This exciting new 'conceptual language' is not really ever replaced; newly acquired languages instead are spoken with its accent. From here, Jameson's thinking moves to his belief that 'all conceptuality is figurative' (2), and that his 'list of language conversions ... would be fairly long' and include 'structuralism, Greimasian semiotics, Frankfurt School dialectics and sentences (but also Proustian sentences), Heideggerianism, Deleuzianism, Lacanianism (cum Mallarmé)' (3).

To do justice to the concept and practice of the interview, its form too must be taken into account, and here, in the structure of the interview, thought is shown to be inevitably transformed: concepts are turned into opinions, 'epistemes are processed into doxa', and 'intellectual commitments are transformed into so many optional thoughts or "ideas" that can be compared or contrasted with others of the same type, which one can swap like stamps or baseball cards, or ferociously defend like your favorite clothing or haircut' (4). This flattening of interests necessarily entails a loss of precision: ideas are reified into slogans and 'the opinion-commodity' is crystallized 'into a catchphrase that can be appealed to in any context, and reused over and over again without any wear and tear' (5). This crystallization, all too familiar within

our contemporary public sphere, with its 24-hour news and opinion cycle, returns us to the question of method and a self-reflexivity about the freezing of thought, of the movement between thinking and the ‘thematized opinions and stereotypes’, the ‘named idea’. Again, as with the dialectic, the choice is not either one or the other, but a recognition of an irresolvable tension between the two:

If this is understood as a tension that can never be resolved, however – as an interminable alternation between the wandering mind and the stylistic or linguistic freeze frame – then the customary search for a resolution might be converted into a method for perpetuating the alternation itself and keeping the whole process going, as something we have to use cleverly since we cannot do away with it, at least in this society. (6)

With echoes of Sartre’s *Search for a Method*, the problem of method forms no less a crux of the matter than the concept or object of study. Form and content are shown to be indissociable, and, in turn, subject to their historical moment, thereby necessitating a method that perpetrates nothing short of the movement of thought at the very moment when such movement, historically, seems impossible. The persistent give and take in this small occasional piece, the ways in which the essay is about thinking – about what thinking looks like, about how thought works – defines Jameson’s corpus as a whole. In short, to understand Jameson is to understand not only his thought but also the shape of his thought, which, as he himself notes, is at once deeply indebted to the Frankfurt School – and Adorno specifically – and replete with multiple other accents.

The acquisition of languages can be seen as so many learning processes (to borrow a notion from another of Jameson’s influences, Alexander Kluge) shaping Jameson’s intellectual development and worldview. After graduating from Haverford College in 1954, Jameson traveled in Europe where he became interested in continental philosophy and structuralism. As a doctoral student at Yale in the 1950s, Jameson then studied under Erich Auerbach

and wrote his dissertation, which would become his first book, on *Sartre: The Origins of a Style* (1961). In the 1960s, amid the anti-war movement, the rise of the New Left, and the Cuban Revolution, he increasingly focused on Marxist literary theory and critical theory, and published his seminal *Marxism and Form* in 1971. Central to his ongoing interest in and development of the Frankfurt School tradition is its emphasis on cultural criticism as integral to Marxism; its articulation of the dialectic; the emphasis on form; and the concept of reification. In the Introduction to *The Ideologies of Theory, Volume 1*, a collection of essays that spans the 1970s–80s, Jameson reflects on his own intellectual path and describes the aim of his essays to

stage the attractiveness of a worldview – the only one, I think – for which those multiple dimensions and temporalities we sometimes crudely call the political, the history of forms, the dynamics of desire, the class texture of the social, the originality of the act, and geological rhythms of human history, all unimaginably coexist. (1988b: xxix)

While he goes on to note a shift in his thinking ‘from the vertical to the horizontal’, or from the ‘multiple dimensions of a text’ to the ‘multiple interweavings’ of texts within history, the dimensions and temporalities he lists here – so many of which equally define the Frankfurt School – continue to capture the essential and interconnected strands of Jameson’s intellectual world.

Holding together what can seem like an inexhaustible range of interests and commitments is the surprise of the dialectic, the unexpected reversal, the persistent self-reflexivity, what Jameson calls its ‘un-naturality ... its provocative and perverse challenge to common-sense’ (2009: 4). Surprise and provocation, the unsettling of the given and critical doxa: these processes mark Jameson’s forays into everything from realism, modernism and postmodernism, and their attendant economic and political histories, to TV and science fiction, architecture and film, theory and Marxism.

## MARXISM AND POSTMODERNITY

If a Marxist literary critic in twenty-first-century America can be said to have a claim to fame, Jameson's undoubtedly would be the publication of his book on postmodernism. While prior books, most prominently *Marxism and Form* and *The Political Unconscious* garnered critical praise, *Postmodernism, or, The Cultural Logic of Late Capitalism* marked Jameson's entrance into the larger public sphere and the debates taking place both inside and outside the academy about contemporary aesthetics and consumer society. *Postmodernism* opens with a signature dialectical move on Jameson's part: 'It is safest to grasp the concept of the postmodern', he begins, 'as an attempt to think the present historically in an age that has forgotten how to think historically in the first place' (1991: ix). Unlike those who had preceded him in the postmodernism debate, Jameson's key contribution, as Sara Danus (2008) has put it, was to bring postmodernism into the analysis of postmodernism. This analysis carries through on the oft-quoted opening to *The Political Unconscious* (1981), 'Always historicize!'. For what postmodernism brings to postmodernism is the means of understanding the multiplicitous cultural signs of postmodern life historically – from the new architecture and contemporary film to Theory with a capital 'T' and new forms of subjectivity. Rather than a proliferation of disparate or varied styles, postmodernism, in Jameson's account, is a 'cultural logic', unified by the economic structure of late capitalism. Against a variety of other assessments of postmodernism, beginning as early as Charles Olson's account in 1948 and extending to Lyotard's and Habermas's respective theorizations in 1979/80, Jameson, as Perry Anderson frames it, 'won [the discursive victory ... over the term postmodernism] ... because the cognitive mapping of the contemporary world it offered caught so unforgettably – at once lyrically and caustically – the imaginative structures and

lived experience of the time, and their boundary conditions' (1998: 66).

More so than any other account of these imaginative structures and lived experiences of postmodernism, Jameson's reading of the Bonaventure Hotel in Los Angeles captured the new reality of postmodernism. In a virtual tour of the hotel, taking us famously up its series of elevators, and into the glassed, reflective spaces now synonymous with major metropolitan hotels, Jameson argues that the dizzying effects of the Bonaventure's interior duplicate our experience of postmodern space and our inability to map that space, or, in Lukácsian terms, to map the global totality. This sense of disorientation, as Jameson underscores, has dire political consequences. The disjuncture between our own bodies and the built environment of the Bonaventure 'can itself stand as the symbol and analogon of that even sharper dilemma which is the incapacity of our minds, at least at present, to map the great global multinational and decentered communicational network in which we find ourselves caught as individual subjects' (1991: 44). Jameson goes so far as to suggest that these new built spaces require us to grow new organs to catch up with these new cognitive and perceptual challenges. His emphasis, moreover, on 'cognitive mapping' underscores his commitment to the pedagogical function of art, an aspect of Aristotle's aesthetics that has gone out of favor to our collective detriment. The importance of aesthetics as pedagogy or of didactic art is developed later explicitly in Jameson's work on geopolitical aesthetics and especially in his discussion of the Filipino filmmaker Kidlat Tahimik, as well as in his book-length study of Brecht (of which more below).

The concept of 'cognitive mapping' derives from an earlier essay of Jameson's, simply titled 'Cognitive Mapping' (1988a). This first formulation of the concept is useful for highlighting a number of key aspects of Jameson's thinking about space. Crucially, Jameson proposes here a more general spatial analysis of culture, identifying the aesthetics

of realism, modernism, and postmodernism respectively in terms of the historical stages of capitalism out of which each arose and the type of space each of these historical stages produced. Realism is shown to coincide with classical or market capitalism and a spatial grid, modernism with market capital or Lenin's 'stage of imperialism', and the increasing contradiction between lived experience and structure, and postmodernism, as we have seen, with a fully global late capitalism and a seemingly unmappable space. Central to this schema is Jameson's commitment to periodization, and the idea that new modes of production create new aesthetic possibilities and challenges. (In *A Singular Modernity*, he directly states that 'We cannot not periodize' (2002: 29).) From the moment of modernism to the present, specifically, problems of figuration become acute as

the phenomenological experience of the individual subject – traditionally, the supreme raw materials of the work of art – becomes limited to a tiny corner of the social world, a fixed-camera view of a certain section of London or the countryside or whatever. But the truth of that experience no longer coincides with the place in which it takes place. (1988a: 349)

Modernist aesthetics grapple with this impasse, searching for new forms to express this new reality, this new social space and the experience of it. Hegel's distinction between essence and appearance is transcoded here into the distinction between lived experience and structure, as the 'limited daily experience of London ... is bound up with the whole colonial system of the British Empire that determines the very quality of the individual's subjective life', even as 'those structural coordinates are no longer accessible to immediate lived experience' (349). With the move to multinational or 'late capitalism', the gap between lived experience and structure widens and is modified.

As Jameson's analysis of the Bonaventure dramatizes, postmodernity ushers in an increasingly spatial politics of globalization,

with its own problems of figuration. In *Valences of the Dialectic*, Jameson gestures toward a spatial dialectic in response to postmodernity, arguing that

[g]lobalization has above all meant the association of space and spatial distance in production itself, whether in terms of outsourcing, of the uneven development of producing and consuming nations, or the migration of labor, as well as the black holes of unemployment, famine, and unspeakable violence into which whole surfaces of the current globe suddenly fall. (2009: 66)

Certainly, as he clarifies, time has not disappeared as a result of space becoming dominant; rather the ratio between them has changed. But, significantly, the political challenges of globalization when seen in spatial terms are considerable.

Not least, they require new kinds of thinking within Marxism. *Marxism and Form*, as we have seen, begins with the assertion that a revitalized dialectical criticism is in order to respond to the changed conditions of postindustrial society: if in the 1930s, Marxist criticism had a 'simpler Europe and America' to deal with in which 'social conflict was sharpened and more clearly visible' (1971: xvii), by the time of the 1970s, the new realities of a (first) world in which 'as a service economy we are henceforth so far removed from the realities of production and work on the world that we inhabit a dream world of artificial stimuli and televised experience' (xviii) necessarily requires new approaches and methods within Marxism. It should be noted, as well, that Jameson really made known for the first time the tradition of Western Marxism and the Frankfurt School, in particular, in the United States – in his attention, in *Marxism and Form*, to Adorno, Benjamin, and Sartre, as well as Marcuse, Bloch, and Lukács, all of whom have continued to influence his thinking.

Key to the changed condition of the 1970s and 80s is the dominance of culture and hence of aesthetics. In a revelatory exchange between Nancy Fraser and Jameson after he delivered his talk on 'Cognitive Mapping', she presses him on

his insistence that cognitive mapping is an aesthetic rather than a social scientific project, to which he responds: 'Now I think that you can teach people how this or that view of the world is to be thought or conceptualized, but the real problem is that it is increasingly hard for people to put that together with their own experience as individual psychological subjects, in daily life' (1988a: 358). Unlike social scientific approaches, then, which 'model the real independent of its relations to individual subjects ... [a]esthetics is something that addresses individual experience rather than something that conceptualizes the real in a more abstract way' (358). The relationship between lived experience and structure is necessarily mediated and requires new ways of thinking, as both lived experience and structure are radically transformed under late capitalism. In other words, unless Marxism wishes to risk obsolescence, it too must change.

At the same time, Marxism is not simply one of many equally viable methods of criticism. For Jameson this means, as he provocatively claims in *The Political Unconscious*, that Marxism – or 'the political perspective' – is not an 'optional auxiliary to other interpretive methods ... but rather ... the absolute horizon of all reading and all interpretation' (1981: 17). A claim that galvanized Marxist literary criticism, and criticism of Marxism, especially more recently, it was equally inciting for its use of 'absolute', and its embrace, more generally, of interpretation. In fact, the long opening chapter of *The Political Unconscious*, titled 'On Interpretation', is a ground-clearing tour de force, which not only subsumes all other interpretive methods, but also 'transcodes' the body of major contemporary theoretical work, from poststructuralism and semiotics to psychoanalysis and Althusserian Marxism. Althusser's notion of structural causality, in particular, grounds Jameson's conception of the three 'semantic horizons' of texts, or levels of interpretation, and their semi-autonomous relationship to each other: (1) historical events, (2) society, or

the 'constitutive tension or struggle between social classes', and (3) history in the 'vastest sense of the sequence of modes of production'. Each of these horizons registers a 'widening out of the sense of the social ground of a text' and represents 'distinct moments of the process of interpretation' (1981: 75). They also mark how history enters a text, and against the current of the day – characterized by Nietzschean anti-interpretive stances such as those of Deleuze and Guattari and Foucault – insist on the necessity of a hermeneutical approach to texts precisely because of their multiply mediated horizons. This too is where overly deterministic models of causality, such as those of vulgar Marxism (and its base/superstructure architecture) and Hegelian expressive causality are shown to be inadequate to the task of modeling the overdetermined nature of social phenomena. Against older Marxist approaches to literature, Jameson constructs what Douglas Kellner calls a 'double hermeneutic' (1989:13): interpretation entails equally a 'negative' ideology critique and the 'positive' recognition of a Utopian impulse within texts, regardless of their overt political commitments.

In *The Political Unconscious*, Jameson frames the question of how a conservative ideology and a Utopian impulse can co-exist in a text in the following way: 'how is it possible for such a text to embody a properly Utopian impulse, or to resonate a universal value inconsistent with the narrower limits of class privilege which inform its more immediate ideological vocation?' (1981: 288). His 'solution' is to suggest that 'all class consciousness – or in other words, all ideology in the strongest sense, including the most exclusive forms of ruling-class consciousness just as much as that of oppositional or oppressed classes – is in its very nature Utopian' (289, emphasis in original). This is so because class consciousness is fundamentally an expression of class solidarity. But Jameson adds one crucial caveat: such a proposition is allegorical insofar as ruling-class collectivities, along with

other collectivities, are ‘*figures* for the ultimate concrete collective life of an achieved Utopian or classless society’ (291, emphasis in original). This sense of a Utopian impulse leads to the kinds of dialectical reversals or surprises that allow us to see contemporary and/or popular culture differently. Jameson’s attentiveness to Utopian desire or a Utopian impulse in high and low culture alike significantly challenges Adorno and Horkheimer’s famous account of ‘The Culture Industry’ in *The Dialectic of Enlightenment*. In contrast to the monolithic image of the ‘deceived masses’ who ‘immovably ... insist on the very ideology which enslaves them’ (2002: 133–4) in Adorno and Horkheimer’s analysis, Jameson proposes a more complex relationship to mass culture in which both repression and wish-fulfillment are present, in which, in other words, mass culture contains both negative and positive functions, at once tapping into Utopian desires even as it manipulates those desires. Moreover, Jameson works to undo the divide between high and low culture that grounds ‘The Culture Industry’ chapter. As he comments in ‘Reification and Utopia in Mass Culture’, ‘what is unsatisfactory about the Frankfurt School’s position is not its negative and critical apparatus, but rather the positive value on which the latter depends, namely the valorization of traditional modernist high art as the locus of some genuinely critical and subversive, “autonomous” aesthetic production’ (1990: 14). Instead, the opposition between mass culture and high culture needs to be understood dialectically; both, in Jameson’s account, must be seen as ‘twin and inseparable forms of the fission of aesthetic production under capitalism’ (14). In this view, and again in contrast to the Frankfurt School’s reading, modernism is no less ‘reactive’ than mass culture to the social crises of its day; what differs is their respective responses to the increasing commodification of everyday life and, by extension, art and culture. In the provocative readings of *Jaws* and *The Godfather* that follow this proposal for a new model of manipulation,

Jameson shows how these mass cultural Hollywood blockbusters engage Utopian desires for the collective, be it in the form of the partnership between Hooper and Brody in *Jaws* or the family in *The Godfather*. These films, like works of mass culture more generally, ‘cannot manipulate unless they offer some genuine shred of content as a fantasy bribe to the public about to be so manipulated’ (1990: 29) – a claim that extends even to phenomena as repellent as National Socialism, with its vision of the collective, or, in our contemporary moment, one might add, to the populism of the Tea Party, Trump, and Brexit. As Jameson underscores, such an approach to mass culture establishes a new and necessary realm of study for Marxist critics. He ends ‘Reification and Utopia in Mass Culture’ by emphasizing just how critical this change in orientation is:

To reawaken, in the midst of a privatized and psychologizing society, obsessed with commodities and bombarded by the ideological slogans of big business, some sense of the ineradicable drive towards collectivity that can be detected, no matter how faintly or feebly, in the most degraded works of mass culture just as surely as in the classics of modernism – is surely an indispensable precondition for any meaningful Marxist intervention in contemporary culture. (1990: 34)

Written in 1979, this claim serves much like a mission statement for Jameson’s work to date.

Recently, Jameson has further developed his notion of the Utopian impulse in the context of divergent texts and cultural forms ranging from Marx’s *Capital* to *The Wire*. In an essay that would become part of *Representing ‘Capital’*, Jameson distinguishes between Utopian texts that are ‘political’ insofar as they map or plan Utopias imaginable or achievable within our present system, and the Utopian impulse, which is ‘profoundly economic, everything in it, from the transformation of personal relations to that of production, of possession, of life itself, constitutes the attempt to imagine the life of a different mode of production

... of a different economic system' ('A New Reading of *Capital*', 2010: 8–9). Likewise, in *The Wire*, the HBO series that ran from 2002–2008, Jameson (2012) finds, amid the grim portrayal of postindustrial Baltimore, a Utopianism that co-exists with the series' realism. Residing in different collective visions in the multiple seasons of the series, including the labor leader, Frank Sobotka's plans to rebuild the Baltimore port (season 2), and Major Colvin's drug-free zone (season 3), this Utopianism is notable for its ability to break through in the realistic present in the plot rather than as fantasy or wish-fulfillment. The power of these plots rests in the fact that, in order to succeed, they would each require 'the Utopian (or revolutionary) transformation and reconstruction of all of society itself' (371). The series, in other words, not only reworks realism by creating a 'slight crack or rift' in the 'seamless necessity' that characterizes realist projects, but also provides a vision of a Utopian future that 'here and there breaks through, before reality and the present again close it down' (372). That this future is unrealizable within the limits of the present powerfully expresses the limits of the present.

In all of these readings, the imperative to historicize and to read dialectically shifts attention away from evaluative judgments toward an attempt to understand cultural forms and aesthetic movements, and their social, political, and economic coordinates, without taking a moralizing approach. The problem with such moralizing, as Jameson sees it, is two-fold: on the one hand, it prompts ahistorical thinking; on the other hand, it leads to sterile oppositions. The dialectic, he reminds us, 'is "beyond good and evil", in the sense of some easy taking of sides, whence the glacial and inhuman spirit of its historical vision' (1991: 62). In the context of postmodernism, specifically, repudiating or celebrating it are equally facile given that we are already fully within the thick of it. As a result, 'ideological judgment on postmodernism today necessarily implies,

one would think, a judgment on ourselves as well as on the artifacts in question: nor can an entire historical period, such as our own, be grasped in any adequate way by means of global moral judgments or their somewhat degraded equivalent, pop psychological diagnoses' (62). In short, there is no resting place in moral judgments; we must get on with the work of assessing our own cultural forms and ways of life in their dialectical relationship to the totality of relations structuring late capitalism. And while there have been changes even in the time since Jameson first wrote about postmodernism, we are still, in his estimate, within postmodernity: 'you can say that postmodernism is over, if you understand postmodernism in a narrow way, because art has certainly changed in many respects since the '80s. But I don't think that you can say that the whole historical period – the third stage of capitalism, I would like to call it – has come to an end, unless you are able to specify what has followed it' (Baumbach et al., 2016: 144).

## REPRESENTATION, ALLEGORY, AND POLITICS

The project of *Postmodernism* can be seen to inform Jameson's work, more broadly, given its commitment to (or its aim) of unearthing the historical content of aesthetic forms. Indeed, Jameson is currently in the process of completing a multi-volume series entitled *The Poetics of Social Forms* that includes the *Postmodernism* book, as well as *A Singular Modernity*, *Archaeologies of the Future*, and *The Antinomies of Realism*. It is notable that the series will include a book on allegory, which has been a central trope in Jameson's oeuvre, precisely because of its exceptional capacity to mediate between the individual and the social, a capacity shared by the aesthetic more generally. In one of his more controversial uses of the concept of allegory, Jameson argued in 'Third-World Literature

in the Era of Multinational Capitalism' that 'all third-world texts are necessarily ... allegorical, and in a very specific way: they are to be read as what I call *national allegories*' (1986: 69, emphasis in original). This assertion sparked controversy, especially among postcolonial scholars, who objected to what they saw to be the reductiveness of his claim that '*the story of the private individual destiny is always an allegory of the embattled situation of the public third-world culture and society*' (69, emphasis in original). They also saw his use of the category 'Third World' as homogenizing and Eurocentric. Jameson, however, understood this essay to be a 'pendant' to the postmodernism essay; the validity of its claims, for him, lay in articulating the fundamentally different relations informing First- and Third-World cognitive aesthetics, given the differential space of the world system, and the possibility still of a collective politics beyond the West. In short, Third-World aesthetics necessarily differ by dint of their relationship to the global order; hence, the possibilities of mapping the totality, with 'national allegory' being one form of that mapping, are different – a position that extends Georg Lukács's notion of the standpoint of the proletariat to First World–Third World relations and, as with Lukács's analysis, opens up space for a collective politics of dereification. It is worth noting, as well, that Jameson introduced the concept of 'national allegory' initially in his book on Wyndham Lewis, *Fables of Aggression: Wyndham Lewis, the Modernist as Fascist* (1979). National allegory, he argues there, 'should be understood as a formal attempt to bridge the increasing gap between the existential data of everyday life within a given nation-state and the structural tendency of monopoly capital to develop on a worldwide, essentially transnational scale' (94).

Despite older criticisms of his use of allegory and more recent turns against it as outmoded (to which I will return), Jameson stands by the notion and necessity of allegory as the means through which to represent

the unrepresentable. In a recent interview, Jameson clarifies what he means by allegory:

Saying that the world has a narrative structure does not mean that you can tell a simple story about it, or that there are representational techniques for translating realities into stories. Insisting on contradiction does not mean that anybody ever saw one, or that it would be easy to make a picture of whatever it is. So the insistence on allegory is an insistence on the difficulty, or even impossibility, of the representation of these deeper and essentially relational realities ... Allegory happens when you know you cannot represent something but you also cannot not do it. (2007: 195–6)

Capital, contradiction, globalization: these are all realities, but not realities that are 'out there' to be transparently represented; as 'relational realities' they pose distinct challenges to representation, with allegory being one mode of representation that addresses this challenge. Allegory and representation thus go hand in hand and offer one way of understanding the primacy of narrative for Jameson and his belief, as noted above, that 'all conceptuality is figurative'. This emphasis on the figurative equally applies to literature and philosophy, political theory and politics. As he comments about contemporary invocations of the multitude, 'Surely all of those collective words – *the people, the multitude, the nation, the masses*, and so forth – these are all representations – so is general will – and I think all of them are attempts to model something that's not representable' (2007: 230, emphasis in original). On the one hand, this insistence on the allegorical or the figurative puts the question of mediation at the heart of Jameson's Marxism. On the other hand, it firmly places aesthetics at the center rather than the periphery of a Marxist politics.

It is no accident then that Jameson's book on Marx's *Capital* is entitled *Representing 'Capital': A Reading of Volume One*. Both the 'representing' and the 'reading' in its title are integral to Jameson's understanding of *Capital* and capital. And with respect to both, there are new and surprising things to

be found in this urtext of Marxism. At the broadest level, there is a lesson to be learned about reading and interpretation more generally, and more specifically about reading the forms in which ideology appears: as Jameson characterizes Part One of *Capital*, it is a 'polemic waged against conventional forms of thought and language – the equation – which presupposes the possibility, indeed, the natural and inevitable existence, of this form, and thereby the plausibility of all the ideologies that issue from it' (2011: 22) – e.g. the notion of a just price or a just wage, as well as, in philosophy, epistemological or aesthetic conceptions of reflection. Again, the idea of any kind of empirical immediacy is shown to be deeply ideological, drawn to mere or false equivalences.

When we do read figurally, what we discover for our own time is the 'scandalous' claim that *Capital* is a book about unemployment – a category generally not understood in structural terms, i.e. as a primary rather than secondary feature of global capitalism. Seeing *Capital* in this way underscores the dialectical nature of capitalism – its unity of opposites, encapsulated in the at once immense productivity and immiseration that capital generates – and the fact that it needs to be seen as a total system, at a time when systemic, totalizing analyses, not to mention dialectical ones, are very much out of favor. More pointedly, *Capital, Volume One* has something 'unexpected' to offer regarding our understanding of the present system of globalization, for what we can see that Marx could not is a further intensification of this 'absolute general law' of capital: the unity of capitalist production and unemployment. Supplanting or intensifying Marx's 'reserve army of labor', the category of the structurally unemployed registers this marked change, and the need for a concomitant 'change in theory and in practice' able to rethink 'all such lost populations of the world in terms of exploitation rather than domination' (2011: 150). Here too the question of representation is key: it is the 'recoding' of

'multiple situations of misery and enforced idleness, of populations in prey to the incursions of warlords and charitable agencies alike' in terms of 'global unemployment' that offers the potential for inventing 'a new kind of transformatory politics on a global scale' (151). If the slogan uniting the proletariat in Marx's time was addressed to the workers of the world, the vantage point our present circumstances affords to the reserve army of labor demands new conceptual and political tools with which to unite a largely surplus population defined by its lack of work.

In *Valences of the Dialectic*, Jameson writes about the world market today, 'the closure of the world market is ... not to be understood as the filling up of an empty container but rather as the progress of an epidemic' (2009: 582). With this formulation, Jameson aims at once to (1) draw attention to the category of the 'formerly employed' and the ways in which capital now leaves whole swathes of the world behind when it moves to new spaces – entire areas, he suggests, essentially have "'dropped" or "fallen out" of history'; and (2) underscore the importance of the figural itself in describing capital. In short, it matters whether we think of the world market filling up empty spaces or functioning like an epidemic that spends itself and moves on because each figuration not only produces different visions of capital, but makes visible different potential 'actants' or agents of history. The figuring of capital as an epidemic is precisely what brings into view the category of the 'formerly employed'.

In *Representing 'Capital'*, Jameson uses the language of figuration specifically to signal the precarity of theory and the material conditions out of which it arises. In fact, given the claim that *Capital* is not a political book but rather an economic one – by which Jameson means that it is not explicitly about revolution, or proletarian politics, or the living labour on which the 'infernal machine' called capitalism feeds – reading figurally is what we must do, on one level, in order to read *Capital* for its political consequences

(2011: 38). On another level, Jameson's insistence on the disjunction between politics and economics is meant also as a provocation to contemporary post-Marxist theorists who, in his view, neglect the economic in the name of a politics centered around the language of domination. The same provocation holds for non-Marxist critics, who employ the language of domination at the expense of the realities of exploitation. Both in *Valences of the Dialectic* and in *Representing 'Capital'*, Jameson underscores that 'an emphasis on exploitation is a socialist program, while that of an emphasis on domination is a democratic one, a program and a language only too easily and often coopted by the capitalist state' (2011: 150).

Jameson's claim about *Capital* is hardly the only scandalous assertion to be found in his later work. For instance, his collection of essays on dialectical thinking, *Valences*, contains both original and reprinted articles with similarly scandalous propositions. An essay entitled 'Utopia as Replication' famously proposes a reading of Wal-Mart as the 'new institutional candidate for the function of Utopian allegory' (2009: 420) and prompts us to think 'quantity positively', despite our tendency to see 'an impending future of size, quantity, overpopulation, and the like' only in 'dystopian terms' (419). The final essay on 'The Valences of History', likewise, makes us feel palpably the contours of our 'secular totality', originally theorized by Marx, and dramatized by Jameson via the metaphor of the spider, an analogy worth quoting at length for its exemplary style and *cri de coeur*:

We have indeed secreted a human age out of ourselves as spiders secrete their webs: an immense, all-encompassing ceiling of secularity which shuts down visibility on all sides even as it absorbs all the formerly natural elements in its habitat, transmuting them into its own man-made [*sic*] substance. Yet within this horizon of immanence we wander as alien as tribal people, or as visitors from outer space, admiring its unimaginably complex and fragile filigree and recoiling from its bottomless potholes, lounging against a rain-wall of exotic and artificial plants or else agonizing

among poisonous colors and lethal stems we were not taught to avoid ... in its cosmos ... we continue murmuring Kant's old questions – what can I know? What should I do? What may I hope? – under a starry heaven no more responsive than a mirror or a space ship, not understanding that they require the adjunct of an ugly and bureaucratic representational qualification: what can I know *in this system*? What should I do in this new world *completely invented by me*? What can I hope for *alone in an altogether human age*? And failing to replace them by the only meaningful one, namely how can I recognize this forbiddingly foreign totality as my own doing, how may I appropriate it and make it my own handiwork and acknowledge its laws as my own projection and my own praxis? (608, emphasis in original)

How we see this reality – 'our ultimate Being as History' (608) – and our emancipation from it may no longer be in temporal but rather spatial terms, as Jameson bookends *Valences* with his gesture toward a spatial dialectic, a 'thought mode that does not yet exist' (67): in the final sentence of the book, an alternate world (rather than a Utopian future) is now characterized as a world

contiguous with ours, but without any connection or access to it. Then, from time to time, like a diseased eyeball in which disturbing flashes of light are perceived or like those baroque sunbursts in which rays from another world suddenly break into this one, we are reminded that Utopia exists and that other systems, other spaces are still possible. (612)

As with Jameson's thought more generally, his willingness to continually test and reconsider his own formulations illuminates the necessity of theory to be informed by practice and vice versa, even, or especially, when these assessments require the acknowledgment of failure – of theory or practice, or both. Steven Helmling identifies what he calls a 'failure imperative' in Jameson's work and argues that 'in the context of the historical intransigences of "late capitalism", no critical gesture could be more unseemly than seeming to succeed: a critique too readily satisfied with merely critical success might seem ... deluded by its own false consolations for the revolutionary movement's realworld failures' (2001: 4). In this

final passage from *Valences*, the possibility of 'other spaces' is recognized as increasingly fleeting and captures how much has changed just in the time between the 1980s and the first decade of the twenty-first century. Reflecting back on these changes, Jameson notes the presence of the socialist bloc in the 1980s (regardless of its lack of success) and forms of art that preserved some sense of an 'outside' to commodification, whereas now 'everything seems subsumed, in that sense; people seem resigned to the idea that everything is commodified' (Baumbach et al., 2016: 144).

The sense of alternate spaces being increasingly hard to find or imagine save in 'disturbing flashes of light' or sunbursts is perhaps best felt when viewed in light of Jameson's earlier enthusiasm for particular writers, artists, and filmmakers, many of whom are discussed in *The Geopolitical Aesthetic: Cinema and Space in the World System* (1992), and whose art resists commodification. In the final chapter, for example, Jameson turns to Kidlat Tahimik and finds in him a Brechtian aesthetic that not only counters the division between aesthetics and production but also offers an alternative vision of progress and 'development'. In Tahimik's *Perfumed Nightmare* (1977) jeepnies, old American Army jeeps transformed into colorful taxi cabs or omnibuses, represent a radically different relationship to production as recycled, repurposed, and aesthetically pleasing 'painted traditional artifacts' (1992: 209). These jeepnies, for Jameson,

mark the place of a properly Third-World way with production which is neither the ceaseless destruction and replacement of new and larger industrial units ... nor a doomed and nostalgic retrenchment in traditional agriculture, but a kind of Brechtian delight with the bad new things that anybody can hammer together for their pleasure and utility if they have a mind to. (211)

By extension, the jeepnies are allegorical figures for Tahimik's aesthetic, which itself is an act of recycling and utopian production: he uses expired film stock, recycled imagery

and found objects, and non-professional actors, for example. For Jameson, the film's utopian production is supplemented by its function as an 'omnibus and omnipurpose object that ferries its way back and forth between First and Third Worlds with dignified hilarity' (211), driven by the humorous antics of Kidlat himself, who, as *Perfumed Nightmare*'s jeepney driver, comes to terms with his own fascination with American culture and American commodities. In his reading, Jameson positions Tahimik's film and the Third World generally as 'the last surviving social space from which alternatives to corporate capitalist daily life and social relations are to be sought' (188). Not insignificantly, Jameson also argues that Tahimik 'eschews the political for the economic, and the thematics of power for that of reification' (191), in the process offering a critique of capitalism as a universalized, global system in which, as Marx famously said, 'all that is solid melts into air'. What is most startling for Jameson, and what lends the film its didactic force, is that Tahimik demonstrates this destabilizing force of capitalism not only within the Third World, but also within the heart of the First World, in Paris, where the nefarious effects of the constant overturn of the forces and relations of production are shown to eradicate the very last vestiges of noncommodified space in the metropolis.

Eschewing the political for the economic: this is the Brechtian *plumpes Denken* or crude thinking of Jameson's Marxism, and that which militates against all forms of identity politics, and pertains equally to the First and Third World (to stay with Jameson's terms). If Jameson's use of national allegory in his reading of Third-World literature became a focal point for criticism of him as Eurocentric early on, his assertion that there are not multiple modernities but rather a singular modernity has similarly provoked the charge of Eurocentricism now, both within Modernist Studies and among his international readers, the latter of whom were early celebrants of Jameson's work and the *Postmodernism*

book, in particular. At issue is the claim that cultural differences do not make for multiple modernisms, a claim deemed Eurocentric for its positing of European modernity as *the* model for a modernity to which the rest of the world then must catch up. Recently, in response to the negative reactions he has received to *A Singular Modernity* from his readers in China and Brazil, Jameson has reiterated his argument against the idea of multiple modernisms and his belief that ‘the only possible “alternate modernity” open to us today is called socialism, and that merely cultural versions of these forms of difference are not helpful’. As he attempts to explain the disaffection of his readers, he speculates: ‘But perhaps what pained my critics more was less the attempt to impose my Western thinking on them than my expectation that they would develop alternatives that might reenergize us in the West or the First World: an expectation perhaps too hard to live up to’ (2007: 7).

Despite his claim that the Third World offers the last refuge of alternate spaces to the homogenized commodified universe of capital, there is an inherent, immanent, and dialectical logic to his own thinking that permits it to regenerate and self-differentiate from within. *A Singular Modernity*, for example, develops his analysis of modernism and modernity in the now changed context of postmodernity; in one of his four theses of modernity he proposes that ‘No “theory” of modernity makes sense today unless it comes to terms with the hypothesis of a postmodern break with the modern’ (2002: 94). *The Antinomies of Realism* (2013) sees Jameson returning to realism, the third aesthetic form in the trio of realism–modernism–postmodernism outlined in ‘Cognitive Mapping’ (1988a) and developed in multiple ways over the course of his career to date. In an older essay on ‘The Brecht-Lukács Debate’ (1977), for example, Jameson stages a dialectical reversal in which Lukács’s allegiance to realism, in the changed context of the postmodern, takes on a different valence. Whereas the new aesthetic forms

of modernism – and especially the privileging of the fragment in Jameson’s analysis – championed by Brecht were part of a resistant, noncommodified practice of art, with the advent of postmodernism those same forms are shown to be complicit with rather than resistant to market ideology. In this same essay, which prepares some of the ground for his later coining of the term ‘cognitive mapping’, Jameson too identifies what he sees as the unique status of realism, namely its joining of the cognitive and the aesthetic.

In his new work, however, a different problematic surfaces, due in part to the current popularity of affect theory. On the one hand, contemporary work on affect has led Jameson to amend one of the central features he identified with postmodernism, namely the ‘waning of affect’, which he now wishes to specify as the waning of ‘emotion’ or ‘named emotion’. On the other hand, in *The Antinomies of Realism*, he proposes a new model of realism centered on a set of antinomies that includes the irresolvable tension between affect, which for Jameson signifies the ineluctable present of the body and its resistance to language, and named emotion, which designates the consequence of the body’s inevitable entrance into language or the symbolic more generally. For Jameson, this antinomy is crucial to realism, and any attempt to resolve it in favor of one term or the other will end up not only destroying the opposite term, but the problematic upon which the realist project is grounded. The tension between named emotion and affect arises, in Jameson’s account, in the mid nineteenth century in response to the emergence of the ‘bourgeois body’: ‘alongside a crisis of language, in which the old systems of emotions come to be felt as a traditional rhetoric ... there is also a new history to be written, the “bourgeois body” as we may now call it, as it emerges from the outmoded classifications of the feudal era’ (2013: 32). The kind of linguistic innovation we associate with modernism has its roots here as realists grapple with this new body and its ‘nameless bodily states’ (32). Over the course of

Part One of *Antinomies*, Jameson moves from Zola and ‘the codification of affect’ to Pérez Galdós and the ‘waning of protagonicity’ to George Eliot and Alexander Kluge. In Part Two, Jameson then moves to contemporary works of realism, and the issue specifically of the historical novel today, ending with yet another scandalous claim: ‘that the historical novel of the future (which is to say our own present) will necessarily be Science-Fictional inasmuch as it will have to include questions about the fate of our social system, which has become a second nature’ (298). Although his use of the term ‘affect’ does not line up with contemporary invocations of the term by critics such as Brian Massumi or Sianne Ngai (a lack of connection that Jameson acknowledges in a footnote), the story of realism that Jameson tells not only puts the nail in the coffin of simplistic views of realism’s naive sense of the real and of the transparency of language, but also dovetails with and expands indirectly on recent attempts to reinvigorate the project of realism and its ongoing pull for us today, whether in the resurgence of reality TV and the serial realism of shows like *The Wire* and *Mad Men*, or the renewed interest in memoir as the new realism. What Jameson brings to this discussion is an attempt, as he puts it,

to try to isolate and experimentally to observe [the bourgeois body/s] emergence in language: here it is the language which is the sign and symptom of historical change and transformation, it is the process of grappling with new language-problems that we can catch sight of this phenomenon.... (Blix et al., 2014: nonsite.org, n.p.)

In the process he enriches our sense of a range of writers and, ironically, given its identification with modernism, makes realism new. He not only suggestively offers an explanation for when and why it came into being but also provides a compelling account of its end in the dissolution of the tension or antinomies that kept it alive. As with Jameson’s other work, the test of its power is in its ability, time and time again, to speak to aesthetic phenomena and everyday life in

ways that continue to resonate and generate yet more examples of the very dynamic he has identified and articulated, whether it be the ‘waning of protagonicity’ in Galdós and the trajectory of realism generally, or the broad claim for the primacy of narrative in all attempts to come to terms with history and ‘our ultimate being as History’.

## THEORY AND POLITICS TODAY

History has proven hostile to the project of critique, which Jameson has attempted to sustain against overwhelming odds. At a time when the end of critique is being declared, Jameson’s *The Political Unconscious* has been back in the theory spotlight, gaining notoriety as the prime target for attack. In various new formalisms, from the call for ‘surface reading’, to a return to questions of beauty, to Bruno Latour’s influence on diverse strands of social and cultural analysis, symptomatic or hermeneutical models of reading and interpretation are being dismissed as obsolete. While Jameson certainly recognizes that we must respond to the changes – in representation, the status of art, the ‘intransigences’, as Helmling (2001) calls them, of our present and its political cynicism – that have taken place since the 80s, he is not so quick to throw out the baby with the bathwater, as it were, and maintains that interpretation and dialectical thinking are still necessary and indispensable if we are to think beyond the limits of the present.

This commitment to a dialectical criticism marks one of the key ways in which Jameson’s work continues the legacy of the Frankfurt School. Just as with Adorno, Horkheimer, and Marcuse, the very possibility for critical thinking is at the center of Jameson’s work, with the forces of domination, the processes of reification and commodification now more subsuming even than Adorno in his bleakest moments could have predicted. And yet, despite the loss of ‘Adorno’s notion of the

negative' or of 'Left ideas of subversion' (Baumbach et al., 2016: 144) as a force of resistance to a commodified world, Jameson's project carries on the work of critical theory in these new dark times in its most basic sense. As Horkheimer described this project in 'Traditional and Critical Theory', 'Critical theory maintains: it need not be so; man can change reality, and the necessary conditions for such change already exist' (1972: 227). In short, the Frankfurt School tradition lives on in Jameson's work in a new way now, in its broadest aims as a voice – in the wilderness, increasingly – of critique *and* hope.

Keeping this voice of critique alive, throughout his oeuvre, is Jameson's commitment to Utopia, the aspect of his thought most often neglected in accounts of the outmoded nature of his interpretive model. 'If then Utopia is what allows us to become aware of the absolute limits of our current thinking', Jameson surmises, 'then such are the limits and such is the contradiction we have become able to confront. I have described it as a contradiction between Utopia and Cynical Reason. If so, then it virtually produces its own slogan: Cynicism of the Intellect, Utopianism of the Will!' (2010: 13). The contours of this 'Desire Called Utopia' are treated in depth in Jameson's book about science fiction, *Archaeologies of the Future* (2005), where, in a reference to Sartre's famous proposition of a politics of 'anti-anti-Communism', he offers a more grounded or practical version of his utopian appeal: 'the slogan of anti-anti-Utopianism ... might well offer the best working strategy' (xvi) today.

But in his most recent book, *An American Utopia*, he takes a step further, moving from what he calls in *Archaeologies* and elsewhere the 'utopian impulse' to the generation of an actual 'utopian program'. This program is hallmark Jameson in its promise to surprise and provoke. The opening gambit is that the waning of historicity 'confronts those of us still committed to radical system change with some very real political problems and in particular with the obligation to think revolution

in a new way' (2016: 13). That way turns out to be a new version of the old idea of 'dual power', or, the search for an institutional structure or event along the lines of the soviets that co-existed with Kerensky's Provisional Government. For Jameson, that institution is the army, which, through universal conscription, will become a universal army with the capacity to become not another government (the old government will 'wither away') 'but rather a new social structure, or better still, a new socio-economic structure' (20). This universal army, in its collective structure and its ability to provide everything from food and shelter to health care and a sense of a unified collectivity – will radically transform the army of today insofar as what was a professional, voluntary army becomes a wholly socialized institution. A manifesto replete with specific details about how the universal army will be constituted, the services it will provide, and the ways it will answer the socio-economic problems of late capitalism, *An American Utopia*, like Jameson's thought *in toto*, takes to heart the need to be aware of and push against the 'absolute limits of our current thinking' and to practice 'Cynicism of the Intellect, Utopianism of the Will'. Jameson leaves us at the end of his manifesto anticipating the instinctive distaste for a Left politics that conscripts the army:

This is the moment in which, as Sartre put it, existentialism supersedes Marxism as a philosophic horizon, and we can detect the nature of our own ideological reflexes by way of our reactions to it. However those may be, it is at the very least at least one way in which an alternate future can be imagined as opening once again, a future sealed and effaced by the absolute limits currently imposed by late capitalism as such. So this may not be the place to stop; but also to begin. (96)

# Moishe Postone: Marx's Critique of Political Economy as Immanent Social Critique

Elena Louisa Lange

## INTRODUCTION: REINTERPRETING MARX

This essay will provide an overview of Moishe Postone's key work *Time, Labor, and Social Domination* (1993) that according to its own claim presents a 'fundamental reinterpretation' of Marx's mature economy-critical work, especially the central categories of *Capital*. In doing so, Postone's critical reinterpretation relates to the theoretical interests and draws on the conceptual framework of critical theory. Postone's work must therefore be situated within the tradition of critical theory itself, even if it is precisely Postone's *critical* evaluation of some of its positions, developed from his reinterpretation of Marx, that qualifies him as a critical theorist in his own right.

In *Time, Labor, and Social Domination*, Postone rethinks the method as well as the object of Marx's Critique against the background of so-called 'traditional Marxism' that has hitherto interpreted the fundamental

Marxian categories either insufficiently or spuriously, leading to a truncated understanding not only of capitalism as a general social relation based on a historically specific mode of production, but also to a questionable interpretation of possibilities for its overcoming. Essentially, the book aligns positions of 'traditional Marxism' with critical theory by arguing that especially Friedrich Pollock and Max Horkheimer gave way to 'pessimism' due to their reliance on the framework of traditional Marxism's interpretation of Marx's central concepts.

After giving a brief outline of the formation of Postone's thought in a short introductory biographical note, the essay will primarily discuss Postone's major contribution to international Marxian research in value theory, *Time, Labor, and Social Domination*. Following the biographical note, the chapter is divided into three parts: the first part presents Postone's *method* as that of 'immanent social critique', elucidating Postone's intellectual heritage in the twentieth-century Hegelian Marxism

of critical theory in Germany, and clarifying its usefulness for understanding Marx's own intervention. The second part discusses Postone's *object* of critique, namely the theoretical assumptions of traditional Marxism. Here the emphasis lies on: (1) the positive and 'transhistorical' role it ascribes to the notion of labour as the underlying general hypothesis; (2) its discussion of the object of Marx's critique, capitalism, as a form of *class* society, rather than a form of *society*; (3) its emphasis on the notion of the market, private property and modes of distribution, as presented in Ricardian Marxism (Paul M. Sweezy, Maurice Dobb); and (4), in building on these assumptions, early critical theory's understanding of capitalism's basic contradiction in the 'forces' against the 'relations' of production, as presented in the works of Friedrich Pollock and Max Horkheimer. The third and final part shall present Postone's own reconstruction of Marx's central categories with special emphasis on the notions of abstract labour, the fetish-character of the commodity, and the difference between abstract and historical time and its 'social-epistemological implications'.

For reasons of circumventing redundancies, Postone's critique of Habermas and the chapter on 'The Trajectory of Production' will not be discussed separately, but rather mentioned within the context of the analyses directed at the critique of traditional Marxism and Postone's reconstructive framework, respectively.

## **THE FORMATION OF AN INTELLECTUAL: MOISHE POSTONE AS A STUDENT OF MARX AND CRITICAL THEORY**

Moishe Postone studied at the University of Chicago in the 1960s where he became involved with the political left. Though he never aligned with self-avowed Marxist movements, such as the Maoists and the Trotskyites, the (often) emigré faculty members of the

University of Chicago helped to shape his interest in modes of thought that attempted to grapple with the social and cultural dimensions in addition to the 'purely economic'. Postone's first encounter with Marx, in the 'Economic and Philosophical Manuscripts of 1844', left him with a sense of sensation while at the same time he discovered the works of the Frankfurt School. The greatest impact Postone received at that point was reading the *Grundrisse* (in translation). It also formed the basis for his dissertation proposal that was accepted by the University of Frankfurt in Germany where he enrolled as a doctoral student in the autumn semester of 1972. In Frankfurt, Postone worked closely with Adorno's former associates and assistants, such as Oskar Negt and Alfred Schmidt, but also Jürgen Ritsert, Gerhard Brandt and Iring Fetscher, although his intellectual formation was distinctive: while Postone's reading of the *Grundrisse* and *Capital* was strongly informed by his reading of texts from the critical theory tradition, he in turn re-read Adorno and Horkheimer through the lens of his new reading of Marx. In this sense, Postone's theoretical incentive was indebted to a kind of 'cross-fertilization' of both readings. This allowed Postone, in the seminal *Time, Labor, and Social Domination*, to point towards a path for overcoming the antinomies of classical critical theory in a fundamentally different way than, for example, the attempt by Habermas.

Moishe Postone was Thomas E. Donnelley Professor of Modern History, co-director of the Chicago Center for Contemporary Theory and member of the Committee on Jewish Studies at the University of Chicago. He died aged 75 on the 19th of March, 2018.

## **IMMANENT SOCIAL CRITIQUE AS METHOD**

Going back to Hegel's claim that the 'most difficult' task is to unite judgement and comprehension in the matter's 'presentation'

(Hegel, 1986: 11), this essay will first try to elucidate the method of 'immanent critique' influenced by critical theory, especially Adorno's approach, that structures Postone's presentation in his reconstruction of Marx's mature theory.

Against interpretations that limit Marx's analysis and critique to a theory of material production, class structure or simply a 'different' kind of economics ('critical' economics included), Postone stresses that Marx's theory understands not only the object of its critique – the historically specific form of production called 'capitalist', but also its own *standard* of critique – mediated by particular categories and concepts, as historically determinate. This enables this kind of critique to account for its conditions of possibility within its own social and historical context. Postone calls this kind of critical method 'immanent social critique' (1993: 87) and adopts this view of Marx's method for his own criticism of what he terms 'traditional Marxism'. It is crucial for Postone that 'Marx's theory is thought to grasp the relationship of theory to society self-reflexively, by seeking to analyse its context – capitalist society – in a way that locates itself historically and accounts for the possibility of its own standpoint' (1993: 16). Only this approach can be called an 'immanent' critique in which the social dimension relates not only to the criticized object, (capitalist) society, but also to its subject as being socially and historically mediated by the fabric of the very society it criticizes. This standpoint reflects the theorem of the dialectical unity of method and object, or the judgement immanent to its object, as often invoked by Adorno (1976: 109, 117–18; 1993: 7–9).

The acknowledgement or demand of the criticizing subject's own immanent standpoint opens a perspective to an evaluation of Marx's Critique of Political Economy that emphasizes the relation of subject and object, positivity and negativity (affirmation and negation), universality and particularity, essence and appearance, content and form, substance and function, the dynamic and the

static, as being an integral part of Marx's categorial critique of political economy. The re-evaluation of these classical metaphysical topoi within the context of Marx's categorial critique also provides a more fundamental approach to not only the critique, but also to how capitalist society can be efficiently overcome. Here, Postone's understanding of the underlying structure of capitalist society as owing to the deeply inverted and reified structure of the capitalist mode of production, and yet presenting itself as rigid social objectivity, is eminent. It is only with this set of critical categories that as historically specific also address the historically specific *Problemstellung* of capital that theories of reification and fetishism of social relations can be adequately addressed. In other words, it is only within the self-reflexive standard of immanent social critique that the problem of the fetish-character of value, of social objectivity and subjectivity, and that of social mediation are expressed as the structural fundamentals of capitalist society in their own right, so that their overcoming becomes a real possibility. Because the emphasis of the problem of social objectivity and subjectivity informs Postone's basic assumptions, he hereby declares the first conceptual determinations of *Capital* – value, abstract labour, the commodity, and capital, in which the problem of subjective and objective social constitution is already expressed – as 'fundamental categories' of Marx's analysis, and likewise of his own reinterpretation.

The emphasis of the historical specificity of Marx's categories of value, (abstract) labour, capital, etc. not only provides a critique of the 'naturalism' inherent in both classical political economy and what Postone terms 'traditional Marxism' – it also provides the criticism of the idea that production in capitalism in some way or the other represents the interaction of humans and nature that constitutes a realm outside of capitalism itself and therefore also the standpoint of its critique. It also moves beyond a mere critique of exploitation: 'the basic categories

of Marx's critique not only delineate a mode of exploitation. They also are temporally dynamic categories that seek to grasp modern capitalist society as a mode of social life characterised by quasi-objective forms of domination (commodity, capital) that underlie an intrinsic historical dynamic' (Postone, 2004: 53–4). The emphasis on the historically specific in the immanent critical approach also formulates the conditions of how a socially valid and holistic critique can be conceptualized. Postone calls this approach a 'negative critique'. A 'negative critique', resonating Adorno's concept of 'negative dialectics', and in accordance with the presuppositions of immanent social critique as a *holistic* critical theory, 'criticizes what is on the basis of what could be' (1993: 64) while a 'positive critique' 'criticizes what exists on the basis of what also exists' (ibid.), a position that holds for the traditional Marxist view of labour as the standpoint of critique. The representatives of the traditional Marxist viewpoint, by de-emphasizing the historically specific role of labour as value-producing, abstract labour in the particular socio-historical constellation called 'capitalism' – hereby fatally underestimating Marx's essential theoretical intervention of the dual character of labour in the capitalist mode of production – fail adequately to grasp the object of Marx's critique, the form of value and its production in this kind of society, and the call for its abolishment. By making the value-based capitalist mode of production and the historically specific form of labour that creates value the object of his critique, Marx, in Postone's view, 'transformed the nature of the social critique based upon the labor theory of value from a positive to a negative critique' (1993: 63). In contrast, traditional Marxism does not see abstract labour as the *substance* (or 'content') of value as the object of critique, but merely addresses a particular *function* (or 'form') of labour in capitalist society and therefore remains trapped in the positive critique *from the standpoint of labour*, instead of a negative critique *of labour* in capitalism.

Traditional Marxism therefore has the character of 'redemptive criticism' [*rettende Kritik*] (although Postone never uses this term to characterize traditional Marxism). In the 'positive/redemptive critique' of traditional Marxism, therefore, the 'essence' of Marx's analysis becomes an entity like a '(truly) human society' that should be *realized*, instead of capitalism that should be *abolished*. What is therefore underlying the methodological standard of immanent social critique is a particular dialectic: precisely because the traditional critique points to an *external* essence ('human self-fulfilment', the 'truly human society'), it remains positive. In contradistinction, Postone's position of immanent social critique is a negative one: it calls for the overcoming of the very social and historical configuration within which it is set. In it, the 'realizable "ought" that is immanent to the "is" and serves as the standpoint of critique' (1993: 88). It must be conceptualized as the *negation* of the existing conditions.

At this point, the notion of immanent social critique must be reviewed against its theoretical background in Hegel's metaphysics or logic that Postone identifies as one essential cornerstone of Marx's (and consequently, his own) position. As indicated above, the emphatic use of Hegelian terminology and the themes of classic German idealism provide Postone with a solid basis to investigate the epistemological implications of his reinterpretation of Marx's fundamental categories, like the commodity and capital, and the forms of obfuscation that accompany them. Hegel's concepts like the idea, the self-moving subject, and also the concept [*der Begriff*] itself, here also deliver a rich source for reconceptualizations of *a theory of subjectivity as a theory of capital* that arguably represents the main interest of Postone's intervention at the level of method.

The basic assumption of Postone's adaption of Hegel's theory is that Hegel's notion of *Geist* (or Subject/Substance, or Idea, or *Begriff*) finds its adequate expression in

Marx's notion of capital in his *Critique of Political Economy*. Like Hegel's *Geist*, value becomes the 'self-moving subject' that subsumes the forms of appearance of social structures under its own logic, a logic for its own sake. It is 'constituted by forms of objectifying practice' (1993: 75), a practice that finds its expression in a determinate social reality it moulds according to its own inner structure (e.g. commodity exchange). '[Marx] investigates the nature of that social reality in *Capital* by unfolding logically the commodity and money forms from his categories of use value, value, and its "substance"' (1993: 75), the particular form of labour in capitalism that produces (surplus) value, abstract labour. For this hypothesis, Postone finds textual proof in a crucial passage of the first volume of *Capital* in which Marx presents the transformation of money to capital, especially in Marx's well-known conceptualization of value (not, as is often thought, capital) as 'automatic subject' (see Marx, 1976: 255–6). Yet, how can the adaptation of Hegel's theory of subjectivity deliver a ground to a social critique that emphasizes the mutual mediation of the objective and subjective dimension of practice expressed in the notion of capital? Postone's answer is that Marx's move to conceptualizing Hegel's *Geist* as the self-moving subject of value, entails a shift from the subject-object paradigm of classic epistemology to a social theory of consciousness (1993: 77). With the help of Hegel's methodological-theoretical overarching architecture of the self-mediation of the identical subject-object – a Subject in the true meaning of the word, divested of and incorporated in its 'own' objectivity – Postone can reconceptualize the forms of really existing capitalist social relations as forms of both subjectivity and objectivity, implying and excluding one another. In this sense, the commodity form is not simply a social reality, expressed in a more or less arbitrary thing-like form, but as a social reality it already *encompasses* the fundamental social relations of production, namely in the

notions of use value and value, of concrete and abstract labour, and both its fundamentally contradictory, yet mutually conditioning objective and subjective dimensions (which will be discussed in part three in more detail). However, Postone defies what could seem as a reformulation of the classic analysis of Georg Lukács' essay 'Reification and the Consciousness of the Proletariat' in his path-breaking *History and Class Consciousness* (1923). In fact, both regarding its method and its impetus, Postone's understanding of Marx's appropriation of Hegel's method is quite different from its appropriation in Lukács. In his essay, Lukács has tried to demonstrate the insufficiency of the epistemological paradigm of the subject-object dualism associated with 'bourgeois' science. Hegel, in Lukács' view, provides the antidote to this kind of thinking 'in terms of finitude' by not only overcoming the opposition of epistemological subject and object in the infinite 'identical subject-object' of the *Geist*, but, by delivering the conceptual means to 'materialistically' appropriate this identical subject-object to the object of history and historical emancipation, identifying it with the proletariat. The proletariat accordingly becomes the 'identical subject-object' of historical progress, and its emancipation by way of self-realization or *Selbstbewusstwerdung* is equal to that of mankind as such. Postone argues that Marx's understanding of Hegel differs from Lukács' interpretation in three essential aspects: first, as indicated above, Lukács' argument relies heavily on a critique of capitalist society from the standpoint of labour, and with it, the glorification of the 'labouring proletariat' as the emancipatory force of history, instead of positing it precisely as the *object* of Marx's critique. In consequence, Lukács' interpretation remains confined to a 'positive' and redemptive critique. Second, Marx 'suggests that a historical Subject in the Hegelian sense does indeed exist in capitalism, yet he does not identify it with any social grouping, such as the proletariat, or with humanity' (1993: 75). Were this the case,

the concept of the identical subject-object of history would not supersede the collective version of the bourgeois (economic) subject, 'constituting itself and the world through "labor"' (1993: 78). Rather, as preliminarily indicated before, this historical Subject is a strictly *impersonal* entity, namely value or capital itself as the fundamental social nexus [*Zusammenhang*] of capitalist society. Lukács therefore disregards the particular historically dynamic character of domination in capitalist society in which even class domination is encompassed within the logic of the capital relation necessarily obeying the law of valorization, and hence, of value (for a critique of Postone's interpretation, see Feenberg, 1996). Third, in contrast to Lukács, Marx perceives of capitalist relations as the *necessary constitutive* of the modern subject, not as *extrinsic* to it. They 'veil' neither the 'real' social relations of capitalism (class relations) nor a 'human essence' attributed to the exploited class. To the contrary, there 'is' no real kernel to the existing mechanisms of social constitution other than those performed in capitalist practice. This critique indirectly also demonstrates Lukács' misrepresentation of Marx's theoretical intervention as belonging to the paradigm and discourse of 'enlightenment' critique. Here, mankind exists in the mode of 'estrangement' (rather than alienation as a specific form of estrangement) from its essence, the emancipative universal structure of rationality. The self-empowerment of the intellect, as expressed in Kant's 'Sapere aude' – in Lukács' terms, the *Selbstbewusstwerdung des Proletariats* – would serve as the death blow to authority, personified in the King or the capitalist class. Contrary to its anti-Kantian impetus, Lukács' conceptualization is still embedded in the mode of enlightenment critique. To be sure, contrary to Kant, Lukács' remedy would not be the well-formed and sound argument alone, but human practice aimed at self-emancipation.

What is furthermore essentially 'Hegelian' and to some extent 'un-Lukácsian' in this

adaptation is Postone's stress on *contradiction* that forms the underlying hypothesis for the possibility of immanent social critique. For Marx, as for Postone, the fabric of capitalist society is constituted on a fundamental social contradiction. For now, it should suffice to say that this social contradiction is already incorporated in the form of the commodity or the value form, the 'economic cell form' of bourgeois society (Marx, 1976: 90) and its aspect of use value and value that 'characterizes its social universe' (1993: 88). As such, it is not only historically specific to capitalist society, but the specific social dimension of the commodity, its value, refers to the totality of social relations that manifests itself in objective structures while being subjectively mediated. They find their realization in the inverted structures of fetishism that are both objectively valid and socially constructed in practice. The nature of the contradiction of the commodity form therefore points to the subjective and objective dimension of social mediation that can only be grasped from the standpoint of totality. This methodological approach allows Marx to conceptualize a theory 'of the ways in which humans constitute structures of social mediation which, in turn, constitute forms of social practice' (1993: 218). In this sense, Hegel's 'speculative identity' of subject and object serves as the buttress for Postone's interpretation of Marx's notion of value and its necessary realization in modes of practice. Needless to say, Marx's theory forecloses Hegel's idealist standpoint. Postone, though aware of their essential difference, has probably not made clear enough *how* Marx's difference from Hegel must also be understood in relation to the notion of 'truth'. For Hegel, the concept *reveals* itself. At first, at the level of appearance, it is superficially true, while with the further distinctions it becomes false, before it becomes finally true 'again', but now as the concrete totality of all the previous determinations which are sublated in it, in the triple meaning of the word. For Marx however, understanding the operations of the capitalist system is

not a question of the self-presentation of the concept at all. Quite to the contrary: what the concept and the concepts present [*darstellen*], has to be read *against themselves*, as the abyss between their appearance and their uncomprehended presuppositions, or their essence. Here is why his Critique of Political Economy presents itself as the critique of the mechanism taking place in the economic categories that in and out of themselves *increasingly obscure* the origin of (surplus) value in the exploitation of living human labour. The fetish-character that value takes on as a form in this dynamic points to a greater *mystification* instead of a greater approximation towards the Idea or truth, as in Hegel. Hence, for Marx, in a concept such as interest-bearing capital ‘the fetish character of capital and the representation of this capital fetish is ... completed’ (Marx, 1981: 516). For Marx, the truth of what *is* will not come to appear – and precisely because of that, the presentation of the categories not only proceeds from the simple to the complex as in Hegel, but *at the same time from the level of essence to that of appearance*. This is also why Marx introduces his labour theory of value together with the presentation of the twofold character of labour right at the beginning of his Critique. That being said, while Marx and Hegel are fundamentally opposed in this regard, Postone is correct to highlight Marx’s indebtedness to Hegel’s methodological approach of critical immanence.

## FALLACIES OF TRADITIONAL MARXISM

### *The Transhistorical View of Labour*

At the most general level, the basic objection against what Postone terms the traditional Marxist interpretation is that its critique of capitalism is one *from the standpoint of labour* instead of being a *critique of labour* in capitalism (see 1993: 5). The latter, as

indicated above, entails a critique of the capitalist mode of production in its totality, whereas the former implies a transhistorical notion of labour as underlying Marx’s analysis in *Capital*. In this view, labour is endowed to provide the metabolism between humans and nature throughout human history, so that labour is seen to be in itself a worthy social practice and generally attributed with positive features. Postone rejects this ‘productivist paradigm’ on the grounds that Marx’s critique points to the historical specificity of the particular role of labour in capitalist society, namely, to be the substance of value whose (value’s) production and re-production is capitalist society’s only rationale. Postone’s emphasis on the historical and systematic specificity of value-producing labour in capitalism enables him to reinforce Marx’s crucial distinction of concrete, use-value-producing labour and abstract, value-producing labour to show that only the latter form of labour constitutes the kind of social nexus mediated by the value form that is characteristic for capitalism. Value, accordingly, as a historical determination specific to capitalist society expresses ‘both the determinate form of social relations and the particular form of wealth that characterize capitalism’ (1993: 44). This particular form of social wealth expressed in value, Postone argues, is contradictorily opposed to wealth expressed in use value, as in the ‘immense collection of commodities’ people may or may not use to satisfy their needs. In contrast, the form of production aimed at value, specific to capitalism, has substituted the meaningful coherence of social life directed at the satisfaction of needs (concrete wealth) with the production of abstract wealth directed at abstract wealth itself.

According to Postone, traditional Marxism not only conflates what Marx calls ‘crucial to an understanding of political economy’ (Marx, 1976: 132), namely the character of social production aimed at use value with that of value, but underestimates the significance of his critique. In this sense, influential

Marxist economist Paul Sweezy's intervention is centred around the notion of the *distribution* of value, instead of delivering a critique of its *production*. It therefore remains on the traditionalist standpoint of a positive notion of labour that identifies the market as the 'self-regulatory' instance that demonstrates the efficacy of the law of value. He thus maintains that isolated workers 'are, in fact, working for each other' (Sweezy, 1969: 27) which not only assumes that the goal of this kind of production is use value, but that the market distributes the goods so that a 'general equilibrium' (Sweezy, 1969: 53) can be maintained. In his critique, Postone claims that 'The law of value, according to Sweezy, then, is an attempt to explain the workings of the self-regulating market, which implies that value is a category of distribution alone, an expression of the non-conscious, "automatic", market-mediated mode of distribution in capitalism' (Postone, 1993: 45). The tenet of Sweezy's critique remains at the level of the non-overt vs the overt relations of production whereas value and the labour it creates remain historically unspecific and are exempt from Sweezy's critique. If, however, value were only a category of the mode of distribution, 'the labor that creates that wealth would not differ intrinsically from labor in noncapitalist formations' (Postone, 1993: 45), even if the relations of production were mediated in an 'overt' way.

Another way to inaccurately perceive of Marx's theory of value from the standpoint of labour is the discussion of its social and/or private character. Apart from Sweezy, Postone specifically refers to Vitali Vygodski and Ernest Mandel who both – notwithstanding their difference over the centrality of private property to capitalism – suppose that the social character of labour in capitalism is 'indirect' and, as such, only validated through the market (Vygodski, 1973: 54; Mandel, 1971: 98). The goal of Marx's value theory would be to show that in a non-capitalist society, like socialism, private and individual labour would be 'directly' social

and need not rely on an ex-post validation through market mechanisms that obscure labour's directly value-producing properties (Mandel, 1971: 97). Postone argues that this view of the 'indirectly' social labour in capitalism, misrepresents Marx's understanding of the character of private and social labour that, contrary to these views, does not 'specify an extrinsic difference' (1993: 46), but is conceptually derived from the crucial difference between abstract and concrete labour. With the terminological convention of his early *Critique of Political Economy* where 'exchange-value' and 'value' are still synonymously used, Marx contends in the *Contribution to the Critique of Political Economy* (1859) that '[t]he labour which expresses itself in exchange-value is presupposed as the labour of the isolated individual. It becomes social by assuming the form of its immediate opposite, the form of abstract generality' (Marx, 1970: 34, quoted in Postone, 1993: 47). According to Postone, the relation between private and social labour cannot be adequately grasped in the critique of mediation (viz. the market) from the standpoint of immediacy ('direct social labour'), the latter of which a socialist society would purportedly realize. The point of Marx's understanding of the character of labour in capitalism is the mutual conditionality and simultaneity of its private and social character. Labour in capitalism, directed at the production of (surplus) value, is privately expended labour [*privat verausgabte Arbeit*], conditioned by the particular social nexus expressed in value, which itself is conditioned by the existence of the expenditure of private labour. As such, this kind of labour is directly social. Even more, because of its double character, for Marx, 'it is *only* in capitalism that labor also has a directly social dimension' (1993: 48). The truncated understanding of the meaning of 'social' in the traditional views leads to an interpretation from the standpoint of labour: '[Marx's characterization of labour] refers not to the difference between the "true", trans-historical "essence" of labor and its form of

appearance in capitalism, but, rather, to two moments in capitalism itself' (1993: 47). Because value constitutes the social nexus in capitalism, labour in the mode of its production is *directly social*.

In the following, the general critical interventions against critiques from the standpoint of labour will be addressed in some of its specific forms.

### ***Capitalism as a Form of Class Society***

In Postone's analysis, traditional Marxism has often emphasized the meaning of capitalism as a class society in which the dominant, capitalist class, lives off the wealth produced by the exploitation of the labouring or working class. While this is not in itself wrong, Postone laments that this view departs from the standpoint of totality that an imminent social critique can provide. By understanding capitalism not as a form of society, but a form of class domination, traditional Marxism also brackets what is *specific* to capitalism and fundamentally distinguishes it from all previous forms of social formation: its form of abstract and impersonal social domination by value and capital itself, the 'abstract form of wealth'. The bourgeois class, too, is not exempt from this form of domination (while, being caught in the fetishism of its self-understanding, it must protect its implementation). This has also problematic consequences for the projections of a future, noncapitalist society ('socialism') in which domination and exploitation shall be overcome. In the traditional view, it is not labour itself – as wage labour – that must be abolished, but its unfree, 'fettered' condition of existence. Consequently, for Postone, the interpretation of capitalism as class society sees the 'possibility of theoretical and practical critique ... in the gap between the ideals and the reality of modern capitalist society, [not] in the contradictory nature of the form of social mediation that constitutes that

society' (1993: 67), and thus remains positive and external. The traditional critique takes off 'from an already existing structure of labor and the class that performs it. Emancipation is realized when a structure of labor already in existence no longer is held back by capitalist relations and used to satisfy particularistic interests but is subject to conscious control in the interests of all' (1993: 66). The working class or proletariat, thus glorified, should not be abolished, but merely emancipated from its particular social rank as the oppressed class. The 'dignity of production' is therefore hypostasized onto future (and past) societies. Along these lines, traditional Marxism also positively refers to industrial production as the site in which 'the worker' can instantiate his/her labour to 'come to its own' and unfold its potential. Labour is proclaimed as the locus of self-realization of not only the working class, but mankind as such. This progressivism of traditional Marxism also uncritically adopts the view that a social reproduction process, the capitalist one included, must be based on use value. Hence, this position often views demands for a top-down re-distribution of wealth, understood as the expression of use value, as an adequate critique of capitalism. At the same time, the intrinsically *structural* relation between the abstract form of wealth in value, exploitation, and their historical specificity remains unthematized. The positive, redemptive critique of capitalism is also reflected in traditional Marxism's false attribution of a 'right' consciousness to the proletariat, as opposed to the ideology or 'false consciousness' of the bourgeois class. Immanent social critique in contrast perceives of the 'inverted' structure of capital, as a social relation, as a *totality* from which the labouring class cannot be exempted: the fetish-character of value is not one exclusively reserved for the bourgeois class or political economists. This is why the standpoint of labour is not antagonist to capitalist relations, but one of its inherent components. Indeed, 'the standpoint of capital and wage labour is the same' (Bonefeld, 2004: 113. For a critical

discussion of Postone's view, see also Bonefeld, 2004).

In this regard, Postone discusses a more pertinent question: why is it that labour in capitalism is perceived as a transhistorical force of the self-realization of mankind? His answer is that the particular form of labour in capitalism, abstract labour, delivers in and out of itself its appearance as transhistorical, and hence, use value-producing. This point shall be elaborated in the overview of Postone's own reconstruction of Marx's categories in part three.

### ***The Market, Private Property, and Modes Of Distribution as Defining Moments: Ricardian Marxism***

Another critique of capitalism from the standpoint of labour is that of a specific form of traditional Marxism, namely the Ricardian Marxism notably represented in Paul Sweezy and Maurice Dobb that Postone locates in their emphasis on the market, the significance of the notion of private property, and the modes of distribution. The crucial objection to this reading of Marx is that in its basic assumptions, it hypostatizes convergences between Marx and classical political economy, especially David Ricardo, instead of seeing Marx as a predominant *critic* of Ricardo, his labour theory of value, and the emphasis on distribution (for the detailed critique of Ricardo, see Marx, 1973: 557–64 and Marx, 1989: 9–208). According to Postone, the alleged common features of Marx's and Ricardo's theory include (a) the normative critique of nonproductive social groupings (land owners in Ricardo, capitalists in traditional Marxism), (b) the identification of labour or the 'labourer' with the general interests of society, as expressed in Ricardo's transhistorical labour theory of value (see Ricardo, 1911: 5), (c) the critique from the standpoint of labour as a quasi-natural point of view and its evocation of social ontology, and (d) the moralistic critique in the name of justice, reason, universality, and

nature. Also the positive evaluation of industrial production is a convergence between the traditional view of Marx and Ricardo, exemplified in Ricardian Marxism.

Like Sweezy, Dobb views value as a 'market category'. It indicates that 'a system of commodity production and exchange can operate of itself without collective regulation or single design' (Dobb, 1940: 37, quoted in 1993: 49–50) and positively refers to Adam Smith's classic idea of the 'unseen' or 'invisible hand'. For Dobb, Marx's law of value and the idea of classical economists are however not to be conflated: the classics 'had not provided a historical critique of capitalism itself' (Dobb, 1940: 55, quoted in 1993: 50). This became Marx's task. However, what the classical political economists, notably Smith and Ricardo, purportedly provided for Marx's analysis, was a positive theory of production that implied a normative critique of the nonproductive, consuming class – the owners of landed property. Dobb's understanding of social critique, according to Postone, is therefore 'a critique of non-productive social groupings from the standpoint of production' (1993: 50). For Dobb, consequently, both Smith's and Ricardo's classical labour theory of value (see Smith, 1846: 13 and Ricardo, 1911: 5) served as the vantage point for Marx's own labour theory of value that he refined in terms of a critical weapon against both of the 'unproductive classes', the owners of landed property and the bourgeoisie. As for differences between Smith and Ricardo, it should be briefly mentioned that while Smith attacked the 'unproductive' land owners, he still believed that rent constitutes one of the three 'sources of revenue', next to labour and capital. Ricardo departed from this view to question that 'the appropriation of land, and the consequent creation of rent, will occasion any variation in the relative value of commodities independently of the quantity of labour necessary to production' (Ricardo, 1911: 33ff.) This 'refinement' of Smith's and Ricardo's value theory was purportedly expressed in the category

of surplus value. Here, Dobb argues, Marx goes beyond Smith and Ricardo to show that profit is not a function of capital, but of labour alone, to include the bourgeois class in his criticism. This allegedly enabled Marx to predominantly criticize how the products of labour, based on the private ownership of the means of production, are *distributed*. 'Social domination is treated as a function of class domination which, in turn, is rooted in "private property in land and capital"[Dobb: 78]. Within this general framework, the categories of value and surplus value express how labor and its products are distributed in a market-based class society' (1993: 53). Dobb's misrepresentation of Marx's intervention then, in Postone's view, is a double one: neither does Marx attack the 'unproductive classes' from the standpoint of the 'productive' ones, nor does he attack the 'non-overt' operations of the mode of distribution, i.e. the market and the existence of private property, from the perspective of an ontological and quasi-natural notion of 'labour' that embodies the general interests of society. The crucial difference between classical political economy and Marx's critique is, rather, the *critique of labour* specific to the capitalist mode of production. In the latter, labour is neither the positive standpoint from which to attack class domination, nor can be endowed with the dignified status of a 'social ontology'. At this point, Postone's critique of Ricardian Marxism could be extended to more recent Proudhonist reinterpretations of Marx's work, notably those of Karatani Kōjin, that also stress the distributive or 'consumption' side of reproduction with its strong emphasis on the allegedly 'emancipatory' potential of use value against value (see Karatani, 2014. For a critique of this view, see Lange, 2015).

The consequences of the theoretical proximity between traditional (Ricardian) Marxism and classical political economy also fall back onto traditional Marxism's projections of a future society. If the critique of domination in capitalism relies predominantly on a positive, transhistorical notion

of labour, then its moralistic dimension is equally evoked. Hence, the traditional critique is directed against 'unjust' modes of distribution in the name of the 'particular' interest of the bourgeois class. In a quasi-natural understanding of labour, then, all the 'artificial fetters' of capitalism (the market, private property) should be abolished. A society that most adequately grasped human essence would then be one in which labour can develop its natural forces unobstructedly. In short, it would be 'socialist'. The dialectic of this moralistic dimension of the critique consists in the hypostatization of ideals that themselves are products of the social configuration that shall be overcome. Especially the opposition between abstract universality and concrete particularity as that of nature and artificiality, critically evaluated by Postone, 'is not one between ideals that point beyond capitalism and the reality of that society; rather, as an opposition, it is a feature of that society and is rooted in its labor-mediated mode of social constitution itself' (1993: 67). This, however, is a problem of the epistemological dimension of the critique in its social constitution. The positive, external critique of traditional Marxism neglects to undertake its self-reflection on the specific historical conditionality of its 'ideals' projected onto a future, noncapitalist society.

In the next and final part, on the 'fallacies of Traditional Marxism', the epistemological self-reflection becomes a prevalent condition to examine critical theory's regress towards pessimism. It is expressed in Max Horkheimer's politico-theoretical assumptions sharing parallels with Ricardian Marxism's reductionist interpretation.

### ***The Forces and The Relations of Production as the Basic Contradiction: The Case of Horkheimer***

Beyond the more obvious targets of what Postone terms 'traditional' Marxism, he also,

probably more counter-intuitively, critically evaluates the political theory of critical theory, especially that of Friedrich Pollock and Max Horkheimer. For reasons of space, the critique of Pollock will only be briefly taken up, to pay more attention to Horkheimer whose later position was largely influenced by that of Pollock.

At the core of two articles Pollock published in 1932 and 1933 (Pollock, 1932, 1933) stood the theory of state capitalism: the reassessment of the political in Marxist terms in which, with the rise of the interventionist state in the wake of the Great Depression in the early 1930s, 'the political sphere has superseded the economic sphere as the locus of both economic regulation and the articulation of economic problems' (Postone, 1993: 90). The theoretical framework behind this assessment is informed by understanding the basic contradiction of capitalism – *nota bene*: one that leads to its demise – as one of the forces of production (*Produktivkräfte*, i.e. industrial production) and the relations of production (*Produktionsverhältnisse*, i.e. private ownership of the means of production, class relation, the market, etc.). Providing a prognostic viewpoint, Pollock assumes that this basic and *growing* contradiction would lead to the abolishment of the present economic form while being able to give room for state capitalism, expressed in planned economy. Political power would gradually determine and reconfigure the economic sphere, and a conscious, yet possibly authoritarian control of society would become a reality. Postone's main criticism is that the economic categories, i.e. profit, become subspecies of political concepts, i.e. power, and that the concept of capital remains unconsidered as a category of social critique. Furthermore, if the market and private property characterize the relations of production of capitalism, and these are abolished with state capitalism, then this form cannot be characterized as capitalist. While Pollock's understanding of the basic contradiction of capitalism, formulated along the lines of the forces and the relations

of production, was rendered inadequate by the development of twentieth-century capitalism, Postone argues that Pollock has himself failed to reconceptualize it (1993: 104) and remained in its discursive framework.

Directly influenced by Pollock's views on the basic contradiction between the forces and the relations of production to form capitalism's basic contradiction, Horkheimer takes a 'pessimistic turn' (Postone, 1993: 104). In its adequate contemporary form, according to Horkheimer, the Critique of Political Economy has been superseded by the critique of politics, the critique of ideology, and the critique of instrumental reason. These vantage points form the cornerstones of critical theory. The first, not yet pessimistic expression of this refiguration of social critique as defining critical theory, was Horkheimer's programmatic essay 'Traditional and Critical Theory' (1937). While, in Postone's view, Horkheimer's position is an 'epistemologically sophisticated version of traditional Marxism' (1993: 108), the standpoint of critique, however, still remained within the framework of viewing capitalism's basic contradiction in the one between the forces and relations of production. However, in contrast to traditional vulgarizations of identifying labour *sans phrase* with a state of human nature 'come onto its self', Horkheimer critically indicates its *opposition* to 'nature' and labour's propensity for nature's domination. But according to Postone, Horkheimer failed to criticize the particular *form* of labour in capitalist societies, only questioning the mode of its organization and application (1993: 108). This blind spot paradigmatically led to Horkheimer's opposition between human activity and the 'waste' of labour power and human life (Horkheimer, 1972/2002: 204, quoted in 1993: 106), or his insistence that human development is arrested, fragmented, and alienated by the market and private property. Like the traditionalist view, Horkheimer's early analysis suggests an emancipation *of*, but not *from*, labour (in support of this view, see also Horkheimer,

1972/2002: 213, 218). Notwithstanding these underlying assumptions, Horkheimer's early understanding of social critique is largely in compliance with Postone's own method of immanent critique. In 'Traditional and Critical Theory', Horkheimer, in accordance with Postone's characterization of immanent social critique, 'uncovers the growing discrepancy between what is and what could be' on the basis of the intrinsic contradictions of a society grasped as a totality (1993: 107). In that sense, Horkheimer's programmatic proposal for critical theory is still embedded in an optimistic vision of possibilities for critiques of the dominant form of society as well as overcoming it.

According to Postone, however, this early view gave way to an increasing pessimism, reflected in 'The Authoritarian State' (1940). Note that Postone's diagnosis is founded on the unreflected traditionalist Marxist assumptions in Horkheimer, namely that the contradiction between the forces and the relations of production is one between a general positive evaluation of the development of human labour in its typically industrialist phase and the 'fetters' or 'limits' imposed on it by the market and private property (as for Postone's different view of the basic contradiction in capitalism, see the final part of the essay). What is new in 'The Authoritarian State' however is a deeply ambiguous attitude towards the emancipatory potential of the forces of production. Adhering to Pollock's state theory of conscious planning that may take authoritarian forms, Horkheimer realized that with the rise of national socialism and fascism, the inherent contradictions of capitalism did not only lead to a state capitalist form of planned economy, but came to be realized in the repressive state. With the development of the forces of production, 'the state has become potentially anachronistic' and 'must become more authoritarian, that is, it must rely to a greater degree on force and the permanent threat of war in order to maintain itself' (Horkheimer, 1978: 109–11; Postone, 1993: 110–11). Horkheimer

maintains that the basic contradiction of capitalism is superseded in the repressive state, but in such a way that its outcome is an even more disastrous one: no longer are the relations of production putting 'fetters' on the emancipatory potential of labour the greatest obstacle to human emancipation, but the political *itself* has turned against human life in its immediacy. It is, indeed, a more vital and fundamental contradiction than the capitalist one. The forces of production, freed from market and private property, now turn against emancipation itself to consolidate the authoritarian system. In its pessimistic conclusion: the repressive state system and emancipatory socialism share the same material basis (1993: 111, see also Horkheimer, 1978: 114). With this 'turn to a pessimistic theory of history' (1993: 112), Horkheimer now reconceptualizes his views of the revolution, of human emancipation, and of a future society – instead of reconsidering his own conceptual presuppositions, as Postone suggests (for a critique of Postone's view, see Abromeit, 2011: 420ff.). In Horkheimer's new view of revolution, two moments complement each other: that of historical necessity and the 'voluntaristic' spontaneity of freedom (Horkheimer, 1978: 107). Labour is no longer viewed as the source of emancipation, nor is it a 'bearer' of human emancipation at all: the necessity of historical progress has no longer chosen a formidable role for labour in its course. At the same time, he has nothing to put in its place, except for the 'act of will against history' (Postone, 1993: 112). Moreover, Horkheimer now grasps the totality of capitalist society not as an internally contradictory and specific system of production, but affirmatively, identifying it with 'the absolute'. 'Horkheimer reverses his earlier position: "labor" and the totality, which earlier had been the standpoint of the critique, now become the grounds of oppression and unfreedom' (1993: 114). In this sense, also the *character* of the critique changes from the emphasis on human emancipation to a 'disjunction' of the concept (i.e. the Absolute,

as grasped in Hegel and appropriated by Horkheimer for his view of society) and actuality. In sum, by not reconsidering the basic traditional Marxist views even after the ‘basic contradiction’ explained in that way had been superseded in the authoritarian state, Horkheimer embarks on historical pessimism in which only the relation between the concept and reality becomes thematic and the potential of immanent social critique of his early critique is left unrealized.

A similar diagnosis, Postone argues, can be made for Habermas who shares the premise of a traditional understanding of labour, and yet ‘attempts to limit the scope of its social significance’ (1993: 120). Habermas, leaving the crucial difference between abstract and concrete labour unthematized, understands the category of value as a quasi-natural, trans-historical, and technical category of wealth. His interpretation therefore reduces Marx’s critique of the social relations of production in capitalism to a critique of its *particular aspects* that are not only wrongly attributed, but also failing to grasp it as a self-reflexive and historically specific critique of capitalist society in its *totality* (Postone, 1993: 230–4). (For a critical discussion of Postone’s critique of Habermas, see Kim, 2014. For an elaboration of Postone’s critique of Habermas, see Elbe, 2017.)

### **ABSTRACT LABOUR, THE FETISH-CHARACTER, AND ABSTRACT AND HISTORICAL TIME**

The final section takes a brief overview of Postone’s own reconstruction of Marx’s central categories that form the latter part of *Time, Labor, and Social Domination*, insofar as they have not already been made clear in the critical discussion of the traditional Marxist standpoint.

For Postone, the crucial conceptual and real distinction of value and use value in the commodity form, functions as the interpretative

template to analyse the character of abstract labour, social domination, and time in capitalist society. Abstract labour has been a widely contested concept in the history of the scholarly reception of Marx’s *Capital*. Not least, because in its first definition, provided at the outset, Marx had given an explanation inviting misunderstanding, namely that abstract labour was the ‘expenditure of human labour power, in the physiological sense’ (Marx, 1976: 137). This naturalist view, even if Marx never uses it again throughout the three volumes, would, however, contradict what we have seen so far, namely that abstract labour is a purely social category, and specific only for the capitalist production mode. Postone here adheres to I.I. Rubin’s interpretation that both value and abstract labour are ‘determined social forms of production’ and that Marx had no physiological concept of abstract labour at all (Rubin, 1972: 135, quoted in 1993: 145). Why, then, does Marx invite the reader to believe it is? Postone’s argues that this first conceptualization was no ‘mistake’ of Marx’s, but a deliberate methodological move that delivers its own informative content. This argument requires a closer look.

As we have previously seen, Marx’s critique of political economy as a categorical critique of bourgeois economy targets the increasing mystification or the fetish-characteristic forms of value manifesting themselves in the categories of the commodity, money, capital, wage, price and profit, interest-bearing capital, rent, the sources of revenue, and so on. For Postone, this categorical critique not only serves to ‘reveal’ the essence of abstract labour in its inverted forms of appearance in these categories, as e.g. Lucio Colletti maintains (1972, 89–91, quoted in 1993: 147) with the objective to ‘defetishize’ the world of commodities (1993: 147), but to show that abstract labour itself constitutes a total ‘social mediation’ that simultaneously provides its own forms of appearance as transhistorical, ontological, and hence, physiological. After all, it *appears* as though

capitalist production is organized in a way to satisfy needs on the level of consumption. It *appears* as though the goal were material, concrete wealth that is only faultily distributed. The social mediation however that is presupposed for capitalist production to appear that way is bracketed from this view. For Postone, therefore, the relation between the essence of value in abstract labour and its appearance in its fetish-characteristic forms is a necessary one: 'the essence must be of such a quality that it necessarily appears in the form that it does. Marx's analysis of the relation of value to price, for example, is one of how the former is expressed and veiled by the latter' (1993: 166). The categories of essence and appearance, in accordance with Postone's theory, are not to be understood as ontological, but as historical categories directly related to the 'specific social function of labor' (1993: 167). Postone's critique therefore is not so much directed at Colletti's objective of 'defetishization', but, rather that 'defetishization' alone does not deliver the means to understand the 'mediating function' of abstract labour and value (1993: 167). In order to present abstract labour's mediating function, then, Marx chose to present and critically examine the fetishized forms such as its physiological function, in order to deliver an *immanent critique* of it in his succeeding analysis. (For a critique of Postone's undeclared usage of this original interpretation by Helmut Brentel, see Elbe, 2008: 243–4.) The mediating function of abstract labour therefore lies with its social and objective forms of expression that hitherto constitute the object of Marx's critique in the three volumes of *Capital*. It does *not* lie in its metabolic function to mediate human activity and nature, understood as a transhistorical and ontological process, as initially understood. Yet, '[the] appearance of labor's mediational character in capitalism as physiological labor is the fundamental core of the fetish of capitalism' (1993: 170).

Postone's conceptualization of abstract time demands a preliminary closer look at

some fundamentals of Marx's value theory. As is well known, Marx determines the substance of value as 'abstract human labour' and the measurement of value that determines its magnitude in 'the quantity of the "value-forming substance"', measured by its duration 'on the particular scale of hours, days, etc.' (Marx, 1976: 129). However, since the value of a product may then rise with greater unskillfulness and laziness of an individual producer, Marx introduces the notion of socially necessary labour time to give a more exact definition of the measure of value:

Socially necessary labour-time is the labour-time required to produce any use-value under the conditions of production normal for a given society and with the average degree of skill and intensity of labour prevalent in that society ... What exclusively determines the magnitude of the value of any article is therefore the amount of labour socially necessary, or the labour-time socially necessary for its production. (Marx, 1976: 129)

For Postone, the 'quantitative' side of value – its expression in labour time and consequently in money and exchange ratios – has dominated the traditional discourse over the qualitative one, introduced by Rubin and others in the 1920s, to designate the specific social *form* or coherence that value creates. Postone however claims that even the determination of the magnitude of value entails a *qualitative* determination of the relation of labour, time, and social necessity. Value, understood in terms of its measure in time, becomes the defining moment of capitalist totality that impresses its 'norm' on the social relations. As a non-consciously operating social objectivity, it 'expresses a quasi-objective social necessity with which the producers are confronted' (1993: 191). Hence, Marx's famous sarcastic statement that 'in the midst of the accidental and ever-fluctuating exchange relations between products, the labour time socially necessary to produce them asserts itself as a regulative law of nature. In the same way, the Law of Gravity asserts itself when a person's house collapses on top of him' (Marx, 1976: 168).

Postone's intervention consists in demonstrating how, with the historical emergence of the capitalist mode of production, 'time' becomes a *social* category. It loses its previous contingent, natural and concrete dimension and becomes a socially determinate and abstract-general category that structures the social nexus in the form of abstract domination. Note that this understanding refines the one previously stated, namely that the capitalist mode of production is solely oriented towards abstract wealth in value. It shows how both social objectivity and subjectivity mutually constitute the conditions on which the adherence to abstract time emerged, expressed in the objective forms of value. As a part of this process, abstract time changed the social function of human labour, while the latter increasingly oriented towards the demands of the new form of time. In other words, capitalist society organized itself in such a way that it is no longer the concrete and particular labour time required to produce an individual commodity that determines its value – in other things, there is no such thing as 'individual value' – but always a 'general social mediation', expressed in socially necessary labour time. Strictly speaking, this 'socializing' [*vergesellschaftende*] function of time became one of the constitutive elements of value itself. Socially necessary labour time then functions as the mediator of moment and totality, of the particular and the abstract-general, to relate the productive activity of concrete labour and the socially mediating activity of abstract labour. The opposition of the use value and the value dimension of the commodity is consequently mediated through abstract time (or socially necessary labour time) as the one condition to generate a social coherence in capitalism. It is through the quasi-objective abstract temporal measure of social wealth that abstract time becomes a 'new time-form' – new as against pre-capitalist social formations. While this essay cannot go into Postone's historical analysis of the shift from concrete to abstract time, it should suffice to

say that this new, adequately capitalist time form, oriented towards value production, has stripped off the cyclical perception of time in pre-capitalist, use-value-oriented social formations. Here, as often presumed, time was distinguished by seasonal cycles, or day and night, accommodated to the natural rhythms of life and (mostly) agrarian reproduction. When productivity changed its paradigm from quality to quantity with the rise of modern production techniques, etc., and it was practically possible to produce everything at any given time in any given space, the natural conditions of reproduction were dispensed with. The new paradigm of production required an independent framework of time that was 'uniform, continuous, homogenous, "empty"' (1993: 202) and in that sense quite close to Newton's theory of absolute time that 'flows equably without relation to anything external'. A theory that tellingly has been developed in the wake of the capitalist relations of production in the late seventeenth century (Newton quoted in Heath, 1936: 88, quoted in Postone, 1993: 202). The new time paradigm also included acceleration. Since, as Postone argues, 'each new level of productivity, once it has become socially general, not only redetermines the social labor hour but, in turn, is redetermined by that hour as the "base level" of productivity' (1993: 289), humans and their labour become part of a *treadmill effect* of production.

With the 'tyranny' of abstract time, Postone's understanding of the basic contradiction in the capitalist mode of production can now be revealed. As shown in the previous discussion, it does not consist in the contradiction of the forces with the relations of production, but more fundamentally in the concept of value itself: while abstract time is the standard of measurement in value, increased productivity resulting from the application of new techniques and innovation, *lowers* the time – and hence, the value – necessary to produce commodities in the average. The paradigm of abstract wealth in value and the paradigm of ever-increasing

productivity, both vital for capitalist production, cancel each other out – and yet, capitalism cannot exist without both. In Marx's own words: 'Capital itself is the moving contradiction, in that it presses to reduce labour time to a minimum, while it posits labour time, on the other side, as the sole measure and source of wealth' (Marx, 1973: 706). The concept of production of relative surplus value in which we can see 'not only how capital produces, but how capital itself is produced' (Marx, 1976: 280), developed in Volume I, captures this predicament from which he also develops one aspect of *crisis* in capitalism. (Discussed as the 'Law of the Tendency for the Rate of Profit to Fall' in part three of Volume III of *Capital*, Marx, 1981: 316–78.)

Towards the end of *Time, Labor, and Social Domination*, Postone presents the concepts of 'historical time' and 'abstract time' as the fundamental categories of the dialectic of capitalist production. The 'treadmill effect' or pattern is entailed by both categories insofar as the dialectic of value and use value here unfolds its grip on the production process. Rather than viewing the dialectic of value and use value simply as a problem of the commodity in atemporal, logical terms, Postone attempts to reconfigure it towards its temporal dimension. With this conception, Postone can effectively argue against conceptions of the 'materiality' of use value being distorted by value that remain on a purely logical hypothesis. He can also substantiate his previous contention that overcoming capitalism would involve overcoming both the form of growth and of production (labour) in capitalism, and not only the market and private property. Both abstract and historical time interact in a specific historical dialectic that, itself, generates a form of domination.

Here, Postone's analysis diverges in part from the clear conceptualizations of 'immanent social critique', applied to his understanding of the value form. In somewhat unmediated fashion, the category of 'space' is suddenly introduced – while its contribution to the explanatory power of the concept of

historical time somehow remains in the dark: 'Although the measure of value is time, the totalizing mediation expressed by "socially necessary labor time" is not a movement *of time* but a metamorphosis of substantial time into abstract time *in space*, as it were, from the particular to the general and back' (1993: 293). The only pertinent distinction between abstract and historical time, then, is that the former is a movement *in* time, while the latter is a movement *of* time. The explanatory objective of this distinction, however, remains obscure, or does, in any case, not move beyond the conceptual distinctions of his previous analysis. This becomes problematic especially against the background that both concepts designate *capitalist* time forms. As for the probable motive to introduce this concept, in this latter part of his analysis, Postone seems to incorporate philosophical classic dualisms (abstract–concrete, time–space) to give further proof of the holistic nature of his own interpretation, while it seems that the theoretizations of concepts such as space and historical time have not received the analytical treatment needed for such an attempt. (For a critical discussion, see Osborne, 2008: 19.)

All in all it must be stated, however, that since its first publication in 1993, Moishe Postone's reinterpretation of Marx's Critique of Political Economy has set new standards in the discourse of the critique of capitalism in aligning itself with the methodological approach of immanent social critique of critical theory. In addition to being a philosophically and historically well-informed and seminal theoretical intervention in the study of Marx's work, it has set the standard for a critical theory of society adequate for the twentieth century.

# John Holloway: The Theory of Interstitial Revolution

Ana Cecilia Dinerstein

## INTRODUCTION

John Holloway's work spans over four decades of intellectual development and commitment to radical change. Holloway develops his ideas through ongoing dialogues, conversations, debates and discussions with both Marxists and radical scholars and students, and social movements and activists, worldwide. His work developed within the context of the Conference of Socialist Economists (CSE) and was foundational for the establishment of Open Marxism. The chapter focuses on Holloway's theory of interstitial revolution which, paraphrasing Holloway, has produced a 'crack' in Marxist praxis. I start with an account of Holloway's life and intellectual trajectory. Then, I discuss his theory of interstitial revolution, presented in his two single authored books, *Change the World without Taking Power: The Meaning of Revolution Today* (CTWWTP) (2002) and *Crack Capitalism* (2010). I conclude that for critical theory as a critique of capital, Holloway's work is groundbreaking.

## LIFE AND INTELLECTUAL TRAJECTORY

John Holloway was born on the 26th of July 1947 in Dublin, Ireland. He studied law, did a degree in Higher European Studies at the College of Europe, and received a PhD in Political Science from the University of Edinburgh. He taught Politics at the University of Edinburgh until his move to Mexico in 1991. He settled in the Spanish colonial city of Puebla, where he established himself as a Professor at the Institute for Social Sciences and Humanities 'Alfonso Vélaz Pliego', at the Benemérita Autonomous University of Puebla, where he currently (March 2018) teaches post-graduate courses. He is also a member of the Editorial Board of *Bajo el Volcán*, the journal of the Sociology Graduate School of the University.

Holloway began his intellectual relationship with the Frankfurt School when he read Marcuse's *One-Dimensional Man*, in 1967. But it was not until he read the work of Ernst Bloch that he entered the realm of Critical Theory and Marxism. He came across his

philosophy around 1968, when a friend who was a student at the University of Tübingen, where Bloch worked from 1961 until his death in 1977, recommended Bloch's work to him; he read Bloch's work before Karl Marx's *Capital*. He studied Adorno's theory in the 1970s and continued working with it, encouraged by Richard Gunn and Werner Bonefeld, in the late 1980s and early 1990, then through joint work with his colleagues at the Benemérita Autonomous University of Puebla in the 1990s and 2000s.

In 1974, Holloway joined the CSE, which was created as a non-sectarian and internationalist forum for theoretical Marxist political debate in the United Kingdom as a response to the need to develop a socialist critique of Marxist orthodoxy. The Thatcher years brought about intense debates on globalization and the internationalization of the nation state among the various groupings of the British Left. The CSE aimed to understand the relation between domestic policy and international developments and the character of the capitalist state within the context of a globalizing world economy, and empower the Marxist critique of capital.<sup>1</sup>

Within the context of the CSE state debate, Holloway developed the category of state as a political form of definite social relations, in distinction to those approaches that tended to regard it as a political *institution* and argued that 'the internationalization of capital had undermined the ability for the state to serve the interests of "national" capital' (Clarke, 1991b: 22). Holloway agreed with other CSE members (Hugo Radice, Sol Picciotto and Simon Clarke) about the importance of raising 'the question of the relation between class struggle and the restructuring of capital' (Clarke, 1991b: 23) and the need to reintroduce class struggle as intrinsic – rather than external – to the analysis of the state. The CSE State Study Group was influenced by the German State Derivation (GD) debate, whose members, i.e. Joachim Hirsch and Heide Gerstenberger, conceived of the state as the political *form* of the capitalist social

relations, and sought to develop a materialist critique of the state. The GD debate applied the concept of 'form' to their exploration of the state, conceiving of the latter as logically and historically derived from capital. The GD debate interpreted Marx's *Capital* as a *materialist critique of the capitalist economy*, wherein the political and the economic were not separated spheres but rather distinct moments of capital as a social totality. While this development was vital for the CSE State Debate, they rejected the GD's problematic assertion of a 'logical derivation' of the state from capital. As Holloway highlights:

there is a tendency to see logic as establishing the general framework of development, with the actual details being filled in by the history of class struggle, so that in the end class struggle is seen as being subordinated to the structural logic of capitalism (Holloway, 1993a: 78).<sup>2</sup>

By rejecting the idea of 'logical' derivation and arguing for the existence of the state as a historical necessity of class struggle (Clarke, 1991a), the CSE State Study Group succeeded in the task of re-integrating class struggle into the analysis of the political and the economic forms of the capitalist social relations.<sup>3</sup> In 1977, John Holloway co-authored an article with Sol Picciotto where they contested Ralph Miliband's and Nicos Poulantzas' analysis of the state, arguing that their

approach rests ... on a misunderstanding of Marx's great work, which is not an analysis of the 'economic level' but a materialist critique of political economy, i.e. precisely a materialist critique of bourgeois attempts to analyse the economy in isolation from the class relations of exploitation on which it is based. (Holloway and Picciotto, 1977: 82)

According to Holloway and Picciotto, in order to understand the crisis of capitalism and the role of the state within it, it was essential to abandon the idea of crisis as 'economic crisis' and to interpret crisis as the crisis of the capital relation. The materialist theory of the state does not start from the analysis of the state, but from the analysis of

capital as a definite form of social relations. A 'political' theory of the state (such as Miliband's or Poulantzas'), autonomizes the state as an object of study, which leads to the *methodological* detachment of the study of the state form from the capitalist social relations. As suggested by Hirsch, the separation between the political and the economic prevents understanding of the state as the political form of capitalist society.

The theoretical developments of the CSE State Study Group constituted a turning point in the Marxist state debate.<sup>4</sup> To Holloway, 'to understand the political and the economic as two forms, as two moments, of the relation between capital and labour implies to understand the state as a process that fetishizes social relations' (Holloway in Thwaites Rey and Dinerstein, 1994: 14, author's interview).<sup>5</sup> The question was not what is the state, but what is capital and why the state appears as autonomized from capitalist society. Holloway and Picciotto discussed the specific form of domination in capitalist society by using Pashukanis' question:

Why does the dominance of a class not continue to be that which it is – that is to say, the subordination in fact of one part of the population to another part? Why does it take on the form of official state domination? ... Why is it disassociated from the dominant class – taking the form of an impersonal mechanism of public authority isolated from society' (Pashukanis, cited in Holloway and Picciotto, 1977: 79; see also Holloway and Picciotto, 1977)

Their analysis pointed to the distinctive character of the state in capitalist society: while it *appears* above society as a *deus ex machina*, i.e. as an autonomous institution above society, it is but the political form of capital. For Holloway and Picciotto (1977: 79) 'the important distinguishing feature of class domination in capitalist society is that it is mediated through commodity exchange'. In practical terms this means that 'the state has to be derived from the analysis of class struggles surrounding the reproduction of capital instead of being derived in some way from the surface forms of appearance of capital' (Clarke, 1991c: 185).

Yet, it was still not clear how the state was experienced in everyday life. In 1979, Holloway was a member of the CSE London Edinburgh Weekend Return Group (LEWRG), and they published a pamphlet entitled *In and against the state*.<sup>6</sup> It criticized 'the dominant, "Fabian" ideology of the Labour Party' in which

the expansion of the welfare state is identified with the onward march towards socialism. Often people make a distinction between two different sides of the state. They think of the state as having a 'good' (i.e. socialist) side, which would include social services, health, education and nationalised industries; and a 'bad' (i.e. capitalist) side, involving such functions as defence, law and order, and aid to private industry. In this view the struggle for socialism involves trying to expand the good side and restrict the bad side. (LEWRG, 1980: 56)

In their argument, the problem with reformism was its lack of recognition of the capitalist character of the state. The state is not a state *in* a capitalist society but a *capitalist state*: 'How is the state a capitalist state?'. The LEWRG maintained that 'what makes the state a capitalist state is the way in which it is built into the whole structure of capitalist social relations' (LEWRG, 1980: 56). They offered the notion of 'in and against the state' to express the contradictory form of both the state and the experience of the state, as both a form of social relations and an institution: 'The two senses are closely intertwined, but the distinction is important. The problem of working in and against the state is precisely the problem of turning our routine contact with the state apparatus against the form of social relations which the apparatus is trying to impose upon our actions' (59).

But if the state was conceived of as the political form of capital, what was the relation between the nation state and global capital and how did the state form change as a result of major transformations in the form of capital accumulation? According to Holloway the state is not the starting point for the analysis of the state. If we do so, the world 'appears as the sum of nation-states' (Holloway, 1996b: 117).

He argued that ‘to reach a satisfactory understanding of the changes taking place [...] we need to go beyond the category of “the state”, or rather we need to go beyond the assumption of the separateness of the different states to find a way of discussing their unity’ (118).

Holloway makes an important distinction between ‘the political’ and ‘the state’. The political is a ‘moment of the totality of capitalist social relations’ (Holloway, 1996b: 123) which exists not as a global state, but as a ‘multiplicity of apparently autonomous territorially distinct national states’ (124). National states are political ‘forms of the global totality of social relations’ (122). The relation between both – the political and the nation states – is such that the political is

fractured into territorially defined units: this fracturing is fundamental to an understanding of the political ... The world is not an aggregation of national states, national capitalisms or national societies: rather the fractured existence of the political as national states decomposes the world into so many apparently autonomous units. (Holloway, 1996b: 124)

The CSE State Study Group members had already reached the conclusion that the problem was not that the nation state was being weakened by global capital, illustrated by the impossibility of maintaining the Keynesian state due to increasing pressures from global capital but that the state was the political form of the social relations of capital as fundamentally a world market relationship. With the transformation of capital into money (financialization), national states were now competing for a portion of global capital to sustain domestic social reproduction. The neoliberal form of the state was not ‘economic’ or ‘political’ but induced material changes produced by the global transformation of capital that were brought about by the class struggle. The crisis of Keynesianism and the emergence of monetarism could thus not be explained by recourse to either political or economic rationality. Rather, they manifested a crisis-ridden process of restructuring of the capitalist social relations at the

level of the world market level (Clarke, 1988: 11).

Holloway’s contribution to this specific debate focused on ‘labour’ as the central category of the capitalist crisis. In this argument, the crisis of Keynesianism amounted to a crisis of the specifically Keynesian form of the *recognition of the power of labour*. Keynesianism expressed the power of labour as ‘mode of domination’ (Holloway, 1996a: 8). That is, the Keynesian state contained the power of labour via the ‘monetization’ of class conflict: ‘In the face of rigidity and revolt, money was the great lubricant. Wage-bargaining became the focus of both managerial change and worker discontent’ (23). He thus analysed the crisis of Keynesianism as a crisis of the containment of labour (27).

In Holloway’s approach, the notion of *form* developed from an earlier account of the state as the political form of capitalist society into an argument about fetishism as an open process of fetishization (Holloway, 1992). This change marks a second moment in Holloway’s trajectory as a key contributor to Open Marxism. The term was employed by Werner Bonefeld, Richard Gunn and the late Kosmas Psychopedis in the early 1990s to challenge the ‘closed’, ‘scientistic and positivistic’ Marxist tradition. Open Marxism was inspired by the tradition of unorthodox Marxists and critical radical thinkers such as Adorno, Agnoli, Bloch, Lukács, Luxemburg, Rubin, Pashukanis and Marx (Holloway, 1993a: 77). The term Open Marxism goes back to the title of a book in which Ernst Mandel and Johannes Agnoli (1980) ‘debated the meaning of Marx’s critique’ and, connected with it, whether Marxist economics is a contradiction in terms. While Mandel argued that it is not, the open Marxist followed Agnoli who contended that it was because ‘Marx primarily negated the world of capital by revealing its human social content’ (Bonefeld, in Bieler et al., 2006: 178). Open Marxism rejects the dogmatic closure of the categories of thought: ‘open Marxism offers to conceptualize the contradictions

internal to domination itself ... critique is open inasmuch as it involves a reciprocal interrelation between the categories of theory (which interrogates practice) and of practice (which constitutes the framework for critique)' (Bonefeld et al., 1992a: xi; see also 1992b; 1995). Holloway described Open Marxism as 'freeing Marx' from traditional theory (Holloway, 1993b). In his account, it entailed a theory of struggle: 'to speak of struggle is to speak of the openness of social development; to think of Marxism as a theory of struggle is to think of Marxist categories as open categories, categories which conceptualise the openness of society' (Holloway, 1993a: 76).

One of the issues at stake in the above-mentioned debate between Mandel and Agnoli was that '[t]he critique of social forms ... amounts to a critique of economic categories on a human basis and it does so by returning the constituted forms of the economic categories to "relations between humans" (Marx, 1972: 147)' (Bonefeld in Bieler et al., 2006: 178). For Holloway's theoretical development this critique of social form is crucial. He developed it by dissecting the category labour, and its 'relation with capital', which led him to the argument that capital and labour form an *inner connection*.<sup>7</sup> In Holloway's contribution the argument about inner connection established Marx's *critique of political economy* as a critical theory of labour as constitutive power. As he put it, 'it is labour alone which constitutes social reality ... *our own power is confronted by nothing but our own power, albeit in alienated form*' (Holloway, 1993b: 19, emphasis in original). As a consequence, the resolution to Marx's theory of struggle cannot lie in the 'reversal of the polarity between capital and labour, but in its dissolution' (Holloway, 1995: 164). That is, labour appears in capital as its alienated form of existence (Dinerstein and Neary, 2002b). As Gunn (1987) highlights, '[s]ocial roles are mediations of class struggle, i.e. they are *modes of existence* of class struggle ... : as mediated in terms of roles, class struggle exists

*in the mode of being denied*' (20, emphasis in original).<sup>8</sup>

The notion of 'form' points to the historical condition of *transitoriness* of the ways in which labour exists in and against capital. The forms of existence of labour are not 'constituted' (emph. in orig.) by some abstract social forces (Bonefeld, 1995: 183). Rather, they are *being* constituted through class struggle. Hence, 'to introduce the concept of form is to move from the photographic print to its negative ... [the] various implications of forms (historicity, negativity, internality) are well captured by the term "mode of existence"' (Holloway, 1995: 165). Form is 'central to Marx's discussion in *Capital*' (164) and facilitates the understanding of the inner connections (and mediations) of class struggle. Form implies a concept of totality (see Jay, 1984). But a totality that is not as impenetrable as Marxist traditional theory suggests:

the fetishised forms in which capitalist relations appear are not a totally opaque cover completely concealing class exploitation from those who are subjected to it ... Money, capital, interest, rent, profit, state – all are commonly experienced as aspects of a general system of oppression, even though their precise interconnections may not be understood (Holloway, 1992: 157).

The problem at stake was how to theorize labour resistance and labour subjectivity against this totality. Holloway offered a critique of the concept of work understood as resistance, as practical subjectivity and negativity, and replaced the notion of fetishism with fetishization. Both will be central to his theory of revolution. Work 'is subjectivity – practical subjectivity, since there is no other; and work is negativity, since it involves the practical negation of that which exists. Work is all-constitutive. "Objectivity" is nothing but objectified subjectivity' (1995: 172). Subjectivity exists then in a contradictory form based on the existence of work 'in the form of the two-fold nature of labour' (1995: 172): as concrete labour and as abstract labour. As we will see below, this distinction is key to Holloway's re-conceptualization of

class struggle. Although Marxists acknowledge the two-fold character of labour, they have neglected the fact that the 'subordination of concrete to abstract labour (the production of value)' and the resistance to it, are central to class struggle. Work, he contends, 'exists in a form which negates that "free conscious activity" which is the "species characteristic of man"'. Marx's central criticism of capitalism is that it dehumanises people by depriving them of that which makes them human' (1995: 172).

The focus on the dehumanizing effect of work in capitalism marks a third 'moment' in Holloway's intellectual trajectory, which coincided with the Zapatistas' uprising in 1994. The uprising inspired a worldwide discussion of class struggle as a struggle for dignity, which cannot be attained in capitalist society. Holloway found in Zapatismo, the inspiration to produce a theoretical revolution. The indigenous revolt challenged existing revolutionary traditions, as the movement put 'human dignity' instead of class at the centre of their revolution. Following indigenous traditions of self-determination and self-government, they were not interested in taking power. The Zapatistas rebelled against traditional ways of conceiving of radical change and problematized the traditional concept of class. Holloway became interested in the way the Zapatistas challenge the binary thinking of class analysis with their notion of 'we' or 'revolutionary we' [*nosotros revolucionario*] and anti-power. The Zapatistas' discourse mediated by Subcommander Insurgent Marcos' speeches, poems and prose, and the movement's Declarations of the Lacandon Jungle resonated with Holloway's critique of Leninism, 'Real Socialism' and Scientific Marxism. More importantly Holloway connected with the movement's rejection of the state as the main locus for revolutionary change. Holloway became one of the intellectual reference points for the Zapatistas' message and resistance beyond Chiapas. During this time, and in addition to his short articles about Zapatismo in *Common Sense*,

he co-edited a book (with Eloína Peláez) featuring several dimensions of the Zapatistas' uprising and movement, including his own reflections on the movement's notion of power, the meaning of revolution and their concept of dignity (Holloway and Peláez, 1998; Holloway, 1997).

Holloway's book *CTWWTP*, published in 2002, can be regarded as the culmination of his theoretical efforts to gain understanding of a world in flux. According to Holloway, 'the aim of the book is to promote discussion, a discussion that moves forward, that recognises that we all desperately want to change the world but that none of us know how to do it' (Holloway, 2005b: 284). Holloway characterized his book as Janus-faced: 'an attempt to say to activists that, in order to take their activism seriously, they must read Marx and theorise austere; and to say to austere Marxist theorists that they must break through their austerity and think politically, and thereby transform their own theory' (283–4).

The years that followed the Zapatistas' revolt were politically stimulating. In 1999, a two-day street protest outside the State Convention and Trade Center in Seattle, that prevented the World Trade Organization (WTO) Ministerial Conference from taking place, appeared as a turning point in social activism.<sup>9</sup> Both the 'Battle of Seattle' and the Zapatistas' revolt led to the birth of the Global Justice Movement (GJM), an umbrella movement that comprised new forms of social activism and citizen mobilization that were not led by the labour movement, did not aim at taking part in or take the power of the state, and left behind the traditional leftist discourse based on class to advocate dignity instead.

The emergence of transnational activism as well as the intensification of local resistance to neoliberal globalization put Holloway in the spotlight of passionate debates and discussions among academics as well as activists about the meaning of collective actions, social movements, of politics and anti-politics and the relationship

of anti-capitalism to the state and money. While the book's argument resonated among those who celebrated autonomy as a tool for radical change, Holloway's proposition produced intellectual adversaries too, i.e. those who hold onto traditional readings of Marx and Marxist politics and will not forgive his irreverence towards the working class as the subject of revolution and, above all, his contempt for the state (see Callinicos, 2005: Bensaïd, 2005). His experience of the two years after the publication of *CTWWTP* was like 'playing at the edge of the sea and being hit by big waves of enthusiasm and criticism which roll me over and over: an exhilarating and sometimes confusing experience in which I occasionally lose the thread of the argument' (Holloway, 2005a: 39).

Holloway continued working in the Institute for Social Sciences at the Autonomous University of Puebla. He co-edited a book, *Negativity and Revolution*, on the significance of Adorno's negative dialectics for understanding resistance and political activism today, with Sergio Tischler and Fernando Matamoros (Holloway et al., 2009). The publication was an outcome of the ongoing seminar in 'Subjectivity and Critical Theory' delivered for the Sociology Postgraduate Programme by the three book editors.

Despite the subtitle, *The meaning of revolution today*, *CTWWTP* does not offer a theory of revolution. It took six more years for such theory to emerge amid the context marked by the capitalist financial crisis of 2008 and the expansion of the politics of austerity in the global North. *Crack Capitalism* (2010a) offers a more sophisticated discussion of crisis, labour, resistance and revolution and it is here where Holloway offers the idea of 'crack' as a way of thinking about revolutionary struggles. He asserts that *revolution cannot be other than interstitial* (Holloway, 2010a). Since then, John Holloway has continued tirelessly to give keynotes and lectures, participate in workshops, events and conferences worldwide, and to write short

interventions and articles on the crisis of abstract labour, the reading of Marx's capital, communization, hope and the Greek crisis, in English and in translation.

