rodino Antitrust Improvements Act. The act established that state attorneys general could file suit on behalf of citizens in their state, and it allowed for awards in an injury settlement of threefold the amount to the state. It also changed the personal settlement from threefold of damages sustained, to figuring the damage sustained by a statistical measurement approved by the court, to be awarded to the persons who sought the suit. Section 8 of the Clayton Act was also revised to state that no individual could acquire the capital stock of another company, where the original text stated that no corporation could have controlling interest in two companies in direct competition. This would prevent the formation of a monopoly. Today, the enforcement of the act is delegated to the Anti-Trust Division of the Department of Justice, Interstate Commerce Commission, Federal Reserve Board, and Federal Trade Commission.

Clean Air Act

Ratified in 1970 but extending a previous statute from 1955, the Clean Air Act (CAA) is a federal law in the United States. Functioning within the jurisdictional authority of the Environmental Protection Agency (EPA), the CAA aims to maintain a certain level of air quality by regulating the amount of hazardous air emissions that may be produced by stationary and mobile sources. Under the mandate of the CAA, the EPA has developed several regulatory measures, most notably the National Ambient Air Quality Standards (NAAQS), which established a set of primary and secondary standards intended to safeguard public health and welfare and to protect the environment from hazardous air emissions. Although the EPA established NAAQS, state governments have the responsibility to enforce the standards set. The six air pollutants that are particularly targeted under this program are carbon monoxide, lead, nitrogen dioxide, ozone, particle pollution, and sulfur dioxide.

Since its original enactment, the CAA has been significantly amended twice, in 1977 and 1990. These amendments ultimately expanded the technical scope of the CAA and afforded additional powers to the EPA to ensure industrial compliance with the amended version of the CAA. Specifically, the amendments created new regulatory initiatives that addressed pressing concerns of acid rain and the degradation of the ozone layer, and established new avenues to enforce existing standards of air quality. With these amendments, sources that fail to meet the requirements of, or otherwise violate, the CAA are vulnerable to financial, administrative, and other penalties. In recent years, several large corporations have been alleged or found to infringe on the CAA. In 2012, for instance, Essroc Cement Company, a large cement producer, paid $1.7 million in fines for breaching certain terms of the CAA. The EPA actively maintains a watch list of corporations that are considered high-priority violators of the CAA.

How Effective?

Scholars and policymakers have undertaken numerous studies to analyze the effectiveness of the CAA. Much of the extant literature on the CAA has found that its benefits exceed its costs. For example, in a recent report, Christopher Van Atten and Lily Hoffman-Andrews identify three broad economic benefits stemming from the CAA. First, citing a study produced by the Office of Management and Budget, they assert that the CAA yields economic benefits between four to eight times the costs of enforcement and compliance (other sources suggest that benefits outweigh the costs at a ratio of up to 100 to 1). Second, they contend that there is a corresponding relationship between the implementation of the CAA and economic growth. Whereas the CAA engendered 41 percent less common air pollutants from being released from 1988 to 2008, the same period saw GDP growth of 64 percent. This leads them to conclude that there is a positive correlation between economic growth and protecting the public health and the environment. Third, they find that the implementation of the CAA increased the national employment rate by adding 1.3 million jobs to the American economy between 1977 and 1991.

Overall, as J. Scott Holladay notes, a cost/benefit analysis vividly illuminates the efficiency of the CAA because there is evidence that the costs are largely absorbed by violators while the benefits are reaped by society as a whole. By regulating air quality, the CAA has played a crucial role in defending public health and welfare and protecting the environment. For the CAA to continue to meet its central mandate of preserving a certain level of air quality in the future, it will be integral for the EPA to attend to emerging challenges that potentially undermine air quality, and for state governments to fulfill their enforcement responsibilities.

Clean Water Act

The Clean Water Act of 1972 (CWA), also known as the Federal Water Pollution Control Act, is a body of legislation designed to ensure that U.S. waterways are clean, monitored, and protected from contamination. The intent of the CWA is to "restore and maintain" the integrity of U.S. waterways. The CWA represents the first federal initiative to regulate water quality and establish national water-quality standards. Currently, the CWA maintains jurisdiction over 60,000 public bodies of water.

Prompted by Environmental Activism

The passage of the CWA occurred in an era of environmental activism in the United States. Much of this activism was spurred by highly publicized environmental catastrophes such as Love Canal and Times Beach. One of the most relevant of these disasters was the 1969 fire on the Cuyahoga River in Cleveland, Ohio. Years of industrial dumping in the river resulted in the spontaneous outbreak of fire on the water. Estimates suggest that this fire caused tens of thousands of dollars in damages. The fire sensitized the public to the consequences of water pollution and galvanized citizens to organize and demand protected waters. It simultaneously revealed that if left unregulated, the private sector would have little to no interest in modifying production to preserve public health. The CWA was largely the product of the grassroots environmental movement of the 1970s.

To achieve its stated intent, the CWA outlines 12 objectives. These objectives include limiting the quantity of pollutants discharged into waterways and investing in research initiatives and technologies that monitor and control water pollution. At the initial passage of the CWA, it was anticipated that these efforts would culminate in the abolition of pollution discharge into navigable waterways. In an effort to ensure this, the CWA states that by 1983, waterways would be restored to a standard that protects fish and wildlife. The CWA also states that the discharge of pollutants into navigable waterways would end no later than 1985. Neither of these goals was attained. One of the most important provisions in the CWA is the discharge permit program. The discharge permit program is the primary mechanism by which the CWA's water-quality standards are transformed into enforceable limits. Permits are issued under the National Pollution Discharge Elimination System (NPDES) and are valid for no more than five years. According to this provision, any person who is responsible for discharging pollutants into waterways at point sources must apply for and receive a permit. Permits are issued by the EPA, although as of 2010, 46 states have been granted authority to issue permits. According to the EPA, in 2009, over 45,000 facilities had such permits. Unfortunately, 2009 EPA figures also suggest that of major (larger) permit-holding facilities, approximately 55 percent were in noncompliance with CWA standards.

The CWA grants authority to the EPA, state agencies, and civilians to enforce the conditions of permits. Facilities found in violation of permits are subject to compliance orders issued by the EPA and/or are subject to civil suit by the EPA. Negligent or knowing violations can result in fines ranging from $25,000 to $50,000 per day. More serious infractions subject facilities to fines as high as $250,000. The EPA may also impose criminal sanctions on permit violators, instead of or in addition to civil penalties. Individuals violating permits are subject to as much as 15 years of imprisonment. The EPA is also granted authority to intervene if it finds that state entities have been negligent in enforcing permits. Civilians are also authorized by the CWA to file suit against violators and/or government entities that have demonstrated a failure to regulate CWA standards. Since 1972, the CWA has undergone a number of amendments expanding or limiting the authority of the CWA. For example, the 1987 revisions to the CWA expanded the CWA from addressing strictly point sources of water pollution (e.g., pipes) to including nonpoint sources of water pollution (e.g., storm runoff and snowmelt). Conversely, HR 2018 (passed by Congress in 2011) reduces the EPA's ability to cross-check state entities in water quality regulation. The passage of HR 2018 threatens to increase the presence of contaminants in water (e.g., lead and mercury) and underscores the need for criminology to better understand regulation and enforcement of the CWA.

Clinard, Marshall

Marshall Barron Clinard was a sociologist and criminologist, widely recognized as a pioneer in the study of corporate crime. Clinard was born in Boston, Massachusetts, on November 12, 1911. He died of a heart attack at the age of 98 on May 30, 2010, in Santa Fe, New Mexico. He received his B.A. (1932) and M.A. (1934) from Stanford, and a Ph.D. in sociology from the University of Chicago (1941). He married Ruth Blackburn in 1937, and they had three children. Clinard taught at the University of Iowa and Vanderbilt before joining the faculty at the University of Wisconsin, where he taught for 34 years. He was a popular and award-winning teacher. His influence on the discipline was enormous. Many of his doctoral students and their students now teach in sociology and criminology departments throughout the United States and Canada.

He expanded the traditional definition of crime to include corporate malfeasance and crime perpetrated by wealthy and powerful people. He was instrumental in establishing the study of corporate crime as an integral and legitimate area of sociological and criminological research. Beginning in the 1950s, with his research on corporate corruption, Clinard produced the first serious, systematic research revealing the wide range of unethical and illegal actions of large corporations and their executives. He was not a muckraker, but a serious and moral social scientist. He studied crimes committed by the largest corporations in the United States, finding corporate crime rampant and unabated.

Two Forms of White-Collar Crime

Continuing the work of Edwin Sutherland, Clinard, along with critical sociologist Richard Quinney, separated white-collar crime into two distinct forms. Corporate crime involved large-scale actions that benefited the corporations and those in control of corporate actions. On a far smaller scale, occupational crime was committed by individuals for their personal benefit (e.g., embezzlement). Clinard's research uncovered a staggering amount of corporate crime. He estimated that the cost of corporate crimes in terms of money, health, and lives was exponentially greater than that of crimes perpetrated by individuals or street gangs.

Clinard believed that deviant and criminal behavior was learned, like any other form of behavior, and that it persisted because of a lack of internal and external social controls. Corporate executives and managers (often greedy and narcissistic) neither held themselves accountable to the public nor were held accountable by social control agencies. Without regulators and law enforcement agents enacting regulations and laws, corporate managers felt free to take any action they desired. In his early work, he listed the automobile, petroleum, pharmaceutical, and defense industries as major offenders. Today, he would add financial, insurance, and governmental institutions to the list. The crimes and behaviors he described include violations of health and safety regulation, price fixing, fraud, hazardous waste disposal, corporate violence, bribery, and the systematic destruction of third world countries. Clinard also revealed the contradictions between the level and wide distribution of corporate crime and the squeaky clean, socially conscious image of corporations promoted through print and TV advertising and other forms of propaganda. Clinard noted that self-regulation and the existence of codes of ethics have only minimal success. Rather, he suggested stronger enforcement of existing laws and regulations; the passage of new, tougher laws with enforcement guidelines; and the deconstruction of propaganda that promotes a favorable image of corporations engaged in criminal activities.

Clinard's professional status is exemplified by his accomplishments. From 1961 to 1962, he served as president of the Society for the Study of Social Problems. In addition, he was awarded the Donald Cressey Award, the Edwin H. Sutherland Award for Distinguished Contributions to Criminology, and the Gilbert Geis Lifetime Achievement Award from the American Society of Criminology. He published 11 books, over 40 journal articles, and numerous book chapters and reviews. Included in this list is perhaps the most influential text in the area of deviant behavior. His text, *The Sociology of Deviant Behavior*, now coauthored with Robert Meier, is in its 14th edition. Tens of thousands of students have learned about deviant behavior and corporate crime from Marshall Clinard.

Clinton, William J.

William Jefferson (Bill) Clinton was born William Jefferson Blythe on August 19, 1946, in Hope, Arkansas. His mother, a widow, would later marry Roger Clinton. Bill took his stepfather's last name while in high school. During his high school career, Clinton was a delegate to Boys Nation (a civic education program sponsored by the American Legion), through which he had the opportunity to meet President John F. Kennedy; later, Clinton would say that this meeting was what inspired him to take on a career in public service. Clinton received his undergraduate degree from Georgetown University and was a Rhodes scholar at Oxford University before completing his law degree from Yale in 1973. After finishing Yale, he returned to Arkansas initially to teach at the University of Arkansas, Fayetteville Law School, later beginning a career in politics. In 1975, he married Hillary Rodham, a fellow Yale Law graduate. Clinton was elected attorney general of Arkansas in 1976 and won the governorship two years later. Though he lost a bid for reelection in 1980, he would regain the governorship in 1982, and he held it until his successful presidential bid in 1992. As a result of the 1992 elections, the White House, the Senate, and the House of Representatives were controlled by the Democrats, the first time all three bodies had been controlled by the same party in 12 years. This edge would be brief, as Republicans captured a House majority in 1994.

Controversy, Scandal, and Corruption

Despite a postelection promise to "lead the most ethical administration in history," the Clinton administration was rife with controversy and scandal. A few weeks into the administration's term, the White House fired seven longtime employees in the White House travel office and replaced them with Clinton family friends. This prompted the

Federal Bureau of Investigation to look into the firing, which was decried as conducted under pressure from the administration.

The next scandals to envelop the Clinton administration concerned Clinton appointees Zoe Baird and Kimba Wood. Clinton nominated Zoe Baird as the first female attorney general of the United States. Baird ultimately withdrew her name from consideration for the position when it was discovered that she had hired illegal immigrants as nannies for her children, a violation of federal law. The second nominee from Clinton, Kimba Wood, was similarly knocked from consideration. Clinton then nominated Janet Reno, a much safer bet, as she had never married and had no children, and thus had no need for illegal nannies. As attorney general of the United States, Janet Reno was tasked with investigating campaign illegalities in both the presidential and vice presidential campaigns, as well as investigating Clinton's involvement in the Whitewater scandal and the sex scandals uncovered in the Whitewater investigation. Reno also pursued companies violating antitrust laws—one of the most notable cases was her suit against Microsoft—and exerted pressure on companies and federal lawmakers to end insider trading. Under her watch, the largest criminal fine in the history of the U.S. Department of Justice (at the time) was levied against Hoffmann-La Roche Pharmaceutical Company for breaking antitrust laws and engaging in price fixing. She was also well known for appointing ethics advisors to serve in the offices of all U.S. attorneys.

Following "Nannygate" and the appointment of Reno, the Clinton administration had to weather the Whitewater scandal. This scandal got its name from the land deal that the Clintons invested in during the late 1970s. Their partners in the deal, James and Susan McDougal, bought a savings and loan facility in the early 1980s that was ultimately shut down by the federal government. James McDougal hired the Rose Law firm—where Hillary Clinton was a partner—to try and keep the business afloat. During a federal investigation into the failure of the savings and loan, the Clintons were named as potential beneficiaries of its alleged illegal activities. In an attempt to clear the air around Whitewater, Clinton tasked Janet Reno with beginning an investigation into the Whitewater matter. Reno appointed Robert B. Fiske to lead the investigation, but within eight months, he was replaced with Kenneth Starr. Under Starr's lead, the investigation into Whitewater was widened to try and uncover anything that the Clintons may have done illegally. Starr did not find any conclusive evidence that the Clintons had acted unethically or illegally in their business practices regarding the Whitewater land deal and its accompanying matters; however, Starr unearthed information in the form of sex scandals that would ultimately lead to Clinton's impeachment. First, Paula Jones accused Clinton of sexual harassment. Though it was later revealed that she was financed by a group of conservatives hoping to take down the president, Starr continued to pursue the investigation. The continued investigation led to the discovery of Clinton's affair with former White House intern Monica Lewinsky.

While under oath in the Paula Jones harassment case, Clinton testified that he did not have sexual relations with Lewinsky. Though he later acknowledged that he had "intimate relations" with her, he maintained that his earlier testimony was technically accurate. This flub would enable the House of Representatives to impeach him on two articles—perjury and obstruction of justice. The Senate, however, rejected both articles, and thus Clinton was able to remain in office. Clinton's time in office following the impeachment trial was not without scandal. In his last hours before leaving office, Clinton officially pardoned 140 individuals. Opponents accused him of selling pardons because of his personal ties to at least three of the pardoned individuals—including Susan McDougal for her part in the Whitewater scandal. Another controversial pardon was that of Marc Rich. Rich was indicted for income tax fraud and breaking a U.S. embargo (by selling oil to Iran during the hostage crisis) but had fled the country before being brought to court. Clinton's pardon of Rich was controversial because Rich's wife has lobbied hard for the pardon; her efforts included a \$70,000 donation to Hillary's Senate campaign and a \$450,000 donation to Clinton's presidential library. Though the U.S. Senate Judiciary Committee held hearings on the legality of the pardon, results were inconclusive.

Coal Mining

Coal mining has played a key role in industrial development. By 1900, the success of the American economy, the world's leading coal producer, had become largely dependent on coal. The treatment of coal miners shaped American labor history, labor law, and corporate crime. Mine owners were among the most powerful "captains of industry" to emerge during the Industrial Revolution, and coal miners became a core sector of the working class. The industry was particularly important in several states, such as West Virginia, where it remains concentrated today. Across the largely rural areas where mines were located, dozens of company towns emerged, and mine operators provided workers and their families company housing as well as other benefits (such as company-sponsored stores). Miners received minimal pay and faced harsh working conditions, and mine owners controlled virtually every aspect of their lives. Mine operators were adept in gaining control of local and state politics, leaving the industry largely unregulated, and abuses and accidents were commonplace.

Fairmont Coal Company

The worst mine disaster in U.S. history reflects the hazardous conditions facing coal miners, in which 300 miners (including many young boys) were killed in 1907 in an explosion that occurred at two mines operated by Fairmont Coal Company in West Virginia. An investigation failed to pinpoint the exact cause of the explosion, but officials concluded that it was likely triggered by a spark that ignited the methane gas or coal dust that had collected in the mine shaft. For more than a century, hazardous working conditions have led to over 100,000 deaths. Mining accidents are caused by several factors: explosions are the most immediate cause (and typically occur when gases reach excessive levels in underground mines); workers may also suffocate when toxic gases reach elevated levels; and collapsing roofs cause many deaths. Accidents are linked to the risks inherent in the extraction of coal, but they are often tied to negligence and misconduct of mine owners, and lax regulation exacerbates these problems. Miners have also faced occupational illnesses that can cause disability and death, and coal workers' pneumoconiosis (CWP) is the most serious and common of these. This fatal respiratory disease, recognized by doctors as early as the 1820s, is caused by long-term exposure to coal dust. For decades, mine operators resisted acknowledging this or providing compensation to disabled workers, allowing CWP to result in thousands of fatalities, far exceeding the deaths caused by coal-mining accidents.

Unions and Federal Legislation

In 1890, the United Mine Workers of America (UMWA) was established, largely in response to unsafe working conditions. From 1890 to 1933, the UMWA led many key strikes, demanding improved safety and higher wages. These strikes often paralyzed the national economy and often turned deadly as employers depended on private militia, local law enforcement, and the National Guard to confront strikers. This use of force claimed the lives of hundreds of coal miners who were caught in the "coal wars" that raged from West Virginia to Colorado. The UMWA eventually secured several historic political victories, such as the Wagner Act (1935), which redefined labor relations, outlawed many of the corporate tactics to curtail union organizing, and helped the UMWA to grow and improve the safety conditions of mine workers.

In 1891, the first federal statute governing mine safety imposed ventilation requirements for underground coal mines and prohibited child labor. In 1910, the Bureau of Mines emerged to further

Miners at the Virginia-Pocahontas Coal Company Mine #4 near Richlands, Virginia, line up for the elevator shaft, April 1974. One miner (far left) carries Red Man chewing tobacco, which was popular due to the smoking ban in the mines. The Federal Coal Mine Health and Safety Act of 1969 established monetary penalties for health and safety standards violations as well as criminal penalties for "knowing and willful" violations. After 1977, the Mine Safety and Health Administration was put in charge of enforcement.

promote safe working conditions, but the bureau was barred from inspecting mines. Responding to a series of mine disasters, the bureau gained nonbinding inspection powers with the passage of the Mine Inspection Act in 1941. Though limited in scope, the law had an immediate impact, as inspections increased fourfold (between 1946 and 1952) and fatalities declined. In 1952, the Federal Coal Mine and Safety Act expanded enforcement powers of the bureau, and certain mines were subject to annual inspections. Inspectors could issue withdrawal orders that required workers to be evacuated when they were in imminent danger. Operators who failed to comply with these orders or refused inspectors access to mines could face civil penalties. The law's impact was limited to large mines (exempting mines employing 14 miners or less) until Congress extended the law to cover all underground coal mines in 1966.

The Federal Coal Mine Health and Safety Act (1969) represented the most comprehensive legislation, broadening federal enforcement powers and setting new safety and health standards. For the first time, the law set an exposure limit for coal dust, with the promise of eliminating CWP and other respiratory problems. In addition, a system was established for compensating those totally and permanently disabled by CWP. The law required two inspections at every surface coal mine and four inspections at every underground mine each year. Monetary penalties were mandatory for violations of health and safety standards, and criminal penalties were established for "knowing and willful" violations. In 1977, the law was amended, shifting enforcement of the act from the Bureau of Mines to the newly created Mine Safety and Health Administration (MSHA) within the Labor Department.

Continuing Negligence

Federal legislation has resulted in a significant decline in injuries, and illnesses and fatalities have dropped sharply in the past 40 years. However, several recent mining disasters point to corporate negligence and misconduct. One of the deadliest disasters (in 2010) claimed the lives of 29 miners at the Upper Big Branch, West Virginia, mine. Sparks from outdated equipment triggered the massive explosion of methane gas and coal dust. A state-funded independent investigation found both Massey Energy and the MSHA to blame for the disaster. Massey was charged with operating this mine in a "profoundly reckless manner," failing to properly maintain the ventilation system and observe other safety measures. MSHA was faulted for allowing the company to operate without adequately addressing a long record of problems, including the 515 safety violations identified in an inspection conducted in 2009.

In 2011, the MSHA levied $10.8 million in civil penalties for flagrant violations of safety laws. Concurrently, Massey's successor reached a record settlement of $209 million with the U.S. attorney (for corporate criminal conduct). In 2012, the former chief of security at the mine was sentenced to three years in prison for destroying evidence during the accident's investigation. A former mine superintendent, he pleaded guilty in 2012 to conspiracy charges in which he admitted the deliberate concealment of health and safety violations and falsification of records to avoid the shutdown of the mine. He faced up to five years in prison and a $250,000 fine.

Cohen, Albert

Albert Cohen, born on June 15, 1918, in Boston, Massachusetts, is an American criminologist best known for his 1955 book *Delinquent Boys: The Culture of the Gang*, in which he outlined his theory of delinquent subcultures. In 1993, the American Society of Criminology presented Cohen with one of its highest honors, the Edwin H. Sutherland Award, in recognition of his outstanding contribution to criminological theory. He had intended to major in political science at Harvard University, but after taking introductory sociology from Pitirim Sorokin, he changed his major to sociology. Cohen would also take courses from Nicholas Timasheff, Robert K. Merton, and Talcott Parsons. Working out the differences between the competing theories offered by these professors helped him to develop his theory. Despite high grades and references from Timasheff, Parsons, and Merton, Cohen found entry into graduate school difficult. He applied to more than a dozen M.A. programs in sociology. Without financial support, he would not be able to continue his education.

Only Indiana University offered him financial assistance, in the form of a teaching assistantship. Cohen's suspicion that he was not given assistance because he was Jewish was confirmed by a rejection letter from one of the schools, informing him that it was school policy to not hire Jews. His acceptance from Indiana University was received via a telegram from Edwin H. Sutherland, whose theory of differential association would make a major contribution to Cohen's theoretical development. While at Indiana, he took his first course in criminology. He would go on to do a Ph.D. in sociology at Harvard. Cohen's official supervisor was Talcott Parsons, but because Parsons had so many students, Robert Freed Bales became Cohen's de facto supervisor.

Although each of his Harvard professors, especially Parsons and Merton, had some influence on his thinking, Cohen sought to explore the potential for combining aspects of Merton's theory of anomie with aspects of Sutherland's differential association theory. According to Cohen, each theory offered only a part of the explanation for deviant behavior. Cohen accepted Sutherland's analysis that lower-class society is organized differently from middle-class society. Within lower-class society, some groups are organized to conform to dominant values, whereas others are not. Each group attempts to ensure that its members adhere to the values of the group or subculture. Working-class youth form gangs, subcultures that define standards and goals for themselves. What he found lacking in Sutherland's theory was an explanation for why these groups existed in the first place. He turned to Merton for this explanation.

Influence of Robert K. Merton

Cohen rejected aspects of Merton's theory that he believed too individualistic but accepted Merton's theory regarding the creation of societal goals and defining the accepted means for attaining those goals. Cohen also accepted that society does not necessarily distribute the mechanisms for goal attainment evenly throughout society, and that this leads to some frustration among lower-class juveniles. Cohen termed this "status frustration." As a result, lower-class youth develop alternative goals and alternative means to attain goals. Cohen termed this process "reaction formation." Within this context, the deviant behavior of lower-class youths becomes quite different from what Merton had proposed. Differentially socialized members of working-class youth gangs do not engage in purposeful and utilitarian deviance, as do adults and some professional juvenile delinquents. Their deviance is nonutilitarian, impulsive, negativistic, and hedonistic. It is typically a rejection of dominant social values and expectations, and an indication of acceptance of the values of the gang.

Cohen's theory has won praise for stimulating a high volume of research, both accepting and rejecting his theory. His concepts of status frustration and reaction formation, and the processes by which working-class youth organize their activities, has been subjected to significant scholarly scrutiny. Cohen has been criticized for not validating his data and assuming them to be accurate as well as assuming that working-class youth gangs are aware of middle-class values and practices, without providing evidence to support the assumption. He has also been criticized for developing a theory that could not explain other types of deviance, including corporate and white-collar crime.

Coleman, James

James William Coleman developed an integrated theory of white-collar crime. Working in the tradition of Edwin Sutherland and Donald Cressey, he developed a theory stating that white-collar crime emerges when motivation and opportunity coexist. Motivation relates to socially constructed values and rationalizations for participating in crime. Opportunity concerns structural characteristics that influence the ability and desire to engage in crime. Coleman was born in Los Angeles on November 23, 1947. His father was a police officer who strongly opposed the Vietnam War. His mother was a homemaker. His grandfather was a member of the Communist Party. Early in life, Coleman was preoccupied with social injustice. After studying sociology and obtaining his bachelor's degree from California State University, Northridge, in 1969, Coleman went to graduate school at the University of California, Santa Barbara. There, he studied under Donald Cressey. After the death of Edwin Sutherland, Cressey worked as a co-author, updating Sutherland's textbook, *Principles of Criminology*, which introduced the theory of differential association. Influenced by Sutherland's ideas and Cressey's research on embezzlement, Coleman began formulating theories on white-collar crime.

Coleman's integrated theory starts with the idea that deviance approaches to white-collar crime are too broad. In addition, separating white-collar crime into areas of occupational and organizational crime creates confusion. Although it is clear that occupational criminals act in their self-interests and organizational crime takes place to further a corporation's goals, there are too many similarities between the two to justify a theoretical division. The most useful way to study white-collar crime is to define it as a law violation, regardless of occupational or organizational issues. Moreover, the concepts most important to understanding white-collar crime involve motivation and opportunity.

Anything of value motivates people to act. With older forms of social structure, open sharing characterized interaction. With the capitalist culture of competition, values shifted to self-interests and finances. If one does not have money, one is considered a failure. In turn, white-collar criminals want money, bend the rules to get it, and rationalize getting it, regardless of the means. This links motivational aspects to techniques of neutralization. Neutralization theory proposes that criminals create motives for their actions after they are caught. Conversely, Coleman argues that white-collar criminals recognize that they are going to break the law ahead of time, so they construct psychological frameworks to legitimize their behavior. White-collar crime rationalizations include denying anyone will be hurt, complaints about unjust laws, necessity based on economic survival, and claims related to deserving money. They also involve arguments that criminal behavior is acceptable because it reflects peer behavior and business norms. Even if wider culture condemns white-collar criminal behavior, business subcultures can suspend the realities of mainstream beliefs. This allows the individual to accept white-collar crime as legitimate.

Motives are secondary to opportunity. If someone is not in a position to carry out white-collar crime, it will not occur. For example, an accountant will have a better chance of embezzling from the company than will a janitor. Opportunity is firmly seated in objective social structures. Coleman argues that white-collar crime is more likely when someone knows that he or she will not be punished severely by regulators. If victimization involves stealing small amounts of money from a large number of people, white-collar criminals know that their actions are less noticeable. If an individual works for an organization with a complex hierarchy, detection is also less likely. White-collar crime is more likely in private, profit-seeking organizations because nonprofit agencies are less likely to reward employees for such monetary offenses, especially if they create financial gain for the organization.

White-collar crime occurs more often when organizations have lax official policies on illicit activities. White-collar crime is more likely to take place when external economic pressures place organizations under financial strain. Finally, white-collar crime happens more when organizations have declining profits, whether because of new regulation or increased competition. Coleman believes that social justice, whether it concerns white-collar crime or some other social problem, cannot be achieved through institutional rules and regulations alone. Above all else, it requires a change in individual consciousness.

Collateralized Debt Obligations

The housing collapse of the mid-2000s is blamed, in part, on the overuse of subprime lending practices. During the housing bubble that preceded the collapse, these subprime mortgages and other mortgage products were often combined into financial instruments called collateralized debt obligations (CDOs). These CDOs were then sold to investors, just like other financial products (i.e., stocks and bonds). Although the creation and use of CDOs are perfectly legal, the ambiguity surrounding the mortgages that constituted many CDOs led to their misuse. Many people creating and selling these CDOs, as well as those buying the products, were unaware of what they really were.

A CDO is an asset-backed security. An asset is any resource that has economic value (e.g., cash on hand, inventory, loans issued, or corporate bonds) that can be used to provide economic benefits immediately or in the future. A security is simply an investment instrument that is issued by a corporation. A CDO is an investment instrument issued by a corporation that is based upon some grouping of assets held by the corporation. The corporation issues the investment instrument as debt, meaning that investors are paid a fixed percentage return on their investment.

A company builds a CDO by identifying a group of assets it wishes to buy. It then issues debt in order to obtain the funds with which it will purchase the identified assets. The purchased assets are called collateral assets and are what make up the portfolio underlying the CDO. Typical CDOs contain a mix of bonds, mortgages, bank debt, and other financial securities. The types of CDOs used during the housing crisis are formally known by the term collateralized loan obligations (CLOs) because they were made up entirely of bank-issued loans (mortgages).

A CDO is broken down into subgroups of assets, called tranches. These tranches are labeled by rank: senior, mezzanine, and subordinate. The less risk in the tranche, the lower the expected return; senior tranches carry the least amount of risk and therefore the lowest potential return. However, payments are made in order of rank, meaning that although senior tranches have the lowest potential return, they also have the highest guarantee of payment. Should the assets underlying the CDO go bad or fail to return at sufficient levels, the company issuing the CDO may fail to pay its obligations. In this case, those owning the senior tranche will be paid first, while those owning the subordinate tranche will be paid last, if at all.

Essential to the legitimacy of the CDO is the use of credit ratings to assess the riskiness of the investment opportunity. The goal of CDO issuers is to obtain at least an "A" rating for their senior tranches and at least a "B" rating for their mezzanine tranches. The subordinate tranches are typically not rated because they are usually composed of a grouping of high-risk assets. While it may seem intuitive to assume that there will be demand only for those tranches that are rated by a credit rating agency, there are many investors interested in purchasing the more risk-laden tranches. This is because these tranches offer higher potential returns on investment. An additional upside of these risky tranches is that when investors are paid, they are paid at a much higher rate than owners of the senior tranche. The drawbacks are that these investments have the highest risk of default and are the last tranche to have returns paid out.

Why Collateralized Debt Is Used

Typically, nonfinancial institutions will issue CDOs in an attempt to take advantage of an arbitrage opportunity. The arbitrage, in this case, represents the difference between what the company earns on the assets backing the CDO and what it pays out to the owners of the tranches. By borrowing the funds needed to buy the assets, the company is getting a free lunch—it gets to keep the income that remains after debt holders are paid off, but it has not used any of its funds to obtain the assets. So long as the assets continue to return at a level that exceeds the issuers' associated debt obligations, the issuer is making money without actually spending any money. This frees up cash for use on other projects, and it helps increase the corporation's net worth.

Financial institutions use CDOs for a different purpose, which has been associated with the financial crisis associated with the subprime lending problems of the mid-2000s. It has been argued that the use of CDOs by financial institutions gave banks an ever-increasing incentive to continue to issue profitable, yet incredibly risky, subprime loans. But why would any lending institution willingly take on risky long-term loans just to receive significant periodic income? The purpose of CDOs for financial institutions is to remove the risk associated with the loans it has issued while retaining ownership rights to the loans. By packaging loans into a CDO (or CLO), a bank can remove the risk associated with loans it has issued because it is selling that risk to a willing investor.

Reducing the level of risk from the bank's balance sheet allows the bank to increase its capacity to lend money. When banks can make more loans, they can generate more fees from periodic loan repayments. Additionally, banks are required to keep a certain ratio of cash to loans disbursed as a precaution against unusual levels of default. Should the bank experience significantly high levels of default, the cash it is required to keep on hand will keep the institution solvent. By removing the risk associated with these loans from its books, a bank is able to reduce the amount of cash it needs to hold on hand. It can then use this cash to make other loans or investments.

For investors, CDOs are a good way to gain broad exposure to various levels of risk through a variety of assets. A key to proper investing is to own a portfolio that minimizes the potential damage that is inherent in idiosyncratic risk; owning a diverse and broad portfolio minimizes, or eliminates, idiosyncratic risk. Idiosyncratic risk is associated with a particular security. Every security has idiosyncratic risk, and it is typically uncorrelated to what is occurring within the market, the industry, or any other company. By owning a large number of securities, one can cancel out the idiosyncratic risk associated with any particular firm. CDOs offered investors an easy way to gain access to a large number of asset-backed securities at the same time.

Misuse and Abuse

Although CDOs offered investors and issuers many great benefits, they also hid many great dangers. It was difficult to impossible to know exactly what was in any given CDO. CDO managers were not required to disclose the specific assets underlying the CDO, so an investor never really knew which securities he or she was taking a piece of. It is likely that many investors did not care what their respective CDOs contained, so long as they had achieved a desirable rating and were producing the stated returns.

The housing bubble created an opportunity for the issuers of CDOs to take advantage of this ambiguity in the composition of CDOs. Loans with a higher-than-normal potential of default were lumped in with loans that had lower-than-average potential for default. This loan package would, on the basis of the lower default loans, obtain an "A" or better rating, and the issuer could easily move the "bad" loans off its books, thereby freeing up more cash for other investment activities.

Another way in which CDOs were abused came with the development of CDO^2 and CDO^3 products. A CDO^2 is built when the purchaser of a bundle of CDOs splits up the various assets making up its particular portfolio of CDOs and recombines them into new CDOs. When this occurs, the original portfolio of CDOs purchased is replaced by a group of CDOs that is made up of the various parts of the original products. These CDO^2s are then resold in the market; oftentimes the individuals creating the CDO^2 products were unsure of exactly which products were placed where. As with the original CDO, the CDO^2 had tranches that were rated by a ratings agency. However, because of the ambiguity associated with the specific contents of the tranche, a large amount of over-rating occurred, and securities that would never have been given a "B" rating now composed the majority of tranches that received "A" ratings or better.

Collateralized debt obligations are a good way for investors to build diversity into their portfolios and to select broad groupings of assets at desired risk levels. Yet, during the housing crisis of the mid-2000s, these securities were used by banks to move risky loans off their balance sheets so they could, in turn, make more risky loans. Once these risk-laden CDOs made it into the market, the creation of CDO^2 and CDO^3 products left the door open for risk-averse investors to be taken advantage of. Investors seeking relatively riskless investments bought stakes in investments that, in reality, should have held a junk rating.

Commodities Fraud

A commodity is anything that can be marketed. Usually, the term applies to bulk items, from potatoes to pork bellies to quantities of copper or other goods produced to satisfy human needs and wants. Whereas crafts are individual items that are usually marketed individually, if a commodity is the same everywhere on the market—so much so that it cannot be readily distinguished between similar quantities of the same commodity in respect to the origin of either—then it is fungible, meaning that it does not matter what company produced it. That is, a bushel of wheat is the same kind of wheat sold everywhere in the market. In contrast, a product that is branded will be distinguishable, and it is treated as a good rather than a commodity.

Types of Commodities and Contracts

Commodity markets trade in bulk quantities of items such as agricultural products, livestock, lumber, metals, and other supplies that are the basic resources of an economy. Specific agricultural products include grains and oilseeds (corn, wheat, soybean, rice, and oats), dairy (milk, butter, and cheese), livestock (lean hogs and live cattle), and softs (cocoa, coffee, cotton, and sugar). Mineral commodities include gold, silver, copper, platinum, and palladium. Oil, heating oil, gasoline, and natural gas also are traded. These and many more items are traded in spot markets or futures markets.

Commodities contracts are traded as spot price contracts, forward contracts, futures, and options on futures. In addition, trading is done through derivatives for interest rates, swaps, ocean freight contracts, and environmental instruments.

Spot markets are markets in which goods are traded, usually for immediate delivery. A spot contract between a cotton farmer and a spinning mill located next to his farm will be an agreement in which the farmer agrees to deliver the cotton specified in the contract immediately. The cotton should already have been ginned and baled, although there may be circumstances in which it is to be delivered immediately after an imminent harvest.

Most spot market contract sales take place between strangers in broader markets. To get the supplies of hamburger it needs, a national hamburger chain may enter into spot market contracts for immediate delivery if sales have been higher than anticipated. This provides the meat needed immediately. Normally, its supplies will be acquired through a steady expiring of futures contracts that deliver at a specific date.

Forward contracts in commodities are contracts between two parties to buy or sell a commodity at a future time at a price agreed upon today. For example, a cotton farmer may make a contract with a spinning mill at the time of the planting of the crop. The forward contract also includes in its terms delivery of the cotton crop at harvest time for a fixed price. The spinning mill will pay to receive the crop at harvest time. The spinning mill assumes the long position. The cotton farmer assumes the short position because he is currently short a cotton crop at the moment. The price they agree to is the "delivery price," which is also the "forward price." The contract guarantees to the farmer a set return for the crop. The spot contract guarantees for the spinning mill a supply of cotton that will not be exposed to price rises. Since profit margins may be in pennies or even fractions of a cent per pound, the agreement smoothes out price fluctuations and creates a stable price product for the mill.

Normally, futures are contracts made between strangers in a vast market network. The futures market contract supplies commodities for future use at a specific future delivery date, but it provide immediate revenue to the maker of the contract and guaranteed delivery of a commodity at a future date when it is needed, at a known price. The variations in prices may mean that the future user of the product pays less than the spot market price at the time of future delivery, or if prices have fallen, the price paid in the futures contract will be more than the price at delivery. Mills and other kinds of manufacturers that use bulk quantities of commodities, such as wheat or corn are able to average out their commodity costs by hedging.

Futures markets are exchanges where contracts for future delivery are traded. Futures contracts can be bought directly or via options. They allow hedging of costs. The future is always uncertain. Prices will be higher, lower, or the same because they move sideways. To ensure a steady supply of the commodity(s) needed, companies may use options to smooth out the costs of their supplies as a way of delivering a product at a uniform quality and price. It may be financially wiser for a mill to buy call options, or puts, than futures contracts.

Options (puts and calls) provide a type of protection against price fluctuations. A call option allows an investor to "call" a contract at a lower price if the price has risen a little or dramatically. The call option will allow its owner to collect the difference between the sale of the futures contact at a higher price and the price of the call. If the price drops, then the call will be allowed to expire, but at less cost than purchasing futures contracts. A put option allows the investor (or speculator) to "put" the cost of a futures contract at a high price onto the one who sold it. The investor will be able to deliver the futures contract by purchasing it at a low price in the current market.

Commodity markets began as spot markets, but forwarding and futures contracts developed to meet problems caused by fluctuations in supplies and in the prices for supplies. Using forwarding and futures contracts can reduce the risk of inadequate supply and disruptive high prices at the time the commodity is most needed.

Examples of Commodities Fraud

Commodity fraud is as old as the first marketplace. In ancient times, herds of stolen or diseased animals were sold. Other frauds included selling and failing to deliver. Other ways of cheating, such as using false weights, were warned against in both the Bible and ancient Mesopotamian literature. These types of fraud deal with failure to deliver the commodity, delivery of adulterated or damaged commodities, or using false weights. Modern times have produced more sophisticated methods of fraud.

Adulterated wine, a form of commodity fraud, has been sold since ancient times. Many additives, from elderberry juice to other coloring agents that imitate real wine colors, have been used. In Roman times, Pliny the Elder reported that adulterated wine was so common that it was difficult to tell which wine was the real wine and which was a fraudulent substitute. The rise in modern bottling methods has led to wine frauds such as counterfeit labeling.

Olive oil was and remains a basic commodity in the Mediterranean. It is also a growing consumer product in America. However, despite regulations that require the country of origin and the specific labeling of commodities, cheaper olive oil from Turkey is shipped to Italy, where it is packaged and shipped as Italian oil to the United States.

Commodity frauds can take place in the financing of regular business transactions on the basis of forged but legitimate documents. On July 25, 1991, a Bulgarian sugar buyer paid $3.8 million for a shipload of sugar with a letter of credit. The sugar cargo was reported to have been loaded on the MV *Giovanna,* sailing for Varna, Bulgaria, from the Brazilian port of Santos. However, neither the ship nor the sugar existed. The criminals have yet to be found. In another case, a Paris bank paid $2.89 million in August 1992 for a cargo of refined sugar loaded onto the MV *Vladimir Ilyich* in Panama, bound for Kalingrad, Russia. The letter of credit was a forgery. Neither the criminals nor the sugar has been found.

Sometimes, commodity trading is used as a cover for advertising a fake job. The advertisement promises payments for easy work in a commodity trading company. The advertisement is really seeking a crook or someone innocent who will participate in a money mule scam. The money mule, if recruited, will actually become involved in transferring stolen money or merchandise.

Commodity trading fraud can take place through collusion in the marketplace. This is the charge against a number of giant international banks, financial institutions, and oil company giants who trade oil futures in the Intercontinental Exchange (ICE), which was founded in Europe in 2000. It was alleged that they engaged in "dark pool" trading, free from American law. Congressional investigators in 2003 found that "round-trip" trading was taking place. Company A trades a given quantity of oil with Company B, which also trades the same amount with Company A. The trades are all paper trades for nonexistent oil at exactly the same price. However, the price is a signal to other traders to bid up the price of oil.

Currency is a commodity, just as agricultural products. Foreign currency trading (forex) is a legitimate business but is open to fraudulent practices. To protect the public from currency trading fraud, Congress created the U.S. Commodity Futures Trading Commission (CFTC) in the Commodity Futures Modernization Act of 2000. The law gives the CFTC the authority to regulate commodity futures and options markets in the United States. It issues warnings and investigates frauds involving foreign currency trading.

Insider information is also used to manipulate the commodities market. The 1983 film *Trading Places,* starring Eddie Murphy and Dan Aykroyd, is a story of insider commodities market trading. The Duke brothers of the firm of Duke & Duke (Ralph Bellamy and Don Ameche) seek to use insider information to make a fortune in orange juice futures but are destroyed financially.

Guarding Against Fraud

It is a federal crime to fraudulently misrepresent oneself as a commodity trading advisor, a pool operator, or an associate of a commodity trader or commodity pool operator. It is also a crime to employ any device, scheme, or artifice in order to defraud a client of a commodity trader or managed commodity trading company. Despite the stiff legal penalties, greed overwhelms the moral integrity of some, who then engage in fraud in commodities markets.

Commodity trading is more sophisticated than many other investment activities. It therefore provides opportunities for fraud perpetrated by slick-talking salespeople who promise what is too good to be true. To guard against fraud in small-pool commodity investment scams, a type of "boiler room" scam, it is important for investors to verify that small commodity pools are managed by an individual who is registered with the CFTC. Most brokers are licensed, but there are unlicensed people who are really scamming the system. Even if brokers are licensed, wise investors check the broker's regulatory history before investing with any agent.

On March 7, 2012, the CFTC filed a complaint against Christopher Varlesi. He operated a fraudulent commodity pool, Gold Coast Futures and Forex (Gold Coast), from his Chicago office that traded commodity futures and foreign currency contracts. In order to attract investors, he made numerous misrepresentations about his trading skills and experience, while not being a registered a commodity pool operator. He also misappropriating investors' funds as his market speculations failed. Large commodity pools, managed by large investment firms, are legitimate firms that offer managed futures contracts for trading. Prudent investors investigate them to check their track record and other pertinent information in their prospectus.

Even with good information and personal relationships, fraud can still happen, as in the Wasendorf case. In July 2012, Russell Wasendorf, Sr., the chief executive officer of Peregrine Financial Group, a futures brokerage firm, confessed to stealing $100 million from his customers. He also lied to federal investigators. He was arrested after a failed suicide attempt outside his headquarters in Cedar Falls, Iowa. Investigations showed that he had embezzled millions by forging false account statements from U.S. Bank. He was sentenced to 50 years in prison on January 31, 2013, and was ordered to pay $215.5 million in restitution.

Civil actions filed by the Commodities Futures Trading Commission shut down Peregrine. Normally, a firm like Peregrine will gain a small margin from matching commodities contracts for buyers and sellers. Unfortunately some of the clients have been defrauded by Wasendorf. He had been able to evade regulators from the National Futures Association with a false post office box. The rise of Internet banking gave him the opportunity to create false online statements.

To evade regulators, Wasendorf used a false post office box to intercept requests from the National Futures Association. When Internet banking became common, he created sham online statements that were accepted by regulators until the collapse of MF Global, a giant commodities and futures firm, where a billion dollars of client money disappeared.

A large commodity company case was opened against Richard Regan, who was at the time the principal in Commodity Trading Advisor (CTA) Pro Trading Course, LLC. He was also a floor broker. He was charged with illicitly soliciting investors to take the commodity futures trading course that he offered. The CFTC charged that the defendants' claim to students that they would learn the commodity trading business if they took the course was false. Students were solicited through Craigslist and other Web sites. The defendants did not disclose that none of the teachers at CTA had ever gone beyond the first level of the course. Nor were any of the people at CTA earning profits to match the "payout charts" used to market the course.

Commodities Futures Trading Commission, U.S.

The Commodities Futures Trading Commission (CFTC) is an independent agency created in 1974 by the Commodity Futures Trading Commission Act, which amends the Commodity Exchange Act of 1936. Under this act, the new commission becomes the regulatory agency over all commodity futures trading. Prior to the passage of the CFTC, futures in the United States came under the governance of the Commodity Exchange Authority, established in 1922.

The role of the CFTC is to protect consumers and those who trade in the futures markets from fraud and to ensure that markets remain sound and competitive. Under the terms of the law, the CFTC consists of a five-member board of commissioners, who serve five-year terms. Commissioners' terms are staggered, and no more than three members can be from the same political party. Members of the commission should have backgrounds in finance, market trading, or working with commodities. The chair is selected by the president and, like all commissioners, must be approved by the Senate. Commission officers are responsible for Freedom of Information (FOIA) requests, distribution of commission reports and other documents, and serving as a liaison with other agencies. The commission has four divisions: Clearing and Risk, Enforcement, Market Oversight, and Swap Dealer and Intermediary Oversight. The commission's organization also includes eight offices that advise and support commission programs and the board.

The commission has sole jurisdiction over accounts, agreements, and transactions related to commodities in the futures market. The jurisdiction is not all-inclusive, so the agency must work with the Federal Trade Commission and the Securities and Exchange Commission when the commodity falls under joint supervision. All persons who trade commodities must register with the commission, and it is the responsibility of the commission to maintain the records and investigate the backgrounds of all applicants. All applicants are responsible for keeping personal records related to their positions and accounts they manage, and for submitting reports to the commission. At any time, the commission can call for a hearing to investigate a trader and decide to revoke his or her license in the interest of protecting the public. The commission is responsible for establishing rules, regulations, and standards that govern commodities futures trading in the United States and for working out agreements with foreign countries in international markets.

The Commodity Futures Modernization Act of 2000 reauthorized the agency for five years and amended some of the agency's duties. The act resulted from the President's Working Group on Financial Markets' Report on Over-the-Counter Derivatives Markets, which recommended three areas that impacted the CFTC. If accepted, the recommendations would allow the CFTC to continue the practice of exempting nonagricultural commodities from the regulations called for in the Commodities Exchange Act, include oversight of companies involved in OTC derivatives, and encourage broad deregulation of the existing trading process. The final regulatory structure was tailored to the various markets, based upon the products and those who participated in the market trade. The final version of the act did not indicate that a swap agreement was a futures contract or a commodity option.

The CFTC governing legislation was updated in 2008 in the wake of the stock market instability caused by over-the-counter derivative markets and the failure of Enron. Further regulation under the Dodd-Frank Wall Street Reform and Consumer Protection Act (2010) gave the commission additional duties, and call for an overhaul of regulations related to securities and derivatives. The purpose of these new rules is to provide market transparency, reduce risk, and protect the American public. Under the new legislation, the commission has expanded enforcement authority that extends to regulating derivatives dealers, over-the-counter derivatives, and transparent trading of standardized swaps. The role of the CFTC in the economy has expanded beyond overseeing agricultural commodities. As an independent agency, it plays a key role in regulating financial institutions in the United States, so that investments made by Americans are made legally by financial traders who are answerable to the commission. In its regulatory role, the commission conducts oversight investigations into complaints, suspends licenses, and works with the Securities and Exchange Commission in a new partnership to protect American investments at home and abroad. The agency has transitioned from a time when commodities were traded on a small scale in various locations around the country to a time when transactions are made in seconds via the Internet and across the globe. The likelihood of fraud and criminal behavior that can impact the entire world justifies the regulation oversight of this agency.

Comprehensive Thrift Act

The Comprehensive Thrift Act, or the Comprehensive Thrift and Bank Fraud Prosecution and Taxpayer Recovery Act of 1990, is Title XXV of the Crimes Control Act of 1990. The purpose of the act is to strengthen the penalties for committing fraud in the financial sector. On November 29, 1990, President George H. W. Bush signed the Crimes Control Act, or Public Law 101-647, including the Comprehensive Thrift Act, a response to financial institution failures in the 1980s. Until the passage of this legislation, the government lacked the ability to locate and prosecute people who conducted criminal actions in banks, thrifts, and savings and loans. The law calls for the parties involved to return monies to taxpayers used to cover insured deposits. The act is related to antifraud legislation in the Financial Institutions Reform, Recovery and Enforcement Act of 1989. In response to the savings and loan crisis, Congress chose to expand regulation of the industry under the Federal Deposit Insurance Corporation (FDIC). Persons affiliated with financial institutions that fail or are in danger of failing have an increased responsibility for their role in the failure of the institution. Those who meet this category and are directly involved include directors, employees, and controlling shareholders. Those indirectly involved include attorneys, other shareholders, and accountants. Bank regulators can investigate anyone who participates in the operation of the institution.

The law restricts who can be affiliated with financial institutions. Prior criminal convictions can impact whether or not a person can fill certain roles in an institution. The FDIC and the financial institution must review all criminal histories of those affiliated with a financial institution, and criminal convictions under any one of 13 statutes can cause the FDIC to call for a 10-year wait period. One exception is if the conviction is reduced after a motion from the FDIC. A conviction also prevents the person from having direct or indirect controlling interest in the institution. Congress also amended the prison terms associated with bank crimes. In 1989, Congress amended the maximum prison term from five to 20 years, and under the Comprehensive Thrift Act, the time increased to 30 years. The law also increased the statute of limitations to 10 years for racketeer-influenced and corrupt organizations, and Department of Justice investigations into violations of bank statutes. Interference with investigations, hiding information, or committing similar acts could lead to a fine and jail time up to five years. Persons described as financial crime kingpins may receive 10 years to life and a $10 to $20 million fine, if found guilty of meeting the definition of a kingpin and accumulating $5 million over a two-year period.

Persons who are involved with the failure of a financial institution are held financially responsible under this new law. Congress revised the Bankruptcy Code so that those affiliated with failed institutions could not declare personal bankruptcy to clear the debt. In addition, regulatory agencies can freeze personal assets of those involved until the case is settled and all penalties are paid. The law also made major changes to the golden parachute practice, based upon prior FDIC experience with the savings and loan failures. Before, the FDIC had no way to restrict bank executives from taking sums of money under the pretext of an indemnification plan. Under the new law, the FDIC can prohibit payments from institutions in danger of failure until they receive approval. This does not impact retirement plans and related packages and is intended to make such packages more reasonable. Under this legislation, the FDIC has to investigate the recipient of the package to see if he or she has either a criminal record or if his or her practices led to the institution's problems. This revised process saves the taxpayers huge sums of money. The purpose of this landmark legislation is to further regulate the banking industry and prosecute white-collar crimes. Executives in the banking and savings and loan industry operated under lax regulations, leading to practices that caused the failures of numerous savings and loans. This law tightened up the loopholes and made people accountable.

Computer Fraud and Abuse Act

Computer-related crime grew exponentially throughout the 1990s. Going into the 21st century, computer-related crimes became more prevalent and diverse. The primary federal statute used in combating the various types of computer crime is the Computer Fraud and Abuse Act (CFAA) 18 U.S.C. § 1030(a)(1)-(a)(7). The CFAA is a law passed by the U.S. Congress in 1986, intended to reduce cracking of computer systems and to address federal computer-related offenses. The act governs cases with a compelling federal interest, where computers of the federal government or certain financial institutions are involved, where the crime is interstate in nature, or where computers are used in interstate and foreign commerce.

It was amended in 1989, 1994, 1996, 2001 by the USA PATRIOT Act (2002), and by the Identity Theft Enforcement and Restitution Act (2008). The CFAA criminalizes actions conducted against computer systems in cases where there is a compelling federal interest, including government computers, computers of financial institutions or used for interstate or foreign commerce, and computer crimes that are interstate, such as those conducted through the Internet. The CFAA is not a comprehensive set of laws but rather provided or modernized laws for areas not already addressed by federal criminal law.

Penalties

Though primarily concerned with defining computer-related criminal activities and assigning criminal penalties thereto, the CFAA also provides a private right of action in subsection 1030(g), allowing civil lawsuits to be pursued against those who access private computers without authorization. Broadly, what is criminalized is the intentional and unauthorized access of a computer, though the broadest interpretation of the law had been rejected by the Supreme Court. Specific crimes identified by the CFAA are enumerated in subsection 1030(a): accessing a computer for the purposes of espionage; accessing or exposing protected information dealing with credit, financial, and government institutions; unauthorized access to a government computer; using unauthorized access to a computer for the purposes of fraud; damaging a computer of a type protected by the CFAA, which includes but is not limited to the use of viruses and denial of service attacks; trafficking in passwords providing access to protected computers or in a way that affects interstate or foreign commerce; or threatening to damage a protected computer.

Subsection 1030(b) criminalizes any attempt or conspiracy to commit the offenses delineated in 1030(a), while 1030(c) defines the penalties for such crimes. Subsections 1030(e) and 1030(f) are standard sections providing definitions of terms used and allowing exceptions to the law for criminal investigations. The 1984 Comprehensive Crime Control Act established credit card fraud and computer crimes as falling under the jurisdiction of the U.S. Secret Service, and 1030(d) affirms this. The Secret Service's powers in this area were extended by the October 26, 2001, passage of the USA PATRIOT Act, which tasked the agency with creating a network of Electronic Crimes Task Forces concerned mainly with computer crimes that target infrastructure, have significant economic impact, involve identity theft, or rely on the use of a new technology. An early success of the ECTFs was Operation Firewall, a year-long operation culminating in the arrest of 28 suspects responsible for the theft of 1.7 million credit card numbers and account information.

Given that the CFAA is a federal statute, federal sentencing guidelines govern these sentences. In 1996, Robert Morris, a Cornell University graduate student, was the first person prosecuted under the CFAA. Robert created a worm (a computer virus) that infected over 6,000 computers across the United States. He was sentenced to three years on probation, fined over $10,000, and ordered to perform 400 hours of community service. The public was not pleased by the light sentence. In 1997, Congress directed the U.S. Sentencing Commission to provide for a minimum of six months of imprisonment for defendants convicted under sections 1030(a)(4) and (a)(5).

Although there have been a limited number of criminal actions based on the statute, the CFAA also has a civil component—§1030(g) of the statute provides a private right of action. These cases have presented courts with many opportunities to consider the evolving world of computer and Internet use, especially in the workplace. The understanding of "unauthorized access" has created the most controversy. A U.S. appeals court rejected the government's broad reading of the

CFAA in April 2012. The CFAA has been used to prosecute workers who steal from company computers, but the 9th U.S. Circuit Court of Appeals in San Francisco stated that such use could expose millions of Americans to prosecution for harmless activities at work. The 9–2 decision diverges from broader readings of the federal Computer Fraud and Abuse Act by three other federal appeals courts. This raises the chance that the U.S. Supreme Court might attempt to resolve the issue in the near future.

Computer Hacking

Computer hacking entails gaining unauthorized access to computers or computer systems. Internet Web sites and books can describe how to hack, though most significant computer hacking occurs by those who are highly skilled and motivated to achieve their goal. A controversy exists with computer hacking in exploring its necessity to secure computer networks (ethical) and infiltrating computer systems illegally with malicious intent (criminal). The limited resources to investigate and prosecute hackers, if they can be identified, place hacking in the category of white-collar crimes, like most computer crimes. This process can have detrimental effects on corporations and critical infrastructures because computers and systems can come under the control of the hacker.

It is possible that the first hackers were young male phone operators who were would conduct pranks with the switchboards to create chaos for phone users. Engaging in unethical, disruptive, or criminal behaviors that impact numerous people tends to be a marker of a hacker. Today, computer hacking centers on the use of computers and the Internet to gain illegal access to an individual computer or business computer system. Permission to infiltrate a computer system is typically not given, and the intent of what a hacker does once he or she has access to the computer or computer network is concerning.

Federal and state laws exist to make computer hacking an illegal act. The Computer Fraud and Abuse Act (CFAA) of 1986 treated computer-related crimes as a federal issue. All computers connected to the Internet are protected, as well as computer activities. The National Information Infrastructure Act of 1996 extended the protections of the CFAA to make viewing information on a computer without permission a crime, instead of the CFAA requirement of a financial gain from the illegal act. The Cyber Security Enhancement Act (2002) increased the penalties under the CFAA. The Digital Millennium Copyright Act of 1998 makes it illegal to circumvent technical mechanisms that protect copyrighted material like music CDs. States have passed various laws that enhance the federal acts or mimic the federal mandates.

Types of Hackers

Depending on the field of study and focus of content, there are numerous types of hackers. Although many people who would be labeled as hacker do not call themselves such or consider their practices illegal, their intent and skill level place them in a group. The intent of the hacker is debated because the act of hacking is an illegal practice, though mitigating factors do arise. Persons who hack into a computer or a computer system with a malicious intent are referred to as "crackers" or "black hats," depending on their discipline. Individuals who have few hacking skills or use hacking information on Web sites can be referred to as "script kiddies." Persons with a computer science degree or a formal relevant college degree are referred to differently, based on their intent. Hackers who engage in hacking for the "public good" are referred to as *hactivists, white hates,* or *ethical hackers*. Professionals whose job is to engage in computer hacking are placed into another group.

One of the first computer hackers arrested and prosecuted for engaging in illegal acts to hack computers was Kevin Mitnick. He was arrested in 1995 for various computer-related crimes such as illegally accessing computer networks of major corporations, wire fraud, and computer fraud. He spent time in prison, and upon his release, he had court-ordered limited Internet access. Once he completed his supervised release, Mitnick started a consulting firm for security professionals and wrote three books on his experiences.

Each year, more and more individuals engage in computer hacking and are prosecuted for their actions. Teenagers, organized crime groups, state officials across the globe, and professionals are entering the practice of computer hacking, some with more success than others. As courts gain more experience and knowledge of computer hacking, the fear in prosecuting offenders has lessened, bringing more charges forward, though knowing the identity and location of the offender is still problematic because of global access to the Internet and the anonymity provided online.

The opportunities provided by computer hacking are now recognized by organized crime and terrorist groups. Cyber terrorism is a real threat for many countries, with the possibility of disabling an entire country through the use of the Internet. With computer hacking information provided online and in numerous how-to books, there is concern about growing numbers of hackers. Although hacking requires much knowledge and skill to undermine federal agencies, this has been done more than once to various countries' top federal agencies.

Hacking Techniques

There are numerous techniques used in computer hacking. Mitnick wrote about his experiences with social engineering, which is the process of gaining trust in people who have relevant information to help access a computer or computer system. There are numerous forms of harmful software programs or malware that are used in computer hacking. Virus-writing programs set out to replicate and attach themselves to other programs to enter another system. The Melissa virus caused used e-mail addresses from its user to send an e-mail with an attached virus. The virus would replicate itself in the e-mail addresses to bombard a computer or system. A worm is similar, but it can replicate alone and can send itself to other systems. The Lovebug worm of 2000 was delivered to computer users by their friends. In 2010, Stuxnet was discovered as a cyber weapon, designed to infiltrate and significantly impact

As a guest instructor at the Wilmington, Delaware, 2010 U.S. Cyber Challenge Camp, which trains college students to become world-class cyber-security experts, Virginia Tech University graduate student John Paul Dunning built this "Nerf rifle" hacking device. It uses two potato chip cans as directional antennas, one to sniff wireless traffic and the other to sniff Bluetooth traffic. It also contains a GPS antenna and small notebook computer to drive all of the equipment and collect data. Its range is slightly over half a mile.

Iran's nuclear program. A Trojan horse appears to be a legitimate program, though there is a hidden destructive component in the software. Denial of service attacks can flood a network with traffic to prevent computer users from accessing the service or site. Web site defacement can be used to gain access to a Web site to corrupt its content. Within each of these techniques, the skill level and sophistication of the malicious act can vary significantly, from copying or pasting from a Web site to an entire Web site shutdown, or critical infrastructures manipulated to harm people.

The technique used depends on the desired outcome for the computer or computer system. Some consequences of these acts are an inconvenience for the user but are not detrimental for the computer. Others can be a public concern for safety and well-being when critical infrastructure computer systems are hacked into.

In 2009, spies from other countries were able to gain access to a U.S. electric grid, though no damage was done by their exploration. It is predicted that a hacker or hacking group could gain access to power grids, sewer treatment plants, or other critical infrastructure. This is a struggle for the government because most infrastructures are privately owned, so a public–private relationship must be fostered.

Because computer crimes are considered white-collar crimes, focus and resources tend to be held in other criminal endeavors. There is debate among experts of the seriousness of computer hacking, as well as its ethical position. Computer hacking can be viewed as necessary to help strengthen computer security for computers and computer systems, though the actions are illegal. The intent of the act becomes paramount to the discussion. The consequences of computer hacking can be detrimental for individuals and society as a whole, which is a characteristic of many white-collar crimes. As various cybercrimes continue to rise each year, computer hacking will continue to be a viable skill and asset for online offenders.

Conflict Theory

Conflict theory is a perspective in the behavioral sciences that explains that the social world is in a continuous state of change because of its broad spectrum of inequality among many parts. This paradigm explores how society stratifies its members by variables such as gender, race, ethnicity, and class. Furthermore, conflict theorists aim to make generalizations and draw conclusions regarding the correlations between such variables and varied manifestations of unequal distributions of resources, power, and prestige. The conflict theoretical paradigm examines social life from the perspective that its vast parts exist in a continuous struggle for that which has been regarded as valuable and scarce. Contrary to structural functionalism, disharmony and inequality drive the social world. Collective behavioral change and social movement typically result from such dissent.

Conflict theory emerge partially in response to capitalism's effect on the lower social and economic classes. The proposed theory assumes the proletariat position that represents a numerical majority. During periods of economic downturn, the growing number of people excluded from the workforce typically reflects broad structural problems beyond the individual's control. Capitalism can be defined as a belief in the ideal of yielding maximum production, from minimal producers, for the lowest costs, as efficiently as possible. Although capitalist economic systems have a variety of forms because of differences in regulatory mechanisms, such systems produce structural economic advantages for the elite, who have a favorable social location. However, economic hardship becomes increasingly likely for the excluded masses. The pluralist concept idealistically serves society as the ultimate requisite for democracy. However, the reality of pluralism fails to produce societal equality because of its tendency to result in an elitist conclusion. Pluralism masks intergroup power dynamics. Through socialization, the powerful become desensitized to their role as beneficiaries from others' oppression.

Mechanisms for Social Control

Conflict theory remains continuously relevant as society and its accompanying institutions exist on a trajectory of relatively rapid change. Such a theoretical paradigm recognizes that social control relies on both external and internal mechanisms. External mechanisms include legislation that conflict theorists view as favoring societies' most privileged because their perception deems laws as collectively designed to prioritize protecting private property and capital. Conflict theorists view public policy as influenced more by lobbyists, special interest groups, and political action committees (PACs) than by common voting constituents. In the case of a criminal trial, the wealthy have the advantage of using their resources to hire highly experienced attorneys with proven track records of success, purchase settlements outside court through negotiations, and use bargaining power in an attempt to lessen charges. Persons of lower socioeconomic classes have an increased likelihood of lacking resources to post bonds or to finance a legal defense, and furthermore suffer lost wages because they are detained for weeks or months prior to their trial date.

Voluntary control functions as an internal mechanism for behavioral modification and criminal deterrence. The mass media and their host institutions, such as politics, the economy, and education, play a role in regulating ideas and information for the purpose of mass consumption. These institutions collectively influence individual preferences, actions, and values. A conflict theoretical perspective views such voluntary controls and their various agents as means to distract the masses from macro-level forces that contrast with their broader self-interest for social progress and upward socioeconomic mobility.

For white-collar and corporate criminals, conflict theory stresses that such offenders receive a degree of invisible structural protection against negative sanctions. For example, informants or other forms of status quo opposition become subject to a swift and harsh backlash. Those who attempt to disclose the complex legal system as lacking objectivity, justice, and fairness risk being labeled as "radical." Second, corporate criminality typically comes from powerful vantage points. Protecting their honor becomes a greater priority than the victims of such criminals. Furthermore, the wealthy have the economic means to avoid character defamation. According to the U.S. Bureau of Justice Statistics, approximately half of white-collar criminals avoided prison sentences. Conflict theorists view white-collar crime as illegitimate activities that typically exist beyond the access of lower socioeconomic classes. Compared to the common person, physicians, for example, have greater access to documents that could lead to Medicare fraud. Likewise, the average person lacks the capability to manipulate the price of stocks, to practice large-scale tax evasion, or to embezzle revenues while purging the records through false bookkeeping. Ultimately, conflict theorists view the white-collar criminal as likely to have broad and subtle victims, disproportionately hurting the poor and the lower-middle class.

A critical response to conflict theory stresses that some positive results have been obtained for the common person, such as consumer protection policies, "right-to-know" legislation, worker safety laws, and market regulation, which in some cases contrast with the elite's self-interest for the "common good." Because of its overemphasis on the structural causes behind crime and deviance, conflict theory is unable to explain criminal behavior as stemming from intrinsic causes such as ill will, delusion, or psychological disorders. Because conflict theory typically focuses on consequences behind inequality and the quest for collective change because of rising discontent, the theory overlooks the idea that moderate social compromise and peaceful negotiation do exist in some social sectors, despite macro-level social, political, and economic disparities.

Consent Agreements and Orders

White-collar crimes are frequently resolved by the use of consent agreements and orders. Variously referred to as *consent agreements, consent orders,* or *consent decrees,* they are legally binding agreements that are voluntarily entered into by the parties in a legal dispute. Given that white-collar crimes are often perpetrated by business entities, rather than single individuals, civil lawsuits are often the vehicles used to attack the perpetrators. Civil suits are generally more useful in punishing the behavior of organizations than are criminal complaints for a number of reasons; for example, there is no upward limit on the amount of monetary damages that can be assessed in a civil case, whereas criminal fines are traditionally low. Moreover, the burden of proof is lower in civil cases.

Consent orders and agreements provide a convenient means to settle civil litigation, backed by court oversight and enforcement. Consent orders and agreements are governed by state and federal laws, which differ by jurisdiction. Consent orders allow the disputing parties to settle complaints expeditiously, without having to take the matter to trial and wait for the court's final judgment. With a consent order, the parties settle the case with the approval of the court that would have jurisdiction over the matter if it went to trial. The court must agree to the consent order for it to be valid. The court cannot force the parties to forgo their right to pursue full adjudication through trial; however, once the court has approved the consent order, it is legally binding on the parties.

The court then has the power to oversee the enforcement of the order and impose sanctions on any party who does not comply with the terms of the order. Consent orders can be entered into for the purpose of resolving all of the issues in the case, thereby ending litigation. Consent orders may also be entered into for the purpose of resolving only selected issues in the case, while the case continues to progress toward a trial, without determining the ultimate outcome of the case. This latter type of agreement is known by the terms *interlocutory consent agreement* or *interlocutory consent agreement order*.

Saving Time and Money

The consent order is popular with both the government and alleged white-collar criminals as a means to resolve legal issues because it saves time and money for both sides. If an organization or individual has failed to comply with regulations, the government could file an aggressive lawsuit, but then offer to drop it if the allegedly offending party immediately begins complying with the regulations and accepts other terms of a consent agreement. The government accomplishes its goal of speedy regulatory compliance without the costs of lengthy litigation. In turn, the alleged offender also avoids litigation costs while at the same time averting hefty damages that may have been assessed by the government had the lawsuit progressed to trial.

The U.S. government took this tactic to force against Ellerbe Becket Inc., an architectural firm, to comply with the Americans with Disabilities Act (ADA) and stop designing sports stadiums that were inaccessible to wheelchairs. After the government filed suit in federal court against Ellerbe Becket in 1995, alleging multiple violations of the ADA, the firm quickly entered into a consent agreement and changed its practices.

In another example, a consent order was used to resolve a charge that certain banking institutions were charging different broker rates for home buyers, depending on their race. The U.S. government filed a complaint against AIG Federal Savings Bank and Wilmington Finance, alleging that they violated the Fair Housing Act and the Equal Credit Opportunity Act by charging African American borrowers higher broker fees than white borrowers. The parties filed a consent order in 2010 with the U.S. District Court of Delaware wherein, without admitting guilt, the banks agreed to change their policies and procedures, establish a settlement fund, and be monitored by the court for three years. Although in theory this case could have been charged and prosecuted as a civil rights violation, the best way for the government to quickly put a stop to the unwanted conduct was to enter into a mutually acceptable, court-enforceable consent order. Consent agreements and orders are also popular tools for licensing commissions and boards. If a licensee, such as an attorney or doctor, engages in wrongdoing that could be subject to disciplinary proceedings, the licensing commission may choose to issue a consent order in which the licensee agrees to sanctions, such as censure or suspension of his or her license. This allows the parties to avoid a full administrative hearing. As in other arenas, using consent orders provides for quick and inexpensive disposition of the case, with the added advantage of ongoing oversight by the commission.

Conspiracy

A conspiracy is an agreement between two or more individuals to commit a crime. Depending on the jurisdiction, the crime may be a felony or a misdemeanor. While some jurisdictions only require the agreement, most jurisdictions require that there must also be an overt act committed by one of the individuals that is in furtherance of the agreement. As a result, two crimes are committed. The first is the conspiracy (to commit a crime), and the second is the underlying offense that the individuals agreed to commit. Examples of underlying offenses include murder, robbery, embezzlement, drug smuggling, and the distribution of stolen property. A conviction for conspiracy does not require a conviction for the underlying offense (*Clune v. United States*, 159 U.S. 590, 1895). Each conspirator is liable for the foreseeable acts of his or her co-conspirators, even if the acts and parties are unknown (Pinkerton's Rule: *Pinkerton v. United States*, 328 U.S. 640, 1946). The Model Penal Code (Section 5.03 Criminal Conspiracy), drafted by the American Law Institute, does not accept the Pinkerton Rule. In addition, statements of one co-conspirator are admissible against his or her co-conspirators. A conspiracy may also "exist even if co-conspirators do not agree to commit or facilitate each and every part of the substantive offense" (*Salinas v. United States*, 522 U.S. 52, 63, 1997).

Types of Conspiracies

There are two basic types of conspiracies: chain and wheel. A "chain" or "link" conspiracy is a linear relationship that involves several individuals who act in concert to achieve a common goal. A common example is the production, refinement, smuggling, and sale of narcotics in the United States. The common goal is the sale of illegal drugs, and each individual is part of the drug conspiracy. This is similar to conspiracies during Prohibition regarding alcohol production and sales. The question arises as to whether there is a single or multiple conspirators in a linear arrangement. In *Blumenthal v. U.S.*, 332 U.S. 539 (1947), a post-Prohibition liquor case, Blumenthal challenged his conviction of a conspiracy to violate the Emergency Price Control Act. In this case, Blumenthal and other salespeople sold liquor above the controlled price for all of the parties (salesperson, known owner, and unknown owner and divided the additional money among the group. The Court found that there was a single conspiracy supported by 10 overt acts.

A "wheel" conspiracy, also known as a "hub-and-spoke" conspiracy, receives its name from the visible structure of the conspiracy and its participants. In this case, there is a central figure, much like the hub (center) of a wheel, who reaches out to various individuals, who work with this person to commit a crime. In a drug case, a dealer works with various runners or street dealers to sell the drug product; these individuals share a common objective, as stated in *United States v. Brown*, 587 F.3d 1082, 1089 (11th Cir. 2009):

> To sustain a conviction for conspiracy to distribute narcotics (21 U.S.C. Section 846) the government must prove (1) that an agreement existed between two or more people to distribute the drugs; (2) that the defendant . . . knew of the conspiratorial goal; and (3) that he knowingly joined or participated in the illegal venture.

Wharton's Rule

Although a conspiracy requires an agreement between two or more individuals, conspiracy cannot be charged where the minimum number of individuals necessary to commit a crime is two. This is known as Wharton's Rule and is also known as the Concert of Action Rule. It is explained in *A Treatise on the Criminal Law* (1846), written by Francis Wharton. Examples of such substantive crimes that require at least two individuals to commit the underlying offense are prostitution and gambling. However, a pimp and his or her prostitutes can engage in a conspiracy to commit prostitution before the purchaser, or "John," becomes involved in the crime. In *Iannelli v. United States*, 420 U.S. 770 (1975), the Court recognized that there are also crimes where a minimum of five individuals is required for federal jurisdiction over the underlying offense, but this would not mean that five individuals are necessary to complete the underlying offense (Title 18 U.S.C Section 1955). As noted in *Iannelli,* the rule traces its origin to the decision of the Pennsylvania Supreme Court in *Shannon v. Commonwealth,* 14 Pa. 226 (1850), a case in which the court ordered dismissal of an indictment alleging conspiracy to commit adultery that was brought after the state had failed to obtain a conviction for the substantive offense.

Statutes

There are conspiracy statutes in both federal and state criminal codes. The primary conspiracy law within the federal code is Title 18 of the U.S. Code—Crimes and Criminal Procedure, Section 371—conspiracy to commit offense or to defraud the United States. The statute states the following:

> If two or more persons conspire either to commit any offense against the United States, or to defraud the United States, or any agency thereof in any manner or for any purpose, and one or more of such persons do any act to effect the object of the conspiracy, each shall be fined under this title or imprisoned not more than five years, or both.

There is a separate conspiracy law that applies to drug conspiracies. Title 21 of the U.S. Code related to food and drugs, Section 846—Attempt and Conspiracy, states the following:

> Any person who attempts or conspires to commit any offense defined in this subchapter shall be subject to the same penalties as those prescribed for the offense, the commission of which was the object of the attempt or conspiracy.

There are many other statutes that include a conspiracy section within the definition of the substantive offenses. Sections 1831 and 1832 concern the protection of trade secrets, and both of these sections contain provisions for conspiracy to violate the law.

Defenses

The defense against a charge of conspiracy is withdrawal. However, the defendant must effect the withdrawal before an overt act is committed in furtherance of the conspiracy. The major problem for the defense is that the crime of conspiracy, unlike the underlying substantive crime, is committed with the completion of the overt act. Crimes like burglary and kidnapping require completion of the substantive crime; all the elements must be met, or only attempt can be charged after substantial steps have been taken to commit the offense. This is why a conspiracy is so easy to charge and convict, and is difficult to defend against.

Consumer Deaths

In white-collar and corporate crime, a variety of victims can be distinguished: the state, competitors, citizens, employees, animals, the natural environment, and consumers. This last category has received little attention in criminology until now. The lack of knowledge about consumer victims contrasts with the fast-growing international consumer market. The general reasons why victims of these white-collar and corporate crimes struggle to have a place in the criminological discourse also concerns consumer victims: The injurious activities are not criminalized, consumers are not aware of the external cause of victimization, consumers lack the expertise to understand who is guilty, companies are too powerful to be accused of a crime, and governments are careful in making harmful companies a political topic. A specific reason why consumers have difficulty being recognized as victims is the connotation of choice or free will related to consuming. Consumer victims are often considered to have free choice in consuming or not, and in what they consume. This brings up the old criminological concept of victim precipitation, which means that victims contribute to their victimization. This complicates the ability of consumer victims or their relatives to receive retribution or compensation.

Characteristics of Consumer Deaths

A first characteristic is the unknown number of consumer deaths. People can die after a long period of illness without really knowing the cause, or they may be aware of the cause without announcing it publicly. The global effect of marketing an injurious product worldwide makes estimating the percentage of consumer victims more of a "guesstimate." The international distance between consumer victims hampers communication about the injurious effect and the eventual collection of victims to take action. New multi-media, however, have facilitated the distribution of information about injurious products.

Injurious products don't need to have immediate effects after consumption. In some cases, it takes years before the effects are visible. The pharmaceutical product diethylstilbestrol, or DES, was a synthetic hormone distributed between 1950 and 1980 to women worldwide during pregnancy to avoid miscarriage or early birth. The medicine had serious physical effects, not only for the mother but also for the children in their teenage years and for the grandchildren. It increased the risk of infertility for these mothers and their daughters, caused genital deformations, and increased the risk of cancer for mothers and their children. In many DES cases where children were the victims, the first symptoms of cancers became visible 15 years after their mothers took this pill. Another example of slow victimization of consumers is the fast-food victim. One of the main diseases and causes of death in Western countries is obesity. Obesity has a higher risk than heart disease, cancer, asthma, and many other illnesses. It is one of the main preventable causes of death in Europe and the United States at the moment. In the United States, people suffering from obesity have accused fast-food producers of creating the false impression that their food was nutritionally beneficial.

Consumer victims bear a gender differentiation. The marketing of consumer products to women makes this gender category more often the victim of consumer products than men. Far more women are victims of pharmaceutical products. This can be explained by the medicalization of the female body. A pill or a medical treatment has been produced for every biological change of the body during a woman's life. Diet pills, medicines for pregnancy, pills to prevent pregnancy, painkillers during childbirth, pills to go through the menopause, cosmetic surgery—all of these treatments purportedly help women to have a pleasant life. For every category of pill or treatment, however, there is an example of consumer victimization, with dramatic effects.

Consumer victimization has a connotation regarding free choice that makes it difficult for victims to be acknowledged as a victim, and to prove that they have a right to retribution. Two extremes may be distinguished on the continuum of consumer victims: the consumer victims who couldn't know the risks of the product and whose victimization was beyond their control, and the consumer victim who must have known about the injurious effects of the product because it is general knowledge. This is the case for all accidents that happen because of a hidden fault. One example in the automobile industry is the case of the Ford Pinto, a car produced by Ford Motor Company between 1970 and 1980. A total of 27 deaths were attributed to the poor construction of the Ford Pinto. A more recent example is the high failure rate of Firestone tires installed on different makes of cars, including Ford vehicles. Tire failures are estimated to have caused 250 deaths and more than 300 serious injuries. People who buy a new car trust that all safety measures have been taken by the producer, and only the engineers have the scientific knowledge to guarantee the safety of the car driver. These consumer victims cannot be blamed for their victimization.

At the other end of the continuum are consumer victims who are informed about the injurious effects of a product. These victims are partly accountable for the injurious effects, while the producing company remains guilty because it deceives the consumer with misleading advertisements or false information. Smokers have accused cigarette producers for being dishonest about the ingredients of their products, while obesity patients have blamed fast-food restaurants for their aggressive advertisement mainly toward children. In both cases, consumers know that regular consumption of these products is harmful. Every lawsuit against cigarette producers or fast-food restaurants involves a legal controversy about who is the most responsible for the injury.

In October 2012, the U.S. Food and Drug Administration (FDA) reported that Monster Beverage Corp.'s energy drinks had been cited in the deaths of five people in the past year, according to incident reports submitted by doctors and companies. A couple in Maryland filed suit against the company in October 2012, claiming that the drinks led to caffeine toxicity that killed their 14-year-old daughter. Energy drinks like Monster aren't bound by FDA guidelines for caffeine in sodas because they are often sold as dietary supplements.

Although blaming the consumer victim is sometimes partly acceptable, in most cases, it is used as a neutralization technique: Companies try to get rid of the responsibility for harm by blaming the consumer victim. An example is the case of amphetamine-based diet drugs that caused dramatic heart and lung failures. Pharmaceutical companies and doctors defended themselves by referring to the free choice of people to take the easy way for losing weight. In this case, the consumers merely trusted the companies that these medicines were safe.

While some company activities have unhealthy effects only in wealthy countries, they may have a fatal effect in less economically developed countries. Breastfeeding has a monopoly position in infant food production because it is free and contains all the nutrients that a baby needs. From 1970 on, the infant formula producer Nestlé has been accused by campaigners for unethical promotion of its products in less economically developed countries. Campaigners who set up a boycott against the use of Nestlé products claimed that the producers contributed to the death of millions of babies born in poverty. About 1.5 million children die every year because of malnutrition. One of the reasons is that women decide, influenced by promotion, to feed their baby after childbirth with breast milk substitutes. The problem with infant formula is that they have to buy the powder, they need clean water to prepare the formula, and they lack the ideal conditions for conservation. The United Nations Children's Fund estimates that babies fed by infant formula have six to 25 times the probability of dying of diarrhea than breastfed babies.

An improper category of consumer victims is people who risk death because of the consumption patterns of others. An example is the habit of Western people of eating meat. Scientists warn that if people continue to consume the same amount of meat as today, in 2050, the world will suffer a shortage of water. The first victims will be people who live in less economically developed countries, where drinking water is scarce. Another category of consumer victims is people who are not able to consume life saving products because of the price of the product. An example is the increase of the price of human immunodeficiency virus infection/acquired immunodeficiency syndrome (HIV/AIDS) inhibitors because of the strengthening of international patent protection by the World Trade Organization. Less economically developed countries are used to obtaining generics, which could be marketed for lower price. After the strengthening of the law, these countries had to respect the patent protection legislation. The measure led to social protest and court cases against the producers of AIDS inhibitors.

Consumer Deaths and Retribution

The most important difference between white-collar and corporate crime, versus traditional crime, is the economic and social importance of companies for a country. The economic and social significance of companies put governments in a dubious position: They have to protect the market to ensure employment. On the other hand, they have a duty to protect people against injurious products. In the history of white-collar and corporate crime research, the critique of governments for their restricted intervention to stop companies from producing injurious products and to sanction responsible companies is constant. Companies that violate the criminal code are only occasionally sentenced, and many company activities are known to be risky but are accepted. Most cases are brought before civil courts, even cases where the violation of the criminal code is obvious. Common law has an alternative in civil court by means of punitive damages for this kind of decriminalization. Punitive damages are imposed on the defendant who has been found guilty. Because the amount exceeds the compensation rate, it has a punitive character. Punitive damages are intended to reform or deter the defendant and it can redress the injury of the plaintiff. In continental law, it is unacceptable to use the civil court to punish a defendant. A civil court case aims to compensate the victim if the plaintiff succeeds in proving the damage as well as the causal relation between damage and the product.

For consumer victims, even a civil court case is often an agony. The reasons are manifold: Victims do not succeed in proving the causal connection because they lack the scientific background, they cannot afford to bear the costs of a long court case, or they cannot stand the emotional weight of a long procedure. For these reasons, consumer victims often accept to settle the case out of court.

This makes the procedure easier for both parties. Because it happens in private, settlement out of court also contains a risk for the less powerful party to not receive just compensation.

One solution to strengthen the position of the consumer victim or his or her relatives is the class-action lawsuit, a legal instrument that allows victims to claim collectively. One of the plaintiffs, a solicitor or another representative, collects the claims of all consumer victims and represents this collectivity in civil court or out of court by a settlement. The class-action lawsuit is often used in the United States. In European civil law, this arrangement was unknown until recently, but changes have been made that allow consumer groups to bring claims on behalf of large groups of consumers. The advantage of the class-action lawsuit is that consumer victims can share the burden of proof and the costs of the procedure. It can make thousands of small claims into one substantial claim that may have a preventive effect for the future and for other companies. An unintended side effect is the restraint of companies, doctors, and other professional groups to offer their services out of fear of becoming the object of a class-action lawsuit.

Consumer Activism

Another means to strengthen the position of the consumer victim is the support of a consumer organization. This can be a rather informal collection of consumer victims or a more formalized organization that represents consumer victims. Until recently, it was hard for consumer victims to meet and set up a movement because the consumer victims were spread around the world. Since the advent of social media, there has been a boom in consumer activism. Consumer organizations can inform people who are not aware of the risk of some products or who are not aware of the connection between their health problems and the product. Consumer organizations can also help support consumer victims in a court case, in the background, by providing expertise or moral support, or on the front line by leading a class-action lawsuit. Consumer organizations can also put pressure on companies. Consumers have the power to play a counterforce against companies because as consumers, they can directly affect the profit of the company. In order to put enough pressure on the company, collective action is needed, as with the Nestlé boycott resulting from aggressive advertisement for infant formula in less economical developed countries.

Every social movement needs a crusader, one person who sets up and moves on the consumer movement. The most famous consumer activist is Ralph Nader, an American consumer advocate who started his activism in the 1950s by blaming the American automobile manufacturers for violations of safety rules. He published his complaints in 1965 in his book *Unsafe at Any Speed*. He continued his consumer activism and became a crusader of the environmental movement and against nuclear energy. His activism is based on informing people and the government by writing well-documented reports. He also tried to break into the political power block by running several times as the presidential candidate.

Consumer Product Safety Commission, U.S.

The Consumer Product Safety Commission (CPSC) is the independent federal regulatory agency created in 1973 to regulate the safety of products made and sold in the United States. The agency serves to protect consumers against injury caused by consumer products, including many structural items. Authorization to establish the commission came from Public Law 92-573, or the Consumer Product Safety Act of 1972, signed into law by President Richard Nixon.

The initial force that led to the creation of this agency was the "Final Report of the National Commission on Public Safety," published in 1971. The product of a two-year study, the report showed that many accidents and deaths from consumer products could be prevented with better standards, regulation, education, and oversight by a government agency. The law established a five-person commission, on which members serve seven-year terms. Members must not be affiliated with a consumer industry by employment or investment. From a political party standpoint, no more than three members can be from the same political party, thus preventing politicization of the commission. A newly elected president cannot remove the members and chair of the commission, like other executive branch offices, at the beginning of his or her term in office.

The commission also has a Product Safety Advisory Council, which consists of 15 members from local, state, and federal levels of government. Members of this group have product safety knowledge and affiliations. Members are divided equally between industry, small business, and industry organizations, and they convene at least four times a year to propose rules for consideration. The purpose of the council is to advise the commission, whose membership cannot be from industry. In its regulatory role, the commission assumes the responsibility for existing laws related to consumer products and their enforcement. These include items covered by other laws like hazardous substances, flammable fabrics, refrigerator safety, and poison prevention. The law gave the commission strong powers to oversee industries as they try to regulate them. When a product is placed on the market and is determined hazardous, the commission can enforce compliance through a variety of sanctions and court injunctions. The agency works with industry to enforce testing for safety of products produced for all ages. Importers are also held to these standards when bringing items into the country for sale to the American public. The responsibility for consumer safety lies with the manufacturer, not the consumer, whose use of a product might not be entirely appropriate. The commission works to educate users to make better-informed decisions.

Tracking Trends in Consumer Accidents

The CPSC examines trends in consumer accidents and uses the information to write regulations to make changes to the design of products. Safety standards are not written solely by the commission because by law, it must consult industry. This is a difficult process because industry writes the standards and the commission must be alert for abuse. The commission polices industry and tracks accident reports. The agency will issue recalls for particular items. Recent examples include baby slings that could cause small infants to suffocate, drop-side baby beds that could trap children, and defective car seats. In some cases, the problem is around for many years, and a spike in the number of accidents leads to the recall and change in standards. Today, cribs sold in the United States cannot have drop sides and must meet strict safety guidelines. The commission recognizes that industry needs to do more to protect consumers and take responsibility for the products put on the market. Industry cannot assume that consumers will use a product the way that it was intended.

In 1972, Congress created the Consumer Product Safety Commission to oversee enforcement of product safety laws and regulations in the United

States. Additionally, the commission is charged with educating the public about the proper use of consumer products and notifying them about items on the market that need to be recalled. This nonpartisan commission is in a position to greatly influence industry and consumer safety in a time when many products are imported from other countries.

Consumer Product Safety Commission Act

The Consumer Product Safety Commission Act created the Consumer Product Safety Commission (CPSC) to oversee regulation of consumer products in the United States. The act was sponsored as Senate Bill 3419 in the 92nd Congress after the release of a report on a two-year study by the National Commission on Product Safety chaired by Arnold B. Elkind, detailing the numbers of injuries caused by consumer products. President Richard Nixon signed the law on October 27, 1972, creating an executive branch independent agency to regulate product safety. The act impacts manufacturers, distributors, retailers, and citizens via the actions of the commission and its advisory council. A five-member commission is appointed by the president for individual seven-year terms and is responsible for regulating consumer products. Under the guidelines in the law, the members cannot have any professional or financial ties to industry, and no more than three members on the commission can be from the same political party. Commissioners receive guidance from the 15-member Advisory Council created under the law. The makeup of the council includes five members each from industry representing local, state, and federal governments.

Oversight Over Safety Laws

CPSC legislation combines oversight of a variety of safety laws under the guidance of the commission. Legislation related to hazardous substances, flammable fabrics, poison prevention, and refrigerator safety all transferred to the commission to make sure that the laws are enforced and updated regularly. The commission receives recommendations from the council on proposed changes suggested by industries. Additionally, the commission conducts studies and makes reports and recommendations based upon those findings.

Today, the commission routinely tests groups of children's toys for lead and other dangerous chemicals. The act impacts manufacturers of products in the United States and those whose products are imported. Companies may be required by the commission to turn over records related to products and reports related to tests on their products. Companies are required to label their products, submit plans for new products, and notify the commission of defective products that need to be recalled. Manufacturers are expected to keep current with regulations and safety standards, and they have the right to ask for review of commission actions and decisions. Manufacturers are obligated to comply with all standards and regulations and report defective products, and they are subject to random inspections. Distributors and retailers in the United States are held to the same guidelines as manufacturers. Defective or recalled products cannot be distributed under penalty of fines, and sellers are required to notify the commission if they receive a defective product.

Imports and exports are also covered by the law. Exports from the United States are not covered by the legislation, unless the goods are going to a military installation, diplomatic mission, or similar situations. All imports to the United States are covered by the act, although this can present some problems for those who import goods. The main benefit of this law is for the American consumer.

Testing, Regulations, and Standards

As the purpose of the act is to protect consumers and to bring about a decline in the injuries and deaths related to consumer products, testing of products, establishing regulations, and standards from industry professionals all work to safeguard the consumer. Recent recalls of defective car seats, drop-side baby cribs, pacifiers, and baby slings seek to improve safety for children whose parents may not use the items properly or who may be exposed to products that have a manufacturing weakness. Acting upon the recommendations of the Commission on Product Safety, Congress created an executive branch regulatory agency with the charge to regulate the consumer products industry. This act was a way to reinforce state and local agencies and to institute a system to inspect products, protecting consumers. Internal efforts from industry proved insufficient, so this legislation established a system that works today. Information about defective products is disseminated efficiently, and manufacturers and retailers alike are required to respond to recalls under penalty of law. This act was updated in 2008 by the Consumer Product Safety Improvement Act of 2008.

Contractor Fraud

Contractor fraud is a form of white-collar crime that is punishable criminally, civilly, and administratively; it occurs through conspiracies among individuals and entities (i.e., legal fictions) that transcend states and nations. It is a global issue. Contractor fraud is not a novel or recent issue, but it has been increasing because of the globalization of economic activity and the increased role of government financing in many jurisdictions. The rights to obtain and obligations to transfer resources, especially financial, are often exchanged without adequate transparency as to the integrity of the parties to these transactions. Contractor fraud involves deceit, theft, and corruption (e.g., theft by deception, bribery, and kickback schemes). It is perpetrated through corruption of the decision-making process of the individual (i.e., the fraudster) as the fraudster intentionally, covertly, and wrongfully diverts economic or financial resources away from the project under which the fraudster is engaged to support.

The means and methods of contractor fraud are variable. For example, the fraudster may be an individual intentionally failing to provide adequate oversight (i.e., deliberately looking the other way as resources are looted), or an individual intentionally creating a materially misleading invoice for payment (i.e., fraudulent invoicing). Similarly, the motivations for perpetrating contractor fraud are diverse: for example, obtaining material resources that the fraudster would otherwise be unable to obtain without incurring unwanted costs, including having project labor and materials wrongfully dedicated to personal projects (i.e., using project resources to perform capital improvements on the fraudster's residence), or wrongfully inflating a contractor's project revenues in support of the fraudster's professional reputation (i.e., reporting fictitious contractor revenues in a career advancement scheme).

Traditional explanations for contractor fraud include Émile Durkheim's concept of anomie, Edwin Sutherland's concept of differential association, and Donald Cressey's concept of the fraud triangle. These concepts are interrelated, identifying elements within the social psychology of fraudsters generally, though it is difficult to predict whether any particular individual will commit contractor fraud. The explanatory power of these traditional models is limited; they are useful more as an after-the-fact description or diagnosis of what went wrong in a discovered case of fraud than as a before-the-fact model that produces reliable predictions about specific individuals based on measurement of perceived attributes of these individuals.

Contractor fraud occurs within and across the private, public, and independent sectors (i.e., commercial, governmental, and nonprofit venues). Transactions commonly subsumed under contractor fraud include those characterized by bribery, kickbacks, illegal gratuities, and special consideration extended to decision makers (e.g., special favors). It is an economic crime of abuse of position, thwarting free and open competition, such that decisions are made that are unfairly influenced by improper advantage (e.g., pay-to-play schemes). These illicit and illegitimate decisions increase costs to project and market participants, and they unjustly enrich the fraudster.

Contractor fraud is generally authorized and executed under the aegis of a corporation, which superficially provides limited liability for business decision making (i.e., the individual decision maker is legally protected against personal liability from unfortunate results flowing from the exercise of business judgment). Though this corporate shield is often ineffective against criminal contractor fraud, it can transform the culture of procurement from risk averse or risk neutral to risk taking: In a risk-taking culture, individuals may be more likely to make decisions that are illegal or fraudulent.

The contractor as independent principal (and legal fiction) is subject to individualized pressures, including demands for efficiency and profitability, and the personal incentives of its agents; the integrity of decision making of the contractor is dependent on the integrity of its agents, many of whom have interests that diverge from the legitimate interests of the contractor.

There are internal and external gatekeepers whose function is to provide an independent and objective check on the risk of contractor fraud. These include employees within the contractor, employees of the buyer of the contractor's product or services, and intermediaries such as architects, engineers, and external project auditors who provide review, approval, and oversight activities. However, their effectiveness is limited, especially where resources applied to mitigating contractor fraud risk are inadequate or collusion exists.

As the contractor is the subject matter expert for the project, whether as designer, builder, or consultant, deference to its decision making may be routine and customary. This results in an opportunity and vulnerability structure for unscrupulous contractor employees to exploit. Within the engineering, procurement, and building functions are a multitude of subcontracts and vendor purchase agreements through which much is at stake: Individual livelihoods depend on participating in the project, whether legitimately and/or illicitly.

The prime contractor or construction manager (i.e., the entity through which the project is directed and controlled) is the relationship manager over the network of subcontractors, sub-subcontractors, vendors, and consultants on which the project depends for successful and timely completion. This network offers resources in the forms of soft costs (e.g., obligations to architects, engineers, and other consultants) and hard costs (e.g., the trades such as masonry, the use of concrete, and carpentry). Contractor fraud is about skimming or otherwise wrongfully diverting the value of the cost of these resources.

Contractor fraud is noteworthy because of the risks created under large projects. The high monetary values of these contracts provide opportunity and incentive for individuals, honest and/or dishonest. Additionally, the complex nature of the processes of project development (i.e., engineering, procuring, constructing, installing, and commissioning) makes oversight expensive, time-consuming, and contingent upon the honesty and integrity of other experts and consultants, properties that tend to result in minimization of resources dedicated to oversight.

Means and Methods

Contractor fraud is deviant conduct violating the norms explicitly and implicitly governing transactions. It is accomplished in a variety of ways. However, a characteristic shared among successful contractor fraud schemes is the failure on the part of the victim to conceive of the materially misleading nature of evidence and data presented and disclosed to it. Additionally, fraud is not in fact committed by corporate entities (though it

New York City Council Member Letitia James speaks at the CityTime press conference at City Hall, December 17, 2010. On March 14, 2012, it was announced that contractor Science Applications International Corp. (SAIC) was to pay the U.S. government more than $500 million to settle charges that SAIC conspired in fraud, resulting in cost overruns to implement the city's computerized timekeeping system, CityTime. James predicted that it would be "the largest fraud on record in the city's history." She turned out to be right.

may be imputed to the entity by operation of law). Individuals commit fraud, whether the buyer and/or seller. Moreover, these agents may be in high managerial positions or much lower in the organizational hierarchy.

The initiation of the fraudulent scheme may occur early in the project development or program management process. In illustrating the variable forms in which contractor fraud occurs, it is not necessary to distinguish between fraud initiated by the contractor's agent and fraud initiated by the buyer's agent because the risk of corruption in the relationship and transaction may develop from either or both points. For example, the bidding process may be corruptly and fraudulently exploited in many ways, including improper development of the request for information and/or request for proposals from potential contractors (e.g., the process may be steered by design to a particular contractor by customizing the description of required work such that competition is unfairly excluded), improper solicitation of bids (e.g., steering invitations only to corruptible contractors), and improper processing of bids (e.g., selective leakage of information to a favored contractor).

Another common means of perpetrating contractor fraud is through exploitation of the contract. There are two basic types of contracts (cost-plus and guaranteed or fixed price contracts); these may be fraudulently executed through improper inflation of costs and/or improper inflation of scope of work. Costs may be fictitious (e.g., charging for ghost employees); scope of work in the base contract may be deliberately misleading and understated so as to take advantage of requiring extra work (i.e., change orders or "scope creep"), the costs for which exceed the initial expected benefit of the bargain by the project owner. Additionally, costs may be fraudulently allocated among different contracts (e.g., improperly charging work to a cost-plus contract that should be charged to a fixed-price contract); costs may be paid that do not even benefit the project (e.g., capital improvements paid for under the project that benefit an individual outside of the contract, such as redeveloping a personal residence for a fraudster or buyer's agent).

The fraudster in contractor fraud exploits and defeats project oversight, creating acceptance by key project decision makers of misleading statements and/or inducing their acceptance of incomplete and misleading statements (i.e., the fraudulent act may be a commission or omission of statement). Though the principals to a project (the owner and prime contractor or construction manager) employ a supporting network of consultants, experts, and specialists (e.g., engineers, architects, trade subcontractors) that prepare and maintain forms, records, and reports for the purpose of managing the project and explaining project expenditures, the effectiveness of the overall oversight system is subject to compromise. This is especially true for project owners such as the U.S. military, which often contracts on a cost-plus basis and is not subject to the same budgetary constraints and deterrence models as commercial project owners, under which cost overruns, even legitimate, may imperil individuals' careers and the project owner's financial viability.

Though the object of legitimate contractor work is generally the development or redevelopment of capital assets, the means and methods of contractor fraud usually demands exploitation of the financial system. Specifically, assets readily convertible to cash (i.e., liquidity) are diverted from the project to the fraudster. Overbilling, fictitious billing, graft, and promises of special consideration are schemes characterized in part by traditional theft by deception and in part by money laundering. Initiating the authorization, recording, processing, and reporting of fraudulent financial transactions is the linchpin of contractor fraud. As in other venues of fraud, the business purpose of the fraudulent transaction is intentionally inadequately presented and disclosed to and/or by decision makers.

The compartmentalization of modern business unintentionally facilitates contractor fraud. Entity hierarchies (e.g., internal control systems) are characterized by an increase in reliance on data and a decrease in reliance on other evidence as the review and approval of the transaction at issue wends its way through the entity's internal controls. For example, in the field, individuals have personal and/or indirect knowledge of whether goods and services are provided consistently with the contract, but as the abstract of the transactions (e.g., the shorthand depicted in double-entry bookkeeping or brief explanatory statements in journals and ledgers) goes upstream, much is left behind, whether as suspicions in the minds of operations employees and agents, or something more dispositive on the issue of fraud (e.g., observation of graft). The layers of intermediary controls (i.e., gatekeepers) may comply with regulations such as Sarbanes-Oxley, if applicable, but may not comply with the demand of obtaining effective evidence of corrupt intent influencing and motivating the transactions (e.g., to benefit a decision maker through undisclosed kickbacks). Data in the space of contractor fraud is generally derivative of evidence; these data are often unwittingly processed within entities and made an essential part of the misleading narrative. Moreover, persons with best or at least significant leverage over the project (e.g., providers of debt and/or equity capital) are distanced both physically and logically from the project (i.e., they are removed from the field, the preparation of books, and the maintenance of records).

Conclusions

Whether contractor fraud as a deviant phenomenon is becoming rarer is difficult to assess. As with most frauds, which are by nature schemes of deceit and concealment, contractor fraud is not readily observable, and whether positive or empirical research by academics, law enforcement agencies, civil society organizations, and related entities can obtain a useful approximation of the true population of the frequency and severity of contractor fraud is dubious. The stated population of fraud generally, and contractor fraud specifically, is a rough estimate. Alternatively, examples abound of instances of contractor fraud throughout the global economy, though these examples may not properly support statistical inferences about the population of fraudsters generally, and contractor fraud specifically. The data are valuable; however, the science of estimating the problem of contractor fraud may rest more on analysis of opportunity structures than inferences from empirical data.

Moreover, selective enforcement of potential contractor fraud is inevitable because law enforcement agencies and regulators have limited resources. Whether these are too scarce to effectively police the landscape of contractor fraud is not clear. Enforcement by private parties faces resource constraints because litigation is not a reliable profit center, being characterized by significant risk and uncertainty. Overall, contractor fraud as a type of illicit financial service is growing globally, along with the general industry growth of financial services, because contractor fraud improperly siphons and diverts resources legitimately committed to large-scale project development and redevelopment. However, bribery and kickback schemes under contractor fraud may go beyond wrongful diversion of financial resources, including procurement and giving of sexual favors, or other nonfinancial special considerations to corrupt decision making.

Difficulties of proof provide a disincentive to pursue allegations of contractor fraud. Because contractor fraud is not an accidental wrongdoing, victims and law enforcement agencies are required to demonstrate bad intent on the part of the defendant, which may not be a significant hurdle in cases of obvious self-enrichment (e.g., charging capital improvements done on the defendant's personal residence to a project involving the redevelopment of a retail mall on behalf of the defendant's employer, the project owner) but may be less clear in cases of inflated project billings under projects characterized by elaborate reviews and approvals, thereby diffusing responsibility (e.g., using kickback schemes to overcharge the U.S. Air Force in the development of a high-tech jet). Process may disguise, cover, and launder the substantive wrongdoing, such that the cause of the higher-than-anticipated cost appears to be financial mismanagement, good faith but erroneous cost assumptions, honest mistakes in judgment, anything other than contractor fraud. Fraud may exist in fact but be left alone and deemed error by the victim.

Legitimate concerns, such as privacy protections that limit open-source information, and illegitimate objects such as inaccessible side agreements that contain illicit promises of special consideration not publicly available to those charged with project oversight, enable contractor fraud. Contractor fraud occurs opaquely underneath the public record. As with other investigative methods that result in a public record, there is an unavoidable cost-benefit analysis and balancing of competing interests performed.

Accounting and administrative controls have been routinely applied in the effort to deter, prevent, detect, and punish instances of contractor fraud. Supplementing the legal remedies of external agents (e.g., public prosecutors and regulators), these control activities by internal agents are powerful. For example, surveillance techniques enabled by computer-based technology can potentially capture every keystroke and observe every conversation; constrained only by the enforceable limits of the law, these techniques have contributed to a social environment in which privacy is scarce.