## THE THEORY OF INTERSTITIAL REVOLUTION

### *Marxism as a Theory of Struggle*

Holloway's proposal that Marxism is a *theory of struggle* originated in a short 'Note on Fordism and Neo-Fordism' where he claimed 'If Marxism is not about the "beat of the heart", it is nothing. If it is not "pushing against the wall", it has no meaning' (Holloway, 1987: 52.<sup>10</sup> In *CTWWTP*, Holloway dedicates an entire chapter to critiquing the tradition of Scientific Marxism, a Marxism that sees itself as a 'theory of' for example, capitalist oppression, but not of the contradictions of that oppression (see Gunn, 1994; Holloway, 1994: 40). Echoing Horkheimer's critique of traditional theory as opposed to critical social theory, Holloway argues that Marxism cannot be 'Scientific Marxism', i.e. the positivization of theory or a paradigm:

In so far as Marxism emphasises the regularities of social development, and the interconnections between phenomena as part of a social totality, it lends itself very easily to a view of capitalism as a relatively smoothly self-reproducing society ... Marxism, from being a theory of the destruction of capitalist society, becomes a theory of its reproduction. (Holloway, 2002a: 136)<sup>11</sup>

Holloway's Marxism as a theory of struggle is decisively Blochian. Ernst Bloch argued that 'Marxism in general is absolutely nothing but the struggle against the dehumanization which culminates in capitalism until it is completely cancelled' (Bloch, 1959/1986: 1358). To Bloch, Marx's humanitarianism is not as an abstract concept. Rather, it invokes struggle to create another form of human society. Holloway's Marxism is similar to Bloch's

Marxism also in another way. Like Bloch, Holloway sees Marxism as a theorization that opens a space to the not yet. Bloch's philosophy appeals to those who aim to escape the caricatures of a ready-made Marxist utopia and wish – like Holloway – to rephrase resistance, antagonism and revolution today.

### ***Fetishization, Form and Totality***

As a theory of struggle, Marxism rejects the traditional Marxist's understanding of 'totality'. To Holloway, the distinction between fetishism and fetishization and the replacement of the former with the latter 'is crucial for a discussion of Marxist theory' (Holloway, 2002c: 27). To re-incorporate class struggle into the discussion of commodity fetishism, 'fetishism' must be seen 'as a process of defetishisation/re-fetishiation' so that we can emphasize the 'inherent fragility of capitalist social relations' (Holloway, 1992: 157). The main difference, maintains Holloway, is that, while fetishism sees the world as domination, fetishization sees it in terms of struggle. This distinction between fetishism and fetishization is a 'central thread' of *CTWWTP*: 'that the struggle against capital is a struggle against fetishism and that fetishism must be understood as a process of fetishisation' (Holloway, 2005a: 38). The notion of fetishization is rooted in the above mentioned work of the CSE State Study Group and their capital relation theory of the state, which conceives of the state 'as a form of the capital relation, an aspect of the fetishisation of social relations under capitalism' (Holloway, 2005a: 39): 'For me, the most important turning point in this discussion was the argument that fetishism has to be understood not as *fait accompli* but as process, as form-process or process of formation, as struggle' (Holloway, 2005a: 39).<sup>12</sup>

Fetishization entails a totality that is open. For Holloway, totality refers to inner connections among fragmented forms of social relations rather than to an entirety. The notion of *form* is most crucial in this regard. To Holloway, 'the concept of "form" ... implies

a concept of "totality"' (Holloway, 1995: 166). To use the notion of form means to look at society 'from the point of view of its overcoming' (Holloway, 1992: 154). Holloway sees in the concept of fetishism the possibility to 'emphasise the inherent fragility of capitalist social relations. Defetishisation/refetishisation is a constant struggle' (157). In *CTWWTP*, Holloway engages critically with Lukács' notion of reification developed in *History and Class Consciousness* (1923). To Lukács, reification affects the totality of social relations and not only the labour process; or in other words, as Holloway cites: 'The fate of the worker becomes the fate of society as a whole' (Lukács, 1971: 91, cited in Holloway, 2002a: 56). In the perverted world we live in, 'relations between people exist in the form of relations between things. Social relations are "thingified" or "reified"' (Holloway, 2002a: 56). Lukács's argument, argues Holloway, 'points to the incomplete or, better, self-contradictory nature of fetishism. The process of objectification induces a split between the subjectivity and the objectivity of the worker, between the worker's humanity and his dehumanisation. The experience of the worker is at once fetishising and de-fetishising. At this point, Lukács seems to be laying the basis for a theory of revolution as the self-emancipation of the workers' (Holloway, 2002a: 35).

However, although this seems to point in the direction of a theory of revolution, writes Holloway, Lukács final move is towards external intervention. The tensions are not resolved with and by the proletariat but by the party: 'Despite the radical character of his essays, Lukács is operating in a theoretical and political context which is already pre-constituted. His approach is far from the crude "scientific Marxism" of the Engelsian-Leninist tradition, yet his theoretical-political world is the same' (84).

Holloway also problematizes Adorno's (and the Frankfurt School's) idea of totality. According to him, it is disengaged from the idea of revolution and could not associate reification or fetishism with anti-fetishism

(Holloway, 2002a: 87). Despite differences, Holloway suggests that all Frankfurt School scholars emphasize ‘the all-pervasive character of fetishism in modern capitalism [which] leads to the conclusion that the only possible source of anti-fetishism lies outside the ordinary – whether it be the Party (Lukács), the privileged intellectuals (Horkheimer and Adorno) or the “substratum of the outcasts and the outsiders” (Marcuse)’ (Holloway, 2002a: 88). Holloway rejects this elitist understanding of theory and points out its profound political implications:

the view either that revolution is impossible, or that it must be led by an emancipated vanguard acting *on behalf of* the working class: this leads to a focus on the state, which is precisely a form of organization *on behalf of*, that is, a form of exclusion and repression (Holloway, 2005a: 39, emphasis in original).

Instead, fetishization starts ‘from a self-divided subject ... against its/our own alienation or fetishisation, driving towards social self-determination ... there is no possible saviour, no possible emancipated vanguard’ (39). *Totality* is an open process full of tensions as the struggle of what exists in the mode of being denied moves in and against the reified forms of capitalist social relations: ‘the struggle for the dissolution of power is the struggle for the emancipation of power-to (*potentia*) from power-over (*potestas*)’ (Holloway, 2002d).

### ***Classification, Class Struggle and the Revolutionary Subject***

Holloway’s theory of revolution deconstructs the categories of class and class struggle and rethinks the revolutionary subject. As Richard Gunn argues ‘it is not that classes, as socially (or structurally) pre-given entities, enter into struggle. Rather – holding fast to the conception of class relations as relations of struggle – we should think of *class struggle* as the fundamental premise of *class*’ (Gunn, 1987: 16, emphasis in original).<sup>13</sup> Holloway rejects *class* as a sociological descriptor or as a

pre-constituted entity. Instead of class he talks about ‘classification’ (2002c). That is, a process through which we are transformed into something else, that is *classified* as the working class.<sup>14</sup> If class is understood as a fixed entity, it inevitably leads to identitarian thinking. But to Holloway, identitarian thinking does not comprehend society, nor class. Instead, it classifies what it perceives and, in so doing, fragments human activity as a whole in thought. Revolutionary praxis is necessarily anti-identitarian. Rather than denying the importance of workers’ struggles (as many critics have charged him with), Holloway rejects the ‘working class’ as the subject of revolution. For him, the radical subject is ‘we’. We are the working class; and yet we *are not* the working class. We live in contradiction: ‘We struggle as the working class *and* against being the working class:

We are/ are not working class ... We classify ourselves in so far as we produce capital, in so far as we respect money, in so far as we participate, through our practice, our theory, our language (our defining the working class), in the separation of subject and object (2002a: 36–7).

The main issue with a theory of revolution based on the power of the working class is that the working class is a subjectivity that is ‘defined on the basis of its subordination to capital: it is because it is subordinated to capital (as wage workers...) that it is defined as working class ... by being *defined*, the working class is *identified* as a particular group of people’ (Holloway, 2002a: 140–1, italics in the original). The definition and classification of the working class ‘on the basis of its subordination to capital’ (140) poses the wrong question of belonging, i.e. who belongs and who does not belong to the working class. This question obscures the complex problem of social antagonism for it limits the struggle to a specific identity. The struggles of today cannot typify the struggle of the ‘working class’ or any other ‘subject’ for the reason that ‘the subject of anti-capitalist struggle is ... an anti-identitarian subject’ (Holloway, 2009b: 98).

Holloway points to the two-fold character of labour in capitalism as concrete and abstract, and argues that traditional readings of Marx have historically neglected the antagonism between useful 'doing' and abstract labour. He moves the axis of class antagonism from labour against capital to doing against labour. He argues that the key to understanding struggles is to see them not as the struggle between labour and capital (the orthodox Marxist view), but as 'the struggle of *doing against labour (and therefore against capital)*' (Holloway, 2010a: 157, emphasis in original). By exposing the two-fold character of labour, Holloway points to the fetishization of human activity (named 'doing') as abstract labour. This process of fetishization produces a constant 'rupture of the social flow of doing' (115). Abstract labour, he argues, amounts to the 'weaving of capitalism' (87), i.e. the abstraction of human activity constitutes the form through which capitalism weaves its web of social cohesion. He translates his reading of the critique of political economy into a new language where labour becomes 'doing' against abstract labour, i.e. where class antagonism asserts itself in the form of a struggle against classification, that is, he conceives of doing as refusal of abstract labour. The labour movement, a movement that represents and defends wage labour, can therefore not be revolutionary (Holloway, 2010a). He thus conceives of doing as a crisis of abstract labour, which, Holloway (2010b: 917) claims, is evident in the decline of the trade union movement, the crisis of social democracy, and the collapse of real Socialism, etc.

### ***Doing, Practical Negativity and Anti-Power***

The historical difficulty for the struggles of the other labour movement is how to construct a critique beyond the idea of work, when capitalist work is still the defining principle of the organization of social life

(Dinerstein and Neary, 2002b: 15). Holloway writes that '[a]n important question that arises is whether the most important anti-capitalist theory, Marxism, is relevant for understanding these movements' (Holloway, 2010b: 912).

Holloway replaces the term work with the above-mentioned notion of 'doing':

There are two different sorts of activity: one that is externally imposed and experienced as either directly unpleasant or part of a system that we reject, and another that pushes towards self-determination. We really need two different words for these two different types of activity. We shall follow the suggestion of Engels in a footnote in *Capital* (Marx 1965 [1867]: 47) by referring to the former activity as *labour* and the latter simply as *doing*. (Holloway, 2010b: 910–11, emphasis in original)

'Doing' is not just work. 'Doing' is the movement of 'practical negativity': 'Doing changes, negates an existing state of affairs. Doing goes beyond, transcends' (Holloway, 2002a: 23). Doing exists in a 'mode of being denied' (Gunn, 1987: 20) because it is constantly transformed into abstract labour (value, money).<sup>15</sup> Thus, the doers are *denied their doing* (Dinerstein, 2012: 525). 'The doing of the doers is deprived of social validation: they and their doing become invisible' (Holloway, 2002a: 29–30).

The argument that class struggle is a struggle of *doing against abstract labour* points to the existence of two types of antagonisms which, according to Holloway, emanate from the dual character of labour in capitalism: the antagonism of exploitation and the antagonism of abstraction. While the antagonism of exploitation is the struggle *of* labour in the work place, the antagonism of abstraction is a struggle *against* labour, that is

the struggle against the constitution of labour as an activity distinct from the general flow of doing ... [this is] the struggle of what is sometimes referred to as the other labour movement, but it is in no sense limited to the workplace ... [these are at a] deeper level of anti-capitalist struggle, the struggle *against* the labour that produces capital. (Holloway, 2010b: 915, emphasis in original)

The idea of class struggle as a struggle of doing against abstract labour is consistent with Holloway's rejection of two antagonistic subjects of struggle, for ultimately it is labour alone which confronts its own existence as capital (Dinerstein and Neary, 2002b); and follows on from the CSE's conclusion reached in 1980 that emphasizes the subordination of human practice to the power of money:

[F]or Marx value did not correspond to Ricardo's embodied labour, but to abstract labour that appeared in the form of money ... the distinctiveness of Marx's theory lay not so much in the idea of labour as the source of value and surplus value as in the idea of money as the most abstract form of capitalist property and so as the supreme social power through which social reproduction is subordinated to the power of capital (Clarke, 1988: 13–14).

For Holloway, doing is the struggle *against* the transformation of all human practice into an abstract measure of labour time. In this manner, he emphasizes subjectivity as negativity. This conception of doing is a fundamental tenet of his theory of interstitial revolution. For Adorno, dialectic means impossibility of closure. The negation of the negation cannot be resolved positively. If this would be the case, 'the negation of the negation would be another identity, a new delusion, a projection of consequential logic – and ultimately of the principle of subjectivity – upon the absolute' (Adorno, 1995: 160). Holloway holds on to this conception of the negative and develops it to its most radical conclusion.

In distinction to Adorno, and paraphrasing Lukács, Holloway is an uncomfortable guest at the Grand Hotel Abyss. His appreciation of Adorno's negative dialectics is combined with Bloch's argument about the necessity of concrete utopia and the utopian function of hope. The 'fusion between negativity and hope' offered by Holloway is founded on the *not yet* in Bloch (Dinerstein, 2015; 2012). Still, Adorno's rejection of activism does not exclude hope as a category of negative

critique. As Amsler reminds us, Adorno defends 'hope as a critical practice' (Amsler, 2016: 20):

In the end hope, wrested from reality by negating it, is the only form in which truth appears. Without hope, the idea of truth would be scarcely even thinkable, and it is the cardinal untruth, having recognized existence to be bad, to present it as truth simply because it has been recognized. (Adorno, 2005[1974]: 98)

Utopia is 'the ray of light that reveals the whole to be untrue in all its moments ... the utopia of the whole truth, which is still to be realized' (Adorno cited by Boldyrev, 2015: 173). Thus, negativity contains the *possibility of affirmation* of another praxis, a praxis that was denied and which, by being enacted, denies the impossibility of the existence of an alternative (Dinerstein, 2016). In this manner Holloway writes:

The struggle of that which exists in the form of being denied is inevitably both negative and positive, both scream and doing: negative because its affirmation can take place only against its own denial, and positive because it is the assertion of that which exists, albeit in the form of being denied. (Holloway, 2002a: 213)

Hope constitutes a call for negativity to understand reality as full of improbable possibilities: 'humans are subjects while animals are not. Subjectivity refers to the conscious projection beyond that which exists, the ability to negate that which exists and create something that does not yet exist' (Holloway, 2002a: 25–6). Therefore, '[r]evolutionary politics (or better anti-politics) is the explicit affirmation in all its infinite richness of that which is denied. "Dignity" is the word that the Zapatistas use to talk of this affirmation' (212).

### **Power, Anti-Power and the State**

One of the most striking theses in Holloway's theory of revolution is that the revolution is about destroying relations of power. The goal

is 'to create a society based on the mutual recognition of people's dignity' (Holloway, 2002a: 20). As we have seen in this section, Holloway conceived of the state as a political form of capitalist social relations, arguing that the state is not a thing but a process of class struggle. For this reason, 'it is crucial to understand the class character of the state as a form of social relations and to develop our own distinctive, a-symmetrical forms, forms which move against-and-beyond the fetishisation characteristic of capitalist forms' (Holloway, 2005a: 40).

The problem is not the state but how we understand power in relation to the state. Power is 'usually associated with the control of money or the state'. The Left, mainstream, Leninist, or social democratic, have all focused on the state as the main locus of social change (Holloway, 1996c: 21). But this strategy has failed. It not only failed in achieving its goals but also 'has tended to destroy the movements pushing for radical change' (22). Holloway thus suggests that the revolutionary experiments of the twentieth century did not 'aim too high, but aimed too low' (Holloway, 2002a: 20). That is, they did not aim to dissolve relations of power. What is therefore necessary is a 'revolutionary challenge' that changes 'the world without taking power' (20).

With the Zapatistas, Holloway dared to address explicitly the insignificant role of the state for revolutionary change: instead of endorsing 'the paradigm that has dominated left-wing thought for at least a century', i.e. 'the state illusion [which] puts the state at the centre of the concept of radical change' (Holloway, 2002b), the Zapatistas' rejection of the state power must be viewed as a principle of struggle for self-determination. To the Zapatistas, people have dignity already, such dignity exists as the negation of power, the negation of degradation (25). The Zapatistas' notion of civil society is not the dominant notion of civil society, defined as a sphere established apart from, regulated via or complementary to the state. Through the struggle

for self-determination, the Zapatistas' notion of civil society must not be interpreted as an 'actualization of the classic term', because, following Esteva, it 'alludes to a mutation in the political body' in which civil society would not counterweight [or substitute] the power of the state but 'makes it superfluous'. The Zapatistas activated the power they already have (Esteva, 1999: 159). Esteva's point is central to Holloway's conclusion of negativity: 'We struggle in and against and beyond ... [fetishized] forms' (Holloway, 2005a: 40).

## CRACK CAPITALISM: REVOLUTION AS AN INTERSTITIAL PROCESS

In *Crack Capitalism*, Holloway rephrases the traditional revolutionary question to how 'to stop making capitalism' (Holloway, 2010a: 255). Revolution, argues Holloway, starts with the 'scream'<sup>16</sup> here and now, and constitutes an ongoing (present) process of refusal to power and construction of anti-power through 'practical negativity'. Practical negativity means a multiplicity of acts of rejection of the capitalist world and the struggle against the transformation of human capacity into abstract labour, i.e. money. To stop making capitalism is to crack it, which, rather than attempting to achieve the total transformation of society by means of taking the power of the state, aims at an ongoing opening of the world.

Conceived as cracks, resistance breaks the 'social synthesis of capitalist society':

Any society is based on some sort of social cohesion, some form of relation between the activities of the many different people. In capitalist society, this cohesion has a particular logic often described in terms of the laws of capitalist development. There is a systemic closure that gives the social cohesion a particular force and makes it very difficult to break. To underline the close-knit character of social cohesion in capitalist society, I refer to it as a *social synthesis*. (Holloway, 2010a: 52, emphasis in original)

Cracks are 'fissures' that offer '[a] thousand answers to the question of revolution' (Holloway, 2003: 4). Thus, '[t]he only way to think of changing the world radically is as a multiplicity of interstitial movements running from the particular' (2010a: 11). The cracks clash with the logic of the state, they disrupt the homogenization of time, they confront the fetishism of commodities and money. The impact of the crack must not be measured in terms of a future gain but in the 'here and now' (11). Cracks always interrupt the process of abstraction, of doing into labour, that forms the capitalist 'social synthesis' (52).

The subject of the interstitial revolution is not 'the working class'. Rather, it is an undefined subject comprised by doers, i.e. 'we'. There is no particular organization to lead the process.<sup>17</sup> Our doings are united by the common experience of a variety of forms of oppression that force our 'doing' to exist as abstract labour (money). Cracks are inevitably 'vulnerable to the gelatinous suction of the capitalist synthesis' (51). They are always at risk of helping the capitalist state to reframe its policies along the lines of market-oriented liberalism. Thus, cracks exist 'on the edge of impossibility' (71). But this is not a zero sum. Total subordination is impossible: 'concrete doing is not, and cannot be, totally subordinated to abstract labour. There is a non-identity between them', an asymmetry: 'doing does not fit in to abstract labour without a remainder'. Cracks point to the emergence of another type activity: *doing*. Hence, '[t]here is always a surplus, an overflowing. There is always a pushing in different directions' (173). Asymmetry is the hidden premise of the capitalist social relations.

## CONCLUSION: THERE IS A BEFORE AND AFTER

John Holloway has turned the page to both a new Marxism and a new thinking about revolution. Both have their roots in a long-term

process of theoretical development where Holloway found his own voice by collaborating with fellow critical theorists within the CSE, Open Marxism and the University of Puebla. He contributed to the process of demystifying the state, the freeing of Marx and the revitalization of Marxism as a theory of struggle. Holloway committed himself to the task of communicating and interpreting Marxism in a way that becomes closer to everyday struggles. Like the first generation of Frankfurt scholars, Holloway criticizes the separation between theory and practice and calls for the creation of a 'we' that unifies both. By so doing, he has achieved something that Richard Gunn suggested some time ago: 'what is needful to show is that Marxism requires an appeal to common sense; that it can make this appeal; and that it can achieve its synthesis of theory and practice once this appeal is made' (Gunn, 1991: 88; 1987). Holloway's rejection of capital as a form of society is uncompromising. Yet, he points to the openness of reality. Capital is not a thing but a social relation. It is porous and can crack. Holloway has given the word 'revolution' a new meaning: interstitial, and rephrased class struggle as a struggle in, against and beyond the reified forms through which both capital and *us* exist.

## Notes

- 1 At their London Conference in 1976, CSE members launched the journal *Capital & Class* (C&C) (which evolved from the CSE Bulletin). Both C&C and the Edinburgh Journal of the CSE, *Common Sense: A Journal of a wholly new type*, created by Richard Gunn and Werner Bonefeld in 1987 in Scotland, would become outlets for Holloway's publications (on the CSE, see Picciotto, 1986; Radice, 1980).
- 2 For a critique of the GD and Hirsch's reformulation of state theory and the Fordist state, see Bonefeld and Holloway, 1991.
- 3 For an account of the CSE State Debate see Clarke, 1991b.
- 4 They reached the conclusion that 'we have to look behind the institutional separation of economy, law and politics, to see money, law and

- the state as complementary economic, legal and political forms of the power of capital' (Clarke, 1988: 15).
- 5 Picciotto highlights that the implication of this is that the real question is what are the *forms adopted by* social relations, what is the relationship between the institutional forms – through which economic activity takes place, and political forms, the public sphere – through which political activity takes place, and how they are synthesized in the reproduction of society as a whole' (Dinerstein and Picciotto, 1998, author's interview).
  - 6 The authors of *In and Against the State* (LEWRG, 1979/1980) were Cynthia Cockburn, John Holloway, Donald Mackenzie, John McDonald, Neil McInnes, Jeanette Mitchell, Nicola Murray and Kathy Polanshek.
  - 7 In a pivotal article, Bonefeld assesses both the autonomist and structuralist approaches to class struggle. Both fail to grasp the inner connection between capital and labour: 'the inversion of the class perspective is dependent upon two "subjects"' (Bonefeld, 1994: 44). The *inner connection* between capital and labour must be re-established: 'the problem of autonomism and/or structuralism arises from a conceptualization that sees labour as existing either merely *against* capital (autonomism) or merely *in* capital (structuralism). Structuralist and autonomist approaches are complementary because both depend on the notion of "capital" as a logical entity. While structuralist approaches emphasize capital as an autonomous subject, autonomist approaches emphasise capital as a machine-like thing. Both approaches depend on a determinist view of capital in as much as capital is perceived fetishistically as an extra-human thing. The notion of labour as existing in and against capital ... stresses the internal relation between substance and social form' (49–50).
  - 8 Coined by Richard Gunn (1987), the term 'mediation' explains the 'possibility of A existing as not A, i.e. as existing *in the mode of being denied*' (1994: 54, emphasis in original). To Gunn, Marx's early concept of 'alienation' (54) means that to be alienated is 'to exist as *other* than oneself' (54, emphasis in original).
  - 9 The 'Battle of Seattle' successfully prevented the launching of the millennial negotiations from taking place after enduring crude police repression. The protests were repeated in several of the locations where WTO members met and led to the creation of the World Social Forum (WSF) in Porto Alegre, Brazil, and the Argentine rebellion of 19–20 December, 2001.
  - 10 Holloway was referring to a poem 'Bass Culture' by Linton Kwesi Johnson, published in *Dread Beat*
  - an' Blood*, Bogle-L'Ouverture Publications, London, 1975.
  - 11 An example of this is Hardt and Negri's *Empire* (2000) where the authors argue for a transition from Imperialism to Empire, thus falling into the 'paradigmatic tradition' that seeks identification and regularity (Holloway, 2005c) and leads to the positivization of theory and the subject or radical change. As Holloway sees it, their idea of 'Saint Francis of Assisi as the example of communist militancy is the repugnant culmination of positive thought' (Holloway, 2005c).
  - 12 See debate Holloway-Clarke on 'Fetishism' in Dinerstein and Neary 2002a, Chapter 1.
  - 13 To Gunn, 'something quite like class in its sociological meaning does *indeed exist* in capitalist society, but only as "appearance" or in other words as an aspect of the fetishism to which Marxism stands opposed. Like vulgar political economy, sociological Marxism takes appearances at their face value and casts itself upon the mercy of the existing order of things' (Gunn, 1987: 20, emphasis in original). To Gunn, 'we can say that class is *the relation itself* (for example, the capital-labour relation) and, more specifically, a *relation of struggle*. The terms "class" and "class-relation" are interchangeable, and "a" class is a class-relation of some historically particular kind' (15, emphasis in original).
  - 14 In February 1999, Holloway presented a paper titled 'Class and Classification' at the International Conference 'The Labour Debate: The Theory and Reality of Labour in a World of Increasing Unemployment and Poverty' convened by Ana C. Dinerstein and Mike Neary at the University of Warwick, Centre for Labour Studies. Holloway's contribution focuses on what he saw as the failure of the concept of the working class and the labour movement for an understanding of activism and subjectivity today. He approached the problem of the subject of labour not by affirming the working class, but by arguing for its abolition. Key to his account is Marx's theory of commodity fetishism, which Holloway transformed into an ongoing process of *fetishization*. To him, commodity fetishism was an open process by which the subject is separated from the object of its productive capacity, and human activity is classified as labour or the working class. His major opponent in the debate over fetishism was his CSE fellow and friend Simon Clarke (see Dinerstein and Neary, 2002a).
  - 15 For a critique of the concept of 'doing', see Stoetzer (2005). He argues that Holloway conflates three forms of resistance in the concept of doing, i.e. 'human doing', 'screaming' and 'effective

resistance', which has important theoretical and political implications.

16 Holloway used this term for the first time in the title of an article where he discussed the importance of Marxism as a theory of struggle and the inner connection between capital and labour (Holloway, 1991).

17 On this, see also Hardt and Holloway (2012).

# Radical Political or Neo-Liberal Imaginary? Nancy Fraser Revisited

Claudia Leeb

## INTRODUCTION: DRAMA IN THREE ACTS

Nancy Fraser, born in 1947, is an American critical feminist theorist, and Professor of Political and Social Science and of Philosophy at The New School for Social Research in New York City. She is known for developing a critical theory of justice through her engagement with Jürgen Habermas and Axel Honneth's work. She earned her Bachelor's degree in Philosophy at Bryn Mawr in 1969 and received her PhD in Philosophy from the CUNY Graduate Center in 1980. She taught in the Department of Philosophy at Northwestern University before moving to The New School for Social Research.

Fraser charts her work of the past twenty-five years in relation to the history of second wave feminism as a 'drama in three acts', each of which utilized a specific imaginary.<sup>1</sup> In Act I, argues Fraser, emerging with the radical movements of the 1960s, second wave feminists utilized a 'radical imaginary'

that exposed the androcentrism of capitalism, challenged the gender exclusions of social democracy, and sought to transform society. As a result, argues Fraser, feminists expanded the boundaries of contestation beyond socio-economic distribution to the realm of culture and thereby deepened the socialist imaginary.<sup>2</sup> One of Fraser's own feminist socialist interventions in Act I was to expose the gendered public/private opposition in Habermas's work on the public sphere which eradicates the ways in which women are subordinated in both their households and in the workforce.

In Act II (around the 1980s) we find, according to Fraser, a new imaginary of cultural politics, encapsulated in identity politics that shifted from the idea of redistribution to recognition. Instead of remaking political economy, which was the focus of the previous generation, here feminists sought to remake culture. As a result, socio-economic struggles were downplayed and a one-sided culturalism prevailed. Here the figure of the struggle

for recognition had 'so thoroughly captured the feminist imagination', that instead of deepening the socialist imaginary it served to replace it.<sup>3</sup> Engaging with the model of recognition of Honneth, Fraser's core intervention in this Act was to reconnect concerns of 'recognition' with the concerns of 'redistribution' in her dual model of justice.<sup>4</sup>

In the current Act III, according to Fraser, with the recent crisis of neo-liberal capitalism, feminists must resurrect the radical potential of second wave feminism by deepening the economic concerns of Act I without neglecting the cultural concerns of Act II, and without forgetting the political concerns made salient by globalization. She aims to capture the political concerns of globalization with her concept of representation – her core intervention in Act III.<sup>5</sup> She suggests that her expanded model of justice, which struggles on the three fronts of redistribution, recognition and representation, delivers the new 'radical' political imaginary to deal with the current escalating crisis of neo-liberal capitalism.<sup>6</sup>

The core question that concerns me in this chapter is the following: Can Fraser's model of justice actually deliver that radical political imaginary that we need today to transform neo-liberal capitalism into a better society where the suffering capitalism has brought onto the world stage ceases to exist? This essay aims to find an answer to this question in the following three sections.

In section two, 'The Drama Continues: Neo-liberalism Reinforced', I first provide an overview of Fraser's redistribution-recognition model of justice as she introduced it in Act II. I then discuss some of its inherent problems which implicate Fraser's project in neo-liberal capitalism – namely her holding on to the language of recognition, and her establishment of an opposition between culture and the economy which contributed to the decoupling of culture from the economy. Whereas feminist thinkers in Act II challenged such decoupling in Fraser's characterization of sexual oppression as 'purely

cultural', what has been less critiqued is her characterization of class oppression as 'purely economic', which is what I will challenge in this section.

In section three, 'Capitalism Transformed: The Proletariat-in-Outline', I further explain why Fraser's model of justice does not allow us to transform neo-liberal capitalism. First, the overarching principle of 'parity of participation' aims at including oppressed social groups into the capitalist enterprise rather than transforming such an enterprise. Second, her 'transformative' remedy to cultural devaluation – the 'constantly shifting identity' – is implicated in the spirit of neo-liberal capitalism rather than allowing us to transform capitalism. Third, her attempt to do away with the proletariat as a political subject does not allow us to theorize an agent of transformative change. I argue that feminists today need a clear break with the idea of the 'constantly shifting identity', and instead I offer my idea of the proletariat as a subject-in-outline as the agent who incites a revolution.

In section four, 'Proletarian Revolution Instead of Reform', I argue that Fraser's transformative account of class injustice, socialism, implies a reformative socialist imaginary that merely attenuates the ills of neo-liberal capitalism but does not allow us to transform capitalism. Moreover, her attack on the welfare state as implied in her affirmative remedy for class injustice contributed to the dismantling of the welfare state advanced by neo-liberal capitalism. I argue that we must bring back the radical imaginary of those early Marxist and socialist thinkers, such as Rosa Luxemburg, who opted for a proletarian revolution instead of reforms within capitalism, to do away with the suffering caused by capitalism.

I agree with Fraser that feminist thinkers must resurrect the critical potential of feminist critique in Act I to deal with the current crises of capitalism. Fraser's own work from Act I provides such critical potential, which I will also bring back in this chapter.

## THE DRAMA CONTINUES: NEO-LIBERALISM REINFORCED

Based on the quasi-Weberian dualism of status and class, Fraser introduces her dual model of justice in Act II. This model implies the 'redistribution perspective', which has affinities with class and is rooted in the economic structure of society. The harm is here 'mal-distribution' and the remedy 'redistribution' of goods and resources. It also implies the 'recognition perspective', which is akin to status, and rooted in the status order of society. The harm is here 'misrecognition' and the remedy 'recognition'.<sup>7</sup>

Fraser provides a continuum for classifying the forms of injustice groups suffer. On one end of the continuum groups suffer a 'pure' form of economic injustice (class oppression), and on the other end they suffer a 'pure' cultural injustice (sexual oppression). In the middle of this continuum we find women and racial minorities, because such groups face both economic and cultural injustice. Since working-class people suffer from economic injustice alone, the remedy for class injustice is 'redistribution', and gay men and lesbians suffer from 'misrecognition', the remedy is here 'recognition'. For class injustice, according to her, we need 'redistribution', for sexual injustice we need 'recognition', and for gender and racial injustice we need both 'recognition' and 'redistribution'.<sup>8</sup>

Fraser argues that she introduced her 'two-dimensional theory of justice' to counter the 'cultural turn' in gender theory with its one-sided focus on recognition at the expense of redistribution, with the aim to reconnect struggles for 'recognition' with struggles for 'redistribution'.<sup>9</sup> However, few, if any, feminist theorists and social movements in Act II have actually couched their claims for justice in such language.<sup>10</sup> Rather, Fraser herself was the main feminist theorist in the Anglo-American context who applied the recognition paradigm, developed by Axel Honneth and Charles Taylor, to feminist theory. It is,

then, not second wave feminists in general, but the philosophic discourse of recognition in academia, in which Fraser was and continues to be a central figure, which contributed to capture the imagination of a younger generation of feminist theorists of the Frankfurt School critical theory kind, and established the dominance of the recognition paradigm in feminist theory.<sup>11</sup>

Moreover, there have been and continue to be central challenges to the recognition paradigm, which Fraser seems not to engage with.<sup>12</sup> The problem with Fraser's dual model of redistribution-recognition is that it accepts the ideal of 'mutual recognition', which covers over, rather than exposes, class antagonisms at the heart of capitalist societies. Also, her model hangs on to the notion of Hegelian desire, according to which human desire is essentially a desire for recognition. Insofar as oppressed social groups need to be recognized from an alienating Other (their oppressors) to secure their existence, the desire for recognition becomes an *exploitable* desire, where becoming recognized implies at the same time subordination to an oppressive power. In such a scenario it is difficult, if not impossible, to theorize transformative agency of oppressed social groups.

Moreover, Fraser's own model of justice contributes to what she charges feminists in Act II with, namely that 'the cultural strand became decoupled not only from the economic strand, but also from the critique on capitalism that had previously integrated them'.<sup>13</sup> As such, it is her own work, and not that of feminists in Act II, as she argues, that 'dovetailed' with the rise of neo-liberal politics.<sup>14</sup> This can be seen in assertions throughout her works, such as her claim that we must maintain a 'first-order distinction' between culture and the economy, which implies oppositional thinking, in which we find culture in opposition to and decoupled from the economy.<sup>15</sup> It is also evident in her repeated assertions that 'by distinguishing redistribution and recognition analytically, and by exposing their *distinctive* logics, I aim

to clarify – and begin to resolve – some of the central political dilemmas of our age'.<sup>16</sup> Rather than clarifying or even resolving the political dilemmas of capitalism, her proposal of a 'distinctive logics' between culture and the economy has contributed to the political dilemmas of neo-liberal capitalism in which we find culture as decoupled from the economy.

Already feminist thinkers in Act II have pointed at the ways in which her dual model of justice contributes to such decoupling. As an example, Iris Marion Young points out that Fraser's theory of justice constructs an absolute opposition between culture and economy, which retreats from New Left theorizing that has insisted that culture and economy are intertwined. Furthermore, she points out that Fraser's continuum framework makes working-class and queer politics appear as more one-dimensional than they are, and that her portrayal of sexual oppression as purely cultural evades the material, economic and political consequences of such oppression.<sup>17</sup>

Similarly, Judith Butler pointed out that Fraser constructs a problematic opposition between culture and the economy, and that her portrayal of sexual oppression as 'purely' cultural is problematic, given the ways in which, as an example, the operations of homophobia contribute to the poverty rate of lesbians.<sup>18</sup> In her response to such critiques, Fraser repeatedly reasserts that we must make an analytic distinction between recognition and redistribution, as such distinction can be fruitfully applied to capitalist societies, because here the economic and the cultural 'are relatively decoupled'.<sup>19</sup> However, it is her own repeated reassertions of a separate logic between culture and the economy that contributed to make culture appear as decoupled from the economy.

Although Butler and Young challenged Fraser's positioning of sexuality as being 'purely cultural', feminists have remained largely silent about her positioning of class injustice as 'purely economic' in her dual

model of justice, which I would like to further address here. For Fraser, class is a collectivity *wholly* rooted in the political-economic structure of society; the issues here are thus *unclouded* by issues of cultural-valuational structure; and the remedies required are those of redistribution, not recognition'.<sup>20</sup> However, class injustice is not as unclouded by culture as Fraser assumes.

Marx showed us that the cultural construction of the working-classes via the mind/body opposition is connected to capitalist economy. As he puts it in *Die Heilige Familie*, 'The critique [The Young Hegelians] transforms "the spirit" ... on the one side and "the mass" on the other side into fixed entities, into concepts, and then relates them to one another as such *fixed extremes*'.<sup>21</sup> The bourgeoisie establishes an absolute opposition between the 'pure mind', and the 'impure body', and links itself to the mind and the masses to the body, which it then uses to justify and cover over the division of labor and the exploitation of the working-classes in capitalist societies.

As Adorno further explains, orchestrating an absolute opposition between the 'pure mind' and the 'despised body' became the purpose of those who benefited from the division between mental and material production. 'The more dependent the ruling classes become on the work of others, the more they despise that work', he points out, 'the exploited body should be considered by those on the bottom as the worst and the mind, into which the others were free to indulge, as the supreme good'.<sup>22</sup> Marx and Adorno point here at two central elements which underline the ways in which the economic and the cultural are interconnected.<sup>23</sup>

First, the absolute opposition between mind and body is the result of an orderly activity of the ruling classes that discursively constructed the 'pure mind' in opposition to the 'despised body' and then linked itself to the primary and the working-classes to the secondary pole. Second, such activity is not innocent, but is connected to the capitalist enterprise, because the mind/body opposition

is implied in the intellectual/material labor opposition, which allows the ruling classes to justify the division of labor and the exploitation of those associated with the despised body. Fraser's argument that class injustice is 'unclouded' by cultural patterns of valuation is not only mistaken, but further decouples culture from the economy.

Although Marx and Adorno exposed the ways in which the cultural construction of the working-classes as the 'despised body' advances capitalist exploitation of workers, they did not grasp the ways in which hierarchical oppositions (such as the mind/body and intellectual/material labor oppositions) are unconsciously not only classed but also gendered, raced and sexed. Although Fraser understands that hierarchical oppositions are gendered and raced, she misses that they are also classed. Moreover, because she rejects psychoanalysis and with that the idea of the unconscious,<sup>24</sup> she misses that the signifiers 'working-classes' and 'woman' as well as racial and sexual minorities are *unconsciously* linked to what constitutes the negative side of hierarchical oppositions (the despised body and material labor), which is used to justify and cover over the division of labor and exploitation along class, gender, race and sexual lines.<sup>25</sup>

Fraser herself aimed to challenge the duality of her redistribution-recognition model of justice in Act III.<sup>26</sup> Here she points out that her model of justice in Act II had been assuming the 'Keynesian-Westphalian frame', where claims of justice were applied mainly to the modern territorial state and the dimension of the political was neglected. Here the 'what' of justice was central, and nobody needed to dispute the 'who' of justice, because it was assumed that the 'who' is the national citizenry. However, in a time of globalization, we must focus on who should count as a member of a political community entitled to claims of justice. In such times the theory of justice must become 'post-Westphalian', which means that it 'must become

three-dimensional, incorporating the political dimension of representation, alongside the economic dimension of distribution and the cultural dimension of recognition'.<sup>27</sup>

I appreciate Fraser's moment of historical self-critique in her essay and her attempt to theorize her model beyond national boundaries. However, the problem is here that Fraser merely adds a new dimension, the political, without addressing the inherent problems in the idea of 'reciprocal recognition' and 'redistribution', which she continues to defend. Moreover, and most importantly, although she argues that these three domains are interconnected with each other, her analytical distinction in her 'three-dimensional' model contributes to a problematic separation of these domains.

Fraser herself, in her early essay 'Struggle over Needs', explains that the separation between the 'political', 'economic' and the 'domestic' are the result of dominant groups in male-dominated, capitalist societies that define what is political in opposition to and separate from the economic and domestic as a means to depoliticize needs. As an example the needs of battered women (such as temporary housing, jobs paying the family wage, daycare, permanent housing etc.) were declared as a domestic issue in opposition to the political, and thus depoliticized.

However, since there are what she calls 'leaky or runaway needs', dominant groups failed to fully depoliticize certain needs. In this moment of 'leaky needs' oppositional discourses from subordinated groups (women, workers, minorities) could enter the terrain and contest the naturalized boundaries between the political, domestic, and economic. Here the women's movement could politicize the needs of battered wives, which challenged the opposition between the domestic and the political.<sup>28</sup>

Also in her early essay from Act I 'What's Critical about Critical Theory', Fraser challenges Habermas's construction of an opposition between the state-regulated official capitalist economy (system), where actions

are coordinated through money and power and the modern, male-headed nuclear family (lifeworld), where actions are coordinated by consensus. She points out that such opposition mirrors the opposition between household and paid workplace, in male-dominated, capitalist societies, that eradicates the ways in which the household is a site of unremunerated labor, and decision-making is permeated by money and power, and that women are subordinated in both spheres.

As she puts it, his 'uncoupling of system and lifeworld institutions tends to legitimate the modern institutional separation of family and official economy, childrearing and paid work', which reinforces the opposition between the public and the private.<sup>29</sup> In this essay, Fraser makes a classic, socialist-feminist intervention that challenges the decoupling of the economic and cultural sphere and shows how they are interconnected with each other. It is of no coincidence that the language of '(mis) recognition' and '(mal-)distribution' is in her earlier work not yet salient.

## **CAPITALISM TRANSFORMED: THE PROLETARIAT-IN-OUTLINE**

Fraser's attempts at including women, racial and sexual minorities into capitalist structures instead of transforming such structures becomes especially apparent with her overarching principle of justice as she introduces it in Act II – 'parity of participation', which implies that material resources must be distributed and cultural patterns of valuation must be in place that allow all adults to participate on par with their peers in social life.<sup>30</sup> Although this model seems to apply to all areas of life, when taking a closer look at the way it is played out in her concrete examples, it becomes apparent that Fraser aims with her parity principle at the inclusion of oppressed groups into the capitalist economy rather than transforming capitalism itself.

As an example, in her response to Judith Butler's critique on her position that sexual oppression is not 'purely cultural', Fraser maintains that 'the economic disabilities of homosexuals are better understood as effects of heterosexism in the relations of recognition than as hard-wired in the structure of capitalism. The good news is that we do not need to overthrow capitalism in order to remedy those disabilities'.<sup>31</sup> The good news is here certainly only for capitalists. Since all we need to do is to change the patterns of valuation that denigrate homosexuals to include them into the capitalist system, the system itself remains intact.<sup>32</sup>

The bad news is that such an understanding of injustice leaves the 'hard-wired' relations of capitalist production intact. One of the central insights of Marx's thought is that to overthrow capitalism we must transform the relations of production, which is also what Butler suggests in her critique on Fraser.<sup>33</sup> However, as we see in the citation above, overthrowing capitalism is not what she aims at. As she further puts it 'capitalist society now permits significant numbers of individuals to live through wage labor outside of heterosexual families. It could permit many more to do so – provided the relations of recognition were changed'.<sup>34</sup> Her message is here that once the patterns of cultural valuations are changed, then women, racial and sexual minorities will all be integrated into the capitalist system of production. Once culture is decoupled from the economy and the relations of production are replaced with the 'relations of recognition', capitalism merely needs to recognize oppressed social groups. Capitalism, as Fraser herself points out in Act III, is only too happy to address issues of 'recognition', 'as it builds a new regime of accumulation on the cornerstone of women's waged labor and seeks to dissemble markets from political regulation in order to operate all the more freely on a global scale'.<sup>35</sup>

In terms of the feminist movement, the problem with inclusion into capitalist structures is that it merely allows some individual (mostly professional) women to advance themselves, but it leaves the suffering caused by capitalist exploitation intact. It seems that Fraser's parity model is embracing a model of feminism that comes close to what Ruth Milkman labels 'corporate feminism' that has become dominant in US American feminism, which excludes the concerns of working-class women.<sup>36</sup> Moreover, it does not challenge, but rather valorizes, waged work for all, in opposition to the feminized unwaged work (such as care work), which, as Fraser herself rightly points out in Act III, has been taken up by the spirit of neo-liberal capitalism in the modern norm of the two-earner family.<sup>37</sup>

Moreover, her account falls short of a critique of wage labor itself, which is based upon relations of exploitation. Since all we need to do is to alter those patterns of cultural valuation that impede 'women, racialized peoples, and/or gays and lesbians from parity of participation', any critique on the exploitation of wage labor, upon which such parity is based, is foreclosed, and such relations of exploitation can remain intact.<sup>38</sup> It is of no coincidence that Fraser does not mention working-class people in this 'laundry list' of parity of participation, since the parity of participation of women, sexual and racial minorities is based upon the exploitation of the working-classes. It seems that Fraser's model aims at what Marx termed political instead of universal emancipation. In political emancipation only a part of society (in Fraser's model those women, sexual and racial minorities who are participating in capitalist structures) undertakes the emancipation of society from its particular situation, 'which leaves the pillars of the building standing'.<sup>39</sup>

Fraser furthermore proposes 'affirmative' and 'transformative' remedies for injustices in capitalist societies. She finds an affirmative remedy for 'misrecognition' in multiculturalism's focus on affirming group identities, in contrast to the transformative one, which is implied in deconstruction's focus on the

'constantly shifting identity' and a politics of constant flux and instability. The affirmative remedy for 'mal-distribution' is the liberal welfare state as we find it in the United States, which entrenches the disrespect for those on welfare, and the transformative one is implied in her account of 'socialism'. In her model, mainstream multiculturalism is the cultural analogue of the liberal welfare state, and deconstruction the cultural analogue of socialism.<sup>40</sup> I suggest that what she calls 'transformative' remedies are in fact not transforming capitalism, but firmly entrenching its ills. Let us start with taking a closer look at her remedies for 'misrecognition'.

Since affirmative remedies, according to Fraser, merely affirm group identities, she opts for 'deconstruction'<sup>41</sup> as the transformative remedy for 'misrecognition' because 'it tends to *destabilize* group differentiations'.<sup>42</sup> This means that we must replace gender dichotomies 'by networks of multiple intersecting differences that are *demassified* and *shifting*.... Its utopian image of a culture in which *ever new constructions of identity and difference* are *freely elaborated* and then *swiftly deconstructed* is only possible, after all, on the basis of *rough* social equality'.<sup>43</sup> Also, racial dichotomies must be replaced with '*demassified* and *shifting* networks of multiple intersecting differences',<sup>44</sup> and the 'homo-hetero dichotomy', must be replaced with 'a sexual field of multiple, *destabilized, fluid, ever-shifting* differences'.<sup>45</sup>

I agree that gender and racial, as well as sexual and I would add class dichotomies which she does not mention, must be challenged, because such dichotomies are interconnected with capitalist exploitation, as I have shown in the previous section. However, I disagree with her turn away from the subject to 'demassified and shifting networks and identities', because such a turn, rather than being consistent with transformative socialism, as Fraser suggests, is firmly entrenched within neo-liberal capitalism.

Marx helps us understand that Fraser's turn to 'demassified and shifting networks and

identities', does not lead to any transformation of the project of capitalism. In *Manifesto of the Communist Party*, Marx points out that one of the central features of capitalist societies is that the 'everlasting uncertainty and agitation distinguish the bourgeois epoch from all other earlier ones'.<sup>46</sup> In such an epoch, we encounter subjects that are characterized by a fundamental instability, or in today's jargon an identity that constantly shifts.

Moreover, Fraser's own characterization of the 'spirit of neoliberal capitalism', with its 'flexible networks' and the 'masculinist romance of the free, unencumbered, self-fashioning individual', which she describes in Act III, bears striking resemblances to her characterization of the 'demassified and shifting networks' and the 'freely elaborated and swiftly deconstructed' identities she proposes as a transformative remedy for 'misrecognition' in Act II. It seems that neo-liberal capitalism has seized upon the idea of the 'constantly shifting identity' which many feminist theorists, including Fraser, have defended in Act II and continue to defend in Act III.<sup>47</sup> The problem with such 'constantly shifting identities' is that they are not in a position to transform neo-liberal capitalism.

As Jodi Dean points out the focus on the constantly refashioned subject in Left politics has resulted in the loss of a 'we' and with that to in-agency.<sup>48</sup> Market capitalism, she argues, allows and needs identities that can be constantly refashioned, because such fragile identities are incapable of challenging the status quo.<sup>49</sup> Already Young was wondering in Act II, how Fraser's deconstructive account of culture could become effective as a political practice.<sup>50</sup> To transform capitalism, feminists need a *clear break* with the idea of the constantly shifting identity, because such an idea is firmly entrenched in the spirit of neo-liberal capitalism, and does not allow us to theorize an agent in a position to effect change. Instead they must turn their attention to what I call in my work the idea of the political subject-in-outline to transform capitalist structures.<sup>51</sup>

The political subject-in-outline, the proletariat, moves within the tension of a certain (albeit not total) coherence (the subject), necessary to effect change, and permanent openness (the outline), necessary to counter its exclusionary character. The proletariat-in-outline has the necessary coherence of a political collectivity in a position to transform capitalism. Yet, because such a political subject remains an outline, excluded subjects can enter (or exit) the political collectivity and redefine its boundaries, strategies and aims.

Again, if we turn to Fraser's earlier work we find a more nuanced view on the subject. As an example, in 'What's Critical about Critical Theory', she counters Habermas's charge that women essentialize their new social identities. She argues that new social identities cannot be dismissed if they lapse from universalism, because they 'are no more particular than the sexist and androcentric meanings and norms they are meant to replace'. However, these new social identities will focus on difference.<sup>52</sup> The defense of identity politics in this early essay stands in stark contrast to her work in Acts II and III, where she argues that identity politics reifies femininity and is responsible for the one-sided turn to 'recognition' that contributed to the rise of neo-liberal capitalism.<sup>53</sup>

In *Feminist Contestations*, as another example, she argues that the proliferation of 'identity-dereifying, fungible, commodified images and significations constitutes as great a threat to women's liberation as do fixed, fundamentalist identities ... Feminists need both deconstruction and reconstruction, destabilizing of meaning and projection of utopian hope'.<sup>54</sup> It seems that it is precisely the 'reconstruction' aspect of her argument that has become occluded in her one-sided turn to 'deconstruction' in her 'transformative' account of how women, and racial and sexual minorities can challenge their 'misrecognition'.

Moreover, Fraser seems to reject the notion of the proletariat as the political subject. Since

for Fraser class injustice is ‘purely economic’, we do not need the transformative remedy of ‘misrecognition’ – the constantly shifting identity. Rather, all we need to do is change the basic economic structure, which thereby eliminates the proletariat. As she puts it,

overcoming class exploitation requires restructuring the political economy so as to alter the class distribution of social burdens and social benefits. In the Marxian conception, such restructuring takes the radical form of abolishing the class structure as such. The task of the proletariat, therefore, is not simply to cut itself a better deal, but ‘to abolish itself as a class’. The last thing it needs is recognition of its difference. On the contrary, the only way to remedy the injustice is to put the proletariat out of business as a group.<sup>55</sup>

It is not clear why she thinks the proletariat ‘would cut itself a better deal’, given the ways the bourgeoisie always has a better deal, because it exploits the proletariat. Moreover, Marx certainly did not think that all we need to do is to ‘redistribute’ burdens and social benefits to restructure the political economy, to get rid of exploitation, as such a move leaves the structures of exploitation intact. And although Fraser is correct that Marx suggests that the proletariat must abolish class society and with that itself, her account of Marx is problematic, because it leaves out a huge part of the picture – how the proletariat manages to transform capitalism into a classless society.

Marx does not argue that we need to put the ‘proletariat out of business as a group’, as Fraser suggests. Rather, Marx makes clear that to achieve universal emancipation, ‘*a class must be formed* which has radical chains ... and which does not claim a particular redress because the wrong which was done to it is not a particular wrong but wrong in general’.<sup>56</sup> For Marx, this sphere of society, which cannot emancipate itself without emancipating all other spheres of society is the proletariat. To transform capitalism into a better society the working-class must exactly do what Fraser attacks as the ‘affirmative’ account of redressing gender, racial

and sexual injustices of ‘mis-recognition’ – the affirmation of group solidarity *beyond* national boundaries via the concept of the proletariat.

However, any conception of the world proletariat today needs to bring forward the deeply raced and gendered aspects of the labor force in urban centers, which is increasingly performed by insecure, part-time, low-paid immigrant women that are excluded in the traditional Marxian conception of the proletariat, and which I aim to bring back with the notion of the proletariat-in-outline.

## PROLETARIAN REVOLUTION INSTEAD OF REFORM

Proposing to change the sea of capitalist bitterness into a sea of socialist sweetness, by pouring into it bottles of social reformist lemonade presents an idea that is merely more insipid but no less fantastic.<sup>57</sup>

Fraser’s affirmative remedy for ‘mal-distribution’ is redistribution as we find it in the liberal welfare state, which leaves, according to her, the basic economic structure intact, and her transformative remedy is redistribution as we find it in ‘socialism’, which transforms the underlying political-economic structure. Fraser’s account of socialism implies a reformative socialist imaginary that merely poured ‘bottles of social reformist lemonade’ into the ‘bitterness’ of capitalism, which does not take away the bitterness of capitalism itself. Moreover, her attack on the welfare state as implied in her critique on ‘affirmative remedies’ as being reformist further assisted to heighten such bitterness.

Fraser argues in Act II against the welfare state as a remedy for ‘mal-distribution’, because it leaves intact the deep structures that generate class disadvantage, which ‘must make surface reallocations time and again. The result is to mark the most disadvantaged class as inherently deficient and insatiable, as always needing more and more’.<sup>58</sup> Moreover,

affirmative remedies when applied to women and racial minorities fuel resentment against affirmative action and are thus to be avoided.<sup>59</sup> It seems that Fraser's attack on the welfare state as implied in her 'affirmative' remedy for 'mal-distribution' itself played into neo-liberal capitalism, which, as Fraser herself points out in Act III, swiftly took up the nuanced feminist critique on the stigmatizing and androcentric elements of the welfare state in Act I into Bill Clinton's plan 'to end welfare as we know it'.<sup>60</sup>

Fraser had a more nuanced view on the liberal welfare state in Act I. As an example, in the last part of 'What's Critical About Critical Theory', where she examines Habermas's account of welfare-state capitalism, she points out that he misses the gendered subtext of the dual system of welfare states: one geared towards the male breadwinner, and one to families without a male breadwinner that become clients of feminine programs for 'defective households'. The welfare state also implies an empowerment for women – by reducing their dependence on individual male breadwinners. However, women become dependent on patriarchal and androcentric state bureaucracies, which contribute to their subordination.<sup>61</sup>

Moreover, in an excellent early essay 'A Genealogy of "Dependency"' co-authored with Linda Gordon, the authors explain a shift from a patriarchal pre-industrial usage where women shared dependency with many men, which was considered as a normal state of affairs, to a modern, industrial male-supremacist usage, where dependence became stigmatized and gendered and racialized notions of dependence emerged with the valorization of independence, to a post-industrial usage where some women claim the same kind of independence to men but it remains a feminized term attached to racialized groups considered deviant and superfluous. Here all forms of dependency became blameworthy and declared as a moral/psychological defect, which remains effective in US welfare debates to delegitimize welfare

today.<sup>62</sup> It is to such insights from Act I that we must return to deal with the current crisis of neo-liberal capitalism.

Now let us take a closer look at Fraser's 'transformative' remedy for 'mal-distribution', 'socialism'. In contrast to affirmative remedies, transformative remedies are, according to her, in a position to transform the underlying political-economic structure, because 'by restructuring the relations of production, these remedies would not only alter the end-state distribution of consumption shares; they would also change the social division of labor and thus the conditions of existence for everyone'.<sup>63</sup>

Although Fraser mentions here 'restructuring the relations of production',<sup>64</sup> this idea remains unelaborated in her work and remains subsumed under the concept of 'redistribution'. Moreover, Fraser proposes a notion of social democracy that occupies a 'middle position', which involves, 'a moderate extent of economic restructuring, more than in the liberal welfare state as we find it in the United States, but less than in socialism'.<sup>65</sup> The problem with such a middle position is that the overarching principle for economic restructuring remains 'redistribution', which aims to arrive at economic restructuring through reforms and never invokes the concept of revolution, and as such implies a reformist socialist imaginary.

The core problem with the turn to distribution is that capitalist exploitation rests on unequal relations of production and *not* unequal relations of distribution. The turn to (re-)distribution erases that the bourgeoisie owns the material conditions of production (land, capital) and the workers own merely the personal conditions of production (their labor power, which they are forced to sell on the 'free market' to survive). Since the redistribution of material (or non-material) goods does not alter the relations of production, those who own the means of production can continue exploiting those who have nothing but their labor power.

Already Marx attacked the Social Democratic Party program's idea of 'fair

distribution of the proceeds of labor with equal right' as implicated in the capitalist enterprise, because the proceeds of labor, material or immaterial goods are also distributed to those who do *not* work – the owners of the means of production. He also points out that raising taxes, which is also implied in Fraser's transformative account, is necessary to alleviate the ills of capitalism, but does not transform it.<sup>66</sup> As Marx puts it, 'income tax presupposes various sources of income of the various social classes, and hence capitalist society'.<sup>67</sup>

Moreover, Fraser, throughout her work, defends rights instead of a revolution as the proper means of addressing injustices in capitalist societies. As an example, in 'Struggle over Needs' she points out that 'needs talk' needs to be translated into rights, as 'I do not believe that rights talk is inherently individualistic, bourgeois-liberal, and androcentric; it only becomes so where societies establish the wrong rights, as, for example, when the (putative) right to private property is permitted to trump other rights, including social rights'.<sup>68</sup>

However, already Marx showed us that the state is a *class* state and attempts to transform society merely via legal reforms serve only to buttress the interests of the bourgeois class. He made clear that in order to transform capitalism, reforms are not enough – we need a proletarian revolutionary struggle.<sup>69</sup> Also Wendy Brown, following Marx, argues that feminism's turn to the state and rights does not lead to any socio-political transformation. Rather, it leads to an *illusory* politics of equality, liberty and community, which is contradicted by an unequal, un-free and individualistic domain of bourgeois society.<sup>70</sup>

Also, Luxemburg points out that because the state is a class state, any reform, including legislative reform, is enacted in the interests of the dominant class.<sup>71</sup> She further explains that legal reforms do *not* lead to social transformation, because wage labor is *not* a juridical relation, but an *economic* relation. The exploitation of wage labor is not based on

laws and the level of wages is not fixed by legislation, but by economic factors. 'The phenomena of capitalist exploitation does not rest on a legal disposition'; Luxemburg points out, 'but on the purely economic fact that labor power plays in this exploitation the role of merchandise possessing, among other characteristics, the agreeable quality of producing value – more than the value it consumes in the form of the laborers means of subsistence'.<sup>72</sup>

Moreover, Fraser seems to rely on trade union struggles to transform capitalist society. In Act III, she explains that in times of globalization, where the national economy is faced with trans-nationalized production and the outsourcing of jobs, the 'nationally focused labor unions look increasingly for allies abroad' to achieve redistribution.<sup>73</sup> However, capitalism is not a recent global phenomenon, as Fraser seems to suggest. Already Marx explained that capitalism goes beyond national boundaries, which is why the proletarian struggle is a trans-national one and because of that workers of the world must unite. The aim of such struggle, moreover, is not to achieve redistribution, as we find it in Fraser's reformist socialist account, but revolution to transform capitalism.

As Luxemburg makes clear, social reforms are only relevant insofar as they help to *prepare* the social revolution, but they are in itself *not sufficient* to transform capitalism. And although trade union struggle is for Luxemburg important to forge class solidarity, and with that prepare the proletarian revolution, it is in itself not a practice sufficient to *transform* capitalism. Moreover, trade unions can only limit the excesses of exploitation, but they *cannot* do away with exploitation itself. In times of rising unemployment rates, trade union action is reduced to the simple defense of already realized gains.<sup>74</sup>

The daily struggles of achieving reforms offer social democracy the means of engaging in the class struggle and working in the direction of the final goal – the conquest of political power by the proletariat and the

suppression of capitalism's growing anarchy. Whereas the reformists do away with social revolution, and instead make reforms the aim of social democracy, for Luxemburg 'the struggle for reforms is its means; the social revolution, its aim'.<sup>75</sup> I agree with Luxemburg that to transform capitalist society into a socialist one, the reformist account as we find it in Fraser's imaginary of socialism is not enough, because it leaves the pillars of capital domination intact.

## CONCLUSION

We must bring back the concepts of a proletarian 'revolution' and the idea of the proletariat-in-outline into political and feminist theorizing, where such concepts have been largely banished. While reforms are necessary to prepare the proletarian revolution, they cannot replace a revolution. Unfortunately, the reformist account of socialism, which both Marx and Luxemburg attack, has become the dominant form of social democracy in Western capitalist society, which largely did not incorporate such critique in its policies. The current crisis of neo-liberal capitalism reminds us that reforms alone did not work and did not change anything.

I suggest that we need to bring back into feminist thought what Marx termed the significance of revolutionary activity, which is for him 'practical-critical activity'.<sup>76</sup> Revolutionary activity implies that both practice and critique (theory) are mediated with each other and both important tools for how we can transform capitalism. We must, as the young Marx points out, both engage in a transformative practice and a ruthless critique of everything existing to transform capitalism. Such a critique is 'ruthless in that it will shrink neither from its own discoveries, nor from conflict with the powers that be'.<sup>77</sup>

Mediation between theory and practice also means to rethink the theory and practice relation in the context of the idea of the political subject-in-outline, which does not

aim at wholeness and accepts contradictions. Luxemburg's argument of accepting errors in revolutionary practice is central, because such errors lead to a better understanding of what needs to be done differently to change the world. Her stress on errors in practice illuminates that practice must remain an outline – an ongoing and never static effort to change the world. Moreover revolutionary activity also implies that theory or critical thinking itself must remain an outline and thus an unfinished process. I thus hope that my critique in this essay will be seen in that light, and will be taken up and further developed by critical feminist theorists.

# Axel Honneth and Critical Theory

Michael J. Thompson

## INTRODUCTION

The work of Axel Honneth has been seen by many as effecting a major shift in the tradition of critical theory. With its emphasis on recognition, a reflexive theory of democracy, and its defense of modernity as a mode of self-realization and social freedom, his ideas have become highly influential for those sympathetic to a post-Habermasian critical theory which has sought for an alternative foundation for normative philosophical questions. If Habermas and the Kantian-pragmatist program for critical theory that he initiated struck many critical theorists during the 1980s and 1990s as too epistemic and ideal-typical with respect to human rationality and social action, Honneth offers a more humane, more comprehensive view of the human subject, a thicker conception of intersubjectivity, and has made a major effort to turn critical theory toward concerns over identity and non-economic dimensions of power. But the extent to which Honneth's

ideas really constitute a critical theory of society is an open question. I will be concerned in this chapter with laying out what I see to be Honneth's most salient ideas and to question their bona fides for qualifying as a critical theory of society. Honneth fails to keep in view the centrality of the ways that the logics of social structures under capitalism shape the cognitive and intersubjective patterns of self and society. Essentially, what I will argue here is that Honneth's ideas and his theoretical reconstruction of critical theory have taken the project of critical social theory away from its radical impulses and morphed it into an essentially neo-Idealist enterprise. I will defend this thesis through an examination of his theory of recognition, his reworking of the research program of critical theory as well as his theory of democracy.

Born in Essen, West Germany in 1949, Honneth studied there and in Munich under Jürgen Habermas. Since 2001, he has been the director of the *Institut für Sozialforschung*

in Frankfurt as well as Professor of Philosophy at the Johann Wolfgang Goethe-University of Frankfurt and, since 2011, the Jack C. Weinstein Professor of the Humanities at the Department of Philosophy at Columbia University. Honneth's early work combined French and German social philosophy, but was deeply marked by his defense of Habermas' intersubjective turn, having been, from 1983 to 1989, Habermas' *Hochschulassistent*. His dissertation, published in English as *The Critique of Power* (1991), was a study of how Habermas' theory of the social as a communicative system of understanding solved the problems of the social in early critical theory as well as the paradoxes of Foucault's theory of society as power. This paved the way for his own distinctive development toward a theory of the social not as a system of power, but rather of understanding and intersubjective relations – as a system of recognition. His *Habilitation*, written in 1990 and published in English in 1995, was *The Struggle for Recognition*, which essentially marked his theoretical contribution to shape and ground the tradition of critical theory in his theory of recognition.

Honneth's relation to Habermas is an important one. He follows the paradigm shift laid out by Habermas' turn toward a post-metaphysical and intersubjectivist model for philosophy and social theory. For Habermas, this meant a shift toward a model of reason that was intersubjective and discursive. The structure of language was the context within which the validity of norms were raised, questioned, and ultimately agreed upon. This meant that the core of critical theory was not simply concerned with diagnosing social institutions and the pathological structures of modernity, as it was for early critical theorists, but was also constructivist as well. Social actors engaged in discursive practices were able to articulate new claims to normative validity, to challenge the encrusted and hegemonic norms and institutions that prevailed within their community, and were liberated from any essentialist conceptions of

the person and society. The postmetaphysical turn meant that reflexive forms of intersubjective relations were now the context which would articulate norms without any kind of grounding or foundations (Habermas, 1998).

Honneth accepts the postmetaphysical and intersubjective pillars on which Habermas scaffolds his theory of discourse ethics (Honneth, 1995a, 2007), specifically the move to embrace an intramundane theory for critical theory and the postmetaphysical paradigm of emancipating social action from structural and functional constraints. However, he reacts to what he sees as its limitation through its emphasis on the purely cognitive aspects of discourse ethics and widens the scope of intersubjective relations to include the cathectic and emotional aspects of the psyche. But even here, Honneth draws a line between his own ideas and the early critical theory tradition. Whereas for early critical theorists, the psyche and cathexis bound subjects to the reality principle of consumption, domination, and exploitation via the culture industry, repressive desublimation, or other such mechanisms of conformity, for Honneth it is the cathectic bonding between mother and child and, in time, between ego and alters, that forms the basis for a recognitive approach to moral philosophy rooted in the structures of modern everyday life.

But in addition to this, Honneth's ideas begin as a kind of disagreement with the focus of Habermas' paradigm as well as its assumptions. For Honneth, the problem lies in the way that subjects experience domination: 'They experience an impairment of what we can call their moral experiences, i.e., their "moral point of view", not as a restriction of intuitively mastered rules of language, but as a violation of identity claims acquired in socialization' (Honneth, 2007: 70). With this move, Honneth now claims that critical theory should focus on the ways that social relations of recognition can provide us with a normative and descriptive means to measure the extent of social pathologies. More importantly, he maintains that critical theory

must restrict itself to this nexus of social relations and abandon critical inquiry into the structural-functional logics of modern society: 'Critical social theory must shift its attention from the self-generated independence of systems to the damage and distortion of social relations of recognition' (Honneth, 2007: 72).

One of the core ideas that motivates and underwrites Honneth's work as a whole is not only his embrace of the postmetaphysical and intersubjectivist paradigm, but also an insistence that this intersubjective lifeworld is shaped by the moral experiences of agents. In the early 1990s, Honneth responded to the question of the salience of critical theory in the following way: 'All the reflections I have so far presented converge in the thesis that the multifarious efforts of a struggle for recognition are what will enable Critical Theory to justify its normative claims' (Honneth, 2007: 77). The normative turn is now, for Honneth at least, the proper path for any useful form of critical theory. Indeed, according to him, the work of early critical theorists was too deeply shaped by Marxism, which he claims constrained its capacity to reveal the broader moral struggles that give shape to modernity. Since earlier critical theorists were concerned with the problems of instrumental reason – promulgated by the spread of capital and technical rationality – they were unable to see 'that dimension of everyday practice in which socialized subjects generate and creatively develop common action-orientations in a communicative manner' (Honneth, 1995a: 72). The extent to which Honneth's work constitutes a valid critical theory of society ultimately must rest on the extent to which this basic proposition can shoulder the weight of a critical grasp of power, domination, social pathology, and the concrete form of life characteristic of modernity.

Honneth's work therefore emerges out of the Habermasian break with early critical theorists and it embraces what I term a 'neo-Idealist' reworking of critical theory. By this I mean a type of theory that isolates

intersubjectivist processes of social action that are nevertheless devoid of the material and structural-functional sources of social power that shape and orient them. The neo-Idealist therefore invests critical potency in these abstract forms of social action – say, communication, discourse, recognition – and believes them to possess a critical power against social pathologies and to promote a more humane and rational community. By viewing Honneth's theory of recognition in this light, we can see how this strand of critical theory has recalibrated its concerns away from the structural and systemic nature of social power and domination and toward the phenomenological and micro-relational levels of sociation. I will tease out the implications of this theoretical move after rehearsing Honneth's theoretical ideas and models.

## THE THEORY OF RECOGNITION

If Honneth's concern with early critical theory is its under-investment in the concept of 'morally-motivated struggle' (Honneth, 1995b: 1), it is because he sees its alliance to a structural and functional understanding of modernity as problematic. Since he is concerned with essentially constructing what we can call a non-Marxian, non-Freudian, and non-Weberian brand of critical theory, his move toward a theory of recognition is the descriptive and normative vehicle for this new approach. Honneth's paradigm rests on a reconstruction of Hegel's concept of recognition fused to pragmatist theories of social action, along with the psychoanalytic theories of thinkers such as Donald Winnicott that bolster the model. It is essentially constructed via two different but parallel paths. First, Hegel's theory of recognition is seen to constitute a theory of the development of consciousness that occurs through stages of struggle which give rise to 'a moral potential that is structurally inherent in communicative relations

between subjects' (Honneth, 1995b: 67). This occurs because, for Hegel, 'conflict represents a sort of mechanism of social integration into community which forces subjects to cognize each other mutually in such a way that their individual consciousness of totality has ultimately become interwoven, together with that of everyone else, into a "universal" consciousness' (Honneth, 1995b: 28).

The limit of this approach, however, is that it remains trapped in a speculative framework that fails to grasp the action-theoretic side of modern social theory. This, he argues, can be fulfilled by the second path of constructing the model by grafting George Herbert Mead's thesis of subject-formation onto Hegel's theory of recognition. Here, Honneth offers a core argument about the nature of self-formation. The thesis is that recognition carries with it a symbolic-interactionist dimension that provides the subject with the second-order capacity to see himself as a subject through interaction with an other: 'a subject can only acquire a consciousness of itself to the extent to which it learns to perceive its own action from the symbolically represented second-person perspective' (Honneth, 1995b: 75). Recognition now can be seen as a process of identity- and self-formation that develops a practical identity for the subject over time. It is this core process of identity-formation that bears much of the weight of the theory, since it is Honneth's claim that recognition is both a formative and evaluative theory. On the one hand, it is the means by which we form our sense of self through others and our self-conception of our identities. This then leads us to have a kind of base line for how we are respected by others. We seek to have our identities recognized not only by discrete others, but through the legal and political system itself. The 'struggle for recognition' is therefore the means by which modern subjects seek to change and assert their desire for respect and for their identities to be accepted by the society to which they belong.

Honneth maintains that individuals articulate an identity and a sense of self-worth from the very processes of social relations that constitute them. But these relations are recognitive relations in that we receive approval and recognition for our actions and for who we are from others. This creates within us a sense of integral identity that constitutes our self-identity as an individual: 'human individuation is a process in which the individual can unfold a practical identity to the extent that he is capable of reassuring himself of recognition by a growing circle of communicative partners' (Honneth, 1995a: 249). This intersubjective pattern of communication allows for the transfer of emotional ties between subjects such that a practical identity is able to emerge. This begins in childhood, with relations to parental and specifically 'maternal' relations that develop into a desire for respect and dignity in the world as adults:

Just as, in the case of love, children acquire, via the continuous experience of 'maternal' care, the basic self-confidence to assert their needs in an unforced manner, adult subjects acquire, via the experience of legal recognition, the possibility of seeing their own actions as the universally respected expression of their own autonomy. (Honneth, 1995b: 118)

To the extent that this happens, we can speak of the existence of an integral sense of self that is formed through recognition that comes into tension with the existing social relations that frustrate or deny this recognition in later stages of social development. Hence, the concept of 'disrespect' [*Mißachtung*] comes to the fore which constitutes what he calls a 'moral injustice' which, he claims, 'is at hand whenever, contrary to their expectations, human subjects are denied the recognition they feel they deserve. I would like to refer to such moral experiences as feelings of social disrespect' (Honneth, 2007: 71).

The ideas of 'respect' [*Achtung*] and 'disrespect' [*Mißachtung*] rest on a prior model of self-development that is produced by a

struggle for identity and recognition. This moves through the initial stage of childhood and then into the secondary stage of an assertion of one's right to be recognized as who one is. But the model then culminates with a form of society that has been shaped by these struggles for recognition that in turn grants social integrity and respect to individuals. A new conception of Hegelian 'ethical life' [*Sittlichkeit*] now opens up, one which is 'now meant to include the entirety of intersubjective conditions that can be shown to serve as necessary preconditions for individual self-realization' (Honneth, 1995b: 173). Since personal identity is seen to be intersubjectively structured and constituted, the model of recognition provides, according to Honneth, a convincing paradigm for a critical theory of society. It meets, in his view, the theoretical conditions of post-metaphysics, of an intramundane, practical, and intersubjective account of social action. But all along, the model that he espouses, and which plays an almost axiomatic role in his entire social philosophy, is that the process of recognition is endogenous to human sociation and secure from the infiltration of exogenous social forces. It is this basic idea that gives Honneth's work its cohesiveness, systematicity, and, ultimately, I believe, is also its greatest weakness. For how can the theory of recognition, even if we accept its basic premises as valid (which, I believe, we cannot), help us in the face of those who explicitly reject the recognition of others? How can it make a political contribution to the problems of nationalism, xenophobia, religious privatism, or ethnic particularism? Indeed, to what extent can we say that the internal or 'intramundane' concept of critique that Honneth elaborates can have any capacity to make those who refuse to recognize the other, do so? (cf. Kauppinen, 2002). It is unclear that it can, and one reason is not so much its moral humanism, but its weak theoretical-explanatory accuracy in understanding the contours of modern power and society.

## TOWARD A NEW RESEARCH PROGRAM FOR CRITICAL THEORY

With his basic model in place, Honneth now begins to see recognition as a kind of lens through which the various categories of critical theory are to be reinterpreted. So, in his attempt to reconstruct the theory of reification, he claims that what Lukács misses in his elaboration of the concept is that it 'can be conceived neither as a kind of moral misconduct, nor as a violation of moral principles, for it lacks the element of subjective intent necessary to bring moral terminology into play' (Honneth, 2008: 25–6). Of course, Lukács' intent was to problematize the capacity of members of the working class to be able to conceive of their own objective interests within capitalist society. This meant that reification was not simply a freezing of the cognitive capacity of these subjects, it also entailed a normative normalization of the social facts that constituted the given reality around them (cf. Thompson, 2017). Lukács effectively sees that the powers of the systemic level of society – such as capital's social rationality – colonize and defectively shape the cognitive and epistemic powers of subjects thereby having effects on their evaluative and critical powers.

In place of this view, which in many ways was foundational for much of early critical theory, Honneth maintains that we must see reification as a 'forgetfulness of recognition', or, in a more complex way, a 'process by which we lose the consciousness of the degree to which we owe our knowledge and cognition of other persons to an antecedent stance of empathic engagement and recognition' (Honneth, 2008: 56). This is a more sophisticated claim about the process of recognition. Honneth's basic idea is that recognitive relations precede cognitive and epistemic capacities, what he terms the 'ontogenetic priority of recognition over cognition' (Honneth, 2008: 42). This thesis deserves considerable attention since it essentially serves as the root argument for the theory of recognition, and

the justification for it serving as a comprehensive paradigm for Honneth's reworking of critical theory. Indeed, it can be said that Honneth's claim rests on the plausibility of this thesis. The reason for this is that, as in his earlier *Struggle for Recognition*, recognition is posited as an unsullied process of self-formation. This then serves, according to the model, as the basis for further instantiations of the thesis. As such, Honneth believes we must shut down the structural-functional and systemic aspects of modern society and move forward with an action-theoretic argument for moral development. But if we can show that this is not the case, that recognitive relations are embedded in and shaped by already existing social and cultural forces rooted in social totality, then the structural integrity of his model weakens significantly.

Essentially, what Honneth claims is that research into developmental psychology as well as the intuitions of certain philosophical arguments (e.g., those of Mead, Dewey, Sartre, and Cavell) demonstrate that the emergence of the capacity for cognition is dependent on the ability of the child to develop an emotional attachment to a parent thereby creating the preconditions for the second-person perspective. What this means is that the child is unable to develop his cognitive capacities without communicative interaction with someone to whom he has forged an emotional attachment. The reason for this is that the child 'learns step by step and through the perspective of a second person to perceive objects as entities in an objective world that exists independently of our thoughts and feelings about it' (Honneth, 2008: 43). The child's development of cognitive capacities is dependent on an emotional recognition of an other because it fosters the development of an objective (i.e., cognitive) perspective that decenters the egoist relation to self and world. It is only through my ability to put myself in the place of the other that I can really form a developed sense of self-relation and cognitive capacities. But even more, Honneth maintains that emotional forms of

recognition are prior to and preconditions for cognition itself.

Honneth's claim that empathic relations precede and make possible cognitive capacities and a neutral relation to the world is not problematic on its face. But he does make a crucial and, I think, fateful error by seeing this process as somehow relevant for later stages of moral cognition and social life. Recall that his reconstruction of reification, for instance, is one that claims that it is a 'forgetting' of this necessary relation between recognitive empathy with an other and reason itself. But this is problematic on several levels. First is the crucial problem of the way that this cathectic relation between the developing ego and the psychological parent is portrayed as a disembedded process. Indeed, the socialization process has been consistently seen as a kind of recognitive relation between ego and alter, but this cathectic relation between the two also shapes value-relations that are embedded in the specific historical and sociological context of those agents. Indeed, the fact that the child develops a cathectic or empathic relation to an alter may in fact open the ego up to the development of the second-person perspective and to cognition, but this process is also inseparable from the installation of value-orientations that can shape and orient moral-cognitive capacities. Indeed, there is little question that the mere fact that empathic relation between child and psychological parent exists means that there is something normatively progressive or rational about the recognitive relation. One can develop racist or exclusionary beliefs about the world through the empathic connection with the parent just as one can develop more egalitarian values. This can lead to the regression of the subject and the failure to develop and articulate a fuller sense of autonomy.

The thrust of my argument is that the social-relational structures that shape the values communicated in the early socialization process (and beyond) are embedded not simply in the family, but that the *family* is

embedded in a social context of norms, values, and logics that shape it and thereby the socialization of the child. There is no protected sphere of parent–child relations that is not permeated by norms of consumption, of attitudes toward race and gender, and so on. Indeed, this has been a core finding since Adorno et al.’s *Authoritarian Personality* (1950) as well as Fromm’s *Escape from Freedom* (1941): It is in the power of alters to shape the cathectic, evaluative, and cognitive layers of the personality, and these relations are not without content, they possess world-views and value-orientations about a basic, axiomatic moral structure which comes to shape different relations to others and the world (cf. Rokeach, 1960). What this implies is that the power of recognition to bind the emerging ego to authoritarian, reactionary, liberal, or any other kind of value system is not anathema to Honneth’s thesis. Why then should we be persuaded that recognition has the power to confront and overcome the powers of socialization, social power, domination, and alienation? What Honneth fails to see is the way that the ‘ontogenetic priority of recognition over cognition’ fails to remove us from the distorting effects of pathological social relations and structures and yet still preserve the process itself. Indeed, it is sullied by the pathologies of the socio-cultural context within which they occur (cf. Thompson, 2013).

Further, as socialization proceeds, the reinforcement between recognition and value-systems only continues to grow. As the ego develops institutional mechanisms reinforce certain value-orientations and undermine others; they select and emphasize certain goals and aims and weaken or delegitimize others. But these values themselves are rooted in the domain of social facts and institutions that operate according to logics of power and interests that are expressions of the social-relational structures of power that pervade any community. Indeed, recognition now becomes entangled in a series of overlapping processes, institutional norms,

social facts, and structural-functional processes from which it can only extricate itself *philosophically* – in other words, in the mind *reflectively*, not from within the practices and actually-existing social forms of capitalistic society. The point of early critical theory now comes more into focus: it correctly diagnosed the powers of instrumental reason, the culture industry, mass society, and exchange value to be able to infiltrate and increasingly to saturate the culture and the social relations that produce and shape the self. Indeed, Fromm held that relations of care and love express healthy, creative expressions of self- and other-relations, but Fromm sees all too clearly that it is the abolition of modern capitalist society that will be able to allow for the more genuine unfolding of such relations. This is because Marx plays a significant role in relation to (Freudian) psychology: insofar as the social structure shapes the formation of the personality structure, it is the organization of society that precedes and shapes the social-relational forms of life in which intersubjectivity is embedded. The key point here is that Honneth has ripped the intersubjective and recognitive relations out of this richer and more critical theoretical architecture. To be sure, Fromm’s ideas on this matter point to the fact that critical theory already held that recognitive relations would be distorted by structural and functional forces. To point theoretically to recognitive relations as a humane alternative to social pathologies is simply not enough to combat the systemic and functional pressures of social power and domination. To suggest that these relations are immanent to and potentially critical of those pathologies may indeed also be simply a misguided view of social reality.

Now a clearer picture of the weaknesses of Honneth’s critical theory can be glimpsed. In order for us to enter into his system, we must be persuaded that recognitive relations are *constitutive of the totality* of society instead of being *constituted by the totality*. If the former is the case, then we can accept

his ideas about recognition leading to a more democratic, humane form of modernity. But if the latter is the case, then it cannot. Honneth believes an emphasis on the social relations of recognition are somehow separate from the pathological forces of modernity that early critical theorists pointed to as destructive and dehumanizing. They would not have been hostile to the goal of creating humane forms of social existence, but they would have taken it for granted that the structures of rationality, of the patterns of consciousness generated by mass society, of the institutional imperatives of capitalist society as well as the irrational psychological forces unleashed by the repressive and authoritarian reactions to modernity, were more than significant blockages for the supposed power of recognition to overcome. As Lois McNay insightfully points out, ‘the spontaneous and innate nature of the desire for recognition is an example of how, in late modernity, disciplinary structures have been so thoroughly internalized by individuals that they become self-policing subjects’ (McNay, 2008: 133).

Honneth, however, does not seem to take these insights into account in any meaningful sense. Instead, he persists along the path of a moral philosophy that relies on a social theory bled of systemic and functional content. He sees, in short, the power of recognition as resistant to the reifying, alienating, and instrumentalizing powers of institutionalized instrumental rationality that pervades modern culture. Indeed, Honneth maintains that: ‘the basic concepts of an analysis of society have to be constructed in such a way as to be able to grasp the disorders or deficits in the social framework of recognition, while the process of societal rationalization loses its central position’ (Honneth, 2007: 74). But as I have been showing, it seems like an increasingly brittle thesis in the face of the reality of modernity. I think this becomes more obvious in Honneth’s turn to constructing a democratic theory based on the idea of social freedom that he sees as the result of the theory of recognition and the kind of social

forms to which the practice of recognition gives rise.

## TOWARD A CRITICAL THEORY OF DEMOCRACY

The theory of recognition becomes a kind of nucleus for a normative theory of modernity that Honneth will seek to defend as a theory of justice and a theory of democracy. He comes to rely more on Hegel, fused with pragmatism, but it is an anti-metaphysical reconstruction of Hegel that prioritizes social relations of recognition as the unifying idea. The basic germ of this development in his thought is summarized when he argues that

Hegel seems convinced that we can talk about ethical structures or ethical living conditions only where at least the following conditions are met: there must be patterns of intersubjective practice that subjects can follow in order to realize themselves by relating to each other in such a way as to express recognition through the way in which they take account of each other morally. (Honneth, 2010b: 54)

Hegel’s theory of ‘ethical life’ [*Sittlichkeit*] is now seen to be a complex of communicative social relations where recognitive relations come to constitute a modern theory of a just society where individual self-development can unfold. Freedom is now circumscribed by this reconstructed Hegelian view where “ethical life” frees us from social pathology by creating for all members of society equal conditions for the realization of freedom’ (Honneth, 2010b: 49).

Key to this concept of democracy is not only the Hegelian view of modernity as an ethical life defined by intersubjective–recognitive relations, but also a Deweyian theme. Dewey’s understanding of democracy is one based on collective problem-solving and the capacity for individuals to find an identity within a cooperative framework toward common ends and purposes. For Honneth, this is an important aspect of a ‘reflexive’

understanding of democratic community. Dewey therefore adds something to the discursive insights of contemporary political theory: 'Although Dewey shares with Arendt and Habermas the intention of criticizing the individualist understanding of freedom, he sees the incarnation of all communicative freedom not as intersubjective speech but as the communal (*gemeinschaftlich*) employment of individual forces to cope with given problems' (Honneth, 2007: 222). In his more comprehensive discussion in *Freedom's Right*, Honneth goes on to advance the idea that the family, friendship, and market society enhance and promote social freedom by allowing individuals to connect and complete their needs for recognition through relations with concrete others (Honneth, 2011: 232ff.). All the while, however, these social relations of love and friendship and mutual needs satisfied by market relations weave a deeply uncritical account of the class-based structure of modern society (cf. Jütten, 2015; Foster, 2017).

And now we can see Honneth reconstruct the wheel of intellectual history, for we are brought back to a kind of Idealism in the sense that non-structural forms of sociation are privileged at the expense of institutional forms of power and the pressures of domination and power on social relations and self-development. The problem essentially comes into focus once we see that Honneth's is essentially *a theory of sociation without society* – at least without a conception of society that has any systemic or structural features with causal powers. As a result, social action is seen to be constitutive of society as a whole. Relations of reflexive, recognitive, and communicative forms of action are taken, on this view, to be the generative source for critical consciousness. This leads to institutions and norms that congeal the normative content of recognition itself. The institutions of a modern, democratic 'ethical life' [*Sittlichkeit*] are those that objectify the ethics of recognition into its institutional and normative life (Honneth, 2011: 119ff.). It

should be noted that this was precisely where Marx came into critical conflict with Hegel's philosophical ideas. But even prior to that, Hegel himself saw that the state had to be the crowning achievement of modern ethical life because it was only through the objectification of the principles of freedom and right that there could exist a stop gap to the pathologies generated by civil society modern market relations, something that also runs against Honneth's ideas. Hegel was moved here by an appreciation of Machiavelli's realism and the kinds of conflicts that would occur due to the realities of interests (cf. Pöggeler, 1979) and Marx was clearly moved by the overemphasis on Idealism to secure the common good of a society increasingly dominated by systems of power (namely capital) that outstripped the capacity of agents to control its dynamics.

Another issue is the reliance on pragmatism and the symbolic-interactionist ideas of Mead in particular. The central concern here is the way that Mead – and Honneth as well – deal with the problem of power and domination. Mead's views on social power and domination specifically are often overlooked in favor of his social-psychological thesis about the development of the social self and the second-person perspective. But Mead actually saw domination as a problem not of modern societies, but rather of pre-modern societies (cf. Athens, 2012). For Mead, in the modern world, we are dealing with processes not of dominance and subordination but of *sociation*; the concern moves away from hierarchies and the static formations of social structure to processes and systems based on social equality. This assumption is made for the purpose, it would seem, to isolate and bring out the bare bones of sociation for his own purposes. But we choose to see what we want to see, in this regard. Mead, like Honneth, cleanses sociation of all forms of power, dominance, subordination, and dependence. One of the core findings of early critical theory, however, was that this is precisely *not the case*. Instead, the problems of power and dominance are able to distort and

deform the self and social relations, thereby blunting the critical powers of reason.

The point of this project of uniting Hegel and Mead is to found a theory of social life, one based on recognitive relations, that can serve as a postmetaphysical theory of democratic ethical life. This leads to another decisive problem that goes unconsidered by Honneth: namely, by shearing Hegel's ideas of their metaphysical power, we are left with no metric for critique, no ground to be able to possess any genuine, rational critical judgment. Recall that Honneth wants to persuade us that processes of recognition lead to struggles for social respect and dignity. But it was Hegel's view that this was not possible because the concept of right is not something that we agree upon, its origins lie in its capacity to achieve universality. Honneth's response to this is clear: he argues that, in fact, recognitive relations shape our understanding of what we accept as universal, i.e., norms of respect and mutuality that should undergird modern, free institutional structures and norms.

But there is more to this argument, as Hegel sees it. His idea is more demanding in that modernity be based not on particularity, but on an individuality mediated by universality. The problem here is to discover what is particular and what is universal. Respecting and recognizing a woman's choice to wear a hijab does not, at least on its face, satisfy the Hegelian idea of modernity since the demands of reason require some critical interrogation of such a choice (which is itself a product of particularist and pre-modern norms), and this requires supplying reasons that are universalizable and which promote the freedom of self and community. In other words, for Hegel, the act of recognition cannot simply be an Arendtian acceptance of the other's or my own practices, beliefs, and norms, nor can it simply be the expression of a Habermasian consensus. Modernity, rationality, requires that there be reasons for one to accept those norms, beliefs, and practices and that these reasons resonate with some kind of

universal categories. For Hegel, we recognize one another as reason-givers, and a modern form of ethical life is held together not simply by the practice of recognition, but also by the reasons we give to one another. But these reasons themselves must have criteria for counting as reasons, and this is why Hegel links his *Philosophy of Right* with his *Science of Logic*. The basic idea is that individuals in modern societies are able to articulate reasons for their practices and beliefs that take the common interest into account, and this requires that we see that the purpose and end of our association with one another is rooted in the development of the self as well as the totality.

This means that for Hegel recognition was not the object, but the *mechanism* allowing rational agents to comprehend the essential properties of social life: specifically that each was not a self-formed, independent subject but rather ensconced in webs of interdependencies that could be brought to rational reflection and consciousness only under the conditions of modernity. And once this was grasped by rational agents, it would shape and guide their rational wills. Recognition was an entry point, not an axiomatic thesis that underwrites all of Hegel's political ideas. Honneth's reading of Hegel's *Philosophy of Right* seems to be at odds with Hegel's actual intentions, since Hegel is not interested in the phenomenon of recognition per se, but in the institutional, objective socio-political forms that a modern society engenders and which can instantiate freedom (cf. de Boer, 2013). He thereby distorts Hegel's project and reads the totality of its argument through one narrow feature of his philosophical system.

Now, Honneth would no doubt respond that he is keeping to this insight, that he is exploding the subjective bias and moving us into the intersubjective, recognitive paradigm where actions and ideas become sublated. His basic insight is that the Hegelian Idea (*Idee*) is to be recast as the objectification of those institutions that can better instantiate and reflect the recognitive and intersubjective

properties of a reflexive form of freedom (Honneth, 2011: 123 and *passim*). Now the claim achieves a political form. But this is not the point: the principle behind Hegel's claim is metaphysical, not based on the recognition process of intersubjective agents alone. And there is a reason for this. Reason cannot be seen as inherent to the social processes and relations found in everyday life. Rather, reason is the product of reflection and of negation, in particular, the negation of the reality principle that props up everyday life. Early critical theory was based on this assumption and the various problems associated with the frustration of this capacity among modern subjects. But the post-Habermasian turn toward intersubjectivity has rooted critical consciousness in the contours of everyday speech-acts and, for Honneth, recognitive acts. The problem that reasserts itself is that Honneth does not allow for the ways in which recognition can – and more often than not, is – a mechanism for securing power and hierarchy than eroding it. Simply recognizing others can have the effect of fostering affirmative attitudes and ideas about the status quo rather than a critical, negative attitude toward it.

But to return to my main point, if we allow for a non-metaphysical path for moral theory, then we must simply accept what gets refracted back to us through our existing structures and practices. We have no way to judge whether the identities that are seeking recognition promote freedom since the identities of the prostitute, the fisherman, or the philosopher have no meaningful differences. Indeed, all can be equally 'recognized' by a community dishing out attention (or 'respect' [*Achtung*]) to others' identities, but not *critical evaluation of those identities*. And there are reasons for being critical of different identities to the extent that they may develop as reactions to defective relations; or they may be expressions of forms of subjectivity that falsely seek to reject or escape the implications of alienating and reifying social structures. Recognition then, for Hegel, must play a different role than it does

for Honneth. For the former, it is the phenomenological process that leads to a transformed cognition of the agent by revealing the ontological structure of social relations that make up the essential structure of human life; but for Honneth, in its postmetaphysical form, it becomes embedded in intersubjective practices that have no criteria for validity *other than those practices themselves*. In this instance, the norms brought to bear by the processes of recognition form the criteria for judgment.

But should we see this as a valid argument? The main problem with this philosophical path, as I am trying to show, is that it rips the process of recognition too far out of its embeddedness within the actual, objective processes of society itself and that the purpose of critical reason must be to allow thought to counterpose something better to what is existent and pathological. Hegel's later work is focused not on the intersubjective mechanisms of mutual recognition, but on the objective social forms – institutions, laws, norms, and so on – that shape objective spirit. This is important because, as I will show below, this opens up the possibility that these objective social forms, as later critical theorists were able to show, have causal and formative powers on individuals and their development. Now, Honneth's claim is that this is precisely what he is doing. He is arguing that we can judge and critique any social form by assessing the extent to which it can secure 'the intersubjective conditions of individual self-realization to all' (Honneth, 2010b: 7). But what it lacks is a realist confrontation of the ways that power operates and shapes the institutions and norms of the community. The essential problem is that intersubjectivity can be a tool for recreating domination and power just as it can be one for shaping humane relations.

But now the concept of a social pathology is shifted from being generated by structures within modern society – economic, cultural, whatever – to a failure on the part of agents to absorb the norms of modernity itself

(cf. Freyenhagen, 2015), i.e., the norms of recognition itself. But not everyone struggles for the kind of recognition that Honneth has in mind. There is no criteria given by Honneth to know when identities that seek recognition are valid or not valid; no way to tell whether or not the kind of weakened egos produced by late capitalism are evincing identities produced by the alienation they experience. The theory of recognition does nothing to help us discern these levels of self-understanding because the self has been too eroded by its embeddedness in intersubjectivity to be able to assert itself.

### HONNETH'S NEO-IDEALISM AND THE RETURN TO TRADITIONAL THEORY

One of the results of this series of problems with Honneth's theories is that we see critical theory entering into a phase where critique is to be detached from a confrontation with the economic and structural organization of society. This should be seen as problematic for any project of critical theory since its distinctiveness was to highlight the ways that social structure shapes and affects the subjective and agentic structures within persons. The social is not, on this view, constituted by intersubjective social practices. Rather, it is an ontological domain that is distinct from that intersubjectivity and possesses causal powers separate from it as well. In this sense, one of the central charges that can be brought against Honneth's attempt to reorient critical theory is that it fails to take into account an insight that has galvanized all critical social science. This can be described as what Karl Popper once termed the 'unintended social repercussions of intentional human actions' (Popper, 1969: 342). What this means is that human sociality and social actions produce congealed social formations of social facts that come to possess their own logics and causal powers. These logics are not totally autonomous from agents – indeed, agents

themselves are the ultimate purveyors of those social facts – but they accrue a kind of power to socialize and to have an ontology all their own. They become systematic, acting behind the conscious volition of individual actors, forming the context within which social relations unfold and operate (cf. Garrett, 2009).

Capital is therefore not simply a social fact, it is an accumulation of social facts, with logics, institutional instantiations, and constitutive power over and through subjects. It is therefore also a set of institutions and norms that shape social structures and functions and also were created prior to the socialization and development of individuals socialized into it. It acts, therefore, as a force on their development and a force shaping the social relations and, therefore, the relations of recognition that shape us. Our sociality is not simply reducible to recognitive relations as Honneth would have it. Indeed, sociality possess a second-order reality (indeed, a *metaphysical* reality) that exists even more powerfully than those first-order, recognitive, relations. Indeed, one can plausibly assert that Honneth wants to rewind social theory and simplify human sociality to this first-order level. The second-order level of sociality consists of the accumulation of congealed practices, norms, and concepts that any society possesses into systems that shape the life-world of subjects. These congealed practices, norms, etc., achieve objectivity and formative effects on subjects because they have causal powers; and they obtain these causal powers once they are able to embed themselves sufficiently in the consciousness of subjects through socialization processes that embed norms (cf. Elder-Vass, 2015). Indeed, this is what thinkers such as Marx, Weber, and Simmel saw as particularly unique to modernity: the capacity of these institutions and logics of practice to divest themselves from the conscious control of agency. Alienation, fetishism, the 'tragedy of culture' thesis, and so on, are exemplars of these kinds of problems. Honneth ignores does this to such an

extent that it is difficult to find the practical relevance of his ideas for explaining real social problems as well as the continued pathologies that infect modern societies.

One reason for this is that the central insight of early critical theorists was that the rationalization of social institutions and their increasingly hegemonic logic was imbuing social relations with the very values and personality systems that would continue to reproduce and instantiate those logics of power that maintain the prevailing reality. In this sense, Honneth's sidestepping of Marx is deeply inadequate as well as problematic. He claims, following Habermas' critique of the 'production paradigm' (Habermas, 1976), that Marx's ideas have little relevance for critical theory today because they are based on an outdated model of human action, namely that of *homo laborans* and the notion that all social action can be reduced to social labor (Honneth, 1995a: 3–91). But Marx's more important contribution is not to the theory of human action per se, but rather to the logics of modern social institutions and those very logics being shaped by the processes of capital; and this further entails that these processes are not only economic, but increasingly absorb more aspects of social reality (cf. Thompson, 2016). When we understand this, we see that Marx's thesis – one that critical theorists accepted as basic, it seems to me – is that there exists a logic of social power and social life that capital creates and which in turn shapes the kind of ontogenetic processes that Honneth claims are the root of recognition and the font for a normative validity for critical theory.

Marx's deeper, more radical claim is that we cannot view society as being simply accumulations of any simple practice, but that there exist systems which shape and orient the life-world of its participants. Capital, for instance, is not simply 'congealed labor', it is a complex of norms, institutions, practices, etc. that shape the social relations and self-understanding of subjects, coordinate their activities, shape the structural forms within which they interact,

shape their ideational and normative consciousness, and so on. And it is the objectivity of this ensemble of social facts that is capital and its capacity to have power over the community as a whole that Marx sees as important because it affects the ways that social life reproduces itself through individuals. For one thing, it is able to shape the very striations of sociality itself which means that, for Marx, mutual recognition would be an abstraction in the sense that it is not constitutive in its own right but is rather constituted by the prevailing social facts and relations that are governed by the objective ensemble of social facts. From a Marxian point of view, recognition is inherently abstract because it is embedded in the phenomenological and micro-relational levels of society rather than the *systemic and functional structures* that shape those levels of interaction. Hence, recognitive relations fail to achieve truly critical content and they lack a capacity to serve as a means to grant critical insight into the structures of modern forms of power. Marx and other critical theorists, Habermas included, accepted a distinction between systematic levels of social life and the phenomenological lifeworld that constitutes the micro-relations of everyday life. Honneth rejects this distinction and, as a result, is able to overstate the case for recognition as a mechanism of social integration and one that can also pick up on mis-recognition as a signal to normative struggles (cf. Borman, 2009: 946ff.).

This problem highlights the ways that the social acts on subjects and subject-formation. This is related, of course, to the problem of unintended social repercussions and the ontology of social facts I discussed above. However, it entails a specific problem, one that can be described as what Harry Dahms has usefully called 'the constitutive logic of the social' (Dahms, 2018). What this means is that the domain of social facts has deep constitutive implications on self-formation which entails the persistence of domination as an internalized and routinized phenomenon. The key issue here, one of which early

critical theorists were keenly aware, was that the social arrangements of capitalist society – imbued with bureaucratic, instrumental rationality and reification, as well as reification and commodity fetishism – overwhelmed the subject and disabled capacities for critical reason. We cannot, in this sense, achieve the overcoming of these forces through the social relations that are embedded within them. Once we see that this is the case, we find that Honneth's normative theory is without any valid social-theoretical ballast. The key issue for critical theorists has been that the basic relations between people (e.g., recognitive relations) are generally unable to withstand the infiltration and socialization pressures of these complexes of social facts and the constitutive logics that they bring to bear on the subject. This does not mean that recognitive relations do not exist or have any ability to shape consciousness, it simply means that it is open to the same infiltration of attitudinal and cathectic problems that the personality suffers under conditions of inequality, domination, and dehumanized relations under modern social formations.

Recall that one of the salient limitations of traditional theory, especially as pointed out by Horkheimer (1972), was its inability to grasp the ways that self-reflection and the subject's cognitive capacities to grasp the object were distorted by the pressures of social and institutional forms that made ambient certain logics and ways of thinking that socialized knowledge in particular ways. With the move toward the pragmatist and phenomenological, Honneth brings us back full circle to this pre-critical situation while promoting it as an advance for critical theory. For he maintains that the experience of disrespect provides agents with the needed normative motivation for critical reflection rather than a lapse into a subjective or ideological form of consciousness that has been created to protect the ego from the dehumanizing processes and reality of an instrumentalized, alienated, and exploitive existence. The practical identities that unfold within the alienated and reified forms

of life that prevail under modern capitalist societies, are more refuges from modernity than intrinsically meaningful expressions of individuality.

Herein lies a central weakness of the pragmatist enterprise, one that Honneth inherits: namely that by dissolving critique into the intersubjective practices of social agents, we have no way to formulate a concrete, objective standpoint for judgment. As Max Horkheimer, in his critical reflections on pragmatism made clear, a central problem is that 'it may be taken to refer to the desires of people as they really are, conditioned by the whole social system under which they live – a system that makes it more than doubtful whether their desires are actually theirs' (Horkheimer, 1947: 53–4). What Horkheimer's critique conveys is the idea that pragmatism essentially conceives of the subject as oversocialized: the self essentially dissolves in intersubjectivity. Honneth seems to embrace this unproblematically. Part of the problem with this move is that critical consciousness has to also achieve a standpoint that lies external to what exists. As Joel Whitebook usefully puts the matter, to think of a critical self is to 'picture a self that can stand outside the world – outside of any given traditional world – and evaluate it. And this capacity, in turn, has generally been viewed as a necessary anchoring point for critique' (Whitebook, 2001: 272). But the pragmatist theory of the self and society that Honneth utilizes is one that relies on the lifeworld at the expense of system; that over-invests recognitive relations with the capacity to generate an ontological viewpoint for critique. The question that pragmatists are unable to tackle is the extent to which ideas generated by reflexive reason-giving can actually achieve critical status. How can we secure the lifeworld, within which this reflexive reason-giving and reason-responding occurs, from the distorting pressures of the social system? Honneth simply sidesteps the issue. It seems to me that no critical theory can adopt such a stance.

Indeed, the use of pragmatism is itself a move into a non-critical framework insofar as its model of social action is cleansed of the realities of social systems of power and domination. Indeed, whereas critical theorists look to the power relations that shape social interaction and socialization processes, Mead's and Dewey's theories about social interaction assume not power relations, but a more idealistic model of 'sociation' as the essence of social action (Athens, 2012). Sociation and social action is thereby confused with society as a totality itself. As a result, Honneth's theory of recognition and his approach to modernity shows no way to immunize themselves from the ways that power relations, the structural-functional logics of institutions, and so on, are able to infiltrate the symbolic and phenomenological domain.

Hence, social power as a concrete form of domination where the structures and processes of the community are shaped is passed over in favor of micro-interactional forms of social action. We are asked instead to accept the view that a critical theory of society should be about the practical identities of individuals concerned with the normative goals of identity, dignity, and respect. But this simply reproduces the kinds of questions that early critical theorists saw as emerging from a society and culture marked by exploitation, alienation, and reification. They knew all too well that the growing conformity of individuals toward the efficient imperatives of the technical and economic goals of modernity were such that the symbolic domain of culture as well as the psychological realm of the individual would come to passively accept these concrete power structures; that the development of the ego and the self would be predicates of those power structures. The key question therefore is the extent to which *social structures precede the affective bonds between people*, the social relations of recognition of respect and dignity that he sees as normatively valid. The weakness of the approach

is therefore that it lapses into 'neo-Idealism' (Thompson, 2016), by which I mean the dis-embedding of ideational and noumenal structures of consciousness from the objective, structural, and functional processes that have constitutive power in shaping the self and social relations. Neo-Idealism brings us away from a critical model of social relations shaped and oriented by power structures and logics and toward one where critique is generated from the phenomenological, micro-relational activities of everyday life. But critique needs more than this since it requires us to adopt an ontological vantage point from which we can call into question the structures and systems of power.

## FINDING THE WAY BACK

None of these critical remarks are intended to detract from Honneth's impressive attempt to construct a normative theory of modernity and social interaction that has genuinely humane implications and intentions. It would be absurd to maintain that Honneth's contributions to moral philosophy do not have an impact on the way that we can think about critical theory, especially the need to keep in view the distortion of recognitive relations as a valid category of social pathology. He offers a highly sophisticated and deeply profound way to think about human sociality and the ways that recognition can foster a richer context for the formation of self-actualization and agency (Honneth, 2015). But it ignores far too much of what early critical theorists saw at the heart of the critical enterprise. And this is where Honneth's project of reworking a critical theory of society falls mortally short. Ultimately, the great limitation of Honneth's ideas lay not in their intellectual originality, but in their inability to provide us with a critical vantage point outside of the phenomenological lifeworld of social agents. A return to a critical theory with radical

political intent would be one that teases out the mechanisms of systemic power and relates them to the degraded forms of agency and subjectivity that derive from it. It would also seek, in addition to this diagnostic program, to provide normative ideas of what a more humane, more just, and more rational society should consist. Honneth can help us with the latter, but not the former, and there should be little doubt that both are required to maintain critical theory's salience in a new century.

The SAGE Handbook of  
Frankfurt School  
Critical Theory

**SAGE** was founded in 1965 by Sara Miller McCune to support the dissemination of usable knowledge by publishing innovative and high-quality research and teaching content. Today, we publish over 900 journals, including those of more than 400 learned societies, more than 800 new books per year, and a growing range of library products including archives, data, case studies, reports, and video. SAGE remains majority-owned by our founder, and after Sara's lifetime will become owned by a charitable trust that secures our continued independence.

*In memoriam*

Moishe Postone

Moishe Postone died on 19 March 2018. Words fail to express the sadness felt and the loss encountered. Amidst the misery of a time made abstract, a time of value for valorisation's sake, Moishe showed us what it means to think against the grain. He was *ein guter Mensch*.

## **VOLUME 1: KEY TEXTS AND CONTRIBUTIONS TO A CRITICAL THEORY OF SOCIETY**

1	Introduction: Key Texts and Contributions to a Critical Theory of Society <i>Beverley Best, Werner Bonefeld and Chris O’Kane</i>	1
<b>PART I THE FRANKFURT SCHOOL AND CRITICAL THEORY</b>		<b>17</b>
2	Max Horkheimer and the Early Model of Critical Theory <i>John Abromeit</i>	19
3	Leo Löwenthal: Last Man Standing <i>Christoph Hesse</i>	39
4	Erich Fromm: Psychoanalysis and the Fear of Freedom <i>Kieran Durkin</i>	55
5	Henryk Grossmann: Theory of Accumulation and Breakdown <i>Paul Mattick</i>	72
6	Franz L. Neumann’s <i>Behemoth</i> : A Materialist Voice in the <i>Gesamtgestalt</i> of Fascist Studies <i>Karsten Olson</i>	89
7	Otto Kirchheimer: Capitalist State, Political Parties and Political Justice <i>Frank Schale, Lisa Klingsporn and Hubertus Buchstein</i>	105
8	The Image of Benjamin <i>David Kaufmann</i>	123
9	Dialectic of Enlightenment. Philosophical Fragments <i>Marcel Stoetzler</i>	142
10	Herbert Marcuse: Critical Theory as Radical Socialism <i>Charles Reitz</i>	161
11	Theodor W. Adorno and Negative Dialectics <i>Nico Bobka and Dirk Braunstein</i>	179

<b>PART II</b>	<b>THEORETICAL ELABORATIONS OF A CRITICAL SOCIAL THEORY</b>	<b>197</b>
12	Ernst Bloch: The Principle of Hope <i>Cat Moir</i>	199
13	Georg Lukács: An Actually Existing Antinomy <i>Eric-John Russell</i>	216
14	Siegfried Kracauer: Documentary Realist and Critic of Ideological 'Homelessness' <i>Ansgar Martins</i>	234
15	Alfred Seidel and the Nihilisation of Nihilism: A Contribution to the Prehistory of the Frankfurt School <i>Christian Voller</i>	252
16	Arkadij Gurland: Political Science as Critical Theory <i>Hubertus Buchstein</i>	268
17	Alfred Sohn-Rethel: Real Abstraction and the Unity of Commodity-Form and Thought Form <i>Frank Engster and Oliver Schlaudt</i>	284
18	Alfred Schmidt: On the Critique of Social Nature <i>Hermann Kocyba</i>	302
19	Oskar Negt and Alexander Kluge: From the Underestimated Subject to the Political Constitution of Commonwealth <i>Richard Langston</i>	317
20	Hans-Jürgen Krahel: Social Constitution and Class Struggle <i>Jordi Maiso</i>	335
21	Johannes Agnoli: Subversive Thought, the Critique of the State and (Post-)Fascism <i>Stephan Grigat</i>	351
22	Helmut Reichelt and the New Reading of Marx <i>Ingo Elbe</i>	367
23	Hans-Georg Backhaus: The Critique of Premonetary Theories of Value and the Perverted Forms of Economic Reality <i>Riccardo Bellofiore and Tommaso Redolfi Riva</i>	386
24	Jürgen Habermas: Against Obstacles to Public Debates <i>Christoph Henning</i>	402

**PART III CRITICAL RECEPTION AND FURTHER DEVELOPMENTS 417**

- 25 Gillian Rose: The Melancholy Science 419  
*Andrew Brower Latz*
- 26 Bolívar Echeverría: Critical Discourse and Capitalist Modernity 433  
*Andrés Saenz de Sicilia*
- 27 Adolfo Sánchez Vázquez: Philosophy of Praxis as Critical Theory 448  
*Stefan Gandler*
- 28 Roberto Schwarz: Mimesis Beyond Realism 465  
*Nicholas Brown*
- 29 Aborted and/or Completed Modernization: Introducing Paulo Arantes 479  
*Pedro Rocha de Oliveira*
- 30 Fredric Jameson 498  
*Carolyn Lesjak*
- 31 Moishe Postone: Marx's Critique of Political Economy as Immanent Social Critique 514  
*Elena Louisa Lange*
- 32 John Holloway: The Theory of Interstitial Revolution 533  
*Ana Cecilia Dinerstein*
- 33 Radical Political or Neo-Liberal Imaginary? Nancy Fraser Revisited 550  
*Claudia Leeb*

# Notes on the Editors and Contributors

## THE EDITORS

**Beverley Best** is an Associate Professor in the Department of Sociology and Anthropology, Concordia University, Montreal. She is the author of *Marx and The Dynamic of the Capital Formation: An Aesthetics of Political Economy* (Palgrave Macmillan, 2010). She has published articles on ideology and the value-form, value and the fetish character of finance, Marx and the aesthetic, the dialectic of affect, and dialectical method in the work of Fredric Jameson and Raymond Williams. Her current research project is a study of the perceptual economy of capital as elaborated by Marx in volume three of *Capital*. She is Vice President of the Marxist Literary Group, [www.marxistliterary.org](http://www.marxistliterary.org).

**Werner Bonefeld** is a Professor in the Department of Politics, University of York (UK). Recent book publications have included *The Strong State and the Free Economy* (Rowman & Littlefield, 2017), *Notes from Tomorrow: On Reason, Negation and Certainty* (Aakar Books, 2015), *Critical Theory and the Critique of Political Economy* (Bloomsbury, 2014) and with Chris O’Kane he co-edits the book series *Critical Theory and the Critique of Society* (Bloomsbury). Recent journal articles have included work on Adorno and the critique of economic objectivity, abstract labor, authoritarian liberalism, German ordoliberalism, and on the political theology of European monetary union. His work contributed to the development of Open Marxism. He is a co-founder of the CSE Trans-Pennine Working Group.

**Chris O’Kane** teaches Philosophy, Politics and Economics at CUNY John Jay. His recent and forthcoming articles and chapters in *Viewpoint*, *Black Box*, *Historical Materialism*, *Perspectives on Henri Lefebvre*, *Logos*, *Capital and Class*, *Review of Radical Political Economy*, *Constellations*, and *The Sage Handbook of Marxism* focus on Marxian and post-Habermasian critical theory, political economy, and the critical theory of contemporary society. He is currently revising his thesis – on social constitution and social domination in Marx, Hegelian-Marxism, and Value-Form Theory – for publication with Brill, and he is editing the selected works of Alfred Sohn Rethel for the Historical Materialism Book Series and with Werner Bonefeld he co-edits the book series *Critical Theory and the Critique of Society* (Bloomsbury).

## THE CONTRIBUTORS

**John Abromeit** is an Associate Professor of History at the State University of New York, Buffalo State, where he teaches courses on modern German and French history and modern European intellectual history and historiography. He is the co-editor of *Herbert Marcuse: A Critical Reader* (Routledge, 2004), *Herbert Marcuse: Heideggerian Marxism* (University of

Nebraska Press, 2005), and *Transformations of Populism in Europe and the Americas: History and Recent Tendencies* (Bloomsbury, 2016). He is the author of *Max Horkheimer and the Foundations of Frankfurt School* (Cambridge University Press, 2011). His articles and reviews have appeared in *Constellations*; *Theory and Society*; *Theory, Culture and Society*; *Radical Philosophy*; *The Journal of Modern History*; and *The American Historical Review*.

**Felix Baum** lives in Berlin and is active in a very marginal political milieu influenced by both the Frankfurt School and Council Communism, amongst others. He occasionally writes for *Brooklyn Rail* and tiny German publications.

**Riccardo Bellofiore** is Professor of Political Economy at the University of Bergamo. He teaches History of Economic Thought and Monetary Economics (in Italian) and Macroeconomics and International Monetary Economics (in English). He is a member of the International Symposium on Marxian Theory and of the editorial committee of the Marx–Engels Complete Works (MEOC), in Italian. He is the editor (with Tommaso Redolfi Riva) of *Ricerche sulla critica marxiana dell'economia*, an Italian collection of the most important articles by Hans-Georg Backhaus.

**Aaron Benanav** is a Collegiate Assistant Professor and Affiliate Faculty in the History Department at the University of Chicago. His book, forthcoming with Verso, is titled *A Global History of Unemployment since 1949*. He also edits the journal *Endnotes*, along with several others in Europe and the United States.