Nonetheless, contractor fraud is neither on the verge of extinction nor a matter of petty concern. The reach of technology is countered by the ingenuity of the fraudster, pushing contractor fraud up the governance hierarchy (e.g., from clerks to senior management), where overrides to controls, weaknesses in controls, laxity in public prosecution, and conspiracies are more readily exploited. There is no bidding process that cannot be rigged and no invoicing process that cannot be fudged. Like other frauds, contractor fraud is primarily a management issue. In the real world, all of the guards (e.g., gatekeepers) are corruptible: Eternal diligence is effective only when the guard labor is adequately informed and possesses integrity.

Coolidge, Calvin

Calvin Coolidge (1872–1933) served as the 30th president of the United States, from 1923 to 1928. President Coolidge was a lawyer by training. His political career began in Massachusetts, where he served as lieutenant governor and then governor before earning a place on the Republican presidential ticket in 1920 as the vice presidential candidate, alongside Warren G. Harding. Coolidge's personal life and political career were relatively devoid of conflict or controversy, despite the fact that his presidency witnessed violent labor strikes, initiation of the Hoover Dam project, Prohibition Era unrest, and the creation of sweeping European peace treaties.

Coolidge, a Republican in favor of small government, was also in many ways a social progressive; he often remarked publicly on the need for equal treatment of all races and genders under the law, though he never acted decisively toward either end. Coolidge's handling of the Boston Police Strike while governor of Massachusetts and the fallout from the corruption scandals of the Harding administration earned him respect from ordinary citizens and his political peers. During his presidency, the U.S. Justice Department investigated and prosecuted an unprecedented number of antitrust cases, further cementing his reputation as an efficient, law-and-order politician of strong moral character.

Born John Calvin Coolidge, Jr., in 1872 and raised by his father near Plymouth Notch, Vermont, Coolidge quickly developed interests in various political issues, eventually earning a degree from Amherst College in Massachusetts. Coolidge remained in Massachusetts after college, becoming a lawyer and part-time politician. He gradually rose to prominence within the Republican Party of Massachusetts, serving as lieutenant governor from 1916 to 1918 and as governor from 1918 to 1920. Coolidge's handling of the Boston Police Strike of 1919 made him a viable candidate for the nation's highest office. American labor union membership and organizing increased following World War I, as workers in a variety of occupations sought better wages and working conditions. At the time, labor union activism was also closely, though unfairly, associated with communism. As a result, significant conflicts between workers, labor organizers, and corporate and political leaders were frequent.

From Police Strike to the Presidency

In 1919, the Boston police commissioner suspended several dozen police officers for attempting to organize a police labor union. In response, nearly the entire Boston police force staged a general strike to protest the suspensions and force recognition of a police union in Boston. Looting, rioting, and property destruction—although not widespread—ensued. Once it became clear that the striking police officers were not going to return to duty without having their demands met, Governor Coolidge chose to quell the strike by calling out the state militia. The presence of the state militia ended Boston's civil unrest. Most of the striking police officers were fired and replaced; members of the new police force received many of the wage and working condition improvements that the previous officers had sought. Coolidge's remarks on the police strike, published in newspapers around the country, earned him the respect and admiration of many people fearful of unionized labor inspired by communist revolution:

"[there] is no right to strike against the public safety by anybody, anywhere, any time."

Coolidge joined the 1920 presidential ticket as the vice presidential candidate to Warren G. Harding, another republican from Ohio. Harding and Coolidge defeated Democrats James M. Cox and Franklin D. Roosevelt in the 1920 election. Coolidge's vice presidency was uneventful. In August 1923, while vacationing with family back in Vermont, Coolidge received notice that President Harding had died while on a multi-state speaking tour of the United States. Calvin Coolidge's father, John, quickly swore Coolidge in as the 30th president of the United States on August 2, 1923. One of the first tasks confronting Coolidge after assuming the presidency was establishing a sense of law and order in the White House, something absent during Harding's presidency.

Warren Harding had surrounded himself with individuals of questionable moral character. It was rumored that Harding was a philanderer, and his gambling parties at the White House were well attended by his closest cabinet members and political associates. Despite the 1919 Prohibition Act's ban on alcohol, Harding and his associates often consumed whatever type of liquor they desired. By the time Coolidge became president, numerous instances of graft, bribery, theft, and other illicit activities by Harding's cabinet members had come to light, and Coolidge was forced to deal with the fallout. The illegal land leases that allowed the Teapot Dome and Elk Hills oil reservoirs to be tapped garnered the most attention. Additional scandals related to the improper sale of surplus military supplies, and the property of German nationals seized during World War I also resulted in investigations and resignations. Despite Coolidge's ties to the Harding administration, he was never implicated in any of the wrongdoing.

Coolidge was reelected in 1924, serving one full term as president before choosing not to run for re-election in 1928. During his tenure, the Justice Department initiated more antitrust investigations and prosecutions than at any other time. These investigations, geared toward curbing corporate actions that unfairly altered the competitive marketplace, did little to harm large corporations. For example, the National Cash Register Company was fined only $50 for price fixing. Likewise, major antitrust cases against the Standard Oil Company and others often did not result in verdicts favorable to the federal government. Likewise, the Federal Trade Commission, tasked with enforcing antitrust laws, was relatively ineffective during Coolidge's presidency.

Copyright Infringement

Copyright infringement is the unauthorized use of a work that has been registered with a federal agency. It was once considered solely a civil court issue. In more recent years, with the advent of computers and the Internet, copyright infringement is a criminal and civil issue. In the United States, once creative works are approved for copyright registration, the authors are given many rights to protect their work. As the world has become more globalized, copyright owners struggle to protect their works around the world because federal protections do not extend to all countries. The Internet has significantly increased the ability and opportunity to commit this infringement, with little confidence that the enforcement will be able to keep up with the practice.

Per the U.S. Copyright and Trademark Office, a copyright is a work that is considered creative, original, and in some tangible form so that the office can review and approve the registration. Poems, books, music, Web sites, and artistic pieces may be copyrighted. The U.S. Constitution, Article 1, Section 8, Clause 8, discusses the significance of copyrights as helping a society to progress by protecting creative endeavors for their author. People may be more enticed to create works if there are federal protections for their hard work and skill.

Copyrights are unique in that they are considered under a strict liability statute, which means that a person can be held accountable for using a registered copyright without permission even if its use was unintentional. If a person copies a picture from a Web site and places it on his or her site, without permission from the owner, the person can be held accountable for damages in court. Not knowing about the law is not a viable defense in a copyright infringement case. Typically, a copyrighted item has information about how to contact the author for permission to use the work, although there are some circumstances in which authorization is not needed.

Benefits and Limitations of a Copyright

A person who creates a tangible work is not required to register the item with the U.S. Copyright and Trademark Office. There is a review process and an application fee in order to seek approval for a registered work. Because of this, some people conduct a "poor man's copyright" to seek some level of protection if the need arises. A person may mail the item to himself or herself and not open the envelope since it would have a date stamp by a federal agency to provide a date for the work. The Copyright Office does not recognize or endorse this practice in place of the registration process. Once a work is approved by the Copyright Office, the author has many exclusive rights. He or she can reproduce the work as much as desired, as well as sell, rent, or lease the piece. Preparing a derivative work is also a given right, so that the author can create translations, dramatizations, products, and other related items representing the original work. Performing and publicly displaying the work is at the discretion of the author, another benefit of registration.

One of the most significant benefits of a registered copyright is that the author has exclusive rights to his or herwork for the time up to his or her death, plus 70 years after. Michael Jackson, the King of Pop, died on June 25, 2009, and his children and family will reap the exclusive rights to all of his copyrighted works for 70 years. After that time, the works will enter into the public domain.

With the exclusive rights that copyright owners have, they also have some limitations, where it is up to the court system to interpret and decipher the balance between exclusive rights and public concerns. Under the First Sale Doctrine, a copyright owner receives benefits from the "first sale," so that if the consumer wants to sell the item later, he or she can do so without paying the author again. If a student buys a textbook, and after the class is over he sells the book online, the author of the book does not reap any profits from that sale, as the author did from the first sale. Fair use is another limitation for copyright owners, in that work can be reproduced without permission if is meets specific criteria. For example, colleges and universities are able to use copyrighted material in their classrooms because it is for educational purposes, not for profit. Public domain creates another limitation to the exclusive rights of copyright owners, in that some material can be deemed "public" so that the author loses or never gains registration for the work, and any person can use the work. Almost all government-produced work is considered to be in the public domain. These limitations do not negate the significant rights and potential success that a registered mark can have for the author.

Copyright Infringement

A registered copyright requires people to seek permission for use of, or purchasing of, a work. When this is not done, a copyright infringement ensues. The author can contact an attorney to initiate a civil law suit. If the infringement results in loss of a certain amount of potential profit from the work, criminal charges may be filed against the infringer, whether intentional or not.

The copyright owner is required to show the court the copyright registration as well as the violation and the liability. The role of the infringer impacts the possible damages ordered if the court finds a violation. The infringer can be the person who actually infringed or a person who contributed but did not initiate the infringement. The role of the infringer, profits received and lost from the infringement, and other factors are considered in civil court.

Copyright infringers can be ordered to pay monetary or actual damages, or statutory damages per work, based on whether they were willful or "innocent" infringers. These damages can range from $200 to $150,000 per work. Attorney fees can be ordered to be paid, and a judge can order an injunction or restraining order to cease use of the work by the infringer.

In response to the growing use of the Internet by the public to access copyrighted material illegally, the No Electronic Theft Act established criminal copyright liability for copyright infringers in 1997. This act does not require the infringer to have made any profit from the infringement to be criminally charged. Copyrighted material must have a total retail value of more than $2,500 for criminal prosecution. This act allows organizations like the Recording Industry Association of America to file criminal charges against people who illegally download and share copyrighted music.

In 1998, the Digital Millennium Copyright Act (DMCA) was passed to support the World Intellectual Property Organization global copyright initiative by protecting copyright holders in the United States across the world. With the span of the Internet, infringers can live in other countries where copyright laws do not exist or are severely limited compared to those of the United States. The DMCA also addressed technological measures to circumvent specific software practices in place to make infringement more difficult.

Impact

Internet users have pushed copyright infringement from a civil issue into a criminal endeavor. Downloading music, movies, pictures, and other items online, without permission, is a copyright infringement that may far exceed the $2,500 criminal charge requirement. Peer-to-peer sites, which have "peers" or computers connected to each other by the Internet, have been the main route used to share illegally downloaded music and video products. In 1999, Napster was one of the first music-sharing sites to experience legal restraints to stop its peer-to-peer sharing of illegally copied music.

More recently, the Federal Bureau of Investigation, with assistance from several law enforcement agencies in the United States, New Zealand, Hong Kong, London, Germany, and Canada, charged seven people and two corporations with maintaining an international organized criminal enterprise responsible for worldwide online piracy of copyrighted works. Megaupload.com and Vestor Limited were indicted and charged with racketeering, conspiring to commit copyright infringement, money laundering, and two other counts of criminal copyright infringement. They supposedly generated more than $175 million in criminal proceeds and caused more than half a billion dollars in harm to copyright owners by unlawfully reproducing and distributing copies of movies, music, television shows, electronic books, and software for over five years. The individuals could face five to 20 years for each charge.

Intellectual property acts, such as copyright infringement, were viewed less seriously in the past because they were civil crimes and little harm was sustained. With the advent of the Internet, copyright infringement has moved into the criminal courts and into criminal organized crimes groups. The United States and other countries are trying to unite to combat infringements, though many obstacles remain, such as cultural differences, variations in copyright laws, and resources for enforcement. Copyright infringements will continue to rise because they are easily perpetuated with online activities across the world.

Corporate Capture

Corporate capture is a phenomenon in which private (corporate) interests pervert the tools of government and employ them to serve their particular ends. It is typically discussed with regard to regulation and hence is also referred to as regulatory capture. Rarely is it used to refer to generic capture.

In debates over governmental regulation, liberals tend to favor regulations as expressions of the public will and serving the common good, to be used to protect minors, patients, and many kinds of consumers from abuse by unscrupulous actors in the private sector. Laissez-faire conservatives and libertarians tend to oppose regulations because they view them as an abuse of the government's power and as harmful to the economic well being of the nation. This form of the debate overlooks the phenomenon of regulatory capture, which reveals that regulations work neither to promote the public good nor to undermine private actors. These observations have led some scholars to argue that regulations are useless or worse, and others to seek more effective forms of regulation.

The term *regulatory capture* is often associated with the work of economist George Stigler and his article "The Economic Theory of Regulation," where he writes that, "as a rule, regulation is acquired by the industry and is designed and operated primarily for its benefit." This work builds upon Stigler's previous essay with Claire Friedland, "What Can Regulators Regulate? The Case of Electricity," which takes up the question of the efficacy of regulation more generally and concludes that regulatory efforts rarely cause any deviation from market outcomes. Stigler's research on regulation influenced the work of a number of later scholars investigating the phenomenon of capture and applying the methods of public choice theory to regulatory issues.

In addition, the liberal–conservative debate represents a case of deficient generalization, in which various observers note incidents where the realities of regulation deviate from their core assumptions, but neither side has proven ready to draw conclusions from these incidents, most of which point in the same direction. Thus, many liberals are aware of regulations that end up serving private interests rather than the public, but they still strongly favor regulations. For instance, they considered the enactment of the Dodd-Frank financial reform bill in 2010 to be one of the major achievements of the Obama administration, despite the fact that the law was in a sense doubly captured: prior to passage, the initial bill was greatly diluted by lobbyists working for the industries it was supposed to regulate. Also, the law as enacted by Congress is particularly open-ended, leaving it to various agencies to shape the needed specifications, under conditions particularly favorable to lobbyists. Conservatives are also aware of incidents in which regulations serve those in the private sector, usually their allies, but nevertheless continue to stand strongly opposed to regulation in general.

Methods of Capture

Capture is achieved in several ways: when special interests compose regulations, by diluting regulations, by weakening enforcement, by gaming the regulators, by setting prices and rates, and through close relationships between regulators and industry.

Lobbyists representing the pharmaceutical industry literally composed the text of the 2003 bill that governs drug benefits for Medicare recipients. This benefit was initially estimated to cost taxpayers $400 billion over 10 years; more recent estimates range as high as $1.2 trillion. Also, as composed by the lobbyists, the law prohibits the federal government from negotiating the prices of these drugs.

In the wake of the 2001 Enron scandal, Congress passed the Sarbanes-Oxley Act in 2002. Hailed in the *Economist* as "the most sweeping reform of corporate governance in America since the Great Depression," the law left it to the Securities and Exchange Commission (SEC) to work out the details of the new regulations. However, the SEC was subjected to extensive lobbying by the accounting industry, such that the regulations that took effect included a definition of auditing that created a loophole for auditors to continue practices initially targeted for prohibition because they entailed a conflict of interest.

Sarbanes-Oxley was further weakened in 2006. Whereas it initially required auditors to investigate any accounting issues that have a "more than remote" chance of damaging a company's finances, the rules were revised to only require auditors to investigate issues that have a "reasonable possibility" of doing so. Moreover, in 2009, small businesses were permanently exempted from two of the act's key provisions—the first requiring executives to confirm the integrity of their firm's internal accounting procedures, and another requiring an outside audit of these procedures. This gradual dilution of regulations is reflected in the size of the regulatory text of the law; it was reduced from 180 pages to a mere 65.

According to a 2006 report, cutbacks in staff and budgets reduced the number of food safety inspections conducted by the U.S. Food and Drug Administration from about 35,000 a year in the 1970s to about 3,400 a year. In addition, over this time, the number of inspectors at the Agriculture Department declined from 9,000 to 7,500.

In 2012, the Federal Trade Commission (FTC) imposed a $22.5 million fine on Google for using tracking cookies on consumers' Web browsers to collect data on their Internet use. This represented an infringement on consumers' privacy rights by the Web company, a charge that has been leveled at them before. However, it is doubtful that the FTC will succeed in doing much economic damage to the Web powerhouse. The tiny fine is less than what Google earns in a few hours.

Special interests affect the regulatory regime in their favor by switching regulations into a new jurisdiction (e.g., from state to federal) or by pitting the regulators against one another. Thus, when mortgage lender Countrywide Financial felt "pressured" by the federal agencies charged with overseeing it, executives, as they put it, "simply switched regulators." As a national commercial bank, Countrywide had been under the jurisdiction of the Office of the Comptroller of the Currency. As early as 2005, Countrywide executives engaged in talks with the Office of Thrift Supervision (OTS), known to be a much more "flexible" regulator. Less than two years later, Countrywide redefined itself as a "thrift" instead of a "national commercial bank," and thus became regulated by the OTS. Over the next two years, OTS proved to be a very lax regulator of Countrywide's mortgage lending, as it also proved to be for IndyMac, Washington Mutual, and other major lenders. These institutions played a significant role in the financial crisis that followed.

Regulators are often charged with limiting the profits earned by one industry or another, such as by limiting the rate increases of utilities. However, in several major cases, captured regulations had the opposite effect: They bolstered the profits of a specific industry by setting higher prices and rates than the market would provide. An example of this can be found in the establishment of price ceilings on gasoline in some eastern Canadian cities. The imposition of price ceilings, which on the surface seemed to hedge against rising prices, actually artificially inflated gas prices in these areas and greatly slowed the pace at which these markets would respond to a general decline in the price of oil. These regulations helped better entrench the position of otherwise inefficient firms already selling in these gas markets, and they worked to discourage the entrance of newer, more efficient firms with higher overhead costs. Thus, the price ceilings served the narrow interests of entrenched firms while preserving inefficiencies in the market and artificially inflating prices.

After the explosion at the Upper Big Branch mine in West Virginia in 2010 killed 29 people, it was reported that the federal agency responsible for mine oversight, the Mine Safety and Health Administration, was reluctant to close even those mines that repeatedly violated safety rules. Furthermore, the agency rarely imposed large fines and often failed to collect the fines it did impose.

After the explosion at BP's Deepwater Horizon well in 2010 and the resulting oil spill in the Gulf of Mexico, there was widespread consensus that the federal agency responsible for regulating the well, the Minerals Management Service (MMS), had failed in large part because it had been captured. In the *Wall Street Journal*, Gerald P. O'Driscoll, Jr., wrote the following:

> By all accounts, MMS operated as a rubber stamp for BP. It is a striking example of regulatory capture: Agencies tasked with protecting the public interest come to identify with the regulated industry and protect its interests against that of the public. The result: Government fails to protect the public.

The Interior Department's inspector general found that MMS officials responsible for overseeing drilling in the Gulf of Mexico were allowing oil and gas officials to fill out their inspection forms, and some even considered themselves part of the industry they were tasked to regulate.

Responses to Corporate Capture

Despite a number of different avenues for private interests to capture regulations, capture is rarely complete, and thus even regulations subject to capture can generate some pubic benefit. The Sarbanes-Oxley act was in part a response to the actions of Enron Corporation and its accounting firm Arthur Andersen, which was found to have used irregular accounting practices to conceal a significant amount of Enron's debts and losses. As these practices came to light, Enron's stock plummeted from over $90 to less than $0.50 per share, forcing the company to declare bankruptcy, causing substantial losses to many thousands of investors and leaving thousands of Enron employees without their retirement savings accounts and other benefits. Similar scandals involved other major American corporations, such as Tyco and WorldCom.

Sarbanes-Oxley was significantly diluted during its creation and in the initial years of its implementation. Nevertheless, the law has achieved some of its goals. In his review of the act, John C. Coates of Harvard Law School concluded that Sarbanes-Oxley created significant incentives for firms to devote greater resources toward internal controls of their accounts. Furthermore, the act provides a number of long-term benefits, including greater transparency and accuracy concerning firms' financial data, which reduces risk of losses for investors. Finally, the act requires that high-level executives sign off on their firms' financial statements, creating not just a paper trail but also a culture of increased accountability at the highest levels of corporate office. Thus, in spite of being significantly diluted, Sarbanes-Oxley can be seen as a somewhat successful attempt at regulation.

Recently, scholars have suggested a new approach to regulation, led by Cass Sunstein and Richard Thaler, who argue in favor of a benign paternalism that induces desired patterns of action through small incentives, opt-out programs rather than opt-in programs, and simple persuasion. Rather than coercing desired outcomes through heavy penalties or regulation, Sunstein and Thaler, whose ideas were embraced by President Barack Obama and British Prime Minister David Cameron contend that the government should operate as a "choice architect" that "nudges" people in the right direction. However, this new mechanism assumes a benign government, out to serve the public, and does not provide antidotes to capture.

Corporate Criminal Liability

A consistent definition of what constitutes corporate criminality has proven elusive over the last 150 years. By today's standards, the labor conditions and treatment of workers (and by extension, consumers) during the Industrial Revolution in both the United States and the United Kingdom would no doubt be deemed unconscionable, not to mention illegal. Yet, as corporations are ostensibly held to higher ethical and environmental standards today, questions persist about how a commercial enterprise is judged under the law and how it is ultimately held culpable for acts of malfeasance and illegality. Settling on definitive answers is especially problematic given that corporations are, like people, sovereign entities under the law, yet are in many respects able to shed this individual accountability once subject to public and media scrutiny in cases of criminal wrongdoing.

What are deemed permissible transgressions of a number of statutes relating to workplace safety and manufacturing standards has historically depended on a number of factors. These factors include the nature of the work performed and the associated remuneration, the location of the work performed, the gender and ethnicity of those performing the work, and the larger socioeconomic conditions of the period in question. In short, corporate misbehavior tends to be defined by complex factors that are socially, rather than legally, determined, and are arbitrary in nature. What is considered an inevitable and competitive manufacturing practice in a saturated commodities market by one generation is considered grossly negligent, reckless, and greedy by another. What workers consider an honest wage, as well as fair and equitable treatment in a nonunionized workplace headquartered in an economically depressed area of America, is decried as worker exploitation by their unionized counterparts in more prosperous and therefore selective regions of the country. Such inconsistencies make qualifying and quantifying the form of corporate deviance that meets the threshold of criminal culpability all the more problematic.

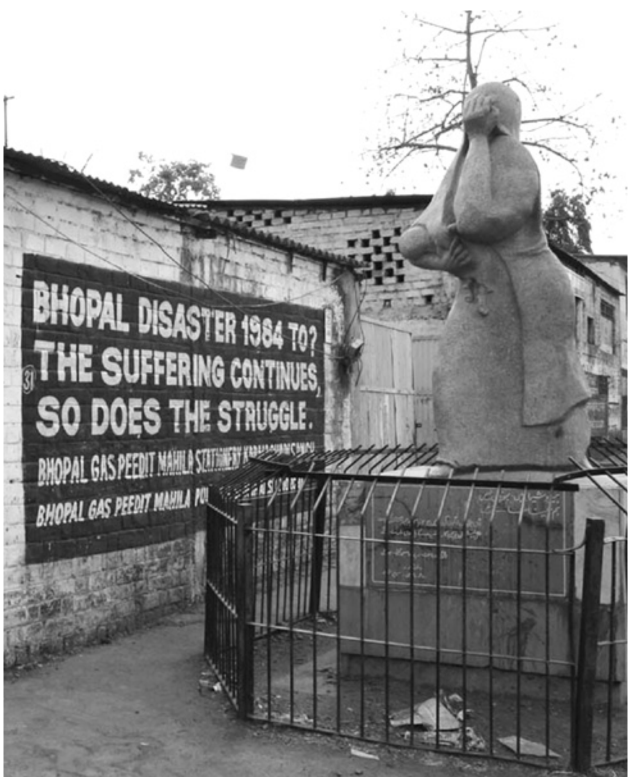
Companies as Individuals

In the 2003 independent documentary *The Corporation*, directors Mark Achbar and Jennifer Abbott overlay the behavioral criteria used for assessing and diagnosing psychopathy, as detailed in the *Diagnostic and Statistical Manual of Mental Disorders*, onto the business model of the generic American corporation: a lack of empathy, self-grandiosity, interpersonally and economically exploitative behavior, and a host other antisocial traits common among criminal psychopaths. The film, at the time of its release, foreshadowed a prevailing anticorporate sentiment that has come to define much of the last decade and its economic turbulence.

Mark Achbar and Jennifer Abbott's assessment of the typical—and typically American—corporation as a psychopath is not some abstract metaphor or anthropomorphization of companies as living and breathing beings. Their profile defaults to 19th-century American case law that assesses the rights and responsibilities of a corporation as equal to those, as defined in the Fourteenth Amendment, of a real person. This concept of corporate personhood, beginning with Supreme Court decisions as early as 1819 in civil cases such as *Dartmouth College v. Woodward* and, later, *Santa Clara County v. Southern Pacific Railroad* were initially rationalized on the basis that in cases of contract violation, corporations should have the same rights and legal recourse as private individuals, because the employees working for corporations do not forfeit their rights as citizens just because they are working in consolidation. However, when moving in the opposite direction with respect to accountability and liability, the corporation is able to default back to an amorphous collective in which no single individual can bear responsibility on behalf of the group. In other words, the corporation has, by the very nature of this paradoxical design, achieved all of the rights of a private and sovereign person, yet in most cases bears few if any of the associated responsibilities.

Part of the problem rests in the fact that a corporation, while defined as a person in the technical sense, cannot be arrested, arraigned, cross-examined, or jailed in the same manner as a flesh-and-blood defendant. As a result, most cases of corporate misbehavior with respect to unsafe products and workplace practices tend to be mediated through civil remedies, including stand-alone and class-action lawsuits. Exceptions include cases where identifiable individuals within a corporation are found engaging in flagrantly illegal practices—such as wire fraud, contract fraud, and insider trading—under the auspices of carrying on business; they are typically charged with crimes that fall within the white-collar category. In these cases, the Enron and WorldCom scandals two of the most recent and better-known examples, the ability to isolate the fraudulent actions of a few allows the parent corporation—while usually insolvent and publicly disgraced—to avoid official prosecution, at least in a criminal context.

In cases that cross the threshold of white-collar crime and enter the realm of violent or predatory crime, or what is sometimes called corporate violence, identifying the usual suspects is much more convoluted. First, the circumstances are often not as clear-cut, and the legal stakes are much higher. In a number of Commonwealth nations, recent legislative changes have allowed for new laws that streamline this process, making company principals criminally as well as civilly responsible for unsafe work conditions and/or manufacturing negligence. In Canada, for instance, the tabling of Bill C45 in 2003 eventually led to changes in the statutory definition of criminal negligence, and the law now allows for the prosecution and imprisonment of corporate executives for acts of corporate violence—preventable work-related injuries and deaths—that they ought to have known were likely. The bill, when first tabled, was commonly known as the Westray Bill, in reference to the Westray Mine disaster in Plymouth, Nova Scotia, on May 9, 1992. On that date, the mine, owned by Curragh Resources Inc., saw 26 coal miners killed underground following a methane gas explosion, a tragedy later deemed preventable when Curragh's spotty safety record and history of mismanagement was brought to light.



A memorial in Bhopal, India, for the thousands killed and disabled by the toxic gas released from Union Carbide Corp.'s chemical plant in December 1984. In June 2012, a U.S. court ruled that the company was not liable for environmental remediation.

In the United States, federal workplace safety legislation has been on the books since 1970. In 1999, the U.S. attorney general published guidelines for the criminal prosecution of corporations, including assessing the corporation's history of malfeasance and identifying a culture of wrongdoing and corner-cutting that might rule out noncriminal alternatives, which are in many cases deemed more realistic from a prosecutorial standpoint. The rare circumstances where criminal prosecutions are initiated tend to reflect egregious breaches of the public trust and safety. Such prosecutions are therefore carried out selectively and judiciously, often to serve as a general deterrent and to bring to heel any number of other corporations that, while not officially named on the docket, may be under scrutiny for conducting business unethically.

Ford Motor Company

With these criteria in mind, the seminal case with respect to the criminal prosecution of American corporations was likely the case against Ford Motor Company for criminally negligent homicide in Indiana in 1978. That year, Elkhart County prosecutor Michael Cosentino convened a grand jury following the horrific deaths by fire of three young local girls, who were rear ended while driving to a volleyball practice. The girls' deaths brought to 27 the total number of drivers and passengers killed in bizarre fires and explosions while traveling in Ford's Pinto model, which at that time had been in production for over seven years. The Ford Pinto Memo, an internal corporate document that had been leaked a year earlier, confirmed that company principals were likely aware as early as 1973 that a manufacturing defect in the fuel tank neck made the Pinto susceptible to explosions following rear-end collisions. Ford's upper echelon decided that it would be more cost-effective to pay out civil damages for deaths, injuries, and property damage resulting from the explosions and fires than to issue an international recall, knowingly imperiling all current and future Pinto owners as well as the motoring public at large.

After it was indicted for the deaths of the Elkhart County girls, the company vigorously defended itself and its executives. Ford's marquee legal team successfully diffused the company's responsibility in the girls' deaths by citing mitigating factors such as the statistically dangerous stretch of road where the collision occurred and the speed of the other driver, who was deemed at fault for the accident and was in possession of alcohol and drugs at the time of the collision. The judge presiding over the trial elected to dismiss the case before it ever went to a jury, but the prosecutor's public message with respect to the duty of care expected of corporations under the law was clear. As a result, Ford issued a recall later that year and discontinued production of the Pinto by 1980.

Although the Ford Motor Company had managed to skirt direct criminal liability in Indiana, its prosecution nonetheless set a precedent with respect to the punitive implications of corporate negligence nationwide. Three years later, on the morning of February 10, 1983, Polish immigrant Stefan Golab reported for work at the Film Recovery Systems Illinois plant and began his usual routine of using a cyanide solution to extract latent silver from used celluloid film rolls. On this particular morning, however, Golab was quickly overwhelmed by toxic fumes released by this rendering process, and he collapsed. He was later rushed to a hospital by ambulance, where he was pronounced dead on arrival. A subsequent toxicology test confirmed that Golab had died from acute cyanide poisoning and that the poison had been ingested through his mouth and nose in a gaseous form. Employees at Film Recovery Systems had been complaining of nausea and dizziness as a result of exposure to high levels of cyanide fumes for weeks prior to Golab's death. The response from company management to these complaints had always been the same: "If you don't like it, quit."

Film Recovery Systems

This cavalier and callous attitude, along with the willful disregard for the welfare of employees, led to the unprecedented convictions of three company executives for murder in June 1985—their negligence and malevolence elevating what under different circumstances might have been an unfortunate workplace accident to a homicide. Sentencing each of the executives to 25 years in prison, Judge Ronald Banks additionally ruled that Film Recovery Systems and its sister corporation, Metallic Marketing Systems, were both guilty, as corporations, of involuntary manslaughter in Golab's death. After languishing in the system for nearly a decade following a successful appeal, and with the company now defunct, the men—who had remained free on bail since 1985—entered guilty pleas to a charge of involuntary manslaughter in September 1993. Two of them later received comparatively minor prison terms of no more than three years, and one was sentenced to probation and community service.

The Ford and Films Recovery Systems cases paved the way for the enhanced criminal liability of corporations in America as well as establishing guidelines with respect to the adequacy standards of prosecutions. Over the last decade, with an increasing shift toward models of global capital and the headquartering of manufacturing operations in developing nations, this may soon change.

It is probable that jurisdiction and extradition issues, as well as the inconsistency of both criminal laws and workplace safety and environmental regulations between nations, will serve as something of a setback for a definitive model of corporate accountability on an international scale. The Bhopal disaster, for instance, not only killed a number of employees at Union Carbide's India-based chemical plant in December 1984, but also affected in excess of 10,000 local residents, while environmentally and economically devastating the entire region. Just days after the toxic explosion, Union Carbide's chief executive officer Warren Anderson was arrested by Indian authorities, but he fled back to America immediately after making bail. In 1987, the Indian government summoned Anderson, as well as eight other company principals, on a charge of manslaughter, demanding that they return for a hearing, but to no avail. After they were formally charged criminally in 1991, Anderson and the other Union Carbide executives are still considered fugitives from justice in India, with the prospects of their extradition dim, especially given that the U.S. Supreme Court has consistently refused to entertain appeals of lower court rulings that would allow civil remedies, let alone criminal sanctions, to be enforced on American soil. Whether these sorts of transnational loopholes are to become the rule or the exception with respect to the future of corporate criminal liability remains to be seen.

Corporate Dumping

Corporate dumping of hazardous waste was defined by the Resource Conservation and Recovery Act (RCRA) of 1976 as the illegal disposal of hazardous or toxic waste. The RCRA defines as hazardous waste a specific list of wastes as well as any waste that is toxic, corrosive, reactive, or flammable.

While the public generally thinks of hazardous waste as an industrial byproduct, numerous businesses are responsible for handling and disposing of hazardous waste produced by their activities, including hospitals, dry cleaners and cleaning services, photo and film processing centers, and any business that maintains, repairs, or fuels vehicles. The Environmental Protection Agency (EPA) is responsible for regulating the management of hazardous waste and has developed strict requirements for treatment, storage, and disposal. The EPA requirements are the bare minimum standard to which companies are held. Most states have also developed regulatory programs of their own. The illegal dumping of hazardous waste is a crime that can have serious consequences to the environment and human life.

Hazardous Waste Disposal

Hazardous waste in the United States is handled from generation to disposal. Generators of hazardous waste give their waste to transporters, who transport the waste to a treatment, storage, or disposal facility. Hazardous waste crimes vary widely, but there are similar methods of operation. One widespread practice involves criminal activity by a generator, transporter, or broker, or a treatment, storage, and disposal facility. For example, a generator of waste may act alone or conspire with others to illegally dispose of hazardous waste, either by on-site disposal or by removal and disposal at unauthorized points. Often, an unlicensed transporter will contact unwitting (or uneducated) generators and convince them that a low-cost disposal strategy is possible. The transporter may conspire with a known treatment, storage, and disposal facility or dispose of the wastes after falsifying the legally required waste manifest. A less common practice, but one seen in several states, is to rent a truck, fill it with hazardous waste, and then abandon it.

Perhaps the most common form of illegal disposal of hazardous waste is "midnight dumping." In a typical midnight dumping scenario, wastes are disposed of in the nearest isolated area. Agents of generating companies can directly commit these offenses or criminally conspire with waste transporters. Three other common types of hazardous waste crimes include "cocktailing," paying illegal "tipping fees," and the forging of manifests. Cocktailing occurs when someone mixes hazardous waste with nonhazardous waste in small quantities so that it will pass for a nonhazardous waste.

Once the hazardous waste is mixed in a 55-gallon drum, county and state landfills should not accept the waste. Unfortunately, many landfills have been caught accepting the waste because the transporter has paid a landfill employee a tipping fee to look the other way. Every shipment of hazardous waste must be accompanied by a manifest. Forging manifests is also common and is mainly done either by the generator or by the transporter. Transporters may illegally dispose of some of the waste, then change the amount of hazardous waste that is shown as properly disposed of on the manifest.

Estimates of the Size of the Problem

Estimating the extent of hazardous waste crime is conceptually and practically very difficult. National estimates of hazardous waste generation are very uncertain. A second obstacle is the various and conflicting definitions of hazardous waste that exist among the federal, state, and local environmental agencies. For example, waste oil may be deemed a hazardous waste by a local agency, but it is not at the federal level. Not only are there varying definitions, but there are also new chemicals produced each year that may or may not be considered hazardous, according to different standards. A third obstacle to obtaining accurate estimates of hazardous waste generation is the difficulty in identifying hazardous waste generators, transporters, and treatment, storage, and disposal facilities.

There are more than 400,000 known organizations handling hazardous waste in America. This does not include many of the small organizations that have not been identified, including the thousands of hazardous waste–producing auto repair shops and dry cleaners operating in the United States. The problem of illegal hazardous waste handling and disposal is possibly worse among these smaller, nonregistered organizations. It is also hard to estimate the actual amount of illegally disposed hazardous waste because there are numerous places to dump it without discovery. Even if the illegally disposed hazardous waste is found, it is nearly impossible to identify when it was dumped and by whom.

America's vast industrialization has resulted in enormous quantities of waste. Hazardous waste crimes have the potential to cause serious harm to both the public and the environment. Since the discovery of the Love Canal hazardous waste dump site in the 1970s, the problem and study of hazardous waste has received a great deal of attention from the public and the media. This attention has mostly focused on the possible health effects that the illegally disposed waste has had on the environment and human life. Today, an estimated one hundred billion tons of hazardous waste are produced in the United States annually, with the majority of it disposed of in an environmentally unsound manner.

Most corporate dumping of waste is handled through administrative or civil penalties, yet criminal penalties have increased over the past decade. There are specific accepted forms of dealing with hazardous waste and not every method is appropriate for every form of waste. The ideal situation is one in which the waste is recycled into a new product. With electronics waste, such as discarded cell phones, computers or computer parts, and obsolete consumer electronics, the heavy metals and batteries can be recovered and reclaimed. Flammable wastes are sometimes incinerated or even used as fuel.

Other wastes may be treated to neutralize their hazardousness. Sewage treatment plants, for instance, use a multistage process that not only filters sewage but also uses chemical precipitation or bacterial processes to remove phosphorous, as well as disinfecting the microorganism content. When it is not possible to dispose of waste in any of the aforementioned manners, or it is too expensive to do so, there are various forms of landfills and permanent disposal facilities.

Honeywell Inc.

One significant case was against Honeywell Inc. Delvin Henry, an employee at Honeywell Inc's Baton Rouge plant, opened a one-ton cylinder that had been erroneously labeled as containing relatively benign refrigerant. Once it was opened, a highly toxic and corrosive hazardous material was violently released from the cylinder. Henry was sprayed with the liquid and engulfed in a cloud, causing severe internal and external injuries. Henry died the following day from his injuries. Honeywell pleaded guilty to a bill of information charging one count of negligently causing the release of hazardous air pollutants and negligently placing another person in imminent danger of death. Honeywell was sentenced to two years' probation, a criminal fine of $8 million, restitution of $2 million to the victim's three children, and community restitution totaling $2 million to the Louisiana Department of Environmental Quality, Louisiana State Police Hazardous Materials Unit, and Louisiana State Police Emergency Operations Center. Chemical and Metals Industries Inc. paid a $1 million criminal fine and $2 million payable in restitution to the victim's estate, including his three children. This was the largest criminal fine and restitution award in the Middle District of Louisiana. In a separate 2011 criminal prosecution, Honeywell International Inc. paid an $11.8 million criminal fine for knowingly storing nearly 10,000 drums of mixed hazardous/corrosive and radioactive wastes without a permit for almost a decade at its yellow cake uranium processing facility in Metropolis, Illinois.

Although the immediate, short-term effects of hazardous waste crime are often hard to detect, the long-term damage can be severe. Illegally disposed hazardous wastes can cause serious harm to the environment and human health through contamination of water, air pollution, fires, explosions, poisoning via food chain contamination, and direct human contact. Hazardous waste pollution has deadly consequences. The dumping of hazardous wastes in lakes, rivers, and streams has a significant effect on the aquatic life residing there.

Corporate Raiding

Carl Ichan once said: "You learn in this business: It you want a friend, get a dog." Mr. Ichan's business was corporate raiding. Prevalent in the 1980s and, to a far lesser degree in the early-1990s, *corporate raiding* is a phrase used to describe a strategically implemented set of investment strategies initiated against a publicly traded company. Corporate raiding often involved a hostile takeover as well as a leveraged buyout. A leveraged buyout is an acquisition in which the purchase is financed via a combination of equity and debt. Additionally, the cash flows or assets of the target company are used to secure and repay the debt. As the debt usually has a lower cost of capital than the equity, the returns on the equity increase with increasing debt. Hence, the debt effectively serves as a lever to increase returns.

Today, private equity firms often utilize this technique to acquire companies. Corporate raiders, those individuals spearheading the raids, aspired to gain acontrolling share of the targeted publicly-traded company. Corporate raiders have been fictionalized on television and in film as capitalist predators; however, corporate raiders are more than just mythic creations.

Generally, corporate raiders use voting rights and other measures to increase the share value of a target company. For many, the term *corporate raider* is used to describe a capitalist extreme—a titan of industry unmoved by human costs who profits from the acquisition of companies, despite whatever fallout the acquisition may have on the company and/or the company's workforce. On some levels, a skilled corporate raider is much like a methodical predator in the capitalist jungle. Corporate raiding begins by assessing or identifying a target.

This process is influenced by many factors, including the raider's financial resources, the target company's board of directors, the involvement/interest of the target company's shareholders, the value of the target companies stock, and what, if anything, above the value of the stock may influence shareholders. Successful corporate raiders are also skilled at maintaining channels of finance. Specifically, a corporate raider must identify financial institutions or individuals to finance and/or underwrite their vision for the target. This greatly influences the tactics utilized to carry out the raid. After securing financial backing, the corporate raider must identify and execute strategies to acquire power within the target company. Corporate raiders often utilized holding companies as investment vehicles for later leveraged buyouts. Again, this is a nuanced process; however, there are some tactics that have been frequently utilized by the most successful raiders.

How a Company Is Targeted and Raided

Hostile takeovers were frequently used by corporate raiders and are often used to differentiate corporate raiding from private equity investments and/or activist shareholders. Hostile takeovers frequently occurred in the 1980s. Anytime a potential investor targets a corporation in a bid to gain control of that entity, this is referred to as a takeover attempt. A hostile takeover is a method by which an individual or group attempts to acquire a corporation in which the current board of the targeted corporation does not cooperate. When a deal is stuck between the current board and the bidder, the takeover is said to be friendly. If the current controlling powers of the targeted company are unwilling to relinquish control and the potential "raid: persists, the takeover attempt is considered hostile.

An individual or group attempting a hostile takeover can also appeal directly to the shareholders to replace members of the current board of directors with others that will approve the takeover. Additionally, voting rights may be used to enact various measures directed at increasing the share value. These measures might include replacing top executives, downsizing operations, or liquidating the company. Finally, the raider may quietly attempt to buy up a controlling share of a corporation's stock on the open market.

When the board of directors and/or management resists the acquisition by a corporate raider, the information available to the raider is limited. Specifically, the raider must rely on publically available information about the target company regarding its finances. As a result, hostile takeover attempts carry a higher degree of risk than pursuing a corporation by nonhostile means. Thus, investment banks were often less willing to finance hostile takeover attempts because of this risk. The realities of a hostile takeover situation sometimes resulted in securities fraud, including insider trading and other white-collar crimes.

During the 1970s and 1980s, investment banking firms sprung up to service corporate raiders and help raise "blind pools" of capital. Corporate raiders could use these "blind pools" of capital to make serious takeover attempts and provide high-yield debt financing of the buyouts. Many corporate raiders turned to the investment banking firm of Drexel Burnham Lambert to acquire the necessary blind pools of capital that were necessary to provide high-yield debt financing.

Michael Milken was affiliated with this firm in the 1980s and played a pivotal role in assisting some of the most notorious corporate raids. For example, Milken raised a blind pool in excess of $700 million for corporate raider Ronald Perelman, who would eventually takeover Revlon in 1985. Milken was indicted in 1989 on more than 90 counts of fraud and racketeering that included allegations of insider trading, tax evasion, and stock parking. Hostile takeovers peaked in popularity during the 1980s along with corporate raiders. As these "blind pools" of capital dissipated in the late 1980s, so did hostile takeovers and corporate raiding.

Specifically, in the late 1980s, many corporate raiders who utilized hostile takeovers suffered from bad investments as a result of bad investments. Ultimately, their investors took huge losses and the lines of credit used in corporate raiding vanished. Moreover, corporations began implementing defensive measures to prevent future hostile takeovers and the luster of the corporate raiding began to fade as the 1980s came to an end. These defensive measures included "poison pills" and "golden parachutes" as well as purposeful increases of debt levels on the target's balance sheet. All of these tactics were aimed at neutralizing the power of the raider.

Case Studies

The 1970s and 1980s saw a number of famous and/or infamous corporate raiders try to acquire companies through hostile takeovers. Carl Icahn developed a reputation as a successful and ruthless corporate raider after his hostile takeover of TWA in 1985. After succeeding in the hostile takeover, Icahn systematically sold TWA's assets to repay the debt he used to acquire the company and make a profit.

This behavior was known as asset stripping, and along with corporate restructuring and layoffs, was not uncommon among the raiders of the1980s. He also attempted a hostile takeover of U.S. Steel in 1989 but eventually failed. T. Boone Pickens, another corporate raider of the 1980s, attempted a hostile takeover of Gulf Oil in 1984. This takeover attempt was a reality check for many in the investment world as to the power of a skilled raider, even when the target was a large company.

Changing Marketplace

In the 1990s, the overall price of the American stock market increased, which reduced the overall number of situations where a company's share price was low in respect to the assets that it controlled. Thus, companies became less attractive options for takeovers. Corporate raiding evolved into work done at the hands of private equity firms. By the end of the 1990s, private equity firms pursued arguably different tactics than their corporate raiding predecessors.

Generally, private equity firms attempt to get the board of a target to "agree" to the takeover. However, if the firm is successful in acquiring a corporation, the same measures found in the corporate raids of the 1980s are frequently utilized.

Corruption

Corruption refers to the misuse of official powers, privileges, and resources for personal benefit, either for oneself or for others. The etymology conveys the notion of breaking something up into pieces, thereby disrupting the descriptive or prescriptive order between the constituent parts. By the middle of the 14th century, the term referred to the decay of bodies or of the soul. By the early 15th century, it came to refer to misuse of public offices, and later that century, of language.

It is misuse because those who commit the act do so knowingly and willingly. The powers, privileges, or resources are "official" because the holder possessed them via a role resulting from orderly circumstances and legitimating assent of those who have conferred these powers, privileges, or resources. For private companies, the last of these would include contributors of capital, for example, through retained earnings. For government entities, this group would include citizens.

Corruption occurs when an agent sets aside his or her role as a representative or agent of one or more others and acts on his or her account. In a traditional example, an employee of a private company offers a bribe to an employee of a government. In each case, the actions of these two individual people reflect on them and on their organizations. Each is an agent of his or her organization, and one can assume that they met in the ordinary course of business.

When the company employee offers a bribe, under agency theory, the law likely will impute this action to his or her company, especially if there is prospective benefit for the company from the payment. If the employee does this with the knowledge and assent of the company, then both the employee and the company have committed an ethical (and likely legal) violation. To the extent that the employee and his or her superior conspired to pay the bribe, one could impute violations to them vis-à-vis the company in any event. If the employee does this without the knowledge of the company, then the employee has committed an ethical and legal violation, both against society and against the company, in violation of his or her implied contractual duties of loyalty and good faith. Depending on the employment relationship, there might also be fiduciary duties of care and loyalty at issue.

If the employee of the government accepts the bribe, then he or she has violated both his or her implied contractual duties of loyalty and good faith to his or her employer and his or her civic legal duty to discharge the responsibilities of his or her office. Even if the employee's position is at a low level, it retains the mantle of public service, and acceptance of a payment on one's account, for the purpose of affecting the performance of one's public duty, violates that duty.

Even though this example includes employees of public and private organizations, it is principally because of the involvement of a governmental organization that the label of corruption applies. Corruption traditionally has referred to circumstances in which the actor, the obligations, and the transgressions occur in the context of public duties. When the facts relate to a private organization and the employee misleads someone to gain personal benefit, then he or she normally has committed fraud.

However, because of the mixed public-private nature of some organizations, the fact that such violations often involve both public and private institutions, and the structural similarity between such violations, the dividing line between "fraud" and "corruption" is not as clear, particularly in the 21st century. Although legal frameworks continue to note the distinctions between these types of violations, practitioners are attaching less significance to such differences.

There are various forms of corruption, aside from payment of bribes for favors, including embezzlement; money laundering; tax evasion; manipulation of markets for information, capital, and commodities; and trafficking in people, drugs, and arms.

Leading Regulatory Frameworks

The first major national regulatory framework to deal with corruption in the form of bribery of foreign public officials was the U.S. Foreign Corrupt Practices Act (FCPA). Congress passed this act in the wake of admissions by over 400 U.S. companies that they had made payments totaling hundreds of millions of dollars to foreign officials, parties, and candidates to secure business advantages. Two especially egregious cases at the time involved the Lockheed Corporation and Chiquita Brands. This act consists of two major sections.

The first section prohibits payments by certain classes of persons and entities to officials of foreign governments or intergovernmental organizations to exert influence on them in their official capacities to violate their lawful duties through acts of commission or omission, or to secure improper advantage to assist in obtaining, retaining, or directing business for, with, or to anyone. The act exempts facilitation (or "grease") payments to low-level government officials, whose scope for responsibility is narrow and whose duties are largely clerical or ministerial. Such payments relate to actions that the government employee already was under obligation to perform.

The initial antibribery provisions of the FCPA applied to all U.S. persons and some foreign issuers of securities. The International Anti-Bribery Act of 1998 amended the FCPA to conform it to antibribery conventions of the Organisation for Economic Co-operation and Development (OECD), principally by extending the antibribery provisions to foreign firms and persons who directly or indirectly participate in such acts inside the United States.

The second part of the FCPA requires companies that list securities in the United States to comply with accounting ("books and records") rules to make and keep records that "accurately and fairly" reflect the company's transactions, and "devise and maintain an adequate system of internal accounting controls." Failure to abide by these requirements constitutes a distinct violation under the act, apart from bribery.

At enactment of the FCPA, there were concerns in the United States that the legislation would handicap American companies vis-à-vis foreign competitors. However, many of the companies that have been targets of enforcement actions, particularly since 2000, have been units of non-U.S. companies.

Moreover, the practical effect of U.S. leadership on this issue has been to raise the bar of expectations for practices by companies in global commerce and to avoid wide disparities of advantage. By promoting transparency and lowering the cost of capital, the legislation has influenced measures in other jurisdictions, for example the United Kingdom Bribery Act 2010 and multilateral conventions such as the United Nations (UN) Convention Against Corruption.

The United Kingdom (UK) passed the Bribery Act in April 2010, and it became effective on July 1 of that year. It repealed all statutory and common law bribery laws and replaced them with crimes of bribery, being bribed, bribery of foreign public officials, and failure of a commercial organization to prevent bribery on its behalf.

The act is more stringent than the FCPA in forbidding payments to representatives of public or private organizations, and in prohibiting even facilitation payments. A key factor in determining whether a violation has occurred is whether the payment compromises the "good faith or impartiality" of the recipient in the discharge of his or her official duties. Where the violation occurs outside the country, "local practises or customs" cannot override its provisions unless these are part of the jurisdiction's "written law."

Just like the FCPA, this law aligns with guidance from the OECD Anti-Bribery Convention regarding payments to foreign public officials. However, unlike what happens with general bribery offenses under the United Kingdom act, only the briber is subject to conviction, not the recipient.

The act's novel offense of "failure of commercial organizations to prevent bribery on their behalf" imposes nearly universal personal jurisdiction on natural or legal persons according to a modest threshold of commercial nexus with the United Kingdom, regardless of the actual location of the crime. The standards are strict liability and vicarious liability. An organization can mount a defense by showing that it had implemented "adequate procedures designed to prevent persons associated with [the organization] from undertaking such conduct." This is similar to the mitigation standards under the U.S. federal sentencing guidelines for organizations. The maximum criminal penalties include 10 years in prison, an unlimited fine, forfeiture of property, and disqualification from service as a corporate director.

The Convention on Combating Bribery of Foreign Public Officials in International Business Transactions is an international agreement under the sponsorship of the OECD for combating bribery and collateral forms of corruption. The purpose of the convention is to harmonize laws in signatory countries regarding the criminalization of bribery of foreign public officials. After years of study and negotiation, the parties concluded and signed the agreement on December 17, 1997, and it entered into force on February 15, 1999.

Accession to the agreement is limited to members of the OECD and the OECD Working Group on Bribery in International Business Transactions. As most of the 39 countries that had acceded to the agreement by March 2012 were economically advanced or were on their way to such status, the organizers had conceived of the convention as helping reduce bribery in developing nations by addressing the supply side.

Authority for implementing provisions remains with respective signatory nations. The convention provides for two types of monitoring by the working group to ensure compliance: review of the terms of legislation for conformity with convention guidelines for criminalization of bribery of foreign public officials, and review of implementation of the legislation to ensure its practical effect conforms to convention guidelines.

On November 26, 2009, the parties to the convention agreed to a Recommendation for Further Combating Bribery of Foreign Public Officials. They released this document on December 9, 2009, to coincide with the 10th anniversary of the convention.

Hundreds of thousands of demonstrators surround the presidential office in Taiwan, calling on President Chen Shui-bian to step down on Taiwan's National Day, October 10, 2006. When first elected in 2000, Chen Shui-bian vowed to end decades of political corruption. Instead, he became embroiled in a series of corruption scandals involving his presidency and his family, including bribery and embezzlement. In September 2009, he was sentenced to life in prison in after a Taiwan court convicted him on graft charges.

The recommendation included the following provisions to enhance the ability of signatory nations to fight bribery of foreign public officials:

1. Adoption of leading practices to hold companies and their subsidiaries liable for bribing foreign public officials and to prevent them from serving as covert intermediaries.
2. Periodic review of policies and practices regarding facilitation payments.
3. Improvement of mutual legal assistance between nations regarding sharing of information and evidence in foreign bribery investigations and prosecutions and in seizure, confiscation, and recovery of transnational bribery proceeds.
4. Creation of an effective means for public officials to report suspected foreign bribery internally and externally to law enforcement, and for protecting whistleblowers from retaliation.
5. Cooperation with the private sector to adopt more stringent internal programs and controls to prevent and detect incidents of bribery.

The UN Convention Against Corruption is the first legally binding, multilateral treaty to fight corruption. On December 4, 2000, the UN General Assembly established an ad hoc committee to draft this agreement to fight transnational corruption. It did so over seven negotiating sessions from January 21, 2002, to October 1, 2003. The general assembly adopted it at the end of that month, and it entered into force on December 14, 2005. A Conference of the States Parties handles administration for the convention and assists signatories in implementing it.

The convention requires signatories to effect an array of anticorruption measures affecting their laws, institutions, and practices. The major sections deal with anticorruption measures through prevention, criminalization and law enforcement, international cooperation, and asset recovery. There are also procedural sections dealing with technical assistance and information exchange, and mechanisms for implementation as follow:

Prevention: The convention addresses public and private means, including leading practices such as anticorruption bodies, transparent election campaign financing, merit-based antipatronage policies, transparent and accountable public finance and procurement, and engagement with civil society organizations to reinforce efforts by government and business.

Criminalization and law enforcement: The convention requires signatories to criminalize an array of corrupt acts, including bribery, embezzlement, trading in influence, money laundering, and obstruction of justice. It also encompasses and construes practices in the private sector that traditionally would have constituted fraud or other criminal activity.

International cooperation: The convention spells out terms for coordinated action among signatories for an array of anticorruption measures, including prevention, investigation, and prosecution of offenders. In addition, it requires specific forms of mutual legal assistance in gathering and transferring evidence and extraditing offenders. It also requires signatories to support tracing, freezing, seizure, and confiscation of proceeds of corruption.

Asset recovery: The convention seeks to deter decision elites from plundering their countries through grand corruption by reducing the number of havens to which they can channel their wealth. This section reflects negotiations between aggrieved nations that have suffered losses of wealth through rent extractions and other forms of plundering, and the mostly economically advanced countries that have become such havens because of bank and incorporation secrecy practices. This section provides for evidentiary and procedural standards for recovery and restoration of embezzled public funds and other proceeds of grand corruption. It also requires signatories to extend the widest possible cooperation with one another in effecting such recovery and restoration.

Social Profit and Advocacy Initiatives

Transparency International has been a leading social profit organization in helping fight various forms of corruption in public and private institutions around the world by promoting transparency and accountability of organizations and their leaders. Its mission is "to stop corruption and promote transparency, accountability and integrity at all levels and across all sectors of society," and its vision is for "a world in which government, politics, business, civil society and the daily lives of people are free of corruption."

The organization guards its independence and proclaims itself as politically nonpartisan. It also expressly declines to allow donors to influence its policies and practices. From its Berlin headquarters, it operates through approximately 100 national and other chapters around the world.

From its founding in 1993, the organization has monitored and publicized incidents of public and private corruption, particularly as they have affected international development. Since 1995, its annual publication of the "Corruption Perceptions Index" has ranked jurisdictions by the perceptions of corruption from people doing business there. It has also published the "Global Corruption Report" and, since 1999, the "Bribe Payers Index," ranking the frequency with which multinational corporations in each jurisdiction offer bribes. The organization also provides free legal services for those with low incomes who are facing corrupt practices, and its representatives advise governments regarding reforms of policy.

Global Financial Integrity (GFI) is a project of the Center for International Policy, a social profit organization in Washington, D.C. It operates as a think tank and advocacy organization, with thought leaders from governmental, intergovernmental, corporate, scholarly, and other backgrounds preparing original research to support policy recommendations for national, bilateral, and multilateral contexts.

It started in September 2006, after its director, Raymond Baker, published *Capitalism's Achilles Heel: Dirty Money and How to Renew the Free-Market System* the year before. The mission of GFI is to "promote national and multilateral policies, safeguards, and agreements aimed at curtailing the cross-border flow of illegal money." It does this to "enhance global development and security."

The work of GFI focuses on "illicit financial flows" across borders, and it has produced empirical research to document that the majority of these outflows from the developing world, particularly from Africa, result from corruption originating in the industrialized economies. Only a minority of outflows relate to corruption, simple tax evasion, and traditional criminal activity in developing nations. The organization estimates that such illicit flows total at least $1 trillion annually, with about one-half of this money ending up in accounts in advanced economies. For every $1 going into the developing world for development projects through World Bank and other programs, about $10 comes out through such illicit financial flows.

GFI has led coalitions of national and global organizations to rally support for statutory and multilateral proposals to enhance global financial transparency and accountability and deal with challenges of money laundering; transfer pricing; tax evasion; incorporation transparency; bribery; trafficking in people, drugs, and arms; and other practices that undermine development programs, extract wealth from developing nations, and cause states to fail. Since 2009, GFI annually has recognized global leaders in the fight against corruption by conferring Global Financial Integrity Awards on Robert Morgenthau, Eva Joly, and Carl Levin.

Transcultural Perspectives

Because concern about corruption often comes from industrialized nations, particularly regarding funding for public, private, bilateral, and/or multilateral projects, there have been concerns that assessments of the problem and prospective responses have reflected the economic, political, cultural, and/or ethical preferences of wealthy nations. When business, governmental, scholarly, and other leaders from economically advanced nations cite the extent and costs of corruption, some in developing nations resentfully interpret this to be economic, cultural, or normative imperialism.

Criticisms from the developing world often reflect perceived judgmentalism by those in economically advanced economies, along with weariness for having to explain qualitatively distinct circumstances in their societies that make bribery and other forms of corruption common. Some in developing nations argue that dismissiveness of such circumstances is unrealistic, opportunistic, and even cruel because the practical effect is to deny economic opportunities to some of the most vulnerable populations in the world.

One response to this is to note that corruption harms everyone, including the poor, and that it is only by aligning the willingness to invest with the cost of capital, including the risks and rewards for investors, that an economic (and ethical) equilibrium can result. Societies that are more effective at promoting transparent and fair markets will find it easier to attract capital than other societies, and this can be beneficial to a broad array of stakeholders.

Moreover, in many cases, governments of developing nations have committed to fighting corruption and promoting financial integrity through ratification of bilateral and multilateral treaties and participation in other initiatives. Such gestures belie claims that corruption is simply a fact of life and a way to conduct business. The prospective conflict, then, is not between the ethos or practices of industrialized and developing nations, but rather between the practices of developing nations and their publicly declared positions. There are no societies that prescribe bribery or other forms of corruption as official positions. Even in those societies where corruption is rampant, there is shame when it comes to light. In bridging these distinctions, the industrialized world has features in common with the developing world, particularly with regard to the need for continuing reform, improvement, and integrity.

Counterfeiting

Counterfeiting involves the manufacture and distribution of facsimiles or replicas of an original product. The process is undertaken by those intending to sell the replicas, which are fairly inexpensive to produce, to the public, which believes that the replicated product has superior value.

Throughout much of history, counterfeiting has concentrated upon the replication of coinage and currency, as these facsimiles can generate tremendous profit. Over the past half century, however, the counterfeiting of a variety of consumer goods has taken center stage, both because of governments' preventive measures to discourage replication of currencies and because of the increased profit margins in the counterfeiting of apparel, recorded music, movies, computer software, electronics, and other goods. Concerted international efforts have been launched to reduce the production and trafficking of such consumer goods, although the lucrative nature of the process has hindered such efforts. Renewed efforts by copyright and trademark holders has led to a certain reduction of the problem, but the predicament caused by counterfeiting continues to bedevil creative artists, manufacturers, and law enforcement agents.

Background

Counterfeiting has taken place since ancient times, with examples of replica coins that contain base metals along with silver or gold being documented in the Greek city of Lydia as early as 600 B.C.E. Once the Chinese introduced paper money in about 1200 C.E., officials took steps to defend mulberry trees, which were used to produce the paper for currency, so that counterfeiters would be thwarted in their efforts. The counterfeiting of currency has been prevalent in almost every society throughout history, with severe penalties reserved for wrongdoers who are caught and convicted. Many government leaders have perceived the act of unauthorized duplication of coinage or currency as akin to an act of treason.

The crime of counterfeiting coinage and currency is treated so seriously in part because the stability of governments often depends on public reliance on its currency. Because making coins and currency was seen as the prerogative of the state throughout history, the act of counterfeiting was seen as more than just a crime against the individual who accepted the specious money—it was an act against the state itself. Therefore, those possessing the skills to counterfeit currency were frequently executed. In times of war, nations even employed the tactic of flooding their enemy's economy with counterfeit currency, devaluing the money of their state and plunging them into economic chaos. During both the American Revolutionary War and the Civil War, counterfeiting was used by the British and the Union, respectively, in an attempt to sway public opinion into opposing the war effort.

Although counterfeiting money is still the most popular outlet for those involved in duplicating authentic goods, other items are also replicated. Counterfeiting documents has been common throughout history, with both legal documents, such as wills or deeds, and collectible items, such as autographs and other memorabilia, as popular targets. Common techniques of counterfeiting documents include using paper, ink, and printing techniques for the fake version that are similar or identical to the genuine article. For this reason, many legal documents include security measures to complicate their replication.

Many popular consumer goods are also replicated. The International Chamber of Commerce (ICC) estimates that counterfeit goods make up approximately 5 to 7 percent of world trade. Despite the continuing international efforts to curtail the counterfeiting of goods, the hands-off enforcement patterns of certain nations such as China, North Korea, and Taiwan have made it difficult to completely halt illicit replications.

Counterfeiting Money

Governments have vigorously opposed the counterfeiting of their currencies since the earliest replications of coinage were attempted. In addition to defrauding the citizens who accept fake money, counterfeiting causes a variety of social ills. Counterfeiting reduces the value of genuine money, causing unrest among all. As more money is circulated in the economy, inflation often results, leading to an increase in prices for all citizens. The appearance of counterfeit money also decreases the sense of security that merchants, consumers, and others feel in accepting money that may be phony—sometimes leading to demands of payment in precious metals or the currency of another nation. Finally, merchants and others who accept counterfeit money are not reimbursed when they turn specious coinage or currency over to law enforcement agents, forcing them to increase their prices.

Attempts have always been made to discourage the counterfeiting of coinage and currency. The designs of notes and bills have included fine detail, raised intaglio printing, and special paper, making it easier for consumers and merchants to spot forgeries. When coins were made of precious metals, milled edges prevented valuable material from being scraped off or taken from the edges of the rim. Leaves were common on many early American examples of currency, as their unique and intricate designs were difficult to duplicate. As a variety of advances in copying technology became prevalent during the 20th century, more complicated and complex anticounterfeiting measures were introduced. Engraving bureaus introduced a variety of measures, including design features that disable photocopiers, embedded strips and other devices, holograms, inks that change color depending on how a bill or note is held, the use of multicolored inks, and microprinting. Various software programs have included safeguards that preclude the manipulation of scanned images of bank notes and currency. Government agents have also created new tests that make the detection of counterfeiters quicker and more efficient.

Counterfeiting Consumer Goods

The Organisation for Economic Co-operation and Development (OECD) estimates that over $250 billion worth of counterfeited consumer goods are sold every year. Others estimates place this figure at two or three times larger, since the OECD does not include online transactions in its estimates. The variety of counterfeited consumer goods is broad, including cigarettes, wine, automobiles, prescription medications, apparel items, watches, jewelry, luggage, software, toys, electronic goods, and other products. As the largest consumer nation in the world, the United States is the destination for many of these goods. Even U.S. government agencies such as the Department of Defense and the National Aeronautics and Space Administration have discovered that their procurement officers have inadvertently purchased counterfeit goods.

Although often overlooked, crimes that infringe upon patents, copyrights, and other intellectual property are not victimless. The presence of counterfeit goods in the U.S. economy is estimated to cost between 750,000 and 1,000,000 jobs that are lost to overseas production facilities. Legitimate copyright and trademark holders lose billions of dollars worth of sales annually, and their ability to invest in research and development for future products is diminished. Additionally, some counterfeit consumer goods present a threat to the general public, as specifications required for certain pharmaceuticals are sometimes ignored or unsafe materials are used to manufacture certain consumer goods. Considerable tax revenues are also lost as those involved in the manufacture of counterfeit goods fail to pay the proper levies to government authorities. Recent reports from the Central Intelligence Agency and other sources suggest that in some situations, revenue from counterfeit goods may flow to terrorist organizations. For these reasons, a great deal of energy is expended in attempts to curtail such counterfeiting.

A variety of U.S. law enforcement agencies, including the Federal Bureau of Investigation, the Department of Homeland Security, Customs and Border Protection (CBP), and the Department of Justice, along with state, local, and municipal law enforcement agents, work to prevent the importation and sale of counterfeit goods. Working in conjunction, these groups have seized billions of dollars worth of counterfeit goods. Such seizures have demonstrated that the brands most frequently counterfeited include those that appeal to an upscale, image-conscious market, including Burberry, Cartier, Chanel, Nike, Polo, Ralph Lauren, and Tiffany. To defend against this influx of counterfeit goods, some have suggested that the United States should adopt practices common in Europe, such as making the sale or purchase of counterfeit goods punishable by significant fines and jail time. CBP has created a supplemental registration of trademarks through a program known as Intellectual Property Rights e-Registration, which facilitates trademark owners' attempts to obtain court orders that permit the seizure of counterfeit goods. Although there has been support for a piece of legislation known as the Stop Online Piracy Act (SOPA) and the Preventing Real Online Threats to Economic Creativity and Theft of Intellectual Property (PROTECT IP) Act, which would permit the shutdown of Web sites used for selling counterfeit goods, significant opposition has prevented its passage to date.

In June 2010, U.S. Immigration and Customs Enforcement reported the seizure of hundreds of articles of counterfeit sports merchandise, such as counterfeit hats, T-shirts, and jerseys during the 2010 Stanley Cup playoffs in Philadelphia, Pennsylvania. Working in conjunction, a variety of U.S. law enforcement agencies have seized billions of dollars worth of counterfeit goods.

A growing appreciation of the complexity of thwarting the manufacture, importation, and sale of counterfeit goods has led to increased collaborative efforts between U.S. authorities and other nations. International initiatives appear to be one of the more promising ways to thwart the continued infringement of intellectual property rights. To that end, in 2011 the United States joined Australia, Canada, Japan, Morocco, New Zealand, Singapore, and South Korea in signing the Anti-Counterfeiting Trade Agreement (ACTA), a multinational treaty that established international standards for intellectual property rights. The original signatories were joined one year later by the European Union, the 22 nations that compose the European Union, and Mexico. ACTA aims to create new initiatives to target the manufacture, transport, and sale of counterfeit goods and would create a new governing body existing outside extant international forums such as the United Nations or the World Trade Organization. The prospects for increased international cooperation pursuant to ACTA appear excellent.

Countrywide Financial Corp.

Countrywide Financial Corporation (also known as Countrywide Mortgage or Countrywide Home Loans) was the largest underwriter of U.S. residential home loans in 2004, originating roughly one out of every five U.S. mortgages. When shareholders learned that its portfolio was loaded with risky mortgages in 2008, the company's stock collapsed. Bank of America bought Countrywide in 2008.

Background

Angelo Mozilo and David Loeb founded Countrywide Credit Industries in 1968. The New York firm sold mortgages to residential homebuyers and then packaged them for sale to investors. Mozilo moved to California to take advantage of the growing residential market, while Loeb stayed in New York to secure capital and package the mortgages for resale. Also, in 1968, Congress allowed the Federal National Mortgage Association (Fannie Mae) to buy prime mortgages and repackage or "securitize" them for sale. Countrywide could now underwrite and sell more prime mortgages, which met high standards for down payments and borrower incomes.

During the 1980s, Wall Street firms began securitizing mortgages and selling them to investors who wanted higher rates of interest. Some firms began packaging adjustable rate mortgages (ARMs), which are mortgages with a low initial interest rate that increases over time. They also packaged subprime mortgages, which are riskier because they are often purchased by people with low credit scores and past defaults. Countrywide avoided writing subprime mortgages during this period because of the risk. In the 1990s, mortgage brokers moved into high gear and Wall Street packagers such as Bear Stearns, First Boston, Merrill Lynch, and Lehman Brothers increased their mortgage operations. The influx of capital encouraged Countrywide and other mortgage originators to find more borrowers. In 1992, Countrywide was the largest U.S. originator of residential mortgages.

Intense competition and pressure from his national sales manager, David Sambol, led Mozilo to start writing subprime mortgages in 1995.

In 1999, Countrywide negotiated an exclusive agreement with Fannie Mae to purchase Countrywide loans at a discounted rate. Mozilo eventually began securitizing loans in-house to capture even more profit. Business accelerated when interest rates dropped from 8.5 percent in mid-2000 to 5.5 percent by mid-2004. ARMs went as low as 3 percent. The U.S. housing market took off, and trillions of dollars poured into the mortgage industry. Countrywide and other mortgage originators wanted to sell more mortgages, which led them to target less-qualified borrowers and to construct enticing, but dangerous, products. These products included exploding ARMs in which interest rates "exploded" upward after three or five years, Alt-A mortgages that required no borrower income information, and interest-only mortgages in which payments could more than double after a few years. Many companies followed this risky pattern, and $7 trillion in mortgage debt was created in the United States between 2000 and 2007.

The Bubble Collapses

In 2006, Mozilo realized that Countrywide owned too many risky mortgages and tried to move his positions, but the market for securitized mortgages had cooled and housing prices began to fall. At the same time, Mozilo told investors that Countrywide was not exposed to significant credit risk. On January 26, 2007, the stock price hit a high of $45.26, but loan defaults began to increase. Later in the year, Mozilo announced a third-quarter loss of $1.2 billion and terminated 12,000 employees. The stock hit $6.96 on January 31, 2008. In July 2008, Bank of America acquired Countrywide for $4 billion.

Countrywide crossed four ethical and at times legal lines in its quest for higher profits. In its efforts to capture more market share, Countrywide structured mortgages that customers could not pay. For some ARMs, monthly payments could increase by 30 to 50 percent unless the borrower refinanced. These loans and others put buyers at risk of foreclosure. In December 2007, 33.6 percent of Countrywide's subprime loans were delinquent. Countrywide also allegedly sold qualified minorities mortgages with higher interest rates while selling qualified white customers prime mortgages, thereby violating the Equal Credit Opportunity Act and the Fair Housing Act. The U.S. Department of Justice (DOJ) alleged that mortgage brokers acting for Countrywide broke these laws by placing over twice as many African American and Latino customers into higher interest subprime loans while guiding similarly qualified white borrowers to prime loans between 2004 and 2008. In addition, executives and board members acted for themselves and not in the interest of shareholders. In 2006 and 2007, while Countrywide was exposed to significant subprime risk, Mozilo and other executives represented the company as a prime lender, without significant exposure to risky mortgages. These representations supported the share price and the value of executive compensation packages. In reality, Countrywide had significant exposure to subprime loans. Moreover, between 1996 and 2008, a special Countrywide VIP unit wrote hundreds of mortgages for Fannie Mae senior managers and members of Congress involved in housing legislation. During the same period of time, Fannie Mae and Countrywide fought against government reform efforts to diminish Fannie Mae's positions in subprime mortgages from Countrywide.

In 2010, Bank of America's Countrywide Finance unit paid the Federal Trade Commission $108 million for allegedly setting loan fees too high. In October 2010, Mozilo and two other executives paid a record $22.5 million fine for misleading investors. Early in 2011, Countrywide reached a $20 million settlement with the DOJ for allegedly foreclosing on about 160 U.S. military members, without proper legal documents. On December 21, 2011, the DOJ settled with the Countrywide unit for allegedly discriminating against 210,000 people of color with a record $335 million fair-lending settlement. Countrywide did not admit to discriminating against anyone.

Creative Compliance

The idea of creative compliance raises questions about how the line between criminal and noncriminal behavior is drawn. It investigates how the "law abiding" abide by the law and shows crime and compliance to be problematic and easily manipulated concepts. Creative compliance is a means by which people can simultaneously escape both legal control and the stigma, and potentially adverse consequences, of out-and-out lawbreaking. It involves circumventing the impact of law, meanwhile retaining immunity from legal sanctions, by being able to claim that the activity in question is arguably "perfectly legal" or "not strictly illegal" and that no specific law has technically been broken, even though the legal policy behind it had been totally undermined. It is a practice that typically requires sufficient economic resources for high-level professional legal input and is therefore particularly pertinent at the white-collar or corporate end of society.

Big corporations, for example, in doing business on a day-to-day basis, face securities laws, accounting regulations, tax law, competition law, and banking regulations that are intended to control corporate behavior, protect markets, consumers, or employees, raise revenues or, to cite a recent example, limit systemic banking risk. These are laws with a public policy purpose. From a business perspective, however, they frequently represent an inconvenient constraint on the ability to optimize deals and profitability. In business culture, these potential legal constraints tend therefore to be seen less as policies to follow and more as obstacles or hurdles to overcome.

Lawyers are seen not so much as advisors on what is not to be done according to law, but as devisers of legal structures that will achieve the business goal, despite the law. Technical legal work is a vital element because the essence of creative compliance is to achieve arguable technical compliance with the letter of the law, while defeating the policy behind it, or its "spirit." The word *arguable* is important because the legal constructs produced may be seen by those constructing them as spurious, bullish interpretations, or "sailing close to the wind." But the fact that a legal argument has been offered in support, even if it is subsequently challenged and fails in court, can be enough to secure immunity from prosecution. It is a failed attempt at creative compliance, rather than a crime.

Labeling Theory

The idea of creative compliance, which began with research on United Kingdom (UK) tax evasion and avoidance in the 1980s, builds on older criminological work on white-collar crime and labeling, which had already raised questions about how the line is drawn between what is defined as criminal and what is not. White-collar crime analysis looked at how the law-breaking activities of corporations tend to be treated differently from "normal" crime in the administration of law. Labeling theory showed how law enforcement agents or regulators actively interpreted and categorized the activities of those they were policing, in a way that led them sometimes to invoke criminal law enforcement and the criminal label, sometimes not. The idea of creative compliance also looks at the role of law and the active construction of criminal and noncriminal labels, but its focus is different. The actors in question are not the regulators, but the regulated. The issue is not how law directly labels white-collar activities in a way that decriminalizes them, but how law is actively used and managed by the regulated to rule out a potential criminal label and claim legal compliance. Law is seen as malleable, as a material to work on, through highly creative legal work. The white-collar element remains key, since the ability to manage the criminal/compliant label through creative compliance is particularly available to those with the power and resources to purchase creative legal work.

The empirical work behind the concept investigated tax evasion (criminal) and tax avoidance (lawful), analyzing what differentiated them. It also looked at creative accounting and fraudulent accounting, and the difference between the two. It suggested that the consequences to society were the same in both out-and-out crime and creative compliance; that in both cases the purpose of the law was totally defeated, and intentionally so; and that the difference lay only in how the objective was achieved: It is not what you do, but the way that you do it. It is done by creatively using the law rather than technically breaking it.

Avoiding Taxes

Creative compliance takes many forms, but it typically involves repackaging the legal form of an activity while the economic substance (which is the target of the law) remains unchanged. The essence of the practice can be illustrated through a simple example from the area of UK Value Added Tax (VAT). When VAT was introduced some years ago on fuel, such as central heating oil, business was largely unaffected because VAT-registered businesses could simply reclaim the costs, but ordinary domestic consumers and other organizations, such as colleges, were unable to reclaim in this way and were hit by the extra costs. In the case of some colleges, a simple solution was found. A college dormitory would sell the boilers or furnaces in its cellar to a specially created company. As a business, the company could buy the fuel to heat them, reclaiming the VAT. The company would then sell the hot water generated by the furnaces to the college dorm. There was no VAT on hot water. VAT was therefore avoided. The substance remained exactly the same. The same furnaces were still in the same cellar, the hot water was still circulating round the same radiators, but the insertion of a separate company in the chain of ownership and consequent change in legal form meant that the tax was avoided. There was no legal noncompliance involved, just creative compliance.

Most corporate creative compliance is much more complicated, with whole chains of avoidance techniques brought into play. A specific banking regulation, for example, might be avoided by a change of legal form, only to find that it has adverse tax consequences that require another tweak in the legal construct, which in turn may necessitate routing through a different jurisdiction or the insertion of a trust, and so on, until a hugely complex legal structure is created. But the essence is always essentially the same. It is a way of changing the legal form in order to protect the economic substance from some adverse law or tax, or alternatively to manipulate it into a category that carries some advantageous legal status.

Practices such as tax avoidance and creative accounting, and circumvention of any regulation seen as an obstacle or inconvenience, are routine and pervasive in big business. The case of Enron has entered the annals of white-collar crime, and senior executives were jailed. Out-and-out crime was involved. But the reality is that many of the practices that misled the market on such a grand scale were in fact examples of creative compliance, manipulating the law, rather than technically breaching it. They were also practices that were in routine use, if not always on such a grand scale, in the corporate world more generally. The role of creative compliance was recognized in the congressional investigations into Enron, in subsequent discussions, for example, by Elliot Spitzer, of the problems posed not just by crime but also by "gaming the system," and in the new emphasis in the sentencing guidelines on business ethics.

Creative compliance reaffirms the concerns over equality and fairness before the law, which the idea of white-collar crime originally spotlighted. It also points to a fundamental issue for legal control and for the rule of law. Creative compliance demonstrates a corporate culture in which law and regulation are seen not as democratically authoritative commands to be obeyed, but as obstacles, hurdles, or inconveniences to overcome, and the role of corporate lawyers is seen as finding creative ways to achieve this. Recent scandals over corporate accounting and the financial crisis have stimulated the usual calls for more effective legal regulation. However, there is little chance of any changes in the law achieving effective control in the corporate world, unless the culture of creative compliance is addressed.

Credit Card Fraud

Credit card fraud is a method of identity theft that comprising the unlawful acquisition of another's credit card information for the purpose of illegally charging procurements to the cardholder's account or removing monies from the account. Credit card fraud is considered a crime against property. The scope of white-collar crime is continuously transforming, which poses a distinct challenge to the law enforcement community. Improvements in, and expanding availability of, technology increase the broadening of approaches used in the commission of high-tech and credit card fraud crimes. Identity theft is usually associated with credit card fraud. Statistical trends reveal the immense pace of the growth of identity crimes. This growing trend in identity theft has strongly paralleled the introduction and expansion of e-commerce. The transaction referred to as *e-commerce* represents both consumer-based and business-to-business transactions.

Credit card fraud has many names or titles, including Kansas' Criminal Use of a Financial Card to Texas' Credit Card or Debit Card Abuse. As more and more individuals rely on credit or debit cards, the propensity for abuse and/or illegal activity related to these cards increases. Between 2005 and 2007, the National Crime Victimization Survey found that the number of households with at least one member who experienced one or more types of identity theft increased 23 percent. The Federal Trade Commission's 2006 identity theft survey found that 3.7 percent of the adult population, or 8.3 million adults, discovered that they were victims of identity theft during that year. The survey also found that identity thieves made off with an estimated $15.6 billion. Rodney Huff, Christian Desilets, and John Kane conducted a survey of households and found that nearly 24 percent of households were the victims of a white-collar crime. Of these, almost 40 percent were the victims of credit card fraud. Credit card fraud was the leading white-collar crime that was committed against households in their study. With identity theft brings the ability to secure a credit card in another person's name. Credit card fraud ploys usually fall into one of two classes of fraud: First is application fraud, and second is an account takeover.

Credit Card Fraud by Application

Application fraud is most often associated with identity theft. Identity theft has become a major concern of law enforcement as well as the community and consumers at large. The anonymity of the Internet and access to much personal information has fundamentally changed the nature of identity theft. The expanded use of the Social Security number is one of the primary reasons for the ease of identity theft, which leads to application fraud in credit requests. Application fraud refers to the illegal and unauthorized initiating of a credit card account in another individual's name. The three major credit reporting bureaus (Equifax, Trans Union, and Experian) control the information on all persons applying for credit in the United States. These companies allow anyone with a name and Social Security number access to a credit history. Credit reports are very valuable to the identity thief. Credit card companies do a better job at security because they make the process more extensive than just a name and Social Security number. This extra level or protection leads white-collar criminals to fall deeper into stealing information about individuals, so that they have enough information to perpetrate an identity theft.

White-collar criminals who engage in identity theft obtain as much information as possible about the individual whom they wish to defraud. This includes information that the general public may not believe is very sensitive. Some examples are children's names, place of birth, dates of birth, pets' names, hometowns, and favorite sports teams. This type of nonessential information may be useful in an account takeover, which is protected by lost password questions related to nonessential information such as that mentioned above. Gaining access to this information can be accomplished through very rudimentary means, such as dumpster diving or through online phishing scams. Dumpster diving refers to scavenging through garbage or trash to obtain discarded materials that identify the person who threw out the garbage. The items of most value have account numbers, addresses, dates of birth, social security numbers, financial records, medical records, or any personal records. With this type of personal information, an identity thief can create convincing counterfeit documents. These documents may assist the thief in setting up rented mailboxes with the phony personal information to have items purchased through the fraudulent credit card. Credit card application fraud schemes are serious because a victim may learn about the fraud too late, if ever.

Methods of Identity Theft

Identity thieves look for both incoming and outgoing mail, left in an unlocked mailbox at a residence. Outgoing mail with a personal check and billing information is the most desirable. Thieves may also steal incoming mail in an attempt to look for this same information. In addition, thieves may attempt to make contacts in mail facilities where the employee steals letters that may have credit cards in them. Thieves have also been known to complete a change-of-address form and divert all mail to a fraudulent address to which they have access.

Eavesdropping on anything, from using a computer in a public place to watching public transactions that involve personal identifiers, can be used by the identity thief. This may seem like a rudimentary way of stealing personal information; however, it still occurs.

Identity thieves can obtain information illegally from unsecured Internet connections. These locations are increasingly prevalent as wireless routers are used in many places. In addition, social media have presented identity thieves with a wealth of personal information. If an identity thief has enough personal information, he or she can use hint questions to obtain access to social media accounts such as Facebook. In addition, many unsuspecting users of social media to post personal information about themselves that the thief may be able to use to perpetrate an identity theft.

Black Market

Identity thieves have access to extensive black markets, where stolen personal information can be sold and resold to individuals throughout the world. Evidence suggests that Internet Relay Chat (IRC) channels and Web sites operate for hackers to sell considerable quantities of personal information obtained through database companies and by other means. These Web-based suppliers exist to sell credit card and bank accounts, PIN numbers, and supporting customer information obtained from victims around the world in lots of tens or hundreds of accounts. Stolen bank and credit accounts are referred to as "dumps" inside these markets, and the individuals who participate are referred to as "carders." Financial accounts in carding markets are sold at extremely low prices. Identity thieves could also buy accounts obtained from countries around the world, suggesting that identity theft and credit card fraud have no geographical boundaries.

Credit Card Fraud by Account Takeover

Account takeovers usually involve the criminal takeover of an existing credit card account, a procedure by which a criminal obtains sufficient personal information about an individual to change the account's billing address. With the increasing use of technology, hackers attempt to gain access to sensitive databases of information. The United States has seen a major increase in the collection and maintenance of digital files to save space. Consequently, these files provide hackers with a wealth of information. Once access is gained to a database, the hacker obtains the personal information that is needed to steal the identity of an individual. Once the criminal has sufficient personal information, he or she subsequently notifies the credit card company that the card is lost or that it was stolen in order to acquire a new credit card and make fraudulent purchases with it.

Another common method used to accomplish an account takeover is called skimming. Skimming plots occur when an employee of a business illegally accesses a customers' credit card information. The employee then either sells the personal card information directly to identity thieves or takes over the customer's identity. The employees use a skimming device that they swipe the consumer's card through, in addition to the regular credit card machine supplied by the legitimate business. Consequently, this plot is done without the customer's knowledge, and the credit card information may be used months after the actual skimming occurred. This type of stealth makes it difficult to determine when the skimming happened. Skimming also occurs at automated teller machines (ATMs).

The skimming devices are illegally installed on ATMs and are usually undetectable by the users. The makers of the skimming devices fabricate the device so that it appears to be part of the ATM. Thus, the customer does not know that their card was skimmed. These unambiguous devices are realistic-looking card readers, positioned over the factory-installed card reader. Customers insert their ATM credit or debit card into the counterfeit reader, and their account information is read by the device and stored on a small attached device or cell phone. In addition, the credit card information can be sent wirelessly to the criminals.

Skimming at ATMs typically involves the use of some sort of hidden camera, installed on or near the ATM. This camera records the ATM customers' submission of their personal identification number (PIN) into the ATM's keypad. Moreover, there have also been instances where, instead of a hidden camera, identity thieves attach a counterfeit keypad above the real keypad, which records every keystroke as customers punch in their PIN.

Skimming devices are installed for relatively short periods of time, oftentimes just a few hours. This relatively short time period reduces the chances that someone will notice the device and consequently reduces the chances that the thieves will be caught. They are then removed by the thieves, who download the stolen credit card account information and encode it onto blank cards. The cards are then sold on the black market or used by thieves to make withdrawals from the customer's account at other ATMs, or are used to purchase items. Many thieves purchase gasoline with the counterfeit cards because they can pay at the pump, and the chance of being caught with a fraudulent card is minimal.

Reporting Trends

According to research on white-collar crime (including credit card fraud) conducted by Huff, Desilets, and Kane, of the known households that reported being a victim of a credit card fraud, only 83.3 percent reported the illegal activity to their credit card companies, and 20.5 percent were reported to the police. This is an alarming statistic, considering the low percentage actually reported to an agency that had the ability to prosecute the offenders. This low reporting statistic, combined with the months that it may take to find out that a crime actually happened, leads to

President Barack Obama signs the Credit CARD Act, a cardholders bill of rights, in the White House Rose Garden in Washington, D.C.., May 22, 2009. He is flanked on his right by the co-sponsor of the bill, Rep. Carolyn Maloney, D-New York.

a low clearance rate by law enforcement. In addition, the investigative response by law enforcement involves both technological knowledge and traditional investigative techniques.

Law Enforcement Response

Federal law enforcement agencies and the criminal justice system have begun to respond to the increasing threat posed by identity theft and credit card fraud. Because this type of crime has been increasing at such an alarming rate, law enforcement has had to devote resources for the specific investigation of both identity theft and credit card fraud. New legislation has been passed, and preventative consumer awareness programs have been launched. Credit card fraud is not a crime that is immediately known to the victim and may take as long as a month or longer until the crime is discovered. In addition, an individual may be the victim of identity theft, but not of credit card fraud. Personal information that is obtained illegally may be stored and used anytime in the future. Consequently, these are real challenges that law enforcement faces.

Determining where the identity theft or credit card fraud took place, for jurisdictional purposes, is challenging. This is particularly true because the identity theft may have taken place in one jurisdiction and the credit card fraud in another jurisdiction. To complicate matters for law enforcement, oftentimes someone steals the identity and another person perpetrates the credit card fraud. Some jurisdictions have set up multi-agency task forces to combat these challenges.

Crédit Lyonnais

Crédit Lyonnais Bank is a French bank with a central role in European and global financial markets. During the 1980s and 1990s, although controlled by the French government, Crédit Lyonnais underwent a period of great expansion and aggressive lending practices. In particular, Crédit Lyonnais became involved in financing a variety of Hollywood films and later financed Giancarlo Parretti's disastrous takeover of MGM/UA Communications Co. These dealings resulted in a $5 billion loss for Crédit Lyonnais and almost resulted in the firm's bankruptcy. Crédit Lyonnais also received the controversial transfer of the Executive Life Insurance Company's portfolio of high-yield, noninvestment grade bonds and later agreed to pay fines based upon false statements that Crédit Lyonnais personnel made to federal bank regulators.

Background

Founded in 1863 by politician Henri Germain in Lyon, France, Crédit Lyonnais had grown to become the largest bank in the world by 1900. Although nationalized along with most of France's other banks after World War II, Crédit Lyonnais remained one of the largest banks in Europe and the largest in France. During much of the postwar period, Crédit Lyonnais was known for its conservative and traditional approach to lending, guaranteeing the bank solid returns but only modest levels of growth. This changed during the mid-1980s, when a new management group sought rapid growth for Crédit Lyonnais. Viewing the United States, especially its film industry, as an area of potentially high levels of profits, Crédit Lyonnais's leadership began pursuing film financing deals.

Financing Hollywood

By the mid-1980s, Crédit Lyonnais had come to play the largest role in the financing of American films. Although such loans were often risky, they also could be highly profitable and bore the cachet that the bank's leadership coveted. Because of the bank's work in this area, it was approached by Italian financier Parretti, who sought financing in his bid to acquire assets in the film industry. Parretti had been interested in purchasing French filmmaker and theater owner Pathé SA. In anticipation of this purchase, Parretti had purchased a smaller film distribution company, the Cannon Group, and renamed it Pathé Communications. As had been the case when he acquired Cannon, to finance the purchase of Pathé, Parretti received support from Crédit Lyonnais's Dutch affiliate, Crédit Lyonnais Bank Nederland (CLBN). Despite his interest, Parretti's bid for Pathé was thwarted when the French government, after a brief investigation of his finances and business dealings, determined that he was an unfit steward for the legendary studio. Undeterred, Parretti again sought financing from Crédit Lyonnais to pursue the purchase of renowned film studio MGM/UA Communications Co. (MGM), home of Metro-Goldwyn-Mayer and United Artists.

Although MGM was one of the most storied of film studios, by the late 1980s, it was reeling as the result of several mergers and acquisitions. MGM was owned by investor Kirk Kirkorian after 1969, although he sold it briefly to entertainment mogul Ted Turner in 1986. After stripping MGM of its film library, Turner sold MGM back to Kirkorian after only a short time. With Crédit Lyonnais's financing, Parretti purchased MGM in 1990. Deeply in debt, Parretti produced few films while in charge of MGM and was criticized by many for looting the company. Parretti installed his 21-year-old daughter as senior financial officer at MGM and used corporate assets to purchase gifts for friends. Unable to make loan payments to CLBN, Parretti defaulted on his loan obligations and MGM was seized by the bank. After infusing billions of dollars into MGM to make it attractive to purchasers, Crédit Lyonnais resold MGM to Kirkorian in 1996. Parretti was charged with securities fraud and misuse of corporate funds, and he in turn alleged that Crédit Lyonnais officers had sought bribes and received other benefits. Parretti was convicted of financial impropriety by a French court for misstatements to financial regulators.

Secretive Dealings

During the recession of the early 1990s, California-based Executive Life Insurance Company also fell upon hard times. Long an investor in high-yield, noninvestment grade bonds, also known as "junk bonds," Executive Life was taken over by John Garamendi, California insurance commissioner, when the value of Executive Life's surplus, or equity reserves, fell. After Garamendi took control of Executive Life, he sought to sell off the company's various components, including its junk bond portfolio and insurance operations. Six months after the April 1991 takeover of Executive Life, the California insurance commissioner sold off its portfolio of junk bonds to Altus Finance and its insurance operations to Aurora National Life Insurance Co. Unknown to Garamendi, Crédit Lyonnais secretly controlled both Altus and Aurora. Crédit Lyonnais's ownership had been kept secret because under the now-repealed Glass-Steagall Act, banks could not own insurance companies.

In 1998, an anonymous French whistleblower alerted the California insurance commissioner and the U.S. Department of Justice about Crédit Lyonnais's actions, and these entities sued the bank to recover damages. After years of litigation, Crédit Lyonnais agreed to pay fines of over $700 million to settle claims against it resulting from Executive Life. In the aftermath of these problems, Crédit Lyonnais merged with former French rival Credit Agricole in 2003. Because Credit Agricole traditionally had focused upon rural and small town accounts, the combination with Crédit Lyonnais, with its focus on urban residents, proved fruitful. The combined operations represent the eighth-largest bank in the world and the second-largest bank in Europe.

Cressey, Donald

Donald Cressey was an American criminologist whose work focused on theories of crime, organized crime, and white-collar crime. Cressey taught sociology at the University of California and authored and coauthored a number of seminal works that are used as fundamental reference points for the study of criminality. Cressey coauthored the 1934 edition of the groundbreaking criminological text *Principles of Criminology* with Edwin Sutherland. It is considered one of the most influential criminological texts and is still referred to as a standard academic text in criminological theory. After Sutherland's untimely death in 1950, Cressey expanded on one of Sutherland's key theories of *Principles of Criminology*, the theory of differential association, which has become one of the historically central theories of crime and penology. Cressey also published works regarding fraud and embezzlement, and conceptualized the "fraud triangle." The foundation of much contemporary work in this field, the fraud triangle is composed of opportunity, motivation, and rationalization.

Theft of the Nation

The most infamous and controversial of Cressey's single-authored works is his study of American-based organized crime in *Theft of the Nation*, which was published in 1969. The impact of this work has led some to describe Cressey as the founder of modern organized crime research. American socio-politics at the time were gripped by an organized crime fever, fueled by highly symbolic imagery provided by frenzied media. For many years, successive government administrations had sought to tackle the allegedly growing problem of organized crime in the United States. Following a number of commissions and task forces instructed to enlighten policymakers as to the causes of organized crime and outline measures to defeat it, the temptation to lay the blame for organized criminality at the feet of an external threat found much favor in the minds of America's power elites. A series of colorful "show trials" took place as a procession of mysterious and flamboyant Italian American "gangsters" gave evidence of a massive, single, organized criminal threat that was seeking to corrupt American society, the Cosa Nostra.

From 1966 to 1967, Donald Cressey formed part of a presidential task force and subsequently published his findings in *Theft of the Nation*. Cressey relied heavily on the testimony previously given by alleged mafia informer Joseph Valachi, as he described a strict Italian/American bureaucratic hierarchy of organized criminality that exhibited many of the structural features of legitimate corporate enterprise. Cressey's claims were cemented by the detail of his assertions, in which he described 24 families, directed by a commission and a council. The families consisted of bosses, under-bosses, counselors, captains, lieutenants, and soldiers, all of whom followed strict orders. The structure of the organization, Cressey claimed, insulated the upper echelons from associations with the actions of the lower-level agents, thus granting protection to the most important members. Cressey further explained that the Cosa Nostra's principal aims were to establish monopolies over illicit goods and services and to pervert the democratic structures of the nation by way of corruption and extortion.

The conclusions of *Theft of the Nation* have been subject to heavy criticism by academic analysis. Cressey's allegations have been described as a leap of faith, particularly his seemingly unquestioning reliance upon Valachi's testimony, which was later proven flawed. Nevertheless, Cressey's model of organized crime and its participants was timely and found much favor among a curious and fascinated public, as well as law enforcement agencies, which appeared to feel vindicated by this depiction of organized crime. Cressey's depiction of organized crime absolved both the public and the government from any direct responsibility. No longer was organized crime seen as the outcome of contradictory laws; rather, it was a conspiracy of outsiders who were intent on undermining the country's moral policies. *Theft of the Nation* cemented the growing Alien Conspiracy Theory model of organized crime, and some argue that this is the model, albeit modified, that still underpins many national and supranational efforts to tackle organized criminality.

Criminal Facilitation

Although the rule of law differs by U.S. state, a person is guilty of criminal facilitation when, acting with knowledge that another person is committing or intends to commit a crime, he or she engages in conduct that knowingly provides this person with means or opportunity for the commission of the crime, and which in fact aids the person to commit the crime. As a category of crime, criminal facilitation essentially means that a person helped someone to commit a crime, but the person rendering assistance was not directly involved in the actual underlying criminality. It is often difficult to establish or define criminal facilitation. One example might be if a person who is a lawful owner of a firearm knowingly and willingly provides that firearm to another person, who intends to use the firearm for a crime such as robbery, assault, or murder.

In many states, a criminal facilitator is tantamount to an "accessory," or a person who assists in the commission of a crime, but who does not actually participate in the criminal activity as a joint principal. The joint principal is the person whose activity, accompanied by related *mens rea* (i.e., guilty mind), is the main cause of the *actus reus* (i.e., guilty act). In many jurisdictions, an accessory is different from an accomplice. An accomplice generally must be present at the scene of the crime and is also in some way directly active in the commission of the crime. In the same vein as a criminal facilitator, an accessory must only have knowledge that a crime is being, or will be, committed. In this regard, a person charged with criminal facilitation or being an accessory to a crime may aide or encourage the criminal toward the act, or may be charged for failing to report the crime to the proper authority. Criminal facilitation or being an accessory to crime may involve financial, emotional, or physical assistance to aide or conceal the crime.

In some jurisdictions, criminal facilitation laws do not require that the principal crime actually be committed as a requirement for criminal accountability. In many states, it is a crime to simply provide a person with the "means or opportunity" to commit a crime. This can occur before or after the criminal act and has also been conceptualized as "conspiracy." Similar to criminal facilitation, a charge of conspiracy may be leveled even if the criminal act was never committed, so long as the intent was present or a plan had been made. In this sense, criminal facilitation or conspiracy is a viable criminal charge when a person is active in planning the crime, incites another person to commit the crime, or aids in concealing, escaping, or failing to report a crime. If this form of criminal facilitation occurs before the commission of a crime, the guilty party is known as an "accessory before the fact"; if the criminal facilitation occurs after the criminal act, the guilty party is known as "an accessory after the fact." Thus, although criminal facilitation is often defined separately in many U.S. states as a criminal act, it overlaps significantly with definitions of conspiracy to commit a crime or being an accessory to the commission of a crime. The fundamental connecting factor to these terms, as criminal charges, is that the convicted person had knowledge that the crime was going to be, or had been, committed and then in some manner aided in the commission of the crime.

Criminal facilitation or being an accessory, especially at the federal level, has also been referred to as aiding and abetting. Derived directly from the U.S. penal code, aiding and abetting is defined as "Whoever commits an offense against the United States or aids, abets, counsels, commands, induces or procures its commission, is punishable as a principal; and whoever willfully causes an act to be done which if directly performed by him or another would be an offense against the United States, is punishable as a principal." Once again, the "principal" is the person primarily responsible for the criminal act. Thus, aiding and abetting is another form of criminal facilitation, being an accessory to a crime, or conspiracy to commit a crime.

Critical Theory

Critical theory and criminology focus on the relationship between power, inequality, and crime. Their roots stem from the conflict perspective, which postulates that there are two groups in society, one with power (the bourgeoisie) and one without (the proletariat), and the proletariat is subject to societal change, legislation, and domination proffered by the bourgeoisie as a means of continued oppression. This oppression will constantly create class conflict, and within a system and society that is rife with class structure and status inequalities, the law, punishment, and justice will always be notably based upon a system of social inequality and blocked opportunities for those situated in the lower classes. Critical theory challenges the fundamental basis of traditional criminological theory through the provision of three alternative theories: Marxism, critical feminism, and power-control.

Three Alternative Theories

In 1848, Karl Marx and Friedrich Engels published the *Communist Manifesto*, a manuscript that focused on oppressive labor conditions, the exploitation of the proletariat, a focus on economic structures in society that control all human relations (productive forces/relations and the relationship between the capitalist bourgeoisie and the proletariat). Even though Marx did not produce much work on crime, his work provided the foundation for the idea of social conflict. William Bonger extended Marx's work in 1916 and argued that the system of production divides society into haves and have-nots, and in every society that is divided in this manner, criminal law is devised to protect members of the ruling class. By proxy, legislation will not mandate punishment for an act that does not harm the ruling class, and the legal system will discriminate against the poor and protect the wealthy. Ralf Dahrendorf and George Vold continued the concepts of Marxist theory with their arguments that society is made up of competing interest groups subject to processes of social change produced by dissent and conflict, and laws are created by groups of people that have the money to create them.

Whereas Marxist theory argues that economic structures dictate oppression, critical feminism argues that power is controlled and structured by gender within a patriarchal society. Under the capitalist system, they argue that women are a commodity that may be possessed and that the origin of class and gender differences can be traced back to the creation of private property. Property owners decide what and whom is valued, males benefit from the division of labor by gender (whereby women's work is compensated less, or not at all), and the powerlessness of women in society renders them more likely to be victimized and less likely to be able to commit violent crimes or crimes of power because they do not have access to powerful positions.

Power control theory is based on John Hagan's premise that crime is a function of class position (power) and family functions (control). Power control theory argues that power and control within the family sphere are translated into the work field, and when families are patriarchal and males hold dominant positions, they control households. This can be done either through direct control, like bringing in/allowing the use of money, or indirect control, such as devaluing women's work or not allowing their spouse an egalitarian position in the workplace or the home. Children raised in these households will mirror the power-control relationships that they see at home. For example, girls growing up in patriarchal homes are more likely to fear rules and punishment (by being controlled), and as a result they are more likely to commit behaviors such as running away or suicide. In contrast, girls who are raised in egalitarian homes view power as equal and learn that they may have equal power in a relationship, feel as though they are able to have successful careers, and feel more freedom to engage in less risky behaviors.

These three alternative theories have been applied individually, as well as in their totality, to explain white-collar and corporate crime. At the heart of conflict theory is the concept that society is characterized by conflict and power relations, rather than consensus. White-collar and corporate crime, by definition, must be committed by individuals with access to power, prestige, authority, and/or money. Conflict theory provides strong arguments as to why white males are more likely to commit white-collar or corporate crime; why laws and legislation appear to protect the wealthy; why when more women gain access to power, control, and authority, female rates of white-collar or corporate crime may increase; and why economic fluctuations are related to levels of white-collar and corporate crime. Policy implications of conflict theory include equalizing the distributions of power, wealth, and status; favoring minimum wage laws, sharply progressive taxation, government controlled health care systems, maternal leave, and national policies of family support; reforms of patriarchal societies; placing more women into positions held traditionally by males; equal treatment of boys and girls by families, schools, and juvenile authorities; increased educational choices; more opportunities for day care and family support; and gender-sensitivity education in schools and workplaces to address gender biases and sexist ideas.

Crocker, Charles

Charles Crocker (1822–88) was born in Troy, New York, into a modest family. At an early age, Crocker began to work in order to support his family, leaving school after eighth grade. In 1836, Crocker moved with his family to a northern Indiana farm, and at the age of 17, he began to earn a meager living, first as a farmhand, then working in a sawmill, and later as an apprentice at an iron foundry. In 1845, he discovered an iron deposit nearby and established a forge known as Charles Crocker Company. Following the California gold rush, Crocker sold the company and set out west with a small band of men, including two of his brothers. The journey took Crocker nearly six months, and they arrived in Placerville in 1850. He later gave up mining, opened a store in Sacramento, and, in 1855, was elected to the city council. Crocker quickly became one of the wealthiest and most prominent men in the city.

In 1860, he was elected to the state legislature as a Republican, and soon after became one of four initial investors, along with Leland Stanford, Mark Hopkins, and Collis P. Huntington, all Sacramento merchants, who formed the Central Pacific Railroad. The men later became known as the Big Four, amassing a vast transportation and land empire. Prior to the start of construction, Crocker resigned from the Central Pacific and formed Charles Crocker & Company (later succeeded by the Contract and Finance Co.). Central Pacific awarded the newly formed company the construction contract for the western part of the first transcontinental railroad. Crocker was head of construction, tasked with the daunting task of building the railroad through the Sierra Nevada eastward. This was a formidable challenge in an era when labor was scarce, a problem that Crocker solved with the use of Chinese workers. In Promontory, Utah, the Central Pacific finally joined tracks with the Union Pacific on May 10, 1869.

Crocker profited enormously, though not without corruption, from contracts with the Central Pacific. In one billing, the jointly owned Contract and Finance Co. charged the government-sponsored Central Pacific $121 million for $58 million worth of work. However, unlike the Credit Mobilier and Union Pacific scandal, the reputations of Crocker and his associates went largely unscathed because records of the Contract and Finance Co. were destroyed prior to any investigatory work. With the line completed, the Big Four were major stakeholders in an invaluable transportation railway, the great majority of which was built at the expense of government loans and land grants authorized by President Lincoln's Pacific Railroad Act of 1862. With the monopoly transportation position established, the Big Four used the Central Pacific and other holdings to reap profits, prevent competition, and dominate politics. Crocker and his associates would often set price structures that milked the profits of farmers and ranchers who sought to ship their goods, a practice later regulated by the passage of the Interstate Commerce Commission Act of 1887. The Big Four also reputedly spent millions to influence legislation.

Crocker and his associates continued the expansion of their transportation and land empire by building additional railways north into Oregon and south into the San Joaquin Valley. They purchased inland and ocean steamship lines, monopolized dock facilities, won additional land grants, and bought all roadways. This allowed the industrialists to individually and collectively exert considerable financial and political weight on the business sector for years. Two years after he was seriously injured in a carriage accident, Charles Crocker died in the Del Monte Hotel on August 14, 1888. He left his wife, Mary Ann Deming, three sons, and a daughter with a fortune estimated at over $40 million.

Cullen, Francis T.

Francis (Frank) T. Cullen may be counted among the top dozen criminologists in the world who study white-collar and corporate crime today. He is a Distinguished Research Professor of Criminal Justice and Sociology at the University of Cincinnati, in Cincinnati, Ohio. Cullen has been at the University of Cincinnati since 1982, and before that spent six years at Western Illinois University. Cullen earned a bachelor of arts in psychology at Bridgewater State University in 1972, followed by a year of graduate study at the University of Rhode Island. He completed a master of arts in sociology and education in 1974, and a doctor of philosophy in sociology and education degree in 1979, both at Columbia University. His doctoral dissertation, chaired by Richard Cloward, was titled "The Structuring of Deviant Behavior: Deviance Theory Reconsidered."

He is the author, or co-author, of hundreds of publications, including 25 books, journal articles, book reviews, book forwards, and government reports. His research interests have crossed a variety of topics including criminological theory, corrections, rehabilitation, juvenile delinquency, sexual victimization of college women, and white-collar and corporate crimes. Cullen has been the president of both the American Society of Criminology and the Academy of Criminal Justice Sciences, and has always been very active in professional service to the discipline.

Cullen's interest in white-collar and corporate crime can be tied to the historical period in which he began his career in criminology. This interest can best be described in his own words:

> I would say that my interest in white-collar crime was spurred by the same factors that led a generation of scholars to become interested in corporate and other forms of white-collar crime at the same time: the changing social context of the 1960s and 1970s that, during our days in graduate school, sensitized us to the crime not only of the poor but also of the rich. This was found most centrally in critical criminology, but its influence was felt across criminology and other disciplines.

Cullen's interests in white-collar and corporate crimes can best be described as falling into three underlying themes. One theme of his research dealt with public opinions of the seriousness of white-collar crimes versus crimes in general.

> My first article was published in 1982. In a different context, I redid a study on the seriousness of crime undertaken by Peter Rossi et al. My focus, however, was on whether, between 1972 (Rossi study) and 1979 (my study), attitudes toward white-collar crime had changed. The study showed that public views toward white-collar crime had shifted to see these acts as more dangerous.

A second theme of interest to Cullen (and co-authors) dealt with public opinions toward the punishment of white-collar criminals.

> I did several other studies and assessments of the extant literature—the last one in 2009 ("Bad Guys; Why the Public Supports Punishing White-Collar Offenders"). My central message of all these studies was as follows: the idea that the public opposes the punishment of offenders is a myth. Public opinion is not a barrier to the use of the criminal law against white-collar offenders (a popular view in the 1970s). Today, I would go even further, as I do in my 2009 essay: the public relishes the punishment of white-collar offenders.

A third theme of Cullen's work in white-collar crime dealt with the prosecution of white-collar offenses and offenders. In 1987, Cullen, William Maakestad, and Gray Cavender, published *Corporate Crime Under Attack: The Ford Pinto Case and Beyond*, which was reprinted in 2006 as *Corporate Crime Under Attack: The Fight to Criminalize Business Violence* (with Michael Benson added as a co-author).

In this book, which has become a classic in the field of white-collar and corporate crime, the authors told the story of an attempt by an Indiana prosecutor to criminally prosecute the Ford Motor Company for the deaths of young women who were burned to death in a Ford Pinto automobile. The trial, which led to a not-guilty verdict, exposed Ford's decision to place profits ahead of safety, even though the company engineers knew of the dangers associated with the vehicle. In Cullen's words:

> The other major focus of my work was on the use of the criminal law against corporations, especially for violent crime. My work on the Ford Pinto case is where this view is found most fully. My coauthored book (two editions) on this case was really about how it became possible, at a specific sociohistorical time, to use the criminal law against corporations—including for violent crime. I tie this mainly to the shifts in the 1960s and 1970s that caused confidence in big business to decline. State officials found that they could bolster their own declining legitimacy by cases against white-collar offenders that showed, in essence, that the law was applied equally to all.
>
> One of my coauthors on the Pinto book was William Maakestad. . . . Bill was the brother of the prosecuting attorney in the Pinto case. That is how we gained access to all the documents on the case and could do interviews with prosecutors—and the defense team.
>
> Mike Benson (mainly him) and I followed this with a book on local prosecutors using the

criminal law against corporations, detailing information on how they did their work.

Perhaps coincidentally, at about the same time as the first edition of *Corporate Crime Under Attack* was published, a trio of important books dealing with other aspects of white-collar crime prosecution and trial also appeared in print. All three books were tied to a large research project undertaken by the late Stanton Wheeler, his colleagues, and graduate students at Yale University. Kenneth Mann's (1985) book *Defending White-Collar Crime: A Portrait of Attorneys at Work*, described the roles and functions of the elite bar of defense attorneys who specialize in defending alleged white-collar and corporate offenders. In 1992, Wheeler, Austin Sarat, and Kenneth Mann published the book *Sitting in Judgment: The Sentencing of White-Collar Criminals*, which described the judicial processes involved in trying white-collar and corporate criminal cases. David Weisburd, Elin Waring, and Wheeler's book *Crimes of the Middle Classes: White-Collar Offenders in the Federal Courts* (1994), analyzed the characteristics of white-collar offenders who were tried in the federal court system. Until that time, it was generally assumed that the typical white-collar offender was a wealthy businessperson who viewed behavior as normal business activity, certainly not criminal behavior. Weisburd, et al. challenged this view of white-collar offenders in that they found that the average white-collar offender was more likely to come from a middle-class or upper middle-class background, and who generally did not engage in high-dollar crimes.

Currently, Cullen continues to publish across a broad range of criminological topics. He and several coauthors have seven books in progress, including one on white-collar crime.

Currency Fraud

Currency is cash money, whether paper or coin, and is a medium of exchange. While physical things such as wampum, shells, stones, or other objects have been commodity money, they are not currency. The first use of coins, according to the ancient Greek historian Herodotus, was by the Lydians. From virtually the beginnings of coinage, counterfeiters have debased currency. A type of counterfeiting occurred when Archimedes of Syracuse used water displacement to prove that a gold votive crown made for King Hiero II has been debased by dishonest goldsmiths who substituted some silver for the gold coins melted to make the crown. Casting a copy of a coin, rather than minting it, is another ancient form of counterfeiting. The invention of paper currency by the Chinese provided a more convenient form of money and new opportunities for counterfeiting. In the modern world, counterfeiting is a continuing problem.

During World War II, the Nazis forged British pounds and American dollars. The dominance of the dollar since World War II has tempted counterfeiters. Some have been so successful that their counterfeit dollars are called *superdollars*. These very high quality bank notes are thought to have been produced in North Korea or by criminals in Russia, Iran, or the Middle East. Since 2002, the euro, in currency and coin, has also been attacked by counterfeiters.

Currency Trading

Another form of currency fraud occurs in the business of currency trading. Money changers are familiar to readers of the Bible, where money changers set up shop in the temple in Jerusalem. In modern times, money changers such as Thomas Cook operate currency exchange centers for travelers at airports or other locations. Local exchange centers are often found in areas frequented by tourists. Banks such as Wells Fargo and financial services companies such as American Express are also often engaged in currency exchanges for their customers. From a financial point of view, money is a commodity that is bought and sold, just like bags of potatoes or bushels of corn. The exchange value (rate) of a currency is like an agricultural commodity in high demand versus one in low demand. Some currencies, for example dollars, are widely sought. Other currencies may not be very convertible because few people want them, like a fruit that is past its prime. The variations in the demand for currency create price differentials (the foreign exchange rate, forex rate, or FX rate) that can generate profits and losses. With a growing global economy, the exchange of currencies may be physical or electronic. In either case, there are opportunities for fraud.

New York U.S. Customs and Border Protection officers at John F. Kennedy Airport discovered this stash of nearly $300,000 in fake U.S. currency on December 22, 2011, during a luggage inspection of a passenger arriving from Columbia.

One major area is in trading foreign exchange contracts on the foreign exchange market. The foreign exchange market is globally decentralized, and international currencies are exchanged (converted). It is based in financial centers around the world, with the Internet used to trade currencies every hour of the workweek day (Sunday at 5:00 P.M. EST to Friday at 4:00 P.M. EST). It does international currency exchanges so that purchases of everything from bananas to foreign investments can take place in the currency of the locality. All that is needed is to purchase a quantity of foreign currency to pay the seller, using the home currency of the buyer. The same currency exchange happens when a tourist makes a credit card purchase abroad and, upon returning home, sees on the credit card statement an exchange rate expressed (possibly with a bank or credit card fee) for the purchase in the foreign currency at the point of sale abroad against the home currency.

Prior to the 1970s, foreign exchange rates were restricted by the rules of the Bretton Woods Agreement. Since then, foreign exchange rates have been floating on the market's supply and demand. The foreign exchange market is huge, very globally dispersed, and very liquid, and it generates profits and losses from low margins. The volume of exchange is several trillion dollars each day and growing. The actors trading in the forex include large banks, central banks, currency speculators, corporations, governments, hedge funds, institutional investors, financial institutions, exchange kiosks, and retail investors. Trading in currency exchanges futures occurs because fluctuations in currency demands vary over the course of a year. The market in exchange futures and options (puts or calls) allows traders who actually will need the currency to hedge on the prices of future deliveries of currency. The Chicago Mercantile Exchange has been a center for trading foreign exchange futures contracts since 1972.

Investment Scams

The decentralized nature of the foreign exchange market, along with the huge sums of money involved, makes it attractive to speculators and criminals. Confidence men (and women) use a variety of sophisticated-sounding advertisements to lure people into investing in foreign exchange companies. Their tactics include scams that make claims that are too good to be true. The fraudulent claims are that currency trading with them will involve low-risk, high returns that are made quickly. Among the false claims may be those that promise investors "leverage" so they can control large quantities of foreign currency for only a small sum. The fraudulent promise is a disguised get-rich-quick scheme appealing to greed. In some cases, the money is never invested; the con-artist just absconds with it.

Another common fraudulent claim by scam artists at fraudulent currency trading companies that is told to retail customers is that the firm is in the "interbank market." The victim hearing this may be fooled by not realizing that the term simply means the loose network of currency transactions made between banks, large corporations, financial institutions, and investment banks. Forex scam artists often target victims in ethnic communities. Chinese, Indian, and Russian immigrant communities have been frequent targets. Advertisements are placed in ethnic community newspapers, radio stations, or television stations. A bait-and-switch approach may be used by advertising "job opportunities" or "account executives." The "mark" is then recruited to use his or her personal money for currency trading. Victims may also be encouraged to bring others into the scheme.

The U.S. Commodity Futures Trading Commission (CFTC) was created in 1972 as an independent federal agency of the United States to regulate futures and options markets. The National Futures Association (NFA), an independent watchdog agency, and the CFTC seek to prevent fraud in the trading of commodities, including foreign currency trading.

The CFTC and NFA also work with state governments to stop illegal foreign exchange investments. Recent cases include judgments against National Investments Consultants Inc., operating in California; Premium Income Corporation (PIC), operating in Texas (civil and criminal judgments); Sunstar Funding, operated by Gregory Blake Baldwin in Utah; and Russell Cline, operating Orion International Inc. in Oregon in a fraudulent forex scheme.

Daisy Chains

Crimes perpetrated through daisy chains generally involve groups of individuals who act together to commit fraud, such as avoiding paying taxes or manipulating stock prices or investments. Most daisy-chain crimes are fuel crimes. When they concern stocks, daisy chains may be used to control stock prices by making stocks appear more active than they are. The more links there are in a daisy chain, the more difficult it is to trace illegal activities back to the source. Perpetrators of daisy chains also create a "butterfly" or "burn" company that exists solely on paper for the purpose of hiding illegal activities. When the situation gets too hot, documents are burned so that such companies disappear. In fuel daisy chains, profits on the typical scam may average up to 50 cents per gallon because invoices are generated showing the price of the taxed product, whereas criminals actually pocket the tax money. Since daisy chains are often used by organized crime, they may occur in conjunction with other crimes such as kidnappings, assaults, bombings, and other forms of racketeering.

During the 1970s, the price of oil became a major issue, particularly during the Arab Oil Embargo of 1973, in which President Richard Nixon banned the purchase of Arab oil and froze fuel prices in response to a 70 percent increase in the price of oil by the Organization of the Petroleum Exporting Countries (OPEC). The OPEC countries initiated the price increase following the decision of the United States to continue supplying Israel during the Yom Kippur War. Some members of the media accused the Department of Energy, the U.S. Department of Justice, and the Federal Bureau of Investigation of working with oil companies to form a daisy chain for manipulating gasoline and oil prices during this period.

One particular daisy chain scam that occurred during this period concerned a group of Texas oilmen who bilked Florida Power Corporation out of $7.5 million. During the Arab Oil Embargo, the group began buying oil and transferring it along a chain of companies before it ultimately reached Florida Power at seriously inflated prices. The Florida Power daisy chain cases reached the courts in the late 1970s. In 1979, Ray Granlund, the middleman in the daisy chain and a retired oilman who served as a consultant for Florida Power, was found guilty of conspiracy to defraud and mail fraud. Despite a three-year sentence, Granlund managed to stay out of prison by continuing to appeal his conviction. When Granlund, who had pocketed $2 million from the daisy chain scandal, died in Houston in 1981, his estate was ordered to pay $600,000 in fines still owed. Angel Perez, the chairman of Florida Power, was found guilty of receiving kickbacks from the oilmen.

Fuel ration books—based on vehicle type, engine size, and horsepower—were issued by the British government during the 1973 oil crisis, when the Organization of the Petroleum Exporting Countries (OPEC) imposed an oil embargo on Western countries that had supported Israel during the Arab–Israeli Yom Kippur War. Oil prices quadrupled, and supplies were restricted.

When the scandal came to light, he worked with the government to target others involved in the deal. Three other oilmen were also given three-year sentences. Vice President Richard Raymond was acquitted of involvement. Separate civil cases were also filed on behalf of Florida Power's customers.

A large number of daisy chain scams have involved organized crime, and Russian and Italian crime groups engaged in such crimes were active in the United States throughout the 1980s and 1990s. Because the Russian connection was so strong in areas such as southern California and New York, the crime was referred to as the "red daisy chain scam." These activities were chiefly designed to avoid paying fuel taxes through falsifying tax records, setting up fake companies, diluting fuel with tax-free additives such as alcohol and transmix, rigging fuel pumps at gas stations owned by individuals involved in the scam, selling dyed fuels for use in off-road vehicles such as airplanes and farm equipment, selling low-grade gasoline at the price of premium gasoline, or moving fuel into lower-tax areas.

On September 13, 1995, officials arrested 13 members of a Russian-Armenian crime group, the Mikaelian Organization, headed by Horsep Mikaelian. The group was involved in a daisy chain scam in southern California and had been pocketing up to 42 cents per gallon from selling tax-free fuel designated for off-road vehicles to gas stations and truck stops. Members of the group were charged with mail and wire fraud, money laundering, extortion, and drug distribution. In 2009, American officials finally succeeded in arresting Aaron Misulovin, a Latvian American who had escaped justice for almost 13 years. Misulovin had been involved in one of the largest fuel daisy chain crimes in American history, which had operated in New Jersey in the mid-1990s. The scam involved selling tax-free home heating oil as diesel fuel and pocketing taxes paid by consumers. Misulovin was charged with wire fraud, money laundering, and tax evasion, and he was sentenced to five years in prison. He was also fined $2.5 million and ordered to make restitution. Ukrainian authorities returned his chief confederate, Igor Erlikh, to the United States to face charges in 1999.

Daiwa Bank Ltd.

At its peak, Daiwa Bank Ltd. was one of the largest international banks by measure of asset size and was one of the top dozen institutions in Japan. Then, in the summer of 1995, with Daiwa still growing, Toshihide Iguchi (then executive vice president of the bank's New York City branch) penned a letter to the bank's headquarters in which he explained in great detail how he had lost more than $1 billion in U.S. Treasury bond trades between 1985 and 1995. Upon receipt of the letter, Daiwa began its investigation by speaking with officials at the Japanese Finance Ministry's Banking Bureau, where its representatives were told to investigate the matter on their own and then submit a report.

After receiving the findings of Daiwa's internal investigations roughly a month later, the finance minister reported what Daiwa had found to the U.S. Federal Reserve. Daiwa Bank was forced to admit to the international community that its head of bond trading in the company's New York branch had misappropriated $1.1 billion of customer securities over the previous decade in order to hide massive trading losses. The scandal hit both Japan and the United States as media rushed to determine how Iguchi had lost so much in trades and successfully got away with the cover-up.

After the U.S. Federal Reserve Board finished its own investigation, Daiwa was fined $340 million and forced to plead guilty to 16 felonies (the most serious of which included conspiracy to defraud the U.S. government, falsifying bank books, wire fraud, and obstructing an examination). Further, Daiwa was ordered to end all operations in the United States within three months of being notified of the ruling, effectively limiting the potential growth of the bank in the West.

Daiwa's Lack of Structural Control

Iguchi had been with the company for almost 20 years at the time of his confession, having started in 1977 as a manager within securities. He was eventually promoted to trader, but he never gave up his previous duties in the office. This dual role was the first of numerous breaches of internal controls within Daiwa's structure contributing to the scandal. The scam initiated in 1984 when Iguchi lost a few hundred thousand dollars and attempted to recoup his losses by using the bonds. Since he was both a trader and a manager, he was able to cover up the scam by falsifying the account statements that he managed. However, he failed to regain the lost money, so the debt began to grow exponentially. Since Iguchi was playing with customers' bonds, when they would come in to sell off or collect interest, he would sell the securities of others and then falsify more records. In order to cover all of the losses, it's estimated that Iguchi forged over 30,000 trading slips, yet not one customer ended up losing money in the scandal.

During the investigation, Iguchi told investigators that other traders had also incurred serious losses in the mid- to late 1980s. In order to prevent detection by regulators, Daiwa had shifted any evidence of the losses to a shell company in the Cayman Islands. It had also conducted business in an unauthorized trading area for many years and disguised it as a storage room during inspections. The United States was not unaware of Daiwa's in-house issues. Regulators had twice warned the company about a lack of appropriate internal controls, especially Iguchi serving as both trader and manager.

While Iguchi's actions of were enough to potentially sink Daiwa, what made the situation worse was that the banks leaders had clearly perpetrated a detailed cover-up to avoid the repercussions of the bank's actions. When they were first informed by Iguchi, they began selling assets. Further, they began shifting losses from the United States to Japan to avoid the more intensive scrutiny provided by U.S. banking regulations. U.S. officials were even unhappier with the Japanese Finance Ministry for failing to report the fraud to U.S. authorities immediately upon being notified, as required by law. In the end, Iguchi pleaded guilty to a series of felonies (including misapplication of bank funds, false entries in bank books and records, money laundering, and conspiracy). He was sentenced to four years in state prison and assessed a $2.6 million fine. In 2000, a Japanese court ruled that 11 board members and top executives who were allegedly responsible for the poor oversight had to pay the bank $775 million in damages. Daiwa has since abandoned the overseas banking industry, instead choosing to focus on regional banking in the area around Osaka.

Dalkon Shield Case

The Dalkon Shield intrauterine birth control device (IUD) was a defective product manufactured and sold by the A. H. Robins Co. of Richmond, Virginia, from January 1971 through June 1974. It was cheap to manufacture, at only $3 apiece, yet caused numerous injuries, including miscarriages, loss of female organs, infertility, and death. The Dalkon Shield was designed to be inserted inside the uterus, just like other IUDs. IUDs are supposed to prevent pregnancy by making it difficult for a fertilized egg to attach itself to the wall of the uterus. A. H. Robins sold 4.5 million Dalkon Shields around the world, including 2.8 million in the United States. The Dalkon Shield was touted as a safer and more effective method of birth control than the pill.

When the Dalkon Shield was created, clinical trials for safety and effectiveness were not required by the Food and Drug Administration (FDA) for the manufacturing of medical devices like they were for drugs. If the device contained active medicinal ingredients, it would be subject to FDA review. A. H. Robins made several design changes that should have been reviewed by the FDA. One of those design changes added copper to the Dalkon Shield, thinking that it would improve its effectiveness. A. H. Robins convinced the FDA that the device did not contain enough copper to create a medicinal effect, therefore making it exempt from review.

The Dalkon Shield was defective because it had a major design flaw: The device had a nylon tail that hung through the opening of the uterus to allow doctors to easily check to make sure the device was in proper placement and to help with removal. The nylon material allowed bacteria to travel up the device's wick and into the uterus, causing infection, most notably pelvic inflammatory disease (PID). PID causes sterility and, in some cases, death.

Dangerous and Defective

Not only did the Dalkon Shield cause serious injury to women, but it also was not a very effective birth control device. A. H. Robins promoted it as the most effective form of birth control on the market, with a 1.1 percent failure rate. However, approximately 5 percent of the women using the Shield became pregnant. The women who became pregnant suffered miscarriages and other reproductive system problems such as PID. A total of 20 women died from complications associated with the Dalkon Shield. Hundreds of children were born with blindness, cerebral palsy, and mental retardation because the Dalkon Shield was not removed during pregnancy. Despite the fact that A. H. Robins had early indications of these problems, because the product was highly profitable, it neither voluntarily warned women nor withdrew the Dalkon Shield from the market. The company did not even order more testing of the product.

Instead, the company launched one of the most aggressive promotional campaigns in history. Even with knowledge that the Dalkon Shield was prone to causing PID, A. H. Robins promoted it widely to doctors and general practitioners. It also advertised that the Dalkon Shield could be safely left inside a woman's body for up to five years. Most medical evidence stated that the longer an IUD was in place, including the Dalkon Shield, the greater the risk of infection and complications.

As more incidences of infections, pregnancies, and miscarriages were reported, the FDA investigated the Dalkon Shield. After much stonewalling by the company, the FDA halted distribution in 1974. A recall was not ordered; instead, the FDA ordered a "voluntary" suspension of sales. A. H. Robins did nothing to warn the thousands of women who were already users of the dangers.

Between 80,000 and 500,000 women in the United States were still wearing the Dalkon Shield in 1983. A total of 100,000 women became pregnant despite its insertion, and an estimated 60 percent of them suffered miscarriages. This was mainly because of leaving the Dalkon Shield in place during pregnancy. The company's medical advisory board had warned of complications for pregnant women if the Dalkon Shield was not removed, but A. H. Robins told its clients that it was perfectly safe.

It was not until 1984, a full 10 years after the FDA halted distribution, that A. H. Robins undertook a massive media campaign to notify the women wearing the Dalkon Shield to have them removed at A. H. Robins's cost. This was done only after A. H. Robins's liability insurer, Aetna, dropped the company.

Two top executives were found guilty of criminal contempt. A. H. Robins sought bankruptcy protection from litigation in 1985. A bankruptcy filing automatically halts all litigation against a company, and the women injured by the Dalkon Shield were converted to creditors instead of plaintiffs. There were over 300,000 Dalkon Shield claims filed in the bankruptcy court. A $2.3 billion trust was set up by American Home Products Corp., a Madison, New Jersey, company that bought out A. H. Robins. The Dalkon Shield Claimants Trust was established in 1989, and during the 1990s, it paid out nearly $3 billion to more than 200,000 women who had used the IUD. The trust closed in April 2000. Through careful management of funds, the trust paid out almost $3 billion, making it the first mass personal injury trust to close after successfully paying all valid claims. The average claimant represented by a lawyer received about $21,000; however, most of the women received only about $725.

The A. H. Robins Company's handling of the Dalkon Shield is a classic tale of indifference to safety, obsession with sales and profits, misleading and fraudulent marketing, unethical conduct, corporate apathy, and greed at the expense of women's health. Today, premarket testing requirements exist for medical devices because of the Dalkon Shield catastrophe. In 1976, the Medical Device Amendment to the Federal Food, Drug, and Cosmetic Act of 1938 was enacted in direct response to the Dalkon Shield fiasco.

Debt Restructuring Fraud

Debt restructuring fraud, concealment, or fraudulent transfer is a type of bankruptcy fraud in which assets are hidden prior to declaring bankruptcy or are discharged for illegitimate purposes. It is a fraud committed by a corporate entity or an officer of that entity in preparation for bankruptcy proceedings, and it is different from personal bankruptcy fraud. It is not to be confused with fraudulent actions committed by companies against individuals facing debt or bankruptcy, such as fraudulent credit repair or debt consolidation services.

Debt restructuring is a legitimate activity, usually conducted in order to avoid bankruptcy. Regardless of the outcome of a bankruptcy court's decision, court and filing costs associated with bankruptcy filings are significant, and less than one-quarter of companies are estimated to survive the process. This puts considerable motivation toward legitimate restructuring in order to avoid bankruptcy, as well as on fraudulently gaming the system in order to survive the process and absorb the associated expenses. Restructuring is similar to refinancing, in which new debts with new payment terms replace old debts, but restructuring is done under financial distress. The simplest form of debt restructuring reduces the amount of each payment made on a debt by increasing the number of payments (usually resulting in a greater total amount paid, because of the interest).

Debt-for-Equity Swaps

Debt-for-equity swaps often resolve some of the debt burden during a debt restructuring by canceling debts owed to creditors in exchange for giving them equity in the company. This is more common in debtor companies that have good long-term prospects, in which case there is the expectation that the equity may someday exceed the value of the original debt. But it may also be an option when creditors accept equity in lieu of debt payments in order to assume control of the company, either to better manage its assets or to reap revenue from its whole or partial sale. This can be an attractive option for creditors because it may be realized faster than bankruptcy proceedings, and it may better preserve the value of the company's assets. Further, the creditors may be unsure of the results of bankruptcy proceedings and how the court's ruling will benefit them; the certainty of the equity offer may be more attractive than gambling on the court.

In the wake of the subprime mortgage crisis, debt-for-equity swaps for banks were advocated by Keynesian economists like Columbia professors Jeffrey Sachs and Joseph Stiglitz. Debt-for-equity swaps in this case would have broader ramifications by preserving bank solvency without a federal bailout, in such a way that improves the liquidity of the credit market.

Debt restructuring done by small businesses is usually called debt mediation. A rarity before 2008, after the global financial crisis, it became a cottage industry, with mediators performing similar services for small businesses that debt consolidation firms have offered to individuals and households. Debt mediation remained common as the credit landscape remained changed by the 2008 crisis. As with credit repair agencies, there are a number of fraudulent companies working in the debt-mediation field. The nature of the fraud ranges from promising results that cannot be achieved; to failing to disclose fees, or misrepresenting the financial picture of the business following the mediation process; to debt collection agencies that misrepresent themselves as working for the debtor rather than the creditor.

The purpose of bankruptcy proceedings is to avoid a result that favors the debtor over the creditor, or vice versa. If debts could be easily forgiven or lessened, simply because the debtor is unable to pay them, creditors would find themselves in a position in which they could not afford to offer credit because too few debtors would be properly motivated to pay the debt back in full. Many of the country's financial crises have been precipitated by households or businesses becoming overextended when the amount of credit offered was not proportionate to the amount that could realistically be paid back, either because of unwise lending practices (as in the subprime mortgage crisis and the earlier farm crisis of the early 1980s) or because a change in the financial landscape reduced debtors' capacity for repayment.

Debt restructuring fraud illegally tilts the results of bankruptcy proceedings in favor of the debtor by hiding assets that could otherwise be used to reduce or pay off debts, and then reclaiming those assets after proceedings have ended and debts have been reduced or discharged. Fraudulent transfers as part of debt restructuring are considered actual fraud when the debtor transfers assets to another party in order to make them unavailable for paying back the debtor's creditors. It is considered constructive fraud when the value received for the transfer of assets is considered too far below their value, which may be the result of mismanagement or incompetence, rather than fraudulent intent. Constructive fraud is still a civil cause of action, and the plaintiff—the creditors—may sue for damages represented by the value of the unpaid debt. A notable exception is when the disputed transfer was made to another creditor for the purposes of paying a debt, which is not considered fraudulent.

Bankruptcy Legislation

In the American legal system, the doctrine of fraudulent conveyance (fraudulent transfers) originates in English common law, in the case of a sheep farmer who attempted to defraud his creditors. It applies not only to debt restructuring cases but also to other fraudulent actions in the name of asset protection, including those of individuals such as the sheep farmer, and individuals who fraudulently transfer assets during estate planning. Today, the doctrine is encoded in both the federal Bankruptcy Code (11 U.S.C. 152) and the Uniform Fraudulent Transfer Act (UFTA), which has been adopted by 39 states and the District of Columbia. The Bankruptcy Code provides remedies for creditors who are victimized by fraudulent transfers by debtors who later declare bankruptcy, so long as the transfer was made within two years of the bankruptcy filing. The UFTA provides remedies for creditors, regardless of whether the debtor files for bankruptcy. The UFTA is held to apply to cases of defrauding either present creditors or future creditors, whose future claim was foreseeable at the time of the transfer.

Under the law, the "transfer" in a fraudulent transfer includes, according to the UFTA (the Bankruptcy Code's wording differs only trivially), every mode, direct or indirect, absolute or conditional, voluntary or involuntary, of disposing of or parting with an asset or an interest in an asset, and includes payment of money, release, lease, and creation of a lien or other encumbrance. The court generally "collapses the transaction," meaning the net result of a series of related transactions—not merely the legality or illegality of any individual transaction. This is particularly important given the number of ways that unscrupulous individuals attempt to manipulate the system or cover their tracks.

Constructive fraudulent transfers are a more common problem outside the corporate world, sometimes resulting from individuals transferring assets to their heirs prior to their decease, ostensibly in order to avoid the uncertainties of probate court or to avoid triggering the estate tax threshold. If this transfer is later followed by a debt that the debtor is incapable of paying, however, that transfer thereby becomes problematic; the creditors could be satisfied if the debtor still possessed that transferred property or had received fair value for it. The Bankruptcy Code provides only partial protection for good-faith recipients of fraudulent transfer; they are entitled only to the value they gave for it.

Forms of Debt Restructuring

Because the determination of whether or not an asset transfer is fraudulent is somewhat dependent on the financial health of the transferring entity across a particular period of time, debt restructuring fraud is easy for businesses to commit accidentally (or perhaps under the impression that they are guilty only of a minor infraction), when they act without the consultation of a bankruptcy attorney.

The line between legitimate and fraudulent debt restructuring can be narrow. In 2003, American Airlines restructured its finances in order to avoid bankruptcy, and in so doing was able to meet its debt covenant obligations—specific measures enforced by its creditors in order to measure economic health, in this case a ratio of EBITDAR (earnings before interest, taxes, depreciation, amortization, and rentals) to fixed-charge coverage. However, the restructuring included persuading the bank to lower that ratio; American Airlines investors, not paying close attention, had no means of realizing that an apparently steady performance actually represented a decline in health, as the standards to which the company was held had been lowered. Even with the lower standard, American had difficulty meeting its debt covenants the following year, and by the end of 2004, more severe changes had to be made. This behavior was arguably deceitful, at least from investors' perspectives, but creditors were not deceived. Had this transpired closer to the date of American's 2011 Chapter 11 bankruptcy filing, the question of fraud would more likely have been raised.

Debt restructuring fraud can be much more blatant than that, and the transfer of assets may not even be to the benefit of the business entity. Officers may instead act in their interests, especially if they anticipate that the business will not survive bankruptcy (or perhaps that their position with the company will not): some corporate officers have fraudulently used corporate funds to pay their personal expenses or debts, or have transferred corporate assets, such as vehicles or equipment, to themselves for personal use. There have been cases of officers collaborating to transfer cash to their personal accounts, directly or indirectly. Many of these examples constitute embezzling as well as debt restructuring fraud.

There are debt restructuring crimes in which bankruptcy is actually expected and is incidental to the criminals' concerns. These techniques are commonly associated with organized crime and its associates, but they may be used by groups and individuals who do not engage in other crimes. In what the Federal Bureau of Investigation (FBI) calls a "bust-out," for instance, a business is opened and run properly in order to establish a good credit rating. The business operator—often a front for the criminals providing the capital—then purchases goods on credit, maxing out the company's lines of credit. The goods are transferred elsewhere and sold under another business name, which is hidden by destroying records and often by destroying the physical property of the business. When bankruptcy is filed, creditors are left with little recourse.

The similar "bleedout" is conducted on an existing business, which is depleted of liquidity and assets over a longer period of time before being forced into bankruptcy. Bleedouts are typically conducted by corporate raiders after a leveraged buyout. Court cases in the 1980s and 1990s (such as *U.S. v. Tabor Court Realty Corp.*, 1986) established that leveraged buyouts, among other transactions, can be fraudulent transfers.

Assets may also be fraudulently transferred in a maneuver called the parallel entity, whereby the officers of a failing business create a second business, while the first business enters into Chapter 11 bankruptcy. Assets, as well as the customer base, are then transferred from the first business to the second, even to the extent of the first business entering into debts on behalf of the second business, with no intention of repaying them. Before the U.S. Department of Justice's late 1990s crackdown on bankruptcy fraud, the FBI estimated that 250 cases of bankruptcy fraud were committed every day in 1995, at which point bankruptcies in general had risen 500 percent since 1973. The subsequent Operation Total Disclosure from December 1995 to February 1996 resulted in 127 indictments. Once reserved for extreme cases, the bankruptcy system had been commandeered by opportunists as a way to manipulate finances and mitigate risks.

Defense Industry Fraud

The U.S. Department of Defense (DOD) is the entity responsible for the coordination and supervision of all agencies of government that function as part of the U.S. armed forces and national security apparatus. The department, also known as the Pentagon, is the largest employer in the world, consisting of 2.13 million active duty soldiers, sailors, marines, airmen, and civilian workers. There are also 1.1 million national guardsmen and members of the U.S. Army, Navy, Air Force, and Marine Reserves, constituting a total of 3.2 million service members and civilians.

The chief executive of the DOD is the secretary of defense, which is a cabinet-level position, separated into three distinct military departments: the Department of the Army, Department of the Navy, and Department of the Air Force. The DOD also encompasses several defense agencies and joint services schools, including the National Defense University (NDU) and National War College (NWC).

The DOD is allocated the highest level of financial resources of all federal agencies, totaling approximately more than one-half of the annual federal discretionary budget. The cost of administering the DOD, which is astronomical in size and scope, raises concerns over the potential for fraud and various forms of criminal liability to emerge as part of a growing dynamic of white-collar crime in American society.

It is not likely that the DOD is inhabited by individuals who purposefully and knowingly commit fraudulent acts. However, the DOD bears some responsibility for allegations of intimidation within the ranks, retaliation against whistleblowers, lax oversight over the auditing process, and generally poor performance, all of which could contribute to fraud and some form of criminal liability in defense contract allocations and control. An overview of the history, organization, expenditures, defense contract management, and defense contract auditing procedures provides several insights into these aspects of white-collar crime.

The DOD originated out of the first U.S. Congress in 1789 with the creation of the War Department, along with the Navy Department. Both departments were headed by senior cabinet-level advisors, secretaries who reported directly to the president.

In 1945, President Harry Truman proposed that Congress create the Department of State Defense to counter the increasing propensity for wasteful military spending and interdepartmental conflicts occurring in the post–World War II years.

Many members of Congress expressed doubt about ceding too much military power to the executive branch. To offset the growing conflict within the ranks, Truman signed the National Security Act of 1947, which gave rise to a unified military command under the National Military Establishment. Under this command, several agencies dedicated to national defense were born: the Central Intelligence Agency, National Security Council, National Security Resources Board, U.S. Air Force (formerly Army Air Forces), and Joint Chiefs of Staff. Formal operations began on September 18, 1947, after Senate confirmation of James V. Forrestal as the first secretary of defense.

On August 10, 1949, the National Military Establishment was reclassified as the Department of Defense, and under the Department of Defense Reorganization Act of 1958 (Pub.L. 85-899), channels of authority within the department were streamlined while still maintaining the authority of the military departments. The legislation also provided a centralized research authority, the Advanced Research Projects Agency, also called DARPA, which transferred decision-making authority from the military departments to the Joint Chiefs of Staff and the secretary of defense. The act, which also shifted command of the military from the president to the secretary of defense, was signed into law on August 6, 1958.

Organization

The secretary of defense (SOD) is appointed by the president with the advice and consent of the Senate. He or she is the principal assistant to the president in all matters relating to the DOD. The secretary, whose powers are derived from constitutional authority, has the ultimate authority, direction, and control over the DOD. The office of the SOD is composed of mostly civilian employees who work on policy development, planning, resource management, and fiscal and program evaluation and oversight.

The DOD also houses the Joint Chiefs of Staff, which is a group of senior military officers who advise the SOD, Homeland Security Council, National Security Council, and the president on military matters. These are the chairman, vice chairman, senior enlisted advisor, and military service chiefs of the U.S. Army, Navy, Air Force, and Marine Corps. All are appointed by the president following Senate confirmation. This group is also managed by the director of the Joint Chiefs of Staff, who holds the rank of lieutenant general or vice admiral.

The DOD has central control over all components of the U.S. military complex. These units constitute the U.S. Army, Navy, Marine Corps, and Air Force. Each department is headed by a secretary, who is also appointed by the president with the advice and consent of the Senate. Department heads exercise authority by delegation through their service chiefs. These are the chief of staff of the Army, chief of naval operations, commandant of the Marine Corps, and chief of staff of the Air Force. Secretaries of military departments and service chiefs do not have operational command over troops assigned to the combatant command group. They are, however, responsible for training, provision of equipment, and troop administration.

The unit responsible for troop operations falls under the Unified Combatant Command, which is a single force composed of personnel and equipment from at least two military departments. Most operations are governed by a Unified Command Plan, developed by the DOD that lays out the command's mission, geographical/functional responsibilities, and force structure. During all military operations, the chain of command begins with the president, the secretary of defense, and combatant commanders.

The cost of managing an entity of this scope and size is astronomical. Expenditures for 2010 indicate that the DOD spends 4.8 percent of U.S. gross domestic product (GDP), which is more money spent than the next 17 largest militaries combined. The DOD constitutes 21 percent the U.S. federal budget and 53 percent of the overall federal discretionary budget.

In addition, the DOD is the largest single consumer of energy in the United States, expending 30,000 gigawatt hours (GWH) of electricity, totaling $2.2 billion in 2006. This constitutes enough electricity to power more than 2.6 million average American homes. In fact, if it were a country, the DOD would rank 58th in the world, which is slightly less than Denmark, and slightly more than Syria.

The DOD was also responsible for 93 percent of all U.S. government fuel consumption in 2007. This statistic encompasses the Air Force (52 percent), Navy (33 percent), Army (7 percent), and other military-related entities (1 percent). The annual fuel consumption of 4.6 billion gallons (17.4 billion liters) is incomprehensible to the average consumer. For example, the military uses 12.6 million gallons (48 million liters) per day. An Army division uses 6,000 gallons (23,000 liters) per day. The Air Force is the largest user of fuel energy in the federal government, equaling 10 percent of the nation's aviation fuel use. If the DOD were a country, it would rank 34th in the world in average daily oil use, coming in just behind Iraq and just ahead of Sweden.

Defense Contract Management

The Defense Contract Management Agency (DCMA), headquartered at Fort Lee, Virginia, is the organization responsible for performing contract administration services for the DOD and other authorized federal agencies, including foreign military sales. For example, the DOD announces contracts valued at $6.5 million or more at the end of each business day. This information is available in the "Top 100 Contractors Report," located in the Federal Procurement Data System, listing the top 100 contractors by sales to the U.S. military. Controls are supposedly placed upon contract auditing procedures and the manner in which contracts are distributed to a corporate entity.

The entity responsible for contract control for the DOD is the Defense Contract Audit Agency (DCAA), which employs 4,000 personnel, located around 300 field audit offices throughout the United States, Europe, and the Pacific. The overall agency is organized into five geographic regions and a field detachment group handling classified contracting services. Offices can be found in the following regions and cities: western, La Mirada, California; central, Irving, Texas; eastern, Smyrna, Georgia; mid-Atlantic, Philadelphia, Pennsylvania; and northeastern, Lowell, Massachusetts.

Each region houses between 15 and 22 field audit offices, also referred to as resident offices (single contractor) or branch offices (multiple contractors). Personnel in these offices provide cost accounting and financial advisory services related to contracts and subcontracts to departments responsible for procurement and contract administration. DCAA personnel also provide contract audit services to other government agencies and countries under the Foreign Military Sales (FMS) program, although many of these services are on a reimbursable basis. One major concern with this organizational structure is that the DCAA does not provide consulting/advisory services to contractors because of independence requirements.

What this means is that DCAA auditors are not allowed to provide guidance to contractors regarding the manner in which accounting systems should be set up, how costs should be treated, or how claims should be compiled. In fact, the primary role of the auditor is to express an audit

Lockheed Martin and Boeing were both awarded cost-plus, fixed-fee contracts for this Joint Strike Fighter 2000 concept program. To prevent fraud in military contracts, the Defense Contract Management Agency is given oversight.

opinion. Contractors not familiar with the federal acquisition process should consult private companies that provide advisory services in this field or view whatever resources are available online. Taken together, these factors raise the probability of fraud occurring within the agency.

For example, companies that are awarded cost type contracts, time and materials contracts, and contracts with more flexible cost arrangements are subject to annual DCAA audits. When these contracts are audited, contractors are required to maintain and supply supporting documentation for all costs incurred during travel and other expenditures. A recurring problem emerges in the fact that contractors often fail to follow procedures or provide adequate documentation, which exacerbates the auditing process. Although Federal Acquisition Regulations (FAR) give DCAA auditors the authority to view contractor records, violations of access to records delay and further exacerbate the auditing process.

Boeing Company and the Bechtel Group

For example, in 2008, a report by the Government Accountability Office (GAO) charged that DCAA managers threatened a senior auditor with personnel action if adverse data were not removed from a report criticizing a large federal contractor. The report charged that individuals employed by the Boeing Company were too close to DCAA management personnel and many contractors they were assigned to audit. The GAO report also stated that DCAA auditors who complied with the investigation were subject to harassment and intimidation from their supervisors. In response to the charge, the DCAA asked the DOD's inspector general (IG) office to investigate. Several problems emerged during the course of the investigation.

First, the investigation uncovered information revealing that DCAA auditors challenged only $4.6 billion, or 1.2 percent, of the contracts under audit with document tampering. Investigators charged that this practice had gone on for quite some time, indicating that the agency had not used its subpoena powers in at least 20 years. In short, the DCAA had the authority to demand defense contractors to produce the required paperwork. Whereas the GAO routinely saved taxpayers $94 for every $1 it spent, DCAA's return on investment was only $7. This is a large disparity in auditing control.

Furthermore, an audit of the Bechtel Group, also supervised by the DCAA regional director, directed attention to a "chronic failure" by Bechtel to produce the required documentation for the audit. DCAA auditors issued an arbitrary report, rating Bechtel's internal accounting procedures as "adequate," which suggested that all systems were clean and that DOD auditors should not concern themselves with what appeared to be several problems with the company. In addition, the DCAA report did not bother to mention Bechtel's failure to produce the required documentation. Therefore, DCAA auditors failed to follow basic auditing standards in 65 of 69 audits.

Second, the GAO also noted that the agency lacked "independence" from the contractors it audits and the DOD agencies doing business with those contractors. This lack of independence is seen as a major problem with the organizational structure of the DCAA, mainly because of its inability to provide consulting/advisory services to contractors. Pressure from outside groups helped create a hostile work environment, which caused agency auditors to rush reviews of contractor billing systems, falsify audit reports, and appease contractors when auditing their business methods and systems.

In the long run, the IG found that the DCAA was organized around an environment that was not conducive to performing quality audits. The IG report also cited an audit of Boeing in which the company was allowed to keep $217 million in taxpayers' money because of a DCAA regional auditor who failed to perform his or her duties properly. To make matters worse, when representatives of the Boeing Company were unresponsive to a request for information, the regional auditor ordered a subordinate to change the audit report in Boeing's favor.

These actions lead one to conclude that the willingness of supervisory personnel to harass and intimidate employees who adhere to proper auditing standards leads to an environment where the potential for fraud in defense contracting increases with every incident. For example, to further exacerbate the situation, the DCAA director lied in the IG report, stating that her agency concurred with the IG's recommendations. In the wake of these investigations, the director was removed from her position at the agency by the DOD comptroller and was reassigned.

Today, the Defense Contract Auditing Agency (DCAA) has undergone a major overhaul of its operations. Under new leadership, the agency is changing on a number of levels, including revamping its hiring process, employee training, and organization of committees dedicated to promoting change in specific areas of weakness. These changes place major emphasis on government auditing standards of quality, or what is considered Generally Accepted Government Auditing Standards (GAGAS). In this respect, a new agency culture has emerged, centered on critical values such as the much-needed standard of independence, quality of work, documentation, and timeliness. As a result, companies subject to DCAA audits should expect a more thorough audit, in lieu of increased audit testing and higher levels of evidence requirements.

DeLay, Tom

Thomas Dale (Tom) DeLay (1947–) is a former member of the Texas Legislature (1978–84) who served in the U.S. House of Representatives (1985–2006), rising to Republican House Majority Leader (2003–05). He resigned from the House in 2006. Tom DeLay was born in the Rio Grande Valley in the border town of Laredo, Texas, and attended Baylor University as well as the University of Houston (UH), earning a B.S. degree in biology in 1970. DeLay was deferred from service during the Vietnam conflict and married his high school sweetheart, Christine Furrh, in 1967. Christine would follow a lifetime commitment to foster-parent programs; the DeLays fostered several teenagers during their marriage and have one biological daughter, Diane. Following his graduation from UH, DeLay found a career in the insect extermination business, purchasing a company in 1973. DeLay oversaw its operations until 1984, when he resigned to run for the U.S. House.

In his early career as a Texas House member, DeLay earned the nickname Hot Tub Tom through his hard drinking and partying around Austin. DeLay claimed that he was “born again” into Christianity in 1985 and focused his energy on electing Republicans to the U.S. House—and maintaining discipline among them once they arrived, rapidly gaining ground in the party and becoming minority whip. In the 104th Congress, DeLay’s relationships with the speaker (Newt Gingrich) and the majority leader (fellow Texan Dick Armey) were close, though not exactly cordial. When Armey retired in 2002, DeLay was elected majority leader.

The (Velvet) Hammer

DeLay’s style as majority leader may have been summed up in his nickname, The Hammer, but by the standards of the post-2010 House, his tactics were actually sharp and subtle. He carefully managed floor votes, counted the exact number needed for the passage or defeat of a given bill (depending on party preferences), and allowed for “platooning” votes, or votes in which GOP members were allowed to defect from the party line when the vote was sure to go the party’s way without them. He was also found “primarying” recalcitrant GOP members—if Republican House members dragged their feet or defected on a needed “party vote,” they ran the risk of DeLay and his powerful allies in the Republican National Committee (RNC) running a primary opponent against them when re-election time came around.

The legal troubles that would eventually derail DeLay’s political career and land him in federal prison had begun much earlier, innocently enough, with an attempt by the Republican Party in Texas to redraw legislative district lines. There were several oddities about the Texas redistricting from 2003 to 2004. First, most states redraw their lines, as required, following the decennial census; since that redistricting had been initiated by a House controlled by the Democratic Party, the process set in motion after the 2002 election—and a change of control of the House to the GOP—seemed a redundancy. However, there is no federal law that prevents states from redrawing lines at any time.

Second, the Texas House minority—the Democrats—reacted to the redistricting battle by fleeing the state en masse to prevent the required quorum from meeting. The House majority and the governor called on the Texas Rangers, an agency of the state police in Texas, to find them and force their return. The situation was exacerbated by the fact that practically no one seemed to know where they had gone. DeLay decided to use the Federal Aviation Administration, the Federal Bureau of Investigation, and other federal investigative agencies to effect their return. Eventually, DeLay was “admonished” by the House Ethics Committee for misuse of federal agencies in the matter.

Though the redistricting plan was probably legal, the means by which the Texas Republicans funneled money to candidates in these races was not. Using corporate money for campaigning was illegal in Texas, but DeLay had a plan to use that money to ensure the Republican majority in 2002: he simply collected $190,000 from friendly corporations and passed it on to the Republican National Committee via his Texans for a Republican Majority; the RNC then supplied checks totaling the same $190,000 to candidates running for office in critical Texas House races. After yet another censure by the Ethics Committee of the House for these activities, a grand jury in Houston indicted DeLay for money laundering. DeLay (following a tradition within the GOP) stepped down as majority leader until such time as the indictment was resolved.

On a new front, DeLay’s troubles intensified as congressional investigations into the activities of Republican lobbyist Jack Abramoff uncovered a series of questionable connections between DeLay and the disgraced influence peddler. Abramoff’s business connections to DeLay included free trips to luxurious destinations (including a golfing trip to Scotland's St. Andrews course) and tickets to sporting events and concerts. DeLay's wife, Christine, was on the payroll of a suspect "fund" connected to Abramoff, the U.S. Family Network, which was largely bankrolled by a consortium of Russian oil magnates who were directly connected to an effort to woo votes in the House from DeLay for a Russian bailout by the International Monetary Fund. Though cleared of illegal involvement with Abramoff, DeLay was eventually brought to book on the money-laundering charges and was sentenced to three years in prison. The case is currently on appeal.

Differential Association Theory

Differential association theory is a learning theory of criminality developed by American criminologist Edwin H. Sutherland (1883–1950). Sutherland's theory focused on crime as a set of learned behaviors. Sutherland posited that learning to "do crime" was not all that different from learning many other forms of conventional, accepted behavior. Thus, he argued that the primary difference was the acquisition of a set of attitudes that supported engagement in criminal conduct. Sutherland suggested that these attitudes were most easily acquired from others who engaged in criminal conduct, and therefore had already accepted attitudes that supported criminal involvement. If a person had access to social settings where positive attitudes toward criminality were held, and entered into intimate, friendly relations with those who already maintained such attitudes, Sutherland theorized that it was in this context that a person—such as a youth—who had no criminal proclivity or involvement would learn to "do crime." Sutherland's theory was one of the two most highly influential criminological theories of the mid-20th century in the United States, and it retains its influence through subsequent criminological elaborations of learning theory by Ronald Akers and others.

No One Is Born a Criminal

Sutherland developed his theory from the initial observation that no one is born a criminal. Early criminological investigators such as Cesare Lombroso (Italian, 1835–1909), Richard Dugdale (American, 1841–83), Henry Goddard (American, 1866–1957), and anthropologist E. A. Hooten (American, 1887–1954) focused on biological and genetic theories of criminality. Each of these researchers suggested that criminals were born with certain inferior features and proclivities that led them to criminality. Although some of these early criminological positivists were more deterministic in their thinking than others, all agreed that nature—as opposed to nurture—was a highly influential force in setting individuals on the road to crime.

By the time Sutherland was ready to develop his theory in the late 1930s, most of these theorists' works had already been discredited. Thus, Lombroso's *The Criminal Man* (1876), Dugdale's study of the Jukes family (1877), and Goddard's *The Kallikak Family* (1912) had been largely relegated to the realm of pseudo-science. Hooten, who was still working in the 1930s and 1940s, was busy assembling a massive database of physical and mental measurements of 14,000 prisoners and a comparison group of 3,000 noncriminals. In 1939, the year Sutherland also first published his textbook on differential association, Hooten released *The American Criminal,* in which he concluded that criminals were organically inferior in virtually every way measurable.

Sutherland's differential association theory was among the early influential alternative approaches that ultimately spelled the end for naïve positivistic approaches like these. Sutherland's theory in its mature form consisted of a series of nine propositions that Sutherland believed were each supported by observations of human behavior. These were set forth in the popular 1947 edition of his textbook, which became the leading text in the field for over 30 years.

He claimed that criminal behavior is learned. By denominating these behaviors as learned, Sutherland was disputing that criminal conduct arose spontaneously, naturally, or from inherited physical and/or mental qualities. Criminal behavior is learned in interaction with other persons in a process of communication. This proposition fixes the source of the learning as the social environment, as opposed to the physical environment or individual nature. Learning of criminal behavior occurs primarily within intimate personal groups. When criminal behavior is learned, the learning must include both techniques of committing the crime—whether complicated or simple—and the specific (criminogenic) direction of motives, drives, rationalizations, and attitudes. The direction of these motives and drives is learned from others who hold definitions of the legal codes as either favorable or unfavorable. A person will engage in delinquent behavior after acquiring an excess of definitions favorable to lawbreaking over definitions unfavorable to law violation.

This is the crux of the theory—hence the term *differential association*—as the balance of a person's socialization will be either differentially associated with lawbreaking attitudes or, alternatively, with law-maintaining attitudes. Differential associations may vary in frequency, duration, priority, and intensity. This suggests that persons can learn criminal involvement at different rates and retreat from criminality as environmental influences subside. The process of learning criminal behavior through intimate association and communication thus involves all the mechanisms involved in any form of learning. While criminal conduct may be indirectly a result of general needs or values, this is not a sufficient explanation because noncriminal behavior also arises from these sources.

In sum, individuals learn attitudes (and techniques) favorable to crime in the course of symbolic interaction with others whom they esteem in an intimate environment. If one wishes to reduce or eliminate crime, one must disrupt these crime-supportive milieus. Sutherland's theory, although highly influential, was not the only sociological theory of crime of note during the mid-20th century. Writing at virtually the same time, Robert Merton's 1938 analysis of social structural factors that lead to anomie shared the field. More recently, Ronald Akers and his collaborators have pursued variations of a learning theory of crime that owe a substantial debt to Sutherland.

Direct-Mail Fraud

Direct mail refers to communication, paper or electronic, sent to individuals in an attempt to persuade them into either purchasing goods or services or donating to a cause. This type of communication is sent through direct marketing. Direct marketing communications are sent based upon certain target marketing criteria such as sex, age, income level, profession, location, and purchasing patterns. Direct marketing differs from mass marketing in that communications are sent directly to potential customers. Companies that engage in direct marketing practices are able to efficiently track measurable responses from customers via the postal service, Internet browser cookies, e-mail addresses, mobile numbers, and fax numbers.

Direct-mail fraud occurs when unsolicited mailings are sent to individuals with deceptive or misleading offers. Claims often differ from what the consumer originally expected. This type of crime is often considered "honest services fraud," schemes that deprive citizens of "the intangible right of honest services." The elderly are the most common victims of direct-mail fraud schemes because of their vulnerabilities.

New mediums of communication, such as the Internet, have made direct-mail fraud flourish. There are approximately 100 billion unsolicited e-mails, or spam, transmitted worldwide every day. Many of these spam messages contain advertisements, some fraudulent in nature. In fact, findings from a study conducted in 2002 revealed that of all the spam mailings, approximately 6 percent were fraudulent e-mails. Direct-mail fraud via the Internet has had alarming monetary consequences. For instance, in 2001, financial losses of individuals and companies were approximately $7 to $8 billion a year.

Types of Scams

There are several general categories of direct-mail scams, including employment fraud, financial fraud, and sweepstakes/lottery fraud. Typically, they take the form of traditional mail via postcards and letters. More recently, they have appeared in e-mail in boxes. E-mail spam has enabled this type of fraud to flourish.

Employment fraud offers recipients the possibility of some type of desirable employment that appears too good to be true. Franchise fraud is a particular type in which recipients are offered illegitimate franchise opportunities. They are persuaded into investing in a business through promises of extensive and guaranteed profit. Employment may also be guaranteed if a recipient completes some type of training course. There is typically a fee for the course. Participants are assured of job placement upon certification. No experience or skills are needed to be involved in the training. In reality, the organization offering the training course has no relationship with potential employers and cannot offer the participant employment.

Financial fraud can take many forms. Perhaps one of the most notorious, which has existed in both electronic and nonelectronic forms, is known as the Nigerian scam, Nigerian letter fraud, advance-fee fraud, Nigerian 419 fraud, or the 419 scam. These schemes are all variations of the pyramid or chain letter scheme, in which individuals are told that they have won a lottery or prize. However, the winner must spend some money to claim the larger prize.

The writer of the letters or e-mails claims to have access to large sums of money, which may or may not have been obtained legally. The letter promises the recipient a significant percentage of the funds for assisting with the laundering of the money to an account in another country. If the recipient of the letter responds, he or she will receive additional messages, luring him or her further but reinstating the importance of confidentiality and the limited time frame. At this point, the recipient may also receive official and authentic-looking documents to further legitimize the deal. Participants are required to provide personal contact information, such as phone numbers, fax numbers, e-mail address, bank account information, blank business letterhead to send to other potential victims, and initial payments (which are for false expenses such as transfer fees or taxes). The scammers are not only able to keep the initial money that is sent, but with the recipients' contact and financial information, they are also able to access their financial accounts. They can easily withdraw income from the victims' bank accounts. The main goal of this type of scheme is to ensure that recipients are fully engaged and committed to the deal so that they can continue to contribute with "extra fees."

Credit card fraud is a type of financial fraud that is aimed particularly at individuals with bad credit or financial histories. They receive a letter stating that they are preapproved for a credit card that does not require a credit check. However, a fee will be charged to earn credit. When the recipient receives the card in the mail, it is simply a single-use credit card that can be used only at a certain store owned by a particular company.

Sweepstakes and lottery fraud promises the recipient that he or she has won some sort of prize. One of the most popular scams offers free vacations. The notification arrives by mail. However, to claim the prize, the recipient must call and purchase a membership in a travel club. Literature will then come in the mail about the trip. However, the recipient will be asked to pay additional fees, and the dates of interest may be unavailable. Very seldom does anyone actually receive the vacation, but the select few who do are shocked at the subpar accommodations.

Phony inheritance scams do not necessarily fit into these categories. The recipient receives a letter from a supposed "estate locator," claiming that there is an unclaimed inheritance awaiting the recipient. The scammers typically claim that they have conducted research to locate the recipient. However, the same letter has been mailed to thousands of recipients with the same last name. Recipient who respond are typically lured into paying a mailing fee for an estate report. The estate report supposedly contains important information as to where the inheritance is located and how the recipient can claim it. In reality, there is no inheritance, and none of the recipients is an heir.

Although all of these scams can occur via traditional mail, the Internet has scams that are solely virtual. The most popular type of Internet hoax is information verification spam. Recipients are sent e-mails that often appear as if they originated from a legitimate company or financial institution. These messages will ask recipients to verify some type of information for security measures. They may be asked to confirm their e-mail addresses, restate passwords, or even provide credit card numbers and bank PIN numbers. A legitimate organization or financial institution would never ask this of its customers.

Prevention and Prosecution

Prosecution of direct-mail fraud has been difficult because of jurisdictional issues. Each state maintains different laws and regulations, so prosecution lacks uniformity. However, various safeguards have been put in place to prevent direct-mail fraud. The Direct Marketing Association (DMA) was founded in 1917 to assist organizations with carrying out direct marketing practices efficiently and ethically. The organization is composed of companies and nonprofit organizations from the United States and 48 other nations. Approximately half of all Fortune 100 companies are members. The DMA represents the interests of the Federal Trade Commission, Federal Communications Commission, U.S. Postal Service, and other agencies.

DMA offers five main types of benefits to members: (1) they are advocates to ensure responsible marketing via the regulation of marketing standards; (2) they engage in reputation management to fight negative perceptions of marketers that consumers and the general public may have; (3) they educate and train professionals in direct marketing via seminars, conferences, in-house training programs, and certification programs; (4) they offer networking opportunities for members to build strong business relationships and connect with peers and community members; and (5) they provide market research information and other intelligence.

The Deceptive Mail Prevention and Enforcement Act was created by President Bill Clinton on December 12, 1999, and went into effect 120 days later on April 12, 2000. The law grants U.S. Postal Service employees powers to better protect consumers against deceptive mailings masked as games of chance, sweepstakes, skill contests, and facsimile checks. However, this law only protects mail sent through the U.S. Postal Service, not via the Internet or telephone. The law strictly prohibits the following false representations in promotions: (1) that the recipient is a winner, unless that person has actually won a prize; (2) that the recipient must order to enter; (3) that an entry must be sent in with payment for a previous purchase; (4) that the recipient must make a purchase in order to receive future sweepstakes mailings; (5) a fake check, if it does not include a statement on it that it is nonnegotiable and has no cash value; and (6) any seal, name, or term that implies a federal government connection, approval, or endorsement.

In addition, the Deceptive Mail Prevention and Enforcement Act requires that all mailings (1) display rules and order form indicating that no purchase is necessary to enter the contest; (2) state that a purchase does not improve the chances of winning; (3) state the terms and conditions of the sweepstakes promotion, including rules and entry procedures; (4) indicate the sponsor or mailer of the promotion and principal place of business, or other contact address of sponsor or mailer; and (5) provide estimated odds of winning each prize; the quantity, estimated retail value, and the nature of each prize; and the schedule of any payments made over time. Consumers are also protected if they would like to have their names removed from sweepstakes offers. Companies must offer the recipients the opportunity for name removal. They must also maintain a record of all the individuals who have requested to be removed for up to five years. Although such regulations have not made direct-mail fraud obsolete, they are a step in the right direction.

Disaster Fraud

Disaster fraud is defined as obtaining or attempting to obtain disaster-related benefits despite having no entitlement to them. Several notable cases of disaster fraud highlight the prevalence of this problem. Prompt verification of claims makes disaster fraud less easy to perpetrate.

9/11 Disaster Fraud

In the wake of the terrorist attacks of September 11, 2001, the Victim Compensation Fund (VCF) was established by an act of Congress. The VCF was allotted $5.12 billion to compensate the injured and the families of those killed in the attacks. For those submitting a claim to the VCF on behalf of a deceased loved one, the required paperwork included an original death certificate, documentation of the victim's presence at one of the target sites on 9/11, a court document specifying a recipient of funds on behalf of the deceased, and proof that all relevant parties had been notified of the claim, as well as income and collateral asset verification. Once the required paperwork had been submitted to the VCF, staff verified it and determined an award amount based on what the deceased would have earned through the rest of his/her lifetime, minus any assets, plus a pain and suffering payment set at $250,000.

By the sunset date of December 22, 2003, the VCF had received over 7,300 claims and paid out approximately $2.6 billion to claimants. There were instances of disaster benefit fraud among these claims. The Office of Inspector General (OIG) conducted an audit of the VCF in 2003 and found that of the 792 claims processed at that time, 17 appeared fraudulent. A total of eight of the 17 were passed along to the OIG's Fraud Detection Office, and legal action was taken against the claimants. At least three other instances of fraud against the VCF came to light in subsequent years.

Fraud in the Aftermath of Hurricane Katrina

Disaster benefit fraud also occurred in the wake of Hurricane Katrina in August 2005. The local, state, and federal response to the disaster was a spectacular failure, and in part to mitigate that failure, the Federal Emergency Management Agency (FEMA) began to distribute monetary assistance to Katrina victims. Claiming FEMA benefits was nearly effortless. All one needed was a telephone or Internet connection and some patience. Upon contacting FEMA, claimants were asked for their names and Social Security numbers, the names and Social Security numbers of their dependents, address in the affected area, evacuation address, assessment of damage to property, estimation of employment situation, and bank account information. Days later, claimants would find emergency assistance in the amount of $2,000 directly deposited into their bank accounts. Nearly one million people registered with FEMA in September 2005, and during that time, $1.2 billion was distributed to FEMA registrants in Louisiana alone. Given the speed with which FEMA distributed benefits to unverified claimants, fraud was an early concern, and the U.S. Department of Justice established the Hurricane Katrina Fraud Task Force (HKFTF) in 2005. A total of 36 people were charged with disaster benefit fraud by the Task Force in the month after Katrina, and by September 2010, 1,360 people had been charged. Katrina fraud was spread over both time and place, with over one-third of those charged residing outside the immediately affected area.

Gulf of Mexico Oil Spill Disaster Fraud

In April 2010, an oil rig in the Gulf of Mexico exploded and sank, killing 11 workers. A leak in the pipe to which the rig was connected was detected several days later, and oil spewed into the gulf for months, with millions of gallons fouling the water, beaches, and wildlife. Those whose livelihoods were dependent on the gulf, including shrimpers, oystermen, fishermen, and hoteliers, lost millions of dollars in revenue. The government directed the owner of the oil pipeline, BP (formerly British Petroleum), to establish a $20 billion compensation fund known as the Gulf Coast Claims Facility and put Kenneth Feinberg in charge of paying claims. Feinberg was the special master after 9/11 and promised a quick turnaround for claimants, about two days for individuals and a week for businesses.

The speed with which Feinberg promised to pay claimants set the stage for fraud. It meant that claims could not possibly be carefully checked before payments were made. Complicating matters was that many shrimpers, oystermen, and fishermen run cash businesses and do not keep the detailed records desired to accurately determine

A Federal Emergency Management Agency (FEMA) community relations representative (right) shows an Ottawa, Ohio, resident her proper FEMA credentials after severe flooding hit the area in August 2007. The agency warns that during disaster recovery, affected residents must be on the lookout for possible fraud. The government electronically cross-checks information from FEMA, its partner agencies, and insurance companies to detect duplicate or fraudulent applications, and claims are inspected and verified.

benefit amount. Moreover, some early claimants complained that they received much less money than requested from the Gulf Coast Claims Facility; the fear of receiving less money than requested may have spurred later claimants to submit claims that exceeded actual losses. By January 2011, over 7,000 of the approximately 481,000 claimants to the Gulf Coast Claims Facility were suspected of fraud, and eight people had already been indicted for fraud by that time. Still, Feinberg called the compensation program a success, noting that over $3 billion had been paid to approximately 168,000 claimants by 2011.

An important safeguard against disaster fraud is making the crime more difficult to commit. In order to make disaster fraud a less attractive crime, it is essential that claims are fully and quickly verified by establishing a claims checking protocol that involves shared databases, effective communication, and clear delineation of responsibilities, before disaster strikes. With these steps, the costly crime of disaster fraud can be reduced and the revictimization of disaster survivors can be minimized.

Dodd-Frank Wall Street Reform and Consumer Protection Act

Short of any fundamental or structural reform of financial markets, the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 contains many useful reforms. Although comprehensive in its approach to financial regulation, there are some reforms that are hollow or have no teeth, such as in the areas of executive compensation and corporate governance.

More significantly, Dodd-Frank provides several loopholes or escape clauses to bail out the financial industry as a whole and to reproduce the recent history of banking on the Federal Reserve System. For example, forcing insolvency and bankruptcy, breaking up the too-big-to-fail institutions, ending taxpayer bailouts, and eliminating certain types of derivative practices are all conditional. Consequently, the new law is not likely to do very much to hedge against or to reduce moral hazards, high-risk betting, or the next financially driven bubble in the economy. Dodd-Frank, like most other regulatory legislation, is also silent on the workings of the contradictions of bourgeois legal justice, with its waivers and exemptions from punishment for high-stakes securities fraud. Finally, the new law is also silent on the superfinancialization of global capital at the turn of the 21st century.

Domino Effect of the Mortgage Crisis

The financial crisis that began with the housing mortgage crisis in mid-2006 set in motion a regimen of regulatory reforms not seen since the Great Depression. Had the regulatory regime of the past engaged in better risk management, the financial crisis may not have occurred in the first place. Had the financial collapse not occurred, then the uncomfortable sequence of bailouts and exceptional favors for a privileged banking oligopoly in order "to right the U.S. system" would not have happened. Dodd-Frank ignores the speculative bubbles that caused the financial debacle. While authorizing studies on the subject, the act is silent about how the newly reformed agencies are to recognize these problems in the future. Similarly, although the new law has also introduced numerous legal reforms, these still represent only a starting place for a dialogue on how to move the financial system safely into the 21st century.

Markets and regulation have always gone hand in hand. The two were more or less invented together during the emergence of modern capitalism in the 17th century. For markets to exist, they have always needed to disconnect transactions from relationships and to formalize those into rules and regulations. Thus, "free" markets require both trust in the rules and trust in strangers to uphold the rules. Over time, periods of regulatory innovation have occurred in waves that are followed by long periods of relative inattention. Each period generally involves a financial collapse, a loss of faith in financial institutions, and an attempt at re-regulation.

Historically, financial regulation of banks and stocks can be traced back to the collapse of the tulip market in 1637, when the Dutch government shut down the speculative flower market. In 1720, the stock market crashes in both France and the United Kingdom were responsible for the establishment of new rules and regulations in an effort to prevent the recurrence of future crashes. Those early financial implosions also introduced the term *bubble*, referring to the lack of substance or trading irrationally based on nothing more than air. In the United States, the stock market crash of 1929 led to the recognition of behavioral and systemic risks to the financial system. The Great Depression that followed also prompted massive increases in financial regulation. After World War II, a period of financial and economic stability over subsequent decades helped support an intellectual drift toward the belief in the natural proper functioning of markets and to the eventual dismantling of many regulatory controls.

In the 1970s and 1980s, deregulation was aided by anti-Keynesian macroeconomic theory known as monetarism and by the efficient markets theory. Together, these theories argue that markets work best when they are free of human intervention or regulation. Unproven to this day, these theories still serve as part of an ideological mantra that spurs both privatization and a climate of financial deregulation. The latter recently peaked with the passage of the 1999 Gramm-Leach-Bliley Act and its evisceration of Glass-Steagall (1933). In turn, this law, also known as the Financial Services Modernization Act, did away with the separation of commercial and investment banks, which enabled the housing bubble and bust of 2000 to 2006 that caused the Wall Street financial collapse of 2007 to 2008. However, Dodd-Frank, with all of its new rules and regulations, does not repeal Gramm-Leach-Bliley or reinstate the key rule of Glass-Steagall, which made it a felony to engage in or combine the activities of both investment and commercial banks.

The consumer protection side of Dodd-Frank is effective. For example, the enactment of the Bureau of Consumer Financial Protection is a step in the right direction. It has the authority to collect information about financial practices. It also has the power to enact new rules to protect individuals against bad practices in credit cards, home mortgages, account overdrafts, payday loans, and other financial products. These rule changes should help focus the attention of financial regulators on the problems faced by common consumers, not unlike the successful Consumer Product Safety Commission.

There are other rules in place that need to be changed in the spirit of democratizing and humanizing finance capital. For example, the government already mandates extensive disclosure, and government policies have endorsed disclosure as central to regulatory processes. However, many of those disclosures unread by investors who rely on word of mouth, news media, and investment advisors for information make it harder for investors to sue issuers of credit. These lengthy contracts are full of legalese designed to skirt consumer protection laws and class-action lawsuits. The same has been true for some of the tort lawsuits involving securities fraud.

Domhoff, G. William

G. William Domhoff is a professor in psychology and sociology at the University of California, Santa Cruz. He has written a number of books and articles concerning the influence of the power elite and ruling class upon American politics. Domhoff became well known for his book *Who Rules America?* (1967), in which he argues that the upper class has a disproportionate influence over a plethora of social institutions, which reflects a power-elite hegemony. Subsequent books and articles refine this view. This sentiment challenged the pluralist perspective that diverse interests are politically represented in the United States' government structure. By "ruling class" and "power elite," he is referring to a group that has a disproportionate amount of wealth and income, has better life chances than other social groups, controls major economic institutions, and dominates governmental processes. However, the ruling class and power elite are not synonymous. The power elite is a subset of the ruling class, who act as an "operating arm," "leadership group," or "establishment" for members of the upper class. This upper class constitutes 1 percent of the U.S. population.

There are various mechanisms in which the interests of the ruling power elite develop cohesive and fairly consistent policies. He admits that there may be some disagreements and failures to advance their interests—which occur primarily in a few isolated pockets in metropolitan areas—but they are overwhelmingly successful in their policy implementations. One instrument of developing a consensus among political leaders was the attendance at elite clubs and organizations in relaxed, remote areas—such as Bohemian Grove. In *The Bohemian Grove* (1974), Domhoff lists names of prominent, national business and political leaders who attend the organization. Many of these leaders are also members of other influential national clubs, such as the Council on Foreign Relations and the Business Roundtable. Those who attend such organizations strengthen their in-group identity by witnessing and participating in extraordinary rituals, such as the Cremation of Care, which is described in detail at the beginning of the book.

Four Processes

In *The Powers That Be: Processes of Ruling Class Domination of America*, Domhoff describes the various processes by which the upper social class is able to wield considerable control over major social, economic, and governmental institutions. They are classified into four main processes: the special interest process, policy formation process, candidate selection process, and ideology process.

The special interest process includes activities such as concentrated efforts of bribery, conflict of interest, and lobbying. With the policy process, interlocking directorates, in which board members of one organization are also on boards of other business and political organizations, is a major mechanism by which policy consensus is more easily achieved. With the candidate selection process, the two-party system does not operate as suggested by pluralists. Both parties collude with one another and with business in selecting suitable candidates who will not present a threat to the status quo. Finally, with ideology, laissez-faire liberalism is promoted through educational institutions via grant funding, which reifies the power elite's interests. Individualism, free enterprise, and competition are promoted. For example, any idea that does not have a practicality is considered "theoretical," "utopian," or "impractical." Such ideas are reflected in and reinforced in myriad other social institutions, such as media outlets.

The policymaking process is not a social process that attempts to control all processes of government, but only intervenes on issues in which the power elite's interests become threatened. Nonintervention has been the modus operandi of the power elite. The processes by which large issues have been refined and agreed upon are through policy network organizations. These organizations, which are underwritten by members of the power elite who control major banks and corporations, utilize policy network organizations such as the Committee for Economic Development to discuss issues of concern.

Domhoff has refined these earlier works and has analyzed other pertinent issues. One of these issues is the increase of African Americans in the power elite; however, true to his original premise, these figures do not arise arbitrarily but are allowed to come into various positions of power because they do not represent a real threat to the political and social status quo. As for white-collar crime, those in political positions of power are not going to create laws and punitive criminal sanctions that are going to directly place themselves in jeopardy. Although many of Domhoff's critiques point to a lack of strong empirical evidence for his social and political theory—such as collating lists of members of various elite groups and examining not class, but the instruments of class oppression—his work provides criminologists with an overview of the major powerful figures and institutions in the United States and the world that yield considerable influence upon policy and ideology.

Dow Chemical Co.

From its beginning as a small operation selling a single product line, Dow Chemical Company, headquartered in Midland, Michigan, has grown into one of the world's largest chemical companies. The diversified, multinational Fortune 500 company boasts over 5,000 products, 52,000 employees, and sales of $60 billion. Manufactured in 36 countries at 197 different locations, Dow's products are vital to many industries, including electronics, water, energy, packaging, medical, and agriculture. Dow has been embroiled in a number of controversies that have challenged its reputation.

Background

In 1897, Herbert H. Dow formed the company to manufacture bleach, using an innovative electrical process to separate bromides from brine. With heavy competition from the world's then-leading chemical firms based in Germany, Dow fought to remain an ongoing concern. However, with World War I naval blockades limiting access to German chemical companies, the U.S. government pressed Dow to manufacture phenol and magnesium, which were used in explosives and incendiary devices. Postwar tariffs protected chemical companies in the United States, and Dow expanded to produce calcium chloride, salt, and aspirin.

Under Herbert's son Willard Dow, the company focused on research and development. In addition to researching petrochemicals and plastics, Dow added iodine and ethylene to its portfolio of products. During this period, Dow labs were developing waste disposal bacteria, Styrofoam, vinyl chloride, and other products and processes. By World War II, Dow was producing 80 percent of the country's magnesium, leading to an investigation that Dow conspired to monopolize magnesium production, but that accusation was later dropped. In addition to these metals and chemicals, Dow produced synthetics, including rubber, styrene, butadiene, impregnite, phenol, and the plastic that forms Saran Wrap. Saran Wrap, introduced in 1953, was Dow's first consumer product.

Dow has continued to innovate and develop its product portfolio and geographic reach. The company owns over 3,000 patents nationally and over 14,000 internationally, approximately 80 percent with a remaining life of six years or greater. Dow's organization is structured around five operating segments: Performance Plastics, Performance Materials, Agricultural Sciences, Advanced Material, and Feedstocks and Energy.

Napalm bombs explode on Viet Cong structures south of Saigon during the Vietnam War in 1965. The burns, chemical poisoning, and deaths it caused horrified the American public, and protesters targeted its producer, Dow Chemical Company.

In 2011, Dow introduced three trademarked products: Enlight Polyolefin Encapsulant Films, which are used in solar panels; Evoque Pre-Composite Polymer Technology, which improves paint performance and reduces cost; and Pascal Technology, insulation designed to improve the energy efficiency of appliances. Dow espouses a commitment to sustainability, and it has invested in product lines to provide clean water, improve the efficiency of wind turbine systems, and contribute to the manufacturing of batteries for hybrid vehicles. Its plants have reduced greenhouse gas emissions and increased the energy efficiency of their operations.

Napalm

In 1965, Dow Chemical began producing napalm, a mix of polystyrene, benzene, and gasoline, for the Department of Defense (DOD). Soon, it was the DOD's exclusive supplier. The military cited the need for such a weapon for the theater of war in Vietnam, as traditional weapons were not effective against an enemy hiding in foxholes and tunnels. Napalm produced a burning, gel-like substance that could penetrate the enemy's secret bunkers. However, the effects of napalm horrified much of the American public. People exposed to napalm experienced significant burns, chemical poisoning, and often death.

As a result, in the late 1960s, student protesters targeted the company and demonstrated during campus visits of company recruiters. Protests continued even after Dow stopped manufacturing napalm in 1969. During the Vietnam War, Dow was one of several companies that produced Agent Orange, a defoliant that caused leaves to drop from vegetation, making the area safer for American soldiers. Agent Orange has been linked to cancer among Vietnam veterans and significant health issues for the Vietnamese population, including birth defects and many deaths. Vietnam sent a letter of protest to the International Olympic Committee when Dow Chemical Company was selected as a corporate sponsor of the 2012 Olympic Games in London.

Controversy and allegations of wrongdoing also engulfed Dow regarding silicone breast implants. Dow Corning, owned by Dow Chemical and Corning Inc., produces a number of silicone-based products, including adhesive, sealants, and breast implants. In the 1980s, these implants were linked to health problems, including breast tissue hardening, breast cancer, autoimmune diseases, and implant rupture. Dow Corning filed for bankruptcy in 1995 as a result of numerous lawsuits filed against it. Litigation against Dow continued with allegations that Dow did not properly test silicone for human implant use. Most plaintiffs were covered in a far-reaching $3.7 billion settlement.

Union Carbide Disaster

In 1984, a Union Carbide facility in Bhopal, India, leaked toxic gas; more than 20,000 died from contamination. A civil case against Union Carbide was settled in 1989, but other litigation remains active. Dow became entrenched in the dispute when it merged with Union Carbide in 2001. Although Dow argues that it did not inherit Union Carbide's liabilities in the merger, activists and the Indian government continue to seek remedy on behalf of the Indian people, and lawsuits remain pending in the U.S. federal court system. Closer to home, Dow has been accused of contaminating waterways in the Great Lakes region with dioxin runoff from the company's

Midland facility. The Environmental Protection Agency identifies dioxin as a dangerous chemical that can cause cancer or disrupt the reproductive or immune system. After over a decade of negotiation, Dow and regulatory agencies reached an agreement on the terms of a cleanup near the company's plant. Because of Dow's association with several destructive products and processes, the Public Interest Research Group has identified it as one of America's most dangerous companies. However, Dow is working to repair its reputation through its product line and philanthropic pursuits. Dow's strong financial performance indicates a successful strategy.

Dream Homes Scam

The Dream Homes scam was a deceptive mortgage payment and investment program that used multiple corporate names to convince over 1,000 investors to part with close to $78 million. It operated from 2005 to 2007 and used the corporation names of Metro Dream Homes (MDH), POS Dream Homes, POS DH LLC, and Metropolitan Grapevine LLC. This scam promised investors that if they made a $50,000 or more investment and paid an administrative fee of under $5,000, MDH would pay their mortgage for them. The investors' money would be used for various investments in electronic public billboards such as flat-screen televisions with business advertising, Touch-N-Buy electronic kiosks that sold telephone cards, and automated teller machines (ATMs). These investment revenues would then be used to fund the investors' mortgage payments with a promise to pay off their remaining mortgage in five to seven years.

Instead of using the funds as promised for those business ventures, however, MDH executives used the funds for other purposes and stopped making mortgage payments. This left the investors having to pay their mortgages. Their investments were used fraudulently and in ways not disclosed to the investors, including third-party businesses. The funds were also used to pay off initial investors of a previously unregistered ATM business venture called Bankcard Group in a Ponzi-type scheme operated by the chief executive officer. Then, investor funds were used to pay off the personal mortgages of several MDH top executives. Investor funds were also used for several executives to enjoy $200,000-plus salaries, vacations, tickets to the 2007 Super Bowl, 10 luxury vehicles with chauffeurs, and other personal items.

The Scam

In order to appear as a high-end, legitimate company, DHS spent thousands of dollars on expensive presentations in upscale hotels. These included the Washington Plaza Hotel in Washington, D.C., the Marriott Marquis Hotel in New York City, and the Regent Beverly Wilshire Hotel in Beverly Hills, California. They even donated $50,000 several times to charities in order to appear more reputable and profitable. The program had multiple offices in the United States, including locations in Florida, Georgia, Maryland, Washington, D.C., Virginia, New York, Delaware, North Carolina, and California. Some initial investors had their homes paid off in a Ponzi-type scheme that was used to add legitimacy to the seminars. These initial investors were used for recruitment purposes. Homeowners or prospective homeowners were convinced to either refinance their current mortgages to pull equity out of their homes for this investment or to buy new homes at much higher prices to have the funding for this mortgage investment. This program ran during the height of the housing market.

In early 2006, it was expanded to a new program called POS Dream Homes. It operated similarly to the original program in investment and promise. Carole Nelson was hired in 2006 to be in charge of the program yet never reviewed documents showing any investment revenue. In fact, the business ventures barely made a profit. She worked for the company for less than 20 months but earned a salary of $413,075. Then, Ms. Nelson and the four key members stopped paying the investors' mortgages. On August 15, 2007, MDH and all of its subsequent companies were issued a cease and desist order. Their assets were frozen by a Maryland judge and were eventually placed into receivership.

During the course of the investigation, the U.S. Department of Justice, the Federal Bureau of Investigation, the Internal Revenue Service Criminal Investigations Division, and many other agencies were involved. The five co-conspirators were indicted. In 2009, several key members of the organization were federally charged, and by 2012, all five had pleaded guilty and were sentenced to federal prison. On November 10, 2011, 58-year-old MDH owner and founder Andrew Hamilton Williams, Jr., of Hollywood, Florida, was sentenced to 150 years in prison, followed by three years of supervised release for conspiracy to commit wire fraud, wire fraud, and conspiracy to commit money laundering. The chief financial officer from New York was Michael Anthony Hickson, age 46, of Commack, New York. He was sentenced to 120 months imprisonment for his charges.

President Isaac Jerome Smith, age 46, from Spotsylvania, Virginia, was sentenced to 70 months in prison, and vice president of operations Alvita Karen Gunn, age 31, of Hanover, Maryland, was sentenced to 60 months in prison. Carole Nelson, age 53, from Washington, D.C., was the chief financial officer for POS Dream Homes. She was sentenced to 29 months imprisonment, followed by three years supervised release, after pleading guilty to money laundering. She was also ordered to pay restitution of over $34 million. Another person charged in connection with the MDH fallout included its legal counsel, attorney Michael Ron Worthy, age 45, of Bowie, Maryland. He failed to file income tax returns in 2006 and 2007, showing income from MDH and other sources as a consultant. Worthy was sentenced to six months in prison, followed by one year of supervised release for two counts of failing to file an income tax return.

Drexel Burnham Lambert Inc.

Drexel Burnham Lambert Inc. was, by the end of the 1980s, one of the five largest investment banks in the United States. Drexel Burnham Lambert was especially well known for its work promoting and selling high-yield, noninvestment grade bonds, also known as "junk bonds," and its mergers and acquisitions business. Aggressive and uncompromising in its business practices, Drexel Burnham Lambert was one of the most profitable of all Wall Street investment banks, and its head of noninvestment grade bonds department, Michael Milken, was credited with creating the market for junk bonds. Often the investment bank of choice for corporate raiders, Drexel Burnham Lambert was closely scrutinized by the Securities and Exchange Commission (SEC) and pleaded guilty to six charges of stock parking and stock price manipulation after years of investigation.

Its business was severely damaged by this, and in 1990, Drexel Burnham Lambert declared bankruptcy and sold off most of its operations.

Background

In 1935, I. W. (Tubby) Burnham founded the retail brokerage firm of Burnham & Co. in New York City. Although the firm soon branched out into investment banking, because of unwritten rules in place on Wall Street at the time, Burnham & Co., which was considered a sub-major firm, was unable to take the lead role in underwriting stock or bond offerings, a privilege reserved for a handful of major firms. To circumvent this problem, Burnham & Co. merged in 1973 with Drexel Firestone, a "major" firm that had fallen on hard times, to become Drexel Burnham & Co. Following another merger with research specialist firm William D. Witter, owned by Groupe Bruxelles Lambert, the firm became known as Drexel Burnham Lambert. One of the few carryover employees from the Drexel Firestone firm, Michael Milken, served as the head of its bond trading division. Also joining the firm at about this time as co-head of corporate finance was Fred Joseph, known for his aggressive style. Joseph would be named president of Drexel Burnham Lambert in 1984.

Drexel Burnham Lambert soon became renowned for its aggressive practices, especially its willingness to work with start-up companies and firms that had fallen on hard times. When Drexel Burnham Lambert began working in the mergers and acquisitions field in the early 1980s, it often worked with corporate raiders such as Ivan Boesky, Carl Icahn, and T. Boone Pickens, who were often involved in hostile takeovers of other firms. The established Wall Street investment banks, which had dominated the field prior to Drexel Burnham Lambert's arrival, had eschewed hostile takeovers. Drexel Burnham Lambert soon established an almost legendary reputation for being able to market and sell any bonds that it underwrote. As a result, when the firm issued a letter stating it was "highly confident" it would be able to obtain financing for a hostile takeover, it allowed corporate raiders to launch leveraged buyouts of other corporations without having the debt portion of their financing package fully in place. These letters proved highly profitable for Drexel Burnham Lambert, because if the deal failed to go through, it did not have to raise any money; and if it did, the letters proved a valuable tool demonstrating the firm's sales acumen.

By 1986, Drexel Burnham Lambert had its most profitable fiscal year, netting nearly $550 million, a record at that time. During the same year, Milken had received a similar sum in compensation, also a record. This level of financial success made the firm a target for the SEC, which closely monitored its transactions and business practices. Dennis Levine, a managing director of Drexel Burnham Lambert, was charged with insider trading in 1986. Although Levine had worked at Drexel Burnham Lambert only since the previous year, when pleading guilty, he implicated one of the firm's clients, Boesky, the well-known investor and arbitrageur. Based upon information provided by Boesky, the SEC began an investigation of Drexel Burnham Lambert in November 1986, and the U.S. attorney for the Southern District of New York, Rudy Giuliani, launched an independent investigation at about the same time. Milken refused to participate in Drexel Burnham Lambert's internal investigation and would answer questions only through his attorneys. Boesky entered into a plea agreement with the SEC and was sentenced to three years in prison and fined $100 million.

Buckling Under Pressure

For two years, Drexel Burnham Lambert resisted the SEC's charges, insisting that the only evidence against it came from Levine and Boesky, both convicted felons. In 1988, however, the firm became aware that Giuliani was considering bringing an indictment against it pursuant to the Racketeer Influenced and Corrupt Organizations (RICO) Act. Had such an indictment been brought, Drexel Burnham Lambert would have been forced to post a performance bond in the amount of $1 billion to prevent having its assets frozen. This threat, coupled with Drexel Burnham Lambert's understanding that if indicted, its lines of credit would be cut off, caused Joseph to enter into negotiations with Giuliani to settle the matter. When news broke regarding a limited partnership (made up in part of Milken's young children) that purchased bonds from clients who had bought them from Drexel Burnham Lambert, the firm was forced to settle. Drexel Burnham Lambert pleaded nolo contendere to three counts of stock parking and three counts of stock manipulation, all felonies. Milken was also convicted. As a convicted felon, the firm was unable to continue in business, laid off over 5,000 employees, and shut down three divisions in 1989. In early 1990, Drexel Burnham Lambert filed for bankruptcy protection.

E

E. F. Hutton & Co.

Founded in 1904 by Edward Francis Hutton, E. F. Hutton & Co. was one of the most respected financial services companies in the United States and, for a period, the second-largest brokerage firm in the nation. Although it first did business in San Francisco, E. F. Hutton was based in New York City for most of its existence, although it was one of the first brokerage firms to have branch offices in vacation resorts such as Palm Beach, Florida, and Sarasota Springs, New York, to cater to its clients' needs. Although it was able to stay independent until the 1980s, E. F. Hutton's reputation was hurt by a check kiting scheme initiated by several of its offices. After allegations arose that the firm was involved in money laundering for the mob, E. F. Hutton was acquired by Shearson Lehman/American Express and ceased to exist as an independent entity.

Led for over half a century by legendary financier Edward Hutton, E. F. Hutton enjoyed a stellar reputation, based in part upon the activities of its leadership. Edward Hutton was for a time the chairman of General Foods Corporation and became well known to the general public with a nationally syndicated newspaper column he penned regarding investments. The firm also benefited from the acumen of Wall Street insider Gerald M. Loeb, who led the firm's trading operations. By the time of Edward Hutton's death in 1962, the firm was listed on the New York Stock Exchange as E. F. Hutton Group and was composed of a trust company, bank, and life insurance venture, as well as the brokerage firm. During the 1960s and 1970s, E. F. Hutton became well known to the general public through a series of television advertisements with the tag line, "When E. F. Hutton talks, people listen," which played upon the firm's stellar reputation. Although many of its competitors faltered during the 1970s and were forced to merge with others, E. F. Hutton maintained its independence and its presence as a major financial firm.

By the early 1980s, E. F. Hutton had one of the largest networks of branch offices of any brokerage firm in the United States. Around this time, several E. F. Hutton branch offices began the practice of "chaining," which entails writing a check on one account for an amount greater than the value of that account, while simultaneously making a deposit from a second account equal to the amount taken from the first account, but also with nonsufficient funds. Chaining, which is a form of check kiting, involves a form of check fraud that makes use of nonexistent funds to procure a "float," or an interest-free use of funds, through reliance on the time it takes banks to process transactions. What made the E. F. Hutton check kiting incidents unusual was not only the size of the scheme, which included over 400 mostly rural American banks and daily chaining of over $250 million, but also the level of knowledge of the system by E. F. Hutton's corporate officers. Thomas Morley, an E. F. Hutton executive, discovered the check kiting and sent a memo disclosing its scope to the firm's president, George Ball. Rather than curtail the scheme, Ball sent out a memo to E. F. Hutton's branch managers sharing Morley's memo and suggesting that since one branch had profited by over $30,000 per month as a result of check kiting, it was a process the rest of them might wish to consider.

Although the check kiting scheme worked well for E. F. Hutton for several years, by 1984, Genesee County Bank in rural New York noted that a local E. F. Hutton branch was making abnormally large deposits and withdrawals. After an investigation, the Genesee County Bank learned that the two Pennsylvania bank accounts that E. F. Hutton was using to make deposits to it lacked sufficient funds to cover the deposits, and it stopped honoring the firm's checks. After the Federal Deposit Insurance Corporation was asked to investigate, it discovered enough evidence of wrongdoing on E. F. Hutton's part to refer the case to the U.S. attorney for the eastern district of Pennsylvania, who began a criminal investigation of the firm and its officers. After internal documents made a conviction of E. F. Hutton appear likely, in 1985, the firm agreed to plead guilty to more than 2,000 counts of mail and wire fraud, pay nearly $3 million in fines and penalties, and make restitution to a group of small banks in the amount of $8 million.

Although the check kiting scandal hurt E. F. Hutton's business, the firm continued operating. In 1987, an internal company investigation disclosed that the firm's Providence, Rhode Island, office had been involved in a money laundering arrangement for the Patriarca crime family. While E. F. Hutton immediately reported this finding to the Securities and Exchange Commission (SEC), prosecutors indicated that the firm's indictment in the matter was inevitable. At the same time, E. F. Hutton suffered a series of financial reverses brought about in part by the 1987 stock market crash. Weeks from collapse, E. F. Hutton agreed to merge with Shearson Lehman/American Express in late 1987, resulting in a new entity after the merger was completed the following year, Shearson Lehman Hutton Inc. At this point, E. F. Hutton ceased to operate as an independent brokerage firm.

Economic Espionage

Economic espionage is a universal threat. Economic espionage deals with the theft of trade and economic secrets from businesses, industries, and governments for the financial and/or political gain of foreign nations or entities. For the most part, economic espionage does not involve violence, but it can include coercion, blackmail, and threats. As a white-collar crime, economic espionage is a high-stakes form of theft. It requires specific know-how and skills, either in social engineering or in computer crime, for individuals to gain access to the materials and information they are seeking. Economic espionage can be very profitable and is therefore mostly profit driven. Some individuals engage in economic espionage as a way to attack a target nation or as a form of patriotism or nationalism. Economic espionage is continuously adapting to changes in policy, investigation, and technology.

In 1996, the United States enacted the Economic Espionage Act (18 USC §§1831-1839) to focus on the investigation and prevention of foreign actors acquiring U.S. trade secrets. Diplomatic missions to the European Union and the Middle East throughout the 1990s included requests from the United States that the illicit collection of trade secrets and other forms of economic espionage be lessened. These diplomatic missions were reportedly successful but do not mean that the practice of economic espionage between enemies and allies ended completely. The greatest concern in economic espionage is the endangering of proprietary information or trade secrets.

Trade secrets include ideas, plans, patterns, programs, codes, prototypes, and formulas. These trade secrets exist in a wide range of enterprises, including the business, scientific, technical, and engineering fields. The theft of these trade secrets does not always mean that an individual has physically stolen a document or prototype; an individual may use clandestinely acquired information or photographs to reverse engineer the product or formula. Reverse engineering calls for the examination of the finished product or a portion of the finished product to re-create the object, and then experimentation with the result until its purpose has been ascertained.

Individuals engage in economic espionage for a variety of reasons; however, it is usually for the benefit of a foreign government or entity. Individuals commits economic espionage when they knowingly acquire trade secrets in one country for the benefit of another. The individuals committing economic espionage can include the employees, consultants, and/or customers of the company that has been compromised. Although sometimes referred to as industrial espionage, the theft of trade secrets from within a country for the benefit of a foreign entity is economic espionage, no matter what the relationship between the thief and the company. Economic espionage can be perpetrated at the request of countries and legitimate governments, but also by organizations without a recognized country, including terrorist groups, political parties, independent businesses, and contractors in intelligence.

With rapid changes in technology, economic espionage has become easier and more profitable. As new ideas and technologies are developed, foreign entities search for ways to acquire the information. In some cases, this is to create a competing product or to find ways to circumvent a new weapon or security measure. Samsung and Apple went to court because of concerns regarding economic espionage and the misappropriation of proprietary technology, through patent infringement in their competing cell phones.

Similar cases have been mediated by private individuals and the court between IBM and Fujitsu, regarding their collaboration and later use of proprietary material in products and programs beyond the scope of their partnership. Both of these situations created competing products and services based on the same technology and programming, one of the pitfalls of information sharing and increased globalization in business. In others, it is not so much about the product itself, but the raw materials needed to create it, giving a foreign entity the upper hand in trade negotiations for those raw materials. This advantage can be used and manipulated in a variety of ways, from demanding a higher cost for the raw materials to refusing to see the raw materials so that they may be used in the country for the manufacture of a competitive product.

Methods of Economic Espionage

One of the ways in which individuals engage in economic espionage is through the Internet. In these situations, malicious software or malware can be used to siphon information from a computer. This style of economic espionage provides the greatest anonymity and least risk and expense. Hackers readily share tools and information across the Internet, providing a wealth of techniques, decreasing the need for an individual to create a new malware program to infiltrate the target. Further, a hacker need not have a direct allegiance to the country that hires him or her, thereby distancing the foreign entity from the act. The level of anonymity that is available through the use of this method of economic espionage decreases the likelihood of discovery, even if the perpetrator has legitimate ties to the company. The ease with which these programs can be used also increases the likelihood of individuals engaging in economic espionage, independently of the directives of a foreign entity or nation.

Prior to the advent of the Internet and improvements in malware technology, it was necessary for individuals committing economic espionage to physically steal documents. This was the case of Dongfan Chung, whose espionage against his

House Speaker Nancy Pelosi and a bipartisan congressional delegation visit an electric car factory in Tianjin, China, in May 2009. The delegation also met with Chinese leaders on a variety of issues of concern, including intellectual property rights and the global financial crisis. According to the Council on Foreign Relations, China is one of the most aggressive players in economic espionage, especially in telecommunications, aerospace, energy, and defense, but it may be undercutting its own quest for indigenous innovation.

employer, Rockwell and Boeing, netted hundreds of thousands of pages of documents for the Chinese government from 1979 to 2006. Because of the physical nature of the documents, Chung and his contacts needed to be very cautious, both in the acquisition of these documents and in passing them on; however, today's technology allows for individuals to acquire the same volume and greater on a single external drive, which becomes easier to hide, explain, and pass to contacts.

Another way in which individuals acquire the trade secrets sought through economic espionage is through the use of requests for information. Either through the use of personal contacts or through social engineering, an individual contacts an individual within the target firm or business and asks for information regarding the classified product or project. These requests can be through telephone, e-mail, fax, mail requests, or other forms of communication. In the case of personal contacts, these requests can be very casual. In social engineering situations, where the individual requesting the information is impersonating someone who has rights to access the information, or a need to know the information that sounds legitimate, the communication is often far more formal. Some single-issue terrorist groups use social engineering against businesses to acquire customer lists or service provider lists in order to increase their list of potential targets for physical, economic, and cyber attacks.

Some economic espionage is perpetrated through the solicitation or marketing of services. In these situations, a foreign company, national company, domestic company, or national seeking to work as an agent of a foreign entity pursues a business relationship with the target. This relationship can be as a supplier of related or unrelated materials, such as raw materials or paper and office supplies. Others may opt to supply services, such as janitorial services, courier services, catering, or payroll, anything that might result in access to the trade secrets that are sought, either directly or indirectly. Examples of direct access may include a janitor's access to an office where documents are stored or a courier who is given the documents to take across town. Indirect access includes a member of the caterer's staff chatting up an individual working on the project or an external accountant keeping tabs on project-related expenditures.

Particularly vulnerable venues for economic espionage are events open to the general public or specialists in a particular field, such as trade shows, conventions, and conferences, or even Webinars sponsored by individuals who are experts in the field that is targeted. Universities can account for billions of dollars in development of new technologies and ideas. Part of the culture of universities and research institutes is the sharing of information at these public or semi-public venues. Likewise, the professional organizations tied to particular fields sponsor a plethora of trade shows, conventions, and conferences so that their members can share ideas and engage in professional development. Although most attendees do not come to these venues with malicious intent, individuals engaging in economic espionage can gain access to these events and the experts who attend them for purposes of exploitation or the creation of personal contacts that can be used later in requests for information.

Sensitive information and trade secrets have also been acquired through official visits, where a foreign government or entity makes specific arrangements for its assignees to visit a location or facility and take a guided tour. During the visit and/or tour, questions can be asked and information acquired for the benefit of the foreign entity. Along the same lines, joint research between companies or colleagues in different countries can be similarly exploited. In these situations, the information shared over the course of the collaboration is then siphoned off and used for other projects for the benefit of the foreign entity.

Individuals traveling abroad are also targets for economic espionage. In these situations, the acquisition of information can be overt or covert. This can include the use of recording devices in and the theft of electronic devices or other materials from hotel and meeting rooms. In some cases, a foreign entity may attempt to arrange seemingly chance or even romantic meetings between operatives and the visiting target. Depending on the information that the individuals may be traveling with or have access to when they return to their home country, these entanglements can be short- or long term. In the past, governments and espionage networks have set up electronic listening devices in brothels and have employed or had employees pose as prostitutes for this purpose. The Soviet Union and Nazi Germany (within their own borders and in other countries), engaged in this practice, and the disintegration of these governments provided the best information about this type of espionage.

Open-source information is also used in economic espionage. Media reports, professional journals, trade publications, company and trade Web sites, conference minutes, social networks, and other media provide a wealth of information that can be exploited for purposes of economic espionage. In some cases, this open-source information is used as background for a concentrated effort, such as determining which targets to exploit using malware or a specific individual to target for a request for information, or determining when they will travel into a territory accessible to or controlled by the foreign entity seeking the information. Individuals who are well versed in economic espionage can easily identify pertinent information and draw it together from a wide variety of sources. Foreign nations and entities engaged in espionage can pick and choose which of these tactics to employ against their targets and can use several in concert.

Costs of Economic Espionage

Economic espionage attacks countries where they are most vulnerable. The increased globalization of business has opened more possibilities and partnerships with untold benefits, but the downside is that the increased global interaction has also broadened the scope of economic espionage. The theft of trade secrets and other economic information puts the target nation or company at a disadvantage. Beyond the loss of proprietary information, a company may also lose money, development time, security, public support, or market stability. Theft of trade secrets has in the past allowed companies to be bought out by competitors as their products and services are rendered obsolete.

From the standpoint of a country, economic espionage can be used to exploit trade negotiations, influence the creation of policy, endanger civilian and military personnel, disrupt economic standing, and/or decrease national security. In the first situation, a country with clandestine knowledge regarding raw materials or manufacturing needs can alter trade negotiations in its favor, increasing the cost of the raw materials and thereby the finished product, giving its own companies or an ally's the time to exploit the available information to create a cheaper competitive product. A wide range of policies is tied to trade secrets, though the most dangerous regard economic espionage or those related to financial market regulation. As the economies of the world become increasingly intertwined, clandestine knowledge of one country's regulatory desires or practices can undermine the financial relationship between countries and decrease that country's standing in the world market.

The theft of trade secrets regarding technologies that are designed to keep people safe or provide a superior weapon, or that provide the recipe for a pharmaceutical, can be exploited to endanger lives, counteract the weapon, alter the chemical compound, and mimic the pharmaceutical, with dangerous and sometimes deadly results. The theft or exploitation of a logo can allow a foreign country or entity to mask one product as another. Trademark infringement is sometimes for profit in knockoffs or counterfeit designer goods. However, there have also been times, such as in the case of counterfeit pharmaceuticals, when the infringement has either unintentionally or intentionally been designed to do outright harm. Counterfeit pharmaceuticals have been marketed that contain nothing but benign materials and none of the prescribed medicine, as well as ones that contain harmful and even lethal ingredients.