**Jasper Bernes** is author of a scholarly book, *The Work of Art in the Age of Deindustrialization* (Stanford University Press, 2017), and two volumes of poetry, *Starsdown* and *We Are Nothing and So Can You*. Together with Juliana Spahr and Joshua Clover, he edits *Commune Editions*. He teaches at the San Francisco Art Institute and lives in Berkeley with his family.

**Nico Bobka** lives in Frankfurt. He is currently pursuing a dissertation project on Theodor W. Adorno's dialectical critique of ontology and the so-called ontological need at the Free University of Berlin.

**Dirk Braunstein** is Scientific Assistant at the Institute for Social Research in Frankfurt, where he is researching the work and the teachings of Adorno.

**Shannon Brincat** is a Senior Lecturer at the University of the Sunshine Coast, Australia. His research focuses on international relations theory; recognition and cosmopolitanism; dialectics; tyrannicide; climate change justice; and Critical Theory. He has been the editor of a number of collections, most recently *From International Relations to World Civilizations: The contributions of Robert W. Cox* (Routledge, 2017), *Dialectics and World Politics* (Routledge, 2015), and the three-volume series *Communism in the Twenty-First Century* (Praeger, 2013). He is also the co-founder and co-editor of the journal *Global Discourse*.

**Andrew Brower Latz** is the Head of Religion and Philosophy at The Manchester Grammar School and the author of *The Social Philosophy of Gillian Rose* (Wipf & Stock, 2018). He co-edited, with Marcus Pound, the *Telos* Special Issue on Gillian Rose (173, Winter, 2015), and, with Arseny Ermakov, the book *Purity* (Wipf & Stock, 2014). His other publications include 'Ideology Critique Via Jurisprudence: Against Rose's Critique of Roman Law in Kant'

(*Thesis Eleven* 133.1, April 2016); ‘Gillian Rose and Social Theory’ (*Telos* 173, Winter 2015); ‘Towards a Rosean Political Theology of Recognition’ in *Misrecognitions: Gillian Rose and the Task of Political Theology* ed. by Joshua Davis; ‘Andrew Shanks’ Civil Theology’, *Political Theology* 13.1 (2012), 14–36; ‘Creation in the Fiction of Marilynne Robinson’, *Journal of Literature and Theology* 25.3 (2011), 283–296.

**Nicholas Brown** teaches in the departments of English and African American Studies at the University of Illinois at Chicago.

**Hubertus Buchstein** is Professor for Political Theory and the History of Political Ideas at Greifswald University, Germany. His research interests primarily center around democratic theory, the history of political science as a discipline, and critical theory. He is the author of books about public and secret voting, about modern democratic theory, about the use of lotteries in political decision making, about right-wing extremism in Germany and about German academic emigres in the US during the period of Nazi-dictatorship. From 2009–12 he was president of the German Political Science Association. In the academic year 2018/19 he will be Theodor-Heuss-Professor at the New School for Social Research in New York. He is currently working on a 6 Volume edition of the *Gesammelte Schriften* of Otto Kirchheimer.

**Tom Bunyard** teaches in the Humanities Department at the University of Brighton. He has recently completed a book on Guy Debord’s relation to Marx and Hegel, and is currently working on issues related to the philosophy of history.

**Vincent Chanson** is a PhD student of Philosophy at Nanterre University. His research interests focus on critical theory, critical Marxism, and aesthetics. With Frédéric Monferrand and Alexis Cukier he co-edited ‘La réification. Histoire et actualité d’un concept critique’ (La Dispute, 2014).

**Matthew Charles** is a Senior Lecturer in Cultural and Critical Theory at the University of Westminster in London. He is a member of the Institute for Modern and Contemporary Culture and was part of the editorial collective of the journal *Radical Philosophy* from 2009 to 2017. His research focuses on critical theories of modern and contemporary culture and education. He is the author of *Modernism Between Benjamin and Goethe* (forthcoming with Bloomsbury), co-author with Peter Osborne of the Stanford Encyclopedia of Philosophy entry on Benjamin, and has contributed to special issues on Benjamin and education in *boundary 2* and *Pedagogy, Culture and Society*.

**Greig Charnock** is Senior Lecturer in International Politics at the University of Manchester, where he teaches international political economy, the politics of globalization, and critical social theory. His most recent research has engaged the ‘open Marxism’ approach with critical theories of the production of space and in analyses of crisis formation and management in Spain. He is co-author of *The Limits to Capital in Spain* (Palgrave, 2014), co-editor of *The New International Division of Labour* (Palgrave, 2016), and has published articles in such journals as *Antipode*, *Society and Space*, the *International Journal of Urban and Regional Research*, *Historical Materialism*, *New Political Economy*, and *South Atlantic Quarterly*. He is a member of the editorial board of the journal of the Conference of Socialist Economists, *Capital & Class*.

**Christopher Chen** is an Assistant Professor of Literature at the University of California at Santa Cruz. Chen has published poetry, essays, interviews, and reviews in *boundary 2*, *The South Atlantic Quarterly*, *The Routledge Companion to Literature and Economics*, *The New Inquiry*, *Crayon, 1913: A Journal of Forms*, and the *Los Angeles Review of Books*. He is completing a book-length comparative study of contemporary black and Asian American experimental writing.

**John Clegg** is a PhD Candidate at NYU Sociology and is an editor of the journal *Endnotes*, along with several others in Europe and the United States.

**Joshua Clover** is a Professor of English Literature and Comparative Literature at University of California Davis. He is the author of six books, including *Riot.Strike.Riot: The New Era of Uprisings* (Verso, 2016). He has collaborated with Juliana Spahr, Jasper Bernes, Tim Kreiner, Christopher Chen, Wendy Trevino, Abigail Lang, Els Moors, Chris Nealon, Michael Szalay, Sarah Posman, Annie McClanahan, and others. He is a founding editor of *Commune Editions*.

**Amy De'Ath** is Lecturer in Contemporary Literature and Culture at King's College London. Her criticism has appeared in *Women: A Cultural Review*, *Anguish Language*, *Metamute*, and elsewhere. With Fred Wah, she is the editor of a poetics anthology, *Toward. Some. Air.* (Banff Centre Press, 2015), and her most recent poetry publication is *ON MY LOVE FOR gender abolition* (Capricious, 2016). She is currently at work on an academic book, *Unsociable Poetry: Antagonism and Abstraction in Contemporary Feminized Poetics*.

**Murray Dineen** has been a member of the School of Music at the University of Ottawa since 1991, where he currently teaches music theory, history, and aesthetics. His research interests address both disciplinary music topics (such as the history of music theory and the study of counterpoint) as well as interdisciplinary matters involving music – primarily criticism and literary theory, but also human kinetics and musical expertise. In 2011, he published a book on Adorno and music, *Friendly Reminders: Essays in Music Criticism after Adorno* (McGill-Queens University Press). His most recent publications include a translation of a Marxist treatise on music published in Vienna in 1935, in *Polygraph: An International Journal of Culture and Politics* 25 (2016). He has received research funds from the Social Sciences and Research Council of Canada. An honorary lifetime member of the Canadian University Music Society, he has edited Canadian and international journals devoted to music studies.

**Ana Cecilia Dinerstein** is Associate Professor of Sociology in the department of Social and Policy Sciences, University of Bath. She has written extensively for academic and non-academic audiences on issues of labour subjectivity; urban, rural and indigenous movements; autonomous organizing; Argentine and Latin American politics; Open Marxism, decolonial theory, social reproduction and the current uses of utopia and Ernst Bloch's philosophy of hope. She was editor of *Capital & Class* (2000–5) and is a member of the editorial board of *Work, Employment and Society*, and the scientific advisory board of *Revista Sociología del Trabajo* (Madrid). She is Research Partner of the Transnational Institute's 'New Politics Project' (2016–20, Amsterdam), and Creator and Convenor of the international research networks 'Labour in Transition' (LATII-Net) and 'Women on the Verge'. Her main publications include *The Labour Debate* (ed., Routledge, 2002), which has been translated into Turkish (2006) and Spanish (2009), *The Politics of Autonomy in Latin America: The Art of Organising Hope*

(Palgrave Macmillan, 2015), and *Social Sciences for An-Other Politics: Women Theorising without Parachutes* (ed.)(Palgrave Macmillan, 2016).

**Kieran Durkin** is a Marie Skłodowska Curie Global Fellow at the University of York, UK and the University of California, Santa Barbara, undertaking the first comprehensive study of the Marxist humanist tradition. His wider research interests centre around the exploration of the possibility of resurrecting a robust radical humanism for contemporary social theory and practice. The first manifestation of this research programme was his monograph *The Radical Humanism of Erich Fromm* (Palgrave Macmillan, 2014), which was shortlisted for the British Sociological Association's Philip Abrams Memorial Prize in 2015. He has also written the first dedicated study of the intellectual relationship between Erich Fromm and Theodor W. Adorno (*New German Critique*, forthcoming).

**Nick Dyer-Witthford**, an Associate Professor in the Faculty of Information and Media Studies at the University of Western Ontario, is the author of *Cyber-Marx: Cycles and Circuits of Struggle in High Technology Capitalism* (University of Illinois, 1999) and *Cyber-Proletariat: Global Labour in the Digital Vortex* (Pluto Press, 2015), and he also writes on the video and computer game industry, the uses of the internet by social movements, and theories of technology.

**Ingo Elbe** studied philosophy, history and social psychology at the Ruhr-Universität Bochum and obtained his doctorate in 2008 at the Free University of Berlin for a thesis on the reception of the work of Karl Marx in the Federal Republic. From 2007 to 2012 he was a lecturer at the Institute of Social Sciences of the Technical University of Braunschweig and from 2011 to 2014 at the University of Applied Sciences Düsseldorf. In 2015, he completed his habilitation at the Institute of Philosophy of the Carl von Ossietzky University Oldenburg with a thesis on paradigms of anonymous rule. Elbe was a visiting professor at the Department of Political Science of Gießen University in the winter semester 2017/18. He is a lecturer and research assistant at the Institute of Philosophy of the Carl von Ossietzky University Oldenburg and Chairman of the Bochum non-profit association Institute of Social Theory. Book publication include *Marx im Westen. Die neue Marx-Lektüre in der Bundesrepublik* (Berlin: Akademie Verlag, 2008) and *Paradigmen anonymer Herrschaft. Politische Philosophie von Hobbes bis Arendt* (Würzburg: Königshausen & Neumann, 2015).

**Frank Engster** wrote his PhD thesis on the subject of time, money, and measure. His areas of interest lie in the different readings of Marx's critique of political economy, the logic and history of money, and the connection between money, measurement, time, and (natural) science.

**Lars Fischer** is an Honorary Research Associate in the UCL Department of Hebrew & Jewish Studies. He has taught at King's College London, UCL and Cambridge. He served as Councillor of the Royal Historical Society from 2012–15 and as Secretary of the British Association for Jewish Studies from 2010–12. His publications include a monograph on *The Socialist Response to Antisemitism in Imperial Germany* (Cambridge University Press, 2007) and a short study on the nexus between antisemitism and racism, "A difference in the texture of prejudice". *Historisch-konzeptionelle Überlegungen zum Verhältnis von Antisemitismus, Rassismus und Gemeinschaft* (Grazer Universitätsverlag, 2016). He edits the website of the critical theories of antisemitism network and is founding editor of the *H-Commons network H-Music* (<https://networks.h-net.org/h-music>). He lives in Berlin.

**Benjamin Y. Fong** is an Honors Faculty Fellow at Barrett, the Honors College of Arizona State University, a director of the Society for Psychoanalytic Inquiry, and author of *Death and Mastery: Psychoanalytic Drive Theory and the Subject of Late Capitalism* (Columbia University Press, 2016).

**Samir Gandesha** is an Associate Professor in the Department of the Humanities and the Director of the Institute for the Humanities at Simon Fraser University. He specializes in modern European thought and culture, with a particular emphasis on the nineteenth and twentieth centuries. His work has appeared in *Political Theory*, *New German Critique*, *Constellations*, *Logos*, *Kant Studien*, *Philosophy and Social Criticism*, *Topia*, the *European Legacy*, the *European Journal of Social Theory*, *Art Papers*, the *Cambridge Companion to Adorno* and *Herbert Marcuse: A Critical Reader*, as well as in several other edited books. He is co-editor with Lars Rensmann of *Arendt and Adorno: Political and Philosophical Investigations* (Stanford University Press, 2012). He is co-editor with Johan Hartle of the 2017 books *Spell of Capital: Reification and Spectacle* (Amsterdam University Press) and *Aesthetic Marx* (Bloomsbury Press).

**Stefan Gandler** received his DPhil from Goethe Universität, Frankfurt in 1997. He is Professor of Social Theory and Philosophy at Universidad Nacional Autónoma de México, Universidad Autónoma de Querétaro. He has been an invited professor at Goethe Universität (2001–2), University of California Santa Cruz (2009–10), and Tulane University, New Orleans (2015–16). He is also a member of *Sistema Nacional de Investigadores*, Mexico (highest category 3). He is the author of *Peripherer Marxismus* (Argument 1999), *Frankfurter Fragmente* (Peter Lang 2013), *El discreto encanto de la modernidad* (Siglo XXI Editores 2013), *Fragmentos de Frankfurt* (Siglo XXI Editores 2009/2011/2014), *Materialismus und Messianismus* (Aisthesis 2008), *Marxismo crítico en México* (Fondo de Cultura Económica 2007/2009/2015), and *Critical Marxism in Mexico* (Brill/Haymarket 2015/2016), of academic articles in 7 languages and 15 countries, and the editor of *Modernidad y diferencia* (M.A. Porrúa 2010) and *Teoría crítica: imposible resignarse* (M.A. Porrúa 2016). Gandler works on the possibility of overcoming the Eurocentric limitations of the Frankfurt School, confronting its critical theory of society with contemporary socio-theoretical debates in Latin America, constructing a critical theory from the Americas.

**Stephan Grigat** is a Lecturer at the Institute for Political Science, the Institute for Philosophy, and the Institute for Jewish Studies at the University of Vienna. He is the 2017–18 Research and Teaching Fellow at the Centre for German Studies at the Hebrew University of Jerusalem, and was the 2016–17 Visiting Professor for Israel Studies at the Moses Mendelssohn Centre for European-Jewish Studies at the University of Potsdam, the 2015–16 Visiting Professor for Critical Theory at the Justus-Liebig University of Gießen, and the 2007–2017 Academic and Executive Director for the NGO ‘STOP THE BOMB – Coalition for a Nuclear-free and Democratic Iran’. He received his PhD in 2006 from the Free University of Berlin. He is the author of *Die Einsamkeit Israels. Zionismus, die israelische Linke und die iranische Bedrohung* (Konkret, 2014) and *Fetisch & Freiheit. Über die Rezeption der Marxschen Fetischkritik, die Emanzipation von Staat und Kapital und die Kritik des Antisemitismus* (ça ira, 2007). He is the editor of *AfD & FPÖ. Antisemitismus, völkischer Nationalismus und Geschlechterbilder* (Nomos 2017) and *Iran – Israel – Deutschland. Antisemitismus, Außenhandel und Atomprogramm* (Hentrich & Hentrich 2017).

**Richard Gunn** lectured on political theory at the University of Edinburgh from 1975 to 2011. He currently writes and researches on an independent basis. His personal website (<http://richard-gunn.com>) contains papers dating from the 1980s to the present.

**Andreas Harms** works as a lawyer in Berlin and has dealt intensively with legal theory and Marxist legal criticism.

**Johan Hartle** teaches Political Aesthetics at the University of Arts and Design, Karlsruhe, and Art Theory at the China Academy of Arts, Hangzhou. He has held research fellowships at the University of Amsterdam, the Hebrew University, Jerusalem, and the Università Roma Tre, and he has taught at the Rietveld Academy, Amsterdam, the Academy of Fine Arts, Münster/Westphalia, and several other art schools. His publications include *Der geöffnete Raum. Zur Politik der ästhetischen Form* (Wilhelm Fink, 2006) and *DADALENIN* (Edition Taube, 2013, edited with Rainer Ganahl), as well as *The Spell of Capital. Reification and Spectacle* (Amsterdam University Press, 2017) and *Aesthetic Marx* (Bloomsbury 2017), both edited with Samir Gandesha. Hartle's fields of research are Marxist aesthetics and cultural theory, the history of Red Vienna (Otto Neurath), Frankfurt School critical theory (Adorno/Benjamin; Negt/Kluge), the aesthetico-political (Rancière), and questions of contemporary political ontology (Spinoza).

**Lars Heitmann** studied Politics and Sociology at the University of Bremen. His publications include *Absoluter Wert und allgemeiner Wille. Zur Selbstbegründung dialektischer Gesellschaftstheorie* (transcript, 2005) and, as editor (along with Hanno Pahl), *Kognitiver Kapitalismus. Soziologische Beiträge zur Theorie der Wissensökonomie* (Metropolis, 2007) and *Gesellschaftstheorie der Geldwirtschaft. Soziologische Beiträge* (Metropolis, 2010). He was a scientific collaborator on the interdisciplinary study on the meaning of security at the Leibniz University of Hanover and associate lecturer at the Universities of Bremen, Hannover and Bielefeld. He currently contributes to the interdisciplinary research project Society after Money, University of Bonn.

**Christoph Henning** is a Junior Fellow at the Max Weber Centre for Advanced Cultural and Social Studies, University of Erfurt. His latest books include *Philosophy after Marx: 100 Years of Misreadings and the Normative Turn in Political* (Brill, 2014), *Theories of Alienation* (Junius, 2015, in German), *The Political Philosophy of Perfectionism* (Campus, 2015, in German) and *Marx und die Folgen* (Metzler, 2017). He has edited several volumes on political philosophy and related topics, the most recent (with Hartmut Rosa) being *The Good Life beyond Growth* (Routledge, 2017).

**Christoph Hesse**, Research Assistant in Media and Communication Studies at the Free University of Berlin, formerly lecturer in Film Studies at the University of Mainz and visiting scholar at the School of Visual Arts in New York, is currently working on an edition of the correspondence between George Grosz and Hermann Borchardt. He is the author of a comprehensive study of German exile cinema in the Soviet Union in the 1930s and 40s (*Filmexil Sowjetunion*, edition text+kritik, 2017), co-author of a textbook on the history of film styles (*Filmstile*, Springer VS, 2016, with Oliver Keutzer, Roman Mauer, and Gregory Mohr), and co-editor of a three-volume anthology of letters to Brecht in exile (*Briefe an Bertolt Brecht im Exil*, De Gruyter, 2014, with Hermann Haarmann). Since 2014, he is also a member of the editorial board of the Journal for Critical Social Theory and Philosophy (*Zeitschrift für kritische Sozialtheorie und Philosophie*, De Gruyter).

**Jan Hoff** is a historian and political scientist from Germany. He received his PhD at the Free University Berlin in 2009 and his Habilitation at the University of Kassel in 2016. His books include *Marx global* (Akademie Verlag, 2009) about the international reception of Marx's critique of political economy and *Befreiung heute* (VSA Verlag, 2016) about the history and present of theories of emancipation inspired by Marx. He has taught at the Universities of Innsbruck (Austria), Kassel (Germany) and Munich.

**Philip Hogg** studied Philosophy, Modern History and Political Sciences in Freiburg, Basle, and Durham. He wrote his doctoral thesis on Adorno's philosophy of language at Goethe University, Frankfurt. Since 2011 he has been a research assistant (since 2013 as a PostDoc) at Carl von Ossietzky University Oldenburg, where he is a member of the Adorno Research Center.

**Tom Houseman** is Senior Lecturer in Political Economy at the School of Social Sciences, Leeds Beckett University, UK. He completed his PhD, on Adorno and the concept of poverty, in 2011 at the University of Manchester, and teaches critical theory, political economy, development and decolonization. His research interests focus on Adorno and epistemology, especially concerning positivism and the politics of measurement in international development.

**Owen Hulatt** is a Lecturer at the University of York's Department of Philosophy. His research interests include Adorno, Spinoza, Aesthetics, and Social Theory. He is the author of *Adorno's Theory of Philosophical and Aesthetic Truth* (Columbia University Press, 2016).

**Anselm Jappe** is the author of *La Société autophage: capitalisme, démesure et autodestruction* (La Découverte, 2017), *Guy Debord* (University of California Press 1999; PM Press 2018), *Les Aventures de la marchandise. Pour une nouvelle critique de la valeur* (Denoël, 2003, La Découverte, 2017), *L'Avant-garde inacceptable. Réflexions sur Guy Debord* (Lignes, 2004), *Crédit à mort* (Lignes, 2011, translated as *The Writing on the Wall*, Zero Books, 2017), and *Contro il denaro* (Mimesis, 2013). He has contributed to the German reviews *Krisis* and *Exit!*, founded by Robert Kurz, which developed the 'critique of value'. He teaches in the Fine Art Schools of Sassari and has been Visiting Professor in various European and Latin American universities. He also lectured at the Collège international de philosophie (Paris).

**Scott Jenkins** is a director of the Society for Psychoanalytic Inquiry. He holds a BA from Reed College and lives in Philadelphia, Pennsylvania.

**Dennis Johannßen** is Visiting Assistant Professor of German Studies at Brown University. He studied Cultural Studies, German Literature, and Philosophy at Leuphana University Lüneburg and at the University of California, Berkeley, and he completed his Ph.D. in German Studies at Brown in 2017. He published articles on the Frankfurt School, Heidegger, Leibniz, and philosophical anthropology, and he is currently working on a book about rhetoric and transgenerational trauma in twentieth-century German literature and film.

**Julia Jopp** lives in Berlin. Her research focuses on materialist epistemology, especially the concept of validity in Hegel, Marx, Critical Theory, and the so-called New Reading of Marx.

**David Kaufmann**, a graduate of Princeton and Yale Universities, is Professor of English at George Mason University. He is the author of *The Business of Common Life* (1995), *Telling Stories: The Later Works of Philip Guston* (2010) and *Reading Uncreative Writing* (2017). He has published a number of articles on the Frankfurt School, literary theory and contemporary poetry, as well as a full century of reviews and features on everything from Bugs Bunny and Allen Sherman to contemporary utopianism and books about dogs. He lives with his family in the suburbs of Washington D.C.

**Sami Khatib** taught at Freie Universität Berlin, Jan van Eyck Academie Maastricht, American University of Beirut and Akademie der bildenden Künste Vienna. He is a founding member of the Beirut Institute for Critical Analysis and Research (BICAR). Currently, he is a postdoctoral researcher at Leuphana Universität Lüneburg. He is author of the book *‘Teleologie ohne Endzweck’: Walter Benjamins Ent-stellung des Messianischen* (Tectum, 2013).

**Amy Chun Kim** is a Postdoctoral Fellow in the Society of Humanities and History of Art at Cornell University. She holds a J.D. from Yale Law School and Ph.D. in the History of Art from the University of California, Berkeley. She has published essays on abstract art in the interwar period and on the problem of constitutional democracy in critical theory. Her book, *Ideologies of Pure Abstraction: Modernism between Paris and Moscow*, is forthcoming from Verso. She is also working on a new book project, *The Nomos of Urban Space*.

**Isabelle Klasen** lives in Mülheim an der Ruhr. She studied philosophy, German philology and sociology at the Ruhr-Universität in Bochum and works in the fields of aesthetics and critical theory. She also is an artist and co-founder of the art society ZeitgenossenSchafft. Currently, she works as a teacher and as a lecturer at the Ruhr-Universität and the Hochschule für bildende Künste in Essen.

**Lisa Klingsporn** works as a researcher at the chair for Political Theory and History of Ideas at Greifswald University, Germany. Her field of interest centers around critical theory and the relation of politics and law, as well as feminist theory, especially the work of Judith Butler. Her dissertation is concerned with the reception of Otto Kischheimer’s work in the US and Germany. In this regard she is currently studying the method of reception theory as an instrument to analyse political thought.

**Gudrun-Axeli Knapp** was Professor of Sociology and Social Psychology at the Institute of Sociology and Social Psychology, Leibniz University of Hannover. From 1999 until 2009, she was the Director of the Interdisciplinary Programme in Gender Studies at the Faculty of Philosophy. She has published articles on feminist issues in various journals and books and has edited and co-authored several books on developments in international feminist theory, recently with a focus on social theory and interlocking structures of inequality and dominance.

**Hermann Kocyba** is senior researcher at the Institute of Social Research and lecturer at the department of social sciences of Goethe University in Frankfurt. His dissertation on the problem of contradiction in Marx’ critique of political economy (“Widerspruch und Theoriestruktur. Zur Darstellungsmethode im Marxschen ‘Kapital’”) was supervised by Alfred Schmidt. It was Schmidt, too, who encouraged him to engage in the debate about Althusser, Lévi-

Strauss, Lacan, Foucault and Deleuze. As a result, however, Kocyba – unlike Schmidt – felt fascinated by the possibility to read them not as antagonists of critical theory, but as sources of a renewal of critical thinking. – His actual theoretical work is focused on the conflict between economy and democracy, his empirical research is focused on labor relations, working conditions and democracy deficits within European Institutions, especially within the European Central Bank.

**Elena Louisa Lange** has studied Philosophy and Japanese Studies in Hamburg and Zurich, where she received her PhD in 2011. She now works as Senior Research Associate and Senior Lecturer at the Institute for Asian and Oriental Studies, University of Zurich. Since 2009, she has taught classes on intellectual history, Japanese philosophy, Marxism, and modernity. She has co-edited books on modern Japanese philosophy (*Begriff und Bild der modernen japanischen Philosophie*, Frommann-Holzboog, 2014) and *Concepts of Philosophy in Asia and The Islamic World, Vol. 1: China and Japan* (Brill, 2018), published articles on recent debates in Marxian value theory, and is currently working on a critical study of the Japanese Marxist Uno Kōzō. She regularly gives lectures and conducts workshops on Marx's *Capital*.

**Richard Langston** is an associate professor of German literature at the University of North Carolina at Chapel Hill and the author of *Visions of Violence: German Avant-Gardes after Fascism* (Northwestern University Press, 2007), a co-editor of the *Alexander Kluge-Jahrbuch* (Vandenhoeck & Ruprecht, 2014–), the lead translator of Kluge and Negt's *History and Obstinacy* (Zone Books, 2014), the editor of *Difference and Orientation: An Alexander Kluge Reader* (Cornell University Press, 2018), and the author of a forthcoming monograph on Negt and Kluge entitled *Dark Matter, in Defiance of Catastrophic Modernity* (Verso).

**Claudia Leeb** is an Assistant Professor in political theory at Washington State University. She is the author of *The Politics of Repressed Guilt: The Tragedy of Austrian Silence* (Edinburgh University Press, 2018), *Power and Feminist Agency in Capitalism: Toward a New Theory of the Political Subject* (Oxford University Press, 2017), *Working-Class Women in Elite Academia: A Philosophical Inquiry* (Peter Lang Publisher, 2004), and *Die Zerstörung des Mythos von der Friedfertigen Frau* (Peter Lang Publisher, 1998). She has articles published in Political Theory, Contemporary Political Theory, Theory & Event, Perspectives on Politics, Constellations, Social Philosophy Today, The Good Society, Philosophy & Social Criticism, and Radical Philosophy Review. She has also contributed several book chapters to anthologies on early Frankfurt school critical theory.

**Carolyn Lesjak** is Associate Professor of English at Simon Fraser University and is the author of *Working Fictions: A Genealogy of the Victorian Novel* (Duke University Press, 2006). Currently she is completing a book on the material basis of character in Victorian literature and culture and its relationship to notions of the common(s).

**Klaus Lichtblau** Since 2004 Klaus Lichtblau has been a full Professor in the Department of Sociology, Goethe University in Frankfurt. He is author of *Theorie der bürgerlichen Gesellschaft* (Focus, 1978), *Kulturkrise und Soziologie um die Jahrhundertwende* (Suhrkamp, 1996), *Georg Simmel* (Campus, 1997), *Das Zeitalter der Entzweiung* (Philo, 1999), *Die Eigenart der kultur- und sozialwissenschaftlichen Begriffsbildung* (VS Verlag für Sozialwissenschaften, 2011), and *Zwischen Klassik und Moderne* (Springer VS, 2017). At present he is working on a book about the different versions of Max Weber's sociology.

**Christian Lotz** is Professor of Philosophy at Michigan State University. His main research area is Post-Kantian European philosophy. His book publications include *The Art of Gerhard Richter. Hermeneutics, Images, Meaning* (Bloomsbury Press, 2015/17), *The Capitalist Schema. Time, Money, and the Culture of Abstraction* (Lexington Books, 2014/16), *Christian Lotz zu Marx, Das Maschinenfragment* (Laika Verlag, 2014), *Ding und Verdinglichung. Technik- und Sozialphilosophie nach Heidegger und der Kritischen Theorie*, edited with H. Friesen, J. Meier, and M. Wolf (Fink Verlag, 2012), *From Affectivity to Subjectivity. Husserl's Phenomenology Revisited* (Palgrave, 2008), and *Vom Leib zum Selbst. Kritische Analysen zu Husserl und Heidegger* (Alber Verlag, 2005). His current research interests are in classical German phenomenology, critical theory, Marx, Marxism, aesthetics, and contemporary European political philosophy. His website is: <http://christianlotz.com>.

**Jordi Maiso** teaches philosophy at the Complutense University of Madrid. He studied at the University of Salamanca, where he received his doctorate with a thesis on Adorno. He has been research grant holder at the University of Salamanca, the Free University of Berlin, and the Center for the Research of Anti-Semitism at the Technical University of Berlin, and he has worked for several years at the Institute of Philosophy of the Spanish National Research Council (CSIC). His main interests are critical theory, critique of political economy, and analysis and critique of modern capitalist society, mainly focusing on issues such as the culture industry today, antisemitism and the politics of resentment, and the social constitution of subjectivity. He is member of the editorial board of the review *Constelaciones. Revista de Teoría Crítica* and a founding member of the Sociedad de Estudios de Teoría Crítica.

**Inara Luisa Marin** received her PhD in philosophy and psychology at the University of Paris Diderot (Paris VII), with a dissertation on psychoanalysis in Critical Theory—from Erich Fromm to Axel Honneth. She has clinical experience both in private practice and in public institutions, including the clinics at La Maison de Santé d'Épinay and the Association En-temps. In her postdoctoral research at the Brazilian Center for Analysis and Planning (CEBRAP), she addressed the possibility of actualizing the relation between psychoanalysis and critical theory through the concepts of anxiety and autonomy. She currently works as a psychoanalytic clinician, as a researcher – developing intersections among critical theory, psychoanalysis and feminist theories – and also as an associate professor the Philosophy Department of the State University of Campinas.

**Ansgar Martins** is a graduate student working on the philosophy of Siegfried Kracauer at Frankfurt University. His research focuses on Critical Theory, philosophy of religion, twentieth-century Jewish intellectual history, and Western esotericism. Among his publications is a monograph on Adorno's Jewish sources (*Adorno und die Kabbalah*, 2016). He is also a co-editor of *Der Schein des Lichts, der ins Gefängnis selber fällt. Religion, Metaphysik, Kritische Theorie* (Neofelis Verlag, 2018).

**Paul Mattick** is the author of *Social Knowledge* (Hutchinson, 1985), *Art in Its Time* (Routledge, 2003), and *Theory as Critique: Essays on Capital* (Brill, 2018), among other writings.

**Christos Memos** is a Lecturer in Sociology in the Department of Sociology Abertay University, Dundee. His research interests include critical social and political theory, political sociology, and economic sociology/critical political economy. He is the author of *Castoriadis and Critical Theory: Crisis, Critique and Radical Alternatives* (Palgrave, 2014).

**Cat Moir** is a Lecturer in Germanic Studies at the University of Sydney. She is an intellectual historian specializing in the history of ideas in the German-speaking world in the nineteenth and twentieth centuries. Her research is particularly concerned with how ideas shape and are shaped by political histories and ideologies. She is currently completing her first book, *Ernst Bloch's Speculative Materialism: Ontology, Epistemology, Politics, 1934–1939*, which explores the intersection between politics and metaphysics in Bloch's philosophy.

**Johannes von Moltke** is Professor of German Studies and Screen Arts and Cultures at the University of Michigan, where he teaches film, cultural studies, and critical theory. He is the author of *No Place Like Home: Locations of Heimat in German Cinema* (2005) and *The Curious Humanist: Siegfried Kracauer in America* (2015). Other publications include *Siegfried Kracauer's American Writings* (edited with Kristy Rawson, 2012), *Culture in the Anteroom: The Legacies of Siegfried Kracauer* (edited with Gerd Gemünden, 2012), and *Siegfried Kracauer's Grenzgänge: Zur Rettung des Realen* (edited with Sabine Biebl and Helmut Lethen, 2018).

**Frédéric Monferrand** holds a PhD in Philosophy from Nanterre University. His research interests focus on critical theory, critical Marxism, and social ontology. With Vincent Chanson and Alexis Cukier he co-edited 'La réification. Histoire et actualité d'un concept critique' (La Dispute, 2014).

**James Murphy** is currently writing his dissertation in the Philosophy Department at DePaul University and teaching as a Clinical Instructor of Business Ethics for the Department of Management at Loyola University. His research focuses on German Idealism, Marxism, early modern political theory, psychoanalysis, and fascism, and his other published work takes up the problem of violence in Frantz Fanon and the libidinal underpinnings of self-identity in Locke's social-contract theory.

**Patrick Murray** is Professor of Philosophy at Creighton University in Omaha, Nebraska. He is the author of *The Mismeasure of Wealth: Essays on Marx and Social Form* (Brill, 2016) and *Marx's Theory of Scientific Knowledge* (Humanities, 1988) and the editor of *Reflections on Commercial Life: An Anthology of Classic Text from Plato to the Present* (Routledge, 1997). He is working on *Capital's Reach: How Capital Shapes and Subsumes*, and with Jeanne Schuler he is co-authoring *False Moves: Basic Problems with Factoring Philosophy*. He is a member of the International Symposium on Marxian Theory (ISMT). His research interests centre on the relationship between capitalism and modern philosophy and include the British empiricists, Kant, Hegel, Marx, and the Frankfurt School.

**Mark Neocleous** is Professor of the Critique of Political Economy, Brunel University, and the author of numerous books, the most recent of which is *The Universal Adversary: Security, Capital and the 'Enemies of All Mankind'* (Routledge, 2016). His work revolves around the mechanisms for managing capitalist modernity through the logic of 'police', 'security', and 'war', and the relationship between this logic and reactionary shifts in political order. This also involves the nature of the political imaginary: how the state has been imagined through categories associated with human subjectivity, how enemies have been imagined as monstrous, and how we imagine our political relationship with the dead. He is currently working on the idea of security as an autoimmune disease.

**Alexander Neupert-Doppler** studied Philosophy, Political Science and History at the University of Osnabrück, where he received his doctorate in 2013 for his work on the concept of ‘state-fetishism’ in (neo-)Marxist theories of the state. He is the author of the books *Staatsfetischismus* (LIT 2013) and *Utopie* (Schmetterlingsverlag 2015). Together with Lisa Doppler he translated Herbert Marcuses Paris lectures into German language and edited them with Peter-Erwin Jansen under the title *Kapitalismus und Opposition* (2017). He is also the editor of *Konkrete Utopien* (2018). Neupert-Doppler works as an education officer for the Socialist Youth of Germany/Falcons in Hannover.

**Mathias Nilges** is Associate Professor of English at St. Francis Xavier University. His essays have appeared in collected editions and journals such as *American Literary History*, *Callaloo*, *Textual Practice*, and *Postmodern Culture*. He co-edited the books *Literary Materialisms* (Palgrave, 2013), *Marxism and the Critique of Value* (MCM, 2014), *The Contemporaneity of Modernism* (Routledge, 2015), and *Literature and the Global Contemporary* (Palgrave, 2017). He has completed a monograph titled *Still Life with Zeitroman: The Time of the Contemporary American Novel*.

**Pedro Rocha de Oliveira** holds a PhD in Philosophy from the Pontifical Catholic University of Rio de Janeiro. He is Associate Professor at the Philosophy Department of the Federal University of the State of Rio de Janeiro. His research interests include the critique of political economy, critical theory, the dialectics of capitalist development, early modernity and critical criminology.

**Karsten Olson** is a doctoral candidate at the University of Minnesota in the department of German, Scandinavian, and Dutch. He is the author of ‘Historical-Sociology vs. Ontology: The Role of Economy in Otto Kirchheimer and Carl Schmitt’s Essays Legality and Legitimacy’, published in the *History of the Human Sciences*, and his research interests include, critical theory, eighteenth-century moral and economic philosophy, democratic constitutional law, and surveillance and social control. His work-in-progress dissertation is a comparative study of figures of the crowd as they appear in philosophical and theatrical works of the eighteenth and twentieth centuries.

**Charles Prusik** received his PhD in Philosophy from Villanova University in 2017. His dissertation focuses on the critical theory of Theodor Adorno and the political economy of neoliberalism. His research specializes in the Frankfurt School, as well as the history of economics and sociology. He has publications in the areas of political economy and aesthetic theory, and is an instructor of philosophy and ethics.

**Anders Ramsay** was born in 1954 in Malmö, Anders Ramsay studied sociology, philosophy and economic history at the University of Lund, where he completed his Dr Phil (‘Upplysningens självreflexion. Aspekter av Thodor W. Adornos kritiska teori’); and in 1987–8 he was a DAAD scholar at the J.W. Goethe University, Frankfurt. He has undertaken various teaching assignments in sociology since 1995, including at the University of Örebro and the University of Gothenburg, and he has been a Senior Lecturer in Sociology at Mid Sweden University since 2017.

**Charles Reitz**, Professor of Social Science and Philosophy at Kansas City Kansas Community College (retired), has published *Philosophy & Critical Pedagogy: Insurrection &*

*Commonwealth* (Peter Lang, 2016), *Crisis and Commonwealth: Marcuse, Marx, McLaren* (Lexington Books, 2013), and *Art, Alienation and the Humanities: A Critical Engagement with Herbert Marcuse* (SUNY Press, 2000). With Peter-Erwin Jansen Reitz he co-edited and published *Herbert Marcuse's Paris Lectures 1974 at Vincennes University* (CreateSpace Independent Publishing Platform, 2015). Reitz studied at Canisius College (Buffalo, New York), the University of Freiburg, and the State University of New York at Buffalo (PhD, 1983). He served for five years as president of his faculty association (Kansas-NEA) and for five years as campus Director of Intercultural Education. He is a charter member of the International Herbert Marcuse Society and served for six years on its Board of Directors.

**Tommaso Redolfi Riva** is an independent researcher. He graduated in Philosophy at the University of Pisa and has a PhD in History of Economic Thought from the University of Florence. He won a grant from the University of Bergamo for a research on the Italian debate (1968–83) between philosophy and (critique of) political economy. He has published several articles on Marx, Marxisms, and the *Neue Marx-Lektüre*. He is the editor (with Riccardo Bellofiore) of *Ricerche sulla critica marxiana dell'economia* (Mimesis Edizioni, 2016), an Italian collection of the most important articles by Hans-Georg Backhaus.

**Josh Robinson** teaches Modern and Contemporary Poetry and Literary and Critical Theory in the Cardiff University School of English, Communication and Philosophy and is an affiliated professor of the University of Haifa. Ze co-edited *Marxism and the Critique of Value* (MCM, 2014) and *Contemporary Marxist Theory* (Bloomsbury, 2014). Hir recent publications include 'Speculation upon Speculation; or, a Contribution to the Critique of Philosophical Economy', in *Credo, Credit, Crisis: Speculations on Faith and Money* (Rowman and Littlefield, 2017), and *Adorno's Poetics of Form* in the SUNY Series in Contemporary Continental Philosophy (State University of New York Press, 2018).

**Matthias Rothe** is Associate Professor of German at the University of Minnesota. He works on critical theory, Brechtian and contemporary theatre, and expanded aesthetics. His publications include 'The Temporality of Critique. Bertolt Brecht's Fragment "Jae Fleischhacker in Chikago"', *Brecht Yearbook* 40 (2016); 'Sohn-Rethel, das Theoriekunstwerk', *Merkur* 70 (801) (2016), and *The Frankfurt School: Philosophy and (political) Economy* (co-edited with Bastian Ronge), *History of the Human Sciences* 29 (2) (2016).

**Eric-John Russell** is a doctoral candidate at the Centre for Research in Modern Europe Philosophy in London. His dissertation examines the ways in which Hegel's *Wesenslogik* and *Begriffslogik* together with Marx's critique of political economy appear within Guy Debord's *The Society of the Spectacle*. He is a founding editorial member of *Cured Quail*.

**Frank Schale** is Scientific Assistant at the institute for political science at Chemnitz University of Technology, Germany. He earned his doctorate with a thesis on Otto Kirchheimer. His research interests lie in the fields of intellectual history and history of science in the 20th century, especially in social and legal theory. He is currently working on a comparative study of changing political theory from German Empire to post-war Germany.

**Gerhard Scheit** is an independent scholar who lives in Vienna. He has published widely on Marxism, critical theory, and antisemitism, with a special interest in theatre studies and

musicology. Inter alia, he edited three volumes of the collected works of Jean Améry, published by Klett-Cotta. He co-edits the journal *sans phrase. Zeitschrift für Ideologiekritik*.

**Hans-Ernst Schiller** studied philosophy, history, sociology and German literature in Erlangen and Frankfurt (Magister in 1978 with a thesis about Marx; Dr Phil in 1981 with ‘Metaphysik und Gesellschaftskritik’ about Ernst Bloch, published in 1982). He has been Professor for Social Philosophy and Ethics at the University for Applied Studies in Düsseldorf since 1996. He published numerous articles and essays and the books *Bloch-Konstellationen. Utopien der Philosophie* (zu Klampen, 1991), *An unsichtbarer Kette. Stationen kritischer Theorie* (zu Klampen, 1993), *Die Sprache der realen Freiheit. Sprache und Sozialphilosophie bei Wilhelm von Humboldt* (Königshausen&Neumann, 1998), *Das Individuum im Widerspruch. Zur Theoriegeschichte des modernen Individualismus* (Frank&Timme, 2005), *Ethik in der Welt des Kapitals. Zu den Grundbegriffen der Moral* (zu Klampen, 2011), and *Freud-Kritik von links. Bloch, Fromm, Horkheimer, Adorno, Marcuse* (zu Klampen, 2017). Schiller is the co-editor of *Staat und Politik bei Horkheimer und Adorno* (Nomos, 2014) and the editor of *Staat und Politik bei Ernst Bloch* (Nomos, 2016). Recently edited with Rüdiger Dannemann and Henry Pickford: *Der aufrechte Gang im windschiefen Kapitalismus. Modelle kritischen Denkens* (Springer, 2018).

**Oliver Schlaudt** is Associate Professor at the Philosophy Department, University of Heidelberg. His main research interests centre upon the philosophy of the natural and the social sciences, with a special focus on measurement and quantification.

**Roswitha Scholz** is a Graduate of Social Pedagogy (FH). At university, she studied at the Faculty of Philosophy, focusing above all on sociology, pedagogy, and philosophy. She has published in numerous Left magazines and anthologies. Her book publications include *The Gender of Capitalism: Feminist Theory and the Postmodern Metamorphosis of Patriarchy* (Horlemann 2000/11), *Differences of the Crisis – Crisis of Differences: New Social Criticism in the Global Age in the Context of ‘Race’, Class, Sex, and Postmodern Individualization* (Horlemann 2005). Her areas of work include feminist theory and radical social critique of form, intersectionality theories of knowledge, and the ‘Zeitgeist’.

**Andrés Saenz de Sicilia** is a Visiting Lecturer in Philosophy at the University of Roehampton and Central Saint Martins as well as tutor at University College London (UCL). He received his PhD from the Centre for Research in Modern European Philosophy (CRMEP), Kingston University, London in 2016, for a thesis on the concept of subsumption in Kant, Hegel and Marx. He has written for *Radical Philosophy* and *Language Sciences*, and has a monograph on the topic of subsumption forthcoming with Brill in 2019. He has translated several essays by Bolívar Echeverría and is currently preparing the first English-language collection of Echeverría’s writings.

**Marcel Stoetzler** is Senior Lecturer in Sociology at Bangor University. He works on social and political theory, intellectual history, and historical sociology. His publications include *Beginning Classical Social Theory* (Manchester University Press, 2017), the edited volume *Antisemitism and the Constitution of Sociology* (University of Nebraska Press, 2014) and *The State, the Nation and the Jews. Liberalism and the Antisemitism Dispute in Bismarck’s Germany* (University of Nebraska Press, 2008). His work has been published in the journals *Sociological Inquiry*, *European Journal of Social Theory*, *Nations and Nationalism*, *Patterns*

of *Prejudice, Sociology, Journal of Classical Sociology, European Review of History, Philosophy and Social Criticism, Historical Materialism, Feminist Theory, The European Journal of Women's Studies, fast capitalism* and the blogs *OpenDemocracy* and *History & Policy*. He is an editorial board member of *Patterns of Prejudice* and a fellow at the Centre for Jewish Studies at the University of Manchester.

**Amy Swiffen** a faculty member in the Department of Sociology and Anthropology at Concordia University, Montreal.

**Michael J. Thompson** is Associate Professor of Political Theory, William Paterson University. He was educated at Rutgers College, Humboldt Universität, and The Graduate Center, City University of New York. His recent books include *The Domestication of Critical Theory* (Rowman & Littlefield International, 2016), *The Palgrave Handbook of Critical Theory* (Palgrave Macmillan, 2017, as editor), *Hegel's Metaphysics and the Philosophy of Politics* (Routledge, 2018) and *The Perversion of Subjectivity: The Eclipse of Autonomy in Modern Society* (Stanford University Press, 2018).

**Sebastian Truskolaski** is Assistant Professor in the Department of Germanic Studies at Trinity College Dublin. His articles on Adorno, Benjamin, Kafka and related themes have appeared in journals such as *German Life and Letters, Radical Philosophy*, and *Studies in Social & Political Thought*. Together with Jan Sieber he edited *Discontinuous Infinities*, a special issue of the journal *Anthropology & Materialism* on the philosophy of Walter Benjamin (2017). Together with Sam Dolbear and Esther Leslie he edited and translated *The Storyteller*, a collection of Benjamin's experimental prose (2016). Together with Paula Schwebel he is currently working on a translation of Adorno's correspondence with Gershom Scholem (forthcoming).

**Asha Varadharajan** is Associate Professor of English at Queen's University, Canada. She is the author of *Exotic Parodies: Subjectivity in Adorno, Said, and Spivak* (University of Minnesota Press, 1995). Her writing and public speaking engage the broad sweep of postcolonial, cosmopolitan, global, secular, rights, migration, and development debates. Her most recent essays have appeared in *Cultural Studies, College Literature, Kunapipi, University of Toronto Quarterly, TOPIA, CSSAAME*, and *Modern Language Quarterly*. She has contributed chapters to books on human rights, biopolitics, and intercultural discourse. The most fun she has had lately was writing her essay on Eric Idle for the *Dictionary of Literary Biography*.

**Alfonso Galileo García Vela** has a PhD in Sociology and he is a research professor at the Department of Postgraduate Studies on Sociology of the Instituto de Ciencias Sociales y Humanidades 'Alfonso Vélaz Pliego' of the Benemérita Universidad Autónoma de Puebla. In 2017 he was a Visiting Scholar at The Department of History in The University of Chicago. With Massimo Modonesi and María Vignau Loría, he co-edited *El concepto de clase social en la teoría marxista contemporánea* [The Concept of Social Class in Contemporary Marxist Theory] (UNAM-BUAP-La Biblioteca, 2017), and with Fernando Matamoros, Manuel Garza, and Eduardo Bautista Martínez, he co-edited *A Diez Años de la Lucha de la Asamblea Popular De Los Pueblos De Oaxaca (APPO)* [Ten Years after the Struggle of the Popular Assembly of the People of Oaxaca (APPO)] (UABJO-MAPorrúa, 2016). His fields of research and teaching are sociology, theories of the state, the critical theory of the Frankfurt School, modernity theories and Western Marxism.

**Marina Vishmidt** is a writer. She is a Lecturer in Culture Industry at Goldsmiths, University of London and runs a Theory seminar at the Dutch Art Institute. Her work has appeared in *South Atlantic Quarterly*, *Ephemeria*, *Afterall*, *Journal of Cultural Economy*, *Australian Feminist Studies*, and *Radical Philosophy*, among others, as well as a number of edited volumes. She is the co-author of *Reproducing Autonomy* (Mute, 2016, with Kerstin Stakemeier) and is currently completing the monograph *Speculation as a Mode of Production* (Brill, 2018).

**Sergio Tischler Visquerra** is Research Professor at the Department of Postgraduate Studies on Sociology of the Instituto de Ciencias Sociales y Humanidades ‘Alfonso Vélaz Pliego’ of the Benemérita Universidad Autónoma de Puebla. He coordinates the research group ‘Subjectivity and Critical Theory’ with John Holloway. His books include *Memoria, tiempo y sujeto* (F&G, 2005), *Tiempo y emancipación. Mijail Bajtín y Walter Benjamin en la Selva Lacandona* (F&G, 2008), *Imagen y dialéctica. Mario Payeras y los interiores de una constelación revolucionaria* (F&G, 2009), and *Revolución y destotalización* (Editorial Grietas, 2013). He co-edited the books *What Is to Be Done? Leninism, Anti-Leninist Marxism and the Question of Revolution Today* (Ashgate, 2002, with Werner Bonefeld), *Marxismo Abierto. Una visión europea y latinoamericana. Vol. I, II* (Universidad Autónoma de Puebla/Herramienta, 2007, with John Holloway, Werner Bonefeld and Alberto Bonnet), *Negativity & Revolution. Adorno and Political Activism* (Pluto Press, 2009, with John Holloway and Fernando Matamoros) and *Zapatismo. Reflexión teórica y subjetividades emergentes* (Universidad Autónoma de Puebla/Herramienta, 2008/2015, with John Holloway and Fernando Matamoros).

**Frieder Vogelmann** is Postdoctoral Researcher at the Institute for Intercultural and Interdisciplinary Studies (InIIS) at Bremen University. He studied philosophy, mathematics, and cognitive science at the University of Freiburg before doing his PhD in philosophy at the University of Frankfurt. He is the author of *The Spell of Responsibility* (Rowman & Littlefield International, 2017) and co-editor of *The Birth of Austerity. German Ordoliberalism and Contemporary Neoliberalism* (Rowman & Littlefield International, 2017). He has worked on the history of the concept of responsibility, on Michel Foucault, and on the concept of critique in critical theory. Recent publications have appeared in the journals *Constellations*, *Distinktion* and *Deutsche Zeitschrift für Philosophie*. His current work is focused on the effectiveness of knowledge and a praxeological understanding of philosophy.

**Christian Voller** studied Cultural Studies, History and Literature in Frankfurt/Oder, Berlin, and Bochum. Currently he is working on his PhD on figures of the autonomy of technology (working title: ‘Die Selbstherrlichkeit der Technik. Ein Topos der Moderne’). His research focuses on Marxist philosophy, the Frankfurt School, critical theory, and reactionary modernism. Since 2014 he has been a Research Associate at the Institute of Culture and Aesthetics of Digital Media at Leuphana University of Lüneburg.

**Adrian Wilding** is a Fellow of the Großbritannien-Zentrum, Humboldt-Universität zu Berlin. He has written and translated widely in the field of critical theory.

**Michelle Yates** is Assistant Professor of Cultural Studies and Humanities in the Department of Humanities, History, and Social Sciences at Columbia College Chicago. She received her PhD in Cultural Studies from the University of California at Davis. Her work is situated in the environmental humanities at the intersection of critical theory, film and media, and gender

and sexuality. She has published in peer review journals such as *Antipode* and *ISLE: Interdisciplinary Studies in Literature and Environment*. She is also the Co-Director of the Chicago Feminist Film Festival.

**José A. Zamora** is a tenured Researcher at the Institute of Philosophy of the Spanish National Research Council (Madrid). He has directed numerous research projects, including the current Social Suffering and Victim Status, for which he is a principal researcher. He is president of the Iberoamerican Society of Critical Theory Studies and is co-editor of *Constelaciones. Revista de Teoría Crítica*. His publications include, among others: *Krise – Kritik – Erinnerung. Ein politisch-theologischer Versuch über das Denken Adornos im Horizont der Krise der Moderne* (Lit-Verlag, 1995) and *Theodor W. Adorno: pensar contra la Barbarie* (Trotta, 2004; Portuguese trans. Nova Harmonia, 2008), and he is editor of *Justicia y memoria: hacia una teoría de la justicia anamnética* (Anthropos, 2011) and *Las víctimas como precio necesario* (Trotta, 2016), among others. His areas of research are Critical Theory, philosophy after Auschwitz, social suffering, political theologies of modernity and political philosophy of migrations.

# Acknowledgement

We are indebted to Neil Larsen for involvement in the early stages of shaping the handbook and for his guidance and advice on the tradition of critical theory in Latin America and Wertkritik.

# Introduction: Key Themes in the Context of the Twentieth Century

Beverley Best, Werner Bonefeld, and Chris O’Kane

## INTRODUCTION

This Volume brings together contributions that explore the key themes of critical theory by means of conceptual argument. Volume 2 serves as a bridge between the chapters on *Key Texts and Contributions* in Volume 1 and the chapters on *Contexts* in Volume 3. Volume 2 develops the thematic concerns and analytical insights of the critical theorists and Volume 3 expounds the theoretical context in which critical theory first developed and explores its further development in a contemporary context.

The title of this Volume was chosen because critical theory emerged and developed as a wide-ranging critique of the historical developments of the twentieth century in Europe in particular. As laid out in the general Introduction to the *Handbook* in Volume 1, Frankfurt School critical theory articulates particular political experiences in theoretical terms. It is an attempt at conceptualizing what is active in society at large.

This Volume explores critical theory as a critique of the social object and the social subject, of society and culture. It focuses on a select number of key themes, and addresses different perspectives within critical theory. The Volume contains two parts. The first part is entitled ‘State, Economy, Society’. It contains chapters on the conception of society, its political form and its social constitution, its economic form and the rationality of social action, on violence and force, class, technology, and the foreshortening of protest. The second part, ‘Culture and Aesthetics’, contains chapters on critical theory and the critique of culture and the production of ideology. It covers topics ranging between education, cinema, music, theatre, literature, and dissonance.

The focus of the first part is on social forms. It provides arguments about society as object, its economic form and political form, and about society as subject, its authoritarian personality, illusory community, and regression. In the first chapter Lars Heitmann explores

society as objective totality, as ontology, and assesses the concept of totality as an innately capitalist category, focusing on the contributions of Hegel, Marx, Lukács, Horkheimer, and especially Adorno. Sami Khatib writes about the relationship between society and violence, focusing in particular on the work of Benjamin. He holds that for critical theory, violence is not an objective transhistorical category. Rather, it is innate to capitalist social relations. It comprises a specific logic, temporality, and modality. It also has a history that is incompatible with traditional conceptions of history as objectively unfolding. José Zamora examines the connection between society and history. He argues that the present contains its historical formation within its concept. The objective appearance of society as a force of nature is therefore not untrue – as a historically specific social nature. Samir Gandesha examines the technological form of capitalist society, that is, the manner in which the productive forces establish a certain abstract instrumentality and perceptive structure that identifies the productive forces as the driver of historical development. In distinction, for Critical Theory, the productive forces are form-determined. They are the forces of definite social relations. Sebastian Truskolaski explores how critical theory's particular approach to materialism is notable for seeking to challenge the orthodoxies of dialectical materialism by casting into relief a Marxism that would liberate humankind 'from the primacy of material needs in their state of fulfilment'. On this basis, he examines how Adorno devised a broadly Marxian form of materialist social criticism that aimed to offset the perceived failings of Engels' and Lenin's dogmatic metaphysics of matter; foregrounding certain epistemological, ethical, and aesthetic impulses, which follow from a focus on individual experiences of visceral, somatic suffering in capitalist modernity. He then shows how the resurgence of certain precepts of materialist metaphysics in speculative realism gives a renewed

actuality to the Frankfurt School's position. Julia Jopp and Ansgar Martins take this argument a step further. They explore materialism as an immanent critique of society that seeks reconciliation in an emancipated society that does not exist and has no material basis in existing society. Jopp and Martins explore the theological dimension of the idea of a reconciled humanity in the materialist critique of existing social relations. Tom Houseman writes about the critical theory conception of the class character of capitalist society. His chapter establishes that traditional conceptions of social class, both Marxist and Weberian ones, derive from classical political economy, especially Smith's contribution. For critical theory, class is a negative category and as such a category of social critique. It is critique of the social relations of production as a definite mode of social reproduction. The final chapter in this group of chapters is Alexander Neupert-Doppler's 'Critical Theory and Utopian Thought'. It explores the relationship between critical theory and utopia in Adorno, Benjamin, Horkheimer, Marcuse, and Bloch. The conclusion assesses Habermas's contention that utopian energies have been exhausted. For the critical theory of Horkheimer, the alternatives to the existing relations of freedom as depersonalized compulsion 'depend on the will of men', that is, what Bloch called 'willing the other'. Neupert-Doppler makes clear that in distinction to the dominant interpretation of Marxism, for the early critical theory, Utopia is a positive term, a glimpse of a longed-for condition beyond contemporary suffering.

The next five chapters explore critical theory as a critique of economic objectivity. Stefan Gandler contributes with a chapter on human praxis that focuses on the work of specifically Alfred Schmidt. The concept of praxis entails nature and labor as the two sources of human social reproduction. Society comprises a socially specific mode of human metabolism with nature. For a critical theory of society, praxis is a historically

mediated category of social reproduction. Frank Engster returns to the critique of society as subject and society as object in his examination of critical theory's double-faceted critique of epistemology and society. In contrast to traditional Marxism, Engster demonstrates how critical theorists', particularly Adorno's, notion of social mediation grounds the German idealist notions of subject and object on a social foundation by drawing on Marx's critique of political economy.

Patrick Murray explores the critique of political economy as a critical social theory, focusing on exchange equivalence as real abstraction and on surplus value as the fundamental category of an equivalent exchange between unequal values. Josh Robinson introduces the contribution of the *Wertkritik* approach to the critique of economic reproduction. *Wertkritik* developed alongside the German-based *Neue Marx-Lektüre* as an Adorno-inspired critique of capitalist wealth, of value as more value, money as more money, and developed its argument about money as the category of the false society into a critique of finance capitalism. In these arguments the critique of capital amounts to a critique of the social relations of production, in which the only productive labor is that which produces wealth in the form of profit.

The following six chapters develop the state as the political form of bourgeois society. Lars Fischer's chapter focuses on fascism. It argues that the concerns of the exiled Frankfurt School with fascism and National Socialism was above all else pragmatic and practical in nature, and no one 'official' conceptualization of fascism ever emerged. In particular, Horkheimer and Adorno by no means subscribed as neatly to Pollock's concept of state capitalism. Fischer argues that Horkheimer and Adorno concluded the dynamics of (state) capitalism alone could not possibly account for the Shoah, which led them to the more broadly conceived critique presented in *Dialectic of Enlightenment*. Conceptually, they viewed fascism as both

the extreme case of the 'administered world' and its dysfunctional other. The legacy of the Frankfurt School's grappling with fascism and National Socialism ultimately lies in the need to deal with this paradox. Alexander Neupert-Doppler's chapter takes Pollock's and Horkheimer's arguments about the authoritarian state as the starting point for his exploration of political form. He explores these arguments further in the context of the debates about the state from the early 1970s onwards until the 1990s on globalization and the state. The political form argument holds with Marx that society doubles itself up into society and state. Political form entails administration of bourgeois society by rules and regulations, and legitimation by procedure, as argued by Weber. It entails instrumental rationality as social mentality. Hans-Ernst Schiller's chapter on the 'administered world' charts the critical theory of bureaucratized society. The implications for law of the arguments of Neupert-Doppler and Schiller are the subject of Andreas Harms's chapter on legal form. The argument here is that capitalist social relations assume legal form in the liberal rule of law. As a consequence, the critique of capitalism entails the critique of law as the legal form of definite social relations of exploitation and domination. However, against the background of the suspension of the liberal rule of law in fascism, the negative critique of the liberal rule of law recognizes its – indispensable – civilizing and protective value, enshrining human rights as inviolable, when compared with political conditions beyond law. In critical theory the critique of the rule of law as the legal form of capitalist society thus goes hand in hand with its endorsement as a means of personal protection, human rights, and individual freedom in capitalist society. Amy Swiffen's chapter focuses on Benjamin's concept of law for contemporary socio-legal theory, focusing on his 'Critique of Violence'. Benjamin wrote this text against the backdrop of political turbulence in

post-WWI Germany. The theme of violence upon which it dwells speaks to the context of parliamentary breakdown and political violence that plagued the country in the lead up to the rise of fascism and the third Reich. The influence of the text in Anglo-American legal and political theory began after WWII when it was translated by Hannah Arendt (1969). Since then it has played an important role in debates on the limits of democracy and the ethics of political violence. The chapter by Mark Neocleous, 'Security and Police', expands on the critique of the rule of law in the context of capitalist world market relations and the politics of security and policing of conditions. He argues that the concepts of security and police have been central to the constitution of bourgeois modernity and that for this reason these concepts should be at the heart of critical theory. Security and police are the processes through which commodification and obedience go hand in hand, and are thereby crucial to the ways in which security becomes inscribed in commodity relations.

The final four contributions to this part elaborate the critique of capitalism through a discussion of authoritarian personality, antisemitism, race and the recognition paradigm, and psychoanalysis. James Murphy explores the research projects on antisemitism and authoritarian personality that the Institute undertook during its exile in the United States. Referring to the socially conditioned character structure of individuals living under late capitalism, Murphy argues that the concept of the authoritarian personality intervened in explanations of the failure of the German Revolution and the development of fascism primarily because it introduced a libidinal dimension to the traditional Marxist conception of the contradiction between the forces and relations of production. Lars Fischer's chapter is on antisemitism. It establishes the significance of Pollock's concept of state capitalism for the Frankfurt School's grappling with the nexus between antisemitism and capitalism. Fischer focuses specifically on Horkheimer's and

Adorno's accounts, including their 'Elements of Antisemitism', and discusses contemporary conceptualizations, including that of Moishe Postone. He asks where the conceptualization of antisemitism in the tradition of the Frankfurt School ought to go next given the contemporary context of anti-semitic projection. Christopher Chen's chapter explores key debates surrounding what has been called the 'politics of recognition' in the context of questions of racial justice and indigenous sovereignty. Recent scholarship on antiblack racism, settler colonialism, and so-called 'neoliberal multiculturalism' has mounted powerful challenges to the recognition paradigm's initial framing of racial injustice in terms of cultural misrecognition. Attempts to move beyond recognitive politics reveal an underlying conceptual tension between antiracist political strategies premised upon the affirmation of racial identity on the one hand, and the abolition of the racial order on the other. As Chen argues, 'This affirmation/abolition bind is subsequently narrated through a Fanonian deformed dialectic of racial nonrecognition, indigenous refusals of settler state authority, or the racially differentiating effects of [economic] maldistribution and state-sanctioned expropriation [of land and labor]'. The concluding chapter is by Benjamin Fong and Scott Jenkins. They explore the social psychology of the Frankfurt School and the development of Freudian Marxism. Sickness in the false society is not an individual pathology. It expresses its mentality. In the false society the sane are numbered. Following the argument of Fong and Jenkins, psychoanalysis explores the unconscious drives shaped in relation to the social environment. It offers the rudiments of a conceptual schema for interpreting and thereby disenchanting the regressive satisfactions that stabilize a society given over to destructive forces. Their chapter reviews and assesses the attempts of researchers associated with the Frankfurt School to mediate these rudiments with a Marxian theory of society. The various 'analytical social psychologies' of Frankfurt School critical theory are passed

down to the present as fragments, i.e. expressions of an historical-philosophical limit and its possible surpassing.

Part V is entitled 'Culture and Aesthetics'. It comprises ten chapters that focus on the critique of cultural forms *as* a contribution to a critical theory of society. Christian Lotz presents a re-reading of 'The Culture Industry' chapter in the *Dialectic of Enlightenment*, as well as a reflection on the topics of culture and industry in general, through the lens of a critical theory of society. Against the reductions of the 'culturalist' understandings of the culture industry, Lotz reconnects the concept of culture to the concept of society, to the concept of political economy, and to the concept of capital. He demonstrates how Horkheimer and Adorno frame the culture industry not only as a social-material concept, but as the principle for establishing the negative unity of society. As a mechanism of social unity, and potentially of dissonance, Matthew Charles turns his attention to the question of education. According to Charles, founding Frankfurt School thinkers such as Horkheimer, Adorno, Fromm, Pollock, and Neumann, while saying little explicitly about the formal activities of teaching and learning in their work, expressed ideas about the activity of scholarship and research that tacitly preserved in its concept bourgeois forms of 'rational' education. Their texts have a tendency to oppose in an undialectical way the mimetic and rational elements of education, an opposition which is manifested in the self-avowed conservatism of their educational attitudes. However, Charles argues, one can distill an alternative critical theory of counter-education from the writings of Walter Benjamin, Herbert Marcuse, Angela Davis, Alexander Kluge, and Oskar Negt.

The following three chapters of this part focus on the question of aesthetics and politics. As the authors of these chapters illustrate, the wide-ranging interventions into the analysis of the modality of aesthetic formation in capitalist society staged generative debates among the founding Frankfurt

School thinkers that, in turn, informed the development of critical theory itself in its ongoing iterations. Engaging directly with this development, Johan Hartle emphasizes the importance of aesthetics for the original program of critical theory and its relevance for contemporary artistic practices. Taking Lukács's program of a politics of form as a point of departure, his chapter focuses on the writings of Benjamin, Marcuse, and Adorno to identify the ideology critical strategies of early Frankfurt School aesthetics. Whereas Benjamin historicized aesthetic perception and formulated a program of proletarian aesthetics, Marcuse presented an immanent critique of classical bourgeois aesthetics to discuss the possibility of collective happiness. Adorno, meanwhile, unfolds the antinomies of modern aesthetics in the image of the commodity and thereby derives both the idea of aesthetic autonomy and its inner conflicts. Isabelle Klasen's contribution looks at Adorno's critique of the theatrical interventions of Samuel Beckett and Bertolt Brecht in light of ensuing debate over engaged versus autonomous art. While Adorno judges Beckett's works, because of their autonomous configuration, to be paradigmatic for an advanced art, he criticizes Brecht's works for their immediate engagement in a false social practice. Klasen argues that, as a result of Adorno's aversion to political art, he over-emphasizes the element of political engagement in Brecht's work and thereby neglects the breaches and contradictions in Brecht's oeuvre. Matthias Rothe's chapter extends the reflection on the intellectual relationship between Adorno and Brecht, but from a very different point of view. While Brecht is commonly seen as Adorno's antagonist, Rothe challenges readers to move beyond their conventionally perceived rivalry and consider Adorno's frequent and extensive writings on Brecht. Rothe argues that Adorno's relationship to Brecht must be seen in its own right and not exclusively through the lens of their friendship with Benjamin. Rothe contends that, approached in this way, one is able to

see how Brecht's work and politics influenced Adorno's thinking decisively.

The remaining five chapters focus on cultural production – specifically, on the analysis of cultural forms such as literature, music, visual art, as well as the ‘technological mass media’ forms such as cinema, radio, and television. For the development of a critical theory of cultural forms, the question of method is a central concern. Mathias Nilges's chapter surveys some of the foundations of the particular theory of literature and method for literary criticism formulated by Adorno, Benjamin, and Löwenthal. The core of this method is to treat art and literature on their own terms – in other words, to engage a form of immanent critique – focusing centrally on matters of form, medium, interpretation, and history. Johannes von Moltke's chapter traces the development of the analysis of cinema and media in critical theory. For von Moltke, milestones of this development are Benjamin's understanding of modern media in relationship to the history of the senses; Kracauer's prolific film criticism and theory from the Weimar era through the Cold War; and Adorno's scattered reflections on technological media such as radio, television, and film. What unites these positions, according to the author, is a consistent concern with the relationship between technological media and experience in modernity. The chapter concludes that critical theory contains untapped resources for a contemporary theory of the media after the century of cinema. Murray Dineen approaches the question of method by staging the confrontation of diverse cultural forms in analysis. Dineen argues that Adorno adopted a style of prose expression called *Scharnier* [Dineen uses *hinge*] where an idea and its negation are brought together succinctly in a form resembling music. Using the concept of ‘hinge’ as a theoretical framework to describe Adorno's prose, Schoenberg's music, and Beethoven's late style, Dineen arrives at a revision of the concept of authenticity as applied to music. Focusing on the interventions of Adorno,

Horkheimer, and Benjamin, Marina Vishmidt looks at the Frankfurt School's sustained contribution to the inquiry into the position of art in capitalist society, more specifically, into the historical dynamic between ‘aesthetic forces’ and ‘aesthetic relations of production’. Vishmidt investigates what she calls the ‘conceptual constellations’ that form in this work around the question of art and technology, around art *as a type of* technology itself, and around the concept of repetition as the logic of the production of art – and as a cultural logic more generally – in capitalist social relations. Finally, Owen Hulatt considers the view, debated by first generation critical theorists, that art can enunciate a critique of society and of the ideologies and distorted forms of rationality that underlie and shore up society. He focuses on the work of Adorno in particular, and argues that the structural preconditions for Adorno's account are no longer realized and that we are now required to reconsider what critical power artworks may have.

## ACKNOWLEDGMENTS

We are most grateful to our translators, who worked wonders in transforming German sentences into free flowing English. Charles Reitz translated ‘Critical Theory and Utopian Thought’ by Alexander Neupert-Doppler. Jacob Blumenfeld translated ‘Rather no art than socialist realism: Adorno, Beckett, and Brecht’ by Isabelle Klasen, and ‘Society as “Totality”: On the negative-dialectical presentation of capitalist socialization’ by Lars Heitmann. Lars Fischer translated ‘Theology and Materialism’ by Julia Jopp and Ansgar Martins, and ‘The Administered World’ by Hans-Ernst Schiller. Joe Fracchia translated ‘Commodity Form and the Form of Law’ by Andreas Harms. Alexander Neupert-Doppler's chapter ‘Society and Political Form’ was jointly translated by Niall Bond and Werner Bonefeld.

# Society as 'Totality': On the Negative-Dialectical Presentation of Capitalist Socialization

Lars Heitmann

Translated by Jacob Blumenfeld

The primacy of totality should also not be hypostatized. The totality reproduces itself again and again out of the details of social life, ultimately from individuals. If we attach such value to the totality of society, Mr. Dahrendorf, this is not because we are intoxicated with grand concepts, with the power and glory of the totality, but on the contrary, because in it we see the doom that, if I may cite myself, 'the whole is the false'.<sup>1</sup>

The concept of society as a 'totality' is of the utmost importance in critical theory. This is particularly true for Theodor W. Adorno, who places this concept at the centre of social critique. Adorno formulated many different versions of this concept, such as 'total socialization',<sup>2</sup> 'total system',<sup>3</sup> he speaks of the 'total structure',<sup>4</sup> the 'power of totality',<sup>5</sup> 'supremacy of totality',<sup>6</sup> 'history as a self-realizing totality'.<sup>7</sup> In the same sense, he speaks vividly of society as a 'universal block',<sup>8</sup> 'network',<sup>9</sup> 'business',<sup>10</sup> 'gigantic apparatus',<sup>11</sup> 'machinery',<sup>12</sup> 'system',<sup>13</sup> 'monstrous totality',<sup>14</sup> of an 'integrated society'<sup>15</sup> and of the emergence of a 'radically

societalized society'.<sup>16</sup> And this 'totality' of the social is characterized as constitutively 'contradictory', 'antagonistic'.<sup>17</sup>

The concept of 'totality' is not only central for Adorno, but in 'dialectical social philosophy' in general.<sup>18</sup> Adorno picks it up from the tradition of Hegel through Marx and Lukács to Horkheimer and gives it his *own* meaning. It can therefore be asked: what *exactly* does Adorno's concept contain for social analysis? And furthermore, what are its implications?

In terms of *content*, the meaning of the concept of 'totality' from Adorno's writings appears quite simple. The concept of society as an 'antagonistic totality' refers to his notion that subjectivity, social relations, and the natural conditions of human beings in modern society are increasingly shaped by an all-encompassing, heteronomous, irrationally dynamic context of capitalist commodity production.<sup>19</sup> Thus, society – brought together by and oscillating around the capitalist exchange of goods – develops into a 'functional nexus' of 'total' subsumption

of human beings and human relationships under the capital relation.<sup>20</sup> Adorno emphasizes that this all-encompassing ‘functional nexus’ – this ‘totality’ – does not exist apart from ‘individual phenomena’, but rather only subsists *in* them: in the thoughts, actions and feelings of ‘individual human beings’ in ‘individual situations’ and ‘individual institutions’, as Adorno says.<sup>21</sup>

For the historical level of social development that Adorno has in mind, this means: held together and driven by the irrationality of the capitalist valorisation process, society develops into a (‘totally’) ‘administered world’ to which people adapt their attitudes and actions.<sup>22</sup>

Adorno *normatively* concludes from his analysis of society that this ‘totality’ should be abolished. For it is a completely ‘inverted’ world, produced by human beings as a ‘false’ unity of the universal and concrete – an ‘administered world’. Human beings can stop making this ‘inverted world’. In view of the development of the division of labour and technology, its abolition [*Aufhebung*] is the condition for a life without coercion, destruction and poverty for every (!) human being. The abolition of the inverted world would mean ‘progress’ in a comprehensive sense for Adorno, not just technically, but also socially.<sup>23</sup>

The *content* of the concept of totality as well as its *normative* consequences are relatively easy to grasp. What is more difficult to grasp are the *systematic* implications of this societal concept. Comprehension entails methodological arguments about Adorno’s approach to the analysis of definite social *contents*. Among other things, the focus here will be on the systematic concepts of ‘unregimented experience’, ‘interpretation’ and ‘thinking in constellations’. I will discuss these systematic implications below. However, this is not so easy, since Adorno’s systematic reflections are scattered all over the place. It is therefore necessary to reconstruct Adorno’s intellectual approach from his own writings, including the sociological ones.

In light of this, I will proceed in the following manner. In the first section, the intellectual-historical background of Adorno’s dialectics is explained. The second section provides a more detailed reconstruction of the systematic character of Adorno’s thinking in dialectical categories; that is, it clarifies how the concepts of ‘totality’, ‘interpretation’, ‘experience’ and ‘thinking in constellations’ are related. In this context, Adorno’s understanding of central sociological categories such as ‘individual’, ‘society’ and ‘capitalism’ is revealed.<sup>24</sup> In this section, I proceed exegetically and let Adorno speak more fully. Finally, I draw a short conclusion.

## THEORETICAL BACKGROUND: ‘TOTALITY’ AND ‘DIALECTIC’ FROM HEGEL TO ADORNO

To understand the concept of ‘totality’ in Adorno, it is worthwhile to see, in broad outline, how the meaning of the concept developed from Hegel through Marx to Lukács, Horkheimer, and Horkheimer and Adorno. The relationship between ‘totality’ and ‘dialectics’ will also be briefly discussed.

### *Hegel*

‘Totality’ is a frequently used concept of Hegel’s philosophy.<sup>25</sup> It can be found in various contexts, such as logic, philosophy of religion, anthropology, epistemology and social philosophy. It always refers to a whole that is more than the sum of its individual parts that stand *external to each other*; this whole, therefore, does not exist on its own *as such*, but rather subsists *in the parts*.<sup>26</sup> Each moment can thus only be thought in its ‘mediation’ with all other moments of the ‘totality’. At the same time, each individual moment is always already determined as self-contradictory: it is always itself and not itself, both immediate and mediated at the same time.

For Hegel, the concept of 'totality' belongs to a comprehensive 'dialectical system of science'. This 'system' is conceived as the conceptual reconstruction of the self-actualization of 'absolute spirit' through various forms (the 'idea', 'nature', the different forms of 'spirit') progressing from being-in-itself through being-for-another towards being-in-and-for-itself.<sup>27</sup> In so doing, Hegel unfolds the objects from each other (or 'derives' them) by always showing how simple forms have contradictions that lead to higher forms.

He thus conceives of actuality as the becoming of a structured whole comprising interrelated forms. For Hegel, this 'whole' is the 'true', namely, the expression of the 'essence consummating itself'. He writes: 'The True is the whole. But the whole is nothing other than the essence consummating itself through its development' (Hegel, 1807: 11).

Regarding the reconstruction of Adorno's concept of 'totality', Hegel's conceptions of 'totality' and 'dialectic' should be noted. In *substance*, the concept of 'totality' in Hegel designates the unity of interrelated moments. On the one hand, it is not reserved for *any specific subject area*. And, on the other hand, it shows that Hegel does not consider 'totality' as *problematic* in any way. From a more *systematic* point of view: the 'dialectical method of development', or the dialectical 'derivation' of concepts, is for Hegel the appropriate analytical means to grasp the inner structure of the world, and thus the 'totality' of being in a comprehensive sense.

## Marx

The concept of 'totality' is also important for Marx. In contrast to Hegel, however, Marx applies the concept essentially to a specific subject area: the *capitalist* economy, and therewith to the division of labour,<sup>28</sup> exchange,<sup>29</sup> money<sup>30</sup> and the 'system of capital'.<sup>31</sup> Marx also conceives the relationship between 'production, distribution, exchange,

[and] consumption' as a 'totality'. Marx writes: 'The result at which we arrive is, not that production, distribution, exchange and consumption are identical, but that they are all elements of a totality, differences within a unity' (MECW 28: 36).

Marx is concerned here with the capitalist economy as an *objective* 'system', which means that all individual economic phenomena are connected with one another in *this* mode of economy. Not only that: at the same time, *this* economy is literally 'perverted' [*verrückt*], because the social relations of production appear as seemingly natural relations between the things themselves, and the product of their social labour assumes the form of value as a socially valid object force. In *Capital*, Marx analyses the central form of the commodity in the 'capitalist mode of production':

A commodity is therefore a mysterious thing, simply because in it the social character of men's labour appears to them as an objective character stamped upon the product of that labour; because the relation of the producers to the sum total of their own labour is presented to them as a social relation, existing not between themselves, but between the products of their labour. (MECW 35: 82 et sq.)

Marx provides proof of this 'systematic' context of inversion by means of a 'dialectical presentation of the economic categories' akin to Hegel's methodology in the *Science of Logic*.<sup>32</sup> That is, Marx develops the (general) concept of 'value' from the 'analysis of the commodity', and then develops all further 'economic categories' as forms of appearance of this 'essence'. In his analysis of capital, Marx shows how the 'economic categories' (value, price, money, capital, wages, profit, interest, etc.) establish a practice of economic activity that belongs to an inverted, seemingly self-moving 'whole'. For Marx, the 'capitalist mode of production' constitutes a crisis-ridden dynamic system of social production that is based on the private appropriation of unpaid surplus labour.

For Marx, the ‘presentation’ of the economic ‘categories’ as moments of an independent, objective-irrational ‘system’ is identical with the ‘critique’ of this ‘system’. On his critique of economics, Marx writes: ‘The work I am presently concerned with is a *Critique of Economic Categories* or, if you like, a critical exposé of the system of the bourgeois economy. It is at once an exposé and, by the same token, a critique of the system’ (MECW 40: 270).

With regard to Marx’s use of the concept of ‘totality’ and the relation of ‘totality’ and ‘dialectics’, we can say the following: the concept of ‘totality’ is used in Marx for the analysis of the *economic* ‘system’. The economic ‘totality’ is the expression of inverted social relations. Marx shows this by way of a ‘dialectical presentation of categories’ which is identical to the critique of the ‘totality’ of capitalist relations.

### Lukács

After Marx and in distinction from him, Lukács develops the categories of ‘totality’ and ‘dialectics’ further.<sup>33</sup> He transposed the category of ‘totality’ to a materialistic theory of society, combining Marx’s ‘critique of political economy’ with Weber’s analysis of modern rationalism. In the 1920s, Lukács analysed what Weber describes as ‘rationalisation’ in connection with Marx’s analysis of the ‘fetish character of the commodity’ as ‘reification’:

The separation of the producer from his means of production, the dissolution and destruction of *all* ‘natural’ production units, etc., and *all* the social and economic conditions necessary for the emergence of modern capitalism tend to replace ‘natural’ relations which exhibit human relations more plainly by rationally reified relations. (Lukács, 1923: 91)

Lukács’ main concern is that the constitution of the commodity form involves the development of a specific objectifying,

‘instrumentally rational’ attitude towards ‘the world’. Lukács conceives of the assumed universality, that is, the ‘totality’ of the principle of ‘reification’, as a form of appearance of the capitalist economy. In *capitalism*, people produce all their relationships, their forms of consciousness, natural conditions and their social relations as ‘reified’.<sup>34</sup> According to Lukács, human beings ‘produce’ the ‘reified’ social forms of instrumental rationality and social structure, which establish an inverted unity of human action and social structure. He considers reified reality as the (necessary) foundation for the revolutionary transformation of society.

For Lukács, the ‘dialectical method’ is a means to think about the historically concrete context; it is thus also the appropriate means to grasp the historical relativity of the object – capitalist society or the (instrumental) subjectivity of modern subjects. The *historical-concrete* forms of ‘reification’ are ‘derived’ from the capital relation; furthermore, they are interpreted as forms leading to the overcoming of capitalism. Lukács argues that the proletariat understands the character of ‘reification’ and therewith the ‘negative totality’ of capitalist modernity. The proletariat is thus able to create a ‘reasonable totality’. The privileged position of the proletariat is due to the fact that workers have ‘first hand’ experience of the process of rationalization in the production process.

Influenced by Weber, Lukács interprets Marx’s analysis of the commodity as a critique of rationality, and then transfers the analysis of the commodity to an analysis of society. Dialectics for Lukács is *the* means to demonstrate the historical relativity of the social object and the necessity of changing it. Lukács thinks of this change as a transition from a ‘negative’ to a ‘positive totality’.

In sum, although the concept of ‘totality’ is *significantly* different for Hegel, Marx and Lukács, they all share the idea that ‘totality’ must be grasped in the context of dialectical *theory*. This changes with Horkheimer.

## Horkheimer

In his writings from the 1930s, Horkheimer is sceptical about Lukács' position.<sup>35</sup> First of all, he conceives of 'totality' as a specific term for describing the negative context of *capitalist* society. But Horkheimer also distinguishes himself from Lukács in a more systematic regard. Horkheimer's programme is to examine the connection of economic, cultural and psychological phenomena within the framework of an 'interdisciplinary materialism' in order to penetrate the 'false totality' of *capitalist* society. The goal is to show how the capitalist 'totality' develops and reproduces itself through empirical forms of subjectivity and its various cultural forms.

The background of this programme is the historical experience that workers do not revolutionize the 'system', but rather practically and theoretically behave in a reactionary manner, tending towards authoritarianism. The absence of revolution gives the 'critical theory of society', as Horkheimer understands it, grounds to more precisely analyse how this 'system' functions: how and why the workers 'participate' in this manner.

For Horkheimer, the analysis of the social 'totality' must result from an analytical synthesis of scientific, theoretical and empirical research (from sociology, psychology, economics and political science) and historical-materialist theory. The 'materialist theory' should guide the 'research'. However, this theory should not be dogmatic at all, but rather correct itself when necessary according to the results of the individual sciences. The claim that materialist theory should lead 'research', however, is still part of a materialist philosophy of history. Horkheimer (still) understands his approach as a contribution to enlightening society about itself, and thus as laying the groundwork for a more reasonable subjectivity. In this respect, he contributes to revolutionizing social conditions.<sup>36</sup>

This ambitious programme of 'interdisciplinary materialism' seems to have been abandoned

in the 1940s against the backdrop of the experience of fascism, Stalin's terror in the USSR, and the Holocaust. The *Dialectic of Enlightenment*, co-authored with Adorno, developed his earlier conception of 'totality' in a new direction.

## Horkheimer/Adorno

In the *Dialectic of Enlightenment*, a 'negativist philosophy of history' (Axel Honneth) of human development and a radical critique of 'instrumental reason' (showing a direct line from the 'slingshot' to the 'atom bomb') supersedes the empirically and scientifically expanded materialist theory of capitalist society. Instead of revolutionary hope, there is a fundamental doubt about the possible emancipation of mankind. The *Dialectic of Enlightenment* understands itself as an enlightenment of the Enlightenment; no longer knowing a direct addressee, it becomes a 'message in a bottle'.<sup>37</sup>

The radical critique of 'instrumental reason' is also reflected in the methodology. This method is an expression of protest against the rationalism of the sciences. The sciences did not contribute to the liberation of mankind or to the establishment of a reasonable form of social life, but rather to man's oppression, that is, to a thoroughly 'irrational' structure of the world. Horkheimer follows the methodology that Adorno had been developing since the early 1930s, in line with Walter Benjamin, and about which Horkheimer had been previously extremely sceptical: the method of 'interpretation'. Because of this method of 'interpretation', the 'presentations' of the *Dialectic of Enlightenment* combine with an experimental, rather tentative, unsystematic-meandering style of thinking and with linguistic exaggerations and literary phrases in the context of a more or less (deliberately) 'fragmentary' overall composition.

Adorno's thinking after 1945 was not oriented by the philosophy of history of the *Dialectic of Enlightenment*. Essentially, it builds upon the perspective introduced by

Horkheimer's programme for 'interdisciplinary materialism' of an empirically substantiated, structural analysis of capitalist society that unfolds within categories of 'totality'. However, Adorno remains faithful to his own systematic approach: the analysis of the capitalist 'totality' is consistently carried out by way of materialist 'interpretation'.<sup>38</sup> Adorno finds a term equally dazzling and appropriate for this approach: 'Negative Dialectics'. The concept of society as an 'antagonistic totality' constitutes its conceptual centre.

## SOCIETY AS 'TOTALITY' FOR ADORNO

### *The Programme for a Social-Theoretical Retranslation of Hegel's Categories*

Adorno argues using the category of 'totality' mainly from the 1950s onwards. At the same time, he elaborates his own manner of using the concept of totality, especially in dialogue with Hegel. Adorno reads Hegel's philosophy in terms of its 'experiential content', differentiating the 'experiential content of the theory' from the 'experiential content in the theory'.<sup>39</sup> 'Experiential content in the theory' are concrete historical experiences that occur in the theory. Adorno is not concerned with this, but rather with the 'experiential content of the theory'. This means that Hegel articulates the 'systematic character' of modern, capitalist society in his idealist-dialectical philosophy, albeit *unconsciously*.

From there, Adorno formulates the programme of 'retranslating' Hegel's categories into social analysis. In addition to the category of 'totality', this includes the 'retranslation' of broader dialectical categories, such as 'individuality', 'universality', 'particularity', 'essence', 'appearance', 'contradiction', 'mediation' and so on. Adorno formulated this programme continuously from the 1950s on. Discussing Hegel, Adorno writes: 'I will try to translate into something as close to

contemporary experience as possible what Hegel essentially understood, what he saw about the world' (Adorno, 1959a: 54). In *Negative Dialectics* of 1966, Adorno writes,

that the object of a mental experience is a *very real antagonistic system in itself*, not just in its mediation with the knowing subject that rediscovers itself therein. The *coercive state of reality*, which idealism had *projected* into the region of the subject and the mind, must be *retranslated* from that region. (Adorno, 1966: 10 trans. mod)

And in the 'Introduction' to *The Positivist Dispute in German Sociology* from 1969, he says:

In terms of society, the idea of an objective *system-in-itself* is not as illusory as it seemed to be after the collapse of idealism, and as positivism asserts. The notion of the great tradition of philosophy, which positivism considers to be outdated, is not indebted to the allegedly aesthetic qualities of intellectual achievements but rather to a *content of experience* which, because of its *transcendence into individual consciousness*, would tempt me to hypostatize it as being absolute. Dialectics is able to *legitimize* itself by *translating* this content *back* into the experience from which it arose. But this is the experience of the *mediation of all that is individual through the objective societal totality*. In traditional dialectics, it was turned on its head with the thesis that antecedent objectivity – the object itself, understood as totality – was the subject. (Adorno, 1969c: 9 et sq.)

These programmatic expressions make clear that the task of 'retranslation' formulated again and again by Adorno should lead to analyses of *sociological* problems. In essence, this involves the *material* question of the relationship between the individual and society or the economy and society. It also includes *systematic* and *methodological* questions about the relationship between method and object as well as the formation of theory and empirical research.

In his confrontation with Hegel in the 1950s, Adorno made a more precise and substantial statement of his programme:

We know that in its emphatic Hegelian version, the concept of system is to be understood organically;

the partial moments are to grow into and be interpenetrated by one another by virtue of a whole that is already inherent in every one of them. This concept of system implies the identity of subject and object, which has developed into the sole and conclusive absolute, and the truth of the system collapses when that identity collapses. But that identity, full reconciliation through spirit in a world which is in reality antagonistic, is a mere assertion. The philosophical anticipation of reconciliation is a trespass against real reconciliation; it ascribes anything that contradicts it to 'foul' existence as unworthy of philosophy. But a seamless system and an achieved reconciliation are not one and the same; rather, they are contradictory: the unity of the system derives from unreconcilable violence. Satanically, the world as grasped by the Hegelian system has only now, a hundred and fifty years later, proved itself to be a system in the literal sense, namely that of a radically societalized society. One of the most remarkable aspects of Hegel's accomplishment is that he inferred that systematic character of society from the concept long before it could gain ascendancy in the sphere of Hegel's own experience, that of a Germany far behind in its bourgeois development. A world integrated through 'production', through the exchange relationship, depends in all its moments on the social conditions of its production, and in that sense actually realizes the primacy of the whole over its parts; in this regard the desperate impotence of every single individual now verifies Hegel's extravagant conception of the system. (Adorno, 1957: 27. trans. mod)

Thus, the 'system' reconciled in philosophical categories is, in truth, an 'unreconciled' one, contradictory *in itself*, fundamentally based on the *violence* of a self-perpetuating capitalist economy. Hegel did not grasp this, but he captured something else: he anticipated the 'systematic character' of the world, which was concretely coming into view before him in the shape of an emerging capitalist economy. With the development of capitalist mass society, the social context finally becomes a 'seamless system'. According to Adorno, this 'seamless', 'systematic' context, based on capitalist exchange, 'realizes the primacy of the whole over its parts', which means that individual persons as well as individual situations and individual institutions become completely transformed into impotent executors of the 'system'.<sup>40</sup>

From a *systematic* point of view, it should be emphasized that this 'retranslated' concept of 'totality' first of all concerns a theoretical 'anticipation' [*Vorgriff*] based on specific experiences: namely, that phenomena which initially appear to us in their singularity are, in fact, not immediately given. Rather, 'something' is reflected in them, they are 'parts' of a larger context. 'Societal knowledge', Adorno emphasizes, 'requires [...] theoretical anticipation, an organ for what determines phenomena and at the same time is denied by them' (Adorno/Jaerisch, 1968: 195).

The *concept* of 'totality' is not yet identical with the *proof* of the specific 'mediation' of the 'immediate'. Habermas also stresses this moment of 'anticipation' in the 'positivist dispute'. He points out that the concept of 'totality' guides the formation of theory as well as 'experience', and that it must prove adequate in the course of (empirical) 'explication': 'This prior experience of society as totality shapes the outline of the theory in which it articulates itself and through whose constructions it is checked anew against experiences' (Habermas, 1969: 135). And further: 'The hermeneutic anticipation of totality must prove itself in more than a merely instrumental manner. In the course of the explication, it must establish itself as correct precisely as a concept appropriate to the object itself (...)' (ibid.: 136).

For Adorno, this 'explication' of the 'concept of totality' is nothing other than sociological 'interpretation'.

### ***The Programme of 'Interpretation'***

Adorno's programme of sociological 'interpretation' runs as follows: the interpreter should perceive the totality in the 'features of social givenness', as they appear in *concrete* individual phenomena:

In sociology, interpretation acquires its force both from the fact that without *reference to totality* – to the real total system, untranslatable into any solid immediacy – nothing societal can be conceptualized,

and from the fact that it can, however, only be *recognized* in the extent to which it is apprehended in the *factual and the individual*. It is the *societal physiognomy of appearance*. The primary meaning of 'interpret' is to *perceive something in the features of totality's social givenness*. (Adorno, 1969c: 32)

Adorno repeatedly formulated this claim. For example, he says: 'I try to think my way deeply into specific phenomena in order that light will fall from them onto the whole' (Adorno, 1964/65: 184 trans. mod). Or, metaphorically put: '(...) to interpret social phenomena as an expression of society, much as one may interpret a face as an expression of the psychological processes reflected in it' (Adorno, 1968a: 146).

With regard to the concept of 'totality', this means that one cannot *immediately* prove its existence, but only make it 'plausible' out of acts of interpretation. In essence, 'interpretation' means the precise analysis of a concrete individual phenomenon that demonstrates its 'mediation' with the 'system of capital' as well as its cultural, political, social and psychological 'manifestations'. These 'interpretations' are not conceived and carried out as strongly systematized, comprehensive 'investigations' but are presented in the form of 'models' or 'analyses of models'. In *Negative Dialectics*, Adorno writes: 'A model covers the specific, and more than the specific, without letting it evaporate in its more general super-concept. Philosophical thinking is the same as thinking in models; negative dialectics is an ensemble of analyses of models' (Adorno, 1966: 29).

This systematic self-understanding is also reflected in the titles of Adorno's publications, for instance, *Interventions: Nine Critical Models*. In this publication, Adorno deals with various topics like 'Television', 'Culture', 'Sexual Taboos' and 'Working Through the Past'. This self-understanding is also expressed in the title and execution of Adorno's last publication, *Catchwords: Critical Models 2*, in which Adorno deals with objects such as 'Free Time', 'Progress',

'Personality', and 'Education after Auschwitz'.<sup>41</sup> In their entirety, the 'models' – as a kind of 'ensemble' – accumulate to far-reaching insights into the social context.<sup>42</sup>

Thus, model interpretations of individual phenomena based on the specific concept of society as 'totality' take the place of the formation of a general theory of society, as formulated by Durkheim, Parsons, Luhmann and Habermas, as well as the early Horkheimer.

Adorno justifies this exemplary and fragmentary approach with the 'complexity' and 'irrationality' of society as such. On the one hand, 'society' in general does not immediately present itself to the researcher; rather, one finds isolated phenomena appearing alone, which, on closer inspection, point beyond themselves. On the other hand, 'society' proves to be 'contradictory' and 'irrational' in so many ways that it would be wrong, from Adorno's perspective, to formulate a self-contained theory.<sup>43</sup>

The overall character of social analysis for *concrete* objects proves to be anti-definitional and 'fragmentary'. In the same way, the conceptual method in the framework of 'interpretation' also proves to be an attempt to explain by means of non-definitional and historical-concrete terms the specific kind of sociality of objects. In *Negative Dialectics*, Adorno describes this approach as 'thinking in constellations'.

### **'Thinking in Constellations'**

'Thinking in constellations' forms the systematic centre of Adorno's societal analysis. In this way, Adorno concerns himself with formulating and solving the fundamental problem of conceptual thinking.<sup>44</sup> This is the core idea: objects, which must always be conceptually designated but are never identical with these concepts, should not be grasped by means of definite and classifying concepts, but through the development of theoretical-conceptual 'constellations'. In a

‘constellative’ way, according to Adorno, meaningful content can be created that ‘overcomes’ [*aufheben*] the limitations of individual concepts:

By themselves, *constellations* represent from without what the concept has cut away within: the ‘more’ which the concept is equally desirous and incapable of being. *By gathering around the object of cognition, the concepts potentially determine the object’s interior. They attain, in thinking, what was necessarily excised from thinking.* (Adorno, 1966: 162)

‘Constellative’ thinking thus explicates the ‘mediation’ of the ‘immediately’ appearing, which turns out to be nothing other than the specific historicity of the thing:

The object opens itself to a monadological insistence, to a sense of the constellation in which it stands; the possibility of internal immersion requires that externality. But such an immanent generality of something individual is objective as sedimented history. This history is in the individual thing and outside it; it is something encompassing in which the individual has its place. Becoming aware of the constellation in which a thing stands is tantamount to deciphering the constellation which, having come to be, it bears within it. The *chorismos* of without and within is historically qualified in turn. The history locked in the object can only be delivered by a knowledge mindful of the historic positional value of the object in its relation to other objects – by the actualization and concentration of something which is already known and is transformed by that knowledge. Cognition of the object in its constellation is cognition of the process stored in the object. (Ibid.: 163)

Adorno also elucidates the method of ‘constellation’ with a metaphor:

As a constellation, theoretical thought circles the concept it would like to unseal, hoping that it may fly open like the lock of a well-guarded safe-deposit box: in response, not to a single key or a single number, but to a *combination of numbers*. (Ibid.)

So, not by turning a *single* ‘key’, but by finding a ‘combination of numbers’, namely, a *specific* arrangement of different individual keys (‘concepts’, theories), the object *reveals* itself.<sup>45</sup> This method of a ‘constellation’ of

concepts is not formal, but experimental, playful, almost ‘artistic-creative’.<sup>46</sup>

If one looks at the different ‘models’ developed by Adorno against this background, then it becomes clear that in carrying out the ‘constellative-conceptual’ ‘interpretation’ of a historical-concrete object, he resorts to different *conceptual* modes of access and thus interrelated ‘individual concepts’. These include:

- the reflection of general political-economic structures and issues that can be shown in the object, such as the differences between ‘free time’ and ‘work’, ‘public’ and ‘private’, as well as other issues like ‘domination of nature’, ‘reification’, ‘rationality’, ‘rationalization’, ‘productive forces’ and ‘relations of production’.
- the reflection of concrete political-economic dynamics, power relations and strategies of capital such as ‘monopoly’, ‘culture industry’, ‘crisis’ and ‘administration’.
- the social-psychological dimension (which reflects the history of domination): ‘ego-weakness’, ‘unconsciousness’, ‘neurosis’, ‘repression’ and ‘identification with the aggressor’.
- the properly sociological dimension: ‘domination’, ‘institutions’, ‘organization’, ‘bureaucratization’, ‘adjustment’, ‘integration’, ‘disintegration’, ‘social control’, ‘socialization’, ‘character masks’, ‘pseudo-individualization’, ‘fetishism’ and ‘ideology’.

Through ‘constellations’ and in ‘models’, these categories are critically examined and, if necessary, reinterpreted. As such, Adorno is able to grasp how different moments are ‘mediated’ with each other: for example, how economic phenomena contain psychological moments and *vice versa*, or how the economic structure influences the psyche.

This can therefore be stated of ‘thinking in constellations’: by emphasizing the tentative, experimental and ‘model’ character of his conceptual-analytical methodology in the framework of a sociological ‘interpretation’ of concrete objects, Adorno maximally distinguishes himself from the formalizing, classifying, and other such methods of sociology. This applies even more so to the

typical rhetorical form of Adorno's 'interpretations', which often trigger defensiveness; they are not just different, but have their own method as well.

### ***Rhetorical Moments in the Process of Interpretation: Exaggeration, Individual Expression and Metaphors***

In his 'models', Adorno systematically uses different rhetorical forms of presentation: exaggeration, genuine literary stylistics and the formulation of metaphors.

Again and again, Adorno uses radical formulations and statements that many consider to be untenable or even absurd.<sup>47</sup> The most incisive examples from the period after 1945 are the well-known phrases from *Minima Moralia*: 'The whole is the false' (Adorno, 1951: 50), 'Wrong life cannot be lived rightly' (ibid.: 39), 'In many people it is already an impertinence to say "I"' (ibid.: 50). These exaggerations have always been systematic in their self-understanding. In *Dialectic of Enlightenment*, Horkheimer and Adorno write: 'But only exaggeration is true' (Horkheimer/Adorno, 1944: 92), and in 'The Meaning of Working Through the Past', Adorno says:

I have exaggerated the somber side, following the maxim that only exaggeration per se today can be the medium of truth. Do not mistake my fragmentary and often rhapsodic remarks for Spenglerism; Spenglerism itself makes common cause with the catastrophe. My intention was to delineate a tendency concealed behind the smooth façade of everyday life before it overflows the institutional dams that, for the time being, are erected against it. (Adorno, 1959b: 99)

Using exaggeration as a 'medium of truth' means that the exaggerated phrase can help illuminate what is *really* at stake, what is *actually* behind the thing at hand and where it 'tends'. Exaggeration never stands alone, but is a rhetorical moment in an overall

argumentative context. Exaggeration hopes to create a shattering effect, ultimately in order to help avoid what it says.

But it is not only Adorno's exaggerated formulations that polarize; his analyses are always carried out in a unique style that rubs many the wrong way.<sup>48</sup> Adorno, however, does not speak in this very specific way out of vanity or arrogance, but on principle: through his style, he highlights individuality in a society which, in his opinion, is characterized by conformity, pseudo-individualization, pseudo-objective (definition-based and quantitative) science and a frequently accompanying anti-intellectuality.

These specific rhetorical forms of 'presentation', in my view, obtain their meaning against the background of Horkheimer and Adorno's assumption that 'no terms are available which do not tend toward complicity with the prevailing intellectual trends (...)' (Horkheimer/Adorno, 1944: xv). Horkheimer and Adorno refuse to speak the sober language of supposedly objective science, because this language has not become the 'medium' of liberation, but a means of oppression.

Beyond these means of exaggeration and individual stylistics, sociological 'interpretation' ultimately integrates a figurative mode of knowledge. As already mentioned, Adorno repeatedly describes 'society' with technical metaphors such as 'system', 'business', 'apparatus' and 'machinery'. In particular, these metaphorical elements of Adorno's social analysis have important systematic significance.

With reference to Benjamin, Adorno's textually interwoven metaphors are by no means arbitrary.<sup>49</sup> Already in the early 1930s, Adorno writes:

Benjamin shows that *allegory* is no composite of merely adventitious elements; the allegorical is not an accidental sign for an underlying content. Rather *there is a specific relation between allegory and the allegorically meant*, 'allegory is expression'. Allegory is usually taken to mean the *presentation of a concept as an image* and therefore it is labelled abstract and accidental. The relationship of allegory to its meaning is not accidental

signification, but the playing out of a particularity; it is expression. *What is expressed in the allegorical sphere is nothing but an historical relationship.* (Adorno, 1931b: 119)

In the course of ‘interpretation’, ‘allegory’ should reveal concrete history, as a ‘historical relationship’ ‘expresses’ itself in the phenomena. The ‘images’ drawn in this context are above all the articulations of suffering in reality:

Everything about history that, from the beginning, has been untimely, sorrowful, unsuccessful, is expressed in a face – or rather in a death’s head. And although such a thing lacks all ‘symbolic’ freedom of expression, all classical proportion, all that is human, nevertheless not only the nature of human existence in general but the biographical historicity of an individual is enunciated in this figure of the most extreme subjugation to nature, in the form of a riddle. This is the *heart of the allegorical vision, of the Baroque, secular exposition of history as the passion of the world*; it is only meaningful in the stations of its prostration. (Ibid.: 120)

Adorno and Horkheimer repeatedly make recourse to allegorical forms of expressions in *Dialectic of Enlightenment*. For example, they speak of the ‘sun of calculating reason’, which ‘illuminates myth’ but ‘beneath whose icy rays the seeds of the new barbarism are germinating’ (Horkheimer/Adorno, 1944: 25). The image of the *Odyssey* is also used to express the suffering of becoming a subject. Referring to the *Dialectic of Enlightenment*, Baars writes:

Introducing the *imagination* into the theory of society allows us to experience what the regressed enlightenment can only conceive as a material of domination, and shows that it is something special and individual that *suffers* under domination. (Baars, 1989: 223 trans. mine)

In his characterization of the overall context of presentation, Baars particularly highlights the theological as well as psychoanalytic meanings of the presentation, indicating a liberating moment that transcends the expression of suffering:

Joining the figurative form borrowed from aesthetic modernism is anamnesis, borrowed from modern psychoanalysis (...). Moments of this anamnesis are, for example, an *expressiveness of suffering*; a *remembrance of prehistory*, which is structured by a *traumatically fixed present*; an *interpretation of prehistory as a history of illness*, and, finally, the *possibility of liberation from compulsive repetition through insight into genesis.* (Ibid.: 210)

It is thus possible to retain the role of the image in the process of ‘interpretation’. The linguistic image – ‘metaphor’, ‘allegory’ – can reveal meaningful content that goes beyond the concept and enriches it. The image, as well as the exaggeration, never replaces the concept, but *supplements* it. Figurative expression is the moment of conceptual reflection of the specific-historical world of experience; as such, it’s a moment of condensing the content of the statement, and so holds the possibility of thinking – and feeling – beyond the concepts expressed in the ‘constellation’. The negation of the reified, hardened and coagulated world appearing in the image makes it possible to imagine *that* and *how* it can be quite different, and foremost what a liberated society does *not* look like: uniform, orderly, hierarchical, technological.

### ***The Significance of ‘Experience’ in the Process of Interpretation***

Up to this point, the essential programmatic and methodological assumptions as well as the most important conceptual elements of Adorno’s ‘sociology’ have been reconstructed. The reconstruction of the most important systematic elements of Adorno’s approach is, however, still incomplete. There is another essential concept that has so far only been discussed in the margins: experience.<sup>50</sup>

Both the formulation of the social-theoretical concept of ‘totality’ and its execution in sociological ‘interpretation’ are closely linked to the concept of ‘experience’.

Thus, in the context of the ‘positivist dispute’. Adorno insists that ‘the supremacy of totality, which is indeed abstract, but also escapes the general concept in a certain sense, can only be encountered in the experience of the individual and in the interpretation of this experience of the individual’ (Adorno, 1968b: 587). Adorno even postulates a primacy of experience before ‘form’. Provocatively, he writes: ‘The key position of the subject in cognition is experience, not form’ (Adorno, 1969b: 254). And: ‘It beckons us to defend experience against empiricism, to bring a less restricted, less narrow, and less reified concept of experience to science’ (Adorno, 1969d: 545). Adorno even calls for a ‘rebellion of experience against empiricism’ (Adorno, 1968a: 51).

It is important for Adorno that one can make experience and that dogmatic theoretical and/or methodological assumptions about the subject area do not prevent this. Thus, Adorno criticizes the fact that ‘the positivists’ know much more about society and its ‘objectivity’ in the context of non-scientific discussions than they acknowledge as *scientists*. In the *Introduction to Sociology* from 1968, Adorno says:

I want only to warn you against adopting a certain type of scientific posture which is not unknown to me and can manifest itself somewhat as follows: you are able to sit down at a *Caféhaus* table – I’m thinking of Vienna now – with someone with whom you can talk about every possible intellectual, social and political issue and who has thoroughly free, reasonable and critical views. But the moment he metaphorically puts on his academic gown – I don’t think too many people are inclined to put it on literally nowadays – he immediately succumbs to what Habermas has called *restringierte Erfahrung* (*restricted experience*). He will now only entertain views so limited and narrow that they bear no comparison with his so-called *prescientific* views – what he knows when you talk to him normally – and are entirely lacking in weight. (1968a: 126)

Adorno is concerned with laying the foundations for ‘primary experiences’ in sociology.<sup>51</sup> In his sociological seminars on ‘social

conflict’ and ‘laughter’, Adorno encourages his students to ‘go out on the streets’ and, in general, to look closely.<sup>52</sup> Adorno repeatedly said that it is necessary for the sociologist to develop an ‘evil eye’, and these seminars are conceived as ‘exercise for the development of that evil eye, without which hardly a sufficient consciousness can be gained of the *contrainte sociale*’ (Adorno/Jaerisch, 1968: 177).

At the same time, this programme states what the ability to make experiences actually means: namely, to develop a feel for the specifically *social* in directly experienced phenomena. On the one hand, Adorno describes such ‘primary experiences’ on the economic level, in the *Introduction to Sociology*:

For example, one might find oneself in certain social situations, like that of someone who is looking for a job and ‘runs into a brick wall’ has the feeling that all doors are shutting automatically in his face; or someone who has to borrow money in a situation in which he cannot produce guarantees that he can return it within a certain period, who meets with a ‘No’ ten or twenty times in a definite, automated manner, and is told he is just an example of a widespread general law, and so on – all these, I would say, are *direct indices of the phenomenon of society*. (Adorno, 1968a: 36)

In another lecture Adorno states ‘that our most immediate experience is that we are all harnessed to an objective trend, and it is hard to disabuse us of this’ (Adorno, 1964/5: 17).

On the other hand, according to Adorno, the social can also be ‘felt’ in concrete situations that initially appear to have no economic or structural character. In the seminars on laughter, for example, more can be found in the many concrete humorous presentations or situations of communal laughter: a collective aggressiveness that indicates the identification of people with the prevailing conditions, against which they are ultimately powerless.<sup>53</sup>

Finally, Adorno combines the development of this ability to make experience, that is, to look closely, with the hope of finding starting points of social change:

Should *experience regain* what she could possibly once do, and what was dispossessed of her by the administered world: to penetrate *theoretically* into the *unknown*, she would have to *decipher slang, attitudes, gestures, and physiognomies, even infinitesimal slights*, to make the *petrified and speechless* speak, whose nuances are as much *traces of violence* as they are secret messages of possible liberation. (Adorno/Jaerisch, 1968: 193)

As a result, Adorno gives experience a central position in his social analysis. As a critic of empiricism, Adorno also knows that experience is never made directly, but that experience and concepts are mediated through one another. In the context of methodological reflections for the seminar on laughter, Adorno states that the relationship between experience and theory is fundamentally ‘circular’:

The task would be to visualise the interaction of theory and experience. Inevitably, therefore, a *circle*: no experience that is not mediated by – often inarticulate – theoretical conception, and no conception that is not based on experience and always measures up to it, whatever it’s worth. The *circle* should not be concealed; by no means, however, should it be accused of lacking reflection or unclear thinking. It is conditioned by the fact *that even in the separation of experience and concept, there is arbitrariness*. (Ibid.: 186)

This can only mean that the interpreter ultimately brings both experience and theory into ‘balance’. This implies that the interpreter does not proceed uncritically from theoretical and/or methodological premises, but remains open to experience (may this be ever so painful!) and also bases this experience in the sciences, in theoretical and conceptual formation. Furthermore, Adorno notes that in addition to ‘lived experience’, theoretical formation can also be oriented by the analyses preceding it. This means orienting oneself to what can be discerned from the available theories and analyses of ‘objectivity’.<sup>54</sup> The concept developed in this way should be applied consistently to the material along with the willingness to stay open to other experiences of the object and, if necessary, to draw consequences for the concept:

The construction of totality has for its first condition a concept of the thing in which the disparate data organizes itself. The construction must bring this concept to the material not according to the socially installed mechanisms of control but from lived experience, from the memory of former thoughts, from the unswerving consistency of one’s own reflection, and, in contact with it, change it. (Ibid.: 197)

What’s crucial is that even the fundamental concepts of (dialectical) social theory, in essence the concept of ‘totality’, can still be legitimized *from experience*. As early as the 1930s, Adorno vehemently criticized Karl Mannheim for developing abstract sociological categories and bringing them *externally* to the object, thus blocking in advance the experience of social contexts:

This methodological requirement [according to which phenomena are to be placed in external contexts, L.H.] is questionable. For it is valid only on the presupposition that social reality is *dominated* by as many *divergent and distinct ‘forces’* as present themselves in the manifold of appearances; it is not valid, however, on the assumption that before all abstraction and generalization by the sociologist, *this society is a highly ‘articulated’ fundamental unity which determines precisely this manifold in each individual feature, namely, the unity of the capitalist system*. (Adorno, 1937: 16 et sq.)

## CONCLUSION

The *critical* kernel of Adorno’s theory, in my view, lies ultimately in the reconstructed conception of the ‘interpretation’ of ‘society’ as ‘totality’. In the *History and Freedom* lectures from 1964/65, which emerged within the context of the development of *Negative Dialectics*, Adorno says:

Interpretation (...) is criticism of phenomena that have been brought to a standstill; it consists in revealing the dynamism stored up in them, so that what appears as second nature can be seen to be history. On the other hand, criticism ensures that what has evolved loses its appearance as mere existence and stands revealed as the product of history. This is essentially the procedure of Marxist

critique (...) Marxist critique consists in showing that every conceivable social and economic factor that appears to be part of nature is in fact something that has evolved historically. (Adorno, 1964/5: 135 et sq.)

Adorno thus explicitly moves his concept of critique closer to Marx's idea of 'critique through presentation', as used in the *Critique of Political Economy*. Critique here means in essence to reveal the 'mediation' of the apparently 'immediate' – that is, the 'fetishized' 'economic categories' – by the irrational overall context – that is, the crisis-ridden process of social production and private appropriation of surplus value.

This critique, based on Marx, means the 'determinate negation' of subjective, cultural, and social reality, its comprehension as 'appearance', that is, as a 'cipher' of the totally inverted social relations. It is only on the basis of *this* critique, and not from some *moral-theoretical* reflections, that the principles underlying an emancipated society can be obtained. Even in the face of total horror, Adorno makes this clear: 'mimesis', 'remembrance of nature within the subject', 'the ability to be different without fear'.

- 22 In the present phase of capitalist development, this 'total context' presents itself quite differently: as 'domination through autonomy'. See also Meyer, 2005: 19 et sqq.
- 23 Adorno discusses this more extensively in his article on 'Progress' (Adorno, 1969a).
- 24 Adorno has always emphasized that his method cannot be separated from its object. See Adorno, 1966: xix.
- 25 For the concept of totality in Hegel, see Pisarek, 1996.
- 26 See Schnädelbach, 1999: 14 et sqq.
- 27 Arndt (2008: 11 et sq.) has concisely summarized the core of Hegel's ambitious dialectical conception: 'One can perhaps summarize what dialectics means in the Hegelian sense in the following points: (1) Hegel's conception links the thinking of totality and contradiction insofar as (...) he thinks of (...) determination as negation (...). To think of something in its determinateness, I must think of it in its negative relation to something else – an other that in turn negates this determinateness; this relation and with it the negation not only of the other but also of itself through the other is an essential component of determinateness itself. This concept compels us to interpret every determination supposedly identical with itself as an existing contradiction, and at the same time forces the transition to the totality of determinations. (2) Contradiction, not identity, forms the foundation of all determinacy; at the same time, the concept of a self-identical entity, a subject as the bearer of determinations, is deprived of its basis. In truth, what exists are not things, but relationships: totality as a network of relations. (3) For Hegel, this network has a conceptual nature, that is, it develops dialectically from the self-mediation of the determinations of thought to the totality, which at the same time is the self-comprehension of the concept. This culminates in the self-consciousness of the completed concept, which ultimately determines itself as dialectical method. (4) The dialectical method mediates the presuppositions, moments, and results of becoming a totality. It is, therefore, the logic of the becoming of this totality in the sense of (historical) genesis as well as its internal reproduction'.

- 33 This section relies on Dannemann, 2005.
- 34 'Lukács' specific version of the concept of totality consists in the fact that he comprehends the social *totality as an organization of heterogeneous forms of practice according to a homogenizing pattern (the commodity form)*. Lukács finds the abstract, quantifying form of the commodity even outside the economy in the formally rational organization of modern bureaucracy, the bourgeois state, and above all in the life forms of capitalist everyday life. According to Lukács, the capitalist mode of production is the only social formation so far that forms such a *strict unity*, while pre-capitalist societies do not structure themselves into a complex unity (with an *overarching form-determination*'). (Dannemann/Erdbrügge, 1978: 146 et sq., emphases by author)
- 35 The following section is influenced by Wiggershauss, 1988; Dubiel, 1978 and Jay, 1973.
- 36 In contrast to Lukács, Horkheimer still has a positive concept of modern 'productive forces'. And, as mentioned, his relationship with the empirical sciences of his time is still positive.
- 37 Following Müller-Doochm, 2003: 278 et sqq.
- 38 On this note, Breuer (1985b) speaks of 'differences in the core paradigm'. Breuer refers here to Brunkhorst (1983), who had dealt with the 'core paradigm' of critical theory. See also Jay, 1981.
- 39 Adorno, 1959a: 54.
- 40 It should be pointed out that the conception of social 'totality' thus understood no longer has a systematic basis in the philosophy of history, but is rather directed at the analysis of modern, capitalist society – its structure and dynamics – as an 'irrational system'.
- 41 The essayist character of 'models' typical for Adorno results from this constitutive understanding of 'interpretation' as model-based concrete analysis.
- 42 See Adorno, 1964/65: 254 et sqq. See also Institut für Sozialforschung, 1956: 8; von Wussow, 2007: 186 et sqq; Müller-Doochm, 2002: 150 et sqq.
- 43 Adorno (1931a, 1931b) argues early on that the 'dispersed' and 'puzzling' character of individual phenomena make it impossible to form abstract-universal theories. For the consequences of 'irrationality', see Adorno, 1969c: 16. See also Müller-Doochm, 2003: 424.
- 44 See von Wussow, 2007: 186 et sqq.; Gripp-Hagelstange, 1984: 127 et sqq.; Müller, 2006: 83 et sqq. In addition, see the studies of Schweppenhäuser, 1991 and Tiedemann, 1993. The remarks in *Negative Dialectics*, in my opinion, should clearly not be read *philosophically*. Adorno says this himself (Adorno, 1964/65: 184 et sq.). As a reference for the concepts of 'models' and 'constellations', Adorno points to the sociological seminar on laughter he carried out. See Adorno/Jaerisch, 1968. Müller-Doochm (1996: 164) also points out that 'constellative thinking' is identical to 'sociological micrologic'. Negt (2001) emphasizes the unity of philosophy and sociology in Adorno.
- 45 Müller-Doochm (1996: 165) uses the example of a nutshell: the contents of the nut – the historicity of the phenomenon – should not be opened with a nutcracker, but rather falling nuts should be caught and smashed together until they burst open.
- 46 See Adorno's (1966: 164 et sq.) remarks in *Negative Dialectics* on the compositional character of the formation of ideal types in Max Weber.
- 47 See, for example, Schnädelbach's (1983) criticism of Adorno's notion that dialectics 'is the ontology of the wrong state of things' (1966: 11).
- 48 On the specifics of Adorno's style and its effect, see the informed article by Henning Ritter, 'When Adorno Speaks', in: *Frankfurter Allgemeine Zeitung (FAZ)*, 11.10.2008. <http://www.faz.net/aktuell/feuilleton/bilder-und-zeiten-1/adornos-stil-wenn-adorno-spricht-1712550.html>
- 49 On the meaning of metaphors in Adorno, see Schweppenhäuser, 2009; Tiedemann, 1993.
- 50 In the following, I will only deal with the fundamental aspects of the significance of the concept of experience. I do not go into the more specific question of Adorno's conception of a *critical* empirical social research. See the more relevant presentations in Bonß, 1982; Müller-Doochm, 2002, 2003; Negt, 2001; Wiggershauss, 1988.
- 51 See, for example, Adorno, 1964/65: 29.
- 52 See Adorno and Jaerisch's 'Remarks on Social Conflict Today' (Adorno/Jaerisch, 1968: 177 et sqq.), based on the sociological seminar on laughter and social conflict held regularly by Adorno. On the Laughter seminars, see also Puder, 1976 as well as Schörle, 2007.
- 53 See Schörle, 2007.
- 54 Thus, for example, the action-theoretical sociology of Max Weber cannot help using objective metaphors such as 'structure' to characterize society. For Adorno's Weber interpretation, see Meyer, 2005: 165 et sqq.

# Society and Violence

Sami Khatib

## **CAPITALIST SOCIETY AND VIOLENCE**

According to Marxist theory, violence is an inherent characteristic of capitalist class society. If the basic socio-economic relation is a violent relation, violence is not an exception but shapes, maintains and sustains capitalist reality in its 'normal' functioning. Violence as a relation is the most obvious expression of the asymmetry of class antagonism. Therefore, in capitalist societies the agents of violence are not merely of individual but also of structural and institutional nature. In the ongoing history of capitalist class struggle, the violence of the state (which acts on behalf of the class of capitalist and feudal landowners) is met by the counterviolence of workers or other excluded or oppressed groups. Since the modern state is founded on the dogma of the state monopoly on legitimate violence, there is a fundamental political asymmetry of state violence and non-state counterviolence. Whoever questions this monopoly challenges the sovereign

power of the state. Sovereignty, as Carl Schmitt (1922) famously declared, is not defined by the normal case but by the extreme limit case: 'Sovereign is he who decides on the exception', that is, the state of emergency (Schmitt, 2005: 5). From this perspective, the state and its 'ideological state apparatuses' (Althusser, 2014: 232–72) is constitutively founded on violence, defined through the sovereign use of 'exceptional' violence and relies on the 'normal' functioning of the systemic violence contained in the sphere of jurisdiction, politics and economy.

Whereas traditional Marxism theorized violence as the natural or naturalized status quo of class relations within class struggle, the later Marx of the 'Critique of Political Economy' and after him critical Marxism and critical theory complicated the picture by investigating the specific logic, temporality and modality of systemic violence. The latter comes only fully into view once the normal and normalized capitalist status quo is analyzed from the perspective of its repressed

origin: Every mundane act of commodity exchange is a congealed remainder of the original violence of the so-called ‘primitive’ or ‘*ursprüngliche*’ [‘original’] accumulation through which capitalism was historically implemented. The disruptive transformation from feudal to capitalist society was enforced through the violent separation of labor power from the means of production by way of expropriation, expulsion and brutal force (Marx, 1962: 741–91). The uneven process, which in the case of Western Europe took from the sixteenth to the nineteenth century, is still present in and, at the same time, repressed from the seemingly peaceful surface of the market. The same applies to the violence of colonialism and imperialism: it is an integral part of capitalism’s history and present (Fanon, 2004: 1–62; Luxemburg, 1951: 446–67).

In *Capital* (1867), Marx shows how the manifest violence of the so-called ‘primitive accumulation’ remains present in the everyday of capitalist production. Commenting on the historical struggles for the normal working day, he notes:

Between equal rights, force [Gewalt] decides. Hence, in the history of capitalist production, the establishment of a norm for the working day presents itself as a struggle over the limits of that day, a struggle between collective capital, i.e. the class of capitalists, and collective labour, i.e. the working class. (Marx, 1976: 344; 1962: 249)

Marx’s employment of the German term ‘*Gewalt*’, here translated as ‘force’, alludes to three difficulties that any theory of violence has to address:

- 1 The *theoretical* challenge: Violence is a dialectical term that applies to both its latent, covert, systemic (‘objective’) and its openly physical, manifest, intentional (‘subjective’) dimension. This dialectics is not identical with, yet often parallel to, the dialectics of structural and individually embodied violence. Violence is thus not a substance or a well-defined content (bound to an action or site of social, political, economic life) but a relational concept that also materializes

itself in language. The latter symbolic dimension of violence is not derivative or idealistic but material in the sense that language produces its own materiality of symbolic economies.

- 2 The *conceptual* vagueness: In the absence of a clear definition, violence overlaps and competes with other semantic fields and concepts such as power, force, strength, coercion and authority. Depending on the degree of its specific determinacy, the concept of violence partakes in the definition of broader neighboring concepts such as terror, struggle, conflict and war.
- 3 The *philological* complication of translation, retranslation and etymology: In the case of critical theory, mostly German, French and English authors have theorized violence. The respective conceptualizations can be either traced to the Latin root of violence (*vis*, *violentus*) or the Germanic root of *Gewalt* (*waltan*).

In the case of Marx’s argument in *Capital*, all three problems coincide.

With the rise of capitalism the direct physical violence of ‘primitive accumulation’ is partly transformed into the less visible systemic violence of the capitalist working day. By the end of the nineteenth century, in Western Europe the daily class struggle of the workers against the capitalists becomes more and more regulated by defining the limits of what is considered as the normal working day. In twentieth-century Western post-war societies, eight hours became a political goal and normative standard, enforced by the wage system of labor and its disciplinary regulations. This standard, however, has been subject to violations and attempts to increase the amount of labor time and exceed the duration of the working day towards its absolute: ‘By the end of the twentieth century it had become possible to see a broader and much fuller integration of the human subject with the “constant continuity” of a 24/7 capitalism that had always been inherently global’ (Crary, 2013: 74). Besides its individual violations, the juridical and administrative regulations of the normal working day already contain violence in its systemic dimension: The increased exploitation of labor power,

that is the extraction of surplus value as surplus labor, is ensured, regulated and normalized by the legal framework of the capitalist wage system, entrepreneurship and competition. Strikes and other forms of sabotage can be regarded as subjective forms of resistance against this form of objective violence which the normal working day contains. The latter's limits are the unstable, always contested, results of class struggle.

In Marx's argument, however, another dimension comes to the fore. If the working day and its legalized results already contain systemic violence in its 'congealed' or 'frozen' form as law, regulation and norm, the objective dimension of violence is only guaranteed by a necessary exception: 'Between equal rights, force [*Gewalt*] decides' (Marx). Force as *Gewalt* is here introduced as a different kind of violence: a decisive and deciding violence that strikes in a different way than the congealed systemic violence contained in the competing equal rights. Exceptional violence decides the seemingly peaceful competition between different factions of commodity owners: those who have nothing else to sell than their labor power and those who own capital to buy labor power (see Tomba, 2009: 128f.). The distinction between the law of the working day and its exception is internal to the earlier differentiation between subjective and objective violence. As we will see later, the functioning of objective violence relies on the possibility of its own exception or 'sovereign' suspension. What Walter Benjamin calls 'mythic violence' – the mutual dependency of 'lawmaking' and 'law-preserving violence' (1996: 241–9) – is not only inherent to the objectively violent sphere of law and jurisdiction but befalls almost all fields of human action in modern capitalist societies, particularly the sphere of economic production and its contractual 'freedom' of the market.

The ideological and epistemological challenge of this dialectics of violence has been succinctly addressed by Slavoj Žižek:

The catch is that subjective and objective violence cannot be perceived from the same standpoint: subjective violence is experienced as such against the background of a non-violent zero level. It is seen as a perturbation of the 'normal', peaceful state of things. However, objective violence is precisely the violence inherent to this 'normal' state of things. Objective violence is invisible since it sustains the very zero-level standard against which we perceive something as subjectively violent. (2008: 2)

The parallax shift from the perspective of the seemingly peaceful zero-level of violence and its subjective interruptions to the perspective of objective (systemic) violence is an epistemo-political move. This move also intervenes in the shifting conceptual ground through which the term violence acquires its meaning.

## VIOLENCE AND CLASS STRUGGLE

In the history of revolutionary Marxism it was Georges Sorel, a self-acclaimed Marxist and revolutionary syndicalist, who in 1906 introduced a theoretical distinction in the term violence, revealing the latter's asymmetric dialectics.

The study of the political strike leads us to a better understanding of a distinction we must always have in mind when we reflect on contemporary social questions. Sometimes the terms *force* and *violence* are used in speaking of acts of authority, sometimes in speaking of acts of revolt. It is obvious that the two cases give rise to very different consequences. I think it would be better to adopt a terminology which would give rise to no ambiguity, and that the term *violence* should be employed only for acts of revolt; we should say, therefore, that the object of force is to impose a certain social order in which the minority governs, while violence tends to the destruction of that order. The middle class have used force since the beginning of modern times, while the proletariat now reacts against. (Sorel, 1921: 195)

Sorel exploits the conceptual vagueness of the term violence vis-à-vis power, authority and force. In the above cited section, he

opposes two seemingly parallel French terms: 'violence' against 'force' (256). In short, for Sorel violence is on the side of the revolt against the force of authority and state power. Violence is an immediate expression of the proletarian masses against the intellectualized, technically and administratively mediated force exercised by the state and capital owners of. The social order of force and the violent resistance of the exploited masses, however, are not symmetrical.

While the ruling order of state and capital and its political representation rely on the mechanical rationality of their forces, violence is linked to the proletariat's direct political action. Relying on the concept of the myth of the proletarian strike, Sorel posits the proletariat in the position of waging a violent and moral class war against the corrupted forces of bourgeois rationality. His anti-bourgeois concept of the syndicalist-anarchist class war invokes Marx, yet his 'apology of violence' also relies on non-Marxian, that is vitalist, notions such as 'struggle for life' (Sorel, 1915: 197), 'instincts' (182), and spontaneity of the masses (44, 165), fusing motifs from Proudhon, Bergson, Le Bon and Spencer. The myth, Sorel's central term and theoretical innovation, functions as an anti-rational link to hold these otherwise contradictory influences and arguments together. His wager thus is: 'the syndicalist "general strike" and Marx's catastrophic revolution are such myths' (22). And myths, as Sorel adds, 'cannot be refuted', they are 'identical with the convictions of a group' and to this extent 'unanalysable' (33). Put differently, the myth is a political category that cannot be validated 'objectively' in terms of its content; it cannot be ascribed to a subject of cognition. Rather than having an epistemological, sociological or scientific function, the syndicalist or proletarian general strike is grounded in the political struggle of a collective: it has no further ideological meaning, it does not provide any Socialist *Weltanschauung*, world-view.

Sorel's distinction between force and violence allows him to give full theoretical

and political weight to the basic asymmetry of systemic violence in capitalist societies. Instead of playing violence and counterviolence against each other, Sorel aims at abolishing the state and its forces through a violent action against which the state cannot defend itself. The myth of the revolutionary syndicalist or proletarian general strike serves this role. Instead of appealing to the state, accepting its force and authority and demanding reforms, the proletarian general strike calls for more. As the forces of the state and violence of the revolution are fundamentally different, so the political and proletarian general strike 'are diametrically opposed to one another' (Sorel, 1915: 174).

It is not the state who could abolish capitalism (as hoped for by the political general strike and its representatives, the parliamentary Socialists) but the proletarian general strike that will abolish the state and with it 'destroy the existing state of things' (Sorel, 1915: 33). Those who 'desire the overthrow of the State' (125) are the only ones who do not believe in the 'superstitious cult of the State' (114) and, therefore, can break with 'the *magical forces of the State*' (138, italics in original). The parallelism of Sorel's asymmetric distinctions, the *forces* of the state vs. the *violence* of the working classes, *reform* of parliamentary socialism vs. *revolution* of the Syndicalist movement, *political* vs. *proletarian* general strike, set the stage for his concept of class war, which is ultimately to be fought between the state (including all political forces that support the state) and the revolutionary Syndicalists who aim at destroying the state in the course of the proletarian general strike. Sorel's image of class struggle as class war relies on this profoundly anti-rational, anti-utopian, anti-middle-class and anti-reformist polarization. In this vein he states: 'With the general strike [...] the revolution appears as a revolt, pure and simple, and no place is reserved for sociologists, for fashionable people who are in favour of social reforms, and for the Intellectuals who have embraced the profession of thinking for

the proletariat' (151). This radical simplification thrives on the sharp antagonism of force and violence; however, it remains blind to the inherent dialectics of violence.

Without going further into detail of Sorel's argument, his differentiation between force and violence sheds light on the asymmetry and ambiguity of violence that modern political theory, in one way or another, attempted to contain. Violence, however, is not one-sided or exclusive – it cannot be attributed to one institution, social group, political agent or historical epoch. Sorel's *Refléxions sur la violence* remain blind to the inherent dialectics of subjective (proletarian) violence and objective (state) force: how can violent revolts transform themselves into state forces and, in return, how can the state itself rely on the exceptional or 'subjective' violence inherent to the functioning of its 'objective' forces? Despite its radical rhetoric, Sorel's moral criticism of the state falls short in producing a materialist insight into the inner relationship, transition and reversal of the two notions that he attempted to separate: violence and force. In other words, the dialectics of violence does not simply refer to a conceptual ambiguity but also to a dialectical reversal of the extremes: the violent act bears 'the seed of its opposite', and vice versa. Any attempt to map violence horizontally fails to grasp this dialectics. Relations of violence thus are both asymmetric and dialectical.

## STATE VIOLENCE AND POLITICAL POWER

Thirteen years after Sorel, the German sociologist Max Weber made an opposite claim affirming the basic view of Marxism that the state and its forces are based on violence:

In the last analysis the modern state can only be defined sociologically in terms of a specific means (*Mittel*) which is peculiar to the state, as it is to all

other political associations, namely physical violence (*Gewaltsamkeit*). 'Every state is founded on force (*Gewalt*)', as Trotsky once said at Brest-Litovsk. That is indeed correct. [...] Violence (*Gewaltsamkeit*) is, of course, not the normal or sole means used by the state. There is no question of that. But it is the means *specific* to the state. (Weber, 1994: 310, italics in original)

In this vein, Weber defines the state as 'that human community which (successfully) lays claim to the *monopoly of legitimate physical violence* within a certain territory' (Weber, 1994: 310f., italics in original). Weber inscribes physical violence [*Gewaltsamkeit*] and force [*Gewalt*] in the instrumental web of means and ends through which modern states produce their claims to legality, legitimacy and morality. If politics within the framework of the modern state is a struggle for '*Macht*' ['power'], the instrumental use of *Gewalt* and *Gewaltsamkeit* as a means is at the bottom of all political struggles. Moreover, any positive law, imposed by the state and its executive forces, partakes in the instrumental chain of violence and its regulation. Weber's definition of politics intertwines the German notions of *Macht* and *Gewalt*, undermining Sorel's plain distinction between force and violence. Once power (*Macht*), violence (*Gewaltsamkeit*) and force (*Gewalt*) are woven into the texture of instrumental rationality, moral calculations and administrative procedures, violence cannot be defined according to a compartmentalized logic that aims at ascribing it to one particular group, agent or epoch. In this respect, Weber's notion of politics provides an insight into the dialectics of violence, which is compatible with the critical Marxian distinction between subjective (individual, direct, physical) violence and objective (structural, systemic, indirect) violence. The functioning of the state relies on the mutual interdependency and translatability of its objective *Gewalt* and subjective *Gewaltsamkeit*. This is the meaning of Weber's intriguing comment, according to which physical violence as *Gewaltsamkeit* is not the 'normal or sole

means used by the state' but the one '*specific to the state*' (1994: 310). Weber's concise analysis of politics, however, fails to grasp the functioning of violence in the sphere of capitalist economy.

If in modern times the economy is political and vice versa, the peaceful semblance of the market and its contractual relations cannot fully obscure the structural violence at the bottom of every economic transaction: 'Between equal rights, *Gewalt* decides' (Marx). Despite his careful analysis of politics and violence, Weber cannot grasp the intertwinement and mutual determinacy of the seemingly peaceful sphere of economic-contractual exchange of commodities and the sphere of politics and its violent foundation. In his influential study *Economy and Society* (posthumously published in 1921 and 1922), Weber follows the schism of his indicative title. His 'interpretive sociology' aims at understanding 'the extent to which the action of the group is oriented to violent conflict [*gewaltsamen Kampf*] or to peaceful exchange [*friedlichen Tausch*] as its end' (Weber, 1978: 47). Marx's point, however, is to show how this alternative is not exclusive but dialectical: what Weber refers to as group orientations of the class of capitalists and workers, whatever their *subjective* rationale may be, embody and impersonate the *objective* yet non-totalizable totality of capitalism and its structural violence.

Against this Weberian-Marxian train of thought, Hannah Arendt proposes a different reading. In *On Violence* (1970) Arendt attempts to disentangle the dialectics of violence by introducing an exclusive set of definitions. Consequently, she puts forth distinctions between 'such key words as "power", "strength", "force", "authority", and, finally, "violence" – all of which refer to distinct, different phenomena' (1970: 43). Her central argument focuses on the strict opposition of power (*Macht*) as 'human ability not just to act but to act in concert' (44) and violence (*Gewalt*, *Gewaltsamkeit*)

as an instrumental use of individual strength (43–7). In short, Arendt's intervention in the political-theoretical debate on violence tries to undo the latter's inherent dialectics by moving as many meanings as possible to other concepts and semantic fields in order to leave a narrow definition of violence as the instrumental remainder of what Weber calls *Gewaltsamkeit* [physical violence] once all systemic and social components of violence are reduced. Such violence is always individual, bound to an individual bearer of violence whose appearance is grounded in one's personal strength. In Arendt's liberal optics, violence is thus the ultimately individual use of physical or symbolic strength as a means in order to pursue legitimate or illegitimate goals. Her depoliticization of violence relies on a dual strategy neither fully naturalizing violence as personal strength and impersonal force nor formalizing it instrumentally with regard to politics and power. Although Arendt concedes that power and violence 'usually appear together', she insists that 'they are distinct phenomena' (1970: 72). Whereas violence can be used instrumentally by the state, violence cannot create any sort of political power. Rather, '[r]ule by sheer violence comes into play where power is being lost' (1970: 53). If, following Arendt, power is the only genuine political attribute, political power appears as a generic human capacity, sealed off from any trace of structural, systemic violence. For Arendt, thus violence is always reduced to its subjective dimension; its objective dimension is either essentialized as power, naturalized as force, individualized as strength, culturalized as authority or depoliticized as merely instrumental violence. Arendt's argument falls short in grasping the Marxian-Weberian insight according to which the subject of the instrumental use of violence is not merely bound to an individual or particular government but also an objective structural agent (the state, the law, the economy). The irreducible dialectics of impersonating violence and impersonal violence is thereby obscured.

## GEWALT: WALTER BENJAMIN'S 'CRITIQUE OF VIOLENCE'

In terms of the dialectics of violence, a philological detour through the German use of *Gewalt* proves instructive in order to grasp the different layers of meaning violence has acquired in modern political and sociological theory. As Étienne Balibar shows, there are different political-economic traditions and languages that theorized the term violence: 'In German [...], the word *Gewalt* has a more extensive meaning than its "equivalents" in other European languages: violence or *violenza* and *pouvoir*, *potere*, *power* (equally suitable to "translate" *Macht* or even *Herrschaft*, depending on the context)' (Balibar, 2009: 101). These different meanings are not only relevant from a philological but also conceptual point of view: 'the term *Gewalt* thus contains an intrinsic ambiguity: it refers, at the same time, to the negation of law or justice and to their realisation or the assumption of responsibility for them by an institution (generally the state)' (101).

In the history of critical theory, it was Walter Benjamin who first theorized the dialectics and asymmetry of violence that is present in the German term *Gewalt*. Benjamin's essay 'Zur Kritik der Gewalt' ('On the Critique of Violence'), published in 1921, examines the intrinsic ambiguity that violence acquires in the modern state and its policy, institutions and jurisdiction, exposing a 'latent dialectic or a "unity of opposites" that is a constituent element of politics' (Balibar, 2009: 101).

The German word *Gewalt* originates from the Old High German verb '*waltan*', which roughly translates into 'to be strong', 'to dominate' or 'to master'. In modern High German *Gewalt* covers a variety of meanings, among them violence, force, power and authority. Benjamin's intricate essay is very aware of these contradictory meanings when reflecting on a political situation shortly after the failed German revolution of 1918/19 and in the light of communist and anarcho-syndicalist uprisings in various regions in

Germany. This historical context is echoed in his critique of the liberal parliamentarism of early Weimar Republic:

When the consciousness of the latent presence of violence [*Gewalt*] in a legal institution disappears, the institution falls into decay. In our time, parliaments provide an example of this. They offer the familiar, woeful spectacle because they have not remained conscious of the revolutionary forces [*Kräfte*] to which they owe their existence. (Benjamin, 1996: 244; 1977: 191)

Taking its cue from this historical conjuncture, the essay formulates a far-reaching critique of all uses of legitimized and legalized *Gewalt*. Due to its 'intrinsic ambiguity' (Balibar), the problem of *Gewalt* is inherent to all legal and moral questions, as the opening passage suggests: 'The task of a critique of violence can be summarized as that of expounding its relation to law and justice. For a cause, however effective, becomes violent, in the precise sense of the word, only when it intervenes into moral relations' (Benjamin, 1996: 236). An action can only assume the status of violence in the strict sense once it stands in a relation – in a moral relation. Benjamin gives no further substantial definition of *Gewalt*; it remains a relational concept, which can only be presented, defined and criticized from within these relations and their respective polarizations.

This immanent critique does not assume a position outside of violent relations. However, Benjamin's critique aims at and points to the concept of nonviolence – not as a normative standpoint but as an extreme case, a transcendental limit so to speak. Benjamin's post-Kantian understanding of 'Kritik' is crucial to understand his intervention as an immanent critique without normative standpoints, external positions or prescribed political agenda. Critique is not simply negative; rather, following Kant, critique is the positive activity of measuring out, exploring the limits of a concept without relying on a safe standpoint beyond or outside the limits of the object of critique. Without the post-Kantian notions of relation

and critique, Benjamin's critique of violence would remain caught in the uneven continuum of violence and counterviolence.

Invoking a paradoxical kind of 'non-violent' violence, Benjamin's 'Critique of Violence' aims at undoing the nexus of life, law and violence. Against the mainstream of political and legal theory, he explores 'the possibility of a violence (...*Gewalt*...) that lies absolutely "outside" (*außerhalb*) and "beyond" (*jenseits*) the law' (Agamben, 2005: 53). Grasping violence in its subjective and objective, physical and symbolic dimension, Benjamin does not fail to register the asymmetry of this dialectics. The violence inherent to the law – be it the law of monarchy, western democracy or autocratic regimes – contradicts itself and cannot be undone by resorting to counterviolence only. Echoing Weber's earlier definition in 'The Profession and Vocation of Politics', Benjamin understands *Gewalt* as integral to the legal rationality of the modern state. Within a legal system, the most essential relation is that between means and ends. If violence is not an ethical or legal goal, it is present only in the sphere of means – as an effective force, whatever its justification or legitimization might be. The basic dogma of any theory of violence is therefore: 'just ends can be attained by justified means, justified means used for just ends' (Benjamin, 1996: 237). Benjamin refers to two legal schools that diametrically legitimate violence: 'natural law' and 'positive law' (i.e. Kelsen, 1934). While the former 'perceives in the use of violent means to just ends no greater problem than a man sees in his "right" to move his body in the direction of a desired goal', the latter, the school of positive law, is more concerned with just means (Benjamin, 1996: 236). Exposing their complementary blind spots, Benjamin does not side with either school. However, he recognizes the effort of the school of positive law to focus on the justification of means as such, whereas the school of natural law conceives of violence as a quasi-organic 'product of nature, as it were a raw material' (236f.). Nevertheless,

both schools, natural and positive law, share a basic assumption: violence can be framed, controlled and compartmentalized by inscribing it into the instrumental nexus of ends and means. 'Natural law attempts, by the justness of the ends, to "justify" the means, positive law to "guarantee" the justness of the ends through the justification of the means' (237). In contrast, Benjamin refutes any concept of violence based upon a theory of just ends or of just means. In short, violence cannot be neutralized through its legitimization or legalization.

Benjamin's immanent critique of violence does not propose a different concept nor introduce a non-violent standpoint. The argument for non-violent means finds its ground in the limits of its object of critique itself: the notion of violence in natural and positive law. The theoretical and political scope of this dual critique is not to be underestimated. Whereas militant anti-hegemonic, anti-imperialist, anti-colonial struggles often legitimize the use of (counter)violence with reference to natural law, the state and its institutions rely on the perspective of positive law in order to justify state repression and institutionalized coercion. Although both standpoints are diametrically opposed in their emphasis on either just ends or justified means, they share the assumption that violence has always to be perceived within a causal chain of means and ends. Benjamin, however, insists on independent criteria for both just ends and justified means.

Following this line of argument, even the most basic theological principle from the Decalogue, 'Thou shalt not kill', cannot be perceived as a forbidden means with regard to certain just or unjust ends. On the contrary, the deed itself, the means of killing, has to be scrutinized as such without referring to a possible goal. Therefore, as Benjamin concludes, 'no judgment of the deed can be derived from the commandment'; it does not exist 'as a criterion of judgment, but as a guideline for the actions of persons or communities' (250). A guideline for actions, however, can never

be fully applied to a situation since it only offers a general orientation; it always needs a negotiation of whether and how a concrete situation can be guided by an ethical principle.

It is precisely this infinite and non-accomplishable work of negotiation and scrutiny that arises from the lack of absolute judgment that Kant's *Groundwork of the Metaphysics of Morals* wanted to contain. According to Kant's first formula of the 'Categorical Imperative', you are to '*act only according to that maxim through which you can at the same time will that it become a universal law*' (Kant, 2011: 71, italics in original). Since this imperative is not a means to certain ends but a self-sufficient end-in-itself or pure end, it has to maintain a timeless and universal applicability to all possible historical situations including those in which violence is exercised. Yet Benjamin strongly opposes the flat temporality of the 'Categorical Imperative'. Since no historical situation is identical to another, nothing can be said categorically in advance. For Kant, it is only the universal applicability that renders a law and morality consistent with itself. Kant's 'Categorical Imperative' is based upon a timeless universalizability abstracting from concrete historical situations. Benjamin, in contrast, distinguishes between the universal value of an ethical guideline and its particular application. Thus the universalizability of judgments, principles or imperatives is never a given. Pacifism, therefore, is not a viable position for Benjamin if it calls for nonviolence and avoidance of armed struggle *before* a specific historical situation is scrutinized on its own terms with regard to possible means of a certain party of conflict.

### THE SPURIOUS DIALECTICS OF 'MYTHIC VIOLENCE'

If, following Benjamin, ahistorical principles of ethico-political acting are to be ruled out and replaced by historically situated

guidelines, the violence, *Gewalt*, of the state and its law can only be criticized historically and immanently. Such a critique exposes the inherent ambiguity of *Gewalt*. As Werner Hamacher argues in his reading of 'Critique of Violence', every '*Setzung*', positing, of law or ethical principle already implies its reversal, for every positing requires its enforcement against any other acts of positing, setting or constituting (1994: 110f.). Hence, the logic of positing is always threatened by other acts of positing. Within the paradigm of the state, Benjamin distinguishes between two forms of violence that mutually presuppose and deconstruct each other: 'All violence as a means is either lawmaking or law-preserving' (Benjamin, 1996: 243). While the former concerns the constitutive act of establishing power through violence, terror or 'primitive accumulation' (Marx), the latter is embedded in state-institutions. Benjamin calls these two forms of violence 'mythic violence'. Their mythic, inescapable or 'fateful' character is rooted in their intrinsic dialectic, which leads into a totalizing circular logic: any law-destroying act results in a new positing of law which again violently tries to preserve itself. For Benjamin, this fateful cycle of overcoming law by re-establishing it is a clear indicator that there is something fundamentally 'rotten in the law' (242).

This rottenness appears as ambiguity, for every action of law enforcement blurs the line between law-preserving and lawmaking violence. In the sphere of direct state repression, i.e. police force, law-preserving *force* and lawmaking *violence* are always spectrally conflated.

[The violence of the police] is lawmaking, because its characteristic function is not the promulgation of laws but the assertion of legal claims for any decree, and law-preserving, because it is at the disposal of these ends. The assertion that the ends of police violence are always identical or even connected to those of general law is entirely untrue. Rather, the 'law' of the police really marks the point at which the state, whether from impotence or because of the immanent connections within

any legal system, can no longer guarantee through the legal system the empirical ends that it desires at any price to attain. Therefore, the police intervene 'for security reasons' in countless cases where no clear legal situation exists, when they are not merely, without the slightest relation to legal ends, accompanying the citizen as a brutal encumbrance through a life regulated by ordinances, or simply supervising him. Unlike law, which acknowledges in the 'decision' determined by place and time a metaphysical category that gives it a claim to critical evaluation, a consideration of the police institution encounters nothing essential at all. Its power is formless, like its nowhere-tangible, all-pervasive, ghostly presence in the life of civilized states. (Benjamin, 1996: 243)

'*Polizeigewalt*' [police force and violence] is the paradigmatic case of violence in modern states since it demonstrates the uneven or spurious dialectics of mythic violence: law enforcement partakes in law destruction and, vice versa, the violent destruction of the law posits a new law. In democratic states, characterized by rationalized administration and institutionalized governance, these mutually codependent acts of violence are not traceable to the sovereign decision of a king or absolute authority but delocalized and amplified into a spectral web of often anonymous *Gewalten* [authorities], which act on both extremes of mythic violence: lawmaking and law-preserving *Gewalt*. In modern democratic states the sequence of politics, policy and policing is indicative not only for etymological reasons. If the *Polizeigewalt* in democracies 'bears witness to the greatest conceivable degeneration of violence' (Benjamin, 1996: 243), there is no way back to seemingly authentic sovereign violence as unalloyed lawmaking violence.

The symptomatic impurity of mythic violence affects the limits of critique. In certain spaces of the social order mythic violence has become almost invisible, an intangible juridical web of biopolitical practices, whereas in other spaces excessive lawmaking violence is exercised in the guise of law preservation, be it external as military intervention or internal as militarization of the police force. With regard to colonial and imperial violence, this

spectral conflation, which Benjamin detected in the case of the police, is projected on a global scale. While mythic violence is distributed *internally* between different spaces and regions of the social order within particular states, it is exchanged *externally* between capitalist states. Under the conditions of the capitalist world market, these asymmetric exchanges follow a colonialist or imperialist logic. Former colonial states outsource lawmaking violence into the post-colonial 'periphery' while, at the same time, formerly colonial lawmaking violence is integrated into the means of law-preservation of so-called western-style democracies. These exchanges of outsourcing and integration lead to a spectral omnipresence of violence attached yet not limited to institutions of state law enforcement, privatized security forces or armed mobs. The most graphic cases of the inflationary redistribution and transformation of mythic violence can be found in territories where 'exceptional' martial law is permanently imposed on civilians, particularly in territories where the roles of the military and police symptomatically overlap. Where the boundaries of lawmaking and law-preserving violence are blurred, the distinction of subjective and objective, individual and structural violence seems to lose its significance. In the uneven continuum of violence and counterviolence, strike and counterstrike, terror and counterterror, the basic asymmetry of violent relations is occluded. These extreme cases of violence demonstrate a general tendency inherent to all forms of mythic violence. Also in legal zones that appear less violent, where police and military forces are legally separated and their actions are rarely performed in public, the spurious dialectics of mythic violence affects all social relations inscribed in the law.

From the perspective of struggles for decolonization, it was Frantz Fanon who analyzed the colonial situation as a situation of continuous omnipresent violence, fully grasping the totalizing dynamic of mythic violence, which Benjamin had initially

perceived in the particular case of the police. Arguing against the colonial bourgeois strategy of nonviolence, Fanon's seemingly paradoxical conclusion from the omnipresence of the all-pervasive colonial violence insists on the asymmetry of colonial and decolonial violence: 'Decolonization is the encounter between two congenitally antagonistic forces that in fact owe their singularity to the kind of reification secreted and nurtured by the colonial situation' (Fanon, 2004: 2). This political insistence on irreconcilable difference, however, relies on the qualitative commensurability of violence and counterviolence the underlying (colonial) logic of which Fanon fiercely criticizes.

The violence which governed the ordering of the colonial which tirelessly punctuated the destruction of the indigenous social fabric, and demolished unchecked the systems of reference of the country's economy, lifestyles, and modes of dress, this same violence will be vindicated and appropriated when, taking history into their own hands, the colonized swarm into the forbidden cities. (Fanon, 2004: 5f.)

Acknowledging the spectral amplification of colonial violence in all domains of social life, Fanon insists on marking the political difference between violence and counterviolence without proposing a qualitatively different kind of violence. He even admits that the 'violence of the colonial regime and the counterviolence of the colonized balance each other and respond to each other in an extraordinary reciprocal homogeneity' (46). At the same time, he clearly sees the difference in terms of the consequences of the violent struggle: 'Once the colonized have opted for counterviolence, police reprisals automatically call for reprisals by the nationalist forces. The outcome, however, is profoundly unequal, for machinegunning by planes or bombardments from naval vessels outweigh in horror and scope the response from the colonized' (47). Fanon's gloomy analysis of the reality of colonial violence articulates the stakes of decolonization: how to fight the mythic violence of the colonizer

without reproducing the mythical violent cycle of lawmaking and law-preserving violence? How to decolonize without simply changing the colonial master for the colonized middle class? How to reject the colonial perspective according to which counterviolence against state violence is categorically rendered as 'terrorism', particularly in spaces where the state acts as an occupying military force within or beyond its borders? How to fully acknowledge the spectral omnipresence of mythic violence as asymmetric and dialectical without resorting to the fantasy of nonviolence or equivalence of (colonial) violence and (decolonial) counterviolence?

Benjamin's dialectical concept of mythic violence proves instructive when read with and against Fanon. The spurious dialectics of mythic violence undermines any political attempt to attain a 'neutral' position vis-à-vis antagonistic forces. The antagonism between forces of repression and counterforces against repression is not symmetric and cannot be represented from a third position independent of the violent relations through which these forces are constituted. It is precisely the inherent ambiguity of *Gewalt* as law-preserving and lawmaking that renders any violent struggle as asymmetric. Asymmetry here is not to be misunderstood as conceptual lack or deficiency; rather, as Benjamin's analysis of legal violence as mythic violence demonstrates, violence is most effective when its asymmetric dialectics is occluded. Theory can only grasp this asymmetry when it gives up the fantasy of a 'neutral' totalizing viewpoint. The parallax shift of perspective, allowing for a critique of violence, is itself an intervention into the force-field of uneven *Gewalten* by taking a political position, that is, a partial, partisan perspective. However, in this context it is worth mentioning that even in the discourse on critical theory some commentators choose to side with the perspective of state violence and its 'self-defense'.

From a different historical perspective and in a different theoretical language, Michel

Foucault (1975) analyzed the modern link between knowledge (*savoir*) and power (*pouvoir*), allowing for a theory of mythic violence beyond the scope of Benjamin's and Fanon's theoretical horizon. Foucault's post-Nietzschean shift concerns the terminological preference for the French term *pouvoir* (power, *Macht*) instead of violence or force. The spectral omnipresence, the formless and intangible shape of mythic violence, which Benjamin detected in the case of the modern police force, is given full theoretical weight by Foucault's notion of the 'micro-physics of power': 'What the apparatuses and institutions operate is, in a sense, a micro-physics of power, whose field of validity is situated in a sense between these great functionings and the bodies themselves with their materiality and their forces' (Foucault, 1995: 26). Power is not simply repressive or symmetrically opposed to other powers but proliferating and productive: it is inscribed in life on a bodily micro-level, it produces the knowledge about life, it functions as a mobile, less tangible micro-physics, which makes it impossible to single out symmetrical acts and subjects of power bound to empirical individuals. 'In short this power is exercised rather than possessed; it is not the "privilege," acquired or preserved, of the dominant class, but the overall effect of its strategic positions' (Foucault, 1995: 26). With Foucault's theory of power one could argue that the implications of Benjamin's relational understanding of *Gewalt* is put to its next stage. Consequently, in a later lecture (1979), Foucault concludes that '[p]ower is not a substance. Neither is it a mysterious property whose origin must be delved in to. Power is only a certain type of relation between individuals' (Foucault, 2002: 324). These individuals, however, are themselves the effect of those techniques and strategies that Foucault analyzed under the heading of the 'micro-physics of power'. The political investment of body and life comes into view only if corporality and life are denaturalized, de-essentialized and grasped as the effects of the constitutive link of power and knowledge.

Before Foucault, Benjamin already theorized how the law of modern states is inscribed into life as naked, bare or 'mere life' (Benjamin, 1996: 250). This productive inscription, Foucault would have said investment, is one of the basic functions of mythic violence. In short, only the application of mythic violence to life produces the very peculiar mode of life that Benjamin calls 'mere life' or '*bloßes Leben*' (Benjamin, 1977: 201). Mere life is not only natural or biological life but the product, effect of legal violence: life as mere life is rendered as the natural bearer of '*Schuld*' [guilt] – '*bloßes Leben*' is a culpable life, which is, at the same time, the subject matter of the modern humanist 'doctrine of the sanctity of life, which [the humanists] either apply to all animal and even vegetable life, or limit to human life' (1996: 250). Benjamin, however, dares to ask what is sanctified in such doctrine – a doctrine which is also the moral foundation of the modern idea of inalienable human rights and humanism. For Benjamin, the abstract subject matter of human rights is mere life – a life deprived of its supra-biological properties (what he calls the '*Lebendige*' [the living], 1977: 200; 1996: 250). The humanist fetishizing of life as mere life leads to a life deprived of ethical categories: freedom, truth and justice. From this consideration Benjamin concludes that the 'idea of man's sacredness gives grounds for reflection that what is here pronounced sacred was, according to ancient mythic thought, the marked bearer of guilt: life itself' (1996: 251). The invention of life and its culpability share the same origin, which is also the mythic ground of modern state violence sanctioned and justified by the law, as argued, for example, by Agamben (2005: 87f.).

## BEYOND VIOLENCE

If the cycle of lawmaking and law-preserving violence cannot be opposed externally by resorting to instrumental violence, the

question remains whether there is a different kind of violence that could internally interrupt the spurious dialectics of mythic violence. Benjamin's term for the interruption of mythic violence is 'divine violence' (1996: 248–52) – a paradoxically pure or non-violent violence that coincides with its tautological opposite: a strikingly violent violence. As a 'pure means' (1996: 246), divine violence performs a pure interruption that sets human action free from all teleological calculations and instrumental prescriptions. A pure means de-posit (ent-setzt) positings (*Setzungen*) of violence without counterpositing another violent position (1977: 202). On a formal level, pure means do not serve external ends but stage an asymmetric negation to all forms of impure, that is, violent means. Pure means do not represent a certain cause, party, group, program or content but present their medium or mediacy as interruption of mediated (teleological or impure) relations of violence.

To clarify the relation of divine violence and pure means, Benjamin refers to the sphere of class struggle, drawing on Sorel and his anarcho-syndicalist distinction between the political and proletarian general strike. While the former fights for certain political-economic ends (political rights, higher wages, better working conditions etc.) the latter acts as a pure means that questions the '*Staatsgewalt*' (1977: 202), the state and its violence and authority. Owing to the German term *Gewalt*, Benjamin, who read Sorel in the French original, does not need to reproduce Sorel's terminological distinction between force and violence. The inherent ambiguity of *Gewalt* provides Benjamin with sufficient conceptual versatility to accommodate asymmetry and dialectical opposition in the interior of his object of critique: *Gewalt* is not a given self-identical term but, depending on perspective, an unstable split-term or a relational limit-concept. Therefore, Benjamin relocates Sorel's antithetical relation of the political and proletarian general strike to the level of their immanent relation

to violent social relations. Following the theoretical footprints left by Max Weber, these relations can be mapped as rationalized relations of means and ends. Concerning Sorel's absolute distinction between the political and proletarian general strike, Benjamin puts forth a clear, yet relational criterion: if the strike serves as a means to an end, its violence will be instrumental; but if a strike is a pure means without any concrete goal other than overthrowing the state, that is, destroying the ultimate horizon of all reformist means-and-ends calculations, it will reach beyond the vicious cycle of mythic violence (Benjamin, 1996: 239–47).

With this modification, Benjamin sides with Sorel that the 'idea of the [proletarian] general strike destroys all the theoretical consequences of every possible social policy' (Sorel, 1915: 147; Benjamin, 1996: 246). For Benjamin, this anti-utopian and anti-ideological concept of the proletarian general strike is not underpinned by a positive concept of Sorel's 'myth' but remains strictly negative. It abstains from all attempts to justify or legitimize the use of violence by employing violence in the causal chains of means and ends.

This ideological disengagement immunizes the proletarian general strike against the reformist threats of political blackmailing and compromising. In short, such a strike refrains from recognizing the institutions of the state as an equal partner in conflict resolution. Affirming the fundamental asymmetry of relations of violence, Benjamin follows Sorel's 'conception of the general strike' since it 'manifests in the clearest manner its indifference to the material profits of conquest by affirming that it proposes to suppress the State' (Sorel, 1915: 190; Benjamin, 1996: 246). The proletarian general strike is not a violent means to an end because there are no concessions to be made under which the workers will resume their work under improved or reformed conditions. The strike's 'striking' character stems from its unconditional character. It is a pure means and only

in this specific sense nonviolent. While the political general strike remains in the domain of mythic violence (for it aims at establishing a new law), the proletarian general strike is anarchistic insofar as it abandons the spurious dialectics of lawmaking and law-preserving violence. For Benjamin, it is only the distinction between violent teleology and non-violent pure means that can give full weight to Sorel's otherwise static opposition of the political and proletarian general strike.

As a pure means without taking into account its possible consequences, however destructive they may be, the proletarian general strike does not envision a stateless new society. Against socialist reformism and idealist utopianism, Benjamin joins Sorel's attempt to think politics beyond the paradigm of the state. Without this paradigm shift the striking workers would only witness 'how the State would lose nothing of its strength, how the transmission of power from one privileged class to another would take place, and how the mass of the producers would merely change masters' (Sorel, 1915: 202; Benjamin, 1996: 246).

As many readers of Benjamin's essay have noted (e.g. Derrida, 1991), his most controversial, if not obscure, concept remains 'divine violence'. Commenting on Benjamin's unconventional employment of theological categories and attributes such as 'guilt', 'fate', 'sacrifice', 'mythic' and 'divine', Herbert Marcuse conceded in 1964 that 'Benjamin has proposed formulations that we find difficult to accept any longer' (Marcuse, 2014: 126). However, structurally Marcuse supports the argument of 'Critique of Violence' and reads it in the context of Benjamin's elsewhere documented references to messianic thought: 'In Benjamin's critique of violence, it becomes clear that messianism is a trope that expresses the historical truth: liberated humanity is only conceivable now as the radical (and not merely the determinate) negation of the given circumstance' (124). It is the totalizing social-political reality of capitalism itself that is reflected in Benjamin's

theological references. Theology, here, has no positive meaning like in political theology but a 'corrective' function *ex negativo* (Benjamin, 1999: 471). A radical critique of state violence cannot count on any given roots of criticism; rather, it also needs to introduce categories that are uncountable and unaccounted for in a certain society at a certain time. With rise of the discourse on political theology after 1979 (Iranian Revolution) and the post-secular turns in political philosophy after 1989 and 2001, however, it is at least questionable whether Benjamin's terminology from 1921 has preserved its radical edge. Being aware of the text's historico-political indexicality, Marcuse concludes: 'Benjamin's messianism has nothing to do with customary religiosity: guilt and restitution are for him *sociological categories*. Society defines destiny, and is itself derelict: within it a person must become guilty' (124). As sociological categories, however, they are not reducible to any positively given realm of the social. On a formal level, they expose the ontological gaps within the fabric of modern relations of violence.

In the absence of a prescriptive definition, Benjamin abstains from identifying divine violence directly with political pure means like the proletarian general strike. Despite its theologically charged name, divine violence functions as a non-totalizable distinction in order to introduce an asymmetric negation into the infinite chain of mythic violence as a sequence of violent positioning and counter-positioning (Khatib, 2013: 392–6). Divine violence does not perform a double negation in the conventional Hegelian sense; its results do not become positive positings (*Setzungen*) of violence. As a de-positing (*ent-setzende*) violence it denotes neither a determinate quality nor a predictable event. For 'only mythic violence, not divine, will be recognizable as such with certainty, unless it be in incomparable effects, because the expiatory force of violence is not visible to humans' (Benjamin, 1996: 252). Thanks to its indeterminate, subtractive or privative efficacy, divine violence is not symmetrical to mythic violence but its

undeterminable zero-level. Therefore, divine violence is not a stable entity, a predetermined act, but an interruption of the spurious cycle of mythic violence – a rupture that can only be retroactively identified as such: '[i]t may manifest itself in a true war exactly as in the divine judgment of the multitude on a criminal' (252). This comment indicates that divine violence is not external, an intrusion from some divine power, but a violence that can be embodied, performed or presented by a profane agent or entity.

With the term divine violence as a 'critical' limit-concept, Benjamin is testing out the scope of the concept of violence and its inherent dialectics, entering a zone of indistinction where a subjective stance for or against violence loses its significance. For only the violence of the depositing of violence is 'pure' and insofar nonviolent:

on the depositing of law [*Entsetzung des Rechts*] with all the forces on which it depends as they depend on it, finally therefore on the abolition of state power [*Staatsgewalt*], a new historical epoch is founded. If the rule of myth is broken occasionally in the present age, the coming age is not so unimaginably remote that an attack on law is altogether futile. But if the existence of violence outside the law, as pure immediate violence, is assured, this furnishes proof that revolutionary violence, the highest manifestation of pure violence by man, is possible, and shows by what means. (Benjamin, 1996: 252; 1977: 202, trans. changed)

It is crucial not to identify divine violence directly with 'the highest manifestation of pure violence by man', that is, revolutionary violence as a pure means (e.g. in the proletarian general strike). Rather, 'between' divine violence and revolutionary violence as a non-violent pure means, there exists a relation of asymmetric correspondence. In this sense, divine violence, a paradoxical violent/non-violent *Gewalt*, is the theological name for an inaccessible site within society and profane life that escapes the logic of mythic violence. Benjamin operates here with two incommensurable perspectives on profane life: divine violence relates to profane life as 'the living'

(life including its supra-natural attributes) to 'mere life'. Only the latter is the subject matter and product of mythic violence – a life deprived of its ethico-political excess over biological life. It is in this sense that revolutionary violence as the profane embodiment of a site inaccessible to mythic violence and mere life may correspond to divine violence. Paradoxically, on the one hand, divine violence belongs to the order of the Event: it is not an integral part of everyday life but introduces a caesura into the mythic nexus of state violence, law and life; on the other hand, it can be performed, embodied or presented by humans in the form of revolutionary pure violence without being predictable or predicable beforehand.

### EXCEPTIONAL VIOLENCE: REVOLUTIONARY VERSUS FASCIST

Lacking definite predications in advance, divine violence in its problematic correspondence to revolutionary pure violence can be mistaken for its mythic doppelgänger, that is, the violence of the sovereign, which aims at grounding the law of state violence in the suspension of it. However, the state of emergency, '*Ausnahmezustand*' (literally: 'state of exception'), has to be strictly distinguished from divine (violent/non-violent) violence and the revolutionary depositing of law. In this context, it has to be noted that the sovereign 'suspension' of the law has also to be terminologically differentiated from the revolutionary 'depositing of law' (*Entsetzung*). Unfortunately, the common English translation of Benjamin's essay renders *Entsetzung* into English as 'suspension' (Benjamin, 1996: 251), which blurs this crucial line of difference. Benjamin comments on this difference in the famous eighth thesis 'On the Concept of History' (1940):

The tradition of the oppressed teaches us that the 'state of exception' [*Ausnahmezustand*] in which we live is not the exception but the rule. We must

attain to a conception of history that accords with this insight. Then we will clearly see that it is our task to bring about a real state of exception, and this will improve our position in the struggle against fascism. One reason fascism has a chance is that, in the name of progress, its opponents treat it as a historical norm. (2003: 392; 1974: 697, trans. changed)

Putting '*Ausnahmezustand*' in quotation marks, Benjamin makes an unmistakable reference to the fascist state of exception, which was theoretically anticipated, rationalized and, ultimately, legitimized by Schmitt (2005 [1922]). In the same vein as the real exception of the rule relates to the fascist exception as the rule, so divine (violent/non-violent) violence as the deposing of law relates to the sovereign suspension of mythic violence. The entire argument of Benjamin's 'Critique of Violence' hinges on this minimal but crucial distinction, on which also his later historical-materialist concept of history draws.

Discussing the seeming proximity of divine violence (Benjamin) and sovereign violence (Schmitt), Giorgio Agamben remarks in the first essay (1995) of his *Homo Sacer* series:

The violence that Benjamin defines as divine is [...] situated in a zone in which it is no longer possible to distinguish between exception and rule. It stands in the same relation to sovereign violence as the state of actual exception, in the eighth thesis, does to the state of virtual exception. (Agamben, 1998: 42)

Against the backdrop of this reading, one could argue that, precisely due to its indeterminate content and attributes, divine violence as the 'real state of exception' cannot symmetrically be opposed to the fascist 'state of exception'. Even in the absence of assignable determinations there is no symmetry *ex negativo* of divine (violent/non-violent) violence and sovereign violence *vis-à-vis* the spurious dialectics of mythic violence. In his later essay on the *State of Exception* (2003), Agamben elaborates further on this point, claiming that the lacuna, which separates the law from its application and enforcement, always remains blind from the perspective of

the apologetics of state violence and law. In other words, the Schmittian decisionist theory of the 'state of exception' misses the nature of the lacuna it is pretending to theorize by introducing a fictitious problem: '[f]ar from being a response to a normative lacuna, the state of exception appears as the opening of a fictitious lacuna in the order for the purpose of safeguarding the existence of the norm and its applicability to the normal situation' (Agamben, 2005: 31). Put differently, the theory of the state of exception can be read as an attempt to include that which is outside the law, yet always remains blind from the latter's perspective, into the law by inventing a fictitious zone of indistinction within a field that Benjamin defines as mythic violence. Unlike sovereign violence, divine violence is not introducing a zone of indistinction between law and nature, outside and inside, violence and law, but short-circuits the spurious dialectics that always inscribes life anew into mythic violence as mere life.

With notions such as divine violence, revolutionary pure violence as the depositing of law, state of exception and sovereign violence, the limits of theoretical presentation are reached. The paradoxical structure of Benjamin's 'Critique of Violence' and the asymmetry of acts of positing and depositing prompted Hamacher to introduce a neologism, drawing on the terminology of speech-act theory and deconstruction:

If one [...] characterizes law imposition in the terminology of speech-act theory as a performative act – and specifically as an absolute, preconventional performative act, one which posits conventions and legal conditions in the first place – and if one further calls the dialectic of positing and decay a dialectic of performance, it seems reasonable to term the 'deposing' of acts of positing and their dialectic, at least provisionally, as an absolute *imperformative* or *afformative* political event, as *depositive*, as political *a-thesis*. Pure violence does not posit, it deposes; it is not performative, but afformative. (Hamacher, 1994: 115)

Hamacher's wager is that the peculiar structure of the 'afformative' – an ad-forming *and*

a-forming event, a formless form (Hamacher, 1994, 128–9) – can interrupt the self-propelling per-formance of law and its application to mere life. In this sense, the proletarian general strike can be read as the affirmative – the striking (‘forming’) undoing (‘de-forming’) of all political action (‘formation’) based on the state and its mythic violence. This undoing remains on a formal level; it accounts for the unaccountable pure mediacy of politics in its relation to *Gewalt*; it does not add any radical content or program but exploits the asymmetric dialectics of the *Staatsgewalt*, state power, from within its formal structure without taking the perspective of the state (as advocated by the apologists of the ‘sovereign violence’).

## CONCLUSION

The analytic task of discriminating between violence and power, force and authority provides the ground for a historical-materialist critique of violence. The history of pursuing this task conveys a political perspective, a parallaxic shift, without which the critique of violence relapses into a dehistoricized anthropological universalism (‘homo homini lupus est’) or succumbs to the individualistic casuistic of normative ethics. Unlike conventional practical philosophy or more recent applied ethics, the critical theory of violence exposes the dialectical instability of its object of inquiry by demonstrating the abstract socio-political categories that are already implicated in the false concreteness of liberal-individualist ethics of violence. Violence is not a given object but a problematic ‘critical’ relation: a relation prior to that which is related through it. If the atomizing perspective on an individual’s concrete acts can, at best, account for the ‘subjective’ dimension of violence, that is physical, manifest or intentional acts of violence bound to an empirical subject, the critical-theoretical view puts this dimension into perspective by

asking what is the nature of its very object of inquiry. Critical theory since Marx has analyzed the socio-political implications of violence in its latent, covert, systemic or ‘objective’ dimension, providing the materialist ground for any concrete analysis of relations of violence. The disavowal of the latter’s objective and, in this sense, productive dimension results in the flat positivism of individual ethics and its biopolitically applied derivatives in the discourses on ‘humanitarianism’ and ‘global security’. If social relations in modern capitalist societies are constitutively violent, even the perspective of anti-hegemonic counterviolence is threatened by reinscribing its critical violence into the asymmetric dialectics of state violence.

The shifting ground of constitutive (‘objective’) and constituted (‘subjective’) violence leaves no safe space for non-violent standpoints. Rather, non-violent politics as the political operation of deactivating the spurious dialectics of violence and counterviolence has to exploit the very porosity and corruptness of its object of critique without resorting to individualistic moralism and the false concreteness of normative orders. The political exploitation, refunctioning and radicalization of the gaps within the ontology of systemic violence has a history, yet no trans-historical subject. If history is the history of class struggles (Marx/Engels), the ‘critique of violence is the philosophy of its history’ (Benjamin, 1996: 251). Violence has a history and it is the uneven temporality of its ‘objective’ history that is incompatible with the linear temporality of constituted violence.

# Society and History

José A. Zamora

The connection between society and history<sup>1</sup>, or more strictly, between the theory of society and the theory of history, is an essential one when it comes to analysing and presenting the fundamental, defining features of modern social formations. In these formations dynamism, change and acceleration go hand-in-hand with the fact that the forms adopted by social structures and relations lose their naturalness. 'Society' itself turns into an object of reflection and enables social theory(ies) to emerge. At the same time, the acceleration of the changes and transformations involved is at the root of what could be called historical consciousness of temporal becoming and social evolution. Within this framework, the idea of a universal history is associated with the creation of an all-encompassing and expansive global market: the capitalist market.

Speaking of society seems to situate us on a plane of objectivity with which individuals are confronted, which is not diluted into a mere collection of individual actions. We find ourselves in the face of structural

crystallizations and objectifications that condition or determine the actions of subjects. Speaking of history, however, situates us on the plane of action that results from subjective intentionality and presupposes a certain degree of freedom, discretion and choice. Speaking of society and history means connecting action and structure, subjectivity and objectivity, singularity and universality. On this specific question, the critical theory of society has made a significant contribution that cannot be ignored. This contribution was in opposition to the idealist construction of a relation of correspondence between the theory of society and the theory of history, whose main proponent was undoubtedly Hegel.

The object of the critique was Hegelian idealism and what it reveals and hides about the reality it interprets. The foundation for this critique was Marx's theoretical contribution. The testing and updating of this contribution in a new historical context posed some extraordinary challenges, as we shall see.

This was the fundamental task of the group of intellectuals whose work fell under the heading of Critical Theory, with their differences and peculiarities.

### **'CAPITAL' AND HISTORY: KARL MARX**

Marx's theory of history is accused of being the last remnant of Hegelian metaphysics, from which he could not detach himself, however much he attempted to put the idealist dialectic 'on its feet' (or perhaps precisely because of this). The accusation of being caught in the traps of the philosophy of history is well known and widespread. The speculative viewpoint is reflected in a series of easily identifiable arguments: conceiving history as a totality that can be observed from a tipping point that opens up the perspective of an all-inclusive or absolute knowledge; conceiving history as a teleological process with an immanent orientation towards a pre-determined goal; integrating negativity into an unstoppable progress for the better and reducing it to the moment that it leads to a (happy) end; identifying a (privileged) subject of the historical process called to realize the (universal) idea (Reichelt, 1995; Heinrich, 1999). Since the dawn of the philosophy of history in the Enlightenment these are the main arguments, with variations, which have characterized hegemonic historical thinking in the modern period. According to these critics, Marx would be one further representative of that hegemonic thinking. One of the source texts for this conception of history, used as a basis for the formulation of Historical Materialism, is the preface to *A Contribution to the Critique of Political Economy* (Marx, 1859: 8–9). Undoubtedly there are a number of similar passages throughout Marx's work that support a positivist interpretation of the logic of capital. This logic is merely a 'reflection' of the objective process of reality. Critics of Historical Materialism have decried that the

critique of political economy has been turned around into affirmative economy in vulgar Marxism (Backhaus, 2011).

Despite the numerous passages throughout Marx's work that point in this direction, there may still be some reasons for controversy over his theory of history. This is due to the fact that Marx's contribution is not exhausted by this representation of historical evolution that is clearly contaminated by the philosophy of history. In fact, the 'de facto' bourgeois economic system can only be analysed and understood through a critique of the economic categories of the bourgeois theories of capitalism. Far from ontologizing dialectics, Marx unravelled the contradictions of social reality by unveiling the contradictions between the premises of bourgeois economics and the reality that they intended to reflect in their theories. Marx also made significant criticisms of speculative thinking about history and the claim to provide a philosophy of universal history. What seems central to Marx's contribution is his conception of the formation of capitalist society as an historical – that is, an unnatural – mode of production. The critique of political economy analysed this social formation as a conscious-unconscious – and therefore pseudo-natural [*naturwüchsig*] – organization of social production. At the same time, this critique provided the key to understanding (contingent) historical processes that made it possible to create this specific mode of production (for example, so-called primitive accumulation) and those (necessary) processes under the law of accumulation that generated the conditions for overcoming it (tendency of the rate of profit to fall, periodic crises, pauperization, etc.). Ultimately this analysis highlights the historical character of the capitalist mode of production: 'Economists do not conceive of capital as a relationship. They cannot do so, without having at the same time to conceive it as a historically transient, relative and not absolute way of production' (Marx, 1862–3: 269).

However, Marx made an observation regarding the fundamental historical condition of possibility for the constitution of the

capitalist mode of production that will prove highly relevant to what will be discussed later about critical theory authors. This concerned the existence of 'free workers' who sell their labour power on the market: 'This singular historical condition encloses a universal history' (Marx, 1890: I, 184). In what way is 'universal history' present in that singular condition, behind which the violence of primitive accumulation hides? How should this universal history be interpreted in the critical disentanglement of the present? This is in fact a present, lest we forget, generated and reproduced with violence. Marx's study of the historiography of his time, the inclusion of historiographic passages in his systematic works, and even some writings that might be called historical, show links to the (critical) historiography of his time, and the meaning that Marx attributed to the concept of 'universal history' (Krätke, 2014/15). But here is also where its limit is found. And not because of a lack of awareness of the violence accumulated in that history. Bourgeois historiography, and even critical or scientific historiography – which rejects the philosophy of history as an unacceptable metaphysics, and seeks to work on data which are schematically represented and used to construct general categories – derives from a model that could be called progressive-sacrificial, to which Marx himself was not immune (Zamora, 2010: 115–19):

Thus capital creates the bourgeois society, and the universal appropriation of nature as the social bond itself by the members of the society. Hence the great civilizing influence of capital; [...] For the first time, nature becomes purely an object for humankind, purely a matter of utility; ceases to be recognised as a power for itself; and the theoretical discovery of its autonomous laws appears merely as a ruse so as to subjugate it under human needs, whether as an object of consumption or as a means of production. (Marx, 1857–8: 323).

His explanation about the British domination of India is another example of this progressive-sacrificial model:

England, it is true, in causing a social revolution in Hindostan, was actuated only by the vilest interests, and was stupid in her manner of enforcing them. But that is not the question. The question is, can mankind fulfil its destiny without a fundamental revolution in the social state of Asia? If not, whatever may have been the crimes of England, she was the unconscious tool of history in bringing about that revolution. (Marx, 1853: 133)

For Marx, civilizing progress and the domination of nature are not only conditions of possibility for establishing the 'automatic subject' of abstract value; also, the abstract socialization of a commodity-producing society constitutes progress with respect to all previous forms of sociality that were still trapped in the natural or mythical order. Commodity fetishism represents an advance over the magical or religious forms of the fetishization of social relations and relations with nature. Commodity fetishism harbours within it the possibility of final emancipation. But in this way of interpreting history, the destructive automatism of value threatens to be presented as an emancipating automatism.

## THEORY OF SOCIETY AND HISTORY AFTER THE THWARTED REVOLUTION

The challenges faced by those critical thinkers who sought to interpret the present in the first third of the twentieth century from the perspective of the critique of political economy are well known. The historiography of critical theory or, as others prefer to call it, the Frankfurt School, reconstructed and contextualized these theoretical and practical challenges in great detail (Jay, 1973; Dubiel, 1978; Wiggershaus, 1988; Asbach, 1997; Demirović, 1999). Perhaps the term that best defines the challenges of critical theory is that of 'crisis', but it would be better to speak of a constellation of several crises: first, the economic crisis of the late 1920s; second, the crisis of the labour movement and the failure of the world revolution in 1917–1918; and third, the crisis of Marxism, which was

unable to provide an adequate response to the two other crises, and became a science of legitimation for the Soviet system. This three-fold crisis would be aggravated further with the coming to power of Hitler and the National Socialist regime.

With regard to the crisis of Marxism and the need for critical self-reflection, the publication of Korsch's *Marxism and Philosophy* (1923) and Lukács's *History and Class Consciousness* (1923) can be considered a turning point. Both works would serve as an essential point of reference for critical Marxism and assist Horkheimer in the construction of the methodological and programmatic basis for critical theory. However, the usual way of presenting the dependence of critical theory on Lukács normally disregards very significant differences (Brunkhorst, 1983, 1985; Habermas, 1988: 455–534). One of the fundamental elements of the theory of society and history that served as a reference for 'western Marxism' (Anderson, 1976) and was critiqued by Horkheimer and Adorno in the 1930s was the concept of 'totality'. Regardless of how this totality is conceived, the concept itself is considered to be idealistic (Horkheimer, 1936: 693). This category is burdened with the aporias of the Hegelian subject–object identity, and with an almost inevitable recovery of his metaphysics of history (Horkheimer, 1932a: 303). The Schopenhauerian pessimism of the young Horkheimer immunized him against the theodicy of history in all of its forms, even if it was concealed under the guise of materialism (Horkheimer, 1934: 326; Schmidt, 1974: 9–26). Lukács came under the same verdict as the bourgeois philosophy of history. The theory–praxis and the subject–object unit postulated under the concept of totality was a clear sign of idealism (Horkheimer, 1931b: 223).

But the critique of metaphysical materialism, of subject–object identity and of the Hegelian-Marxist philosophy of history was one of the two strands in the process of the development of critical theory. The other was the critique of specialization in the bourgeois

scientific apparatus and its reduction to finding and recording facts. In connection with this, critical theory exposed the failure of scientific research 'when faced with the problem of the social process as a whole' (Horkheimer, 1932b: 42). This dual strand defined the fields of influence in developing the programme of social research known by the term *interdisciplinary materialism*, which was first formulated at Horkheimer's inaugural lecture as director of the Institute in Frankfurt (1931a). The course of history and the crises mentioned above imposed the need to resort to psychoanalysis as an 'auxiliary science' of social theory and history (Horkheimer, 1932c: 57). Without its contribution it is impossible to answer the question of why individuals in a revolutionary context, instead of engaging in a liberating action, open their executioners' way to power. This is a key question for the theory of society and history from the Marxist perspective, and it cannot be answered without bringing together the critique of political economy with the theory of culture and psychoanalysis. This shift in the concept of society and history is one of the distinctive features of critical theory. The concept of ideology as the Marxian 'necessary false consciousness' was clearly insufficient and required the incorporation of the psycho-libidinal economy of individuals into analysis and critique.

The significance of Marxist materialism in the social research programme is not to be sought in the presupposition of a theoretical knowledge of the whole socio-historical process. Rather, it lies in knowing the dynamic and supra-individual 'structures and trends' and not offering a 'finished vision of the whole' (Horkheimer, 1932c: 53, 58). Nevertheless, since current misery is linked to the social structure, it is not possible to renounce theoretical knowledge and be satisfied with a mere description of the facts. Neither is critical theory a purely theoretical matter. Both the empirical material and the subject of knowledge are mediated by social praxis. The criteria that guide the knowledge

of critical theory are defined by the historical situation and the emancipatory praxis rooted in it, as no pre-established harmony exists between praxis and theory. It is concerned with showing the existing contradictions and the possibility of their practical overcoming. This is why it is not possible to dispense with the subjects of emancipatory praxis, as they introduce into the cognitive process their interest in a fully rational situation. This process is triggered by social negativity: by excluding a growing number of human beings 'from the happiness made possible by the widespread abundance of economic forces' (Horkheimer, 1933: 105).

The progressive historical problematization of these coordinates of critical theory in the 1930s led Horkheimer to ground them in his programmatic paper 'Traditional and Critical Theory' (1937) through a philosophy of the historical process, and in connection with supposedly objective emancipatory interests. Delving into these methodological questions of the original research programme thus loses its meaning. It is not difficult to recognize in this paper some of the arguments of the Historical Materialism approach: the global historical process, driven by its contradictions, enables a rational construction of society – if not through historical necessity, through a dynamic inherent to human labour. This process produces not only critical theory and emancipatory praxis, but also the subjects that lead society to a truly human state (Horkheimer, 1937: 203). Not that Horkheimer took a turn towards speculation. On the one hand, he continued to stress the non-identity between critical theory and the consciousness of the proletariat, and spoke of the 'mutual influence' and 'tension' between the two. On the other hand, he maintained the need for a link between theory and emancipatory praxis, in order for the contradictory totality to be understood as such, and for both its negativity and the possibility of radical transformation to be argumentatively presented.

The tragedy of this attempt at substantiation and resistance in view of the factual

course of events resonates with the text that Horkheimer published as an annex to the 'Traditional and Critical Theory' after an internal discussion at the Institute. In the absence of better arguments, he ended up settling for an anthropological concept:

As long as thought has not won a definitive victory, it cannot feel secure in the shadow of any power. It demands independence. But if its concepts, which sprang from social movements, today seem empty because no one stands behind them but its pursuing persecutors, yet the truth of them will out. For the thrust towards a rational society, which admittedly seems to exist only in the realms of fantasy, is really innate in every man. (Horkheimer, 1937: 224)

Although Adorno's contribution to the development of critical theory in the 1930s was not as important as that of Horkheimer, his reflections are still of interest, especially considering the developments that took place from the 1940s. Above and beyond the role allocated to Adorno in the field of culture within the 'interdisciplinary materialism' programme, his contributions to the central theme discussed here also deserve to be taken into account. His inaugural lecture on 'The Actuality of Philosophy' (1931) contained programmatic proposals somewhat different to those made by Horkheimer, who did not seem to particularly like them (Wiggershaus, 1988: 112). When looking at the differences, perhaps the most relevant is the one that affects the relationship between social materialistic philosophy and the results of the empirical research provided by the individual sciences. Adorno did not assign social philosophy the task of thinking about the 'global social process', into which the results of the particular sciences would be integrated. Thought is conceptually unable to cover the whole of reality, especially because that reality contradicts any demands of rationality. While the question about totality expresses the intention of the subject of knowledge to find meaning behind the phenomenal appearance of reality, the materialistic interpretation focuses on the fragments, the unintentional

elements, whose complete construction in constellations brings to light a reality that no longer needs any hidden meaning. That reality even makes such hidden meaning disappear in order for praxis to give meaning to events. His understanding of materialism is expressed in this renunciation of the search for meaning, present in major theoretical constructions.

Philosophy understood as interpretation cannot take social reality as it appears in its plural manifestations. This is what positivism does. It considers phenomena as 'facts' that have a kind of finality or indissolubility. If facts are indisputable, then all that remains is a classifying procedure in which the contradictions and tensions of capitalist society are particularized and masked. The key for unravelling social phenomena through interpretive construction is the category 'commodity'. The commodity form is the law to which everything tends to be subject in capitalist society. Adorno had no doubt that in bourgeois capitalist society the 'commodity' form produces an antagonistic totality and determines all of reality. He did not believe that reason is conceptually capable of encompassing this totality. To some extent this would involve taking a perspective that is external to it, a surplus or excess of spirit beyond reality (absolute knowledge, proletariat as subject-object, etc.). Rather, the interpretation should aim to appropriate that universal determination in the constellation of the elements of reality, through its construction. By means of these assembled elements, the antagonism of the social totality can be unveiled through the fragments analysed, without its interpretation needing to be presented as an autonomous magnitude capable of theoretically encompassing that totality. Thus, deciphering is at the service of a praxis whose task is to respond to the enigma posed by reality. A task that theory cannot fulfil.

The other programmatic aspect in which Adorno departed from the conventional view of the Marxist tradition is outlined in his lecture 'The Idea of Natural History' (1932).

This precisely specifies his understanding of the relationship between interpretative work and the philosophy of history. Despite the distance between Adorno's and Horkheimer's arguments, the former intended his lecture to be understood as a contribution to the 'immanent interpretation and deployment' of the materialist dialectics of Historical Materialism (365). The task of the philosophy of history is to disclose the dialectic interweaving of nature and history *through the fragments* mentioned in 'The Actuality of Philosophy'. This was now the way to realize the interpretation sought using that programme (360). For Adorno, the task of the philosophy of history is not to attain a unit that totalizes the discontinuous and disparate with the aid of a universal construction, nor is it to make the ruptures and breaks disappear into a global structure of any kind; rather, he focused on the ruins and fragments of the real and social world and inquired into the dialectic between nature and history contained within them.

It is well known that Adorno relied on Lukács's *Theory of the Novel* and Benjamin's *The Origin of German Tragic Drama*, perhaps because he avoided the construction of philosophy typically found in universal history. The explanation of the dialectic of nature and history needs to demonstrate why history takes place as if it had a natural character, and how that second nature in which history has become frozen is in fact an appearance that can be removed by explaining its historical constitution. Historical reality is affected by the appearance of 'second nature' because, to a certain extent, it is imposed almost as a destiny and eludes our decision-making power. In this sense, it can be stated that *historical* phenomena manifest a *mythical* character. At the beginning of his lecture Adorno explained the meaning of the concept of 'nature' on which he relied. This can best be explained through 'the mythic conception', as he referred to 'what has always been, what as fatefully arranged predetermined being underlies history and appears in history; it is

substance in history' (345–6). From this perspective, the adjectives 'natural' and 'mythic' become synonymous with rigidity, inevitability, coercion and repetitiveness.

But in the dialectic of nature and history, Adorno wanted to show something else. The interpretation of allegory made by Benjamin offered him new categories with which to unravel the meaning of that dialectic. What is expressed in allegory, according to Benjamin, is the face of history as an enigmatic question. The fragments and ruins produced by history are like a scripture to be deciphered, a scripture which speaks of 'everything about history that, from the very beginning, has been untimely, sorrowful, unsuccessful' (Benjamin, 1925: 434). In the ruins and fragments of reality it is possible to recognize what has collapsed and decomposed; that which failed to complete the advance and vanished on the way; and that which was the victim of the historical process in its 'progress'.

This aspect of Benjamin's concept of allegory seems to have been of decisive significance for Adorno. From the allegorical interpretation of the world that has collapsed and decayed into ruins, something emerges that should be thought of as being complementary to the concept of 'second nature': 'Whenever something historical appears, it refers back to the natural element that passes away in it' (Adorno, 1932: 359). History cannot be interpreted as a triumphal march of the spirit that has subjugated nature. Precisely through that subjugation, history is primarily the history of suffering, the history of collapse and decay. Allegory therefore opens the way for the catastrophic dimension of history and individual life as they both go by. The crumbling stations that become visible in the ruins that progress leaves behind confirm the triumphal march of domination. But at the same time they belie it by exposing the discontinuity that cannot be subsumed under any structural totality: everything that is inherent to the civilizing process in terms of failure, regression and barbarism. In the sufferings of history, the mythical spell reigns. The ability to stop the

continuing catastrophe is far from being guaranteed, and it is inadmissible to raise it to the status of an ontological structure of history. This is why Adorno rejects both the ontologization of the catastrophic dimension of history and the postulation of a cunning of reason that leads everything to the ultimate good.

### **WALTER BENJAMIN: PROGRESSION AND CATASTROPHE, OR HOW TO SAVE HISTORICAL MATERIALISM FROM ITSELF**

The importance of Walter Benjamin's work for Adorno's idea of 'natural history' increased over time as critical theory developed. Following Horkheimer's initial incomprehension of his approach to history in the paper for the *Zeitschrift für Sozialforschung* on Eduard Fuchs (Benjamin, 1937), its importance gradually increased, as was clearly shown in the *Dialectic of Enlightenment*. It therefore seems relevant to briefly discuss some elements of his unique contribution here.

First, a radical critique of social democratic revisionism can be found in the theses entitled 'On the Concept of History' (1940). They also contained a critique of traditional Marxism that focused on some essential points, namely, the teleological nature of history, its evolutionary-progressive vision, and the determinism of the revolution: 'The experience of our generation: that capitalism will not die a natural death' (Benjamin, 1927–1940: 819). Benjamin's thesis was that faith in progress had become the most powerful ideology to leave the proletariat disarmed in the face of their tormentors. History is not a chain of events connected by a causal link. What is considered to be History (with a capital 'H') is in fact a historiographical construction that satisfies the needs of those who write it: it is the history of the victors. This view is not only recognizable in bourgeois historiography – against which Benjamin

formulated his critique of historicism – but has also taken over the conception of history within Historical Materialism. The idea of progress found not only in the bourgeois philosophy of history, but also in the social democratic and common Marxist conception of History, brings together the traits of infinity, continuity and irreversibility. And these are the traits that Benjamin revealed as being false. Under the idea of progress, the past appears as definitely closed, as a prelude to the present converted into a canon of a history represented as a sequence of events that form a continuum. Benjamin rejected this idea, among other things, because it was a history of victors, a stylized history in favour of those who dominate the present. And fundamentally, the key issue is the present; but not as a transition or as a small dot in an infinite series, but as a moment when time stops.

History as a continuum cannot be affirmed as a condition of possibility for a present characterized by domination and the threat of catastrophe for the oppressed, since what would be confirmed is the catastrophic present. This should be juxtaposed against a different construction of time. What did not fit the modern concept of progress was the idea of interruption. History takes place throughout an abstract time, and the present in each case is nothing more than a point on an infinite line. The procedure of universal history is 'additive: it musters a mass of data to fill the homogenous empty time' (Benjamin, 1940: 702). By a kind of sacrificial logic everything is functionalized to construct a supposedly better future that must be implemented more or less inevitably. However, what Benjamin perceived in the historic present that he lived in was that time has a catastrophic structure.

This is why he ventured to say that 'the concept of progress is to be grounded in the idea of catastrophe. That things just "go on" is the catastrophe. It is not that which is approaching but that which is' (Benjamin, 1939: 683). The interesting thing about this proposal to use the concept of catastrophe as a basis for the idea of progress is that such

catastrophe is not a future event; it is not so much an end or goal of progress, but its constitutive character. It consists in continually producing, through the force of its advancement, something that is dislodged, abandoned on the margins, something that cannot maintain the pace, which crumbles and becomes rubble because it fails to keep up with time. The modern idea of progress, both in its bourgeois and socialist variants, remains insensitive to this loss. It merely reproduces the dynamics of the merciless advancement of the logic of capital accumulation.

Memory at the time of danger, as a recollection of an already past future – the future that has not happened, which has been stolen from the oppressed – does not establish a historical continuum; rather, it enforces the open-ended character of past suffering and outstanding hopes of the victims of history. Only from that already past future is it possible to think that the current future has a chance to be more than the consummation of the catastrophe. Only from the memory of shattered hopes is it possible to recognize the true dimension of the threat, and curb the optimistic self-deception about the catastrophe that lurks at every moment. However, under the ruins of the past, under the ashes of the almost extinct memory, the time of waiting and desire has sought refuge from destiny: that is where the ember of a forgotten future is preserved. The sudden constellation of the archaic with the latest dialectical images unleashes the revolutionary force of what has been forgotten.

Only through memory does the present become truly actual, by actualizing a forgotten past by connecting it with the present. This requires political will to actively exercise freedom. In the constellations between the present and the past, in the qualitative simultaneity of the dischronic, materialist historians seek to unleash revolutionary energies nestled in the past, in their unfulfilled expectations, in their unfinished business, in their utopian hopes. Only what has escaped integration into the historical continuum of

the history of the victors, the moments of the past that were repressed and forgotten, can form constellations with the present that will interrupt the course of that history and open a gap for the truly new.

In addition to these critical reflections on the temporal pattern of Historical Materialism, Benjamin brought another fundamental concept to the creation of a materialist theory of knowledge from the point of view of the theory of history. This is the concept of 'proto-history' [*Urgeschichte*]. Bearing in mind that the set of writings that make up the *Arcades* project was conceived as a proto-history of the nineteenth century (Benjamin, 1927–1940: 579), it is clear that we are not talking about a remote source, a prehistory, the beginning of a chronological order. It is rather an interpretation of the *present* that is free from the prevailing teleological visions of history. Since this is a key concept in the interpretation of the *Dialectic of Enlightenment*, it is surprising that the vast majority of interpretations of this work persistently read it as a negative *Phenomenology of Spirit*, as a kind of reconstruction of universal history understood as a negative metaphysics of history.

Proto-history aims to establish a new, non-linear and consecutive configuration between past, present and future. Proto-history is produced and reproduced in history as a place where what is silenced, hidden and forgotten becomes visible. That is, proto-history allows the illusions that every present weaves around itself to be broken; it shows the natural-historical dialectic that perpetuates the domination of internal and external nature and social domination, resulting in destruction and suffering. This is not a history of origins, which may form the germ of the current catastrophe by following a causal chain. The concept of proto-history precisely runs counter to this teleological scheme, whether based on an optimistic concept of progress or on a pessimistic concept of decadence (Forster, 2009).

In line with the Marxian critique of commodity fetishism, the explosive force of

proto-history consists in showing the lack of freedom that is hidden in bourgeois freedom (of hiring), the coercion reproduced in the freedom of exchange, or the barbarism that lies in every attempt to dominate nature. Proto-history is primarily a work of memory intended to counteract the oblivion involved in the reification of fetishism. As we have seen, in Benjamin this work of memory is attributed to an unintentional constellation between past and present under dialectical images. The materialist historian constructs them in order to provoke an awakening from the dream in which the capitalist system has engulfed us (Benjamin, 1927–1940: 494). It involves taking hold of a memory that dispels the illusions about history as progress, and not as natural history. Adorno's 'Reflections on Class Theory' expresses this in the following terms:

Knowing the new does not mean adapting oneself to it and to the movement of history; it means resisting its inflexibility and conceiving of the onward march of the battalions of world history as marking time. Theory knows of no 'constructive force' but only of one that lights up the contours of a burned-out prehistory with the glow of the latest disaster in order to perceive the parallel that exists between them. The latest thing is always the old terror, the myth... (Adorno, 1942: 375)

Clearly, the idea of proto-history is essential for a correct interpretation of the *Dialectic of Enlightenment* (Horkheimer and Adorno, 1944), whose true character is to offer a proto-history of catastrophic modernity (Zamora, 2004: 125–85).

## AUSCHWITZ AND THE DIALECTIC OF THE ENLIGHTENMENT

Adorno and Horkheimer saw in Auschwitz a caesura which forced the conventional means of rational analysis to question themselves, and the historical advance in which such an unfathomable abyss of pain and injustice had opened. The historical effectiveness of a supra-historical divine subject, but also of the

bourgeois subject, and of the dialectical process of production forces and relations, were suspended in the death camps of the Third Reich. A catastrophe of this magnitude, which began to systematically eliminate one part of humanity and could turn such annihilation into a purely technical and organizational problem, highlighted the seriousness of the failure of the forces and powers which had, until then, supported the various immanent hopes. Auschwitz represents, therefore, a *break with the civilizing process* (Diner, 1988: 31) which requires a radical rethinking about the way of looking at this process. It also prohibits, from a moral point of view, the desire to extend all that preceded. As Krahel says, 'Auschwitz cannot be explained by capitalist accumulation' (2008: 296).

Moreover, in Adorno's view it was not acceptable to reduce death camps to simply being 'a technical mishap in civilization's triumphal procession' (Adorno, 1951: 265). Considering them to be unique would be tantamount to a temporal, social and cultural delimitation of fascism, which would turn it into a kind of circumstantial anomaly. This relativizing would minimize and significantly reduce the relevance of Auschwitz in understanding the history and the society in which such a catastrophe could take place (Claussen, 1987: 9f.; 1988). This paradoxical situation led Adorno to formulate a phrase that, at first glance, seems oddly contradictory:

The identity lies in the non-identity, in what, not having yet come to pass, denounces what has [...] He who relinquishes awareness of the growth of horror not merely succumbs to cold-hearted contemplation, but fails to perceive, together with the specific difference between the newest and that preceding it, the true identity of the whole, of terror without end. (Adorno, 1951: 266)

What must be avoided is, on the one hand, the spell of the philosophy of origin or *prima philosophia*, in which all of reality is more or less directly derived from a single principle. Within it, uniqueness is the expression or manifestation of the basic ontological structure of reality, regardless of whether the

structure is positively or negatively determined. On the other hand, it would be illicit to maintain a disconnection from phenomena, as this does not do the extent and persistence of historical negativity any justice (Adorno, 1956: 46). The identity of non-identity or *vice versa*, which the new horror allowed to be discovered, could be initially characterized as the stasis of social dynamics, following Marx. As society advances in an *antagonistic* and *pseudo-natural* way, the dynamics of its unbridled expansion remain a reproduction of the old antagonism, and are therefore static. The irrationality of cyclical crises, the impotence of socialized subjects against the advance of their own history, as well as the avoidable but persistent suffering, show that the 'historical dialectic leads, to a certain extent, to the confirmation of fatality' (Adorno, 1961: 234). The Marxian concept of 'prehistory', to which Adorno wanted to remain faithful with his idea of 'natural history', included the historical process under the umbrella of the persistent lack of freedom. So it is not positive continuity, but continuity of the history of suffering. When Marx qualified 'free' paid work as 'wage slavery', he aimed to prevent the appearance of blind progress against the continuity of coercion beyond its historical mutations that could not and should not be denied. The decision to eliminate the social coercion that causes suffering was still to be made. Therefore, for Adorno it was not enough just to expose human history as prehistory, as static in and through dynamics; instead, its hidden reverse needed to be revealed.

By assuming the Marxian concept of 'prehistory', Adorno did not intend a positive determination of domination as a negative and ontological foundation of history, but sought to prevent the relativization of suffering within it and in all historical periods. The unity of the discontinuous and chaotically scattered moments of history can be negatively seen as the continuity of destructive domination, since unjust suffering has not yet been eliminated from any of them. The latest

form of iniquity is an eye-opener to the current suffering at each moment, just as the persistence of unjust suffering is proof of the continued existence of destructive domination. Adorno did not intend to formulate a new – now negative – metaphysics of history with this construction of history as ‘natural history’, but sought to force a *change of perspective* in the way it was considered.

Walter Benjamin superbly formulated this in the theses: ‘The tradition of the oppressed teaches us that the “state of emergency” in which we live is not the exception but the rule’ (Benjamin, 1940: 697). The ability to bring together ‘rule’ and ‘exception’ and – in line with Adorno – ‘continuity’ and ‘discontinuity’, ‘identity’ and ‘non-identity’, depends on this change of perspective. The intention is not to ontologize discontinuity, the state of emergency or suffering, as if it were an essential, inescapable determination of history. Rather, what is required here is to adopt the perspective of the oppressed. The difference in perspective certainly leads to a different perception of historical events. For the oppressed in history, with their individual and non-interchangeable suffering, all progress is non-existent: ‘the last sacrifice is always yesterday’s’ (Adorno, 1953: 269). Each victim is like the negative of persistent coercion, and therefore, the denial that progress really existed. The opposite would be tantamount to integrating the victims into the movement of the totality towards a happy ending, to rising above the victims – in Hegelian terms – and relegating them to mere stations in the unstoppable ascent of the spirit or the human race. And in doing so, their suffering would be converted into a ‘*quantité négligeable*’ that they must inevitably pay as the price of that ascent. ‘The essential character of pre-history is the appearance of utmost horror in the individual detail. A statistical compilation of those slaughtered in a pogrom, which also included mercy killings, conceals its essence, which emerges only in an exact description of the exception, the most hideous torture’ (Horkheimer and Adorno, 1944: 139).

If every reconstruction of history is an anamnesis of the process that has taken place, it is not less true that, to date, the historical reconstructions guided by the idea of progress have shown a curious complicity with amnesia. Such amnesia is determined by how the historical process has effectively occurred. It is not possible to move away from these historic constructions as if they were old furniture once the dirty game has been exposed, as they actually make it possible to discover why memory has always been mutilated (Baars, 1989). So whatever is not expressed (but implicitly hidden) by these constructions needs to be elicited. Real crimes against victims and amnesia are closely connected.

The only way to prevent suffering – which in Auschwitz reached unimagined heights – from disappearing from an interpretation of universal history, and from being reduced to a mere contingency linked to plural, and therefore relative, contexts, is to contemplate the totality of history bearing in mind the break marked by Auschwitz. The most singular – Auschwitz – forced a change of perspective on the totality, so that the dark night of history could be contemplated from its standpoint (Claussen, 1995: 19f.): ‘Certainly, the unprecedented torture and humiliation of those abducted in cattle-trucks does shed a deathly-livid light on the most distant past’ (Adorno, 1951: 266). Thus, ‘manifest history is also revealing its connection to that dark side, which is passed over in the official legend of states, and no less in its progressive critique’ (Horkheimer and Adorno, 1944: 265).

This perspective makes it possible to understand the contribution of the *Dialectic of Enlightenment* without turning it into a mere expression of a state of mind and a wrong assessment of the evolution of the capitalist system, as expressed in the theory of Pollock’s State capitalism (Türcke and Bolte, 1994: 44f.). In the *Dialectic of Enlightenment*, the thoughts are composed in fragments, and the authors did not hesitate to use ‘exaggeration’. They tried to capture in

'dialectical images' the spell of an inscrutable negativity. And they also used 'protohistoric constellations' to suspend the advance of a way of thinking and a history that prolonged the old injustice against which they rebelled. These dialectical images were not intended to bring to light the hidden meaning of history or to rebuild it by the use of a philosophy of history or an evolutionary theory of it, albeit a negative one. Rather, they attempted to make visible the meaninglessness *in* history, in order to issue a wake-up call to a way of thinking that was well practised in oblivion. The objective of the *Dialectic of Enlightenment* was to bring to light the dialectics between nature and history in the sense discussed here, that is, that of breaking the deceptive appearance of a process of civilization which, despite possible setbacks, advances so irresistibly towards individual and social emancipation. The terms 'myth' and 'Enlightenment' that this work connects represent for the dominant consciousness in modernity the two ends of the process: the reassuring opposition that legitimizes the present as a liberation from the enslaving ties of a mythical past. Horkheimer and Adorno tried to build a constellation between the two ideas that both energized and problematized the self-satisfied modern consciousness that was blinded to the catastrophic nature of the present – and of history (Tiedemann, 1998).

Those who claim that the critique of the instrumental domination of nature prevails over the critique of social domination and see here a break with the critique of political economy tend to use a teleological scheme and interpret the concept of 'proto-history' [*Urgeschichte*] to mean that which temporarily existed in the beginning. Even though some formulations of the authors of the *Dialectic of Enlightenment* give reasons for this, the scheme of the bourgeois philosophy of history as a process of teleological-evolutionary cause–effect should not be projected onto them. The *Dialectic of Enlightenment* discusses the historical and natural constitution of both modern society and instrumental

subjectivity, from the perspective of the social and cultural context which manifested itself in the culture industry, antisemitism and the Nazi genocide, and certainly as an ill-fated constitution. The purpose of this was to illuminate the reverse of the 'logic of things' deceptively transfigured by the ideology of progress. What the *Dialectic of Enlightenment* discusses, then, is the dialectic between the constitution of the self and its negation, between the domination of nature and its destruction, between progress and regression, between the universality of exchange and the liquidation of the individual. The diagnosis of a factual failure of the Enlightenment should not be confused, therefore, with its happy postmodern cancellation.

## NEGATIVE TOTALITY AND THE NEGATIVE DIALECTICS OF HISTORY

According to Adorno, what confers on society a character of (negative) totality is that the all-encompassing and all-embracing social organization is characterized by antagonism. The way society is organized – supposedly aimed at ensuring the self-preservation of its members – generates and reproduces relations of domination of some individuals over others. These relations cannot be simply attributed to the necessary division of labour.

The ultimate goal of social organization – that is, ensuring that the needs of its members are satisfied and avoidable suffering is eliminated (Adorno, 1966: 203) – is thwarted by the relations of domination that cause an inversion in the relationship between the self-preservation of all individuals and social organization. The latter is no longer a means to achieve self-preservation; instead self-preservation – mediated by social relations of mainly economic domination – becomes a means to obtain profits (Adorno, 1968: 361). The natural thing is to work to have one's needs met, but capitalism reverses that relationship. It demands postponing the

immediate satisfaction of needs in order to increase capital. Paradoxically, in this way individuals are reduced to a mere struggle for self-preservation, and the autonomy that would allow them to pursue goals beyond it is thwarted. Such goals are only possible when the purpose of social organization truly pursues the self-preservation of all of its members.

As Marx and Adorno noted, this inversion is expressed in the concept of 'capital', the automatic subject of the social process. A social process is run by a kind of mechanism, the expanded reproduction of capital, which carries individuals along with it and reduces them to mere producers or consumers. For Adorno, social objectivity as an antagonistic totality is undoubtedly a real, all-encompassing unit. The inversion that constitutes it is primarily hypostatization, autonomized reification with respect to individuals. The form of the reproduction of capital is truly an inverted world. Through and within the actions that ensure its reproduction, it becomes independent from the individuals who engage in those actions, and develops its own dynamics under laws that operate behind their backs, so to speak. Both Marx and Adorno stated this, not without irony, as their concept of society primarily aimed to be a critique of the autonomization of social synthesis, which is both an ideological construction and an expression of the specific form of capitalist economic development.

This two-fold character comes from the fact that individuals are both subjects and objects at the same time. The system is constituted thanks to their actions, it results from them; its 'naturalness' is 'pseudo naturalness' [*Naturwüchsigkeit*]. But as such, it appears in opposition to them, following a dynamic that overruns them and turns them into mere executors and appendices of the objectivity they have produced (Adorno, 1969: 294). If a short-sighted positivism absolutizes this reified objectivity and omits its genesis, the sociology of (inter)action absolutizes the appearance of atomized individuals, whose

constitution as true subjects is hampered by the existing social organization.

Autonomized social objectivity appears as something external and opposed, whose genesis has become opaque, almost impenetrable for individuals who are not able to unravel the process of their autonomization – even though the real abstraction is nothing other than reification that is independent from the sum total of their labour. While autonomized social objectivity remains in force with respect to individuals, their freedom will be reduced to conforming to market laws, lest they be penalized with economic ruin or social marginalization. This means reproducing in one's own action the inversion that capital consists in, that is, to not pursue the satisfaction of needs as the purpose of their economic action, but to convert that satisfaction into an instrument of an economic action aimed at maximizing profit.

This compels us to enquire into the principle that unifies the antagonistic society. What is the origin of the inversion that is responsible for the autonomized reification of social relations and the opacity that shrouds it? Adorno used two concepts to describe the unifying principle of the antagonistic totality, which were not mere equivalents: exchange and the law of value (Görg, 2004: 249). While the latter is less important in Adorno's theory of society, in his writings he repeatedly used the terms 'exchange' [*Tausch*], 'exchange principle' [*Tauschprinzip*], 'exchange society' [*Tauschgesellschaft*] and 'commodity society' [*Warengesellschaft*] to refer to the capitalist form of economy. In the law of exchange, Adorno recognized the same 'heteronomous objectivity' expressed in the concept of capital that is presented to individuals in the form of coercion (Adorno, 1966: 172). Thus, the inverted world of autonomized social objectivity is grounded in the abstraction operated by exchange: 'Here originates the disregard for the qualitative specificity of producers and consumers, for the mode of production, even for the needs which the social mechanism satisfies as it were in passing, as a secondary

consideration. The primary consideration is profit' (Adorno, 1965: 13).

The principle of exchange levels and eliminates spontaneity and the unique qualities of the individuals who make up society, reducing them to a common denominator. It also tends to demand an abstract and universal equivalence. Under the terms of exchange, abstract labour, that is, the historically specific way of producing commodities as a unit of use and exchange value, becomes the universal social form of useful concrete work. Concrete work, transformed into the average performance of the labour force, becomes a reifying abstraction of human relations, because the social relationships of things decide on the universal social nature of specific jobs. In addition, the quality of things becomes the fortuitous appearance of their exchange value. The products of human labour are identified by quantitative magnitudes and all the products of abstract labour are identical in terms of being the personification of exchange value. According to Adorno, this logic of exchange determines not only the economic processes, but the whole of social life; it penetrates social reality in its entirety and implies a domination of the universal (society) over the singular (its members), whereby the particular ends up prevailing in the antagonistic society (Adorno, 1969: 294).

This domination of the universal over the singular is expressed in the Hegelian concept of 'world spirit' [*Weltgeist*]. This concept, better than those constructions that nominally organize endless facts, expresses the experience that history escapes from the control of individuals. 'The objective and ultimately absolute Hegelian spirit; the Marxist law of value that comes into force without men being conscious of it; to an unleashed experience these are more evident than the prepared facts of a positivistic scientific bustle' (Adorno, 1966: 295). While Hegel transfigures it into a self-conscious subject, Adorno identifies it as 'the negative' (298). It is not what it claims to be, but it is not simply nothing. It has truth content.

The cunning of reason turns individuals into mere means for its own ends, and expresses the hubris of history over them. In line with Marx, Adorno did not retain this concept to give it a negative metaphysical twist, but to offer a materialist reinterpretation of the World Spirit. This simultaneously brings to light its true content, without dismissing it as if it were an empty concept: 'The mythical adoration of the spirit is not pure conceptual mythology' (310). The critique of personification and the ideological affirmation of the objective hubris of history over individuals in the concept of World Spirit cannot ignore the objective character of this hubris and the experience of it that this concept expresses.

The thesis that society is subject to natural laws is ideology if it is hypostatized as immutably given by nature. But this legality is real as a law of motion for the unconscious society, as *Das Kapital*, in a phenomenology of the anti-spirit, traces it from the analysis of the commodity form to the theory of collapse. (349)

Instead, Adorno intends to develop the negative character of that experience: 'to experience the world spirit as a whole means to experience its negativity' (300). This is how he incorporated reflections on the character of natural history dating back to the 1930s. Negativity is the suffering accumulated throughout history that the Hegelian concept reduced to a necessary price. The individual experience of suffering is subsumed under a sacrificial logic. Not that Hegel ignored that suffering, but he subordinated it to the goal of the World Spirit that was imposed over the heads and bodies of singular individuals. Suffering was always perceived from the perspective of a speculatively projected reconciliation. But the falsehood of the World Spirit was, at the same time, its truth: the truth of the coercion that the antagonistic totality exerted on the individuals who reproduced their existence through it. The shift from reason to unreason is the same experienced by self-preservation when mediated through the revaluation of capital.

However, it should not be forgotten that the spell of the concept of the World Spirit, as an ideology of history, is produced by commodity fetishism: 'In human experience, the spell is the equivalent of the fetish character of the commodity. The self-made things become a thing-in-itself, from which the self cannot escape anymore' (339). Commodity fetishism is objectivity that produces a form of consciousness. This explains the difficulty in escaping the spell. But the purpose of asserting objectivity is not to ontologize negativity, which would reduce the critique of the World Spirit to the absurd, but to not underestimate its power. If there is any chance of breaking the spell, it would be a product of false universality itself. The coercion of the universal, and the unity it imposes between individual interests and the logic of the reproduction of capital, produces non-identity between them through the coercion and suffering that it generates (314f.). The domination of nature and social domination produce the breaks and cracks which, belonging to history, do not disappear in the identity of the World Spirit. It is in these breaks and cracks that the failure of that identity is made apparent, and the possibility of its elimination opens up ever again.

# Totality and Technological Form

Samir Gandesha

Critical theory emerges in the early 1920s in response not just to the so-called ‘objective crisis’ of capitalist society but also to its ‘subjective crisis’ (Gandesha, 2014). Running parallel to other influential intellectual currents in the early twentieth century, most notably phenomenology (Husserl, Heidegger, Arendt, Merleau-Ponty) and existentialism (Schmitt, Camus, Sartre, de Beauvoir), Critical Theory understands such a subjective crisis in capitalism as a crisis of reason and experience. Like the former, Critical Theory, at its inception, was particularly concerned with the increasing pervasiveness of scientism and technology; like the latter it was concerned with ascertaining the conditions for the possibility of genuine ‘action’ or praxis as distinguished from naturalistic, unreflexive conceptions of ‘behaviour’.

In this, Critical Theory sought to clearly differentiate itself from the dogmatic, economic and quietist ‘scientific socialism’ of fin de siècle social democracy and to those aspects of Marx’s own thought that it

considered to be characterized by a certain technological determinism. For example, in the *Poverty of Philosophy* (1976: 166) Marx argues infamously that ‘the hand-mill gives you society with the feudal lord; the steam-mill society with the individual capitalist’. Critical Theory differentiated itself from this dogmatic tradition in at least two ways. The first was by reclaiming genuinely ‘dialectical thinking’, which is to say a form of thinking that centred on the reciprocal and mutually determining relations between subject and object rather than on an understanding of their supposed opposition and the positing of mechanistic, causal relations between them. Indeed, it emphasized the central role played by negativity, which is to say the non-coincidence between subjectivity and objectivity, identity and non-identity (see Adorno, 1981; Marcuse, 1986). The second, as alluded to above, was by entering into a productive dialogue with currents that were to some extent exterior to the Marxian tradition, for example the thought of Schopenhauer and Nietzsche,

as well as the schools of phenomenology and hermeneutics, ideas and approaches that presented significant challenges to certain guiding assumptions of historical materialism, at least in its more orthodox incarnations.

At its inception, Critical Theory understood itself in Kantian terms as engaging in a 'rational critique of reason' as well as of reductionist, economistic and dogmatic forms of Marxism (Horkheimer, 1975). It was a theory that was *critical*, but also a critique of existing *theory*. Both dimensions coalesce as in the form of criticism of what Horkheimer (1974) called 'instrumental' or 'subjective' reason or a form of reason confined to the determination or calculation of the most efficient means to the achievement of goods or ends that, themselves, could never appear before the bar of reason but, rather, were simply a matter of an irreducible subjective preference or decision. In the realm of moral theory this was referred to as emotivism. A major challenge of Critical Theory, especially in the work of Jürgen Habermas (1991), was to identify a form of communicative as opposed to strategic and instrumental rationality that would be able to serve to adjudicate between certain ends and outcomes in the form of an ethics of discourse (Habermas, 1992). The subjective form of reason becomes dominant with the eclipse of a form of 'objective reason' that embodies a claim to conceptualize the totality of mediations, historically understood – on the basis of a dynamic account of 'becoming' rather than a static naturalistic account of 'being'.

Crises of reason and experience were diagnosed in the early work of Erich Fromm (1994) and Max Horkheimer (1975, 47–128), through the lenses of psychoanalysis and sociology, respectively, and attributed to the profound transformations in existing forms of authority, familial structures and processes of socialization. Parallel to this was the critique of reason that had become reduced to pure means or the relation of technological form to the social totality. Walter Benjamin (2002b, 144) makes clear this connection

between technological form and the crisis of experience in an arresting passage from his essay on Nikolai Leskov: 'For never has experience been contradicted more thoroughly than strategic experience by tactical warfare, economic experience by inflation, bodily experience by mechanical warfare, moral experience by those in power'. It is this second stream – the crisis of experience – that will be the focus of this chapter.

The roots of such a critique of the crisis of experience, as previously alluded to, can be located in a wider critique of the positivistic and mechanistic reading of Marx in the Second Socialist International (1890–1914) that was geared to understanding with nothing short of scientific precision the so-called 'objective laws' of capitalist society (Joll, 2015). This reading of Marx – what Russell Jacoby (1971, 1975) called 'automatic Marxism' – held that the fundamental contradiction in capitalist society was that between the 'productive forces', on the one hand, which were relentlessly innovative, future-oriented and, ultimately, therefore promised human emancipation, and the relations of production based on private property which, after the transformation of the feudal order, were increasingly static, on the other. The *locus classicus* for this is the *Communist Manifesto*, in which Marx and Engels suggest that the contradiction comes about through the necessarily antagonistic relation between capital and concrete labour within the space of the industrial factory, where the productive forces bring workers together in ever larger numbers in increasing opposition to the bourgeoisie in the context of the increasing immiseration of the population and what Marx would later diagnose in *Capital* as the tendency of the rate of profit to fall.

Written on the eve of the cataclysmic, if ultimately unsuccessful, revolutions of 1848, Marx and Engels spend rather more time praising the historical accomplishments of the bourgeoisie than anticipating the transformative praxis of the proletariat. In particular, Marx and Engels emphasize

the great advances in transportation and communications technologies that would enable the proletariat to shed its allegiance to particular local or even national identities and that would be, instead, like the First Working Man's International – consisting mainly of German and Polish émigrés – for which they wrote the *Manifesto*, truly internationalist if not explicitly cosmopolitan in outlook. Indeed, at the end of the *Manifesto*, the authors, with some prescience, note the advent of 'world literature'. It came as little surprise, then, in the sesquicentennial of the publication of this epochal text in 1998, that the house organs of global capital such as *The Economist*, *The Wall Street Journal* and *The New York Times* praised the text as foreseeing the advent of neo-liberal globalization while, of course, ignoring Marx and Engel's prediction that the bourgeois order would be transitory, giving rise to its communist successor. Marx and Engels held that the dynamic, even explosive, nature of technological forces would create the conditions in which the proletariat – having become the majority of society – would be able to 'expropriate the expropriators'.

Revolutionary transformation in Europe, alas, did not come to pass. In fact, not only did the proletariat fail, during the supposedly 'objectively revolutionary conjuncture' of the 1930s after the Stock Market crash, to seriously vie for social power, it was, to the contrary, largely won over to the side of fascism only to see its autonomous institutions – for example political parties, trades unions and cultural institutions – decimated and incorporated by the party/state apparatus. An important prelude to the incorporation of the working class could already be seen, in retrospect, with the German Social Democratic Party's ignominious vote for 'war credits' in the Reichstag in 1914 and the subsequent implosion of the Second Socialist International due to a resurgence of nationalism that was only apparently superseded by proletarian internationalism. Indeed, fascism, in some analyses

(Postone, 1986, Bonefeld, 2016), was itself a corrupted and displaced form of anti-capitalism, a 'socialism of fools', in words often attributed to August Bebel but most likely to have issued from Ferdinand Kronawetter, insofar as it identified and separated the abstract form of capital, financial capitalism, for capitalism as a whole. In other words, the narrower dynamics of an abstract logic of finance capital were mistaken metonymically for the totality of capital as a whole for which the Jews were taken as personifying in concrete form.

In any case, the rise of fascism became cause for a fundamental rethinking of Marx and Engels' conception of the socially innovative nature of technological forms insofar as it draws attention to the way in which dominant strains of Marxism tended to emphasize concrete over the problem of abstract labour and articulate a critique of capitalism from the standpoint of the former. In other words, the rise of fascism occasioned a rethinking of Marxian categories which continues today in the so-called 'new reading' of Marx (see Heinrich, 2012). According to one such reading, based on a reconstruction of the argument of the *Grundrisse* (1993), Marx's Critical Theory must not be simply understood as a *critique from the standpoint of labour*, entailing a more equitable or just distribution of wealth in the form of value, but rather as the *critique of abstract labour* as the predominant form of social mediation (Postone, 1993). In the first, there is simply a more just distribution of wealth in the form of value, while in the second, the aim is the abolition of the law of value *tout court*. In other words, it wasn't simply the objective reality of capitalist society that constituted the conditions of unfreedom but the very reified categories that capitalism itself produced qua 'real abstractions'.

The historical rise of National Socialism that showed the extent to which what was regarded by the Marxist tradition as the emancipatory implications of technology – emancipatory insofar as it enabled humanity

to increasingly master and control a once overwhelming, threatening but now tamed and domesticated power of external nature – could be turned in the direction of deepening the hold of existing forms of social domination. In contrast to traditional, Romantic or Burkean forms of conservatism, which ultimately drew upon an Aristotelian understanding of a hierarchy of goods established within a traditional organic political community within which reason was to be understood, German National Socialism represented a form of ‘reactionary modernism’ (Herf, 1986) that sought expressly to employ the most *advanced technological forms* in economy and, most importantly, the state, to annul the universalistic ideals that had been actualized, from the standpoint of the Marxian tradition, in a one-sided and incomplete way, during the bourgeois revolutions of the late eighteenth century. Nazism wasn’t simply anti-Enlightenment but precisely embodied the *dialectic* or self-undermining of Enlightenment – the ‘self-devaluation’ of the Enlightenment’s highest, which is to say, universalist, values. While such an actualization was one-sided and incomplete insofar as it liberated, as Marx showed in his early writings, man only as *citoyen* but emphatically not as *homo economicus*, it nonetheless laid the groundwork for the basis of a determinate negation via the proletarian revolution that would represent the genuine ‘realization of philosophy’. And, indeed, as previously suggested, the productive forces would play a key role in such a determinate negation of the bourgeois order. In other words, the abstract, formal achievement of ‘free and equal exchange’, concealing a hidden form of domination of the owner of labour power by the owner of money, nevertheless made possible the concrete actualization of genuinely ‘free and equal’ relations (Adorno, 1981: 147) that it had promised. In contrast, using the most advanced technological means, the Nazis sought to obliterate the radical political legacy of the historical Enlightenment.<sup>1</sup> An important sphere of the deployment of

such technology was mass communications such as radio, on which the F  hrer’s masterfully manipulative oratory was broadcast to the masses, but also film, in particular that of Leni Riefenstahl, in the form of an ‘aestheticized politics’. The Communist left sought to confront such an aestheticized politics – the spectacle of war and violence – by politicizing art (Benjamin, 2002a) through a deployment of the anti-auratic media of cinema and photography in ways that pushed, through an alienation effect [*Verfremdungseffekt*] beyond passive spectatorship under conditions of aesthetic illusion, or ‘*Schein*’, directly into political action. We shall return to this problem of an aestheticized politics below.

The starting point of any account of the relation between totality and technological form is Marx’s (1992) seminal discussion of commodity fetishism in *Capital Volume I*. It will then turn to Max Weber’s influential account of rationalization and disenchantment, before showing how Georg Luk  cs’ systematic account of “reification” (1972a) in *History and Class Consciousness* represents a synthesis of both accounts.

Luk  cs’ account of reification helps us to understand the manner in which technological form fundamentally occludes the social totality of which it is a ‘moment’, or what has been understood as the problem of what Fredric Jameson (1988) calls ‘cognitive mapping’ – the difficulty, if not impossibility, of representing or imagining the totality of social relations and therefore the lines of social and political conflict in late capitalism whose relations of production are increasingly globally dispersed through many discrete yet closely inter-connected nodes and sites. Technological forms become ever more prominent with the deepening of generalized commodity production and the application of advanced scientific techniques to the labour process, which. This deepens reification insofar as the social field becomes increasingly understood not as comprised of social relationships but as anonymous ‘objective’ processes and is therefore converted into

merely technical problems to be mastered or solved. This opposition could be said to lie at the heart of the current discussion of global climate change and the prospective solutions to it. Are these solutions to be understood in terms of more advanced forms of, for example, carbon capture techniques that leave in place social relations geared to an infinite, unfettered accumulation, or do they entail a fundamental transformation of human social relations, the species' relation with external nature and to our relation to own libidinal impulses or desires? Would such transformed, that is to say democratized, relations, at the same time, lead to changes in the actual technical design of objects and their relation to the natural world? In other words, are purely technical solutions to ecological crises possible without directly addressing what Marx calls the 'metabolic rift' between humanity and nature? (Marx, 1981: 949; Bellamy-Foster et al., 2011)?

Critical Theory, broadly understood, can be said to manifest at least three distinct responses to Lukács' diagnosis of this contradictory relation of technological form, on the one side, and social totality, on the other: (1) Walter Benjamin's influential account, already alluded to above, of post-auditory art, which suggests the manner in which technology can successfully confront the crisis of experience by engendering new artistic forms that can articulate a critical perspective on social relations, revealing what he calls an 'optical unconscious'; (2) Theodor W. Adorno's antithetical defense of aesthetic autonomy, specifically in terms of the accelerated development of the 'aesthetic forces of production', for example in the work of figures such as Beckett and Schönberg, that enable them to register the 'truth content' of natural history and point beyond the pure immanence of late capitalism in which virtually all other forces of opposition have been transformed into the means by which the system, or what he calls the 'total context of delusion', is reproduced; finally, (3) the debate

between Herbert Marcuse's phenomenological account of technology as a form of 'world disclosure', subsequently elaborated by Andrew Feenberg into the theory of democratizing technical design (2002), and Habermas' critique of 'functionalist reason'. In what follows, we will focus on the third account of the relation between totality and technological form.

## MARX AND COMMODITY FETISHISM

Marx shows the manner in which generalized commodity production under capitalism (M-C-M,' as opposed to the C-M-C of pre-capitalist formations) already hints at a cognitive crisis. The starting point, namely, Marx's account of 'commodity fetishism', cannot be overestimated in terms of its importance for understanding the relation between technological form and social totality. The logic of the commodity, an object that is at one concrete and abstract, that embodies both use value and exchange value, functions in such a way that the commodity qua fetish becomes both separated from and also obscures the totality of mediations – social relations of production – that constitutes it. The phenomenon of commodity fetishism presents the social world in such a way that relations between human agents appear as the relations between things, and relations between things appear as the relation between agents. Marx's critique of commodity fetishism returns to and develops his early critique of alienation that takes the criticism of religion as its primary model. It should be said that, in Hegel, this critique of alienation anticipates, in its treatment of the Kantian Understanding or *Verstand* and the underlying culture of diremption that it expresses (see Hegel, 1978; Pinkard, 2011), the deep tension between technological reason and an account of reason [*Vernunft*] that is up to the task of grasping the whole.

The alienation of the human essence in religion, as per Feuerbach's 'transformative critique', has its origins, fundamentally, not simply in the human suffering which gives rise to it, as Marx suggests in his early critique of Hegel, but in the mystified realm of alienated production relations constitutive of capitalist society. Such alienation results from the fundamental separation of the worker from the productivity of his labour power. In the same way that the idea of God represents the alienated projection of fundamental human spiritual powers, so, too, do the products of human labour power take on a life of their own independent of it. The worker therefore creates a world that confronts her in the form of an 'alien power' and that possesses a lawfulness that is inherently heteronomous or determined outside of her and beyond her control. Such a heteronomous condition constitutes a particularly vicious circle: the more wealth the worker produces the poorer he becomes; the more *powerful* capital becomes, the more *powerless* the worker.