The theft of economic secrets has been used in times of war to glut markets with counterfeit currency, in times of peace to devalue another country's currency in its rate of exchange or to improve the trade position of the opposing nation, and in both war and peace times to influence political and social unrest in the target nation. The lure of economic benefit to the individuals employed or targeted for information by a foreign entity destabilizes national security by compromising the positions of individuals who are supposed to be trusted to protect and hold in confidence the information to which they have access.

Economic espionage is not only a tactic between enemy nations. Nor is it always instigated by the nation that comes into possession of the clandestinely acquired trade secrets. Trade secrets have value, and therefore there is always someone who is willing to sell, if the price is right. Allied nations and organizations that have friendly relations with the target of the economic espionage can also seek this information. In the realm of economic espionage, everything becomes fair game, as even the closest of allies vie for the upper hand in a wide range of trade and policy negotiations.

The economy of a nation is directly linked to its political capital, both domestically and internationally. The more a nation is the target of economic espionage, the weaker that nation becomes in the eyes of its enemies and allies. The target nation's economic infrastructure becomes suspect, as does its ability to protect its citizenry and any information or secrets that have been entrusted to it by a foreign nation or entity. Nations may highlight successful economic espionage attacks against an enemy as a sign of that nation's weakness and their comparable strength.

Although intelligence communities in the United States and elsewhere seek to counteract economic espionage and tie this clandestine activity to particular places, countries of origin, requesting country, changes in technology, and the expanding availability of information through both legitimate and illegitimate channels, economic espionage continues to be one of the most pervasive and complex types of white-collar crime.

Edelhertz, Herbert

Herbert Edelhertz (1922–99) was a criminologist, lawyer, and scientist, best known for his significant contribution to the definition, conceptualization, and scholarship of white-collar crime. Edelhertz authored and co-authored numerous articles, books, and reports about organized crime business activities, corporate fraud, and the prosecution of white-collar crimes. He is most cited in contemporary literature for his definition of white-collar crime, which emerged in his 1970 *National Institute of Law Enforcement and Criminal Justice* publication titled "The Nature, Impact and Prosecution of White-Collar Crime," wherein he describes it as "an illegal act or series of illegal acts committed by nonphysical means and by concealment or guile, to obtain money or property, or to obtain business advantage."

When Edelhertz emerged as a significant contributor in the literature on white-collar crime, the number of scholars who had focused their attention on the subject had been relatively modest since the work of Edwin Sutherland—a sociologist who had published considerably on the subject about 30 years earlier. Although he expressed respect for Sutherland's pioneering advancements, Edelhertz attributed the hiatus in white-collar crime research to a disjunction between the goals of sociological researchers and criminal justice practitioners based on Sutherland's perspective, which focused (improperly, according to its critics) on the actor versus the act. Edelhertz (among others) found Sutherland's definition of white-collar crime ("a crime committed by a person of respectability and high social status in the course of his occupation") to be too limiting—particularly since it failed to consider that all persons at all levels of the social structure are capable of committing occupational crimes.

Additionally, he suggested that the definition should focus more on characteristics of the act, rather than the actor—a more effective approach in terms of law and policy. Edelhertz also argued that Sutherland's definition excluded a considerable number of white-collar offenses that have nothing to do with corporations or one's occupation. Thus, in sharp contrast to Sutherland, Edelhertz took an act-focused approach to the definition of white-collar crime and expanded the conceptualization of white-collar crime to encompass such acts as the filing of personal false income tax returns, fraudulent claims for social security and/or disability benefits, and planned bankruptcies or consumer fraud. Edelhertz was also criticized for the vagueness and breadth of his definition—primarily in relation to his use of the term *nonphysical* and sweeping incorporation of crimes that are nonoccupational.

Aside from his focus on definitional issues, Edelhertz contributed to the white-collar crime literature in his work on investigative strategies for federal, state, and local law enforcement agencies—work that centered on bridging the gap between researcher and practitioner to achieve more successful detection, enforcement, and prosecution of white-collar crimes. In his essay in the *American Behavioral Scientist* titled "White-Collar and Professional Crime: The Challenge for the 1980s," Edelhertz suggests that society is becoming more vulnerable to white-collar crime because of developments in technology, exposure to new opportunities, and social and economic trends. According to Edelhertz, the primary issue is the difficulty in distinguishing unlawful activity when many white-collar offenses occur during the course of what "appear to be thoroughly legitimate contexts."

He further notes the inconsistencies with respect to the handling of individual cases—particularly in terms of agency definition, enforcement, and conflicting legal remedies. He also comments on the lack of available data with regard to the nature and prevalence of white-collar crime, and the reluctance of law and accounting professionals to contain and report white-collar crimes. Consequently, he asserts, white-collar crime will continue to flourish, as long as the means to successful identification and prosecution are impeded. Edelhertz argues that, "such reconsideration may be encouraged by successful criminal prosecutions and massive civil judgments against major public accounting firms." According to Edelhertz, the proper focus of the criminal justice system should be equity in sentencing, which is dependent upon the elimination of disparities between the charging and prosecution of white-collar offenses and crimes of the poor and disadvantaged.

While employed as an attorney with the U.S. Department of Justice, Edelhertz worked for the Criminal Division as chief of the fraud section, where he managed nationwide prosecutions of a wide range of white-collar criminal activities. Beyond his accomplishments in the investigation, apprehension, and prosecution of white-collar offenders, Edelhertz established the Batelle Law and Justice Center in Seattle, Washington (where he served as staff scientist), created the National District Attorneys Association Economic Crime Project, and served as director of the National Center on White-Collar Crime, sponsored by the Law Enforcement Assistance Administration.

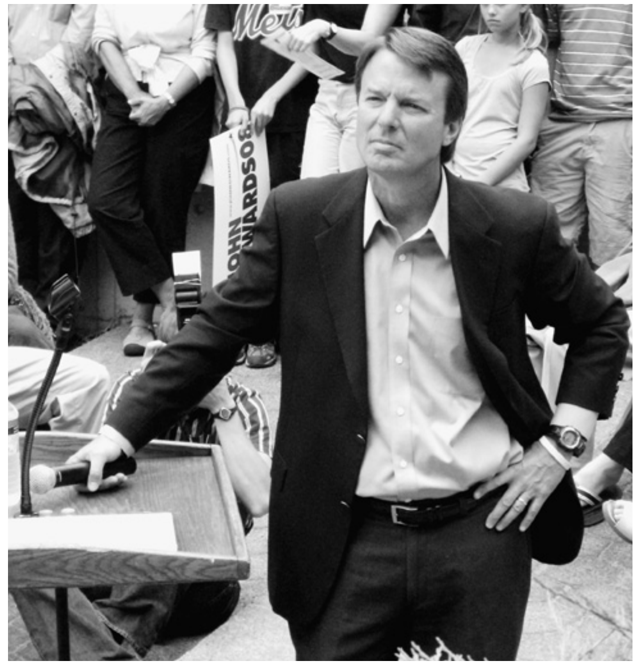
Edwards, John

John Edwards is a former Democratic Senator from South Carolina, the 2004 Democratic vice presidential nominee, and a two-time candidate for the Democratic presidential nomination. During his campaigns, he focused on populist themes, emphasizing his humble upbringing and family values. In 2008, Edwards became embroiled in an infidelity scandal; he later admitted to fathering a child with a campaign staffer, and in 2011, he was indicted for illegally using campaign funds to cover up the affair. Edwards was born on June 10, 1953, in Seneca, South Carolina. In 1974, he graduated from North Carolina State University, and in 1977, he earned a law degree from the University of North Carolina at Chapel Hill. While in law school, he met his wife, Elizabeth Anania; they were married in 1977 and later had four children. He began his political career in 1998, when he was elected to the U.S. Senate from South Carolina. In 2004, Edwards sought the Democratic nomination for president to challenge Republican incumbent George W. Bush. Although he failed to secure the nomination, the eventual nominee, Massachusetts Senator John Kerry, selected Edwards as his running mate. In the election, the Kerry-Edwards ticket lost to Bush and Vice President Dick Cheney by a margin of 51 to 48 percent. The day after the election, Edwards revealed that his wife had been diagnosed with breast cancer. Edwards returned to his private life; he had declined to run for a second term in the Senate during the 2004 election.

In December 2006, Edwards reentered national politics, announcing his intention to seek the 2008 Democratic presidential nomination. In October 2007, in the midst of the primary campaign, the *National Enquirer*, a tabloid newspaper, alleged that Edwards had engaged in an extramarital affair with an unnamed campaign staffer. In December, the *Enquirer* published a photo of the woman, campaign videographer Rielle Hunter, showing her pregnant; the paper alleged that Edwards was the father of the child. Edwards vehemently denied the affair, and the story gained little media traction. Edwards eventually dropped out of the race in January 2008, after finishing third in several primaries, behind New York Senator Hillary Clinton and Illinois Senator Barack Obama. On May 14, Edwards publicly endorsed Obama.



John Edwards, Democratic presidential primary candidate, at a campaign stop in Hanover, New Hampshire, August 23, 2007. Edwards was indicted for using campaign funds to stifle the scandal arising from his affair with a campaign staffer.

Campaign Fund Scandal

In July 2008, the *National Enquirer* published additional allegations regarding the relationship between Hunter and Edwards, reporting that Edwards had secretly visited Hunter and her daughter, Frances Quinn. In August, Edwards admitted that he had engaged in an affair with Hunter but denied fathering her child. An aide to Edwards, Andrew Young, claimed that he was the father of Hunter's child. The scandal acquired a legal dimension in August 2009, when a federal court in Raleigh, North Carolina, began investigating reports that Edwards's chief fund-raiser had illegally funneled campaign money to support Hunter and hide her affair with Edwards. On August 6, Hunter testified before a federal grand jury; she stated that she and her filmmaking company were paid over $100,000 from Edwards's political action committee (PAC) for her work on the campaign. A few months later, in December 2009, Young published a memoir revealing that he was not the father of Hunter's child and that he had lied in order to help Edwards avert a scandal and preserve his political career. In January 2010, Edwards admitted that he was the father of Hunter's daughter.

In June 2011, Edwards was indicted on six federal charges stemming from the attempted cover-up of his affair with Hunter. The charges filed in *U.S. v. John Reid Edwards* were the result of a two-year investigation revealing that Edwards had used nearly $1 million from two wealthy donors, including heiress Rachel "Bunny" Mellon, to pay for the travel, living expenses, and hospital bills of Hunter. Prosecutors alleged that Edwards had violated two aspects of the Federal Election Campaign Act of 1971. First, the law forbids any individual from contributing more than $2,300 to a single candidate during a primary campaign; second, the act requires the campaign to disclose the names of all individuals who donate more than $200 to the candidate. According to the indictment, Edwards had not only accepted contributions from Mellon totaling $725,000, but had also had filed "false and misleading reports" with the Federal Election Commission designed to hide the contributions. The charges carried a maximum penalty of 30 years in prison and $1.5 million in fines. Edwards maintained his innocence, arguing that the funds were personal gifts and thus were not subject to federal election law. Before the trial began, the two sides attempted to fashion a plea bargain that would involve fines but allow Edwards to retain his law license and avoid jail time. These negotiations failed, and the trial began on April 23, 2012. In June 2012, the jury acquitted Edwards on one count of the indictment but failed to reach a verdict on the other five counts; the judge declared a mistrial. The U.S. Department of Justice declined to retry the case. Although Edwards escaped criminal penalties, the affair and trial tarnished his image and ended his political career. The scandal also damaged his marriage to Elizabeth Edwards; the couple separated in December 2009, and she died from breast cancer in December 2010.

Eisenhower, Dwight D.

Dwight David Eisenhower was the 34th president of the United States, serving from 1953 to 1961. The former Allied commander during World War II and only general elected president in the 20th century, Eisenhower served two full terms as president. He was the first president prohibited from seeking re-election through term limits. Eisenhower's political success was based largely on his personality and the goodwill surrounding his Allied command efforts. He was not a traditional politician, ensconced in the world of partisan politics and party machinations. Eisenhower's presidency coincided with a period of unprecedented economic growth during the postwar expansion of the 1950s.

Critics at the time viewed the Eisenhower administrations as highly pro-business, an assessment that has held up under historical analysis. Eisenhower ran business-friendly administrations from the start and peopled his cabinet with business leaders. His policies, including tax concessions to big business, favored the interests of capital, reflecting Eisenhower's view that what was good for business was good for the country as a whole. Eisenhower's defense secretary, Charles Wilson, declared: "What's good for General Motors is good for America." Among the first acts of the Eisenhower administration was the giving away of federal offshore oil reserves. This move allowed private industry to exploit one of the public's most valuable resources. Eisenhower also tried to dismantle the Tennessee Valley Authority (TVA), favoring private utility companies and their profits at the expense of the public and its energy needs.

Notably, at least three business leaders named to Cabinet-level posts—Charles E. Wilson, George M. Humphrey, and Harold E. Talbott—were subjects of questioning by the Senate regarding their investments and possible conflicts of interest between their official and business activities. Talbott, secretary of the Air Force, eventually resigned over the charges. When questioned on the influence of big business on his administration, Eisenhower asked whether government should be run by "some failures" or by "successful businessmen." Despite his claims to economic prosperity, unemployment climbed through his second term, as did public debt. The first Eisenhower administration put in place an extension of insurance coverage under Social Security as well as an increase to the minimum wage. Eisenhower once criticized union busters, exclaiming that "only a fool would try to deprive working men and women of the right to join the union of their choice." At the same time, his first secretary of labor, Martin P. Durkin, resigned his position within a year because despite public utterances, the president failed to uphold his promise to press for revision of the Taft-Hartley Act, which severely restricts the union shop.

Politically, Eisenhower failed to oppose the machinations of Senator Joseph McCarthy, whose anticommunist witch-hunts were responsible for ruining numerous lives and careers, including causing the suicides of targeted individuals. During the campaign of 1952, Eisenhower cut from a campaign speech a defense of U.S. Army General George C. Marshall, his mentor, whom McCarthy had identified as a traitor. Political advisors convinced Eisenhower that he needed McCarthy's support in order to win the election. Eisenhower even went so far as to endorse McCarthy in his campaign for re-election. McCarthyism grew under Eisenhower, with a lasting impact on American social and cultural life. More recent research points to Eisenhower's role in maneuvers to oppose what he saw as communist influences within national liberation struggles. The Senate Select Committee on Intelligence, which reported on activities of the Central Intelligence Agency (CIA) over a 13-year period, concluded in 1975 that there was strong evidence that CIA officials planned the assassination of Patrice Lumumba, progressive leader of the newly independent Congo. The committee suggested that Eisenhower had given the orders for Lumumba's death. The committee report was published despite the opposition of President Gerald Ford and CIA Director William Colby.

Farewell Address

In terms of corporate and white-collar crime, Eisenhower is most often referenced for his 1961 presidential address, his farewell. This address represents a significant statement on the confluence of big business, particularly military contractors and defense firms, the Pentagon, and government. Eisenhower, who had long opposed growing defense budgets, notes not only the drain on public resources involved in military spending but also the expansion of undemocratic decision making within informal corporate-lobbyist-government networks. "In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex." Eisenhower drew the connection between military budgets, their expansion, and the inability of governments to meet other, more pressing, social needs. "Every gun that is made, every warship launched, every rocket fired signifies, in the final sense, a theft from those who hunger and are not fed, those who are cold and are not clothed." In the present context of military expansion and U.S. involvement in war and occupation, commentators note that Eisenhower's fears have, in fact, been realized.

Eli Lilly and Company

The manufacturer of the popular antipsychotic drug Zyprexa and the osteoporosis drug Evista, Eli Lilly and Company was charged in 2011 with illegally marketing both drugs. The company pleaded guilty to two criminal misdemeanors and was required to pay $2.7 billion, plus additional fines. Those fines accounted for the largest criminal fine ever levied against an American drug company. Eli Lilly also spent $1.2 billion to settle more than 32,000 injury claims and $62 million to settle charges of illegal marketing in 33 states. Eli Lilly spent $36 million to settle claims involving Evista, which Eli Lilly had marketed as reducing the risks of developing breast cancer and cardiovascular disease. Parties in lawsuits against Eli Lilly included individuals, insurance companies, pension funds, unions, and the Church of Scientology. In recent years, most of the attention on Eli Lilly has focused on Zyprexa. Eli Lilly has been accused of placing pressure on physicians and nursing homes to prescribe the medication, even when it was unwarranted. Between 1996 and 2008, the sale of Zyprexa grossed more than $39 billion for Eli Lilly. By 2010, Zyprexa was generating $23 billion annually.

Lobbying Activities and Scandals

Eli Lilly has maintained close ties to Republican presidents George H. W. Bush and George W. Bush. When the latter pushed through the Homeland Security Act in 2002, following the terrorist attacks of September 11, 2001, a special provision protecting drug companies was hidden in the bill. Amid public outcry, the provision was removed by Congress in 2003. Eli Lilly spent $3.4 million to lobby against the Barack Obama–sponsored government health plan in the first three months of 2011. Olanzapine, which is marketed as Zyprexa, was approved by the Food and Drug Administration (FDA) in 1996 for patients diagnosed with schizophrenia and bipolar disorder. However, Eli Lilly began marketing the drug for use in patients suffering from conditions such as sleep disorders, disorderly behavior, aggressiveness, and dementia. Patients ranged from young children to the elderly. Eli Lilly particularly targeted nursing homes, pushing the notion of "5 at 5," which advocated giving five milligrams of Zyprexa to patients at 5 P.M. each day to keep them under control.

Eli Lilly has had a long history of scandals. In 1982, itwas forced to pull Oraflex, an anti-inflammatory drug, after only three months because it was responsible for the deaths of more than 100 people. On September 14, 1989, Joseph Wesbecker, a mentally ill patient who was on Prozac, opened fire with an AK-47 in Louisville, Kentucky, killing eight and wounding 12 before killing himself. British journalist John Cornwell vilified Eli Lilly in his account of the Wesbecker incident, accusing the company of corrupting the judicial system. In 2002, *60 Minutes* accused Eli Lilly of illegally marketing its drug Prozac Weekly after its patent on Prozac had expired. In 2003, Medicaid and the National Alliance for the Mentally Ill charged Eli Lilly with charging twice the price of similar antipsychotic drugs, and some states threatened to ban Zyprexa for use with Medicaid patients. In December 2006, the *New York Times* was approached by a whistleblower, an Alaskan attorney who provided evidence that Eli Lilly was covering up evidence that the weight gain associated with Zyprexa was linked to the onset of diabetes and other metabolic disorders. *Rolling Stone* reported that patients on Zyprexa gained an average of 24 to 66 pounds a year. Both the United Kingdom and Japan began requiring warning labels on Zyprexa, alerting users to possible risks of diabetes, hyperglycemia, and death when taking the drug. Lily was also accused of recruiting homeless alcoholics when testing Cymbalta, an antidepressant.

In the fall of 2011, Eli Lilly was forced to remove Xignis from the market after it failed to meet its claims of combating sepsis. In the spring of that same year, Eric Bloomberg, the deputy chief of the FDA, announced that scholarly articles on Zyprexa purportedly written by respected physicians had actually been ghostwritten by Eli Lilly personnel. At least seven studies conducted by private researchers have indicated that Zyprexa is not effective for fighting dementia. Researchers also found that Zyprexa increased the rate of heart attacks in elderly patients and made them more vulnerable to infections such as pneumonia. According to a study funded by the U.S. Agency for Health Care Research and Quality and citied in an article published in the *Journal of the American Medical Association* in 2009, evidence has shown that patients taking antipsychotic drugs have died of sudden cardiac arrest at twice the rate of individuals not taking such drugs.

Embezzlement

No organization is immune to embezzlement, which affects not only organizations but also people, communities, and countries. With advances in technology, embezzlers have found new and innovative ways to commit their crime, leading organizations to constantly examine their organizational policies and internal controls. The changing modus operandi of embezzlers and their motivations must now be re-examined by researchers, simultaneously with changing organizational dynamics. The strategy of the organization to combat the crime of embezzlement also may vary. Despite the changing environment in which embezzlement takes place, the extent of the problem is of great concern. The crime of embezzlement has been on the rise in many continents of the world, but with the changing dynamics, how should criminal justice system professionals and employers treat the crime of embezzlement?

Embezzlement refers to the act whereby an employee is authorized constructive possession of his or her employer's chattel, money, or valuable security and, in a position of trust, steals the property entrusted to him before it reaches the possession of the employer and converts it to his or her use or the use of another person who is not the owner. Academics and researchers have over the years, proposed a multiplicity of definitions to not only reflect new organizational policies but also incorporate the variety of ways that embezzlers have carried out their acts.

Some authors have contended that employees are placed in positions of trust and act on behalf of their employer in the conduct of the organization's business, but this position of trust can be debated, because many employers today have implemented a variety of checks and balances to prevent acts of embezzlement and other instances of occupational fraud. This position of financial trust is now only a position of financial responsibility because that trust no longer exists, and this epitomizes the changing dynamics of contemporary organizations.

Art of Embezzlement

An embezzler can be a very creative thief and is often a strategist. The theif may carry out his or her act on the spur of the moment, plan and execute in a short space of time, or make plans spanning a long period of time before executing it. The embezzler may steal small sums of money or a large sum that can cripple the organization and/or the economy in which he or she operates.

Embezzlement can occur in a variety of ways and is sometimes never discovered or discovered long after it has occurred. Some embezzlers are capable of successfully hiding their wrongdoing, often because of a low level of internal controls or the complicity or complexity of the act. Often, an act of embezzlement is only discovered when an audit is conducted, or through a whistleblower. Embezzlers may be sophisticated or simple, contemporary or traditional, in embezzling from the organization in which they are employed. The act of embezzlement may involve a single employee, or a group of employees. An embezzler can also outsource the assistance of persons who are not even employees of the organization.

Those who carry out acts of embezzlement are not defined by a particular race, color, religion, social standing, or financial position. Why should an employer have to guard against thieves on the inside, those who are already compensated for their work? To ensure that organizations maintain their viability, it is necessary for them to guard against internal and external thieves, although that may result in significant financial investment. The good or service the organization provides, whether it is a profit-making or nonprofit organization, the size of the organization, the country or countries in which the organization operates, and a host of other factors determine how a company can guard against embezzlement.

Changing Dynamics of Organizations

The contributions of an organization's human resources are required to achieve organizational goals. To provide goods and services, organizations must have not only the required human resources but also the requisite financial and physical resources. Employers must be cognizant of these facts when hiring employees because they can help or hinder an organization's progress and competitiveness in the marketplace. In addition to the technological and industrial revolutions that have taken place, globalization has also affected organizations in many positive and negative ways.

Organizations around the world, including companies, nongovernmental organizations, and faith-based organizations, adopt policies, set guidelines, and institute a variety of internal control mechanisms. However, they are still susceptible to embezzlement.

Small and medium-sized organizations can be more vulnerable to embezzlement because of their organizational culture or their inability to implement internal controls, which may be too costly for the company. However, acts of embezzlement are not limited to private organizations, nonprofit organizations, and faith-based organizations. Parliamentarians and other public officials often commit acts of embezzlement. Some of the most successful, profitable, and secure organizations in the world, as well as countries with good and successful governance models, have been victims of embezzlement.

What Drives the Embezzler?

An employee, who initially may not be motivated to embezzle from his or her employer, may do so once the opportunity presents itself and there is a great likelihood that he or she can successfully carry out the act and go undetected. On the other hand, others may carry out the act without any prior motivation, as it can be a spur-of-the-moment decision, not even considering the consequences or the possibility of the act's detection. Not all employees engage in embezzlement because of a need: some employees nurture a bad habit or an addiction, such as gambling; many simply seize an existing opportunity; whereas some simply are greedy and others are coerced or encouraged.

Although many have identified specific circumstances that motivate an embezzler to carry out his or her act, red flags are seemingly nonexistent in some acts of embezzlement. While some red flags can provide a warning for organizations, which would be helpful, they cannot completely prevent acts of embezzlement. However, the identification of red flags can assist the organization in determining what policy or strategy it will implement to combat a possible act of embezzlement.

Extent and Consequences of the Problem

Acts of embezzlement have occurred at Fry's Electronics Inc. and Koss Corporation. Other cases include the Dixon, Illinois, case with Rita Crundwell; the Washington, D.C., case with Hariette Walters; Korea Daewoo's Kim Woo-Choong; Saudi Arabia's Algosaibi conglomerate Money Exchange's Maan al-Sanea; and India's Hisar Forest Department. Acts of embezzlement at nonprofit organizations include those committed at ACORN and the Points of Light Institute.

Embezzlement can have negative consequences for the organization, which can become financially unstable or bankrupt as a result of the crime. Employees can be affected because their services may be terminated as a result of a major financial loss, and their level of supervision may increase physically or through technology, leaving them with feelings of alienation and a sense of not being trusted. The community in which the organization operates may no longer be able to obtain financial donations for community events or assistance in improving the community. The wider society can also feel the effect of an act of embezzlement because the cost is passed on to unsuspecting consumers through higher prices for goods or services. An act of embezzlement can also threaten the financial stability of the economy. Acts of embezzlement cost businesses large sums of money and can damage social relationships. A government may be unable to deliver or have difficulty in delivering, the basic infrastructure to its citizens.

A street crimes are usually considered more dangerous because they often involve high levels of interpersonal violence, it is difficult to quantify the debilitating consequences of embezzlement, which seldom involves violence. Embezzlement can have devastating consequences on employees, families, businesses, communities, and countries, and it is particularly distressing for the employer.

Dealing With Embezzlement

Although some acts of embezzlement are not detected, known cases provide an opportunity for the affected organization to reinforce its internal controls and develop other policies and guidelines that would make it much more difficult or impossible for an act of embezzlement to be carried out. Therefore, policy makers are critical in treating such crimes, which are different from street crimes.

Some of the primary issues in dealing with embezzlement are the reluctance of an employer to report it, the view that such publicity could tarnish the image of the organization, the desire to only obtain restitution, the view that embezzlement is not "real crime," the degree of trust placed in employees, the lack of appropriate internal controls and accountability, and the nonviolent nature of the act. Embezzlers, employees, and the wider society do not view embezzlement as real crime, which is primarily because embezzlement does not usually involve physical violence or harm to human beings, such as an act of robbery, a rape, or an assault. The key is to reduce or remove opportunities for a motivated employee to consider carrying out such an act. Many organizations resort to situational crime prevention strategies. The employer must therefore implement controls or policies that will counter the various employee motivations that make embezzlement in organizations not only difficult to treat but also dynamic. However, as advances in technology are made and organizations are becoming more global in scope, they must continuously examine and assess the effectiveness of their internal controls if they are to keep ahead of embezzlers' innovation.

Guarding against thieves on the inside requires significant investment in an organization's internal control system, which must be regularly checked and upgraded. Organizations must be flexible and innovative if they are to deal effectively with embezzlement at the workplace. While employers balance strategic decisions, such as strengthening the organization's internal controls, they must also promote a working environment that is comfortable and trusting, and that will not result in organizational inefficiency that could hinder the success and viability of the organization.

Employee Crimes

Employee crimes are a reality of the business world today, inflicting serious consequences on organizations, stakeholders, and society overall. These crimes, conducted by employees, refer to deliberate acts that violate moral and legal standards. Today's business media are filled with examples of unethical and illegal behavior, including financial fraud, employee theft, insider trading, bribery of government officials, corruption, and customer deception. Awareness and prevention of employee crimes is critical because these acts can result in serious financial and legal consequences for perpetrators. Public awareness of employee crimes can also significantly damage a company's reputation and result in declining levels of trust, lower customer sales, employee layoffs, and possibly even the closing of a company.

For example, in 2005, Groves Funding Corporation, a mortgage brokerage firm based in Cincinnati, Ohio, had to close its doors as a result of a $7 million mortgage fraud that the firm's chief executive officer and employees orchestrated. Additionally, many businesses that supported this fraud folded, and hundreds of people lost their jobs as a result of this massive banking fraud scheme. The case of Groves Funding Corporation is just one of many.

Academic scholars across the fields of accounting, management, psychology, and business ethics continue to be intrigued by what drives employees to engage in such illegal and immoral behavior. For more than 30 years, scholars have examined individual- and organizational-level factors that impact employees' participation in criminal activity in the workplace. Existing research suggests that causes of employee crimes range from individuals' lack of moral awareness and judgment to unethical leadership and poor organizational infrastructure. Recently, Abhijeet Vadera and Michael Pratt proposed a typology of workplace crimes based on the motivations of employees. Their framework creates three major categories of employee crimes: pro-organizational, antiorganizational, and nonaligned-organizational. Each of these three types of employee crimes is accompanied by distinct perpetrator intentions with regard to beneficiaries and victims of the crimes. Despite differences in intentions, pro-organizational, anti-organizational, and nonaligned-organizational crimes each go against societal and legal norms and can be very damaging to an organization and its members. The cases of Weston Smith, Diann Cattani, and Garrett Bauer illustrate the distinct natures of these three employee crime types.

Pro-Organizational Employee Crimes

Traditional views of employee crimes tend to emphasize the self-interest of employees, assuming that acts of lying, cheating, and stealing are conducted with the primary intention of benefiting the perpetrator. Self-interest often drives behavior; however, employee crimes can also be committed with the intention to benefit others, including one's organization and its members. Pro-organizational acts include illegal activities such as accounting fraud as well as unethical behavior such as exaggerating the benefits of a company's products to customers. Employees may participate in these acts to advance their company's reputation and financial goals. From the employee's perspective, overstating revenues might strengthen a company's position among shareholders, and customer deceit might increase product sales. Although the primary intent is to benefit the organization and its members, employees can also simultaneously personally benefit from these illegal and immoral acts.

For example, a company's chief financial officer could misrepresent earnings in financial statements to strengthen the company's position among shareholders, while benefiting personally from increased share prices. In contrast with other types of employee crimes, pro-organizational crimes are not committed with an intended victim in mind. Employees are motivated to commit these crimes out of a desire to advance their organization, not necessarily to harm any person or organization in particular. Although organizations may benefit in the short term from

Whistleblower Adrienne Kinne at an antiwar protest in New York City, April 9, 2011. As a National Security Agency (NSA) linguist and intercept operator, Kinne shared in 2008 how the NSA ordered the transcription of hundreds of personal (and intimate) calls from American service members and aid workers.

pro-organizational crimes, and there may not be an intention to victimize anyone, these crimes can lead to long-term consequences for organizations and may significantly harm others. For example, an employee who deceives customers to help the company meet its monthly sales goal will also put the company at risk of damaging customer relationships, losing sales, and possibly engaging in legal disputes.

Pro-Organizational Crime: HealthSouth

The case of HealthSouth, a former leading health care provider based in Birmingham, Alabama, illustrates the motivations behind and consequences of pro-organizational crimes. In 2003, Weston Smith, former chief financial officer (CFO) of HealthSouth, found himself in the middle of one of the largest reported health care financial scandals in U.S. corporate history. Under the direction of Smith and other corporate financial officers, HealthSouth initially used aggressive accounting methods to boost its financial statements. In response to rising pressure to meet Wall Street earnings expectations, Smith's boss and chief executive officer (CEO) of HealthSouth, Richard Scrushy, insisted that the company meet earnings expectations and asked Smith to "cook the books." As a result, Smith and his chief accountant falsely created journal entries in order to boost the financial statements, ultimately leading to the false creation of $3.8 billion. There was an entire accounting department devoted to managing the accounting fraud and disguising it from external auditors.

The department was charged with carrying out decisions made by the corporate leaders regarding what financial manipulations needed to occur each quarter. Although Smith felt very uneasy regarding the crime he committed, he strongly believed that he was doing what was right for the company. Smith rationalized his behavior by believing that he was preserving jobs, creating new jobs, and increasing the overall company's stock price. The employees believed that they were doing what was right to protect the company. This is often a common rationalization with pro-organizational employee crimes. When employees frame business ethical decisions, they may use a different cognitive framework than they use for personal ethical decisions. Concerns of personal gain and future benefits can dominate business ethical decisions, whereas concerns of fairness and harm tend to motivate personal ethical decisions. Ultimately, Smith blew the whistle to the Federal Bureau of Investigation (FBI) and served 14 months in a federal prison camp for his role in the accounting fraud.

Prevention of pro-organizational crimes can be effective with the appropriate tone from the top and from middle managers. Additionally, corporate management must properly train employees on how to handle internal crimes and be sure to reward the type of conduct that they want employees to exemplify. Management teams also need to be conscious of programs designed to incentivize employees to meet organizational goals. For example, if an organization sets overly aggressive goals and is solely focused on meeting analysts' expectations at any cost, internal fraudulent behavior may emerge. Pro-organizational crimes may also be reduced as as result of the 2010 passage of the Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act), which incentivizes corporate whistleblowers to come forward with perceived malfeasance. As more employees begin to feel protected by the Dodd-Frank Act, this could encourage more internal whistleblowing, thereby minimizing employee crimes.

Anti-Organizational Employee Crimes

In contrast to employee crimes that are committed on behalf of one's organization, actions can also be taken to deliberately harm an organization and its members. Employees may participate in acts of retaliation against their co-workers, managers, or company as a result of perceived injustice in the workplace. For example, perceptions of unfair compensation or favoritism in the workplace may trigger feelings of employee disgruntlement. Antiorganizational behaviors are driven by the desire to harm others and are intended to result in personal material (e.g., financial) or psychological (e.g., personal satisfaction) gain. Antiorganizational acts include both workplace deviance and unethical behavior that is illegal or immoral in nature. Deviant workplace behaviors range from seemingly minor acts, such as employee gossip or taking excessive breaks, to more serious offenses such as verbally abusing customers and sabotaging company equipment. Similarly, antiorganizational crimes also include more traditional unethical behaviors of stealing (e.g., filing false expense statements). These actions taken by employees can result in significant financial losses for companies. According to the 2012 "Report to the Nation on Occupational Fraud and Abuse" by the Association of Certified Fraud Examiners, the typical organization loses approximately 5 percent of its revenue to fraud each year.

The case of Diann Cattani, former human resources consultant for a privately held company based in Atlanta, Georgia, is an example of antiorganizational crime that resulted in significant consequences for the employee perpetrator and the company that was victimized. Cattani was initially hired to manage a large-scale project that entrusted her with significant responsibility and included setting up the business infrastructure of the company. Similar to many small businesses where duties are not segregated, she was directly involved with a number of important company processes, including determining who got paid, signing checks, reconciling bank statements, and calculating bonuses. Cattani did not originally set out to manipulate internal controls, operating procedures, or relationships with the intention to steal from the company, but with opportunity, she learned how. Her deception started innocuously.

Cattani's entry into company theft began when she noticed that a travel agency had made an error in charging a personal trip to her corporate American Express account. Things were hectic before leaving for the trip, and she did not get around to calling the travel agent to re-issue the tickets, but she planned to reimburse the company when she returned. However, months passed, and she had not reimbursed the company. As more time went by, Cattani's workload continued to increase, while her yearly bonuses were decreasing. She began to feel resentful toward her employers, and as her anger toward the organization grew, the error in the travel agency charge led her to rationalize stealing for personal reasons. For example, she felt that hiring babysitters because she needed to work should be considered a business expense. She also rationalized some gas and meals as additional business expenses.

When her company purchased office equipment, she took some for herself, justifying it as supplies for when she worked from home. The opportunities to steal were numerous, and she seized them in countless ways. She reimbursed herself from physical receipts, and when the credit card statement came in, she reimbursed herself again for the same items. She created "dummy" invoices and paid herself. Additionally, she paid personal credit card accounts with company checks and initiated other forms of deceit and criminal subterfuge. Cattani was able to get away with these crimes because her employers allowed her to control all accounts and decide what information to share. Over the course of a few years, she stole approximately $500,000. As the guilt of her fraud began to impact her health, she confessed to the company's owners and served 18 months in a Florida federal prison for her crimes.

Prevention of antiorganizational crimes can be difficult, especially in circumstances in which segregation of duties is difficult because of a company's size. However, routine training, mandatory vacation days, job rotations, and establishing effective internal reporting channels can help deter antiorganizational crimes. Also, informing employees about whistleblower protection provision offered under such federal statutes as the Sarbanes-Oxley Act and the Dodd-Frank Act can be beneficial in preventing antiorganizational crimes.

Nonaligned-Organizational Employee Crimes

Employee crimes do not need to be conducted with the intention to help or harm one's organization; rather, employees also engage in criminal activity with the primary motive of personal gain. Organizational corruption, defined as fraudulent behavior conducted by those in power, is considered such an employee crime. These crimes are more likely to be committed by employees at higher levels of the organization, such as managers and executives, who are more likely to have access to private company information and resources. Specific examples of organizational corruption include accepting bribes and insider trading. The acceptance of personal bribes is a serious issue across a number of industries, including government, sports, and global manufacturing. Bribes include material transactions in the form of gifts or cash as well as promises of job promotions or future contracts. Each of these exchanges of bribery is accompanied by the expectation that the employee who receives the bribe will make a decision in the briber's favor.

There are serious legal consequences for engagement in bribery. In 1977, the U.S. government passed the Foreign Corrupt Policies Act, which states that payments to foreign government officials for the purposes of obtaining or retaining business are illegal. Individuals engaging in insider trading, which involves illegal disclosure of nonpublic information, also seek personal financial gains at a high risk. In 2004, Martha Stewart, a celebrity businesswoman, was found guilty of insider trading and was sentenced to prison after ImClone's CEO, Samuel Waksal, shared nonpublic information about his company's anticipated financial performance. Nonaligned-organizational crimes can be devastating for organizations, their stakeholders, and employees who engage in such acts.

The case of Garrett Bauer, a former day trader based in New York City, demonstrates the ease with which employees can fall prey to insider trading. Bauer's involvement with insider trading began when he received anonymous tips on upcoming corporate mergers and acquisitions from an attorney who worked at some of the country's premier investment banks. The attorney would give the anonymous tips to a middleman, who then gave the tips to Bauer. Based on these illegal tips, Bauer would then exercise trades and give some of the proceeds to his fellow co-conspirators. Bauer and his co-conspirators used pay phones and several complex schemes to profit by millions of dollars for nearly two decades. During the first 10 years of their scheme, Bauer actually lost millions of dollars; he began to see profits only during the last five years of the scheme.

Although he knew his actions were illegal, he did not view his actions as harming anyone directly. The FBI arrested Bauer in late 2011, and in early 2012, Bauer began speaking to university students about his story and his regrets of engaging in insider trading. In June 2012, Bauer received a nine-year sentence for his involvement in a 17-year insider trading scheme that netted him over $33 million.

It is difficult to prevent nonaligned-organizational employee crime, but hearing from the experiences of convicted felons such as Garrett Bauer can be beneficial in helping individuals understand that these situations can happen to anyone who allows his or her internal moral compass to be compromised.

Future of Employee Crimes

Business executives, employees, and academic scholars all have a role in shaping the future of employee crimes. Organizational leaders must lead by example and create a corporate culture that encourages transparency, ethical business practices, and open communication. Additionally, training, financial controls, and employee incentive programs, if appropriately designed and implemented, can help deter employee crime. Employees across all levels of an organization can also help protect their organization by reporting suspicious behavior. Rather than protecting their colleagues, employees need to be conscious of the potentially severe consequences that others' actions can have on their organization, its customers, and society overall. Scholars can continue to explore the individual- and organization-level factors that influence employees' engagement in illegal and immoral activities, as well as the conditions under which employees feel compelled to cover up the illegal behavior of their colleagues.

Further, business school professors can challenge students, future business executives, to critically analyze issues of employee crimes. Students need to be aware that seemingly "minor" acts of lying can potentially ruin an individual's career. For example, Scott Thompson, former Yahoo! CEO, resigned on May 13, 2012, after falsely claiming that he received a computer science degree on his résumé. There is much work to be done in terms of detecting and deterring employee crimes; however, there is a great opportunity for business professionals and scholars to engage in building solutions.

Employee Safety

Every day, millions of Americans go to work with the expectation that they will return home unharmed; however, this is not always the case. Each year, approximately 6,000 employees in the United States die from workplace injuries, while another 50,000 die from illnesses caused by exposure to workplace hazards. In addition, 6 million workers suffer nonfatal workplace injuries at an annual cost to U.S. businesses of more than $125 billion. Effective job safety and health add value to the workplace and help reduce worker injuries and illnesses. In 2010, 4,690 workers were killed on the job. This breaks down to 3.6 per 100,000 full-time equivalent workers, more than 90 a week, or nearly 13 deaths every day. This is a slight increase from the 4,551 fatal work injuries in 2009 but the second-lowest annual total since the fatal injury census was first conducted in 1992. Many of these cases are caused by egregious and willful safety violations, yet it is rare for an employer to be held criminally liable, let alone be imprisoned, for violation of state and federal safety laws.

Occupational Safety and Health Act of 1970

With the Occupational Safety and Health (OSH) Act of 1970, Congress created the Occupational Safety and Health Administration (OSHA) to ensure safe and healthy working conditions by setting and enforcing standards and providing training, outreach, education, and assistance. The law has given employees a wide range of rights. Workers are entitled to working conditions that do not pose a risk of serious harm. To help ensure a safe and healthful workplace, OSHA provides workers with the right to receive information and training about hazards, methods to prevent harm, and the OSHA standards that apply to their workplace. The training must be in a language that workers can understand. Workers can access copies of results of tests done to find hazards in the workplace as well as review records of work-related injuries and illnesses. Workers are able to receive copies of their medical records. They are able to ask OSHA to inspect their workplace and may use their rights under the law to remain free from retaliation and discrimination.

The OSH Act provides for criminal sanctions in various situations. If an employer willfully violates a standard, rule, order, or regulation and the death of an employee results, the employer may be held criminally liable. If an employer makes a false representation regarding compliance with the OSH Act, this may also make it criminally liable. Employers may be subject to civil and criminal fines, and in rare instances imprisonment. A willful violation is a voluntary action that is done with either intentional disregard of or with plain indifference to the statutory requirements. Malicious intent is not required to impose liability.

OSHA is a small agency; with its state partners, OSHA currently has approximately 2,200 inspectors, responsible for the health and safety of more than 130 million workers, employed at more than 8 million workplaces across the country. This translates to about one compliance officer for every 59,000 workers. According to a report by the American Federation of Labor-Congress of Industrial Organization (AFL–CIO), it would take OSHA 129 years to inspect all workplaces under its jurisdiction. Inspections are the main tool used to make sure that companies comply with safety standards that are set for each industry. Because OSHA is so strapped for inspectors, it allows many of the states to take over this responsibility. Section 18 of the OSH Act encourages states to develop and operate job safety and health programs. OSHA approves and monitors state plans. Even so, OSHA regulations are violated on the federal and state level.

Examples of Unsafe Workplaces

Some historical cases of willful violations include particular occupations, products, and industries, like coal mining, asbestos, and textiles. One of the first major coal mine disasters of the television age occurred in 1968, when 78 men were killed in an explosion in a coal mine in Farmington, West Virginia. The ignition source that set off the original explosion could never be determined. However, investigators found a classic combination of factors, which included inadequate ventilation, inadequate control of explosive methane gas and coal dust, and inadequate testing for methane. All of these factors could have set the stage for the explosion.

The use of asbestos and its harmful effects have also created unsafe working environments. Many employees who have asbestosis, a type of lung cancer, have sued Johns Manville, a major manufacturer of asbestos. Court documents confirm that Johns Manville knew of the hazards associated with asbestos and intentionally kept the information from its employees. In fact, the asbestos industry had a long-standing policy of suppression. The industry did not warn workers of the dangers of asbestos exposure until 1964.

Textile workers in North and South Carolina have high rates of byssinosis, an irreversible respiratory disease caused by the ingestion of textile fibers like cotton dust. An estimated 35,000 workers are inflicted with this deadly disease. Working in a factory can be dangerous work. When one is not told of the dangers in the workplace or is fired for organizing protests, this is a violation of law and is unacceptable. Many in the textile industry spent decades denying the existence of byssinosis. Many times, the factories would hire company doctors who were told to tell employees that they were fine or simply had bronchitis. Many of the employees had no understanding that their illnesses were caused by the industry's criminal negligence in not creating a safe working environment.

There have been several cases where owners and managers have been held criminally liable under state law for willful violation of safety standards, but these convictions are atypical. Two instances of successful criminal prosecutions involve Film Recovery Systems Inc. and Imperial Food Products. On June 14, 1985, Steven O'Neil, Charles Kirschbaum, and Daniel Rodriguez, agents of Film Recovery Systems Inc., were convicted of murder in the death of Stefan Golab. Golab was made to work with cyanide with no safety equipment; even when he began to get sick, he was told to keep working. In 1990, the conviction was reversed and remanded for a new trial. On September 7, 1993, the three former employees entered guilty pleas of involuntary manslaughter. In September 1992, the owner of Imperial Food Products, Emmett Roe, age 65, pleaded guilty to involuntary manslaughter and was sentenced to 20 years in prison for his responsibility in the deaths of 25 of his workers when a fire occurred at his plant. The workers were killed because the fire doors were locked to prevent them from stealing chicken parts.

State and federal regulatory agencies like OSHA can only do so much, given the lack of budget and inspectors. It is the responsibility and legal duty of an employer and company to create and maintain a safe working environment for employees. Workers should not have to worry about injury or death on the job or risk their safety unnecessarily for a paycheck.

Endangered Species Act

The publication of Rachel Carson's *Silent Spring* in 1962 ushered in a new era of American environmental awareness, stewardship, and activism. Throughout the 1960s and early 1970s, human-made environmental disasters such as the Centralia, Pennsylvania, coal mine fire in 1962 and the Cuyahoga River fire in 1969 were juxtaposed with the creation of innovative environmental policies such as the Clean Water Act (1962), the National Environmental Policy Act (1969), and the Toxic Substance Control Act of (1972); powerful environmental interest groups like the Natural Resources Defense Council, formed in 1969; and federal agencies designed to safeguard the natural environment, such as the Environmental Protection Agency, created in 1970.

On December 28, 1973, the Endangered Species Act, which had undergone several transformations since the mid-1960s, was passed by Congress and signed into law by President Richard Nixon. The Endangered Species Act of 1973 (ESA) represented a significantly strengthened extension of several earlier legislative attempts to protect animals, plants, and their habitats from the destructive forces of human population growth and development.

The ESA ratified the treaty known as the Convention on International Trade in Endangered Species (CITES), which was designed to curtail international commerce in imperiled plants and animals. Seen holistically, the regulatory and enforcement mechanisms of the ESA represented a significant step toward combating the black market trade in rare and exotic species. Additionally, the ESA provided a mechanism for preserving plants, animals, and their habitats within the United States from careless, and sometimes unscrupulous, development. Since its enactment in 1973, the Endangered Species Act has undergone numerous revisions, with significant amendments in 1978 and 1979, 1982 and 1988, and the early 1990s.

The rapidly declining population of the American whooping crane in the 1930s spurred federal interest in endangered species. By the 1950s, with public interest in protecting endangered species growing, the federal government began to report annually on the status of the whooping crane population. Protection for imperiled species then progressed in piecemeal fashion throughout the 1960s. In 1962, the congressional Committee on Rare and Endangered Species was formed; it subsequently published a listing of 331 species in danger of extinction. A stipulation in the 1963 congressional Provision in Land and Water Conservation Fund Act earmarked funds to purchase crucial habitat for certain species. In 1966, the first incarnation of the ESA was created. The Endangered Species Preservation Act (ESPA) was primarily concerned with protecting habitats, not species. In 1969, the ESPA was significantly overhauled by Congress and renamed the Endangered Species Conservation Act (ESCA). The ESCA, among other things, expanded the scope of endangered species protection to species outside the United States, primarily by regulating the importation of imperiled species from other countries. By 1973, the ESCA was altered and expanded again into the Endangered Species Act. Further protections for indigenous species within the United States, as well as for species outside the United States (via CITES), were implemented.

Goal of the Endangered Species Act

The goal of the ESA is to protect animals (including vertebrates and invertebrates), plants, and habitats that have "esthetic, ecological, educational, historical, recreational, and scientific value to America and Americans." Oversight responsibility for the ESA resides with the secretary of the interior via the U.S. Fish and Wildlife Service, and also with the secretary of commerce. Species listed by the U.S. Fish and Wildlife Service as endangered or threatened have their statuses reviewed every five years. In addition, the ESA provides support to states in order to ensure adequate protective measures for plant and animal species and their habitats. Additionally, the ESA restricts or regulates the importation or exportation; taking; and unlawful possession, distribution, or sale of any listed species. Criminal and civil penalties for violating ESA prohibitions generally entail fines of between $25,000 and $50,000 per violation and potential imprisonment of between six months and a year.

Over 1,300 species currently listed as endangered or threatened receive protection under the ESA. Since the 1960s, only 13 species have been removed from the endangered/threatened list as a result of population recovery (including the bald eagle in 2007), leading some to criticize the efficacy and worth of the ESA. Proponents of the altruistic vision of the original ESA abhor the multiple amendments that have, in their view, reduced its usefulness. For example, the 1978 and 1979 amendments to the ESA created a special review committee that made it easier for federal agencies to undertake projects with potentially adverse impacts on endangered or threatened species (e.g., the Tellico Dam Project in Tennessee). Amendments in the 1990s also made the ESA more amenable to the development goals of state and private landholders. Despite criticism of the ESA's effectiveness over the last several decades, the landscape of the American natural environment would be quite different today had the ESA not been created.

Enron Corp.

The December 2001 bankruptcy of Enron Corp., an energy firm headquartered in Houston, was the first in a series of major corporate scandals that followed in 2002, including scandals at Adelphia Communications, Tyco International, and WorldCom. Enron became a synonym for corporate greed and accounting fraud, and it was the most studied of the scandals. The bankruptcy was the largest in U.S. history, succeeded by WorldCom. The key element of the Enron debacle was the sophistication of methods used by senior executives to defeat corporate governance safeguards. The Enron story became a television film (*The Crooked E: The Unshredded Truth About Enron* [2003], based on a book by Brian Cruver), a documentary movie (*Enron: The Smartest Guys in the Room* [2005], based on a book by McLean and Elkind) and a stage play (*Enron* [2009] by British playwright Lucy Prebble).

Kenneth Lay formed Enron in 1985, through the merger of Houston Natural Gas and InterNorth. Subsequently, Jeffrey Skilling came in from McKinsey as chief executive and financial officer (CEO, CFO). Andrew Fastow and other executives allegedly used accounting manipulations; special purpose entities (SPEs) such as JEDI, Chewco, Whitewing, LJM, and Raptors; and concealment of debt to mislead the board of directors. Enron pressured the auditor, big-five accounting firm Arthur Andersen, concerning such issues. Skilling announced his retirement (for personal reasons) before the details were known. Sherron Watkins tried to alert Lay quietly concerning the problems. The stock price hit a high of $90 in mid-2000 but dropped to under $1 by the end of November 2001. Enron did not have sufficient cash to operate. When a Dynegy purchase did not materialize and Enron's credit rating fell to junk status, Enron filed for bankruptcy.

Various executives at Enron were indicted for a variety of charges and were later sentenced to prison, including Skilling and Fastow. Fastow and his wife pleaded guilty, and Andrew Fastow testified at the joint trial of Lay and Skilling. In May 2006, Lay and Skilling were convicted. The latter was sentenced to more than 24 years in prison on multiple charges. When Lay died of a heart attack prior to final sentencing, his conviction was vacated. Some 16 individuals pleaded guilty, including Chief Accounting Officer Rick Causey; five others, including four former Merrill Lynch employees, were found guilty. Skilling appealed up to the U.S. Supreme Court, which found that a prosecutorial theory of deprivation of "honest services" did not apply to the Enron situation. The Supreme Court restricted the theory to bribes and kickbacks. The result affected the sentence but not the conviction. Skilling was still appealing on the basis of alleged new evidence in 2012, so his case remained pending, although he was serving time in prison.

In January 2002, Enron fired Arthur Andersen, which argued it had already severed the relationship when Enron entered bankruptcy. Arthur Andersen was found guilty in federal district court of obstruction of justice for shredding thousands of documents and deleting e-mails and company files concerning the Enron audit. Andersen collapsed, as the firm had to surrender its CPA license in August 2002; 85,000 employees lost their jobs. The U.S. Supreme Court overturned the conviction on grounds that the jury was not properly instructed on the charge. Three British employees of Greenwich NatWest bank worked with Fastow on a special purpose entity called Swap Sub. The three were extradited to the United States for trial on wire fraud charges. In a November 2007 plea bargain, the three pleaded guilty to one count and received sentences of 37 months. In August 2010, two of the individuals retracted confessions.

Employees, shareholders, and creditors lost tens of billions of dollars in investments, pensions, and loans. Enron held auctions to sell assets to raise funds for the creditors. Employees have reportedly received about $3,100 each from a lawsuit. Multibillion-dollar settlements were received from several banks and other sources for investors, including the University of California.

Between December 2001 and April 2002, the U.S. Senate Committee on Banking, Housing, and Urban Affairs and the U.S. House Committee on Financial Services held multiple hearings concerning Enron and related issues. The resulting Sarbanes-Oxley Act became law in July 2002. Main provisions included establishment of a Public Company Accounting Oversight Board (PCAOB) to develop standards for the preparation of audit reports, restriction of public accounting firms from providing any nonauditing services when auditing, independence of audit committee members, requirements that executives sign off on financial reports, disgorgement of certain executives' bonuses in case of financial restatements, and expanded financial disclosure of firms' relationships with unconsolidated entities. In November 2003, the U.S. Securities and Exchange Commission (SEC) approved new governance requirements announced by the New York Stock Exchange (NYSE) in June 2002. Key provisions included a majority of independent directors; compensation, nominating, and audit committees composed of independent directors; financial literacy for audit committee members; one member of the audit committee being required to have accounting or related financial management expertise; special sessions of the board without management.

Environmental Protection Agency, U.S.

The U.S. government under President Richard Nixon passed landmark environmental protection laws, including, the Clean Air Act (1970), Clean Water Act (1972), and Endangered Species Act (1973). It also established the Environmental Protection Agency (EPA) on December 2, 1970, to apply and enforce the news laws. Under these new acts and the new agency, citizens were afforded the right to sue polluters and those who would exploit, damage, and/or alter land or assets held as commons. Immediately, businesses tried to undermine the new regulations. During the 1970s and through the 1990s, the government supported strong environmental protections. This changed when George W. Bush took office as president. As a proponent of industries with the largest environmental impact—logging, mining, and drilling—Bush reversed, ignored, or undermined environmental laws. Bush received millions of dollars in campaign funds from these industries, and in return he facilitated billions of dollars in benefits to his corporate contributors. In order to ensure industry success at circumventing environmental regulations, Bush altered the EPA's mission to reflect industrial agendas. EPA Chief Administrator Christine Whitman wrote a memo to Vice President Dick Cheney that "It would be hard to refute the charge that we are deciding not to enforce the Clean Air Act." Her correspondence reflected the acknowledgment that Cheney had met with energy company executives in closed-door meetings to write the nation's energy plan. Scientists representing government agencies were neither consulted nor involved in the process.

An indirect tactic employed by the Bush administration was to eliminate positions within

Entomologist Jeff Pettis inspects honeycombs at the U.S. Agricultural Research Service (ARS) in Beltsville, Maryland, as part of an effort to solve the mysterious syndrome known as colony collapse disorder. It is suspected to be caused by pesticides such as those used as seed treatments, particularly in genetically modified grains. Lack of regulation and enforcement of environmental protections such as those provided by the U.S. Environmental Protection Agency may have caused damage to or even failure of an entire industry.

the EPA's enforcement units. Just after Bush took office, 270 enforcement positions were removed, followed quickly by another 200. In order to reduce criticism, the EPA misled the public by boasting through press releases about its enforcement actions. These releases made claims about a record number of enforcement actions, but as news reporters from the *Sacramento Bee* discovered, the record was inflated because many of the cases were related to counterterrorism, not environmental violators. The reduction in enforcement benefited coal-burning power plants, many of which had been targeted jointly by the EPA and the U.S. Department of Justice for Clean Air Act violations prior to Bush's taking office. Enforcement requirements are significantly reduced when science is ignored, as shown by the following excerpt from Devin's book *Bush Versus the Environment*:

> An EPA draft study found that a process called hydraulic fracturing, used to extract oil and gas, could pollute drinking water with excessive amounts of benzene. A week after discussing this problem with Congressional staffers, EPA changed its tune and said there would not be excessive amounts of benzene, but it offered no scientific explanation, saying merely that the change was "based on feedback" from an industry source.

There are some objections that environmental enforcement costs businesses too much. Not only is there ample evidence to suggest otherwise, but failure to strongly regulate and enforce environmental protections also caused some industries to fail. In 2006, 50 percent of American honeybee colonies died because of colony collapse disorder. Honeybees pollinate 40 percent of the fruits and vegetables consumed in the United States. The cause of the disorder has not been definitively determined, but a strong suspect is the use of systemic pesticides, which are specifically designed to leave residues in the soil. Further, the pesticides include neonicotinoids, neurotoxins that are used as a seed treatment. They are particularly toxic to bees when they travel through the plant and leave residues in the nectar. Nearly all genetically modified corn grown in the United States is treated with the pesticide.

The EPA did not require chemical companies to test the pesticides on juvenile or developing bees. Additionally, the EPA relied solely on the chemical companies' reports to determine whether the products were safe. Farmers and beekeepers relied upon the EPA to adequately mitigate risk. Since 2006, American farmers have imported honeybees from Australia because the domestic honeybee population has not recovered, and the application of neonicotinoids continues, without oversight or restriction. In March 2012, several U.S. beekeeper organizations filed suit against the EPA for violating its rules by permitting use of neonicotinoids without knowing their effects.

Equity Funding Corporation of America

The Equity Funding Corporation of America carried out a massive accounting fraud regarding mutual funds and life insurance policies in the 1960s and 1970s. Employees of Equity Funding used computers to create fictitious life insurance policies, then sold the policies to other life insurance companies. When Equity Funding went public in 1964, the sale price of a stock share was $6, and at that time it had sold about 100,000 shares. In 1969, five years later, the price of a single share of Equity stock was up to $80, and the company had 5.2 million shares of stock. The total value of the company was estimated at $420 million at this time.

The scandal was exposed in 1973, when Ray Dirks and Ronald Secrist blew the whistle. By the spring of 1973, the entire company had collapsed. Equity Funding incorporated the purchasing of insurance policies, along with mutual fund investments. The concept behind the idea of Equity Funding included (1) the investor would buy a life insurance policy and some mutual fund shares from a representative of Equity Funding, (2) the investor would pay for the shares but then leave them in the possession of the corporation, (3) Equity Funding would then use the clients' shares as collateral for a loan, and (4) this loan was given to the client, so that he or she could pay the premium on the insurance policy.

These steps were followed for 10 years, with the loan increasing each year. In order for the loan to remain collateralized, the insured had to purchase more and more mutual funds annually. At the end of the policy's term, the insured would have to pay off the loans, including interest. Usually, selling some of their mutual shares would do this. The policyholder would then keep the rest of his shares and an insurance policy with cash value. It was soon evident that this type of investment could not be legally executed because it involves too many assumptions. First, this strategy assumes that the market is constantly expanding. If the market crashes, or even drops slightly, the policyholder is unable to pay off the loan, thus disqualifying the insurance policy. It also assumes that the value of the mutual funds is enough to make the final payment of the bank loan.

Bogus Insurance Policies

In late 1964, realizing that his company was not progressing at the desired rate, Stanley Goldblum, a founder and chief executive of Equity Funding, told the company's treasurer to record commissions from brokerage firms that had not yet been received. Since it was illegal to book money from transactions that have not occurred, Goldblum informed the treasurer that he should record the money as profit gained from mutual funds and insurance sales. In reality, there were no commissions due to Equity Funding, thus starting the fraudulent business practices. The next major development in the scandal was the sale of bogus insurance policies. Equity Funding bought Presidential Life and Insurance and renamed it Equity Funding Life Insurance (EFLIC). Because of a prior contract with Penn Life Insurance, the acquisition forced Equity Funding Life Insurance into a reinsurance agreement with Penn Life. Under the reinsurance agreement, Penn Life would pay Equity Funding for insurance policies at prices greater than the initial premium paid to Equity Funding, then receive the annual premiums. Penn Life was required to make a final insurance payment in the event of a client's death.

Fictitious Policyholders

This reinsurance agreement would have worked for both corporations if Equity Funding had not resorted to fraudulent practices. Instead of selling Penn Life to real customers, it sold policies to fictitious customers. Fabricating policyholders created a problem because Equity Funding Life Insurance was in need of an audit. Something had to be done because none of its fictitious policyholders had any type of file, and the auditors would ask for files to check figures. Equity funding executives had to create files for the bogus policyholders. This fraudulent work was done at parties held by top executives. They would meet, have some drinks, and create fictitious people. They filled out medical documents, credit applications, and other paperwork that required detailed information. These "fraud parties" involved hard work, and the executives went to great lengths to cover their tracks.

The executives of Equity Funding realized that their bogus policyholders would never die because they were made up, so they began to kill off their fictitious clients by forging death claims. Penn Life would then have to send the insurance payoffs to Equity Funding, since these fictitious policyholders did not have any family members. The executives would then cash in the payoffs. Equity Funding also swindled money from its employees in 1968. Through Equity Funding Life Insurance, it offered "special class" insurance to all of its workers. This "special class" insurance included a 50 percent discount on the first annual premium. It encouraged employees to buy this not only for themselves but also for all of their family members. The company then sold all of these policies to Penn Life, which was unaware of the "special class." In reality, there was nothing special about the insurance except that the next year, the premiums would skyrocket and none of the purchasers could afford to pay Penn Life.

Ronald Secrist Talks

By 1972, a former executive, Ronald Secrist, who had participated in minor fraudulent activities, was the first to talk. He had been removed from Equity Funding because the corrupt practices made him extremely difficult to be around. When he left, he left with all of Equity Funding's secrets. When Secrist found new employment, he told two people about the deviance at Equity Funding. One person was Ray Dirks, who was a securities analyst, and the other was the insurance regulator. During March 1973, insurance examiners from the states of California and Illinois (Illinois was where Presidential Life, now EFLIC, originated) found that $24 million in bonds were bogus. Most of them never existed, and the counterfeit bonds that the executives had created were phony. On April 21, 1973, the Equity Funding Scandal was featured on the front page of the *Wall Street Journal*. Dirks had tipped off the newspaper. Immediately, investors who had not already heard the rumors sold their stocks. By the spring of 1973, the entire company, once worth billions of dollars, had collapsed.

Ethics

The term *ethics* has several related meanings. Ethics can mean the moral principles or morality of an individual. Ethics can mean a widely practiced system of moral principles, as in the mores of a culture. Ethics can mean the rules of conduct for a particular profession, as in medical, legal, or business ethics; or a group, as in Christian, Islamic, or Buddhist ethics. Ethics, or moral philosophy, is the branch of philosophy that studies values determining rightness and wrongness of actions, goodness and badness of motives and ends of such actions, and the nature of virtues and vices. A value is the relative worth, utility, or importance of something. Empirical ethics studies how people behave. Normative ethics concerns how people should behave. There can be powerful conflicts of interest between the desire for money and other values and duties. Ethics and morals can be regarded as synonyms for many purposes. Ethics is about how each individual decides to live and make moral decisions. There are important implications for professional and business conduct.

Three Normative Frameworks

There are two broad categories of ethical theories: consequentialist and nonconsequentialist. These two categories are associated with three major normative frameworks: utilitarianism, Kantianism, and virtue theory. Consequentialism (or teleology) argues that moral choices depend on good versus bad outcomes (i.e., consequences), independently of motives or means. The most important version of consequentialism is utilitarianism, which assesses outcomes in terms of the most good for the most people (paraphrasing Jeremy Bentham, founder of utilitarianism). Two other major approaches are nonconsequentialist in approach. Kantianism (or deontology) argues that moral choices should arise from a sense of absolute duty or binding rules. It is not the consequences of actions that make them right or wrong, but the motives of the person who carries out the actions. Kantianism thus emphasizes duties or rules in relationship to motives. Also nonconsequentialist in orientation, virtue theory concerns moral character, or the nature of virtues and vices, in individuals.

The three normative approaches thus involve, respectively, good versus bad consequences (in consequentialism), right versus wrong choices (in Kantianism), and moral character defined in terms of virtues and vices (in virtue theory). Utilitarianism and Kantianism are Enlightenment rationality theories originating in the 18th century in Britain and continental Europe, respectively. Virtue theory is much older and is typically discussed in terms of Aristotle's discussion of ethics. Confucianism is similarly an ancient theory of virtue.

A standard illustration of the three major approaches is as follows. Someone is in need of help (as in the parable of the Good Samaritan). Utilitarianism, or broadly consequentialism, justifies help on the basis of maximizing well being: Benefits of helping exceed costs of helping. Kantianism, or broadly deontology, emphasizes that help is in accordance with a moral rule, such as treating others as you would wish to be treated in similar circumstances (i.e., the Golden Rule). Virtue theory justifies help as charitable or benevolent conduct, whereas taking advantage of another's distress is, in contrast, a vice. A way of reconciling the three approaches is for a particular action to be governed by a moral rule that aligns virtuous behavior with maximization of well-being.

Consequentialism

Egoism and utilitarianism are the leading consequentialist theories. An egoist judges actions by personal consequences. Egoism is all about self-interest. There is a body of literature defending egoism on various bases. Such egoism may have a strong role in the actual behavior of business executives. Agency theory posits that investors strictly seek return and must align egoist managers with that purpose through financial incentives. Concern for group or community welfare is the basis for utilitarianism, which judges actions by the consequences for aggregate welfare. Cost–benefit analysis, in economics, rests on this utilitarian principle. In the Pareto efficiency criterion, if one person gains at no cost to another person, then aggregate welfare has increased, and no compensation is required. In the Kaldor-Hicks hypothetical compensation criterion, there may be winners and losers, so long as the winners gain more than the loss caused, and thus can in principle compensate the losers. The utilitarian principle aligns with capitalism to the extent that competitive markets tend to increase aggregate welfare of the whole society.

Utilitarianism was a British philosophical development, coming after Adam Smith's *The Wealth of Nations* (1776). Smith earlier published *The Theory of Moral Sentiment* (1759); he was influenced by the earlier work of David Hume. The key works in the early development of utilitarianism are Bentham's *An Introduction to the Principles of Morals and Legislation* (1789) and John Stuart Mill's *Utilitarianism* (1861). Bentham (1748–1832) was a radical legal reformer who also wrote extensively about the philosophy of law. Bentham gave a strictly hedonistic account of motivation and value, in which pleasure and avoidance of pain are the measures of happiness, and one value is just as good as another value. Mill (1806–73) was a political economist and civil servant who served as a member of Parliament. In utilitarianism, one has to determine the ethical community for which consequences matter, and how to weigh differences in values or opinions. Animal rights and nature protection advocates tend to assert equality of weighting of animals and trees to that of people. The Kaldor-Hicks criterion involves the potential difficulty that great harm to a small number of people might yield small benefit to a great number of people.

A basic issue in consequentialist theory concerns whether it is possible to reconcile egoism and utilitarianism. Henry Sidgwick (1838–1900), a philosopher and economist at Cambridge University, proposed the following solution. A person must consider self-interest (or prudence) and other-regardingness (or benevolence). The balance between the two considerations can depend on the situation. Sidgwick's key work is *The Methods of Ethics* (1874).

Kantianism

A nonconsequentialist theory judges the rightness or wrongness of an action based on properties intrinsic to the action, and not on its consequences. The German academic philosopher Immanuel Kant (1724–1804) emphasized the necessity of grounding morality in a priori, rational principles. Kant based morality in a conception of practical reason, in which the motive of duty uniquely expresses a person's commitment to morality and thus gives a special moral worth to human actions.

The development of continental European moral philosophy has basically the same logical structure as the development of consequentialism. Existentialism is broadly analogous to egoism, and social contract theory is broadly analogous to utilitarianism.

In libertarianism, as expounded in John Stuart Mill's *On Liberty* (1859), people should be free to do as they like, as long as they respect the freedom of others to do the same. The theory of liberty and rights arose in the American and French revolutions. The continental European version of liberty is existentialism, which means basically being one's authentic self.

Contractarianism, from the theory of social contracts developed by Thomas Hobbes, John Locke, and Jean-Jacques Rousseau, is based on the idea of a rational agreement within a community, basically stating not to cause uncompensated harm to anyone and to promote the common welfare.

Kant proposed a rational reconciliation of existentialism (i.e., self) and contractarianism (i.e., others) paralleled by Sidgwick's solution for reconciling egoism and utilitarianism. The essential philosophical concept of Kant's approach is the categorical imperative, which is a moral rule that is unconditional or absolute for everyone, and the validity or claim of which does not depend on any ulterior motive or end. The Ten Commandments are categorical (or absolute) in this sense. A hypothetical imperative, by contrast, is associated with an ulterior motive or desire, such as never lying because of a concern for maintaining reputation for truthfulness; never lying is necessary, instrumentally, to the end of maintaining a reputation. Whatever the practical worth of reputation, it is not a moral goal or duty. Of several formulations of the categorical imperative, the leading one is universalizing one's will, as in the formulation in the *Groundwork for the Metaphysics of Morals* (1785): "Act only according to that maxim whereby you can, at the same time, will that it should become a universal law." There is only one categorical imperative in Kantianism; all other imperatives are hypothetical. Imperative simply refers to a reason. Kant also argued that people are ends only and never means, because human beings occupy a special place in creation. All duties and obligations derive from the categorical (and ultimate) imperative. A categorical imperative denotes an absolute, unconditional requirement that asserts its authority in all circumstances, both required and justified, as an end in itself.

Kant's main works on ethics are the *Groundwork for the Metaphysics of Morals* (1785), the *Critique of Practical Reason* (1788), and the *Metaphysics of Morals* (1797). The last named work contains relevant materials on right and virtue. There are other important works in the canon of Kant's moral philosophy.

The modern theory of rights, developed out of the American and French revolutions, can be attached to the theory of duty. The relationship is basically that one's rights imply duties for others. My right to life implies your duty not to endanger me. Rights are entitlements to perform certain actions, or to be in certain conditions, or entitlements that others should perform certain actions or be in certain conditions. Rights dominate modern understandings of acceptable and unacceptable actions, as well as justice versus injustice of governmental and other institutions. The Arab Spring sweeping across the Middle East was a rights and justice revolt against authoritarian governments. The U.S. Constitution is a combination of governmental powers, limitations on those powers, checks and balances, and a Bill of Rights. Any set of rights is a distribution of liberties and authority.

Virtue Theory

Virtue theory is a pre-Enlightenment nonconsequentialist approach. This conception of virtues was the central aspect of ancient Greek ethical theorizing. For Aristotle, ethics is about lifelong self-improvement, and thus the nature of human well-being. Like Socrates and Plato, in whose tradition he followed, Aristotle regarded virtues as the key to a well-lived life. There is a set of identifiable ethical virtues, such as courage, justice, and temperance. Virtue is developed through appreciation of the role of friendship, honor, wealth, and pleasure in well-being. Proper education and habituation help develop the skills to discern in specific cases which course of action is best. Virtue theory is therefore about practical wisdom as distinct from the formal study of metaphysics. The moral theory of caring and empathy, particularly as developed by modern feminist writers, is a variant of virtue reasoning. Business ethics scholars have paid considerable attention in recent years to virtue theory as a form of practical guidance for managers.

Some Alternative Perspectives

In addition to the three major normative frameworks, alternative perspectives include pluralism, pragmatism, and justice theory.

Pluralism, or mixed frameworks, is a method of addressing religious precepts and moral intuition. Christian ethics, for example, includes both the Ten Commandments of the Old Testament and the principle of love of the New Testament. The Ten Commandments are by divine order. Situation ethics, properly defined, argues that in particular circumstances, the principle of love should override the Ten Commandments, which is to say fixed moral rules. Moral intuition, or conscience, means that individuals have moral sentiments, as explained by Adam Smith in *The Theory of Moral Sentiment* (1759).

Pragmatism is a philosophical approach that links theory and practice through reflecting on how best to achieve desired outcomes. Niccolò Machiavelli's *The Prince* is a manual in the exercise of political realism. The precept that the end justifies the means reflects this pragmatic approach.

Justice theory concerns substantive fairness defined in terms of each person receiving what he or she deserves (i.e., just deserts) and procedural fairness defined in terms of appropriate treatment. The leading exponent of modern justice theory was John Rawls. In *A Theory of Justice,* Rawls argues for a principled reconciliation of liberty and equality. The reconciliation approach thus resembles Kant and Sidgwick. For this reconciliation, Rawls constructs a situation in which parties face particular circumstances of justice, involving fair choice for which the parties need principles of justice. The parties face a moderate scarcity of resources and are neither purely altruistic nor purely egoistic. The parties have ends that they seek, but they prefer to achieve those ends through mutually acceptable cooperation. Rawls proposes that the theory of justice proceed from an original position within a veil of ignorance. The parties do not know in advance how they would fare in the future and would hypothetically choose mutually acceptable principles of justice in this condition.

Within this set of constraints, Rawls thinks that the parties would prefer his proposed two principles of justice to be superior to utilitarianism and libertarianism. First, each person has an equal right to the most extensive basic liberty compatible with a similar liberty for others. The basic liberties include political liberty to vote and run for public office, freedom of speech and assembly, liberty of conscience, freedom of personal property, and freedom from arbitrary arrest. The basic liberties do not include ownership of all kinds of property or freedom of contract, the basic requirements for laissez-faire capitalism. Beyond a minimum, low level of economic development (which is not explicitly specified), the first principle may not be violated. The basic liberties may conflict such that trade-offs may be necessary in order to obtain the largest possible system of rights. The second principle of justice addresses social and economic inequalities. Changes should be of the greatest benefit to the least-advantaged members of a society (what Rawls terms the difference principle), and offices and positions must be open to everyone under conditions of what Rawls terms fair equality of opportunity.

Rawls's approach is basically a defense of egalitarianism, subject to a constraint that equality should not be achieved by worsening the position of the least advantaged. Inequalities can be justified if they are to the benefit of the least well off. The reason is that morally arbitrary factors (e.g., family or class, a condition involving accident of birth) should not determine life chances or opportunities. A person does not morally deserve inborn talents, which are distributed accidentally. Therefore, one is not automatically entitled to all the benefits that could be derived from inborn talents.

Professional and Business Ethics

Publicly traded corporations are managed, staffed, and advised by many licensed professionals (e.g. accountants, lawyers, and engineers) and by many individuals who have received undergraduate and/or graduate degrees in business. Professional bodies typically have formal codes of ethics binding on their members. A licensed professional has a high duty to clients (including employers) and the public interest. A licensed professional should avoid even the appearance of conflict of interest and impropriety. Publicly traded corporations typically have formal codes of conduct binding on their employees. Individuals educated for business, although not licensed, are also professionals in the broad sense of having received specialized preparation for their roles.

Senior executives and others at corporations such as Adelphia Communications, Enron, Global Crossing, Tyco, and WorldCom failed in ethical and legal duties. They all engaged in various forms of misconduct, such as accounting fraud. Ethics can be understood as voluntary acceptance of responsibilities beyond legal duties. It is wrong morally to violate laws for personal gain. These corporate scandals and other problems such as the mortgage fraud crisis raise the possibility that there are serious deficiencies in business school education. A serious controversy has been underway, as a result, concerning how to prepare business personnel for legal and ethical issues.

A Mozambique woman and daughter with anti-HIV/AIDS drugs, December 2, 2010. Lawrence Kohlberg's stages of moral development theory can be applied to the question of pricing and distribution of HIV/AIDS drugs in developing countries.

Stages of Moral Development

Building on the work of Jean Piaget concerning the theory of cognitive development, American developmental psychologist Lawrence Kohlberg propounded a theory of seven stages of moral development. At a preconventional level, in childhood, there are three stages: egocentric judgment, punishment and obedience orientation, and instrumental relativist orientation. Basically, a child interprets cultural rules and labels about good and bad, or right and wrong, in terms of the physical or hedonistic consequences of action. In the first stage, a child egocentrically likes (or dislikes) or wants (or does not want) something. In the second stage, a child avoids punishment and defers to power. In the third stage, the child learns to practice the reciprocity of a marketplace in order to satisfy felt needs.

At a conventional level, in early adulthood, there are two stages: interpersonal concordance or "good boy–nice girl" orientation and the "law and order" orientation. In the fourth stage, good behavior is what pleases or helps others and is approved by them. This stage involves conformity to stereotypical images of majority or natural behavior on one hand, and intention on the other hand. In the fifth stage, an individual becomes oriented toward authority, rules, and social order maintenance. There is a sense of performing one's duty and showing respect for authority and the social order. At a postconventional level, there are two more stages of development: the social-contract legalistic orientation and the universal ethical-principle orientation. This level involves autonomy and principled judgment. The social contract orientation defines right action in terms of general individual rights and standards that have been critically examined and agreed upon by the whole society. This stage has a generally utilitarian underpinning. There is a sense of rational law and order, free contracting, and moral obligation.

Kohlberg's final stage of universal ethical-principle orientation defines right by a decision of conscience in accord with self-chosen ethical principles. These principles are abstract (e.g., the Golden Rule or Kant's categorical imperative), rather than concrete (e.g., the Ten Commandments); the principles appeal to logical comprehensiveness, universality, and internal consistency. There is a sense of a theory of justice.

An illustration developed by Kohlberg concerns a drug that might save a person's life. The druggist (or firm) making the drug charges 10 times the cost of production. A sick person's spouse can raise (including borrowing) half the price. The spouse proposes to the druggist a reduction in price or a staged payment over time of the remaining price due. The druggist refuses both options. In desperation, the spouse breaks into the drugstore and steals the drug. In this illustration, there is a conflict between private property and human life. The government might also intervene in some way, such as by controlling patents. The purpose of the illustration is less the answer and more the reasoning process leading to the answer. Kohlberg's stages of moral development have been used in business ethics research. This situation arises concretely in connection with pricing and distribution of human immunodeficiency virus and acquired immune deficiency syndrome (HIV/AIDS) antivirals in developing countries.

Ethics Reform Act

The Ethics Reform Act (ERA) of 1986 was passed to curtail conflicts of interest among government employees of all three branches, to increase the public confidence in government, and to amend the Ethics in Government Act of 1978. Prompted by ethical scandals in the executive and legislative branches, the ERA addresses honoraria, outside income, postgovernment employment restrictions, gifts, financial disclosure, ethics committee procedures, and use of official resources. The ERA allowed a 25 percent increase in salary for members of Congress, certain legislative branch positions, the judiciary, and senior executive branch personnel to offset potential income loss from not receiving honoraria. The Ethics in Government Act and subsequent ERA prohibit federal employees, except members of the Senate, from receiving honoraria or earning money from speeches, writings, or appearances. Initially, the ERA banned even low- and mid-level employees from receiving honoraria, but in 1995, the Supreme Court upheld the rights of federal employees under the First Amendment. Since 1995, federal employees at the level of GS-15 and below can receive compensation for speeches or articles that are outside their official duties. For example, a computer technician in the executive branch can write articles on remote-controlled airplanes or sewing, as long as the employee is not representing the government in his or her official capacity.

The ERA limits outside employment by members of the House of Representatives, as well as officers and employees of the judicial and executive branches. Federal employees in the Senior Executive Service and Executive Schedule cannot work outside the government for organizations that present or may present a conflict of interest, unless they get prior authorization from the appropriate ethics office. Generally, this means that the higher-ranking federal employees cannot have an additional paying job. Other opportunities include sitting on a board, certain endorsements, and teaching.

The ERA expands application of postgovernment employment restrictions to the legislative branch, as well as the previously included members and employees of Congress. This revolving door policy prohibits former government employees from being employed as lobbyists for up to two years after federal employment. Although exceptions occur, the intent was to limit the use of connections made while a public servant to improve one's financial position. A significant aspect of the ERA is the requirement for public disclosure of an individual's and immediate family's financial situation. One criticism of the ERA is that it deters highly qualified candidates and applicants because the public disclosure of employment and finances may seem too intrusive.

Other areas of conflicts of interest, investigation, and enforcement were amended by the ERA. Restrictions on the nature and value were placed on gifts to federal employees from outside and inside the federal government. There are limitations on travel and funding for specific travel activities. For employees or family members forced to sell property to comply with the conflict-of-interest rules, there is a rollover provision for the deferment of tax on a capital gain realized. In addition to addressing ethical standards, the Ethics in Government Act of 1978 and the ERA instituted investigative responsibilities for the attorney general, and set up enforcement and penalties for violations. Initially, the Ethics in Government Act of 1978 established the Office of Government Ethics as the supervising ethics office for the executive branch and created the Office of Independent Counsel to investigate higher-ranking government officials. The House Committee on Ethics and the Senate Select Committee on Ethics were designated as the ethics offices for the legislative branch, and the Judicial Conference Committee on Codes of Conduct was so designated for the judicial branch.

In 1989, the ERA further created conflict-of-interest rules for the legislative branch staff and further delineated the attorney general's investigative powers. It provides a civil fine, increased the criminal fine, and added a jail sentence of one to five years for a criminal conviction. Providing regulations for the executive branch, the Office of Government Ethics establishes requirements for civilian federal employees and for those in the uniformed services, such as the military.

Extortion

Extortion refers to the use of threats, violence, or force to extract unlawful gains and rewards to which one is not morally or legally entitled. This kind of criminal behavior takes many forms and occurs in all societies. The threat of harm could be to property, personal safety, privacy, or economic interests, which makes this a major concern for governments and business firms alike. A central ingredient of extortion is a severe imbalance in the power relationship between the offender and the victim—the former has the power to cause a kind of harm that the victim feels cannot be avoided unless payment is made. However, specific legal criteria vary across major jurisdictions. In the United States, the emphasis is on public officials abusing their power to extort payments from victims. It is also applied more generally to private individuals, groups, or organizations making similar demands. In Japan, the term *sokaiya* is used to refer to groups of highly trained, well-organized extortionists operating parallel to legitimate business organizations as they conduct routine commercial activities. Sensitive information is often the currency for demanding payments in exchange for secrecy.

The Theft Act of 1968 and Hobbs Act of 1951

Extortion is often treated as a more aggravated species of bribery, or it may be classified as blackmail. However, bribery as distinct from extortion does not have an element of threat, whether in the form of violence, force, or fear, and involves a significant degree of cooperation among all parties involved. The payee of a bribe is not a victim of a demand and usually initiates the transaction, though this is not always clear. Current legal understandings of and official responses to extortion, especially in common law jurisdictions such England and the United States, are more easily explained through the long connection with the term *blackmail*. Before the 19th century, blackmail was associated with the use of physical threats to obtain some material gain, and it was deemed a form of theft. By the mid-19th century, the term gained additional connotations to include an attack on a person's reputation. In England, the significance of demands made under "threat of menace" was recognized in a series of legislative innovations, culminating in the Theft Act of 1968. Section 21 of that act sets out the key elements: (1) making a "demand with menaces"; (2) that the demand with menaces must be "unwarranted," unless the defendant is of the belief that there were reasonable grounds for making that demand, and that using menaces was appropriate; and (3) the demand was made "with a view to gain for himself or another or with intent to cause loss to another."

A counterpart to this in the United States is the Hobbs Act of 1951. This statute criminalizes extortion affecting interstate or foreign commercial activities, whether within the context of industrial disputes, corruption by public officials, or a more general set of cases not classifiable under the preceding categories. Following the *Shieldler II* case, the requirement is that the defendant had intent both to deprive the victim of property and to obtain or acquire that property, and that this was induced by violence. The decision in the case *United States v. Tropiano* gives the word *property* a broad meaning, to include tangible and intangible property or interests. In *Bianchi v. United States,* the term *property* was taken to include ". . . any valuable right or interest considered primarily as a source or element of wealth" to which a person or entity is entitled.

Forms of Extortion

For the most part, criminalization targets those engaging in extortion activities who occupy positions of power—public officials, people with controlling authority in corporations, crime syndicates, criminal organizations, or gangs that wield power over territory or individuals—and have the capacity to inflict the harm threatened. This is reflected in the number of lows and range of legislation, especially laws directed at corporate and commercial contexts. There are many examples across the world of police officers planting evidence that could mean imprisonment or worse for the victim. The officers then threaten to bring charges if payment is not made. Other examples include organizations that face threat of harm to assets to which they are legitimately entitled, or delays in the release of funds owed to them for services done, or payments to continue to do business in particular places. Advances in Internet technology now mean that firms face threats to information systems if demands for payment are not met, called cyber-extortion.

Threats of physical harm are often classified as true extortion, and those that threaten harm to investments or other assets are classified as economic extortion. In most jurisdictions, corporations or their employees who make payments to avert threats of extortion could nonetheless be engaging in the wider offense of corruption, or may be answerable to charges under the usual term of bribery. However, in the United States, the distinction between true extortion and economic extortion is of some significance, especially where major corporations that may have business interests overseas are concerned. To bring a charge of bribery under the Foreign Corrupt Practices Act of 1977, the prosecution must show intention to induce an official to use his or her office for improper purposes in order to gain or retain business (it is useful to compare the United Kingdom's Bribery Act of 2010). Given this starting point, it is not clear precisely how bribery amounting to extortion is to be treated.

Responses to Extortion

In cases of true extortion, making payments in the face of such threats negates the necessary intent to induce corrupt practices. However, those facing payment demands that amount to economic extortion do not generally have such a favorable cover in law. In the case *SEC v. Summers*, an employee of Pride International, John Summers, was charged for making payments for the release of fees owed by Venezuela's state-owned oil company to his employers. That this occurred against the background of considerable public unrest that threatened the organization had little effect on the Security and Exchange Commission's decision to bring charges against Summers. However, there is some suggestion in *United States v. Kay* that where the nature of the economic loss is sufficiently serious, some analogy may be drawn with cases of true extortion to negate intent.

Often, several actors work together within and across organizations, or in particular units within an organization. In some contexts, extortion is linked to political power, where demands for payment take place with the tacit approval of the state, in the absence of effective official capacity or political capital to confront offenders. This type of extortion linked to political power is more common in weak states, or may be associated with the drug trade. Some characteristics of this type of extortion include "protection payments" demanded by organized criminal gangs that control specific territory. Organizations or individuals subject to these demands face threats to their businesses or access to particular locations over which they otherwise have some right.

Exxon Valdez Oil Spill

Prior to the 2010 oil spill off the Gulf of Mexico, the worst incident in American history related to petroleum loss was the crash of the *Exxon Valdez* off the coast of Alaska shortly after midnight on March 24, 1989. The *Valdez* ran aground on the Bligh Reef in the Valdez Narrows and proceeded to lose over 11 million gallons of crude oil into Prince William Sound. The ship had been scheduled to make a five-day run from Valdez to Long Beach, California, and had over 1.2 million barrels of North Slope crude aboard at the time of the accident.

The primary causes of the incident involved the crew. First, the crew was overworked and unrested. More important, Captain Joe Hazelwood had been drinking vodka in the time preceding the ship running aground. He was borderline intoxicated, based on his slurred speech and inability to properly identify which vessel he was captaining at the time. His blood alcohol content, had it been taken soon after the accident, would have suggested a strong explanation for the poor decisions he made that night. Using a process called retrograde extrapolation on the blood test taken 11 hours after the accident, a blood-alcohol expert would testify that Hazelwood's blood alcohol concentration at the time of grounding could have been as high as 0.37. A jury would later fail to accept that speculative evidence.

The Accident

Hazelwood had been worried about the possibility of icebergs in Prince William Sound and opted to undertake a series of unusual maneuvers. When encountering ice, most ships opt to go slowly or even stop and wait for the ice to pass. Hazelwood, however, turned the ship around, ordered its speed increased, and had it placed on autopilot. The area he aimed to take the ship was narrow, and the captain's decisions would exacerbate that situation. Hazelwood left only one officer in charge of the dangerous maneuvering, and shortly after he left the bridge, the *Exxon Valdez* ran aground. An investigative report in 2008 made a similar finding. The report claims that Hazelwood was drinking and below decks when the third mate ran aground, in addition to not having the radar turned on—which it could not have, since it had been broken for over a year. Ultimately, the 2008 report blames Exxon for determining that repairing the radar was prohibitively expensive.

The floundering ship immediately began spilling high volumes of oil into the water. The captain spent nearly 30 minutes trying to push the boat forward but was eventually forced to await help from the U.S. Coast Guard. Although the immediate cause of the grounding was clearly the inability of the officer to successfully maneuver the tanker through the strait, numerous other variables were in play. First, Hazelwood's decision making was clearly blurred. Second, the crew was overworked and exhausted. Third, Exxon had not replaced radar equipment in the tanker. Fourth, Exxon did not have any recovery plans in place if such an accident occurred.

The Aftermath

Although the initial incident was troublesome enough, the bigger concern was the environmental effects of the oil spill. Given Prince William Sound's location (which can be reached only by plane, helicopter, or boat), it was nearly impossible for either the U.S. government or Exxon to respond efficiently and effectively to the incident. The oil spill occurred during a time period in which most of the native wildlife (mainly salmon, otters, seals, and birds) were in the middle of reproductive cycles, those jeopardizing both current and future populations. Over 200,000 birds and thousands of otters were lost as a result of the oil spill.

Beyond the wildlife victims, local economies struggled mightily in the aftermath. Commercial fishing had been a staple of the economy, and it was all but eliminated by the accident. Exxon desired to assist with recovery, but everything moved very slowly. The area is still not fully recovered. Most shellfish cannot be safely consumed by humans, and many animals have not returned to their previous numbers. Other animals—such as seals, ducks, and killer whales—have rarely been seen in the region since the *Exxon Valdez* crashed. Most concerning, large volumes of oil still exist in the geology of the area.

Exxon suffered in the aftermath of the wreck, as its reputation continued to nosedive. The company was required to pay billions of dollars in criminal and civil fees. The surrounding ecosystem received the largest sum of money, nearly $900 million, from a civil suit filed under the U.S. Clean Water Act and the U.S. Comprehensive Environmental Response, Compensation, and Liability Act. The company paid a $100 million fine for a criminal conviction and was ordered to pay an additional $5 billion in punitive damages to help natives harmed by the spill. An Anchorage jury ultimately awarded just under $300 million for actual damages and $5 billion in punitive damages. To come up with the $5 billion, the jury used a one-year profit yardstick for Exxon. In order to protect its business in the event the jury's awards were upheld, Exxon utilized a line of credit from J. P. Morgan for $4.8 billion. Ultimately, the U.S. Supreme Court found the amount excessive and rolled back the punitive damages to $507.5 million (equal to compensatory damages in the case).

As for Hazelwood, he was ultimately convicted of negligent discharge of oil, a misdemeanor. Jurors also decided that Hazelwood's decision to leave the bridge in the hands of others was questionable enough for a finding of negligence, but not recklessness. He was acquitted of operating a watercraft under the influence of alcohol and reckless endangerment. He ended up serving many thousands of hours of community service.

F

Fair Housing Act

The Fair Housing Act (FHA) became law in 1968, upon the passage of the Civil Rights Act of 1968. The definition and laws related to fair housing made up Title VIII of the Civil Rights Act. Prior to 1968, the only law governing fair housing was the Civil Rights Act of 1866, which included language that only alluded to fair housing and had no details about federal enforcement. The impetus for the law came from post–World War II growth of suburbia and attempts by realtors to restrict the purchase of homes on the basis of race. The Supreme Court had already ruled against the legality of covenants to segregate neighborhoods in 1948, and in 1964, it ruled against Proposition 14 in California, which sought to deny equal access to housing. In the decision of *Reitman v. Mulkey* (1967), the Court ruled that the proposition violated the Fourteenth Amendment. On the federal level, the Civil Rights Act of 1964 also made some provisions for fair housing but lacked federal enforcement guidelines.

The Civil Rights Act of 1968 corrected the problems of the 1964 legislation by detailing enforcement provisions in Title VIII, titled the Fair Housing Act. Prior legislation addressed the public rights of nonwhites, whereas the 1968 law specifically addressed the private housing market. Initially, the act prohibited landlords, realtors, and others who sold, leased, or rented property from denying approval because of race, color, religion, sex, or national origin. Further, these discriminatory terms could not be included in contracts or advertisements for dwellings. The act also forbade the use of coercion, threats, or similar actions that prevent or interfere with a person's right to fair housing. Exceptions include owner-occupied buildings with less than four units, houses rented or sold by the owner without a realtor, and properties owned by organizations or clubs requiring membership for occupancy. Mortgage lenders cannot take certain actions based upon race, color, national origin, religion, and sex. Persons cannot be denied information about loans or be denied for a mortgage loan or a purchased loan based on the protected categories.

Because of the expansion of federal enforcement rights in 1968 and 1988, those who believe that they have been discriminated against can file a complaint with the U.S. Department of Housing and Urban Development (HUD). Under the law, these are investigated by the Office of Fair Housing and Equal Opportunity, which will issue a determination and a charge of discrimination that is heard by a HUD administrative law judge. Alternatively, the two parties may opt to have the case heard in federal court. The 1988 Fair Housing Act Amendments (FHAA) addressed weaknesses in the 1968 act, as noted in the *Federal Fair*

In Teaneck, New Jersey, protesters march against housing discrimination in 1970. Beginning in the 1960s, the African American population in parts of Teaneck grew substantially. Along with that came a "white flight" triggered by the blockbusting efforts of local real estate agencies. Blockbusting is the real estate and building practice that uses subterfuge and fear to prompt white homeowners to sell their homes at below market value; the real estate agency then sells the property at inflated prices to African Americans.

Housing Enforcement Effort report, published in 1979. Advocacy groups and citizens who tried to use the law found that the federal enforcement portion of the law still left the Department of Housing and Urban Development with little power, and realtors and rental agents knew that there was little chance of penalty. The FHAA also expanded the coverage of the law to prohibit discrimination against the disabled and families with children. Reasonable accommodations to a building must be offered, at the renter's expense, and changes to rules and policies must make the building usable for the disabled. New buildings, built after 1991, must have an elevator and access to public areas. Families must be allowed to rent housing unless the community is for older persons. Communities can no longer discriminate against families, pregnant women, and those who have custody of children.

In 1995, the Housing for Older Persons Act further amended the FHA with regard to the 55-and-older exemptions. Facilities must have at least 80 percent of their units occupied by persons 55 and older, and the FHA established further policies for facilities to qualify as 55-and-older housing. Families can reside in exempt properties that are for the elderly, but as long as the 80 percent rule is followed, families are not required. Since its passage in 1968, the coverage provided by the Fair Housing Act includes all persons and housing situations, and it has since become a stronger law in order to meet the needs of all American citizens.

False Claims Act

The False Claims Act (31 USC §§ 3729-3733) imposes liability on persons and organizations who defraud government programs. The False Claims Act (FCA), or the Lincoln Law, was passed in 1863 to combat fraud against the government. The FCA is notable because it includes a *qui tam* ("who as well") provision, allowing individuals not affiliated to file actions on behalf of the federal government. A person filing such a claim, known as a "relator" or "whistleblower," may receive a portion of the damages recovered.

The FCA prohibits the following:

1. Knowingly presenting or causing to be presented a false or fraudulent claim for payment or approval;
2. Knowingly making, using, or causing to be made or used, a false record or statement to get a false or fraudulent claim paid or approved;
3. Conspiring to defraud by getting a false or fraudulent claim allowed or paid;
4. Delivering or causing to be delivered less property than the amount for which the person receives a certificate or receipt;
5. With intent to defraud, making or delivering a receipt without completely knowing that the information on the receipt is true;
6. Knowingly buying public property from a government employee who does not have the legal right to sell the property; and
7. Knowingly making or using a false record or statement to conceal, avoid, or decrease an obligation to pay or transmit money or property to the government.

The federal government recovered more than $30 billion from 1987 to 2011, not including criminal fines, portions allocated to the states, and unreported cases. Typical cases involve a corporation overcharging the government for goods or services, making and/or presenting false records, and insufficient testing or defective products. Used previously with defense contractors, the FCA currently is used in the health care sector to combat fraud, such as receiving government payments for medically unnecessary treatment or regulatory noncompliance. In 2011, approximately $2.4 billion of the $3 billion recovered was from the health care sector. Some compliance managers recommend reducing corporate risk by encouraging internal whistleblowing.

A complaint must be made in federal court under seal and is served on the government, but not on the defendant. The plaintiff must also provide documentation to the government, but not file it in court, to detail the complaint. The U.S. Department of Justice (DOJ) then decides whether to pursue the case. If so, the percentage reward for the plaintiff is less, but the success rate tends to be higher. If the DOJ does not pursue the case, the plaintiff can continue the lawsuit. Claims may be prejudiced if disclosure of the alleged unlawful act has been reported in the press, if complaints were filed with an agency instead of a lawsuit being filed or if the person filing a claim is not the first to do so. The FCA does not provide for claims against certain government employees and members of the armed forces, and it does not apply to claims made under the Internal Revenue Code.

FCA amendments in 1986 provided employment protection for whistleblowers and established defendant liability for deliberate ignorance of and reckless disregard of the truth. The amendments increased the potential rewards to 15 to 30 percent of recovered funds. The Fraud and Enforcement and Recovery Act of 2009 amended the FCA by expanding the scope of potential liability, expanding conspiracy liability, redefining claim, defining obligation to include retention of any overpayments, and increasing protection for *qui tam* plaintiffs, including contractors and agents. The Patient Protection and Affordable Care Act and the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 further amended the FCA, including changes to the public disclosure bar, the original source requirement, timely return of overpayments, and the statutory antikickback liability.

As of 2012, over 25 states, the District of Columbia, and several municipalities have some type of false claims act equivalent, with varying procedures, limitations, penalties, and division of proceeds. Several of these equivalents apply only to the Medicaid program, but all states with a qualified equivalent may be eligible for an increased share of monetary recovery from certain lawsuits.

False Foreclosures

In order to obtain a mortgage, a borrower presents a security interest to a lender. The borrower can pledge a number of acceptable assets, based on the financial lending institution's criteria, with the goal of securing a mortgage loan. Once the borrower has successfully met the criteria to secure the loan, the financial lending institution will then issue a loan to a borrower, and this will commence the initiation of a mortgage agreement. Foreclosures provide financial lending institutions a legal mechanism to attempt to secure unpaid balances left by borrowers who have defaulted on loans granted by the lenders. Courts of equity assist borrowers in gaining equitable right of redemption against foreclosure, upon the borrower's repayment of the unpaid balance. In foreclosure, the financial lending institution moves to acquire legal and equitable ownership of the asset and to foreclose on the borrower's equitable right of redemption. This allows the financial lending institution the opportunity to sell or repossess the property for which the financial institution lender has previously authorized the loan. In many foreclosures, additional entities with liens on the borrower's assets will also seek to foreclose on the borrower's equitable right of redemption. These debts usually include a number of other bills related to the home. When the borrower is successful in obtaining equitable right of redemption, a gray area exists regarding whether or not the financial lending institution can actually repossess the property in payment default. Thus, with the borrower's securing of equitable right of redemption, there is no assurance to the financial lending institution that it has a legal opportunity to sell the property in an effort to recover the defaulted debt.

False Foreclosure Issues

False foreclosure involves the presentment of false, misleading, erroneous, or fraudulent documentation in a court of law for the purpose of repossessing a home in which a borrower has defaulted on the loan repayment (or mortgage payment). Many of the country's leading financial lending institutions have been scrutinized and investigated for gaining access to legitimate legal foreclosure support, from the courts, through the unfair submission of false and misrepresenting foreclosure documentation. Numerous law firms, representing these prestigious lending institutions that are staples in society, have been investigated for their foreclosure practices. In a number of cases, attorneys general across the nation have discovered a common practice of lending institutions signing legal affidavits without confirming the accuracy or completeness of the information upon which the court is petitioned to act.

For several months, state and federal officials and the nation's largest financial lending institutions sifted through and reviewed evidence, revealing that financial lending institutions were regularly engaging in a practice termed "robo-signing" (among other malpractices). Robo-signing refers to the use of poorly constructed and fraudulent paperwork to speed the process of moving along massive amounts of foreclosures through an already overburdened process. At the heart of the robo-signing problem is the inattention of financial lending institution employees to fully verifying the accuracy of the information contained in the affidavits. State law, however, requires that employees of these financial lending institutions must actually read the foreclosure documents signed in order to verify their accuracy and legitimacy. A further issue is the implementation of illegal fees embedded into refinancing terms of an agreement without the knowledge or consent of the borrower. Many employees of these financial lending institutions have completed depositions and attested to their blatant omission of the reading requirement, prior to signing the questionable foreclosure paperwork. Allegations of false foreclosures became so widespread that the Senate Banking Committee held a hearing to investigate false foreclosure practices, with Senate Majority Leader Harry Reid encouraging financial lending institutions across the nation to review their practices and ensure fairness to homeowners.

Notable Legal Actions

In 2010, Massachusetts sued several of the nation's major financial lending institutions over false foreclosures and related practices. The lawsuit cited robo-signing of documents and deceptive practices regarding loan modifications as the cause for the suit. In 2011, the attorney general's office in Florida initiated a case against financial lending institutions in that state over false foreclosures. The Florida attorney general cited rampant robo-signing practices as the cause for the suit. In 2012, the state of New York settled a $130 million lawsuit with five of the state's largest financial lending institutions regarding false foreclosures.

Later in 2012, government officials filed a complaint in U.S. federal court alleging that certain financial lending institutions took advantage of the housing crisis and began a pattern of unfair and deceptive practices. According to the complaint, these practices ranged from the filing of false documents, to the passing of illegal fees to borrowers, to deceiving homeowners regarding loan modifications, to hiring inept staff, to the most egregious—foreclosing on members of the military engaged in active duty. The Federal Housing Finance Agency also sued law firms, in the billions of dollars, who were handling foreclosures for various financial lending institutions. The Federal Housing Finance Agency cited varied and complex illegal mortgage practices as the cause for the lawsuit.

Publicized Relief From False Foreclosures

In February 2012, New York settled a $130 million lawsuit with five of the largest financial lending institutions in the state of New York, regarding false foreclosures. A complaint filed in March 2012 on behalf of the federal government requires $25 billion in relief to struggling homeowners, by offering a list of settlement options intended to maximize the homeowners' ability to take advantage of incentives to prevent foreclosure. These incentives include making several thousands of dollars available to assist with lowering the homeowners' interest rates, provided they are current on their loans.

Further, homeowners who have already been foreclosed upon would be granted eligibility for a few thousands of dollars in payouts. Other notable incentives for homeowner borrowers include counseling, mediation, and legal services that would also be available upon request, as a result of the monies provided to states that are implementing housing and foreclosure prevention procedures and programs. Further, the foreclosure actions against several hundred active duty military members, resulting in the loss of their homes, have also been revisited. Active duty military members have already received settlements from all of the major financial lending institutions to include any equity that may have been lost as a result of the false foreclosures. It is expected that numerous financial lending institutions will implement improved mortgage-servicing standards.

False Foreclosure Legislation

New York State Attorney General Eric Schneiderman presented a bill in the summer of 2012. The goal of the bill is to reduce a propensity of financial lending institutions toward fraudulent foreclosures and subsequent practices. The bill would make fraudulent practices Class A misdemeanors and up to Class E felonies, increase existing penalties for fraudulent foreclosures, and result in a period of incarceration for employees of financial lending institutions who engage in false foreclosure practices. In early 2012, President Barack Obama detailed his ideas regarding the eradication of false foreclosures. President Obama expressed his support of an expansion of existing investigations, indicating that new initiatives are in the process that will control unfair lending practices. Subsequently thereafter, U.S. Attorney General Eric Holder discussed the U.S. Department of Justice's immediate execution of civil subpoenas to several financial lending institutions.

After probing into their institutions' practices, and settling numerous lawsuits, many of the nation's major financial lending institutions have suspended the practice of foreclosing. They are currently focused on developing and instituting better guidelines for lending practices across the country. At least one financial lending institution has committed to a nationwide moratorium (of all of its branches) on foreclosures until practices become more amenable to homeowner repayment success. Financial lending institutions provide access to the American dream for borrowers who could not otherwise have access to home ownership. Abusive mortgage practices have overshadowed, and in some cases derailed, a process originally established to empower borrowers toward home ownership.

Fear of Crime

Fear of crime is concerned with individuals' perception of whether or not they are likely to be a victim of crime. The typical analytical starting point is the assumption that more people experience fear of crime than actually experience crime. This point is particularly salient because it has been recognized internationally in the Anglo American, European, and Australasian contexts that the total recorded crime rate has by and large steadily declined over the last decade or so, while the level of fear of crime has risen. Key longitudinal victimization surveys, such as the National Crime Victimization Survey (NCVS) in the United States and the British Crime Survey (BCS) in the United Kingdom, readily attest to this state of affairs. This reinforces the need to focus on a range of possible factors that can influence a person's perception of the level of risk that he or she faces with regard to crime.

Gender

Several factors correlate with a person's fear of crime. Research shows that individuals from lower socioeconomic backgrounds and ethnic minority groups tend to report that they are more afraid of becoming a victim of violent assault, mugging, and motor vehicle crime. Victimization surveys such as the NCVS reinforce that a respondent's gender, age, and geographical location all play key roles in shaping a person's fear of crime.

Perhaps the most consistent finding internationally is that women are more fearful of crime than are men, in spite of the fact that they are less likely to be victimized. It has been suggested that fear of crime means different things to men and women. Studies show that men are likely to be most fearful of violent assault and women are afraid of sexually motivated attacks. Women are also more likely to be afraid of types of crime such as home burglary, which may place them in a vulnerable position and increase their likelihood of being the victim of a sexual assault. Nevertheless, fear trends between the genders are generally not reflective of the actual likelihood of reported victimization. Even though statistically, men are more likely to be victims of crime than are women, like women, they tend to overestimate the likelihood of their victimization.

Age

Age also plays a role in shaping people's perception of whether they are at risk of being a victim of crime, even though elderly people are not as much at risk from crime as younger people. For example, people over 60 years of age often report that they are fearful of being mugged on the street, when most victims of this crime are between the ages of 16 and 40. In contrast, women over 60 years of age frequently report that they are less fearful of being sexually assaulted than younger women. Such trends reinforce how gender and age interact in complex ways to help shape people's perception of the likelihood that they will be a victim of crime. While early research indicated that elderly people are the most fearful of crime, more recent studies have started to report the opposite. This may well be because the anxieties of the elderly concerning crime in general are tempered by a degree of awareness—perhaps reinforced by the news media—that crimes such as sexual assaults typically involve comparatively youthful victims.

When questioned about the steps they take to avoid being a victim of crime outside their home, the evidence indicates that both men and women over 50 years of age tend to adopt preventive behavioral strategies similar to those sometimes reported by young women, such as avoiding walking by themselves in city centers at nighttime, traveling with a companion for safety, or avoiding certain streets and particular types of people, such as groups of young men.

Location

Geographical location plays a key role in shaping a person's self-reported fear of crime. Most reported crime occurs in inner cities, and city residents living in inner-city areas with high levels of victimization and social disorder, such as graffiti and vandalism, frequently report that they are fearful of crime. However, the level of familiarity that an individual has with an area influences his or her fear of crime. This suggests that people living in high crime areas do not necessarily automatically feel a high risk of victimization once they become familiarized with the location. Research has found that those who have lived in inner-city properties for longer periods of time are more likely to report adopting preventive behavioral strategies, such as avoiding particular streets at night; are less likely to be fearful of crime and are more likely to install additional security devices in their homes and general property. Research also suggests that older people may be more affected by the presence of social disorganization factors, such as run-down housing, graffiti, and the presence of incivility between neighbors, than cosmopolitan young professionals, who sometimes report that they consider such things to add to the colorful tapestry of life within inner-city neighborhoods. Nevertheless, neighborhood disorder and incivility is a significant indicator of perceived risk among both men and women, young and old. This is consistent with contemporary situational crime-prevention theories, such as J. Wilson and G. Kellings's broken windows theory in 1982, which suggest that negative features in the physical environment are related to the presence of high levels of criminality, deviant behavior, and fear of crime within inner-city areas.

Underreporting and Crime Rates

Researchers face a number of methodological issues when analyzing fear of crime and actual crime rates. Victimization surveys such as the NVCS are often used to identify crime patterns and rates and are also frequently used to act as a contrast to the level of fear of crime that people self-report. Problems arise because a significant number of crimes are underreported, such as physical assault, domestic violence, and rape. Also, respondents' answers to fear of crime survey questions are often influenced by their personal, families', friends', and acquaintances' unreported victimization experiences. However, for a mixture of personal and sociocultural reasons, individuals may be unwilling to admit if they, their family, friends, or acquaintances or have been victims of crime, particularly when issues such as gender-based violence and sexual assault in the home are discussed. As a result, differences between a person's self-reported fear of crime and the officially recorded crime patterns and rates found in the NVCS and BCS must be treated with some caution. Actual crime may well be higher than reported, and a person's fear of crime may be heavily mediated by his or her awareness of other people's direct and indirect experience of crime.

Social Media

Finally, it is also important to consider external factors, such as news media coverage and the growth of modern mass communication technologies, in shaping public perceptions of crime and the risk of being victimized. Research shows that the volume of crime stories and the presentation format used by the mass media to report them can significantly influence, for better or worse, the level of fear of crime possessed by individuals. Fear of crime must be seen as a dynamic, rather than static, construct that varies over time and place, is mediated by external factors such as news media reporting, and is not solely definable by social categories such as age, gender, and geographical location. The rapid development of social media technologies, such as Twitter, YouTube, and Facebook, is adding an extra dimension to the ongoing exploration of the role played by technology and mass communications in dynamically influencing the fear of crime.

Federal Deposit Insurance Corp.

The Federal Deposit Insurance Corporation (FDIC) was established by the Banking Act of 1933, also known as the Glass–Steagall Act, in response to the bank failures caused by the stock market crash of 1929 and poor business practices in the financial sector. The purpose of the FDIC is to insure the deposits of bank account holders in the event of a bank failure and to promote consumer confidence in investments. Legislation to establish the FDIC was sponsored by Senator Carter Glass of Virginia and Representative Henry B. Steagall of Alabama, who introduced separate bills in Congress. Both bills proposed a version of deposit insurance and established differing versions of how banks would become members of the insurance corporation. The administration of Franklin D. Roosevelt also had two requirements that could be found in both bills, including a sliding scale for deposit coverage and a one-year delay before the corporation would begin operations.

Operations Begin on July 1, 1934

The final version of the bill, signed by President Roosevelt—despite his personal reservations—on June 16, 1933, amended section 12B of the Federal Reserve Act and created the FDIC, which began operation on July 1, 1934. The agency has a six-member board of directors, including two ex-officio members, the comptroller of the currency and the director of the Consumer Financial Protection Bureau; and four members appointed by the president to six-year terms. One appointee serves as the chairman of the board, and another as the vice chair, both with five-year terms. Like other federal commissions, no more than two persons on the committee can be from the same party.

The purpose of the FDIC is to insure deposits, regulate financial institutions to ensure soundness, and manage receiverships. Under this legislation, the FDIC oversees banks that are not part of the Federal Reserve and their member banks. The main office for the FDIC is located in Washington, D.C., and the agency has eight regional offices, three temporary satellite offices, and field offices located all over the United States. The eight regional offices are located in Atlanta, Boston, Chicago, Dallas, Kansas City, Memphis, New York, and San Francisco. Each regional office has three or more field offices in the surrounding area.

When the FDIC was first established, the insurance coverage for deposits was $2,500, and over time the amount has increased nine-fold. Currently, the FDIC insures deposits in American banks and savings and loan institutions up to $250,000 and monitors the business practices of all financial organizations. The Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 created a $250,000 maximum liability per account. The FDIC is funded not by Congress, but by the insurance premiums paid annually by member banks. Under the rules of the FDIC, only member accounts can be insured; securities, mutual funds, and other investments are not included. Participating banks must post notices indicating that their deposits are insured by the FDIC. In its regulatory role, the FDIC monitors all state-chartered financial institutions to make sure that they are following consumer protection laws. When a bank fails, the FDIC steps in and typically organizes the transfer of loans and deposits to another institution, with little interruption in accounts and service. In this practice, the users become account holders in the new bank, and they do not lose their investments.

The 2006 Federal Deposit Insurance Reform Act made major changes to the FDIC. It created the Deposit Insurance Fund (DIF) as the repository for the insurance premiums paid by member institutions. The new DIF replaced two separate funds that insured bank and savings and loan accounts separately. Participating institutions are assessed an amount based upon the deposits in the bank and the amount of risk to the fund by the institution. Additional requirements under the law include reports and surveys to the agency on a periodic basis.

In response to the economic situation in 2008–10, the FDIC now maintains a list of banks that are in trouble and reports on them quarterly. Since 1934, the FDIC has met its mission to stabilize the financial industries of the United States. Since that time, investors have received their deposits up to the insured amounts when banks failed. FDIC procedures have worked well to ensure that, even during the savings and loan failures of the 1980s and 1990s, American's deposits were safe.

Federal Gambling Regulation

The federal government has historically offered little gambling regulation, aside from the organization of the original large-scale lotteries. In the early United States, lotteries were used to fund the original colonies, universities, and other community projects. Until the 1960s, little federal law directly dealt with gambling regulation. In 1961, the Federal Wire Act was passed, which made sports betting conducted through any wire communication in the United States illegal.

Along with the Wire Act, the Travel Act was passed, which made any participation in a gambling through the mail or by traveling across national or state lines illegal. Both of these acts were passed with the intent by the federal government to halt and prevent organized criminal enterprises involved in illegal gambling. The federal government again stepped into the role of regulator with the passage of the 1970 Illegal Gambling Business Act. The act was aimed again at organized criminal gambling institutions that facilitated, through funding, more serious organized criminal activity. With these acts, the federal government strictly regulated the types and methods of gambling in the United States.

The federal government was thereafter inactive in federal gambling regulation until the late 1980s. In 1988, the federal government passed the Indian Gaming Regulatory Act, which sought to outline the structure of Native American gaming jurisdictions. Under this act, reservations were able to continue revenue generation through organized gaming. This federal gaming regulatory law sought to further protect Native American gaming from infiltration by organized criminal enterprises. The framework of the act allowed for a system of regulation to ensure gaming integrity and just revenue transmission, by tribes, to rightful Native American communities.

During the early 1990s, the U.S. Congress took action that would not only regulate gambling but also seriously limit the power of individual states to regulate gambling activities within their jurisdictions. In 1992, the Professional and Amateur Sports Protection Act was passed, making it illegal for an individual, business, or state to operate gambling schemes or accept wagers on any professional or amateur sporting event. The bill allowed for the inclusion of states that were operating sports betting schemes prior to the passage of the bill through a grandfather provision. Furthermore, the bill allowed state governments a one-year period after the bill was passed to set up legislation legalizing gambling in their states. The federal government exempted horse and dog racing events from the act. Also in 1992, the Illegal Money Transmitting Business Act aimed to prevent the transfer of money through illegal gambling institutions. The bill prevented criminal gambling organizations from bypassing banks and other legal financial institutions to move funds.

Online Gaming

As the Internet proliferated, the need for further gambling regulation at the federal level was realized. The American Gaming Association and other organizations have pressured Congress to outline regulatory guidelines that would make online gambling legal and safe for Americans. This is in response to several unclear interpretations of the Wire Act and its implications for online gaming. The U.S. Department of Justice (DOJ) has sought out online gaming institutions and their users, often seizing hundreds of millions of dollars in an

A dealer works a table at Harrah's Hotel in Las Vegas, April 23, 2011. Until the 1960s, few federal laws directly dealt with gambling regulation. In 1961, two acts were intended to prevent organized criminal involvement in illegal gambling: The Federal Wire Act prohibited sports betting via any wire communication, and the Travel Act prohibited gambling through the mail or across national or state lines. The 1970 Illegal Gambling Business Act was also aimed at organized criminal gambling institutions.

attempt to stem the proliferation of online gaming. Most of these attempts to prosecute gaming institutions and their users have hinged on interpretation of the 1961 Wire Act. The DOJ took the position that all online gaming involving the transfer of funds is illegal and has used the Wire Act to justify this stance.

Adding to the confusion about Internet gaming in the courts, the federal Fifth Circuit has found that the Wire Act only applies to sporting events. In an effort to further regulatory power on Internet gambling, the federal government passed the Unlawful Internet Gambling Enforcement Act (UIGEA) in 2006. The law makes it a federal offense to accept funds for the use of or payment to Internet gaming services. In response to the UIGEA, many Internet gaming businesses withdrew from the United States market altogether. There are many supporters of Internet gaming who have pressured Congress to take a step away from strict prohibition and toward more tolerant Internet gambling regulation. Justification for this stance cited by such supporters includes the loss of taxation revenue and the propagation of illegal Internet gaming, where users are at greater risk because of the absence of federal regulators.

States have stepped into the debate to exercise their rights to prohibit or regulate online gaming activities. Future bills have been proposed that would license and create a tax structure for modern gambling through federal regulation. Many gaming institutions argue that certain games should be exempt from strict gambling regulation. This is centered on the idea that certain games are not reliant on mere chance. These games, like poker, are said to be driven by the players' level of skill. Online gaming, the classification of gaming activities, and the role that states play in exercising regulatory power will continue to shape federal gambling regulation. As the gambling industry grows, so will the money that federal and state governments stand to collect through effective regulation. How long governments can legitimize the loss of revenue that could be generated through regulation may be a driving force for law in the current economic environment.

Federal Trade Commission

The Federal Trade Commission (FTC) was established in 1914 after the passage of the Federal Trade Commission Act of 1914 by Congress. The legislation was proposed by President Woodrow Wilson in response to the antitrust stance of the Progressive movement and the recent breakup of the Standard Oil Trust. The FTC replaced the existing Bureau of Corporations, which was created in 1903 under President Theodore Roosevelt.

The purpose of the commission is to protect American consumers from the results of anticompetitive business practices. The commission helps enforce not only the FTC Act but also the terms of the Clayton Antitrust Act of 1914. The commission hears complaints from individuals and businesses and conducts investigations. It also has partnerships with other federal agencies, like the U.S. Department of Justice, when investigating antitrust violations. A five-person Board of Commissioners is appointed by the president to rolling seven-year terms, and all commissioners must be approved by the Senate. Under the rules in the FTC Act, no more than four board members can be from the same political party. One of the commissioners is appointed to the position of chairman.

The commission has eight offices and three bureaus that report to the commissioners and handle the day-to-day workings of the commission. Offices include: Congressional Relations, Public Affairs, Policy Planning, Secretary, and International Affairs. Legal offices include three areas: Administrative Law Judges, Inspector General, and Equal Employment Opportunity. The three bureaus include the consumer protection, competition, and economics bureaus. Rounding out the organization are the general counsel and executive director. The commission also has seven regional offices, located in Los Angeles and San Francisco, California (western); Dallas, Texas (southwest); Atlanta, Georgia (southeast); Chicago, Illinois (Midwest); Seattle, Washington (northwest); Cleveland, Ohio (east central); and New York City (northeast). These offices serve multistate areas and provide education and outreach services to both consumers and businesses.

Among the powers granted to the FTC, the largest are its investigative powers granted by the FTC Act and the Clayton Antitrust Act. The agency has the power to investigate proposed mergers and antitrust violations, conduct line of business studies, and work with foreign governments investigating spyware and Internet safety problems under the U.S. SAFE Web Act of 2006. The Hart-Scott-Rodino Act of 1976 required companies to submit a premerger notification and mandated a waiting period before commencing the merger. Pharmaceutical companies and generic drug manufacturers also have to file their agreements with the FTC for oversight purposes. The FTC has oversight privileges that are designed to protect American consumers. Among its administrative powers are adjudication and rule making. The commission can file a complaint against a company that has violated a consumer protection statute and, if necessary, pursue a trial with an administrative law judge. The commission can also address problems with trade practices by issuing regulations and enforcing them. The FTC also enforces the antitrust laws that impact unfair trade practices under the Sherman Antitrust Act and Clayton Antitrust Act.

With the rise of the Internet and electronic information, the FTC has expanded its consumer protections beyond what was imagined in 1914. In recent years, the agency has filed against major corporations like Countrywide and debt collectors for using aggressive practices. Other companies have had their assets frozen for false advertising on the Internet by posing as a news site or claiming false endorsements. Today's FTC is on the lookout for instances where private information is collected by people posing as legitimate companies on the Internet. Today's FTC still pursues the same mission and goals it had in 1914 to protect the American consumer. The world has changed, and consumer protection has expanded from price fixing and monopolies in the times of Standard Oil and Bell Telephone, to monitoring the Internet for scams and people who steal personal information by posing as legitimate companies. The FTC has increased its role in educating the American consumer and has created ways for Americans to control who gains access to their information through services like the National Do Not Call Registry. The agency was nearly a victim of the deregulation movement during the 1970s and early 1980s, when Congress felt that the agency had outlived its purpose.

The role of the FTC in government and business often places it at odds with major companies and legislators that hold power in Washington. Despite this, the agency has moved into the 21st century and uses the Internet and other online tools to provide options for the public to relay their concerns and to investigate identity theft, illegal debt collection practices, and other problems that come with a weakened economy. In its 100th year, the FTC is a strong regulatory agency that works to protect the American consumer.

Federal Trade Commission Act

The Federal Trade Commission Act became law on October 17, 1914, and was intended to enforce antitrust laws and protect American consumers. Today, the act encompasses not only trusts and monopolies but also oversight of the National Do Not Call Registry and the protection of consumers from false information on the Internet. The origins of the FTC act began on January 20, 1914, when President Woodrow Wilson proposed an antitrust initiative to Congress. He sought an agency to advise and investigate to help courts and businesses—an interstate trade commission. Senator Henry Clayton drafted a series of four bills related to the FTC act, together called the "five brothers." These acts made up an antitrust package containing numerous procedures and provisions to be overseen by the commission. The U.S. Department of Justice had a role in enforcing the civil aspects of regulation, and subsequent criminal sanctions that could be assessed on corporations and individuals. The proposed bills ran into problems in the House and Senate when various interests argued about the amount of power the commission would have, and Wilson changed his emphasis as the 1914 fall elections neared.

The act was heavily debated in both houses of Congress before the final version of the act was passed by the Senate on October 5 and the House on October 8. The major disagreement was over Section 5 of the bill, which discussed enforcement powers of the commission. Wilson signed the bill into law on October 17, 1914. After all of the versions had been through the committee and changes were made, the act kept sections on price discrimination; the biggest change was to limit the commission to administrative enforcement. The final version of the bill created the Federal Trade Commission (FTC) as an independent regulatory agency, replacing the Bureau of Corporations, created in 1903. The president could appoint five commissioners to rolling seven-year terms, and only four of the seven commissioners could belong to the same political party. The commission had the ability to investigate cases of monopoly and unfair competition. It had the formal powers granted to investigate and prosecute, while having informal powers to educate and work with businesses to increase compliance.

Amendments have been passed to update the act. The Webb-Pomerene Act of 1918 made it possible for export companies to avoid regulation. The purpose was to free the companies from regulation during World War I. The Wheeler-Lea Act of 1938 gave the commission authority over advertising and provided penalties for not obeying Section 5 orders. These amendments protected citizens from false advertising. The 1976 Hart-Scott-Rodino Act expanded the commission's powers to prevent monopolies by requiring companies to declare their intention to complete a merger to the FTC. As a result, the commission could investigate the merger and intervene through the courts to protect consumers. The advent of the Internet led Congress to pass the SAFE Web Act of 2006 to protect American consumers from problems associated with spyware and persons posing as online companies to collect personal information from consumers for the purpose of fraud and identity theft. In connection with the SAFE Web Act, the commission is authorized to work with international governmental agencies to investigate spam activities originating outside the United States.

The Federal Trade Commission Act of 1914 has survived well since its passage and remains a vital force in regulatory legislation. Originally, the commission's role included the enforcement of antitrust regulations that fell under the Sherman Act of 1890. Progressive reforms that began in 1903 under Theodore Roosevelt to break up the trusts and monopolies that dominated American industry continued into the presidency of Woodrow Wilson. The resulting legislation has needed amendment and expansion over the years, but the agency it created remains intact, fulfilling its role of protecting the American consumer. The legislation now includes handling consumer complaints about excessive phone calls, protection from Internet spam, and continual education of consumers about protecting their information. The act and its resulting amendments are landmarks in their oversight and regulation of American business and related interests.

Fertility Fraud

Fertility fraud refers to instances where doctors and other medical professionals exploit opportunities that arise when people use assisted reproductive technology (ART) to address fertility issues. The Centers for Disease Control and Prevention (CDC) defines ART as any process in which human eggs are removed from ovaries and combined with sperm in order to facilitate a pregnancy. Procedures can involve use of a woman's eggs, donated eggs, donated sperm, placement of an embryo in a woman seeking to become pregnant, or placement of an embryo in a surrogate mother. In addition, eggs, sperm, and embryos can be used immediately after harvesting or can be frozen for extended periods.

These procedures are possible because of the relatively recent explosion of reproductive technologies managed by health care professionals who stand to profit from their use. Since the first "test-tube" baby was created in 1978, the number of infants conceived using ART has grown exponentially. In 1996, ART was responsible for 14,507 live births in the United States. By 2010, that number more than tripled, to 47,090 live births, some involving multiple infants, for a total of 61,564 babies that year. Those figures reflect only procedures associated with successful, full-term pregnancies. Some estimate that as many as 138,000 ART procedures were performed in the United States in 2010. Because these procedures are notoriously expensive—an infant conceived using ART costs anywhere from $20,000 to $400,000—a booming fertility business has flourished. However, development of ART has outpaced regulation and has allowed unscrupulous health care professionals to exploit ART in a variety of ways. Attempts have been made to address that regulatory void, but some critics argue these measures are inadequate. Moreover, there is evidence that some rogue medical and legal professionals actively attempt to avoid regulation through international means.

Types of Fertility Fraud and Notable Scandals

Fertility fraud can take many forms and can occur at different stages. Fertility clinics competing for patients have made false or misleading statements about the success rates of their ART procedures in advertisements and during patient counseling. Because many ART procedures are not covered by insurance, treatment providers have performed ART services and have then fraudulently billed insurers for covered procedures. Some critics have asserted that because patients lack access to information about what constitutes proper fertility treatment, or because they are desperate to conceive, unethical doctors have subjected patients to unnecessary or untested procedures that have little chance of success or have agreed to perform services for patients who are physically unable to benefit from them. Some physicians take such deceptions even farther. Noted Virginia physician Cecil Jacobson injected women with hormones so that they erroneously believed that their ART treatments resulted in pregnancies. He then charged the patients for follow-up care and visits before eventually telling them that their fetuses had died.

A number of the most chilling frauds, however, involve misuses of sperm, eggs, and embryos. In addition to using hormones to induce fake pregnancies, Jacobson used his own sperm to impregnate unsuspecting patients over a 12-year period, fathering as many as 70 children before he was convicted of fraud in 1992. Similarly, a doctor admitted to using his own sperm for donations during his residency at Georgetown University Hospital. Those donations resulted in 33 women becoming pregnant, even though professional guidelines limited sperm donations to 10 recipients. Robert Edwards, the doctor responsible for the first test-tube baby in 1978, allegedly used eggs without obtaining donor consent to do so.

In addition, in the most notorious fertility fraud, doctors Ricardo Asch and Jose Balmaceda at the University of California (UC) Irvine's Center for Reproductive Health stole eggs and embryos from patients and used them to impregnate other patients. Neither the patients providing eggs and embryos nor the patients receiving them were aware of the misappropriation, which later came to light after three whistleblowers complained to officials about laboratory misconduct. Both doctors fled the country after they were federally indicted for fraud. A third doctor, Sergio Stone, was also accused of stealing and misusing eggs and embryos at UC Irvine, but he was acquitted of those charges and convicted of mail fraud for his role. Over 100 patients filed civil suits against the university, asserting a number of claims, including civil fraud and racketeering. The last of those suits was finally settled in September 2009.

However, the case has had a lasting impact. When a California couple who had their embryos frozen in 2008 returned to Santa Monica Fertility Clinic in 2011 to have their embryos implanted in the couple's wife, they were told that their embryos had been accidentally destroyed. The couple filed suit, alleging that the embryos had likely been implanted into other patients, and demanded that all patients receiving treatments from the clinic have their babies undergo genetic testing to determine biological parentage. That case is pending.

U.S. Public and Private Regulation

In the United States, medicine, including fertility medicine, is subject to federal and state regulation, as well as self-regulation through professional organizations. At the federal level, only one statute, the 1992 Fertility Clinic Success Rate Certification Act (FCSRCA), directly governs ART. The FCSRCA and its implementing regulations allow clinics to voluntarily participate in a data-collection system, reporting fertility treatment success rates, and authorizes the CDC to develop a model program for certifying embryology laboratories. Adoption of the certification program is left up to the states, and no state has adopted it yet. In addition, other federal regulations relate to, but do not govern, ACT. For instance, standards for testing the health and safety of sperm and eggs are set by the federal Food and Drug Administration, while standards for fertility tests are set by the Centers for Medicare and Medicaid Service.

At the state level, prohibitions against medical malpractice and fraud are generally applicable, but specific regulation of ART varies widely. For instance, New Hampshire has adopted a comprehensive regulatory scheme governing in vitro fertilization. In contrast, Pennsylvania merely sets reporting requirements for fertility clinics, whereas Louisiana requires that fertility clinics adhere to guidelines set by professional organizations such as the American Society for Reproductive Medicine. Most governing has been done through standards set by professional organizations, which can set standards quickly and are thus better at keeping pace with rapid technological developments than are legislatures.

This combination of federal, state, and self-regulation has prompted one group to claim that reproductive technologies are highly regulated in the United States, but critics complain that these measures, many of which are voluntary, are not comprehensive. Because of that, in 2008, the American Bar Association set forth a model act governing ART and encouraged states to implement it. No state has done so.

Recent International Developments

Because the United States lacks a comprehensive regulatory scheme, couples have recently begun traveling to the United States to avoid strict regulation of ART in their home countries. In particular, British citizens have avoided strict regulations in the UK by engaging in "fertility tourism" in the United States. Moreover, U.S. citizens have used international means to evade the relatively lax regulations that do exist.

For example, one California company, Planet Hospital, deliberately seeks out egg donors from one European country, sperms donors from a second, and surrogate mothers from a third, to "assemble" an overseas baby for U.S. couples. In the process, the company manages to avoid U.S. regulations and skirt surrogacy restrictions abroad. Some in the United States have gone even farther. For instance, in 2011, two prominent U.S. attorneys, Theresa Erickson and Hilary Neiman, pleaded guilty to an elaborate international surrogacy and baby-selling scheme that was designed to work around minimal regulations on surrogacy enacted in California, which, unlike other states, allows commercial surrogacy if certain guidelines are followed. One of those guidelines is that a surrogacy contract be in place before a surrogate is implanted with an embryo. This requirement is designed to prevent pregnant women from selling their unborn infants after they are conceived. Erickson and Neiman avoided this requirement, however, by recruiting surrogates from across the United States and sending them to Ukraine, where they were implanted with embryos created with donor sperm and eggs. After waiting until the second trimester, when the highest risk of miscarriage had passed, Erickson and Neiman found buyers in the United States who were willing to pay as much as $150,000 for the unborn infants. The surrogates were told that the process was legitimate and that they were sent abroad for innocuous reasons. The full impact of this international dimension to fertility fraud remains to be seen.

Fiduciary Fraud

A fiduciary is a person who acts as an agent, trustee, partner, corporate officer, or director, while the represented person is the principal, beneficiary, partnership, corporation, or other person to whom a fiduciary owes trust and confidence. The fiduciary, therefore, is in a position of financial trust for the represented person or organization. A fiduciary has the duty to act for the benefit of the one seeking the fiduciary's services. The fiduciary relationship is premised on the special knowledge and expertise of the fiduciary. As a result, there is a fundamental imbalance of information that necessitates the represented person placing significant trust in the fiduciary. Given this vulnerability on the part of the represented person, the fiduciary is the dominant party and is held to high standards. Fiduciary fraud occurs when one person or entity intentionally deceives or lies to another person or entity.

Determination of Fraud

To determine when and to what extent one is operating in a fiduciary relationship depends on the facts and circumstances of each case, particularly the relationship of the parties involved. The fiduciary relationship requires the parties to comply with rules stipulating such things as: neither party may deal with a subject matter of the trust in such a way as to benefit one party or prejudice the other, except in the utmost good faith and with the full knowledge and consent of the other. Examples of fiduciary relationships are those between attorney and client, guardian and ward, principal and agent, executor and heir, and landlord and tenant. Stockbrokers, insurance agents, investment advisors, and financial planners are types of fiduciary agents.

If it is determined that a person acted in a fiduciary capacity, the burden of proof shifts from the plaintiff alleging fiduciary fraud to the defendant fiduciary, to prove that he or she acted honestly. To prove fiduciary fraud in court, the plaintiff must show that an intentional misrepresentation or omission was made, with the intent to defraud the other party; that the plaintiff relied on this misrepresentation or omission; and that the plaintiff suffered reasonable damage as a result of the reliance on the information. If the client is successful in showing that the fiduciary engaged in fraud, the client can recover monetary damages for the injury or loss. The client can sue for such monetary damages as the contract fees, in addition to actual loss resulting from the fraud. The client may also be able to recover punitive damages.

Embezzlement is a common fraudulent act committed by the fiduciary. A bank, as a third party, may be sued if it takes an instrument by a fiduciary (such as a check) in clear violation of its fiduciary duty. The bank is on notice of a breach of fiduciary duty when a check that is payable to the represented person or the fiduciary is deposited in an account other than a fiduciary account or account of the represented person.

The Uniform Fiduciaries Act and the Uniform Commercial Code are the sources for the law in civil suits. In a case that was brought to court in 2009, the defendant allegedly squeezed the plaintiff out of the company the plaintiff founded and was an officer member of the board of directors by fraudulently misrepresenting that an investment firm was willing to invest large sums of money, on the condition that the plaintiff divest his shares of stock and become an at-will employee. The plaintiff was told that if he did not comply, then the investment would not occur, and the corporation would become insolvent. The plaintiff complied and was later fired.

Enforcement

Criminally, the federal government is increasingly using 18 U.S.C. § 1346 to prosecute company executives for breaching fiduciary duty. This statute makes it a felony to engage in a scheme to "deprive another of the intangible right of honest services." Following revelations of the massive fraud and wrongdoing in corporations such as Enron and other public companies, the U.S. Department of Justice has invoked §1346 to criminally indict executives for breaching their fiduciary duties. Chief Executive Officer Jeff Skilling from Enron is one of the corporate executives to be found guilty of the fraudulent acts that occurred during the massive breach of duty. One reason to apply this statute to gain criminal convictions for fiduciary fraud was because of pressure that Congress had exerted for more prosecutions. Under this law, fiduciaries may be criminally liable for conduct that would not subject them to civil sanctions.

Fiduciary liability insurance is protection for fiduciaries against losses resulting from a breach of fiduciary duty.

Film Recovery Systems Inc.

The Film Recovery Systems (FRS) case put corporate executives on notice that there was a possibility that extremely serious consequences could ensue if they were not diligent in obeying rules regulating their company's workplace and its products. In the first time such a charge had been leveled against corporate moguls, four FRS officers were indicted by a state grand jury in 1983 for the crime of murder, as well as for more than a dozen counts of reckless conduct.

Poisoning at the Plant

FRS, located in Elk Grove Village, a Chicago suburb, operated a plant that extracted the small quantities of silver residual in X rays taken in hospitals and clinics. Workers cut the X-ray films into pieces and then put them into huge tanks containing 500 gallons of water and seven and a half pounds of sodium cyanide. Further increments of cyanide were added over the following three days. After constant stirring, the mixture separated the film from the silver, which was routed by a continuous flow system into a polyurethane tank. Inside each tank were two stainless steel electrode plates with positive and negative charges that detached the silver from the cyanide. Workers then scraped off the accumulated silver. Afterward, they had to pump the liquid and shovel the remnants of the cyanide-coated film out of the tank. Their work brought FRS income of $20 million the year before legal proceedings against it and its leaders were set in motion.

Cyanide is absorbed into the human body by various routes, with serious health-impairing consequences. The FRS workers, mostly undocumented aliens, were subject to constant bouts of dizziness and nausea. The situation came to a head on February 10, 1983, when Stefan Golab, a 59-year-old undocumented worker from Poland, had convulsions, frothed at the mouth, and died. The cause of his demise was determined by the coroner to be acute cyanide toxicity.

Investigators learned that the FRS workers were never told of the risks they were running. They generally were unwilling to complain to management because they were vulnerable to deportation. Also, their unfamiliarity with English kept many of them from understanding the dangers of working with cyanide. The skull and crossbones on a vat, the universal sign of danger, had been defaced and partially burned off so that it was barely visible. The prosecuting attorney would describe the FRS workplace as a huge gas chamber and point out that the workers were not permitted to wash their hands before eating lunch. They were supplied with inadequate paper masks on a regular basis, but when a safety inspection was scheduled, they were given proper face protectors.

The Prosecution

One of the accused was dropped from the case before trial, but the president of FRS, the plant manager, and a foreman were found guilty after a two-month trial before a judge hearing the case without a jury. The men were sentenced to 25 years in prison and given a 364-day sentence for each of the 14 charged acts of reckless conduct. This second term was to run concurrently with the longer period of incarceration. In addition, the convicted men were fined $10,000 for the killing and $1,000 for each of the episodes of reckless conduct.

The prosecutor was able to avoid having to prove criminal intent, a requirement that often proves an insurmountable barrier in white-collar crime cases, because the Illinois criminal code specifically defines as murder instances in which the accused "knows that such acts create a strong probability of death or great bodily harm." An unusual twist marked the FRS case when Michael MacKay, vice president of the company, also under indictment, fled to Utah, and that state's governors refused on three occasions to extradite him back to Illinois for trial on the stated ground that he was more useful in Utah than he would be in Illinois. MacKay, the co-owner of FRS, was an upstanding member of the Mormon Church, a war veteran, a philanthropist, a Boy Scout leader, and, like most alleged white-collar criminals, a model citizen once he moved out of his business role.

In 1990, an Illinois appellate court overturned the conviction of the three FRS officials because of what it deemed a technical flaw in the original proceeding. The court ruled that it was legally impermissible to charge both murder and reckless conduct for the same conduct because the behaviors require incompatible states of mind. The state supreme court declined to consider the case. Thereafter, the defendants negotiated a plea bargain on a charge of involuntary manslaughter. One went to prison for three years and a second for two years, and the third, the foreman, was placed on probation.

Financial Accounting Standards Board

The Financial Accounting Standards Board (FASB), a subsidiary of the independent, tax-exempt Financial Accounting Foundation (FAF), sets financial accounting and reporting standards, the core of generally accepted accounting principles (GAAP). The Securities Act of 1933 provided for the Federal Trade Commission to regulate reporting for public companies and the practice of public accounting. The Securities Exchange Act of 1934 assigned this to the Securities and Exchange Commission (SEC). Between 1936 and 1938, the SEC allowed some authority to revert to private entities, such as the American Institute of Certified Public Accountants' (AICPA) Committee on Accounting Procedure (1936–59) and Accounting Principles Board (1959–73).

Because these lacked enduring influence, the profession developed a new framework in 1973, including the FASB. Two advisory and oversight bodies promote FASB independence: the Financial Accounting Standards Advisory Council (FASAC) and the FAF. The FASAC consults for the FASB, assists in setting priorities, recommends issues for consideration and action, and helps establish task forces for research and implementation. Its more than 30 members reflect constituencies that prepare, audit, and use financial statements and collateral information.

The FAF selects members of the FASB and the FASAC (and Governmental Accounting Standards Board), finances them, and supervises them. Its board emphasizes efficiency and effectiveness in financial reporting in the public interest through nominations by prominent accounting organizations and at-large members. This framework prevailed for decades, though problems arose with savings and loan audits and auditor independence by the 1980s. When frauds involving Enron, WorldCom, accounting firm Arthur Andersen, and others emerged in 2001; confidence in the integrity of accountants, corporate leaders, capital markets, and the economy dropped as millions lost jobs and wealth. The profession and the George W. Bush administration resisted additional regulation through early 2002, when the indictment of Arthur Andersen for obstruction of justice, and its dissolution as clients departed, made a federal response necessary to restore confidence. Accountants focused on influencing what became the Sarbanes-Oxley Act. This law resumed federal oversight of the profession through the Public Company Accounting Oversight Board (PCAOB), a tax-exempt organization with rule-making authority over corporations listing securities in public capital markets, as well as their auditors. The SEC oversees the PCAOB and appoints its members. Under the act, the SEC designated the FASB a "private-sector standard setter" on April 25, 2003.

Mission of the Board

The FASB's mission is "to establish and improve standards of financial accounting and reporting for the guidance and education of the public, including issuers, auditors and users of financial information." It promotes efficient and effective capital markets, and it safeguards the interests of stakeholders who depend on them. The FASB consists of seven full-time members with five-year terms (renewable once), who must sever relationships with their organizations during their service. Members must possess "knowledge of accounting, finance and business, and a concern for the public interest in matters of financial accounting and reporting." A staff of 60 from public accounting, industry, academe, and the public sector assist the FASB and task forces, perform research, contribute to meetings, analyze public comments, and draft recommendations and responses.

The FASB promulgates the following: statements of financial accounting standards, statements of financial accounting concepts, interpretations, technical bulletins, and staff positions. Bulletins include material from the 1984 Emerging Issues Task Force, which it formed to address timeliness of financial reporting and other issues. On September 18, 2002, the FASB and the International Accounting Standards Board agreed to promote convergence of international financial reporting standards (IFRS) and GAAP. The migration from historical to fair-value asset cost has been controversial for risk of undue influence, as some alleged in June 2009 regarding accounting for toxic bank assets. On July 1, 2009, the FASB launched the Accounting Standards Codification as "the single source of authoritative nongovernmental U.S. [GAAP]" to organize promulgations underwriting these principles.

Financial Crime Kingpin Statute

The Comprehensive Thrift and Bank Fraud Prosecution and Taxpayer Act of 1990 is a U.S. federal law that is theorized to have stemmed from the savings and loan scandal of the 1980s. The act contains the Continuing Financial Crimes Enterprise Statute, which is also known as the Financial Crime Kingpin Statute. For conviction under this statute, the offender must have been a creator, organizer, manager, or supervisor of the continuing operation and have obtained income or resources from these violations of $5 million or more in a 24-month period. The act contains three new criminal offenses and new sentencing guidelines, under which the offender can be fined $10 million and sentenced to a maximum of life in prison. It is the white-collar counterpart to the Continuing Criminal Enterprise (CCE) drug law. The similarities between the two laws are primarily in their composite makeup: both the Financial Crime Kingpin Statute and the CCE discuss "modern compound crimes" in that they require the commission of a series of specified acts to occur, and the establishment of a "criminal enterprise."

The purpose of the financial kingpin statute was to punish those responsible for causing the rash of savings and loan failures in the 1980s. Criminal misconduct was not the primary cause of the savings and loan scandal. The multiple reasons included high interest rates, decline in the housing market, government deregulation of the banking industry, regulatory controls, and high-risk investments with government-insured money. All of these made for an environment that was unstable and allowed for some individuals act criminally within the industry. The public pushed Congress to enact statutes to allow the persons involved to be sanctioned to the fullest extent of the law. Congress took the public's outrage seriously, as evidenced by the "retributive tenor of many comments made by members of Congress."

The first individual to be prosecuted under the Financial Crime Kingpin Statute was Roy Harris, former president and chief executive officer of Arochem. He was convicted of 22 counts of felony fraud for illegally obtaining $245 million in loans from several banks to keep the business operating. He hid the true financial condition of the company when applying for the loans. One critique of the statute is that it allows more discretion on the part of the prosecutor, especially in the plea bargain area. Prosecutors can amend charges according to what they feel will be most negotiable, thus using the fine and life imprisonment as leverage. Prosecutors are allowed great leverage and discretion with these types of statutes. Some scholars feel that the laws are not pursued as diligently as others because of the types of offenders they target: those of great financial means. In 2009, 83,000 cases were prosecuted under federal jurisdiction. Out of these cases, approximately 11.7 percent were for white-collar offenses. Most of the cases prosecuted still tend to be for immigration and drug-type offenses (63 percent).

Financial Crimes Enforcement Network, U.S.

The Financial Crimes Enforcement Network (FinCEN, or FCEN) is a federal bureau headquartered in Vienna, Virginia, under the auspices of the U.S. Department of the Treasury, which collects and analyzes information on financial transactions in order to undercover "dirty money" and fight a range of related crimes such as money laundering, terrorist financing, organized crime, and other financial crimes, including frauds and scams. Its overall mission is to "provide a government-wide, multisource intelligence and analytical network in support of the detection, investigation, and prosecution of domestic and international money laundering and other financial crimes by federal, state, local, and foreign law enforcement agencies." The director of FinCEN is appointed by the secretary of the Treasury. James H. Freis, Jr., assumed office in March 2007.

The Anti-Drug Abuse Act (1988) closed a loophole in the Bank Secrecy Act to expand the definition of "financial institution" to include some large businesses used as fronts by money launderers, such as car dealerships and real estate agencies.

Although FinCEN was officially established on April 25, 1990, by the secretary of the Treasury, the history of FinCEN dates back to 1970. In that year, the U.S. Congress passed, and has since then amended, the Bank Secrecy Act, which requires private individuals, banks, and other financial institutions in the United States to create and maintain records of monetary or negotiable instruments—documents guaranteeing payment, either on demand or at a set time, of a specific amount of money—in order to help identify the source, volume, and movement of currency, whether transported or transmitted into or out of the United States, or deposited in financial institutions. Specifically, the act requires banks to file reports of cash transactions over $10,000, using the Currency Transaction Report; requires financial institutions to provide assistance to federal agencies for the detection and prevention of money laundering; and requires the reporting of any related suspicious activity, such as tax evasion.

Over a decade later, in a time of increased credit card usage and concern over the war on drugs, two more key laws were passed. In 1986, Congress passed the Money Laundering Control Act, which officially made money laundering a federal crime by prohibiting individuals from participating in financial transactions generated from unlawful activity and concealing the source or true ownership of such proceeds. Similarly, two years later, Congress passed the Anti-Drug Abuse Act, which essentially was created to cover a loophole in the original Bank Secrecy Act to expand the definition of "financial institution" to include various big and popular businesses created and used as fronts by money launderers, such as car dealerships and real estate agencies, and therefore requires these entities to file reports on large currency transactions and, as a second line of defense, requires the identity verification of monetary instruments over $3,000. Shortly after creation of FinCEN, the bureau was further strengthened through new legislative power with the Annunizo-Wylie Anti-Money Laundering Act in 1992, Money Laundering Suppression Act in 1994, and Money Laundering and Financial Crimes Strategy Act in 1998.

In ensuring that these acts are upheld and executed efficiently and effectively, FinCEN is engaged in a number of initiatives. For example, in the Agent Request Initiative that was instituted on April 27, 2011, the network requests lists of money service business (MSB) agents, which must be maintained and updated annually, and provides an additional source of information for all parties involved in financial transactions.

Financial Industry Regulatory Authority

The Financial Industry Regulatory Authority (FINRA) is a private, independent membership organization through which brokerage firms and securities exchanges develop, promulgate, and enforce regulatory standards so as to operate fairly and efficiently in the United States, and to safeguard the interests of investors. It is "dedicated to investor protection and market integrity through effective and efficient regulation of the securities industry."

It discharges this mission by (1) validating qualifications of sellers of security products through testing and licensing, (2) ensuring that advertisements for securities products are truthful and not misleading, (3) aligning promotional and sales activities for securities to suitability of investors' needs, and (4) promoting a regime of disclosure so that investors receive all relevant information they require prior to purchasing an investment.

The organization operates with more than 3,400 employees out of principal locations in New York and Washington, D.C., with 20 regional offices across the country. It maintains the Central Registration Depository, the nation's largest database of brokers and brokerage firms. It regulates these service providers according to the aforementioned approach to protecting investors by training, examination, and licensing of registrants; alternative dispute resolution services; and regulation of major financial exchanges under contract. It also can discipline registered representatives and firms for violating securities laws and regulations and FINRA rules, such as by fining, suspending, or expelling firms or individual brokers from practice in the industry. It sometimes orders payments of restitution as well.

The founding of FINRA's principal predecessor, the National Association of Securities Dealers (NASD), came in 1939 in the wake of the Maloney Act of 1938, which amended the Securities Exchange Act of 1934 and enabled the creation of self-regulatory organizations (SROs), including national securities associations. These assist the SEC in regulating association members. In 1971, the NASD extended its scope by creating an electronic stock trading system, the National Association of Securities Dealers Automated Quotations (NASDAQ). This served as an alternative stock exchange and grew in competitive influence.

Formation of the Authority

In 1996, the U.S. Securities and Exchange Commission (SEC) criticized the NASD for incongruities between its mission and this exchange. The result was that the NASDAQ recapitalized and separated from the NASD in 2000 so that each could focus on its respective role. In the meantime, in 1998, the other two major exchanges had merged: the New York Stock Exchange (NYSE) and the American Stock Exchange. In 2007, the NASD merged with the New York Stock Exchange's regulatory arm, NYSE Regulation, to form FINRA, making it the largest SRO in the United States.

Under its bylaws, FINRA operates under the governance of a board consisting of its chief executive officer (CEO), the CEO of NYSE Regulation, 11 public governors, and 10 industry governors representing firms of various sizes.

Funding is mainly through assessments of member firms' registered representatives and applicants, members' annual fees, and fines it imposes. The annual fee includes a basic membership fee, an assessment reflecting gross income, a fee for each principal and registered representative, and a charge by number of branch offices.

Because of industry complexity, as well as information and power asymmetries between (1) brokers and brokerage firms and (2) their customers and employees, the dispute-resolution role for FINRA rapidly rose to prominence. Service and employment contracts with brokerage firms routinely include mandatory arbitration clauses, and courts generally have upheld these as valid and enforceable. In class-action lawsuits, however, courts have allowed plaintiffs to bypass these agreements.

The organization follows a systematic procedure for assembling arbitration panels. It initially drew from pools of thousands of industry and nonindustry arbitrators, depending on circumstances, including the amount in dispute. However, after criticism about fairness of such participation and concern about congressional intervention, FINRA gradually amended its procedure to allow for panels consisting solely of nonindustry arbitrators. After a testing period of almost three years, it implemented this policy in February 2011.

The number of arbitration cases varies annually but usually exceeds 5,000 nationally. The rules do not require or prohibit representation by legal counsel, but many do rely on such representation because the brokerage firms routinely do so. This has led to additional concerns about the elusiveness of the distinctive value proposition for such "alternative" dispute resolution in terms of efficiency, expeditiousness, and fairness.

Firestone Tire and Rubber Co.

Soon after founding his company in 1900, Harvey Firestone capitalized on his friendship with Henry Ford to become the tire supplier to the Ford Motor Company. To associate the company with driving, Firestone equipped many Indianapolis 500 racers with tires beginning with the inaugural event in 1911. Between 1920 and 1964, every winner was driving with Firestone tires. The company's positive public image and bottom line were damaged by several accusations of illegal or immoral behavior, including violations of the Sherman Antitrust Act, patent laws, and human rights and child labor laws; making illegal contributions to politicians; paying bribes to foreign officials; and in two distinct instances, knowingly selling defective tires. By 1979, Firestone was more than a billion dollars in debt and continued to lose money. It was forced to close factories, move its headquarters, and spin off non-tire-related businesses; and it negotiated the sale of the company to the Bridgestone Corporation of Japan in 1988.

From 1936 until 1950, the Firestone Corporation, along with General Motors, Standard Oil of California, Mack Truck, the Federal Engineering Corporation, and Phillips Petroleum, conspired to purchase over 100 streetcars and electric train systems in 45 urban areas with the intent of dismantling them and replacing them with buses. In total, nine corporations and seven individuals were convicted in 1949 for their roles in what became known as the Great American Streetcar Scandal. Firestone was accused of having a $1.1 million political slush fund and making $330,000 in illegal contributions to local, state, and federal politicians between 1970 and 1973.

To account for these funds, it falsified books by indicating that the funds were paid to executives. During this period, the U.S. Securities and Exchange Commission (SEC) alleged that Firestone paid Mexican government officials $39,600 to obtain a price increase for its tires. The company agreed to settle, without admitting or denying the SEC's charges. Accusations leveled against the company's operations in Liberia included purported payments of $2 million per year to Charles Taylor's National Patriotic Front for "protection" after the 1992 abduction and torture of several of its Liberian rubber plantation employees. In 2005, Firestone was accused of human rights and child labor law violations in Liberia, which, according to a plantation manager, must be viewed within the context of the country's 15 years of civil war.

Responding to Goodrich and Michelin's introduction of radial tires to the U.S. market in the late 1960s, Firestone developed and produced its Firestone 500 radials. The tires, manufactured on equipment designed to produce bias-ply tires, soon showed signs of tread separation at high speeds—a problem the director of development acknowledged in a 1973 internal memo. Despite company tests in 1975 that documented a serious problem tread separation problem, it continued to manufacture, advertise, and sell these defective tires. When the National Highway Transportation Safety Authority (NHTSA) requested a voluntary recall, the company sold the tires at clearance prices. Firestone recalled 400,000 of the 500 model tires and 5,000 of its Primero tires in 1977, as well as about 10 million additional tires in 1978, which resulted in an after-tax charge against earnings of $147.5 million in 1978.

Investigation and Fine

In 1978, the NHTSA began an investigation of and Congress held hearings on the tire problem. Despite Firestone blaming consumers' underinflation and poor tire maintenance for the problems, the NHTSA declared the tires defective and responsible for 41 deaths. It fined Firestone $500,000—the largest civil penalty imposed since passage of the 1966 National Traffic and Motor Vehicle Act—for illegally delaying the recall of tires that did not meet federal safety standards. The bond between Ford and Firestone, which began in 1900, ruptured in 2000 as the two companies blamed each other—in Senate hearings, court cases, and exchanges in Venezuela—for the deaths and injuries caused when Ford Explorers, Mercury Mountaineers, and Mazda Navajos rolled over after the tread separated on its Bridgestone-Firestone tires. Public Citizen blamed the deaths and injuries on poorly designed tires (designed to Ford's specifications), production deficiencies, and design flaws in the Ford Explorer.

Firestone's Wilderness AT, Firestone ATX, and ATX II tires experienced an unusually high level of tread separation (a problem more pronounced in vehicles with high inflation, driven in hot climates, at high speeds) that led to between 271 and 476 deaths and over 800 injuries. Ford and Bridgestone-Firestone learned of tire failures in Fords in Saudi Arabia in 1988. Firestone eventually admitted that it made bad tires. In 1999, Ford and Bridgestone-Firestone conducted a limited recall of SUV tires in Middle Eastern countries, Malaysia, Thailand, and Venezuela. Only after a Houston television station aired an exposé in 2000 did Bridgestone/Firestone announce a voluntary recall of 6.5 million tires. Nine months later, Ford recalled all 13 million Firestone Wilderness AT tires that remained on its vehicles. In 2001, the company asked the Department of Transportation to investigate whether the Explorer's high-center-of-gravity design made the vehicles unstable and susceptible to rollovers.

Fisher-Price Inc.

Fisher-Price was originally opened in 1930 by Herman Fisher and Irving Price. Since its conception, the toy manufacturer has become the most recognized company in its field. Fisher started his career in New York working for a game manufacturer; Price operated his own variety store. The duo was aided by Helen Scheele, who had a strong sense of the toy market given that she owned a toy store. While Fisher-Price is well-known for its numerous products and lines of toys, the company faced two major scandals in its history related to toy defects.

Two Major Scandals

Fisher-Price has faced two major scandals in the history of the company related to problems with its toys. The first related to its popular Power Wheels toys. The company manufactured and sold roughly 10 million of the battery-powered units between 1994 and 1998. The vehicles, designed for 2- to 7-year-olds, came with six- or 12-volt batteries, had nearly 100 models, and retailed for between $75 and $250. The U.S. Consumer Product Safety Commission (CPSC) found that in just that four-year period, there were over 100 incidents of fires in the vehicles as well as almost 2,000 reported incidents of overheating, short-circuiting, melting, or failing electrical components. Approximately 10 children were burned, and 25 structures sustained property damage.

Fisher-Price was also aware of approximately 75 cases in which a Power Wheels unit failed to stop an accident when the vehicle hit a stationary object with a child driving. Most damaging, however, was the fact that the company chose to not disclose this information until the CPSC asked for a full report. Such a decision violates immediate disclosure laws. The company further opted not to voluntarily recall and replace Power Wheels vehicles in the interest of safety.

In the end, Fisher-Price ended up in a significant amount of legal trouble. It agreed to settle with the CPSC and was forced to pay $1.1 million, the largest civil penalty ever assessed on a toy manufacturer. As part of the settlement, Fisher-Price was able to deny knowingly violating the Consumer Product Safety Act. To go along with the civil penalty, Fisher-Price recalled over 10 million Power Wheels vehicles spanning 14 years of production.

Learning from the Power Wheels fiasco, in August 2007, Fisher-Price chose to voluntarily recall almost 1 million of its most popular toys (including ones based on Dora the Explorer and Sesame Street) due to the possibility that the toys were coated in lead-based paint while being manufactured in China. Lead is toxic if ingested, especially by children, and even exposure to lead can have adverse health effects. The general manager of the company, David Allmark, publicly claimed that the problem was detected internally during a routine examination and was immediately reported to the CPSC. The CPSC and Fisher-Price jointly issued statements warning parents to remove the toys from their children and contact the company for further information. Allmark further explained that well over half of the toys falling under the recall notice for high lead were taken off the shelves before being purchased. Parents were told to still be careful and check their children's rooms and play areas to make sure none of the toys were present. What the lead paint recall clearly showed, however, was the increased level of detail and attention paid by Fisher-Price. There was clearly no cover-up or debate on whether to voluntarily recall.

Not all of the company's recall demands were equally serious, however. Toward the end of 2008, Fisher-Price introduced a new baby doll in the United States known as the Little Mommy Cuddle & Coo. It took only a few weeks before customers began complaining about things the doll said. Many parents claimed they heard the baby doll state that "Islam is the light." As a result, a large number of stores stopped selling the doll, and eventually Fisher-Price had to rework the doll's statements to clarify its language. The range of concerns over the toys run the gamut, but Fisher-Price's willingness to revise this product demonstrated the type of behavior that is expected from a company that has learned to exercise due diligence.

Food and Drug Administration, U.S.

The Food and Drug Administration (FDA) is the federal agency located under the Department of Health and Human Services that is responsible for regulating food and drug safety in the United States. The origins of the Food and Drug Administration date back to the establishment of the Division of Chemistry in the Department of Agriculture in 1862. Prior to the establishment of the agency, states oversaw food and drug laws, resulting in varying degrees of coverage. As agriculture and science made advances, it became necessary to investigate adulteration of food and labeling of both food and drugs to protect the American consumer.

Whistleblowing Publications

Two publications led to the call for a federal law regulating food and drugs in the United States. A 10-part study, "Foods and Food Adulterants," was published by chief chemist Harvey Wiley between 1887 and 1902, exposing the use of additives in foods. The publication of *The Jungle* by Upton Sinclair in 1906 detailed the actions of the meatpacking industry. In 1906, the Food and Drug Act established the first overall regulation of the food and drug industry, overseen by the Bureau of Chemistry. The agency became known as the Food and Drug Administration in 1930 and remained under the Department of Agriculture until June 1940, when it was transferred to the Federal Security Agency. The FDA transferred in April 1953 to the Department of Health, Education, and Welfare, then to the Public Health Service in 1968. In May 1980, it moved to its current location, the Department of Health and Human Services.

The FDA is responsible for enforcement of laws and establishing regulations related to the food, drug, and cosmetic industries in the United States. The 1906 legislation addressed the use of additives in food and drug products, the false labeling of products, and the prosecution of those responsible. The agency worked for improved language in the law because many products on the market contained false information. Change in the agency's governing statute came during the 1930s, when Franklin D. Roosevelt was president, and it became apparent that the 1906 law needed updating. Congress worked on the legislation for five years with little success, until the 1937 deaths related to an untested drug, Elixir Sulfanilamide, raised national awareness of the problem. In 1938, Congress passed the Federal Food, Drug, and Cosmetic Act which broadened the agency's scope far beyond that of the 1906 law.

The FDA could now oversee not only food and drug additives but also medical devices and cosmetics. Agency regulations addressed labeling of all food products, testing for new drugs, and labeling and instructions for medical devices, and allowing for inspections of factories. The agency began issuing standards for food production and established a process for the inspection and approval of new drugs. Agency standards were strengthened further in the 1950s, when Congress passed laws related to pesticide residues and food and color additives, and banned the use of additives that could cause cancer. This legislation, called the Delaney clause, placed a restriction on approving the use of any additives in food for humans that was found to cause cancer in lab animals.

The FDA today continues to monitor the nation's food and drug supplies. Recent cases include outbreaks of *E. coli* and salmonella in the food supply, including a major recall of peanut products in 2011, and problems with infant formula over the years. The FDA continues to track prescription drugs and the production of generics, and it issues recalls of medications that have undeclared ingredients, problems with the containers, or dosing discrepancies. All new drugs to be marketed in the United States must be approved through an application process that includes clinical trials. Over-the-counter medications undergo a similar process that includes a monograph published in the *Federal Register*. In 2008, the agency recalled over-the-counter children's medication to clarify dosing instructions and warnings about giving the medication to children under the age of 2. Agency recalls include animal food products, medications, and biologics.

Oversight of medical devices ranges from syringes to ventilators that might not work properly during procedures. The role of the FDA extends beyond just regulating food and drugs. During times of national emergency, such as floods and hurricanes, the agency can be consulted to ensure the safety of the food supply and to provide information about medications that might be contaminated. The agency works with states to make sure that facilities are inspected annually to ensure the safety of foods and drugs produced throughout the country. The role of the FDA is to ensure the legal production of foods, drugs, and related products in the United States.

Food Fraud

Food fraud, along with the subcategory of food-related economically motivated adulteration, is a white-collar or corporate crime. The often extremely complex planning and product distribution networks of the food industry are fluid and flexible. While only recently defined by the food industry as a distinct threat, food fraud is a type of product fraud that is growing in scope and scale. A subcategory under food fraud is economically motivated adulteration (EMA) of food.

The Journal of Food Sciences *lists honey as one of the most frequent cases of faked foods. U.S. Food and Drug Administration guidelines state that any product that does not contain pollen cannot be considered honey, and testing conducted for* Food Safety News *found that more than three-fourths of the honey sold in U.S. grocery stores lacked sufficient amounts of pollen to be considered pure honey. Pollen filtering hides honey origins; honey imported from countries such as China and India is a common culprit.*

These fraud incidents have led to companies closing, industries on the verge of collapse, thousands of lost jobs, and severe public health threats. As with EMA, the food fraud incidents are growing in the number of incidents and the severity of impact. The perpetrators are often individuals or small groups, but there are examples of large-scale organized crime groups or even terrorist involvement. The planning is often similar to white-collar crime, but the implementation involves direct contact with, and threat to, a consumer. The actions are often conducted within a corporation, but often without tacit approval, or even knowledge, by management. In some cases, the act is not a violation of a criminal or civil law. Regardless of the exact offense, this type of product fraud is leading to increased regulatory and enforcement prioritization because of public health threats and intellectual property rights infringement efforts.

Public Health Threat

Food fraud is a collective term used to encompass the deliberate and intentional substitution, addition, tampering, or misrepresentation of food, food ingredients, or food packaging, or false or misleading statements made about a product, for economic gain. Food fraud is broader in scope, and includes concepts beyond adulteration such as misbranding, tampering, theft, and smuggling. Although the objective is economically motivated, and any public health threat would be through negligence rather than intent, the public health vulnerability is real. The fraudsters are probably not following the regulations for good manufacturing practices.

The types of food fraud include actions to adulterate, tamper, overrun, steal, divert, simulate, or counterfeit. The types of risks are direct, such as acute toxicity leading to an immediate public health consequence; indirect, such as chronic toxicity leading to a public health consequence after repeated exposure, or lack of a benefit such as with a vitamin; and technical, such as nonmaterial in nature or involving country of origin. The level of fraud is estimated at 5 to 10 percent of the world's food supply, regardless of product or country.

Although there is evidence of intentional adulteration of food back to Roman times, the classification as food fraud was only defined in 2011. The concept evolved from the goal of focusing on prevention rather than just intervention. A follow-up article in 2012 provided insight on the incidents from 1980 to 2010. The regulatory and statutory authority is defined in food and drug laws, such as the Federal Food, Drug, and Cosmetic Act, under terms such as adulteration and misbranding. The fraud is also often defined as a violation under a criminal statute for smuggling, theft, intellectual property rights infringement or counterfeiting. The Food Safety Modernization Act of 2011 has 11 mentions of "intentional adulteration," which applies to the adulteration aspects of food fraud. This is also covered under other acts, such as the Protect Intellectual Property Act of 2008, focusing on trademarks and patents; and the Prescription Drug Marketing Act of 1987, focusing on drug safety and security.

Worldwide Prevention

Although the subcategory EMA is a focus of the FDA, it is currently explicitly defined only in a *Federal Register* notice. Food fraud is a concept that is receiving attention by the likes of certification bodies such as the U.S. Pharmacopeia (the body assigned to oversee the specifications for food and drug ingredients, with several expert panels on adulteration, as well as a new draft general chapter) and the International Standards Organization (ISO) Technical Committee 247 on Fraud Countermeasures and Controls, with an explicit focus on all consumer product fraud. The prevention concepts and efforts are similar to other food industry quality efforts, such as Six Sigma and Hazard Analysis and Critical Control Point (HACCP) programs.

As with other types of hybrid and complex crimes, a variety of criminology theories can be applied to understand and prevent the crime opportunity. The full process of the crime often defies a clear classification because the preparation is similar to that of white-collar crimes, but the interaction with the end consumer is similar to that of traditional crime. The fraudsters are often very skilled at evading detection and avoiding enforcement. These factors emphasize the importance of applying prevention theories such as situational crime prevention and the crime triangle. There is a nearly infinite number of fraudsters and types of fraud, so reducing opportunity is a key to reducing the public health threats.

The trend for food fraud, as with EMA, is that it will continue to grow in scope, scale, and threat. Globalization is a major driver of this growth through expanding power of brands, a worldwide growing middle class expecting more specialized and higher value products, and the impact of wider geographic distribution. As globalization is supported by the increased speed of product transportation, it also increases the economics toward manufacturing consolidation. Both of these benefits of globalization create an additional fraud opportunity and public health threat because more products will move faster around the world. This increasing complexity and speed will increase the demands on the detection regulations and enforcement, which will emphasize deterrence. The deterrence and prevention focus will continue to emphasize the application of the criminology concepts of situational crime prevention and the crime triangle. Although this shift to prevention may seem logical—especially considering the industry acceptance of quality programs such as Six Sigma and HACCP—the shift will be difficult. The current management and enforcement infrastructure and metrics are focused on detection rather than prevention.

Ford, Gerald R.

White-collar crime played a significant role in the rise and fall of the political career of the 38th president of the United States, Gerald R. Ford. The crimes committed by Spiro Agnew and Richard Nixon paved the way for Ford to become president in August 1974. Ford's September 1974 pardon of his predecessor for all crimes committed while in office was perceived as a major contributing factor in Ford's electoral loss to Jimmy Carter in 1976. Ford returned to his hometown of Grand Rapids, Michigan, following his World War II service in the U.S. Naval Reserve. He joined the law firm of Butterfield, Keeney and Amberg, and during his law practice, family and friends encouraged him to seek the Republican nomination for the House of Representatives in 1948. Ford won the nomination and the election, and he would go on to serve consecutive terms in the House from January 1949 to December 1973.

Spiro Agnew's rise to the second-highest office in U.S. politics was meteoric. A politically moderate local official in Baltimore in 1962, he ran for and won the Maryland governorship four years later. Just two years after that, he became Richard Nixon's running mate on the national ballot. By virtue of winning the elections of 1968 and 1972, Agnew served one term as vice president of the United States and was looking forward to serving a second complete term in early 1973. As vice president, he took on a more conservative persona, alienating liberals and Democrats as well as surprising longtime friends and political observers. Agnew's fall from grace was as stunning as his rise; he resigned from the vice presidency in October 1973, after he was investigated for bribery, extortion, and income-tax violations allegedly committed since his term as Maryland governor. He pleaded no contest to a single income-tax charge and was fined $10,000. In lieu of jail, he was sentenced to three years of unsupervised probation. Because of the vacancy in the office of vice president, Ford was nominated to fill Agnew's unfinished term. Ford easily passed the confirmation process in both chambers of Congress and became vice president on December 6, 1973.

Nixon's Impeachment

In July 1974, President Nixon was charged with three articles of impeachment by the House of Representatives. In Article 1, it was alleged that he prevented, obstructed, and impeded the administration of justice related to his role in covering up the Watergate break-in of June 17, 1972. The article alleged that six days after the break-in, the president used his power to redirect the Federal Bureau of Investigation's (FBI) inquiry of the incident, thus obstructing justice in federal law enforcement's efforts to follow the trail of the money found with the Watergate burglars.

Article 2 accused the president of using the power of his incumbency to disrupt the finances of his political enemies and to violate their civil rights. The article states that the Internal Revenue Service was used to audit the tax returns of political enemies and that the Federal Bureau of Investigation (FBI) and Secret Service arranged electronic surveillance of the president's opponents.

Article 3 stipulated that the president failed to comply with subpoenas issued by the Judiciary Committee. When irrefutable evidence emerged in early August 1974 that the allegations in Article 1 were true, President Nixon resigned from the presidency at noon on August 9. Gerald R. Ford became the 38th president in the hour following the resignation of President Nixon. On September 8, 1974, 30 days into his tenure as president, Ford issued a full and complete pardon to his predecessor for any crimes that Nixon committed while holding the office of president. Ford's rationale for the pardon was to put the divisive period of the Watergate scandal behind so that the nation could begin to heal from the partisan political fallout that was left in the scandal's wake.

Early in his presidency, Ford appeared to launch a crackdown on white-collar crime. Working hard to clean up the tarnished image left by Nixon, he directed the U.S. Department of Justice to develop enforcement priorities to combat antitrust violations, price fixing, fraud, embezzlement, and similar infractions because the cost of such crimes to the public exceeded $40 billion in 1974. He also asked that public corruption cases become high priorities of law enforcement. However, Ford's pardon of Nixon prompted critics to suggest that the new president's commitment to enforcement of white-collar crime laws was actually very weak.

By his actions, rather than his words, he was showing that political loyalty, backstage dealing, and granting amnesty to one of the nation's most famous white-collar criminals were more important than strengthening or enforcing the laws against white-collar crime. President Ford lost his bid for re-election by an electoral college margin of 297–240 to Jimmy Carter on November 4, 1976. Carter promised to be a champion in the fight against white-collar crime.

Ford Motor Co.

Ford Motor Co. has a history of engaging in anti-consumer behavior, cover-ups, and purported criminal behavior. The company's questionable behavior began in 1904, when Ford was accused of violating George Selden's patent on gasoline engines. Since then, Ford has allegedly profited from its relationship with Nazi Germany; environmental violations, including falsifying Environmental Protection Agency (EPA) test results; and putting consumers' lives at risk by refusing to address problems that would have delayed production or were deemed too costly to fix. Ford was tried on reckless homicide charges for deaths associated with the Ford Pinto. Some of its sport utility vehicles (SUVs) were deemed dangerous and environmentally harmful.

The Fateful Pinto

Losing sales to foreign subcompact manufacturers, Ford rushed its Pinto, a vehicle designed at 2,000 pounds and that cost less than $2,000, to market within 25 months. Ford's managers and engineers knew from preproduction crash tests that Pintos were susceptible to fires from low-to-moderate-speed rear-end crashes that damaged gas tanks. This problem, which could have been rectified with an expenditure of $11 per vehicle, caused approximately 500 deaths and numerous burns. A cost-benefit analysis estimated that repairs would cost $137 million, while payments for 180 burn deaths, 180 serious burn injuries, and 21,000 destroyed vehicles would cost only $49.5 million. Purportedly, the memo stating this conclusion was not used for internal decisions; rather, it was sent to the National Highway Transportation Safety Administration (NHTSA) as part of Ford's eight-year campaign to delay issuance of safety regulations that would have fixed the gas tank problem and saved lives. In 1978, Ford recalled 1.5 million Pintos manufactured between 1971 and 1976. That year, three teenagers died when their Pinto was rear-ended. Ford was charged with reckless homicide for their deaths. Outspending and outmaneuvering the state prosecutor, Ford's attorney received an acquittal from the jury.

The NHTSA determined that many Fords manufactured from 1966 through the early 1980s had transmissions that slipped from park to reverse.

These defective transmissions, which Ford knew about at least 10 years prior to the recall, were responsible for 1,710 injuries and 98 fatalities. The failure of Ford's thick film ignition module in vehicles sold between 1983 and 1995 caused unexpected stalls. The 11 deaths and 31 injuries attributed to the failure could have been avoided if the module had been repositioned. By concealing internal documents and delaying its response to the NHTSA's requests for information, Ford allowed the statute of limitations to expire. In 2000, a California judge found Ford guilty of fraudulent concealment for failing to report this known safety defect and ordered the recall of 1.7 million Ford cars and trucks sold in California.

Ford's SUVs were essentially passenger bodies on a truck chassis. The top-heavy, narrow-wheelbase design had a propensity to roll over, even at low speeds, a fact that Ford knew in 1984 when it produced its first SUV, the Bronco. The rollover problem would have deceased if the wheelbase had been just two inches wider, a fix that would have required re-engineering the chassis system and delayed production. This problem therefore remained unaddressed, even when Ford created subsequent models. The Explorer was introduced in 1990 with the same frame, similar wheelbase-to-height ratio, and stability problems as the Bronco II. Although its engineers recommended several changes to the design and suspension—increasing its track width, lowering its center of gravity, and using smaller tires—to counteract the rollover problem, Ford only lowered the recommended tire pressure.

Placing Bridgestone-Firestone tires, which had a tread separation problem, on vehicles that had a propensity to roll over was a recipe for disaster for which both companies shared responsibility. Ford provided Bridgestone-Firestone with tire specifications for its SUVs and F-series pickups, and it approved the design prior to production. Once aware of a tread separation problem on Ford vehicles in Saudi Arabia as early as 1988, Ford's engineers tried to address the problem without interfering with the Explorer's 1990 release date. Lawsuits related to tread separations and rollovers began appearing in 1991. The tire problem escalated enough in hot climates that by 1999, Ford began replacing Firestone tires on its SUVs in Middle Eastern countries, Malaysia, Thailand, Colombia, and Venezuela. Ford treated the problem as if it belonged to individual foreign units instead of recognizing it as a corporate concern, which would have required it to notify U.S. authorities and all consumers. The rollover/tire separation problem did not receive much attention in the United States until a report in 2000 by a Houston television station led to a Senate hearing. At the Senate hearing, in court cases, and in exchanges in Venezuela, the companies blamed each other for the 271–476 deaths and over 800 injuries caused when Explorers rolled over after Bridgestone-Firestone tires failed. Public Citizen blamed the deaths and injuries on poorly designed tires, production deficiencies, and design flaws in the Ford Explorer. To date, Ford has faced criminal charges related to rollovers only in Venezuela.

Foreclosure Fraud and Rescue Schemes

Foreclosure fraud and rescue schemes target homeowners who have defaulted on their mortgage or are facing foreclosure and, as a consequence, are vulnerable to schemes that offer ways to allow them to remain in their homes. The perpetrators of these frauds make aggressive overtures toward the mortgage payees, offering them a means of refinancing their existing mortgage loan or paying off their mortgage in its entirety. However, these schemes result in various forms of harm to the homeowner, including a loss of money paid in fraudulent fees, exorbitant monthly rent being paid to the perpetrators for people to remain in their own homes, and even the loss of their home.

Spike in Foreclosure Fraud Since 2008

There has been an increase in the number of foreclosure frauds since the economic crisis of 2008. Contributing to the crisis were predatory lending practices that saturated the lending market prior to 2008. These included deceptive, unfair, and abusive practices that occurred during the process of securing a home loan or at the origination of the mortgage loan. Although there are many practices associated with predatory lending, most often associated with this time period were loans secured with lax qualification criteria, little federal oversight, aggressive selling of variable-rate loans, and inflated monthly loan payments. This increased the number of people eligible to purchase a home, some of whom would not have previously qualified.

As a result of the increase in buyers, property prices soared, with many buyers purchasing their homes for prices in excess of the property's value and holding loan repayment plans they could not maintain over the length of the loan. As homeowners failed to meet the conditions of their loan repayment plans, lenders began to tighten their qualifications, which restricted the number of buyers on the market. Individuals trying to sell their homes had fewer buyers to work with and could no longer charge the inflated prices that had become characteristic of the housing market. This in turn caused a dramatic drop in housing prices. Homeowners who could not afford to pay their large mortgage payments were left with properties with a considerably lower values than the loans secured for their purchase. As many homeowners entered delinquency, the housing market entered into a state of crisis.

The housing crisis led to an increase in the number of housing foreclosures, with as many as 2.1 million properties in foreclosure in 2010. The number of foreclosure filings also dramatically increased—by 120 percent. The Federal Housing Administration (FHA) reported that since 2009, the number of borrowers who have instantly defaulted on their loan (that is, before making a single payment) has increased by 320 percent. With increased foreclosures, instant defaults, slow sales, and loan delinquencies, the pool of potential victims vulnerable to foreclosure fraud and rescue schemes has considerably increased. In 2010, the Federal Bureau of Investigation (FBI), in conjunction with the U.S. Department of Justice (DOJ), indicated that as homeowners continue to default on their mortgage loans and file for foreclosures, the perpetrators of foreclosure frauds and rescue schemes will continue to grow as they prey on the desperation of delinquent homeowners.

In early 2009, in an effort to assist families who otherwise qualified as responsible homeowners but were facing foreclosure, the Barack Obama administration announced the Making Home Affordable Program and Home Affordable Refinance Program (HARP), overseen by the Treasury Department, the U.S. Department of Housing and Urban Development, and the U.S. Department of Urban Affairs. The goal of the program is to assist 5 to 7 million families by restructuring and/or refinancing their loans to make the monthly payments more affordable, preventing foreclosure and further financial hardship. Despite the initiation of this program, in late 2009, the Treasury Department reported that less than 10 percent of delinquent homeowners eligible for HARP assistance were seeking it. Furthermore, the FBI reported that the numbers of foreclosures continued to increase, creating the perfect conditions for a growing pool of potential victims and the perpetration of foreclosure frauds and mortgage rescue schemes.

The emergence of many fraudulent actors offering illegitimate schemes to assist increasingly delinquent and desperate homeowners can be tied directly to the housing crisis. For example, in a 2009 survey of online and print advertising, the Federal Trade Commission identified 71 companies running advertisements for fraudulent mortgage foreclosure rescue schemes. Furthermore, in 2013, the DOJ reported that foreclosure frauds and rescue schemes have amounted to billions of dollars in losses to the mortgage industry. These schemes are extremely complex, relying on the victim's lack of understanding of the complex financial and legal processes involved. Compounding the issue of complexity are the many variations of both foreclosure frauds and rescue schemes, so that not all schemes follow the same pattern in their execution. Generally, however, there are five different types of schemes that can be identified: the lease buy-back, equity stripping, consulting services, fractional transfer, and reverse mortgage schemes.

Lease Buy-Back Schemes

The most common form of foreclosure fraud, also termed a lease buy-back scheme, typically results from a solicitation that is mailed to the mortgagee promising short-term financing, sourced by a private financer, to pay off a delinquent loan. Although solicitation through the mail is typical, other methods are more informal, such as e-mails and roadside signs. This type of rescue scheme makes promises to homeowners such as allowing them to stay in their home while effectively renting back their own property from the investor. As a means of securing this deal, the homeowner is convinced to transfer the title of the property to the private investor. The homeowner believes that this provides collateral for the deal and that he or she can reacquire the title at a later date, either through a repurchase or by refinancing. The rent charged to the homeowner is extremely high and impossible to afford over a long period of time. The homeowner then defaults on the rent and is evicted by the perpetrator, who has acquired the property through a legal deed and is then free to sell, refinance, or keep the property.

Equity Stripping Scheme

As with the lease buy-back scheme, an equity-stripping scheme begins with a solicitation that promises short-term financing to pay off a delinquent loan through private financing. Again, this type of rescue scheme makes promises to homeowners allowing them to stay in their home, renting back their own property from the investor. The homeowner is convinced to transfer the title of the property to the private investor as a means of collateral for the deal based on the belief that he or she can reacquire the title at a later date. The rent charged to the homeowner is typically highly inflated and impossible to maintain. When the homeowner defaults on the rent, the perpetrators of the fraud evicts the homeowner. They are then left with the property, which they sell for the equity. This type of scheme is a form of predatory lending of which there are many variations, including a version that involves a third party who is introduced to the scheme under the pretense of offering new financing to the original homeowner. The process is more complex if there is an offer for new financing, as this involves a straw borrower.

A straw borrower, as it relates to equity stripping, is an individual who provides personal details, such as name, social security number, and credit history to qualify for a loan. The straw borrower is used to conceal the identity of the organization and the individuals involved in perpetrating the rescue scheme. The perpetrators are also reliant on the straw borrower to qualify for the loan or new financing that they could not, or do not, wish to otherwise obtain without a third party. Typically, the straw borrower is told that he or she is purchasing an investment property that has an existing tenant who will make the loan payments. The straw borrower is often compensated for his or her time and information with a financial payment and told that he or she bears no responsibility for the mortgage payments. However, this is false, as the new mortgage financing is acquired with the straw borrower's name and credit details and therefore becomes that person's legal responsibility. The perpetrators of the fraud, who have previously acquired the home through obtaining the title or deed from the original homeowner, sell the home to the straw borrower and appropriate all the existing equity in the home.

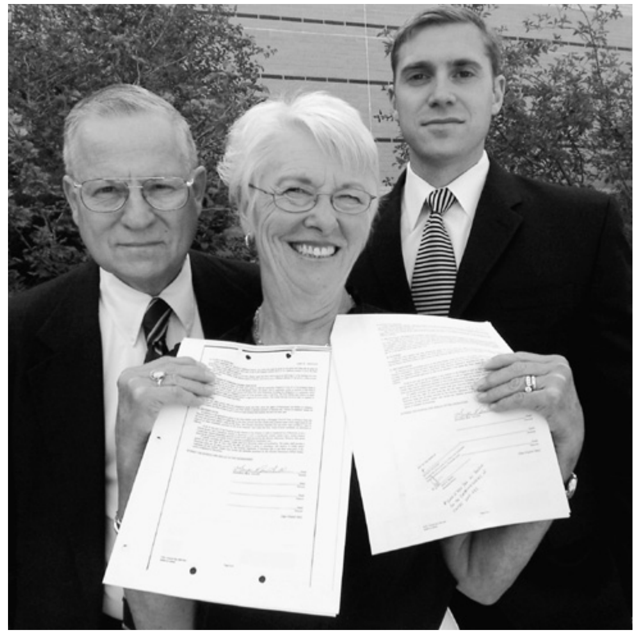
When new financing is secured through the straw borrower, the perpetrators of the scheme then secure a lease with the original homeowner, charging an exorbitant monthly rent for staying in the home. When the original homeowner cannot make the payments, an eviction is initiated and executed. The straw borrower is then responsible for the mortgage payments. If the straw borrower cannot pay, then the mortgage company initiates foreclosure proceedings against the straw borrower, negatively impacting his or her credit history. There is no paper evidence tracing the organizers of the scheme to the fraud, and they are able to disappear with any equity obtained from the refinancing of the home as well as rent payments by the original homeowner.

Consulting Services

Another common foreclosure fraud and rescue scheme is when a company offers a consulting service to homeowners who are experiencing financial hardship and facing foreclosure. The consulting firm offers to act as an intermediary for mortgagees with their mortgage company in an effort to renegotiate better loan terms. In exchange for this service, the fraudulent company charges a fee. The consulting firm does not have any greater negotiating power or skill than the homeowner and is not able to negotiate better terms for the loan. The fee charged is therefore disproportionate to the service offered; in some cases, the consulting firm does not even contact the mortgage lender to discuss the loan on the behalf of the mortgagee. The consulting firm advises homeowners to avoid contacting the mortgage company themselves under the pretense that it may compromise their efforts at negotiating a loan reduction or better payment.

In reality, if mortgagees did contact their mortgage company during this time, they would expose the consulting firm—which had not contacted the mortgage lender at all—as acting fraudulently. In some cases, if the consulting company does contact the mortgage company, it negotiates a deal in its own self-interest, such as purchasing the property from the lender itself. This is most likely to occur when the equity value of the property is less than the loan (also known as being "upside down"), as the mortgage lender can limit its loss by selling the property immediately, taking a smaller loss on the loan than it may incur if it retained the property and the defaulted loan and gambled on the future housing market.

If the consulting firm is successful in securing a deal with a lender for a purchase of the property, then the scheme takes on the characteristics of the aforementioned lease buy-back scheme, where the homeowner rents the property from the consulting firm at an inflated cost.



Flanked by her attorneys, Margaret Sadler, of Larkspur, Colorado, holds two promissory notes: an original (from Countrywide Home Loans) and an altered version (from the Bank of New York) from the foreclosure on her daughter's house. On June 19, 2008, a state court dismissed the foreclosure when the Bank of New York was unable to show that it was the real party in interest.

Fractional Transfer Schemes

Other schemes, such as fractional transfer schemes using fictitious corporations, also lead to other financial abuses such as filing fraudulent bankruptcy claims. This scheme convinces homeowners to deed only a partial interest in their property to a third party, which in this case is a fictitious company that is created by the perpetrators. The perpetrators fraudulently file for bankruptcy in the name of the fictitious company. This stops the foreclosure process by initiating an automatic stay, which immediately stops the lender or creditors from collecting any monies against the property. When the case goes to bankruptcy court and relief is granted from the automatic stay, effectively allowing the creditors and lenders to resume efforts to collect on the delinquent loans, another fractional interest is transferred to another fictitious corporation.

This second fictitious company then files a fraudulent bankruptcy claim, which again invokes the automatic stay, freezing any pending litigation and/or claims from creditors until the matter is heard in bankruptcy court. This process prolongs the foreclosure process and generates extra profits for the perpetrators.

Reverse Mortgage Schemes

A mortgage scheme that is increasingly widespread involves federally insured home-equity conversion mortgages, which are more commonly referred to as reverse mortgages. This scheme is targeted toward older people, as the eligibility criteria requirements offer this type of scheme to individuals 62 years of age or older. The criteria also provide that to be eligible, the individual must own his or her home or be in the process of purchasing a primary residence. If he or she meets the eligibility criteria, then he or she may borrow the total equity in the home and do not have to pay mortgage payments. The only condition attached to this scheme is that the homeowners have to occupy their home. The eligibility criteria to qualify for a reverse mortgage are less stringent than for a traditional mortgage, as there is no requirement that the applicant has any credit, employment, or an income. The mortgagee then receives the equity payment either as a lump sum or through monthly payments. When the mortgagee dies, the lender then acquires the property, which it sells to recover the loan amount.

This scheme becomes fraudulent when the organizers of the reverse mortgage are rescue-scheming family, friends, or neighbors of the homeowner. These perpetrators, through either solicitation or proximity, may become aware that the homeowner is experiencing financial difficulties. Additionally, this population is particular vulnerable to these schemes because of the age requirement, which in some instances means the homeowners have health difficulties that may impact their memory or other mental faculties. The perpetrators use the victims' health difficulties to their advantage by having them sign documentation transferring their control over the lending process, such as power of attorney. The perpetrators are then able to have the equity distributed as a lump-sum payment, which they then use for themselves, depleting the amount available to the borrower.

In some cases, the perpetrator organizes a false appraisal of the home to generate the illusion of greater equity and a larger payment. Therefore, the homeowner loses the equity in his or her home, the loan proceeds, and, in some instances, the home as well. This occurs when the perpetrator, having depleted the funds from the loan through the power of attorney, files bankruptcy on the homeowner's behalf to stop creditors and lenders from collecting money and to eliminate other unsecured debt it may have acquired using the homeowner's name.

Conclusion

Foreclosure fraud and rescue schemes are extremely complex and depend on the vulnerability of those who are faced with the prospect of losing their homes. There are many variations on these schemes, and the techniques used to perpetrate these frauds are constantly changing, making detection difficult. All 50 states have legislation specifically addressing this type of fraud, and the federal government has increased collaborative efforts between state and federal law enforcement to better identify perpetrators and hold them accountable. Notably, in November 2009, the Obama administration established the interagency Financial Fraud Enforcement Task Force, which utilizes both civil and criminal legislation and resources at all levels of government to hold these types of perpetrators accountable. This multilevel approach improves the ability of law enforcement to identify schemes that use the federal court system to perpetrate these frauds and victimize individuals vulnerable to these schemes. Civil and criminal remedies can now be brought against perpetrators, straw borrowers, third parties involved in preparing fraudulent documents, and lawyers who represent the perpetrators.

Other prevention efforts focus on educating potential victims to differentiate between legitimate and illegitimate schemes. For those who are most vulnerable, the goal is to apply caution in seeking financial help, know the questions to ask in order to detect fraudulent schemes, and report suspicious solicitations and transactions to the authorities.

Foreign Corrupt Practices Act

The Foreign Corrupt Practices Act of 1977 (FCPA), as amended, makes it unlawful for U.S. persons, some foreign nationals, and issuers of stocks and other securities in the United States to bribe officials of foreign governments or conduct close business with those who do so. The FCPA lays the legal groundwork necessary to combat the problem of international bribery but is not enforced on a scale that sufficiently impacts international commerce.

Several incremental advances offer hope. Whistleblower provisions of the Dodd-Frank Wall Street Reform and Consumer Protection Act make whistleblowers eligible to receive from 10 to 30 percent of settlements that have reached $1.6 billion. Changes to federal sentencing guidelines in 2010, U.S. Securities and Exchange Commission (SEC) guidance, and the Sarbanes-Oxley Act make it more attractive for companies to provide a path for whistleblowers to alert upper management, which reduces the likelihood that rogue divisions will be used to partition enforcement and allows internal controls to respond in collaboration with enforcement officials and external auditors. Similarly, accounting practice requirements in the FCPA amendments make it harder to conceal foreign bribes.

U.S. persons, U.S. corporations, or corporations regulated by U.S. securities laws are forbidden from making corrupt payments to foreign officials. Because the FCPA is a mechanism of the federal government's control of interstate commerce, violations occur only if the action takes place across U.S. borders or uses a means of interstate commerce, such as the mail, telephone calls, wire transfers, or interstate or international travel. In 1998, the FCPA was amended to include foreign nationals and corporations acting directly or indirectly to make corrupt payments within the United States. The FCPA defines foreign officials as those with substantial influence or the perception of substantial influence within a foreign government. Recent enforcement actions have also considered state-controlled corporations and individuals acting as "instrumentalit[ies] of the government."

The FCPA contains three essential provisions, as follows:

1. *Antibribery*: the FCPA operationally defines an array of unlawful payments to foreign governments while delineating actions that are not considered corrupt. For example, paying a permit fee to a foreign government office is not usually considered a corrupt act, but paying a fee to a closely aligned engineering consultant required to get a permit may be considered corrupt, and paying a fee directly to a foreign official with control over permits is considered a corrupt act.
2. *Record keeping*: companies are required to accurately record expenses. Bribes cannot be recorded as bribes, so violators are subject to enforcement of the

record-keeping provisions. It is a violation to hide corrupt payments.
3. *Internal controls requirement*: companies are required to implement internal controls to remain compliant with the record-keeping provision and to prevent payments to foreign officials. It is a violation to lose track of corrupt payments.

The Organisation for Economic Co-operation and Development (OECD) reports that 199 individuals and 91 entities were sanctioned under the FCPA between 1999 and 2010. Individual sanctions include 54 individuals sentenced to prison. Corporate sanctions include Siemens's record fine of $1.6 billion and KBR, Halliburton, and Technip's collective sanctions of $917 million. Worldwide corruption statistics are collected under the convention, but other members of the OECD did not start reporting until 2010. The Fraud Section of the U.S. Department of Justice (DOJ) is responsible for enforcement of both the criminal and civil provisions of the FCPA. Fraud Section attorneys, investigators, and accountants investigate and prosecute complex white-collar crimes like FCPA violations. The Fraud Section also coordinates and supports law-enforcement efforts and the activities of U.S. attorney offices in multidistrict litigation.

International enforcement is coordinated by the Fraud Division under the stipulations of the Convention on Combating Bribery of Foreign Public Officials in International Business Transactions, ratified with other member nations of the OECD in 1998. This agreement was enacted through an amendment to the FCPA, called the International Anti-Bribery and Fair Competition Act of 1998. This act gave the SEC responsibility for the enforcement of the antibribery provisions of the FCPA against issuers of certain securities within the United States. To fall under SEC jurisdiction, a corporation must either have registered securities within the United States or be required to make periodic reports to the SEC. Joint efforts by governments around the world may offer hope of curbing abuse in developing nations.

Forensic Auditing

An audit is an examination of a subject; in forensic auditing, the subject is financial. *Black's Law Dictionary* defines the word *forensic* as "belonging to courts of justice." Accordingly, forensic auditing is a financial examination within the judicial system. Accountants specializing in forensic accounting apply their profession's standards and practices to disputed financial issues, but their activities are not restricted to courts. Other professionals, including lawyers and investigators, can support or lead efforts to resolve financial disputes outside the courts that may include forensic auditing. There is no clear, unified professional discipline to set standards and define a role for forensic auditors, outside their base professions. However, there is a body of subject matter requiring input from multiple disciplines.

Forensic audit practice includes both fraud investigations and disputes not involving fraud. In fraud investigations, the "crime scene" often exists in reports and ledgers describing the conduct of business. For example, in recent cases involving loan fraud, forensic auditors duplicated the standard banking industry auditor's practice of verifying supporting documentation for loans. Toxic loans were distinguished from good loans, based on the documentation present. Fraud committed by the borrower and abetted by loan officers can be discovered in these "crime scenes."

Forensic auditors also help establish the facts in a financial dispute that may not involve fraud. Large mergers and acquisitions are enormously complex deals that are negotiated over time. During that time, the value of assets or entire businesses may change before a critical date. Sometimes, one party to a transaction overstates the value of assets or understates liabilities. Given the natural change in values, it can be difficult for one party to distinguish intentional overstatement, which allows the purchasing party to recover its overpayment, from natural changes in value, which yield fewer recovery options. Forensic auditors can establish the value of assets in the deal. Once the facts are presented to both parties, the deal can proceed or fall apart.

Forensic auditors also support litigation by providing expert reports and witness services. An expert witness may be called upon to render a professional opinion to the court in a case in which the facts are in dispute. Because a forensic audit is a review of documents, it is common for a lead auditor to send team members to compile information. The lead auditor reviews the compiled evidence and writes an expert report. The expert does not have to be an investigator to draw conclusions from the facts found in business documents. A well-supported expert report can cause the opposing side to seek settlement. In fact, the vast majority of cases initiated do not end in trial; authoritatively establishing the facts may make it clear to both sides how the dispute will be resolved. The professional skills and knowledge used to derive expert reports for the court may also be used to inform negotiations in a dispute.

Legal Authority and Audit Standards

In the United States, auditing standards for public companies are set by the Public Company Accounting Oversight Board (PCAOB). The Sarbanes-Oxley Act of 2002 instituted the PCAOB and gave it the authority to define Generally Accepted Audit Standards (GAAS). PCAOB is a private, nonprofit organization. However, it exercises the powers defined by Sarbanes-Oxley under the oversight of the U.S. Securities and Exchange Commission (SEC). This authority had previously rested with another private organization, the Auditing Standards Board (ASB) of the American Institute of Certified Public Accountants (AICPA). The ASB retained the authority to set audit standards for nonpublic companies. However, standards established in one context are applied from one situation to others based on their utility. It is also more practical to operate under unified standards.

In theory, the standards reflect the right way to conduct an audit and should generally be applicable. The International Organization of Securities Commissions (IOSCO) includes 95 percent of the world's securities regulating agencies. It does not have binding authority, but its members have binding authority in their respective countries. Self-regulatory organizations such as the ASB may join, but only in consulting roles. The IOSCO recognizes the international nature of business and the burden of meeting multiple, conflicting standards for audits. Members can implement practices that reflect a consensus of the world's regulators, and they may serve to regularize practices across jurisdictions. The IOSCO also allows members to establish enforcement efforts for international crimes like bribery in foreign countries. The Foreign Corrupt Practices Act (FCPA) includes several provisions for record keeping and audits facilitated by IOSCO standards.

Forensic Accounting

Forensic accounting is the practice of applying standards and practices of accounting to questions in the courts or disputes. The generally accepted accounting principles (GAAP) serve as guidelines for how financial information should be recorded. Departures from these principles may indicate problems including fraud, abuse, or intentional misstatement. Public accountants are trained to know these standards and can often readily identify such departures during normal audits. Audits require records reconciliation in financial statements and many interviews with the accountants who prepared the statements. Using their skill bases, accountants with a forensic specialty can derive meaningful conclusions based in matters under dispute, even though forensic accountants may not be able to rely on even minimal participation from those preparing the records or statements because of the dispute. In some cases, the forensic auditor may work directly with attorneys in a dispute to compel production of documents and supporting materials for analysis.

Certifications

The AICPA is the self-regulating and self-certifying body of public accountants in the United States. Although bookkeepers and uncertified accountants work throughout the United States, only accountants who hold a bachelor's degree and pass the CPA exam can earn the designation of certified public accountant and become members of the AICPA. In light of their certification, public accountants hold a position of trust in the same way as attorneys or physicians. They also enjoy special recognition under the law and have special legal responsibilities. Failure to meet the profession's standards can result in criminal penalties for egregious violations.

Certified fraud examiners (CFEs) must also meet educational or experience standards, adhere to a code of ethics, and pass an exam with continuing certification requirements. However, the CFE, although respected in the industry, does not enjoy special status under the law, and not all certifications enjoy this level of respect. Short, 40-hour certification courses with minimal testing and quick certifications do not convey the investment of time and personal effort that underlie professional credentials.

California has identified certain "loan auditor" certifications as subject to abuse by those seeking to defraud mortgage holders. Certified Forensic Loan Auditors, Forensic Loan Auditors, and similarly entitled specious certifications have been implicated in a new variation of foreclosure rescue scams and loan modification scams. Loan auditors claim to be able offer homeowners relief from mortgage payments or foreclosure by identifying errors in the mortgage. Forensic audit does not function in that manner. Reports from forensic auditors may be used in court in a lawsuit, but they do not offer quick relief to desperate homeowners. The abuse of these certifications emphasizes the lack of value of short-course certifications. Even if the holders of these credentials intend to act ethically, they lack professional investment, education, and experience for a position of trust implied by the title.

Activities of Forensic Auditing: Case Example

Forensic audits often focus on a single instance. A regular audit is inductive because it attempts to draw in all the information within its defined scope and seek a statement about the phenomena observed. A forensic audit is often deductive because it starts with a specific proposition and seeks to confirm or refute that proposition.

For example, a bank suspects that loan officers and possibly managers at a bank branch have conspired to fund loans that do not meet the bank's criteria. A number of the questioned loans are in default. An internal audit team finds that there are too many similarities in the summary statistics of documents used to support loan applications from the branch. The internal team also finds evidence of missing documentation in a few of the loans approved by the manager. The bank makes all necessary reports to regulators and engages a forensic audit team from a small audit firm specializing in consumer loan fraud. The team includes CPAs, nonaccountant CFEs, and audit associates trained by the firm or with extensive banking experience.

CPAs and CFEs begin interviews with a few of the loan officers, while audit associates begin to examine all loan document packages for the last three years. The paper audit reveals that numerous packages from three loan officers are missing essential documentation, such as proof of income. Some packages contain photocopies of other people's proof of income. The interviews and analysis of financial reports submitted by the bank reveal patterns in the abusive loans clustering around goal deadlines for bonuses. The CFEs and computer forensic investigators find e-mails between the three loan officers and the assistant manager detailing a plan to subvert internal controls by bypassing the branch manager. The investigation also discovers a protracted exchange between a fourth loan officer and the branch manager to fund a loan that does not meet the criteria of the bank but is fully documented. The loan was funded, but details were omitted in the reports sent to the bank's headquarters.

Follow-up interviews with the three loan officers and the assistant manager flesh out details of the plan in the report and lead to voluntary separation of these individuals from the bank. The final report from the forensic audit firm's partner is submitted by the bank to regulators and law enforcement. The evidence collected by the audit team has a full chain of custody and is admissible in court. The bank acknowledges the losses to regulators, and meets all remediation requirements.

In the banking example, forensic auditors performed a semiskilled review of source documents, assessing them in terms of policy, regulation, and law in light of the suspected fraud. Forensic auditors performed interviews with key employees and decision makers, while also reviewing written statements and reports. In this case, the team left the bank and put together an initial report. The professional staff members reviewed the document packages prepared onsite. At the same time, the team began to draft submissions to the partner in charge of the engagement. Questions raised by the partner and new issues identified in the document review were pursued in a second round of interviews, focusing on key players. The out-of-policy loan endorsed by the manager was acknowledged and documented well enough that it did not appear to be fraud, so it was noted but not pursued. The supporting documentation for the final report was compiled according to the rules of evidence, indicating that the source and continuing custody were documented with signed chain of custody forms.

In theory, each person having custody of the data should be listed on the chain of custody, and each person on that chain could testify to his or her custody of the evidence. In practice, such testimony would lead to little more than a recitation of facts on the form. However, this information is useful to track events and can be called into question if it is missing. The final report prepared by the partner may be supported by highly credentialed expert testimony from the partner, even though the partner never appeared onsite.

Forgery

Forgery is the fake making or altering of handwritten or electronically produced documents, artwork, or cultural artifacts with the intent to deceive or defraud. A person may commit the crime of forgery for a variety of reasons, including personal financial gain, prestige, to avoid criminal or financial liability, or political reasons (i.e., to influence public opinion).

The crime of forgery is similar to, and often overlaps with, the crime of counterfeiting, which is the intentional reproduction of currency, documents, and products, primarily for financial gain. However, unlike forgery, counterfeiting is not always done with the intent to deceive or defraud.

Although there is a wide variety of items that are subject to forgery, such as artwork (e.g., paintings, drawings, and sculptures) and cultural artifacts (e.g., arrowheads, beads, fossils, pottery, and tablets), the items that are most commonly associated with the crime of forgery are handwritten, historic, and electronically produced documents. In order to understand how forgery has evolved and its impact in society, it is important to know the history of forgery law, the different types of forgery, and how forgeries can be detected using forensic techniques and technology.

Evolution of Forgery Law

Archaeological findings date the existence of counterfeit items back to ancient Greece and Rome. Some scholars estimate that the law of forgery may have originated in Rome around 80 B.C.E. In his book *Law of Disputed and Forged Documents*, J. Newton Baker contends that the forging of documents occurred in every place where writing was used to communicate. Under Roman law, the Code of Justinian (c. 539 C.E.) outlines the rule for the identification and comparison of handwriting in cases of questioned writing. Therefore, forgery law predates 539 C.E.

In England, the statute that prohibited the forging of officially recorded and sealed documents was established in 1562 and was expanded in 1726 to include the forging of signatures and seals on private documents. In the United States, the federal statute that made forgery or the alteration of any writing a crime was enacted in 1823. Since then, individual states have adopted forgery laws; however, what constitutes a forgery and the severity of the punishment varies from state to state. For example, the type of forgery and the severity of the crime determine if a person will be charged with a misdemeanor or a felony.

Although a person who commits forgery can be charged with a felony and is ultimately convicted of this crime, in today's society, the crime of forgery is viewed less harshly than it once was. In England in 1729, and early in American history, a person convicted of forgery was often tortured and in some cases was sentenced to death. Now, a person found guilty of forgery is rarely sent to prison and is never sentenced to death. Instead, most forgers are given probation and are ordered to pay restitution.

Forgery is a difficult crime to prosecute because the prosecution has to prove beyond a reasonable doubt that the accused reproduced or wrote something with the intent to defraud. In many cases, proving intent is difficult to do. Furthermore, obtaining legally admissible evidence that demonstrates to the court that the accused is the person who forged the item in question, or proving that the item in question is not genuine, can be challenging. As a result, many forgery cases go unsolved or uncharged, are pleaded outside the courtroom, or are dealt with in the civil court system, where the burden of proof is much less.

Types of Forgery: Artwork

Forgery can be divided into three main categories: artwork, cultural artifacts, and handwriting and documents. Artwork includes items such as paintings, drawings, prints, and sculptures. People who forge artwork do so primarily for financial gain and, in some cases, to win prestige. The art industry is estimated to be a $50 billion market, and according to the Federal Bureau of Investigation (FBI), art and cultural property crimes are estimated to cost $6 billion annually. However, this estimate is not for art forgery alone; it also includes the theft, fraud, looting, and trafficking of art across state lines. In this regard, calculating a total dollar value for art forgery is further complicated by the large number of art crimes that go unreported. Nonetheless, the impact of art forgery on businesses and private citizens who are involved in this niche market is astounding. For instance, the Dutch painter Han van Meegeren, who is considered one of the best art forgers of the 20th century and is known for his Jan Vermeer forgeries, sold his forgery of *Christ With the Adulteress* for $7 million. Before Meegeren's arrest and conviction, he had reportedly earned from $25–$30 million selling his art forgeries to collectors.

Cultural Artifacts

People who forge cultural artifacts are also driven by financial gain and prestige to commit forgery. Because most cultural artifacts are hard to find and carry a high degree of historical value, people who collect them are willing to pay large amounts of money to acquire them. Examples of cultural artifacts include arrowheads, jewelry, beads, gemstones, fossils, pottery, dishes, tablets, stonework, wood carvings, and historical and religious relics. Given the uniqueness and invaluable worth of some cultural artifacts, history is rich with examples of this type of forgery. One such example, dating back to the Old Babylonian period, is the stone cruciform monument from Sippar, which is located in the southern region of Mesopotamia (today's Iraq). More recently, fossils and Native American artifacts have attracted the interest of forgers, resulting in a flood of forgeries in this market.

Handwriting, Documents, and Data

Although the costs associated with forged artwork and cultural artifacts are significant, the oldest and most prevalent kinds of forgeries are those involving handwriting and documents. Handwriting and document forgery is composed of a large list of items that includes contracts, wills, deeds, trusts, checks, money orders, invoices, receipts, stock certificates, coupons, gift certificates, airline vouchers, vehicle titles, college transcripts, diplomas, credentials, medical records, identity documents (e.g., birth certificates, passports, social security cards, driver's licenses, identification cards, and visas), historical documents, postage stamps, autographs, letters and notes, literary works, and scientific data. People who forge handwriting and documents are primarily motivated by four things: personal financial gain, prestige, avoiding criminal or financial liability, or political reasons.

The forging of handwriting and documents is most commonly committed for personal financial gain. The kinds of document forgery cases that typically end up in the criminal courts involve checks, credit cards, medical records, and identity documents. Because charges of forgery often overlap with other crimes, people who are accused of forgery may also be charged with identity theft or other forms of financial fraud. For example, the complicated fraud schemes that are often involved in white-collar crime typically include forgeries in the form of signatures or electronically produced documents. Many handwriting and document forgery cases never make it to the criminal courts; rather, they are litigated out in the civil court system. In addition to contract disputes between individuals and businesses, an overwhelming number of forgery cases involve family disputes where issues related to wills, deeds, trusts, and private property are in question.