Capitalist society as a totality of social relations and productive forces is occluded by the commodity form, or what Sohn-Rethel (1977) describes as a 'real abstraction'. That is to say, it is not an abstraction qua 'idea' posited by a philosophical concept or a sociological theory but an actual *phenomenon* induced by social relations themselves. The commodity as the embodiment of abstract, measurable labour time, and is 'alienated' from the direct producers, that is, goes its own way independent of their will. So, it conceals from view the fact that it is itself a product of social relations and is, in effect, therefore a form of 'socially necessary illusion' under capitalist production relations. Such an illusion lies at the heart of the self-presentation of capitalist social relations as a 'natural' order. The commodity form precludes, therefore, an immediate grasp of capitalism as a set of determinate social relations but rather presents the latter in the form of the simple appearance of what Marx calls 'an immense collection of commodities'.

Exactly one hundred years after the publication of *Capital* in 1967, Guy Debord (1992) elaborated this into a theory of the 'society of the spectacle,' 'capital accumulated to the point where it becomes an image'. The spectacle transforms the active, laboring subject into a passive spectator who beholds the products of his own sensuous activity from a distance.

Commodity fetishism is the point of departure for Georg Lukács' (1972a) theory of reification. Marx held that the inverted relation of humans and things could be demystified, dialectically, within a larger account of the unfolding of the mediations or relations constitutive of the social whole, that is, the realms of production, consumption, distribution and exchange, which is precisely what he sought to provide in the three volumes of *Capital*. It is for this reason that, as Lenin argued (Lenin, 1976), it was first necessary to grasp the mediations of Hegel's *Logic* in order to properly understand Marx's argument in *Capital*. In his essay 'Reification and the Consciousness of the Proletariat', Lukács takes up the problem of inversion of the relation between human beings and things that Marx understands as the immediate self-presentation of capitalist social relations and elaborates the theory of 'Reification' (literally 'thingification') with the help of Max Weber's account of disenchantment and rationalization.

## WEBER, RATIONALIZATION AND DISENCHANTMENT

Weber's account of rationalization shows the way in which the conception of nature undergoes a fundamental transformation through the process by which it is reduced to mechanical causal relations and could, therefore, no longer be understood as inherently meaningful. Modern thought can be understood in terms of a break with a teleological Aristotelian ontology that saw nature as

embodying purposes. A decisive step was of course the Copernican-Galilean revolution in the conception of the universe via the invention of the telescope, which also marked the emergence of the modern empirical-scientific world-view (Husserl, 1970). Rationalization can be understood as the reduction of the complex, manifold understanding of causality in ancient philosophy to a single form of causality – efficient causality – mechanically understood.

Disenchantment means that there are neither inherent meanings nor indeed any mysterious forces embodied in nature. Nature in its totality can, in principle, be explained by way of science and manipulated and controlled by purposive reason. In other words, we can no longer understand nature as embodying final causes or purposes. As Weber (1958: 155) puts it, the ‘disenchantment of the world’ entails that ‘[p]recisely the ultimate and most sublime values have retreated from public life either into the transcendental realm of mystic life or into the brotherliness of direct and personal human relations’. What results from this is a decentring of a single and hierarchical account of the good life and a re-emergence of conflicts between what Weber calls ‘warring gods and demons’ within increasingly differentiated, complex, pluralistic capitalist societies, which culminates in the Westphalian system of nation-states. In the ‘dark writers of the bourgeoisie’, such as Machiavelli, Hobbes, de Sade and Nietzsche (Horkheimer and Adorno, 2002: 92), final causes or ends are shown to be no longer determinable by a reason reduced to pure instrumentality.

With the decentring of a totalizing account of the good, there is a corresponding transformation of authority. The charismatic authority upon which many religious world-views, particularly those of the Abrahamic religions, was based, as well as the traditional authority of agrarian societies, is increasingly replaced by what Weber calls ‘legal-rational authority’. While charismatic authority is grounded in insight into the divine, and the traditional

form is ‘the authority of the eternal yesterday’, legal-rational authority derives from the adequacy of the procedure by which a given social norm is generated or determined. In other words, the binding character of the norm has to do with the degree to which a legitimate procedure is followed. Crucially, here rationality [*Zweckrationalität*] is *by definition* restricted from judging the outcome of content of the procedure and concerns itself with only the adequacy of the *form* of the procedure itself.

The bureaucracy of the modern state is founded precisely on this form of rationality, centring exclusively on calculability and technical efficiency in attaining its ends, but this also makes it constitutively *unable to reflect* on the validity of those ends themselves. The apparent inability of rationality to attend to outcomes is what gives rise to the possibility of the genocidal events of the twentieth century, in particular the Nazi Holocaust, which constitutes the uniquely ‘banal’ form of modern evil (Arendt, 2006). This procedural conception of rationality, which also governs science, suggests the neutrality of technology insofar as it can serve either good or evil ends. As we shall see, however, in Marcuse’s phenomenologically inspired critique of technology, technology cannot be thought of exclusively as technological but is constitutive of practices of ‘world disclosure’.

It is important to bear in mind Weber’s account of purposive rationality as articulated in the context of his account of the role of religious ideas or spirit of capitalism in the emergence and consolidation of capitalist social relations in Western Europe. Challenging the orthodox Marxian view (Anderson, 2013) that the rise of capitalism could be understood to result from objective contradictions intrinsic to the previous, feudal order, for example, in the growing antagonism between the town-dwelling burghers (the incipient bourgeoisie), on the one hand, and the aristocracy and Absolutist state, on the other, Weber argued that the

subjective transformation of the world-view of the Puritan created a subjective disposition uniquely suited to capital accumulation. Following Nietzsche's *Genealogy of Morals* (1989), Weber (2001) called this unique disposition 'inner-worldly asceticism'. By this, Weber meant that the bourgeois Puritan's asceticism entailed activity outside of the monastic order (in the world) but, like the monastic order, it entailed self-abnegation and the deferral of gratification in the service of what were initially higher, spiritual ends. Rather than immediately consuming the surplus that his enterprise had generated (by exploiting the labour of others), according to his methodical 'rational life practice', he reinvested it back into the enterprise itself. While, given the doctrine of predestination, no amount of worldly success could guarantee 'election', inner-worldly success could be, nevertheless, read or interpreted as a *sign* of divine grace.

As processes of rationalization and disenchantment deepened, however, and produced an increasingly secular world, religious world-views began to lose their hold. The accumulation of capital, which was initially a means, once detached from any reference to a higher purpose or end, becomes an end in itself. In other words, Weber puts his finger on the manner in which technical means becomes an end-in-itself. In a logic of what Nietzsche (1968: 9) called 'nihilism', that the 'highest values devalue themselves', Christian faith proves itself unable to withstand the very transformations inaugurated by the Reformation itself. Rationality, which had previously been understood in terms of the realization of purposes, including, of course, the highest good, understood in either Aristotelian or Christian terms, now becomes reduced to a pure means, instrument or tool (Taylor, 1992) stripped of any possible relation to transcendence. In other words, rationality becomes a mere technique by which capital accumulation is pursued or bureaucratic state power administered without being indexed to a conception of the 'good life'

lying beyond it. The processes of rationalization and disenchantment culminate, therefore, in a seemingly inescapable fate, an 'iron cage'.

## LUKÁCS AND THE PROBLEM OF REIFICATION

In the key chapter of *History and Class Consciousness*, 'Reification and the Consciousness of the Proletariat' (Lukács, 1972), written in the wake of the failures of the central European Revolutions, Lukács presents a synthesis of Marx's account of commodity fetishism and Weber's theory of rationalization in his concept of 'reification', or the process by which what is living, vital and dynamic becomes hollowed out and static, seemingly governed by law-like regularities that mirror laws governing nature. In other words, reification is a form of 'second nature' that resembles first nature. Marx had sought to show the manner in which the commodity was a moment in the unfolding of the mediations of the capitalist mode of production as a whole. Indeed, as already suggested, the contradiction between the relations and forces of production would make possible the transformation of the class-in-itself to the class in-and-for-itself and enable the proletariat to challenge the power of the bourgeoisie.

In contrast, Lukács indicates the manner in which the increasing specialization within the division of labour and rationalization of the labour process through the integration of technical knowledge (for example Taylor's principles of 'scientific management' that came to play such a key role within the post-War Fordism) further alienated and isolated individual workers from one another, themselves and the labour process as a whole. In other words, the fact that abstract labour was the given form of social mediation constituted the social world as a kind of 'second nature' (Lukács, 1974) that

seemed, as a result, impervious to human will and action; quality was replaced by quantity. Reification gave rise to a pervasive passivity, or what he called a 'contemplative attitude' (1972b: 83–222), which was a regression insofar as it inverted the modern hierarchy in the relation between the *vita activa* and the *vita contemplativa* in which the former prevailed over the latter. Again, it was only a short step for Guy Debord (2002) to elaborate Lukács' insights into a theory of the spectacle in post-war Europe (Gandesha and Hartle, 2017). To emphasize the difference with Marx and Engels' *Communist Manifesto*, once more, it was precisely because of the pervasiveness of reification in all of its manifold forms that it became clear that it was now no longer possible for workers in the space of industrial production to directly grasp the totality of capital that confronted them collectively and to mount a challenge to this, what amounted to *their own 'alien powers'*.

The phenomenon of reification was not confined to the sphere of production relations but came to penetrate even the most intimate or refined cultural sphere, including the assumptions of philosophy itself. It culminates in the philosophy of Immanuel Kant, in particular in his conception of the Understanding [*Verstand*], in which various oppositions are established, between ought and is, freedom and necessity, etc. within differentiated spheres of value: science, morality and art. Indeed, for Lukács, Kant's opposition of the world as appearance and as the 'thing-in-itself' crystallized the contemplative attitude and represented the very apotheosis, at the level of thought, of the process of reification that derived from and 'expressed' (Althusser, 2006) the fundamental contradiction at the heart of capitalist social relations. It is in the subsequent history of German idealism, in Hegel's Absolute Idealism in particular, that we find the best strictly philosophical solution to this problem.

## MARCUSE, TECHNICS AND TECHNOLOGY<sup>2</sup>

As previously suggested, Critical Theory strives to come to terms with the fact that, rather than playing an unequivocally emancipatory role, technology is at best ambivalent. Marcuse addresses such ambivalence through a critique of Max Weber, whose concept of rationalization, as we have seen, plays such a key role in Lukács' influential account of reification. Far from being value-neutral, as Weber maintained, Marcuse argues that the very abstractness of technology conceals a substantive complicity with domination, much in the same way the abstract 'equal' exchange between the 'owner of money' and the 'owner of labour power' conceals what is, at bottom, a structurally unequal, exploitative relationship. Such a critique of Weber is significant because it highlights Marcuse's own ambivalent relationship to technology, it contrasts with Habermas' own critique of the one-sided nature of Weber's account of rationalization, and it enables us to identify the stakes in the respective accounts of technology in Marcuse and Habermas.

Marcuse challenges Weber's claim to value-neutrality by situating him within the context of Wilhelmine Germany and suggests that, in its very insistence of value-neutrality, Weber's concept of rationality reveals its inherent political disposition. Genuine value-neutrality is premised upon self-reflection, on the 'power of resisting interference' (Marcuse, 1965). Marcuse's point here is that value-neutrality can only be thought of as a regulative ideal, a moment of which must be a reflection on the way in which technology embodies value. In the absence of such self-reflection, putatively value-neutral rationality becomes vulnerable to heteronomous determinations or determinations from the outside. Given the nature of formal rationality, such determinations cannot, by definition, be adjudicated in the court of reason. Moreover,

Marcuse identifies three salient elements of Weber's account of reason: the progressive mathematization of experience, here the natural sciences, in particular physics, become the model for the social sciences as in Hobbes' political theory (2008) as suggested above; the insistence on the necessity of rational experiment and proofs in the organization of both science and the conduct of life; and the genesis and solidification of a technocracy. It is indeed in the transition from theoretical to practical reason that the apparently neutral conception of formal rationality reveals itself to be circumscribed by the conditions of its own historical emergence. The parallels with classical political economy are clear. Weber's account of rationality, in Marcuse's view, is unequivocally marked by its own historicity, which is to say, the conception presupposes a form of abstract labour 'freed' from the means of production and its increased control by private firms. Weber's supposedly 'neutral' conception of rationality, in other words, presupposes liberal capitalism. With the eclipse of this social order, what becomes increasingly clear is the inescapably irrational nature of technical reason. The 'inner-worldly asceticism' which, as we have already seen, drove the rational life-conduct of the emergent bourgeoisie, now becomes objectively irrational in a transformed capitalism ever more dependent upon solving its inherent contradictions by the mass production and consumption of commodities.

Here Marcuse seeks to provide an answer to the question that we posed earlier: how do the productive forces, whose 'liberation' played such a decisive role in the undermining of the old order, now contribute to the freezing of social relations in an eternalized present? Marcuse argues that, in his understanding of industrialization as a logic of the 'iron cage', Weber inadvertently demonstrates the manner in which formal rationality is substantively determined. Weber, according to Marcuse, 'generalizes the blindness of society that reproduces itself behind the

back [sic] of the individuals, of a society in which the law of domination appears as an objective, technological law' (1965). Weber's concept of rationalization shows how, in contrast to previous modes of production in which political and economic domination were fused, the nature of domination under capitalism seems increasingly impersonal, abstract and necessary, taking on, therefore, a fateful character. Recognition, however, that this fate has in fact *become* a fate, that is to say, a historical rather than a natural phenomenon, implies the possibility of its transcendence or determinate negation. Any scientific analysis that fails to commit itself to such a negation places itself in service of 'actually existing' domination.

If Marcuse's two-fold critique of Weber is to hit home, if the identification of the limits of Weber's account of rationality is, as Hegel had shown in his critique of Kant, a transcendence of those limits, then it was incumbent on Marcuse to provide an alternative to the culmination of the unfolding of rationalization in a stultifying and nihilistic 'iron cage'. Only through such an alternative would the triumph and domination of formal rationality not appear as the singular fate of modern societies. Marcuse locates such a possibility, anticipating his later account of the possibility of a new reality principle in the idea of non-alienated labour. Lukács' response to Weber entails an understanding of the proletariat as the collective subject that grasps its own objective reality in the self-consciousness of the historical process, which nonetheless makes the error of conflating 'objectification' and 'alienation'. Marcuse, in contrast, with the benefit of having read Marx's *Economic and Philosophical Manuscripts*, offers an existential and ontological interpretation of labour as the foundation of historical materialism.

We can now see the clear outlines of Marcuse's critique of the reified nature of technological reason. Marcuse provides an account of how the insights of Husserl's

diagnosis of the crisis of the European sciences can be fleshed out by historical materialism. What the *Epoché* reveals isn't the pure structure of intentionality – the consciousness always already directed towards an object – but rather the objectivity of the object is, in the final instance, the *objectification* of an embodied form of sensuous subjectivity. Through practical reason, the reified structures of the lifeworld are dynamized into actuality and cease standing over and against human beings as a heteronomous order.

What becomes clear in Marcuse's encounter with Weber is an apparent ambivalence in Marcuse's approach to technology that stems from the two sources of his critique: historical materialism and phenomenology. In other words, Marcuse wants both to appropriate the concept of the lifeworld understood as the symbolic or meaningful structures into which individuals are always already 'thrown' and offer the possibility of their fundamental transformation via 'historical and social labour'. Marcuse argues that the ideological nature of technology does not just come from the outside – that is, in the specific ends to which it is put – but rather constitutes its innermost essence. The ambivalence is thus one between technology as a *project*, on the one hand, that discloses human beings and things within the 'world' in such a way as to make them available for the apparatus of industrial capitalism and technology understood as *technics*, or neutral instrumentality fettered only by society's production relations, on the other. Such an ambivalence can be said to run throughout Marcuse's post-war writings, in particular *Eros and Civilization* (1974) and *One-Dimensional Man* (1964). It is evident also in his important essay from 1941 'Some Social Implications of Modern Technology' (1990).

Technology and technics converge in Marcuse's account of the way in which the automobile embodies the new 'matter-of-factness' of technological reason. While in the past such 'matter-of-factness' played a progressive role in countering metaphysical

world-views, as in the modern physics and the rationalism of the eighteenth-century Enlightenment, today it contributes to reproducing the existing order (see also Horkheimer, 1975: 232). This gets to the heart of Marcuse's answer as to why, after a period of rationalization that contributes to the overthrow of the *ancien régime*, technological reason plays a crucial role not in pushing beyond the capitalist order – as some contemporary 'Accelerationists' (see Mackay and Avanessian, 2014) think it still possesses the capacity to do – but rather in buttressing and justifying this order. This is the dialectic, in other words, whereby the normative ideals of the bourgeois society, in particular the idea of reason as the actualization of human autonomy in opposition to external authorities, are reversed. Technological reason forms the basis of one-dimensional society insofar as it supplants critical, which is to say, negative reason, which seeks to liberate the untapped potential that lies dormant in human beings and in external nature alike.

In contrast to his later position, however, Marcuse retains the orthodox Marxian view of the productive forces as inherently dynamic and emancipatory. If the proletariat, and with it the possibility of an immanent critique of political economy, is at the point of being fully incorporated within the dominant form of technology of the late capitalist order, technics or the productive forces can still be understood as embodying contradictory tendencies that result from its inherently innovative logic. As such, technics retains the ability, for example, to 'democratize' functions and, in the process, reveal the existing production relations as arbitrary and obsolete. How this is actually to come about is not clearly specified. Nonetheless, what is crucial is Marcuse's attempt to keep open the relation between technology and technics. Let us now turn to Habermas, who makes such ambivalence central to his response to Marcuse, and his important alternative reading of Weber, which plays such a crucial role in his attempt to work out his account of communicative reason.

## HABERMAS' CRITIQUE OF MARCUSE

Taking as his point of departure Hannah Arendt's (1958) differentiation within the *vita activa* of labour, work and action, Habermas distinguishes in his reading of Marx between labour and interaction: action oriented towards mastery and control and action oriented to mutual understanding. Such a differentiation enables Habermas to provide, like Lukács and Marcuse before him, a critique of Weber's account of rationalization. While showing that the 'inner-worldly asceticism' of the Puritan was central to the spread of what he calls 'cognitive-instrumental' rationality ('formal' as opposed to 'substantive' rationality), Weber underplays the transposition of the rationalization of world-views into 'societal' rationalization. With the process of secularization that comes in the wake of the process of rationalization, Habermas comes to rethink this process in his notion of 'post-secularity' (2005), fundamental questions of the 'true', the 'beautiful' and the 'good' become differentiated and supplant, as distinct and irreconcilable spheres of value, the metaphysical systems in which they were bound together. While Weber, in his Nietzschean diagnosis of nihilism as the unending war between contending 'gods and demons', drew the pessimistic conclusion that reason had forever lost its unity, universality and capacity to grasp the whole, Habermas elaborates on the vague conception of formal rationality inherent in Weber. The fragmented dynamic of cultural rationalization, according to Habermas, is unified by a *communicative* form of rationality, guided by the regulative ideal of undistorted communication or mutual understanding. The latter takes the form of the argumentative redemption of claims to validity: 'The unity of rationality in the multiplicity of value spheres rationalized according to their inner logics is secured precisely at the formal level of the argumentative redemption of validity claims' (Habermas, 1991: 249). Habermas therefore

attempts to show that communicative reason mediates the universal structure of action oriented towards understanding and the particular claims made within each quasi-autonomous sphere of value.

In contrast with Marcuse's critique the shortcomings of Weber's account of modernity lie in the refusal to recognize that the process of rationalization is, itself, accompanied by a simultaneous differentiation of value spheres no longer rooted in either traditional or charismatic forms of authority, and the corresponding possibility of a 'rationalization' of the lifeworld grounded in the argumentative procedure of the giving and taking of reasons. Marcuse's and Habermas' critiques of Weber's account of rationalization are inverse images of each other. While Marcuse argues for an extension of the concept of labour as the cultural mediation of subject and object, Habermas argues for its foreshortening in an account of the rationalization of the symbolically mediated interaction of the lifeworld that is attendant upon the spread of formal rationality.

Habermas therefore argues that Marcuse's ambivalence towards technology, discussed above, results from the collapse of 'work and 'interaction'. Work is defined as 'purposive-rational action', which is, itself, further differentiated into instrumental action, rational choice (strategic action) or some combination thereof. Purposive action is action geared to realizing goals defined under given conditions guided by criteria for the effective control of reality (instrumental action) or the correct evaluation of possible alternative choices (strategic action). Interaction, as distinguished from work, is defined as communicative or symbolic action and 'is governed by binding *consensual norms*, which define reciprocal expectations about behavior and which must be understood and recognized by at least two acting subjects' (1970: 92).

According to Habermas, the central problem with Marcuse's critique of technology lies in its misguided attempt to cash out a philosophical critique of technological reason in

sociological terms. As we have already seen, Marcuse's critique of Weber lies in what he takes to be the latter's suspect conflation of reason and rationalization which, for the former, is inextricable from domination. It is necessary, in Habermas' view, to keep the philosophical and sociological dimensions of his critique separate and distinct. The former derives, as it does for the first generation of Critical Theorists as a whole, from what Habermas regards as the problematic horizon of what he calls the 'secret hope of the redemption of a fallen nature, of restoring 'nature's voice'. This would entail, then, 'a different scientific methodology in general ... The viewpoint of possible technical control would be replaced by one of preserving, fostering, and releasing the potentialities of nature' (1970: 86). Because Marcuse articulates his philosophical critique from within the antiquated confines of the metaphysics of the philosophy of consciousness, his critique of technology becomes obsolete. If technology could be viewed phenomenologically as a 'project' at all, it could only be as a 'generic' one, which has the human species as a whole as its subject, 'not one that could be historically surpassed' (1970: 87). Habermas accuses Marcuse of the category error of attempting to apply concepts that are applicable only to inter-subjective relations to relations between subject and object.

Habermas is, nonetheless, more sympathetic to Marcuse's sociological critique of technology as the dominant ideology within late capitalism. He agrees with Marcuse's view that rather than exploding capitalist social relations from within, technology legitimizes this order. Technological reason, in Habermas' view, becomes the means by which the 'productive forces ... continually threaten the institutional framework *and at the same time* set the standard of legitimation for the production relations that restrict the potential' (1970: 89, emphasis in original). This is an early version of Habermas' 'colonization' thesis articulated in the second volume of the *Theory of Communicative*

*Action*, according to which the fundamental pathology of late capitalist societies lies in the tendency of the steering mechanisms of the social subsystems of economy and state, namely money and power, to 'colonize' the symbolically mediated sphere of the life-world. So, rather than rejecting Marcuse's critique of technology *tout court*, Habermas seeks to set it on firmer, post-metaphysical footing. This is accomplished by arguing that the ideological nature of technology (and science) inheres not in its orientation towards controlling nature, but rather in the transgression of the boundary of its own sphere of value. Because its legitimate orientation consists of controlling nature, technological or cognitive-instrumental rationality becomes ideological when it overflows or exceeds the sphere of subject-object relations or the sphere of work and spills into that of inter-subjective relations or that of 'interaction'. This argument rests upon a theoretical edifice that becomes clearer in Habermas' subsequent work, central to which is an understanding of language that privileges validity over meaning.

Indeed, as alluded to above, Habermas' account of language enables him to reconstruct the relationship between technological form and totality. This account of language is based on an appropriation of speech act theory, and rationality itself is understood in terms of a formal conception of argumentation. By shifting the perspective from the relation between subject and object to that between subject and subject or inter-subjectivity, Habermas grounds rationality in the 'argumentative procedures for directly or indirectly redeeming claims to propositional truth, normative rightness, subjective truthfulness and aesthetic harmony' (1987: 314). The dirempted spheres of validity (science, morality, art) are unified not in an emphatic, metaphysical way as in Hegel's conception of Absolute Spirit, or in Lukács' conception of the identical subject-object of history, or in Marcuse's early ontological understanding of labour but, rather, in terms of communicative action.

Habermas' critique of Marcuse's understanding of technology and, indeed, his reconstruction of Critical Theory as a whole is based on the marginalization of a 'world disclosive' conception of language (Lafont, 2000; Kompridis, 2006). Such a marginalization becomes especially clear in Habermas' engagement with Derrida, in which he draws a strong line between pragmatic or 'problem-solving' and disclosive conceptions of language (Habermas, 1987; Gandesha, 2006). In other words, with his emphasis on the *argumentative* redemption of claims to validity within the 'objective', 'social' and 'subjective' worlds, Habermas could be said to suspend the question of the meaningfulness of these worlds themselves. But what precisely is meant by 'world disclosure'? The world disclosive conception of language (in a lineage stretching back to Wilhelm von Humboldt and Herder) emphasizes, as Gadamer puts it, that 'Language is not simply one human possession among others in the world, rather, on it depends the fact that human beings *have* a world at all' (cited in Bohman, 1996: 200). The concept of 'world refers to the always already articulated, shared orientations and interpretations, independent of individuals who are socialized in it' (Bohman, 1996: 200).

As Bernstein (1994: 210) has suggested, while Habermas claims that interpretation has a key role to play within his theory, he nonetheless privileges discourses of justification. Such a privileging has a tendency to rehabilitate the positivist position that tends to denigrate the rationality of logic of discovery by holding that only justificatory discourses are rational. Validity claims within the three spheres are modelled on that of scientific truth which itself, at least for Habermas, presupposes 'nature as it is'. The marginalization of the disclosive conception of language places the emancipatory aspiration of modernity – its unique consciousness of time, its relentless impulsion to generate its own normativity out of itself, its need for a new beginning unencumbered by the past, etc. – in jeopardy. In his assessment

of poststructural critiques of the discourse of modernity, Habermas juxtaposes in sharp outline his pragmatic conception of language with the disclosive conception that figures so prominently in the work of thinkers such as Jacques Derrida but whose provenance is clearly Heideggerian. Central to Habermas' critique of the poststructural appropriation of Heidegger is that it is based upon the idea of the 'ontological difference': the happening of truth that discloses the world is a mysterious extra-mundane dispensation of Being, rather than the result of intra-mundane action and learning processes.

## MARCUSE, TECHNOLOGY AND WORLD DISCLOSURE

As previously suggested, Marcuse's conception of technology (as opposed to technics), albeit without its fullest linguistic implications, is based on a notion of disclosure. If this aspect is emphasized, then it is possible to defend his account of technology from Habermas' critique. By so doing it may also be possible to expose some of the weaknesses of the communicative paradigm.

It might be argued that the very strength of Habermas' critique of the pre-eminence of the paradigm of production in Marcuse is at the same time its weakness. While Habermas might be correct to take issue with Marcuse's attempt to ground his critique of technological reason in the paradigm of production, such a critique can perhaps be undertaken without necessarily accepting the premises of the paradigm of communication. As suggested above, the elements of the production paradigm, namely its emphasis on the centrality of labour as an ontological category, sit rather uncomfortably with the phenomenological dimension of Marcuse's critique. The productivity of meaning and the productivity of labour power cannot be assimilated. Meanings accumulated and embedded in cultural traditions are not to be re-appropriated

in an analogous way to the appropriation of accumulated, 'dead labour' by 'living labour'. Habermas must privilege validity over meaning in order to complete the transition from the philosophy of consciousness to communicative reason.

In contrast, Marcuse can be defended if we read his critique of technology as anticipating the following insight: that in each of the three realms – science, morality and art – it is possible to discern the operations of a disclosive conception of language. This is what Adorno calls 'constellation' and what Wittgenstein calls 'aspect seeing'. Far from subverting rationality ('the acquisition and use of fallible language'), linguistic world disclosure, in fact, makes such rationality possible. Any theory that fails to elucidate the manner in which the world, itself, becomes possible ends up reifying the symbolic resources of the lifeworld and, therefore, short-circuits the possibility of its transformation. In contrast to Habermas, the merit of Marcuse's critique of technology is to show the way in which validity and meaning exist in a relation of genuine tension.

While Habermas is correct to note the ambivalence in Marcuse's approach to technology as both value-neutral and a specific historical 'project', such an approach isn't so contradictory as it may *prima facie* appear. The key concept that undergirds Marcuse's critique of technological reason is what he calls the 'technological *a priori* which organizes modern science and technology. It is the culmination of the processes of rationalization and disenchantment that Marcuse outlines in his critique of Weber and appropriation of Husserl. As rationality comes to be defined in terms of objective laws of motion, values become purely subjective as opposed to indexed to a conception of objective reason. The effect of this is that, theoretically, the transformation of humanity and external nature is free from all limitations except, of course, from the 'brute factuality of matter', and become a '(hypothetical) system of instrumentalities'. The elaboration of

such a system becomes more than simply the development of all forms of particular technical organization; rather, it is their precondition. 'Proved in its effectiveness', Marcuse (1965b: 152) argues, 'this conception works as *a priori* – it predetermines experience, it *projects* the direction of the transformation of nature, it organizes the whole'.

Marcuse's example is that of the automobile which, of course, gives its name to an entire 'regime of accumulation', namely: Fordism:

A man who travels by automobile to a distant place chooses his route from highway maps. Towns, lakes and mountains appear as obstacles to be bypassed. The countryside is shaped and organized by the highway. Numerous signs and posters tell the traveller what to do and think; they even request his attention to the beauties of nature and the hallmarks of history. Giant advertisements tell him to stop for the pause that refreshes. And all this is indeed for his benefit, safety and comfort; he receives what he wants. Business, technics, human needs and nature are welded together into one rational and expedient mechanism. He will fare best who follows its directions subordinating his spontaneity to the anonymous wisdom that ordered everything for him. (Marcuse, 1990: 143)

The automobile, the 'rational and expedient mechanism into which is synthesized 'business, technics, human needs and nature', functions as the 'technological *a priori*'. The very judgement that it is the most effective means of travelling from point A to point B structures in advance the visible and the invisible (what Rancière calls the 'distribution of the sensible'). The automobile as technology materialized participates therefore in disclosing the world. Albert Borgman views the modern highway system, as well as symbolic logic and modern architecture, as exemplifying the essential features of technology. Like the other two forms of technological practice, the highway system qua 'embodied calculus, is not just *instrumental* but *paradigmatic*' (Borgman, 1978: 20). As a paradigm it shapes our vision of objectivity. Thus, like the vicious circle that Marcuse discerns in Husserl,

in technological practice formal features are discovered in the concrete phenomena of our world. Such discoveries lead to the construction of formal models that cover a certain domain of the concrete world. These models form a hierarchy from concrete and limited realizations at the bottom to more abstract and encompassing models in the higher reaches of the hierarchy. (Borgman, 1978: 20)

In the process, technological practice 'delimit[s] in rigorous form the space of all possibilities of the domain that they cover', the result of which is that the 'world in its historical coherence and its actual and singular presence recedes' (20). Or, as Marcuse (1990: 143) puts it, 'The countryside is shaped and organized by the highway'.

Viewed now in light of the concept of 'technological a priori', the apparent contradiction between technics as neutral, and technology as value-laden, dissolves. The form functions at the level of what Marcuse calls technology, while technics constitute the productive forces that can promote either domination or liberation. Marcuse takes up the phenomenological understanding of technology as 'nothing technological' (Heidegger), that is, as a mode of 'revealing beings' without at the same time understanding world disclosure as existing beyond the pale of history. The technological disclosure of being happens through historically situated human decisions and practices. In fact, it is precisely the very productivity of technics that makes it possible to imagine the objective possibility of a radically different set of social arrangements. This does not mean that the appearance of such an imaginary is its realization. Rather, Marcuse provides us with the possibility of understanding the relation between technology and technics as the relationship between meaning and validity respectively. While technics can and must be understood in terms of the criterion of 'success' in achieving a given end, the sense or meaning of success itself would have to be understood in terms that lay beyond the narrow provenance of pure instrumental means

or efficiency. Such a criterion would have to make reference to a wider set of assumptions, orientations and commitments that cannot ultimately be understood independently of the languages within which they are expressed. Success can be defined in terms of the furtherance of domination of human beings and external nature alike or it could be understood in terms of the thriving and flourishing of human and non-human life within a 'pacified existence'.

## CONCLUSION

What we have tried to show is that, from its origins in the mid 1920s, Critical Theory applied itself to the question of why, in the midst of a profound crisis of capitalism in the inter-war period, the outcome was counter-revolution rather than proletarian revolution. Committed to the idea that any compelling grasp of the physiognomy of this crisis must be premised on totality, Critical Theory disavowed a purely philosophical conception of it. Rather, it constituted an interdisciplinary research project geared, in part, to empirical analysis of the social-psychological and institutional nature of the crisis that questioned some of the key assumptions of traditional or 'world-view' (Heinrich, 2012) Marxism. In particular, it challenged the role such a form of Marxism assigned to the productive forces. Drawing upon Marx's critique of the value form, Lukács' important elaboration of this critique in the concept of 'reification' and Weber's account of the rationalization of disenchantment, Critical Theorists, in particular Herbert Marcuse, sought to show the manner in which, far from constituting a neutral, abstract form of rationality that would burst asunder capitalist production relations from within, technology actually helped to consolidate rather than transform these relations. Technology, Marcuse argued, wasn't simply an abstract instrumentality but rather

constituted the principle perceptive structure – the ‘technological a priori’ – through which the world takes shape. It is for this reason that the aesthetic dimension comes to play a key role in the politics of Critical Theory.

## Notes

- 1 This was perhaps most dramatically represented by Thomas Mann in his novel *Dr. Faustus*, in which the troubled yet brilliant composer, and representative of the most advanced artistic form, Leverkühn, threatens to ‘revoke’ Beethoven’s *Ninth Symphony* with its *pièce de résistance* ‘Ode to Joy’, a beautiful paean to the solidarity of a universal humanity proclaimed in Schiller’s song.
- 2 Much of what follows draws upon Gandesha (2004).

# Materialism

Sebastian Truskolaski

## INTRODUCTION

The aim of this chapter is to outline the significance of materialism for the formulation of the Frankfurt School's critical theory of society. Traditionally, materialism has been taken to mean that the world is composed of a single substance or matter, and that all worldly phenomena – including ostensibly intangible ones, such as thought – are modifications or attributes thereof. Accordingly, materialism has long been equated with the view that our experience of the world is rooted in (and conditioned by) tangible, material circumstances. It signals an effort to explain the world out of itself, on its own terms, i.e. without appealing to any higher principle, be it the primacy of the Idea or the supreme reign of God. The wider implication of this view – famously elaborated in the nineteenth century by Karl Marx, Friedrich Engels and their followers – is that these material circumstances are historically produced, rather than naturally given or divinely

sanctioned, and that, as such, they can be contested, challenged and, ultimately, changed. However, as we will find, many of the most prominent attempts to give concrete shape to these views have wound up inadvertently reproducing the very metaphysical assumptions that they set out to overturn. The materialism of the Frankfurt School stems squarely from within this contested space. Accordingly, the positions advanced by figures from its so-called 'first generation' (particularly Max Horkheimer and Theodor W. Adorno, as well as Ernst Bloch, Walter Benjamin and Herbert Marcuse) mark a significant, if not uncritical, contribution to the history of this idea. Horkheimer, for instance, discusses the question of materialism in his early essays 'Materialism and Metaphysics' (2002a), 'Materialism and Morality' (1993) and his seminal 'Traditional and Critical Theory' (2002b). This theme is taken up again in his discussions with Adorno (Adorno and Horkheimer, 2011), who – in turn – treats it in his lectures on *Philosophical*

*Terminology* (1974) and his magnum opus *Negative Dialectics* (1973). Other notable examples include Bloch, who explores the issue in his book *Das Materialismus-Problem, seine Geschichte und Substanz* [*The Problem of Materialism, its History and Substance*] (1972), Benjamin, who debates the matter in the notes comprising his unfinished *Arcades Projects* (1999), and Marcuse, who examines the subject in his essay 'New Sources on the Foundation of Historical Materialism' (2005). What holds these texts together is that, in one way or another, they all interrogate the professed materialist disposition of Marxian social criticism, which, they suggest, had hardened into a dogmatic worldview by the 1930s – at least in its official iterations. Following figureheads of 'Western Marxism' (Elbe, 2013), such as Georg Lukács and Karl Korsch, the authors from the Institute for Social Research thus re-inscribe the diverse concerns collected under the heading of materialism into the history of philosophy, especially that of German Idealism – a tradition which, in their estimation, had been prematurely left for dead. In this regard, Horkheimer, Adorno et al. explore questions of experience and affectivity, cognition and morality, as well as the relation between nature and culture in the age of 'positivism' – a byword for the philosophically un-reflected empiricism of much scientific thought, including its Marxist variants. By re-engaging with the problems of materialism in this expanded sense, and by drawing on a range of disciplinary specialisms – from sociology to philosophy and economics – the authors from the orbit of the Institute for Social Research thus sought to recast the parameters of this concept with and beyond Marx. In this regard they position themselves against a tendency, prevalent amongst Soviet Marxists such as Lenin, who tended to neglect the wide-ranging philosophical implications of Marx's early writings, thus re-converting the emphasis on the material transformation of society into a metaphysical doctrine.

It is noteworthy, too, that many of the most pointedly Marxian aspects of the early Frankfurt School's materialism were taken up in the 1960s/1970s by students of Adorno and Horkheimer in Germany, and Herbert Marcuse and Leo Löwenthal in the United States. Significant examples include works by Alfred Schmidt (1971, 1973, 1974, 1975, 1977, 1981), Hans-Jürgen Krahl (1974), Hans-Georg Backhaus (1997), Helmut Reichelt (2001), Alexander Kluge and Oskar Negt (2014), as well as Angela Davis (1998). Their positions markedly contrast with those of prominent figures from the so-called 'second-generation' of the Frankfurt School, including Jürgen Habermas and Axel Honneth, whose work has tended to foreground questions of normativity over explicitly Marxist-materialist forms of social criticism.

Without presuming to account for the full breadth of the Frankfurt School's materialism – there are, of course, considerable differences between its individual players – the following pages will attempt to highlight some of its salient features, such as the prominent emphasis on the suffering body, on materialist epistemology, and on the negative image of utopia that the examination of these themes is supposed to throw into relief. To this end the chapter is organised into three parts: (1) An overview of the history of materialism, and an indication of the Frankfurt School's place therein; (2) An account of Adorno's 'imageless materialism' as a paradigmatic instance of the Frankfurt School's position; (3) An attempt to highlight the cotemporary resonance of the Frankfurt School's ideas in contrast with a recent form of philosophical materialism known as Speculative Realism. All the while the overarching conceit is the following: the Frankfurt School's re-formulation of materialism – the malleability of man's historical, material situation – intends to safeguard Critical Theory from the perceived pitfalls of both Soviet-style Marxism and liberal scientism by creating an interdisciplinary toolkit with which to change the world that philosophy has hitherto only interpreted.

## OVERVIEW OF THE HISTORY OF MATERIALISM

Although it is arguable that the concern with matter and the way that it relates to consciousness is coeval with the emergence of (European) philosophy itself, *materialism* – in the sense of a distinctive intellectual formation – means an eminently modern phenomenon; one that rose to prominence in eighteenth-century France during the era of the so-called ‘High Enlightenment’ and is associated with the writings of the Baron d’Holbach, Julien Offray de la Mettrie, Denis Diderot, Claude Adrien Helvétius and others (Israel, 2001). In turn, the French materialists – whose fiercely atheistic views are frequently named in connection with the revolutionary ferment of the late 1780s – forged their positions in response to a wide range of older philosophies, which foregrounded the material stuff of life over the lofty realm of ideas: from the Pre-Socratic Atomism of Democritus and his follower Epicurus, to the pantheistic monism of Spinoza, and the scientific thought of Galileo, Bacon and Descartes. With a view to these sources, amongst others, the French materialists developed their characteristically polemical, politically explosive view that human beings are quasi machine-like, that they are independent of divine design, and that – as such – they are not answerable to clerical and (by extension) royal authority. A famous formulation of these views appears in d’Holbach’s *The System of Nature* (1770), which denies the existence of any final causes, arguing that there is no soul apart from the living body, and suggesting that faith in God is the result of an irrational fear before the ultimately mechanistic processes of nature.

Despite the widespread political reception of the French materialists’ ideas amongst German-speaking intellectuals, which was due – above all – to their association with revolutionary Republicanism, their philosophy as such tended to be met with some suspicion. Immanuel Kant, for instance, whose declared, if not unambiguous, sympathies for

the French revolution are well documented (Kant, 1996), rejected materialism – alongside Idealism – as insufficient for grounding a critically self-reflexive form of philosophy. As he writes:

Through criticism alone can we sever the very root of materialism, fatalism, atheism, of freethinking unbelief, of enthusiasm and superstition, which can become generally injurious, and finally also of idealism and skepticism, which are more dangerous to the schools and can hardly be transmitted to the public. (Kant, 1998: 119)

The German aversion to materialism, which was foreshadowed in the famous controversy between Leibniz and Newton (Bertoloni-Meli, 1993), remained in force throughout the first three decades of the nineteenth century – a period that was dominated by the Idealist systems of Fichte, Hegel and Schelling. The Idealist’s relation to materialism can be gleaned in Hegel’s lectures on the history of philosophy (1995), which praise the French materialists’ attempt to overcome the dualism of body and mind, whilst rejecting their view that it is possible to grasp totality in terms of mere matter. What is important here is that following Hegel’s death in 1831, Idealism – the philosophy of Spirit – increasingly came under fire. As a consequence, numerous attempts were made to circumnavigate its perceived failings. They are characterised by an extraordinary conceptual breadth, ranging from Søren Kierkegaard’s Existentialism to Hermann von Helmholtz’s Neo-Kantianism. Amongst these varied programmes there are four specifically materialist approaches that bear mentioning, insofar as they form the backdrop to the Frankfurt School’s subsequent work. They are, first, the physiological materialism of Jacob Moleschott, Carl Vogt and Ludwig Büchner; second, the anthropological materialism of Ludwig Feuerbach; third, the early dialectical/historical materialism of Karl Marx and Friedrich Engels; and fourth, the late reformulation of dialectical/historical materialism by Engels, as well as its reception by Vladimir Ilyich Lenin.

(It exceeds the limitations of the present chapter to outline a fifth important forebear of the Frankfurt School's position, namely: the messianic materialism of the Jena Romantics [Frank, 2004].)

First, then, Moleschott, Vogt and Büchner are notable principally because their positions demonstrate the extent to which German-speaking philosophers had abandoned the precepts of Idealism by the mid nineteenth century (Gregory, 1977). Over the course of the 1850s, Vogt, for instance, published a series of popular texts that echoed the fierce atheism of the French materialists by rejecting the biblical view of creation on biological grounds, arguing that the world, and our experience of it, is to be explained in purely physiological terms; a view that, in turn, led him to identify psychological processes with physical ones (e.g. thinking with brain activity). Vogt's ideas were vigorously contested by an array of Christian thinkers, most prominently Rudolf Wagner, culminating in a public disagreement at Göttingen in 1854 – the so-called *Materialismus-Streit* (Bayertz et al., 2012). Without touching on the finer points of these debates – in essence they amount to a series of broadly ideological declarations of the superiority of materialism over spiritualism and vice versa – the public interest in such issues, spurred on by major advancements in the life sciences, created a fertile climate for the proliferation of other materialist philosophies.

Second, Ludwig Feuerbach – a contemporary of the physiological materialists, who corresponded for a time with Moleschott and Vogt (Feuerbach, 1993) – is significant for introducing an anthropological dimension into the newly fangled German debates about the primacy of matter. Along with Bruno Bauer, Max Stirner and others, Feuerbach had been associated with the left-leaning Young Hegelians, who – in the period before 1848 – foregrounded aspects of Hegel's philosophy that had seemed to them to call for a ruthless criticism of the present (chiefly religion, but also the state) in the name of a fully

actualised form of reason, and an associated state of freedom, which, they claimed, followed from Hegel's thinking, but exceeded in its radicality his stated intentions. Although Feuerbach is best remembered for the criticisms levelled at him by Marx (2000) and Engels, his central work – *The Essence of Christianity* (1957) – is an important forerunner of dialectical/historical materialism, not least because it emphasises the importance of human sensuality. As Feuerbach writes, 'I negate God. For me this means that I negate the negation of the human. I put the sensual, real, and, consequently, necessarily political and social position of the human in place of its illusory, fantastic, heavenly position' (Feuerbach, 1990: 189). On this basis, Schmidt has done much to rehabilitate Feuerbach's philosophy by pointing out the importance of his atheistic humanism for the development of subsequent materialisms. As he argues:

If, in its most advanced form, Marx's theory discusses societal reality on two levels (which are related precisely by dint of their *mediation*); if it insists that, despite their objectivity, economic categories, such as the commodity, value, money, and capital are 'subjective', i.e. that they are concrete existential determinations of embodied human beings, then this insight points back to Feuerbachian impulses. (Schmidt, 1973: 19)

Third, then, Marx and Engels are crucial for carrying out a practical re-orientation of Feuerbach's anthropological materialism, by foregrounding the agency inherent in human sensibility, which is central for the wider project of re-shaping the material world. Although Marx acknowledges the importance of Feuerbach for the development of these ideas, one of the best-known documents of his consequential efforts to recast the concept of materialism is a set of critical notes known as the 'Theses On Feuerbach' (2000): 'Feuerbach', we are told, 'wants sensible objects – really distinguished from thought-objects: but he does not conceive human activity itself as *objective* activity ... Hence he does not grasp the significance of

revolutionary, practical-critical activity' (Marx, 2000: 171). As such, Marx chides, Feuerbach merely presents another variant of traditional materialism. By contrast, he suggests, the true task of materialism would be to outline an approach that is intellectually adequate to the actualisation of philosophical ideas, to 'revolutionary, practical-critical activity' – in short, to changing the world. This is why, as Schmidt points out, Marx's concept of materialism aims at a critique of social objectivity. But there is another instructive point that can be gleaned from this short passage, namely: Marx's redefinition of the then prevalent philosophical conception of subjectivity. That is to say, Marx sought to recast the (Kantian) concept of the subject – the 'I' – as, in the first place, passively apprehending the material world as an object of intuition before mastering it intellectually through its conformity to certain mental structures that are deemed to be universally human (space, time, causality). However, although Marx concedes Kant's point that the subject is central to producing knowledge of the material world, he denies that the role of human sensibility is merely passive in this process. Rather, he ascribes sensibility – and hence human activity more generally – a transformative role. As Peter Osborne points out, 'This new materialist redefinition of the human subject as sensible practice (practical activity as the sensuous being of the human), rather than a subject being defined by its knowledge of an object, has profound consequences for the traditional philosophical concept of human essence' (Osborne, 2005: 29). Instead of appearing as a mere 'abstraction inherent in each single individual', the inter-relatedness of human activity means that the old conception of society as an aggregate of competing individuals no longer holds. Instead, Marx foregrounds the relational character of socially transformative practice under the banner of his new materialism – a materialism aimed at changing society.

Finally, it bears stressing the importance of Engels' reformulation of his and Marx's concept of materialism in later works like *Anti-Dühring* (1987a), *Dialectics of Nature* (1987b) and *Ludwig Feuerbach and the End of Classical German Philosophy* (1990), as well as the reception of these works by Lenin. (As we will find, it is the Engelsian-Leninist position that prompts the Frankfurt School's reformulation of materialism.) On Engels' late account, his and Marx's common goal had been to demonstrate a 'general law of development of nature, society, and thought', which is at once historical and ontological (Marx and Engels, 1990: 361). Engels thus equates certain socio-political developments with particular natural processes. As he argues, 'what is valid for nature' – the material world as such – 'must also be valid for history'; 'Political praxis is ... the consummation of historical' and, by extension, natural 'laws' (Elbe, 2013). This schema has epistemological implications. For Engels, the 'law' of the dialectic, which he and Marx had taken over from Hegel, is, in fact, 'split into "two sets of laws"': into 'the dialectic of "the external world"', on the one hand, 'and the dialectic of "human thought"', on the other (Elbe, 2013). In this sense, Engels' view aims at a materialist reversal of Hegel's philosophy. 'The inversion of the dialectic in Hegel rests on this, that it is supposed to be the "self-development of thought", of which the dialectic of facts is ... only a reflection, whereas the dialectic in our heads is in reality the reflection of the actual', material, 'development going on in the world of nature and of human history in obedience to dialectical forms' (Marx and Engels, 1975: 520). In this sense, Engels suggests, Hegel's dialectic is marked by a simple mind-matter dichotomy, which is unduly weighted in favour of thought. It is not Spirit which drives the historical process, but an as yet unnamed material force. (By contrast, it will be recalled, for Marx this force had been human activity: practice.) Undoing this confusion is supposed to put the dialectic back on its feet. On the one hand, this is intended

to demonstrate the interconnectedness of all fields of intellectual inquiry (philosophy, political economy and the natural sciences are all seen as evincing the same dialectical-historical tendency); and, on the other hand, this unifying endeavour is designed to put socialism on the authoritative ground of empirical science. However, Engels' view that the dialectic 'in our heads' is merely a reflection of 'actual developments in the world' undercuts the primacy of praxis, and with it critique, which he and Marx had previously insisted on. Engels portrays consciousness as a mere 'product of evolution and a passive reflection of the process of nature, not however as a productive force' (Schmidt, 1971: 55–6). In other words, as Schmidt points out, Engels' later characterisation of his and Marx's concept of materialism portrays the external world as a rigid, immutable given, in which humankind is 'limited to a mere mirroring of the factual', i.e. the 'uncritical reproduction of existing relationships in consciousness' (Schmidt, 1971: 56). It seems clear, then, that if the Frankfurt School's conception of a Marxian materialism entails that human beings have the power to practically affect their material circumstances (a return to Marx's early insight), then the cogency of this view will depend on how effectively they can challenge Engels' position. In order to gain a fuller sense hereof, however, it remains to consider a final episode from the history of materialism, namely: the reception of Engels' ideas by Lenin.

Engels' late re-formulation of his and Marx's concept of materialism resounds in Lenin's meta-scientific opus *Materialism and Empirio-Criticism* (1961) – a work that went on to significantly shape the theoretical foundations of Soviet Marxism. On the surface, Lenin's book is couched in a string of factional debates concerning recent developments in the natural sciences. The discovery of radioactivity, in particular, is supposed to have led to a widespread rejection 'of an objective reality existing outside the mind'; a sentiment that – in turn – provoked 'the

replacement of materialism by idealism and agnosticism' (Lenin, 1961: 252). Lenin's misgivings are directed chiefly at Alexander Bogdanov's three-volume work *Empirio-Monism* (1904–6), which – for its part – draws on theories developed by the Austrian physicist Ernst Mach. In brief, Mach argues that physics proceeds not from the study of matter, but from the study of sense-experience: 'not bodies produce sensations, but element-complexes (sensation-complexes) constitute the bodies' (Mach, 1959: 29). Bogdanov follows Mach by advocating a strict empiricism, which rules out any form of *a priori* knowledge. As he argues, 'The real world is identical with human experience of it' (Rowley, 1996: 5). His specifically Marxist manoeuvre is to recast the individual experiences described by Mach into those of a collective subject: the proletarian class itself. Accordingly, knowledge of the external world – and the ability to change it – is not based on the merely subjective whims of individuals. Rather, it is made up of the 'shared perceptions of the collective consciousness of a society' (Rowley, 1996: 5). However, as Lenin charges, Bogdanov's idiosyncratic adaptation of Mach cannot escape its rooting in a fundamentally individualistic outlook. Accordingly, the prioritisation of sense-experience is said to displace the primacy of mind-independent matter – a circumstance whose political consequence is taken to mean that materialism, which Lenin equates with political praxis, is transformed into subjective quietism. Accordingly, the purportedly bourgeois 'belief that our knowledge of the world is constructed out of a field of sense-data' is seen as creating 'an insuperable barrier between human consciousness and the external world' (Richey, 2003: 43). Lenin's effort to defend the priority of matter thus requires an alternative account of how human beings relate to the material world – an alternative epistemology. As Lenin argues, rather than constituting bodies, sensation appears as 'the direct connection between consciousness and the external world' (Lenin, 1961: 51).

In a clear echo of Engels' later works, sense data is said to mirror the world as it really is, independently of (and external to) consciousness. Consequently, Lenin argues that 'sensation, perception, idea, and the mind of man generally' are to be regarded 'as an image of objective reality' (Lenin, 1961: 267). This framework is supposed to guarantee the simple primacy of matter over ideas since 'consciousness is only an image of the external world, and it is obvious that an image cannot exist without the thing imaged, and that the latter exists independently of that which images it' (Lenin, 1961: 69). The proof that these images are bearers of objective truth is supposed to be provided by scientific experimentation, the analogue of which is seen as political praxis. However, here Lenin runs into difficulties since his suggestion that 'it is absolutely unpardonable to confuse ... any particular theory of the structure of matter' with the 'epistemological category' of matter itself, suggests that the primacy of matter is somehow immune to scientific contestation (Lenin, 1969: 129). Accordingly, his effort to escape the trappings of Idealism (the mastery of reality in thought) runs the danger of reproducing, rather than refuting, the position he rallies against. Indeed, the problem that Adorno, Schmidt and others point to in this regard can be summed up as follows: if no 'particular theory' can pose a challenge to the unshakeable reality of matter as an 'epistemological category', then matter itself – along with the revolutionary politics that it is supposed to guarantee – is dogmatically elevated to a metaphysical invariant.

It goes beyond the limitations of the present chapter to explore in detail how Lenin's reflections bear on his explicitly political thought, and, furthermore, on his consequential revolutionary activities. The mediations are complex. Suffice to note that Lenin's views became fundamental for formulating the theoretical self-understanding of the Soviet Union as the quasi-inevitable product of history's untrammelled, 'dialectical' progress. It is *this* official iteration of a Marxist

materialism that was forcefully contested by the members of the Frankfurt School, especially following the publication of Marx's *Grundrisse* in 1939. This juncture invites a preliminary observation. To the extent that one can speak of materialism in terms of a unified concept, it seems to fall under what Adorno and Horkheimer describe as a 'dialectic of enlightenment' (Adorno and Horkheimer, 2002: 26): on the one hand, the philosophically problematic insistence on the simple primacy of matter can serve as an emancipatory blow against the entrenched, and apparently divinely ordained social structures of, say, the *ancien régime*; however, on the other hand, a suggestion such as Lenin's, that human consciousness merely reflects mind-independent matter, risks reproducing these structures under a different name – as incontestable facts of a seemingly inevitable historical process, which tends (in Adorno and Horkheimer's estimation) to culminate in barbarism rather than socialism. In other words, a materialist programme like that of the Frankfurt School – to 'reject the illusion that ... the power of thought is sufficient to grasp the totality of the real' (Adorno, 1977: 120) – cannot be put into practice if matter is transformed into a philosophical ideal.

## ADORNO'S 'IMAGELESS' MATERIALISM

Having briefly outlined some major markers from the history of materialism – from d'Holbach to Lenin – it remains to consider the Frankfurt School's particular contribution to the development of this theme. Instead of surveying its members' individual positions, the following section will focus on one paradigmatic example, which speaks to many of their common concerns, namely: Adorno's notion of an 'imageless' materialism. As will become apparent, Adorno outlines a philosophically self-reflexive challenge to the scientific tendencies of Marxist materialism

by elaborating on a number of the Institute's core ideas: a form of mimetic rationality that would radically reconfigure the relationship between humankind and the material world under the yoke of capitalist modernity; the suffering body as a negative expression of humankind's wish for physical fulfilment; and an associated form of historiography that would resist the progressive narratives of vulgarised leftist discourse. In one way or another all of these themes are echoed in a memorable passage from Adorno's magnum opus *Negative Dialectics*, titled 'Materialism Imageless'. There Adorno writes:

Representational thinking [*Abbildendes Denken*] would be without reflection – an undialectical contradiction, for without reflection there is no theory. A consciousness interpolating images, a third element, between itself and that which it thinks would unwittingly reproduce idealism. A body of ideas would substitute for the object of cognition, and the subjective arbitrariness of such ideas is that of the authorities. The materialist longing to grasp the thing aims at the opposite: it is only in the absence of images that the full object could be conceived. Such absence concurs with the theological ban on images. Materialism brought that ban into secular form by not permitting Utopia to be positively pictured; this is the substance of its negativity. At its most materialistic, materialism comes to agree with theology. Its great desire would be the resurrection of the flesh, a desire utterly foreign to idealism, the realm of the absolute spirit. The perspective vanishing point of historic materialism would be its self-sublimation, the spirit's liberation from the primacy of material needs in their state of fulfilment. Only if the physical urge were quenched would the spirit be reconciled and would become that which it only promises while the spell of material conditions will not let it satisfy material needs. (Adorno, 1973: 207)

Above all, this passage seems to stake an epistemological claim: that a purportedly materialist form of cognition which interpolates images – 'a third element' – between consciousness and 'that which it thinks', in fact, 'unwittingly reproduces idealism'. Adorno's phrasing thus recalls the traditional opposition of materialism and idealism – the realm of 'material needs' vs. that of 'absolute spirit'. It acknowledges a 'risk that

supposedly materialist thinking will involuntarily turn into its opposite' (Jarvis, 2004: 96), i.e. into a form of subjective domination, which Adorno associates with certain unspecified 'authorities'. To be sure, Adorno's reference to 'representational thinking' calls to mind the various forms of 'reflection theory' that punctuate the history of materialism from Democritus to Locke. In this respect, the German term *Abbild* – image, copy – takes centre stage. The locus of the problem, Adorno suggests, lies in 'the Eastern countries' (Adorno, 1973: 206). Notwithstanding this indelicate indictment of the so-called 'East', it is striking that Adorno speaks here of a 'materialism come to political power', of 'governmental terror machines' that 'entrench themselves as permanent institutions, mocking the theory they carry on their lips' (Adorno, 1973: 204). Accordingly, his invective appears to be directed chiefly against the official materialist doctrines of the Soviet Union, not least amongst them Lenin's *Materialism and Empirio-Criticism*. This suspicion is confirmed by the fact that Adorno explicitly names Lenin in the paragraph preceding the one from which the long citation above is drawn. As he writes, 'When Lenin, rather than go in for epistemology, opposed it in compulsively reiterated avowals of the noumenality of cognitive objects, he meant to demonstrate that subjective positivism is conspiring with the powers that be' (Adorno, 1973: 205–6). This is further borne out in a lecture dated 17 January 1963, where Adorno describes 'the big book by Lenin about *Empirio-Criticism*, which through a sort of dogmatic repetition declares the objective reality of the world vis-à-vis its reduction to subjective givens' (Adorno, 1974: 200). Accordingly, the question arises as to what kind of materialism is at issue here – what kind of politics is supposed to follow from it? Certainly, any attempt to answer these questions cannot go unqualified today. Inasmuch as the theoretical and political sway of the Soviet Union has been irrevocably consigned to the history books, Adorno's

objections to the functionaries of dialectical materialism may appear to have lost much of their currency. Nevertheless, 'Materialism Imageless' points beyond its immediate context by holding fast to what Adorno describes elsewhere as a 'Utopia of cognition' (Adorno, 1973: 10). That is to say, 'the materialist longing to grasp the thing' means nothing less than a desire to radically reconceive how thinking bears on the material world, albeit not without certain caveats. For what can we really say about a 'cognition that neither merely depicts nor constitutes things – how is it to be thought?' (Schmidt, 1984: 25). After all, the Utopia implied by Adorno's concept of materialism – 'harmony between man and nature', as Schmidt puts it (1984: 25) – is subject to a ban on representation. As Adorno argues, 'one may not cast a picture of Utopia in a positive manner'; 'one can only talk about Utopia in a negative way' (Adorno and Bloch, 1988: 9). To form any image of Utopia is to predetermine it from the standpoint of the present situation and thus 'to garnish the status quo with its ultimate apologia' (Comay, 1997: 348). The question thus arises as to how we can make sense of Adorno's concept of materialism given that it resists any positive determinations.

One possible avenue would be to respond to this question negatively, i.e. by clarifying the terms in which Adorno criticises Soviet materialism, especially Lenin's theory of reflection. This will allow us to situate his views, and – by extension – those of the Frankfurt School more generally, in the long history of materialism sketched in the previous section. The following pages, then, will consider two prominent aspects of Adorno's 'imageless' materialism: its quasi-epistemological dimension and its somatic moment.

In *Negative Dialectics* Adorno argues that Lenin's concept of materialism is rooted in 'an Epicurean-style materialist mythology, which invents the emission by matter of little images' (Adorno, 1973: 205). As he writes, the 'naïve replica-realism' of Lenin's theory of reflection is rooted in a 'materialist

metaphysics, such as that advanced by antique Epicureanism, with its thesis that we continually receive little images from matter' (Adorno, 1974: 213–14). Adorno thus raises the question as to how matter, which Lenin characterises as being 'wholly without soul or spirit, i.e. causal-mechanical material in the sense of Democritus', comes to emit such images in the first place (Adorno, 1974: 214). What interests us here is how the analogy between Moscow and Athens allows Adorno to expose certain metaphysical presuppositions underlying Lenin's account of how consciousness relates to the material world. In this regard it is worth considering a lecture on Atomism, perhaps the earliest form of philosophical materialism, which Adorno gave in 1963.<sup>1</sup> Drawing on a major work by the pre-eminent Neo-Kantian historian of materialism, Friedrich Albert Lange (Lange, 1887; Schmidt, 1974), Adorno describes how, in Democritus and Epicurus' view, all matter continually emits 'fine particles', which are absorbed by our sense organs (Lange, 1887: 106). The origin of our sense impressions – mental images – is thus due to a constant flow of such particles from the surface of material bodies. As Lange expounds, it is thus that 'actual material copies of things' are said to 'enter into us' (Lange, 1887: 106). Accordingly, it is the impact of these particles on our sense organs that enables us to perceive the images supposedly sent out by matter. Adorno objects to the Atomists' views by asking how it is possible 'to simultaneously teach the being-in-itself of nature as something independent of us, whilst', at the same time, 'assuming that our sensory perception is the source of all cognition?' (Adorno, 1974: 212). In order to square this contradiction, Adorno suggests, 'Epicurus is forced to posit a metaphysical thesis, which is irreconcilable with Materialism's denial of metaphysics' (Adorno, 1974: 212), namely: that matter emits little images, whose truth is verified by sensory experience. In turn, Adorno asserts a convergence of the Atomists' views with Leninist reflection theory. As he argues:

This reflection theory, then, played a significant role in the history of Marxist materialism. To this day it lives on in the form of DIAMAT reflection theory, according to which theory is supposed to be an image of reality, regardless of the fact that whilst the spiritual and intentional may be directed at particular states of affairs – it may mean them, make judgements about them – it does not resemble them ... imagistically. (Adorno, 1974: 212)

To be sure, Adorno's identification of Lenin's dialectical materialism with Epicurean Atomism is uneasy. His suggestion that there is an absolute correspondence between Democritus' belief that nothing happens by chance and Lenin's alleged historical determinism, for instance, does not account for the role of Democritus' doctrine of the atomic swerve – *clinamen* – which states that the movements of atoms, the indivisible building blocks of matter, are ultimately random – a claim that is supposed to account for the existence of human beings' free will in an otherwise mechanistic universe. Nevertheless, Adorno argues, Lenin's theory of reflection reproduces those meta-physical presuppositions that it seeks to recant by assigning an extra-physical quality to ostensibly disenchanted matter. By positing the mysterious ability of mind-independent bodies to emit images whose truthfulness is confirmed through sensory reflection, and by elevating this reality to the status of an unalterable philosophical principle which ensures the efficaciousness of revolutionary praxis, Adorno charges that Lenin's concept of materialism succumbs to the very 'meta-physical subtleties and theological niceties' that it aims to overcome (Marx and Engels, 1996: 81). In other words, Lenin is said to fetishise matter by imbuing it with life-like qualities, whilst simultaneously reifying human consciousness by turning it into a passive object: a reflecting mirror. It follows that if the official materialist doctrines of the so-called 'East' aid the 'uncritical reproduction of existing relationships in consciousness', as Schmidt suggests, then the kind of Marxism that these doctrines serve to ground

is, at the very least, theoretically deficient. As Adorno contends, Lenin's trans-historical metaphysics of matter embeds human beings in a system of seamlessly determined nature which belies 'the possibility of freedom, whilst', paradoxically, 'speaking at the same time of spontaneous action, even revolution' (Schmidt, 1984: 18). Whether or not bad politics necessarily stems from bad theory, as Adorno implies, cannot be decided here. Suffice to note that his objections to Lenin are designed to underscore the historical constructed-ness of capitalist modernity, as well as the imperative to critically interrogate its apparent permanence.

But what does Adorno's criticism of Lenin say about his own conception of materialism? If 'Materialism Imageless' negates the images of Leninist reflection theory by polemically invoking the theological ban on images, then this strategy implies a different mode of grasping (and acting upon) the material world, which does not limit itself to mere mirroring, and which does not inflict on it the kind of violence that Adorno associates with identity thinking. In other words, Adorno seeks to cast into relief a different way of construing the relation between mind and matter; a relation which calls to mind the 'Utopia of cognition' cited above. Such a relation, however, resists positive portrayal, not least because the tools available for its construal are insufficient for expressing it. The task of philosophy is thus to think thought beyond its inbuilt limitations whilst using the restricted terms at its disposal. Materialism, on this reading, implies a complete overhaul of how human beings think the material world, and the possibility of its transformation, from the inside out. Such a complete overhaul, however, raises questions – not directly answered by Adorno – as to the kind of Marxism that is conceivable on this basis. What seems clear is this: whereas Lenin (following Engels) postulates socialism as a quasi-natural historical inevitability, Adorno (and the other members of the Frankfurt School) stress contingency, failure and the reversal of an

emancipatory tendency into its opposite; and whereas Lenin (again, following Engels) emphasises the mind's propensity to reflect the world, Adorno aims to negate the image of the status quo.

Having thus established the sense in which Adorno's confrontation with Leninist reflection theory throws into relief a new form of materialist epistemology whose utopian implications cannot be positively pictured, it remains to explore the aforementioned somatic dimension of his thought. In *Negative Dialectics* Adorno argues that 'the object', whose primacy is dogmatically asserted by Lenin, 'is a terminological mask' (Adorno, 1973: 192). It covers over an elusive excess of matter that cannot be captured by thought. Wittingly or not, 'Once the object becomes an object of cognition', Adorno suggests, 'its physical side' – its irreducibly material moment – 'is spiritualised' (Adorno, 1973: 192). As he contends, leaving this spiritualisation unchallenged reduces sensation – 'the crux of all epistemology' – to a 'fact of consciousness' (Adorno, 1973: 193). In this sense, theories of reflection, such as Lenin's, run the danger of misconstruing the thing that is registered in sensation as being merely another link in the chain of cognitive functions. By contrast, Adorno argues, sensation is not spent in consciousness. 'Every sensation is a physical feeling also' (Adorno, 1973: 193). It is such 'physical feeling' that Adorno associates with a 'resurrection of the flesh' in 'Materialism Imageless'. Curiously, Adorno explicitly denies the Christological connotations of his formulation. Instead, he cites the *Wisdom of Solomon* as his source (Adorno, 1974: 187). Whatever the provenance of Adorno's imagery, 'resurrection' is intimated negatively. Suffering becomes the somatic index of the non-identity between humankind and the material stuff of nature. This contrasts starkly with Lenin's Engelsian suggestion that matter is simply reflected by sensory experience. Adorno suggestively illustrates this point in a passage from *Negative Dialectics* titled 'Suffering

Physical'. As he writes, 'all pain and all negativity, the motor of dialectical thought, is the variously mediated, sometimes unrecognisable form of physical things' (Adorno, 1973: 202, translation altered). In a characteristic gesture Adorno identifies the antithetical moment of dialectical thought – 'negativity' – with 'pain'. His 'Utopia of cognition' thus presents itself as 'the mirror image' of a negative affect, which inversely signals a state of hedonic fulfilment (Adorno, 1974: 247). Adorno thus upends the Engelsian-Leninist topos of reflection. This is the sense in which, for Adorno, suffering is imbued with an ethical imperative. The 'physical moment' tells our knowledge that suffering ought not to be, that things should be different "Woe speaks: Go". Hence the convergence of the specifically materialist with the critical, with socially transformative praxis' (Adorno, 1973: 203, translation altered). Once again, Adorno's multifarious concerns converge: materialism is assigned an ethical dimension, one which coincides with his view of critique as a form of socially transformative praxis. Schopenhauer, Marx, Nietzsche and Freud resound in these lines. As Adorno continues, 'the *telos* of such an organisation of society' as would allow for the satisfaction of want 'would be to negate the physical suffering of even the least of its members' (Adorno, 1973: 203–4). The insistence on a negation of 'physical suffering', in turn, recalls a formulation from another important document of Adorno's materialism, his 'Theses on Need' (1942). 'The question of the immediate satisfaction of needs should not be posed under the aspects "social" and "natural", "primary" and "secondary", "true" and "false". Rather it falls into the same category as the question of the suffering of the vast majority of all the people on earth' (Adorno, 2005: 43). In a 'classless society', he argues in an atypically affirmative manner, the relation between 'need and satisfaction *will* be transformed' (Adorno, 2005: 43, emphasis added). Notwithstanding the question as to what kind of anthropology informs Adorno's

slippery conceptions of need and satisfaction, this passage points forward to a central tenet of his unfinished final work, *Aesthetic Theory* (2002). The alleviation of bodily suffering, the reconciliation of subject and object, the overcoming of societal antagonisms – in short, Utopia – can only be achieved in semblance, through the labours of autonomous art, conceived of as the paradoxical product of modernity *par excellence*. In the present context this means that whilst the possibility of societal transformation is mandated by an individual experience of bodily suffering, the ‘satisfaction of material needs’ hinges on the continued criticism of a philosophical tradition, and a lived political reality, that has been prematurely declared obsolete. ‘The power of determinate negation’, as Adorno puts it in Hegelian terms, ‘is the only permissible figure’ of such fulfilment (Adorno, 1992: 18). It occurs in formally advanced works of art. With this in mind, let us recall briefly the long passage cited at the beginning of this section. If Adorno argues that ‘spirit’ would ‘be reconciled and would become that which it only promises while the spell of material conditions will not let it satisfy material needs’, then the implication seems to be that ‘such spirit may only emerge undiminished when the conditions of lack and privation, which it repressed, will come to an end’ (Buchholz, 1991: 144). This ‘end’ can only be arrived at critically – through the consummate negation of false life. Accordingly, Adorno argues that ‘one of the substantive misinterpretations of materialism believes that, since it teaches the preponderance of matter, or, indeed, of material conditions, this preponderance itself is what’s desired’ (Adorno, 1974: 198). Rather, he suggests, ‘the telos ... of Marxist materialism is the abolition of materialism, i.e. the introduction of a state in which the blind coercion of people by material conditions would be broken and in which the question of freedom would become truly meaningful’ (Adorno, 1974: 198). On Adorno’s reading, then, a truly Marxian concept of materialism is ultimately self-cancelling. This is the sense

in which he argues that ‘the perspective vanishing point of historic materialism would be its self-sublimation, the spirit’s liberation from the primacy of material needs in their state of fulfilment’ (Adorno, 1973: 207). That is to say, properly speaking, materialism would mean its own undoing, erasing even the trace of itself in the satisfaction of need. As such, it is not simply a counter-position to Idealism but rather the outcome of its immanent critique – an immanent critique that aims at an altogether different relationship between humankind and the material world, which goes beyond the coercive strictures of the status quo. Adorno’s ‘imageless’ mode of materialist cognition, then, points beyond the critique of ‘representational thinking’ to a ‘Utopia of cognition’ whose quasi-messianic ‘promise’ motivates the unlikely deployment of an ostensibly biblical motif in the critical re-imagination of a Marxian materialism that rejects the lure of positive portrayals of a reconciled future.

## SPECULATIVE REALISM

Having thus outlined Adorno’s misgivings concerning Lenin’s mode of ‘representational thinking’, it remains to explore the contemporary resonance of his critique. Accordingly, it is worth noting that central precepts of Lenin’s *Materialism and Empirio-Criticism* have recently resurfaced in a variant of philosophical materialism known as Speculative Realism. This is especially true of Quentin Meillassoux’s book *After Finitude* (2008a), which has been described as reading ‘like a repetition of Lenin’s ill-famed *Materialism and Empirio-Criticism* ... rewritten for the twenty-first century’ (Žižek, 2012: 625). Before proceeding to interrogate this claim, however, it bears emphasising the sense in which Lenin’s presence at this juncture is revealing: if it is true that *After Finitude* seeks to ‘complete and correct the programme of Marxist philosophy undertaken by Lenin’ (Brown, 2011: 163), as has

been suggested by some critics, then the question arises as to whether the kind of social/political change conceivable on this basis is prey to Adorno's critique of dialectical materialism. The point here will be to argue that, if Meillassoux's approach marks a resurgence of a quasi-Leninist metaphysics of matter, then Adorno's position – and by extension that of the Frankfurt School more generally – provides a timely model for rethinking materialism (and, indeed, Marxism) today. In order to do so, however, it is necessary to briefly summarise the central claims of *After Finitude*.

Put briefly, Meillassoux's argument is two-pronged: on the one hand, he suggests, it is possible to have determinate knowledge of mind-independent matter; on the other hand, he insists, one can demonstrate that the form of this mind-independent matter is radically contingent. He expounds these views in two steps: (1) Through a critique of what he calls 'correlationism'; (2) Through a radicalisation of what he describes as 'Hume's problem'.

As a first step, Meillassoux's effort to show that human beings can grasp mind-independent matter depends on his objections to a characteristic of modern philosophy, which teaches that 'we only ever have access to the correlation between thinking and being' – mind and matter – 'and never to either term considered apart from the other' (Meillassoux, 2008a: 5). In the main, Meillassoux argues, European philosophers since Kant have mistakenly surmised that nothing can be totally a-subjective since objectivity can only be construed on 'the foundations of the cognition in which it is grounded' (Kant, 1998: 507). He illustrates this point by citing a passage from Kant's *Critique of Pure Reason*, which famously likens the endeavour of critical philosophy to 'the first thoughts of Copernicus' (Kant, 1998: 110), the so-called Copernican turn. Whereas, in Kant's view, traditional metaphysics assumed that 'our cognition must conform to objects' (the metaphorical

analogue of the sun's revolution around the earth), we must now consider the reverse: that objects 'conform to our cognition', i.e. that the earth revolves around the sun (Kant, 1998: 110). Without presuming to recount the intricacies of Kant's argument, the comparison with Copernicus is important because – as Meillassoux points out – it contains a slippage.

It has become abundantly clear that a more fitting comparison for the Kantian revolution in thought would be to a 'Ptolemaic counter-revolution', given that what the former asserts is not that the observer whom we thought was motionless is in fact orbiting around the observed sun, but on the contrary, that the subject is central to the process of knowledge. (Meillassoux, 2008a: 118)

If Copernican heliocentrism places reality at the centre of intellectual inquiry, then Kant's critical turn entails a geocentric counter-revolution through which humankind becomes the measure of matter. Notwithstanding the biases of Meillassoux's reading (Cole, 2015), his objection serves to frame the question that he shares with Lenin: how can thought grasp mind-independent matter? Meillassoux seeks to 'overcome the correlational obstacle' from the inside out by showing that Kant's 'critique of metaphysical necessity itself enables ... the speculative affirmation of non-necessity' (Hallward, 2011: 136). In short, the correlation between thought and being itself is presented as a mere contingency. As Hallward explains, 'in order to guard against idealist claims to knowledge of absolute reality', Kant 'accepts not only the reduction of knowledge to knowledge of facts', that is, to knowledge of appearances within certain intellectual strictures; he also accepts that this 'reduction' is itself nothing but one fact amongst others: 'another non-necessary contingency' (Hallward, 2011: 136). In this tacit admission, Meillassoux locates the supposed non-necessity of subject-object dialectics, which are presented as incidental to the history of philosophy. Immediate access to matter as such is thus deemed possible.

In a second step, Meillassoux attempts to radicalise the passages from Hume's *Enquiry Concerning Human Understanding* that contest the principle of sufficient reason. As he suggests, 'any cause may actually produce any effect whatsoever, provided the latter is not contradictory' (Meillassoux, 2008a: 90). In other words, 'we may well be able to uncover the basic laws that govern the universe – but the cause that underlies those laws themselves, and which endows them with necessity, will remain inaccessible to us' (Meillassoux, 2008a: 90). Meillassoux concedes Hume's basic point; however, he suggests that Hume shied away from the full consequence of his insight by declaring it as being beyond demonstration. By contrast, he contends, the impossibility of demonstrating that things are as they are of necessity in fact *proves* that no such necessity exists. 'Rather than try to salvage a dubious faith in the apparent stability of our experience' – like Lenin, Meillassoux speaks of fideism – 'we should affirm the prospect that Hume refused to accept': that 'an infinite variety of "effects" might emerge on the basis of no cause at all, in a pure eruption of novelty *ex nihilo*' (Hallward, 2011: 132). Here a decisive difference between Meillassoux and Lenin comes into focus. Whereas Lenin holds that ordinary sense experience provides the ultimate proof of matter's primacy, which, in turn, ensures the pre-eminence of transformative political praxis, Meillassoux argues that it is precisely the stability of ordinary sense experience which prevents us from surrendering to the full consequence of absolute contingency: complete, spontaneous transformation. As Hallward points out, the 'conversion of Hume's problem into Meillassoux's opportunity' thus requires a 'deflation of experience and the senses' (Hallward, 2011: 133); it demands 'that thought must free itself from the fascination for the phenomenal fixity of laws, so as to accede to a purely intelligible Chaos capable of destroying and of producing, without reason, things and the laws which they obey' (Meillassoux, 2008b: 274).

In this respect, Meillassoux is far from Adorno's insistence on the significance of sensory experience and human affectivity. Instead, he isolates the mathematical dimensions of objects from their physical extension: 'what is mathematically conceivable is absolutely possible' (Meillassoux, 2008a: 126). The irrefutable reality of mind-independent matter is supposed to be proven – *ex hypothesi* – in terms of pure number.

There are at least two aspects of Meillassoux's argument which resonate with Adorno's critique of Lenin: one regarding the place of transformative praxis, the other regarding materialism's relapse into idealism.

First, Meillassoux equivocates between meta-physical and physical necessity, between 'epistemology and ontology' (Hallward, 2011: 137). In short, he inverts the Engelsian-Leninist view that reality evinces a developmental logic, whereby both cells and societies evolve according to dialectical laws that are reflected in consciousness. After all, as we have seen, Meillassoux claims that 'there is no cause or reason for anything to be the way it is'. Consequently, the transformation of material conditions may be both absolute and instantaneous (Meillassoux, 2008a: 138). Although the consequence of the Engelsian-Leninist dialectic is a strong form of historical necessity, whereas the outcome of Meillassoux's speculative-realist deduction is an absolute form of contingency, both positions converge in mistaking metaphysical claims for ontological ones. Whereas the former over-determines the course of history, the latter can provide no account of what drives processes of transformation. In other words, whereas Engels and Lenin struggle to make room for spontaneous action, Meillassoux can provide no adequate substitute for what others have called 'substance, or spirit, or power, or labour' (Hallward, 2011: 138). That is, 'his insistence that anything might happen can only amount to an insistence on the bare possibility of radical change' (Hallward, 2011: 138). By contrast, Adorno insists on the need for radical societal transformation

without consigning it to the realms of absolute necessity or absolute contingency, but, rather, to the domain of possibility, however slim it may be.

Second, Meillassoux's defence of mind-independent matter tends to get tangled up in mathematical abstractions, which not only lose sight of the material reality they purport to safeguard, but which – on Adorno's model – might be seen as reproducing capitalism's abstract reduction of quality to quantity.

As a matter of course, every unit of measurement, from the length of a meter to the time required for a planet to orbit around a star, exists at a fundamental distance from the domain of number as such. If Meillassoux was to carry through the argument of 'ancestrality' to its logical conclusion, he would have to acknowledge that it would eliminate not only all reference to secondary qualities like colour and texture but also all conventional primary qualities like length or mass or date as well. What might then be known of an 'arche-fossil' ... would presumably have to be expressed in terms of pure numbers alone ... Whatever else such ... knowledge amounts to, it has no obvious relation with the sorts of realities that empirical science tries to describe. (Hallward, 2011: 140)

Meillassoux's misstep, then, lies in the assumption that such mathematical forms of argumentation can remedy the ills of capitalist abstraction, which seem to appear to him as 'mere errors of the intellect' that do not have 'any basis in a social, material and extra-logical reality' (Hallward, 2011: 140). That is to say, the mathematical form of Meillassoux's argument undermines its purportedly materialist content: the material condition of 'the tiny, fragile human body', to use Benjamin's evocative phrase (Benjamin, 2002: 144). The point, then, would be to say that Adorno's outline of an 'imageless' materialism gains currency in the present context because it models a radically open-ended criticism of capitalist modernity, which does not foreground mind-independent matter, so much as it insists on the importance of an on-going criticism of everything that exists.

## CONCLUSION

As has been argued, the Frankfurt School's particular contribution to the history of materialism lies in its foregrounding of certain epistemological, ethical and aesthetic impulses, which follow from a focus on individual experiences of visceral, somatic suffering in capitalist modernity. On these grounds, Adorno et al. aim to negatively intimate a Utopian mode of relating to the material world, including humankind's own corporeality, which resists the dogmatic prioritisation of mind-independent matter. Accordingly, the authors from the orbit of the Institute for Social Research are notable for seeking to challenge the orthodoxies of dialectical materialism by casting into relief a Marxism that would liberate humankind 'from the primacy of material needs in their state of fulfilment'. On this basis, the Frankfurt School tacitly devised models for a broadly Marxian form of social criticism that aimed to offset the perceived failings of Engels and Lenin's dogmatic metaphysics of matter. The resurgence of certain precepts of such a materialist metaphysics in the work of authors including Meillassoux, in turn, gives a renewed actuality to the Frankfurt School's position. However, the openness of their concept of materialism – its critical disposition – means that its applicability to current political struggles must continually be determined afresh by subsequent generations of readers.

## Note

- 1 Adorno refers in passing to the surviving fragments of Marx's doctoral dissertation, *The Difference Between the Democritean and Epicurean Philosophy of Nature* from 1841. A more thorough investigation of this text might have prompted him to redraw the genealogy of Marx's concept of materialism in order to contrast it with its Leninist re-imagination – a task that is laudably undertaken in Schmidt's doctoral dissertation, which was written under the supervision of Adorno and Horkheimer.

# Theology and Materialism

Julia Jopp and Ansgar Martins  
Translated by Lars Fischer

The Frankfurt School stood in the tradition of the Enlightenment critique of religion, especially in its formulation by Feuerbach, Marx, and Freud. In response to the historical experiences of the twentieth century, it radicalized this critique in fundamental ways. For Horkheimer and Adorno, religion was no longer merely ‘opium’ or the ‘sigh of the harried creature’.<sup>1</sup> Their critique went much further. The First World War and the failure of the German Revolution had already rocked the belief in progress and the plausibility of religious attempts to ascribe meaning to reality. These attempts now fell into the rubric Adorno described as that of ‘unbelieving belief’, maintained only for the sake of adhering to some belief.<sup>2</sup> Auschwitz aggravated this state of affairs yet further. Reason had tipped over entirely into the irrational and the idea of God itself, which was supposed to guarantee the reconcilability of reason and the world, was no longer just implausible but had become irrevocably unthinkable: it could no longer be conceived

of in a consistent manner.<sup>3</sup> To ascribe a purpose to history or even to an individual life amounted at best to a mockery of suffering.<sup>4</sup> Religion no longer functioned as a form of opium offering some measure of manic compensation. Where it had not been absorbed by the culture industry anyway it amounted to no more than a lustreless reduplication of reality.<sup>5</sup>

## THE PROHIBITION OF THE IMAGE (*BILDERVERBOT*)

Their sociological and cultural diagnosis drove Adorno’s and Horkheimer’s approach to theological problems, which had been ambivalent all along, towards the ultimate aporia: on the one hand, the great promises of reconciliation and truth associated with theology must not be ceded to the prevailing utter meaninglessness of the reality we inhabit; on the other hand, historical experience flies

in the face of any form of hope. At the same time, it would be cynical to fob off the survivors with a relativistic or nihilistic shrug of the shoulders. Only a concept that 'goes beyond its affirmation by extant facts' could assimilate this contradiction. The potential for both truth and delusion resided precisely in the 'difference between the concept and its [factual] affirmation'.<sup>6</sup> Given this aporia, theological content could be taken up only *ex negativo*. Hence the much cited prohibition of the image in critical theory, which Adorno, Kracauer, and Löwenthal had already adopted in the early 1920s.<sup>7</sup> It represented the attempt to sustain the idea of reconciliation negatively, its factual impossibility notwithstanding. In the meantime, only the critique of the delusion could act as a placeholder for the possibility of redemption.<sup>8</sup> Any attempt to portray redemption in the here and now ignored its own historical contingency, thus becoming delusional and distorting everything.<sup>9</sup> 'Hence, anyone who believes in God cannot believe in God'. Instead, the 'possibility' associated with the divine name – this 'possibility' will be a recurrent focal point throughout this discussion – is maintained by the nonbeliever.<sup>10</sup> The theological reflections of the critical theorists largely gravitated around this aporia. As opposed to Kierkegaard, who on Adorno's reckoning had 'immobilized and hypostatized' the paradox,<sup>11</sup> they did not want to let matters rest there. Yet the possibility of an escape towards some 'other' state of affairs, in which utopia and the absolute would become one, could only ever be formulated by means of radical negation, by portraying reality without the slightest illusion. It was precisely this dilemma that underpinned the prohibition of the image. Horkheimer in particular never tired of emphasizing that 'German philosophy', and especially Kant's critical philosophy, shared 'with Judaism the notion ... that the critical issue is not so much the naming and determining of the absolute but rather the deciphering of the mundane and the

deposition of the idols'.<sup>12</sup> He thus amalgamated ideology-critical activity and the driving force underlying a possible negative theology. It was by revealing the historically contingent nature of the relative and conditional claims perceived of by human beings as unconditional truths that idols were deposed. Horkheimer referred to this approach as the 'awareness that the world is appearance' and therefore does not represent the ultimate reality.<sup>13</sup> The idea of truth, which can only be determined negatively for the time being, will only be fulfilled when humankind has been liberated.<sup>14</sup>

## THEOLOGY, METAPHYSICS, REVOLUTION

Neither for Horkheimer nor for Adorno was this selective recourse to a negative idea of God meant to endorse any particular religion. Indeed, on their account, even the metaphysical thought of antiquity had, from its very inception, been the inevitable critique of religious notions. Only philosophical-metaphysical reflection rendered conceivable the 'possibility' that revelation 'imposes and thus defiles' because obedience to it amounts to heteronomy.<sup>15</sup> Metaphysics, then, as philosophy, is by its very nature both a deliberative critique of religion and 'the attempt to salvage categories that are theological in origin'.<sup>16</sup> Philosophy had to reject the dogmatic-authoritarian surfeit of these categories, yet in so doing it passed on some of their potential. The religious notions of redemption had been (quite literally) more full-bodied than the disembodied philosophical concept of the immortality of the soul. As the credibility of institutionally established dogmas waned, modern philosophy gradually subverted its own earlier theological grounding, a development epitomized by positivism.<sup>17</sup> Religion itself, without a 'core of revelation', became little more than a 'mere cultural reminiscence' or consoling

'heartwarmer' at best;<sup>18</sup> or, at worst, a means of direct ideological domination.<sup>19</sup> Enlightenment reason had destroyed the certitude of salvation but failed to offer a substitute. Only a genuine revolution realizing the Enlightenment ideal of the autonomous individual would have facilitated the annulment of the existing order and the fulfilment of philosophy. The Critical Theorists were interested in the hope of redemption once invested in theology that had remained illusive 'because the moment for its realization was missed'.<sup>20</sup> Consequently, metaphysical-religious questions continued to be virulent within philosophy. Historically, then, both faith and reason had been equally rooted in the immanence of the factual, rendering history a 'permanent catastrophe' or what Benjamin called a constantly growing 'heap of rubble'.<sup>21</sup> Philosophy 'can do no more than patiently trace in ever new configurations and perspectives the ambiguity of melancholy'. 'Truth' it could attain only if one day 'genuine deliverance were to come forward from these configurations of the unreal after all'.<sup>22</sup> Only melancholy, the preconscious certitude that 'something is missing',<sup>23</sup> remained true to the hope that this might occur.

### **MIGRATION INTO THE PROFANE, OR: INTO THE FIERY NUCLEUS**

Horkheimer and Adorno juxtaposed the requisite negative inversion of religious consciousness critically to the extant religious tradition. Horkheimer distinguished between 'religion in the good sense' – the enduring hope that everything will change – and 'religion in the bad sense' – the ideology that 'gilds the scourged reality all the same'. Any attempt to ascribe purpose to human suffering, i.e., any attempt to develop a positive theodicy, resulted in the 'bad' variant. Not only was this form of apologetics alien to the 'good' religious impulse, the latter was

incapable of offering a justification even for itself.<sup>24</sup> Positive religion, then, was heteronomous and ideological on principle. Only if the 'yearning for something other than the world' assimilated doubt in the possibility of its fulfilment could it avoid immediately tipping over into ideology.<sup>25</sup>

Their stance reflected not only an emancipatory critique of religious tutelage but also a vision of secularization in the tradition of Cultural Protestantism and liberal Judaism, which envisaged the abandonment of residual irrational elements in accordance with the standards of bourgeois reason. Accepting the content of revelation after the critique of religion amounted, in Adorno's formulation, to 'playing off the even more out-dated against the out-dated'.<sup>26</sup> Hans Mayer recalled a conversation in Montagnola in which Horkheimer 'explained to me that the Jewish service needed to be reformed? In what way? By eliminating Hebrew and most of the rituals. I suggested that this went to the core of this religion ... This did not seem to impress him.'<sup>27</sup> Adorno was arguably the member of the inner circle of the Frankfurt School whose critical engagement of religious tradition was the most intense. His notion of what secularization needed to entail was altogether more radical than Horkheimer's. 'No theological content', he insisted, 'will continue to exist untransformed; all its elements will have to pass the test of migrating into the secular, into the profane'.<sup>28</sup>

The profanation postulate operated on a number of planes. It encompassed partisanship for intra-religious enlightenment and the appropriation of critical impulses within the religious traditions – and, ultimately, of the utopian momentum that supposedly inhered in those impulses. In some of his most audacious moments, Adorno sought not only to address the idea of profanation as a critical demand to religion but also to anchor it within religion itself, referring to the 'heretical theology' of religious mysticism. In this connection, he focused especially on 'the kabbalah', which, on his reading, was a

'heresy' that had been nonconformist from the outset. Drawing on Gershom Scholem, he celebrated its late Sabbatean variant as a precursor of the Haskalah. On Adorno's account, the crucial point was that the 'mystical ... motif, that the tiniest mundane trait is pertinent to the absolute' bound transcendence and immanence together and thus, instead of proclaiming an already redeemed world beyond, incorporated human history.<sup>29</sup> The 'historical truth' of this nexus 'can be seized only at the greatest distance from its origin, through complete secularization'.<sup>30</sup> It was not in its religious origin or its atheist neutralization that truth could be found, then, but only in its most alienated secular – utopian – forms. In a well-known letter to Benjamin, Adorno called on him – with reference to his Arcades Project – to undertake a 'radicalization of dialectics all the way into the fiery nucleus of theology'. This would also throw the 'societal-dialectical, indeed the economic motifs' into the sharpest possible relief.<sup>31</sup> Adorno's comments demonstrate just how inextricably Adorno's envisaged 'theology' was linked to the immanent. This forward-directed impulse explains why Adorno conceived of his metaphysics not as a *prima philosophia* but as a tentative, open-ended quest for the *ultima philosophia*.<sup>32</sup> Remote as this transcendental long-term objective may have been, the profanation concept had clear implications for the present. *All* positive religious speculation had to be abandoned. Transcendence 'transcends only where it conceals itself'.<sup>33</sup>

For Adorno, one way of responding to the demise of transcendence was to 'treat profane texts like holy scripture'.<sup>34</sup> In a world darkened by Auschwitz, thought could find 'refuge' only in the 'interpretive immersion' in the great texts.<sup>35</sup> They were handed down 'as though they were simply there and had authority'.<sup>36</sup> Hence they could serve as a point of departure for reflection even in the absence of objective meaning. A western canon of literature and philosophy was thus enlisted, which, for Adorno, had stored

up historical experience that pointed beyond the meaningless present. On the one hand, this approach led into the field of aesthetic and metaphysical experience. On the other hand, Adorno posited a form of recourse to tradition that brings it into the present as a prerequisite for any form of philosophy not reduced to mere positivism. Contrary to the illusion that the process of insight was transparent on its own terms, 'knowledge of the past' resided and 'pressed on' in every issue.<sup>37</sup> Rather than submit passively to this over-determination of the present by the past, one should develop a critical awareness of it in order to render the claims of the past and the demands of the present 'commensurable'. In the 'transition from philosophy to interpretation', the patient rearranging, time and again, of the elements at hand, their implicit historical dimension could suddenly illuminate the present and vice versa. This procedure secularized 'the irrecoverable archetype' of the exegesis of 'holy scripture' that had fallen silent.<sup>38</sup>

### THEOLOGY IN THE PROFANE: TILlich, BENJAMIN, KRACAUER

The antecedents of the idea of a hidden 'theology in the profane' can be traced to Adorno's teachers of the 1920s and 1930s. Protestant theological debates like the 'Discussion on the Task of Protestantism in a Secularized Civilization' on 17 June 1931, organized by Heinrich Frick with Paul Tillich as one of its participants, played a key role.<sup>39</sup> Tillich, who supervised Adorno's post-doctoral thesis (*Habilitation*) on Kierkegaard, had himself developed a concept of profanation as 'de-demonization'. For Tillich, 'Protestant form-creation' referred 'expressly religious forms to the profane that questions them'.<sup>40</sup> To Adorno's mind, this was not radical enough. It was possible that the 'historical function of Protestantism ... has been both fulfilled and

exhausted', and that, as a result, Christian concepts were now merely the 'empty husks' of historically obsolete responses to the world. All those contents that were still topical had already shed their religious form.<sup>41</sup> In a radio eulogy for Tillich broadcast in 1966, Adorno returned to the issue of profanation. Tillich's inexhaustible ability to engage other individuals and positions had matched 'the theological ideal of surrendering oneself': 'I gather in Paul we read, "Lose, so you may win"'.<sup>42</sup> Adorno's determination to anchor the migration into the profane now went further than it had done in 1931. Originally grounded in the critique of religion, his attempt to associate Tillich's habitus with the indirect theology he envisaged and identify it specifically with Paul now connected this line of argument to a (historically questionable) line of 'heretical' or 'mystical' tradition. Evidently, then, not only Horkheimer's but also Adorno's take on theology too mellowed over time.

Tillich's influence and his own various attempts to paint the profanation postulate, *post facto*, in kabbalistic colours notwithstanding, none of Adorno's intellectual interlocutors shaped his theology more strongly than Walter Benjamin. According to Benjamin's blotting paper simile, thought (the blotting paper) became saturated with the ink (the theology). Left to its own devices, it took up as much ink as possible and thus removed the writing (revelation).<sup>43</sup> The latter could now be reconstructed only from the palimpsestic blotting paper. Benjamin's imagery of historical materialism as a chess automaton that won every game yet was in fact secretly operated by a hunchbacked dwarf inside it functioned in a similar manner. Theology, 'which is small and ugly nowadays and in any case may not show its face', was the hunchbacked dwarf. In both instances, theology could survive only where it became the core or engine of materialism.

Adorno had already rejected the religious quest for meaning of his first teacher, Siegfried Kracauer, in the 1920s. With the

benefit of hindsight, the great stylistic and intellectual impact of the latter's essay, 'Die Bibel auf Deutsch' ['The Bible in German'], of 1926 is nevertheless evident. In it, Kracauer played the migration of truth into the profane off against Martin Buber and Franz Rosenzweig's translation of the Tanakh. Luther's bible translation had still been a political and religious act in one, he argued. Given their claim to make the divine word resonate anew in the present, Buber and Rosenzweig's recourse to archaic and primal modes of expression made their translation a work of neo-romantic literature at best. For the mundane world had long since superimposed itself on, and absorbed, the realm of religion. The latter was no longer able to articulate absolute truth. Only the focus on the imperfection of the profane could do so.<sup>44</sup> In the 1960s, Adorno's critique of the 'Jargon der Eigentlichkeit' [jargon of authenticity] took issue precisely with the sort of subreption of ostensible meaning by deploying seemingly portentous formulations that had roused Kracauer's criticism of Buber and Rosenzweig's translation. By suggestively invoking theological concepts, this jargon sought to construct immanent-ontological meaning. Its buzzwords were sacred without having a sacred content.<sup>45</sup> Against this swindle of unity, Adorno defended the notion of a form of radical transcendence without whose theological 'sting' redemption had been inconceivable.<sup>46</sup> The limits of conceptual synthesis had already resonated within religious notions of redemption. Consequently, as Hegel famously argued,<sup>47</sup> they also pointed to something extraneous. It was the quest to salvage this idea from the decaying religious-institutional traditions and redeem it for the benefit of this-worldly felicity that determined the critical theorists' engagement with religion.<sup>48</sup> As the 'unfolding of one single existential judgement', social criticism drew for its claim to truth on the denunciation of the whole as being 'universally irrational and untrue', they argued.<sup>49</sup>

## BETWEEN POSSIBILITY AND REALITY: MESSIANIC EPISTEMOLOGY

In contrast to the vague aforementioned jargon, the critical theory of society insisted that the possibility of reconciliation was and is, in principle, always given, no matter how insoluble the contrariety of society may seem. Analogously to Benjamin's account of the way in which pious Jews, while adhering to the prohibition on imagining the future, nevertheless assumed that 'every second could be the slight gate through which the Messiah might step',<sup>50</sup> the rejection of a fatalistic understanding of the course of the world generated the motivation to engage in criticism.<sup>51</sup> 'Only if that which is can be changed, is that which is not all.'<sup>52</sup> Yet as long as no practical way out was available, the reference to the possibility of change remained cognition's only source of light.<sup>53</sup> This begs the question of why the 'repeated promises of something other ... are constantly broken again'.<sup>54</sup> Adorno would presumably answer that the way in which those promises had been interpreted to suggest that their practical crossover was a foregone conclusion had perhaps been inadequate.<sup>55</sup> Adorno was similarly speculative in explaining whence the disastrous state of society might originate. In vague terms, he mused about a 'primeval irrational catastrophe', which superseded the religious narrative of the fall.<sup>56</sup> Suggestions that guilt reproduced itself *subjectively* 'in each one of us' were juxtaposed to the notion of an *objective* 'unfathomable calamity that occurred in primeval times',<sup>57</sup> a mishap in the process of creation, as it were, like the 'breaking of the vessels' in Lurianic kabbalah, that required no human participation.<sup>58</sup> This illustrates how consistently subjective, albeit unconscious, action and objective development were mediated in Adorno's concept of history.<sup>59</sup> On his account, reliable source material about these beginnings had been lost in the 'fog of primitive history', yet speculation about them was in any case futile since the

crucial issue was not its origin but the future resolution of the contradiction.<sup>60</sup>

For Adorno, the relationship between possibility and reality, as the relationship between thought and being, was of crucial importance. Dissociating himself from the crypto-theological production of ideology, the submissive accommodation to authority or despairing nihilism, Adorno raised the fundamental question of the possibility of metaphysics in a novel way.<sup>61</sup> The driving force here was a motif that he had characterized in a letter to Horkheimer of 1941 as an imperative in engaging theology ('or whatever one wants to call it'): one still needed to try and 'think the secret'.<sup>62</sup> What he still categorized as theology in 1941, Adorno subsequently subsumed under the rubric of metaphysics. Transcending thought poses the question of whether, all the social catastrophes and the anguish they caused notwithstanding, meaningful life was still possible.<sup>63</sup> Metaphysics and the possibility of a meaningful life intersected in the 'secret' as the other of conceptual thought. Philosophy as a form of profane theology (as presented in *Negative Dialectics*) sought to palpate dominant social concepts that shaped subjective thought to trace fissures within them. Having plummeted from its lofty heights, metaphysics was now dependent upon the recesses that remained in a fragile world dominated by heteronomous compulsion. Traces of the other were to be found only in the tiniest and least significant phenomena that conceptual thought had not yet seized. Metaphysics had 'migrated into micrology' to seek 'refuge from the totality'.<sup>64</sup>

Adorno's notion that residual traces of that which is 'right' might be found here drew on the assumption that all conceptual content was stimulated by non-conceptual impulses.<sup>65</sup> An urge towards the concept inhered in the phenomenon itself.<sup>66</sup> The concept depended fundamentally on contents, which only became palpable conceptually. Speaking in the lecture theatre in 1965, Adorno exemplified this with reference to

the metaphysical concept of freedom, which one could deploy only 'because its realization is viable', because its fulfilment was possible 'at any point in time'.<sup>67</sup> This was demonstrated empirically by the fact that the development of productive forces had long since provided the means to eradicate global deprivation.<sup>68</sup> Yet the potential inherent in the phenomena had barely begun to exhaust its conceptual leeway. Consequently, people failed to comprehend that 'in the world, in which we exist' nobody even came close to being 'what each one of us *could* be'.<sup>69</sup> 'Immanent critique' sought out instances in which a non-identical surplus revealed how inadequate individual judgements, qua their conceptual unambiguousness, actually were vis-à-vis the material.<sup>70</sup> It demonstrated how little justice finite identity did to the tangible infinity in its manifoldness and agility, a discrepancy to which the immobilized thought patterns of everyday consciousness were necessarily oblivious.<sup>71</sup> Any attempt, then, critically to transcend what was simply given faced the paradoxical task of taking into consideration 'its own impossibility'. 'For the sake of the possibility', any such attempt had to be aware of its own futility.<sup>72</sup>

Knowledge, then, had to 'abandon itself, à fonds perdu, to the objects'.<sup>73</sup> In *Dialectic of Enlightenment*, Horkheimer and Adorno may have portrayed the cultural process as a permanent tyranny over humans, resources, and internal drives,<sup>74</sup> but this by no means implied a deterministic philosophy of history. An intrinsic potential for, indeed, an urge toward, self-refutation inhered in the human ability to judge: 'Thought patterns want to transcend that, which is merely given'.<sup>75</sup> As opposed to the idealistic hope in conceptual and actual progress, based on reason or the belief in a higher being, critical consciousness was thrown back onto itself. All it could do was tirelessly and critically empathize with the given objects and draw truth from their inconsistencies until, ultimately, thought turned 'even on itself' and allowed the principle of identity to implode.

While nominalists abstracted from being and remained non-committal, rationalist dualists, who distinguished between conceptual conceivability and actual viability, contributed to the idealization of corporeal suffering. Adorno, by contrast, dialectically took up the struggle on two fronts. In terms of social theory, the mediation of concept and object established a form of social realism. To inter-subjectively constructed incorporeal institutions like the state, law, or money, Adorno attributed the characteristic of developing an objective life of their own and thus impacting on the thoughts and activities of their agents.<sup>76</sup>

## THE ONTOLOGICAL PROOF OF THE EXISTENCE OF GOD

In the face of Adorno's observations about the tangency of concepts and reality in the social sphere, any strict distinction between them was rendered brittle. Consequently, a number of fundamental questions in the history of philosophy assumed to have been resolved became virulent again. Adorno's exploration of the viability of metaphysics logically raised the question of whether Kant's radical refutation of the ontological proof of the existence of God had 'really solved the problem ... comprehensively'.<sup>77</sup> Kant's claim that being was not a genuine predicate had suspended a priori the interdependence of concept and object, form and content.<sup>78</sup> Yet it seemed clear to Adorno that the impact of incorporeal-material institutions could easily be sensed in one's own powerlessness – 'where it hurts?'.<sup>79</sup> Adorno coined the paradoxical term 'actually governing metaphysics' to characterize this dynamic.<sup>80</sup> Its hopelessness spread existential fear that pervaded even 'the most subtle layers of behavior'.<sup>81</sup> Late capitalist society, unwittingly reproduced by its subjects, manifestly defied a clear distinction between the sensuous and the conceptual.

On Adorno's account, then, world and ideology were continually converging in the sphere of identity.<sup>82</sup> This precipitated a loss of individual experience and led to metaphysical indifference and obliviousness to religious questions.<sup>83</sup> Horkheimer referred to this 'real metaphysics' – the repressive apparatus of integration – as the 'administered world',<sup>84</sup> Adorno as a 'context of deception'.<sup>85</sup> Its efficacy donned the mantle of perpetual laws of nature. Regardless of the odds, Adorno insisted that thought, as long as it was not abandoned, held on to the aforementioned 'possibility'.<sup>86</sup> It was the scepticism as to whether Kant's delineations really were the last word in this matter that explained this thesis. Thaidigsmann has called this scepticism 'the hidden metaphysical-theological motif' in Adorno's thought.<sup>87</sup> That said, it is remarkable how little space this fundamental complex took up in Adorno's work, given its systematic significance.

Drawing on his contention that one could not distinguish 'all that radically ... between the utopia to which thought, as concept, feels drawn and reality',<sup>88</sup> Adorno sought to render the onto-theological argument plausible as a purely negative one. As the affinity between the Non-identical and the *Ding an sich* [thing in itself] indicates, Adorno enlisted Kant against Hegel, leaving the absolute indeterminate, even though it formed a necessary conceptual prerequisite.<sup>89</sup> Thinking as such primarily referenced an unattainable transcendental ground of knowledge to which individual judgements were connected relationally. Without the 'idea of the absolute' as the necessary condition for truth, thought was effectively impossible, since judgements unrelated to a common generality could only be arbitrary.<sup>90</sup> In a conversation with Bloch, Adorno noted that 'the force of the concept' must also encompass 'its element of actuality'.<sup>91</sup> While every specific judgement was necessarily erroneous in relation to the whole, all philosophical truth claims, including Kant's own, depended on the successful execution of the ontological proof of the

existence of God in order to ground knowledge in a universal and binding generality.<sup>92</sup> Hence, in the final meditation in *Negative Dialectics*, Adorno expressly equated the concept of the non-identical with the 'absolute, as it was envisaged by metaphysics'.<sup>93</sup> While the grey of the sensuous world alone offered no consolation, the dependence of consciousness on the 'concept of another colour' indicated its real, albeit 'dispersed trace in the negative whole'.<sup>94</sup> While the possibility of the absolute invariably imposed itself in the abstract, critical theory also converged on the corresponding object and the 'secret' of the non-identity between them. This was the source of Adorno's hope that social praxis could be different, that it could shed its inherent relationship of force.<sup>95</sup> According to Liedke, it was the assumed proximity between potentiality and actuality that prevented *Negative Dialectics* from 'plunging into the abyss', though it did pose the risk of encouraging a form of 'speculative materialism'.<sup>96</sup>

The metaphor of the 'dispersed trace' of 'another colour' underscores the call for mimetic openness to experience that transcends conceptual categories and grasps that which is missing, a form of experience that must accompany all perception. Where Kant's indispensable transcendental subject established absolute identity,<sup>97</sup> Adorno insisted that absolute non-identity was indispensable. Where concepts falter – in the case of successful aesthetic or physical encounters, for instance – thought fleetingly became aware of its fallibility and contingency. In such moments it moved towards the aforementioned 'secret'. In the face of objective obstacles in the object itself, self-denial rendered the 'last trace of the ontological proof for the existence of God, possibly its ineffaceable dimension', tangible.<sup>98</sup> The superiority of conceptual subsumption notwithstanding, it transpired that the constitution of the subject was absolutely dependent on something other.<sup>99</sup> In *Negative Dialectics*, Adorno contented himself with

the ‘unverified expectation’ of that other and limited his onto-theological argument negatively to the justification in principle of the possibility that thought could enter into being.<sup>100</sup> Prima facie, theology, stripped down in this way, like all forms of enlightenment thought, sought to approximate the objective. In contrast to the taming of external chaos with blindly posited general concepts that had shaped the history of the species, it drew out the ‘idea of the objectivity of felicity’ through reconciliation.<sup>101</sup>

Kant had still posited the necessity of the idea of God as a rational, regulative concept that was categorically not subject to justified judgements. In the face of the actual suffering, Horkheimer and Adorno abandoned the moral teleology underlying Kant’s postulate of the existence of God.<sup>102</sup> This raised the question of whether dominant thought patterns could be transcended towards the this-worldly revelation of the ‘secret’.<sup>103</sup> In contrast to Kant’s conservative position, the critical theorists answered this question in the affirmative.

Adorno focused primarily on the social praxis of commodity exchange as the locus of mediation between consciousness and being.<sup>104</sup> In its current form the identity principle had to be understood in terms of the abstract value form underpinning it. Since the inception of the modern world, as revelation lost its authority, it had been conflating ‘the entire world into the identical, the totality’.<sup>105</sup> The ‘spell’ of the value form was increasingly creating a subjective consciousness whose perception of the world encompassed only a multitude of units of value destined for exchange.<sup>106</sup> At this juncture, Adorno amplified Marx’s critique of commodity fetishism, turning it into a comprehensive epistemological concept: ‘Social criticism is critique of knowledge and vice versa.’<sup>107</sup> In the mediation of being and social consciousness, Kant’s assumption of a timeless objectivity of logical categories turned out to be untenable. Just as prevailing norms were shaped by the material distribution of wealth, so too

factual knowledge was contingent upon historical constellations.<sup>108</sup>

Due to Adorno’s negative defense of the ontological proof of the existence of God, objects and things, possibility and reality, thinking and being moved so closely together that they began to morph into each other. To the irrationally interlocked ‘contradictions of reality’, *Negative Dialectics* juxtaposed the successful ‘convergence of all thoughts in an absolute’.<sup>109</sup> Only the latter could transcend the contradictions. Adorno’s hope was inextricably linked to this ‘convergence’, which vouched for God’s existence, understood as the possibility of a social utopia.<sup>110</sup> As he noted in 1962: ‘To think this through, with and against Kant, is my task and that of philosophy. The one thing I do know: If this is nothing then everything is but nothing’.<sup>111</sup>

### **TOTAL CHANGE: THE END OF LOGIC AND THE SELF-SUSPENSION OF EXCHANGE**

A statement by Lichtenberg that Adorno quoted in his Husserl study hints at the implications of the notion that the renegotiation of the ontological proof for the existence of God transcended the chasm between thought and being: ‘If one day an angel were to recite from his philosophy ... presumably some sentences would have to sound like 2 times 2 is 13.’<sup>112</sup> Theological visions of reconciliation migrated into the attempt to escape ‘the prison of logic’ with logic’s ‘own devices’.<sup>113</sup> For the time being, the extant ‘logic of things’, though contingent, remained valid if thought did not want to cross itself out in an act of misguided abstraction.<sup>114</sup> The idea of a divine logic – as a metaphor for a different order of thought and being – helps explain Adorno’s fascination with a ‘Jewish theologumenon’ handed down by Martin Buber that Benjamin, Bloch, and Scholem also discussed.<sup>115</sup> It stated that when things were finally put right everything would be ‘just a

little different', yet how exactly was unfathomable.<sup>116</sup> Only then would humans and objects be shifted [*verrückt*]<sup>117</sup> into 'their proper position'.<sup>118</sup> That the frame of reference encompassed both humans and objects implies that this redemption would take place in this world and impact it in its entirety, including its most mundane aspects.

The German term *verrückt* can mean to shift or move from one place to another or, as an adjective, denote madness. Adorno was intentionally playing on this double meaning. Precisely those things that might seem out of place or 'mad' by the standards of the existing order might turn out to be the only ones foreshadowing the proper, truly 'sane' order of things. The dynamics of Adorno's orientation toward the 'ideal of free and just exchange'<sup>119</sup> can be clarified by recalling Marx's underlying insight. Marx characterized bourgeois society as a nexus of independent producers of commodities organized in accordance with the division of labour and held together by the constant exchange of commodities.<sup>120</sup> In *Capital*, he focused particularly on the exchange of the commodity labour between the otherwise propertyless and the owners of the means of production. Insofar as the worker obtained the exchange value of his labour in the form of the indispensable means for the reproduction of his capacity to work, this exchange was obviously entirely just. Yet according to Marx, what distinguished labour from other commodities was its ability to produce additional value.<sup>121</sup> As the vendor, the capitalist obtained this surplus free of charge. With it he was able to cover his own livelihood and pay for additional labour and means of production, which allowed him to remain competitive. Hence, capital constantly increased its wealth through exploitation while maintaining the appearance of an entirely equitable relationship of exchange.<sup>122</sup> The exchange of labour was precisely the point at which, as Adorno put it, 'everything is in order while at the same time nothing is in order'.<sup>123</sup> The fundamental role, which Marx attributed

to the law of exchange in accounting for the persistence of the wrong state of affairs,<sup>124</sup> returned in Adorno's call to pin down the concept of exchange in order to facilitate the 'realization of the promise of exchange, which, in terms of its concept, is broken time and again'.<sup>125</sup> This allowed him to elaborate more specifically on his concept of convergence, for instance, when he noted that this realization would 'converge with its abolition; exchange would disappear where it was truly equitable'.<sup>126</sup> The exchange of equivalents in which equality pertained only to the 'exchange values of the exchanged commodities' would transcend itself, creating truly just relations in which there would no longer be any contradiction between object and concept. Qualities would no longer be abstracted to quantities, and use values no longer to exchange values.<sup>127</sup> Everything would be in its proper place, then, when the dialectic was reconciled in the demise of exploitation, domination, and violence. History would finally become open to 'the non-identical, which would emerge only once the compulsion of identity has dissolved'.<sup>128</sup>

Note the active form of this dissolution. It indicates a passive role of the finite subject in redemption. The finite subject was reliant upon the utmost 'grace', which 'tempers justice' and 'on which the cycle of cause and effect founders'.<sup>129</sup> With this 'act of grace'<sup>130</sup> Adorno circumscribed an additional element, which could not be anticipated qualitatively in extant reality because it had to be of an entirely new quality. From a specific constellation of concept and experience this insight, like a bolt of lightning, pointed beyond particular knowledge.<sup>131</sup> The escape from the cycle of exchange in all its self-contradictory forms and the attendant elusion of suffering depended on a form of transcendence of which thought was unable to conceive under its own steam.<sup>132</sup> Since this transcendence could be grounded only in an experiencing subject, the messianic perspective Adorno arrived at was fractured. Not least, it was

not some cosmological law but the subject's own social praxis that was supposed to be overcome.