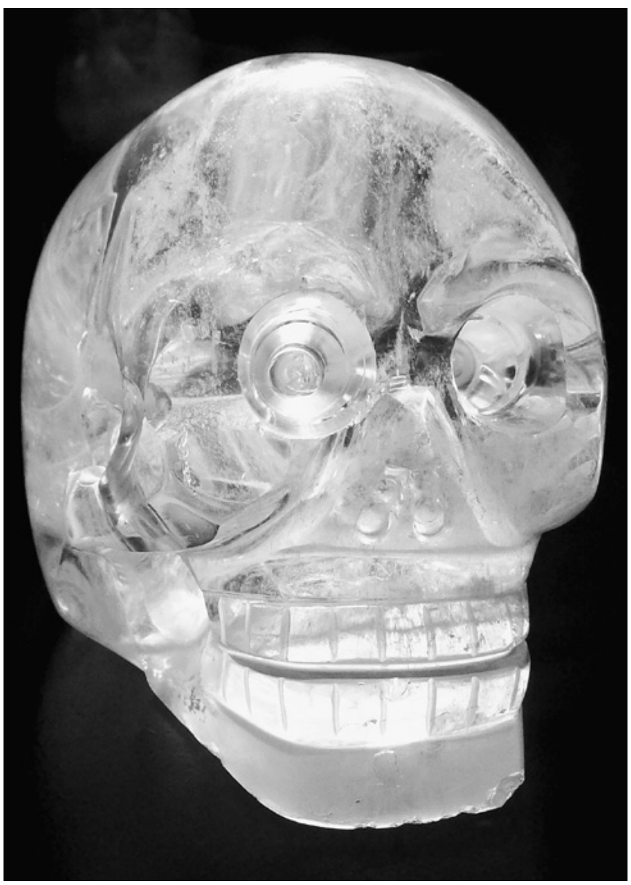
The desire for admiration and respect also motivates people to fabricate documents and information. Some examples include the forging of college transcripts, diplomas, awards, credentials, and autographs of famous people. One of the most famous cases in which forgery was used to obtain money and prestige was turned into a movie called *Catch Me If You Can*. The movie is based on the exploits of Frank W. Abagnale, Jr., who over a five-year period passed more than $2.5 million in forged checks and used fake identity documents and credentials to create several highly respected fictitious identities. As a phony U.S. Bureau of Prisons agent, commercial airline pilot, medical doctor, and lawyer, Frank Abagnale, Jr. found the respect and admiration that he desired, and criminal prosecution.

An individual wanting to avoid criminal or financial liability may resort to forging signatures and creating documents. The motivation behind this kind of document forgery is commonly associated with terrorist groups, drug dealers, war criminals, car thieves, criminal fugitives, undocumented immigrants, and people involved in business fraud. In 1976, an in-depth study conducted by the Federal Advisory Committee on False Identification (FACFI) reported that 100 percent of all federal fugitives and 80 percent of all drug traffickers who were apprehended by the police were using fake identification. In 2002, the Center for Immigration Studies issued a report claiming that most undocumented immigrants use fake documents to obtain genuine identity documents, which give them access to a variety of social benefits and services. Most recently, the "9/11 Commission Report" asserts that the terrorists who carried out the September 11, 2001, attacks were able to do so because they were using fake documents.

Political forgeries are committed to influence public opinion and to shape public policy. In this regard, forged handwriting and documents are used to falsify scientific data, rewrite history, and wage propaganda campaigns.

The forging of scientific data, although uncommon, can have a significant impact when it occurs. An example of how the falsification of scientific data can be used to influence public policy involves the issue of global warming. In 2007, the United Nations released a report on global warming claiming that the Himalayan glaciers would melt by 2035 because of dramatic rises in global surface temperatures. After the report was released, it was determined that the scientist behind the study had reported misleading data to, allegedly, put pressure on world leaders. In 2008, scientists from the United Nations' Intergovernmental Panel on Climate Change (IPCC) were accused of citing false data that supported the notion that human-made global warming was accelerating. In 2009, the global warming campaign came to a head when one of the world's leading climate scientists, from the University of East Anglia in England, had his e-mail account hacked. The e-mails that were obtained appeared to demonstrate that the reporting of misleading climate data had been an attempt to influence public policy related to global warming.

The rewriting of history is another way in which forged documents are used to further a political agenda; the *Protocols of the Elders of Zion* is a famous example from the 20th century. The document claims to hold the details of a secret meeting among Jewish leaders late in the 19th century, at which they outline the Jewish plan for world domination. The *Protocols*, which has since been determined to be a forgery, was first published in Russia in a St. Petersburg newspaper in 1903 and was translated into English in 1920. Henry Ford, the American industrialist and the founder of the Ford Motor Company, purportedly funded the printing of at least 500,000 copies that were then distributed throughout the United States. The source material for the forgery was later found in two literary works: the first, a political satire by a French lawyer named Maurice Joly, who wrote a fictional dialogue in Hell between Niccolò Machiavelli and Baron Montesquieu; the second, a violent anti-Semitic novel by Hermann Goedsche, a German novelist. Despite being identified as a forgery, some people and groups, such as the anti-Semitic Christian Nationalist Crusade, continue to accept and distribute the *Protocols* as an authentic piece of work.



This crystal skull at the Musée du quai Branly, Paris, is almost certainly a forgery. Eugène Boban, a controversal "relics" dealer from the 1870s, sold the skull (and two other crystal skulls) to Alphonse Pinart, a young explorer. In 1878, Pinart donated it to the Museum of Ethnography at Trocadéro, Paris.

During propaganda campaigns, forged documents can be used to misrepresent reality. Although propaganda campaigns tend to take place during wartime, there are instances when forged documents have been used to ensure that political leaders or political parties win elections. During the British general election campaign of 1924, a letter purportedly authored by the president of the Communist Party in Moscow, Grigori Yeusevich Zinoviev, and addressed to the Communist Party of Great Britain, was published in the conservative newspaper the *British Daily Mail,* a few days before the election. The contents of the letter asked the British Communist Party to pressure the ruling Labour government into finalizing a proposed Anglo–Soviet trade treaty and to continue preparing for an armed revolution by infiltrating the military. The letter had an effect on the outcome of the 1924 election because it ensured the fall of the Labour Party and put the Conservative Party back in power. Although the letter was later determined to be a forgery, the damage it had caused was irreversible. Historians argue that the primary effect of the Zinoviev letter was on Anglo–Soviet relations, and they credit the letter with causing the isolation of the Soviet Union from the West in the late 1920s and 1930s, which eventually led to a Nazi–Soviet partnership.

A more recent example of political forgery occurred in Iraq in 2003, when the Italian Military Intelligence and Security Service (SISMI) obtained documents that suggested that the president of Iraq, Saddam Hussein, had tried to buy yellow-cake uranium powder from Niger during the Iraq disarmament crisis. The documents were regarded as proof that Iraq was trying to acquire nuclear material to develop weapons of mass destruction. This information was then used by the United States and the United Kingdom to justify going to war with Iraq. Soon after, a thorough and detailed analysis of the documents revealed that they were poor-quality forgeries.

Scientific Detection of Forgeries

The scientific detection of forgeries is accomplished by people who have received specialized training, and it involves the use of a variety of tools and techniques. The examination of artwork and cultural artifacts often includes the use of radiocarbon dating, thermoluminescence, dendrochronology (i.e., tree-ring dating), radiography, microscopy, and ultraviolet (UV) and infrared (IR) luminescence. For example, when the Shroud of Turin was discovered, it was subjected to a series of scientific examinations including the use of radiocarbon dating, through which it was determined that the shroud dated to sometime around the end of the 13th century and the beginning of the 14th century, which made it far too recent to be associated with the tomb of Jesus.

The examination of questioned handwriting, signatures, and documents is performed by a forensic document examiner. Additionally, the forensic document examiner investigates issues involving paper, ink, writing instruments, font styles, typewriting, computer-generated documents, printing processes, copy machines, stamps, and impressions. The document examiner uses several different tools during the process of examination. These instruments include microscopes; cameras; ultraviolet and infrared lighting techniques; an electrostatic detection apparatus (ESDA), which is a forensic device used to detect writing indentations in paper; and a video spectral comparator (VSC), which is used in the examination of inks and paper.

As the crime of forgery continues to grow and evolve with society, the criminal justice system faces the challenge of preventing, investigating, and prosecuting forgery cases in a timely and assertive manner. Not only are people's identities, reputations, and financial assets at stake, but also their safety, as national security is repeatedly threatened by this crime. In 2003, as part of a security test, the Government Accountability Office (GAO) created fake identity documents using inexpensive computers, printers, and photo editing software that could be purchased at any electronic, or business supply store. Using these fake identity documents, undercover government agents then attempted to gain entry into the United States; they got through security and re-entered the country. The advancement of computer technology and photo editing software has made it easier for forgers to create documents and pass them off as genuine. In this regard, the challenge of those who are charged with investigating forgeries will have to develop the appropriate tools and techniques to detect and deter this persistent crime.

Frankel, Martin

Martin Frankel was one of the 20th century's biggest con men, an international fugitive, and then a convict. According to Ellen Pollock's *The Pretender,* Frankel created a fairly slipshod Ponzi scheme that involved phantom trades of stock, imaginary stock portfolios, money laundering, and asset skimming. He collected $208 million in five states, pocketing the premiums. Before it fell apart in 1999, his scam became the largest in U.S. history.

The Scam Begins

Frankel operated his first firm, the Frankel Fund, from the bedroom of his Toledo, Ohio, home in the 1980s. In 1991, he formed Thunor Trust. In 1992, the U.S. Securities and Exchange Commission (SEC) barred him from trading stock. He continued using Thunor to buy small insurance companies, generally those that specialized in burial policies for poor people, usually companies that were in financial trouble. He spent $71 million on purchasing companies, primarily in states with lax oversight. In 1994, he began his insurance scam. Thunor claimed to be enhancing the profitability of the companies by improving returns on their portfolios. Instead, it put all the money into Liberty National Securities, the unregistered brokerage that Frankel ran from his house. Frankel gave the companies fraudulent statements showing market-beating returns. By the spring of 1999, Frankel's Liberty National managed at least $335 million. It managed to avoid investing any of the money, moving it to accounts controlled by Frankel for his personal use.

He posed as a successful investor, acquired insurance companies, siphoned off their money, and spent it on two mansions and $1.8 million worth of automobiles. Before fleeing, Frankel headed Franklin American Life Insurance, headquartered on his four-acre Greenwich, Connecticut, estate. In 1998, he used his knowledge of Catholicism and St. Francis of Assisi to establish a fake Catholic charity and dupe priests tied to the Vatican into giving his charity $55 million. They also provided bona fides for the charity that Frankel used in an unsuccessful attempt to attract Lee Iacocca and Walter Cronkite to the board of directors. Even after the two declined, Frankel used their names in company publicity.

Up in Smoke

By March 1999, the foundation had almost $2 billion in assets, and Liberty National, a Frankel company, managed part of it. Mississippi regulators became suspicious in 1999 because of the concentration of funds at Liberty National. When they started investigating and ordered Frankel to return millions to the insured, Frankel left town. He asked an assistant to destroy the evidence, but the smoke alarm went off, the fire department came to the mansion and saw the bags of shredded documents, and detectives were soon on the scene. Among the mass of evidence was Frankel's to-do list containing items such as "launder money" and "get $ to Israel, get it back in." Frankel's documents included an astrological chart with the question, "Will I go to prison?"

Investigators found Frankel four months later in a Hamburg, Germany, motel with about a dozen fake passports under different names and hundreds of diamonds. The diamonds he had in Hamburg were worth over $8 million. He was imprisoned in Germany for 18 months for failure to pay taxes on his diamonds and for holding fake passports. His crimes in the United States were fraud and racketeering. In prison, he attempted to saw through the window bars. He attempted to beat extradition by arguing that life in prison would violate his human rights because it was an effective death sentence. German officials gave him to U.S. marshals.

In 2004, in New Haven, Connecticut, Frankel received a sentence of 16 years and 8 months from federal district court judge Ellen Bree Burns. He had a court-appointed attorney who attempted to show that the fraud was not $200 million but was instead under $80 million, the threshold for harsher sentences. The judge rejected the defense claim and also agreed with the prosecution witnesses who testified that Frankel knew right from wrong and, despite some degree of mental disorder, could control his behavior. The defense lawyer also sought to elicit sympathy by pointing out that the only friend Frankel had in the courtroom was his former driver, Joseph Ghattie, who later told reporters that Frankel was a good man and that he was in court to cheer him up. The judge also rejected Frankel's claim that he deserved some sympathetic treatment because the German prison was harsh. The judge gave Frankel credit for helping prosecutors find some of the money and his accomplices.

Frankel's address to the court lasted 45 minutes and included biblical quotations, jokes, settlement of grudges, and a plea for clemency. His presentencing statement was a rambling tale of remorse, massive losses, and mental health issues. He apologized for looting his insurance companies. He blamed his problems on his desire to give coconspirator Sonia Howe and her children money. He also said that he didn't set out to take $200 million but had to continue the scheme because after the first fraud it would have fallen apart if he'd stopped. He also justified his fraud by claiming that he was trying to raise funds to fight world hunger. In 2004, at the age of 50, Frankel began serving his nearly 17-year sentence. He also surrendered $88 million in personal assets and $30 million in Swiss bank accounts. Regulators in the states where his fraud occurred sued him for $600 million. A total of 16 accomplices were convicted, including a former Roman Catholic Church official in Rome, who claimed to be running a Vatican-endorsed charity. Several of the Thunor insurance companies went into receivership, and St. Francis's $1.98 billion was gone, if it ever existed at all.

Friedrichs, David

David Friedrichs, born in 1944, is a distinguished university fellow and professor of sociology and criminal justice at the University of Scranton, in Pennsylvania. He is a prolific writer on white-collar and corporate crime, including state crime. He has authored over 130 articles, book chapters, encyclopedia entries, and essays, many addressing various dimensions of white-collar crime. His work has focused on addressing definitional, conceptual, and typological issues, and the "mapping" of the terrain of white-collar crime scholarship, and his publications have been cited over 900 times. Friedrichs attended New York University for his undergraduate and graduate studies, completing a B.A. in sociology, an M.A. in sociology, and doctoral studies. While at NYU, Friedrichs studied criminology under Richard Quinney, who developed (with Marshall Clinard) an influential typology differentiating between corporate and occupational crime. This mentorship paved the way for Friedrichs's extensive work on white-collar and corporate crime. After teaching for nine years at the City University of New York-College of Staten Island, Friedrichs accepted a faculty position at the University of Scranton, where he has been since 1977. In addition to his teaching and research at Scranton, he has been a visiting professor and guest lecturer at many universities, including the University of South Africa, Flinders University (Australia), and Ohio University (Rufus Putnam visiting professor). Throughout his tenure, he has inspired many to take an interest in white-collar and corporate crime. He collaborated with his daughter, Jessica, to introduce the concept of "crimes of globalization": the crimes of international financial institutions such as the World Bank and the International Monetary Fund.

Trusted Criminals

In 1996, Friedrichs wrote what is now considered the most comprehensive text on white-collar crime and its control: *Trusted Criminals: White Collar Crime in Contemporary Society*. This text covers definitions of white-collar, corporate, and occupational crime, differentiating these crimes from crimes like those committed by the government; presents theories explaining why these crimes occur; and reviews various responses to these crimes. In the first edition of the book, Friedrichs developed a typology of white-collar crime, including core forms (corporate and occupational), cognate (governmental), hybrid (state-corporate, crimes of globalization, and finance crime), and marginal (avocational, enterprise, contrepreneurial, and technocrime)—a typology that has been used extensively. According to Harzing's Publish or Perish author impact analysis software, *Trusted Criminals* is cited on average 75 times each year. As a testament to its influence and Friedrichs's commitment to the study of white-collar and corporate crime, *Trusted Criminals* won the White Collar Crime Research Consortium 2011 Outstanding Publication Award.

In addition to his abundant, oft-cited writing, Friedrichs has worked on the other side of publishing. He served as editor of *State Crime, Volumes I & II*, published by Ashgate in 1998. Additionally, since 2005, Friedrichs has participated in international symposiums on state crime and political white-collar crime in Jerusalem, Prato, Maastricht, Onati, Utrecht, and Wellington, and has contributed chapters to anthologies emerging from many of these symposia. His extensive research on white-collar and corporate crimes has been lauded by other scholars in the field. Friedrichs was elected as the second president of the White Collar Crime Research Consortium, serving from 2002 through 2004. In 2005, he was awarded the Lifetime Achievement Award by the American Society of Criminology Division on Critical Criminology.

G

G. D. Searle & Company

G. D. Searle and Company, or Searle, was a company with interests in the life sciences, specifically pharmaceuticals, agriculture, and animal health. Its best-known products include Metamucil (a laxative), Dramamine (for motion sickness), Enovid (the first commercial oral contraceptive), and perhaps most controversially, NutraSweet (aspartame). Searle was founded in 1888 in Norman, Oklahoma, by Gideon Daniel Searle, and was purchased by Monsanto in 1985, and later, in 2003, by Pfizer, which retired the Searle name.

Sweet Poison

The history of the approval of aspartame is one of state and corporate intersection and the transferability of executives from the corporate world into offices of governance. According to a growing number of scientists, aspartame is the most dangerous food additive, accounting for more than 75 percent of adverse reactions reported to the U.S. Food and Drug Administration (FDA). Among the numerous highly serious reactions are birth defects, brain tumors, hearing loss, and seizures causing death. A 1976 FDA investigation of Searle's laboratory practices found Searle's testing procedures shoddy, full of inaccuracies and "manipulated" test data. Senator Edward Kennedy's Sub-committee on Health of the Senate Judiciary Committee, between 1975 and 1975, became convinced that Searle's testing procedures were characterized by widespread fraud and incompetence.

In 1977, the FDA directed the U.S. Attorney's office to begin grand jury proceedings to investigate whether indictments should be filed against Searle on the basis that the company knowingly misrepresenting findings and "concealing material facts and making false statements" in aspartame safety tests. This event represented the first time that the FDA initiated a criminal investigation of any manufacturer. The investigation would almost immediately come under a cloud of suspicion. As the grand jury probe began, the law firm representing Searle, Sidley and Austin, would initiate job negotiations with the U.S. Attorney in charge of the investigation, Samuel Skinner. Later that year, Skinner would indeed take a position with Searle's law firm. The resulting delay associated with Skinner's resignation and the need to replace him meant that the statute of limitations on the charges associated with the aspartame tests expired.

Still in 1977, concerned over the difficulties in the capital, Searle hired longtime Washington insider Donald Rumsfeld as its new chief executive officer (CEO). A former member of Congress and secretary of defense in the Gerald Ford administration, Rumsfeld brought in several of his Washington colleagues to fill top management positions in the company. Aspartame was banned by FDA on the basis of findings from a 1980 FDA board of inquiry, comprising three independent scientists, which concluded that the substance "might induce brain tumors." On January 21, 1981, the day following Ronald Reagan's inauguration, Searle reapplied to the FDA for approval to use aspartame as a food sweetener. Reagan's transition team included Rumsfeld.

Reagan's newly installed FDA commissioner, Arthur Hayes Hull, Jr., appointed a five-person scientific commission to review the board of inquiry's decision. When it became clear that the panel would uphold the ban by a 3–2 decision, Hull installed a sixth member on the commission, resulting in a deadlocked vote. Hull then personally intervened to break the tie in favor of approving aspartame, ignoring the recommendations of the FDA and overruling the public board of inquiry. Hull would later leave the FDA under allegations of impropriety involving unauthorized rides on a jet belonging to General Foods, a major purchaser of NutraSweet. He went on to a position with Burston-Marsteller, the chief public relations firm for both Monsanto and G. D. Searle. Despite objections of the National Soft Drink Association, which had concerns about the volatility of aspartame and lawsuits by consumer lawyers and doctors over safety issues associated with aspartame, the first carbonated beverages containing aspartame were available for public sale in late 1983. In 1996, the FDA removed all restrictions on the use of aspartame, allowing its use in heated and baked goods.

Faulty Birth Control Devices

Searle was also the subject of lawsuits and questions about testing practices with regard to its line of intrauterine devices (IUDs) for birth control. In 1988, a federal jury awarded a woman nearly $9 million after finding that Searle made intentional misrepresentations of the Copper-7 IUD, which had been the best-selling IUD in America prior to withdrawal from the U.S. market in the face of mounting legal cases. Finding that the Copper-7 IUD contributed to women's sterility, the jury decided that the company had been negligent in testing, but not in manufacture, of the product. During that trial, internal documents revealed that Searle had been aware that use of the IUD was associated with a three to five times increase in the risk of pelvic inflammatory disease, a cause of infertility. Around 500 lawsuits were filed over the Copper-7. The Copper-7 had been the first IUD to receive premarketing approval from the FDA and, over 12 years on the U.S. market, had earned Searle an estimated $80 million in profits. The company continued to sell the IUD in the developing world, where threats of lawsuits were minimal.

Rumsfeld served as CEO and then as president of Searle between 1977 and 1985. During his tenure at Searle, Rumsfeld directed the mass downsizing of employees, cutting the number of workers by 60 percent. The resulting increase in company profits and rewards to shareholders led Rumsfeld to claim awards as the Outstanding Chief Executive Officer in the Pharmaceutical Industry from the *Wall Street Transcript* (1980) and *Financial World* (1981). In 1985, Rumsfeld was instrumental in the acquisition of G. D. Searle and Company by Monsanto. He would serve as Secretary of Defense under George W. Bush from 2001 to 2006.

Gambling and Lotteries

Gambling in general and lotteries as a specific form of organized gambling fall within the set of

This nighttime photo by Lewis Hine captures a group of messengers absorbed in their usual game of poker in the "den of the terrible nine" (the waiting room for Western Union messengers) in Hartford, Connecticut, March 5, 1909. Playing for money, some would lose a whole month's wages in a day. By the early 20th century, gambling's depiction as a social ill led to legislation and enforcement that was modeled after Prohibition. The efforts were primarily successful in driving gambling underground.

activities often categorized as "games of chance." The functional premise underlying such games is that of investing a comparatively small amount of funds in a transaction wherein one or more, but not all, of the participants will receive a larger portion of the pooled money. The person who receives the payout is considered the winner of the game, and the opponent is not the other entrants but the probability of losing the invested money. This adversarial notion is often symbolized as luck or chance. Unlike more conservative forms of investment and return, gambling offers the prospect of rewards within a short period of time.

The methods of offering such chances include lotteries, raffles, drawings, and games played with cards, dice, and machines. Other forms of organized gambling involve wagering on the outcomes of sporting events or even natural occurrences.

As an enterprise and as personal behavior, gambling lends itself to the sort of exploitation and profit motivation that is involved in other forms of corporate and individual deviance.

History of Gambling

The connection between numbers and unknown outcomes is a fundamental social artifact in human history. Almanacs developed from folklore as devices to ensure better outcomes in hunting and agriculture by assigning quantitative values and then laying out numbered patterns of weather, climate, and other observed phenomena. Those who understood the patterns were able to use them to their advantage in acquiring the basic necessities of life. Early documents such as the *I Ching* from China purported to determine the future by randomly selected combinations of numerical groupings from an arrangement of 64 possible clusters. For each portentous reading, sticks, coins, or other binary representations would be dropped or thrown in a manner that allowed gravity to control the distribution. It was believed that future events might be known or even perhaps controlled through this method, setting forth a human willingness to equate a desirable outcome with a chance grouping of numbers.

From this concept were developed both the notion of the scientific testing of hypotheses against mere chance and the popular belief in luck as a source of revenue. In each culture, there was a period where those who applied such methods of divination were considered to hold some skill or ability to account for their predictive successes. Whether in the form of soothsayers or professional gamblers, "beating the odds" has acquired its own particular mythos. In contrast, behavioral psychology has studied in primates the ability to grasp the concept of monetary symbols along with values such as work and stealing to acquire concrete benefits, but so far there is nothing to support the notion that animals engage in anything that could be defined as gambling to gain possible but undetermined rewards.

As human technologies developed, the methods of predicting future outcomes appeared in various forms; dice, cards, and even wheels were set up to generate random number combinations in place of the earlier sticks and coins. Some individuals realized the profitability of matching the random numbers strictly by chance, and gambling enterprises soon developed. As with the early oracle pursuits, those who became successful in gambling endeavors were seen as possessing some special traits in either ability or luck. Games of chance began to develop the trappings of games of skill with rules, with impartial distributors of the gaming devices functioning as referees among several competitors.

Advances in machine making among the industrial segment of society were reflected in the appearance of purely mechanical games where the player would deposit money and participate via levers or buttons in the production of the "winning" numbers. This in turn led to gambling machines in their current forms, from slot machines to electronic poker to the casino-based, large-screen interactive video games offering large prizes and entertainment.

From the early oracle-based systems to these modern, sophisticated electronic gaming devices, humans have refined the concept of using randomness to link to unknown outcomes into an enormous enterprise that affects a very large number of people around the world. A parallel set of gambling enterprises has evolved by following the premise that the end results of athletic competitions are random future occurrences from which people can profit by correctly choosing among their possible outcomes in advance. Contests between humans and animals such as horses and dogs range from speed matches to brutal displays of violence and even death. The attraction to betting on the outcomes of spectator sports also harkens back to the era where gladiatorial events were first staged in Rome.

Illicit Gambling

As governments became more structured and religions gathered more centralized power, there was a noticeable rise in disapproval of gambling. Whether declared a civil crime against public order or a moral violation against religious doctrine, gambling was firmly assigned a place in the category of deviant or immoral social behavior. As with other deviant behaviors, gambling was not diminished in the long run by any prohibitions. In fact, it flourished in the company of other vices such as drugs, prostitution, and smuggling as a traditional profit center for organized crime. The selling of chances in competitive events or on a random series of numbers continues to make vast profits both inside and outside legal strictures.

By the early 20th century, the depiction of gambling as a social ill led to legislation, and both political and law enforcement campaigns were modeled after similar efforts against such moral turpitude. The efforts were similarly unsuccessful at accomplishing much except driving gambling underground.

Because of the legal and law enforcement situation of the era, many operators of gambling establishments developed partnerships with cruise lines and installed gaming devices on passenger ships that traveled in international waters. In the case of violent contests, bouts of human or animal fighting were conducted in a variety of places and manners hidden from the common view. In the case of selling numbers or taking bets away from racetracks and sports arenas, off-site betting offices or parlors were again profit centers for organized groups of criminals who divided such establishments up along territorial lines similar to their drug and sex-traffic enterprises.

Legal Gambling

In contrast to gambling suppression attempts in most municipalities, there were several locations around the world, such as Hong Kong, Macau, Havana, Las Vegas, and Monte Carlo, that developed enclaves combining many formats of open gambling with lavish entertainment and an aura of opulence. They were very beneficial to modern organized crime as places to transfer large amounts of money from criminal enterprises into the general circulation, and vice versa. In popular culture, these resorts and casinos were portrayed as centers for famous entertainers and other celebrities and for the public to aspire to visiting. Casinos and their environs became staple settings for movie producers, adventure novel authors, and popular singers and dancers. They even offered an arena for the resurgence of large-scale stage magic acts and prospered as a result.

Today, the popularity of casinos has spread to countries in the Middle East, South America, and Asia, and to other, far less glamorous sites in the United States such as Tunica, Mississippi, and multiple parcels of land owned by Native American tribes. The public perception of casinos has shifted away from the exotic and the taboo and toward family-friendly resort sites found in the most popular vacation destinations. The casino industry has followed a standard corporate pattern of merger and takeover, with a small number of large companies dominating the market. As these companies gain market share, their ability to apply more expensive marketing and advertising in mainstream outlets increases, as does their ability to lobby local governments for expansion. This leads to a modern duality in which gambling is still referred to as a sin in religious circles and still treated as a crime in prosecutorial domains but is marketed as a normal facet of recreation if packaged in a legitimate fashion.

State Sponsorship of Gambling

In order to maintain this apparently contradictory premise, governments adopted methods similar to those brought about by the failure of Prohibition and began licensing certain gambling establishments while continuing to censure others. In this manner, churches were allowed to operate games of chance to raise money for good causes in the form of bingo games, raffles, and other similar activities. As a function of sovereignty for Native American tribal authority, the federal government allowed casinos to be built and operated on tribal properties as a means of increasing funding for the tribe as a whole.

Once the concept of regulating gambling to raise money for a good cause became accepted, the notion of state-operated lotteries spread. Only seven U.S. states do not currently have a state-sponsored lottery. All states allowing gambling in any commercial fashion have an agency in charge of regulating gaming and enforcing codified restrictions on the operators of gambling premises.

In a state-operated lottery, drawings are held at weekly or biweekly intervals, and tickets are sold through licensed vendors until a cut-off point hours before the drawing. The more tickets that are sold, the larger the amount of money awarded to the people holding the tickets that match the drawing numbers for that date. In addition to the repeating drawings, the same retail establishments offer cardboard tickets with random numbers or symbols concealed by a layer of paint that is scratched off to reveal number or symbol combinations. More matches after a preset number of scratch-offs equals a higher payout.

Whereas the advertised value of prize money ranges from thousands to hundreds of millions of dollars, the reality is that the profit to the states is in the billions. This is because of the high rate of sales for the drawings and scratch-off tickets as well as the severely disproportionate chances of any one individual receiving a large prize award. Each state's lottery legislation earmarks a significant portion of the proceeds for a predetermined budget area such as education.

Effects of Gambling

A fundamental principle of gambling in all of its forms is that the actual chances of a participant receiving more money than he or she has paid in for any given game or event are low enough to guarantee a very large return for whoever is operating the game. This ratio applies across the board, from those who put penny bets into slot machines to those who participate in games that require high-dollar buy-ins with rapidly increasing wagers. It is because of this imbalance between revenue and return to the gamblers that casinos are able to build and operate very lavish facilities and offer enticements such as free meals, alcoholic beverages, and hotel accommodations.

Although the various governmental regulatory agencies set mathematical limits on each casino's rate of return, for all practical purposes, customers (gamblers) as a whole face insurmountable odds. In spite of this, gambling remains a very popular activity, as people apply a form of "gambler's fallacy" to rationalize a behavior that appears to offer no practical value or logical benefit. In that fallacy, any event that does not profit the gambler is evaluated against a potential future event where winning will occur at a size that erases the losses and gives the gambler an overall net benefit. In reality, each occasional win creates a skewed perspective that minimizes the total losses into a less significant amount and magnifies the money won into a perceived, but artificial, profit.

For some gamblers, this cognitive dissonance is manageable as a choice of where and how to use expendable income as a form of recreation. The enjoyment of the casino or racetrack environment, various enticements such as accommodations, or the vicarious thrill of watching a wagered contest unfold can all deliver some form of satisfaction equal to the money wagered.

There is cause for concern regarding those who do not manage their gambling expenditures carefully. In those cases, failure or inability to stop gambling has led individuals to suffer financial distress ranging from minor to extreme. Beyond the purely budgetary issues, there are emotional and personal problems affiliated with gambling, which affect not only the gambler but also those in the gambler's family, workplace, and community. The American Psychiatric Association considers problem gambling as an impulse control disorder when it interferes with the ability to function normally in important areas of life. Whether considered a disorder or the more common designation of gambling addiction, the inability of some individuals to stop gambling merits examination and discussion because of the large percentage of society that engages in some form of gambling.

In the eyes of some analysts, gambling is acting against the statistical logic that dictates little to no chance of an actual win for the vast majority of players. Considering its similarity to chemical and emotional addictions, some argue for designating gambling as a social ill along the lines of poverty or prejudice. In any case, the sheer profitability of gambling is the most obvious reason that such criticisms will do little to effect change in the near future.

Geis, Gilbert

Gilbert Lawrence Geis was a professor emeritus in the department of criminology, law, and society in the School of Social Ecology at the University of California, Irvine. He published nearly 500 articles, chapters, and books, with scholarship appearing every year from 1947 through 2012, the year of his death. Born in 1925, Geis served in the U.S. Navy during World War II and earned a B.A. in English and journalism from Colgate University (1947). He earned sociology degrees from Brigham Young University (M.S., 1949) and the University of Wisconsin, Madison (Ph.D., 1953). Geis married three times: his first wife was Ruth Geis, his second wife and occasional co-author was Robley Geis, and his third wife, Delores Tuttle, preceded him in death.

Geis first read Edwin Sutherland's book *White-Collar Crime* in his fall 1952 term. Geis's 1962 article in the journal *Sociological Inquiry* concludes that white-collar crime should begin its focus on the elements of the crime instead of the social status of the actors, thus differentiating his approach from Sutherland's. Geis edited a collection of 32 readings that appeared in a 1968 book, *White-Collar Criminal*. This collection was followed by a 1977 second edition, co-edited with Robert F. Meier, and by a third edition in 1994, co-edited with Robert F. Meier and Lawrence M. Salinger. His introductory essay notes that white-collar crime must be related to theories of behavior and deviance; in order to evaluate the meaning of white-collar crime for a country's survival, anthropological and historical studies are needed, relating it to social well-being. The 19-page essay covers intellectual history from Aristotle and Harry Elmer Barnes to George Vold and Max Weber, and is reprinted in Geis's book of 12 articles, *On White-Collar Crime*.

In the preface to his collection of articles, Geis posits that studying white-collar crime moves scientists closer to the social system's guts than scrutiny of street crime; fashioning a better world requires redirecting the behavior of the powerful. Geis at first advocated a white-collar crime definition of "corporate offenses" but found no takers. He wrote that he later abandoned definitional questions as a maze of verbiage that trapped the novice and the nitpicker. In 1982, Geis considered "whether the term *white-collar crime*" would survive; 30 years later, it is thriving.

Geis's case study "The Heavy Electrical Equipment Antitrust Cases of 1961" is much anthologized after initially appearing in Marshall B. Clinard and Richard Quinney's collection *Criminal Behavior Systems* in 1967. Using press accounts and congressional hearing testimony, Geis found information on the high-level corporate managers who committed price-fixing crimes in violation of the Sherman Antitrust Act of 1890. The managers euphemistically termed their schemes "stabilizing prices." Geis described and interpreted the firms' cultures and the managers' practices within them over time, relating them to Sutherland's hypotheses on white-collar crime and Sutherland's differential association theory of crime causation.

From 1979 to 1983, Geis was a principal investigator on state and federal grants, studying automobile repair fraud, employers' attitudes and actions regarding occupational health in California, and practitioner fraud and abuse in government medical benefit programs. The last study became the basis for a 1993 book he co-authored with Paul Jesilow and Henry Pontell, *Prescription for Profit: How Doctors Defraud Medicaid*. The book states that the prevalence of Medicaid fraud shows that the medical profession is not able to detect and discipline wayward doctors. Fraud by doctors is found by government auditors, ex-employees, and patients.

In 1994, Geis delved into corporate crime theory with "A Review, Rebuttal, and Reconciliation of Cressey and Braithwaite & Fisse on Criminological Theory and Corporate Crime," reprinted in his reader. Geis wrote that a theory of corporate crime must demonstrate how it is the result of particular conditions and processes—only then might corporate crime be accurately predicted. The search for a corporate crime theory is "worthwhile" even if it will not be as elegant as a physics formula. The American Society of Criminology bestowed the Edwin H. Sutherland Award for Outstanding Contributions to Theory or Research in Criminology on Geis in 1985. In 2008, the National White-Collar Crime Center presented Geis with its Lifetime Achievement Award for Outstanding Contributions in the Field of White-Collar Crime, now named the Geis Award. Geis continued to write well into his eighth decade. He died on November 10, 2012, after a lengthy illness.

Gender Discrimination

Gender discrimination is exhibited when women and men are treated differently on the basis of perceived differences in ability, physical prowess, intellectual capacity, or proper societal and cultural roles. This differential treatment can be manifested in a wide variety of policy areas, such as the workplace, education, the criminal justice system, health care, and childcare. Both men and women can be victims of gender discrimination, and they can be discriminated against by members of both sexes. The practice of gender discrimination is rooted in the philosophy of separate spheres for men and women. According to this theory, men maintained an influence within the public sphere, where they served as the primary provider for their families, while women's influence resided within the private sphere, where they served as the primary caregiver. Attempts to redefine this belief structure in the 19th and early 20th centuries were met with resistance.

The first wave of the feminist movement was concentrated on women gaining the right to vote. An early step in this journey was the first women's rights convention in New York. The Seneca Falls Convention in 1848 aimed to publicly call attention to inequalities in women's rights by creating the Declaration of Rights and Sentiments, which used the Declaration of Independence as its prototype. The convention was organized by Elizabeth Cady Stanton and Lucretia Mott, two strong proponents of women's equality and the elimination of slavery.

Women protest against Walmart in Utah, July 14, 2005. The largest class-action employment discrimination suit in U.S. history, Dukes v. Wal-Mart, *was dismissed in 2011 as a class-action suit because there were too many differences among the plaintiffs.*

After the Civil War, women continued to work for the right to vote, although it would take another 55 years before the ratification of the Nineteenth Amendment, which granted women suffrage. Antisuffragists resisted women earning the right to vote because they maintained discriminatory attitudes that women were too emotional, were not intelligent enough, or simply should remain in the private sphere. Others feared that if women voted en masse, it would change the power structure in politics, and could lead to the prohibition of alcohol. On the other hand, many activists felt that the vote would give women a voice in politics and the means to indirectly change policies that discriminated against women through the careful selection of political leaders. However, following suffrage, women voted at lower rates than men, and this pattern of turnout continued until approximately 1980. Despite lower turnout, women and men continued to work to address other areas of gender discrimination, using the legislative, executive, and judicial branches of government. The economic, political, and social change that resulted helped reduce gender discrimination in many areas, including the workplace.

Prior to World War II, few women worked outside the home; however, this pattern shifted dramatically as women began to take over the workplace responsibilities formally held by men, who were away at war. Women also gained traction in industries that produced materials for the battlefield. Women were encouraged to enter the workforce by way of the U.S. government's Rosie the Riveter campaign. Rosie appeared everywhere from posters to newspaper articles, and she became the defining image of women at work in wartime America. The propaganda met its objectives as, according to at least one estimate, in just four years (1940–45) the number of women in the workforce rose by around 50 percent. However, peacetime brought a reduction in the rate of female employment as men returned home from the war and the production of wartime products declined. This workforce expulsion did not last long, and the rate of women in the workforce began to rebound as early as the 1950s. According to the U.S. Department of Labor, as of 2010, women made up approximately 47 percent of the total U.S. labor force. Although women and men still face occupational obstacles in areas pertaining to equal pay and sexual harassment, the U.S. government, various labor groups, and individual employees have worked to create more equitable workplaces through the passage of legislation and the pursuit of litigation. These techniques have been used in an effort to address grievances in matters of hiring, termination, promotion, salary and benefits, and sexual harassment.

Workplace Legislation

One of the first major pieces of federal legislation designed to address gender discrimination in the workplace was the Equal Pay Act of 1963. This act, along with subsequent amendments in 1972, required employers to provide equal pay to men and women who work at the same location and in positions that require basically the same degree of talent and accountability. Exceptions were allowed for differences based on seniority, merit, or the amount and type of work produced by employees.

This act was followed by Title VII of the Civil Rights Act in 1964. Title VII was originally conceived to ban discrimination in the workplace on the basis of race, color, national origin, and religion. In a fortuitous twist, one representative, Howard W. Smith (D-Virginia), added the word "sex" into the text of the legislation. Many scholars argue that this was done in a deliberate attempt to prevent the legislation from passing, because Smith was a conservative representative who was thought to oppose the act. Smith counter this claim, stating that his amendment was a testament to his support of women's rights and his work with the National Women's Party. Regardless of Smith's intention, the act became law with the addition. The Civil Rights Act went well beyond the scope of the Equal Pay Act by making it illegal to discriminate in a wide variety of areas, such as hiring or termination, compensation and benefits, and promotion and training. However, as with the Equal Pay Act, exceptions exist on the basis of merit, seniority, and the type of work produced. To help ensure proper enforcement of these stipulations, the Equal Employment Opportunity Commission (EEOC) was created to oversee the law's implementation.

Less than 10 years later, in 1972, Congress passed the Equal Rights Amendment (ERA). The passage was achieved partly as the result of strong lobbying efforts by interest groups advocating for women's rights. The ERA stated that sex should not be a reason to deny or abridge anyone's rights. Although the amendment had support in many circles, it was also opposed by conservative women. The ratification process was contentious, with women on both sides of the issue engaging in letter writing campaigns, media blitzes, and marches. The amendment was given a seven-year window to achieve ratification, and this window was later extended. By 1982, the ERA had still not achieved approval by the requisite three-fourths of the state legislatures, and it failed to become part of the U.S. Constitution.

Although this amendment fell short of ratification, it was not the end of legislation designed to eliminate gender discrimination. The Pregnancy Discrimination Act was passed in 1978, barring employment discrimination against expectant mothers. The act states that a woman cannot be fired or denied employment or promotion within her occupation as a result of the intent to become pregnant or because she is pregnant. Employers are also restricted from requiring a woman to take pregnancy leave.

Another major piece of legislation designed to reduce discrimination in the workplace was the Family and Medical Leave Act. This act was passed by Congress in 1993 and provides men and women with the opportunity, albeit unpaid, to leave the workplace for up to 12 weeks under certain circumstances. These conditions include grave illness on the part of the worker or on the part of the worker's family (e.g., a spouse or child). In addition, employees can take a leave of absence for the same duration if they give birth to or adopt a child. The bill contains some limitations and exceptions. For instance, employees must have been employed with the company for no less than 1,250 hours before they can qualify, and small businesses (those with fewer than 50 employees) are exempt. The bill was meant to ensure a better work–life balance for employees and to make it more difficult for an employer to fire an employee impacted by these circumstances.

One of the most recent pieces of antidiscrimination legislation is the Lilly Ledbetter Fair Pay Restoration Act. This act was signed into law by President Barack Obama in 2009, becoming his first law as president of the United States. This law was passed by Congress in reaction to a 5–4 decision by the U.S. Supreme Court in the case *Ledbetter v. Goodyear Tire & Rubber Co*. The case made its way to the U.S. Supreme Court after Ledbetter filed suit against her employer, Goodyear Tire and Rubber Company. She filed suit after discovering through an anonymous letter that she was being paid substantially less than male employees at the same management level. The U.S. Supreme Court denied her pay-equity claim, ruling that Ledbetter should have filed suit within 180 days of the receipt of her first discriminatory paycheck. Ledbetter's case was then taken up by Congress. The legislative branch disagreed with the ruling of the judicial branch and changed the timeline under which an employer can be held accountable for pay discrimination. Now, employees can file a complaint with the government within 180 days of any discriminatory paycheck they receive.

In June 2012, the U.S. Senate fell eight votes short of the 60 needed to open the floor for debate on the Paycheck Fairness Act, an expansion of the Lilly Ledbetter Fair Pay Restoration Act. The Paycheck Fairness Act was designed to prevent companies from taking retaliatory action against employees who question employers about salary differences. In addition, the act sought to make it easier for employees to sue their employers for punitive damages when they have suffered from pay inequity.

Occupational Litigation

The passage of federal legislation was not the only vehicle whereby opponents of gender discrimination could work for change. In *Ledbetter v. Goodyear Tire & Rubber Co*., the courts set the precedent for decisions on many gender discrimination suits from the 20th century through today.

In support of the Equal Pay Act, in 1970, the court ruled in the *Schultz v. Wheaton Glass Co.* case that employers could not simply change job titles in order to avoid paying female employees as much as equivalently situated male employees. According to the ruling, jobs need not be "identical" but must meet the standard of being "substantially equal" in order for employees to qualify for the protections granted in the Equal Pay Act.

The provisions in the Equal Pay Act were again reaffirmed in the 1974 *Corning Glass Works v. Brennan* case. This case addressed the differential pay rates received by male and female shift inspectors at the Corning Glass Works plants. The court ruled that male and female employees were performing the same work, regardless of the time of day at which the inspections occurred, and must receive equal wages.

In 1984, the court took up a different gender discrimination matter when it produced a ruling in the *Meritor Savings Bank v. Vinson* case. This case dealt with the issue of sexual harassment. In the case, Mechelle Vinson, an employee of Capital City Federal Savings and Loan Association, alleged that her supervisor, Sidney Taylor, had asked her for sexual favors and sexually harassed her and other employees of the association. The court declared that Vinson had alleged that the advances made by Taylor were not welcome, and as such, they created a "hostile work environment." As a result, they constituted the basis for sexual discrimination under Title VII of the Civil Rights Act and were a violation of the standard of equitable employee treatment.

In another case involving Title VII of the Civil Rights Act, the U.S. Supreme Court ruled in 1999 that Carole Kolstad had been the victim of gender discrimination. Carole filed suit against the American Dental Association when it promoted a male colleague over her. The Supreme Court ruled that gender discrimination did not have to meet a level of severity in order for an employee to file suit for punitive damages. Instead, an employee must only be able to demonstrate that the employer knowingly violated the law.

Another act that received consideration by the U.S. Supreme Court is the Family and Medical Leave Act (FMLA). In the case *Nevada Department of Human Resources v. Hibbs*, the Supreme Court ruled in favor of William Hibbs, an employee of the Nevada Department of Human Resources. Hibbs was granted leave to care for his ailing spouse as per the conditions of the FMLA; however, he was subsequently fired by the department when he failed to return to work at the end of his leave. The U.S. Supreme Court declared that the Eleventh Amendment did not prohibit an employee of the state from suing his employer for monetary compensation in federal court if that employer violated the provisions of the FMLA.

Perhaps the most discussed gender discrimination case of late, *Dukes v. Wal-Mart*, deals with the class-action suit brought by female employees of Walmart. This case, sparked by Walmart employee Betty Dukes in 2000 and dismissed on June 19, 2011, is the largest class-action employment discrimination case in U.S. history and marks a reversal in rulings favorable to employee. The court did not make a determination as to whether Walmart had violated standards of equitable pay and promotion between their male and female employees. Instead, the court restricted their ruling to whether the case could proceed as a class-action suit. The court ruled that it could not because there were too many differences among the women who had brought suit. For instance, the justices held that the women worked in stores all across the United States and were employed under disparate managers.

Following the Supreme Court's decision, female employees filed a new class-action discrimination lawsuit against Walmart. This time, the suit is restricted to employees of stores within the state of California. In addition, almost 2,000 women brought individual claims to the Equal Employment Opportunity Commission against Walmart in 2012. These charges mark the first step before women can bring individual lawsuits against the company for gender discrimination.

Demonstrating Employment Discrimination

Employees may file an official complaint with the Equal Employment Opportunity Commission (EEOC) in person, over the phone, or through the mail if they feel that they have been discriminated against by their employer. The period of time in which an individual may file a formal complaint with the EEOC varies by state but typically ranges from 180 to 300 days following the date on which the alleged discrimination took place. Prior to filing a complaint, the Equal Rights Advocates, a nonprofit legal organization, recommends that employees keep a record of the discriminatory actions and keep any relevant communications with their employer. In addition, employees who feel that they have been victims of gender discrimination can ask to see their personnel file and can file a report through their employer or with their union representative. An official charge must be filed with the EEOC before a lawsuit can be brought before the courts.

When courts are deciding employment discrimination claims, they typically use one of three criteria. The first criterion is proving that there was intent to discriminate. This is a very difficult standard to meet because it involves providing the court with written or verbal testimony from the employer that it intentionally discriminated against an employee. The second criterion involves the use of a "disparate treatment test." The court will apply this test when, for example, a female candidate is not hired for a position, whereas a male candidate is hired, even though both met the requisite qualifications for the position. In this case, the female candidate must provide evidence that she was not hired because of discrimination. The final criterion involves the use of "disparate effects." The court will apply this test when a victim alleges that some type of employment criterion (e.g., height or weight) had a distinct, negative impact on him or her. At this point, an employer must provide evidence that this criterion is relevant to the performance of the job in question, and is not an unfounded justification for refusing to hire women or other groups protected under Title VII of the Civil Rights Act.

General Dynamics Corp.

Criminal investigations and criminal and civil penalties are concentrated in the defense industry. General Dynamics (GD) is currently the fourth-largest defense contractor in the world. Notable projects of GD have included the F-111 and F-16 fighter aircraft, as well as the M1 Abrams and Stryker armored vehicles. The F-16 was the most produced jet fighter in the West in the postwar period. Founded through various mergers, GD has its headquarters in Fairfax County, Virginia, and, following divestment of its aircraft division, is focused on four divisions: Marine Systems, Combat Systems, Information Systems and Technology, and Aerospace. The long history of questionable or unethical corporate practices dates back to GD prehistory in its forerunner, the Electric Boat Company. In 1904 and 1905, Electric Boat gained a reputation for unscrupulous arms dealing for practices of selling submarines to both the Imperial Japanese Navy and the Imperial Russian Navy, combatants at war with each other.

Recent investigations into GD have focused on suspected procurement fraud, overcharging, conflicts of interest, underestimating income, and sale of defective products. GD has a long history of defense fraud convictions. During the mid-1980s, GD became emblematic of defense procurement fraud and the overcharging of government for questionable or unaccountable services. It was reported that charges were made for such expenses as country club memberships for executives and kennel charges for an executive's dog. In 1985, the company was charged with criminal fraud over its work on an air defense gun system, the Division Air Defense weapon (Divad), for the U.S. Army. That same year, notice was given by the secretary of the U.S. Navy that it would cease business with the company until management was changed and fraudulent practices were ended.

In response, GD hired Kent Druyvesteyn of the University of Chicago School of Business to develop and oversee an ethics program. In 1988, 206 sanctions were leveled against company personnel, with 35 leading to discharges and four resulting in criminal referrals. In 1986, under Defense Secretary Caspar Weinberger, the U.S. Navy lifted the suspension of GD. The company was given promises that it would not be suspended again for additional indictments stemming from earlier practices, even though such a suspension from further contracts typically accompanied any indictment. A government complaint in 1987 claimed that in the 1970s, GD, through its Quincy Shipbuilding division, had falsified an estimate for purposes of winning an $80 million government subsidy. The charge declared that GD kept two sets of books—one with accurate costs and profit projections, and another with inflated costs and improbable estimates. A lawsuit in 1991 to recover $240 million from the company was abandoned, and in 1996, the government was forced to pay GD $25 million in legal fees.

$4 Million Settlement

On August 19, 2008, GD agreed to pay a $4 million settlement in response to a lawsuit brought by the U.S. government. The government claimed that a unit of GD fraudulently billed the government for defective parts that were used in U.S. military aircraft and submarines. The U.S. government claim alleged that from September 2001 to August 2003, GD failed to test parts or produced defective parts used in U.S. military aircraft, including the C-141 Starlifter transport plane. The GD unit implicated in the allegations closed in 2004. In addition to issues of corruption, GD has been responsible for harm to workers. In 1984, General Dynamics was charged with involuntary manslaughter and criminal violations of state occupational health and safety standards following the death of a worker exposed to fluorocarbon solvent at a military tank plant in Center Line, Michigan. A state court eventually dismissed the charges, citing the worker's "hypersensitivity" to the solvent.

In 1991, during a period in which GD was in the process of laying off 30 percent of its workers, Chairperson William Anders proposed to shareholders an increase of $7.6 million in bonuses to the top 25 executives at the company. Bonuses were approved by 77 percent of stockholders, a decision that was met by public demonstrations by angry GD workers. The concerns over specific issues, such as fraud or corruption, are limited within a legal-objectivist framework. From a more critical perspective, one might highlight the vast numbers of people, civilian as well as military, killed, injured, and maimed by military products, and the communities and environments destroyed. These outcomes are typically not criminalized or pursued within criminal justice systems in Western countries.

General Electric Co.

General Electric Co. (GE) is a household name because it makes light bulbs and consumer appliances, but that accounts for less than 10 percent of its revenue. GE is a diversified company that also makes parts for power plants, jet engines, nuclear power plants, and medical equipment. Its lending division, GE Capital, provides more than half of its profit and would be among the 10 largest banks in the United States if it were classified as a banking company. This diverse base of operations has led GE to diverse criminal activity and abuse of power. In 2010, GE was the fourth-largest company in the United States. If company revenue was ranked against the gross domestic product of countries, GE would have the 54th-largest economy in the world—smaller than Pakistan or Romania but bigger than Peru or New Zealand. This size insulates it from some consequences of wrongdoing and allows it to shape the tax code; therefore, GE's legal tax avoidance usually results in little to no U.S. corporate income tax, in spite of billions of dollars in profit. GE also owns media interests through NBC Universal, which allows it to shape perceptions of its actions and corporate wrongdoing.

In the 1950s, GE and several companies agreed in advance on the sealed bids they submitted for heavy electrical equipment. This price fixing defeated the purpose of competitive bidding, costing taxpayers and consumers as much as $1 billion. In the 1970s, GE made illegal campaign contributions to Richard Nixon's presidential campaign. Widespread illegal discrimination against minorities and women resulted in a $32 million settlement. Also during this time, three former GE nuclear engineers—including one who had worked for the company for 23 years and managed the nuclear complaint department—resigned to draw attention to serious design defects in the plans for the Mark III nuclear reactor because GE placed more emphasis on sales than on safety.

In the 1980s, GE pleaded guilty to felonies involving illegal procurement of highly classified defense documents. In 1985, it pleaded guilty to 108 counts of felony fraud involving Minuteman missile defense contracts. In spite of a new code of ethics, GE was convicted in three more criminal cases over the next few years; it also paid $3.5 million to settle cases involving retaliation against four whistleblowers who helped reveal the defense fraud. GE subsequently lobbied Congress to weaken the False Claims Act, which protects whistleblowers. In 1988, the government returned another 317 indictments against GE for fraud. A 1990 jury convicted GE of fraud for cheating on a $254 million contract for battlefield computers, and the $27.2 million fine included money to settle government complaints of improper billing on 200 military and space contracts.

GE is also one of the prime environmental polluters and is identified as contributing to 52 active Superfund sites in need of environmental cleanup in this country alone. In 1999, it agreed to a $250 million settlement to clean up the Housatonic River in Massachusetts. GE is responsible for one of America's largest Superfund sites, the Hudson River, where the Environmental Protection

Agency claimed that the company dumped over a million pounds of toxic waste. Instead of cleaning up its part of the 197-mile site, GE mounted an eight-year challenge to the Superfund law that requires polluters to remedy toxic situations that they created.

In 2010, GE reported $5 billion in profits from U.S. operations but paid almost no federal income tax and actually claimed a tax credit; the pattern for the previous five years was similar. Although GE was not originally eligible for government support through programs enacted to help with the financial crisis, it engaged in lobbying and received $74 billion in loan guarantees. GE is one of the entities sued by the Federal Housing Finance Agency over "securities law violations or common law fraud" in the sale of mortgage-backed securities to Fannie Mae and Freddie Mac.

GE also has the ability to shape public opinion through its ownership of NBC Universal, which owns television networks NBC, A&E, USA, MSNBC, and CNBC. From 1985 until 2011, GE owned a controlling interest in NBC Universal, which fell to 49 percent after selling a portion to Comcast. This ownership provides a means through which GE can shape public opinion. For example, the NBC *Nightly News* did not cover the story of GE not paying corporate income tax, and critics charge that this is consistent with the news program's lack of coverage of safety issues in GE-designed nuclear power plants and environmental pollution. Some call CNBC an "economic infomercial" because of a little-discussed conflict of interest between owning a financial news outlet, being one of the world's largest financial operations, receiving government support during the economic crisis, and being charged with mortgage-backed securities fraud. The USA network airs a series called *White Collar*, nominally about white-collar crime. However, the crimes portrayed on the program are a narrow, apolitical set of white-collar crimes that do not challenge abuses of power by corporations or government.

General Motors Co.

One of the icons of U.S. industry in the 20th century, General Motors Co. (GM) was founded on September 16, 1908, in Flint, Michigan, by William C. Durant. Its headquarters later moved to Detroit, Michigan. Its brands came to include Buick, Cadillac, Chevrolet, Daewoo, GMC, Holden, Opel, Vauxhall, and Wuling, which are all still held by the company, and at various times it also owned Hummer, Oakland, Oldsmobile, Pontiac, Saab, and Saturn. With a presence around the world, GM was well regarded and had a reputation for looking after its employees. From 1931 until 2007, GM led global sales of automobiles for 77 years, and it was the second-largest global automaker by sales from 2008 to 2010, regaining its position as the leader in global sales in 2011.

In 1973, Robert Eldridge Hicks published that General Motors had been involved in a policy, along with road builders, to increase car usage at the expense of public transport by trying to eliminate competition. In the Great American Streetcar Scandal, from the 1920s until the 1940s, streetcars were replaced with autobuses, and then the public transport system was gradually replaced by cars. GM had an interest in encouraging the use of cars, which would maximize its profits, but it is uncertain whether GM broke any laws.

Financial Downturn

From the mid-1970s, with the increase in the purchase of Japanese cars in the United States, there was a decline in the market share of GM. This was partly because the Japanese competitors were better structured to deal with a downturn, but also because of a rise in the price of gasoline, which saw many more people seeking smaller and more fuel-efficient automobiles. Many people outside the United States also turned to buying Japanese cars, and GM had to restructure, changing its designs and remaining the leading automaker in the world in terms of sales, although its profits declined. The decline in the stock market following the September 11, 2001, attacks led to the GM pension and benefit fund having less financial resources than it needed to meet its liabilities. General Motors then helped formulate the Keep America Rolling campaign, which initially boosted sales. The main problem facing GM was a serious downturn in business for new automobiles in the late 1990s as a result of the global financial crisis and a number of other factors. Because GM maintained its position as the major automaker in the world by sales, this problem was not quickly recognized. It is claimed that the management at GM was so keen on maintaining its corporate position that it paid less attention to ever-declining profits, and continued to pay staff more than many of their competitors, with better terms, conditions, and pensions.

In the late 1990s, GM was badly hit because it had been heavily involved in the sale of light trucks and sport-utility vehicles. The share price, which had reached \$80 at the peak in the late 1990s, fell, forcing GM to restructure, sell some subsidiaries, and halve its dividend. GM sold many car brands. There were many accusations of mismanagement at GM, which was slow to react after posting a loss of \$10.6 billion in 2005. The George W. Bush administration managed to put together a package to keep the company going, but with auto sales continuing to decline, on March 30, 2009, President Barack Obama said that he would not provide future financial aid to GM, which then had to seek Chapter 11 protection from bankruptcy on June 1, 2009. At that time, it was stated to own \$82.29 billion in assets and owe \$172.81 billion in debt. A week later, the company was removed from the Dow Jones Industrial Average. The company was then totally restructured, and Rick Wagoner resigned as GM chairman and chief executive officer.

Georgia-Pacific LLC

Georgia-Pacific LLC faced serious legal battles in 1991 and 2002, related to major infractions committed by the company. Georgia-based Georgia-Pacific is an international leader in making tissue, pulp, paper, toilet and paper towel dispensers, packaging, building products, and related chemicals. The company has over 300 locations internationally and employs just fewer than 50,000 employees. As indicated by an instance of tax evasion and unwillingness to pull asbestos-containing products, Georgia-Pacific appears to have been dominated by a culture of greed during its growth years.

Problems Begin

The company's legal problems began in 1984 when it took a tax credit for a \$24 million donation of a large swamp in Santa Fe, New Mexico, to the River Water Management District.

Although it was entirely legal to claim the contribution, the plot of land was only worth \$2 million, leaving a \$22 million discrepancy. As a result, the company was forced to plead guilty to tax evasion in 1991. It paid $21 million in fines and back taxes—a record for corporate criminal penalties at the time.

Asbestos Investigation

While the tax evasion case was costly and concerning, it pales in comparison to the asbestos predicament that Georgia-Pacific encountered at the turn of the 21st century. Since the 1940s, the public has been aware of the dangers posed by asbestos exposure. Individuals who are exposed to the mineral over the long term can develop mesothelioma, an aggressive cancer that eats away at the lining of the lungs and heart. Those who suffer from mesothelioma are likely to have symptoms similar to those of pneumonia at first, before the disease quickly develops. Most concerning is that asbestos can remain dormant in the body decades before causing the disease. Even with an early diagnosis and aggressive treatments, the disease can be deadly after minimal exposure.

However, it was not until the 1970s that federal regulators became fully knowledgeable about the health hazards linked to the substance. At that point, the U.S. Occupational Safety and Health Administration began forcing factories using asbestos to add ventilation and worker protections. Construction workers and home-improvement workers were also at risk from continual exposure. The *Atlanta Journal Constitution* provided an investigative series in 2002, looking at Georgia-Pacific's past usage of asbestos in some of its major products, especially Ready-Mix joint compound.

In 1965, Georgia-Pacific acquired Bestwall Gypsum, a Pennsylvania-based company that manufactured products made out of gypsum, a soft mineral used to make drywall, plasters, and fertilizers. Like many companies at the time, Bestwall used asbestos in a number of its gypsum products. The naturally occurring mineral was readily available, inexpensive, and extremely effective as a binding and strengthening agent. The newspaper report found that Georgia-Pacific was well aware of the dangers posed by asbestos prior to 1970. However, it willingly continued making products containing the dangerous mineral and sold them through 1977, likely because Ready-Mix needed asbestos to adhere to drywall. Aware of the concerns, Georgia-Pacific tried a version of the product without asbestos for a period in the early 1970s, but it failed to sell and was pulled from the shelves.

By 2002, more than 314,000 claims had been filed against Georgia-Pacific. More and more are likely to come forward, even into the new decade, as other companies facing similar claims have opted to declare bankruptcy to avoid the legal cases and costs. Georgia-Pacific ultimately found itself having to pay roughly $221 million for its share of approximately $1 billion in payments over the course of a decade to settle asbestos-related complaints. Insurance money covered the remainder. Since December 2003, Georgia-Pacific has faced 269,700 asbestos lawsuits, including settled, dismissed, and pending cases. With more than 66,000 pending cases, the company decided to increase its defensive spending on asbestos claims in response to escalating settlement demands. In 2004, the number of new claims fell 32 percent from the year before as Georgia-Pacific began to take a more aggressive approach to litigation. There was a notable increase in affirmative defense and medical research regarding asbestos illnesses. The overall number of cases taken to trial nearly doubled. These actions resulted in a decrease in the average payments for mesothelioma, cancer, and nonmalignant cases in 2004. Georgia-Pacific continued its aggressive defense in the following years and expected the trend to continue for years to come. The company has decided to increase its asbestos defense reserve by approximately $11 million per year through 2014, before tax benefits.

In 2012, new allegations emerged, and the case was granted class-action status in July. Effingham County, Georgia, residents filed suit against the company, alleging that hydrogen sulfide emitting from the plant's waste treatment facility has damaged their property and caused loss of property values. The lawsuit includes over 100 plaintiffs.

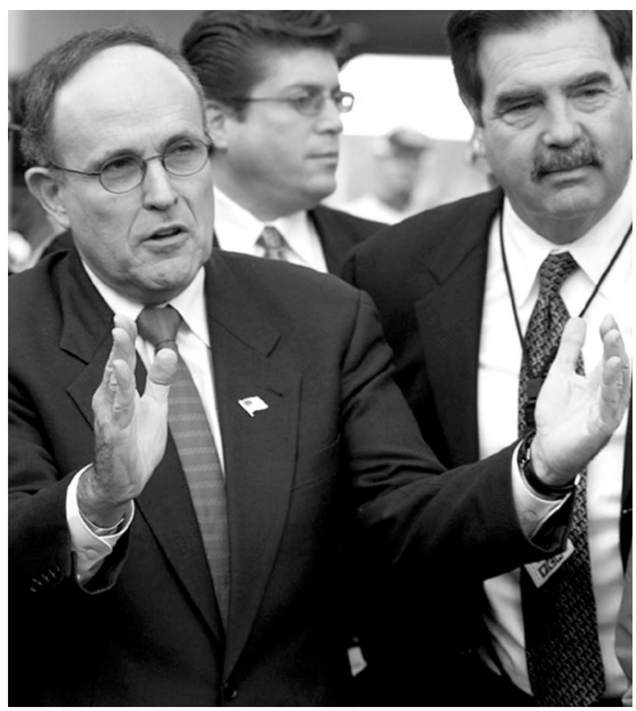
Giuliani, Rudy

Rudolph William Giuliani was dubbed with the title of America's Mayor after his exceptional leadership in the aftermath of the terrorist attacks of September 11, 2001. Giuliani is also known for his get-tough-on-crime strategies on street and violent crime as the mayor of New York City from 1994 to 2001. According to C. R. Sridhar, Giuliani's policies, directed through Police Chief William Bratton, were very successful in reducing total violent crime in the city, by 51 percent. He also acted as the U.S. attorney for the Southern District of New York. While in this position, Giuliani made substantial efforts to eliminate organized and white-collar crime as well as government corruption. His success fighting white-collar crime, Wall Street corruption, and major organized crime set the stage for Giuliani's rise to national prominence.

Giuliani, a product of Brooklyn, New York, was raised by working-class parents. His grandparents were Italian immigrants who had aversion for the Italian mafia in New York. This animosity was passed down to Giuliani and had an impact on his dedication to investigate and prosecute crime.

In the early 1980s, Giuliani became the U.S. attorney for the Southern District of New York, where he developed the reputation for fighting white-collar crime. One tactic, which some perceived as a scare tactic, was to effect arrests of white-collar criminals at their place of business during working hours. For example, in February 1987, federal agents entered the arbitrage department at Goldman Sachs & Company, where they handcuffed Robert Freeman and arrested him for insider trading. Giuliani made these top-level white-collar professionals do the "perp walk" before media cameras. Richard Wigton, who was a vice president at Kidder, Peabody & Co., was also handcuffed in his office during business hours. Some high-profile business leaders accused of white-collar crimes were taken to jail after hours and consequently had to stay overnight until they could be arraigned the next morning.

Arresting white-collar criminals at their place of employment, rather than asking them to turn themselves in, was unusual at the time. Giuliani considered white-collar crimes as serious, and the individuals whom he arrested as real criminals. Giuliani pursued white-collar criminals just as tenaciously as he did street or other violent criminals. He used an organized crime statute, the Racketeer Influenced and Corrupt Organizations Act (RICO), rather than traditional



Rudy Giuliani at the World Trade Center's Ground Zero, New York City, November 14, 2001. Giuliani was dubbed America's Mayor for his leadership after the terrorist attacks of September 11, 2001. He was tough on perpetrators of white-collar crime.

criminal statutes as an avenue to indict white-collar criminals.

During his time as the U.S. attorney for the Southern District of New York, Giuliani also engaged in criminal prosecution of politicians and politicos who operated outside the law. This tenacious dedication to ending political corruption may have galvanized his first run for mayor, an unsuccessful attempt in 1989. The crime rate in New York after his failed election remained high, and Giuliani offered his crime control alternative in the next election, which he won in 1993.

Giuliani's managerial attributes have helped him in his role as investigator, prosecutor, and manager. Author Fred Siegel describes this attribute as an innate ability to see things from a managerial perspective. Giuliani has the ability to see things from the top down. For example, when he goes to a New York Yankees baseball game, he watches it as if he were the manager of the team, keeping notes of which batters are hitting and which are not. When he investigated organized crime, he imagined himself as the "boss." He used this same perspective to investigate and prosecute white-collar crime. Giuliani was able to understand how white-collar criminals, operating within a business structure of an organization, affected its performance. Giuliani was able to see weaknesses in business models that left the door open for criminal activity, taking advantage of the weaknesses in businesses and exploiting profit from criminal activity.

Global Crossing Ltd.

Global Crossing Ltd. was founded in 1997 by Gary Winnick, a former junk-bond trader, who was tutored under the watch of Michael Milken. Winnick established the company for the purpose of revolutionizing data transmission by the creation of a global fiber-optic network. The company went public on August 13, 1998, and its stock price immediately soared 300 percent on its first day of trading. The stock price continued to rise, and by 1999 the company was valued at over 30 times its earnings, fueled in large part by mass telecom deregulation, the craze of the Internet boom, and the U.S. Commerce Department's prediction that Internet traffic would double every 100 days. The company was a Wall Street favorite, in part because it often paid handsome fees for underwriting and other services, and in part because Winnick used his natural charisma to sell a deceptively simple plan for a global data network. Just five years from its inception, however, the company filed for bankruptcy protection, in January 2002, then the fourth-largest bankruptcy in U.S. history.

Massive Network

To construct such an ambitious fiber-optic network, Global Crossing purchased the largest independent undersea cable-laying firm in the world, ultimately laying 100,000 fiber-optic miles to 27 countries and 200 major cities on four continents. The construction cost for the global network was high, reaching $15 billion. Much of the construction cost was financed with debt underwritten by investment banks. The total debt exceeded $12 billion when the 2001 market downturn hit the company, triggering a subsequent write-off of $17 billion in assets.

Global Crossing filed for bankruptcy soon after, unable to overcome its mounting debt, combined with rapidly falling bandwidth prices because of increased competition and a glut of network capacity. The stock price plummeted with the bankruptcy announcement, yet just a few weeks prior to the company's collapse, Winnick sold shares valued at $123 million, bringing the total value of shares cashed out during Winnick's tenure to $734 million. Winnick also received other expensive perks, spending hundreds of thousands of dollars for lavish redecorations of corporate offices and millions for political contributions; and he also required Global Crossing to maintain a fleet of five jets. In addition, Winnick purchased a $94 million mansion in Beverly Hills, setting the record for the highest single-family home in the United States. After it emerged from bankruptcy reorganization, Singapore Technologies Telemedia purchased a 61.5 percent stake in Global Crossing for only $250 million, eliminating $52 billion of combined stock and debt investor value, while Winnick became nearly $1 billion richer.

Global Crossing was later charged by the U.S. Securities and Exchange Commission (SEC) with accounting manipulations. The SEC investigated Global Crossing's use of swap transactions, in which telecom companies trade equal amounts of network capacity, each paying the other for offsetting capacity. The seller recorded the trade as revenue, and the buyer recorded the trade as a capital expenditure. The effect of the swap transaction was that actual cash payments were offset by the parties, but the capital expenditure was amortized over time, keeping the expenses related to the sales of bandwidth off of the income statement until future years. The accounting mechanism overinflated sales and cash flows and underreported expenses.

A class-action suit alleged that swap revenues totaled over $700 million in 1999, or one-half of the company's revenue. The 2000 and 2001 financial statements also failed to show losses of $25.7 billion. Global Crossing did not report these losses until December 2003, after it had filed for bankruptcy. The SEC investigation concluded that there was no evidence of fraud or insider trading. However, the SEC noted that the accounting treatment of the swaps was wrong, and that Global Crossing executives failed to adequately disclose the transactions, but did not do so with the intent to commit fraud. Three Global Crossing executives settled with the SEC, paying fines of $100,000. No fine was imposed on the company, and Winnick was not charged after the SEC commissioners concluded in a 3–2 vote that he should not be held liable because he was the company's chairman, not an executive officer.

Winnick was also a defendant in 70 lawsuits, ultimately resulting in a settlement with various parties, including the company and the company's lawyers and insurance firms, with Winnick paying $55 million. Winnick paid an additional $25 million to settle a lawsuit involving employees holding Global Crossing stock in their 401(k) accounts.

Global Warming

Scientific writings on global warming began in the latter part of the 19th century, notably by Swedish scientist Svante Arrhenius, who suggested that emissions from the Industrial Revolution would cause the planet to warm. Articles relating to climate change have appeared routinely in the popular press in the United States since the 1950s. In the 1980s, there was little controversy or debate as to the realities of global warming. In fact, environmental reporting in popular American newspapers, such as the *New York Times* and the *Washington Post,* peaked in the late 1980s. In 1989, more than 70 articles were written on environmental issues, mostly focused on the problems caused by climate change. By 1994, there were less than 20 articles produced by the major news outlets, according to Robert Hensen. Although fewer environmental articles were published, there was a dramatic increase in the production of articles reflecting climate-change skepticism. This created the appearance that skepticism was a legitimate or widely held belief. In fact, the opposite was true. As more scientific studies were published in peer-reviewed academic papers, reflecting vast and irrefutable evidence of climate change because of the accumulation of greenhouse gases in the atmosphere, the public was consuming mass-media reports of naysayers' claims.

The largest newspapers that engaged in this practice claimed that they were merely promoting a "balanced" view by demonstrating "all views" of the topic. This is not a plausible argument when one considers that Holocaust deniers are not provided an opportunity to equally promote their views, like those who admonish the German government for enacting genocide. Reports critical of the press were published, indicating that major newspapers failed to seriously question the cause and reasons for starting the war in Iraq or creating a bailout for the financial institutions that created the economic troubles confronted by Americans and residents of the European Union. The media do not have an established or consistent history of presenting "balanced" reporting on complicated issues that generate divergent perspectives.

Through historical analysis of the scientific data on global warming, it appears that the controversy on the topic was created by the media. The transformation from consensus to dispute on the impacts of greenhouse gas release was stimulated by the Kyoto Protocol of 1997. As scientists throughout the world had been discovering through studies of glaciers by glaciologists; alteration of climate as noted by climatologists; increases in droughts, wildfires, and hurricanes as observed by ecologists; northward drifts of forests witnessed by biologists; and increases in sea level as discerned by oceanographers, all collectively directed the scientific community to draw the same conclusion. Even Patrick Michaels, a climate warming skeptic who worked as a scientist for the George C. Marshall Institute, which received funding from oil and gas companies, claimed the following:

> Of course there's a warming trend. All you have to do is connect the dots. And I can point you to five truly independent papers in world-class journals—not the crackpot stuff you see in unreferenced Web sites—that must lead you to conclude that slightly less than half of global warming is due to carbon dioxide.

Corporate Influence

By the late 1980s, a collective called the Global Climate Coalition was created. This group comprised representatives from General Motors, Exxon-Mobil, British Petroleum, Dutch Shell, and other persons from the American National Association of Manufacturers. The coalition funded anti-Kyoto Protocol commercials, print ads, and radio advertisements. The commercials depicted Americans as the "global losers" in this "United Nations derived scheme." It promoted the notion that the hard-earned wealthy lifestyle of American citizens would be compromised by foreign and global entities. In total, more than $13 million was spent in the United States to defeat the Kyoto Protocol agreement.

The United States did not sign the Kyoto Protocol. The failings of the Kyoto Protocol since then can largely be attributed to the fact that the United States, as the world's largest polluter, not only failed to do its part but also influenced other nations such as China and Canada to not maintain standards in alignment with the protocol. Because the United States demands resources such as oil from Canada and large-scale manufacturing of low-cost products in China, environmental issues will continue to stretch beyond America's borders. Effects of the coalition and the protocol continued for more than 15 years.

In 2001, Paula Dobriansky, the under-secretary of state under President George W. Bush, sent a memo to a high-level Exxon executive, claiming that the president rebuffed the standards of the Kyoto Protocol "partly based on input from you [the Global Climate Coalition] . . . the industry voice on climate change has served its purpose by contributing to a new national approach to global warming." The fact that the president's family wealth was derived from the oil industry is never thought to be coincidental to the fact that the oil industry continues to flourish, despite a depressed economy.

To ensure that the oil, mining, and automotive industries continue to be influential in the climate-science debate, companies such as Exxon have continue to fund substantial campaigns against evidence presented by academics. Between 2000 and 2003, Exxon gave more than $8 million to more than 40 groups challenging the scientific consensus on global warming. In 2006, the Royal Society of the United Kingdom asked Exxon to stop funding skepticism. Exxon agreed two years later that it would cease to fund these groups, yet it was noted by the *Times* of London in 2009 that Exxon gave another $1.3 million to other groups that promoted rhetoric against climate change.

In the United States, Koch Industries, a large and extraordinary Kansas-based company with substantial oil holdings, gave twice as much to skeptic groups as Exxon. In addition, Koch is the most significant company to oppose clean energy. The Koch founders, two brothers, are two of the top six wealthiest persons in America, meaning that they have considerable opportunity to promote their views on climate change. The companies that promote skepticism and label clean energy policies as inadequate or expensive have also garnered the greatest profit from being the largest contributors to climate change, but the media have consistently failed to present this facet of the rhetoric speaking out against the global warming consensus. The largest media outlets do not highlight the funding sources of the skeptics, nor do they criticize the vast largesse of these companies.

In the first quarter of 2012, Exxon Mobil posted profits of $9.45 billion, which is roughly $1,300 of profit for every second of that quarter, or $104 million per day. From this abundance, Exxon paid chief executive officer (CEO) Rex Tillerson $34.9 million and provided $1,091,000 in political contributions, $992,810 of which was directed to Republicans.

Television producers rarely, if ever, require that meteorologists or weather experts generate stories relating to local weather and climactic conditions to global warming. Those in the industry fear that a meteorologist, the most qualified member of a news team to cover such a topic, might appear as an activist. However, failure to cover such topics means that a position has been taken; coverage of global warming, while well established and agreed upon in scientific circles, may be offensive to the program's sponsors. Media outlets often shirk from coverage of issues that may make their corporate sponsors appear culpable or reduce the demand for the corporate sponsors' products.

Government Complicity

Enron founder Ken Lay and Enron CEO Jeffrey Skilling, convicted of 11 counts of securities fraud, ran an international Houston-based energy company. Enron was responsible for rolling blackouts and energy crises in California between 2000 and 2001. It did so by turning off the power to hundreds of thousands of California residents in order to pretend there was a blackout.

This drove the cost of energy up by more than 10,000 percent each hour that the power was down. The scandal behind this crime is that other power companies were involved in the same scheme: San Diego Gas and Electric, Duke, Dynergy, Entergy, El Paso, and Reliant. When the federal government took the case to criminal court, the California power crisis was not allowed to be discussed in the trial, according to Greg Palast. In the end, only one company and two people were on the hook for a systemic problem of corruption by governmental consent. California Governor Arnold Schwarzenegger met with Dick Cheney; Michael Milken, who had een released from prison for his multi-billion dollar stock fraud; and Ken Lay at the Peninsula Hotel in Beverly Hills, California. This meeting was set up to negotiate the settlement between California and the energy companies. Schwarzenegger agreed to the receipt of a $47 million settlement with Enron, whereas the former governor, Gray Davis, had demanded the full amount of Enron's profit garnered through price gouging and energy delivery manipulation. This would have totaled more than $9 billion.

Lay had been one of the largest financial supporters of George W. Bush, even when Bush was governor of Texas. Their relationship was so close that when Bush became president, he asked Lay to rewrite America's environmental and energy regulations. Lay did, and Bush promoted the new policy, which was strictly voluntary, as a new way of promoting industry in the United States. It had deleterious effects on air quality and the health of American forests. Lay provided to Vice President Dick Cheney a list of three people who he thought should be on the Federal Energy Regulatory

Commission (FERC). All three were appointed. When Governor Davis, Schwarzenegger's predecessor, asked the federal government to intervene in the Enron-derived energy crisis, Cheney, along with the FERC, decided to let the "free market run itself." In the old days, the mobsters had to pay off the police; in Lay's time, he simply had them appointed.

The final overtly complicit act to ensure corruption in the energy markets occurred in 2005, when President Bush repealed the Public Utility Holding Company Act, which was originally enacted by President Franklin D. Roosevelt. This act prohibited the energy companies from price gouging by switching power off and on. Additionally, Senator Phil Gramm of Texas promoted legislation that would permit power companies to contribute to political campaigns while free of political oversight. Gramm did this while his wife, Wendy Gramm, was on the board of Enron. This combination of deregulation enabled Enron and other energy companies to run up tremendous debt, which was concealed by imaginative accounting that was done by Arthur Andersen.

This collusion of government and corporate entities, and the perpetuation of media bias by similarly related companies, allows the impacts of global warming to continue unabated. While the government works to ensure that energy companies' interests are met, and that these companies garner huge profits from the exploitation of natural resources, scientific pursuits are not taken seriously. There is too much money at stake to heed the warnings of experts.

Globalization

Globalization refers to the extension of trade, investment, migration, knowledge, and culture across national boundaries. It is marked by the expansion of social processes, once confined within nations, throughout the globe. Globalization has led to greater economic, cultural, and political integration of nations, the fragmentation of the state system, and the formation of global institutions such as the International Monetary Fund, United Nations, World Bank, and World Health Organization. These processes intensified during the latter half of the 20th century, largely as a result of technological advancements in the fields of communication and transportation, as well as the breakdown of barriers to trade.

Though globalization has brought innumerable benefits to both developed and developing nations, it also has generated new challenges, the costs of which are difficult to assess accurately. As it relates to crime, globalization has resulted in greater standardization of legal practices and the sharing of security techniques across nations, but it also has lead to the emergence of new forms of crime, especially terrorism, organized crime, and white-collar crime. Such crimes are particularly challenging to global society because they require cooperation between national forces and often involve offenses that fall beyond the purview of traditional legal definitions.

Though instances of white-collar crime, including activity across national boundaries, can be found in the historical record as far back as ancient Greece and Rome, concern over this sort of activity relative to other criminal activity remained low until the early 20th century. This concern has continued to grow with the hastening of globalization in recent years. As business relations have become increasingly complex, the opportunities to commit white-collar crime have greatly increased. The current era of globalization has ushered in new forms of white-collar criminality, unprecedented in previous eras, as well as modified versions of more traditional forms, such as fraud and market manipulation. In many ways, these newly emergent problems are the unforeseen consequences of rapid technological advancement. Communication and transportation technologies designed to facilitate the production process and enhance trade have placed greater demands on regulatory agencies responsible for monitoring and enforcing securities and exchange laws around the globe. Despite these challenges, technological advancements have also brought the promise of greater control over illegal activity within the market, as regulatory agencies find new and innovative ways of using these technologies to disseminate security techniques and coordinate efforts. Nonetheless, new challenges continue to arise that require security responses at all levels, from the local to the global.

A Brief History

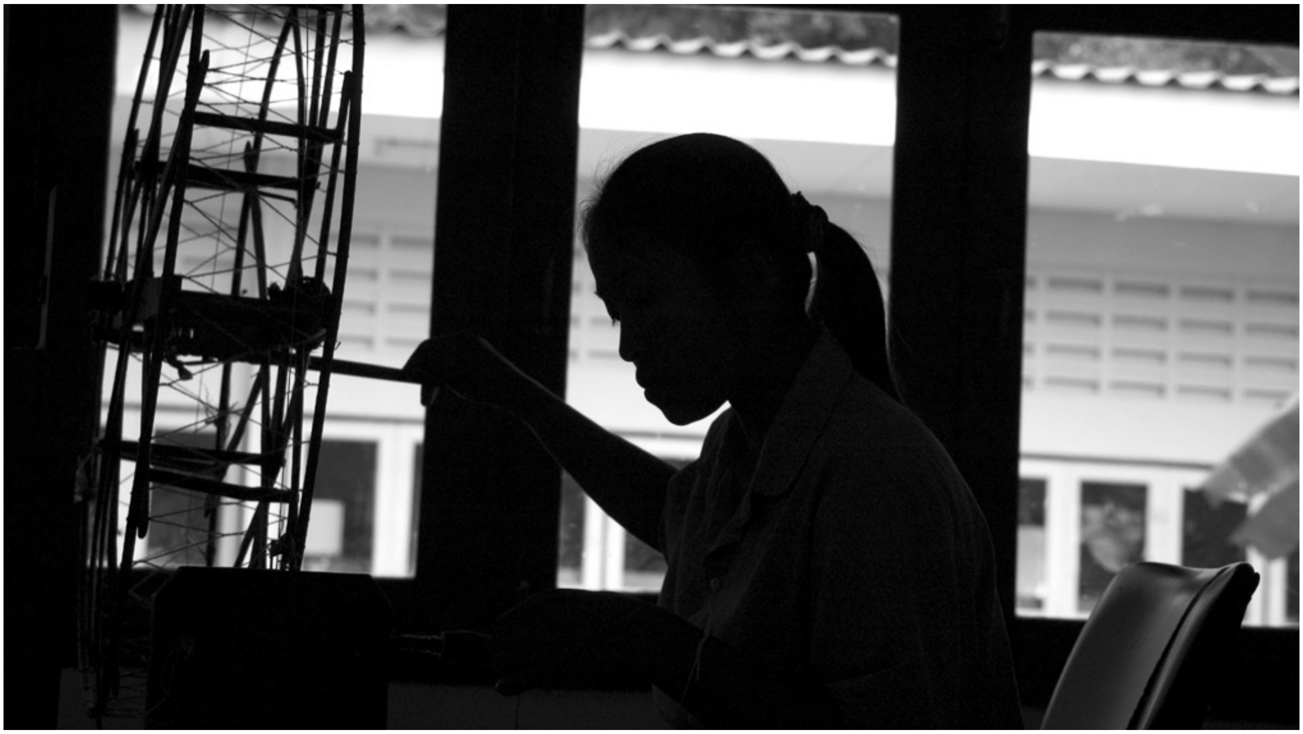
International relations intensified throughout the 19th century as the number and scope of transnational corporations expanded rapidly. Around this time, economists and other social scientists began exploring the underlying causes of the related phenomena and the impact they might have on national development, however, the term *globalization* was not coined until the early 20th century, and most discussions remained outside the mainstream of academic literature until the 1960s, when technologies began accelerating the rate at which these processes occurred. Since globalization has become a primary focus because of its impacts on nearly all aspects of life. In particular, globalization has had profound effects on human ecology, the transmission of culture, and economic conditions within and between nations. Although many of the changes brought about by globalization have led to greater economic freedom, they have also increased opportunities for crime, specifically white-collar crime.

The term *white-collar crime* was introduced in 1939 by Edwin Sutherland. He noticed how rapid expansion of business relations around this time created perverse incentives for professionals to avoid the law. Sutherland argued that this sort of crime had a greater impact on society than traditional forms of street crime and urged criminologists to shift their attention from crimes of homicide and robbery to emerging forms of white-collar crime, such as embezzlement and market manipulation.

Since then, research into the causes of white-collar crime has increased dramatically. Public and scholarly interest in white-collar crime has spiked in recent years as a result of numerous corporate scandals involving large multinational corporations, such as Enron and WorldCom. The magnitude of such offenses has led many to question issues of corporate responsibility. This can be seen in reactions to the 2010 BP oil spill in the Gulf of Mexico, a disaster with far-reaching environmental and economic impacts that many see as the result of corporate negligence. Scholars have begun to assess the relationship between these and other similar scandals to the ongoing decline in the global economy. Additionally, research continues to expose links between white-collar criminality and other forms of crime influenced by globalization, including state-sponsored violence, terrorism, human trafficking, transnational gang activity, and the international drug trade.

Forms of Global White-Collar Crime

Crime tends to follow opportunity, and white-collar crime is no different. The era of globalization has ushered in new forms of white-collar crime, such as environmental crimes, questionable business practices, and stock market manipulation, and it has expanded opportunities to commit traditional forms of white-collar crime, including fraud, tax evasion, and money laundering. In many cases, the actors, both individual and corporate, who commit these sorts of crimes are aware that their actions violate the law, and they rely on disparities in national legal codes to evade detection. However, white-collar crimes are often complex and involve unwitting victims, many of whom are members of vulnerable social groups. Through the use of advanced communication and transportation technologies, white-collar criminals are able to manipulate victims across great distances while enjoying protection of lax legal systems in other parts of the world. White-collar



This woman in her early 20s was trafficked into a denim sweatshop in Thailand, where she and other young women were locked in and made to work 20 hours a day, had to sleep on the floor, were given little to eat, and were not paid. She managed to escape to a Bangkok shelter; when the police were informed,the sweatshop was raided. Improvements in transportation have allowed developed countries to move their production to less-developed countries with lower labor costs, but many of the workers involved receive substandard pay.

crime can take the form of fraud-related crimes, corrupt business practices, environmental crimes, market manipulation, and trade in illegal goods.

Fraud-Related Crimes

Fraudulent practices, from embezzlement to Ponzi schemes, have long been a concern of those interested in preventing white-collar crime. However, in the current era of globalization, these practices have intensified and have become widespread, as white-collar criminals continue to find ingenious ways to transfer monies between national accounts and use communication technologies to reach a greater number of potential victims throughout the globe. Crimes that previously required advanced knowledge of the banking industry or insiders within networks of high-profile investors, can now be conducted by individuals with access to a personal computer and the Internet. Currencies are exchanged instantaneously, and victims are targeted via mass e-mail. Variations in legal codes also allow individuals and corporations to evade taxes more easily than ever. Coupled with this is the increased liquidation of fiscal capital resulting from the rise of the finance industry, which has provided greater opportunity for money laundering.

A notable case involved Bernard Lawrence (Bernie) Madoff. Madoff used his wealth management business to attract a portfolio of high-end investors from around the globe. He defrauded these investors out of billions of dollars by fabricating investment gains and issuing returns that were paid out of the initial capital. In 2009, Madoff admitted to running a Ponzi scheme and later pleaded guilty to 11 federal felonies. This case, one of the largest instances of financial fraud in U.S. history, demonstrates the ease with which such crimes can be committed.

Corrupt Business Practices

Though laws emerged in most advanced capitalist nations during the early 20th century to protect workers' rights and curb corporate negligence, technological improvements to transportation in recent years have created opportunities for companies to relocate production operations to less-developed countries with less-regulated labor markets. This has increased average wages in many of these countries and lowered the costs of production for many firms; however, in many instances, workers remain underpaid and are forced to work long hours, with little recourse under the local law. Scholars, journalists, and activists have uncovered numerous cases of human rights violations in which laborers have been subjected to unsafe working conditions. Such exploitation has even led to the death of some workers. Often, these cases are the result of corporate negligence, as companies avoid implementing better business practices because they are not required to, according to local law.

The clothing apparel firm Nike Inc. has been a primary target of labor rights activists because of its use of sweatshops in developing countries. Advances in transportation during the 1990s allowed Nike to move production operations overseas and thereby reduce labor costs. Lax laws in these areas led to unsafe working conditions for laborers, who were primarily women. Long hours, low wages, and cases of employee abuse in several of these factories caught the attention of activists in more-developed countries, which led to several protests and the formation of transnational advocacy groups. Such groups work to protect human rights and ensure that labor practices are held to reasonable standards. Though formal charges have never been leveled against Nike for these business practices, the company has taken several steps, including the formation of the Global Alliance for Workers and Communities, to monitor and improve working conditions in overseas factories.

Environmental Crime

An emerging form of crime, often categorized as white-collar crime, is environmental crime. Corporations have a long history of dumping wastes that result from production processes. However, throughout much of this history, the costs of externalizing this waste, often hazardous waste, were not recognized, and regulations did not exist to control waste disposal. In recent years, this has begun to change in many parts of the globe, and corporations are now held accountable. In April 2010, Deepwater Horizon, a BP oil platform located in the Gulf of Mexico, exploded, killing 11 people and injuring numerous others. This incident marks the largest offshore oil spill in U.S. history. Criminal charges involving the cover-up of relevant information began surfacing in early 2012, with further charges related to corporate negligence likely to come. Because the Deepwater Horizon platform was produced in South Korea, owned by the United Kingdom–based BP, operated off the coast of the United States, spilled into the Caribbean, and affected energy markets worldwide, this case epitomizes the relationship between globalization and white-collar crime.

Because of disparities in legal codes between nations, corporations are also able to export, and in some instances sell waste, to other, often less-developed countries. While this is true for most types of waste, it is a major issue for hazardous and electronic waste. Often, the countries receiving these wastes do not have the facilities to dispose of them safely. As a result, numerous cases have been documented forms of harmful chemicals have been introduced into the atmosphere or have leached into water systems, exposing large portions of the population to health risks. In some cases, the waste spills into neighboring countries. Additionally, less-developed nations pay high prices to buy some electronic waste that is valued for their precious metal components. Extracting precious metals from electronic waste involves the use of harsh acids that pose a direct health risk to those involved and indirect risks to others exposed to the by-products.

Market Manipulation

Advances in communication technologies have also created opportunities for investment bankers, brokers, accountants, and others involved with the sale of corporate interests and currency exchanges to inflate or deflate stock values, falsify financial statements, and engage in speculation in unprecedented ways. In some cases, these activities do not technically violate the law but instead represent risky business practices. However, in many cases, the actors involved in these sorts of dealings intend to purposefully misrepresent information in order to manipulate markets. The emergence of investor chat rooms online and the ease of constructing personal Web sites have provided new outlets for corrupt businesspeople to overstate stock values, highlight misleading data regarding volumes of trade, and generally deliver misinformation to potential investors. Individuals who utilize these tactics are able to increase their share in growing markets through devaluation, and liquidate investments in faltering markets through overvaluation, either of which can lead to enormous personal gains. Corporate practices, such as insider trading and price fixing, are also considered forms of market manipulation.

These practices enable companies and their employees to use nonpublic information to guide business decisions and adjust commodity prices in ways that harm other investors and consumers. The U.S.–based energy company Enron was a market leader during the 1990s, with businesses operations throughout the Americas and Europe. By 2001, Enron had filed for bankruptcy, and a series of questionable accounting practices were revealed shortly afterward. This led to the conviction of several of the company's top executives, including Kenneth Lay and Jeffrey Skilling. This case was influential in the development of the Sarbanes-Oxley Act, which increased the accountability of corporate executives in federal investigations.

Trade in Illegal Goods

A final category of white-collar crime involves trade in illegal goods. Though much of the illegal trade in arms, drugs, and other contraband falls under organized crime and terrorism, seemingly legitimate businesses can play key roles in these sorts of transactions. Corporations involved in the legal production of these and other commodities may allow unauthorized sales, may knowingly transport illegal goods along with their other products, or may even fund illegal operations in order to receive a share of the profit. Corporations and other producers also participate in the trade of illegal goods through the intentional sale of faulty products. Agricultural producers take advantage of disparities in the law by selling tainted products to consumers in markets with lax regulation over foodstuffs. Another example is the illegal organ trade. This involves doctors and other medical practitioners removing organs from patients to sell on the black market.

Goldman Sachs Group Inc.

Goldman Sachs Group Inc.—headquartered in New York's financial district but with several international locations—holds a reputation as a leading global investment banking, securities, and investment management firm. Founded in 1869 by Marcus Goldman and Samuel Sachs, the firm has influence throughout the world, as indicated by having had two secretaries to the U.S. Treasury in the last two decades and the prime minister of Italy among its former employees. After both the Securities and Exchange Commission (SEC) and the U.S. Department of Justice (DOJ) dropped recent cases against Goldman Sachs, the firm was able to keep this worldwide reputation, albeit tarnished.

Senate Investigation

After the U.S. Congress passed the American Recovery and Reinvestment Act of 2009 and the financial crisis ostensibly ended, the troubles did not end for Goldman Sachs. The U.S. Senate's Permanent Subcommittee on Investigations, chaired by Senator Carl Levin (D-Michigan), identified wrongdoings and failure on the part of Goldman Sachs. The committee accused the firm of breeding a "greedy culture," but that is not a criminal act. What the committee specifically charged Goldman Sachs with doing was creating complex securities that included "junk" from its inventories. According to the committee, the company then misled investors by making them believe that Goldman Sachs's interests were aligned with its investors' interests, while betting heavily against those same securities and its customers, at a considerable profit.

Further, Levin charged the chief executive officer of Goldman Sachs, Lloyd Blankfein, with lying to Congress about the firm betting against the housing market. This added a possible perjury charge. On April 13, 2011, all of these accusations were included in a 635-page report released by Senator Levin and Senator Tom Coburn (R-Oklahoma), the ranking Republican on the bipartisan committee. These accusations compelled the DOJ to investigate the matter.

At the same time, Goldman Sachs was fending off another investigation—the SEC accused Goldman Sachs of fraud related to a mortgage-bond deal called ABACUS 2007-AC1. The SEC alleged that Goldman Sachs and one of its vice presidents, Fabrice Tourre, failed to inform investors that a hedge fund firm, Paulson & Company, had helped choose underlying securities in this deal and was betting against it. The claim against Tourre states that he was principally responsible by structuring the transaction, preparing the marketing materials, and communicating directly with investors. Investors in the liabilities of ABACUS lost over $1 billion.

The SEC sought injunctive relief, disgorgement of profits, prejudgment interest, and financial penalties. Goldman Sachs agreed to pay $550 million to end the SEC's fraud suit, contending that marketing materials for the ABACUS deal contained "incomplete information." The settlement included the largest penalty ever assessed by the SEC.

Dropping the Case

On August 9, 2012, the DOJ announced that it would not pursue prosecution of Goldman Sachs or any of its employees for any nefarious activities during the global financial crisis. Although the subcommittee's report strongly suggested that there may have been criminal wrongdoing, after a year's investigation, the "burden of proof" could not be met by the DOJ. Senator Levin reacted strongly to the DOJ's news, commenting that the results stemmed from either weak laws or weak enforcement. The DOJ also announced the right to reopen the case if new evidence is uncovered.

On the same day, Goldman Sachs was informed by the SEC that it had resolved its case against the bank, and would not be seeking any "enforcement action," although it pursued a civil case against Tourre. Tourre, who was a 31-year-old vice president when the investigation began, previously nicknamed himself "The Fabulous Fab." While awaiting his civil trial, Tourre had plans to work for a nonprofit organization in Rwanda and to begin a Ph.D. program in economics at the University of Chicago.

Bayou Blues

Goldman Sachs was cleared in the last round of investigations, but another somewhat muddy situation lay ahead, involving a hedge fund called the Bayou Group. The fund was founded by Samuel Israel III and was considered to be run by a "trading whiz." When it was discovered that Israel was a con man who tried to fake his own death, it was also discovered that Israel had been running a Ponzi scheme. He was sentenced to more than 20 years in prison, leaving it up to bankruptcy courts to decide the fates of the Bayou Group's investors. Goldman Sachs had both executed and cleared trades for the Bayou Group, so on July 30, 2012, the firm paid $20.7 million to approximately 200 Bayou investors. A securities arbitration panel awarded that amount, and it appeared to be a "win" for the Bayou Group's investors, but Goldman turned around and filed a creditor's claim for the same amount. The bank contended that by paying the award, it then became a Bayou Group creditor. The group's investors planned to fight Goldman's claim, but if Goldman Sachs wins the case, the investors who won their arbitration case will be out of luck. A spokesperson for Goldman Sachs told the *New York Times* that the bank's claim was consistent with bankruptcy law.

Dragon Slayers

Yet another legal battle await Goldman Sachs. A husband-and-wife team with Ph.D.s, Janet and James Baker, are credited with being pioneers in speech technology. They began their business—Dragon Systems—in the 1980s and grew it without incurring any start-up debt. In 1999, offers for their then–multimillion dollar business came pouring in, and the Bakers turned to Goldman Sachs for financial advice. Four employees of Goldman Sachs, now known as the Goldman Four, were assigned to the Dragon account and issued a memo that all due diligence would be executed regarding Dragon's deal with L&H, a Belgian company.

At some point in the negotiation period, L&H offered to change the original offer to the Bakers from half cash/half stock to all stock. The Goldman Four did not dissuade the Bakers from accepting this offer. After the deal went through, it was learned that L&H was fraudulent and that none of their alleged Asian investors actually existed. The Bakers had already paid Goldman Sachs $5 million for its advice, and instead of receiving $580 million, they received nothing. They sought redress of over $1 billion.

Even with legal action coming at Goldman Sachs from every direction, Martin Sosnoff, chairman of Atalanta Sosnoff Capital, says that underneath it all, Goldman Sachs boasts a team of overachievers. The bank has been able to outperform or defeat most of its opponents. Whether or not it can continue to overachieve and polish its tarnished reputation will be revealed over time, but so far, the more damaging taint of criminal wrongdoing has been successfully avoided.

Government Contract Fraud

Government contract fraud is often in the news; the phenomenon is a source of skepticism for citizens and regards government activities at all levels, from local jurisdictions to national and international agencies. Some contract fraud stems from the diverse activities of government; Medicare and Medicaid, national defense, education, transportation, and public safety serve so many different contexts that the resultant government contracts are by nature wide ranging and complex. Part of the contract problem comes from the sheer magnitude of annual spending by government. For example, U.S. federal spending was $3.7 trillion in 2011. It involves many players and requires processes that invite some percentage of fraudulent activities. Recent pressures on the growing national debt have reinforced the unacceptable nature of fraud involving taxpayer dollars, and federal legislation aimed at transparency heightens initiatives to curtail contract fraud in attempts to restore public confidence in uses of taxpayer money.

Government contracting involves extensive procedures to ensure appropriate treatment at various stages: prior to awarding the contracts, during contract negotiations and award determination, and during performance of contracted activities. Detailed procedures and controls in the administration of contracts throughout these stages are necessary to ensure that fair and legitimate behavior ensues. For the federal government, the Federal Acquisition Regulation (FAR) was established to codify uniform policies for acquisition of supplies and services by executive agencies.

Four guiding principles of the FAR system are stated in Subpart 1.102: the first relates to issues of cost, quality, and timeliness of delivery of a product or service; the second is to minimize administrative costs; the third relates to fairness, integrity, and openness of activities; and the fourth relates to fulfilling the public policy objective. A part of the guiding principles is the specification of all individuals acting in part of the procurement process as part of an "acquisition team." Thus, the principles that stipulate exercising "initiative and sound business judgment" regarding the best product to meet needs extend not only to employees of the federal government but also to customers and contractors.

The guiding principles are lofty, given the vast spending that serves as a magnet to potential fraudsters; thus, programs and guidelines are put in place appropriate to the varied circumstances. For example, the Department of Defense (DOD) in a time of war may require flexibility and responsiveness. Consequently, Directive 5000.01 was passed in 2003, and amended in 2007; this directive tailored the principles of FAR to the Defense Acquisition Systems. Matters addressed included levels of authority related to milestones, policies pertaining to information security, use of small businesses, and interoperability of systems.

Types of Generic Government Contract Fraud

In the stage of presolicitation of contracts, the primary issue revolves around need, or what a governmental entity is in the market to buy. A common element of fraud entails collusion related to potential kickback schemes; for kickbacks to occur, an amount of collusion is typical between the buying agency and the contractor. Because much government work is subject to bidding, in this initial phase of contracting, the collusion might work to allow developing specifications for purposely vague language or language that favors one contractor over another. This was one of the elements that originally alerted whistleblower Bunny Greenhouse of potential issues when Kellogg Brown and Root (KBR), a subsidiary of Halliburton, was allowed to remain present during a Pentagon meeting where oil field contracts were discussed just prior to the Iraq War; the presence of the contractor representatives during these discussions gave the company unfair advantage.

Other kinds of collusion at this stage involve hidden or vague agreements that allow the contractor to increase prices, once awarded. An example invovled Darleen Druyon, an Air Force procurement official, who was found guilty of corruption and served prison time. Druyon admitted exercising favoritism with Boeing contracts, partly because of clouded judgment related to the fact that Boeing had hired her daughter and future son-in-law. After Druyon's admission of guilt, there was substantial review of hundreds of contracts that had been awarded to multiple vendors during her nine-year tenure. This fraud perpetration was possible in part because of Druyon's personality; she was very strong and was allowed to operate with virtually unchecked supervision. For example, the *Washington Post* reported that "Air Force officials coined the term 'DSS: Darleen Says So' as a short response to dismiss questions about Druyon's decisions." This situation caused the department to reconsider aspects of its acquisition policies.

Some changes to contracts are a normal part of industry operations. Change orders to construction contracts are a common example, but all contract modification should take place with scrutiny. An annual audit of change orders is a customary practice to ensure that both contractors and agency personnel maintain accuracy and integrity in the stage that is subsequent to a contract award. A change order audit might allow an agency to recover funds from inadvertent errors on the part of agency employees in accounting, the project manager, or the contractor. Change orders may be overstated in the contractor's favor, may not be calculated correctly, or may not use correct or allowable percentages. Some change orders merit close inspection because of materials involving health or safety hazards or to ensure continued compliance of contractors in accordance with prequalification guidelines.

For example, subsequent work may not allowed beyond the scope of authorized duties; plumbers might be doing electrical work in the form of change orders. Knowing that auditors will subsequently verify random samples of change orders serves to keep employees on both sides (buyers and suppliers) more diligent in their paperwork and documentation. In the negotiation and contract award phase, fraud schemes involving collusion may ensue that are related to bid submission. For example, schemes making use of insiders from the buyer's sides involving opening bids prematurely, altering bids, extending the bid opening date, or falsifying bid logs or documentation. An important internal control is opening construction bids in a public area, with recorded audio and written documentation in the form of minutes or transcripting of the bid opening meeting maintained for ongoing public view. Many cities, counties, and state agencies utilize this kind of transparent forum; attendees include interested parties who want to find out immediately who bid on the contract and the terms of the bids.