### THE PHOTOGRAPH OF THE WORLD AS HELL: GNOSIS AND INVERSE THEOLOGY

As is well known, Adorno vehemently distanced himself from any concept of praxis of the kind postulated by vulgar Marxism.<sup>133</sup> Against blind forms of activism, Adorno focused on the disclosure of heteronomous modes of mediation to the individual. Consequently, his intertwining of metaphysics and the material created a hermeneutical proximity to gnostic concepts (as the etymology already indicates, given that the Greek term *gnosis* means knowledge). Prima facie, the notion that the world was 'faulty to its core' indeed recalled a form of cosmic dualism already characteristic of the Gnosticism of antiquity.<sup>134</sup> According to the Gnostics, the Biblical God was a demonic demiurge and the world thoroughly corrupt. Juxtaposed to this Biblical God was an unattainable God of light revealed to his followers by reason. Yet Adorno's hope of redemption from the corrupted world did not hinge on a hidden God of light. Instead, he saw the new myth precisely in the bright 'deus absconditus' of the principle of enlightenment. As an advancing form of identity, this 'entirely abstract and indeterminate God cleansed of all anthropomorphic-mythological qualities' morphed into a 'fatefully ambiguous and threatening' one. Demythologization turned out to be a form of demonization.<sup>135</sup> This ostensible God, 'masked by his own contradictoriness',<sup>136</sup> embodied only the 'repressive and pernicious character [*Unwesen*] of society'.<sup>137</sup> It represented 'not the divine absolute', then, 'but its ... opposite; if I wanted to put it in theological terms, I would have to say: hell'.<sup>138</sup>

For Adorno, the true God – the sensible organization of society – was concealed in

the non-identical beyond of consciousness. Adorno confronted the 'theological niceties' of the abstract law of value substantiated in the domination of humans not with an otherworldly authority but simply with subjective desire.<sup>139</sup> Knowledge of the existence of an absolute as the other of logic drove his socio-philosophical inventory beyond itself because 'without the hope in this-worldly improvement ... creation itself would inexorably turn into the work of a gnostic demon'.<sup>140</sup> Yet, in its antinomianism, critical theory by no means turned on Torah or Halakhah, as the Gnostics had done. Instead, it took issue with the unconscious impact of the mythical compulsions generated by the contention that there was no third alternative and the 'magic circle' that contention created.<sup>141</sup> The incriminated ideology underpinning the pernicious state of affairs, beholden as it was to conceptuality and the value form, would have to recede before the manifoldness of objects.<sup>142</sup>

In the well-known final aphorism in *Minima Moralia*, Adorno called on philosophy, 'in the face of despair', to look at the world as it would appear 'in a messianic light', in which its 'rifts and crevices' would be revealed.<sup>143</sup> In his Kafka essay he again drew out this scheme in a gnostic-antinomian manner, describing as the optimum 'light source' one which makes 'the fissures of the world glow hellishly'.<sup>144</sup> Adorno had already presented his interpretation of Kafka to Benjamin in 1934. Kafka's technique created a 'photograph of mundane life from the perspective of a redeemed life'. The photograph thus taken presented a terrible picture, which seemed lopsided and distorted because the camera was recording the absurdity of the wrong world from a 'right' perspective. One might call this 'image of theology ... "inverse" theology'.<sup>145</sup> The inversion in question amounted to a shift in theological perspective. Nothing could be said about the deity, but one could emulate its view of the world's faultiness. This presupposed an extraneous vantage point, which could only be constructed 'for the sake of the possibility'

but never actually assumed.<sup>146</sup> Since this vantage point remained philosophically unattainable, Adorno had to take recourse to Kafka's prose to verify the existence of this possibility. Three years earlier, he had attributed this sort of 'inverse, luciferic theology' to Brecht and Weill's opera *Aufstieg und Fall der Stadt Mahagonny* [*Rise and Fall of the City of Mahagonny*]. It successfully constructed the whole, the negative totality, from the 'fragments' of 'disintegrating reality'.<sup>147</sup> Through the de-familiarizing inherent logic of aesthetic expression, successful works of art provided a detached representation of the totality as a monad. Idiosyncratically recombining the totality's component parts, they created an alternative world to that of social immanence. For Adorno, this capacity for the virtual refraction of faulty reality allowed art to approximate [visions of] utopia. 'Art owns truth as the appearance of being no mere appearance', he wrote.<sup>148</sup> It represented the possibility of experiencing an alternative order but was by no means a surrogate for praxis. It only provided possible ways of thinking.<sup>149</sup> By looking at the world from the outside, as it were, inverse theology, as determinate negation, was already a placeholder for the other. 'Accomplished negation, once thoroughly explored', revealed like a flash of lightning the 'mirror image of its opposite'.<sup>150</sup> In this sense, Adorno claimed both in his post-doctoral dissertation (*Habilitation*) on Kierkegaard and in *Negative Dialectics* that elements of immanence could become intelligible as bearing a utopian meaning; elements of reality could 'solidify into script', 'fissures of disintegration' become recognizable as 'ciphers of promise'.<sup>151</sup>

To create this script, Adorno wrote in *Negative Dialectics*, metaphysics needed to 'know how to wish for something', how to integrate desire and thought.<sup>152</sup> For Adorno, desire originated in the quest of the imposed vital needs for conceptual articulation. If the indeterminate suffering created by the violent conditions was consciously reflected upon and sublimated as desire, it would serve as

a source of judgement on the 'accomplished negation'. The wish that things should be different rendered the constituents of that negation legible. The minuscule gap presupposed by the extra-mundane vantage point of inverse theology between itself and faulty reality thus consisted in the corporeal experience of non-identity. Because the idealistic concept of the world's intellectual integrity fragmented at this point, Adorno considered the corporeal 'our stance on theology'.<sup>153</sup>

## BODY AND RESURRECTION

So far the content of the position God would hold in the conventional ontological proof for the existence of God has been left undefined. The missing link – the idea of the absolute or the other – was corporeal experience which, on Adorno's account, needed to be reflected: 'The intellect evolves from ... the urges'.<sup>154</sup> The somatic moment was 'irreducible as the not purely cognitive dimension of knowledge'.<sup>155</sup> Since the persistence of suffering was avoidable, it was irrational. Given that it ignored or even justified suffering, the rigid world beyond of traditional metaphysics had turned out to be a lie.<sup>156</sup> Adorno's metaphysics of the tiniest and shabbiest detail hinged not so much on the 'positive' moment of sensual joy but focused primarily on 'the unmeaningful stratum of life', the suffering and frail body. It sprang from the only remaining moral impulse, the universal 'revulsion, turned practical', against physical pain.<sup>157</sup> With it came the minimum demand that there should be no suffering. It culminated in the categorical imperative to arrange one's 'thoughts and actions so that Auschwitz may not repeat itself, so that nothing similar may occur'.<sup>158</sup>

Adorno complemented his solidarity with the tormentable body with the 'remembrance' [*Eingedenken*] of one's own human 'naturalness' and mortality. The point was by no means to idealize some infirm *conditio*

*humana* but to become fully aware of its horror, including the terror of death. For Adorno, the fact that a beloved human being was dead was unimaginable.<sup>159</sup> He paraphrased the attendant sentiments: 'The sense of unfinished business; things had really only just begun – all the things we should have done ... that one might make good on the omissions and that this miserable and fragmented life does not even suffice to bring one's own life and that of one's nearest and dearest to a meaningful conclusion'.<sup>160</sup> Adorno pitted this shock against a frigid culture that depended integrally on the repression of mortality. He thus rehabilitated the notion of the resurrection of the flesh against any form of purely intellectual metaphysics. Hope was hope for the flesh, and the theological notion of resurrection was conceptually more consistent than that of the abstract immortality of the soul.<sup>161</sup> The rational 'gravity' of the corporeal was juxtaposed to the irrationality of indeterminate and generalizing identitarian thinking. 'Should theology, which wants to abolish death, die, nobody will feel compelled to constrain death anymore.'<sup>162</sup> The idea of resurrection as the vanishing point of all critique also originated with Benjamin, who defended it against Horkheimer in the 1930s. Against the notion that history was open-ended and the past could be salvaged, Horkheimer repeatedly insisted that 'the injustice of the past is done and dusted. The slain really have been slain'.<sup>163</sup> Adorno, by contrast, aligned himself with Benjamin's motif of the 'collector' whose attention focused on the lost causes that had been overwhelmed by history. Indeed, he identified Benjamin's 'rescue of the hopeless', the recording of the history of 'creaturely suffering' and of that, which had not come about, as the 'central motive' underpinning his own work.<sup>164</sup> The potential reader of those records could only be situated in a better future, in which the suffering and joy of earlier generations would become accessible and be taken up again. Since no inner-worldly rectification of that, which was irrevocably in the past, was possible, a

redeemed humanity was conceivable only in theological terms. The need to conceive of resurrection tells us more about the forms of economically preformed thought than the reality or unreality of redemption. Thus, 'a caveat was immediately lodged on religious hope again, it was precluded from becoming positive'.<sup>165</sup> The dilemma of being compelled to think theologically against the faulty world, yet unable to do so within it, could not be neutralized. It drove Adorno to the notion that metaphysics was the 'intellectual effort to salvage that, which it dissolves'.<sup>166</sup> When he concluded his lectures on metaphysics by pointing to a convergence between the inadequacy of his own elaborations and 'the impossibility of thinking what must be thought',<sup>167</sup> he was not simply being ironic but also offering a concise outline of his programme. Fallibility was what vouched for the compatibility of the concept of redemption and the experience of its absence. Any suggestion of certitude would be ideology.

## METAPHYSICS AND EXPERIENCE

Thought that reached its limits but could substantiate no positive theology depended on other forms of evidence. Even if neither of them was entirely successful in this respect, Adorno's agreement with Benjamin that one should 'refrain from any overt usage of theological categories' reflected this.<sup>168</sup> Against the conclusions of the self-deluded intellect, solidarity with the 'tormentable body' insisted on the incorporation of experience. Adorno's entire 'critical ... transformation of religious tradition guided by freedom' culminated in his plea for a critical philosophy of experience.<sup>169</sup> Thought that concurrently dissolved its own conclusions as it proceeded would match the mimetic capacity to devote oneself in precisely this sense to the hopeless aspects of mundane existence so desperately in need of rescue. The 'ideal of surrendering oneself' denoted this way of proceeding.

Against the self-referential immanence of the generalized functional context, the subjectively experienced structure of the object would be decisive, and the object would determine whether that experience was successful or missed the mark.

In this context, Adorno referred to experiences that 'accrue or do not accrue' and spoke of a specific 'metaphysical experience'. Mysticism, tied to the object of holy scripture it interpreted, had once been its medium. Adorno's maxim of 'treating profane texts like holy scripture', applied to Proust and Beckett, brought such experiences into the present. In secularized 'metaphysical experiences' like *déjà vu* ('where have I seen this before'), or the juxtaposition of the sites of happy childhood memories and reality, the latter turns out to be altered and manifests itself as contingent.<sup>170</sup> Kracauer had described himself in 1922 as somebody who was waiting, no longer capable of believing, even while his 'hesitant openness' for the absolute betrayed his wish to do so.<sup>171</sup> After Auschwitz, Adorno rejected the possibility of positive metaphysical experience altogether and appropriated Kracauer's notion of 'waiting', bringing it to a head with a pessimistic turn. The only way of heightening metaphysical experience was now to wait in vain while wondering in a disillusioned manner whether this was really everything there is.<sup>172</sup> What remained was the alternative of either capitulating in the face of everyday depravity or reflecting critically upon it. The choice, then, as Adorno noted pointedly, was between 'theology' and 'tautology'. Faced with *this* alternative, he preferred the former.<sup>173</sup> This distinction was no less radical than Horkheimer's earlier juxtaposition of traditional and critical theory. In this scheme, knowledge as the replication of the given state of affairs – what Horkheimer called the conceptual 'duplication of the reality' knowledge 'had set out to comprehend'<sup>174</sup> – was tautological. Theological, on the other hand, was the negation of the 'categories ... that are valid in the existing order'.<sup>175</sup> Theology, then,

consisted in the immanent critique of the tautology whose only transcendent ingredient was the corporeal or metaphysical experience of the inadequacy of self-referential immanence.

The relationship between metaphysics and experience also ran through Adorno's philosophy of the arts. The undivided attention music demanded of the serious listener precipitated devotion to a fleeting object, he noted. 'Mahler's theology', for instance, was 'gnostic like Kafka's'. The only remaining transcendence was that of longing.<sup>176</sup> A similar gnosticism prevailed in Beckett, for whom the world was 'radically evil' so that its negation maintained 'the possibility of another world'.<sup>177</sup> For Adorno, the hopeless state of affairs in Beckett's dramatic art represented 'the only genuinely metaphysical creation since the war'.<sup>178</sup> In contrast to the desolate worlds of Beckett, the utopian contents of the classical arts now constituted no more than missed opportunities. Adorno's theological hope perished in and with Beckett.

## AMBIGUITIES IN THE RECEPTION HISTORY: JÜRGEN HABERMAS

There have been various theological attempts to incorporate Horkheimer's and Adorno's ideas. The topic seems to be altogether less popular outside of theology departments. Readers in the tradition of the ideology-critical self-understanding of the Frankfurt School frequently take recourse to the formulations and imagery pertaining to reconciliation, yet without referencing their religio-philosophical implications. Outside of this all too sympathetic coterie, the theological problems of critical theory are generally brushed aside as a dead end and metaphysical ballast. Both strategies are exemplified in the work of Jürgen Habermas. His essay, 'Der deutsche Idealismus der jüdischen Philosophen' ['The German Idealism of the Jewish Philosophers'] of

1961, concluded with a plea that, given the crimes of National Socialism, one should highlight the achievements of Jewish philosophers, though not for their sake but to benefit post-war Germany: 'If there were no German Jewish tradition, for our own sake we would have to invent it today', he wrote. For Habermas, this remarkably candid plea followed from the fact that the 'physical carriers' of this tradition had been murdered and the Germans were now in the process of 'forgiving and forgetting everything in a climate of noncommittal conciliatoriness'.<sup>179</sup> Against this trend, historical recollection needed to be kept alive. 'The Jews' German idealism', Habermas wrote, 'produces the leaven of a critical utopia; their aspiration finds its most precise, dignified, and beautiful expression in the very Kafkaesque final segment of *Minima Moralia*'. Indeed, Habermas concluded the essay with a complete rendition, without any further comment, of the already quoted aphorism, 'Finale', that invoked the 'messianic light' as a hypothetical source of knowledge.<sup>180</sup> Habermas, then, was interested in this aphorism not for its theological implications but as proof of a 'German Jewish tradition' (of which Adorno, incidentally, knew precious little). Among German Jews before 1933, the juxtaposition of 'Germandom and Jewishness' had been a controversial issue. In the volume that contained Habermas's essay, Horkheimer also explicitly touched on this historical debate. He argued, for instance, that Kant's critical philosophy and the Jewish prohibition of the image amounted to the same thing.<sup>181</sup> Habermas went further and sought to reactivate these problematic categories 'for our sake', in other words, for the (non-Jewish) Germans' benefit. For him, 'taking up the Jewish Question again without Jews' represented an 'historical irony'.<sup>182</sup> While the harmony of 'Germandom and Jewishness' had been the issue of 'a controversy among Jews from Germany' prior to 1933, it had advanced to becoming a German pet theory after the Shoah.<sup>183</sup> Habermas's

identification with an 'older' Critical Theory designated as Jewish thus turns out to be characteristic of a generation that 'had entered the university in 1949 with a reasonably clear awareness of the historical magnitude of Auschwitz'.<sup>184</sup> Jewish teachers seemed best suited to act as monuments to the grandeur and vagaries of the German educational tradition.<sup>185</sup> The consequences were evident in Habermas's reassessment of Schelling's 'Weltalter'-philosophy ['Ages of the World'-philosophy], which had been the focus of his dissertation, *The Absolute and History*. Drawing on his engagement of Critical Theory and Gershom Scholem, Habermas interpreted Schelling's cosmogonic notion of the 'contraction of God' not only as an expression of 'dialectical idealism in transition to materialism' but also took recourse to the kabbalistic motifs of *zimzum* and *tikkun olam*, which he had not invoked in his dissertation.<sup>186</sup> He argued that the philosophy of Ernst Bloch, for instance, derived from the same Schellingian philosopheme. It transported 'the legacy of the kabbalah from the spirit of Romanticism to the Protestant philosophy of German idealism', rendering 'the most Jewish elements of Bloch's philosophy concurrently the truly German' ones.<sup>187</sup> Habermas never tired of highlighting Scholem's achievements. Yet his ill-founded enthusiasm for the theological ideas of critical theory as the ostensible proof of a German-Jewish synthesis did not last. It was followed by the demonstrative renunciation of 'the pitch-black totality conception of the philosopher Adorno' in favour of his own utopia of communication.<sup>188</sup> The theological arguments of the 'first generation', which he had previously adopted as a matter of course – albeit not as worthy of philosophical discussion but merely as historical testimony to a productive German-Jewish dialogue – were re-evaluated in the process and interpreted as the illegitimate silver lining inherent in the conception of totality. Horkheimer and Adorno had been unable to develop the idea of a 'mimetic' form of

reason that could take the place of identitarian thought, Habermas claimed. At best, they had been able to point to it ‘in the imagery of Judaeo-Christian mysticism’.<sup>189</sup> Apparently, then, their excessive wariness of instrumental reason drove Horkheimer and Adorno to irrationalism. ‘An overdrawn promise of redemption and exaggerated pessimism complement each other in this reading’.<sup>190</sup> This polemic notwithstanding, traces of the earlier engagement are still evident in Habermas’s religio-philosophical texts. Practical reason missed its ‘purpose if it no longer has the capacity to rouse and maintain in mundane minds an awareness of the solidarity that is violated the world over, of that, which is missing, that, which stinks to high heaven’.<sup>191</sup> Habermas’s notion of the ‘verbalization of the sacred’, i.e., the translation of its semantic contents into profane reason, reiterated the aforementioned profanation postulate. This allowed Habermas to subscribe to Scholem’s and Adorno’s discussion of how the turnover from the theological to the profane transpired while nevertheless maintaining an agnostic notion of incommensurability: Adorno’s error, Habermas argued, consisted in his idealistic attempt to engage theology on an equal footing.<sup>192</sup>

This accusation of idealism renders the radical critique of religion and all forms of theology impossible. Faith and reason, immanence and transcendence break apart. The establishment of two separate, complementary truths eliminates the idea of the one truth that must exist because ‘there is no redemption unless it is all-encompassing’.<sup>193</sup> A liberated humanity would not be liberated if it coexisted with an unfree one; truth would not be true if it encompassed contradictions. As long as they remain unfree, individuals can only find their own way to salvation or seek to be reasonably happy. While neither the premises of reason nor those of faith can be imposed, theology and materialism must assume that the whole truth will ultimately come into being as the truth of humankind. The concept of theology at stake here is

obviously at odds with the academic disciplines that bear this name. Their contents, if we follow Horkheimer and Adorno – and Habermas’s notion of the ‘verbalization of the sacred’ – can be critically recovered only as catalysts of profane, practical reason. Conversely, the need to hold on to the one truth and the all-encompassing redemption drives profane reason towards theological problems of justification. The constant turnover of this immanent and transcendent motion is critical theory’s mode of reflection.

# Social Constitution and Class

Tom Houseman

Critical theory is not well known for its interest in phenomena such as class, which are conventionally held to belong to political economy. This is partly due to the attention-grabbing influence of the philosophical, sociological, cultural and aesthetic analyses produced by members of the Frankfurt School, which contributed to a popular misconception that critical theory marks a departure from the traditional heartland of Marxist thought. The apparent distance from Marxism was exacerbated by the strategic veiling of references to Marxist theory throughout the work of Adorno and Horkheimer in particular (Wiggershaus, 1994: 401; Rubin, 2002: 174–5), but also by a tendency to assume that Friedrich Pollock’s work on political economy spoke for the whole Frankfurt School, leaving Adorno and others to develop more philosophical and cultural critiques (Postone and Brick, 1982: 618–19).

This is, however, a grave misconception. The starting point for critical theory is class society. The dialectical character of Adorno’s

work is necessary precisely because it enables thought to encounter contradiction as ‘something more than an accidental error on the part of the thinker’ (Jarvis, 1998: 170), as something that inheres in the object of thought itself. The perversity of identitarian reason (Adorno, 1973) and the mythical character of enlightenment rationality (Adorno and Horkheimer, 1997) belong to an antagonistic social totality in which that antagonism is not at all obvious to its participants. The basic premise of Adorno’s work, and indeed of Marx’s materialism, is a world governed by mediation, a world in which social reality appears to those involved in mystified, fetishized forms. Understood as a critical project of demystification, Marx’s *Capital* uncovers what is encrypted in the economic abstractions that dominate our everyday lives: the social relations of production (Bonefeld, 2016a: 61–6). The central contradiction of capitalist society, as revealed by Marx, is that the social relations of production are structured as a class antagonism but

this appears as its opposite, namely the free and equal exchange of commodities between seemingly independent individuals, each pursuing their own interests as equals by means of freely entered contracts.

In this way, ‘class society’ does not fully capture the place of class in critical theory. Instead, class must be conceived as a relation of struggle. The different poles of the class struggle are constituted by this relation, rather than being pre-existing entities that come together and begin struggling, competing or cooperating. Capital is the ‘not-labour’ moment of the capital–labour relation, and vice versa. Class struggle is ‘the fundamental premise of class. Better still: class struggle is class itself’ (Gunn, 1987: 16). This is not an inevitable or inescapable situation, a trans-historical truth to which critical theory resigns itself. Instead, for Adorno especially, the abolition of capitalist social relations of production, and indeed the abolition of class, is urgent and necessary (Bonefeld, 2016a: 71). Capitalist social relations take the form of petrified economic abstractions, and so the life and work of society appear as abstract economic mechanisms that are indifferent to human needs (Adorno, 1976: 80), allowing for the coexistence of extremes of excess and luxury alongside abject deprivation. This indifference also has a role to play in the perpetuation of atrocities, and the need to abolish capitalist social relations is the obvious implication behind Adorno’s famous ‘new categorical imperative’ that ‘mankind ... arrange their thoughts and actions so that Auschwitz will not repeat itself, so that nothing similar will happen’ (Adorno, 1973: 365). In contrast to those approaches that take (a specific) class as their positive starting point, something to be affirmed as an agent of radical change, critical theory argues that emancipatory praxis must confront class as the basis of the unintelligibility and irrationality of capitalist society. ‘Contrary to the rumour about critical theory’, therefore, ‘its critique of existing conditions does not entail an impoverished praxis. Rather, it entails the question of praxis: what

really does it mean to say ‘no’ in a society that is governed by the movement of economic abstractions?’ (Bonefeld, 2016b: 237).

This chapter fleshes out the above claims through a series of critical engagements with various traditional and Marxian approaches to theorizing class. Against sociological approaches to class, including Weberian and Marxist variants, I argue that the impulse to conceptualize class as a classificatory schema to organize complex social differentiation is an affirmation of the way that class *struggle* appears, in a perverted conceptual system, as its opposite. To take the results of fetishistic thought as its basis in this way, commits to a host of problematic theoretical and political positions. I then turn to the teleological Marxist conception of class as the trans-historical development of a revolutionary subject, and Lukács in particular, arguing that this rehearses the same problematic manoeuvre that underlies the sociological account of class, namely to erase the contradictions within the concept of class. Whereas sociological accounts start with assuming the noncontradictory existence of class, Lukács attempts to preserve the contradictions but fold them into a noncontradictory whole. In contrast, a critical theory of class does not attempt to reconcile the social contradiction. Rather, it locates class as an entirely negative category, both in terms of theory and praxis. Finally, I turn to the omissions of classical political economy to highlight the critical importance of class exploitation and the social constitution of the doubly free labourer on which this exploitation rests.

## SOCIOLOGICAL APPROACHES TO CLASS

### *Weberian Sociology*

The sociology of class emerged from the growing division between economics and other social sciences, in which the former, as

part of its marginalist revolution and the rise of microeconomics from the close of the nineteenth century, ejected any form of agency beyond utility-maximizing individuals and firms (Clarke, 1991: 37). As this new disciplinary division of labour emerged, Max Weber took up the analysis of class as a sociological phenomenon, cementing the demise of political economy for which class had been a central concern (which I return to, below). In *Economy and Society* (1978), Weber sets out class as a methodological problem: how to examine the complex intersections of different bases for social action in modern, mass society. Weber's solution was the construction of 'ideal types' that can be verified empirically, at least roughly, by the types of social action they are theorized to promote. Complex, pluralistic society is thus carved up methodologically into stratifications, and class is the economic version of social stratification, alongside the political (parties) and social (status groups). A class is defined in terms of differences in how agents act in the market (Wright, 2005: 210–16), which is ultimately determined by their 'position' in the economy: the resources they bring with them as they interact with the market, which determine the chances that they will achieve their goals, whatever they might be (Weber, 1978: 302). The sociology of classes therefore consists in theoretically modelling the opportunities and likely market preferences of the holders of specific types of assets, with the assumption that individuals with similar assets, and therefore similar prospects in the market, will behave similarly.

There is a formal connection between the classes (in that a class defined by its exclusive ownership of a particular resource logically entails the other classes lack this resource); however, this connection is far from constitutive. Weber stipulates that while class differentiation in capitalist societies occurs along the axis of property, including the 'positively privileged classes' of capitalists and landlords, as well as the 'negatively privileged classes' of workers and tenants,

stratification also occurs in terms of differential power within the market due to the possession of specialized skills or positions of authority, such as managers (Mommsen, 1989: 63–4). Consequently, the alignment or conflict between different classes' interests are contingent, within a broader matrix of power and social action that is also structured by political and social stratification.

The crucial point here is that class is an abstract and analytical device, which simplifies the complexity of plural modern society. The taxonomy of classes, their interests and their relations, are all open questions that may change from place to place and at different times. Class, for Weber, is not a question of struggle, nor really of relation, as classes do not confront each other directly, but rather interact with the market itself. The existence of classes as methodological categories is mirrored in the Weberian approach to class consciousness. Weber leaves open the possibility of members of a class becoming conscious of their shared situation and thus organizing as a class (Weber, 1978: 932). However, the normal operation of social action for classes is that individuals tend to conform to a pattern that corresponds to their position in the market. This is in contrast to parties and status groups which contain greater scope for concerted collective action. To the extent that 'ideal-typical' class analysis remains deliberately abstract, with the concrete details to be filled in by social action, the interests of a specific class 'lack any determinate form' and 'can be derived only from the average beliefs and activities of class members at a given point in time' (Wenger, 1987: 57).

Class, then, is a methodological device, a heuristic means to rationalize complex reality; as an empirical phenomenon, class is meaningful only to the extent that there is some similarity between the beliefs and behaviour of those placed in the same classification. This opens the door to the later characterization of class as cultural affectation (for instance, Bourdieu, 1984), but more

importantly removes any critical component of the concept of class. Classical political economy, which sociology and economics dissolved, was at least able to articulate class interest in such a way as to recommend specific courses of action; it had a role to play in each class' political education. The Weberian approach, by contrast, furnishes the members of a class with only their own reflections, allowing for no gap between perception and the economic situation. As Morton Wenger complains, this means

if in one century the majority of the feudal peasantry of Germany experiences economic hardship as a result of a depression in urban demand for farm products and perceives its interests as served by slaughtering the Jewish population, then, deploying Weber's logic, this represents their class interests at this point in time. (1987: 56)

The paradox of the empiricist and sociological approach to class is that it locates class as category in the production of knowledge, a methodological abstraction, while at the same time denying the epistemological validity of anything not empirically observable. This means, for Adorno, that sociology 'reduced the essential fact, namely, class, to an ideal type and banished it to the realm of methodology, while abandoning reality to a cult of unique events that the theory merely garnished' (2003: 101). The primary result of this 'cult of unique events' is that each classification becomes immediately suspect as soon as differentiation within an identified class becomes visible. This prompts the postulation of ever more granular stratifications, with overlapping schema and varying degrees of sub-classes and variations. Class, as a meaningful concept, falls victim to a methodological approach imported from types of social action more readily identified around organizational structures and conscious allegiance (such as Party or club membership). In the absence of such identifying features, class is condemned to fragment almost to the point where each individual comprises her own economic class.

### ***Gramsci and Marxist Sociology***

Drawing on both Weber and Marx, Antonio Gramsci's contribution to class theory can be seen as an attempt to rescue the sociological approach to classes as identifiable groups from its regress into fragmentation by grounding it in classical Marxism. The classical or orthodox Marxist tradition, associated especially with the Second International, was heavily influenced by figures such as Engels, Plekhanov and Lenin, who promoted *Capital* as the pinnacle of economic science, a work of political economy (rather than the critique of it), distinguished from Smith and Ricardo by its technical superiority (Clarke, 1991: 71–4). A distinctive feature of the Marxist orthodoxy is the progressive disarticulation of Marx's 'economics' from the social, political and ideological dimensions of the critique of political economy, which are held to be separate structures, each of which can be theorized (separately) from a Marxist perspective (Bonefeld, 2001: 5–6). As the property relations that underpin the bourgeoisie's exploitation of the proletariat are as much political and juridical as economic, class becomes separated from the 'proper' objects of economics, namely value, the circulation of money, and the different types of capital. Thus, the primary consequence of the economic reading of *Capital* is that the theory of class is relinquished to a separate Marxist discipline concerning one or more of the dependent structures – political, ideological, legal – that Marx did not have time to analyse in the same depth as his economics.

Class poses questions in this classical universe of interlocking but separate structures, one theoretical and one practical. Viewed from the economic 'base', it is a given that there are two different groups: one deploys its labour to ensure the survival of society, creating social wealth through its effort and creativity; the other is a parasite that persists by exploiting the first, growing ever richer. This is the essential fact of capitalism, and its

emergence, often theologically conceived as the inevitable result of the internal contradictions of feudalism, hardly matters (although see the section on Lukács, below). The practical problem is that in spite of the obviousness of this relationship of exploitation, the proletariat has so far failed to cast off its shackles and rid itself of the parasites, hence the Gramscian turn to ideology and the political and institutional context of class action. The theoretical problem for this tradition is ‘the embarrassment that not all individuals in bourgeois society can be fitted, tidily, into the groups which it labels as “capitalists” and “proletarians”’ (Gunn, 1987: 16). Gramsci’s sociological inheritance provides the answer to both questions by positing a variety of additional classifications in which to contain those that do not fit into the original two, such as middle classes and sub-class ‘fractions’, which may be assessed in terms of likely class allegiances that might further or impede socialist strategy (Bonefeld, 2014: 104).

Following Gramsci’s emphasis on the specific requirements of a successful political movement, the more sociological Marxist approaches pay particular attention to the idea of class leadership. This idea, and its development in the concept of hegemony, presupposes a plurality of different ‘social forces’, which forms the context in which class leadership can make sense. Society is ‘naturally’ one of difference, and unity (for instance in a historic bloc) is something artificial, against which Marx complains, in *Theories of Surplus Value*, that ‘in this society unity appears as accidental, separation as normal’ (1977: 398). Significantly, this entails some departure from the orthodox Marxist conception of class in terms of the social relations of production, understood as the capital–labour relation. Instead, a more diffuse understanding of how classes are ‘engendered’ by the social relations of production (Bieler and Morton, 2003: 476) is ‘often invoked but never conceptualised’ (Bonefeld, 2004: 236).

Marx’s two ‘great classes’ are broken down into a more diverse arena of ‘collective actors’

(Bieler and Morton, 2003: 476), making the logic of class struggle commensurable with the politics of how non-class social forces articulate and pursue their interests. Indeed, Cox argues that hegemony consists of three interacting types of force: ideas, institutions and material capabilities (Cox, 1981: 136), in an echo of Weber’s triad of class, party and status group. For the less pluralist Gramscian tradition extending from Poulantzas, this diversity of social forces extends inwards into class, with the ‘collective actors’ not being entire classes but rather ‘rival fractions’ within them (Bieler and Morton, 2003: 480). In this way, for instance, neoliberalism is interpreted as the project of a hegemonic class fraction, whose particular interests determine the social form of society in this period.

The focus on fractions, especially within the capitalist class, entrenches the Gramscian tendency to approach class as a group rather than a social relation. Fractions are identified according to the similarity and collusion of their members – a unity of interests – and the question of antagonistic relations between various social forces (which must be negotiable for hegemony to be possible) is established to some extent empirically (Poulantzas provides a good example of this: see Clarke, 1977: 19–20, and the rest of that article for how these problems undermine his theory of the state). As Bonefeld (1992, 2004) argues, this depoliticizes the capitalist economy by substituting ‘class struggle for class strategy’ (1992: 96), the latter being located in a political field of contesting ideas and political machinations. Despite the frequent references to the ‘social relations of production’ in the Gramscian literature, the way in which capitalism reproduces itself is rendered politically inert, and those social relations become something distinct from class.

While Althusser drew heavily from Gramsci, he resists the separation of (economic) social relations and (political) social classes. Althusser ascribes to the orthodox view of a Marxist economics, alongside a Marxist theory of politics and a Marxist

theory of ideology, but asserts that class belongs to all three simultaneously (Connell, 1979: 310). This avoids the economic reductionism inherent in orthodox Marxism, without overemphasizing the cultural or ideational existence of class as does Gramsci. However, this approach replicates the sociological conceptuality of class as classification: the goal is a positive, concrete description of the class situation whose measure is empirical accuracy rather than a (critical) enquiry into the constitution of the empirical appearance. The attempt to deal with class as the interaction of three relatively autonomous 'instances' gives rise to 'a truly formidable number of possible situations and schemes of analysis, which makes it possible to treat every situation as the exception it is' (Connell, 1979: 312). Here again is the theory of class degenerating into a positivistic 'cult of unique events' (Adorno, 2003: 101) that provide the concrete and contingent facts behind which sits orthodox Marxism's economic 'base', as explained by the scientific economics of Marxism. Althusser suggests that this accumulation of complexity rescues Marxism from the charge of determinism; however, as Richard Gunn aptly comments, this is 'like claiming that a machine is no longer a machine in virtue of the number of cogwheels in its motor drives' (1987: 22).

## CRITICAL THEORY AGAINST THE SOCIOLOGY OF CLASS

Conceptualizing classes as identifiable groups, which between them may successfully subsume every member of a society under one classificatory schema, pulls decisively away from the critical insights Marx develops in his critique of political economy. The capital-labour relation quickly degenerates into an ever-more fragmented taxonomy of different groups, strata and sub-class fractions. Even where this degeneration is halted, usually by the dogmatic assertion of the

ontological priority of the bourgeoisie and proletariat, the political result is the same: theory is tasked with strategizing to further the (theorized or articulated) interests of its chosen side. Crucially, classes become groups that have an empirical existence within a society 'structured' by the economic system of capital. To forward the interests of this or that class, to advocate its 'class leadership' and to theorize its routes to power, is to leave the economic categories untouched. This 'world-view describes capitalist economy as an irrationally organised economy of labour, and proposes socialism as a rationally organised economy of labour by means of conscious planning by public authority' (Bonefeld, 2016b: 240–1). Central economic planning, which thus derives partly from the sociological theory of class, preserves the perverse economic categories of capitalism, merely seeking to organize the distribution of outcomes between different groups: 'to secure for the slaves their existence within slavery' (Adorno, 2003: 105).

In contrast to the conception of class as group difference, critical theory conceives of class, and specifically class struggle, as a negative category. The capital-labour relation, which Marx uncovers as the constitutive basis of capitalist society, is a relation between categories, in a world where social relations appear as relations between things. Rather than being a system that works independently of its human participants (as it appears to economics), or a 'real' system of human oppression that is concealed by an ideological cloud (as it appears to structural Marxism), capitalism is a world of appearances: human social relationships (for instance, providing food for another) exist in the form of the interaction of quantities of things: commodities, and especially money. But this fetishized world remains a human world. It obtains through human action. 'Economic objectivity imposes itself over the social individuals because it prevails in and through them.... In this "coined" relationship, the social individuals vanish, only to reappear as personalities

of economic reason, calculating the movement of economic quantities, winnings and losses, and struggling for money-based access to subsistence' (Bonefeld, 2016a: 63). This is the substance of class in capitalism. Social relations are encrypted into economic categories, which acquire social reality in the form of roles (Marx uses the term '*dramatis personae*' (1976: 280)) that we must play, on pain of our losing access to the means of subsistence. Individuals are 'the personifications of economic categories, the bearers [*Träger*] of particular class-relations and interests' (1976: 92).

To personify the economic categories of capital and labour is not to personify one or the other as self-contained things. Rather, it means the internalization of the capital–labour *relation*, which manifests in a diversity of different configurations of interests, resources and behaviours (Bonefeld, 2014: 106; Gunn, 1987: 17–19). A single class relation (capital–labour) appears as a multitude of positions, including *but not limited to* capitalists and workers. Managers, self-employed entrepreneurs, shop-owners, retirees, housewives, prisoners, the disabled and many more: all confront their social world and the problem of subsistence as different configurations of the capital–labour relation, but where this relation 'cuts through' them rather than each inhabiting one side or the other (Gunn, 1987: 16–24). The employee who puts some of her savings into the stock market, for example, internalizes the concerns and class interests of both poles of the capital–labour relation. As the logic of capitalism that Marx uncovers entails the growth and concentration of capital, and thus the expansion and intensification of capital's insatiable hunger for (unpaid) labour, the personifications of employers and employees do form the norm of capitalist society, but not at the exclusion of other configurations of personified economic categories. In this way, capitalism produces both the empirical support for the sociological Marxist view of class and its falsification. The critical point is that conceptualizing class in terms of

*classification* takes the result of fetishism and personification as a positive and basic fact, and constructs its understanding of capitalist society and its political programme on this basis. Critical theory, by contrast, recognizes that class – and specifically the appearance of multiple positions that can be grouped together into different classes – belongs to a fetishized and irrational totality that must be subjected to critique in its entirety.

### **Reflections on Class Theory**

It may be objected that a critical theory of class, by conceiving of class struggle as something that does not appear immediately but rather takes the form of its opposite – as (sociological) class difference – tells us little about the actual configuration of interests and behaviours that shape day to day experience. This is already a misperception as the critical approach allows us to conceptualize, in terms of class struggle, the quotidian pressures that dominate the majority of our ordinary experience, from purchasing food to the offices, factories and other environments where we spend much of the day. But it is also pertinent to observe that it is critical theory, rather than sociological approaches to class, that is able to recognize the contradictions that structure and disorganize the class politics of the personifications of capital and labour, and therefore produce a more sober prognosis of the proximity of a historic change in the social relations of production.

In his 1942 essay, 'Reflections on Class Theory' (2003), Adorno takes up the familiar Marxist trope of the apparent decline of the working class as a potent force for revolutionary change. He argues, against the view that nineteenth century exploitation has given way to a more cooperative and humanized relation between employers and employees, that capitalist domination over labour has increased and intensified, past a tipping point at which class itself ceases to be recognizable: 'The omnipotence of repression and

its invisibility are the same thing.... So great has the tension become between the poles that never meet that it has ceased to exist' (Adorno, 2003: 97). In a perverse way, the capitalist class as the personification of self-valorizing value reasserts itself as the ideology of a classless society. Class struggle

disappears behind the concentration of capital. This latter has reached a magnitude and acquired a weight of its own that enables capital to present itself as an institution, as the expression of society as a whole.... By virtue of its omnipotence, the particular is able to usurp the totality: this overall social aspect of capital is the end-point of the old fetish character of the commodity according to which relations between men are reflected back to them as relations between things. (2003: 99)

As a result of the almost total asymmetry in the economic power of concentrated and centralized capital (a result of each successive crisis) in contrast to even organized labour in possession of the vote, the personifications of capital become ever-more anonymous, in spite of conspiracy theories that seek to give them recognizable faces and names (and ethnicities). In the face of the anonymity and irresistibility of the old foe, the exploited 'are unable to experience themselves as a class. Those among them who claim the name mean by it for the most part their own particular interest in the existing state of affairs' (2003: 97). Faced with the progressive invisibility of capital as a moment of class struggle, organized labour retreats into the affirmation of the sociological character of the class tied to labour, seeking to preserve its unity and political gains through a strategy of celebrating the particular dignity and moral improvement of proletarian culture (*Endnotes*, 2015: 96–7). *The Communist Manifesto*'s call for the workers to throw off their chains, and thereby abolish class itself, degrades into a moralizing defence of everything proletarian – flat caps and whippets, calloused hands and thick accents – in contrast to the perceived decadence and iniquity of the bourgeoisie. From this point, class becomes a form of identity politics: the

zealous policing of what counts as a positive in-group characteristic and what marks one as 'other'. Class identity then irresistibly intersects with other axes of oppression and exclusion, especially race and gender, which are (mis)characterized as non-economic forms of identity. The strategic and affirmative defence of proletarian identity and conditions almost inevitably became a denial of the political salience of racial and gendered injustice, for instance the British labour movement's decision to let the franchise question rest with 'universal' male suffrage, postponing women's suffrage as a lesser priority. Tendencies within radical politics, such as competitions over which group suffers the worst or most important oppression, partially emanate from the transcription of class into a sociological register, which is itself motivated by the growing impossibility of labour experiencing itself as a unity.

Adorno's insight in *Reflections on Class Theory* is that the fragmentation of the working class, conventionally narrated in terms of decline, is in fact characteristic of the very concept of class in capitalism, and is exhibited far more clearly by the bourgeoisie: 'As the anonymous unity of the owners of the means of production and their various appendages, the bourgeoisie is the class par excellence' (2003: 98). Far from acting as a concerted unity of interests, members of the capitalist class are locked in deadly competition with each other, and it is the potential for ruin at the hands of competitors that drives the endless quest for increased accumulation. Moreover, the capitalist class is not, and has never been, a competition of equals, but rather is structured by asymmetries in power, position, resources and advantages. This is not to say, along with the neo-Gramscians, that it is class fractions that are agential and therefore of explanatory and strategic importance, and we might well observe the same asymmetries among the members of a fraction. Instead it is to highlight, rather than efface, the contradictory nature of class. It is worth quoting Adorno at length here:

In other words, real though the class is, it is also ideology in equal measure.... [Marxism] denounces the bourgeois class as a unity, a class against the proletariat, in order to expose the fact that the universal interest it claims to represent possesses a particularist dimension. But this particularist unity is necessarily a non-unity in itself.... The critique of liberal society cannot stop short at the concept of class, which is both as true and as false as the liberal system itself. Its truth is its critical aspect: it designates the unity in which particular bourgeois interests are made real. Its untruth lies in the non-unity of the class.... Its real non-unity is veiled by its no less real unity. (2003: 98–9)

The only way to make sense of this is to recognize that class is not a question of self-coherent groups, but is nothing other than a relation of struggle, and one that appears in contradictory ways. Class is ‘a living contradiction. Contradictions cannot be classified’ (Bonefeld, 2014: 107). To live in a class society is to act and think as the personification of economic categories, and even where this produces classes in the sociological sense, membership of the same class ‘by no means translates into equality of interests and action’ (Adorno, 2003: 97), precisely because class society is a contradictory reality.

## LUKÁCS AND THE THEOLOGY OF CLASS

A significant problem for classical Marxists, not unrelated to the above discussion, is the self-proclaimed status of Marxism as the critique of capitalism from the historical perspective of the working class. To affirm the working class as an ontologically privileged subject of history is to assign a positive status to a component part of a fetishized, antagonistic and contradictory totality. The way out of this, at least for the classical Marxists who recognized it as a problem, is to ascribe the working class with a historical status that transcends the time of capital, thus exempting the proletariat from belonging ‘only’ to capitalism. The most sophisticated version of

this is Georg Lukács’ *History and Class Consciousness* (1971), in which he attempts to develop a theory of class consciousness that both recognizes that we labour under the thing-like false objectivity of economic categories and seeks to ground the proletariat as a positive force against capitalism.

Lukács does this by turning to a Hegelian understanding of history as an unfolding dialectical process. Briefly, Lukács argues that the coinciding of the objective class situation and our subjective experience of it is profoundly blocked by what he termed ‘reification’, which consists in the fact that we are confronted by our own social activity, such as the labour process, in the guise of mysterious objects with their own independent existence and laws of motion, driven by ‘invisible forces that generate their own power’ (1971: 87). This is combined with the pressure of rationalization, in which the drive to efficiency produces an ever-more specialized divisions of labour in which each person becomes a smaller and more atomized part of an increasingly large and complex social totality, culminating in the subordination of the human to the machine.

Lukács’ solution to the problem of reification is that the objectification of the worker, her progressive transformation into a mere commodity, will push towards a point at which the dialectic implodes, and the workers’ subjective experience coincides with the social reality of their personification of objectified social relations (1971: 171). This would constitute the proletariat as a class possessing the self-consciousness of the capitalist epoch, allowing them to play a transformative role in the Hegelian unfolding of history. As the consciousness of the proletariat develops through its praxis, it begins to recognize its actual situation, in spite of reification, and threatens to overthrow capitalist class relations in their entirety. As such, it becomes capable of fulfilling the inner necessity of history:

Only when the consciousness of the proletariat is able to point out the road along which the dialectic

tics of history is objectively impelled, but which it cannot travel unaided, will the consciousness of the proletariat awaken to a consciousness of the process, and only then will the proletariat become the identical subject-object of history whose praxis will change reality. (1971: 197)

Even aside from the dogmatic idealism in presuming an innate dialectic of history (Bonefeld, 2014: 68), in which the proletariat acquires a messianic status, Lukács' attempt to identify the revolutionary proletariat as the identical subject-object of history runs into severe difficulty. Theoretically, it raises a perplexing question of how Marx (and indeed Lukács) was able to penetrate the veil of reification when this is something reserved for the privileged perspective of a class that has become history's self-consciousness. Lukács argues that the possibility of intellectually, that is, scientifically, understanding the inner necessity of history does not equate to the ability to 'change reality', which can only occur through praxis. However, this is a flawed argument as it separates science from consciousness, and intellectual labour from praxis, implying that scientific analysis is a shortcut to objective knowledge, which is precisely what the theory of class consciousness against reification rejects. If true consciousness is the exclusive prize of praxis, either the scientific knowledge Marx is supposed to have produced, and which underwrites Lukács' account of reification, is flawed in ways that it cannot know, and must await historical verification, or it somehow channels the self-consciousness of a class that has not, and currently cannot, yet come to exist.

In terms of practice, the problem is more pronounced. The self-consciousness of the proletariat, as the identical subject-object of history, is the achievement of a revolution that would destroy the false immediacy of reification, commodity fetishism and objectification. But in order for the revolution to occur, and the proletariat to fulfil their messianic historic mission, the proletariat must already possess a revolutionary – that

is, non-reified – consciousness as a class. Class consciousness is both a necessary precondition for the revolution and its eventual achievement. Lukács suspends this paradox in the idea of the Communist Party, which has not quite earned class consciousness through praxis but nevertheless embodies the vanguard, the most developed, form of that consciousness: the Party 'must exist as an independent organisation so that the proletariat may be able to see its own class consciousness given historical shape' (1971: 326). This (all too convenient) substitution of the proletariat's revolutionary class consciousness for the leadership of the Communist vanguard (which for Adorno is a purely idealist act of the identification of non-identical things) initiates a chain of possible substitutions in which the Party is substituted for the central committee, which is in turn substituted for the Leader, who thus becomes the living, pre-revolutionary embodiment of the proletariat's future self-identical class consciousness, and therefore the very self-consciousness of history. The messianic character of the proletariat is transferred to the head of the Party, who is therefore justified in purging the proletariat of its beliefs in its own name.

## CRITICAL THEORY AGAINST THE THEOLOGY OF CLASS

While his work is much more sophisticated than much of orthodox Marxism, and a significant inspiration for Adorno and the Frankfurt School in general, Lukács succumbs to essentially the same rationalizing impulse as sociological Marxist accounts of class: the attempt to erase the contradiction. Whereas sociological approaches assume at the outset that society is made up of difference, not contradiction, and classes are a way of organizing, stratifying and hierarchizing this world of discrete, different positions, Lukács preserves the contradictions in the

idea of reification and class struggle, but seeks to locate them, as does Hegel, in an ultimately non-contradictory whole, namely history. Contradiction is understood as having a destiny: it is a stage or a clause in a wider equation that will inevitably resolve into a self-identical subject-object: history's self-consciousness made flesh. Critical theory rejects this metaphysical and idealist apotheosis of noncontradiction as the inner truth behind a sequence of contradictions. If capitalism is to end, if the social relations of production are to be radically reconfigured – and materialism has no reason to consider this inevitable – it will not be the work of an agent that transcends history, although it may well be the result of that unpredictable (because it is contradictory) phenomenon, class struggle.

What this means for the critical theory of class is that class is entirely a negative category. It belongs completely to the false society, which is so contradictory as to require 'dialectics as the ontology of the wrong state of things' (Adorno, 1973: 11), and the same is therefore true of any particular class. To belong to the working class is not to be a member of a special club of the virtuous, it is not to possess some magical power of creation (as tends to be the view of those Marxisms that make labour a trans-historical category), nor is it to be the bearer of a privileged historical mission and its consciousness. To be in the great mass of people whose only access to subsistence is the sale of their labour power is 'not a piece of luck but a misfortune' (Marx, 1976: 644). Lukács is, however, right to suggest that the experience of those who survive by selling their labour power yields some insight into the nature of the system to which they belong, although this is not the historical self-consciousness he envisaged, and nor does it imply an awareness, in spite of reification and fetishism, of the exploitation which is the engine of class struggle. Instead, it is the constant, looming threat of not having enough money to survive, the

equation of unemployment and destitution, that provides the daily experience that tells the truth of capitalism:

Pauperization is the flip side of the free play of economic forces in the liberal system, whose theory is reduced ad absurdum by the Marxist analysis: with the growth in social wealth there is also, under capitalist relations of production with their immanent systemic compulsions, a corresponding growth in social poverty. (Adorno, 2003: 103–4)

As Adorno points out, though pauperization is a necessary consequence of capitalist social relations of production, it is not a mechanical law that asserts itself independently of the actions of individuals. The economic production of poverty is mitigated through 'extraeconomic' measures to raise the standard of living of the poorest, through minimum wage standards, unemployment benefits and social provision of certain goods, among other devices. Such measures are not the result of the operation of the economic logic of capital, but rather an index of the operation of class struggle. Class struggle between the poles of labour and capital has produced numerous such outcomes, but class struggle also produces configurations of interests within the capitalist class which pit the interest in lower wages and the disciplining power of poverty against an equally capitalist interest in minimizing poverty 'lest it blow the system apart' (Adorno, 2003: 104). This conflict of interests does not adhere to one or the other side of a schism within the capitalist class, *qua* Gramscian class fractions, but rather comprises part of the contradictory configuration of the interests of individual capitalists. Which impulse wins out, and determines the next phase of extra-economic mitigation (or indeed exacerbation) of social poverty, is a matter of class struggle. It is not preordained by the 'inner necessity' of history, but a contingent and active process that is itself mediated by the contradictions of a world in which social relations appear as the relations between things.

## CLASSICAL POLITICAL ECONOMY AND CLASS

The discussion of poverty brings us to another important component of a critical theory of class, namely the social constitution of the class struggle. This is best illuminated through a critical engagement with the classical political economists, especially Smith and Ricardo, who provided the categories that Marx's *Capital* critiques.

Contrary to a popular misconception that a class-based analysis of capitalist society starts with Marx, it was in fact a mainstay of classical political economy (Clarke, 1991: 10). Adam Smith inherited from his predecessors the task of identifying how an economy characterized by class differentiation fitted together, but was the first to do this systematically (Clarke, 1991: 20). Smith rejected earlier conceptions of the constitutive classes of a capitalist economy, which had hitherto revolved around either property (in the sense of landowning classes) or activity (such as agricultural labourers), and instead derived his classes from the contributing parts of the production of commodities: land, stock (capital) and labour. The three classes that appear in *The Wealth of Nations* are defined by the form of income that they receive – rent, profit and wages – each of which is regulated by a distinct set of principles, with corresponding interests and tendencies. Smith's enduring, if neglected, contribution to political economy consists in his attempt to theorize how the separate interests of the three classes might balance out within what he called commercial society. There is little space here to explore this system, but there are three features of Smith's understanding of class that warrant attention.

First, the identification of a class does not proceed as classification – the attempt to distil general categories from a range of observed characteristics, such as types of property, levels of wealth, or social status – but rather starts from the totality of the economic system and enquires after its component parts.

The various plausible types of revenue in a capitalist economy are held to correspond to one corner of the triad of rent, profit and wages, and therefore the apparent diversity of economic actors is ultimately reducible to the landowning, stockholding and labouring classes (Clarke, 1991: 26). Smith thus builds into the very definition of each class a necessary relationship with the others and to the functioning of society as a whole.

The second feature of Smith's theorization of class emerges from his view of role differentiation, visible in the component parts of production, as itself arising from the principles of private property and equal exchange upon which his system is based. Smith assumes these principles as having a natural provenance, written into an innate human tendency to 'truck, barter and exchange', and concludes that an undifferentiated society will gradually and naturally congeal into class differentiation, due to natural propensities that lead to the accumulation of stock and land by some individuals, and the desire to employ others (Smith, 1904: I.6).

Third, Smith's conception of capitalism includes the possibility – and indeed the likelihood – of class struggle, especially between the capitalists, who want to lower the cost of labour, and workers, who want to raise it. In a system of competing, self-interested economic agents, where classes have differing interests concerning the price of labour, Smith explicitly predicts unrest and violence (1904: I.8.13). It falls to the state to intervene forcibly if it must, but also to encourage institutions (including religious instruction, scientific education and 'public diversions') that might 'correct whatever was unsocial' in the behaviour of the common people and the upper classes alike (1904: V.1.200, see also Bonefeld, 2014: 172–4). By 'unsocial', Smith does not mean lacking in altruism, as his society is based squarely in self-interest. Instead, sociality is the recognition that all particular interests are served best by a thriving, expanding economy: 'It is not the actual greatness of national wealth, but its continual

increase, which occasions a rise in the wages of labour' (1904: I.8.22). The awareness of this harmony of interests in increasing accumulation, as growth 'trickles down' even to the lowest paid parts of the labouring class, does not emerge (or persist) automatically, but requires careful management by the state.

After the initial glowing reception of *The Wealth of Nations*, political and economic convulsions in the early nineteenth century illuminated the intractable difficulty of producing harmonious relations between the classes (Heilbroner, 2000: 79–81). Among a number of political economists attempting to reconcile Smith's system to a rather more pessimistic worldview, David Ricardo's contribution stands out as the most influential. Ricardo sought to rectify a number of technical problems in Smith's theory, not least the latter's vacillations on the determination of value and therefore profit, but more importantly, for our purposes, he also supplemented Smith's theory to suggest that class conflict might be provoked even during expanded accumulation. Ricardo, as did Smith, recognized that the interests that united members of the same class would not necessarily coincide with those of the other classes (particularly, the labourers' desire for higher wages, the landowners' desire for higher agricultural prices, and the capitalists' desire for low agricultural prices, low rent, and low wages). But whereas Smith thought all three classes' interests would be best served by economic progress, through the steady increase in productivity, Ricardo discerned mechanisms that ensured the fruits of accumulation would be concentrated in particular hands, precipitating frustration, dissatisfaction and eventually social strife. Against his own intention, by replacing Smith's equivocations over the basis of value with his more rigorous 'labour theory of value', Ricardo invited a conclusion that all of classical political economy strenuously resisted: that the capitalist's profit was necessarily a deduction from the labourer's share in the value of the product created, thus adding the politically volatile contaminant of

exploitation into Smith's system of interlocking classes (Clarke, 1991: 35–7).

With Ricardo, membership of a class does not merely confer a particular set of interests but also specific behavioural characteristics. As agents in the economy, individuals are not, for Ricardo, people but rather 'they are prototypes. Nor do these prototypes, in the everyday sense of the word, live: they follow "laws of behavior"' (Heilbroner, 2000: 94–5). In the case of capitalists, the blanket generality of Smith's self-interest acquires the more specific form of an unceasing drive to accumulate, hounded by competition and its attendant threat of ruin. The working class, by contrast, is condemned to undermine any chance of receiving wages above subsistence levels, by its 'hopeless addiction to what is euphemistically called "the delights of domestic society"' (2000: 95), whereby any increase in wages due to the relationship of supply and demand will result in a growth in the working population, therefore depressing wages again back towards their 'natural' value. Only this dynamic saves Ricardo's system from the conclusion that profit is a deduction from wages, and thus employment is a form of exploitation. It is the rejection of this caveat, allowing the presentation of Ricardo's system to take on a tone of indignation at the exploitation of labour, that forms the basis of 'Marxist' economics, which shared the same fate as Ricardo under the 'devastating' critique of the labour theory of value by the likes of Sraffa and Böhm-Bawerk (Clarke, 1991: 73).

### **CRITICAL THEORY AGAINST POLITICAL ECONOMY: SOCIAL CONSTITUTION**

Smith and Ricardo provide a much more solid basis for thinking about class than the sociological variants discussed above, including the Marxist accounts, which to varying degrees all derive from Smith (as argued by

Clarke, 1991). Class is conceived as a relation that is integral to the totality of social reproduction, and thus acts as a check on the fragmentation and degeneration of classification-based approaches. Also, Ricardo paves the way for considering labour to be different from all other commodities, as the source of value, and therefore the class that must sell its labour power sells something that exceeds the blanket fungibility of commodities in general. But Smith and even the socialist reading of Ricardo fail to adequately conceptualize how wealth is produced in the production process, and therefore misrecognize the extent and character of the class struggle.

Marx's critique of classical political economy revolves around the apparent paradox of a system built upon the principle of the exchange of equal values, but that is driven by the accumulation of *surplus* value: 'money is thrown into circulation to beget more money in the form of profit, which is realized by means of an equivalent exchange (M ... M', say £100 = £120)' (Bonefeld, 2016a: 67). In Adorno's formulation, the concept of surplus value resolves the mysterious character of an equivalent exchange between two unequal values (M ... M') (quoted in Bonefeld, 2014: 3). The secret of this magical self-valorization lies, for Marx, in the process of capitalist production, in which the consumption of the commodity of labour power produces a value that is greater than its own. Thus, during the working day labour reproduces its own value, the value of labour power, *and* creates a surplus in value that represents unpaid labour time. 'Capital, therefore, is not only command over labour, as Adam Smith thought. It is essentially the command over unpaid labour. All surplus-value ... is in substance the materialization of unpaid labour-time' (Marx, 1976: 672). The 'misfortune' of labour as a class is specifically this: the purpose of capitalist production is the extraction of surplus value by various means (for which see *Capital* Vol. I, Part 5 especially). That is, its purpose is maximization of unpaid

labour time as foundation of profit. Its purpose is not production of use-values to satisfy human needs, which, says Adorno (2006: 51), is 'never more than a sideshow and in great measure no more than ideology'.

The important point here, in terms of class struggle, is that the equivalent exchange relations between the seller and buyer of labour power are founded on the existence of two classes: one which owns the means of production, and one which produces surplus value. As Marx explains,

Capitalist production ... reproduces in the course of its own process the separation between labour-power and the conditions of labour. It thereby reproduces and perpetuates the conditions under which the worker is exploited. It incessantly forces him to sell his labour-power in order to live, and enables the capitalist to purchase labour-power in order that he may enrich himself.... In reality, the worker belongs to capital before he has sold himself to the capitalist.... The capitalist process of production, therefore, seen as a total, connected process, i.e. a process of reproduction, produces not only commodities, not only surplus-value, but it also produces and reproduces the capital-relation itself; on the one hand the capitalist, on the other the wage-labourer. (Marx, 1976: 723–4)

The capital–labour relation is founded on a class that has to work for its subsistence; that is, 'this worker must be free in the double sense' (1976: 272) of being 'free' of the means to subsist and 'free' to sell her labour power to whomever in return for wage-based access to the means of subsistence. The separation of the worker from the means of subsistence is thus fundamental to the class relationship. Under the established operation of capital accumulation, the logic of separation makes the sale of labour power appear as an equal exchange between seller and buyer, which is of benefit to both parties: the worker receives from the buyer the value of her commodity and the capitalist receives the right to consume labour power during the duration of the working day. For critical theory, valorization – wealth in the form of money that begets more money – is founded on the social relationship between the buyers of labour power

and the producers of surplus value, and this relationship has a specific history. The forcible, legally sanctioned and often violent expropriation of human beings from their various means of subsistence, which is documented so well by Michael Perelman (2000) and conceptualized insightfully by Negt and Kluge (2014), is the secret history of capitalist social relations. The violence of expropriation, depriving people of their means of support, is the hidden premise of the equality of capital and labour as contracting parties on the labour market: the one selling to make a living, the other buying to make a profit.

The critical point, however, is that this process of ‘so-called primitive accumulation’ is not historically confined to the prehistory of capitalist society, a bloody memory erased and forgiven by the more civilized operation of bourgeois relations of free and equal exchange. Rather, primitive accumulation is a necessary precondition of the doubly free labourer, and therefore of capital; it is the historical basis of struggle, ‘conflict and survival’ (Adorno, 2006: 49ff.). As Bonefeld argues, the chapter sequence of *Capital* Vol. I, in which the discussion of capitalist accumulation is followed by the section on primitive accumulation, is not an accidental presentation, where the latter is an afterthought or appendix (2011: 390). Instead, the legalized robbery of primitive accumulation, which makes capital accumulation possible, tells the truth of the latter (on this see Negt and Kluge, 2014).

Capitalist accumulation is fundamentally the accumulation of unpaid labour in conditions of generalized equivalence exchange relations. Within capitalism’s own conceptual system, there is nothing improper here: economic compulsion is not personal, and equivalent values are indeed exchanged. But under the logic of separation, which is inaugurated by primitive accumulation, the abstract economic compulsion that returns workers to work each day retains a striking similarity to the ‘old age activity of the conqueror, who buys commodities from the conquered with the money he has stolen from them’ (Marx,

1976: 728). The difference is that under capitalism, the worker does not confront the capitalist as the source of their compulsion to seek waged work, on pain of starvation. If anything, the employer offers the antidote to that threat, and the success of the business (and of capital accumulation in general) is the precondition of sustained access to waged work. The spectre of ruinous unemployment arises not from the malevolent designs of the bourgeoisie but from the barriers to the accumulation of surplus value. Thus, the class struggle whose most explicit form is the violence of primitive accumulation, morphs into a necessity to work, imposed by an abstract and impersonal system of economic quantities. For the class tied to work, the necessity of selling one’s labour power in order to access the means of subsistence belongs to an ‘objective motor’ by which ‘the life of all men hangs’ (Adorno, 1973: 320), and thus appears as a simple fact of life, as economic nature. Primitive accumulation reveals the social, violent and antagonistic basis of this ‘nature’, namely that capitalist society is not only ‘antagonistic from the outset’ but also that it ‘maintains itself only through antagonism’ (1973: 304, 311). This is precisely why critical theory refuses to treat class as a positive category. ‘The critique of class society finds the positive only in the classless society, in communism’ (Bonefeld, 2011: 397).

## CONCLUSION

This chapter has sought to outline a critical theory of class, revolving around the conception of class as insolubly contradictory and antagonistic in character. Class, and more properly *class struggle*, is a necessarily negative concept, and can only be properly apprehended as appearing in a twice-mediated form: first as the dry abstractions of economic categories, and second as the personification of these categories. Attempts to think class in terms of classification – an analytical

ordering of social differentiation into identifiable strata – takes the second form as basic, and so misses the contradictory existence of class that drives such classifications into ever-greater degrees of fragmentation. The dissolution of class into a form of affirmative identity politics, which is a symptomatic attempt to halt this fragmentation, is mirrored by the ‘theological’ approach that raises the working class to a messianic agent that will fulfil Hegel’s promise of a self-identical subject of history. A critical theory of class utterly rejects such a view, not merely for its obvious idealism that obfuscates suffering but also for its attempt to ascribe to suffering an ontological privilege as part of a (dialectical) truth of history as a totality. Critical theory conceptualizes class struggle as the substance of a perverse totality that ‘does not simply survive *despite* conflict, but because of it’ (Adorno, 2006: 50). The totality, society, is both a coherent whole and an antagonism. It is a system constituted by a struggle, appearing simultaneously as both a vast objective movement of economic quantities and the activity of free individuals in pursuit of their own interest. Critical theory seeks to comprehend class struggle as the social dynamic of existing society. Its untruth is the untruth also of class. For critical theory, to think out of contradiction rather than impose our rationalizations, as it were, from above, is essential. Adorno’s negative dialectics resists the temptation to reconcile the irreconcilable. To finish a quote I began earlier: ‘dialectics is the ontology of the wrong state of things. The right state of things would be free of it: neither a system nor a contradiction’ (Adorno, 1973: 11).

# Critical Theory and Utopian Thought

Alexander Neupert-Doppler  
Translated by Charles Reitz<sup>1</sup>

The relationship between critical theory and Utopian thought is often misunderstood. The influential theorists of the Frankfurt School, particularly Adorno and Horkheimer, but also Benjamin and Marcuse, were critical of the Utopian novels like Thomas More's *Utopia* [1516] because of the latent authoritarianism in the detailed social designs in this tradition. Yet a Utopian element can still be found in their visions of social liberation. Ruth Levitas notes that Western Marxism in the twentieth century 'has undergone a partial re-ordering of economism and is more sympathetic to the importance of ideas (and thus Utopia) in the process of social change' (Levitas, 1990: 157). In this context she points in particular to the Frankfurt School. As she puts it, 'there is a tendency here to use the term Utopia in a positive sense, as a glimpse of a longed-for condition, rather than in the strongly negative sense that has become characteristic of the dominant interpretation of Marxism' (102). What does Utopia mean, as seen from the perspective of critical theory?

Levitas and others make the following distinction: 'In exploring existing definitions of Utopia, we can consider three different aspects: content, form, and function' (Levitas, 1990: 4). The focus on content is certainly the most challenging, because 'Utopias are reflections of the issues that were important to the period in which their authors lived' (Sargent, 2010: 21). With regard to the forms of Utopia, it will help to distinguish 'literary Utopias, Utopian practice, and Utopian social theory' (5). Sections 1 and 2 of this essay will furnish commentary and clarification with regard to the first two of these elements. A central concern here will be the question of the function(s) of Utopian thinking. A discussion of certain theoreticians of Utopia, notably Ernst Bloch and Karl Mannheim, will take up this aspect. These considerations will be presented in Sections 3 and 4, after which, Sections 5 and 6 will examine the functional perspective on Utopia as presented in critical theory. A concluding segment will respond to Habermas's (1985: 144)

diagnosis of the contemporary 'exhaustion of Utopian energies', and the question of the possibility of a re-invigoration of Utopian thought today.

## LITERARY UTOPIAS AND THE BOURGEOIS PHILOSOPHY OF HISTORY

In 1930, a year before his appointment as director of the Frankfurt Institute for Social Research, Max Horkheimer published his study on *The Origins of the Bourgeois Philosophy of History*. This work appeared one year after the Frankfurt School's competitor, Karl Mannheim, published his *Ideology and Utopia*. Horkheimer argues the following:

If ideology produces deceptive facade, Utopia to the contrary is the dream of the true and just order of life. In this sense, Utopia enters into every philosophical assessment of human society. As perspectives from different social groups, ideology and Utopia need to be understood in terms of the social reality as a whole. (Horkheimer, [1930] 1971: 9)

Utopias are tied to social realities as much as are ideologies; because of this, critical theory can explicate both phenomena. Functional differences are stressed: the ideological facade mystifies the given society; the Utopian dream contributes to the philosophical assessment of it. The materials used to explicate these several theses begin with the classical literary Utopian novels of the Renaissance, starting with More's *Utopia*. This is distinctly different from older, e.g. religious, visions of future prospects. Instead, 'More introduces a new element in the appraisal of reality with his emphasis on the category of reason as an expression of human nature' (Honke, 1985: 170). Certainly, reason had been a criterion characteristic of the philosophical projects of antiquity, yet there was an additional difference in More's

humanistic and positive image of man, which was in no way hostile to the pleasures of the senses.

But if our authentic humanity, which is more appropriate to us than any other virtue, is constituted by relieving the distress of others, by remedying their sorrow, and thereby giving their life joy again, that is to say, pleasure, why should not Nature motivate each one of us to perform the same service? (More, [1516] 1998: 71)

Unlike Plato, for example, who furnishes a caste system in service to the ideal political order, More desires the unification of reason with happiness. Sensible planning will allow Utopia to 'reduce working hours' to six hours a day, and it would be this liberation that would make 'happiness in life' possible (More, [1516] 1998: 58). Essential to More's Utopian vision is the contrast between exploiting labor and conserving labor. With this in mind, Horkheimer develops his account of Utopia's primary purpose:

Utopia actually has two components: it is the critique of all that is – and an illustration of what should be ... [T]he intended result is essentially already included in the critique. A people's real situation can be inferred from their hopes; from More's Utopia of contentment, we can see the state of the masses in England, whose aspirations the humane chancellor was shaping. (Horkheimer, [1930] 1971: 64)

Horkheimer accepts Utopia as a valid criticism of a given state of affairs. For example, there is More's criticism of the expulsion of farmers in favor of the rearing of sheep. These could become 'so voracious and evil, that they would even eat humans' (More, [1516] 1998: 26). Many of the aspects of the fictional island of Utopia, from universal education, to the secret ballot in the election of public officials, to public housing, can be understood as the expression of real neediness. This is especially interesting when it comes to hopes that have, over time, ultimately been realized. Horkheimer is careful to consider the stages involved in the historical process. More's *Utopia* includes a

communist view of life where 'everyone owns everything' (106). This Horkheimer judges to be historically premature. He bases his judgment on the Marxist conception that capitalism must break up the order of feudalism, and develop its own productive forces, before socialism can succeed. Horkheimer contrasts this objectivist perspective of chronological periods in history against what he sees as the contrived nature of the early Utopian novels. 'The actualization of their imaginative visions would have meant an artificial subversion of the developmental process, which still required the unfolding of the creative initiative of the individual within free competition' (Horkheimer, [1930] 1971: 63). Without justifying the miseries of the past, these hardships were considered to be historically necessary. *Utopia* is, in 1516, only an 'expression of impotent longing' for the 'ultimate goal', while individuals 'suffer during a period that is necessary for historical development' (67). What More describes as Utopia would become social reality in many places, but only much later, e.g. the prohibition of the marriage of women before the age of 18 and the implementation of a right to divorce.

Just as a Utopia may be ahead of its time, an epoch may also lag behind its possibilities. In this sense, Horkheimer criticizes the Marxism of his time. It was not Utopian hope that influenced the theory of social change of the workers' movement at that time, but rather the false belief according to which progress, i.e. the transition to socialism, would be guaranteed by the objective laws of history. Ten years later, in exile, Horkheimer criticized the lack of the Will to Utopia: 'At one time the [Marxian] critique of utopia helped to maintain the thought of freedom as the thought of its realization. Today utopia is maligned because no one really wants to see its realization' (Horkheimer, [1940] 1968: 75).

Horkheimer is referring to the critique of Utopia made by Marx and Engels. They were less opposed to the literary Utopian novels

than to the early socialist settlement Utopias of Charles Fourier and Robert Owen. The latter were rejected as island-type solutions made peacefully – i.e. as *unrevolutionary* and *unscientific*. As much as Horkheimer agrees with this, his intention is to rehabilitate the Will to Change. 'The material conditions are fulfilled. If all necessities for change are at hand ..., then the alternative depends solely on the will of men' (Horkheimer, [1940] 1968: 76). Instead of waiting for history, what really matters is the will and the desire, the hope and the action of the people. The Alternative is defined through critique of what exists, that is, negatively. Neither literary designs nor experimental settlements can anticipate the future. 'One cannot pre-determine what a free society will do or allow' (62). Nonetheless it is possible to determine that the liberation of society is feasible; also which Utopias can be made real given the will to realize them. 'Critical theory explains: it does not have to be this way, human beings can change the world; the conditions are now at hand' (Horkheimer, [1937] 2005: 244).

When conditions are ripe, however, the absence of change must also be attributed to consciousness. A bitter experience has given rise to the need for the theoretical rehabilitation of Utopia: 'Not even the situation of the proletariat in this society is a guarantee of the correct awareness' ([1937] 2005: 230f.). When the development of a will to socialism is not guaranteed by objective processes, the subject's Utopian Will attains an even greater importance than it had in its earlier form in the Utopian novel.

## SCIENTIFIC MARXISM AND UTOPIAN SOCIALISM

It may come as a surprise that in 1966 a theoretician like Adorno, who is credited with wanting to ban all depictions of the liberated future society, engages in the editing and

publication of the work of Charles Fourier, the most Utopian of all Utopians.

Because the political and power interests of the Eastern Bloc have made the theorems of socialism into a dogma, there is a renewed interest today in concepts that emerged earlier and elsewhere, before they were stigmatized as Utopian. [...] The prohibition against thinking through what it should be like to make socialism into a science has not contributed positively to science or socialism. To condemn the imagination as merely fanciful is to conform to a kind of practice that is an end in itself, more and more stuck in that present which it once wanted to supersede. (Adorno, 1966: 6f.)

It is clear that Adorno does not want to go back to the time before scientific socialism – to that of the Utopian novels of the sixteenth, seventeenth, and eighteenth centuries, or to the prototype socialist settlements of the nineteenth century. Robert Owen's theory and practice reveal also the dogmatism of the socialist settlement idea. 'In order to achieve all the benefits of cooperation, people must be gathered in small communities' (Owen, [1827] 1988: 24). What remains to be defended in Owen is his overflowing Utopianism. 'And the time will finally come, in which [...] all individuals will receive what they need – without money and without price' (30). Even as a recollection, the idea of a needs-based economy without money is still a viable criticism of state socialism, which did not even tolerate such a Utopian idea.

Walter Benjamin also discovered something to recover in the Utopian phantasies of Fourier:

According to Fourier, the well-thought-out and well-executed labors of social humanity would have the effect that four moons would light up the earthly night, that the ice would withdraw from the Poles, sea water would no longer taste salty, and that the beasts of prey would do good turns for all of humanity. This illustrates a kind of work that, instead of exploiting nature, is able to release the creations that slumber as possibilities within it. (Benjamin, [1940] 1965: 87)

Fourier, like the early Utopians, had dreams of reduced working hours; in the novels of

More and Campanella – to about six or four hours a day. Not only that, but he and Owen anticipated work in their settlements as 'healthy, pleasing, and desirable employment' (Owen, [1927] 1988: 30). Utopia was no longer only measurable quantitatively, but also qualitatively, as an improved experience of life.

The price of happiness for More was the exploitation of women and nature; these are missing in Fourier's Utopia. 'Social progress takes place only insofar as progress is made in the liberation of women' (Fourier, 1846, in Burckhardt, 2006: 107). Likewise, humanity's inner nature and our diverse human needs should be gratified rather than repressed. 'The diversity of tastes, which would be totally ruinous in a [monocultural] civilization, will be economically and productively advantageous in a [multicultural] association', as Fourier prophesies in his *Theory of Universal Integration* (156). Herbert Marcuse has pointed out that Fourier's goal of attractive work, which was still pure Utopia for Marx, is an attainable Utopia on a world-social scale today (see Marcuse, [1967] 1980: 17).

The return to early socialist Utopias is interesting in several respects. Adorno sees in them a critique of what had become actually existing socialism. Marcuse foresees the feasibility of earlier Utopias in the future. Benjamin emphasizes that critical theory has an obligation to the social Utopians of the past. He asserts that 'our generation has a rendezvous, at a time as yet undisclosed, with former generations. They are expecting us on Earth. Like every other generation before us, we have been granted a faint Messianic power that owes an obligation to the [Utopian] pleas of the past' (Benjamin, [1940] 1965: 78). For him the source of this power is *not* the 'ideal of liberated grandchildren', but the 'image of our unfree forebears' (88). Messianic revolution is a reckoning we undertake in remembrance of our ancestors' unmet necessities and needs. Both Benjamin and his friend Ernst Bloch share this retrospective starting point. But Adorno is

mistaken when he makes his appeal *For Ernst Bloch* that 'Bloch's idea is a messianic end of history' (Adorno, 2003g: 191). Benjamin's messianic idea is redemption from a history of catastrophes. Bloch's Utopian idea, on the other hand, is the fulfillment of all the Utopias of history. Vivid parallels are to be found in both, especially in the connections they make between the present day and the history of the world. 'From the falcon-like heights of Bloch's philosophical outlook, the utmost metaphysical loftiness and a coarse political grittiness were conjoined' (192). In the partially realized literary Utopias of the early modern period, Bloch sees an enduring cultural heritage. He also finds that there is a reward still to be gained from the early theories of socialism. In practice, the promise of these Utopias could not be fulfilled through the 'private idylls and the uncomprehending dreams of the settlers' (Bloch, [1923] 1985: 305), but Marxism – as a concrete Utopia – does have the capacity to do so.

### **BLOCH'S UTOPIAN THOUGHT: ON THE CONCRETENESS OF THE [IM]POSSIBLE**

The relationship between Ernst Bloch and the members of the Frankfurt School is biographically and theoretically conflicted. Even in exile, and despite his own wishes, he did not become a member of the Institute for Social Research; yet he spurred on their work. 'Bloch, together with Lukács and Karl Korsch, was a key figure [...] an important influence on the group of intellectuals (including Fromm, Marcuse, Tillich, and Adorno) centered in the Institute for Social Research in the 1930s' (Levitas, 1990: 102). Adorno confirms this influence in an essay in honor of Bloch's eightieth birthday in 1965:

Bloch's first book (*Spirit of Utopia*) was his foundation for all that came later, and seemed to me a singular revolt against the [political] acquiescence

that at that time threatened all thinking, even that of a purely formal nature. This [activist] intent, which precedes all theory about any subject matter, is something I have so deeply absorbed that I have had it in mind, implicitly or explicitly, in everything I have written. (Adorno, 2003f.: 557)

In 1968 Marcuse also noted that Bloch's 'work, *Spirit of Utopia*, [...] influenced my generation ... more than forty years ago' (Marcuse, 1970: 12). Bloch's 'Philosophy of Hope' involved a critique of the German Marxism of his time; just as did the critical social theory of Adorno, Horkheimer, and Marcuse. This began in 1914 with his critique of the SPD's consent to the loans for the First World War.<sup>2</sup> In addition to this collapse of Marxist internationalism, some theorists among the Social Democrats defended their conviction that capitalism, through its own internal contradictions, was being driven toward socialism. Bloch's criticism was directed precisely against this 'social-democratic automatism, which was nothing but a superstition that the world would improve all by itself' (Bloch, [1953a] 1985: 168). Contrary to this theory of postponement, he proclaimed that a concrete Utopia had to be a theory of praxis.

The Social Democrat, a completely non-Utopian type, becomes a slave of the objective tendencies ... Objectivist idolatry of the objectively possible just waits with a wink and a nod until the economic conditions have matured. But they never so fully mature or become so perfect that they need no subjective factor, no will to act, no anticipatory dream. (677)

The SPD, according to Bloch bereft of Utopianism, lacked the Will to Act in the revolution of 1918. In his view the will to act is *not* a substitute for objective circumstances: only a concordance of external and internal, of strength and effort, is concrete utopia. But once all conditions are met, change hinges upon the will. If the knowledge is lacking of what is really possible, or the will to realize the utopia is missing, the momentum of the revolutionary movement is

lost, and counter-revolution threatens on the horizon. Instead of building hope for a new era, foreboding will force an evasion into the mythology of the good old days. 'This is how the Nazis survived, but their deceptions could only go on unchallenged because the all-too-abstract (that is backward) Left had not adequately nourished the imagination of the masses' (Bloch, [1935] 1985: 149). Certainly people who live in real dread of imagined international Jewish conspiracies may seek security in their vision of ethno-nationalist community; they will not be talked into affiliation with an International of Hope. But it is important for critical theory to do more than just 'unmask ideologies', something which Bloch called the 'chilling current in Marxism' (Bloch, [1953a] 1985: 240). It must also keep alive the 'the real political tendencies, that are humanely material — and materially humane — i.e., possessing emancipatory substance'; these Bloch called 'the warming current in Marxism' (241). If the former can be disheartening, the latter is encouraging; but they both go hand in hand. It should also help to be aware of the historical legacies of earlier (e.g. peasant and bourgeois) forms of Utopia. The terrain of hope, yearning, and desire must not be abandoned to the enemy. 'For its part the success of German National Socialist ideology shows that the Marxist progress from Utopia to science had become all-too-great' (66).

In exile in the USA from 1938 to 1947 – during and after the period of German National Socialism – Bloch wrote *The Principle of Hope*. Its three volumes were later published from 1954 to 1959 in East Germany, to which he had returned after the war. Bloch would subsequently emigrate from East Germany to Tübingen in West-Germany in 1961.

In that year Adorno wrote an essay criticizing Bloch: 'Hope is Not a Principle' (Adorno, 2003f: 233). Nothing can be derived from hope alone. Given the new 1960s edition of Bloch's earlier volume, *Indications*

[sometimes translated as *Traces*], Adorno also charges that Bloch's philosophy remains 'untroubled by what has become of the indications of revolution in the thirty years since the first edition' (248). In Bloch's 'tale of the adventurous journey to our Utopian finale' (235), National Socialism becomes a mere interruption on this long road. Contempt for Bloch's 'hard-boiled naivete' (247) is combined with mock admiration: 'He is one of the very few philosophers who does not quake before the thought of a world without domination' (249) even when 'the possibility of making real what is promised remains uncertain' (242).

Uncertainty, however, is far from alien to the philosophy of hope. Bloch's philosophical system, in fact, takes National Socialism to be a form of the 'monstrous break with the trend toward progress' (Bloch, [1975] 1985: 187). He warns, however, that a phenomenon like Auschwitz cannot be causally explained, either by subjective delusion or objective oppression (Bloch, [1968] 1985: 319). Goodness, not evil, impels humanity onward. Bloch, for his part, speaks critically of Adorno's 'exalted despair' (Bloch, [1968] 1985: 324), against which his own theory counter-poses a 'militant optimism' (325). This, in contrast to all 'rotten negativity' or any 'automatic positivity' (324).

What is alien to Bloch's dualistic philosophy is the idea of a Dialectics of Enlightenment. In his estimation, history remains an open process: Utopia is but delayed by evil. 'A Nero, a Hitler, any of these flashes of satanic activity, must be understood as outbursts of the dragon in the previous abyss, not as an enduring force in the process of history' (Bloch, [1953a] 1985: 362). According to this, history itself does not lead to catastrophe, but each catastrophe stood opposed to the course of history and its inherent possibilities of the good. 'Satan', the one who contradicts, the one who opposes, is Bloch's name for this obstructionist evil. As he sees it, the witch trials blocked enlightenment, antisemitism blocked liberation (Bloch, [1961] 1985: 346).

He is not persuaded that the Enlightenment's demand for the rule of reason over humanity and nature has contributed to the failure of progress toward human emancipation.

Above and beyond all Bloch's social criticism, his philosophy remains primarily a theory of praxis. 'How can I slow down or prevent the deleterious possibilities that are unfolding? How can I promote the favorable opportunities, opportunities advantageous to us as a people, how can I promote them?' (Bloch, [1962, 1970] 1985: 410). We are not merely to escape to some haven from the present storm, as this may be determined by criticism alone, but to the attractive force of the telos/sun, around which all Utopias gravitate. This points to Utopia as a 'not-yet, in the sense of being a possibility that could exist if we were only to do something to make it happen' (Bloch, [1964, 1978a] 1985a: 352). Bloch answers with a tautology the question raised by critical theory concerning the extent to which people are capable of doing anything [radical, i.e. Utopian] within the existing society for a better social order: if Utopia is a concrete whole encompassing all possibilities of the good, he maintains then that its realization must be both possible and feasible. Karl Mannheim has further advanced this idea by understanding Utopias as the motive force for political action.

### **MANNHEIM'S UTOPIAN THOUGHT AS MOTIVATION FOR ACTION**

The sociology of knowledge, worked out by Mannheim in *Ideology and Utopia* [1929], must be seen as a rival philosophy vis-à-vis the critical theory being developed at the University of Frankfurt. Horkheimer and Mannheim both joined Frankfurt University in 1930, the former as Director of the Institute for Social Research, the latter as Professor of Sociology. Mannheim participated in discussions with Paul Tillich, and also with his

opponents, Leo Löwenthal, Max Horkheimer, and Theodor Adorno. Included among the many topics discussed was the social role of the intellectual (Hofmann, 1996: 31). Mannheim knew he would be reproached for trying to make Marxism into a neutral form of social analysis. In spite of Horkheimer's own ideas and criticisms of the concept of Utopia which were published in his 1930 study of bourgeois philosophy of history, he also wrote in 1930 against Mannheim's sociology of knowledge. His essay, 'A New Concept of Ideology', sharply criticized Mannheim's theories of ideology and Utopia. For Mannheim, ideologies of the existing order serve domination; Utopias challenge it. He therefore thinks that these two modes of thought may be attributed to the ruling classes or to upwardly striving classes via sociological explanation. Utopias, therefore, are always connected 'to certain historical stages and to certain social strata' (Mannheim, [1929] 1995: 180). The Utopia of the Kingdom of God on Earth, which Thomas Münzer had proclaimed, addressed the conditions of the peasants of the early modern era. So too liberalism's constitutional state met the needs of the aspiring bourgeoisie, as did the socialist Utopia of a free humanity standing in mutual solidarity for workers. Horkheimer comments: 'The belief that one can understand a *Weltanschauung* without taking into account its material development within its conditions of social existence, that is, through research solely into mental structures, is idealistic delusion' (Horkheimer, [1930] 1987: 288). Ideologies and Utopias do not directly correspond to the interests of certain strata, rather 'ideology and Utopia need to be conceived as attitudes of social groups within the totality of social reality' (Horkheimer, [1930] 1971: 9). Sociology of knowledge does not attain critical theory's criterion: to understand society as a whole. It is true that Mannheim does indeed deal with the influence of ideologies and Utopias on social change, but he does so in a one-sided way, according to Horkheimer. Mannheim

sees Utopia as an inner-intellectual motivation for political action.

From a sociological point of view, such intellectual constructions can take two forms: they are ideological when they are intended to mystify or stabilize the existing social order; Utopian when they lead to concerted collective action that seeks to change reality in such a way that it attains goals that surpass what is established. (Mannheim, [1935] 1986: 115f.)

The function of Utopia is, therefore, the evocation of collective engagement, the motivation for joint practice. Horkheimer by no means denies this motivation for action, but he connects subjective factors to objective conditions. Mannheim fails to examine how the concrete form of social relations 'affects the adherence to the old way of thinking, and on the other hand, how it influences action' (Horkheimer, [1930] 1987: 293). Those things that Mannheim investigates as the effect of mental attitudes, Horkheimer understands in a dialectical manner: Utopian thoughts exert influence, but they are themselves influenced by the circumstances.

A certain understanding of the historical alterability of social conditions is quite evident in Mannheim. Instead of connecting change to contradictions and conflicts, however, he connects visions of social Utopia to the historical stages of linear progress. If the Utopian expectations of a social stratum are disappointed, sociology of knowledge does not explain this out of a social dynamic, but solely from the Utopian idea itself. 'The Utopia of the aspiring bourgeoisie was generally about the idea of freedom. [...] And yet today, when these Utopias have become a reality, we now know exactly to what extent the idea of freedom of that time was not only Utopian but also contained ideological elements' (Mannheim, [1929] 1995: 178). To look back and assert that a failed Utopia was really just ideological would be problematic. Adorno, on the other hand, elucidates an alternative in a later paper, referring also to Mannheim. It is neither the Utopian nor the ideological aspects of a way of thinking as

such that are crucial, but rather how Utopias may convert into ideologies. Falsehood is not a statement about thinking, but a judgment about reality. 'Ideologies become untrue only because of their relationship to existing reality. They can be true in and of themselves, just as are the ideas of freedom, humanity, justice; but they are invalid if they are assumed to have already been made real' (Adorno, [1954] 2003e: 473). Adorno applies this mode of criticism to liberalism as well, and asks whether 'freedom is indeed achieved with the establishment of formal civic equality' (464). This is the approach of immanent criticism in the sense that liberalism is taken at its word. The ideology of freedom is thus measured against at the freedom of Utopia. Here critique is the 'confrontation of ideology with its own truth'. This is 'only possible insofar as the former contains a rational element with which critique can operate' (465).

According to Bloch, such an immanent critique is not possible with German National Socialism because it rejected the Utopian promises of liberalism and socialism, freedom and equality, in favor of the ethno-nationalist community and the persecution of the Jews. 'Hitler, for example, cannot be criticized by way of *Mein Kampf*. He has already fulfilled all that was prophesied in *Mein Kampf*. ... In contrast, I can criticize, immanently criticize, Marx, Engels, and Lenin from the writings of Marx, Engels, and Lenin' (Bloch, [1970] 1975: 140). Mannheim, on the other hand, even in exile in 1935, leaves the ideologies of fascism and German National Socialism unexamined – though his own knowledge of intellectual history spans a broad spectrum from chiliasm, to liberalism and socialism, to conservatism. The longing for a German national community cannot be attributed to any social stratum. Mannheim thus rendered the distinction between ideology and Utopia much more problematic than did Horkheimer's analysis.

Let us recall: 'If ideology produces deceptive facade, Utopia to the contrary is the dream of the true and just order of life'

(Horkheimer, [1930] 1971: 9). Mannheim, to the contrary, finds his criterion for this distinction only in a retrospective historical view. 'We will recognize as a Utopian tendency *only* a reality-transcending course of action, which is translated into practice, and partially or completely breaks with the really existing social order' (Mannheim, [1929] 1995: 169). But if this is so, the Utopias of chiasm, even the Utopia of More, would not qualify as Utopian since they had no success in terms of this-worldly historical impact.

Bloch's idea of an untapped reward yet to be found in Utopias of the past is unthinkable for Mannheim. He had difficulty enough just trying to distinguish among various modes of thought in his own time. 'Given the co-existence of rival contemporary social visions, it is extremely difficult to determine that which is a true Utopia of up-rising classes and that which is the mere ideology of dominant (but still aspiring) classes' (Mannheim, [1929] 1995: 178). This clearly shows the neutrality that Horkheimer criticized. Ultimately, the sociology of knowledge can only distinguish ideologies from Utopias in retrospect. By retracting use of the critique of ideology as a means to distinguish between false consciousness and correct analysis, Mannheim evades this problem. As he himself says, Mannheim thus creates a new concept of ideology that 'gives up every intention to de-mystify [...] and instead tries everywhere to work out the linkages between social strata and social perspective' (71).

If intellectuals who contribute to ideological critique are no longer legitimately tasked with exposing falsity, then Mannheim regards their new assignment as building a 'total overview and context within historical change' (Mannheim, [1929] 1995: 140). Intellectuals, as inhabiting a 'relatively classless social stratum' and possessing a 'socially free-floating intelligence' (135), are at liberty to construct and assume a universal perspective through independence, education, and sensitivity. This is supposed to obviate the particularism of social-stratum-specific

ideologies and Utopias. If, for Horkheimer, it is solidarity with the oppressed that guarantees the truth of the critical theory, Mannheim defends his neutrality vis-à-vis all social strata and classes. For him, socialism is only one Utopia among many. Marx, on the other hand, worked out a method to expose ideologies among competing perspectives. In Mannheim, the actual conditions under which human beings live and suffer are excluded; sociology of knowledge is thus supposed to preserve its neutrality against particular forms of thinking. The intellectuals, who should be able to keep an overview, thus become the real authority. Where critical theory disapproved of Bloch for hypothesizing all Utopias as premonitions of their pending redemption, it reproached Mannheim for diminishing all Utopias to mere viewpoints. What remained valid in Mannheim's reasoning for a critical theory of Utopia was his notion of a Utopian consciousness that gets beyond Horkheimer's criticisms and Bloch's theory of hope, and always urges engagement in action.

The Utopian element fully completes the conscious mind only when it abounds as a form life and experience, as a form of action, as a total worldview; then we can speak not only of forms of Utopia, but of 'the unity of the known with what it knows', i.e., of the various stages and forms of Utopian consciousness. (Mannheim, [1929] 1995: 182)

With regard to different forms of Utopia, Mannheim also provides an interesting indication of their different temporal horizons. The chiasm of Thomas Münzer, whose work was explicitly praised by Ernst Bloch and by Karl Mannheim (Mannheim, [1929] 1995: 185), is characterized by the idea of a historical breakthrough (196). Not waiting for, nor working toward, a better future, the Kingdom of God is to be Now and Here (189). Liberalism, on the other hand, represented the idea of slow progress (196). Socialism represented a synthesis, since messianic hope for salvation was connected with liberal insight into developmental

conditions (207). Here, with the socialism of Marx, we come to a multi-dimensional experience of time and history: a consciousness of current conditions, the trends they represent, and a vision of a better future (212).

A thesis which Mannheim shares with critical theory is the demise of Utopia. Horkheimer explained this with reference to the bureaucratization of the party and the union; Mannheim linked it to the integration of social democracy into the state. 'The more a party strives and grows into parliamentary co-rule, the more it gives up the vision of totality that radiates from the primordial energy of Utopian thought, all the more its transformational force is reduced to bare survival in concrete individual cases' (Mannheim, [1929] 1995: 216). Mannheim's fear of a world without Utopias has a certain affinity with the critique of instrumental reason: 'The disappearance of Utopia leads to a desiccated business mentality in which human beings become mere commodities and the Will to History is lost' (225). He declares that intellectuals need to protect and preserve Utopia, so that they will not need to criticize its abandonment.

## UTOPIAN THOUGHT AND DETERMINATE NEGATION

Because of the diminished Utopian thinking that he witnessed, Karl Mannheim raised a question as to the future bearers of Utopian thought. His answer – the intellectuals – was not much different than the perspective of critical theory. In his reflections on the revolutionary failure of the mass organizations, Horkheimer concluded: 'The activities of political groups and isolated individuals may contribute decisively to the preparations for freedom' (Horkheimer, [1940] 1968: 54). He may have been thinking of the circle of the Frankfurt Institute. But even more weighty than the question of *who* carries Utopian consciousness forward, was the question of

*how*. An alternative avenue is suggested emergent from a more modest view of theory. Adorno remarks in a conversation with Bloch: 'As little as we are able to pin-point all the features of Utopia, as little as we know what Justice would be, still we *do* know *exactly* what is wrong' (Bloch, [1964] 1978a: 362f.). But how is it possible to recognize the wrong without the criterion of right?

Prior to all theory is the often-overlooked physical experience of suffering. 'The physical dimension reports that suffering is to be alleviated, that it must not be' (Adorno, [1966] 2003c: 203). Knowledge in this sense represents a kind of mediation between the experience of suffering and the hope of Utopia, without either of the two dimensions being reduced to the other. Christian Kreis (2006: 11) calls this the 'self-constraint of Utopia' within critical theory. Take, for example, hunger as a painful experience – from which we envision Utopia as a world without hunger. This makes something explicit – that 'the feeling of compassion does get roughly generalized: no one should go hungry' (Adorno, [1951] 2003b: 178). This means that Utopia is something entirely apart from the established social order, and that its realization must include the eradication of world hunger. This is no pin-pointing of Utopia's features, it is at most a general outline of the Not-Yet. This is the foundation that precedes all thought. It is perfectly evident, but this is still not knowledge. Knowledge is only possible through theoretical critique. One example is the critique of the Enlightenment that Horkheimer and Adorno undertook in *Dialectic of Enlightenment*, written between 1939 and 1944. 'The criticism of Enlightenment thus undertaken is intended to formulate a positive concept of it, liberated from its entanglement in blind societal domination' (Adorno, [1947] 2003a: 16).

It is true that Horkheimer and Adorno do not think they can say what reason is, in and of itself, but they believe they can turn our attention to the social contradictions within which reason has historically been interwoven.

This is especially interesting when developing a critical theory of Utopia, since beginning with More, Utopia has been animated by the idea of individual happiness gained through the rational reorganization of society. If utilized as a mere means, however, reason can devolve into an instrument. Reason, as a capacity of subjective human beings, can step away and outside of them toward the world which has become an object. Control over the social world through reason gets converted into a new world of social control. This conversion is only possible because reason as such already bears features of control: social control and self-control. Control over nature begins with control over our innermost human nature, through discipline and work, which were already of central concern to Thomas More. This critique of reason is purposive; it is not a renunciation. It takes particularly seriously the claim of reason to be able to contribute to a better world, especially through immanent critique. 'At the same time, however, reason forms a version of calculative thought by which we may control the world for the purpose of self-preservation, and which acknowledges no further function than transforming an object from being mere sensory material to being material under its command' (Adorno, [1947] 2003a: 16).

The *Dialectic of Enlightenment* does not describe the decline of reason. Reason's claim to freedom is not invalidated because of its entanglement in the haphazard and indiscriminate; it remains – as Utopia. This dialectic is deeply historical. 'The French Revolution had been given much of its hopefulness through Utopia. This was also evident in the empowerment – and disempowerment – of German music and philosophy. In the aftermath, however, the established bourgeois order reduced reason completely to an instrument' (Adorno, [1947] 2003a: 108). Humanity's Utopianism in 1789, which took the shape of the Declaration of Human Rights, endures in both classicalism and idealism, but the powers of the existing order sharply emphasized the impotence of refined

culture vis-à-vis the mighty. Reason has forever been connected with self-preservation in relation to nature; so too, a customary competitiveness becomes the rational means for the preservation of capitalism. 'For the powerful the struggle for Fascist power is but cunning self-preservation; for the rest, survival means adaptation to injustice at any cost' (110). A promise of deliverance is not to be found in the abandonment of reason, but rather in critical theory, which can distinguish between really existing forms of instrumental reason and the sensible and rational possibility of establishing a social order of solidarity. Reason must liberate itself from its entanglement in domination. It will be measured by the demands it makes of itself, and these are understood to be thoroughly Utopian.

Reason as the transcendental, super-individual self, contains the notion of human beings living together freely, that is, where they have organized themselves into the general subject and sublated the contradiction between pure and empirical reason in the conscious solidarity of the whole. This would be the idea of the true universality, Utopia. (102)

But how is this Utopia, embedded as it is within the mandate of reason, to come to consciousness? For Horkheimer and Adorno there is a residue of Utopia in art and philosophy. The Utopia of a rationally organized society, whose pre-theoretical criterion is an abolition of suffering that makes happiness possible, miscarried in the revolutions of the eighteenth century. Art cannot be a substitute for such unrealized happiness, but it can be, as it was for Ernst Bloch, a kind of foretaste. 'Art is not only the emblem of a better way than that which prevails today in practice, but it is also a critique of that practice which means the rule of brutal self-preservation within the existing order and for the sake of the existing order' (Adorno, [1969/1970] 2003d: 26). But art is neither merely an emblem, nor a sampling of what is to come; rather, it is a form of critique, for its own sake, not for the sake of something else. 'The Utopian quality of art resides in assemblage

of that which exists and that which does not exist' (347). In this sense, art, like philosophy, is not merely a niche phenomenon or game. Precisely because art is a part of a world in need of being brought together, it is a critique against the world as it is.

Our lack of a liberated society is called to our attention in art – and philosophy. Just as art wants to convey more than it can actually display, true philosophy encompasses the objects of its study, but never defines them fully. Philosophy and art share the property of not bringing their content to manageable forms; instead they require that we apply ourselves and make an effort. 'Knowledge that wants to apprehend reality must want also to apprehend Utopia' (Adorno, [1966] 2003c: 66); 'Utopia is that kind of knowledge that tries to capture in its concepts that which cannot be comprehended, being aware that its concepts are not identical with what is real' (21). The intention is not to bring material under a single concept, instead concepts must approximate their object. If thought carefully approaches what it is thinking about, that which it is thinking about will go directly into thought. The purpose of critical theory is not to make what is known functional but to liberate what is known via its conceptual approximations.

Ever since Critical Theory has had a Utopian aim: the anticipation of a condition in which human beings are reconciled with themselves, each other, and nature. 'Such a Utopia emerged with the revolutionary avant-garde from its cover in German philosophy's rationalism and irrationalism, and proclaimed a reconciliation between nature and the self and the idea of an association of free men. Thereby it drew upon itself all the fulminations of the *ratio* [deformed rationality, where all is reduced to quantitative and calculative reasoning]' (Adorno, [1947] 2003a: 110). In thought that is both rational and irrational, Marx makes concrete his vision and goal: an association of free people as the realization of philosophy. The fulfillment of human needs is the basis for this association. Instrumental

reason, which fails to recognize humanity as an end in itself, provided what was needed for the murder of Jews as a means to an end. Benjamin translated Jewish messianic power into revolutionary power, but it was too weak. It was not the association of free people, but the *Volksgemeinschaft* [this community of blood and soil] that prevailed in Germany. Critical theory foresaw the failure of emancipatory politics in the coming collision with barbarism, and this led to the question of the absence of the revolution. If the external circumstances were at hand and are still present, 'the Alternative depends squarely on the will of human beings' (Horkheimer, [1940] 1968: 76). It is precisely this question of the Will to the Alternative, or I should say, the deformation of this will, through (1) its adjustment to the social-psychological influences of authoritarianism, (2) the affirmative character of the culture-industry, and (3) its barely recognized but bedazzling amalgamation of all this, that leads back to the question of the meaning of Utopia. Here it is difficult to accept Adorno's prohibition against any depiction of a future Utopian freedom, as he himself acknowledges in a conversation with Bloch. This is because 'prohibition of concrete statements about Utopia tends to defame Utopian consciousness itself, and to obscure what is really important, namely, this will, that is the Will to the Alternative' (Bloch, [1964, 1978a] 1985a: 363). Making the Alternative real, i.e. into Utopia, is possible only by changing what exists. This begins, according to Adorno, not with Utopia as idea, but with critical negation. 'What Utopia is, what Utopia can be imagined to be, is the transformation of the whole' (353).

If we think of something as having been totally transformed, we should not imagine that it represents *all* of the possible alternatives that might be seen as total transformations. Even Thomas More and Charles Fourier, who are so esteemed by Horkheimer and Adorno, could only think of a few possible alternatives. Experiences of misfortune do fuel Utopian thought and give rise to

images of alternative possibilities for happiness. 'Happiness has its own truth in and of itself. It is essentially an effect. It unfolds with the suffering' (Adorno, [1947] 2003a: 81f.). Utopia would therefore be a desirable condition in which suffering is eliminated, but which can only be conceived through the negation of the really existing order. What Adorno calls reconciliation cannot be described through specifics. Utopia is not to be thought of as the sum of all historically present possibilities, but as the very goal of history. It cannot be anticipated in thought, but must be determined by criticism. 'In all events, Utopia is to be found essentially in the determinate negation of that which merely is, and inasmuch as it concretely discloses what is as false, it always points at the same time to that which should be' (Bloch, [1964, 1978a] 1985a: 362).

Determinate negation is the task of critical theory; hence 'for the sake of Utopia it is forbidden to depict Utopia in an image' (Bloch, [1964, 1978a] 1985a: 361). But how then can Adorno's Will to the Alternative – It Must Be Different! – be preserved? How can the indeterminate Utopia be willed? Adorno resolves this problem through a scarcely noticed dual use of the concept of Utopia. On the one hand, he speaks of a Utopian consciousness, that is, on the subjective side, the capacity to engage in Utopian hope. 'Utopian consciousness means a consciousness for which the possibility that people no longer have to die does not have anything horrible about it, but is, on the contrary, that which one actually wants' (358). The question is not how the abolition of death would be feasible, but that it might well be desired in a consciousness capable of Utopian thought. This subjective side, because of its unbridled desires, makes possible *one sort* of Utopia. On the other hand, there is an objective side that Adorno says can sustain *multiple sorts* of Utopias. Adorno's Utopian consciousness is similar to Mannheim's Utopia as an inner-intellectual motivation for political action; they both come close to Bloch's

concrete, action-building Utopia of the possible. Adorno considers the task of Utopias to 'concretely say what would be possible in the present state of the productive forces of mankind' (363). In this way, his Utopia, in the tradition of More, Owen, and Marx, asks about the possibilities of human life in solidarity and common work, which Herbert Marcuse further extends.

### MARCUSE'S UTOPIAN THOUGHT AS THE ARTICULATION OF NEW NEEDS

In contrast to Horkheimer, who always maintained his reserve vis-à-vis the Utopian, and Adorno, who saw Utopia as an unknowable gravitational force around which art and philosophy revolved, Utopia was explicitly central in Marcuse's critical theory. In his posthumously published papers we find the following considerations:

I believe that the Utopian is today not only an historical concept, but also an historical imperative – a categorical imperative that must serve to prevent the fossilization of socialism under new forms of rule. Only when the enormous capacities of science and technology, of the scientific and artistic imagination, guide the construction of a sensuous environment; only when the work-a-day world loses its alienating character; only when productivity is supplanted by creativity, only then will the roots of domination within humanity wither away [...] The transformation of the [economic] foundations cannot proceed without the subjective factor – the human sensibility as a productive force. (Marcuse, 1999: 102f.)

The ritualization of socialism as dogma, which Marcuse analyzed in *Soviet Marxism* in 1958 (Marcuse, [1958] 2004a), formed the impetus for his rehabilitation of the Utopian. Like Bloch, Marcuse distinguishes between objective and subjective conditions that can make Utopia concrete. Technology and science belong to the side of the objective, creativity and sensibility to the subjective factors. The desire for a liberated society is not simply a Will that may be present, but a *need*,

which is first developed and articulated in Utopian thought. With regard to these areas, Marcuse broadens the scope of critical theory. There are not only the blockages, which oppose liberation, but also the potentials that must be sketched-out. 'Social theory is expected to be an analysis of existing societies [...] but also an illumination of trends (if there are any) that could lead beyond the existing state of affairs' (Marcuse, [1969] 2004d: 244). In 1967, Marcuse talks about 'The End of Utopia' in a lecture in Berlin. By this he meant that objective and subjective factors have really come into existence, and as such Utopia can be *attained* – thus the end of Utopia *as* Utopia. 'Since the technical and intellectual forces are present for this revolution now [...] we can indeed speak of an End of Utopia today' (Marcuse, [1967] 1980: 12).

At the same time, he talks about the emergence of 'Utopian possibilities' (Marcuse, [1967] 1980: 14). What Bloch designates as abstract and concrete Utopias – dream and wishes on the one hand, and possibilities of Alternatives on the other – are not sharply distinguished in Marcuse. As Peter-Erwin Jansen remarks, Marcuse instigates some 'confusion' here. This can be remedied if we recognize that Marcuse's insights from the mid-1960s onwards are nonetheless 'strongly based on 'Bloch's notion of a concrete Utopia' (Jansen, 2006: 37–8). A few years later in *An Essay on Liberation*, in 1969, Utopia and possibility coincide.

It is the dynamism of productivity that deprives Utopia of its traditionally unreal content; what is pejoratively labeled as Utopian is no longer that which has no place and cannot have any in the historical universe, but rather what is prevented by the power of the established societies from coming into being. The technological powers of advanced capitalism [...] possess latent Utopian possibilities, and the rational utilization of these powers on a worldwide scale would end poverty and scarcity in the foreseeable future. (Marcuse, [1969] 2004d: 244)

It is not technological progress alone, which Marx called the development of the

productive forces of the base, that is responsible for this advance; tendencies in the cultural superstructure and the psychological infrastructure of society also contribute. Marcuse looks at the pacification of the struggle for human survival through communal living as the foundation of Utopia. The power of the Utopian imperative is manifested in the aesthetic dimension which makes clear the 'difference between artistic and social reality. The break with the latter, its magical or rational contravention, is an essential quality' of art (Marcuse, [1964] 2004c: 83). Because art liberates the New from the existent social sphere, it is an ideal example of the Utopian mentality. On the attachment of the Utopian to objects of art, whether literature, painting, or novel, it is the need for beauty that can potentially nourish the need for social change. 'Moral and aesthetic needs become fundamental necessities, and these mandate new relationships among peoples, generations [...] and nature' (Marcuse, [1972] 2004e: 25). Marcuse's use of the term *need* is unusual. Needs can only be understood historically, so that their expressions and satisfactions can be altered. But the need for a qualitatively new life is in the first instance something satisfied by having basic needs met, such as eating, drinking, sleeping, sexuality, security, and social bonding. The development of Utopian needs is 'only possible after these requirements have been satisfied, so that time, place, and energy may be released for a realm beyond necessity' (Marcuse, 1999: 104). Still, Marcuse is not speaking here in terms of simplified hierarchical stages that would rise above well-known survival needs to new kinds of living needs. Needs for recognition, self-realization, and peace do get added, but also new dietary habits, forms of sexuality, and forms of associated living will change with history. But it is always a question of a *possible* needs development that is by no means *guaranteed*. Possibility is an ambivalent concept. It includes the Utopian and the dystopian. Here, the goal and the path to the

goal are crucial: 'The goal is human happiness' (Levitas, 1990: 133) and this means 'shortening the working day and the active participation of individuals' (Marcuse in Levitas, 1990: 144). But the following holds true: 'If the demand for the abolition of (alienated) labor does not exist, then what is to be expected is only that the new technical possibilities will in fact become new possibilities of repression and domination' (Marcuse, [1967] 1980: 15). Technical progress alone does not yet determine the direction of social change. Here Marcuse is referring back to Walter Benjamin's critique of technological progress. 'Instead of dredging and channeling rivers, technological progress directs a torrent of men into the beds of its trenches, instead of scattering seeds from its airplanes, it peppers cities with firebombs' (Benjamin, [1935] 1963: 44).

Now, it is not as if a need for trenches and incendiary bombs outweighed the need for canals and seeds. The use of productive forces as destructive forces has more to do with the failure to concretize the need for social transformation. This is made more difficult by the capacity of capitalism to integrate the oppressed through partial need satisfaction. Of his time, Marcuse maintains that 'the absorption of the greatest part of the working class into the capitalist social order is not a superficial phenomenon', because the working class 'benefits from the super-profits of neocolonial exploitation, military spending, and immense governmental subsidies' (Marcuse, [1972] 2004e: 15). Neither needs nor their satisfactions are neutral. Needs can be fulfilled by struggling against each other or by cooperating with each other. In any case, Marcuse proposes that some needs already suggest alternative forms of satisfaction. It may well be true that an individual's victories within a system of permanent societal competitiveness bring prosperity and recognition, but the price for this comes at the expense of repressed needs, whose expression is the business of Utopian thinking. Along with Mannheim's motivation to action

and Bloch's concrete Utopia, for Marcuse 'Utopia is primarily negation' (Levitas, 1990: 118). A recognition of new needs requires the determinate negation of established needs. 'Negation of the need to earn a living, negation of the need for a wasteful, destructive productivity ... negation of the need for fraudulent instinctual oppression' (Marcuse, [1967] 1980: 15).

Marcuse emphasizes that wage labor, productivity, and the repression of instincts here function as modes of need satisfaction under capitalism. He contrasts these with entirely new needs and feasible modes of gratification, which under capitalism go completely unrecognized. These include, for example, the need for 'rest', the need for 'being alone, with oneself or the self-chosen other', the need for the 'beautiful', for 'uninvited happiness', and the need for 'peace, which is today not a vital need of the majority' (Marcuse, [1967] 1980: 15). What distinguishes these needs from the everyday? His attempt to address this question involves a particularly suggestive perspective: 'We can distinguish true and false needs' (Marcuse, [1964] 2004c: 25); false needs are those whose satisfaction is at the expense of ourselves, our environment, and others, because they 'make it necessary to continue the frenzied chase to keep up with the Joneses and scramble over the detritus of planned obsolescence' (25). In the aftermath of neoliberalism, which presents capitalism itself as a machine for the production of ever new desires, Marcuse's criticism of purely private desires is, in the best sense, Utopian. It is interesting to note that, despite Marcuse's insightful criticisms of the absorption of the individual into the one-dimensional society, he still appeals to the personal responsibility of individuals in order to bring about change: 'What are true and what are false needs must be answered by the individuals themselves' (26). No philosopher-kings can, as in Plato, prescribe the criteria for correct needs; the fulfillment of needs remains a question of individual experience and political advice at the same

time. Appropriate needs point toward Utopia; new needs are its substance.

The critical negation of prevailing needs, the articulation of new needs, and the concretization of alternative satisfactions are the tasks of Utopia; yet the outcome and resolution require discussion. Utopian hope can only be really substantiated by critical theory; otherwise 'the controlled and manipulated productivity of labor and the controlled and manipulated satisfaction of needs mobilize not only consciousness, but also the instinctual structure to replicate the existing social order' (Marcuse, [1974a] 2004f.: 157). Because capitalism not only influences the economic base and the cultural superstructure, but also our psychological foundations, Marcuse is in search of Utopia's conditions of possibility.

In *Eros and Civilization* (1955), Marcuse worked out a theoretical foundation that enables aspects of the instinctual structure to be mobilized against existing society. He connects this to Freud's late analysis of human instincts, which distinguishes life-instincts and death-instincts, Eros and Thanatos. Both types of instinct, the drive toward creativity and social bonding, the drive to destruction and aggression, are, according to Freud, guided into forms that are socially acceptable. An internalized superego limits sexuality to marriage, aggression to the state of war. Marcuse expands upon this model by examining the reverse or reciprocal impact of society upon the assemblage of instincts in the individual. The death instinct and aggression, as they exist and persist in our society, are interpreted by Marcuse as an 'unconscious flight from pain and want' (Marcuse, [1955] 2004a: 33). In his retrospective view, the abolition of scarcity, which is now increasingly possible technically, should result in a weakening of the aggressive instincts and the strengthening of the life instincts. In this way Eros would become an ally of Utopian fantasy in humanity's psychological infrastructure. This is where the Utopian idea 'arises and is sustained of a culture based on

free libidinal associations and bonds' (178). The energy of Eros is understood by Freud as extending beyond the sexual, and as nourishing sublimated forms such as the bonds of solidarity and creative achievements. Marcuse uses this to more fully understand society. To him the categorical imperative of Utopia does not demand new people, but, that the 'roots of domination wither away in people' (Marcuse, 1999: 102), as has been mentioned above. The presupposition here is not that people are good by nature; instead it is a matter of the social dispositions gained through social learning. Freud identified the aim of the Erotic instincts as 'creating and maintaining ever greater social groups and bonds' (Freud, [1938] 1970: 12). Marcuse saw this as an opportunity for our 'self-sublimation into expanded and enduring relationships' (Marcuse, [1955] 2004a: 190).

Just as Thomas More's *Utopia* had previously sought the condition for happiness in his (veiled authoritarian) vision of reason, so too Marcuse says that the actualization of a Utopian happiness will hinge on rational thought. But here repressive reason 'is supplanted by a new rationality of gratification, in which happiness and Reason coincide' (Marcuse, [1955] 2004a: 191). Marcuse's intention is to identify the technical, aesthetic, and psychological conditions of a concrete Utopia. A concrete Utopia makes possible our activist interventions. Still, critical theory can only identify latent possibilities, point out problems, and designate trends. Utopia must outline the range of existing possibilities, which have yet to be recognized by people or desired by them. 'Within the framework of objective conditions, the alternatives [...] depend on the intelligence and the will, the consciousness and the sensibility of the people' (Marcuse, [1972] 2004e: 35). Of course, Utopian thought itself contributes its part to this development. As Levitas emphasizes, referring back to William Morris, all of this belongs to the 'function of Utopia, which is not just the expression, but the education of desire' (Levitas, 1990: 124).

The question of Utopian consciousness again becomes a question of its bearers. Marcuse mentions the New Left of the 1960s, the non-integrated, underprivileged peoples of the global South, and the racially oppressed (Marcuse, [1967] 1980: 46), and also the students availing themselves of the privileges of education (Marcuse, [1967] 1980: 47). If some persons claimed that the laws of nature afforded them the satisfaction of their basic needs through struggle, others required new ways of life to meet their concrete needs. In the 1970s, Marcuse sought Utopian potential to be found in the youth and environmental movements and above all in the women's movement as the 'potentially most radical political movement' (Marcuse, [1974b] 2004g: 131). These various and partial aims may well be merged together. Critical theory would need to elevate them into a long-term Utopian goal that could bridge the contradictions and needs articulated then and now by these social movements. 'The goal would be the development of socialism as a movement away from alienation and toward creative work, away from the mastery over nature toward a cooperation with nature, away from repression toward the emancipation of the senses, away from rationality of exploitation to the rationality of social solidarity' (Marcuse, [1974a] 2004f: 153). The specific intermediary political goals needed to make progress along this path are *not* task of Utopia, but rather political debate.

### **THE REHABILITATION OF UTOPIA: CRITICAL THEORY ON UTOPIAN THOUGHT**

In contrast to the confidence which kept scientific Marxism buoyed-up even in its decline, critical theory found it had to work to strengthen the sense of its Will to an Alternative. Just as for Horkheimer, 'the Alternative depends only on the will of men' (Horkheimer, [1940] 1968: 76), and for

Adorno the essential feature of Utopian consciousness is what Bloch called 'willing the other' (Bloch, [1964, 1978a] 1985a: 363), so too for Marcuse the alternatives depend on 'the intelligence, the will, the consciousness, and the sensibility of the human beings' (Marcuse, [1972] 2004e: 35). What Bloch identified as the importance of the subjective factor became even stronger, early on, in the development of critical theory. 'An objectively real possibility is on the verge of its factual being, yet it requires a subjective factor, so that the possibility is enriched precisely by those conditions which it requires to be factual' (Bloch, [1971, 1978a] 1985b: 281).

At the same time, critical theory knows that the odds do not favor such transformations. If the entire society reinforces its mechanisms of ideological mystification and its fetishized inversions of reality, such that exploitation appears as equal exchange, structured inequality as equal opportunity, domination as justice, and in which revolution can take on an authoritarian quality that leads from bad to worse, the chances of a Utopian upsurge are not good. The real theoretical challenge is to visualize the Alternative only as an outline, a plan, not as a finished work of art. In contrast to the latent authoritarianism of Thomas More's Utopian novel or Robert Owen's Utopian settlements, the restraint of critical theory is easily understood. In the end, it is left up to us. 'If a future society really does not function through the immediate of mediated use of force, but instead through agreements that it has itself settled on, we will not be able to anticipate theoretically the culmination of these agreements' (Horkheimer, [1940] 1968: 72). On the other hand, it is already Utopian to expect a qualitative difference between the present organization of society and the hoped-for agreements of the future. In spite of his critique of Mannheim's idealism, Horkheimer does agree with a concept of Utopia that finds its meaning in inspiring social groups toward action. Despite criticism of Bloch's optimism, Adorno must

agree with a concept of Utopia which locates its meaning in the actualization of objective possibilities.

But neither the subjective factor of inspiring ideas nor the objective factor of circumstances that may be concretely transformed can guarantee the actualization of Utopia as the determinate negation of the existing order. In the search for those who could carry on with hopefulness, Marcuse recognized that the Utopias of the New Left – seeking liberated individuality, a new morality, different attitudes in terms of gender relationships and in terms of our bonds with the natural world – could be reintegrated into the established order as steps toward the modernization of the state, capitalism, and patriarchy. Against these false satisfactions, which stand opposed to the real pacification of life's struggles, critical theory must call upon the as-yet-to-be claimed rewards within the Utopian impulse. Like any critique, a Utopia is always a child of its time, not an image of the future, but a product present conducive to the future. The challenge is: 'To abolish the mechanisms that reproduce the old needs, there must first of all *be* a need to abolish the old mechanisms' (Marcuse, [1967] 1980: 38).

After the death of Bloch and Marcuse in the 1970s, Jürgen Habermas tried to lead critical theory out of the dilemmas of subjective philosophy. On the one hand, he diagnoses the 'exhaustion of Utopian energies' (Habermas, 1985: 144), given the disappearance of the hopes which, in the protest movements of the 1960s and 1970s, brought critical theory and political practice closer together. On the other hand, he displaces the potential for societal transformation – away from the contradiction between instrumental reason and Utopian reason – into the field of communicative rationality. A tendency toward reconciliation is to be found in language itself. In order to release this tendency, however, subjects would still be required to communicate without – under conditions free of domination – but according to certain rules. Communication that

is without any trace of domination, assuming that humans are capable of this, is yet another Utopian thought to be assiduously pursued. Instead of retreating to an ostensibly anthropological basis, however, it might be better to look for those who are carrying forth a Utopian consciousness today. Oskar Negt's (2012: 13) proposition that 'Utopias are the decisive sources of power for every movement of emancipation' has guided this exploration of Utopian theory. The question is: where are critical Utopias now to be found in contemporary social movements? To guard against the absorption of (new) Utopias into the established social order, we must heed the advice of Charles Fourier that Marx used as a criterion of social freedom – 'Reject restraint on thought and restraint on desire!' (Fourier, [1846] in Burckhardt, 2006: 116).

## Notes

- 1 *Translator's note*: Translations of all German language reference materials are mine, and remain sourced to the original German language texts; so too the parenthetical remarks [in brackets] are my additions. All iterations of *utopia* are rendered *Utopia*. Completed January 20, 2017 in honor of the day's massive, Utopia-inspired protests against the US presidential inauguration.

# Praxis, Nature, Labour

Stefan Gandler

The study of praxis holds the key to a critical and dialectical interpretation of Marxist theory. Nevertheless, at best, the vast majority of Marxist writing considers ‘praxis’ as secondary. At worst, like the Orthodox or Reformist interpretations of Marx’s work, the (critical and dialectical) implications of Marx’s theory of praxis are not understood at all, leading to often quite sterile discussions that are characterised by abstract idealism and mechanic materialism, simple objectivism and simple subjectivism, and, finally, the artificial separation between production and consumption as seemingly distinct spheres of social reproduction. Similarly, Althusserian structuralism fails to come to terms with the concept of praxis. Although it proposes a concept of ‘theoretical practice’, it is limited to the realm of thought. In distinction, praxis is the philosophical basis of a critical theory of society. In contemporary society, and against the background of (abstract) ecological thought and rejection of Marxism as Eurocentric,<sup>1</sup> its elaboration is most

important given the degree of human destruction of the environment that, as (abstract) environmentalism sees it, has moved on from the ‘old continent’ to the so-called periphery. While environmentalism bemoans the loss of the Amazonian rainforests as a destruction of our ‘collective lungs’, it does not concern itself with the mode of human social reproduction in the affected regions.

In Frankfurt School critical theory, to this day the outstanding theorist of human praxis is Alfred Schmidt.<sup>2</sup> Schmidt’s concept of praxis is not to be confused with either an atheoretical practiciness or purely abstract notions of what Althusser termed ‘practical humanism’.<sup>3</sup> Everyday consciousness believes itself to be in direct connection with the world of praxis, and, precisely as a result of the self-postulated circumstance of not being stained by any theoretical reflection or negative critique of the existing relations, believes that, in the realisation of everyday tasks, such reflection would be more a hindrance than a help. It is worth noting that

this posture could be based on practicalist hostility to theory and anti-humanist conceptions of society, which themselves could be based on formulations by Marx such as the following: '[Men] begin, like every animal, by *eating, drinking*, etc., hence not by "standing" in a relation, but by *relating themselves actively*, taking hold of certain things in the external world through action, and thus satisfying their need[s]. (Therefore they begin with production)'.<sup>4</sup>

However, and in distinction to such views, Alfred Schmidt argued that 'these formulations are not to be understood in the sense of practicist enmity toward theory'. Schmidt continues, with reference to historical praxis: 'Historical practice is in itself "more theoretical" than theory, as indeed it was in Hegel (although in his case of course it was determined in the last analysis as a mode of knowledge). Practice has already accomplished the mediation of Subject and Object before it becomes itself the theme of reflection'.<sup>5</sup> In other words, a fully *atheoretical* world does not exist. Indeed, theory is required because reality demands comprehension, and reality is always Man in his social relations, and these relations are always relations of social reproduction – of the human metabolism with nature.

This chapter presents Schmidt's critical concept of praxis as comprising definite social forms of the human metabolism with nature. Social reproduction entails the concept of labour as exchange with, and consumption of, nature. In this context, I argue that, understood critically, theory is not something applied to practice, as in the state socialist tradition from Lenin to Althusser. In fact, in this tradition, German idealism appears as its radicalised other, that is, as theory disengaged from practice. Rather, I hold that theory articulates and presents the knowledge of praxis – praxis is innately theoretical as social knowledge. The chapter elaborates this insight by first developing Schmidt's conception of praxis in two sections, focusing on notions of natural law, natural form,

and human labour. The aim is to establish a critical theory of Marx's conceptions of human labour and use-value. In a second section, the argument focuses on the concept of tool and the philosophical role that it plays in reflection on the means of production.

## HUMAN PRAXIS, NATURE, AND HISTORY

Alfred Schmidt formulates his critical theory of praxis in three different variants. Material being, which no doubt exists independently of human subjects, only 'acquires meaning' in a first formulation – ontological, if you will – after having passed through human praxis: 'It is true that material being precedes every form of historical practice as extensive and intensive infinity. But in so far as it is meaningful for men, this being is not the abstractly material being presupposed in its genetic primacy by any materialist theory, but a second being, appropriated through social labour'.<sup>6</sup> In a second formulation, Schmidt says that the existence of natural material objectivity, the precursor to human praxis, only comes to be 'pronounceable' once it has become, at least partially, an object of human praxis:

The social subject, through whose filter all objectivity passes, is and continues to be a component of the latter. No matter how much man, a 'self-conscious natural thing', goes beyond the immediacy of 'natural substance' found in each case, in transforming it through an ideal anticipation of his ends, the natural context [*Naturzusammenhang*] won't be ruptured in this way. Faced with this natural context (and in this Marx also follows Hegel's 'logic') purposeful doing can only assert itself by cunningly meshing with the process of the internal laws of matter. The fact that these laws exist 'in-themselves', independent of all praxis (and its theoretical implications) is, of course, *pronounceable* only insofar as the objective world has become a world 'for us'.<sup>7</sup>

This second formulation grasps the problem on the philosophical–linguistic level. Like the

first, it includes the broader problem that a materiality external to the immediate sphere of influence of human praxis can only be grasped by subjects in counterposition to matter already formed by praxis. This reaches the point that even the very term of the 'being untouched' of external nature can only be created by human beings who already practice a massive domination over nature: 'Even those objects which have not yet fallen into the sphere of human intervention depend on man insofar as their *being untouched* can only be formulated with relation to the human being'.<sup>8</sup>

In another passage, the philosopher from the Frankfurt School tradition of critical theory indicates that the romantic yearning for the 'beautiful nature of God' is established historically at the precise moment in which the industrial development of a specific region or nation – with its consequent domination of nature through heavy machinery – had reached a certain level of development, as had the destruction of nature. Thus, it was at the dawn of capitalism that a few bourgeois gentlemen from the English industrial cities, dressed in their chequered shirts, started to scale the Alps – a desire that they declared to be irresistible.<sup>9</sup>

In a third formulation – in terms of the philosophy of consciousness – the material world, in its form of movement corresponding to the laws of nature, without a subject in itself, is only 'recognisable' if it has already been the object of human praxis: 'The *dialectical* element of Marxist materialism does not consist in the denial that matter has its own laws and its own movement (or motion), but in the understanding that matter's laws of motion can only be recognised and appropriately applied by men through the agency of mediating practice'.<sup>10</sup> In another passage, Schmidt formulates a similar idea in describing the relationship between materialism in general and 'dialectical materialism':

The fundamental materialist tenet could be summed up as follows: the laws of nature exist independently of and outside the consciousness

and will of men. *Dialectical* materialism also holds to this tenet, but with the following supplement: men can only *become certain* of the operation of the laws of nature through the forms provided by their labour-processes.<sup>11</sup>

In their productive activity, human beings confront the transformability of matter, and thereby recognise their subordination to the laws of nature. It is only by means of this recognition that they can, in turn, push back the barriers of nature where its objective content makes that possible. The double movement of praxis toward theory and theory toward praxis is visible in Schmidt's account. With reference to Marx's and Hegel's reflections on 'labour's purposes', among which productive praxis stands out, Schmidt proposes the following idea: 'Anticipatory knowledge presupposes practical action which has also been completed and from which this knowledge proceeds, just as, inversely, it forms the precondition of any such activity'.<sup>12</sup>

Now it is very important to insist that this reciprocal interdependence between praxis and knowledge does not simply put both on the same level. The mutually dependent relationship does not lead to a suspension of the primacy of matter *vis-à-vis* the subject and its capacity for knowledge and decision. But, at the same time, in Marxism this 'priority of external nature' is not static, but mediated.<sup>13</sup> 'Nature was for Marx both an element of human practice and the totality of everything that exists'.<sup>14</sup> These reflections are much more than philosophical subtlety. The path across the tightrope that a philosophy of praxis must walk is focused well by Alfred Schmidt:

These considerations are less trivial than they might seem, since if the concept of praxis is tightened excessively as it is by Fichte (as also in the early Lukács, who transforms historical materialism almost into an idealism of 'creation' in sociological clothing), it is toned down and becomes a concept of mere contemplation. 'Pure and absolute activity which is nothing more than activity' thus finally ends up in the 'illusion of "pure thought"'.<sup>15</sup>

We could make the following comment regarding this line of argument: the illusion of pure thought and pure activity leads, in political praxis, to the presumption that ideal processes determine material processes. To judge a specific policy within this logic, one merely examines the argumentative strategies of the agents and their followers in search of the internal coherence of reasoning (for example, in its moral argumentation), instead of wondering about the real motives behind those policies. In consequence, the effects of that policy are not considered and valued in and of themselves, but always with respect to whether these effects were desired or not.

In Marxist theoretical debates, the concept of praxis is indispensable in being able to confront the objectivist tendencies of both the reformist and Stalinist Lefts. Despite their considerable theoretical differences, one important parallel between the revisionist and dogmatic Lefts consists in the fact that both tend to understand the transition to socialism as an inevitable process. The reformist position is based on the idea that transition will occur through a *passage*, as smooth as possible, through a gradual transformation (which can only be sped up through reforms) of capitalist structures into socialist ones. The orthodox Marxists, in contrast, invoke the idea that a radical rupture must be reached at some particular moment. Despite this difference, they have something in common: both tendencies fear nothing so much as the spontaneous rebellion of the oppressed and exploited beyond the bounds of the party and the given organisational structures of social reproduction.

But to grant praxis such a central position in his theory, as does Alfred Schmidt in his philosophical investigation, throws these objectivist understandings of politics and history radically into doubt. The concept of praxis, which is fundamental for Marxist theory, contains an element of rebellion against all those who, from their desk, aspire to lead the activities of the rebels of all countries.

Since the concept of praxis already contains within itself the mediation of theory and activity, and, speaking more generally, of subject and object, and since it shows in theoretical reflections that the straight separation of the two (contained in the conception of *leading the masses through the Party*) leads to utter absurdity, this concept resists the authoritarianism of both the reformists and the orthodox. Given that both currents, confronted with the spontaneous rebellion of the masses, take pleasure in arguing that they lack theoretical knowledge and preparation, with the objective of taking charge of them again, the *philosophy of praxis*, which pleads the case of praxis on a highly theoretical level, is a splinter which is not very easy to remove. Conversely, this doesn't mean simply to take the side of spontaneous and non-reflective action, endorsing practice-ism over theory. Alfred Schmidt is more interested in showing that theoreticism (and stubborn insistence on one's own theoretical training against those who do not formally possess it) is not necessarily any closer to the process of theoretical knowledge than is praxis in the fullest sense of the word.<sup>16</sup> It should thus be understood that Schmidt insists on the fact that 'historical practice is in itself "more theoretical" than theory'.<sup>17</sup>

Despite everything, these reflections continue to be of great importance when the problem of the relationship between theory and practice, between subjective and objective relations, and between cadres and *party base*, are posed to us with an urgency that has not decreased. It remains valid today to insist that emphasising the meaning of praxis does not mean simply taking the side of subjectivity against the importance of objective relations. In the critical-philosophical concept of praxis, what is more interesting is grasping the dialectical relationship between these two instances, which can only be counterposed so simply on the terminological level, and to understand the importance of this relationship. Thus, we should follow Alfred Schmidt when he indicates that simple objectivism

and simple subjectivism should in no way be identified as unequivocal opposites, but rather that – in specific ideologies or forms of political action – both tend to coexist.

With Alfred Schmidt, we could say that both positions under critique – that of the dogmatic Left as well as its reformist variant – contain a peculiar combination of mechanical materialism and idealism. This does not mean that the defenders of those positions truly understand it in this way. It is precisely in the uncomprehended (or even unconscious) combination of these two philosophical traditions that the theoretical problem is buried.<sup>18</sup> Marx's contribution consisted in critically – which is to say, through reflection – contrasting the epistemological contributions of mechanical materialism to those of idealism, in order to thereby arrive at the developed concept of praxis. Schmidt emphasises that, for Marx, the question

...given the unavoidable historic tasks of humanity, is no longer one of arguing – on the basis of higher principles of being and knowledge (for which it matters little whether their interpretation is spiritual or material) – but rather one of setting out from the 'materiality' of the human living conditions – a materiality which is anything but ontological – which are 'practical' from the outset, that is, relations established by action': productive and class relations.<sup>19</sup>

## READING CAPITAL PHILOSOPHICALLY

For Schmidt, 'Marx was by no means at his most philosophical when he made use of the traditional, scholastic language of the philosophers'. Indeed, in his book on Marx's concept of nature, he warns the reader from the beginning that Marx's

middle and later, politico-economic writings will be consulted much more than is customary in interpretations of Marxist philosophy. Particular attention has been paid to the *Grundrisse der Kritik der politischen Ökonomie (Rohentwurf)*, the preliminary draft of *Capital*, which is of the utmost importance for understanding the relation between

Hegel and Marx, and which has so far hardly been used.<sup>20</sup>

In this context of reading *Capital* philosophically, Schmidt emphasises the importance of the concept of use-value and of the natural form:

The natural form of the commodity, called by Marx its use-value, only appears in the analysis of the process of creating value in so far as it is the 'material substratum, the depository of exchange-value'. Here, on the contrary, we are concerned primarily with the philosophical elements of Marxist theory, and the process of production will be considered above all in its historical movement, as a labour-process bringing forth use-values.<sup>21</sup>

In the cited passage, Schmidt places at the centre of his observations the importance of use-value above all in relation to its *production*, and not so much to its *consumption*. Schmidt realises perfectly well the unity of production and consumption in Marx's theory, but setting out from the primacy of production, as we see clearly, for example, in the following formulation: 'Marx, like Hegel, regarded productive activity as consumption as well, which used up both the material worked on and the activity of work'.<sup>22</sup> At issue are the conditions of social reproduction.

Marx's two tendencies, though contradictory at first sight, namely of recognising the importance of use-values and thereby understanding very early on the danger of their destruction, on the one hand, while on the other hand referring to use-values systematically only in terms of a 'material substratum ...bearers of exchange-value',<sup>23</sup> are not two totally divergent tendencies within Marxian thought, but rather both the expression of a single situation.

Just as Herbert Marcuse, in his *Reason and Revolution*, views Hegel's affirmative expressions with regard to the existing social formation (for example toward the monarchy or war) as directly related to his ideas critical of bourgeois society, so too can we, by analogy, rationally conceive and understand

this contradiction within Marx. Thus, when Hegel glorifies war as something as beneficial for society as the storm is for the sea, freeing it of stagnation by stirring it up, this is not only the most shallow affirmation of the existing, but also one of his most critical formulations – one which could also be understood to mean that this social formation would collapse if not for war, since, as Hegel puts it in another passage, bourgeois society's reason ends at the border of the nation state.<sup>24</sup>

With reference to the problem at hand, we could then say: Marx's limitation in referring systematically to use-value – the natural form of the commodity – only in connection to the analysis of the production of value, is on the one hand a genuflection toward classical political economy studied in the present, but simultaneously and in the same sense, this theoretical limitation is nothing other than the account of the full subordination of use-value to value as manifested in the capitalist mode of production. This latter side is radicalised even further because Marx analyses use-value in relation to value, above all in its tendency to be destroyed by value. To celebrate use-value would not have provided any better solution to the actually existing problem, and nor would it have contributed to resolving it. To return to the parallel with Marcuse's critique of Hegel: just as the naïve musings on perpetual peace and the idea of being able to create and guarantee it within the framework of existing social relations and through international peacekeeping institutions<sup>25</sup> ultimately run off course and miss the central problem, so too a naïve fixation on the use-value side of production and consumption always runs the risk of being less critical than Marx's proposal on this point, which seems at first glance to be uncritical.

The reflection is on the knife's edge. Without doubt, we should not remain within Marx's undeveloped reflections on use-value – on the natural form of social reproduction – but here we run up against a question which is more than merely scholastic: how can we take this step today, when the formation of

society is not *in principle* different from what it was in Marx's times, without losing the realism that led to his critical insights, which, in large part, still have not been surpassed?

Maybe the key to this surpassing lies in the concept of labour power, that is, the most important and fundamental use-value for the human being is the human being itself. The first 'natural form' that humans encounter is their mother, and they later come to be increasingly conscious of the use-value of their own bodies and that of all other humans. Marx himself also says that labour power is a fundamental use-value, and, in a certain degree, the most important, since it is the only commodity that creates value (and that is fundamentally surplus value). Seen in this way, use-value is even more central to Marx's analysis than value, not only quantitatively (with regard to the number of pages devoted to it), but also in terms of its fundamental focus. This focus evidently sets out from the massive destruction and gradual annihilation of the human life of the English working class, which – on account of the factory inspectors, who were often brave and committed<sup>26</sup> – represents one of the best-documented cases of the capitalist destruction of use-value.<sup>27</sup> But this speech for the defence in support of Marx has not been inserted here in order to distract the reader from the limitations that Alfred Schmidt diagnoses in his treatment of use-value, but instead to indicate a danger that we see in the way that many today follow the fashion of referring to ecology and use-value.<sup>28</sup>

Marx has been criticised for not having analysed use-value, the natural form of social reproduction, sufficiently within his theory. This critique largely neglects the fact that the destruction of 'human use value' – especially in the form of the proletarian and the members of his family – occupies a central position in Marx's main work. The failure to recognise this could have a double meaning. Either it comes from the belief that the destruction of *external* nature in Marx, as the destruction of natural forms alongside

the *internal* (that proper to human beings), should be discussed in more detail; or, alternatively, it sets out from the belief that the very destruction of human nature *itself* is no longer a topic for discussion, because, in its extreme form, such destruction has been transferred from Europe to other continents, and that, in the (ostensible) mother continent of the capitalist mode of production, the destruction of external nature, at least at first glance, has become the most urgent problem. If the second variant were the case, then Marx's focus is surely closer to the truth than those ecological propagandists who see nothing more in the deforestation of virgin forests than the loss of *our* collective lungs, who do not know – and much less want to know – what happens in the affected region when these forests are destroyed, and who do not care at all that the inhabitants of those forest regions were destroyed long before the holes in ozone layers over the polar ice caps were discovered. It is this of false ecologism, which represents little more than the highest stage of pseudo-humanist Eurocentrism,<sup>29</sup> of those who remember basic human needs only when their necks burn, that we must beware. It is very interesting to note that such a view fits much less comfortably with Marxian theory than with the conceptions of those who seek to overcome the aforementioned limitations in Marx solely through an act of will or a mere redefinition of the problem.

According to Marx, social reproduction has a 'double form': a 'value form' and a 'natural form'.<sup>30</sup> The concept of natural form is presented by the use-value of a commodity. The commodity, in Marx's words, has a double-objectivity: the 'objectivity of commodities as values' versus their 'sensuous objectivity'. It is precisely its 'double' way of existing as something that converts this specific historical product into a commodity. It is from this 'plain, homely natural form', as Marx calls it [*hausbackene Naturalform*]<sup>31</sup> – which, in opposition to the value form, does not only appear in bourgeois forms of production, but in all forms of production throughout

history – that research into the Marxian concept of nature must set out.<sup>32</sup> In current Marxist debates on a non-Eurocentric interpretation of the concept of use-value, the possibility is seen of applying the Marxian concept of natural form not only to the 'sensuous objectivity of commodities as physical bodies', but also to other aspects of production, not directly related to the capitalist mode of production, which are older and which could even outlast it. In order to do so, regional traditions, peculiarities, and preferences, as well as culturally caused differences in how human products are made and consumed, were put in the centre of the discussion. It is certain that, in the framework of this theory, the necessity of this conceptual expansion is argued, but it should be documented – on the basis of Marx's texts, and with detailed arguments – up to what point this interpretation of the natural form of social reproduction could be justified by a Marxian conceptualisation.

The fundamental question on this topic could be put as follows: does Marx's concept of natural form refer exclusively to non-human, external nature, or also to the activity of humans and the manner in which they live? The mentioned interpretation of Marx would only be convincing on this point if the latter were the case, since these theories relate the concept of the natural form of social reproduction to the human *ethe*, which expresses itself in the concrete manifestations of society. In fact, these *ethe* are not in any way considered as something that belongs exclusively to the conditions of external nature.<sup>33</sup>

Alfred Schmidt offers a relevant observation for the problem of natural form. Its conception comes with certain reservations, since in Marx's theory – a dialectical theory – external nature cannot be strictly separated from the human influence exercised over it.

But as far as the world of experience as a whole is concerned, the material provided by nature cannot be distinguished from the practico-social modes of its transformation. The question of the quantitative and qualitative share of man and the material nature

in the creation of the product of labour is one to which there is no general answer for Marx. The fact that this relation cannot be fixed formally is an indication of the dialectical nature of the process.<sup>34</sup>

The concept of natural form, however much it comes from the natural character of the objects and instruments of labour, cannot be reduced to a merely external nature. Just as was emphasised in the discussion of the concept of praxis in Marx, the concept of a nature which is external to the human being is no longer possible, imaginable, or expressible outside its connection with the radical appropriation of that nature. But, as soon as human praxis confronts external nature, the latter – as ‘humanised nature’<sup>35</sup> – ceases to be strictly external.

Schmidt insists on this dialectical relationship of human intervention with nature and nature’s ultimately irrevocable external immediacy: ‘The immediacy of nature asserts itself at ever higher stages of the process of production, though now humanly mediated through men’.<sup>36</sup> In the reciprocal interpenetration of external nature and human praxis, the results of this process become as external to human beings as the immediate natural material: ‘Once created, the world of use-values compounded of labour and natural material (i.e. humanized nature) confronts men as something objective, existing independently of them. The material of nature itself confronted men in the same way in its first immediacy, when it had not yet been penetrated by men’.<sup>37</sup>

Nature and human activity are distinct in unity. They reciprocally interpenetrate one another in productive praxis in such a way that it may be comprehensible to use the concept of the natural form of social reproduction for the analysis of the historically definite forms of social reproduction. Above all, in reference to the material results of the culturally conditioned everyday processes that the mentioned theories analyse (the four *ethe* theory and the comprehension of communication as a production–consumption process), this use of the Marxian concept of the natural form of

social reproduction is substantially justified. Marx’s concept of the natural form of social reproduction not only represents the point of departure in such a search for a materialist theory of culture, but will also return – upon the completion of his ambitious theoretical project – as the final point of his analysis.

The concept of ‘historical *ethos*’, which is central in the above mentioned discussions in Latin America on a non-Eurocentric interpretation of Marx’s theory, can be understood simultaneously as the *foundation* and the *result* of the dialectical relation that exists between human subjectivity and all that exists independently of consciousness. The primacy of matter can be understood to be confirmed, by this application of the concept of natural form to the modes of subjective human behaviour in the production and consumption of use-values, and not – as it is sometimes naïvely suggested – as idealistically toned down. The critical character of the relationship between human productive force and natural substance is well brought out by Schmidt: ‘Human productive forces stamp the material of nature intellectually and practically. This process however completely confirms nature’s independence of consciousness rather than destroys it’.<sup>38</sup>

## NATURE AND TOOLS: ON THE MEANS OF LABOUR

In the critical conception of human praxis, the theory of production transforms into a critique of production. For this context, too, Alfred Schmidt’s theory of tools remains unsurpassed. The previous section posited a yet unresolved problem regarding the relationship between the instrument of labour and the object of labour,<sup>39</sup> and, therefore, also of the relationship of the tool to raw materials, which points to the need to refer to Marx’s ‘theory of the tool’.<sup>40</sup> For Marx, all that humans find pre-existing on Earth and on which they can work can be considered an

'object of labour'. Therefore, the Earth in its totality constitutes an 'object of labour' for the human beings who inhabit it.<sup>41</sup> Here, Marx distinguishes between 'objects of labour spontaneously provided by nature', which humans merely 'separate from immediate connection with their environment', and 'raw material'.<sup>42</sup> The 'raw material' is differentiated from the 'object of labour' in that it has already undergone a treatment which goes beyond mere detachment from nature as a whole, 'for example, ore already extracted and ready for washing', which has thus already been 'filtered through previous labour'.<sup>43</sup> Hence, the concept of the object of labour is broader than that of raw materials.<sup>44</sup> Evidently, for Marx, something analogous happens with the conceptual pairing of 'instrument of labour' and 'tool':

An instrument of labour is a thing, or a complex of things, which the worker interposes between himself and the object of his labour and which serves as a conductor, directing his activity onto that object. He makes use of the mechanical, physical and chemical properties of some substances in order to set them to work on other substances as instruments of his power, and in accordance with his purposes.<sup>45</sup>

But Marx understands the instruments of labour, which have already been transformed by human labour, as 'tools'.<sup>46</sup> This concept of the tool as an already-produced instrument of labour can also be found in Benjamin Franklin's definition of the human being as a 'tool-making animal'.<sup>47</sup> Marx does not make the distinction between instruments of labour in general and those which are produced – that is, tools – as unequivocally as the previously mentioned distinction between objects of labour in general and those which have been worked, which is to say, raw materials. In any case, Marx repeatedly observes the particularity which characterises the 'instruments [of labour] [*Arbeitsmittel*]... which have already been mediated through past labour' from those pre-existing instruments of labour which are used just as they were found.<sup>48</sup>

One explanation of the fact that Marx uses the term 'tool' rarely, employing instead 'instrument of labour', can consist in the fact that, effectively, today there exist fewer instruments of labour that have yet to be transformed by humans than there exist objects of labour which are still untransformed. Also, in the history of humanity – for example, in the material remains of extinct civilisations – it is easier to demonstrate the use of the latter than the former. While in unelaborated instruments of labour it is possible that, in dropping them after use, they leave no or little trace of that use, it is a different matter with objects of labour which have not been previously worked-upon, since in most cases these form a material part of the final product. In strictly logical terms, it is also correct to substitute the term 'tool' for that of 'instrument of labour', since 'tool' is a subcategory of 'instrument of labour', and consequently, every tool is also always an instrument of labour. The problem here is that the readers could get confused and create the impression that Marx used the two terms 'instruments of labour' and 'tool' synonymously.<sup>49</sup>

The consequences of this problem are not immediately serious because Marx, in his analysis, does not study closely those instruments of labour which are not themselves procured through labour, but instead refers almost always in his examples to those which have been produced.<sup>50</sup>

According to Alfred Schmidt, Marx's theory of the tool in *Das Kapital* is that of 'the existing, the materialised mediator between the labourer and the object of labour [*Arbeitsgegenstand*]'.<sup>51</sup> In saying this, he stresses the importance of tool-making for the entirety of human development, and above all the development of human intellectual capacities: 'There can be hardly any doubt that the most basic abstractions have arisen in the context of labour-processes, i.e. in the context of tool-making'.<sup>52</sup>

In this sense, the attempt to see a parallel between the processes of production and communication stands in the non-dogmatic

Marxist tradition. To the question of whether or not this attempt makes its authors idealist philosophers, we could respond that, in such matters, a separation cannot always be established with the kind of clarity we find in the textbooks of dogmatic Marxism. In this context, it is worth emphasising the closeness between Hegel and Marx regarding the theory of the tool. In this respect, Schmidt underlines Hegel's contribution to understanding the inner connection between the development of tools and the human capacity for communication:

Hegel, as well as Marx, was aware of the historical interpenetration of intelligence, language and the tool. The tool connects man's purposes with the object of his labour. It brings the conceptual element, logical unity, into the human mode of life. Hegel wrote in the *Jenenser Realphilosophie* [the Jena manuscripts]: 'The tool is the existent rational mean, the existent universality of the practical process; it appears on the side of the active against the passive, is itself passive in relation to the labourer, and active in relation to the object of labour'.<sup>53</sup>

It is precisely in Hegel's linking of the processes of production and communication in his formulations on the tool that Schmidt sees Hegel's importance for historical materialism.<sup>54</sup> In his discussion of the tool in *Capital*, Marx cites Hegel's understanding of the 'cunning of reason' in an effort to understand philosophically the 'cunning of man' in the use of tools, as Schmidt describes it in summarising Marx.<sup>55</sup> The human being – Marx writes – 'makes use of the mechanical, physical and chemical properties of some substances in order to set them to work on other substances as instruments of his power, and in accordance with his purposes'.<sup>56</sup> In a footnote inserted at this point in *Capital*, Marx immediately quotes the following well-known phrase from Hegel's *Logic*:

Reason is as cunning as it is powerful. Cunning may be said to lie in the intermediative action which, while it permits the objects to follow their own bent and act upon one another till they waste away, and does not itself directly interfere in the process, is nevertheless only working out its own aims.<sup>57</sup>

Despite this direct reference by Marx to Hegel in the context of his theory of the tool, we must note an important difference between the two philosophers. Alfred Schmidt draws attention to the fact that 'Marx had a far lower estimation' of the tool than did Hegel.<sup>58</sup> The latter viewed the ends of production as subordinated to its means, since the end is finite, and, therefore, 'it is not an absolute, nor simply something that in its own nature is *rational*'.<sup>59</sup> The tool, on the contrary, as the '*means is superior to the finite ends of external purposefulness: the plough is more honourable than are immediately the enjoyments procured by it and which are ends*'.<sup>60</sup> On the contrary, for Marx the tool is not something completely extrinsic to the product, and nor does he subordinate the latter to the former in terms of its capacity to immediately satisfy human needs, as does Hegel. While, for Hegel, the presumed durability of tools situates them on a higher level *vis-à-vis* those products which are extinguished in consumption,<sup>61</sup> Marx – here moving completely within the materialist tradition, which was generally far from asceticism and indeed opposed to it – 'had no intention of deriving any arguments against the satisfactions of the senses from their transitory nature'.<sup>62</sup>

Moreover, Alfred Schmidt distinguishes 'three forms of tool'.<sup>63</sup> 'The tool can maintain itself in its identical form, it can enter materially into the produce of labour and, finally, it can be completely consumed, without becoming part of the product of labour'.<sup>64</sup> It is evident that of these three types of tool, Hegel knows only the first. If Schmidt understands this as a limitation of the dialectical idealist's understanding of the tool, he clarifies that 'it had an element of truth in it, in that most tools remain the same in use, and are foreign to their product'.<sup>65</sup> In this respect, Hegel has limited his philosophical reflection to the predominant form of tool. In any case, we can see the degree to which the materialist Marx grasps reality better than Hegel, moreover, in the fact that he understands just

how relative the conceptual determinations of these various objects with regard to their position in the labour process are.<sup>66</sup>

Certainly, we could say that the Hegelian conception could grasp these components again at any moment of production, and that, insofar as his philosophy is dialectical, he ought to be able to understand conceptually the double form of objects. However, Hegel's emphatic discourse on the tool as the 'more honourable', and his disparaging appraisal of consumption [*abfällige Bewertung des Konsums*], indicate a static element in his theory. The concept of 'productive consumption',<sup>67</sup> which is central for Marx and indicates precisely the difficulty of fixing determinate elements of reproduction on one factor and in one static form, as Hegel does, is unfamiliar to the great dialectician, who, in his turn, gave Marx important indications for his theory of the tool.

Alfred Schmidt tends to be, in this conceptual tension between the theory of tools in Hegel and Marx, more to the understanding of the latter. The distance to Hegel's glorification of the tools for their *durability* is based, not only in a critical lecture of Marx's works, but also in his interpretation of one of the most ancient opponents to slavery, in the materialist theory of Western philosophy: Epicurus. In the last session of his final seminar that Alfred Schmidt gave only a few weeks before his death, he referred emphatically to Epicure's materialism, which rejected radically the idea that human pleasure, i.e. happiness, could be measured by time. In that sense, the Hegelian argument, that tools are more important than other objects of consumption because the tools endure normally much more time than any object of immediate consumption (as food, for example), is senseless in the Epicurean perspective, in which the importance of human pleasure depends exclusively on the quality of human wealth, and not its quantity. That is, social wealth is free time: time 'for enjoyment' (Marx) – freely disposable time (Adorno). In the words of Schmidt, Epicurean philosophy

entails a materialist rejection of any philosophical reflections on death. It considers that the fear of God comes from the fear of death: 'As long as the death has not occurred, it is not our business; but when it occurred, it is again not our business'.<sup>68</sup>

## CONCLUSION

The critical concept of human praxis does not, therefore, free practice from the social structures. Rather, it comprehends social structures as institutions of social practice, however perverted this practice might be in the form of the object. Instead of negating society abstractly, it refuses to accommodate for the sake of human existence. In this sense, the critical theory of praxis, as it has been established here, comprehends the intricate relations of material existence and idealist thinking as in dialectical materialism. In the form praxis, the laws of nature exist outside the consciousness and will of men, but, at the same time, men can become certain of them through the processes of social labour as conscious activity. Therefore, in this dialectical tension, materialism recognises praxis as fundamental – not as a static truth, but as a historical mediation. The critical understanding of this relation, as developed in the work of Alfred Schmidt, is essential in linking Marx's work with contemporary discussions of both political – reformist and orthodox left-thinking – and ecological agendas. Regarding the political agenda, their insistence on a clear separation of theory and activity expresses the rejection of the spontaneous rebellion of the exploited and oppressed as thoughtless activism; as laid out earlier, any clear separation between theory and practice is impossible. The dismissal of the emancipatory praxis of the masses as non-theoretical belongs to the same reality that left politics, ostensibly, seeks to overcome. On the other hand, and in keeping with the earlier illustration, the environmental activist

tends to focus almost exclusively on the deforestation of virgin forests and the destruction of the ozone layer. In this, they forget that the consciousness of these problems exist only because environmental destruction is a threat to human existence. Without considering the true critical significance of concepts such as praxis, labour, nature, or tool, thought risks falling into mere perspectivism – as in Althusserian structuralism – that naïvely adopts either a mechanistic or subjectivist point of view, staggering about from one to the other without being aware of it.

- 2 On Alfred Schmidt, see Hermann Kocyba's contribution to Volume 1 of this *Handbook*.
- 3 Louis Althusser, *For Marx* (London: Verso, 1996), chapter 7. According to Schmidt, Althusser 'does not interpret familiar Marxist ideas in structuralist language...rather he presents structuralist positions without ceremony as Marxist ones'. Alfred Schmidt, *History and Structure* (Cambridge, MA: MIT, 1983), 83. Werner Bonefeld, *Critical Theory and the Critique of Political Economy* (London: Bloomsbury, 2014), chapter 2. Devoid of a conception of the actual relations of human praxis, one could argue with Adorno that practical humanism does 'not talk about the devil'. Instead, 'it looks on the bright side'. Theodor Adorno, *Minima Moralia* (London: NLB, 1974), 114.
- 4 Karl Marx, 'Notes on Adolph Wagner', in *Marx: Later Political Writing* (Cambridge: Cambridge University Press, 1996), 235.
- 5 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 194. In the German original, Schmidt writes here about 'historische Praxis', which would have been better translated as 'historical praxis', even though in English this term is less usual than the term 'practice' (compare Alfred Schmidt, *Der Begriff der Natur in der Lehre von Marx*, republished in revised and expanded form in 1974 [Frankfurt am Main: Europäische Verlagsanstalt, 1974], 204). This edition of the book is identical – including the pagination – to the 1993 edition, with the only difference that the latter includes a new prologue from Schmidt, paginated with roman numerals (i–xvii). The same applies for the whole book: where Schmidt writes in German 'Praxis', in the English translation there always appears 'practice'.
- 6 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 194. He puts it similarly elsewhere: 'Like all materialism, dialectical materialism also recognizes that the laws and forms of motion of external nature exist independently and outside of any consciousness. This "in-itself" is however only *relevant* in so far as it becomes a "for-us", i.e. in so far as nature is drawn into the web of human and social purposes' (58f, emphasis by S.G.).
- 7 Alfred Schmidt, 'Praxis', in *Handbuch Philosophischer Grundbegriffe. Studienausgabe*, vol. 4, edited by Hermann Krings, Hans Michael Baumgartner, and Christoph Wild (Munich: Kösel, 1973), 1117, emphasis by S.G.
- 8 Ibid. On the linguistic plane, this circumstance can be observed above all in literary activity, in which virgin nature is discovered at the same moment that its definitive conquest appears as the order of the day. Thus, the English poet Percy Bysshe Shelley describes Mont Blanc in 1816, in his poem of the same name, as 'Remote, serene, and inaccessible' after its summit had been reached five times by groups of climbers in the twenty years following its first ascent in 1786; Percy Bysshe Shelley, 'Mont Blanc, Lines Written in the Vale of Chamouni' (Mary Wollstonecraft Shelley, *History of a Six Weeks' Tour* [London: Hookham, 1817, facsimile reprint: Oxford, Woodstock, 1989], line 97).
- 9 Alfred Schmidt mentioned several times in his classes the following situation: The first ascents of high mountains, above all the Alps, are an excellent example of the relation between external untouched nature or materiality, on the one hand, and subjectivity or praxis, on the other. The idea of an untouched nature has, from a certain moment of its potential, imaginable *tangibility*, an incredible force of attraction, and thereby, this intangibility – which is from the beginning linked with the imagination of its potential tangibility – turns into the reality of already having been touched. The first high peak to be climbed by humans, according to the historical register, is Mont Blanc, the highest in Europe. This first great alpine ascent took place three years prior to the French Revolution. It is not only industrial development, but ideological development as well, that provokes and makes possible the yearning to reach the apparently unreachable parts of external nature. Compare: Horace Bénédict de Saussure, *Premières ascensions au Mont Blanc: 1774–1787* (Paris: Maspéro. 1979).

- 10 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 97. In the English translation of Schmidt's book, the following footnote is included after 'motion': "'Movement" and "motion" are alternative renderings of the German word "Bewegung", both of which are required by the English context at different points' (220 n17a).
- 11 Ibid., 98, second emphasis by S.G.
- 12 Ibid., 100. 'Labour's purposes' is, in the German original, 'Die bei der Arbeit verfolgten Zweck-Inhalte' (Alfred Schmidt, *Der Begriff der Natur in der Lehre von Marx*, republished in revised and expanded form in 1974 [Frankfurt am Main: Europäische Verlagsanstalt, 1974], 99).
- 13 'Marx, like Feuerbach, wrote of "the priority of external nature", although with the critical reservation that any such priority could only exist within mediation' (Alfred Schmidt, *The Concept of Nature in Marx* [London: NLB, 1971], 26–7; Alfred Schmidt cites Karl Marx, 'The German Ideology' in *The Marx-Engels Reader*, ed. R. C. Tucker, second edition, [New York: W.W. Norton, 1978], 44).
- 14 Ibid., 27.
- 15 Alfred Schmidt, 'Praxis', in *Handbuch Philosophischer Grundbegriffe. Studienausgabe*, vol. 4, edited by Hermann Krings, Hans Michael Baumgartner, and Christoph Wild (Munich: Kösel, 1973), 1117. Schmidt cites here according to Marx and Engels, 1969, *Die Deutsche Ideologie*, in *Werke*, vol. 3 (Berlin: Dietz., 1969), 452f.
- 16 Brecht expresses a similar idea when, in his *Flüchtlingsgespräche* [*Refugee Dialogues*], the character of the intellectual confesses to the character of the proletariat: 'I always think of the philosopher Hegel. I have taken some of his books out of the library so that you will not be behind, *philosophically speaking*' (Bertolt Brecht, *Flüchtlingsgespräche* [Frankfurt am Main: Reclam, 1961] 76, emphasis by S.G.). In any case, this should only be understood negatively, i.e. as an ironic critique of theoreticism and not as a banal cult of the proletariat. As a disdainful allusion to the conceptual capacities of the working class, amateurishly praised, which finds its expression in the substitution of classics with *textbooks* by the communist party, the character representing the proletariat adds shortly thereafter, referring again to Hegel: 'They gave us extracts of his works. In him, as in crabs, one must focus on the extracts'. There exists in English a published adaptation of the text for theatre performance: 'Conversations in Exile', adapted by Howard Brenton from a translation by David Dollenmayer, in Bertolt Brecht, *Theater*, 17, 2, 1986.
- 17 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 194.
- 18 In this regard, see also: 'Marx does not "combine" (which would be a pure eclecticism) reflective motives rooted in idealism and materialism, but rather puts forth the idea (which had appeared in different shades from Kant to Hegel) that the immediate is already mediated, against its previously idealist formulation' (Alfred Schmidt, 'Einleitung', *idem.*, *Beiträge zur marxistischen Erkenntnistheorie* [Frankfurt: Suhrkamp, 1969], 11).
- 19 Ibid. Schmidt cites here from Marx's 'Notes on Adolph Wagner', in Marx: *Later Political Writings*, trans. and ed. T. Carver (Cambridge: Cambridge University Press, 1996), 235, Marx's emphasis. Schmidt continues here by referring to Mao: 'These reflect in each case not only the degree to which society has already achieved true power over nature, but they also determine the what and the how of human knowledge, of the general horizon in which it moves' (ibid.).

- 24 G.W.F. Hegel, *Elements of the Philosophy of Right* (Cambridge: Cambridge University Press, 1991), §324. See also Herbert Marcuse, *Reason and Revolution* (London: Routledge & Kegan Paul, 1955), especially 220–3.
- 25 Hegel reproaches Kant for this *philosophical eye-wash*: 'Perpetual peace is often demanded as an ideal to which mankind should approximate. Thus, Kant proposed a league of sovereigns to settle disputes between states, and the Holy Alliance was meant to be an institution more or less of this kind. But the state is an individual, and negation is an essential component of individuality. Thus, even if a number of states join together as a family, this league, in its individuality, must generate opposition and create an enemy'. Ibid., §324, addition, 326.
- 26 'The social statistics of Germany and the rest of Continental Western Europe are, in comparison with those of England, quite wretched. But they raise the veil just enough to let us catch a glimpse of the Medusa's head behind it. We should be appalled at our own circumstances if, as in England, our governments and parliaments periodically appointed commissions of inquiry into economic conditions; if these commissions were armed with the same plenary powers to get at the truth; if it were possible to find for this purpose men as competent, as free from partisanship and

- respect of persons as are England's factory inspectors, her medical reporters on public health, her commissioners of inquiry into the exploitation of women and children, into conditions of housing and nourishment, and so on. Perseus wore a magic cap so that the monsters he hunted down might not see him. We draw the magic cap down over our own eyes and ears so as to deny that there are any monsters'. Marx, *Capital*, vol. 1 (London: Penguin, 1976), 91.
- 27 In the end, simply emphasising the importance of use-values does not eliminate the problem that external or internal natures are only understood – to use Kant's language – as a *means* and not an *end*. This relates to the economist's view of social relations, a view which Marx adopts not because he finds it especially convincing, but because he is interested in analysing a society in which human beings can live, if at all, only because they possess the use-value of creating value. But, in the end, Marx is interested in something more than an 'economy oriented toward use-value'. Without using Kant's language, there is in every description of the living conditions of the English working class a resonance of what interests him, but which he very rarely dares to state: a society in which, as Brecht says, 'man is no longer a wolf to man'.

- 31 Ibid. (Original: Karl Marx, *Das Kapital*, Vol. I, in Marx and Engels *Werke*, vol. 23, [Berlin: Dietz, 1975], 62.)
- 32 See, for example, Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 66: 'If exchange-value is a "non-natural characteristic" typical of the bourgeois form of production, in the use-value the commodity confronts us in its "plain, homely natural form". The present investigation is particularly concerned with the latter form of the commodity'.
- 33 See Bolívar Echeverría, 'La "forma natural" de la reproducción social', *Cuadernos Políticos*, (Mexico City: UNAM, 1984), 41, 33–46.
- 34 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 67. Here, Schmidt adds: 'If labour is the formal "creator of value", the stuff of nature is its material creator. Hence, through what we have already said of the character of labour, the division of natural material and labour cannot be absolute. At the level of the individual use-value, it may *in abstracto* be possible to make a distinction between what derives from labour, i.e. from the activity of men, and what is provided by nature as the "material substratum" of the commodity'.
- 35 Ibid.
- 36 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 67.
- 37 Ibid., 66. It is from this understanding that both the theory of alienation and, in the final instance, the critique of ideology were set out in Marx and in Western Marxism.
- 38 Ibid., 66f.
- 39 'The simple elements of the labour process are (1) purposeful activity, that is work itself, (2) the object on which that work is performed, and (3) the instruments of that work'. Marx, *Capital*, vol. 1 (London: Penguin, 1976), 284.
- 40 See, in this regard, Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 99–107, here: 103.
- 41 Marx, *Capital*, vol. 1 (London: Penguin, 1976), 284. Today even the Moon and outer space have begun to serve as objects of labour for humans, albeit only in an experimental stage at this point.
- 42 Ibid.
- 43 Ibid.
- 44 'All raw material is an object of labour [*Arbeitsgegenstand*], but not every object of labour is raw material; the object of labour counts as raw material only when it has already undergone some alteration by means of labour'. Marx, *Capital*, vol. 1 (London: Penguin, 1976), 284–5.
- 45 Ibid., 285.
- 46 Compare: 'As soon as the labour process has undergone the slightest development, it requires specially prepared instruments. Thus we find stone tools [*Werkzeug*] and weapons in the oldest caves'. Ibid.
- 47 Benjamin Franklin, cited in Marx, *Capital*, vol. 1 (London: Penguin, 1976), 286. Elsewhere in *Capital*, Marx contrasts this definition to that of Aristotle's definition, according to which the human being is 'by nature a citizen of a town'. While this is 'characteristic of classical antiquity', Franklin's definition is 'characteristic of Yankeeedom'. This should not be understood to mean that, in Marx's opinion, Franklin's definition is only valid for the United States, but merely that it goes hand-in-hand with the ideology of that society (444, 7). Marx, generally quite succinct in his use of reflections on 'human nature', makes use of both authors on this question, albeit with the limitation that 'man, if not as Aristotle thought a political animal, is at all events a social animal' (444). We can observe a certain distance

- between Marx and the authors in question due to the ideological tendency of the latter, which expresses something about the problem forcibly confronted by critical theory when it attempts to formulate assertions regarding 'human nature'. See Stephan Bundschuh, *Und weil der Mensch ein Meinsch ist: anthropologische Aspekte der Sozialphilosophie Herbert Marcuses* (Lüneburg: Zu Klampen, 1998) for a first systematic study of this issue.
- 48 Among other things, Marx distinguishes between instruments of labour 'in general' and those 'already mediated by labour', referring to the subcategory of those which, without intervening directly in the labour process, are nevertheless its unconditional premise: 'Once again, the earth itself is a universal *instrument* of this kind, for it provides the worker with the ground beneath his feet and a "field of employment" for his own particular process. *Instruments* of this kind, which have *already been mediated through past labour*, include workshops, canals, roads, etc.' (Marx, *Capital*, vol. 1 [London: Penguin, 1976], 286–7, emphasis by S.G.). Ben Fowkes translates Marx's concept of 'Arbeitsmittel' simply as 'instrument'. In other cases, mentioned above, he translates the same term more precisely as 'instrument of labour' (compare Marx, *Das Kapital*, Vol. I, in *Marx and Engels Werke*, Vol. 23 [Berlin: Dietz, 1975], 195). When Marx separately mentions the use and construction of instruments of labour, he equally indicates the conceptual difference between instruments of labour in general and their elaborated form, which is to say, tools: all instruments of labour are used, but only tools are fabricated (*Capital*, 286).
  - 49 Alfred Schmidt also refers to 'the instrument of labour, which was for Marx identical with the tool' (*The Concept of Nature in Marx* [London: NLB, 1971], 103).
  - 50 See, for example, Marx's mention of the oldest known human instruments of labour, in which he emphasises their character as a tool, that is, their having been made available previously through human labour: 'domesticated animals, i.e. animals that have undergone *modification by means of labour*, that have been bred specially, play the chief part as instruments of labour along with stones, wood, bones and shells, which have *also had work done on them*' (Marx, *Capital*, vol. 1 [London: Penguin, 1976], 285–6, emphasis by S.G.).
  - 51 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 103. Ben Fowkes here translates (in 1971) 'Arbeitsgegenstand' as 'subject of labour', as it was used in the English translation of *Capital* published in Moscow. Fowkes revises that in 1975, when elaborating his own English version of *Capital*, and translates 'Arbeitsgegenstand' now more precisely as 'object of labour'. (Compare *The Concept of Nature in Marx*, 102 with Marx, *Capital: A Critique of Political Economy*, vol. I, trans. S. Moore and E. Aveling [Moscow: Progress Publishers, 1954], 125 ff.)
  - 52 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 102.
  - 53 Ibid. Here Schmidt cites Hegel, *Jensener Realphilosophie* (Leipzig: Meiner, 1932), 221.
  - 54 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 105, notes: 'Lenin stated correctly that Hegel was a precursor of historical materialism because he emphasised the role played by the tool both in the labour-process and in the process of cognition'.
  - 55 Ibid.
  - 56 Marx, *Capital*, vol. 1 (London: Penguin, 1976), 285.
  - 57 Hegel, cited according to *Capital*, 285, 2. Compare, moreover, Hegel's observations which precede his reflections on tools in the *Logic*: 'That the end relates itself immediately to an object and makes it a means ... may be regarded as *violence* ... But that the end posits itself in a *mediate* relation with the object and *interposes* another object *between* itself and it, may be regarded as the *cunning* of reason'. W.F. Hegel, *Science of Logic* (London: Routledge, 2002), 746.
  - 58 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 104. See also, on Marx: 'He was wary of fetishizing the tool in relation to the immediate use-values created with its help, as Hegel had done' (Marx, *Capital*, vol. 1 [London: Penguin, 1976], 285, 2.).
  - 59 W.F. Hegel, *Science of Logic* (London: Routledge, 2002), 747.
  - 60 Ibid. The immediate philosophical relationship between Hegel's *Logic* and Marx's *Capital* gets lost for the reader in English on account of the different ways in which the German term 'Mittel' is translated: in the *Logic*'s case as 'means', and in *Capital* as 'instrument', for example in the case of the central Marxian concept of 'Arbeitsmittel' translated by Fowkes as 'instrument of labour', instead of 'means of labour', as mentioned above.
  - 61 'The tool lasts, while the immediate enjoyments pass away and are forgotten. In his tools man possesses power over external nature, even though in respect of his ends he is, on the contrary, subject to it' (ibid.).
  - 62 Alfred Schmidt, *The Concept of Nature in Marx* (London: NLB, 1971), 104.
  - 63 Ibid., 103.

64 Ibid.

65 Ibid.

66 'Hence we see that whether a use-value is to be regarded as raw material, as instrument of labour or as product is determined entirely by its specific function in the labour process, by the position it occupies there: as its position changes, so do its determining characteristics'; and 'Again, a particular product may be used as both instrument of labour and raw material in the same process. Take, for instance, the fattening of cattle, where the animal is the raw material, and at the same time an instrument for the production of manure'

(Marx, *Capital*, vol. 1 [London: Penguin, 1976], 288–9).

67 Ibid., 290.

68 Alfred Schmidt, quoting Epicure from memory, in German: 'Solange der Tod nicht eingetreten ist, geht er uns nichts an; ist er aber eingetreten, geht er uns abermals nichts an' (Alfred Schmidt, Seminar '*Einführung in die Geschichte der Philosophie [Introduction to the history of philosophy]*', last session: 12 July 2012, J.W. Goethe-University Frankfurt/Main, video recording, part 2, minute 36. Available at <https://www.youtube.com/watch?v=Py2pmR4fpH0>).

# Critical Theory and Epistemological and Social-Economical Critique

Frank Engster

Spiegel: 'Professor, two weeks ago the world seemed still to be ok...'

Adorno: 'Not for me!'

The understanding of the socio-historical conditions of consciousness was at the core of early Critical Theory's<sup>1</sup> attempt to combine social-economic and epistemological critique. Since Max Horkheimer and Theodor W. Adorno primarily developed this approach, the chapter focuses on their accounts.

First, I look at their understanding of the socio-economic and epistemological critique of society. I then discuss how their notion of mediation – which materially socializes the German idealist notions of subject and object by drawing on the critique of political economy – is formulated in regard to this notion of critique. Finally, I take a closer look at the fundamental core of this critique: the social mediation that constitutes a specific capitalist objectivity, specific capitalist subjectivity and a correspondening non-identity.

## THE IDEA OF CRITIQUE

Horkheimer's programmatic 1937 essay 'Traditional and Critical Theory' marks a turning away from not one but two traditions. It explicitly criticizes the understanding of critique, mediation and subject-object in philosophy and the sciences. But Horkheimer also strives to overcome the critique that this tradition had already been subjected to from a traditional Marxist perspective. Even though Horkheimer was still committed to emancipation from the standpoint of labour, the essay was an attempt to break with the positivism of both traditions,<sup>2</sup> opening them up to a new *critical* theory in distinction to the positivist world-view Marxism of the Second and Third Internationals.<sup>3</sup> This theoretical development came along with a critique of notions of historical progress – evolutionary in traditional bourgeois theory, revolutionary in the Marxist tradition – for the supposed forward march of history had not led to overcoming capitalist society.

Instead the latter had become one-dimensional, wherein social reproduction in the form of economic compulsion produced the immanence of a false totality and thus a self-closure.

In Critical Theory, the critique of this closure avoids Hegel's speculative dialectic which takes contradictions as proof of an ideally speculative solution. But it also avoids the traditional idea in Marxism according to which the antagonism between labour and capital contains its own progressive resolution. These insights led to Marcuse's *One-Dimensional Man*<sup>4</sup> and to the importance of 'eros' and 'drive' in Marcuse, to Adorno's notions of a 'universal context of delusion'<sup>5</sup> (*'universaler Verblendungszusammenhang'*), the 'non-identical' and the critical force of individual reflection, and to Horkheimer's total domination of 'instrumental reason' as well as notions of subjective 'non-compliance'. Indeed, it also led to Horkheimer's later flirtations with messianic, utopian and religious notions.<sup>6</sup>

As a theory oriented on the Marxian insight (taken from Hegel) that 'presentation is critique and vice versa',<sup>7</sup> Critical Theory's approach to contradiction established the defining character of Critical Theory, which holds that the exposure of social content *is* critique. The former and the latter also expose contradictions in social and historical development: scientific and social progress, illumination and universalism, freedom and autonomy are not contradicted because they are simply hindered or held up by their opposite. Rather they create their opposites. This fateful immanent turn is key to the argument in *Dialectic of Enlightenment* (DoE) (Horkheimer/Adorno, 2002) and *Negative Dialectics* (ND) (Adorno, 1973). This understanding of immanence has important consequences for the field at stake here: the connection between the capitalist economy on the one hand and the forms of thought in capitalism on the other.

The aim of such a critique (which draws on Kant, Hegel and Marx' notion of radical

critique) is to find the conceptuality of object and subject in their socially specific capitalist conditions. Following Marx, Critical Theory holds that the categories of political economy 'express the forms of being, the characteristics of existence',<sup>8</sup> constituting a social objectivity and a corresponding objective subjectivity. Thus, capitalist objectivity comprises a specific *socio-natural* objectivity and capitalist subjectivity likewise comprises a *socially specific* subjectivity that appears as timeless and quasi-natural. Yet, Critical Theory also inverted Marx' approach to ask: why can thought – in everyday life or in philosophical thinking – *not* adequately grasp its own capitalistic social conditions? Why do the conditions and mediations of thinking remain opaque and lead to naturalized and ideological forms?<sup>9</sup> Further, while capitalism leads to enormous increases in productivity, why is there no corresponding emancipatory consciousness?

## CRITICAL THEORY AS SOCIETY'S SELF-CRITIQUE

Even though Adorno and Horkheimer rather modestly referred to themselves as sociologists, their main calling was philosophy.<sup>10</sup> In combining both sociology and philosophy, they sought to unite empirical research with epistemological critique and social philosophy.<sup>11</sup> Drawing upon Kant and Hegel's notion of critique, Horkheimer and Adorno's aim was to 'socialize' the philosophical concept of critique and its central notions (consciousness and self-consciousness, reason, identity, totality, subject-object, spirit, etc.) by grounding them in the *Critique of Political Economy*<sup>12</sup> and Freudian psychoanalysis.<sup>13</sup> Yet their goal was not to turn the Hegelian Spirit 'on its feet', reducing the idealist view of knowledge, rational self-understanding and reason to vulgar materialism (as Traditional Marxism had done with Marx and Hegel). Instead, Critical Theory endeavoured

to use the categories of the critique of political economy to demonstrate the social character of philosophical categories. This implies philosophy, especially German Idealism and its understanding of philosophical problems, is a perverted form of thought in that it merely reflects one's own society. However, since society and its social contradictions always already appear in philosophical terms as problems of reason and cognition, knowledge and thinking, the social nature of these contradictions and problems disappear *in this form of appearance*. Thus philosophy in general and German Idealism in particular already represent in its form of thought and its central categories the reified, alienated and inverted character of bourgeois society.

Yet this does not invalidate philosophical thought, rather, this process of mystification is emblematic of nothing less than the hidden genesis of thinking and knowledge in *general*, for all thought is – and this is the main epistemological insight Horkheimer and Adorno took from Marx – socially constituted (which does not mean socially *constructed*), but trapped in false immediacy and immanence that cannot grasp its social origins. Moreover, this hidden genesis reaches the point of self-reflection in philosophy. Consequently, philosophy can be turned into a self-critique of thinking, especially when German Idealism is read in conjunction with Marx: the aim of Critical Theory is to uncover the social constitution of categories of thought and of being that present themselves as natural or ontological.

According to Adorno, the disappearance of the social first 'appeared' in the non-empirical, a priori status of Kant's 'transcendental subject', and it reached its climax in Hegel's overcoming of that transcendental subject in the supra-individual 'Spirit'. Yet both find their truth-content in their inversion of the social and natural conditions of thinking into the supremacy objectifying reason holds over its objects. Moreover, in their philosophy the self-reflection of thinking must necessarily understand and at the same time misunderstand its social conditions and social genesis, and thus its own thinking.

Art, which plays a major role especially in Adorno's writing,<sup>14</sup> is used in the same way as philosophy: 'The basic levels of experience that motivate art are related to those of the objective world from which they recoil. The unsolved antagonisms of reality return in artworks as immanent problems of form. This, not the insertion of objective elements, defines the relationship of art to society'.<sup>15</sup>

But while in philosophy, and especially in German Idealism, an unresolved reality finds closure in a systematic immanence, in art this unresolved reality is reformulated in the explicit non-systematic and configurational form of art itself. Therefore, while philosophy offers an adequate critique of systemic closure in thinking, art expresses the unresolved reality in a non-systematic way.

Thus, on the one hand, the 'first' truth of philosophy is to reflect on its own categories – being, form, consciousness, reason etc. – the disappearance of the social in thought, while on the other hand, philosophy is needed to draw attention to these social origins of thought, in order to change the former and the latter. 'Philosophy, which once seemed obsolete, lives on because the moment to realise it was missed'.<sup>16</sup> That is why the duty of historical materialism is first of all, in Adorno's words, the 'anamnesis of the genesis'.<sup>17</sup> This anamnesis, which Adorno conceives of as 'dissolution of things understood as dogmatic',<sup>18</sup> does not in fact intend to reconstruct the social and historical genesis of thinking, at least not in a systematic or scientific sense. Instead, it traces the process of disappearance in thinking that becomes both practical reality and its blind spot, and it is because of this blind spot that he draws on both Marx' critique of the political economy and Freud's psychoanalysis and his notion of the unconscious.

## THE CRITICAL STATUS OF THEORY

Adorno and Horkheimer's materialist theory of knowledge is distinct not only from

Traditional Marxism's quasi-official 'reflection theory',<sup>19</sup> but also from Lukács<sup>20</sup> and Alfred Sohn-Rethel's formulations of the former.<sup>21</sup> The difference lies in the *critical* status of Adorno and Horkheimer's Theory.<sup>22</sup> Lukács' attempt to formulate a materialist theory of knowledge privileged a non-contemplative, practical, epistemological standpoint: that of the proletariat as the 'identical subject-object of history'.<sup>23</sup> Sohn-Rethel claimed to reconstruct the social genesis of the conditions of the non-empirical forms of cognition akin to Kant's 'transcendental subject'.<sup>24</sup> Adorno and Horkheimer, however, turned away from such emphatic – and, in the case of Lukács, even revolutionary – expectations of a materialist theory in general and of a materialist theory of epistemology in particular. Instead of constructing a coherent materialist theory of thought, they pointed out the shortcomings and aporias of such an attempt: such a theory points to the domination of subjectivity that must be the object of critique, or to be more precise, that must be the object of subjectivity's *self*-critique. The aim therefore is not to replace the existing theories of knowledge with one of properly rational (self-)understanding, but rather to show the domination and harm caused by forms of thinking and subjectivity – not in the least against subjectivity itself.

This self-reflexive *critical* theory thus reveals the irrational and the ideological in the seemingly rational and objective on the side of the socio-economic constitution of social objectivity, and the corresponding subjectivity of individual experience, consciousness, thinking and science. This individual subjectivity, however, has to be derived from the supra-individual subjectivity of capitalist society's objectivity since Critical Theory regards this capitalist society as an 'autonomous subject' (Marx). This is because social relations manifest themselves in the form of an incomprehensible movement of economic objects upon which society's reproduction depends. The critique of society as an automatic subject thus shows the constitutive untruth of both society as object and society

as subject while also revealing the conditions that constitute individual subjectivity and its corresponding socially necessary forms of thinking.

The real object of critique is neither the supra-individual subjectivity of society's objectivity nor the subjectivity of individuals, but their mutual social mediation, and that mediation is their social mode of existence. The duty of critique is thus to show the irrational, ideological and reified effects of this process of social mediation on subject and object. Rather than grounding a scientific theory or Hegelian speculative identity, the critique of social mediation reveals its subjective and objective untruth. Hence, the critique of social mediation points to that which the process of mediation compulsively subsumes but cannot totally sublate. If there is an idea of *truth* in Critical Theory, it is one that appears negatively:<sup>25</sup> in the unresolved contradictions, promises and desires in society; in the forgotten moments and possibilities in history; in what remains powerless, overwhelmed and in misery; in what resists identification; and in that something simply is lacking. Even if, or precisely because, all this only appears negatively, critique is then 'based' on what breaks and thwarts the mediation between the supra-individual and objective subjectivity of the capitalist society and the subjectivity of individuals.

Moreover, critique also points to the dark, fatal side of social mediation: when illumination and universality, progress and freedom become their opposites. By showing their regressive development, Critical Theory uses the immanent turn of these ideas for an immanent critique that still tries to rescue them for emancipation, particularly in Horkheimer and Adorno's main works *Dialectic of Enlightenment* and *Negative Dialectics*.

This (self-)critical, negative status of critique has led to charges that Critical Theory cannot explain or legitimize in any positive manner its own theory and its refusal to sanction the world.

Critical Theory was aware of this quandary. Instead of a systematic or scientific explanation, it saw the purpose of critique as pointing to the 'damaged life'<sup>26</sup> of unconscious 'second nature',<sup>27</sup> thus indicating its ideological and traumatic effects but also what in history has been forgotten or lost, what remains unfulfilled or, not least, what resists as the hope, the promise and the desire for a better life that, after all, remains as unfulfilled as insatiable.

## TOTALITY AS MEDIATION

Totality is not an affirmative but rather a critical category.<sup>28</sup>

Since Critical Theory posits critique inside the perverted mediation of capitalist objectivity and subjectivity, then its 'first' critique is that there *is* mediation at all. This critique is directed against the type of understanding that takes different scientific objects and methodologies for granted without even asking how society presents itself, thus paving the way for a positivist thinking that takes the different objects of knowledge and its scientific spheres as immediately given.<sup>29</sup>

For Adorno, following Hegel, the immediate is always already mediated and this mediation, following Marx, is socially determined and historically specific. Consequently, positivist thinking can neither adequately pose the question of mediation, nor can it adequately challenge its own thinking. The former and the latter are the goal of critical theory's specific notion of *critique*.

Since this form of critique aims to point to an individual subjectivity that, however false, irrational or unconscious it might be, still – or even especially then – corresponds to the constitution of social objectivity, this also means that Critical Theory holds onto the notion of *totality*. More specifically, it follows an idea of totality that derives from Hegel and Marx: that totality *is* mediation.<sup>30</sup>

Consequently, this idea of totality-as-mediation also means a *dialectical* conception of mediation, which does not exist outside, prior to or detached from the mediated, but rather comprises the interrelated constitution of objectivity and subjectivity. However, with the perverted character of this subject–object mediation and its immanent turn from progress into regression, Critical Theory modifies Marx' critique of Hegelian totality: inverting Hegel's speculative identity which turns the negativity of the mediation of subject–object into the positivity of their correspondence and mutual progress (which is Hegel's supra-individual Spirit). It does so by refusing this affirmative turn by holding back the 'closing' and 'positive turn' brought by the second negation in Hegel's 'negation of negation'.<sup>31</sup>

However, in this refusal of the 'second' affirmative and closing negation there is also a positive determination. But now the determination lies in the independence and self-determinateness of what is not sublated in mediation by negativity and withdraws itself, giving it back its dignity by opening the way for emancipation in non-representative thinking.<sup>32</sup> To avoid 'Being' disappearing into an identity with thinking, Adorno not only insisted on the 'preponderance of the object'<sup>33</sup> but on 'Something' ('*Etwas*'),<sup>34</sup> since to speak about 'the' object already makes it an undetermined material of thinking, while thinking itself becomes identical with its abstraction from its substrate. This, according to Adorno, is already the 'first' abstraction in Hegel's concept of Being against which Adorno vehemently claims: 'There is no Being without Entities'.<sup>35</sup>

But as much as Adorno refers to what is not sublated and resists its determination, he also shows the truth of Hegel's speculative version of mediation and totality: they become true through 'reconciliation under duress'.<sup>36</sup> This leads to an immanence that is true through the very same extortion, but becomes untrue because what is not sublated

is forced to appear as if it is identified.<sup>37</sup> This true and false process of forced reconciliation culminates in the total immanence of what Hegel developed as the supra-individual Spirit [*Geist*].

Total immanence is fatal even as it remains contradictory. For, in contrast to Hegel's 'cunning of reason', the hidden burrow of the good 'old mole' – as Marx borrowed from Shakespeare<sup>38</sup> – and to Traditional Marxism's notion of class antagonism, there is no emancipatory urge in the contradictions of the capitalist society. Rather, social contradictions are the antagonism, maybe even the agony of the false world.<sup>39</sup> The fatality of the immanence of totality is not only that enlightenment, democracy, liberalism and progress turn into their own opposite, but that also the possibility of their overcoming and the attempt to form alternatives culminated in the authoritarian and repressive forms of real socialism and Stalinism. That is why Critical Theory positions its critique not only after the failures of the Enlightenment, but also after the failures of the attempts to practically overcome these.

Thus confronted with such a false totality, Critical Theory's negativity should not to be conflated with resignation,<sup>40</sup> but immanent critique is 'the only' way out so far.

## THE NEGATIVE TURN OF DIALECTICS AND THE PLACE OF CRITIQUE: THE PREPONDERANCE OF THE OBJECT AND THE NON-IDENTICAL IN MEDIATION

Critical Theory's first move against Hegel's emphatic-affirmative version of the dialectical mediation of subject–object precedes Marx' materialism. It is a constant reference to Kant. Critical Theory draws upon the critical distinction Kant makes between the 'transcendental subject' and the 'thing in itself' [*Ding an sich*]. The gap between the former

and the latter limits knowledge to individual experience. This leads Adorno to use the thing in itself against Hegel's attempt to overcome the limits of the Kantian notion of reason.

The thing in itself stands for three critical 'materialist interventions' that run through Adorno's entire work: (1) the 'preponderance of the object', (2) the 'non-identical' and (3) the way that both work together to open up philosophy which in its systematicity reflects the forced closure and false immanence of social mediation.

What first concerns the 'preponderance of the object'<sup>41</sup> is that it marks the turn into an explicit *materialist* dialectic: 'It is by passing to the object's preponderance that dialectics is rendered materialistic'.<sup>42</sup> But the materialism of this preponderance is nevertheless still governed by the more fundamental rule of dialectical mediation as such: that the immediate is always already mediated.<sup>43</sup>

The object, too, is mediated; but according to its own concept, it is not so thoroughly dependent on the subject as the subject is on objectivity. Idealism has ignored such differences and has thus coarsened a spiritualization that serves abstraction as a disguise.<sup>44</sup>

For Hegel there exists nothing un-mediated by the supra-individual Spirit which *is* the reality of the mediation of subject–object and all subjective knowledge is as much mediated as its objects and content. For Adorno, on the other hand, Spirit cannot abstract from the finite. Or rather: Spirit itself *is* this abstraction. Only by paying the price of hypocrisy can Spirit deny its own genesis: that its origin is *an abstraction from its finite conditions*.

The materialism of the preponderance of the object lies neither directly on the side of the object nor on the side of its social or subjective mediation. It lies in what – and that is the second reference to the thing in itself – mediation does not sublate and what withstands identification. This grounds a

materialist critique that speaks in the names of what resists: including use-value,<sup>45</sup> nature,<sup>46</sup> the body<sup>47</sup> and its agony, the misery of the mind and suffering in general, but also the autonomy of subjectivity and, not least, the hope of the utopian 'total otherness',<sup>48</sup> or simply what provides comfort and shelter. It is a criticism that neither points to empirical facts or evidence nor makes scientific claims. The aim is to speak in a non-representational manner in the name of what is forced into objectivation and generalization, culminating in Adorno's concept of, or better reference to, the 'non-identical', elaborated in particular in *Negative Dialectics*.

Although 'preponderance of the object' means the inevitability of both nature and society, the subject has an autonomy and independence that is neither derivable from nor reducible to its natural or social conditions – the subject arises from a *process of (self)objectification*. Acknowledging the preponderance of the object thus provides no insight into the conditions of thinking, knowledge and subjectivity. For, since as subjectivity's 'first', self-constitutive condition is to objectivity itself, the first condition of its emancipation would be to return to the object in order to acknowledge its preponderance, but also the preponderance of the social mode of (self)objectification.

There is thus a positive determination and even an emphatic expectation in Adorno's negative dialectic, namely ensuring the impossibility of the absolute detachment or total independence of subjectivity and of the Hegelian Spirit from material conditions. For the more the subject tries to itself from its conditions of possibility and denies them, the more it grounds its existence in repression and domination that will, like in a 'return of the repressed', turn against the subject itself – and here, Adorno's emphatic taking the side of the object brings to the fore *negative* dialectics for the subject. The critique of this social process of self-objectification is the third materialist intervention.

## THE LOGIC OF IDENTIFICATION AND THE HIDDEN CONNECTION BETWEEN CONCEPT-THINKING AND COMMODITY-FORM: MEDITATION BY ABSTRACTION AS SOCIAL SYNTHESIS

'Identity is the primal form of ideology'.<sup>49</sup>

Critical Theory uses Marx to criticize the mediation of subject–object in a two-fold way. First, the mediation is socially and historically specific<sup>50</sup>. Second, in capitalism, the social and historically specific character of mediation is a synthesis of the individual mind with the unconscious but practical social activity that constitutes a capitalist social objectivity with the character of a second nature. Yet, the actual object of critique lies in the calamitous entanglement that results from this mediation: the very same subjectivity that unconsciously but practically constitutes social objectivity, thinks of it as an immediate given,<sup>51</sup> quasi-ontological objectivity.<sup>52</sup> Since this objectivity becomes supra-individual domination behind the backs of all individuals and individuality as such, this social objectivity is regarded as mere material for a subject that imagines itself as dominant.<sup>53</sup> The subject belongs therefore to the inverted and mystified social objectivity over which it deems itself to be in charge; in this entanglement Adorno radicalizes Marx's notion of the subject as a personification of economic categories and a 'character mask'. This domination of the subject over its own other – over its outer and inner objectified nature – in an immanent process, renders this dialectic negative: while on the one hand social and historical disasters have the character of an inevitable natural necessity or destiny, on the other hand, even what in nature strikes back is due to the control and domination over the inner nature of the individual's body and mind and of its outer nature.

Adorno's critique holds that this objective entanglement of the subject to its own

perverted world appears as process of *identification*. Hegel conceptualized this logic of identification as concept-thinking in his *Science of Logic* and phenomenologically in his *Phenomenology* as the supra-individual Spirit.<sup>54</sup> Adorno develops an immanent critique of this Hegelian notion of identification with reference to Marx' critique of economic exchange and equivalence. According to Adorno, the 'principle of exchange' is the 'identifying principle of thought'.<sup>55</sup> Hence concept thinking and the idea of a supra-individual Spirit are entangled with 'exchange', although their internally related social genesis is obscured.

If mankind is to get rid of the coercion to which the form of identification really subjects it, it must attain identity with its concept at the same time. [...] The exchange principle, the reduction of human labor to the abstract universal concept of average working hours, is fundamentally akin to the principle of identification. Exchange is the social model of the principle, and without the principle there would be no exchange; it is through exchange that nonidentical individuals and performances become commensurable and identical. The spread of the principle imposes on the whole world an obligation to become identical, to become total.<sup>56</sup>

To trace the logic of identification back to the social form of capitalist mediation marks a decisive shift from Traditional Marxism, which argued that labour was the social mediation of subject-object and the essence of the historical process, and aimed at the liberation of labour from capitalist domination. Critical Theory, in contrast, searches for the mediation between object-subject and their reciprocal constitution in the commodity-form and sphere of circulation. In this effort at establishing the social nature of the capitalist social relations it followed Lukács, Benjamin, Sohn-Rethel, Korsch, Bloch and others.<sup>57</sup> The critique of the commodity-form exposes not only its functions in modern society, but also how it unconsciously becomes the dominating form of second nature.

## SOCIAL SYNTHESIS AS SUBSUMPTION AND FORCED IDENTIFICATION

The critique of social synthesis via the commodity was undoubtedly central to early Critical Theory,<sup>58</sup> especially Adorno.<sup>59</sup> His first remarks about the commodity-form can be found in his habilitation<sup>60</sup> as well as in his inaugural lecture of 1931.<sup>61</sup> Further remarks appear in his studies about the sociology of music undertaken between 1932 and 1935<sup>62</sup> and later in his main works, notably *Dialectic of Enlightenment* and *Negative Dialectics*. His last remarks are in his final major and unfinished work, the *Aesthetic Theory*.<sup>63</sup> As a whole, Adorno's critique was influenced by Marx' critique of the commodity-form as a perverted form of social mediation, and by Lukács' and Sohn-Rethel's philosophical and epistemological reformulation of the latter.<sup>64</sup> In addition – like Lukács and Sohn-Rethel – Adorno was also influenced by Weber's notion of modern rationalization.<sup>65</sup>

However, while these remarks appear throughout Adorno's works, they ultimately remain systematically unelaborated, much like his interpretation of the critique of political economy.<sup>66</sup> Consequently, his critique must be reconstructed through fragments and intuitive leaps. That being said, one can still identify the continuity of the idea that the hidden connection between the economy and thinking somehow lies within the homologous logic of identification of the concept and exchange. For, even if Adorno refrains from historically reconstructing or logically constructing the genesis of this connection<sup>67</sup> – it is less than a strict causality but more than a mere analogy or isomorphy<sup>68</sup> – the idea that both identifications are mechanisms of *abstraction*<sup>69</sup> and assertions of power appears throughout his work. Moreover, he also repeatedly points out that such abstraction is the hidden connection between Spirit, commodity exchange and their associated

properties: the concept, concept-thinking, rationality and scientific objectivity for the former; exchange-value, the automatization of exchange-value in capital, economic rationality and objectivity, reification and alienation for the latter.

The act of exchange implies the reduction of the products to be exchanged to their equivalents, to something abstract, but by no means – as traditional discussion would maintain – to something material. [...] Exchange value, merely a mental configuration when compared with use value, dominates human needs and replaces them; illusion dominates reality. To this extent, society is myth and its elucidation is still as necessary as ever. At the same time, however, this illusion is what is most real, it is the formula used to bewitch the world.<sup>70</sup>

The abstraction made by conceptual thinking and exchange-value constitutes nothing less than the difference between the subject and the object. Abstraction constitutes objectivity for a subject, which responds by objectifying its own subjectivity. Abstraction thus becomes double-faceted instrumental domination; both concept and exchange-value *make* their object commensurable through generalization, reduction and hence the subsumption of the specific, particular and singular under the generality of the concept and of the exchange-value. The mediated is thus made commensurable by an act of identification that hides its domination in this very same process: while concept-thinking grasps the object as a pure object of identification and aims for the correspondence of thinking and being,<sup>71</sup> exchange-value becomes identical with the use-value it ‘grasps’. The dominance of exchange-value over use-value corresponds not only to the dominance of concept-thinking over the identified to the point that ‘all qualitative moments whose totality might be something like a structure are flattened in the universal exchange relationship’;<sup>72</sup> What is thereby unconsciously executed by individuals is their own praxis that manifests itself behind their backs and becomes a second nature which gains

independence from the acting individuals. The capitalist valorization and accumulation of exchange-value becomes a power of its own and manifests itself as – just like Hegel’s Spirit – the ‘real total movement of society’.<sup>73</sup> ‘In the form of the exchange principle, the bourgeois ratio really approximated to the systems whatever it would make commensurable with itself, would identify with itself – and it did so with increasing, if potentially homicidal, success. Less and less was left outside’.<sup>74</sup>

## CONCLUSION

The epistemological and social-economic critique of early Critical Theory, and Adorno’s in particular, is characterized by brilliant insights rather than a systematic exposition of how the economic object presents itself in capitalist society. Their most important insight was that epistemological and social-economic critique starts from the false semblance of the sphere of commodity-exchange and -circulation rather than from labour, production and the social metabolism with nature. On this basis, early critical theorists concerned themselves with the critique of the social constitution of a socially objective social rationality and its corresponding socially necessary epistemology as realized in both scientific rational thinking and ideological phenomena such as nationalism and antisemitism. Hence the real object of critique is the unconscious, inaccessible process of social constitution, which in the form of the mediation by concept-thinking and exchange-value constitutes both subject and object. Unlike Hegel’s dialectical logic of identification and correspondence, this process leads to reification and alienation, personified ‘character masks’ (Marx) and socially necessary ideology. Hence the identification of concept and exchange-value is real – as objective illusion. This is why Adorno’s inversion of Hegel’s notion that

‘the true is the whole’ says that ‘the whole is untrue’ – the false process of identification is the truth of capitalist society. Immanent critique, in turn, endeavours to unveil and overcome this social untruth by critiquing this subjective–objective process of identification. For the exchange principle this immanent critique means that ‘when we criticize the exchange principle as the identifying principle of thought, we want to realize the ideal of free and just exchange. To date, this ideal is only a pretext. Its realization alone would transcend exchange’. Concerning his critique of the concept, immanent critique means that Adorno wants to ‘overcome the coercive nature of the concept by means of the concept’.<sup>75</sup> This is the ‘systematicity’ of immanent critique. However, ‘the limit of immanent critique is that the law of the immanent context is ultimately one with the delusion that has to be overcome’.<sup>76</sup>

## Notes

- 1 Critical Theory with upper case letters refers to the early Frankfurt School or its so-called ‘first generation’.
- 2 Horkheimer, 2002b: 213, 217; Postone, 1993: 107ff.; Honneth, 1993: 187–214.
- 3 To be precise it was already a *return* to Marx, as according to Horkheimer’s essay ‘Traditional and Critical Theory’, Critical Theory was founded by Marx, cf. Horkheimer, 1980: 626.
- 4 Marcuse, 1964.
- 5 Adorno, 1997: 168.
- 6 For an overview cf. Breuer, 1977.
- 7 Marx, 1987.
- 8 Marx, 1973: 107.
- 9 For critical theory, ideology comprises the necessary illusion of capitalist society. If in the classical Marxist context the question after World War I was ‘only’ why the proletariat was not gaining revolutionary consciousness, this question took a dramatic turn with the rise of fascism and was reformulated as follows: why do the masses not only have no emancipatory or even revolutionary consciousness, but voluntarily choose to support a type of domination that is actually against their interests – not only as a member of a class, but even as self-responsible individuals? The techniques and mechanisms of forming mass-consciousness were perhaps the most important new phenomena in the time of early Critical Theory. The Institute researched the former with a very serious but contested use of psychoanalysis. Many of the controversies among Critical Theorists concerned not only classical Marxist issues but how to adequately use the psychoanalytical terms and arguments, especially those related to the theories of Erich Fromm and Siegfried Kracauer, who provided the best research in these areas.
- 10 McCarthy, 1993.
- 11 This connection was often criticized for the lack of grounding in empirical analysis and operating with a philosophical concept of history, cf. Honneth, 1993.
- 12 Important for the authors of Critical Theory first of all was *Capital* Vol. I, but also Marx’ *Economic and Philosophical Manuscript from 1844*, especially for the concept of reification and alienation.
- 13 Programmatic already at the beginning of ND: 10, and then ongoing.
- 14 It’s important to keep in mind that in the case of Adorno, half of these writings concern culture, aesthetics, music and literature.
- 15 Adorno, 1997: 6.
- 16 This is the famous first sentence in the introduction to ND: 3.
- 17 Sohn-Rethel, 1978a: 139.
- 18 Adorno, ND: 196.
- 19 Referring to Engels’ *Dialectics of Nature*. Lenin developed reflection theory in the course of his polemics with empirio-critics, cf. Lenin, 1970.
- 20 Lukács, 1971; Lukács’ *Theory of the Novel* was also influential on Critical Theory. Karl Korsch’s *Marxism and Philosophy*, published at a time when Marxism was still dominated by the traditional Marxism of the Second International, was likewise important for Critical Theory.
- 21 See the chapter on Sohn-Rethel in Volume 1 of this *Handbook*.
- 22 For the critical status cf. Jameson 1971, 1990; Rose 1978; Jay 1984; Jarvis, 1998.
- 23 For Adorno’s critique on Lukács, cf. Adorno, 1977.
- 24 Sohn-Rethel, 1978.
- 25 ‘The idealistic magic circle can be transcended only in thoughts still circumscribed by its figure [...]. Pure identity is that which the subject posits and thus brings up from outside. Therefore, paradoxically enough, to criticize it immanently means to criticize it from outside as well’ (ND: 145); for the importance of negativity cf. Buck-Morss, 1977.
- 26 Adorno’s *Minima Moralia. Reflections of a damaged life*, together with DoE and ND, is Adorno’s third programmatic title. With its reference to Aristotle’s *Magna Moralia* it is close to ethics and

- also attempts to open up a minimum gap for individual self-reflection in the hermetically sealed world of capitalist identity, see Adorno, 1974.
- 27 ND: 38, 67ff., 295, 356ff. The notion first came from Hegel. But when Adorno refers to Marx' *Capital* when stating that 'the law of capitalist accumulation ... has been mystified into a law of nature', then he refers not, like Hegel, to a second nature in which the spirit recognizes itself. Instead Adorno refers to the materialist turn of second nature via economic commodification, quantification and valorization not only of nature and use value, but of social relations in general; this was overlooked in Cook, 2011: 8.
  - 28 Adorno et al, 1976: 12.; similar Adorno, 1976b: 107.
  - 29 This understanding began with the aim of disciplinary research inside the Institute for Critical Research and was later fought out in the so-called positivist dispute in German sociology, cf. Adorno et al, 1976; for the beginnings see Bonß, 1993.
  - 30 'Totality is a category of mediation' (Adorno et al, 1976: 107).
  - 31 Cf. ND: 158ff.
  - 32 Long before post-structuralism, Critical Theory's critique of generality and identity tried to speak in the name of what isn't sublated in a non-representative way – the non-systematic constellations in Adorno and his focus on aesthetics, Benjamin's notion of pictures, Marcuse's non-conformism and subjectivity of desire, drive and eros, and Horkheimer's messianic – but without rendering its 'positive' consequences into a politics of recognition, speaking in the name of a minority or alterity or in deconstructing the correspondence between text (text in the largest sense) and meaning. Critical Theory remained loyal to the universalism of Enlightenment; it would be problematic to take it without further ado as a post-structuralism avant la lettre.
  - 33 ND: 192.
  - 34 ND: 22, 27, 29, 34 and ongoing, in particular 135ff.
  - 35 ND: 134.
  - 36 Even if this sentence entitles a text on Lukács (Adorno, 1977), it can be taken as the overarching formula to combine the his conception of negative dialectics with that of the dialectics of enlightenment.
  - 37 ND: 10f.
  - 38 Marx, 1951.
  - 39 'There is no right life in the wrong one' (Adorno, 1974: 39).
  - 40 This 'pessimistic turn' in the history of Marxist-oriented critique of capitalist society has been often discussed. For Critical Theory in general cf. Postone/Brick, 1982; for Horkheimer's 'pessimistic turn' cf. Postone, 1993. To align this pessimism in the broad history of social critique cf. Agger, 1992: 57ff. Conveniently in his last text, written in 1969, in the period of the German student revolt, Adorno responded to this accusation of resignation, cf. Adorno, 1998.
  - 41 The translations of the central works of Critical Theory, especially Adorno's, are sometimes problematic when it comes to decisive passages. This also affects the secondary literature. In particular the general concepts like *Bewusstsein*, *Selbstbewusstsein*, *Verstand*, *Vernunft* and *Geist* must be treated very carefully because of their differences. Also 'preponderance' (of the object, ND: 192) is not the same as 'primacy'. Adorno's critique of the fallacy of the – here explicitly – primacy of the *subject* is keen to avoid a vulgar materialist turn like he found in Traditional Marxism.
  - 42 ND: 192; for the object's preponderance see the whole chapter in ND: 183ff. For the three stages in Adorno's concept of materialism in his late work cf. Schmidt, 1983, 2002.
  - 43 Largely elaborated in Adorno, 1982.
  - 44 Adorno, 2014: 155.
  - 45 Pohrt, 1976.
  - 46 Cf. Alfred Schmidt's *The Concept of Nature in Marx* (Schmidt, 1973), encouraged by Adorno and directed against 'productivism' in both western capitalist and eastern socialist states; cf. also Vogel, 1996.
  - 47 ND: 203. In particular Feminist and Disability Studies have pointed out the importance of the body in Adorno, cf. Heberle, 2006; Lee, 2005.
  - 48 Both Horkheimer and Adorno in their late period referred to the utopian: Horkheimer more to preserve the hope inherent in utopian and religious thinking, Adorno more to have a placeholder for a different society and because of the vacancy of any revolutionary force. Quite telling is Horkheimer's *Spiegel-Interview* from 1970, <http://www.spiegel.de/spiegel/print/d-45226214.html>
  - 49 ND: 148.
  - 50 Alfred Schmidt pointed out the importance of history in two writings on structuralism's 'attack against history'. For the English version see Schmidt, 1981.
  - 51 'The totality of the process of mediation, which amounts in reality to principle of exchange, has produced a second, deceptive immediacy' (Adorno, 2001: 124).
  - 52 This ontologization of the social, Adorno most explicitly critiqued, contra Heidegger, in *The Jargon of Authenticity*, cf. Adorno, 1973b.
  - 53 ND: 19 and then throughout.
  - 54 ND: 11 and then throughout.
  - 55 ND: 190, 146–7. In some translations 'commodity exchange' is translated as 'barter'. Even if this

- translation is problematic, it still gives a hint of Adorno's understanding of an exchange that historically goes beyond capitalist commodity production and his derivation of the exchange principle from the tradition of gift and sacrifice. This was often discussed, cf. Koltan, 1999; Müller, 1988: 177; Habermas, 1991a: 428 ff.
- 56 ND: 146, similar 47. Translation amended from the German original.
- 57 In these period-identical formulations about the whole world becoming a commodity, compare Lukács, 1971: 86: 'The commodity can be understood in its undistorted essence only when it becomes the universal category of society as a whole'; Bloch, 1991: 107: 'this process of the whole world becoming a commodity' (similarly in Bloch, 1970).
- 58 'This is elaborated in Marx' chapter on fetishism, truly a piece from the heritages of classic German philosophy' (ND: 189f.).
- 59 Horkheimer in his early writings referred more than Adorno to Marxist terms like labour, production and class. Later, in contrast to Adorno, he mostly avoids Marxist terminology. Despite all later restraint, Horkheimer always agreed with the centrality of the category of commodity and of Marx in general.
- 60 Adorno, 1989.
- 61 Adorno, 1973a.
- 62 Cf. Adorno, 2002, here focusing on the commodity character of art; likewise in the culture industries chapter of DoE. It is important to notice that this critique is also thoroughgoing in his works on culture.
- 63 Adorno, 1997.
- 64 About the hidden influence of Lukács, see Claussen, 2008: 82ff. For the connection of epistemological and social critique based on the commodity-form in Lukács, Sohn-Rethel and Adorno, see Engster, 2016.
- 65 The critique of rationality from Lukács, Horkheimer, Adorno and others led even to the term 'Weberian-Marxism'. However, for Adorno and Horkheimer, the 'disenchantment of the world' by rationalization was a turn back into mythology, cf. DoE: ff. and then especially 'Excursus I': 35–62.
- 66 Hans-Georg Backhaus claimed that 'Adorno and Horkheimer [...] totally ignored the value-form analyses' (1997: 76). Habermas, 1987: 178 and Jay 1996: 146f. make similar claims, while Braunstein: 2011 is less strong in this regard. Adorno's own most precise elaboration is to be found in his work on philosophical terminology, cf. Adorno, 1973c.
- 67 Jameson, 1990.
- 68 Much criticized is Adorno's extension of his critique of the commodity-form and fetishism to mass-culture, and his theory of the culture industry as a form of industrial mass-production and monopoly capitalism; see, for example, Miklitsch, 1998.
- 69 In ND it is already explicit on p. 8 and then throughout.
- 70 Adorno, 1976a: 80; ND: 178.
- 71 Rose, 1978: 35ff.
- 72 ND: 88; similar sentences appear throughout: 'imposes on the whole world an obligation to become identical, to become total' (ND: 146. Translation amended in line with German original).
- 73 Quote ND: 304, cf. also 244. Adorno's idea that exchange-value makes everything identical with itself leads to the thesis that use-value in late capitalism becomes the empty bearer of the exchange-value, stripped of all content and faking it. Wolfgang Pohrt and others have radicalized this idea, cf. Pohrt, 1976. For a general critique of this 'use-value fetishism', cf. Hafner, 1993. For money as the blind spot in the whole critique of social mediation by commodity-form, see Engster, 2014.
- 74 ND: 23. Translation amended in line with German original.
- 75 Mullen, 2016: 94. In particular, the last chapter of ND is dedicated to this. It was radicalized, as often was noticed, in Derrida's deconstruction, cf. Wellmer, 1998: 183.
- 76 ND: 182.

# Critical Theory and the Critique of Political Economy: From Critical Political Economy to the Critique of Political Economy

Patrick Murray

The story behind the title of this chapter concerns a sea change in critical theory from critical political economy to the critique of political economy. The title marks the distance from studies of the Frankfurt School and political economy, such as Giacomo Marramao's 'Political Economy and Critical Theory', to a reconsideration of the Frankfurt School in relationship to 'the new readings of Marx' (*die neue Marx-Lektüre*).<sup>1</sup> I will explore two features of the failure of critical theorists to grasp the Marxian critique of political economy: what Moishe Postone calls traditional Marxism and the shift from traditional Marxism to a Weberian 'critique of instrumental reason'. Postone links the two:

Lacking a conception of the specific character of labor in capitalism, Critical Theory ascribed its consequences to labor *per se*. The frequently described shift of Critical Theory from the analysis of political economy to a critique of instrumental reason does not, then, signify that the theorists of the Frankfurt School simply abandoned the former in favor of

the latter. Rather, that shift followed from, and was based upon, a particular analysis of political economy, more specifically, a traditional understanding of Marx's critique of political economy. (Postone, 1993: 119)

I want to discuss the conceptual horizon shared by classical (and neoclassical) political economy, traditional Marxism, and the critique of instrumental reason in terms of 'the illusion of the economic'.<sup>2</sup>

## **'THE ILLUSION OF THE ECONOMIC' AND THE HORIZON OF POLITICAL ECONOMY**

One way of expressing Marx's fundamental critique of political economy is to say that political economy is lost in 'the illusion of the economic'. Marx explains how David Ricardo dismisses the crisis tendency of general overproduction by discounting social forms: 'In order to prove that capitalist production cannot

lead to general crises, all its conditions and distinct forms, all its principles and specific features – in short *capitalist production* itself – are denied’ (Marx, 1968: 501). Marx later comments, ‘This fiction arises entirely from the inability to grasp the specific form of bourgeois production and this inability in turn arises from the obsession that bourgeois production is production as such’ (529). The ‘fiction’ to which Marx refers is ‘the illusion of the economic’. It is the notion of an economy-in-general, or ‘production as such’, to which the capitalist mode of production is reduced, precisely by performing the violent abstraction of negating all its constitutive social forms and purposes. Marx needled political economists by pointing out that any actual mode of production, whether based on slave, serf, or free labor, can be regarded as ‘production as such’ – just subtract all its constitutive social forms.

The conceptually impoverished horizon of discourse of political economy is what is left when the scientific revolution brought about by Marx’s critique of political economy is missed. Simon Clarke contrasts that horizon with Marx’s:

There was a scientific revolution in nineteenth-century social thought .... It was inaugurated by Marx’s critique of the ideological foundations of classical political economy, which he located in the political economists’ neglect of the social form of capitalist production. (Clarke, 1982: 240)

The neglect of social form generates ‘the illusion of the economic’, the illusion of an actual economy-in-general, where needs, wealth, labor, and production have no specific social form or purpose. Classical and neoclassical economics take this illusory object to be the locus of inquiry.<sup>3</sup> Inasmuch as traditional Marxism misses Marx’s critique of political economy, it operates within the same universe of discourse. The sea change represented by new readings of Marx as critic of political economy, as opposed to radical political economist, promises to put critical theory on a stronger conceptual footing.

## CRITICAL POLITICAL ECONOMY AND FRANKFURT SCHOOL PESSIMISM

In treating Marx as a critical political economist and failing to grasp Marx’s critique of political economy, Frankfurt School thinkers, notably Friedrich Pollock, Max Horkheimer, and Jürgen Habermas, kept themselves from grasping the contradictory, crisis-prone dynamism of capitalist production. They landed on a conception of capitalist crises rooted in distribution; crises that can be managed by the state. Friedrich Pollock used the phrase ‘the primacy of the political’ to capture this new constellation.<sup>4</sup> The result was a pessimism regarding historical change and a misjudgment of the kind of change needed. Directing their criticism at Horkheimer and Adorno, Moishe Postone and Barbara Brick trace the root of critical theory’s pessimism to its traditional Marxism:

The critical pessimism so strongly expressed in *Dialectic of Enlightenment* and *Eclipse of Reason* must be understood not only with reference to its historical context. It must also be understood as expressing an awareness of the limits of traditional Marxism in the absence of a fundamental reconstitution of the dialectical critique of what, in spite of its significant transformation, remains a dialectical social totality. (Postone and Brick, 1993: 246–7)

Postone’s reinterpretation of Marx’s critical theory as a critique of political economy means to show that, due to the contradictory dynamics of capitalist production, the historical possibilities for radical transformation of capitalist society have not reached a standstill. His reinterpretation also points to the abolition of value rather than a redistribution of value as the goal of historical transformation.

## THE FRANKFURT SCHOOL AND DIE NEUE MARX-LEKTÜRE

I want to pursue a narrative of the new reading of Marx that brings out its debts to Theodor Adorno and especially to students

of his from the 1960s, among them Alfred Schmidt, Hans-Georg Backhaus, Helmut Reichelt, Hans-Jürgen Krahel, Helmut Reinicke, Herbert Schnädelbach, and Jürgen Ritsert. Chris Arthur (2002: 12) observes, regarding Backhaus, 'The interesting thing about Backhaus is that he came out of Frankfurt school *critical theory*'. In his *Dialektik der Wertform* (1997), Backhaus published notes he took in a 1962 seminar that Adorno directed on Marx and the Basic Concepts of Sociological Theory. These notes, along with studies such as Gillian Rose's *The Melancholy Science*, Dirk Braundstein's *Adornos Kritik der politischen Ökonomie*, Christian Lotz's *The Capitalist Schema*, and Werner Bonefeld's *Critical Theory and the Critique of Political Economy*, advance the idea that the Marxian critique of political economy is central to Adorno's critical theory.

A secondary Frankfurt School root of the new reading of Marx, namely the work of Henryk Grossman and Paul Mattick, Sr, will be considered.<sup>5</sup> There is a line from Grossman to Mattick Sr and Roman Rosdolsky on to Paul Mattick Jr, Fred Moseley, and the International Symposium on Marxian Theory (ISMT) that Moseley initiated.<sup>6</sup> Postone treats Pollock, Horkheimer, and Habermas at length but not Adorno or Grossman. The narrative that arises from his *Time, Labor, and Social Domination* pits a critical theory that plumbs Marx's critique of political economy against a Frankfurt School lodged in critical political economy that morphs into a critique of instrumental reason and dead ends in pessimism. That narrative positions Postone's book and other new readings of Marx outside the traditional scope of the Frankfurt School as an alternative stream of critical theory to later thinkers identified with the Frankfurt School, notably Jürgen Habermas and Axel Honneth. The alternative narrative offered here identifies Postone's work and other new readings of Marx as a branch of the Frankfurt School with roots in Adorno, Grossman, and students of Adorno.

Only three members of the Institute for Social Research were educated as economists: its first director, Carl Grünberg; his former student Henryk Grossman; and Friedrich Pollock. They and the non-economists of the Frankfurt School were all indebted to Marx's ideas; the present question is to what extent members of the Frankfurt School pursued the Marxian critique of political economy.<sup>7</sup> However, the question is not as black and white as pitting critical political economy against the critique of political economy. On the one hand, there is a wide range of social theories operating within the conceptual horizon of political economy; on the other hand, there are multiple dimensions and levels to the critique of political economy. Over time, different members of the Frankfurt School adopted various ideas within the conceptual horizon of political economy and took up – or failed to take up – various aspects of the critique of political economy.

## THE CRITIQUE OF POLITICAL ECONOMY

In identifying Friedrich Pollock, Max Horkheimer, and Jürgen Habermas as traditional Marxists, Moishe Postone tags them critical political economists. I agree with Postone's assessment that the critique of political economy is largely or wholly absent from their thinking. Therefore, these three members of the Frankfurt School will get less attention in the present chapter than will two who receive less scrutiny from Postone: Theodor Adorno and Henryk Grossman.<sup>8</sup> Critical political economy adopts the conceptual horizon of political economy; the critique of political economy opens onto a very different discursive horizon. Attention – or lack of attention – to specific social forms and purposes distinguishes the two. The critique of political economy self-consciously makes specific social forms and purposes integral to its fundamental concepts.

By contrast, political economy is oblivious to social forms or neglects or discounts them or treats them haphazardly.

Paul Mattick, Jr. (1993: 124) describes the difference between the critique of political economy and its target this way: 'Marx's critique – his "scientific revolution" – therefore involved not merely a reworking of economic categories but the construction of another set of concepts, explicitly social and historical ones'. The fundamental point of the critique of political economy is that concepts of specific social forms of needs, wealth, labor, production, and distribution must be integral to a scientific account of any actual human provisioning process. General observations can be made about them, but needs, wealth, labor, production, and distribution never exist in general: any 'economic' inquiry that purports to study them is bogus.

### ***Historical Materialism and the Critique of the 'Bourgeois Horizon'***

The revolutionary shift from the discursive horizon of political economy to that of the critique of political economy is multi-dimensional – phenomenological, ontological, methodological, sociological, and political. Marx's critique of political economy is rooted in the critique of what he calls the 'bourgeois horizon' and in the historical materialism that he developed with Friedrich Engels. Over and over, Marx attributes the conceptual failures of those in the political economy tradition to the 'bourgeois horizon' of their thinking:

Yet even its best representatives remained more or less trapped in the world of illusion their criticism had dissolved, and nothing else is possible from the bourgeois standpoint [*bürgerlichen Standpunkt*]; they all fell therefore more or less into inconsistencies, half-truths and unresolved contradictions. (Marx, 1981: 969)

Marx identifies the 'bourgeois horizon' as the philosophical orientation that structures

political economy, much of modern philosophy, and many forms of socialism.<sup>9</sup> In the patterns of bourgeois thinking, we find a series of bifurcations: mind versus world, subjective versus objective, form versus content, concept versus object, passive versus active, and immediate versus mediated. Marx's appeal to praxis in the first thesis on Feuerbach is directed against the 'bourgeois' split that underlies the distinction between idealism and materialism. A key target of Marx's critique of political economy is the bifurcation between production and distribution. That false division allowed John Stuart Mill to achieve 'a more developed and critical awareness' than previous classical political economists by recognizing the historical character of distribution, while remaining within the horizon projected by 'the illusion of the economic' with respect to production (Marx, 1981: 1018). Traditional Marxism likewise represents 'a more developed and critical awareness' stuck within the horizon of political economy.

In the *German Ideology*, Marx and Engels emphasize that a mode of production involves a particular way of life:

This mode of production [*Weise der Produktion*] must not be considered simply as being the reproduction of the physical existence of the individuals. Rather it is a definite form of activity of these individuals, a definite form of expressing their life, a definite *mode of life* [*Lebensweise*] on their part. (Marx and Engels, 1976: 31)

Here is historical materialism's breakthrough: there is no production in general; production always has a specific social form and purpose – and they matter in many ways. To think otherwise is to fall into 'the illusion of the economic', as political economy and traditional Marxism do.

In reflecting on Marx's concept of value, Postone relates the phenomenological error of conceiving of distribution and production as separable to the misinterpretation of the historical materialist distinction between forces and relations of production:

value should not be understood merely as a category of the mode of distribution of commodities ... rather, it should be understood as a category of capitalist production itself. It seems, then, that the Marxian notion of the contradiction between the forces and relations of production must be reinterpreted as referring to differentiable moments of the production process. (Postone, 1993: 24)

The language of 'differentiable moments' makes the phenomenological point that forces and relations of production are inseparable aspects of actual relations of social reproduction.

### ***Backhaus and Postone on the Critique of Political Economy***

To develop an account of what is involved in the critique of political economy, we may draw on two leading figures in the new reading of Marx: Hans-Georg Backhaus and Moishe Postone.<sup>10</sup>

When we turn to the remarkable opening pages of Backhaus' (1980) seminal essay, 'On the Dialectics of the Value-Form', we quickly encounter a series of powerful ontological, methodological, sociological, and substantive observations. (1) Marx's theory of value has been mistakenly identified with the classical (Ricardian) labor theory of value, which is asocial and ahistorical. Marx's theory of value is cut from different cloth. It is not about 'labor'; rather it is entirely about the specific social form of labor. Value is not embodied 'labor'; it is a ghostly social objectivity, the necessary, fetishistic outcome of a specific social form of labor. (2) Marx has been mistaken for a political economist; he is a profound critic of political economy. (3) What I. I. Rubin (1972: 73–4) called the 'qualitative sociological' side of Marx's theory of value has been missed. (4) Marx's theory of the value form – money is not value but it is the necessary expression of value – has been overlooked or misunderstood. When Marx's theory of value is confused

with Ricardian theory, failure to understand the value form is unavoidable, since the classical theory of value offers no basis on which to show that money is the necessary form of appearance of value. (5) The dialectical method of Marx's presentation in *Capital* has been either ignored or badly misunderstood. (6) 'It is first to be recalled that the use-values are always posited in the price-form'; that is, by 'exchange-value' Marx means price from the first sentence of *Capital* (Backhaus, 1980: 105). Marx's account of the value form is not some 'dialectical' tale about how bartering useful things transforms itself into commodity exchange. (7) 'Innumerable authors ignore the claim of the labour theory of value to derive money as money and thus to inaugurate a specific theory of money' (102–3). Once again, the classical theory of value does not provide the conceptual basis for Marx's theory of money. (8) 'The analysis of the logical structure of the value form is not to be separated from the analysis of its historical, social content' (107). Of course, if value were embodied 'labor', it would have no 'historical, social content'. Methodological considerations involved in the critique of political economy cannot be separated from substantive economic and sociological ones.

Since what Postone calls traditional Marxism counts as critical political economy and is 'bound within the framework of classical political economy' rather than free by the critique of political economy, we may take the several points he makes in criticizing traditional Marxism as windows onto the critique of political economy:

Interpretations of the determining relations of capitalism in terms of the self-regulating market and private ownership of the means of production are based upon an understanding of the Marxian category of value that remains bound with the framework of classical political economy. Consequently, that form of critical social theory itself – the social critique from the standpoint of 'labor' – remains bound within that framework. It does differ in some respects from

political economy, of course: for example, it does not accept the bourgeois mode of distribution as final, and calls it into question historically. Nevertheless, the sphere of distribution remains the focus of its critical concern. Whereas the form of labor (hence, of production) is the object of Marx's critique, an unexamined 'labor' is, for traditional Marxism, the transhistorical source of wealth and the basis of social constitution. The result is not a *critique of political economy* but a *critical political economy*, that is, a critique solely of the mode of distribution. It is a critique which, in terms of its treatment of labor, merits the name 'Ricardian Marxism'. Traditional Marxism replaces Marx's critique of the mode of production and distribution with a critique of the mode of distribution alone, and his theory of the self-abolition of the proletariat with a theory of the self-realization of the proletariat. (Postone, 1993: 69)

Here we can sort out several points to which we will add from other of Postone's observations: traditional Marxism (1) focuses on distribution rather than labor and production; (2) in so doing, it assumes that production and distribution are separable; (3) it fails to recognize the specific social form of labor and production; (4) instead, it adopts the asocial and ahistorical Ricardian conception of the substance of value as embodied 'labor'; (5) in conceiving of value as embodied 'labor', that is, human labor regardless of its social form, it regards value as transhistorical; (6) since the deepest root of capitalism's dynamism lies in the contradictory drives in production, it 'does not and cannot directly provide the basis for a historical critique of capitalism or for an explanation of its dynamic character' (Postone, 1993: 52); (7) it conceives of revolution as the triumph of 'labor' rather than a transformation of the social form and purpose of labor; and (8) since it lacks the idea of a specific social form of production, it fails to grasp that 'the way in which people perceive and conceive of the world in capitalist society is shaped by the forms of their social relations, understood as structured forms of everyday social practice' (176).

## A CRITIQUE OF THE IDEA OF INSTRUMENTAL ACTION

Action is purposive and, in that regard, can be considered instrumental: action is instrumental in achieving an action's aim. I set my alarm at night so that I wake up on time in the morning. In that familiar sense, the terms 'purposive' and 'instrumental' are commonplace. To speak of action in that everyday way as instrumental is to speak of an aspect of action; it is not to identify a kind of action. How would instrumental action, taken to be a kind of action, distinguish itself from other actions? The answer must be that instrumental action is *purely* instrumental. Instrumental action, or purposive-rational action [*zweckmässige Tätigkeit*], presupposes a world stripped of social forms and purposes, devoid of moral, aesthetic, gendered, social, legal, and political features – a world without a way of life. Only then could action be purely instrumental.<sup>11</sup>

We might also say that instrumental action presupposes affect, intention, and action nominalism: instrumental action assumes that there are no morally, aesthetically, socially, legally, or politically determinate kinds of action. If action came in such kinds, it could never be (purely) instrumental.<sup>12</sup> A world without social forms and purposes would lack normatively charged kinds of action, but that world, presupposed by instrumental action, does not exist. Since there can be no object to which the concept of instrumental action could direct us, it is a pseudo-concept. The fears of a 'totally administered world' or a 'technocracy' ruled by instrumental action are bad dreams triggered by troubling features of the actual capitalist order under which we live.

Nevertheless, instrumental action has come to be thought of as a particular kind of action. For some thinkers, such as Jürgen Habermas and Hannah Arendt, productive labor is conceived of as instrumental action in a transhistorical or 'quasi-anthropological'

way. That is, across human history, productive labor just is instrumental action. The scope of instrumental action, however, is historically variable, and Habermas and Arendt worry about the spread of instrumental action into regions of social life where it does not belong – Habermas under the heading of the ‘colonization of the life-world’ and Arendt under ‘the rise of the social’.<sup>13</sup> Moishe Postone finds both these lines of thinking in Max Horkheimer:

Horkheimer, despite some equivocations, identifies labour in and of itself with instrumental action.... but this can hardly explain the growing instrumental character of the world – the growing domination of ‘value-free’ means over substantive values and goals, the transformation of the world into one of means. (Postone, 1993: 180)

Although Horkheimer may conceive of labor simply as instrumental action, like Max Weber he conceives of instrumental reason as a product of the modern world. Like Habermas and Arendt, Horkheimer is troubled by the growth of instrumentality.

Let us return to Postone’s observation that the move of some members of the Frankfurt School, notably Horkheimer and, later, Habermas, from critical political economy to the critique of instrumental action was easy because the underlying conceptual terrain remains the same. Because Pollock, Horkheimer, and Habermas fail to grasp the constitutive social forms of capitalist society, starting with the capitalist form of social wealth, value, they end up thinking about shadows of those constitutive forms, in particular instrumental reason, which proves to be a pseudo-concept. The sterile conceptual terrain shared by critical political economy and the critique of instrumental reason is projected by ‘the illusion of the economic’. Critical political economy and the critique of instrumental action are directed at an object that does not exist, production-in-general.