Other bidding schemes in the contract award phase include bid rotation, in which qualified prospective vendors take turns at submitting the low bid. Another scheme is bid suppression, in which competitors agree to refrain from bidding, or to withdraw a previously submitted bid. In complementary bidding schemes, contractors submit bids known to be too high to be accepted, or to include special terms that would not be considered. Complementary bidding schemes give an appearance of genuine bidding; such schemes are referred to as protective, courtesy, or shadow bidding. A final bidding fraud scheme, called phantom bidding, involves creating fake or dummy companies. This scheme is common in auctions, for example, in real estate or items listed on eBay, to drive up prices for the sellers (the contractors). Phantom bidding, when utilized in government, allows the appearance of competitive forces, since governments often require that a minimum number of bids be received. In reality, where phantom bidding is under way, the fake companies are really just driving up the bid for a sole company. A deterrent to this is prequalification of companies or contractors; something as simple as requiring that the companies submit audited financial statements for recent years does much to preclude phantom bidding.

Another type of contract award scheme entails defective pricing, with inaccurate cost data included in the proposal to increase the price. This may include inflated labor or material costs and might be perpetrated through not disclosing vendor discounts or using vendors other than those the bid had documented using. Pricing schemes may be detected if vendors refuse to provide historical records or are slow to update data after price reductions have occurred.

After a contract is awarded, opportunities for fraud continue. Product substitution involves the use of inferior or reworked material. Related to this is falsifying reports on testing of materials. Detecting this kind of fraudulent activity might involve the purchasing agent doing unannounced inspections or tests for the company, or reviewing files or inspection reports carefully. Mischarges are another way to defraud during contract fulfillment, involving charges for accounting, materials, or labor services. One case example involved this type of scheme for a vendor who held a freight contract with a state liquor control commission. In this case, the perpetrator developed a relationship with the commission's accounts payable supervisor, who unwittingly helped contribute to the fraud after she left that unit. When helping someone in her prior unit, she accidentally discovered that delivery weights were consistently overstated. She confronted the perpetrator but she did not report him for six months. Their relationship deteriorated, and the perpetrator became increasingly unstable, causing her to fear for her safety at the time that she came forward.

Improving Transparency

One recommended control is to have watch lists and debarment policies, which serve notice to managers that potential contractors are not trustworthy. Since 1981, the Project on Government Oversight (POGO) has been tracking federal waste; it was originally initiated because of excessive defense industry spending. Presently, an online database reporting U.S. contractors associated with fraud, contractormisconduct.org, is maintained by POGO. The World Bank maintains a list of individuals and contractors who are not eligible to obtain a World Bank–financed loan for a specified period. The entities on the list are sanctioned according to corruption policies set forth in the bank's procurement policies. The federal government has a System for Award Management at sam.gov. In addition, many states presently have debarment lists related to different functions where contracts should be avoided with entities for a specified period of time. Examples include construction companies, medical practices, or professionals such as dentists or certified public accountants (CPAs).

The Federal Funding Accountability and Transparency Act of 2006 mandated that the Office of Management and Budget (OMB) provide, at no charge to the public, a single, searchable database with extensive detailed information pertaining to federal awards. The Web site, USAspending.gov, was launched in December 2007.

In 2009, President Barack Obama issued Executive Order 13520, Reducing Improper Payments and Eliminating Waste in Federal Programs. This was to expand and improve on earlier endeavors such as the Improper Payments Information Act of 2002 by providing guidelines for improved transparency. The OMB was charged with identifying the federal programs with the highest amounts of improper payments, as well as with prioritizing and setting targets for reducing this waste. The secretary of the Treasury, attorney general, and OMB were to jointly publish information about improper payments. These data are tracked from multiple databases and includes payments that may not be required on the www.USAspending.gov Web site. For example, payments are tracked for spending on Medicare, Medicaid, school lunches, Pell Grants, unemployment insurance, improper tax payments, or earned income credits at the Web site www.paymentaccuracy.gov.

The Improper Payments Elimination and Recovery Act of 2010 (IPERA) amended the Improper Payments Information Act of 2002. IPERA charged agency heads with reviewing programs susceptible to improper payments, performing risk assessments at specific intervals, and estimating improper payment amounts according to a statistically valid estimation tool using approved methodology. Risk factors were identified (new agencies, complexity, and volume of payments) by IPERA. Recovery plan efforts for improper payments were prescribed, including setting targets. Eventual agency reduction targets, by program and agency, are to be approved by the OMB. The OMB was charged with developing pilot accountability mechanisms to ensure that improper payment situations improved. Pursuant to an April 2012 memorandum from the OMB, agencies were charged with finalizing plans with the OMB to implement centralized solutions (e.g., a Do Not Pay List). This will assist in curtailing the high amounts of improper payments; estimates indicated that fiscal year 2010 had nearly $125 billion of such payments.

Government Contract Fraud Efforts

The U.S. Department of Justice (DOJ) continues to vigorously prosecute cases that come to its attention related to government contract fraud. These cases often take years and often involve multiple contractors. For example, in 2007, IBM and PricewaterhouseCoopers (PwC) settled for a combined $5.3 million for allegations of improper payments on technology contracts with federal agencies; the suits originally were filed in 2004, involving other computer vendors that claimed kickbacks or other activities. Both IBM and PwC settled and claimed no wrongdoing; payments from other technology vendors yielded high amounts to the DOJ in subsequent years. Fiscal year 2009 was a record year for DOJ recoveries of false claims, the second-largest amount for a single year in its history; recoveries that year came primarily from businesses in the health care and defense industries.

Since 2009, recoveries have not been publicized as much by the DOJ. A recent DOJ report discussed the fact that improper payments were less than in the past; the report attributed this to recent initiatives made by all departments to prevent such payments in the first place. A useful perspective on internal controls is to look at controls from the preventive, detective, and corrective vantage points. Perhaps in the United States, the situation of government contract fraud reached a level that, combined with the burgeoning public debt, made for awareness of issues, so that all vantage points of internal controls are now covered. A combination of factors may yield changes to eventually reverse the trend: increased education in combating fraud schemes, preventive mechanisms of increased disclosure of perpetrators through publicized watch lists, incremental attempts at improved legislation to demand department accountability, and expectations of punishment in the form of continued and consistent prosecution. Time will tell if these factors will lead to less government contract fraud.

Government Procurement Fraud

Government procurement fraud is a vast and costly problem worldwide. Procurement policy, sometimes called public contracting, involves multiple steps in a cycle. The cycle begins with an assessment of needs; includes documentation to ensure adherence to regulations pertaining to the solicitation, award, and monitoring phases of contracts; and concludes with final accounting mechanisms. Both competitive and noncompetitive processes exist in public procurement. Opportunities exist in processes throughout the cycle for corruption and collusion to result. A call for transparency of procurement processes has ensued recently. Secrecy is in the very nature of collusion; thus, procurement fraud can be hard to detect. Because of increased economic pressures, along with public outcry as whistleblowers continue to emerge with tales of taxpayer waste, many initiatives have been put in place to heighten awareness of ethical expectations and to serve as preventive, detective, and corrective controls regarding to the varied issues.

Public procurement processes typically use three acquisition methods, any of which can be handled in a fraudulent manner. Competitive bidding allows for competitive and fair forces, as long as there is no collusion between players; collusion and secrecy often abound in the bidding process. The competitive proposal or negotiation method allows more flexible bidding arrangements. This method is used when government knows what it wants but does not have the knowledge of costs or expertise to develop specifications. In this case, the vendors are more involved in the development of the proposals, and this enables them to lure the government into paying higher prices. The third method, sole source, is justified in situations of select personal services or the importance of a particular brand, compatibility concerns, proprietary purchases, matters of compelling urgency, or national security issues. Sole sourcing tends to shift power to the contractors, with the contracting officers charged with responsibilities under the oversight of Congress or other authorities. In sole sourcing, the contracting officers report accordingly to the higher authorities.

According to the Organisation for Economic Co-operation and Development (OECD), within OECD countries, public procurement amounts to 15 percent of gross domestic product (GDP); in most developing countries, the proportion is substantially higher. Transparency International has estimated average damage amounts between 10 and 25 percent of a contract's value (in some cases as much as 50 percent) because of corruption; its 2010 report further highlights costs in lost lives, citing how flawed construction contracts have been associated with high death tolls in devastating earthquakes in multiple countries. Government procurement fraud is pervasive because of the incentives for collusion and corruption. One may take the perspective of an economic approach of self-interest or a more pervasive organizational behavior approach, which finds that corrupt actions can become institutionalized in role identities.

Four aspects of the public procurement process were noted in the Executive Summary of the 2010 OECD Global Roundtable that cause public procurement processes to be especially vulnerable to corruption. First, projects with large budgets invite opportunity. Second, the resultant volume of goods and services make monitoring difficult, which increases the likelihood of malfeasance. Third, the industry sectors of construction and medical-related goods and services are prone to anticompetitive or corrupt practices, and bulk procurement relates to these sectors. Finally, regulatory requirements for procedures result in predictability, which affords opportunity for collusion.

In the fiscal year ending September 30, 2009, the United States secured the second-largest recovery of civil fraud claims in history: $2.4 billion in settlements and judgments in cases involving fraud against the government. Procurement fraud constituted one-fourth of that total at $608.4 million in settlements and judgments, including $422 million attributable to Department of Defense (DOD) contracts.

Efforts to Make a Difference

Attempting to make a difference at the global level is the OECD, which continues research into public procurement fraud in many locations. One tool is the OECD Guidelines for Fighting Bid Rigging in Public Procurement. Proactive efforts taken as part of the ongoing campaign begun a year earlier are illustrated in the second Myth Busting Memo, sent by the Office of Federal Procurement on May 7, 2012. The memo aims at eliminating eight misconceptions of vendors and federal procurement employees. One initiative, launched in December 2007, is the Web site www.USAspending.gov. Another initiative is the Vendor Collaboration Central Event Listing at www.fbo.gov, the FedBizOpps (Federal Business Opportunities) homepage.

There are many recommended controls, such as employee background checks of individuals with authority levels to hire or authorize other contractors. Mandatory vacations and job rotation serves to help potentially catch employees who are violating procurement policies, as well as serving as a deterrent to those in positions; thus, both of these are preventive and detective controls. In addition to the internal employment policies in governments, extending caution to the external environment as a form of preventive control is advised.

Examples of improvements in the U.S. government relate to the National Fraud Procurement Tax Force; this group issued a white paper in 2008 that looked at, and proposed legislative efforts and other suggestions to provide clarity in, addressing procurement fraud. For example, a national fraud database (including data from states pertaining to contractor, fraudulent actions) was one preventive control recommendation presented, as was increased use of background investigations. Both of these actions have come to fruition in the interim as debarment lists, with preapproved and consistently maintained and updated watch lists and debarment policies put in place.

A debarment list is a prohibition against using a particular contractor or vendor, and this list serves notice to managers that potential contractors are not trustworthy. One database reporting on U.S. contractors associated with fraud, contractormisconduct.org, is maintained by a private watchdog group, Project on Government Oversight. In addition, the government maintains the Excluded Party List. Also in the interim, under President Barack Obama, the Office of Management and Budget was charged with pilot accountability mechanisms to ensure that improper payment situations improved. The paymentaccuracy.gov Web site is operating with public access, and a Do Not Pay list was under development as of 2012.

Ethics policies and clear messages about expectations pertaining to whistleblowing (on the part of contractors) were included in the National Fraud Procurement Tax Force white paper. However, it takes time for a change in organizational culture to move in this direction, and it is likely that not all recommendations of the tax force were implemented. Typically, whistleblowers at the federal level have faced retaliation.

A Whistleblower’s Poor Treatment

An example of retaliation for speaking up about government procurement fraud is the story of Bunnatine “Bunny” Greenhouse, who was a civilian procurement executive with the Army Corps of Engineers. Greenhouse reported to Congress that this was “the most blatant and improper contract abuse I have witnessed during the course of my professional career.” After her reports, she was demoted from her position.

The facts of the Greenhouse case began with her initial realization of impropriety when Kellogg Brown and Root (KBR), a subsidiary of Halliburton, was allowed to remain in a Pentagon meeting three weeks prior to the Iraq invasion. This meant that KBR was privy to knowledge that other contractors were not. The Restore Oil Contract (RIO) was drafted, and stated that required knowledge of the KBR plan be a condition for follow-on contracts; this meant that KBR would be the only one that would be able to engage in follow-on contracts. Normally, companies involved with contingency plans are excluded from follow-on work.

In addition, the fact that this sole source no-bid plan was going to be for a period of five years was disturbing to her. With war eminent and her options limited at the time, Greenhouse inserted a handwritten note on the Justification and Approval form that stated that the time beyond a one-year contract was detrimental. Later, the document surfaced when the Defense Contract Audit Agency indicated that KBR overcharged $61 million for fuel. Pursuant to a Freedom of Information Act request, *Time* magazine requested permission to interview Greenhouse, which created more tension, and brought the matter to greater public awareness. The outcome of this case resulted in a settlement of $970,000 with Greenhouse in 2011.

Lessons Learned and Proactive Actions

A lesson was learned from Darleen Druyon, who was known as the Dragon Lady because she had a reputation as one of the toughest managers working for the Pentagon; she was prosecuted because of the favoritism she awarded to select contractors in the defense industry. When red flags arise from someone with an especially strong personality, monitors and investigators should be paying attention. In this case, the acronym DSS, which stood for "Darleen Says So," should have been a cue, if anyone had been monitoring the processes under her tight fist of control.

Another red flag has to do with one of the legs of the fraud triangle; specifically, the risk factor known as pressure or incentives. In the Druyon case, the incentives or pressure stemmed from the employment by the contractor of both her daughter and her son-in-law with Boeing. Quality-control practices within certified public accounting (CPA) firms should ensure that audit staff are independent, realizing that sometimes the relationship may go beyond the immediate employee to family members. Many CPA firms maintain some kind of record of where immediately family members are employed, as well as the companies in which their employees own stock, so that audit engagements can be accepted where employees will not be accused of crossing the line of independence or objectivity. The "appearance of independence" is emphasized in the Code of Conduct of the American Institute of Certified Public Accountants, not just "independence in fact." Nepotism and potential family member conflicts of interest should be closely monitored, as well as any other circumstances that may impair objectivity or result in bias in decision making. These come under the category of preventive controls.

Anonymous hotlines to report suspicious activities are highly recommended, as the ACFE 2012 report of occupational fraud indicates that fully 43 percent of occupational fraud is initially detected because of tips. A total of 51 percent of the companies where fraud was detected had some form of hotline, while only 35 percent of the companies without a hotline received tips. Companies without a fraud hotline reported discovering fraud "by accident" (greater than 11 percent), more often than did companies with a hotline (less than 3 percent). Often, many individuals are aware of schemes; some of them may not be employees but may hear about the schemes through friends or family. Tip hotlines and increased emphasis on ethical behavior serve as preventive, detective, and corrective internal controls.

The Sarbanes-Oxley Act of 2002 (SOX) increased attention to the importance of internal controls for public companies, with provision of mandatory disclosures that were certified by chief executive officers and chief financial officers. SOX also installed penalties for those who certified disclosures if fraudulent activities were uncovered. Section 406 of SOX required that publicly held companies report as to the existence of codes of conduct; although SOX did not mandate that ethics codes be put in place, if corporations did not do so, they had to indicate the reason. Certifications and ethics codes promote awareness, which in turn should serve as preventive controls in the procurement process.

In 2010, the Dodd-Frank Act greatly expanded whistleblower remedies for those who provide to the Securities and Exchange Commission (SEC) information of sufficient quality that results in ordering sanctions greater than $1 million. Whistleblowers can obtain 10 to 30 percent of the remedies, and the act also prohibits retaliation against whistleblowers. The United States is putting "teeth" into the law to send a message about fraud. With the incentive of rewards, perhaps this action may serve to deter public procurement fraud domestically; whether it actually will make a difference remains to be seen, because enacting legislation and implementing it are not the same thing.

The continued research by global players (ACFE, big-four CPA firms, OECD, Transparency International) serves to build knowledge in the area of public procurement fraud, in terms of both its pervasiveness and the best practices to combat it. A silver lining from the economic downturn in 2008 is public outrage, which has meant that more people are interested in the subject. Supplement the increased interest with the existence of quality resources and statistics via the Internet, and the result may be a slowdown in the trend of increased government procurement fraud.

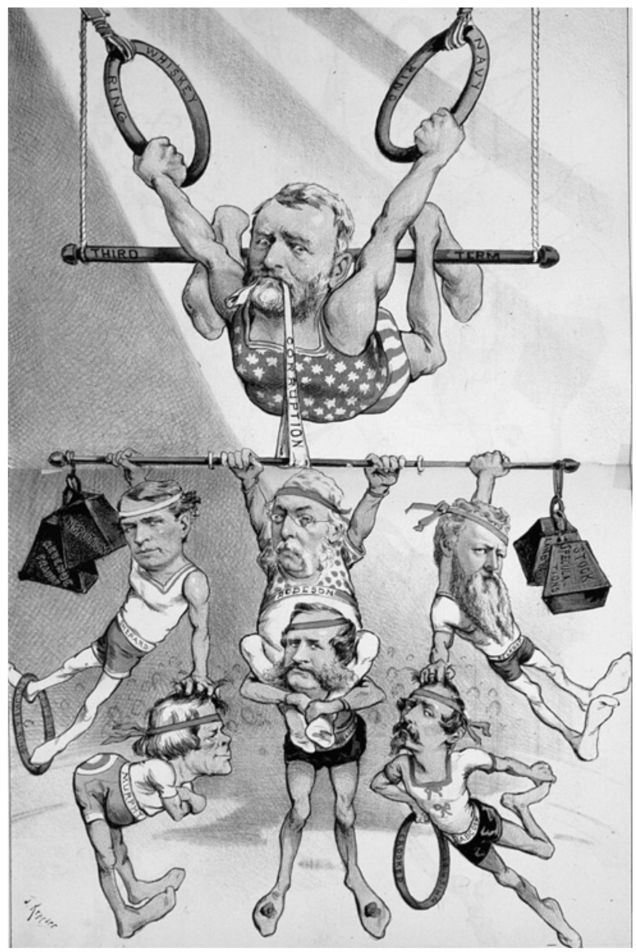
Grant, Ulysses S.

Hiram Ulysses (later changed to Ulysses Simpson) Grant was born in Point Pleasant, Ohio, in 1822. He attended West Point, and after service in the Mexican War, he tried his hand at farming and in several unsuccessful businesses, eventually working for his father. While serving in the army earlier on the frontier, perhaps lonely for his wife and family, he lapsed into problem drinking, for which he was labeled an alcoholic for the rest of his life.

When the Civil War broke out, he was given command of an Illinois state unit of troops and was later given a commission in the regular army. Achieving early successes along the Mississippi River in the western theater of operations, Grant arrived in the nick of time to save the Union army from destruction at the battle of Shiloh in 1862. From that pivotal battle, he returned to the Mississippi to complete the siege of Vicksburg in July 1863. When still in Tennessee, he issued General Order 11, which expelled all Jews from his area of operation. This was aimed at profiteers but also banished resident Jewish families. President Abraham Lincoln quickly ordered him to countermand this edict, and finally made Grant responsible for reducing the Confederate army of northern Virginia. In a series of brutal battles fought in 1864 and 1865, ranging through eastern and central Virginia, Grant's force wore down the Confederate army while the Union army sustained massive casualties. On April 9, 1865, the army of northern Virginia surrendered at Appomattox, Virginia.



The various fraud and bribery scandals of Ulysses S. Grant are represented in this February 4, 1880, issue of Puck *by the "whiskey ring" and "Navy ring" he grips and the "corruption" strap in his teeth, which holds up the other "acrobats" involved.*

Grant showed great magnanimity and statesmanship in granting certain liberal conditions to officers of the defeated army. Chaos was to follow.

Lincoln was assassinated within days, and a period of conflict ensued. President Andrew Johnson, a "war Democrat," tried to restore the south to conditions that it enjoyed before the war, excepting slavery. A fracas with Radical Republicans in Congress followed. Johnson was impeached but not convicted by Congress, and he did not prevail when he ran against Grant for president in 1868. Many hoped that when Grant became president in 1869, he would work to heal the wounds of the country and end the turmoil that dogged Reconstruction. However, rampant political corruption and nepotism, labeled "Grantism," dogged his administration. Some historians have argued that Grant was incorruptible and that he was untouched by the corruption that surrounded him. He was commander in chief, and as president, he quipped, "the buck stops here" (at the president's office). Liberal Republicans were aghast at the pervasive corruption in his administration and at his poor control of Reconstruction policies; as president, Grant essentially arrogated unto Congress all Reconstruction policy. The harshness and inconsistency of the resulting policy proved disastrous for the nation.

Scandals of "Grantism"

Grant's administration was unfairly saddled with the consequences of the Credit Mobilier scandal. Republican politicians received $20 million of public money funneled through Credit Mobilier for the benefit of the Union Pacific Railroad. When the enormity of this came to light, Grant's vice president, Schuyler Colfax, was implicated, as was the vice president in Grant's second term, Henry Wilson.

Grant was more closely touched by the Whiskey Ring scandal, in which his personal secretary, Orville Babcock, was implicated. This scheme also involved Grant's brother, Orvil, and his son, Frederick Dent Grant. Grant had been persuaded to sign several orders facilitating the scam—unwittingly, he claimed. The fraud consisted of various distillers of spirituous liquors defrauding the federal government of tax revenue. Bribes were paid to federal revenue officials in lieu of much higher taxes. Much of this illegal revenue went to support Republican candidates, and some was used to encourage editors to take positions favoring the Grant administration's policies. As the scheme matured, more money ended up in the pockets of revenue agents than went to the party.

Though the operation was centered in St. Louis, scams also were noted in many other major cities in which Republicans dominated federal elective and appointed offices. As an investigation by Secretary of the Treasury Benjamin Bristow uncovered the involvement of 86 Republican officials, Grant became obstructive, insisting, for example, that his secretary should be tried by a military court. Grant, while presenting a façade of cooperation with the investigation, eventually fired the special prosecutor and tried to block the prosecution of the case in various other ways. During the trial, it was discovered that Grant had accepted expensive gifts from major players in the Whiskey Ring.

Other scandals involved Secretary of War William Belknap, who took kickbacks from dishonest vendors. The secretaries of the navy and interior also took bribes, as did the secretary of state. Not to be outdone, the secretary of the Treasury, the attorney general, and the ministers to Great Britain and Brazil were also involved in inappropriate financial dealings.

Rampant Corruption

Even if Grant was burdened with corrupt family and friends, but was essentially blameless, his actions with respect to the endemic corruption that characterized his administration remain troubling. He continued appointing and reappointing to various federal offices people known to be corrupt or unqualified, obstructed investigations, refused to answer questions in depositions, and fired prosecutors who pursued evidence too enthusiastically for his taste. Moreover, the organization outlined in Whiskey Ring player John McDonald's self-serving and sensationalistic account painstakingly describes an organized criminal political enterprise—headed by the president. That no direct legal culpability adhered to Grant in court reflects the fact that subordinates, as in any criminal hierarchy, took the rap for the boss, several even spending terms in prison. Some were eventually pardoned by Grant, a circumstance that raises questions about his possible level of involvement. Even more ominous was the involvement of his son, brother, and brothers-in-law in a series of inappropriate investment schemes. Grant was not immune to bad investments, and after retirement he lost everything in yet another get-rich-quick scam in which he served as an unwitting dupe. However, Mark Twain encouraged him to write his celebrated *Memoirs,* and their posthumous publication saved his family from penury after his death in 1885. At best, Grant was a very poor judge of personnel and was a poor leader in civilian life; at worst, he was at least peripherally involved in a criminal enterprise. His administration is recognized as the most corrupt in American history.

Grassy Narrows First Nations Reserve

Grassy Narrows is a First Nations (Native American) reserve in Ontario, Canada. It is the home of the indigenous Ojiba tribe, Asubpeeschoseewagong. Between 1962 and 1970, Dryden Chemicals Inc., operating a paper mill, dumped more than 20,000 pounds of mercury into the Wabigoon River, Ontario, Canada. On April 6, 1970, the Canadian government shut down the fishery located on the Wabigoon and banned any future commercial fishing from the waters that ran through Grassy Narrows land. Commercial fishing was the primary source of income for the local population. The closure of the fisheries increased the unemployment rate from 5 to 95 percent. Additionally, wildlife in the area started to shows signs of distress. Eagles in the region began flying atypically. Otters and minks were no longer observed in the area, and ducks and their offspring were noted to have high levels of mercury in their systems. Furthermore, cats that fed or drank from the river had symptoms of Minamata disease. Minamata disease is a neurological disease characterized by ataxia (inability to coordinate muscular movement), narrowing of vision, diminished hearing, and generalized muscular weakness. The cause of Minamata disease is mercury poisoning.

Health Impact Study

Less than one-fiftieth of a teaspoon of mercury per 20 acres of lake is enough to make fish unfit for human consumption. When people eat fish contaminated with mercury, the mercury is absorbed into the bloodstream and then negatively impacts the central nervous system. In 1975, Dr. Masazumi Harada, a mercury and Minamata disease expert, conducted a health impact study in Grassy Narrows and the neighboring native community of White Dog. The study indicated that mercury levels of Grassy Narrows residents were three times the Health Canada (Canada's national health department) limit, and those in White Dog had levels of mercury that were seven times the national limit. Despite this, the Canadian government issued a report in 1979 stating that Minamata disease "has not been found in Canada, milder forms of mercury poisoning, although difficult to prove conclusively, possibly have occurred." Health Canada repeated this statement in 1999.

Harada and his fellow scientists issued reports that there were many cases of Minamata disease that were not recognized. The Canadian government did not acknowledge that the disease could be contracted from long-term consumption of contaminated fish. Government standards and regulations set allowable levels too high to protect the local population and the environment from the harms caused by mercury. A problem faced by the White Dog and Grassy Narrows residents was that if they could not afford to purchase food, they continued to fish from the river. This included pregnant women, whose children, born later, had higher-than-average incidence of cerebral palsy, seizures, and delayed development. In 1985, the Canadian government agreed to pay Grassy Narrows and White Dog residents $8,000 per person if their mercury level was at or higher than Canada Health standards. Although mercury dumping had ceased, commercial logging began on native land, without the consent or participation of Grassy Narrows tribal members. In 2000, native trappers sued the Ontario government. In 2002, tribal members began blockading logging trucks, as industrial companies had continued to receive permits for clear-cutting by the Ontario provincial government. The locals claimed that commercial logging on traditional lands was compromising their economic opportunities and further damaged their waterways.

In 2006, the tribal nations sent letters to the Weyerhaeuser and AbitibiBowater logging companies to stop all clear-cut logging practices. The cease and desist letter stated the following:

> For many years our people have suffered from a forced industrial invasion of our forest homeland . . . we are not consenting to the clear-cutting of our traditional lands, which is an assault on our culture, our way of life, and indeed our very existence.

The Ontario government issued the logging permits without discussion with the tribes' members. The nations then sued the provincial government for violation of an Indian treaty. The treaty, signed in 1873, gave Grassy Narrows the right to hunt and trap. The Indian nation questioned if this treaty permitted the province to deforest the land. This legal battle had been ongoing for 11 years and had moved into an appeal stage, with the Supreme Court of Canada. The clear-cut logging practice is one more environmental insult to a tribe still facing a 40-year struggle with high levels of mercury in its waterways. The tribal case ended in August 2011, when Justice Mary-Anne Sanderson of Ontario Superior Court ruled that the province of Ontario did not have the right to interfere with the tribe's treaty. The case established the precedent that the Canadian government has an obligation to seek accommodation for and agreement with the First Nations' members before taking action on native traditional lands.

Great Electrical Equipment Conspiracy

The Great Electrical Equipment Conspiracy of the 1950s involved 47 electrical manufacturers that colluded to price fix as many as 20 product lines, exceeding total annual sales of $2 billion each year. The conspiracy involved some of America's largest corporations, including General Electric, Westinghouse, Allis-Chalmers, and others. Over 40 representatives from the manufacturers took part in the price-fixing meetings. The conspiracy was widespread throughout the industry and was organized along product lines. Conspirators came to see collusion as a way of life.

The conspiracy was exposed when the Tennessee Valley Authority (TVA) notified the U.S. Department of Justice of nearly identical bids across a range of products. Court fines imposed on both companies and industry managers approached $2 million. Many executives, some from America's most revered companies, were sentenced to jail. The 1950s electrical manufacturing market featured periods of severe price competition because of industry overcapacity, which was aggravated by the entry of foreign suppliers. Rather than compete, managers colluded to price fix. The conspiracy was organized along product lines, producing a set of organizationally distinct price-fixing conspiracies within the industry. Three product lines—switchgears, transformers, and steam turbine generators—accounted for the largest annual sales, and their conspiracies were the most serious.

Price Fixing

In the late 1950s, switchgear sales totaled $75 million per year. Switchgears are sets of disconnect switches, fuses, and circuit breakers designed to control and protect electrical equipment. Switchgears are standardized products with stable sales. The social organization of the switchgear conspiracy was decentralized. Division managers across the industry met and then set general price-fixing policies and goals, then delegated the organization of the conspiracy to a working-level group of subordinates within their companies. The switchgear conspirators developed a turn-taking schedule known as the "phases of the moon" that law enforcement officials never deciphered. The phases of the moon used a schedule of numbers to rotate, every two weeks, which company would be the low bidder on contracts. A second schedule of numbers instructed the low bidder how much to deduct from book price. As the company scheduled to be the low bidder bid below book prices, the rest of the companies honored their turn to bid above book price.

The transformer market totaled $500 million in sales per year during the late 1950s. Transformers are used to change electricity to a higher voltage to make long-distance transmission economical. Like switchgears, transformers are standardized products with stable sales. The transformer conspiracy was organized in a decentralized fashion, similar to the switchgear conspiracy. A higher-level group of vice presidents and division managers met several times a year to set prices and establish price-fixing rules, and to agree upon the percentage of the market allocated to each company. A working-level group of assistant general managers, marketing managers, and sales managers regularly met to devise and execute the price-fixing routines and procedures necessary to carry out the pricing policies agreed upon by the higher-level group.

Steam turbine generators totaled sales of $400 million each year during that time. Steam turbine generators use steam to produce rotary motion of a turbine that turns a generator and produces electricity. Unlike switchgears and transformers, steam turbine generators are not standardized products and must be custom built according to the specifications of the buyer. Unlike transformers and switchgears, steam turbine generators are enormous products costing millions of dollars each, taking 18 months to three years to manufacture. Moreover, market demand for turbines is sporadic, making sales difficult to predict. Economists hypothesize that the unstable demand pattern for steam turbines made it more likely that the steam turbine generator conspirators would cheat on agreements—meaning that they would make an agreement to let another company be the low bidder, but then later dishonor that agreement when the bids were submitted. However, empirical analysis shows that the conspirators mostly honored their price-fixing agreements and that the steam turbine generator conspiracy effectively raised cartel prices above market prices.

The steam turbine conspirators were effective price fixers because of the social relations constituting their price-fixing actions. From 1953 until 1959, there were 144 price-fixing meetings in the steam-turbine conspiracy. Analysis of the steam-turbine conspiracy has shown that the steam-turbine generator cartel used the following social relations to run an effective price-fixing conspiracy: (1) frequent, well-attended price-fixing meetings; (2) the attendance of division managers at meetings where the "corporate brass" would remind the "working-level" cheaters that price-fixing rules were both industry and company policy; and (3) conflictual social interactions at price-fixing meetings about accusations of cheating that functioned to continually redefine, maintain, and remind the conspirators of the normative price-fixing rules that they had agreed upon. Finally, market power played an enormous role in maintaining cartel discipline to honor price-fixing agreements.

General Electric had the largest market share and had more resources than the other companies. General Electric would remind the other conspirators of historical periods of all-out price wars that had been damaging to the financial standing of all of the companies but were devastating to the smaller companies. The conspirators horrifically referred to one such period as the "white sale." When conspirators began to cheat and recognized that they were in need of cartel discipline, they asked William S. Ginn—vice president and general manager of the transformer and steam-turbine generator divisions at General Electric—to attend price-fixing meetings. Ginn was forceful and threatened another white sale if companies did not play by cartel rules. Market power and social structure ensured that the price-fixing cartel extracted a deviant rent from the market, in spite of competitive, market pressures to cheat on pricing agreements.

The criminal proceedings of the price-fixing conspiracy concluded in a Philadelphia courtroom on February 6, 1961, with Judge J. Cullen Ganey sending seven executives to jail and giving 23 others suspended jail sentences. Judge Ganey fined many of the conspirators. The companies were fined close to $2 million. Afterward, many suits were brought against the equipment manufacturers by public utilities and private businesses.

Green, Mark

Mark Green is a New York–based public-interest lawyer, consumer advocate, and author. Early in his career, he worked with Ralph Nader's organization, Public Citizen. He fought political corruption and the growth of political action committees (PACs) that he felt were a threat to democracy. Throughout his career, Green helped formulate public policy. He investigated and revealed corporate malfeasance and corruption, and he served as an important spokesman for the public good in print and electronic media.

Green was born on March 15, 1945, in Brooklyn, New York. His father was a lawyer, and his mother was a schoolteacher. He received a bachelor's degree with honors from Cornell University in 1967 and a law degree in 1970 from Harvard, where he was editor-in-chief of the *Harvard Civil Rights–Civil Liberties Law Review.* He is a member of the Washington, D.C., bar association, and the New York State bar association. In 1977, he married Deni Frand, a director of People for the American Way. They have two children.

Activism Work

From 1971 to 1980, Green worked for Ralph Nader's Public Citizen organization, and he served as director of Public Citizen's Congress Watch from 1977 to 1980. He fought the emergence and growth of PACs, emphasizing that these special interests were directing millions of dollars into political campaigns. Through PACs, wealthy corporations were able to buy votes and political protection for their corrupt practices and criminal activities. In his book *Selling Out*, Green interviewed dozens of corporate executives and managers in his search for how money given to elected officials leads to actions detrimental to the public good. He found that money given to elected officials was related to deregulation, the nonenforcement of laws regulating pollution and health and safety, tax breaks for the wealthy, legislative and tax loopholes, and corporate subsidies (corporate welfare).

In 1981, Green organized the New Democracy Project, an organization dedicated to developing enlightened public policy. He served as its director for 10 years. From 1990 to 1993, Green served as the consumer affairs commissioner of New York

City. In 1993, he was elected to the position of New York City public advocate, and he was re-elected to a second term in 1997. As public advocate, Green investigated the city's health delivery system, including health maintenance organizations (HMOs), hospitals, and nursing homes, which led to laws and regulations that protected consumers. He brought legal action against the tobacco industry's advertising that was directed toward children. Joe Camel ads and other youth-directed ads were discontinued as a result. As a public advocate, Green sued New York City Mayor Rudolph Giuliani twice for the use of racial profiling by the New York City Police Department. He was one of the first defenders of the public interest to focus on racial profiling. In 2002, Green was appointed distinguished visiting lecturer at New York University Law School. There, he taught public-interest and consumer law to future lawyers.

In addition to his official activities, Green has been a prolific writer, has hosted radio talk shows, and has regularly appeared on radio and television, advocating for the public interest. He has published 22 books and countless articles in prominent publications. He is the host of the syndicated radio program *Both Sides Now With Huffington and Matalin*. He served as co-host with Ariana Huffington on the radio talk show *7 Days in America*. On television, he has been a frequent guest on CNN's *Crossfire,* duking it out with Pat Buchanan and Bob Novak; on William Buckley's *Firing Line*; and on *Hardball* with Chris Matthews.

Greenmail

Greenmail occurs when a publicly traded company is targeted by corporate raider(s) for a hostile takeover; however, the takeover is blocked by the purchase of the shares of the corporate raider(s) at a price premium. The takeover is thwarted by buying off the corporate raider.

The term *greenmail* is a neologism derived from its similarity to the practice of blackmailing. In blackmail cases, money is extorted from the victim as the price of silence. In greenmailing cases, money is extorted from the victim as a purchase of peace. Blackmail is illegal, but greenmail is legal. Green refers to the color of the currency of the U.S. government. Greenmail is a very effective, but very dirty, business tactic.

Greenmailing is very similar to blackmail because the victim in both cases is the victim of threats that can be removed by a payoff. In the case of blackmail, information could be revealed that would do serious damage to the reputation, finances, physical well-being, freedom, or something else that concerns the victim. In the case of greenmail, serious damage could occur if the corporate raider were successful in the takeover bid. Consequences could include firing the management, dissolution of the company, the loss of jobs for employees, or possibly diverting the company's cash and assets into other endeavors.

Corporate mergers and acquisitions have a long history. In the case of a single entrepreneurial company, the founder of the company may have reached retirement age and have no reason to continue in business, so he or she may consider it prudent to sell the company. A corporation may wish to sell off a portion of its business in order to focus on a core business or move into other businesses.

Corporate mergers and acquisitions by purchase occur on a regular basis. Some mergers or acquisitions are attempts at the takeover of a company that does not want to be acquired. These hostile takeovers may or may not be successful. Greenmail is a tactic used in some hostile merger or acquisition takeovers. Wealthy individuals or companies who engage in hostile takeovers in order to "loot" a company by acquiring its assets, to the detriment of the interests of other stockholders, are called corporate raiders.

Corporate Raiders

Corporate raiders target companies that are weak and inefficient for greenmailing. In this case, the corporate raider is a kind of predator. To raiders, the company is a desirable target for some reason. The intention of raiders in a great many mergers or acquisitions is not to operate the company but to dismantle it in order to sell its assets. Target companies may have low prices of their shares of stock because they are undervalued by the market. The target company's lower price may be because of its low return on investment compared to its large cash position, intellectual properties, or other valuable assets such as real estate. Consequently, the target company looks tempting to corporate raiders because it may be worth less on the open market as an entire enterprise than its various pieces would be worth if sold separately.

A company does not need to be undervalued for it to become the target of corporate raiders bent on greenmail; it just has to have enough shares on the open market to allow a serious hostile takeover attempt. When the corporate raider has acquired a large block of shares, the threat of a hostile takeover is made. The threatened takeover may be real or just a bluff. The threatened takeover is treated as real by the management of the target corporation. Fighting the takeover might be expensive, so the path of least resistance may be to agree to the terms of greenmail by purchasing back the company's shares at a premium above the current fair market price.

In the terminology that businesspeople use in the world of mergers and acquisitions, an expensive buyback of the target corporation's shares is called a bon voyage bonus, or it may be called a good-bye kiss. The payment is really a ransom of the company from a kidnapping attempt.

If a good-bye kiss deal is reached, the target company's management and the greenmailer may sign a confidential agreement to purchase the corporate raider's shares at a premium. In return, the corporate raider will agree to abandon the hostile takeover and to disappear for some period of time.

When greenmailing is successful, the target company is the loser. The shareholders' stock shares lose value because the overall value of their stock is reduced by at least the premium paid to thwart the predatory raid. The stockholders are also losers because the management and employees who allowed to the company to become vulnerable to a hostile takeover attempt are left in place. This means that the weaknesses of the company may not be addressed, which does not help share values.

Corporate raiding flourished in the 1980s. Raiders would seek to acquire corporate voting rights in order to achieve goals such as replacing top management, reducing company operations, liquidation of the company, or some other goal. However, the management of large, publicly held corporations developed countermeasures to defend against hostile takeovers. The defensive measures included golden parachutes (expensive retirement packages for the top management), seeking a "white knight" (a friendly purchaser), and increasing the company's debts in order to make it less attractive.

Examples of Greenmail

In the 1980s, Martin Lipton, a lawyer specializing in mergers and acquisitions, invented the "poison pill" tactic for thwarting hostile takeovers. It is an agreement that the board of directors of a company uses when facing a takeover to make the company's stock too expensive to acquire. There are several variations of this tactic. In the "flip-over" poison pill tactic, current shareholders are given the option of purchasing the bidder's shares at a discount after the takeover, which devalues the raider's stock and dilutes its stake in the company. The management dilutes the values of shares by offering shares to investors at a discount, making it too expensive for the raider to gain control. Many shareholders may oppose the management's fight against the corporate raider because it is in their interest to sell their shares at a premium.

One well-known corporate raider of the 1980s was T. Boone Pickens. He gained notoriety when he led his company, Mesa Petroleum, in a number of takeover plays. He claimed that corporate oil had adopted a "no-risk mentality" that needed to change; so, he sought undervalued companies for restructuring. He was accused of radicalism, of ignorant meddling, and of other "offenses." However, he was able to use restructuring, which had until then been used mainly in bankruptcy in order to shake out money for all stockholders, including himself. In 1984, he attempted to gain control of Gulf Oil; however, that company found a white knight in Chevron. Pickens's Mesa Petroleum still made $404 million from the play.

During the struggle, Gulf offered Pickens greenmail, but he held out for all stockholders.

Other corporate raiders include Sir James Goldsmith, Carl Icahn, David Murdoch, and Rupert Murdoch. Goldsmith was paid $90 million in greenmail by Goodyear Tire and Rubber Company. Occidental Petroleum Company paid greenmail to David Murdock in 1984. His shares (5 percent of the company) were purchased at $40.10 per share; the market price was $28.75.

St. Regis Paper Company was twice the target of hostile acquisition attempts. Sir James Goldsmith led a group that acquired 8.6 percent of the company at an average of $35.50 per share. St. Regis Paper agreed to pay this group a premium price of $52 per share, for a profit of $51 million. As soon as St. Regis's management paid greenmail to Goldsmith, the company was hit by a second hostile takeover attempt, led by Rupert Murdoch. It found a white knight in Champion International, which acquired the company in a friendly takeover. Murdoch still made a profit when he sold his shares to Champion.

Changes in federal and state laws in the 1990s reduced the ability of corporate raiders to exact greenmail. The federal tax code imposes a 50 percent tax on greenmail profits. In recent years, greenmailers have been called *activist shareholders*.

Greenpeace

Greenpeace is one of the major international environmental nongovernmental organizations (NGOs), with 2.8 million members worldwide and national and regional offices in 41 countries. Its missions are to change the attitudes and behavior of governments, multinational corporations, and the general public; to protect and conserve the environment; and to promote peace.

Greenpeace International (formally called Stichting Greenpeace Council), the governing body of Greenpeace in Amsterdam, the Netherlands, mostly coordinates global Greenpeace policies and strategies formulated at an annual meeting. Seven members of the board of directors of Greenpeace International reflect the global nature and diverse regions that Greenpeace activism covers. Greenpeace is an independent organization. It does not solicit contributions from governments or corporations. Its income is from voluntary donations from individuals and foundation grants.

In 1969, an ad hoc citizen's group in British Columbia, Canada, formed the Don't Make a Wave Committee (DMWC), the predecessor of Greenpeace, to launch a campaign against nuclear testing. DMWC set sail on a boat, the *Phyllis Cormack*, to Amchitka to "bear witness" (a Quaker tradition of silent protest) to U.S. underground nuclear testing. In 1971, DMWC was renamed Greenpeace, which unites antiwar movements (peace) and ecology movements (green). The tradition of bearing witness in a nonviolent manner remains the foundation for Greenpeace activism to this day.

Since its initial campaign, Greenpeace's activism has been global. Over time, it has diversified to include all threats to the planetary ecosystem, such as climate change, overfishing, the destruction of forests, the extinction of endangered species, toxic dumping, chlorofluorocarbons, and genetically modified organisms (GMOs). While mainstream environmental organizations primarily use an institutionalized mechanism, such as lobbying, Greenpeace is more action oriented but also engages in science-based lobbying. Greenpeace confronts governments and corporations that engage in environmental wrongdoing with direct and nonviolent actions to expose wrongdoing and to sensitize citizens. It collects and disseminates data on nuclear weapons, ocean dumping, electronic waste, and genetically modified organisms (GMOs). For example, Greenpeace tracks ships loaded with nuclear weapons and alerts host countries of the presence of the nuclear weapons when the ships dock in their jurisdictions.

The activities of Greenpeace are eye-catching in order to attract wider media coverage and to publicize issues. Greenpeace hung its first campaign banner on 12 billboards throughout Vancouver with the message, "Ecology? Look it up! You're involved." Its antiwhaling campaign has become the staple of Greenpeace activism. Greenpeace activists steer small rubber inflatable boats between the harpoon guns of whaling vessels and their prey. Greenpeace's confrontational tactics have invited retaliation. In 1980, Spain seized the *Rainbow Warrior,* a Greenpeace ship, because of the ogranization's frequent interference with its whaling. In 1985, French intelligence sunk the *Rainbow Warrior*, which had been used to obstruct French nuclear testing in the South Pacific since the 1970s, while the ship was berthed in Auckland, New Zealand. The sinking resulted in the death of a Greenpeace photographer.

Greenpeace has contributed to the establishment of some international treaties, including a comprehensive atmospheric nuclear test ban treaty. Since the early 1980s, Greenpeace has been active in the Conference of the Parties to the London Convention, the international treaty governing ocean dumping. Greenpeace lobbies at international negotiation conferences. It is part of the Climate Action Network, the Pesticide Action Network, and the International Persistent Organic Pollutants Elimination Network. Greenpeace has been a force behind the creation of international environmental agreements governing global chemical policy, including the 1989 Basel Convention on the Control of Transboundary Movements of Hazardous Waste and Their Disposal, the 1998 Rotterdam Convention on the Prior Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade, and the 2001 Stockholm Convention on Persistent Organic Pollutants. During the negotiation of the Basel Convention, Greenpeace provided a coalition of countries—many African and other developing countries—with information on north–south hazardous waste trade, and it advocated a complete ban.

Greenpeace has been involved in numerous global campaigns against corporate crimes such as industrial disasters. It launched the International Campaign for Justice Against Dow Chemical in Bhopal with survivors of the 1984 Bhopal disaster in India, one of the world's worst industrial disasters. Greenpeace is also an active participant in the campaigns against Exxon and British Petroleum for their oil spill disasters (e.g., the *Exxon Valdez* and Gulf of Mexico oil spills). In terms of hazardous waste, Greenpeace has been pressuring electronics manufacturers and apparel companies to eliminate hazardous substances (e.g., toxic dyes) from their products or their production processes. Greenpeace has also targeted food giants. It led the anti-GMO campaign against Gerber Baby Food in the late 1990s. The anti–Kit Kat campaign against Nestlé in 2010 aimed to protect rain forests in Indonesia by eliminating the use of palm oil.

Gulf of Mexico Oil Spill

On April 20, 2010, an explosion on the Deepwater Horizon drilling rig in the Gulf of Mexico was the start of one of the largest economic and environmental disasters in U.S. history. The rig, operated by BP (formerly British Petroleum), was drilling for oil in the exploratory Macondo well

U.S. Coast Guard platform supply vessels battle the blazing remnants of the offshore oil rig Deepwater Horizon, April 20, 2010. In the aftermath, BP pledged a $20 billion trust to compensate individuals and businesses that had suffered directly.

in 5,000 feet of seawater and below, to a depth of some 13,000 feet. The explosion killed 11 crew members and injured 17 others. It took until September 19 for the well to finally be capped, and in the interim, an estimated 200 million barrels of oil flowed into the gulf; some 320 miles of Louisiana coastline had been contaminated, and a slick of over 80 square miles was visible on satellite images from space. The disaster can usefully be divided into three main components: first, the events and equipment that led to the physical blowout; second, the protracted efforts to stem the flow of oil and seal up the well; and third, the cleanup and compensation efforts.

The Deepwater Horizon rig was owned by a company called Transocean and leased by BP and two other companies (Anadarko Petroleum and MOEX Offshore); BP had overall operation control, with a 65 percent share of the Macondo Prospect. The National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling drew upon the inquiry to the *Columbia* space shuttle disaster, claiming that "complex systems almost always fail in complex ways" to describe the chain of events that led to the Deepwater Horizon explosion. Open water oil exploration is a hazardous enterprise. However, preliminary conclusions from the commission suggested that a "culture of complacency" existed within BP (and its main contractors). In addition, this extended to the oil exploration industry and even as far as the regulators and government bodies responsible for permitting and overseeing these operations. These concerns ranged from the physical drilling through disaster-relief responses.

Cause and Aftermath

The main cause of the blowout was still under investigation more than two years after the initial explosion. As the main operator of the Deepwater Horizon rig, BP is primarily accountable, although Transocean (the rig's owners) and Halliburton (responsible for cementing the well), as well as two other companies, are also implicated. Much of the debate surrounds the failure of one specific component: the Blow-Out Preventer (BOP), made by Cameron International. The Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) and the Coast Guard published a report on March 23, 2011, which suggested that overall loss of control of the well had caused the failure of the BOP.

In its investigation, BP accepted that there were some issues that preceded the failure of the BOP, and that these began when the incorrect cement was injected into the well by Halliburton, a charge it denies. The commission, while unable to report on the ultimate significance of the BOP at that point, made some broader claims against BP, its contractors (principally Transocean and Halliburton), and the industry as a whole. It reiterated that their inquiry revealed "systematic failures in risk management [which] place in doubt the safety culture of the entire industry." It also claimed there was a "business culture [that had] succumbed to a false sense of security" with the Deepwater Horizon blowout the result of "recurring themes of missed warning signals, failure to share information, and a general lack of appreciation of the risks involved."

In the aftermath of the disaster, BP pledged $20 billion (in the Deepwater Horizon Spill Trust) to provide compensation to individuals and businesses that had directly suffered as a result of the spill. Despite claims of complacency on behalf of BP, on March 3 (less than three weeks after the initial explosion), the company reached a settlement with the Plaintiff's Steering Committee (PSC) acting on behalf of individuals and businesses in the Multi-District Litigation proceedings (MDL 2179). This constituted an initial $2.3 billion to settle economic loss claims, and it is estimated that it could run as high as $7.8 billion. By the end of 2011, BP estimated that it had spent a total of $14 billion in compensation, cleanup, and associated response activities. This does not include civil penalties brought by the U.S. government under the Clean Water Act and Oil Pollution Act, which amounted to $4.5 billion, the largest criminal fine in U.S. history.

In 2012, the U.S. Department of Justice filed the first criminal charges against a BP engineer, Kurt Mix, who was charged with two counts of obstruction of justice after allegedly trying to delete text messages between himself and his supervisor. According to the Federal Bureau of Investigation, these texts related to the fact the "top kill" efforts were not succeeding as was played out in the media by BP Chief Executive Tony Hayward, who was replaced by Bob Dudley in late 2010.

Gulf Oil Corp.

Around the turn of the 20th century, oil was discovered in Spindletop, Texas. The Gulf Oil Corp. was established in 1901 to exploit that oil, with William Larimer Mellon, Sr., at the company's helm. By 1979, Gulf Oil had become the ninth-largest oil company in the United States. In 1985, Gulf Oil was merged into Standard Oil, ultimately becoming Chevron within the United States. In the 1970s, in the midst of the Watergate investigation that made the entire nation more aware of political scandals and illegal campaign contributions by large corporations, Gulf Oil became the focus of a federal investigation concerning a secret slush fund that was used to influence politicians in the United States and abroad. Gulf Oil's activities played a major role in subsequent campaign finance law reforms and in the passage of the Foreign Corrupt Practices Act of 1977.

Political Persuasion

In 1971, Congress passed the Federal Election Campaign Practices Act (FECA) in an attempt to limit illegal campaign contributions and mandate reporting of contributions to individual politicians and national parties. With FECA set to go into effect in 1972, Richard Nixon's Committee to Re-Elect the President (CREEP) began scrambling to cover up illegal contribution activities. When the Watergate scandal broke, federal investigators began paying close attention to political contributions from large multinational corporations, particularly those from oil companies. Public attention was also focused on the issue in response to columnist Jack Anderson's announcement that International Telephone and Telegraph was sponsoring the Republican National Convention. By 1973, investigators were looking into an alleged $10 million slush fund operated by Gulf Oil. Four separate investigations into Gulf Oil's activities were opened over the next two years as the investigation gained steam.

Investigators learned that Gulf Oil had a long history of political contributions, including an alleged donation to Vice President Lyndon B. Johnson in 1961. Gulf Oil contributed $150,000 to support various politicians in the 1972 elections. At least $100,000 was given to the Nixon campaign. Some $15,000 went to the campaign of Congressman Wilbur Mills (D-Arkansas) and another $10,000 to Senator Henry M. (Scoop) Jackson (D-Washington). Other politicians receiving money from Gulf Oil included Senator Fred Harris (D-Oklahoma), Senator Hugh Scott (R-Pennsylvania), and Congressman Richard Roudebush (R-Indiana). The guiding force behind those contributions was Claude C. Wild, Jr. Based in Washington, Wild was Gulf Oil's chief lobbyist. Convinced that Gulf Oil needed more political leverage, in 1959, W. K. Whitehead, then chief executive officer of Gulf Oil, had created the Bahamas Exploration Company in Nassau. It was a dummy company created for the purpose of using the slush fund to hide Gulf Oil's political activities and launder money that flowed into the fund. The existence of the fund was never known by the Mellon family.

Gulf Oil also involved itself in foreign elections. Bob Dorsey, the head of Gulf Oil, acknowledged during the investigations that he had contributed millions of dollars to political parties in other countries. *Time* magazine reported that Gulf Oil paid $1 million to the ruling Democratic Republican Party of South Korea in 1966 and another $3 million in 1971 to meet political demands for funding. Some $460,000 was channeled to Bolivian politicians, and Gulf Oil donated a helicopter to dictator General René Barrientos. Another $50,000 was donated to politicians in Beirut. Parties in developed nations also benefited from Gulf Oil's largess, with some $4 million earmarked for politicians in Italy, Sweden, Canada, and Turkey. By the time the slush fund was eradicated, it had channeled some $13 million to various politicians.

The investigation also demonstrated Gulf Oil's susceptibility to political persuasion. The company unwillingly sponsored a rebroadcast of the wedding of Tricia Nixon to Edward Cox at the urging of Nixon aide Charles Colson. Gulf Oil contributed $10,000 to the campaign of Republican Senator Mark Hatfield of Colorado when asked to do so by the government of Kuwait. During the Watergate investigation, which brought down the presidency of Richard Nixon, Gulf Oil was accused of having contributed to the campaigns of all members of the Watergate Commission except for Chairman Sam Ervin (D-North Carolina).

Once Gulf Oil's illegal activities came to light, politicians returned illegal campaign money. Critics complained that Gulf Oil got by with only a few slaps on the wrist. Wild was forced to pay a fine of $1,000, and Gulf Oil was fined $5,000. Bob Dorsey was ousted. Even as Gulf Oil began to rebuild its damaged reputation, new scandals arose over the company's involvement in a uranium price-fixing cartel between 1972 and 1975 and the bribing of an Internal Revenue Service agent. In the latter case, Fred W. Standefer, vice president for tax administration, and Joseph F. Fitzgerald, tax compliance manager, were charged with paying Cyril J. Niederberger, who was conducting an ongoing IRS audit, $3,300 to send him and his family on five vacation trips, in return for ignoring Gulf Oil's tax liabilities during the slush-fund era (1959–74). All three men were subsequently indicted, and Gulf Oil pleaded guilty to tax fraud and paid a fine of $36,000.

H

Halliburton Co.

Halliburton Co. is a Houston-based oil and gas company that began in 1920 when Erle Palmer Halliburton of Tennessee popularized an oil extraction method known as oil well cementing. Since then, the company has diversified to include technical products and services for petroleum and natural gas exploration and development as well as the engineering and construction of refineries, pipelines, and chemical plants. Halliburton has operated in over 70 countries, with hundreds of divisions and more than 60,000 employees worldwide.

Halliburton and one of its former subsidiaries, Kellogg Brown-Root (KBR), has continually come under government and public scrutiny for incidents involving special treatment in government-issued contracts, unfair political influence, cronyism, bribery, security and tax issues, and environmental incidents. It has been said that Halliburton illustrates the sometimes murky and questionable connection between private corporations, military interests, and government.

Controversies and Questionable Connections

The Halliburton Company diversified its products, rode the ups and downs of the oil industry, and expanded globally over the years, even in countries considered adversaries of the United States. The early 1990s found Halliburton facing violations of federal trade barriers in both Iraq and Libya and being penalized with over $2 million in fines and penalties.

In 1995, Dick Cheney (former U.S. secretary of defense under George H. W. Bush) served as Halliburton's chief executive officer (CEO) and president. Several years later, Halliburton underwent a multibillion-dollar merger with Dresser Industries, which included KBR, and almost automatically became one of the world's largest service providers for the oil industry. Its two primary business interests were its energy services group and its engineering and construction interests. Cheney retired from Halliburton in 2000, reportedly with a $36 million severance package, to become the presidential running mate to Republican and Texan George W. Bush. It is reported that under Cheney's tenure as CEO, the number of Halliburton subsidiaries housed in offshore tax havens increased from nine to 44 between 1995 and 1999.

After Cheney's departure from Halliburton, David Lesar became the company's new CEO and had to face the mounting asbestos claims that had been plaguing it—as well as a newly implemented investigation by the U.S. Securities and Exchange Commission (SEC). The total of 474,000 asbestos claims against Halliburton dated back to the 1970s. In the early 2000s, Halliburton agreed to

A cementer with Halliburton Co. discusses what transpired aboard Deepwater Horizon during a joint investigation hearing held by the U.S. Coast Guard and the U.S. Minerals Management Service in Kenner, Louisiana, May 28, 2010.

pay over $4 billion to settle all claims in exchange for protection against any future asbestos litigation. In 2002, the SEC investigated Halliburton because of changes in its accounting practices that were not reported to shareholders or the SEC for more than a year's time and involved possible inflated cost overrun claims. In the following year, Halliburton noted in SEC filings that one of its major subsidiaries, KBR, was involved in bribing a Nigerian official with over $2 million so that Halliburton could receive preferential tax treatment.

Halliburton also faced scrutiny after accusations of special treatment in government defense contracts began to surface. Civilian chief contracting officer Bunnatine Greenhouse complained publicly on several occasions that Halliburton and its subsidiaries, managed by Cheney before he became vice president, were illegally receiving special treatment for work that the company conducted in Iraq, Kuwait, and the Balkans. KBR was reportedly awarded more than $16 billion in government contracts for work in the Middle East between 2004 and 2006, including the largest contract ever given during the Iraq War: the Logistics Civil Augmentation Program. Critics say that some of these defense-related contracts not only cost far less to complete than estimated but also may have included no-bid contracts. The U.S. Department of Justice (DOJ), the Federal Bureau of Investigation (FBI), and the inspector general opened a criminal investigation into the accusations. In 2009, Halliburton resolved the DOJ investigation through a nonprosecution agreement in which Halliburton and KBR agreed to cooperate with the investigation and pay over $400 million in criminal fines. Halliburton also agreed to pay the SEC $177 million and allow for an independent entity to conduct a 60-day (and after one year, 30-day) evaluation of Halliburton's recordkeeping and bribery/foreign agent controls.

More recently, a former Halliburton employee, Jamie Leigh Jones, testified in a 2005 congressional hearing that she had been gang-raped by numerous KBR co-workers and falsely imprisoned for 24 hours in a shipping container while working for KBR in Iraq. While the 5th Circuit Court of Appeals ruled in favor of Halliburton in 2009, the incident added to the increasingly negative public perception of Halliburton in the eyes of American watchdog groups and the public. Critics have also implicated Halliburton as a partly responsible subcontractor involved in the Deepwater Horizon (or BP) oil spill of 2010.

Since 1995, there have been at least 10 incidents involving some type of Halliburton corporate misconduct that have resulted in settlements of more than $790 million, not including Halliburton's subsidiaries (particularly KBR), which account for another 22 incidents. In 2007, Halliburton sold all of its shares in KBR. Halliburton continues to be watched by critics for any involvement in the hazy connection between private companies, military interests, and governments.

Hart-Scott-Rodino Act

Half a century before Edwin Sutherland coined the term *white-collar crime,* the U.S. government formally recognized the fact that corporations can, and do, engage in abusive acts. The Sherman Antitrust Act of 1890 was one of the first pieces of legislation in the United States to deal with the problem of monopolistic practices by corporations. Since that time, the various statutes that constitute antitrust legislation in the country have proliferated into one of the most widely recognized bodies of legislation aimed at illegal corporate behavior. The Hart-Scott-Rodino Antitrust Improvements Act of 1976 (HSR) was developed to revise existing antitrust statutes in order to improve the government's ability to regulate corporate mergers, in an attempt to prevent anticompetitive practices. HSR mandates that the federal government be given advance warning (typically 30 days) of a corporation's intent to merge with another corporation. However, not every corporate merger falls under these requirements because the act only applies to publicly traded firms proposing a merger that exceeds a specified economic size. Currently, this size is approximately $65 million in transaction value.

The ultimate purpose of HSR is to prevent anticompetitive mergers that would have a significant and detrimental impact on consumers and the market. Prior to the enactment of HSR, the federal government had long recognized the serious negative consequences of anticompetitive mergers. However, its enforcement efforts were restricted to evaluating the impact of the merger post-transaction. This approach had the potential to create serious issues for consumers, the market, and the corporations involved in the merger. It is rather difficult to break up a completed merger and return the original corporations, stockholders, and other stakeholders to their "whole," pre-merger positions. Rather than taking a retroactive approach, HSR moves merger oversight into a forward-looking position. This means that regulatory agencies can prevent mergers that would create anticompetitive market conditions. As such, consumers, stockholders, stakeholders, and the market are spared from having to deal with the chaos of breaking up an anticompetitive merger, and the federal government can proactively deal with anticompetitive corporate practices.

After the passage of HSR, the Federal Trade Commission (FTC) and the U.S. Department of Justice (DOJ) established standards by which to judge the fairness of any proposed merger. Upon receiving notification of intent to merge, the FTC examines the proposed merger as outlined by the involved companies to determine what the impact of the merger might be within the market. The ultimate factor that the FTC uses in determining whether the merger may lead to an anticompetitive situation, and should therefore be challenged, is the postmerger change in the Herfindahl-Hirschman Index (HHI). The HHI takes the market share for every corporation within an industry, squares each respective firm's value, and then adds these values to get the total industry HHI score. This concentration ratio is used because it reflects how market share is distributed within a particular industry. Squaring the value of each firm's market share places greater weight on market leaders, companies that have more power and control within the industry. In determining the impact of the potential merger, the FTC will compare the postmerger HHI to the premerger HHI.

Depending upon the premerger HHI, an increase of 50 or 100 points or more would signal a significant change in the concentration of power in that industry. Should a merger meet or exceed these thresholds, the FTC would attempt to block the merger. Typically, when the FTC challenges a proposed merger, it works through negotiations and consent decrees to enforce its ruling. Taking a more cooperative approach with corporations leads to situations where the FTC can avoid extensive legal procedures. However, there are times when proposed mergers reach and exceed the stated threshold of industry concentration, yet the merger is still allowed to progress. Once the FTC makes a determination that a merger should be blocked, the involved companies have the ability to argue that the merger should continue. There are many legitimate reasons why the FTC would allow a merger under these circumstances to be completed, the chief of which may be that such a concentration within the industry would actually present benefits to consumers.

Hartung-Burgess Debate

Criminologist Edwin Sutherland made it clear that white-collar crime would always be difficult to study. Whereas the study of violent and common crimes is aided by the existence of accepted, official databases full of valuable information, no similar collections of facts are available for those studying white-collar crimes. Since it is largely impossible to compile such data individually, many researchers began utilizing case-study methods. The case study is different from traditional social sciences. There is not a large sample of criminals and crimes from which researchers can test predisposed theories. Instead, case studies use a detailed examination of a single case to explain it as thoroughly as possible.

Regulatory Violations as White-Collar Crime?

In the fledgling field of criminology, case studies figured greatly in the work of criminologist Frank Hartung and the subsequent critiques by sociologist Ernest Burgess. Hartung focused his white-collar crime research on the meatpacking industry in Detroit during World War II, examining both the offenses and the offenders in an effort to truly understand what was occurring within the plants. The main question for Hartung was whether violations of wartime regulations could be considered as white-collar crime. He argued that they could, largely believing that individuals who committed such violations were also white-collar criminals. The evidence within his case studies only validated his beliefs. Yet the idea that someone could be labeled a white-collar criminal for merely opting to not follow special government regulations did not sit well with many.

Whereas some found value in Hartung's contribution to this newly developing field of study, Burgess—a prominent sociologist at the time—levied considerable criticism at the findings of Hartung's research. Working from the perspective of the Chicago School, Burgess felt that wartime regulatory violations did not qualify as white-collar crimes. More important, he strongly disagreed with referring to such perpetrators as criminals. When discussing Hartung's examination of the Detroit meat industry, Burgess claims that while violations did occur, they were code violations. Administrative actions were misguided and health ordinances were ignored, but to Burgess, these were not serious enough offenses to be labeled as crimes—or at the least, the offenders do not merit being labeled as criminals. The primary explanation offered by Burges is that the offenders do not see themselves as being criminals since new administrative laws turned previously status-quo operating procedures into violations of the law. Further, Burgess argues that society at large is not in a hurry to condemn the violators for committing criminal acts and, if those who violate regulations (whether traffic, administrative, or health) are labeled as criminals, then the criminal population will vastly outnumber the noncriminal population in the country.

Simply put, Burgess urged that because these "violators" did not perceive themselves as criminals, society should not either. More poignantly, Burgess attacked the overall validity of Hartung's assertions. With over half of the country (per Burgess's estimates) violating wartime regulations, it becomes impossible to view such a large number of Americans as white-collar criminals.

Hartung was led into a rather pointless debate over whether half of the U.S. adult population participated in the black market, whether wartime regulations had public support, and whether sentencing procedures favored the white-collar offender. These are important questions, but they ignore the larger element of the dispute: whether white-collar criminals who do not consider themselves criminals and are not regarded as such by society should be considered criminals within this newly emerging field. In this sense, the central findings of this debate in retrospect are clear: Whereas Hartung used a strictly legal lens in determining illegality, Burgess went further and considered only those actions that arouse a strong negative sentiment from members of the general public as criminal. In the case of wartime regulation violations, Burgess simply did not see people angry with the offenders.

Hayward, Tony

Anthony (Tony) Bryan Hayward (1957–) was the chief executive officer (CEO) of British Petroleum (BP) at the time of the Deepwater Horizon explosion. A lifelong BP employee, Hayward was intensively mentored by his predecessor, Lord John Browne, who was forced to relinquish his position as CEO after a series of fatal accidents at BP facilities. While many of the problems at the company predated Hayward's tenure as CEO, he nevertheless instituted company policies that encouraged the reckless pursuit of profit at the expense of safety, ultimately contributing to the blowout of the Macondo well. Hayward resigned from his position at the company following a series of embarrassing public remarks and was replaced by Robert (Bob) Dudley.

After earning a Ph.D. in geology from Edinburgh University, Hayward began his career at BP in 1982 as a rig geologist in Aberdeen. He quickly rose up the company ranks and, by 1992, he had become the head of exploration in Colombia, later relocating to Venezuela in 1995. During his time in Latin America, his main role was to improve BP's image and generate support for the company's prospects in the region. Hayward also spent time working in other countries, including England, China, Canada, and Papua New Guinea. In 2003, he became head of BP's exploration and production sector, responsible for drilling offshore wells such as Macondo. Closely mentored by his predecessor, John Browne, Hayward was part of a small group of rising executives that included John Manzoni (head of BP's refinery division) and Bob Dudley (head of BP's joint Russian venture). Often inaccurately attributed to the Teenage Mutant Ninja Turtles, Browne referred to the trio as his "turtles" because they traveled everywhere with him, which required them to live with their homes on their backs. This intensive training ensured that Browne's policies of decentralization, outsourcing, and cost cutting would continue beyond his reign, through Hayward's term as CEO.

In the years leading up to the Deepwater Horizon disaster, the company experienced numerous accidents at its facilities, including a fatal explosion at the Texas City refinery in 2005 and multiple oil spills at the Prudhoe Bay production facility in 2006. Investigations into the incidents identified budgetary pressure from executive management and aggressive cost cutting as contributing factors in deteriorating safety conditions. With his record tarnished by these accidents as well as a scandalous tabloid story, Browne was forced to resign and was replaced by Hayward on May 1, 2007.

While many of the problems at the company existed before Hayward became CEO, he nevertheless helped perpetuate a corporate structure that put short-term financial goals ahead of the health and safety of employees. Upon his appointment, Hayward promised to reform BP's safety culture, but it was difficult for the new CEO to institute change. As stock prices stagnated, Hayward was pressured to institute budget cuts across the company. Following in Browne's footsteps, he reduced layers of management and oversight in an effort to make the company more efficient. Furthermore, he instituted a system of bonuses linked to drilling timetables that motivated managers to complete projects below cost and ahead of schedule, often at the expense of safety.

In contrast to Browne, who relished his celebrity status in the United Kingdom, Hayward did not perform well in public and struggled to convey the right message, even in prepared statements. As the spill continued to wreak havoc on the Gulf of Mexico, Hayward repeatedly made inappropriate remarks to the media, which conveyed the image that BP was not treating the incident seriously. For example, he was photographed sailing his private yacht off the Isle of Wight, which elicited public criticism. Moreover, dismissing the size of the spill, Hayward remarked that the oil spill was "relatively tiny" in comparison to the "very big ocean."

When attempting to publicly apologize to the residents of the gulf for the damage and disruption caused by the spill, he remarked, "I would like my life back." Following these statements and BP's inability to bring the Macondo well under control, members of the U.S. Congress and President Barack Obama suggested that Hayward should be fired because of his poor handling of the disaster. In late June, the company announced that Bob Dudley would become the next CEO, yet it was not until October 1, 2010, that Hayward officially stepped down.

Hazardous Waste

Hazardous waste, or discarded material harmful to human or environmental health when improperly managed, was not regulated in the United States until the 1970s. During that decade, Congress passed a number of statutes to oversee the generation, transportation, and disposal of hazardous material. The need for such legislation was underscored by high-profile incidents illustrating the devastating health and environmental effects of improper management and dumping of hazardous waste. Though regulations governing hazardous waste might be most effective if derived from scientific investigation, the processes of establishing oversight remain highly politicized.

According to the Solid Waste Disposal Act of 1965, solid waste includes garbage, refuse, or sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility. It can also include discarded solid, liquid, semisolid, or contained gaseous material that derives from industrial, commercial, mining, and agricultural operations, or from community activities. Hazardous waste refers to any solid waste (not necessarily in a solid state form) that has the potential to cause fatalities or threaten human or environment health when not properly managed.

The Environmental Protection Agency (EPA) identifies four primary categories of hazardous waste: listed, characteristic, universal, and mixed wastes. Listed wastes are substances known to be hazardous by the EPA and are delineated on three lists: the F-list, which includes wastes from common manufacturing and industrial processes; the K-list, which outlines wastes from specific industries, for example petroleum refining; and the P- and U-lists, which itemize wastes from commercial chemical products.

Some wastes may not be included on one of the lists but exhibit ignitability, corrosivity, reactivity, or toxicity. Ignitable wastes, such as oils and solvents, under certain conditions create fires, are spontaneously combustible, or have a flash point of less than 140 degrees F. Corrosive wastes, like battery acid, can destroy metal containers such as storage barrels, drums, and tanks. Unstable under standard conditions, when heated, compressed, or mixed with water, reactive wastes can cause explosions, toxic fumes, and gases. If toxic wastes are ingested, they can be harmful or fatal; if dumped, toxic waste can pollute the supply of groundwater. Batteries, bulbs, pesticides, and mercury-containing equipment are classified as universal waste, while mixed waste includes both radioactive and hazardous features.

Hazardous waste may be generated by commercial or industrial activities, but households can also generate hazardous waste such as batteries, paint, and pesticides. Among industries regulated by the EPA, chemical, petroleum, and coal products manufacturing account for approximately 85 percent of recorded hazardous waste. The federal government, primarily the Department of Defense, Department of the Interior, and Department of Energy, create millions of tons of hazardous waste each year. Entities emitting hazardous waste are assigned a category based on how much hazardous waste they generate each month. Large-quantity generators, among them pharmaceutical companies and chemical manufacturers, produce more than 1,000 kilograms a month. Small-quantity generators, such as a small print shop, a dry cleaner, or a diagnostic lab, create 100 to 1,000 kilograms a month and are allowed to accumulate 6,000 kilograms of hazardous waste, and conditionally exempt small-quantity generators (e.g., a dental office) create less than 100 kilograms of hazardous waste a month, and are subject to only minimal requirements.

Hazardous Material Legislation

To protect health, property, and the environment that might be endangered because of the risks of shipping hazardous material, Congress passed the Hazardous Material Transportation Act in 1975, which was amended by the Hazardous Materials Transportation Uniform Safety Act of 1990. The federal hazmat law, which applies to movement of cargo by land, sea, or air, gives the secretary of transportation authority to designate certain substances as hazardous and to specify the designated packaging and labeling required for each category of hazardous material. The act also addresses emergency preparedness and response to accidents involving hazardous material. Several agencies within the federal government share enforcement authority and are authorized to levy civil or criminal penalties for violations.

Enacted in 1976, then amended in 1980 and 1984, the Resource, Conservation, and Recovery Act (RCRA) authorized the EPA to regulate hazardous material at each point in the waste cycle, including generation, recycling, transportation, treatment, storage, and disposal. RCRA established a tracking system that generators must use to track material from generation to final disposal. Additionally, the EPA or the relevant state agency must issue a permit to any facility before it can treat, store, or discard hazardous waste. To ensure compliance with RCRA regulations, transfer-storage-disposal facilities are inspected at least once every two years, and state and federal facilities are inspected annually. Inspectors audit company records, evaluate the operating methods, take waste samples, and verify that the facility is using established groundwater monitoring techniques and proper handling and labeling of waste material. If a facility is found noncompliant, the EPA or state agency can enforce the regulations through civil or criminal penalties, orders to correct any violations, fines, and possibly imprisonment. The corrective action program enables the EPA to require companies to clean up any hazardous waste contamination.

Passed in 1980, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as the Superfund, imposed a tax, which expired in 1995, on the chemical and petroleum industries and empowered the federal government to respond directly to releases or threatened releases of hazardous substances. The $1.6 billion collected in taxes was placed in a trust fund used to clean abandoned or uncontrolled hazardous waste sites when no responsible party could be identified. When parties responsible for the discharge are known, CERCLA establishes liability. In 1986, the Superfund Amendments and Reauthorization Act (SARA) incorporated new enforcement authorities and settlement tools, increased state involvement in the program, encouraged more citizen participation, and increased the size of the trust fund.

Love Canal, in Niagara Falls, New York, was one of the earliest Superfund sites. Between 1947 and 1952, Hooker Chemical Company buried approximately 22,000 tons of 80 different chemicals. After Hooker stopped using the site, it sold the property for $1 to the Niagara Falls School Board. In 1955, an elementary school opened on the site, and the surrounding area became home to hundreds of families. After heavy snow and rainfall in 1975 and 1976, corroding waste drums broke through the surface of the landfill, contaminating surface water and oozing into basements. Children and pets experienced burns after being outside. Residents around the canal were evacuated, and it took 21 years and $400 million to declare the site clean. Women exposed to the contaminants had a high rate of miscarriages, and children of former Love Canal residents experienced elevated incidents of birth defects.

The Clean Air Act of 1963 was the first federal legislation to address the need to regulate air pollution. In 1970, amendments to the Clean Air Act created emission standards. Additional amendments in 1977 and 1990 strengthened the provisions in the act, with the 1990 amendment increasing enforcement authority and establishing a program to eliminate chemicals that damaged the Earth's atmospheric ozone layer.

With growing public concern over water pollution, Congress passed the Clean Water Act in 1972. The act protects the nation's waterways, including coastal areas, lakes, and rivers. Using comprehensive standards and financial assistance, the Clean Water Act addresses causes of pollution and poor water quality, namely municipal and industrial wastewater discharges, polluted runoff, and habitat destruction. The act outlines

Divers from the Environmental Protection Agency retrieve microextraction devices, which absorb contaminants over a period of time, for measuring toxins at a former creosote manufacturer Superfund site at Puget Sound, Washington, October 2, 2010.

performance standards that municipalities and companies must meet to reduce pollutants, provides funding to states and communities to improve water infrastructure, and issues permits to ensure environmentally sound development that has minimal negative effects on wetlands and aquatic habitats.

In 1974, Congress passed the Safe Drinking Water Act (SDWA) to safeguard public health by regulating the public drinking water supply. The original act focused on treatment of the water supply, but amendments to the act in 1986 and 1996 emphasized protection of drinking water, along with its myriad sources: groundwater wells, lakes, reservoirs, rivers, and springs. The nation's water supply can be contaminated by chemicals, animal waste, human sabotage, pesticides, and waste products injected underground. The SDWA attempts to minimize these risks by setting standards for drinking water, emphasizing source water protection, enhancing operator training, funding improvements to the system's infrastructure, and disseminating public information. When water systems fail to meet established standards, the EPA has regulatory power to issue administrative orders, take legal action, or levy fines.

Titles I and II of the Marine Protection, Research, and Sanctuaries Act (MPRSA), also known as the Ocean Dumping Act, prohibits the transportation of sewage sludge or industrial waste from the United States with the purpose of dumping it in the ocean, proscribes U.S-flagged vessels or U.S. agencies to initiate from any location the transportation of waste with the purpose of dumping it in the ocean, and forbids dumping of material in U.S. territorial waters from any vessel originating outside the United States. Any deviation from these injunctions requires a permit issued by the U.S. Army Corps of Engineers, the standard for issuance that the dumping not unreasonably adulterate human health or the marine environment.

The Toxic Substances Control Act (TSCA) of 1979 empowers the EPA to collect information on both existing and new chemical substances and to regulate substances that might cause damage to human health or the environment at the production, use, and disposal stages through recordkeeping, reporting, and testing. Special provisions address asbestos, radon, and lead-based paint.

The Nuclear Waste Policy Act of 1982, as amended, requires the federal government to provide a permanent location to dispose of high-level radioactive waste and used nuclear fuel, overseen by the Nuclear Regulatory Commission (NRC), and for generators of the waste to pay the disposal costs. The Low-Level Radioactive Waste Policy Amendments Act of 1985 gives states the responsibility to dispose of low-level radioactive waste, with the option of collaborating with other states to create common facilities regulated by the NRC. The act also gives the NRC authority to establish guidelines for the amount of radionuclides in waste streams that are in concentrations or quantities low enough to be outside regulatory concern.

Hazardous Waste Minimization

The most effective way to manage hazardous waste is to reduce the amount that is generated. One of the most effective approaches is to substitute raw materials that create hazardous waste with those that create little to no waste. The cradle-to-cradle design philosophy advocated by William McDonough and Michael Braungart rests on this paradigm of using safe materials at the initial stages of the design process. Products receiving their Cradle-to-Cradle Certification achieve minimum standards on the toxicity level of the chemicals used in the manufacturing process. Waste minimization can also occur by changing or eliminating processes that produce hazardous wastes. For example, companies can utilize electronic, rather than mercury-based, thermometers or replace toxic cleaning products with nonhazardous options. Generators can reduce hazardous waste by recycling reusable elements such as solvents, acids, and metals. An inexpensive and easy method for reducing waste is practicing source segregation, so that hazardous waste and nonhazardous waste are kept separate by management practices that prevent the substances from coming into contact with one another. This simple tactic reduces disposal, handling, and transportation costs.

Any hazardous waste not recycled must be treated to reduce its toxicity. A common treatment and disposal method, incineration, requires permits and strict emission controls. Other treatments include neutralization, solvent extraction, and oxidation. Once treated, the waste must be discarded. Land disposal might be in a landfill, a surface impoundment, a double-lined depression, or an underground injection well. Waste piles, noncontained accumulations of hazardous waste, can be used if the material is solid and nonflowing. A final alternative is land treatment, a process in which hazardous waste is incorporated into the soil surface as microbes break down hazardous components. Despite the regulations governing treatment and disposal, waste sites are vulnerable to land and water contamination. Determining locations for hazardous waste sites is a difficult and controversial process.

Environmental Justice

Environmental justice requires that all citizens, regardless of race, color, national origin, or income, receive the same level of protection from environmental and health hazards, in addition to enjoying equal access to decision-making processes. During the Bill Clinton administration, an executive order required federal agencies to attempt to achieve environmental justice by identifying and modifying programs and policies that might disproportionately and negatively affect minority and low-income populations. These populations, however, often live in neighborhoods that house hazardous waste treatment, storage, and disposal facilities. Individuals in these communities tend to experience high rates of cancer, asthma, and reproductive issues.

While the constellation of federal and state laws governing hazardous waste, combined with improved access to information on the part of community members, has reduced some of the egregious incidents of improper waste management, a number of issues remain unaddressed. Political pressure and congressional votes friendly to business concerns curtail the ability of the EPA to effectively manage hazardous waste that impairs human, animal, and environmental health. The "Halliburton loophole" of the Energy Policy Act of 2005 exempts oil and gas drilling from requirements in the underground injection control (UIC) program of the Safe Drinking Water Act.

When coal is burned to produce electricity, coal ash, about 140 million tons each year, is left behind. This ash contains high levels of the radioactive elements uranium and thorium. It often also contains heavy metals including arsenic, lead, mercury, cadmium, chromium, and selenium. The toxins observed in coal ash have been linked to cancer and nervous system impacts such as cognitive deficits, developmental delays, behavioral problems, heart damage, lung disease, respiratory distress, kidney disease, reproductive problems, gastrointestinal illness, and birth defects. Although the EPA has attempted to categorize coal ash as a hazardous substance to be regulated by the Clean Air Act, dissenting voices in Washington have thwarted their efforts.

Studies demonstrate that companies that implement effective hazardous waste management systems can reduce their direct and indirect costs. With proper hazardous waste management, generators experience fewer accidents and spills; therefore, they have lower expenses related to cleanup. When less waste is generated, companies pay less for recycling, transporting, or disposing of the material, and pollution liability insurance premiums decrease.

Although the assorted statutes regulating hazardous waste have reduced the destruction caused by ignorance or negligence, some harmful materials remain unregulated. Additionally, either knowingly or unknowingly, businesses frequently fail to meet the standards for proper waste management. Continued cooperation between industry and government entities, technological advances, and a commitment to environmental justice are critical to protecting human and environmental health.

Health Care Fraud

Health care fraud consists of intentional acts that cost the country an estimated $80 billion a year. This white-collar crime is punishable by prison time, deportation (if the criminal is not a U.S. citizen), fines, and restitution. The U.S. Department of Justice (DOJ) and the U.S. Department of Health and Human Services (DHHS) jointly operate the Health Care Fraud and Abuse Control Program (HCFAC).

Investigative agencies of the Federal Bureau of Investigation (FBI), the DHHS, the Defense Criminal Investigative Service, the Center for Medicare and Medicaid Services (CMS), and a variety of state Medicaid fraud control units are devoted to waste and abuse in health care programs.

Under the Health Information Portability and Accountability Act (HIPAA) of 1996, fraud is knowingly and willfully executing or attempting to execute a scheme to defraud any health care benefit program, or to obtain any of the money or property owned by any health care benefit program, by means of false or fraudulent pretenses, representations, or promises. Later in 2003, the Federal Bureau of Investigation (FBI) recognized health care fraud as knowingly executing or attempting to execute a scheme to defraud a health benefits or insurance program or the willful execution of a scheme to defraud a care recipient. Similarly, the National Health Care Anti-Fraud Association (2003) described health care fraud to specifically include the deliberate submittal of false claims to private health insurer plans and/or tax-funded health insurance programs, such as Medicare or Medicaid.

Distinguishing fraud from negligence is imperative in discerning health care fraud. Fraud generally occurs when individuals knowingly disregard the truth by submitting intentionally false claims or other acts as described. An oversight or an inadvertent error does not indicate this same level of fraud. However, a pattern of oversights or errors and consistent activities may increase the likelihood of fraud liability. For example, intentionally submitting claims before learning the truth about a health claim can be prosecuted. Fraud and abuse are similar, except that in abuse, the investigator cannot establish that the act was committed knowingly, willfully, and intentionally. Abuse is most often defined in terms of acts that are inconsistent with sound medical or business practices, and the abuse could be an unintentional practice that directly or indirectly results in an overpayment to the health care provider.

In addition to health benefits and insurance programs, the U.S. Food and Drug Administration (FDA) describes health care fraud as the deceptive promotion, advertising, distribution, or sale of a product that has not been scientifically proven to be safe and effective. In addition, the product may be represented as effective to prevent, diagnose, treat, cure, or lessen an illness or condition, or provide another false beneficial effect on health. Further, recognition of health care fraud includes the articles of unproven effectiveness that are promoted to improve health, well-being, or appearance, to include drugs, devices, foods, or cosmetics for human or animal consumption.

The FDA shares federal oversight of health fraud in products with the Federal Trade Commission (FTC). The FDA regulates safety, manufacturing, and product labeling, including claims in labeling, such as package inserts and accompanying literature. The FTC regulates advertising of these products. The agency's regulation of health fraud products is based on a priority system that depends on whether a fraudulent product poses a direct or indirect risk to the consumer. A direct risk is identified when the use of a fraudulent product results in injuries or adverse reactions. The risk may be considered indirect when the product does not cause harm but its use may keep someone away from proven, sometimes essential medical treatment. In a collaborative partnership, the FDA, with the DHHS and the Office of Regulatory Affairs, Office of Enforcement, offers a consumer resource of how to avoid health fraud scams and how to report a problem of health care fraud.

Types of Fraud

A variety of activities can count as health care fraud, including billing for services not rendered, upcoding of services or items, unbundling services, excessive services, and unnecessary services. Soft fraud, where providers code for more than they are entitled, is estimated to be 80 percent of fraud. Targets of fraud include government programs, which are the hardest hit by fraud, including Medicare, Medicaid, and the Children's Health Insurance Program (CHIP). While providers and hospitals make up a sizable portion of fraud perpetrators, organized crime groups are also participants in fraud. These organized crime groups bring their criminal abilities and skills to the fraud scheme, and, if caught, face prison terms as white-collar criminals. Health care fraud allows these organizations to launder money, making more money for the organizations than their usual illegal businesses.

Several examples of fraud identified in the fee-for-service or managed-care environment include overutilization or excessive/unnecessary services, billing for services not provided, upcoding, failure to provide needed services, unbundling, and filing false cost reports.

Overutilization refers to providing unnecessary services to the health care consumer. Unfortunately, "fee-for-service" medicine presents economic incentives for overutilization of health care services. Fraud may occur when more services are provided than are medically necessary and are billed for reimbursement.

Billing for services not provided (phantom billing), or misrepresenting the types of services that were provided, is a form of health care fraud. This may include billing for supplies not provided, misrepresenting the supply provided, or double billing, when a provider bills more than one agency for the same services. Frequently, the only issue to be resolved is whether the billing submitted was intentional or simple oversight. If intentional conduct can be proved, then fraud can be determined.

Upcoding assigns a current procedure terminology (CPT) code that reflects a higher level of service than was actually provided. Medicare payment under Part B is generally based upon values assigned to specific CPT codes. These codes theoretically reflect a variety of health procedures performed by physicians and other health care professionals. Inadvertent miscoding may occur because of both the complexity and the volume of the CPT codes. Moreover, Medicare regulations governing coding for evaluation and management services may be viewed as unclear, complicated, and ambiguous. Determining medical necessity is the designated health care professional's responsibility. Practice modalities differ based upon specialization, location, practice standard, and a variety of other factors, complicating the identification of health care fraud. Proving health care fraud in upcoding is often more difficult than detecting other fraudulent activities.

Failing to provide needed services in managed care is most often a result of professionals who are paid on a capitation basis. Typically, the health care professional is paid a fixed fee for furnishing all of the required services needed by a specific individual or group of individuals. Essentially, the managed-care environment penalizes the health care professional for overutilization; thus, providers may be monetarily encouraged to administer a reduced level of services. The economic incentives in managed care are exactly the reverse of those occurring in the "fee-for-service" environment identified in overutilization. Failing to provide necessary services may not only result in the poor health consequences of the Medicare enrollee but also viewed as a misuse of taxpayer dollars. Recently, this premise has been used to prosecute long-term care providers receiving Medicaid funds who deliberately neglect patient health and welfare.

Unbundling of services intentionally contributes to health care fraud. Unbundling occurs when health care services that are intended to be covered as a package are billed separately to increase the financial return of the provider. Bills for a particular service may be submitted in a fashion that appears staggered out over time. These services would normally cost less when bundled together, but by manipulating the claim, a higher charge is billed to Medicare, resulting in a higher financial reimbursement to the party committing the fraud.

Filing false cost reports is a fraudulent health care activity. The filed cost reports are submitted by providers who are paid under Medicare Part A, including hospitals, skilled nursing facilities, and home health agencies. These cost reports must be filed in accordance with the Health Care Financing Administration regulations that are designed to ensure that only allowable costs are charged to the government. Many cases can be cited involving cost report fraud, such as simply disguising an unallowable cost as an allowable cost. Falsification of information in medical record documents can also include information that is not accurate to reflect the required coding. All health care professionals are responsible for accurate, honest documentation in providing information in a medical record.

Incidence

Health care fraud costs the country an estimated $80 billion a year, with national health care spending at more than $2.7 trillion. The General Accountability Office (GAO) has estimated that 10 to 15 percent of all expenditures can be traced to loss, although recent efforts have resulted in a reduction of health care fraud. Health care fraud detection has been a significant priority of the Barack Obama administration, which has seen a record-breaking $10.7 billion in recoveries during the past three years, according to the DHHS.

The DHHS and the DOJ have partnered with several health insurers to help prevent fraud and abuse in health care billing. In 2012, the DOJ and DHHS released the annual HCFAC report, noting that the government's health care fraud prevention and enforcement efforts recovered a record-breaking $4.1 billion in taxpayer dollars during fiscal year 2011. Efforts recognized were the Health Care Fraud Prevention and Enforcement Action Team (HEAT), charged with the prevention of fraud, waste, and abuse in the Medicare and Medicaid programs. In fiscal year 2011, strike force operations charged a record number of 343 defendants, who allegedly collectively billed the Medicare program more than $1 billion. Strike force teams secured 172 guilty pleas, convicted 26 defendants at trial, and sentenced 175 defendants to prison. The average prison sentence in strike force cases was more than 47 months.

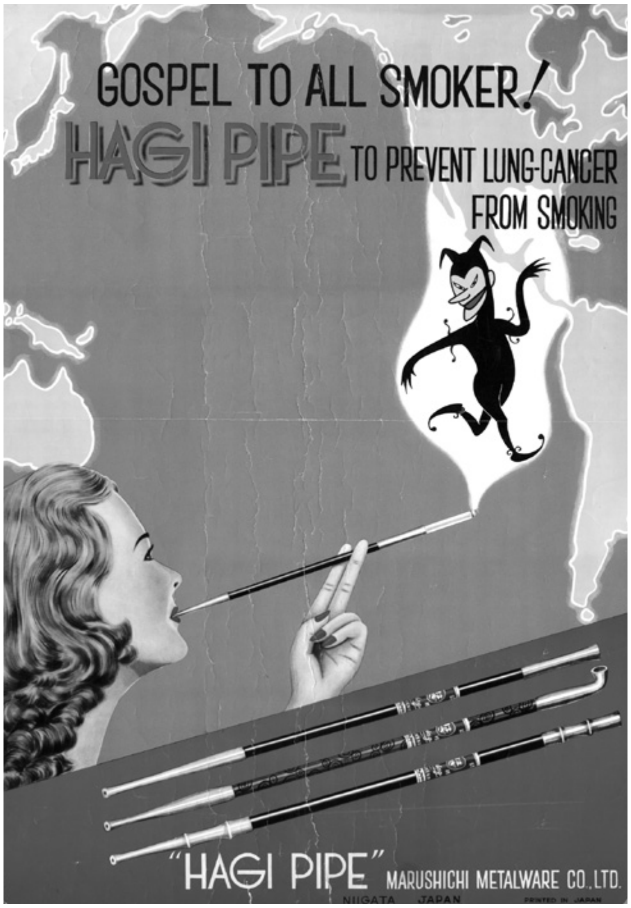
It is estimated that between $60 and $230 billion is stolen from the health care system every year through fraud. According to FBI statistics for 2011, of the 1,676 indictments of fraud and 736 fraud convictions for crimes related to health care fraud, the FBI was able to recover $1.2 billion in restitution, $1 billion in fines, $96 million in seizures, $320 million in civil restitution, and $1 billion in civil settlements. This was the largest number of health care fraud defendants charged in a single year in the history of the department. The problem is expected to get worse as more Americans enter Medicaid and Medicare programs, which have become targets for fraud.

In criminal fraud involving the pharmaceutical and device manufacturing industry, the department obtained 21 criminal convictions and $1.3 billion in criminal fines, forfeitures, restitution, and disgorgement under the Federal Food, Drug, and Cosmetic Act. This included the illegal marketing of medical devices and pharmaceutical products for uses not approved by the FDA and the distribution of products that failed to conform to the strength or quality required.

In civil health care fraud, $2.4 billion was recovered through cases brought under the False Claims Act (FCA). These cases included unlawful pricing by pharmaceutical manufacturers, illegal marketing of medical devices and pharmaceutical products for uses not approved by the FDA, Medicare fraud by hospitals and other institutional providers, and violations of laws against self-referrals and kickbacks. More than $2 billion was recovered in FCA health care matters in 2011. Since 2009, more than $6.6 billion in federal health care dollars was recovered because of the FCA.

Enforcement and Whistleblowing

In 1993, the attorney general announced that tracking fraud and abuse would be a top priority for the DOJ. The Health Insurance Portability and Accountability Act of 1996 (HIPAA) established HCFAC. In 2007, DHHS and the attorney general allocated $248,459 to HCFAC to fight health care fraud and abuse. The Office of the Inspector General (OIG) was mandated by Public Law 95-452 to protect the integrity of DHHS programs. This included Medicare and Medicaid programs, as well as the health and welfare of the beneficiaries of those programs. As the Office of Investigations for the DHHS, OIG works collaboratively with the FBI to combat Medicare fraud. Defendants convicted of Medicare fraud face stiff penalties according to the Federal Sentencing Guidelines, as well as



During a 1960 congressional appropriation hearing, U.S. Food and Drug Administration Commissioner George Larrick referred to the Hagi Pipe as an example of why the agency needed funds to continue its accelerated oversight of health care fraud.

disbarment from DHHS programs. The sentence depends on the amount of the fraud. A defendants can expect substantial prison time, deportation (if not a U.S. citizen), fines, and restitution.

To combat fraud and abuse, the federal government's False Claims Act (FCA) of 1986, also called the Lincoln Law, specifically targeted health care fraud and abuse. Under the FCA, the United States may sue violators for treble damages, plus $5,500 to $11,000 per false claim. The federal law imposes liability on persons and companies who defraud governmental programs. The law includes a provision that allows people (whistleblowers) who are not affiliated with the government to file actions on behalf of the government. Persons filing under the act stand to receive a portion (usually about 15 to 25 percent) of recovered damages.

Because of multiple whistleblowers stepping forward to provide detailed information on an alleged fraud, Forest Pharmaceuticals Inc. was found to be selling a drug, Levothroid, which had never been approved by the FDA. The allegations settled for $42.5 million. The collective reward to the relators was over $14.6 million.

In common law, a writ of *qui tam* allows a private individual who assists prosecution to receive all or part of any penalty imposed. The qui tam whistleblower statute allows private individuals to sue on behalf of the U.S. government when they become aware of fraudulent activities. The whistleblower is a person who tells the public or someone in authority about the alleged dishonest or illegal activities occurring in a government department, private company, or organization. Half of all qui tam lawsuits involve accusations of health care fraud. Rewards for a concerned citizen can result in 15 to 30 percent of any amount collected by the government, with millions paid to whistleblowers. Consequences include individuals or entities involved in health care fraud being excluded from participating in any federal health program, including Medicare and Medicaid.

It is illegal to provide any remuneration to any individual or entity in exchange for a referral to be paid by the Medicare or Medicaid program. This law prevents overutilization of Medicare reimbursed services. Knowingly providing such remuneration in exchange for services paid for by Medicare or Medicaid is a federal crime punishable by imprisonment. An analogous civil statute is the Stark Law, which prohibits physician self-referral for laboratory or other designated health services. The law prevents physicians from referring a patient to laboratories in which they or a member of their immediate family have a financial interest. An example of the Anti-Kickback Act is when physicians have been prosecuted for accepting payments from hospitals in exchange for referring Medicare patients to those hospitals. Also, kickbacks may be identified when illegal payments are made by durable medical equipment suppliers to nursing homes and home health agencies for promoting business. Kickback rewards may be identified as cash, jewelry, free vacations, corporate sponsored retreats, or other gifts to entice medical professionals into using specific medical services.

St. Jude Medical Inc. agreed to pay $16 million to quiet allegations of paying kickbacks to physicians. The whistleblower was able to provide detailed insider information about the kickbacks to physicians, ranging from entertainment to sporting event tickets and other gifts, resulting in an award of $2.64 million.

Additional recent exemplar cases of health fraud include a Baton Rouge, Louisiana, fraud bust that discovered $225 million paid out to seven people for mental health services falsified since 2005; a Brighton Beach, New York, fraud scheme that cost $250 million and involved nine clinics; and a fake medical device company in southern California that took in $11 billion by submitting claims for high-priced durable equipment. Medicare has been defrauded in a larger medical scam involving a criminal ring's attempt to steal $163 million from various health care organizations. Of the 73 individuals indicted for this scheme, more than 50 people were arrested in 2010 in New York, California, New Mexico, Ohio, and Georgia. In a $163 million case involving fraudulent services to senior citizens and the elderly, including Medicare and Medicaid payments, Armenian Americans living in the United States were arrested in 2010 in a case involving FBI agents, the Internal Revenue Service (IRS), and local enforcement agencies in California, Georgia, New Mexico, New York, and Ohio.

Future of Health Care Fraud

The Affordable Care Act provides additional resources to help fight fraud to boost the HCFAC activities, including enhanced screenings and enrollment requirements, increased data sharing across government, expanded overpayment recovery efforts, and greater oversight of private insurance abuses. This initiative will use advanced technology and data analysis to identify when and where health care fraud is occurring. The Medicare Fraud Strike Force with HEAT expanded local partnerships and educated Medicare beneficiaries about how to protect themselves against fraud. In addition to regional fraud prevention summits, it has provided free compliance training for providers and other stakeholders.

Investigative agencies of the FBI, the DHHS, the Defense Criminal Investigative Service, as well as a variety of state Medicaid fraud control units are devoted to the waste and abuse of health care programs. The Centers for Medicare and Medicaid Services (CMS), the federal agency that administers the insurance program for the elderly and the public health program for people with low incomes, is beginning to use predictive modeling technologies to detect patterns of health care fraud. The system uses algorithms and an analytical process to examine Medicare claims as they are made, assigns risk scores, and issues alerts to CMS before claims are paid. The system is an analytic program that roots out fraud in the same way that companies identify stolen credit cards. This information will assist in identifying potentially fraudulent claims and analyze them further. Payers for health care, including government programs and commercial insurers, can protect themselves by doing background checks on new providers, by suspending payments to providers when there is suspicion of fraud, and by sharing information about new schemes.

America's Health Insurance Plans is participating in a partnership with the Blue Cross and Blue Shield Association as well as other health plans, including Humana, United Health Group, and WellPoint. A total of 21 groups, representing federal, state, and private payers, have been included. Sharing data, information, and best practices across all payers, the partnership will ensure that the public and private sectors are even better equipped to fight fraud and will provide a powerful deterrent to potential perpetrators. An Automated Provider Screening (APS) validates every new provider and hospital, and it runs routine checks on all validated providers in the system.

CMS officials and law enforcement agencies are putting more agents into areas where fraud is prevalent. These areas are throughout the country, in larger cities such as Miami, Los Angeles, Detroit, Houston, Brooklyn, Baton Rouge, Tampa, and Chicago. In addition to more human resources, agencies are using a dual-technology approach to fraud. The first approach is CMS's Fraud Prevention System, and the second is the Automatic Provider Screening. Additional solutions to fraud and abuse include training and education, implementation of computer-assisted coding (CAC), increased federal enforcement of fraud and abuse monitoring, and use of data modeling and data mining.

Health Corporation of America

The Health Corporation of America began in 1987 with Richard Lynn Scott, an attorney; and Richard Rainwater, a Fort Worth financier, member of the board of the Hospital Corporation of America, and the Bass family financial advisor. Seeking to create a national health care provider network, they formed the Columbia Healthcare Corporation in order to purchase two hospitals in El Paso, Texas.

The innovations adopted by Columbia Health Care significantly improved patient care. The innovations attracted the attention of a number of local physicians, who joined with the company to create the El Paso Health Care System Ltd. (EPHS). EPHS purchased the Columbia Health Care System hospitals and other health operations. As the EPHS operations grew, Scott moved into other markets with purchase of hospitals in Miami, Florida; Corpus Christi, Texas; and other cities.

In 1990, Columbia merged with Smith Laboratories, Sitter Corporation, and Medical Care American of Dallas. It also went public with a stock sale. It continued its growth program with acquisitions in Indianapolis, Indiana; Ft. Lauderdale, Florida, and other cities. By the end of 1992, Columbia held over 24 hospitals and $1 billion in assets.

In 1993, Columbia merged with Galen Health Care. Its revenues were now over $5 billion, and its hospitals numbered around 100. The company was renamed Columbia Healthcare Corporation. A few months later, in 1994, the company merged with the Hospital Corporation of America (HCA), which was started in 1968 by Dr. Thomas F. Frist, Sr., a Nashville, Tennessee, physician, and Jack Massey, a founder of Kentucky Fried Chicken. Massey, a businessman with hospital management-experience, became the first chairman of the board. Both men believed that services delivered by hospitals could be greatly increased in efficiency through sound management practices. With improved efficiencies, profits would attract investors, which would attract top medical personnel and increase the quality of health care provided to a community. HCA had grown partly through building standard community hospitals with a small group of skilled contractors. This model aided the company's replacement of aging hospitals in smaller communities in a time of rising health care costs.

The merger of HCA and Columbia Healthcare Corporation produced a $10 billion company, operating in 26 states. It was named the Columbia/HCA Healthcare Corporation (Columbia/HCA), and Richard Scott was made the first chief executive officer. Frist was named the chairman. Scott continued the program of new acquisitions. By 1996, Columbia/HCA had 340 hospitals in 36 states and many other operations and facilities.

Its revenues were over $17 billion, with assets of over $18 billion, and more mergers and acquisitions were on the horizon.

Medicare and Home-Health Investigation

On March 19, 1997, federal investigators from the Federal Bureau of Investigation, the Internal Revenue Service, and the U.S. Department of Health and Human Services raided Columbia/HCA facilities in El Paso, Texas, with search warrants in hand to examine the billing records. Soon, the investigation spread to other company locations, with over 500 federal agents raiding facilities in seven states. The focus of the investigation was on Medicare billing practices and the company's home health care operations.

The investigations frightened the company's board of directors. In July 1997, Richard Scott resigned, as did company president David Vandewater. Dr. Thomas Frist, Jr., replaced Scott, and then led the company away from trying to establish a national brand as Scott was building a more community-focused identity. The company's name was soon changed to Hospital Corporation of America.

Columbia/HCA reached two settlements with the Civil Division of the U.S. Department of Justice. The first settlement, in 2000, met the government's claims regarding the company's coding and billing practices for outpatient services, home health care, and laboratory billing. The company agreed to pay a fine of $745 million.

HCA also admitted to filing false cost reports, inflating diagnoses in order to fraudulently bill Medicare and other health programs, and fraudulently billing Medicare for home health care workers. It also admitted to using a kickback scheme to reward doctors with partnerships in company hospitals or in the sale of home health care agencies if they would refer patients to HCA. In other cases, doctors were given office space, office furniture, and drugs from hospital pharmacies without charge, and "loans" that were never repaid.

In late 2002, the second settlement resulted in a fine to the U.S. government of $631 million plus interest, payments to state Medicaid agencies of $17.5 million, and a payment of $250 million that was used to settle previously unresolved Medicare expense claims. The total cost to the company was over $2 billion to settle what, at the time, was the largest fraud case in American history.

Company felony convictions were accepted for systematically overcharging the government when it claimed market costs as reimbursable; making illegal deals with home health care agencies, and with falsifying data about the use of hospital space. The company pleaded guilty to 14 felonies.

Hedge Fund Fraud

Hedge funds are multimillion-dollar investment funds, developed in the late 1940s to hedge against possible poor performance of traditional investments. Investors would put a small portion of their assets into the fund. Hedge funds made slightly riskier investments for higher returns. Subsequently, funds made riskier investments, seeking even higher returns, and investors placed more of their wealth into them. Every hedge fund contains millions of dollars, and some hold billions. Such wealth tempts dishonest managers to steal great sums of money or cheat investors in a number of ways. When fraud occurs, investor losses can reach into the billions of dollars, as in the Bernie Madoff case.

Hedge funds are formed to invest in arbitrage, bonds, commodities, currencies, derivatives, equities, and stocks, using various strategies. Most funds last two or three years because the investment opportunities that they are formed to take advantage of come and go quickly. Funds are dissolved for investors to take a profit or cut losses. Fund failure and asset value losses occur for many reasons, not usually because of fraud. The case of Long Term Capital Management in the 1990s is a good example. Market factors and unwise investments account for most fund terminations.

Fund Managers and Regulation

Hedge fund managers receive substantial fees, typically 1 or 2 percent of fund asset value as a management fee, and a performance fee of 20 percent of profits. Managers are to build and protect net asset value and conserve investor wealth. Managers earn little or nothing if net asset value declines. They are paid for their financial expertise and to act on it for the benefit of investors. Top hedge fund managers can earn sums of around $1 billion per year.

Hedge funds are subject to less regulatory oversight than are other investments. Most investments, and those who administer them, must strictly comply with the Securities Act of 1933, Securities Exchange Act of 1934, Investment Advisor's Act of 1940, and Investment Company Act of 1940. Some provisions of these regulations apply to hedge funds, but hedge funds are structured to avoid many of them and often are incorporated offshore. Investors trade the risk of less regulatory oversight for the opportunity to quickly respond to new investment opportunities and avoid compliance paperwork. This gives managers freedom to rapidly shift investments to promising new ventures on behalf of investors.

Hedge Fund Fraud Mechanisms

High management fees, less regulation, and control of vast sums of money can tempt fraud by a dishonest manager. Most frauds either outright steal investor assets or maintain appearances of high performance and net asset value so that the manager can receive inflated management fees. Investors are warned about potential Ponzi schemes, and some hedge funds have been created as Ponzi schemes. The classic example is Bernie Madoff. However, most hedge fund frauds are not Ponzi schemes. A wide range of fraud mechanisms are used by dishonest managers to steal assets or attain unearned fees. Misrepresenting fund size and performance inflates management fees. New investments can be entered on the books as performance gains instead of as asset value increases, inflating the manager's performance fee. Trading losses may not be reported. Investment strategy is violated when fund assets are placed in other investment markets, like mutual funds, and are used for illegal trading in areas like market-timed trading, which yield substantial fund gains. Dishonest managers have put assets in other Ponzi scheme hedge funds.

Many hedge fund frauds are accounting frauds. Accounting fraud usually occurs when any fraud is committed. Reporting false growth, the manager claims inflated fees. Some managers set up fictitious accounting firms, using their personal phone number and fake Web sites. Suspicious investors are then assured that figures are correct and investments are safe. Falsified financial statements constitute misreporting, and if mailed to investors, involve mail fraud. "Cherry picking" takes selective advantage of profitable trades. Investors are to share profits and losses. Instead of pooling assets, the manager puts good investments in a personal trading account, leaving less profitable trades for investors. With a large amount of capital, a manager can commit insider trading by acting on a tip, earning millions for the hedge fund and increasing performance and asset value fees.

Market manipulation, or "portfolio pumping," occurs when a manager uses the multimillion-dollar fund to manipulate small company stock prices. Buying up shares causes the price to rise, and when it reaches a predetermined price, the manager sells all fund shares at the artificially high price. Another way to claim high management fees is to overvalue assets, giving the appearance of high fund value. Stocks are hard to improperly value because quotes are readily available. Other assets can be assigned high values by the manager, rather than disinterested third parties. Diversion and conversion of funds occurs in all hedge fund frauds. The easiest way is for managers to put investor money in their personal bank account.

Hedge Fund Fraud Warnings

A common sign of fraud is promised high returns on investment. Madoff's lessons are informative. He claimed significant returns, little affected by market trends. Harry Markopolos became suspicious in 1999 because Madoff never reported declines. Deconstructing Madoff's strategy, he discovered that no combination of investments that Madoff claimed to have made could produce such returns, and he warned the Securities and Exchange Commission that Madoff's fund had to be a Ponzi scheme.

If a manager claims a "no risk" investment strategy, investors will lose, because no such strategy exists. Managers wanting to attract investors can overstate their qualifications and past performance records. Investors should check manager's backgrounds and litigation against them with the Securities and Exchange Commission. While incentives are high and managers are subject to less regulation when exercising control of other people's major assets, the vast majority of hedge fund managers are honest administrators and conservators of investor wealth.

Hoarding

Hoarding is not a new concept, although in recent times, hoarding has been investigated from a psychological perspective, seeking to distinguish individuals who have an uncontrollable desire to accumulate items. From a socioeconomic perspective, hoarding has an even longer history, dating back to the 3rd century C.E. Given the nature of white-collar crime, its dependence on specific occupational positions and existing wealth, and its adverse effects on society, especially economically disadvantaged individuals, some hoarding can be considered to be serious types of white-collar crime. A simple definition of hoarding in the context of white-collar crime is the excessive accumulation of goods and/or currency, with the main aim of creating artificial scarcity for profit maximization. Hoarding is capable of undermining demand and supply dynamics.

Hoarding can harm the economy and lead to social unrest. As is typical of white-collar crimes, hoarding is characterized by deceit and concealment, which is a violation of many white-collar statutes and the public's trust. The essence of hoarding is found in the motivation or reason for the acquisition, not solely on the quantity amassed. Therefore, one who purchases a large amount of an item is not hoarding if the item is used for a specific and immediate purpose, instead of creating artificial scarcity with the intent to engage in price gouging. Hoarding in most cases has led to price gouging, which is illegal in 33 states. Among top U.S. corporations, there is considerable hoarding, with data indicating that up to $2 trillion is lying dormant in their coffers, hampering the country's economic recovery.

Since the identification of hoarding as a harmful economic activity, many countries and states have created antihoarding laws to curb the act. An early example of the legal and moral effects of hoarding was seen in the Babylonian Talmud of the 3rd and 5th centuries C.E., where specific information was given regarding the prohibition of hoarding of essential commodities such as oil, grain, wine, and weapons. In Britain, antihoarding laws were introduced during the world wars, whereas in America, it was not until 1994, under the Bill Clinton administration, that federal antihoarding laws were created. However, many states in America introduced antihoarding laws during World War II and at other times to protect the economy from the exploitation of deceitful businesspeople. One challenge with the definition of hoarding is the plethora of items hoarded. Though not exhaustive, the list includes cash, food, medication, gold and other metals, ammunition and weapons, and oil.

There are numerous social conditions that facilitate hoarding, some of which include natural disasters, impending economic changes, political changes, and war. Throughout history, many businesses and individuals have engaged in hoarding for profit. Hoarding can be seen as a financial crime, at both corporate and individual levels. At the corporate level, companies restrict spending by freezing salaries and hiring, withholding paying dividends, and holding off on reinvestment and other financial investment. Approximately $2 trillion was held in hoarding by U.S. firms at the end of 2012. With trillions of dollars sitting idle, corporations are refusing to inject money into the economy and fill vacant positions and, as such, are undermining economic growth and recovery. While hoarding in this case may not fit the definition of a white-collar crime, it may be viewed as economic sabotage.

At the individual level, particularly with money laundering regulations and attempts to evade taxes, individuals who have hoarded cash engage in numerous black-market transactions, including transnational financial crimes. People engage in hoarding for business advantage. The effects of hoarding are varied and can largely be seen as the root cause of numerous maladies within communities and the economy. One such crime is the adulteration of commodities, in cases where there is a shortage of goods or essential items such as food, where retailers have resorted to selling adulterated goods. The creation of regulations against hoarding is costly in terms of both legislation and enforcement. The money used to ensure enforcement and education of the public could instead be channeled to other social services in society.

Hobbs Act

The Hobbs Act is a federal law that is commonly associated with the Anti-Racketeering Act of 1934. The Anti-Racketeering Act of 1934 was intended to protect trade by prohibiting individuals from using illicit means to gain profit from interstate commerce. The Anti-Racketeering Act provided protections for commerce from acts of extortion, but there were exceptions that provided opportunities to circumvent the law. One of the most significant exceptions of this nature pertained to organized labor. The Anti-Racketeering Act included a provision that proscribed the application of the law's prohibitions in instances when they would undermine the legitimate rights of an organized labor group to carry out its official duties. In practice, the exclusion made it difficult to apply the provisions of the Anti-Racketeering Act to organized labor groups, even in instances when they relied on threats of violence to obtain financial gain by forcing businesses to accept unsolicited and unwanted labor or services. As a result of this organized labor exception, efforts were undertaken to revise the Anti-Racketeering Act. In 1946, the Hobbs Act was passed as an amendment to the Anti-Racketeering Act in an attempt to amend what were viewed as deficiencies in the existing legislation.

The Hobbs Act amended the Anti-Racketeering Act so that organized labor groups would no longer be able to circumvent the protections provided to interstate commerce by using violence or threats of violence to force business organizations to accept unsolicited labor. Advocates of the Hobbs Act feared that a lack of oversight and legislation could seriously damage interstate commerce and provide too much power to organized labor. At the same time, the legislation specifically prohibited undermining the efforts of organized labor groups to pursue permissible objectives through legitimate means. For example, the Hobbs Act does not limit the ability of organized labor groups to actively engage in rigorous and demanding negotiations with employers in an attempt to improve working conditions or pay. This was an important concession because critics of the legislation feared that it amounted to poorly concealed attempts to undermine the strength and influence of organized labor. Once passed, courts used the amended provisions of the Hobbs Act to prohibit organized labor from using force or the threat of force to gain financial benefit by forcing businesses to accept superfluous and unsolicited labor.

The original purpose of the revisions contained within the Hobbs Act was to curtail what were widely perceived as the protected abuses of illicit organized labor activities. However, the legislation has been further amended since its inception, and its scope and applicability have grown as a result. This wider utilization of the Hobbs Act has been made possible by the legislation's revised language, which provides for a wider and more robust application of its provisions. The more generalized provisions of the Hobbs Act, which prohibit individuals from using robbery, extortion, or threats to obstruct or delay commerce, have been used to prosecute individuals outside traditional organized labor and organized crime groups. This is especially true of the extortion provision of the Hobbs Act, which has been broadly interpreted and applied.

The Hobbs Act has been used by American law enforcement agencies to target criminals who have robbed commercial organizations and to prosecute public officials in a variety of different contexts. The provisions of the Hobbs Act, which prohibit using mail or telephone systems to facilitate criminal endeavors, along with the provisions that prohibit using an individual's public office for illicit personal gain, have been used to target the actions of corrupt public officials. Given its historical importance and growing contemporary applicability, the Hobbs Act remains one of the more important pieces of federal legislation in regard to controlling the abuses of organized labor groups and corrupt public officials.

Holley, Louis Malcolm

Louis Malcolm Holley was born in 1949. He was a U.S. Army veteran and a resident of Tempe, Arizona. He was 52 years old in June 2001, when he stole $3.2 million in remittances in the form of money orders, cash, and checks from a Phoenix, Arizona, postal facility. He had been a postal employee for 28 years with no previous criminal record. Holley was arrested in an Extended Stay America motel room without incident in the Lynnwood, Washington, area just outside Seattle on August 17, 2001. Approximately $1.7 million was recovered ($1,500 in checks and $1.35 million in cash) from his car, and $417,000 in cash from his motel room. Investigators concluded that the rest, largely in money orders and checks, had been destroyed. Holley's conviction that November resulted in a three years and five months sentence passed in March 2002. This was a reduced sentence, given Holley's cooperation and guilty plea; prosecutors had wanted a 10-year sentence.

A federal investigation by the General Accounting Office (GAO) after the incident revealed that a key had been left in the lock of a cage for storing valuables, and all employees at the facility could access it. Available cameras were not in use, and there were other human security lapses, such as failing to properly record the deposits. It took the Postal Service 10 days to acknowledge the theft. A national examination of U.S. Postal Service locations also revealed that their $65 million in annual remittances was at some risk of loss because of employees failing to follow security procedures. In the Holley case, the manager of the postal facility had been warned by the Postal Inspector the year before to improve security.

In addition to human lapses, Holley's theft was also attributed to the Postal Service's efforts to save costs in handling daily deposits. Until 1997, postal deposits were made daily at 5,500 local banks. To save costs, the Postal Service used armed couriers to take the deposits to a central location for later bank deposit. Holley worked at a central location, the Postal Service's Processing and Distribution Center at Van Buren and 48th streets in Phoenix.

Holley worked a night shift in a secure area of the facility called a registry room. He had the responsibility of processing remittances from various locations twice a week. Court documents indicate that on June 1, 2001, Holley had signed for six large bags of cash at different postal sites in Tucson and Phoenix. He left work early the next day. Two days after the theft, a Bank of America employee scheduled to pick up the bags noticed that three deposit sacks had empty mailbags, instead of funds. A postal employee also noticed that three other bags had missing deposits, and the bags' serial numbers had been altered. Holley's fiancée was then contacted, who revealed that Holley was missing and had left her the title to his vehicle, with instructions to sell it, and a list of his bank account numbers. Holley admitted in court that he had time to plan his theft, even though his actions seemed spontaneous and poorly executed. At the time of the heist, he had developed an interest in gambling. He had two cars, one of which was recovered in a casino parking lot. When he was captured, casino tickets were found in his car. Holley had rented at least one of the cars on June 1, but the rental company eventually reported that vehicle stolen. After the Holley incident, the U.S. Postal Service implemented a plan emphasizing strict adherence to security measures and employee accountability.

Home-Stake Swindle

Robert S. Trippet started the Home-Stake Production Company of Tulsa, Oklahoma, in April 1955, as an oil tax-shelter investment. Beginning in 1964, Home-Stake began creating subsidiary corporations each year, which were available for investment as oil drilling "programs." Trippet's promise of tax deductions and profits of 400 percent spread by word of mouth through the Hollywood movie industry, the social circles of big business, and the professional community of law. From 1955 to 1972, Home-Stake took in $140 million from investors, but only spent an estimated $30 million actually drilling for oil. The U.S. Securities and Exchange Commission (SEC) began investigating Home-Stake in 1970, and in 1973, the SEC formally sued the company for running a Ponzi scheme. Investor-filed lawsuits followed. Four officers of Home-Stake were convicted on criminal charges. Home-Stake was declared officially insolvent on September 20, 1973.

Massive Ponzi Scheme

When the Home-Stake swindle collapsed in 1973, it was the largest, most elaborate, and most enduring Ponzi scheme in history. A Ponzi scheme operates by promising investors profits from a legitimate business. The swindler uses some of the original investment to pay a higher-than-anticipated dividend to attract more investors. As new investors pay into the swindle, their money is used to pay off earlier investors. The swindler uses some of the money to maintain a core business, but investments in the core business are insufficient because of the deviant mismanagement of funds, and the swindle inevitably collapses.

Trippet organized the fraud by informing investors that their money would be used to develop oil fields. He was careful to impress upon investors that the commitment to develop a field was long-lived—typically 12 years—with low returns in the early years of the drilling program. Investors were told that profits from the oil fields would rise in the middle years, then gradually taper off as the oil became more difficult to extract, and then the fields would eventually be depleted.

Trippet sent quarterly reports to investors, informing them of the progress of oil drilling and profits. In the early years of the investment program, Trippet made sure that profits exceeded Home-Stake's originally conservative estimates. It was in the middle of the typical 12-year investment program when Trippet would begin to inform investors that profits would be lower than expected. When investors complained about the disappointing profits, Trippet had two methods to keep stringing them along. Trippet's first method was to remind Home-Stakes' wealthy investors that although profits were lower than expected, they still had sheltered their money from taxation. The second technique was to suggest that if they were so disappointed in the performance of Home-Stake, then they could donate their stock to charity.

The point about Home-Stake functioning as a tax shelter worked to settle down swindled investors because at that time, U.S. tax law allowed investments in domestic oil production to be deducted from taxable income. Trippet bet that when wealthy investors were told about disappointing profits, they would rationalize that they had still been prudent investors because they had sheltered their money from taxes. The concept of donating Home-Stake stock to charity also worked to calm down swindled investors, for several reasons. First, in spite of the fact of having failed in the investment choice of Home-Stake, by donating their stock to charity, the swindled investor could maintain a positive self-image as a charitable person. Second, charitable organizations are less likely to complain about the disappointing performance of the stock because the stock was gifted, and social custom disapproves of complaining about a gift. Finally, the charitable donation could also be used as a tax deduction.

Home-Stake went to great lengths to create the illusion of a legitimate oil business, even painting the irrigation pipes of a farm orange so that they would look like an oil field pipeline as investors flew overhead. By deliberately using word of mouth to spread the news of Home-Stake within a social community, Home-Stake was following the techniques of an affinity fraud, which exploits trust among the network of investors. Trippet was thus able to swindle sophisticated businesspeople, including the former chairman of General Electric ($440,920) and the presidents of American Express ($57,000) and Time Inc. ($68,500), among many others.

The Home-Stake criminal case concluded on February 7, 1977. Robert S. Trippet, Frank E. Sims, Harry L. Fitzgerald, and John T. Lenoir were convicted on various criminal charges. Trippet, Sims, and Fitzgerald were sentenced to one day in jail plus probation. Lenoir was sentenced to three years of probation. Trippet was fined $19,000, with an additional order to pay $100,000 to a fund for civil claimants. Sims was ordered to pay $5,000 to a fund for civil claimants.

Hoover, Herbert

A trained engineer, Herbert Hoover is one of the few Americans elected president without prior experience in elective office or the military. Hoover enjoyed a stellar reputation as the U.S. secretary of commerce in the administrations of Warren G. Harding and Calvin Coolidge. Despite this success, Hoover struggled to deal with the many economic problems facing the nation during the Great Depression, which began months after he took office. As head of the Commerce Department, Hoover promoted the standardization of many products, which he felt would lower costs and reduce consumer fraud. As president, Hoover authorized the U.S. Department of Justice (DOJ) and the Internal Revenue Service (IRS) to prosecute gangsters such as Alfonse (Al) Capone for tax evasion, created an antitrust division within the DOJ, and instituted broad-reaching prison reform, which included establishing the Federal Bureau of Prisons. Although often overlooked by his contemporaries, Hoover made significant and important contributions to the fight against white-collar crime in the United States.

Hoover was the first president born west of the Mississippi River, in 1874, in West Branch, Iowa. The son of Quaker parents, Hoover's father was a blacksmith who owned a farm implement store. By 1884, both of Hoover's parents had died, leaving him an orphan at the age of 9. Hoover was sent to live with his uncle John Minthorn, a physician and real estate investor who lived in Newberg, Oregon. While Hoover did not go to high school, he attended a night school that allowed him to take classes in bookkeeping, typing, and accounting. In 1891, Hoover became a member of Stanford University's inaugural class. While at Stanford, Hoover took many engineering classes, earning a degree in geology in 1895. Hoover moved to Australia soon after graduation, working to locate gold deposits for a London-based mining company. After he was appointed manager of a mine near Gwalia, western Australia, Hoover combated the militancy of the Australian mine unions by bringing in Italian immigrants, allowing him to cut labor costs considerably.

Hoover's work led him to a partnership in Beswick, Moreing & Co., and he acquired a personal worth of $4 million by 1914, a substantial sum in that day. Hoover retired from day-to-day business affairs, acting as a consultant to struggling mines and lecturing at schools such as Columbia University and Stanford University. The transcriptions of several of Hoover's lectures were combined into a textbook, *Principles of Mining*, which perennially enjoyed good sales.

At the end of World War I, Hoover helped manage 500 volunteers who organized the return of the over 120,000 Americans in Europe. Hoover's

President Herbert and Mrs. Hoover at the final game of the World Series, Philadelphia, Pennsylvania, October 14,1929. That year, In the first months of his presidency, Hoover moved rapidly to change the federal response to white-collar crime.

success led to his appointment as chair of the Commission for Relief in Belgium (CFB), an organization that sought to alleviate hunger in war-torn Belgium. Hoover was named by President Woodrow Wilson as secretary of the U.S. Food Administration and the American Relief Administration, and he was seen by many Democrats as a successor to Wilson. Hoover instead remained a Republican and was appointed the secretary of commerce in 1920 by Harding. Hoover greatly increased the profile of the Commerce Department, seeking to diminish the sometimes adversarial relations that existed between business and government. Hoover worked to get business and government leaders to forge voluntary partnerships, sometimes termed *associationalism*, and as a result turned the Department of Commerce into an important arm of government that reduced labor losses from trade disputes, minimized accidents and injuries of workers, and increased standardization. After serving as commerce secretary under both Harding and Coolidge, Hoover was elected president on the Republican ticket in 1928 with 58 percent of the popular vote.

While Hoover is most commonly associated with the Great Depression, which began seven months into his term, he played a significant role in changing many federal agencies' responses to crime. In 1929, for example, in the aftermath of the St. Valentine's Day Massacre in which seven individuals were killed by Capone's underlings, Hoover urged agents from the Bureau of Prohibition and other government agencies to vigorously pursue convictions. Bureau of Prohibition agent Eliot Ness began an investigation of Capone's business operations. Multiple attempts to find Capone culpable for various crimes such as extortion, murder, prostitution, and other offenses had proven unsuccessful, so Ness concentrated on Capone's compliance with income tax laws, finding that Capone had been guilty of multiple counts of income tax evasion as well as numerous violations of the Volstead Act, which implemented Prohibition. Capone was convicted of these crimes, was sentenced to 11 years in a federal prison, and was subject to heavy fines and multiple garnishments of his property.

In 1930, Hoover also established the Federal Bureau of Prisons (BOP), an agency of the DOJ. The BOP administers all federal penitentiaries and was established in part because of Hoover's desire to professionalize the service provided in prisons, to provide more humane and progressive care for inmates, and to ensure consistent, competent, and centralized administration of the then-11 operating federal prisons, which served approximately 13,000 prisoners. The BOP replaced a group of three different offices that had been inconsistent in their application of policy, and it made available to to various employees formal training opportunities in applicable laws, correctional techniques, firearms safety, report writing, self defense, and other topics. These innovations greatly improved the operation of the federal prisons and increased the competency of its employees.

Hopkins, Mark

Mark Hopkins was born in Henderson, New York, to a family descended from Puritans. He was a vegetarian and a Congregational Church member. He was quiet and slender, and he had a minor lisp. Hopkins married his cousin, Mary Sherwood, in 1854, and they adopted a son, Timothy. Hopkins's family moved to Michigan when he was 12 years old. His father died, and at age 16, Hopkins became a clerk in a mercantile establishment in Niagara County. He then became lead partner in Hopkins & Hughes in Lockport. He also studied law.

He was working as a bookkeeper in New York City when he got word of a gold strike in California. Almost immediately, he headed west for Sacramento. Rather than becoming a miner, however, he sold supplies to the miners, and before long he opened a store in Placerville in 1849, hauling merchandise from Sacramento. In 1850, he became a wholesaler in partnership with E. H. Miller, Jr., and in 1955, he partnered with Collis Huntington in a Sacramento hardware store.

The Big Four

Hopkins was a political ally of Charles Huntington, Edwin Crocker, and Leland Stanford; the group would become known as the Big Four. Hopkins eventually joined the Republican Party, which in California was chartered at the Huntington & Hopkins hardware store in 1856. Abolitionists with discretion in a Democratic milieu, they emphasized instead their commitment to the Republican candidate and the Pacific Railroad. They were also involved in larger enterprises than hardware stores. Hopkins was quiet, whereas Huntington was the boaster. Hopkins handled the books, while Huntington made the deals. He was earnest and frugal, he wore a gray beard, and his nickname was "Uncle Mark." The other three trusted him absolutely. No paper left the concern until Hopkins blessed it. He could be stubborn.

The Central Pacific Railroad formed in 1861, with Hopkins as treasurer, a position he retained until his death. He had final approval over all Big Four projects. Huntington and Hopkins would control the railroad, the Central Pacific, and make massive profits. Hopkins and the others each put in $15,000 to finance the Central Pacific, after passage of the Pacific Railroad Act of 1862, which gave the Central Pacific the western starting point, and the Union Pacific the start at Omaha, Nebraska, for the transcontinental railroad. In 1863, the Central Pacific broke ground, but after 20 miles it was broken. The Big Four bought votes, created a toll road, moved a mountain range, and did whatever it could to garner state and federal funds. Wartime inflation shot prices through the roof for rails, locomotives, and powder, and greenbacks were worth less than 60 cents to the dollar. In 1864, Huntington bought congressional votes and got a land entitlement for the railroad. The Big Four also formed the Contract and Finance Company, a scam construction company that skimmed $63 million, while holding most of the Central Pacific stock, valued at $100 million, and nine million acres of federal land.

Hopkins ran the finances of the railroad during the construction years, basically operating the same as he had at the store, just with larger numbers for higher stakes. He stayed in the background as the others dealt with the press, the public, government, and labor. He kept the books, kept an eye on the financial implications, and kept the complex financial arrangements on target. He kept his partners from diverging from the main path, even for potentially lucrative opportunities. When Huntington wanted to buy coalfields in Utah, Hopkins blocked the move. When Crocker wanted to buy the Western Pacific Line, he found no financial justification for diverting resources from the Central Pacific Railroad. Eventually, he came around, and Central bought Western in 1867. For Hopkins, the bottom line was fiscal rationality, and he didn't particularly care if a deal was legal or not, but he didn't like the tendencies of the others to make irrational promises in their exuberance. In 1872, when the Union Pacific/Crédit Mobilier scandal raised questions about similar bribery and corruption by the Central Pacific, Hopkins burned the books.

After the Central Pacific, the Big Four built the Southern Pacific, a second transcontinental railroad. Hopkins died in Yuma, Arizona, on an inspection trip of the Southern Pacific lines that also provided sunshine and warmth for his severe rheumatism. He left an estate of $40 million to $50 million. Even after he became extremely rich, he continued to rent a small cottage. His wife finally coerced him into building a large house on Nob Hill, but he died before it was finished.

House Stealing

The economic crisis, globalization, and technological advancement have resulted in new types of offenses, such as identity theft and cybercrime. The Federal Bureau of Investigation (FBI) also describes house stealing as a new type of crime. House stealing is a combination of identity theft and mortgage fraud. Stealing a house has five steps: finding a property, finding information about the owner, producing fake documents, transferring the deed, and taking possession of the property.

In the first stage of house stealing, criminals look for a vacant house, rental property, or house where someone is living, to steal. Then, criminals obtain personal information about the landlord of the facility from easily accessible public records. When they find the necessary information for the initial transaction, they use the Internet to find more personal clues that would help them during the transaction process. Once criminals have all the information they need for the initial transfer of the property, they produce different fake forms of identification, such as a driver's license or social security card of the owner, which can be used to forge legal documents. Then, they find necessary forms, either online or from an office supply store, for transferring the property. After filling out the required forms, criminals have them notarized by a local notary. Then, they file these papers in the county where the property is located for transferring the deed of the property into their names. After transferring the deed to their names, they take possession of the house. In some cases, criminals move into the house. In other cases, criminals sell the house immediately, then apply for a mortgage loan for the property and have the bank make the purchase amount to them.

Since house stealing is a new type of crime, and it is hard to detect it easily, there are some precautions to protect from becoming a victim of house stealing. Some precautionary measures include: scanning mortgage company mail, periodically checking the public record, monitoring protection, and raising public awareness. When mail from a mortgage company about payments or for information arrives, open and read it carefully. Make sure that on the envelope, the contact information is correct. If there is suspicious activity on a mortgage payment, immediately contact the mortgage company. Additionally, checking mortgage account activity online may help detect problems early. Sometimes, it is better to check deed information from a local county office, especially for nonoccupied properties or a vacation home. By doing this, irregularities about a property can be recognized earlier. There are some online services for property owners by which, after registering on the site, the owner will be notified when there are public record filings on his or her property, such as a deed of trust or deed to convey ownership. Raising public awareness of crimes is also one of the most effective solutions to fighting them.

Housing and Urban Development, U.S. Department of

The U.S. Department of Housing and Urban Development (HUD) has its roots in the National Housing Act of 1934 and the creation of the Federal Housing Administration (FHA). The primary mission of HUD has been to help families buy homes. HUD has faced both internal and external problems for decades. Incidents have ranged from cronyism and corruption; to politically based preferences and price rigging; to bribery, fraud, and theft. In one form or another, residents, tenants, homeowners, contractors, vendors, and taxpayers have been victims of HUD-related scandals. The rise and fall of HUD and its wrongdoings along the way can best be viewed through the eras in which it has operated and through some of the leaders that have been at its helm over the years.

Problems Over the Years

The first HUD scandal reportedly occurred in the 1950s, when the FHA Section 608 program financed private housing for World War II veterans and became embroiled with deceitful builders. The 1970s found HUD coming under scrutiny again for what critics believed was wasteful and costly spending involving FHA mortgage insurance and Section 235 subsidiary programs.

The most notable scandals involving HUD first surfaced in the 1980s, after President Ronald Reagan's HUD secretary, Samuel Pierce, Jr., left office and his successor, Jack Kemp, completed an audit of HUD. Kemp found substantial evidence of internal corruption, fraud, and theft. Pierce and his affiliates were reportedly responsible for manipulating low-income housing bids, overmortgaging ventures that generated high fees and profits, providing federal dollars to people with political business ties, and mismanaging HUD budgets. The results were staggering, involving losses in the billions of dollars. Ultimately, 16 convictions were handed down to seven HUD associates. Pierce escaped prosecution after publicly and formally acknowledging his responsibility for the scandal.

David Burns, a former senior staff member of HUD's New York office, recalled how he had been pressured by one of HUD's top administrators who had close ties to New York Senator Alfonse D'Amato, a Republican. Burns told of the senator's support for criminal activity as well as a senior housing project that was planned for an area of Manhattan already filled with subsidized housing. The construction company that was selected for the senior housing project employed the senator's brother as an attorney and had contributed to the senator's political aspirations. A group of residents tried to block the venture through federal court, which compelled Burns to testify against his employer. District Judge William C. Conner concluded that HUD's justification for the project contained misrepresentations of data and misuse of its own regulations.

The early 1990s found President Bill Clinton, a Democrat, advocating HUD as an avenue for providing home-ownership opportunities to millions of Americans. Fannie Mae and Freddie Mac, two large government agencies that financed mortgages, began venturing into subprime lending, by which buyers who were credit risks could obtain home mortgages at higher interest rates (and precarious terms). Congressional friction between Democrats and Republicans at the time became even more politicized when HUD secretary Henry Cisneros, a Democrat, used his position and office as a platform for politically motivated rallies, propaganda, and pressures.

The 1995 revisions to the Community Reinvestment Act (CRA) gave Cisneros and regulators the ability to deny mergers to banks that did not make enough loans available to moderate- to low-income borrowers. Consequently, banks began to feel pressured to maintain their CRA ratings and increased their loans to risky borrowers. In the process, they also diluted the mortgage underwriting standards. This practice ultimately trickled down to the prime and subprime lending markets and contributed to the housing bubble and devastating housing market collapse in the 2000s.

Cisneros was replaced as HUD secretary by Andrew Cuomo, a Democrat, in 1997 after Cuomo spent several years as the organization's assistant secretary. Like his predecessor, Cuomo promoted efforts to have Fannie Mae and Freddie Mac maintain the business of supplying riskier loans to already credit-risky borrowers. As well, Cuomo advocated for less stringent regulations governing FHA mortgages, which some believe may have contributed to the defaults on FHA mortgages that occurred down the road. An unwelcomed audit by Inspector General Susan Gaffney revealed political and deceitful management of billions of dollars in HUD contracts.

In 2004, Alphonso Jackson, a Republican, became the HUD secretary under President George W. Bush. Rumors of cronyism continued to plague HUD under Jackson's tenure, highlighted in a *Washington Post* investigation that found a disproportionate number of HUD contracts being awarded to Republican, minority-owned businesses. Similarly, accusations began to surface that some government officials were being given preferential mortgage loans through Countrywide Financial, one of the largest housing lenders at the time. Countrywide was also involved in privileged agreements to sell Fannie Mae mortgages with substantially lower fees to originators. Countrywide, Fannie Mae, and Freddie Mac are often blamed for the demise of the subprime lending markets.

Today, HUD continues to play a vital role in the U.S. housing market and economic landscape as it attempts to reposition itself as an innovator and creator of housing opportunities for the American people.

Human Trafficking

Human trafficking refers to the trading of human beings for the purpose of forced labor and/or sexual exploitation. It involves acts of transporting, transferring, harboring, or receiving a person through a use of force or coercion, and it is recognized by the United Nations (UN) as a crime against humanity. Every year, tens of thousands of men, women, and children fall into the hands of traffickers, in their countries and abroad. Every country in the world is affected by trafficking, whether as a country of origin, transit, or destination for victims.

Human trafficking is a global industry. It is estimated by the UN that over 2.5 million people are in the forced labor or forced sex trade worldwide, with just over half under the age of 18. People are often trafficked into the agricultural industry, to work as prostitutes in brothels or in the pornography industry, to undertake construction work, to carry out food processing and packaging, to be domestic servants, to aid in drug production and transportation, and for organ harvesting purposes. The U.S. State Department estimates that over 600,000 men, women, and children are trafficked internationally each year as part of the forced labor and sex trade, while perhaps double that number never cross an international boarder. A huge demand exists for human beings for the global sex industry and the exploitable labor industry. Organized criminal networks, black market gangs, and corrupt government officials find it an extremely profitable enterprise. It is the third-largest global business, after the arms and drugs trades, with an estimated annual turnover of over $30 billion.

Causes of Human Trafficking

The causes of human trafficking are complex. Although traffickers can use coercion, deception, and violence, half of the world's population lives in poverty, on less than $2 a day, while a further one billion live in extreme poverty on less than half that amount. Such circumstances provide the socioeconomic structural conditions in which people can easily fall prey to the false hope given by criminals involved in trafficking. Families living in extreme poverty in developing nations in Africa, Asia, and South America often possess few means to resist approaches from the seemingly friendly and helpful traffickers, who are offering them or their children an escape route from a desperate daily struggle to survive. Intimidation and violence may also be used against the victims, or against their families, their friends, and even their neighbors.

Although in more developed countries, such as Russia, and the United States, as well as in Europe, although poverty may be less immediately apparent, it still exists and is a cause of trafficking. However, promises of a life with better educational and/or employment prospects are the more commonly used recruitment methods in these contexts. In addition to the poor and those seeking a better life and new opportunities, runaways, refugees, and other displaced people are common victims of trafficking. The struggle against human trafficking is closely related to the ongoing international struggle against poverty, deprivation, debt, social exclusion, famine, gender-based violence, and war.

To ensure complete control of a trafficked person, traffickers typically arrange every aspect of the movement process, including travel documents and tickets, meals, and housing. This allows traffickers to control people through keeping their passports and also enables them to demand labor in return for alleged debts such as travel costs, false registration fees, or administrative costs. This reinforces how traffickers operate as part of large, well-organized criminal networks that include forgers, bogus employment agents, drivers, pimps, brothel owners, and even government and other public officials. Where corruption is endemic in local and national government, or where embassy and immigration officials are incompetent, it is often easy for traffickers to obtain documents and to transport their victims across national frontiers, without being properly checked by border controls.

Responses to Human Trafficking

In response to a growing recognition on behalf of the international community of the important roles played by organized criminal networks operating internationally in the trafficking industry, in 2000, the UN adopted the Convention against Transnational Organized Crime. This is also called the Palermo Convention. It contains two key protocols. The first is the Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Woman and Children. The second is the Protocol Against the Smuggling of Migrants by Land, Sea and Air. These two protocols represent a concerted effort on behalf of the countries that make up the United Nations to establish an international legislative framework that can tackle the problem of human trafficking, within and across national borders. A 2006 United Nations report, "Trafficking in Persons: Global Patterns," identified 127 countries of origin, 98 transit countries, and 137 destination countries for human trafficking. It also highlighted the urgent need to address the trafficking of women and children into the sex trade, with South America, Asia, and eastern European countries as sex trafficking hot spots.

The poor, the homeless, adults and children without families, displaced homemakers, runaway

Like slaves on an auction block waiting to be selected, prostitutes are on display in front of a go-go bar in Pattaya, Thailand, in 2005. Victims of human trafficking have to perform as they are told, or risk being beaten. Sex buyers often claim they had no idea that most women and girls abused in prostitution are desperate to escape, or are there as a result of force, fraud, or coercion.

teens, refugees, drug addicts, and kidnapping victims make up the majority of trafficking victims. The protocols that make up the Palermo Convention have led to an increase in the development of cross-national work between governments, criminal justice officials, and charitable organizations, such as Stop the Traffik and Amnesty International, with the aim of promoting public service announcements and educational initiatives, alongside coordinating information pertinent to the detection and punishment of individuals who are part of the criminal networks that both engage in, and profit from, human trafficking. For example, in 2008, Ukrainian and United Arab Emirates officials undertook a detailed joint investigation that uncovered a criminal group in the city of Dnipropetrovsk, which trafficked Ukrainian girls and women to the United Arab Emirates. They made at least $2,000 on each girl forced into prostitution. It is estimated that the gang managed to traffic more than 50 Ukrainian young women aged between 16 and 30 to the United Arab Emirates before they were stopped.

The Palermo Convention formed the basis for the development of the UN Global Initiative to Fight Human Trafficking (GIFT), which was launched in 2007. The development of GIFT into a coordinated trafficking strategy worldwide has revealed that, of the estimated 2.5 million people in forced labor (including sexual exploitation), 56 percent (1.4 million) are in Asia and the Pacific, 10 percent (250,0000) in Latin America and the Caribbean, 9.2 percent (230,000) in the Middle East and northern Africa, 5.2 percent (130,000) in sub-Saharan countries, 10.8 percent (270,000) in industrialized countries such as the United States and in Europe, and 8 percent (200,000) in countries in transition. The information collected also revealed that 52 percent of those who recruit victims are men; 42 percent are women, and in 6 percent of cases, both men and women worked together to recruit victims. The statistics also reveal that in just under half of cases (46 percent), the person who recruited a trafficking victim knew the victim.

Typically, such individuals act as local, community-based contacts for trafficking gangs, and so are a point of entry into a broader criminal network, which may well be funded by organized crime syndicates involved in other illegal activity, such as the Mafia, sometimes operating alongside corrupt regional and national government officials. Knowing the relative distribution of the trafficking problem worldwide, alongside identifying how traffickers typically operate, allows for the targeting of resources and information sharing between agencies and countries.

An Anti-Trafficking Policy Index (ATPI) was established by the UN as a result of the Palermo Convention to track and evaluate the success or failure of countries in tackling the problem of trafficking. A five-point scale is used to indicate good policy practices and success in catching and stopping traffickers, with a score of five the highest score and one the lowest. The ATPI has three dimensions relating to prosecuting traffickers, protecting trafficking victims, and preventing trafficking in the first place. The ATPI collects annual statistics for 177 countries worldwide, and year-on-year data reveals that antitrafficking policy has improved over the last decade. High-scoring nations include Germany, Norway, Australia, Sweden, the Netherlands, Belgium, and the United States. France, South Korea, Norway, Croatia, Canada, and Austria also score well. The two worst-scoring nations are North Korea and Somalia.

Statistical Trends

The statistical trends that underpin the political and policy making discourse surrounding the problem of human trafficking have been criticized for being misleading. The human trafficking industry forms part of the shadowy black market of illegal activity, and it is therefore impossible to know the true nature and extent of the problem. Most governments and agencies must rely on reasoned guesswork and estimates. This has led to some critics arguing that the number of people trafficked is far less than the estimated 2.5 million, while others argue that it is far more. Similarly, some critics argue that the estimated profit of $30 billion annually that criminal networks allegedly make out of trafficking is grossly overestimated, while others say that the figure is likely higher. Other commentators stress that it is far more important to focus on reducing both the number of individuals who fall victim to traffickers and the profits that traffickers make.

Most charitable groups, such as Amnesty International, argue that worldwide government measures to tackle human trafficking remain woefully inadequate. Although positive steps have been taken over the last decade, there remains a lack of properly funded support for victims of trafficking in many developed nations, let alone in developing countries, with the result that many suffer from discrimination in housing, employment, and social-service provision. Research also shows that victims of trafficking suffer lasting physical, psychological, and emotional damage; can find themselves facing criminal sanctions as a result of their involvement in the drug and sex trades; and in many countries are stigmatized and socially excluded by their local communities once they return to them, particularly if they are female victims of the sex trade. Although some progress has been made over the last decade, much work remains to be done at both the grassroots and international levels to tackle the problem of human trafficking.

Hunter, Rielle

Born on March 20, 1964, in Fort Lauderdale, Florida, Rielle Hunter is an American actress and filmmaker whose birth name is Lisa Jo Druck. After a moderately successful film and television career as an actress, Hunter began a career in film production that included a series of short films for the 2008 presidential campaign of North Carolina Senator John Edwards. While she served as Edwards's campaign videographer, Hunter and Edwards engaged in an extramarital affair that produced a daughter. Hunter's affair with Edwards led to the termination of Edwards's presidential campaign. Prior to her involvement with Edwards, Hunter's father, James Druck, was involved in a scandal involving the killing of show horses for the purpose of claiming insurance money, a crime with which he was never ultimately charged.

In her early teenage years, Rielle Hunter, then known as Lisa Jo Druck, rode show horses. In 1982, her father, James Druck, was accused of hiring a man named Tommy Burns to electrocute and kill Lisa's show horse for the purpose of collecting $150,000 in insurance money. He was never charged with the crime. James Druck's involvement in the murdering of horses for insurance money was perhaps Rielle Hunter's first exposure to the world of white-collar crime. Fraudulent behavior on the part of Hunter and deceiving authorities were major elements of the act that brought Hunter national notoriety and brought down the career and life of a prominent American politician.

Rielle Hunter first met John Edwards in 2006, at a bar in New York, and started working with him shortly thereafter, when she and her production company were hired by Edwards's 2008 presidential campaign to produce a series of behind-the-scenes videos focusing on his presidential campaign. In 2007, an anonymous source told the *National Enquirer* that Edwards and Hunter had engaged in an extramarital affair during the course of the campaign and that Hunter was pregnant with Edwards's child. For the purpose of covering up the affair and saving Edwards's campaign, Hunter announced that the father of the child was Andrew Young, a staffer on the Edwards campaign. Hunter and Young's family, who were living in North Carolina at the time, moved to California to escape the media.

On February 27, 2008, Hunter gave birth to a daughter named Quinn in Santa Barbara, California. Hunter gave her daughter her last name on the birth certificate and did not identify the child's father. In July 2008, the *National Enquirer* once again publicly claimed that John Edwards was the father of Hunter's daughter. In August of the same year, Edwards publicly disputed that he was the father of Hunter's child and volunteered to take a paternity test.

It was later determined that Edwards had lied about his affair with Hunter. In January 2010, Edwards finally admitted publicly that he was the father of Hunter's daughter, Quinn. In December of the same year, Edwards's wife, Elizabeth, succumbed to breast cancer. In 2012, Edwards and Hunter ended their relationship, but they were jointly raising their daughter Quinn, then 4 years old. Edwards's use of campaign supporters' funds to support Quinn during and after his presidential campaign led to later federal charges. Rielle Hunter is a prime example of the intersection of privilege, power, fame, and white-collar criminal behavior.

Huntington, Collis P.

Collis Potter Huntington (1821–1900) achieved lasting notoriety as one of the leading railroad tycoons of his time. Huntington was one of the founders of, and major investors in, the Central Pacific Railroad, which constituted the western link of America's first transcontinental railroad. In Washington, D.C., Huntington was one of the most effective advocates for the Central and Southern Pacific, using favors and bribes to influence Congress on his railways' behalf.

Huntington was born on October 22, 1821, to a family of farmers in Poverty Hollow, a poor area of Harwinton, Connecticut. Huntington did not stay in Poverty Hollow for long; as a teenager, he found work as a peddler and travelling salesman. He eventually moved to Sacramento and, working with future railroad magnate Mark Hopkins, set up shop selling mining equipment and other supplies to men caught up in the California gold rush. His business venture with Hopkins proved successful, and in the 1860s, the two partnered with Charles Crocker and Leland Stanford, Sr., to form the Central Pacific Railroad Company. Stanford won the presidency of the company; Huntington had to settle for a secondary position. Contemporaries labeled the men the "Big Four," though in private they referred to themselves as "the associates." The four men were the major shareholders in the company, soon also acquiring the Southern Pacific Company. The Central Pacific linked with the Union Pacific to provide the first transcontinental railway of the United States, while the Southern Pacific monopolized rail travel in California.

Among the Big Four, Stanford lobbied, and to a large degree controlled, the political situation in California, while Huntington worked with the U.S. Congress on behalf of the Central and Southern Pacific lines. Huntington secured millions of dollars in governmental loans and undervalued land for his railroads, largely through providing bribes, political favors, and campaign contributions to sympathetic congressmen. Allegedly, Huntington also paid off newspaper editors. Subsequent investigators found that the company spent over $2 million to influence legislation at the federal, state, and local levels. Huntington was able to avoid the fate of his counterpart within the rival Union Pacific Railroad company, Congressman Oakes Ames. Ames was caught performing similar misdeeds in the Crédit Mobilier affair of 1872, one of the biggest scandals of the Gilded Age. Huntington, on the other hand, managed to prevent congressional investigators from definitively examining the Central Pacific's financial books.

Huntington maintained a long rivalry with his company president and fellow partner, Stanford. Hopkins and Crocker died in 1878 and 1888, respectively, and in 1890, Huntington succeeded in forcing Stanford out as president of the company. Huntington served as president for the next decade and had the pleasure of being the last surviving member of the four associates. He died on August 13, 1900, at his camp in the Adirondack Mountains.

I

ICN Pharmaceuticals Inc.

ICN Pharmaceuticals Inc. was founded by Milan Panic, a Serbian American multimillionaire, in the late 1950s. He became the company's chairman, chief executive officer, and president. Milan Panic was born in 1929 in Belgrade, Yugoslavia, and his father died when he was 2 or 3 years old. He was a young teenager during the German occupation, starting to work for the partisans when he was 14 years old. A keen cyclist, he was an alternate for his country's cycling team at the 1952 Stockholm Olympics. He completed a B.Sc. degree at the University of Belgrade in 1955. When he was participating in a state-sponsored cycling event in the Netherlands in 1956, he defected to West Germany, and later that year he moved to the United States. He was naturalized as a U.S. citizen on June 14, 1963, in Los Angeles. His wife, Jelica, who had defected with him, died in 1972; they had three children. He remarried in 1978.

International Chemical and Nuclear Corporation, located in the City of Industry, California, was established with $200 in capital in 1960, with a washing machine used as a centrifuge. Initially involved in making chemicals for the pharmaceutical industry, Panic visited many laboratories and decided to produce pharmaceutical products. The company was renamed ICN Pharmaceuticals in 1973. As with all pharmaceutical companies, there was the hope of finding a cure for a particular ailment, and in 1970, the drug L-dopa was released, which was hoped to cure Parkinson's disease. The stock of the company rose dramatically but then fell after severe side effects were noticed from treatment with the drug. However, with other products, and occasionally over-optimistic financial forecasts, the company's stock rose to $34 in 1986; in 1991, its peak was $19, and it fell to as low as $2.50.

ICN Pharmaceuticals sold its West German operations to Revlon for $25.37 million in May 1976. In mid-March 1980, it sold its Brazilian operations to Revlon for an undisclosed sum. It decided to focus much of its research on human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS), and on January 9, 1987, it announced that its viral agent Ribavirin was effective in preventing people exposed to the HIV virus from developing AIDS. *Lancet* published the results of a test-tube trial in which Ribavirin was able inhibit the HIV virus from replicating. There were then two-year clinical trials, but the U.S. Food and Drug Administration queried the statistical significance of the findings. It was released for a wider trial, although the U.S. Securities and Exchange Commission and a congressional committee were critical of the role played by Panic in promoting the drug, although with so many people dying from HIV, some people felt that even if the treatment was successful only with a small number of people, it might be worth the risk. In fact, journalist Jonathan Kwitny claimed in his book *Acceptable Risks* (1992) that the National Institutes of Health and some other federal agencies were not keen on Ribavirin, with AZT promoted after having been developed by the better-known company Burroughs Wellcome.

With the collapse of communism in eastern Europe, Milan Panic returned to Yugoslavia—then involved in a civil war, with several states having declared their independence. He was the prime minister of the Federal Republic of Yugoslavia from July 14, 1992, until February 9, 1993, and also contested the 1992 presidential elections, losing to Slobodan Milosevic. There was a query about his U.S. citizenship because of the U.S. constitutional prohibition on any U.S. citizen accepting office on behalf of a foreign nation. Therefore, President George W. Bush granted special permission for Panic to hold office in Yugoslavia. After Panic lost the election, Milosevic's supporters in the Parliament ousted him, and he then returned to the United States to remain the chief executive officer of ICN Pharmaceuticals in March 1993.

There were many clashes between ICN Pharmaceuticals and the Securities and Exchange Commission, and Panic decided to consolidate the company. During the 1990s, ICN Pharmaceuticals was merged with ICN Biomedicals, SPI Pharmaceuticals, and Viratek; a new entity, also called ICN Pharmaceuticals, emerged. In 1997, it had annual sales exceeding $672 million, and subsequently it changed its name to Valeant Pharmaceuticals International Inc., under which it still trades. Valeant Pharmaceuticals merged with Biovail Corporation in 2010, moving to Canada. It was then involved in a clash with the Securities and Exchange Commission again with Eugene Melnyk, the chief executive officer of Biovail, being fined and banned for five years from senior roles in public companies in Canada. Valeant Pharmaceuticals currently has revenue of $3.5 billion and has its headquarters at Laval, Quebec, Canada.

Identity Fraud or Theft

Identity theft can be generally defined as the illegal taking of a person's or business's identifying information to commit fraud or theft, or to escape financial and or criminal liability. Identity theft involves a full range of crimes such as counterfeiting, forgery, theft, driver's license fraud, check fraud, postal fraud, immigration fraud, credit/debit card fraud, identity document fraud, social security number fraud, insurance fraud, health care fraud, and tax fraud.

Given the complexity of identity theft as a concept, its meaning varies depending on the type of crime that a particular organization is interested in combating. For example, agencies interested in financial crimes, like the U.S. Secret Service or the Internal Revenue Service, define identity theft as the misuse of a person's identifying information to gain access to a person's financial accounts. Agencies interested in identity document fraud, like the Department of Motor Vehicles or the Social Security Administration, may define identity theft as the misuse of a person's identifying information to obtain a driver's license, passport, or social security card to gain employment or access to various social services.

Identity theft is an old crime with a modern name. Identity theft most likely began as a simple form of criminal impersonation; imposters would imitate another person with the intent to defraud him or her for personal gain. Over time, this form of identity theft evolved in order to accommodate society's new ways to identify individuals.

A U.S. Marine corporal displays her military identification, which is increasingly becoming a target for identity thieves, as evidenced by a number of serious thefts. In 2006 and 2007, several hard drives belonging to Veterans Affairs were stolen; they contained data on a total of about 28 million retired, active, and reserve military personnel. Service members deployed overseas can also become victims. Con artists can set up credit card accounts, start businesses, and even buy houses using their data.

The advent of identity documents, such as identity cards, made the traditional form of criminal impersonation less effective because of their widespread use as proof of identity. However, these early forms of identity documents lacked reliable security features and were easily forged and counterfeited by individuals wanting to steal the identity of someone else. A novel development in identity management came in the 1930s with the introduction of the social security number. Although it was originally issued to track Americans' earnings and provide a safety net for retirees, the social security number eventually became an all-purpose personal identity number that holds the key to almost all of an individual's personal and financial information. As a result, a new form of identity theft emerged.

The social security number was established around the same time that credit cards came into existence. However, credit cards were not widely used at the beginning because they were business specific, which required cardholders to carry more than one card with them. As credit-card technology advanced, a system was established to make it possible for one card to be used to pay almost any creditor across the United States. Consequently, the use of credit cards became widespread, and identity thieves adjusted to take advantage of the new opportunity. Credit-card fraud and identity theft then became synonyms; credit-card fraud was the most common form of identity theft. In its latest stage of evolution, identity theft has extended its reach to computer technology and online banking. Now, identity thieves steal personal information through online scams and hack into personal and business Web sites with relative ease.

After the U.S. Congress passed the Identity Theft and Assumption Deterrence Act (ITADA) in 1998, the Federal Trade Commission (FTC) launched the Identity Theft Data Clearinghouse (ITDC) in November 1999. The ITDC was established to collect identity theft complaints from victims and produce annual statistical reports based on the data collected; it became the most comprehensive database on consumer fraud and identity theft. Moreover, various groups have conducted further statistical research on identity theft, thus contributing to the accumulation of information on identity theft over the last 10 years. Estimates reported on the identity theft problem have been inconsistent from study to study, most likely because different survey methodologies are used. However, the studies concur that roughly eight million Americans are victimized each year, with annual identity theft losses reaching in excess of $50 billion. Although these figures have several government agencies, such as the Social Security Administration, claiming that identity theft is one of the fastest-growing crimes in the United States, the true scope and scale of identity theft are largely unknown because the studies that have been completed on this crime tend to focus primarily on financial identity theft, and they exclude the emotional toll of victimization. Furthermore, the estimates do not include other forms of identity theft or data on other countries, where identity theft is purportedly growing at enormous rates.

Types of Identity Theft

Even though identity theft is often associated with financial crimes, and many identity thieves are likely motivated by personal financial gain, there are other kinds of identity theft. In general, identity theft can be classified into five categories: financial, medical, identity document, social security number, and criminal.

Financial identity theft is the most common form of identity theft, and it occurs when an individual uses someone else's identifying information to obtain loans, goods, or services, or to commit some other kind of fraud for economic gain. Financial identity theft can be as simple as someone using a credit card without the owner's authorization, or as complex as an identity thief using stolen identity information to open new credit card accounts, obtain loans, or even buy a house in someone else's name.

Medical identity theft happens when someone's identity information is stolen and then used to commit health care fraud. Medical identity thieves use other people's personal information to receive treatment or surgery, or to cheat insurers by making fake claims. Additionally, identity thieves resort to stealing doctors' identifying information to defraud state and local medical service programs. According to the FTC, 3 percent of all identity theft victims have their personal information stolen and used to receive medical treatment and services. The FTC claims that people who are 50 years of age or older are at a higher risk of medical identity theft because they tend to have government-supported insurance such as Medicare or Medicaid.

Identity document theft is the stealing of another person's identity document, or the submission of a counterfeit identity document, to obtain other forms of identification such as a state-issued driver's license, a government-issued passport, or a social security card. Once identity thieves have acquired one or more of these forms of personal identification, they can access just about every aspect of American society. Although identity document theft is most commonly associated with the use of another person's driver's license, other identity documents that are also targets of identity thieves are birth certificates, visas, alien registration cards, passports, voter registration cards, government IDs, and privately issued identifications.

Social security number identity theft is the theft and fraudulent use of another person's social security number. The social security number is a high-value identifier for identity thieves because it gives them access to almost everything with which the person's number is associated. It also enables them to use numbers issued to children and dead people, without being easily detected. Identity thieves use the social security number as a key to access the financial benefits available to their victims and to obtain identity documents such as a driver's license, identification card, or passport. Furthermore, imposters can gain employment in another person's name by using a stolen social security number.

Criminal identity theft occurs when an imposter gives another person's name and personal information, such as date of birth or social security number, to law enforcement during an investigation or upon arrest. It is common for criminals to use fake identity documents and provide false information when committing a crime so that the crime goes under another person's name in the event that they are caught. Consequently, criminal identity theft may be the most devastating kind of identity theft. When an imposter commits a crime in someone else's name, a warrant may be issued in the name of the victim, who will probably be arrested and sent to jail. In this regard, victims of criminal identity theft are more likely than victims of other forms of identity theft to spend a considerable amount of time and effort trying to restore their good name. In some situations, the victim's name may never be cleared because it will forever be linked to the criminal's true identity in the form of a known alias.

How Identity Theft Occurs

The identity of a person is a social reflection of who she or he is; it establishes a person's reputation and status in various social settings. Identities allow people to identify others to determine who they are, who they are related to, what they do, what they have accomplished, where they have been, and how much property they own. A person's identity is based on different kinds of identifiers, which distinguish one person from another.

Although the identifiers that make up an identity are too numerous to list and can vary greatly from one person to another, they are typically grouped into four categories: something you are, something you are assigned, something you have, and something you know. "Something you are" identifiers include biometric characteristics such as DNA, fingerprints, and handwriting. "Something you are assigned" identifiers include a person's address, name, title, and social security number. "Something you have" identifiers include items such as identification cards and passports. Finally, "something you know" identifiers are pieces of knowledge that a few others may know, like the password to a bank account. Identifiers, such as fingerprints or DNA, are permanent, highly individualistic, and difficult to obtain, whereas names and birth dates may be less distinct and relatively easy to acquire. Consequently, identity thieves target the latter identifiers and use them to commit crimes.

Identity thieves steal the identity of individuals to fulfill their economic or social needs. The manner and ease with which an identity theft is accomplished is dictated by the offender's motivation and the existing opportunities. For any crime to occur, three elements are necessary: a motivated offender, a suitable target, and the absence of a capable guardian against the crime. Therefore, for an identity theft to occur, a motivated offender must converge in space and time with suitable targets, in the absence of capable guardians.

The perpetrators of identity theft, or motivated offenders, are individuals who want or need to use someone else's identity information. They might use this information themselves or give it to others to use. The motivation of identity thieves may be money, anonymity, obtaining goods, services, employment, revenge, or some combination of each. Although a comprehensive profile of a typical identity thief is unavailable because of the limited amount of research that has been conducted in this area, the existing research suggests that the characteristics of an identity theft offender are different from those of other kinds of criminals. For example, although identity thieves are more likely to be male, which is consistent with other crime categories, female involvement is higher for identity theft than for other crimes attributed to women. Additionally, the aging-out process that tends to occur among all other crime groups of offenders does not apply to identity theft. In fact, compared to other types of crime, identity thieves begin committing identity theft at an older age and continue later in life. Even though identity theft is a crime often committed independently, law enforcement agencies across the United States are reporting increases in organized identity thefts that are carried out by street gangs, criminal organizations, and terrorist groups.

Identity thieves target certain kinds of identity information, depending on their goals and skill levels. Moreover, the form and accessibility of the identity information are also factors considered by these offenders. For example, biometric identity information, which includes DNA and fingerprints, is not a suitable target compared to other forms of identity information because it is difficult to steal and then utilize in a way that is useful to the identity thief. In this regard, the most suitable targets are those that contain unique pieces of identity information, such as social security numbers and birth dates. Suitable targets take one of three forms: paper (e.g., junk mail, bank statements, credit reports, receipts, checks, and applications), plastic (e.g., credit cards, identity cards, and licenses), and digital (e.g., computer, compact disks, compact drives, cell phones, and smart cards). To obtain this information, identity thieves may search through trash; steal people's mail, wallets, or purses; or even undertake more complex strategies, such as stealing identifying information from an employer, hacking into a Web site, or carrying out online scams.

Available research studies contend that identity theft victims are people from all ages, races, genders, and income levels. Although everyone is at risk of victimization, some people are more at risk than others. For example, credit card fraud is the most prevalent kind of identity theft; therefore, people with higher rates of credit card use are at an increased risk of victimization.

Other factors that have been found to increase the risk of victimization include geographic location and age. The FTC has reported that people living in Arizona, California, Florida, Texas, Nevada, New York, Georgia, Illinois, New Mexico, and Colorado are at a greater risk of having their identity stolen than those in other states. This may be because of population density, the number of undocumented immigrants working and living in these states, or the comprehensiveness of state identity theft legislation. With regard to age, people aged 18 to 39 are at the highest risk for victimization. The increased vulnerability of this age group may be because of their high risk-taking lifestyles, which include frequent and open use of personal information. This is evident by their regular use of social networking sites and their high engagement in online banking and shopping activities.

The guardians against identity theft, or the people charged with protecting identity information, include the owner of the identity information and other people or entities who are charged with safekeeping the identity information of others. Examples of such entities include banks and government agencies like the Internal Revenue Service and the Department of Veterans Affairs. Often, members of society have no choice but to provide personal information to government and private businesses when asked to do so, or they risk being denied access to goods and services. As a result, government and privately operated businesses have an enormous responsibility when it comes to protecting people's personal information. However, since the level of guardianship of people's personal information varies from one agency to another, those places where guardians are absent or careless become targets of identity thieves. This reality is evidenced by the number of preventable data breaches that have taken place. According to the Identity Theft Resource Center (ITRC), there were at least 3,159 disclosed incidents of data breaches from January 2005 to December 2011 that potentially exposed more than 510 million people to identity theft.

Response

Identity theft is a component of several other well-known crimes that are perpetrated with stolen identity information. Modern-day identity theft became well known in the mid-1990s, when large numbers of identity theft victims came forward and reported their losses. As a result, identity theft became a federal crime in 1998, when Congress passed the Identity Theft Assumption Deterrence Act (ITADA). Following the passing of the ITADA, the federal government enacted a series of additional identity theft statutes, and many states now have identity-theft laws that are similar to those passed by the federal government.

In addition to the federal government's legislative response to identity theft, there has been an increase in law enforcement efforts to combat this crime, which is demonstrated by the increased number of identity-theft prosecutions. However, the overall impact of identity theft is significant, and the growing number of international identity thieves, aided by computer technology, is making enforcement efforts more difficult.

As a result, the best way to combat this crime is through prevention. The more difficult people make it for identity thieves to steal their personal information, the more unattractive they become as targets. Although this practice does not guarantee that individuals will not become victimized, it increases the chances that the identity thief will search for an easier target.

As society continues to rely on computer technology and the Internet to complete financial transactions and to store and send personal information, identity theft will be a war increasingly waged in the online world. Moreover, society is more connected now than ever before, making it easier for identity thieves to prosper from this persistent and growing crime from anywhere in the world.

Iguchi, Toshihide

Toshihide Iguchi is a former American executive for Japan's Daiwa Bank Ltd., New York branch, where he engaged in illegal trading. In 1997, he was sentenced to four years in prison in New York for the losses incurred, and he was ordered to pay a fine of $2.6 million. Daiwa Bank was expelled in late 1995 from the United States for failing to disclose Iguchi's fraudulent activities after he revealed them to its senior executives, and for their subsequent attempts to cover up; the bank agreed to pay a fine of $340 million. The focus on Iguchi is of critical importance because it represents the challenges of white-collar crimes.

Iguchi was born in Kobe, Japan. He moved to the United States shortly after high school to pursue higher education. He earned a bachelor's degree in psychology in 1975 from Southwest Missouri State University, which is now known as Missouri State University. He was regarded as a very personable individual by one professor. Despite having a degree in psychology, his first job after graduation was as a car dealer. He later became a citizen of the United States.

In 1976, Iguchi was employed by Daiwa as the result of the assistance and influence of his father, who had connections to people in the banking industry. Although he had no previous experience or apparent knowledge of banking, he was given a position in the securities custody division, which involves the safekeeping of securities such as bonds, commodities, and stocks for investors, and where he could organize, sell, and deliver securities or even monitor the bank's actions on securities. Daiwa's management did not consider the risks involved, despite being regarded as one of Japan's largest commercial banks and one of the world's top banks.

A "Shrewd" Trader

After eight years in the securities custody division, Iguchi was promoted in 1984 to bond trading in U.S. Treasury bonds because he was regarded as a well-respected local and shrewd trader, despite his lack of experience in trading. His high position in the bank allowed him to conceal his illegal activities. Shortly after his promotion, he lost $200,000 through trading. In an attempt to recover that loss, he began trading more aggressively by illegally selling bonds from the bank's portfolio and from investors' accounts. In addition, he forged bank statements for the stolen bonds, thereby giving the appearance that the bonds were still in place. He continued with the rigorous trading activities to cover each loss and protect his image as a "shrewd" trader. He was able to avoid detection by regulators.

Fearing he would be caught by regulators, he confessed in 1995 in a 30-page letter to the president of Daiwa Bank in Japan, in which he also revealed that two other unnamed traders had incurred massive losses. By this time, Daiwa had lost more than $1 billion between 1984 and 1995—a period of 11 years—without any suspicion from senior executives or regulators in Japan or the United States before his confession. Iguchi made about 30,000 illegal trades and embezzled thousands of dollars from Daiwa Bank. He was arrested in 1995 and held without bail for falsifying bank records and attempting to conceal the losses. He was formally sentenced to prison in 1997. He wrote about the Daiwa experience while in prison, and since his release in 2000, he has continued to write.

The role of regulators in the banking industry remains problematic because of the notion that such oversight interferes unfairly with operations and has negative impacts on the markets. With regard to Iguchi, it appears the regulations that had been put in place forced him to confess his fraudulent activities. However, they have not deterred several other rogue traders. Many companies not only fail to disclose fraudulent activities but also tend to lobby legislators to loosen regulations on banks. It is evident that closer scrutiny of Iguchi's activities by regulators in both the United States and Japan could have prevented the fraud from ballooning so large.

Illegal Competition

Competition law (also known as antitrust law) protects healthy market competition and regulates against anticompetitive behavior demonstrated by companies. Competition regulation is mainly known through the European Union (EU) Competition Law and the U.S. antitrust law, even though national competition authorities across the globe often maintain discretion regarding the exact implementation of such rules. National competition law usually does not cover activity beyond territorial borders unless it has significant effects at the nation-state level.

Particularly in the case of cartels, competition law mainly focuses on prohibiting agreements or practices that jeopardize and restrict free trading and competition among businesses. It also bans abusive behavior of a firm that dominates a market, as well as anticompetitive practices that tend to lead to such a dominant position (e.g., predatory pricing or tying). Finally, it supervises the mergers and acquisitions of large corporations, safeguarding that they abide by all the necessary rules.

Competition law gained recognition in Europe when Germany enacted the first anticartel law in 1923, and Sweden and Norway adopted similar laws in 1925 and 1926. Currently, the Treaty of Lisbon prohibits anticompetitive agreements in Article 101(1), which includes price fixing. Therefore, agreements are almost always illegal if participants engage in actions of price fixing, limiting production, sharing markets or customers, or abusing their market dominance. These agreements between businesses distort competition and ultimately harm the business sector, the market, and individual consumers.

Regulation

From the early utility theories advanced by Jeremy Bentham and Francis Edgeworth, economics has developed a powerful framework for understanding human decision making as a calculus of pleasures and pains. Cesare Becarria formulated a theory that installing sufficiently large expected pains to breaking the law deters even the toughest criminal; therefore, high penalties and low policing efforts may be the solution. What is more, the transnational criminality of illegal competition renders it even more difficult to be regulated outside the context of an international body of law, such as the EU. A great part of competition law violations includes price fixing and cartel establishment.

The EU framework that regulates competition law enforcement is expressed through Regulation No. 1/2003, through antitrust enforcement in EU member states. It allows members to implement criminal sanctions in their national legal framework regarding Articles 81 and 82 EC. It further regulates that the states must enforce their national competition laws in accordance with these articles, rather than allowing full independence.

In particular, Regulation No. 1/2003 (Article 5) states the following:

> . . . the competition authorities of the Member States shall have the power to apply Articles 81 and 82 of the Treaty in individual cases. For this purpose, acting on their own initiative or on complaint, they may take . . . decisions . . . imposing fines, periodic penalty payments or any other penalty provided for in their national law.

Member states can therefore impose both administrative or civil fines on companies violating Articles 81 or 82 EC, as well as criminal fines. These provisions demonstrate the wide range of penalties that can be imposed in a case of competition law violation, facilitating the effort of the respective national competition authorities for efficient prevention. The legal interpretation of these principles widens the field of penalties that can be enforced even more. Finally, Article 12(3) of Regulation No. 1/2003 covers any other penalty on individuals, including imprisonment. On the other hand, Article 12(1) of Regulation No. 1/2003 also confirms that the European Commission and the national competition authorities can cooperate in terms of exchanging and using information and evidence.

This is contradictory to the view expressed by some scholars that Articles 81 and 82 EC are inherently noncriminal, and therefore that the EC Treaty would exclude criminal enforcement in implementation of these articles at both the levels of EU institutions and of member states. The unanimous adoption of Regulation 1/2003 in practice rejected this opinion by allowing member states to implement criminal sanctions in their respective authorities. What is more, it is evident from Article 83EC that the council will define potential prohibitions of agreements and abuse of dominant position.

Decentralization as an Enforcement Method

Initially, Articles 81 and 82 were vague in the treaty, regarding the jurisdiction of the community courts. This was resolved in 1962, with the adoption of Regulation 17, introducing the centralized route. The model of administration chosen to enforce these articles for the commission resembled the German model of central administration, with judicial authorization and authority for exemption. The 1999 White Paper (White Paper on Modernization of the Rules Implementing Articles 85 and 86 of the EC Treaty, OJ 1999 C132/1) justified the existence of the monopoly in terms of a harmonized interpretation of the legal rules found in Article 81(3).

Even though centralization was considered a wise choice in the beginning, eventually it was apparent that the commission did not have the resources needed for this; therefore, Article 81(3) introduced the decentralized system, resembling the French system of *exception legale*. A great achievement was therefore reached with Regulation 1/2003, as the commission for the first time left its monopoly of enforcement.

Overall, national competition authorities are expected to bring to justice more cases compared to the commission, in particular addressing local competition law infringements, where they have a comparative advantage because they are familiar with the local markets and they are better placed to regulate national markets. This leads to another concern about the tools that a state might use in order to achieve these goals.

Table 1 Sanctions of European countries regarding competition law violations

Member state	Provision for criminal sanctions	Details
Austria	Yes	Sec. 168b of Austrian Penal Code
Belgium	Yes	Limited sanctions provided by the competition
Bulgaria	No	
Cyprus	No	Exceptions apply in limited cases
Czech Republic	Yes	Article 127 of the Act No. 140/1961 Coll., on the Criminal Code (only natural persons)
Denmark	Yes	All fines are criminal sanctions except daily and weekly payments
Estonia	Yes	Articles 399-402 of Penal Code (karistusseadustik)
Finland	No	
France	Yes	Provisions pursuant to Article L. 4620-6 Commercial Code
Germany	Yes	The only criminal sanctions available are those under § 298 of the Criminal Code (StGB) (bid rigging) and under § 263 of the Criminal Code (StGB) for fraud
Greece	Yes	Article 29 of Law 703/1977 provides for criminal sanctions
Hungary	Yes	Hungarian Criminal Code (Act IV of 1978) Art. 296/B
Ireland	Yes	Provisions under the Competition Act 2002 or of Articles 81 and 82 of the treaty is discovered, the Competition Authority
Italy	No	
Latvia	Yes	According to the Latvian criminal law, only natural persons and not legal entities may be liable for such crimes
Lithuania	No	
Luxembourg	No	
Malta	Yes	An infringement of Article 5 or Article 9 of the act is a criminal offense that may result in a fine
Netherlands	No	
Poland	No

Implementation in Practice

In the EU guideline on fines, provisions include the 1/09/2006, declaring that a fine will multiply for each year that a company participated in a cartel, with the Danone case affirming this (*Groupe Danone v. The Commission*, Case C-3/06 P [8/02/2007]. In 2007, EU fines topped $1.8 billion, whereas a cartel in the automotive glass market resulted in a fine of 1.4 billion euros. This is the highest fine ever imposed, including a fine of 869 million euros for Saint-Gobain.

The commission has also followed the example set by the U.S. Department of Justice (DOJ); it designed and published a document regarding the nonimposition or potential reduction of fines in cartel cases (known as the Leniency Notice), with several member states developing and implementing a national legal leniency system. In order to enforce Article 82, the commission can initiate an investigation, collect and examine facts, make determinations, and impose fines or other remedies.

The decisions set out by the commission are afterwards subject to judicial review by community courts. They are responsible for ensuring that the commission has followed appropriate procedures, observed the law, and kept within the powers of its administrative discretion. Furthermore, the Court of First Instance (CFI) is the principal body responsible for hearing actions of competition law cases in the first instance, except where a state member is involved, where the European Court of Justice may perform the judicial revise.

A key feature of European cooperation is the European Competition Network, which provides for member states to share even confidential information about their enforcement activities and to assist in investigations. A total of 23 member states are signatories to this model. The possibility of settlement is also provided in these cases, with Neelie Kroes, a past European commissioner for competition, introducing a possible settlement process in cartel cases.

Member States Examples

After the advocacy of the DOJ affecting the Organisation for Economic Co-operation and Development recommendations on individual sanctions, many jurisdictions have reinitiated introducing criminal sanctions, including Australia, Canada, South Africa, and Brazil. At the EU level, the process of detection and punishment is hardened, affecting the interaction between the business world and competition authorities. A number of member states have therefore implemented criminal sanctions in their national competition laws, and others are fiercely debating whether they should do so.

However, the European Commission grants immunity to revealing firms under the leniency notice, which complicates even further the prosecution on a national level, as technically it does not include respective employees. Transformation of these provisions of EU competition law may eventually lead to a higher deterrence rate, rather than the criminalization that brings a tough penalty. Neither the EC treaty nor Regulation 1/2003 is likely to provide a legal basis for the greenfield introduction of criminal sanctions in the enforcement of EC competition law at the community level. Despite the effective work of watchdogs across the EU, practice shows that the fight against cartels requires more. The United Kingdom (UK) is one of the most prominent European examples of criminalizing cartel activity in 2002, authorizing prison sentences of a period of up to five years. According to the Enterprise Act of 2002 (s. 188 and s. 190), an individual must dishonestly agree to cartel conduct, such as price fixing and bid-rigging. The penalty for such action can include imprisonment and/or an unlimited fine. This regulation signifies an extensive criminalization of cartel offenses in the UK, which was not previously given much emphasis, especially before the Competition Act of 1998.

On the other hand, a great advantage of the criminalization process that may encourage further criminal sanctions in other states has been that, according to UK evaluation exercises and the Office for Fair Trading (OFT), from 2004 to 2007, there was an estimated consumer savings deriving from the UK merger regime of 92 million pounds sterling per year. These studies analyzed the direct effect of enforcement, whereas there is also a deterrent effect of the violations that did not occur, given the fear of investigation, which cannot be accurately measured.

Imperial Food Products Inc.

On September 3, 1991, 25 workers at the Imperial Food Products chicken processing plant in Hamlet, North Carolina, were killed in an explosion that resulted in a fire. A rupture of a hydraulic line near a deep fryer caused the explosion. It was determined that the major contributing factor in the employee deaths was the locked fire doors, from which they were unable to escape. The fire doors had been locked to prevent employees from stealing chicken parts. All but one of the deaths were caused by smoke inhalation, which would have been prevented if the employees had been able to escape. Many of the employees escaped the smoke by retreating to a large freezer, but they were unable to fully close it to keep out the toxic smoke, and they subsequently died. Since the employees had time to reach the freezer, they would have had time to escape if the fire doors had not been locked and other means of escape were known. This evidence led to criminal charges levied against the plant owner and manager.

Regulatory Failure

This unfortunate disaster has been labeled a state-corporate crime because of the failure of not only the plant owner and manager, but also a long history of failure to inspect the plant by various state and federal agencies. The Occupational Safety and Health Administration (OSHA) is the main federal regulatory agency charged with the health and safety of workplaces for employees in the United States. OSHA was created in 1970 from the Occupational Safety Health Act. The acts' stated goal is to insure that every working person in the United States has safe and healthy working conditions. The law has given employees a wide range of rights in regard to workplace safety. One of these rights requires companies to reduce risks in the workplace, and if there are risks, then employees have the right to fight for improvements.

OSHA currently has approximately 2,200 inspectors who are responsible for the health and safety of more than 130 million workers, employed at more than 8 million workplaces across the country. This translates to about one compliance officer for every 59,000 workers. According to a report by the American Federation of Labor-Congress of Industrial Organizations (AFL–CIO), it would take OSHA 129 years to inspect all workplaces under its jurisdiction. Inspections are the main tool used to make sure that companies comply with safety standards that are set for each industry. Because OSHA is so strapped for inspectors, it allows many of the states to take over responsibility for inspections. Section 18 of the Occupational Safety and Health Act of 1970 encourages states to develop and operate proprietary job safety and health programs. OSHA approves and monitors state plans.

North Carolina, where Imperial Food Products was located, is one of the states that has a state-run OSHA program. Many of these states may have only conditional approval because they may not fully comply with federal OSHA regulations. North Carolina was not in compliance and was on probation at the time of the Imperial Foods explosion. State-run programs are permitted to set penalties and priorities. North Carolina has historically minimized the penalties for health and safety violations. For example, many of the maximum fines in North Carolina are only a fraction of the federal fine standards. The Imperial Foods plant never had a safety inspection during its 11 years of operation, which shows the complete failure of the North Carolina OSHA inspectors.

OSHA requires that all work sites post OSHA's phone number or the state-equivalent phone number so that employees know whom to contact to report safety violations. At the Imperial Food Products plant, the poster listed a number that was disconnected. Dozens of other safety violations were also evident at the plant, including a lack of fire alarms and a sprinkler system, in addition to the blocked and locked doors. By law, in the case of a fire, exits should be clearly marked and known to employees. Federal OSHA law is even stronger in language. Every exit must be well lit, door passages and stairways need to be clearly marked, and all doors must be unobstructed. This was not the case at the Imperial Food Products plant.

In September 1992, the owner of Imperial Food Products, Emmett Roe, age 65, pleaded guilty via a plea bargain to involuntary manslaughter. His son Brad was let off scot-free as part of the plea bargain. Imperial Foods was fined $808,150. The amount was smaller than potential federal penalties because North Carolina administers its safety program. The fine was still the highest in the history of North Carolina. Emmett Roe was sentenced to 20 years in prison for his responsibility in the deaths of 25 workers. This was one of the strongest punishments for a worker-safety violation at the time. Roe became eligible for parole in March 1994 and was released just less than four years into his sentence.

The Hamlet factory was close and lobbyists working for the insurance companies succeeded in having legislation passed that capped the compensation paid for the injuries and deaths caused by the fire. New job safety and whistleblower laws were passed only under the threat of federal agencies imposing their own regulations if the state legislatures proved unable to do so. The factory fire left a lasting legacy, memorialized in film, song, and poetry, and when a memorial was held in 2000, less than 10 years later, there were few survivors left to attend.

Industrial Espionage

Industrial espionage is industrial spying, the secret gathering of proprietary information such as trade secrets to advance a business purpose. The collecting of information or intelligence is not unique to the past century, but the methods used are as unique as the information sought. With the end of the Cold War, what had been the trade of national security spies became the craft of industrial spies working for corporations. Industrial secrets make Coke and Pepsi, for example, unique products within the business world. Government research into space exploration has produced technology that is worth millions on the open market.

The Federal Bureau of Investigation (FBI) is responsible for investigating violations of federal laws, and it distinguishes industrial espionage from economic espionage by who is doing the spying. The FBI reports that the theft of trade secrets occurs when someone knowingly performs targeting or acquisition of trade secrets or intends to convert a trade secret to knowingly benefit anyone other than the owner. Economic espionage occurs when someone knowingly performs targeting or acquisition of trade secrets to knowingly benefit any foreign government, foreign instrumentality, or foreign agent. With some countries, it is difficult to separate the corporation and its many entities from the government.

The U.S. Department of Commerce, National Institute of Standards and Technology's Computer Systems Laboratory (CSL), in its March 1994 bulletin, described the two terms a little differently. According to the CSL, industrial espionage involves the collection of proprietary data from private corporations or government agencies for the benefit of another company or organization, perpetrated either by companies seeking to improve their competitive advantage or by governments seeking to aid their domestic industries. The bulletin then described economic espionage as foreign industrial espionage carried out by a government. Businesses and governmental organizations will not always agree on the precise meaning of the two terms. However, when a foreign government is involved, it is economic espionage.

Business Intelligence

To understand industrial espionage, it is important to understand the term *business intelligence*, also known as competitive intelligence. The gathering of business intelligence or information about another company in an open-source environment is a legal part of strong business acumen. Certain industries within the United States have always seen strong competition among the key companies. The photocopier, fast-food, computer, auto, music, cell phone, and defense-related industries have all had their share of legal intelligence gathering and competition. Each of the companies would gather information (intelligence) on marketing strategy, the direction of new products, and what features a new product will have. It is important for each company to be on the correct track with its product lines. Gathering intelligence on the sales, costs, profits, and respective marketing strategies provides the answer. Most of this intelligence is available in open sources and is found in business reports, newspapers, Securities and Exchange Commission filings, corporate annual reports, Department of Commerce reports, congressional committee reports, and Internet postings.

Industrial Espionage Law and Enforcement

Industrial espionage is the typical white-collar crime because it involves the theft and/or fraudulent conversion of trade secrets and other similar secret proprietary data entrusted to someone who breaches a position of trust. Prior to the passage of the Economic Espionage Act of 1996, there were few laws that directly focused on criminal conduct involving the theft of trade secrets by one corporation from another.

The U.S. Criminal Code, Chapter 90, is for the protection of trade secrets. The code defines a trade secret as the following:

> . . . all forms and types of financial, business, scientific, technical, economic, or engineering information, including patterns, plans, compilations, program devices, formulas, designs, prototypes, methods, techniques, processes, procedures, programs, codes, whether tangible or intangible, and whether or how stored, compiled, or memorialized physically, electronically, graphically, photographically, or in writing. . . .

Title 18 of the Criminal Code has several sections that are on point. Section 1832 focuses primarily on individual actors/corporations that steal trade secrets for corporate advantage. Section 1831 is primarily directed at foreign governments or agents.

In addition to these criminal violations, Section 1836 provides for civil injunctive relief against any individual or organization that violates trade secret laws. "Protection of trade secrets" laws also apply to conduct occurring outside the United States (Section 1837). Criminal penalties for violations can include a prison term of up to 15 years and fines up to $10 million per offense.

There are more sections of the U.S. Criminal Code that can be applied to industrial espionage violations, as well as various sections of U.S. export-control laws. Three other related laws involve counterfeiting: the Trademark Counterfeiting Act of 1984, Anti-Counterfeiting Consumer Protection Act of 1996, and Stop Counterfeiting in Manufactured Goods Act (2006).

The FBI has noted that U.S. companies lost more than $13 billion to trade secret theft in just six months in 2012, and one American corporation lost $1 billion of intellectual property in just a few days. Over a six-year period, Dow Chemical lost $100 million of insecticide research, DuPont lost $400 million of chemical formulas, Motorola lost $600 million of proprietary data, and Valspar lost $20 million of paint formulas. McAfee, a software data company, estimated that there were worldwide losses of $1 trillion in 2008 because of data leaks. In one of over 50 lawsuits filed by Apple against Samsung Electronics Corp. Ltd. in 10 countries, Apple won a recovery of over $1 billion in August 2012 for the theft of trade secrets and intellectual property regarding technical design information of its iPhone and tablets.

Insider Theft Case Examples

The FBI estimates that $100 billion is lost each year to industrial espionage as a result of competitors who target the technology successes of other companies. Companies find it cheaper to steal ideas than to produce them. The following are a few recent insider theft cases involving industrial espionage highlighted by the FBI.

An engineer became disgruntled and was fired from his job based on poor performance. He signed statements affirming he had returned all proprietary information to his employer and was reminded of nondisclosure policies. He kept numerous computer files and trade secrets before entering into a consulting agreement with a rival company.

After accepting a job in February 2009, an employee downloaded trade secrets from his employer's secured computer system for several months prior to his resignation. The stolen trade secrets were worth between $7 and $20 million.

An engineer employed by Turbine Engines Components Technologies Corporation (TECT) in Georgia took approximately 100 computer discs containing multiple pieces of information considered trade secrets from TECT. He was later employed by Precision Components International (PCI) in Georgia, a competitor of TECT. He admitted that providing the information could be considered industrial espionage. TECT suffered losses not exceeding $14 million. U.S. Attorney Michael Moore said, "This type of industrial espionage is a serious matter, especially when it involves the production of parts for our military aircraft."

A former employee of Goldman Sachs was convicted for theft of trade secrets in 2010. Media reports have indicated that Goldman Sachs made in excess of $300 million in one year through its use of high-frequency program trading and would not license the software for anything less than $1 billion.

Two brothers agreed to sell information about Pittsburgh Plate Glass (PPG) for $1,000 to a Pittsburgh agent posing as a representative of Owens-Corning, in Toledo, Ohio. They were charged under Title 18, United States Code, Section 1832 (18 U.S.C. 1832; Theft of Trade Secrets).

A 30-year employee of the Eastman Kodak Corporation established a consulting firm and hired many former Kodak employees. He stole a considerable amount of Kodak trade secret and proprietary information for use at his firm. The market share at risk could have been in the billions of dollars.

In 2011, there were numerous trade-secret cases resulting in civil action to preserve information. Three of those cases were *Design Insights Inc. v. Sentia Group Inc.*, *Tewari De-Ox Systems Inc. v. Mountain States/Rosen LLC*, and *Avid Air Helicopter Supply Inc. v. Rolls-Royce Corp*. In a trade-secret theft claim by MGA Entertainment in U.S. district court, Mattel Inc. was ordered to pay $310 million in damages regarding the Bratz line of dolls. Mattel is alleged to have had an intelligence unit in which members traveled with fake identities, gaining entrance to rivals' confidential product briefings and using spy cameras to film secret demonstrations of computer models of toys.

In December 2011, *Bloomberg News* reported that the computer networks of at least 760 companies were compromised over the last decade by cyber spies. The companies ranged from some of the largest corporations to niche innovators in sectors like aerospace, semiconductors, pharmaceuticals, and biotechnology. An estimate of the value of the blueprints, chemical formulas, and other material stolen from U.S. corporate computers in the last year reached almost $500 billion.

Industrial Revolution

The Industrial Revolution of the late 18th and early 19th centuries marked the most profound transformation of human culture since the agricultural revolution, which changed human society from nomadic hunting and gathering to settled agricultural communities. All aspects of human life changed during the Industrial Revolution. It transformed the economic system of production from hand tools and handmade items to machine-manufactured and mass-produced goods, moving Europe from an agricultural and rural economy to a capitalist and urban economy, and from a household, family-based economy to an industrial economy. It changed human labor, consumption, family and social structure, and even the emotional and intellectual functioning of individuals. The abandonment of the family economy was the most dramatic change that Europe had ever seen, and the world is still struggling with these changes in the 21st century. The Industrial Revolution also marks the introduction of white-collar crime, as class delineations of professionals/managers (white collars) and workers (blue collars) became more distinct as economies industrialized.

Rise of Technology

Technological revolutions have punctuated history. In Europe during the 12th and 13th centuries, technological knowledge exploded, bringing about changes in production and labor. Methods of making glass, clocks, and chemicals advanced significantly during the 16th and 17th centuries, and by the mid-18th century, the state and guild resistance to industrialization had weakened significantly in England and France. Popular interest in industrialization resembled the wave of enthusiasm that had welcomed experimental agriculture a century earlier.

Originally, the 18th-century Industrial Revolution referred to the technological developments between 1750 and 1830 that transformed Great Britain from a largely rural, agricultural population to an urban manufacturing society. This Industrial Revolution started in England because England had led the way in developing social and technological innovations. This wave of industrialization spread to other European countries and America during the 19th century, and other countries, like Russia and Japan, experienced their Industrial Revolutions during the first half of the 20th century.

The English Parliament inspired much of the 18th-century Industrial Revolution by permitting lands that had been held in common by tenant farmers to be enclosed into private farms. These enclosure laws increased agricultural production and increased the urban population in England by forcing many landless farmers to move into cities. The English merchant and capitalist interests firmly controlled Parliament, which passed much legislation favoring mercantile and capitalist interests.

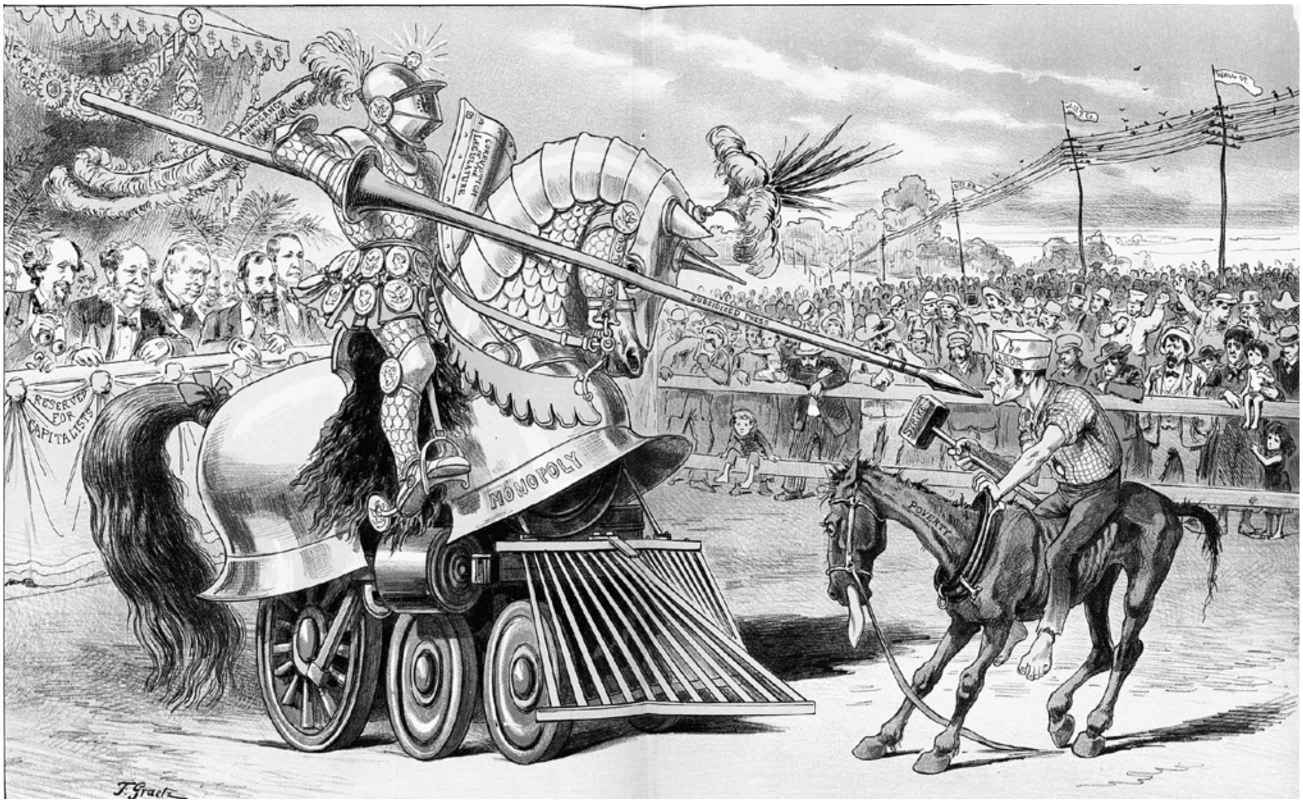
England acquired new overseas territory in every 18th century war that it fought, and during this time, mercantilism thrived in England. Also, England had come to monopolize overseas trade, including trade with its North American colonies. In the 1740s, one-half of all British exports went to America, but England also began to control the South American and the Indian trade. All this trade produced the largest merchant marine in the world, along with a navy to protect this merchant marine fleet. England was able to dominate the new capitalist economy through its navy.

Inventors also contributed to the English Industrial Revolution. The first factories appeared in 1740, and they concentrated on textile production. James Watt and Thomas Newcomen developed the steam engine, James Hargreaves the spinning jenny, Richard Arkwright the water frame, and John Kay the flying shuttle and carding machine. From the 1790s to the 1830s, more than 100,000 power looms with 9,330,000 spindles were put into service in England and Scotland. British success with steam locomotion encouraged the building of railroads in most European countries, often with British capital, equipment, and technicians. Britain exported its railroad expertise, and after 1842, France began constructing its railroad system. Russia, Canada, and the United States built railroads to link communities and move freight and passengers. In Germany, railroads helped bring about political and economic integration.

In 1840, the British government established a penny post on all letters after someone figured out that handling, and not the distance the letters traveled, determined the cost of mail delivery. All letters weighing a half-ounce or less could be carried for an English penny. By 1875, the Universal Postal Union had been brought about to send mail between foreign countries. In 1871, telegraph cables reached from London to Australia, and messages could be flashed halfway around the world in a matter of a few minutes.

American Industry

The United States simultaneously fought its political revolution with Britain and the first skirmishes in the Industrial Revolution. America had the closest ties with Great Britain and its expanding industrial capacity. The factory system that had taken root in England revolutionized the manufacture of



In the August 1, 1883 issue of Puck*, an illustration of a jousting tournament pits an oversized knight on a locomotive-like horse—a ferocious monopoly—against a meek, barefoot man and horse representing labor and poverty. His ineffectual sledgehammer is labeled "strike." Capitalists such as Cyrus W. Field, William H. Vanderbilt, and Jay Gould watch from the stands. During the Industrial Revolution, many industrial giants spurred great economic growth, but monopolies grew out of extreme approaches to capitalism.*

cotton, thread, and cloth. Improvements in weaving and spinning created a demand for new carding devices in America and England. The most important innovation, steam power, developed after the appearance of James Watt's advanced steam engine, patented in 1769. Despite the efforts of the British government to prevent the export of English industrial technology, knowledge of the new engines spread quickly to other countries, usually when people emigrated with knowledge of the technology used in British factories.

America received most of the benefits of English technology because more immigrants came to American from Great Britain than from any other country. Samuel Slater used the knowledge that he had gained in England to build a spinning mill for the Quaker merchant Moses Brown in Pawtucket, Rhode Island, in 1790, and it was the first modern factory in America. From 1770 on, various men had experimented with engines on boats in England, Scotland, and the United States. The development of the steamboat brought a new era in river transportation. Englishman James Watt and his steam engine helped hasten the advent of steamboat transportation, as well as locomotives and mill machinery. Inventor Robert Fulton and promoter Robert R. Livingston were responsible for perfecting the steamboat and bringing it to the attention of their fellow Americans.

The *Clermont*, equipped with paddle wheels and an English-built engine, chugged up the Hudson River during the summer of 1807, demonstrating that steam navigation was the wave of the future. Legend had it that people on the bank, seeing the sparks from the *Clermont*'s smokestack, thought that the devil had sailed by on a raft.

By the 1840s, steamships regularly crossed the North Atlantic. Steamship traffic increased tremendously during the last half of the 19th century, and improvements in hull design, engines, and fuel further increased traffic. By 1839, the propeller replaced the paddle wheel, steel replaced iron in the hull, and multicylinder engines appeared. After 1920, the smaller and lighter diesel engine marked another major change.

Like England, America produced inventors. Oliver Evans of Delaware devised several ingenious new machines, including an automated flour mill, a machine to make card teeth for carding wool, and improvements in the steam engine. Eli Whitney transformed both cotton production and weapons manufacturing. The invention of the cotton gin changed the economy of the south and helped New England entrepreneurs develop an American textile industry in the 1820s and 1830s. It also helped drive a wedge between the nation's two most populous regions, with the north became increasingly industrial and the south more firmly agricultural. This industrial division contributed to the Civil War and the eventual Union victory. Whitney also developed a machine to make each part of a gun according to an exact pattern. This made it possible to divide tasks among several workers, and one person could assemble a weapon out of parts made by several others. Before long, manufacturers of sewing machines, clocks, and other complicated products were using the same system.

Unlike England, the United States had no established transportation system to transport raw materials to factories and finished goods to markets, so the country set out to create one and increase its shipping business. Between 1789 and 1810, the total tonnage of American vessels engaged in overseas traffic rose from less than 125,000 to nearly 1 million. American ships had carried only 30 percent of the country's exports in 1789, but by 1810, they were carrying over 90 percent. American entrepreneurs also developed new markets at home by improving transportation between the states and into the interior of the continent.

Meanwhile, the turnpike era began. In 1792, a company built a toll road of crushed rock that ran 60 miles from Philadelphia to Lancaster, Pennsylvania. The road was so popular that several other companies built turnpikes. The turnpikes had to turn a profit, and construction costs had to be low enough, and traffic heavy enough, to ensure a profit. As a result of these economic restrictions, turnpikes radiated from eastern cities and ran short distances through thickly settled areas. It took another century before state governments and the federal government would finance highways over the mountains and into the less-populated areas. After the invention of the steam engine, America began to build railroads, and by the time of the Civil War, the American economy relied in part on railroads and urban construction.

American industry had built a solid foundation before the Civil War, but during the three decades after the Civil War, the national economy raced far ahead of the steel rails of the first transcontinental railroad, completed in 1869. The remarkable growth increased the wealth and improved the lives of many Americans. Industrial titans, some of the first and most notorious white-collar criminals, and a growing middle class enjoyed prosperity without precedent in American history, but workers, farmers, and others experienced poverty and social chaos.

One of the most important factors leading to the post–Civil War transformation was the transformation of iron and steel production in the late 19th century. It took capitalists and monopolists like Andrew Carnegie, John D. Rockefeller, and J. Pierpont Morgan to furnish the capital and knowledge to build companies like U.S. Steel and the Standard Oil Company, to build the banking industry, and to ensure substantial American economic growth. By the end of the 19th century, as a result of corporate consolidation, 1 percent of the corporations in America controlled more than 33 percent of the manufacturing production. A system of economic organization was emerging that lodged enormous power in the hands of very few men: the great bankers of New York, such as Morgan, and industrial titans, such as Rockefeller, all of whom, if alive today, would be brought up on major corporate criminal charges.

Henry Ford and his mass production of the automobile in the early 20th century sparked more economic and social changes in American society. Whether or not this relentless concentration of economic power was the only way, or the best way, to promote industrial expansion became a major source of debate in America in the late 19th century and into the present.

Effects of the Industrial Revolution

The Industrial Revolution turned out to be a mixed technological and social blessing. It created an increase in population and urbanization and produced new social classes. England and Germany enjoyed a population growth rate of more than 1 percent annually, a rate that doubled the population about every 70 years. In the United States, the increase averaged to more than 3 percent, a rate that could have produced disastrous results if the continent had not been practically empty of people at the start of the process and overflowing with natural resources. Only the population of France, among the major power, remained fairly static after the 18th century. The growth of medical science and public health measures during the Industrial Revolution helped decrease the death rate and added to the population base.

The Industrial Revolution transformed the population from a rural to an urban base. By the mid-19th century, half of English people lived in cities, and by the end of the century, this was also true of other European countries. Between 1800 and 1950, most large Europeans cities enjoyed spectacular growth. At the beginning of the 19th century, there were scarcely two dozen cities in Europe with a population of 100,000, but by 1900, more than 150 cities in Europe had reached that size.

"We cannot all live in cities, yet nearly all seem determined to do so," Horace Greeley wrote shortly after the Civil War. America's urban population increased sevenfold in the 50 years after the Civil War, and the 1920 census revealed that for the first time, a majority of the American people lived in urban areas.

Around the industrial world, middle classes expanded, and to varying degrees came to dominate the economies of their nations. Urban living intensified conditions like poverty, lack of good housing, and class divisions. Factory towns in England and America tended to spawn tenements, and the mining towns produced rows of company cottages providing little but minimal shelter. Unlike rural landlords and local aristocrats, factory owners and managers were usually remote and inaccessible, and they tended to regard laborers as commodities, not as human beings. They dealt with their workers impersonally, and there was a growing schism between the two classes. Working men and women all over the world grew to think of themselves as a distinct class with common goals and interests. Clashes with management created social turbulence.

The Industrial Revolution created a new working class that included all the men, women, and children laboring in the textile mills, pottery works, and mines. Often, skilled artisans were demoted to laborers as machines began to mass produce the products formerly made by hand. As a rule, wages were low, hours were long, and working conditions were unpleasant and dangerous. The nature of labor changed. It was fixed, disciplined, routinized work with a fixed and rigid schedule, a sharp contrast to the varied seasonal working pattern of the rural economy.

The industrial giants of the late 19th century in America and Europe created economic systems that spurred great economic growth. They integrated operations, cut costs, built a great industrial infrastructure, stimulated new markets, created jobs for a vast new pool of unskilled workers, and opened the way to large-scale mass production. They also laid the foundation for some of the greatest public controversies of their era. Modern industrial cities produced great increases in pollution, crime, and infectious disease, as well as culture and economic opportunity. The problems of poverty, the degradation of the environment, the specter of monopoly, the question of wages and working conditions, the struggle to unionize, strikes—all of these creations of the Industrial Revolution are still being addressed in the 21st century.

Infant Formula

Violations of World Health Assembly Codes for marketing infant formula have occurred for decades by most of the prominent companies that make infant formula, despite known negative health impacts to babies who are bottle fed. Companies continue to establish the rules in marketing infant formula, rather than abiding by standards that have been agreed to by 118 countries.

Extensive infant formula marketing targeted mothers from the 1950s through the 1970s, primarily in developing countries, in an attempt to increase sales of the product. Advertisements bombarded messages about the benefits that infant formula offered, leading many mothers to incorrectly believe that formula was healthier for their newborns, a message that is false and misleading. Breast feeding babies exclusively from birth to 6 months of age dramatically increases their likelihood for survival and promotes healthy cognitive and physical development. Babies who are bottle fed are more vulnerable to disease and death because of challenges for some families in attaining safe, clean drinking water to mix with the formula. Women who cease breast-feeding quickly have decreased or no milk supply.

Nestlé is the most famous company associated with unethical practices related to infant formula, primarily for its aggressive marketing implemented in developing countries to recruit new mothers to use formula rather than breast-feeding. Because of the known harm that could be caused to children, Nestlé was met with well-organized boycotts in the 1970s to protest the corporate decisions to promote the use of infant formula rather than breast-feeding. Nestlé's priorities and business tactics are often a prominent point of discussion in business ethics classes.

The World Health Assembly's International Code of Marketing Breast Milk Substitutes was authored in 1981 and was intended to serve as a minimum requirement for the marketing of infant formula. The code states that breast milk should be promoted as the healthiest and safest choice to feed babies, no advertised information should contradict these facts, and nothing should undermine the prioritization of breast-feeding. The primary goal of the code was that commercial baby milk would be used only by those who truly needed it. A total of 118 countries originally signed on with the code; the United States was the sole country that did not. Although countries demonstrated support for the code, infant formula companies have repeatedly violated the code in countries around the world.

Baby Food Action Network

The International Baby Food Action Network (IBFAN), based in the United Kingdom, was created in the late 1970s as a watchdog and advocacy group to monitor companies' adherence to the code. Save the Children has also been highly active in monitoring companies that produce and market infant formula. Recent assessments have identified thousands of code violations in almost 70 different countries. Nestlé continues to be identified as the company with the worst record of violations, followed by Numico. Numico reports that in the countries where there is national legislation that dictates behavior, it will follow that policy; and in countries where there is no such legislation, it will follow the policies set by the company. Numico has created guiding principles to which the company will adhere. One of the common differences between the code and corporate policies is the age at which infant formula can be marketed to babies.

For example, much research recommends exclusive breast-feeding until a baby is 6 months old. The guiding principles say that infant formula will not be marketed in the first months of life, avoiding a set timeline and purposefully avoiding the 6-month mark. A second common violation is manipulating language. The code addresses all breast milk substitutes and sets clear expectations on how these products should and should not be marketed, but Nestlé extracted select articles from the code to imply that it only needed to adhere to the standards of the code in marketing its infant formula, and not other products that are milk substitutes. Wyeth was convicted for illegal advertising of its products in the United Kingdom in 2003, and the judge accused the company of committing this crime deliberately and cynically. These are three examples of unethical business practices that violate policy and the code from three companies. Many companies that produce and market infant formula have violated the code in multiple ways.