Marx is not engaged in radical political economy. Rather, he undertakes a critique

of political economy that makes the constitutive social forms and purposes of the capitalist provisioning process the focus of inquiry. Instrumental action has no place in his thought. Instead, he grasps all the action involved in producing and distributing wealth on a capitalist basis as constituted by specific social forms, the value forms, and the acting subjects as personifications of these forms – what Adorno called ‘character masks’. We see this in how *Capital* is structured. Commercial activities, that is, activities in the sphere of simple commodity circulation, are constituted first by the commodity form and money and by the social roles of buyer and seller. But as we read on in *Capital* we learn that the sphere of commodity circulation is the cheery form of appearance of the deeper and ominous reality of capital’s circulation. Commodities turn out to be not simple commodities but rather commodity capital: useful things produced for the specific social purpose of yielding a profit upon sale. The entire account of the production process in *Capital* is treated under the rubrics of absolute and relative surplus-value, which is to say that labor and production in *Capital* are always form-determined by capital, whose single-minded purpose is the production and accumulation of surplus value. With the recognition of the phenomenon of relative surplus value, it is checkmate for the very idea of instrumental reason. Relative surplus value arises from the material transformation of production processes by their specific social purpose of pumping out ever more surplus value. Such production methods lack the neutrality of purpose that instrumental action presupposes. There is no conceptual space in *Capital* for (purely) instrumental action.

*Capital* provides a socio-epistemological account of how capitalist social forms give rise to the pseudo-concept of instrumental action, which helps capital cover its tracks. Postone calls attention to the instrumental character of commodity-producing labor, that is, wage labor:

As we have seen, commodity-determined labor is, as concrete labor, a means for producing a particular product; moreover and more essentially, as abstract labor, it is self-mediating – it is a *social means* of acquiring the products of others. Hence, for the producers, labor is abstracted from its concrete product: it serves them as a pure means, an instrument to acquire products that have no intrinsic relation to the substantive character of the productive activity by means of which they are acquired. (Postone, 1993: 181)

It is true that commodity-producing labor is a '*social means* of acquiring the products of others'. It is also true – and peculiar – that 'the substantive character of the productive activity by means of which' those working for a wage acquire products has 'no intrinsic relation' to that substantive character. That expresses Marx's point that the substance of value is abstract labor and that the social kind of labor that produces value is 'practically abstract' because, when its products are sold, concrete labor is socially validated *as* abstract labor.<sup>14</sup> In that transformation from commodities into money, the 'substantive character' of value-producing labor (its concrete character, say, tailoring) is extinguished. Nevertheless, the labor of value-producing workers is not simply pure 'means' or 'instrument'.

Value-producing labor cannot serve only workers as a means, since commodity-producing workers are able to work only because they are hired by capitalists, a social arrangement that involves specific relationships and purposes. Profit is the aim of the capitalist; the wage is the goal of the worker. Value-producing labor serves both worker and capitalist only by being surplus-value-producing labor. The labor of wage workers, then, is not 'pure means', since it aims at the wage, which is a particular social form of income that presupposes a class-constituting private property system, profit as the goal of production, and a monetary system in which money possesses that uniquely abstract sort of social power – purchasing power.

Postone criticizes the Frankfurt turn to the critique of instrumental action, but the

criticism needs to reach down to the very idea of instrumental action:

Although social labor is always a means to an end, this alone does not render it instrumental ... in precapitalist societies, for example, labor is accorded significance by overt social relations and is shaped by tradition. Because commodity-producing labor is not mediated by such relations, it is, in a sense, de-signified, 'secularized'. (Postone, 1993: 180)

When Postone writes here that being aim-oriented does not make social labor instrumental, he must mean purely instrumental. Postone's description of 'commodity-producing labor' as 'de-signified' calls to mind Karl Polanyi's characterization of capitalism as the 'disembedded economy'. If capitalism is the 'disembedded economy', from what, exactly, is it disembedded? To answer, as Polanyi's unqualified phrase suggests: to be disembedded from specific social relations altogether, plunges us into 'the illusion of the economic', the imaginary notion that capitalist production is production-in-general.

Postone makes it clear that, while capitalism is disembedded from 'overt social relations ... shaped by tradition', new, non-overt social relations – not the absence of specific social relations – take their place. In describing value-producing labor as 'self-mediating', Postone interprets Marx as identifying a historically unique form of the social mediation of labor and production, not denying the presence of social mediation. On the contrary, as Marx insists: 'Mediation must, of course, take place' (Marx, 1973: 171). Postone links the 'de-signification' of labor in capitalism with instrumental action as follows: 'Labor acquires its meaning from the social relations in which it is embedded. When these social relations are constituted by labor itself, labor exists in "secular" form and can be analyzed as instrumental action' (Postone, 1993: 221). Because the social character of surplus-value-producing labor is not overt, it is easily mistaken for instrumental action, but it cannot properly be analyzed

as instrumental action. It is the other way around: instrumental action is properly analyzed not as an actual kind of action but rather as a shadow form cast by surplus-value-producing labor, which is the constitutive social form of labor in capitalist societies.

Postone rejects identifying the general concept of social labor with instrumental action but then identifies labor in capitalism with instrumental action: 'Social labor as such is *not* instrumental action; labor in capitalism, however, *is* instrumental action' (Postone, 1993: 180, emphasis in original). Of Horkheimer's identification of labor with instrumental action Postone comments, 'Horkheimer, in effect, attributes a consequence of the specific character of labor in capitalism to labor in general' (181–2). But *is* instrumental action 'a consequence of the specific character of labor in capitalism'? That conclusion does not follow, since labor in capitalism is surplus-value-producing labor, which is a specific social form of labor – though not an overtly social one embedded in traditions.

It may seem that if instrumental action is not labor as such, as Horkheimer and Habermas contend it is, then it must be some specifically historical kind of labour – what else? In that case, what better candidate is there than labor in capitalism? Postone does conclude that instrumental action is labour in capitalism. But such reasoning relies on a false dilemma, for instrumental action is neither a general concept of labor nor a specific social kind of labor. Instrumental action is no actual form of social labor at all, and since there is nothing for it to refer to, the notion of instrumental action is a pseudo-concept. Labor in capitalism is not instrumental action. Labor in capitalism is surplus-value-producing labor, which is a type of labor that has a definite – not an arbitrary – purpose and is laden with moral, social, legal, and political significance.

Postone focuses on the peculiar social character and purpose of production in capitalism in order to make sense of the idea of

instrumental action and the primacy of means over ends:

Thus production for (surplus) value is production where the goal itself is a means .... The instrumentalization of the world, within such a framework, is a function of the determination of production and social relations by this historically specific form of social mediation .... Production for the sake of production signifies that production is no longer a means to a substantive end but a means to an end that is itself a means, a moment in a never-ending chain of expansion. *Production in capitalism becomes a means to a means* .... the domination of means over ends noted by Horkheimer .... is rooted in the character of labor in capitalism as a social means that is quasi-objective and supersedes overtly social relations. (Postone, 1993: 181–2)

Capitalist production supersedes overtly social relations but not social relations altogether. And, in capital's accumulation process, surplus-value does endlessly function as a means to the production of more surplus-value. That makes the purpose of capitalist production strange and not 'substantive' in a traditional sense. But in capitalism, value is the social substance, and money takes the place of overt social relations – 'all bourgeois relations are gilded' (Marx, 1970: 64). But instrumental action is not 'a consequence of the specific character of labor in capitalism', because action in capitalism is not instrumental action. A phrase such as the 'instrumentalization of the world' is a way of talking about capital's domination without mentioning capital.

Postone, of course, is talking about capital and about the social mediation of labor in capitalism:

As the duality of concrete labor and labor-mediated interaction, labor in capitalism has a socially constituting character. This confronts us with the following, only apparently paradoxical, conclusion: it is precisely because of its socially mediating character that labor in capitalism is instrumental action. Because the mediating quality of labor in capitalism cannot appear directly, instrumentality then appears as an objective attribute of labor as such. (Postone, 1993: 182–3)

This is a neat twist on the fetishism of the classical, 'embodied labor' theory of value, for which the value character of the commodity is taken to be a socio-natural property of it. But commodities *are* values, products of surplus-value-producing labor. They are not pure means; they are not products of instrumental action. What Postone describes as the 'only apparently' paradoxical conclusion that 'it is precisely because of its socially mediating character that labor in capitalism is instrumental action' is actually a contradiction: labor cannot lack social character because of its social character. The paradox is that labor appears to lack any social character because of its social character. Because labor in capitalism is socially mediated, even though by non-overt social mediations and an oddly empty and monotonous purpose, it is not instrumental action. Indeed, because there is no labor that is not socially mediated and directed by particular social purposes, there is no instrumental action. Because capitalist production is embedded in the value forms and the purpose of accumulating capital, it appears to be disembedded, and surplus-value-producing labor appears to be instrumental action.

Tony Smith takes a position similar to Postone's on the relationship between labor in capitalism and instrumental action. At the conclusion of *The Logic of Marx's 'Capital'*, Smith (1990: 196) writes: 'I shall briefly and provisionally examine three of the most significant theoretical alternatives to Marxian value theory: neoclassical economics, Weberian social theory, and Neo-Ricardian (Sraffian) economics'. In defending Marxian value theory as the key to grasping modern society, Smith rejects all three alternatives, each of which operates under 'the illusion of the economic'. Smith examines the claim that 'Weberian social theory offers an alternative to value theory', namely the notion of instrumental reason. Smith writes,

[Weber does] propose certain basic categories from which the key features of the capitalist mode

of production can be derived. The central category here is that of technical (formal) rationality.... Capitalism can indeed be grasped as a system in which formal rationality holds sway in the economic sphere, in contrast to other modes of production where traditional considerations or a material rationality are more essential. (1990, 197–8)

For Smith, capitalist social relations are unlike 'other modes of production where traditional considerations or a material rationality are more essential'. But capitalist rationality is not purely formal rationality any more than labor in capitalism is (purely) instrumental action. Formal rationality and instrumental action in the Weberian sense taken up by members of the Frankfurt School are indifferent to social form and purpose. Capitalist rationality (preoccupied with accumulating surplus value) and the labor in capitalism (which produces that surplus value) involve definite social forms and purposes.<sup>15</sup>

## HENRYK GROSSMAN AND THE DESTABILIZING DYNAMICS OF CAPITALIST PRODUCTION

Henryk Grossman does not fit neatly into Postone's category of traditional Marxist. Grossman's value theory is largely classical. In the 'value-price transformation', however, Grossman sees that Ricardo's theory of value, according to which individual commodities sell at their individual values, is untenable. A number of Ricardo's contemporaries recognized that. Where those critics abandoned a labor theory of value, Marx, as Grossman recognizes, radically reconceived it. Marx shifted value theory to the level of the total social capital. But Grossman does not follow Marx on two other fundamental criticisms. First, Ricardians see value as embodied 'labor', labor of whatever social sort; indeed, the topic of the specific social form of labor does not enter into Ricardian thinking. Marx, by contrast, grasps value as a

‘purely social substance’, a ‘ghostly objectivity’ that is wholly the consequence – not of ‘labor’ – but of ‘practically abstract’ labor, the specific social form of labor in capitalism (Marx, 1976: 128). Second, Ricardian theory has no, and can have no, account of the value form: it has no explanation of why value must be expressed as money. On these points, Grossman does not adopt Marx’s advance over Ricardo; here he fits the mold of a traditional Marxist.

Postone identifies traditional Marxism with a focus on distribution rather than production. Grossman does not fit that description. On the contrary, the major thrust of Grossman’s work is to criticize those Marxists, including Luxemburg, Kautsky, Hilferding, and Otto Bauer, who restricted capitalism’s crisis tendencies to problems in the sphere of distribution. Grossman explores the crisis tendencies that Marx located in the sphere of production with his study of ‘the breakdown of the capitalist system’ (Grossman, 1992). The key to the crisis tendencies mounting in production lies in what Postone calls ‘the value treadmill’. As increases in the productive power of labor are generalized across a branch of production, workers produce more units per hour, more use-values, but no more value, thereby cheapening commodities. The value treadmill, Marx argues, is due to the fact that abstract labor is the substance of value:

As productivity [*Produktivkraft*] is an attribute of labor in its concrete useful form, it naturally ceases to have any bearing on that labour as soon as we abstract from its concrete useful form. The same labour, therefore, performed for the same length of time, always yields the same amount of value, independently of any variations in productivity. But it provides different quantities of use-values during equal periods of time. (Marx, 1976: 137)

From the standpoint of the total social capital, gains in relative surplus value are made when improvements in the productive power of labor drive down the value of labor power by cheapening the commodities that workers

buy. But these productivity gains have a contradictory tendency: they tend to push down the rate of profit by increasing the organic composition of capital. (There are multiple countertendencies.) Grossman concentrates on this contradictory dynamism of capitalist production, which drives what Postone (1993: 238) calls the ‘shearing pressure’ that makes capitalist production historically dynamic – his answer to the pessimism of the Frankfurt School.

The fact that Grossman can stress the contradictory character of capitalist production and yet still be a Ricardian value theorist brings out a point about value and abstract labor made by Geert Reuten.<sup>16</sup> One can grasp the destabilizing dynamics of capitalist production yet still hold a Ricardian conception of value inasmuch as one fails to recognize that value is produced by a historically specific kind of labor and fails to grasp why value is necessarily expressed as money. Reuten’s point is that one can take abstract labor to be a transhistorical category and identify it as the substance of value – which provides the conceptual basis for the value treadmill – yet remain a Ricardian because abstract labor is not a social kind of labor. It is not a kind of labor at all. Marx’s critique of political economy moves beyond Ricardo by recognizing that value is produced by a specific social kind of labor, namely, privately undertaken labor that is socially validated through the sale of the commodities it produces – ‘practically abstract labor’.

Rick Kuhn observes, ‘The “neo-harmonists” such as Karl Kautsky and Rudolf Hilferding, on the other hand [to Grossman], argued that disproportion in production could be overcome by means of government policy’ (Kuhn, 2016: 96). Kuhn’s point reveals a striking parallel with Postone. Just as Grossman rejects the ‘neo-harmonists’, Postone rejects Pollock’s comparable thesis of the ‘primacy of the political’. Grossman and Postone both stress the destabilizing dynamics of capitalist *production*: capital is its own barrier.<sup>17</sup>

Grossman's attention to specific social forms – the hallmark of the critique of political economy – is a mixed bag. He recognizes that abstract labor is the substance of value, which allows him to locate capital's contradictory dynamism in production, but he fails to see that value-producing labor is 'practically abstract' labor. He calls attention to the double character of capitalist production as 'simultaneously' a labor process and valorization process as well as to Marx's identifying the factors of production in capitalism as constant and variable capital. But Postone criticizes Grossmann's and Franz Borkenau's attempts to provide a historical materialist account of modern natural science. For Postone (1993: 176), the critique of political economy puts 'the emphasis on the *form* of social relations as an epistemological category'. But Borkenau and Grossman focus on the technical character of labor in the period of 'manufacturing' (prior to 'large-scale industry') rather than on labor's specific social character. Grossman's socio-epistemological efforts, then, belong to critical political economy, not the critique of political economy.

Grossman anticipates the preoccupation of the new reading of Marx with Marx's method: 'My view is that the unsatisfactory state of the literature on Marx is ultimately rooted in the fact – which will appear strange to some – that until today no one has proposed any ideas at all, let alone any clear ideas, about Marx's method of investigation' (Grossman, 1992: 29). Grossman introduced the idea of *successive approximations* [*Annäherungsverfahren*] as the way to interpret Marx's method in *Capital*. That way of understanding *Capital* was adopted by important Marxist thinkers including Maurice Dobb and Paul Sweezy. Though there are many controversies over Marx's method in the new readings of Marx, Grossmann's successive approximations conception has largely given way to a systematic dialectical conception of Marx's method of presentation in *Capital*. The two interpretations share a conception of *Capital*

as having different stages of analysis based on different levels of abstraction, but they differ importantly.

First, levels of approximation in Grossman's approach are conceived of as existing independently, either possibly or actually, as, for example, with Engels' idea that simple commodity circulation in *Capital* refers to an actual historical stage of 'simple commodity production'. In systematic dialectics all the stages in the presentation refer to levels of abstraction from the same object of inquiry – not to independently existing stages.

Second, the successive approximations approach is a one-way street, analytical rather than dialectical: the later stages presuppose the earlier ones, but the earlier ones do not presuppose the later ones. If the earlier levels in the presentation presuppose the later stages, as in a systematic dialectical structure, then the earlier ones do not – cannot – refer to independent stages. Returning to simple commodity circulation, a systematic dialectical understanding of *Capital* holds that there is a dialectical development from simple commodity circulation to the circuit of capital. That dialectical transition – a subject of controversy (Campbell, 2013) – reveals that simple commodity circulation presupposes the circuit of capital; the systematic dialectical account is a two-way street, a dialectic of mutual presupposition.

The difference matters. In *Money and Totality*, Fred Moseley (2016) argues that there is no 'transformation problem' and that the mistaken notion that there is results from the failure to grasp the method of *Capital*. The key to his 'macro-monetary' reading of *Capital* is that the crucial givens in the circuit of capital, the original M and the M' of the M-C-M' circuit, which appears first in chapter 4 of *Capital I*, are the actual sum of money invested by the total social capital (M) and the actual sum of money returned to that investment (M'), respectively. That account is incompatible with the successive approximations approach. Since in capitalism individual

commodities tend to sell not at their individual values but rather at their prices of production, Moseley reasons, the actual prices at which the elements of constant and variable capital are purchased are prices of production, not individual values. In other words, the complaint that Marx did not transform the inputs to the circuit of capital from values to prices of production, which is thought to create the ‘transformation problem’, is misconceived. By the time of writing the *Grundrisse* (1857–8), Marx knew that commodities did not sell at their individual values, so that the classical labor theory of value was untenable and had to be abandoned or reimagined. The transformation problem does arise for Grossman’s successive approximations approach, however, because it interprets the earlier stage as claiming that individual commodities sell at their individual values. The fact that this is known to be false is not a problem to Grossman, since the ‘approximations’, which are known to be false, are successively ‘corrected’ by better approximations to the truth.<sup>18</sup>

That takes us to a third difference: in the successive approximations approach, what is claimed at earlier stages of approximation is shown by later stages of approximation to be false. According to the successive approximations approach, we come to recognize that the claim it attributes to *Capital* I, namely that commodities exchange at their values, is actually false. Rather, individual commodities sell at prices of production, a concept that is developed only at a later stage of approximation (in *Capital* III). According to the successive approximations interpretation of Marx’s method, *Capital* proceeds by making a series of claims known to be false, until, by making fewer and fewer abstractions from the reality of the capitalist mode of production, one approaches the truth about it. In a systematic dialectical approach, by contrast, the claims made at the higher levels of abstraction, that is, in the earlier stages of the presentation, are true and remain true throughout. Two key examples are the claims

that the price of the total heap of commodities – but not of commodities taken individually – is determined by its value and that the total surplus value (interest plus profit of enterprise plus rent) – but not the profit realized by the sale of individual commodities – is determined by the amount of surplus labor represented in that heap.

## THEODOR ADORNO AND HIS STUDENTS

Christian Lotz observes: ‘The majority of Anglo-American scholarship on Adorno fails to see that Adorno remained committed to Marx’s Critique of Political Economy’ (Lotz, 2014: 25, n.4). Gillian Rose’s book *The Melancholy Science: An Introduction to the Thought of Theodor Adorno* (1978) is one of the exceptions. Rose rejects the narrative that Adorno moved away from Marx’s theory of value to adopt a transhistorical critique of instrumental reason. Adorno, she writes, ‘did not share Horkheimer’s concern with instrumental reason and the logic of domination. The concept of reification and Marx’s theory of value are much more important in Adorno’s analysis of society’ (Rose, 1978: 5). Confirming Rose’s view, Lotz quotes Adorno:

It occurs to nobody that there might be services that are not expressible in terms of exchange value. This is the real pre-condition for the triumph of that subjective reason which is incapable of thinking of truth as intrinsically binding, and perceives it solely as existing for others, as exchangeable (Adorno, GS4, 222). (Lotz, 2014: 21)

For Adorno, the ‘real pre-condition’ of Horkheimer’s ‘subjective reason’ is generalized commodity circulation and its ideological effects. Instrumental reason is an ideological shadow of the law of value.

Both Lotz and Rose go against the grain by insisting that Adorno is neither a critical political economist nor a critic of instrumental reason. Rather, Adorno is operating

within the horizon of the critique of political economy. However, both Lotz and Rose are critical of what they see as Adorno's truncated appropriation of the critique of political economy: Adorno restricts it to commodity fetishism and the sphere of commodity circulation. Lotz points out that Adorno called encountering Alfred Sohn-Rethel's interpretation of 'real abstraction' – in the exchange of commodities and money, every commodity under the sun is transmuted into a sum of money – the single most important intellectual experience he had (Lotz, 2014: 25, n.4). Lotz runs with that, stating that the core of Adorno's philosophy 'is the exchange principle of *Capital* interpreted through the lens of Sohn-Rethel's theory of the relation between commodity form and thought form' (25, n.4). On Lotz's reading, the shortcomings of Sohn-Rethel's appropriation of Marx carry over to Adorno.<sup>19</sup>

Lotz takes Adorno to be working within the horizon of the critique of political economy, but it is a foreshortened one that limits itself to the fetishism of commodity circulation. 'Put in Marx's language', Lotz writes, 'Adorno does not realize that the simple circulation process remains "an abstract sphere of the bourgeois process of production as a whole, which through its own determinations shows itself to be a moment, a mere form of appearance of some deeper process lying behind it, even resulting from it and producing it" (MEGA II.2.68)' (Lotz, 2014: 20–1). That deeper process, presupposed by simple circulation, is capitalist production. Lotz sums up his complaint: 'Adorno identifies capitalism with the exchange principle' (22). Thus, Lotz takes issue with Horkheimer and Adorno in *Dialectic of Enlightenment* for failing to trace the ideological structure of the 'culture industry' 'back to the structure of production' (23). While this charge of restricting the critique of political economy to the exchange principle holds for Sohn-Rethel and 'exchange-only' value-form theorists, it is not the last word on Adorno.<sup>20</sup>

Gillian Rose, too, sees Adorno as working within a fragment of the critique of political economy. Rose begins with the observation, 'Adorno's thought depends fundamentally on the category of reification' (Rose, 1978: ix). She goes on to criticize Adorno for being fixated on commodity exchange: 'Adorno's theory of reification was based on commodity fetishism in a way which depended not on Marx's theory of work or the labour-process (alienation) but on Marx's theory of value, especially on the distinction between use-value and exchange-value' (43). She elaborates:

'Reification' has often been used in order to generalise the theory of value and of commodity fetishism without taking up the theory of surplus value or any theory of class formation, and without developing any theory of power and the state. (28)<sup>21</sup>

In the critique of Adorno made independently by Lotz and Rose, we see Postone's critique of traditional Marxism's focus on distribution taken to a higher power: Adorno thinks within the horizon of the critique of political economy but limits himself to exchange.

A number of scholars, including Dirk Braunstein, Werner Bonefeld, and Chris O'Kane, find in Adorno a more complete adoption of the critique of political economy. A document that supports their view is the set of notes taken by Backhaus to a 1962 seminar on Marx and sociological theory that Adorno led.<sup>22</sup> Before moving on from the conceptual level of commodity circulation, Adorno distinguishes the fetishism involved in thinking of a commodity's value as natural, not social, from the fetish character of the commodity:

We really are dependent on the world of commodities. On the one hand, commodity fetishism is an illusion; on the other hand, it is utmost/ultimate reality – and the superiority of the reified commodity over humanity stands testament to this. That the categories of illusion are in truth also categories of reality, this is dialectic. (Adorno, 1997: 507)

In the illusion, 'the commodity no longer appears as a social relation, but it seems as if value was a thing in itself' (Adorno, 1997: 506); in the reality, as values, commodities have power over their producers.<sup>23</sup> The illusion and the reality are consequences of the commodity form.

In characterizing Marx's critique of political economy, Adorno shifts focus from commodity circulation to capitalist production:

What does critique of political economy mean in Marx? 1. Critique of the classical theory of liberalism. 2. Critique of the economy itself .... Marx is concerned with an immanent critique of liberalism .... Liberal theory is confronted with its own claim with regard to the act of exchange. 'You say that equivalents are exchanged, that there is a free and just exchange, I take your word, now we shall see how this turns out'. (Adorno, 1997: 504)

Paradoxically, the exchange of equivalents – labor power for wages – lays the foundation for the extraction of surplus value from the wage worker: the equity of the exchange principle conceals class antagonism and exploitation:

On the one hand, exchange takes place in the form of equivalents: the former [the worker] gives his labour time and receives what is required for the reproduction of his labor power in return .... One exchanges the same for the same and simultaneously the same for not the same. Behind this lies the entirety of class relations. Only because the worker has nothing else but his labour power does he accept these conditions. (Adorno, 1997: 509)

Adorno recounts how Marx's theory of surplus value overturns liberalism and punctures its justification of the capitalist mode of production. The egalitarian exchange principle presupposes the class relations that make capitalist production possible: 'The relation of exchange is in reality pre-formed by class relations: the heart of the theory is that there is an unequal control of the means of production' (Adorno, 1997: 505). Commodity circulation manifests, while concealing, class conflict and capital's drive for endless accumulation. Despite his fascination with exchange and his enthusiasm for

Sohn-Rethel, for Adorno: 'the sphere of circulation is secondary' (508).

In addressing the destabilizing dynamics of capital accumulation, Adorno sounds like Grossman or, more so, Postone:

Capitalists are forced to try to accumulate surplus. For this purpose, they are impelled to develop machines in order to replace living with dead labour. If not, then they are laid low in competition. Here, a moment of the sphere of circulation impacts on the sphere of production. However, because they are forced to, capitalists create the conditions of productive forces that do not need the chains of capitalist economy. Second, they thereby create a dynamic which turns against themselves; more and more labour is set free, thereby creating the conditions of crisis and the continuously increasing threat to the system itself. In order to maintain itself, the system must produce precisely such moments through which it increasingly undermines [*untergräbt*] its own possibility. The purpose of spontaneity is to get this process under control, which is headed for the destruction of the whole, so as to transform [*aufheben*] the whole to a higher mode of production. (Adorno, 1997: 508–9)

For Adorno, capital cannot free itself of a contradictory dynamism that keeps it on a perilous course of historical possibilities.

Adorno contrasts the critical power of Marx's critique of political economy, which discloses the social forms that constitute a society as capitalist, with the apologetic character of subjectivist economic theories. Marx's critique of political economy

raises the problem of constitution ... it enables more of reality to be expressed. The point is whether the constituents of totality can be grasped. The question of constitution is already present in the ostensible discretion concerning where to cut through reality for the purpose of abstraction. The subjective doctrine is essentially apology. The analysis of the question of price is an epiphenomenon in contrast to the questions of constitution. (Adorno, 1997: 511)

For Adorno, the critique of political economy and the associated critique of forms of thought that represent life in capitalist societies advance a critical theory that focuses on the peculiar social forms and purposes that

constitute capitalist society. In capitalist society, products take the commodity form, becoming fetishes that dictate to their producers through the impersonal system of prices. The voluntary, egalitarian, and harmonious appearance of commodity exchange masks a crisis-prone production process fueled by class antagonism and exploitation:

Society stays alive, not despite its antagonism, but by means of it; the profit interest and thus the class relationship make up the objective motor of the production process, which the life of all men hangs by, and the primacy of which has its vanishing point in the death of all .... What historically made this possibility may as well destroy it. (Adorno, 1983: 320)

Adorno's grasp of the critique of political economy does not restrict itself to commodity circulation; it comprehends the class antagonism and precarious historical dynamism inherent in capital's accumulation process.

## CONCLUSION: CRITICAL THEORY BEYOND 'THE ILLUSION OF THE ECONOMIC'

The sea change that has been moving at least some quarters of Critical Theory to renew the Marxian critique of political economy calls into question the conceptual horizon that underlies both critical political economy (traditional Marxism) and the critique of instrumental reason, a horizon projected by 'the illusion of the economic'. That illusion of an actual economy-in-general, which arises from obliviousness to or neglect of the specific social forms and purposes that constitute any actual mode of production and way of life, is an ideological shadow cast by the social forms that do structure capitalist production. 'The illusion of the economic' impedes critical social theory by putting questions concerning the constitutive social form and purpose of wealth, labor, and production out of consideration. As a consequence, critical political economy and the

critique of instrumental reason attempt to criticize capitalist society by employing categories adopted from economics. In doing so, however, they trade in the pseudo-concepts of 'the economic' and 'instrumental action', concepts for which there can be no referent.

By contrast, we have seen how, in different ways, Henryk Grossman, Theodor Adorno, and a group of Adorno's students that includes Hans-Georg Backhaus and Helmut Reichelt all transcend the limitations of traditional Marxism and the critique of instrumental reason. In their account the critique of political economy calls economics into question at the level of its fundamental concepts, challenging its socially empty categories and identifying and criticizing the capitalist forms of wealth, labor, production, and distribution. Overcoming capitalism is then not a matter of redistributing surplus value but of moving past value as the social form and measure of wealth. Understood as a critique of 'the obsession that bourgeois production is production as such', the critique of political economy opens doors to an expansive critical theory of society.<sup>24</sup>

## Notes

- 1 Marramao, 1975. On '*die neue Marx-Lektüre*', see Elbe, 2010; Henning, 2008; Bonefeld, 2014; and Bellofiore and Riva, 2015.
- 2 On 'the illusion of the economic' see chapter 14 in Murray, 2016. Marx points out the ideological function that 'the illusion of the economic' plays; political economy posits 'society in the abstract' and conflates it with bourgeois society: 'The aim is, rather, to present production – see e.g. Mill – as distinct from distribution etc., as encased in eternal natural laws independent of history, at which opportunity *bourgeois* relations are then quietly smuggled in as the inviolable natural laws on which society in the abstract is founded. This is the more or less conscious purpose of the whole proceeding' (Marx, 1973: 86–7).
- 3 Since there is no such object, economics lacks an object of inquiry; see Backhaus, 1997. Werner Bonefeld writes, 'Critically conceived, *Capital* is therefore not an economic "text"'. Economics

- is the formula of an inverted world' (Bonefeld, 2014: 6).
- 4 Of Friedrich Pollock's thesis of the 'primacy of the political', Moishe Postone and Barbara Brick write: 'an understanding of the contradiction between the forces and relations of production as one between distribution and production – that is, in terms of the growing inadequacy of the market and private property to conditions of developed industrial production – implies that a mode of distribution based on planning and the effective abolition of private property is adequate to those conditions.... The pessimism of his theory is rooted in its analysis of postliberal capitalism as an unfree, yet noncontradictory society' (Postone and Brick, 1993: 222).
  - 5 Rick Kuhn sums up the reception of Grossman: 'Neglect and misinterpretation have been the main responses to Grossman's work, including among Marxists' (Kuhn, 2016: 92).
  - 6 Rick Kuhn writes of Paul Mattick Sr: 'Paul Mattick espoused Grossman's contributions to Marxist economics in English and German for fifty years' (Kuhn, 2005: 91). On Mattick Sr see Roth, 2015. Rosdolsky, 1977, is loaded with references to Grossman.
  - 7 There are other critiques of political economy. Thorstein Veblen is widely regarded as the founder of institutional or evolutionary economics; George Bataille explores 'general economy' in *The Accursed Share*; various feminist critiques of economics have been developed by Marilyn Waring, Julie A. Nelson, Nancy Folbe, Diane Elson, Marianne Ferber, and others. All further references to the critique of political economy will be to the Marxian one.
  - 8 John Abromeit (2011: 177–80) questions Postone's account of Horkheimer.
  - 9 Marx writes to Annenkov that Proudhon 'does not rise above the bourgeois horizon' (Marx, 1963: 190). Marx harshly criticized the socialist Gotha Programme for its 'bourgeois phrases', which attributed a '*supernatural, creative power to labour*' (Marx, 1966: 3).
  - 10 Werner Bonefeld (2014: 3–4) observes: 'the "new reading of Marx" ... was principally developed by Hans-Georg Backhaus, Helmut Reichelt and also Moishe Postone'. Bellofiore and Riva (2015: 24–5) write: 'Backhaus can be considered as the initiator of *NML [neue Marx-Lektüre]*.... Under Adorno's influence, he elaborated the essential elements of a new interpretation of Marx'.
  - 11 In introducing the concept of instrumental reason ('subjective reason') in *Eclipse of Reason*, Max Horkheimer acknowledges but immediately dismisses the ubiquitous presence of social norms: 'Naturally the circumstances of each situation, as well as laws, customs, and traditions, should be taken into account. But the force that ultimately makes reasonable actions possible is the faculty of classification, inference, and deduction, no matter what the specific content – the abstract functioning of the thinking mechanism' (Horkheimer, 1974: 3). Of course the normative 'circumstances' of human action and reasoning 'should be taken into account' – except that they are irrelevant!
  - 12 In remarks on Bertrand Russell, Horkheimer calls attention to this presumptive moral nominalism in regard to human actions. He takes Russell as a representative of subjective reason but praises his inconsistency: 'Despite his philosophy, which holds "ultimate ethical values to be subjective", he seems to differentiate between the objective moral qualities of human actions and our perception of them: "What is horrible I will see as horrible". He has the courage of inconsistency ... If he were to cling to his scientific theory consistently, he would have to admit that there are no horrible actions or inhuman conditions, and that the evil he sees is just an illusion' (Horkheimer, 1974: 8).
  - 13 See Habermas, 1987 and Arendt, 1958.
  - 14 On 'practically abstract' labor see chapter 4 in Murray, 2016, and Bonefeld, 2010.
  - 15 I am indebted to Jeanne Schuler for her ideas on why instrumental action is a pseudo-concept.
  - 16 See Reuten, 1993, and chapters 4 and 18 in Murray, 2016.
  - 17 Postone (1993: 102, n.59) observes that Maramao 'approvingly presents aspects of Henryk Grossmann's analysis as an interpretation of Marx very different from that dominant in the Marxist tradition' but 'does not follow through its implications'. That suggests that Postone sees his own work as following through on Grossman.
  - 18 Postone (1993: 133) relates the question of the 'transformation problem' directly to the difference between critical political economy and the critique of political economy: the treatment of the transformation problem 'has suffered from the assumption that Marx intended to write a critical political economy'.
  - 19 Of Sohn-Rethel, Postone (1993: 178) writes, 'He argues that the sort of abstraction and form of social synthesis entailed in the value form is not a labor abstraction but an exchange abstraction'.
  - 20 On 'exchange-only' value-form theory, see chapter 15 in Murray, 2016.
  - 21 Rose's closing points are pursued in Bonefeld, 2014.
  - 22 The notes were published as an appendix to Backhaus, 1997. An English translation of these notes and an introduction by Chris O'Kane, drafts of which he kindly shared with me, are forthcoming

in *Historical Materialism*. The translations of texts from that seminar included here draw on that draft translation but contain my revisions.

- 23 Werner Bonefeld (2016: 235) observes, 'In the blink of an eye, the economic movement of society can cut off a whole class of individuals from access to the means of subsistence, just like that, indifferent to their needs and regardless of their efforts'.
- 24 For their help, I want to thank Werner Bonefeld, Chris O'Kane, Christian Lotz, David N. Smith, and especially Jeanne Schuler.

# The Critique of Value and the Crisis of Capitalist Society

Josh Robinson

## THE CRITIQUE OF VALUE

The critique of value, or *Wertkritik*, presents a radical and thoroughgoing critique of categories of bourgeois society and particularly of the extent to which both our actions and our thoughts are unavoidably saturated with these categories – categories which as real abstractions take on a socially objective character. This critique concentrates its critical force against the closely related tendency to treat as universal, timeless and natural givens what are in fact specifically capitalist concepts that not only develop as a result of (and thus bear the imprint of) a history of coercion and violence, but also silently reproduce the conditions of the possibility of the furtherance and exacerbation of this history. In this respect it takes its lead from its thinkers' interpretation of the famous claim in the first sentence of *Capital*, that 'the wealth of societies in which the capitalist mode of production dominates appears as a "monstrous collection of commodities", the individual

commodity as its elementary form' (Marx, 1962: 49), according to which the commodity form is the historically specific – and highly restricting – form which social wealth takes under capitalism. The distinction of this social, material wealth, understood as an abundance as much of experiences of richness as of access to things, from the abstract, alienable and alienating wealth (such as in the forms of possession and property) of capitalist society, lies at the heart of the critique, which aims at and aspires to the liberation of material wealth from the commodity form, and thus from abstract value. Insofar as this critique represents what the young Marx termed the 'ruthless critique of all that exists' (Marx, 1956: 344), it is thus a critique both of the extent and of the very fact of the mediation of human life through the categories of the economy – a mediation that is so thorough that it generally appears as entirely natural, and that forms an all-encompassing system of social relations.

Despite – or perhaps more accurately, precisely because of – the ways in which it responds to and develops aspects of Marx's thought, the critique of value represents a radical break from traditional Marxism, or what its theorists have tended to refer to as workers'-movement Marxism. The critique of value emerged in the Federal Republic of Germany in the mid-1980s. Its principal theorists – including Robert Kurz, Ernst Lohoff, Roswitha Scholz and Norbert Trenkle – came together out of a diverse range of intellectual and organizational traditions, the prevailing currents of which were on the one hand the predominantly Maoist cadre organizations of the *K-Gruppen* that had been particularly strong in the Federal Republic during the 1970s (when their total membership was estimated at about 15,000), and on the other hand the new social movements, squatters' movement and *operaismo*-influenced *Autonome* which had in different ways emerged from the Extra-Parliamentary Opposition of the late 1960s (cf. Larsen et al., 2014b: xix–xx). Until 2004 its formative theoretical development was concentrated in the pages of the journal *Krisis*, the first seven issues of which were published under the title of *Marxistische Kritik* between 1986 and 1989; a split in the editorial group in 2004 led to the emergence of *Exit!*, edited by several figures formerly associated with *Krisis*, which also continues to publish value-critical theory.

In this respect the critique of value is a relatively recent formation, and its roots are intermingled across multiple critical traditions. The early 1980s had seen the emergence of theoretical discussions and debates, reading groups and seminars that brought together people from a wide range of traditions – outside the two principal currents mentioned above, notable influences included the thought of Trotskyist traditions, the peace movement and the anti-nuclear movement. The development of a shared conceptual repertoire out of this heterogeneous range of traditions and influences took

considerable discussion and debate – not to mention the falling away of a large number of initial participants to leave a core group that was much smaller. While this smaller group continued to contain representatives from a diverse range of traditions, there was nonetheless identifiable a set of shared theoretical interests that exerted a decisive influence on the formation and subsequent development of the critique of value. The particular influences include Frankfurt School Critical Theory, most specifically Adorno's immanent critique of the way in which many philosophical concepts carry the mark of a history of domination and heteronomy: the critique of value seeks further to develop this critique from the perspective of that which resists the apparent objectivity of social categories, and is oriented toward ending the domination that they represent. Other influences include Marcuse and some of the discussions around the analysis and critique of the value form that emerged in the 1970s. This was complemented by an interest in crisis theory (and particularly in the writings of Paul Mattick Sr) which had found attention in contemporary debates in the pages of journals such as *Prokla*, and which resonated with interests in the reduction of working hours and in the development of other forms of work that had emerged from parts of the environmental movement.

What characterizes the critique of value – and what distinguishes it from the traditional Marxism from which it represents a departure – is the aspiration to formulate and develop a radical, thoroughgoing critique of capitalism that proceeds from a fundamental critique of the elemental aspects of capitalist society – the commodity form, and commodity production. It seeks critically to reveal and to undo the extent to which life in capitalist society – not only the institutions of capitalist industry and the state, but also the very concepts with which we think and act – is permeated by assumptions that are themselves bound up with the commodity form. Its orientation toward emancipation thus consists

to a considerable extent in the programmatic insistence that critical social theory escape the presuppositions of the society that is the object of critique. In this respect it has in common with a wide range of critical social theory an aspiration not only to account for but also to undo structures of domination: it seeks to formulate what Adorno terms an 'ontology of the wrong state of things' (Adorno, 1966: 22) that is oriented toward its radical change.

The diversity of the critique of value's theoretical and activist heritage is reflected in the fact that it has hitherto had very little connection with the academic production and reception of theory. Its principal theorists have generally written alongside or between other employment, and their theories have received relatively little attention within academic writings; two significant exceptions to this are the figures of Roberto Schwarz, former professor of literary theory at the Universidade de São Paulo and the Universidade Estadual de Campinas, whose reception of Kurz's *Collapse of Modernization* (Schwarz, [1991] 2004) has inspired considerable interest in the critique of value in Brazil, and Anselm Jappe, member of *Krisis* and subsequently of *Exit!*, author of *The Adventures of the Commodity* (2003), and best-known in the anglophone world as a biographer of Guy Debord, who has taught at the Accademia di Belle Arti de Frosinone and at art schools in Tours, Bourges, Besançon and Tourcoing. In many respects this reflects a tradition of theorizing (and indeed, of intellectual life more generally) outside the institution of the university that is much richer in Germany than is the case within the anglophone world, but it also testifies to a commitment to critical-theoretical reflection and development outside the institutional walls of the academy.

The development of the critique of value has nonetheless involved a productive and frequently collaborative exchange with more institutionally established critical theories. In addition to the figures associated with the first generation of the Institute for Social

Research (and Adorno in particular), the influences on its formation included Rudolf Wolfgang Müller's *Geld und Geist* (1977) and the work of Barbara Brick and Moishe Postone (1982). Engagement with the work of the latter would subsequently prove particularly influential: his essay on antisemitism and National Socialism (1980) triggered considerable discussion on the critical-Marxist left in the Federal Republic, while several members of *Krisis* were involved in the German translation of *Time, Labor, and Social Domination* ([1993] 2003a, 2003b).

## REAL ABSTRACTION AND THE CRITIQUE OF CAPITALIST CONCEPTS

At the heart of the critique of value's theoretical departure from traditional Marxism is its re-evaluation of the particular categories of labour and value, which are rethought in three closely related ways. The first, from which the other two follow, is that these are not natural universal categories of human sociality, but rather phenomena that are specific to capitalist social relations. Labour, that is, is understood as the specifically capitalist form of abstract, commodity-producing labour, rather than as a general and transhistorical concept of intentional activity oriented toward the production of an object or an experience that someone (whether or not the producer in question) will consume or appreciate. Similarly, value is conceived not as a timeless conception of personal or social benefit, but as the specifically capitalist, abstract, quantitative and quantifiable value of the commodity form. Following from this, the second rethinking is that neither value nor labour is understood as a pole or standpoint from the perspective of which capitalist social relations can be criticized: they are rather themselves the object of critique. The third is that neither is thought of as the basis for the construction of the blueprints for a utopian (or indeed actually existing socialist)

society. Labour – abstract labour, the abstract category of labour under which all manner of radically different tasks are subsumed – is rather the subjugation under the regime of abstract time of the worker who carries out an aspect of the production of goods that will be used by people whom she does not know. Value, meanwhile, is the never only monetary expression of the expenditure of this reified, abstract labour time – never only monetary precisely because of the tendency for these in fact specifically bourgeois categories to present themselves as universal and natural givens.

This thoroughgoing critique of the categories of political economy distinguishes the critique of value from what its proponents term traditional or workers'-movement Marxism, the adherents and theorists of which are accused of treating the Marxian categories as 'empty husks that lie outwith or prior to the analysis itself', with the result that in their analysis the 'Marxist' character of their work consists solely in expressing the results of their research within these categories (Lohoff, 1986: 51). In doing so, they miss the force of Marx's work, and set out an alternative political economy, rather than its critique:

In no way does the dynamic of the logic of the unfolding of the categories flow into the analysis. They are treated statically, as invariable, transhistorical laws of the capital relation that from the beginning remain permanently fixed. Marx, in contrast, was always essentially concerned with the relation between the conceptual-logical and the historical development of capital. The categories that he worked through determine capital in its processual development. (Lohoff, 1986: 51)

This approach sees in Marx the critical project of the formulation of the categories which correspond to the development of the capitalist mode of production – critical in the sense not only that the uncovering of their historical and social specificity undermines their claim to universal, transhistorical validity, but also that it is oriented towards their dismantling. And more specifically, it

is a rejection of the understanding that value is what is produced by labour (understood ahistorically as all deliberate activity oriented toward the production of a personal or social benefit), according to which the problem of capitalism is the fact that this value is not equitably distributed (that is, that the expropriation of surplus value by the capitalist constitutes an injustice, which ought to be remedied by the fair redistribution of the surplus value away from the exploitative class, and to the workers who produce the value). Against this view, the critique of value is aimed not at overturning an injustice with respect to the distribution of the value produced by labour, but rather at abolishing the domination over life exerted by the reified categories of abstract labour and abstract value.

In this respect the critique of value develops a tendency which is present in Marx's late writings, but not thought through to its fullest extent. The critique of value thus seeks to take the implications of Marx's mature critical theory beyond the limits of his own writings:

Marx distinguishes between abstract and concrete labor, and calls this the dual character of labor particular to commodity-producing society. He thus suggests – and also states explicitly – that it is not until the level of this doubling, or splitting, that a process of abstraction takes place. Abstract labor is abstract insofar as it moves away from the concrete material properties and particularities of the respective specific activities – for example, the work of a tailor, a carpenter, or a butcher – and is reduced to a common equivalent. But Marx overlooks here (and in any case, Marxism has yet to develop an awareness of the problem at this level) that labor as such is already such an abstraction. And not simply an abstraction in thought like a tree, animal, or plant; rather, it is a historically established, socially powerful, actually existing abstraction that violently brings people under its thumb. (Trenkle, [1998] 2014c: 2–3)

Central here is the distinction between concrete labour – the concrete, particular activities carried out during the labour process – and abstract labour – the conception of human labour as such that is indifferent to its material

content. Whereas for Marx abstract labour is the source of exchange value while concrete labour, as the particular activity by which use values are produced, is the source of material wealth (Marx, 1961: 23), for Trenkle even the thought of concrete labour as such is already an abstraction. The notion of concrete labour as such already presupposes a conception of labour as productive activity that is distinguished from the other aspects of life. As Trenkle argues, it would not have made sense for a medieval peasant to measure the time spent on the harvest in hours and minutes ‘because this activity merged with his life, and its temporal abstraction would have made no sense’ (Trenkle, [1998] 2014c: 6). No more than use value is concrete labour to be conflated with the material wealth that represents the realization of human potential set free from the constraints of commodity production. The conception of concrete labour already depends on the establishment of an autonomous sphere of economic production, and on the separate autonomous spheres of leisure, culture, politics and religion which house that which is not deemed to be productive.

This abstraction exerts a force on human life as what Trenkle, following Alfred Sohn-Rethel, terms an *actually existing* or ‘*real abstraction*’ resulting from spatio-temporal activity’, and thus an abstraction which ‘does not originate in men’s minds but in their actions’ (Sohn-Rethel, 1978: 20, emphasis original). This is a concept that Sohn-Rethel develops from Marx, arguing that in the process of exchange qualitatively different activities and objects are rendered identical. This is a concept (if not a term) which goes back to Marx’s contention that the abstraction of the concept of labour from the concrete particularity of the activities that are thought under it is the result not simply of a mental process according to which these activities are thought together under a single concept, but rather of a particular set of social and economic actions that have become habitual and commonplace:

[T]his abstraction of labour as such is not the intellectual result of a concrete totality of labours. The indifference to particular labour corresponds to a social form in which individuals move from one labour to another with ease, and the particular kind of labour is coincidental to them – thus they are indifferent to it. Here labour has become, not only in its concept but also in reality, a means of creating wealth as such, and has ceased to be entangled with individuals in their particularity as a determination. (Marx, 1961: 635)

Rather than the result of an intellectual process, the abstraction is already present in the workings of a social and economic system in which goods are produced for sale on the market. Abstract labour exerts a force on human activity not by means of our conceiving of labour in the abstract, but rather as the logic that underlies the abstract equivalence of commodity production and exchange – a logic that is revealed by the critique of political economy. This is what is at stake in Lohoff’s claim that the category of abstract labour is ‘not simply a prerequisite of the capital relation, but rather, at least in its more developed form, its product’ (Lohoff, 1986: 51): the capital relation and the form of wage labour that it enables create the concept of abstract labour that comes to pervade even the concept of concrete labour. The objection to abstract labour is not simply that it prevents us from thinking human activity oriented toward individual and social benefit except as mediated through the terms of exchange value, but rather the restrictive power which this abstraction exerts over our lives and actions.

Where the critique of value differs in its conception of the real abstraction from that of Sohn-Rethel is in its expanded application, beyond the sphere of commodity exchange. For Sohn-Rethel restricts his concern to the market, in which the sensuous particularity of commodities (and the sensuous particularity of the labour that produced them) is effaced as they are exchanged as fungible equivalents (cf. Jappe, 2013: 7–10). In this respect, in Sohn-Rethel’s theory ‘the social “nexus” always appears as a distinct activity, because

he conceives the sphere of circulation of commodity production as the alien element in society, but production for this sphere, conversely, as an anthropological constant' (Kurz, 1987: 83), and he is accused of having 'an abstract, ahistorical understanding of "untainted" production which is only ever haunted by exploitative intentions from the outside' (Kurz, 1987: 83). For the critique of value, in contrast, the abstract labour time that is expended in commodity production already presupposes the mediation of social reproduction through a comprehensive system of production and circulation, and thus of exchange on the market (Trenkle, [1998] 2014c: 8).

In commodity production there takes place something like the real subsumption of sensuous-material wealth under exchange value, as production carried out for the sake of the profit motive fundamentally alters what is produced. The manner in which the production of commodities alters their material constitution – understood not simply as their physical and chemical properties, but also as the ways in which we are able to interact with them, from the process of their making to the use we make of them. It is not simply that exchange value is indifferent to the sensuous particularity of the commodity by which it is represented, but rather that production for the sake of maximizing exchange value leads to changes – for the worse – in the product. While it is true that no chemist has discovered exchange value in a pearl or a diamond (Marx, 1962: 97–8), it is also the case that no one but a capitalist has undertaken research to discover what can be added to flashlight bulbs in order to *shorten* their lifespan (cf. Slade, 2007: 80–1).

## **PATRIARCHY, DISSOCIATION AND THE CRITIQUE OF THE SUBJECT**

What is diagnosed and criticized here is something like a double process of abstraction or of mystification. In the first part of the

process, the value of the commodity (as the unity of use and exchange value) claims to stand for something universal and transhistorical – for individual and social benefit *tout court*. In the second, the use value which is defined against exchange value within the commodity, and which itself appears to represent the universal and transhistorical material content that only appears in the form of the commodity under capitalist social relations, is on close examination revealed not only to be conceptually dependent on and unthinkable without the exchange value that is peculiar to this commodity form, but also to have undergone specific, material changes – to the detriment of the product, of the person who will buy it, and often also both of those who make it and of those who live close to the site where it is made or where the waste products of its manufacture are disposed of – as a result of its subordination to the logic of exchange and of profitability within the process of production.

Moreover, the claim of abstract value to stand for human benefit as such masks the fact that economic value is predicated on the separation – or dissociation – of the public and private spheres, in which the 'male' public sphere of abstract labour, state, politics (and art and science) understands and presents itself as superior to the 'female' private sphere of familial, sexual and reproductive labour (Scholz, 1992: 25). Scholz theorizes this as 'value-dissociation', a process by means of which 'all the sensuous content that does not go into the abstract value form without leaving a remainder, but nonetheless remains a prerequisite of social reproduction (sensuality, emotionality etc.), is delegated to woman' (Scholz, 1992: 23). Abstract, economic value is thus predicated on its exclusion of the activities that are in fact the condition of the possibility of its reproduction (Scholz, 1992: 24). And just as the critique of value seeks not for a more equitable distribution of the value produced by abstract labour but rather for the abolition of both labour and value, Scholz's critique goes

beyond the appeal for the recognition of the activities of the private sphere as labour: 'the women's movement has no need to redefine feminine activity as "labour" in order to prove its (moral and economic) value, for "labour" in this sense is itself as it were the "root of all evil"' (Scholz, 1992: 20). Such an appeal to the value of domestic labour takes abstract value's claim to universality at face value, and in doing so misses the fact that, in Scholz's terms, 'the "feminine sphere" and the characteristics that are ascribed to women merely represent the flip-side of the coin of abstract "labour" in patriarchy as it is mediated through the value form' (Scholz, 1992: 20). The critique of value aims at the abolition of the masculine and feminine sphere alike.

The dissociation of the feminized sphere is not merely a side-effect of the fetishism of value and labour and of the production of commodities as an end in itself, but is rather in a relationship of 'dialectical mediation with value':

That which is dissociated is not a mere 'subsystem' of this [value] form (such as is the case for foreign trade, the legal system or even politics) but essential and constitutive for the social relation as a whole. That is to say, the relationship between value and dissociation is not one of immanent logical 'derivation'. Dissociation is value and value is dissociation. Each one is contained within the other, but without being identical with it. (Scholz, 2000: 18)

The fetishistic form of value as an end in itself, that is, is not the cause of the dissociation; the two are mutually dependent and mutually constitutive. For Scholz the dissociated sphere is that which cannot be grasped by value, akin to but not coterminous with what Adorno theorizes as the non-identical, that of the object which is particular and qualitatively different, which is effaced by the object's subsumption under its concept (Adorno, 1966: 17). The difference lies in the fact that dissociation is not the imposition onto the dissociated of an external structure that is indifferent to its particularity; rather, 'the dissociated represents the dark

underbelly of value itself', dissociation is 'a precondition which ensures that the contingent, the irregular, the non-analytical, that which cannot be grasped by science, remains hidden and unilluminated, perpetuating classificatory thought that is unable to register and maintain particular qualities, inherent differences, ruptures, ambivalences, and asynchronies' (Scholz, [2009] 2014: 132).

This process of dissociation has hugely significant implications for the theory of the subject, the constitution of which is revealed to depend on its failure to recognize the falsity of its claim to universality. For the subject is constituted in opposition both to the 'non-subject', who carries out the functions that are split off from the rational political and economic subject, and to the demonized 'un-subject' onto whom all the subject's evil aspects can be projected, allowing the white, male, Christian subject to appear as virtuous and morally unblemished (Lohoff, 2005: 23–4, 26). The dissociation of the sphere of domestic and reproductive labour is the condition of the possibility of the emergence of a (masculine) subject who acts within the public sphere. At the same time, the emergence of the subject form depends on its creation of a repository for all shameful or evil motivations and behaviours. In the emergence of capitalism this is the figure of the Jew, and Lohoff traces a connection between the religiously motivated medieval antisemitism of the blood libel and the exterminatory racial version found in National Socialism – in this respect Lohoff dissents from the thesis of the radical distinction between racial and religious antisemitism, but does so not by theorizing National Socialism as a kind of relapse to 'medieval' ways of thinking, but rather by seeing religiously motivated early-modern antisemitism as itself already heralding the history of modernization (Lohoff, 2005: 25–6). The constitution of the subject form is thus dependent on a false universality – the misrecognition as universal of a form that is in fact highly gendered and racialized.

## LABOUR AND THE FETISH OF CLASS STRUGGLE

This critique of the subject provides the theoretical context for the critique of value's rejection of labour and (anti-)political orientation away from the labour movement as the force of social emancipation. The political left is criticized for only taking exception to the exploitation of labour by capital, but never to labour itself – the labour movement 'only ever wanted the "liberation of labour" but not the liberation *from* labour' (Gruppe Krisis, 2004: 16, emphasis original). This leads to what is diagnosed as a 'fetish of class struggle', the critique of which follows from the critique of the ahistorical conception of labour according to which the working class 'appears as the absolute entity of "labour" in an a historical sense', which leads to a politics which are directed not 'against the social relation as such (which always also comprises the "working class")', but merely against the subjective action of the "capitalists" in accordance with their "interests"' (Kurz and Lohoff, 1989: 11).

Class struggle remains immanent to the presuppositions and the categories of commodity production, and by supporting the working class in its opposition to capital, continues to support the opposition, rather than taking aim at the very division of the world into classes: "'Class struggle" is in this sense nothing other than the subjective side of the "self-movement of capital" – that is, of the self-valorization of value in the form of an unconscious social relation that is external to individuals' (Kurz and Lohoff, 1989: 11–12). The adoption of the perspective of the working class thus remains trapped within the confines of commodity fetishism no less than bourgeois subjectivity. That is to say, the adoption of the perspective of the working class renders any critique impossible: 'Thought that is developed on the basis of this untrue, constituted subjectivity remains unable to conceive of its true form, of which the commodity form of social reproduction is

the foundation' (Kurz and Lohoff, 1989: 12). The adoption of the perspective of partisanship for or belonging to the working class represents a limitation of thought. The adoption of a positive and affirmative reference to class, and to class conflict, which is assumed in advance and taken as the starting point of any critique, prevents the radical critique of the bourgeois categories and institutions of nation and state – for these are products of the same stable as that of the working class.

In his account of 'Struggle without Classes', Trenkle concludes that the future 'belongs not to class struggle, but to an emancipatory struggle without classes' (Trenkle, [2006] 2014a: 221): here the focus is on the dissolution of the proletariat as class. Trenkle thus seeks to identify 'approaches and moments which point to the perspective of a liberation from the totality of commodity society' in struggles that go beyond the capital–labour relation and its negation, arguing that while struggles and movements such as those of 'the Zapatistas, the autonomous currents of the Piqueteros, and other grass-roots movements' must not be romanticized or idealized, they nonetheless contain perspectives, approaches or tactics which can help liberate social, material wealth from the constraints of the value form (Trenkle, [2006] 2014a: 220–21). His concern is with the nature of the struggles that have emerged in recent years, and with their prospects of leading to social emancipation, in the light of four principal trends that he identifies that characterize the labour in contemporary society. The first is the tendency toward the replacement within the labour process of direct production with processes of surveillance and control – which is internalized to an ever greater extent, most obviously in the case of freelance and self-employed labour, but also in the case of the initiatives described in the jargon of contemporary management as enhancing the enrichment or personal responsibility of employees. In this respect what is easily presented as empowerment of employees in fact involves their adoption,

coerced or induced, of the functions of monitoring and controlling themselves: the contradiction between labour and capital is shifted 'to a point within individuals themselves' (Trenkle, [2006] 2014a: 204).

The second is the tendency away from the identification with a single and determinate part of the production process – in the form not only of the 'job for life' at a single company, but also with a particular occupation or trade. The demand for a flexible workforce preaches the doctrine of compulsory availability, whatever the task and the conditions. 'Whoever wants to survive must be prepared perpetually to switch between the categories of wage labor and self-employment, and to identify with neither – although, of course, even this brings no guarantee' (Trenkle, [2006] 2014a: 205). The third tendency is the emergence of hierarchies and divisions that 'cut across the categories of capitalist function rather than overlapping with them', both within the workforces of sites as discrepancies and tensions are opened up between permanent and casualized workers, and across society as a whole as the differentiations between different sectors with respect to pay, working conditions and status are exacerbated (Trenkle, [2006] 2014a: 205–6). The fourth is the explosion in long-term unemployment and the resulting emergence of a new underclass characterized primarily by the fact that its members are deemed dispensable and redundant by the process of production and valorization.

These trends help to account for the paradox that even while 'social contradictions are being exacerbated, class-contradictions are being defused' (Schandl, 2002: 12). The opening up of contradictions and tensions that are not strictly those between capital and labour, and the increasing internalization of those that are into subjects that are as it were stuck in an abusive and dependent relationship on labour that renders them increasingly superfluous, lead to a situation in which, in Schandl's terms, the process of declassing 'does not pertain solely to the

so-called proletariat, but encompasses everybody' (Schandl, 2002: 12). Against this background, the emergence of any kind of class struggle, let alone the anti-class struggle of a negatively conscious proletariat oriented toward its own abolition, would involve either the active struggle to create a negative proletarian self-consciousness that is oriented toward its own abolition, or the assertion that the actually existing struggles that emerge at the moment are somehow in truth or essence those of a revived working class. This latter manoeuvre in particular involves either the categorical extension of the working class into 'a metacategory which fundamentally encompasses capitalist society in its entirety' and is thus meaningless (Trenkle, [2006] 2014a: 209), or the reinscription of all conflicts as class struggle, with the result that there is no analytical basis for the exclusion from the concept of working-class struggle of, for example, reactionary populist and ethnic-nationalist movements, or the fundamentalist pentecostal religious revival moments of Latin America and sub-Saharan Africa (Trenkle, [2006] 2014a: 215).

The first option, however, is diagnosed as the product of economic and social conditions that no longer pertain:

The movements of social resistance at the start of the nineteenth century emerged against the background of a repression of non- and proto-capitalist living conditions that were incompatible with the industrial-capitalist mode of production. In the light of this collective experience and of the tremendous imposition that was daily factory labor and the selfishness of capitalist competition, cultural patterns of interpretation and forms of practical solidarity were developed in resistance, which ultimately led to the formation of the consciousness of belonging to a class with a common fate. (Trenkle, [2006] 2014a: 219)

The four tendencies of contemporary labour society identified above do not constitute a process where the moments of the richness of life are under threat of extinction by the emergence of industrial production. The underlying structure here is an exacerbation of the

tendency described in Adorno's account of the dependence of leisure or free time on the state of society as a whole, which 'holds human beings under a spell' with the result that 'they do not dispose over themselves truly freely either in their labour or in their consciousness' (Adorno, 1977: 645). Critique is focused not simply on the increasing commodification of a leisure industry in which the products of labour (be they goods or services) are sold back to those who produce them for use in the free time that is determined solely negatively against labour time, but rather on the expansion of labour by means both of the increasing internalization of the capital-labour relation into the individual consciousness, and of the increasing permeability of the limits that no longer rigidly demarcate its border to what is not labour, resulting in the inability to switch off from work, and the saturation of even notionally free time with a mentality of labour – tendencies which are further sharpened by the rise of the gig economy.

Against the context, the attempt to create the consciousness of a cohesive proletariat represents a Sisyphean struggle against economic forces that prevent this cohesion. As Trenkle observes, there is 'no new working class emerging here; what is rather taking place is the action of people who have been formed into subjects of labor and the commodity but who can no longer ordinarily function as such' (Trenkle, [2006] 2014a: 219). Moreover, the attempt to establish the class-consciousness of a coherent class – let alone a negative consciousness oriented against its own abolition – risks missing the more urgent task, as expressed in Schandl's formulation that 'it is not deproletarianization against which it is imperative to struggle, but rather the ever-present process of dehumanization' (Schandl, 2002: 12).

## TERMINAL CRISIS

The fragmentation of class struggle is theorized as the reflection of a process in the

fragmentation of capitalism, and more specifically the 'intensification of the logic of capital in the stage of its decomposition' (Trenkle, [2006] 2014a: 219). This decomposition is what is identified as the terminal crisis of capitalism, the diagnosis of which is set out in the text with the strongest claim to being the founding text of the critique of value, Kurz's account of 'The Crisis of Exchange Value', which was published in the first volume of *Marxistische Kritik* in 1986, and which sets out, by means of an analysis and exposition of Marx's account of the tendency of the rate of profit to fall, the crisis theory that will underpin the critique of value. Kurz examines the implications of the divergence of abstract value from material social wealth according to which production and productivity refer at once to the creation of material wealth as the things that are required for life and that make life worth living, and to that of abstract economic value. For Kurz, it is not simply the case that capital prioritizes abstract value over material wealth to the point of indifference to the latter, such that as long as enough abstract value is produced it is of no consequence to capital whether its commodities fulfil any useful or beneficial social function: that as long as a market can be found, that is, from the perspective of capital it makes no difference whether its products are swords or ploughshares. Even the absolute quantity of value produced is irrelevant, for capital 'is fixated only on surplus value' (Kurz, [1986] 2014: 48).

Kurz proceeds by means of an elucidation of Marx's analysis of the category of relative surplus value, and specifically the phenomenon whereby increases in productivity as a result of the development of new technologies can enable a workforce of the same size to produce a greater quantity of commodities – or the same level of production to be maintained with a radical reduction in labour power. Productivity, then, increases. But this increase is brought about by a change in the organic composition of capital, as the ratio

of constant to variable capital grows significantly: it requires a higher investment in the technological means of production. As a result, there is a decrease in the quantity of surplus value embodied in each individual commodity: the constant capital (the technological means of production, the value of which is merely sustained and reproduced in the production of commodities) grows, while the variable capital (that is, labour power – the part of capital that produces additional value) decreases.

The central dynamic here is that of technological developments that reduce the amount of labour time required to produce a given commodity. Initially, the introduction of the new technology on a particular site or within a particular enterprise enables its inventor or first adopter to increase the surplus value in production, leading to an additional or extra profit, even when undercutting competitors. However, as these competitors are driven out of business, the new technology becomes the norm across the sector, and the additional profit disappears again – with this the rate of surplus value reverts to the original figure, and the absolute quantity of surplus value decreases with respect to the original figure before the introduction of the new technology. Scientific and technological developments are decisive here. In this respect Marx's famous observation in the *Grundrisse* that the state of advancement of science and technology influences the creation of wealth much more than the number of hours of labour time expended (Marx, 1983: 600) plays a central role in the development of value-critical crisis theory.

Capitalist competition, the driver of which is the profit motive, enables growth in prosperity and absolute rises in prosperity, but, as Claus Peter Ortlieb has shown, only up to a certain point (Ortlieb, [2008] 2014: 92–8). Before this point is reached, this competition appears to be the driver of innovation and creativity as such – which in a respect it is, but its primary aim not to make better (or more desirable) products (although this can of

course in some case be a means of satisfying the profit motive by capturing market share), but rather of doing so more efficiently (that is, by expending less labour power). But after this point has been reached – when the rate of surplus value reaches 1 – the continued expulsion of labour from the process of production, which continues to be driven by the profit motive, slowly comes to destroy the basis for the production of surplus value, and with it the production of commodities.

Although capitalist competition appears to drive both creative invention and increases in material wealth, in fact these are as it were positive side-effects of the pursuit of increased valorization. But this only functions while there is a correlation between value and material wealth. Once this correlation is broken, when the mass of surplus value has reached its peak, it becomes increasingly clear that these side-effects are temporary, and that growth in productivity is in fact indifferent to material wealth: 'if the destruction of material wealth serves the valorization of value, then material wealth will be destroyed' (Ortlieb, [2008] 2014: 112). It is not only the case, firstly, that capital is indifferent to the content of what it produces – that there can be competition for the more efficient production of more effective weapons, for example, as well as for goods that enrich life – or, secondly, that the production of goods can take place at the as it were incidental cost of environmental degradation or the decrease in quality of life, as natural resources are destroyed for the sake of increased valorization, and experience is impoverished as a result of the increasing commodification of life. It is also the case that if it serves valorization, commodities themselves will be destroyed, as was seen for example in the case of the bulldozing of thousands of foreclosed homes in the United States in 2010–11. Such processes go beyond the merely incidental destruction or degradation of non-commodified material wealth in order to produce value in the form of the commodity, but rather involve the wilful destruction of the material wealth of

commodities for which there is no market, in order to increase the sale price of other such commodities.

Acts of destruction of this kind testify to the growing divergence of the production of value from the enrichment of life in the fullest sense. Rather than driving innovation and creativity, commodity production harnesses and restricts it, letting it flourish only when it (as if incidentally) allows it to produce more abstract value. Or, put differently, the innovation, creativity and productivity with which commodity society is concerned are those that enable the production of more abstract value – whatever the cost. And yet the two forms of wealth remain commonly conflated, despite their increasing divergence from one another – perhaps the most striking contemporary manifestation of this phenomenon is theorized by Lohoff and Trenkle as ‘inverse capitalism’, in which the real economy with its production of goods has become dependent ‘on the growth of fictitious capital’ (Lohoff and Trenkle, 2012: 211). This concept of fictitious capital is developed from Marx, who coined the term in the third volume of *Capital* to analyse the crisis of 1857 to refer to the phenomenon whereby capital seems to multiply itself as a single debt is sold on, and yet functions as capital in different forms in the hands of different people (Marx, 1964, 3: 483–5). But whereas in Marx’s time fictitious capital played a subordinate role to functioning capital, the inverse capitalism that Trenkle and Lohoff theorize consists in the fact that fictitious capital has itself become the motor of accumulation.

As the financial rewards from the production of commodities fall away, capital takes flight in search of valorization to the speculative economy and to what Lohoff terms ‘second-order commodities’, commodities ‘which demonstrate the specific use-value of representing *future* value’ (Lohoff and Trenkle, 2012: 19, emphasis original). In this respect the massive growth in the speculative economy seen in recent years is not the cause of the ongoing financial and economic crisis,

but rather a means of initially deferring what was previously theorized as a long-overdue crisis of the Fordist economy, which subsequently opened a new phase of capitalist expansion and accumulation. This theorization underlies the prescience of the critique of value’s analyses – or, more cruelly, the criticism, in the words of the old joke, that the diagnosis of the decline in the production of surplus value has successfully predicted six of the last three crises. However, the force of the critique of value is not its ability to forecast the state of the economy, but rather its theoretical account of capitalism’s tendency toward crisis – not multiple punctual or cyclical crises, but rather a single process of crisis which is repeatedly deferred.

The more recent discussions thus share and develop the conclusion to which Kurz had come more than two decades previously with respect to the increasing expulsion of living labour from the process of production:

The new and final crisis of capitalism is fundamentally different from previous crises. All the crises that have happened up until now were crises of the growth of capital which could only temporarily interrupt the process of accumulation; the new crisis, however, reveals itself to be the end of the process of the accumulation of abstract wealth itself, because concrete material wealth can no longer be engendered within the limits of the value relation. The new crisis is thus no temporary crisis of overaccumulation or overproduction, but rather a crisis of the creation of value itself, from which there can no longer be a way out for capital. (Kurz, [1986] 2014: 54)

This diagnosis of the terminal crisis is at once the perspective from which the theoretical developments of the critique of value are produced and the optic through which its insights are made, the adoption of which signalled the renaming of the journal *Marxistische Kritik* as *Krisis* for the publication of its first (double) issue after the fall of the Berlin Wall in 1990. This change in name represents, as the issue’s editorial makes clear, no break from the development of the Marxian tradition, but rather the recognition that ‘working out

the revolutionary explosive force of Marxian theory involves precisely the radical critique of “Marxism” (Lohoff and Tomazky, 1990: 5).

## EMANCIPATION AND ANTI-POLITICS

The editorial to *Krisis* 8/9 advances the programmatic claim, in the light of Kurz’s account of the crisis of exchange value, that the increasing manifestations of and appeals to crisis – of the family, of the environment, of the individual, of state finances – are in fact the crisis of commodity-producing society itself, and attributes the failure of the proposed solutions to their failure explicitly to call into question the commodity form itself – which ‘to the consciousness that is imprisoned within the value form can only appear as the failure of every possible kind of solution’. As a result, ‘crisis becomes a synonym for apocalypse, and is thus forbidden from being thought’ (Lohoff and Tomazky, 1990: 7). In this respect the critical theory of crisis also involves a critique of the subject – both of the subject of cognition that cannot escape the presumptions of the value form, and of the search for an emancipatory subject that will bring about social and political transformation.

This goes hand-in-hand with an account of social domination as the subordination of life under the imperative for value to be valorized, akin to Postone’s conception of the abstract social domination that ‘subjects people to impersonal structural imperatives and constraints that cannot be adequately grasped in terms of concrete domination’ (Postone, [1993] 2003a: 3–4). In her analyses of patriarchy in commodity society, Scholz terms this a ‘subjectless domination’, in the sense that those who exercise domination ‘are not self-conscious subjects, but rather act in a historically unconsciously constituted framework of sociality’: even the dominant man who has ‘set mechanisms in motion in the formative

cultural and political institutions’ finds that they turn to dominate him as they ‘begin to lead a life of their own’ (Scholz, 1992: 22). Trenkle similarly theorizes the dependence of the establishment of capitalism on the ‘male-inscribed modern subject of labor and commodities, whose central essential characteristic is that the entire world becomes to him a foreign object’ (Trenkle, [2008] 2014b: 146). As more and more labour power is expelled from the process of production, the basis of this subjectivity becomes redundant, which ‘unsettles one of the basic pillars of male identity’, but because this process ‘leads to an intensification of competition at all levels of everyday life’ the result is not the progressive dismantling of this toxic identity, but rather its exacerbation, as qualities such as ‘hardness, assertiveness, and ruthlessness are more in demand than ever’ (Trenkle, [2008] 2014b: 149).

Scholz analyses the consequences for gender of conditions under which ‘capitalism is ceasing to be capable of reproducing humanity’ (Scholz, 2000: 17), paying particular attention to the effects of what Regina Becker-Schmidt terms the ‘double socialization’ of women, whereby they are simultaneously responsible for family and profession alike (Becker-Schmidt, 2008: 66). Theorizing the coincidence of the increasing (often compulsory) permeability of the divide between the two gendered spheres, and the frequently celebratory theorization of binary gender, Scholz observes that this has taken place ‘without fundamentally eradicating the hierarchy of genders’ (Scholz, [2009] 2014: 135). For gender is not simply a narrative or a signifier that can be deconstructed by means of a discursive intervention, but rather a structure of domination with its own history. Far from being an emancipatory liberation from ‘modern subjects with their fixed (sexual) identities’, what Scholz terms ‘postmodern flexi-individuals’ are themselves also the result of a patriarchal set of economic and social conditions: both are subject forms that are

'structured by patriarchy in its commodity-producing form'. 'The new compulsory flexi-subject which postmodern capitalism relentlessly demands is thus nothing other than the continuation of the modern subject in splintered form, that continues to await its emancipatory abolition' (Scholz, 2000: 7).

Such an abolition involves a radical transformation of the sphere in which all political tendencies of both left and right have accepted and indeed support a 'social apartheid' whereby distinctions are drawn between those who are able to sell their labour and those who are not, a situation that is exacerbated in a situation in which 'the successful sale of the commodity labour power has become the exception rather than the rule', in which left and right 'no longer disagree as to *whether* an ever larger proportion of the population should be pushed to the margin and excluded from this form of participation in society, but only as to *how* this selection should be bulldozed through' (Gruppe Krisis, 2004: 7, emphasis original). The opposition between the 'neoliberal fraction leaves the dirty work of social Darwinism to the trusty "invisible hand" of the market' (Gruppe Krisis, 2004: 7) by dismantling the social safety net provided by the welfare state in order to marginalize those who cannot keep up with the competition and its opponents, and its opponents who are equally committed to the view that 'a human being without work is no human being at all' (Gruppe Krisis, 2004: 9) is a dispute merely as to the means by which people should be forced to work in order to gain access to a share of social wealth, both proceeding on the shared presumption of the necessity of labour, at least for those who have no source of income except by means of the sale of their labour power.

Politics depends on the separation of the political and economic spheres, as the satisfaction of needs is left to an economic mechanism that is deemed to be outwith the scope of decisions as to how society is organized. The critique of value thus rejects any struggle

that presupposes or supports the continuation of this hypostatized separation:

The aim of politics can only be to conquer the state apparatus in order to carry on with labour society. The opponents of labour thus wish not to occupy the control centres of power, but to shut them down. Their struggle is not political, but anti-political. (Gruppe Krisis, 2004: 48–9)

With the decline in the quantity of surplus value produced per commodity as a result of the continued expulsion of labour from the process of production as a consequence of ever more sophisticated automation, the foundation on which this separation rests is being slowly undermined. The ensuing progressive divergence of value from material wealth testifies to the need to wrest this material wealth from the control of value, in an anti-political struggle that is directed against the very presuppositions of the separation of the political from the economic.

There is no reason why this erosion of the political should represent more of an opportunity than a threat: the critique of value testifies to the inevitability of collapse of capitalism, but not to the inevitability of communism. With the decline in the power and efficacy of social mediation through the value form, there is a danger of a renewed assertion of more direct power in the form of resurgent authoritarian populisms, whether they come to power in the form of authoritarian measures imposed in response to an emergency or terrorist threat, or are swept into office on the back of the popular appeal of a pseudo-antipolitics that claims to reject the conventions of politics and resounds with the sense of loss of the labouring subject (and the ensuing threat to masculinity) with slogans such as the promises of 2016 to 'take back control' and 'make America great again'.

The kind of anti-politics that is required for any emancipatory response to the ongoing crisis involves the breaking of the hold value over material wealth, and the development and establishment of practices that gain direct and communal access to material

wealth. That is to say, the kinds of anti-political movement that are required have to go beyond and call into question not only the relationship between labour and capital, but also the mediation of material wealth through value. In this respect, programmes for a universal basic income perpetuate the self-evident certainty that money is the only means by which this wealth can be attained, and that the state must mediate it, while attempts to develop a 'free economy' are themselves confined within the assumption of the separation of the political from the economic, which rather than representing the germ that could flourish into an emancipated life can in fact only ever be a marginal form within the interstices of the decaying capitalist economy (Flatschart, 2012: 38–40). But the blockade of thinking material and in particular social wealth outside the constraints of the value form is not simply an error in thinking, but a powerful real abstraction that has developed over the course of a history of unfreedom that spans generations: the challenge posed by the critique of value is to establish the practices that can dismantle their power in order to unleash the world's potential shared wealth.

Such practices would necessarily involve an orientation toward universality that breaks the claim of politics – the sphere of the false universal – to stand for universality. In part this means raising the demand for free and universal access in opposition to the current mediation of access to social wealth through the commodity form and the principle of exchange. But it also means the development of new ways of making decisions as to how resources should be expended, and as to the forms that social wealth should take – rather than, for example, continuing to restrict access to complex technologies (or indeed those that pollute) to those who have the ability to pay (Lohoff, [2009] 2014: 180–1). A minimal condition of the development of such practices is the unforgetting of the distinction between the potentially emancipatory content of any emergent initiatives, and the reified, competition-driven ways in

which we are conditioned to act as commodity subjects (Lohoff, 2006: 82). Above all, it means continually striving to orient ourselves toward the possibility of what Lohoff terms 'a life beyond the religion of valorization and the subject' (Lohoff, 2006: 89).

# The Frankfurt School and Fascism

Lars Fischer

On 9 May 1945, one day after VE Day, Theodor W. Adorno, who was in Los Angeles, wrote to Max Horkheimer, who was in New York. ‘I feel the need’, he explained,

to send you a few lines today, even though I have no ‘pragmatic’ reason to do so, simply because it is a pity that we have not experienced the demise of the Nazis together. Hitler’s regime has, after all, been the immediate cause of all the external developments in our lives for the last twelve years, and the expectation that things might change has been one of the decisive forces that have kept us alive. Conversely, the fact that our two lives have become conjoined is inextricably linked to fascism. Due to this phase good fortune and misfortune have become indissolubly entangled for us.<sup>1</sup>

The centrality of fascism in general and National Socialism in particular to the Frankfurt School’s evolution that Adorno stressed so clearly in this letter is obvious enough. It needs to be historicized in an appropriate manner, though. The dealings of the Frankfurt School with National Socialism were indeed immediate and they were, in the

first instance, of an empirical and practical nature. Much as the members of the Frankfurt School and their associates sought to develop a conceptual understanding of fascism in general and National Socialism in particular – as significant political movements and regimes whose policies and crimes they witnessed – this was a rather different undertaking from subsequent (and current) attempts to develop some sort of definitive, succinct and yet all-encompassing definition of fascism and/or National Socialism. To be sure, their concept of fascism doubtless became rather too inclusive in the course of the war. Even so, at the time, the task of identifying who or what was fascist was, for the most part, not one of the principal challenges faced by Horkheimer, Adorno, and their colleagues and associates because they lived in a world in which fascists and their supporters for the most part proudly professed their own fascism in all too inescapable a way. For all that fascism was generally rather more hesitant to speak its name after 1945, evidence

for the ‘afterlife’ of National Socialism in post-war Germany too was so palpable and abundant that it could be identified without any great finesse. The critical theorists’ assessments of fascism were heavily conceptual because they assumed that all descriptive work needed to be inherently conceptual to be of any genuine use, not because they assumed they were in the process of analytically isolating some unique category called fascism. They, in any case, focused most of their descriptive and conceptual work on fascism on German National Socialism, occasional cross-references to Italy or to ‘*international fascism*’ notwithstanding.<sup>2</sup>

The discussion of fascism among the members and associates of the Frankfurt School comprised a variety of positions and although Horkheimer and Adorno sided with Friedrich Pollock’s concept of state capitalism, no one ‘official’ stance ever emerged – I will discuss the one (rather improbable) text that arguably comes closest to formulating an ‘official’ position on the topic in some detail later. Indeed, at least in terms of their prognoses, even Horkheimer and Adorno did not see entirely eye to eye, as the latter noted in his letter of 9 May 1945:

As usual when we disagree it has turned out that we were both right. My bourgeois thesis that Hitler could not last has come true, albeit with a delay that makes it ironic. In other words: the forces of production of the economically more advanced countries proved stronger than the technological and terrorist spearhead of the late-comer: The war, following the overall historical trend, has been won by industry against the military. Yet your thesis about the historical force of fascism is also true, except that this force, like the embourgeoisement of Europe following Napoleon’s fall, has moved its abode.... Technically speaking, the [German] attempt to come to an understanding with the West at Russia’s expense has failed but it was inspired by the world spirit.<sup>3</sup> The conflict between the two absolute tickets from which there will no longer be any escape is clearly looming.<sup>4</sup>

I will return to Horkheimer and Adorno’s notion of ‘ticket mentality’ and their take on

the fate of fascism after 1945 towards the end of this chapter.

What all the contributions to the debates among the members and associates of the Frankfurt School had in common, however, was the fact that they were meant to serve one purpose before all others: to facilitate the most effective possible opposition to Nazi Germany and its fascist allies. This desire was to varying degrees complicated by the fact that for all those involved, the distinction between fascism in particular and capitalism in general was ultimately one not of kind but of degree – ‘Fascism has only revealed what was already inherent in liberalism’.<sup>5</sup> Yet this by no means prevented most of the members of the Frankfurt School from actively supporting the US war effort with their expertise – and with Horkheimer’s unreserved encouragement. To be sure, given the Institute’s dwindling finances, he was also relieved that some of its members were able to secure employment elsewhere, but it is quite clear that Horkheimer whole-heartedly endorsed their activities anyway. As is now well documented,<sup>6</sup> from 1942 onwards, Franz Neumann, Herbert Marcuse, Otto Kirchheimer, Leo Löwenthal and Arkadij Gurland worked in various capacities for the Office of War Information (OWI) and the Research and Analysis Branch (R&A) of the Office of Strategic Services (OSS). Pollock acted as a consultant for the Justice Department and participated in discussions about post-war European reconstruction under the auspices of Eleanor Roosevelt; and Adorno too co-authored at least two memoranda with Marcuse for circulation in Washington.<sup>7</sup> Neumann rose to deputy head and eventually acting head of the R&A Central European Section. Marcuse joined him there and was widely respected as ‘the leading analyst on Germany’.<sup>8</sup>

Raffaele Laudani has argued that the R&A Central European Section produced ‘a cohesive interpretation of the Nazi “enemy” with a clear Frankfurt imprint’, though he also concedes that Neumann and his colleagues

'nearly always lost' the 'political "battles"' they provoked 'inside the American administration'.<sup>9</sup> As the war drew to a close, they played a crucial role in putting together a *Handbook on Nazi Germany* and *Civil Affairs Guides* for the War Department's Civil Affairs Division,<sup>10</sup> and Marcuse drew up a list of entrepreneurs and economic officials who, despite not being members of the Nazi party or apparatus, had played an essential role in Nazi Germany.<sup>11</sup> Neumann eventually travelled to London, where he headed up a special research group on war crimes and worked with Robert H. Jackson, the US chief prosecutor at Nuremberg. In this capacity he evidently pushed his 'spearhead' theory of antisemitism so successfully that it was adopted by Jackson, which helps explain why the Shoah played such a relatively subordinate role at Nuremberg.<sup>12</sup> In other respects, his suggestions were repeatedly ignored, however, and Neumann resigned only days after the main trial opened.

There is a certain irony to Neumann's 'career' in the OSS, given that he had initially warned against undue identification with the United States. In his preface to the State Socialism issue of the *Studies in Philosophy and Social Science* (on which more later), Horkheimer wrote: 'The unprecedented governmental power necessarily associated with state capitalism is now in the hands of a democratic and humanitarian administration'.<sup>13</sup> He then went on to stress the importance of ensuring it stayed there and the difficulties this was likely to entail. Commenting on a draft version of the preface, Neumann wrote: 'It goes without saying that I disagree with your positive assessment of American democracy but I am happy to drop my objection, given the political situation'.<sup>14</sup> It is indicative of the complications that arose from the contention that fascism in particular and capitalism in general differed not in kind but by degree that Adorno took issue with the same passage, albeit precisely with the opposite motivation: given Horkheimer's evident scepticism about the viability of a democratic

form of state capitalism, the statement that the current 'democratic and humanitarian administration' already held the 'unprecedented governmental power necessarily associated with state capitalism' in its hands might well be understood as a 'veiled attack on the Roosevelt administration'.<sup>15</sup>

Ambiguities of this kind were also reflected in the terminology deployed by Horkheimer and his colleagues and associates in their grappling with fascism. The terms fascism, National Socialism, state capitalism, authoritarianism and totalitarianism were occasionally contrasted but most of the time they were used more or less interchangeably. State capitalism, to some extent, was the odd one out insofar as we do find the occasional vague hint at the possibility – more precisely perhaps: at the desperate hope – that it might also be able to exist in a democratic, non-totalitarian guise.

In part, this relatively loose use of terminology reflected a genuine double bind that invariably arises if one insists, as one should, that fascism in general and National Socialism in particular were ultimately not fundamental aberrations from the course of Western history but a logical consequence of certain potentially problematic elements integral to that history. Fascism and non-fascism, far from being radically distinct entities, are thus placed on a continuum and the crucial question then concerns the transition, the qualitative leap, from a non-fascist state of affairs in which the potential for fascism nevertheless inheres to a fascist state of affairs in which, in turn, many of the characteristics of the non-fascist state of affairs are still present and yet take on a radically different meaning.

With the benefit of hindsight, it is evident that the relatively loose use of terminology also reflected erroneous assumptions on the part of the Frankfurt School about the overarching socio-economic processes they were encountering and which they saw, at the time, as leading inexorably to only one possible outcome, which they identified fundamentally with fascism. Yet the critical theorists'

concepts need to be judged not against current insight but against the backdrop of the convulsions of the first half of the twentieth century. That capitalism underwent massive changes and experienced a profound crisis at the time is obviously undeniable. Across the board, be it in the United States, in Europe or the Soviet Union, industrial production was subject to a previously unimaginable degree of centralization, streamlining and state intervention, leading to an equally unprecedented regimentation and functionalization of labour. From the perspective of the 1930s and 1940s, this economic regimentation was largely matched by ever more crass forms of political and cultural regimentation, which eventually played out against the backdrop of a previously unimaginable measure of destruction and barbarism. The apocalyptical account of an inexorable descent into a fascist/National Socialist/authoritarian/totalitarian hell on earth, which the Frankfurt School offered in the 1940s, may seem too teleological, mono-directional and all-encompassing with the benefit of hindsight. And yet, to want to accuse the Frankfurt School of undue alarmism seems an odd conceit against the backdrop of increasing repression and terror, the danger and then reality of the Second World War and, especially, the Shoah – not yet in its capacity as conceptual putty but as an ongoing, unfolding, seemingly interminable genocide.

When all is said and done, however, the Frankfurt School's relatively loose use of terminology was also just that – loose. Or, to be more precise, it was indicative of the overlap of a number of conceptual concerns that, certainly for Horkheimer and Adorno, were ultimately complementary yet competed with one another as they sought to work them out. I repeat: it is important to remember that many of the questions that continue to preoccupy scholars of fascism to this day were, for Horkheimer, Adorno, and their colleagues and associates of immediate practical import. That fascism differed in possibly decisive ways from what went

before was inescapable, yet neither could one reasonably claim that it had nothing in common with the order it replaced. Was fascism, then, ultimately, more of the same in a more extreme form or was it a qualitatively distinct phenomenon? Was fascism ultimately created and determined by economic necessity or had fascism submitted the economy to its own political ends (or was it in the process of doing so)? Given its extreme, violent and rapacious nature, was fascism inherently unstable and set to implode of its own accord in a relatively prompt fashion or did it represent a new order that could be sustained indefinitely or at least for the foreseeable future? As we will see, the question of fascism's potential to remain stable in the long run was a major preoccupation for the critical theorists. The explanation for this is simple enough: any suggestion of its acute instability might have been taken to mean that fascism was a problem that would resolve itself in fairly short order and/or whose implosion might yet precipitate a successful (proletarian) revolution in Central Europe. Assuming fascism was indicative of a new developmental phase of capitalism, was this new form of capitalism inevitable and/or irrevocable? If fascism was a form of state capitalism and state capitalism was the newest form of capitalism, could this new form of capitalism also take on a democratic guise or was fascism the only mode of sociation that it allowed for, and what exactly did that mode of sociation entail? And if fascism did represent the newest developmental phase of capitalism, would it be possible to defeat fascism without also overcoming capitalism?

In response to these and a host of attendant questions, the critical theorists deployed a range of conceptual approaches including the state capitalism concept, the racket theory,<sup>16</sup> the evolving conceptual frameworks of the integrative force of the culture industry, the dialectic of enlightenment and the administered world – and, far from least and closely connected to all of these, the core contention Adorno formulated in 1940 as follows: 'if it

is true that one can understand antisemitism only if one understands National Socialism, then it must be equally true that one can understand National Socialism only if one understands antisemitism'.<sup>17</sup> As we will see, contrary to the widely accepted narrative, Horkheimer and Adorno were in fact quite selective in their endorsement of Pollock's concept of state capitalism. Clearly, though, Pollock's emphasis on the elimination of the sphere of circulation in state capitalism resonated strongly with them and it is hard to resist the impression that this was so because it allowed them to hang their conceptualization of antisemitism rather neatly (to their minds) on a materialist and 'empirical' hook. As Adorno had written to his parents in February 1940, 'fascism in Germany, which is inextricably linked to antisemitism ... represents a universal tendency with an economic foundation, which you yourself, Dear WK [i.e., Adorno's father, Oscar Wiesengrund], recognized fairly early on, namely, the demise of the sphere of circulation'.<sup>18</sup> The ongoing attachment to this notion is indicated not least by the prominent role this particular 'element of antisemitism' continued to play in their discussions, even as their much more broadly contextualized work on *Dialectic of Enlightenment* progressed apace.<sup>19</sup>

The Frankfurt School's grappling with fascism per se, then, was, for the most part, pragmatic in nature, on the one hand, and ultimately subsumed under more wide-ranging conceptual concerns, on the other. This was also reflected in Adorno's letter to Horkheimer of 9 May 1945. Having just emphasized how central a role fascism had played in their lives, Adorno promptly added:

It is remarkable that life nevertheless takes on so much momentum of its own that one becomes quite oblivious to this reason, much as the bet on which his fortunes hinged is forgotten in the course of Faust's long existence. Only Mephistopheles perfunctorily and hastily thinks of it again at the end, yet it no longer bears any genuine meaning for the life, which has become autonomous.<sup>20</sup>

## TEXTS

The final two issues of the *Zeitschrift für Sozialforschung*, now *Studies in Philosophy and Social Science* – volume 9, numbers 2 and 3 – formed the crucial focal point of the Frankfurt School's contemporaneous grappling with fascism. Adorno expressly referred to the first of these as 'the State Socialism issue' [*Staatskapitalismusheft*].<sup>21</sup> It contained the following essays:

Frederick Pollock, 'State Capitalism';  
A. R. L. Gurland, 'Technological Trends and Economic Structure under National Socialism';  
Otto Kirchheimer, 'Changes in the Structure of Political Compromise';  
Max Horkheimer, 'Art and Mass Culture';  
T. W. Adorno, 'Spengler Today'.

The journal's final issue drew in part on a lecture series delivered by Institute colleagues at Columbia University in November and December 1941. The lectures were:<sup>22</sup>

Herbert Marcuse, 'State and Individual under National Socialism';  
A. R. L. Gurland, 'Private Property under National Socialism';  
Franz Neumann, 'The New Rulers in Germany';  
Otto Kirchheimer, 'The Legal Order under National Socialism';  
Frederick Pollock, 'Is National Socialism a New Order?'

The line up of the issue, which came out towards the end of May 1942,<sup>23</sup> was as follows:

Max Horkheimer, 'The End of Reason';  
T. W. Adorno, 'Veblen's Attack on Culture';  
Herbert Marcuse, 'Some Social Implications of Modern Technology';  
Frederick Pollock, 'Is National Socialism a New Order?';  
Otto Kirchheimer, 'The Legal Order of National Socialism'.

Presumably Neumann's lecture was omitted due to its overlap with the relevant discussion in his *Behemoth*, the first edition of which came out just before the final issue of the journal.<sup>24</sup>

In addition to these two journal issues and Neumann's *Behemoth*, further key texts were:

Horkheimer's 'Die Juden und Europa' ['The Jews and Europe'] (1939);<sup>25</sup>

Horkheimer's 'Autoritärer Staat' ['Authoritarian State'], originally written in 1940 with what would become the State Socialism issue of the *Studies* in mind.<sup>26</sup> In the event, it appeared in the mimeographed memorial publication for Walter Benjamin published by the Institute in 1942;<sup>27</sup>

Horkheimer's text on 'The Sociology of Class Relations' (1943);<sup>28</sup> and Adorno's corresponding 'Reflexionen zur Klassentheorie' ['Reflections on Class Theory'] of 1942,<sup>29</sup> neither of which were published at the time.

All nine volumes of the *Zeitschrift für Sozialforschung*/*Studies in Philosophy and Social Science* – and with them most of these texts – are now readily available online. Neumann's *Behemoth* has consistently been widely circulated and repeatedly reissued, and diehard scholars of critical theory can even access all five drafts of Horkheimer's 'Sociology of Class Relations' online among the digitized holdings of the Horkheimer Archive in Frankfurt. Consequently, the debates reflected in these texts can easily be reviewed by anyone whose interests go beyond the aspects I can reasonably discuss in this chapter.

Helmut Dubiel and Alfons Söllner published a German-language selection of these texts in 1981, focusing specifically on analyses of the National Socialist economy, law and state.<sup>30</sup> While a selection obviously needs to be selective, Horkheimer and Adorno would surely have been deeply resentful of this separation of the more obviously political and economic contributions from those that were, *prima facie*, more 'feuilletonistic' in character, insistent as they were that 'the analysis of a single work of art can lead more deeply into the inner structure of society than the most elaborate questionnaire with a giant apparatus for investigation and with tremendous statistical results'.<sup>31</sup>

## STATE SOCIALISM

It is generally accepted that a fundamental divide ran through the Frankfurt School in the late 1930s and early 1940s in terms of their understanding of the nexus between fascism and capitalism. This controversy pitted Neumann, Gurland and Kirchheimer, on the one hand, against Pollock, Horkheimer and Adorno, on the other.<sup>32</sup> On Pollock's account, fascism corresponded to a new, qualitatively distinct phase of capitalism, that of state capitalism in its totalitarian guise (though, as already indicated, he had relatively little to say about its potential non-totalitarian counterpart, democratic state capitalism). The chief feature of state capitalism was the redundancy of the market whose functions had been resumed by the political sphere. That political sphere, in turn, now consisted of a range of competing rackets. While Pollock thus insisted on the primacy of politics in state capitalism, and Horkheimer and Adorno endorsed his position, Neumann, Gurland and Kirchheimer continued to insist on the primacy of economic factors in understanding the dynamics at work in Nazi Germany.<sup>33</sup> It is no coincidence that this disagreement mapped neatly onto the assessment of the significance of antisemitism. While Adorno and Horkheimer insisted on the centrality of antisemitism to National Socialism and linked it to the ostensible demise of the sphere of circulation supposedly characteristic of state capitalism, Neumann maintained that 'one can offer an account of National Socialism without attributing a central role to the Jewish problem'.<sup>34</sup>

Yet while all this is certainly the truth and nothing but the truth, it is anything but the whole truth. To what extent Horkheimer and Adorno genuinely subscribed to Pollock's conceptualization of state capitalism is, as already indicated, a rather moot point.<sup>35</sup> While generally full of praise, Horkheimer had already expressed certain reservations about Pollock's outline for the essay that was going to open the State Capitalism issue of

the *Studies*. He had two principal reservations. Firstly, he feared that the portrayal of state capitalism, including its totalitarian variant, i.e., fascism, as the logical and ultimately inevitable contemporary guise of capitalism could be understood as an expression of partisanship for totalitarian state capitalism, a concern he reiterated on reading a draft of the essay itself.<sup>36</sup> That this was an ongoing issue for Horkheimer is demonstrated by the fact that he also raised it in the context of his harsh critique of Henryk Grossmann. Grossmann, Horkheimer suggested, was being Hegelian in that he subscribed to 'Hegel's crucial mistake', which had lain 'in his confusing theory and justification ... Do you really think', he asked Grossmann rhetorically, 'that the objective necessity of fascism, which draws all the currents of late capitalism into itself like a vortex, cannot be demonstrated just as easily as that of all the previous phases – perhaps even more so?'<sup>37</sup>

A second, more general worry was that Pollock's account was, by Horkheimer's and Adorno's standards, insufficiently dialectical. In his outline, under the final heading, 'End of the Economic Era', Pollock had suggested a scheme of thesis (feudalism), antithesis (private capitalism), and synthesis (state capitalism).<sup>38</sup> To Horkheimer's mind, the conceptualization underlying this scheme was 'still extremely shaky'. After all, it was 'certain aspects of Imperial Germany', not fascism, that 'seemed like a sort of synthesis between feudalism and private capitalism'.<sup>39</sup> He also expressed his unease at Pollock's contention that, in the new (state capitalist) state, 'the seemingly independent institutions namely party and economy are only its specialized arms':<sup>40</sup>

Party and economy (their coordination with 'and' is presumably just an oversight) are not just slaves but just as much masters, or rather: the means shape those who deploy them – and by economy I don't mean just the laws of the market under liberalism and by party not just the hierarchical form but also the interests that assert themselves within it.<sup>41</sup>

Having been asked by Pollock to comment on a draft of the article itself, Adorno was highly alarmed. As he explained to Horkheimer, the 'critical suggestions' he had made to Pollock

could deal only with details and questions of presentation and it would have been simply impossible to alert him to the actual extent of my concerns. Impossible, first, because as a non-economist I do not have the authority required to present those concerns but also, second, because it would have been psychologically irresponsible of me to articulate a critique genuinely reflecting my point of view. I can best summarize my concerns about this essay by saying that it represents an inversion of Kafka. Kafka presented the hierarchy of the office as hell. Here hell turns into a hierarchy of the office. Moreover, the whole thing is so thetical and it is written to such an extent, in the Husserlian sense, 'from above' [*von oben her*] that it lacks all conviction [*Eindringlichkeit*], not to mention the undialectical assumption that a non-antagonistic economy can exist within an antagonistic society. I anticipate a genuinely aporetic situation. If the essay comes out in this or a similar form it will only harm the reputation of the Institute and, above all, Fritz's own reputation, and unleash sardonic howls of triumph from the Lowes,<sup>42</sup> Neumanns *e tutti quanti*. On the other hand, it would be a grave setback for the State Socialism issue if it were not published.<sup>43</sup>

His own essay on Spengler 'only works as a philosophical link to the problem of state capitalism', Adorno added – clearly demonstrating the integral connection Horkheimer and Adorno envisaged between the 'political' and 'feuilletonistic' contributions in the journal – but it was 'far too modest to carry such an aspirational issue'. The only solution, Adorno suggested, would be for Horkheimer to rewrite Pollock's essay in a manner combining it with the motifs 'in your "State Capitalism"'. After all, the central motifs in Pollock's text

obviously originate in your essay but they have been simplified and de-dialecticized [*entdialektisiert*] to such an extent that they have been turned into their opposite. I am pretty certain that, if one could convince Fritz that this offers an opportunity to publish your theory in connection

with his work and merge the two pieces, he would go along with anything, and you would be able to turn it into the essay we envisaged. Perhaps the essay could appear under both your names, which would surely be a matter of great satisfaction for Fritz.<sup>44</sup>

Adorno did admit, though, that it was hard to dismiss ‘the argument that it would be a shame and uneconomical simply to omit your essay on state capitalism in such an issue’.<sup>45</sup> By ‘your “State Socialism”’, Adorno meant Horkheimer’s aforementioned essay on the ‘Authoritarian State’ (eventually published in the commemorative publication for Benjamin), which had originally borne the title ‘Staatskapitalismus’. This surely means that Horkheimer’s essay on the authoritarian state is a much better source for the understanding of Horkheimer’s and Adorno’s approach to state capitalism than Pollock’s flagship article on state capitalism in the *Studies*.

Horkheimer thereupon tried to impress on Pollock once again, this time in somewhat clearer language, though to little effect, the need to place greater emphasis on the ‘entanglement and ambiguity of the phenomena ..., the crossover between the concepts etc’. He urged Pollock to revise the text so that ‘it might all come across in a slightly less rigidly administrative manner’.<sup>46</sup> Adorno seems to have been slightly more successful in suggesting to Pollock, as he reported to Horkheimer, that he revise ‘the final part of the essay on democratic state socialism’ by giving it ‘the guise of questions and issues for future research. The intercalation of this protective device seems to me to be the only way to avoid embarrassing ourselves in the eyes of our friends by giving the impression that we endorse theses, which simply cannot be endorsed. What do you think? In terms of the content’, he continued,

the crucial problem is: does the tendency towards a crisis-free command economy presented in the text really express the objective tendency of reality or does the current antagonistic state of affairs continue to preclude the notional purity of this

construct in future too? I feel in no position genuinely to answer this question. My instinct is as follows: the truth of the concept lies in its pessimism, i.e., the view that the chances of domination in its immediately political guise being perpetuated are greater than those of getting out [from under it]. Wrong is the optimism, even for others. What is being perpetuated is not so much a stable and in some way rational state of affairs but rather, for the foreseeable future, a relentless succession of catastrophes, chaos, and terror – but with that, conversely, also a renewed chance of escape.<sup>47</sup>

Eventually, Horkheimer wrote a rather longer preface than usual for the State Socialism issue to place Pollock’s article in the ‘right’ context. Adorno certainly felt that Horkheimer had done an excellent job of solving ‘the tactical challenge of ruling out the misunderstanding that Fritz’s essay actually acknowledges the possibility of a non-antagonistic form of state capitalism [on the one hand] without making the slightest concession to the official Marxist optimism [on the other]’.<sup>48</sup>

Responding to the draft of the preface, Neumann wrote to Horkheimer:

you interpret Pollock’s essay in a manner that renders it entirely harmless so that it [the essay] entirely contradicts your interpretation [of it]. Anyone who reads Pollock’s essay and your preface must conclude that you have misunderstood each other. I appreciate entirely why you have undertaken this reinterpretation [*Uminterpretierung*]. You want to avoid distancing yourself from Pollock. I think it would be much better to let the disagreements become apparent, rather than hiding them and suggesting to the uninitiated that the two directors of the institute are talking past each other.<sup>49</sup>

In his response, Horkheimer assured Neumann that,

since my trust in your study of the economic processes in Germany is unlimited, I take your word for it that Germany in its current state comes nowhere close to being a form of state capitalism. On the other hand, I cannot shrug off Engels’s opinion that society is heading towards such a state of affairs. Consequently, I have to assume that it is in all likelihood looming and, to my mind, this renders Pollock’s construction a valuable basis for discussion, all its flaws notwithstanding.

He added that he could only agree with everything that Neumann had to say about the 'profound identity' between the fascist state of affairs and its predecessors.<sup>50</sup>

Nor does the story end there. Rolf Wiggershaus has pointed to Neumann's essay on 'Approaches to the Study of Political Power', published in 1950.<sup>51</sup> There Neumann explained that 'the Soviet Union presents a clear-cut marginal case where political power not only has made itself supreme but has become the fount of whatever economic power positions exist', adding that, 'had there been no war or had the Nazis been victorious, the Soviet pattern would have prevailed' in Nazi Germany too.<sup>52</sup> In short, he conceded that a primacy of politics was conceivable and that the momentum in Nazi Germany was indeed headed in that direction. Adorno, conversely, felt no compunction about praising Neumann's *Behemoth* to his students in 1968 as 'the most congruous socio-economic account of fascism to date',<sup>53</sup> though admittedly this praise hinged principally on Neumann's implicit appropriation of the racket theory. Neumann, Adorno emphasized, had demonstrated that the ostensible integration of society under National Socialism had been superficial at best. In fact, 'under the mantle, the very thin mantle of the total state, an almost archaic and anarchic struggle between the various social groups' had raged.<sup>54</sup>

### **HORKHEIMER'S 'PREFACE' IN THE FINAL ISSUE OF THE *STUDIES IN PHILOSOPHY AND SOCIAL SCIENCE***

One might well argue, then, that Horkheimer's preface to the State Socialism issue of the *Studies in Philosophy and Social Science* is the closest there is to an 'official' contemporaneous statement on fascism by 'the Frankfurt School', especially since, Horkheimer's re-interpretation of Pollock's article aside, Neumann too – who had characterized

Pollock's essay on state socialism as 'contradicting the Institute's theory from beginning to end' and signalling a 'departure from Marxism'<sup>55</sup> – expressly confirmed that 'I find the formulations excellent and fully agree with the first 4¾ pages ... The formulations are exemplary and I would not want to change them in any way'.<sup>56</sup>

Given my earlier remarks about the critical theorists' preoccupation with the transition or qualitative leap between non-fascism and fascism it will hardly come as a surprise that Horkheimer began his preface by explaining that 'the articles in this issue deal with some problems implied in the transition from liberalism to authoritarianism in continental Europe'.<sup>57</sup> Note also the reference to authoritarianism rather than fascism. He then went on to develop a typological juxtaposition of pre-modern society (implicitly), 'classical' liberal capitalism (or, as Adorno called it, 'competitive capitalism' [*Konkurrenzkapitalismus*]),<sup>58</sup> monopoly capitalism and state capitalism. Initially, he explained,

private industry consisted of numerous independent entrepreneurs who in each country competed with likewise independent traders and bankers for social power. The outcome of this struggle expressed itself in the relative size of the capital controlled by each of them. Dominion over men and things was distributed among the members of this diversified social group according to the rules of exchange.

In contrast to the early modern absolute state that had gone before,

power had become decentralized; it had been transferred from relatively well-organized privileged bodies to the multitude of proprietors who possessed no other title than their wealth and their resolve to use it. The course of social production was the resultant of their respective business policies.

The 'seigneurial ordinances' of pre-modern society had been 'replaced by anonymous laws and autonomous institutions, by economic, legal, and political mechanisms

which reflected the size and composition of the nation's industry'. In the next phase,

[c]ompetition among independent entrepreneurs eventually culminated in the giant concerns of monopolist industry. Under their hegemony competition assumed a different form. Their urge to compete with equals within the nation declined, and with it the motive for increased investment and full employment. The great leaders of business and other avenues of social life found their peers only across the various national borders. Rivalry among equal powers shifted more and more to the international scene alone.

At this point Horkheimer moved beyond the predominantly economic line of argument, stressing that 'the transition affected culture as a whole'. He then moved straight on to 'the advent of fascism' – without offering any explanation as to how fascism related to monopoly capitalism.<sup>59</sup> 'Would it not be a good idea', Adorno had asked after reading the draft of the preface,

to say something explicit about the relationship between monopolism and fascism? I would be all the more in favor of a differentiation at this point because Kirchheimer's essay ['Changes in the Structure of Political Compromise'] is far too crude in equating the two. One could do this in a very Hegelian way and conceive of fascism as monopolism that has come into its own. Through its totalization, monopolism develops the new quality of fascism. The total domination of the monopolies transforms economy and society because it is identical with the elimination of the very market previously dominated by the monopolies.<sup>60</sup>

Yet evidently Horkheimer was not convinced of the need to explain this transition. 'With the advent of fascism', then,

dualisms typical of the liberalistic era, such as individual and society, private and public life, law and morals, economy and politics, have not been transcended but obscured. Individuals have become less and less independent of society, while society has fallen to the mercy of mere individual interests. With the decline of the individual, moral feelings that stood against authoritarian law have lost their force, while authoritarian law has been entrusted to a perverted moral sense.<sup>61</sup>

Combining the state capitalism concept, racket theory and elements clearly prefiguring the notion of the 'administered world', Horkheimer continued by arguing that

[r]igid discipline such as ruled inside the factory has now spread throughout the hinterland, borne forward by élites who in their composition and function have combined economy and politics. The leaders of industry, administration, propaganda, and the military have become identical with the state in that they lay down the plan of the national economy as the entrepreneur before them had laid down policy for his factory.<sup>62</sup>

The 'streamlined unconcern for material and ideal barriers' shared by the rackets that had usurped the state and their need to defend their status against the claims of the general-ity did not, however,

endow the ruling group with a real solidarity ... To counterbalance their antagonism, no common faith exists, as among the medieval clergy, no belief in chivalry and princely blood, as among the seigneurs of absolutism ... The unity of fascist leaders is cemented merely by their common fear of the people they tyrannize, by their dread of ultimate doom.

In fact, 'the big industrialists attack the fuehrers for their expensive political apparatus; the fuehrers blood purge the underfuehrers because of their radical claims; the generals would like to get rid of all of them'. The ruling 'clique', in short, 'does not become the dupe of its own ideologies; it shuffles them about freely and cynically according to the changing situation, thus finally translating into open action what modern political theory from Machiavelli and Hobbes to Pareto has professed'.

The next two sentences then read:

These are the basic features of authoritarian society as it took shape after the debacle of European liberalism, and most typically in Germany. Under National Socialism the distribution of goods is carried on by private means, though competition has become even more one-sided than in the era of the 200 families.

Evidently, then, fascism, authoritarianism and National Socialism could all be equated.

This alone makes it very difficult to discern what Horkheimer assumed the dialectic of continuity and discontinuity to be in these developments. Did 'the debacle of European liberalism', for instance, mark a caesura or simply a stage in the logical progression of capitalism? That Horkheimer and his colleagues should not have been troubled by this lack of clarity, I would argue, only bears out my contention that the Frankfurt School did not see itself as engaging in the purist distillation of an essentialist concept of fascism but was putting up a desperate fight to take on, both in conceptual and practical terms and in the most pragmatic way they knew how, a host of evidently interrelated and deeply troubling developments.

'Intra-national competition', Horkheimer continued, 'turns into oppression.... As long as its power had been decentralized', he explained,

industry, propelled by its self-interest, had to cater to the needs of the population and, willy-nilly, promoted technical, political, and social progress, at least to a certain degree. But under its totalitarian set-up big industry is in a position not only to impose its plan upon its former competitors, but to order the masses to work instead of having to deal with them as free parties to a contract. Popular needs determine production far less than they did through the market, and industry converges on the production of instruments of destruction.

Having reiterated the notion of the elimination of the market that was crucial to the state capitalism concept, Horkheimer now moved squarely into dialectic of enlightenment territory. 'Planned waste of intelligence, happiness, and life',<sup>63</sup> he continued,

succeeds the planless waste caused by the frictions and crises of the market system. The more efficiently authoritarian planning functions and the more smoothly nature and men are exploited, – the more are subjects and objects of the plan dominated by dead matter and the more senseless, exorbitant, and destructive becomes the whole social apparatus which is maintained for the perpetuation of power exclusively.<sup>64</sup>

All the rhetoric to the contrary notwithstanding, 'the blind calculative rationality of business life, so bitterly denounced by fascism, has carried over to the authoritarian society'. In it, the previous 'irrational rationality' of liberal capitalism had been replaced by 'madness with method'. While genuine socialism would be characterized by a humankind that is 'conscious of its common good and solidarity' and 'guides its own destiny', under 'this so-called socialism ... the natural conditions, the pressures of the masses, the rivalries of cliques play themselves off against each other in the sinister hearts of the *fuehrers* and emerge as the blind laws of fascist economy'. To be sure, 'during the earlier periods of private industry', too, 'the achievements of men turned increasingly against them; no masterpiece of engineering, no gigantic factory, no ladies paradise arose without enhancing the power of society as well as its misery'. Now, however,

in authoritarian society, technical, social, military advances are the handmaids of doom and disaster. Every frontier torn down by fascism only strengthens the walls separating men from each other, every means of communication it improves only places them farther apart, every scientific invention only blinds them the more to nature.<sup>65</sup> Progress in the abstract triumphs. The world belongs to the clever, and the devil take the hindmost, –

he continued, and then added: 'this is true more than it ever was', a formulation that surely epitomizes the intimate entanglement of continuity and discontinuity in Horkheimer's account. 'The soul of fascism', he went on, was 'the principle of letting nothing lie still, of stirring everyone to action, of tolerating nothing that has no utility, in a word, dynamism ... Moral taboos and ideals are abolished; true is that which has proved serviceable'.<sup>66</sup> What Horkheimer described in this instance as 'the soul of fascism' would, of course, resurface in *Dialectic of Enlightenment* as Horkheimer and Adorno's critique of the Enlightenment that had yet to develop a sense of its true purpose and power

and thus transcend its own limitations. 'Can anyone dare question the serviceability of the secret police, of concentration camps, blood purges against the insane, anti-Semitism, relentless activization of the people?' Horkheimer continued.<sup>67</sup> 'Fascists have learned something from pragmatism. Even their sentences no longer have meaning, only a purpose'.<sup>68</sup>

Fascism, he suggested,

feels itself the son, nay the savior, of the world that bore it. That world collapsed, as Marx had prophesied, because after it had reached a certain point in its development, it was unable to fulfill human needs. Technological unemployment has evidenced the crisis which cannot be alleviated by returning to the market system.

This would suggest that there was indeed no way back.

'National Socialism attempts to maintain and strengthen the hegemony of privileged groups by abolishing economic liberties for the rest of society', he went on. Turning finally to 'the German people' in general, Horkheimer suggested that 'in tolerating Hitler', they 'went along with the facts; given the prevailing inequality and injustice it was politic to profit from the weakness of the old world powers and to supplant them. With the world as it was, Hitler seemed more practical than Stresemann. National Socialism became the die-hard competitor on an international scale. And now', he concluded the general section of his preface, in a perhaps somewhat surprising twist, 'the question is whether the long established houses can remodel their enterprises fast enough to get rid of it'. Evidently, then, fascism need not have the last word after all.

Horkheimer then turned to Pollock's essay on state capitalism. Its topic was

an authoritarian society that might embrace the earth, or one that is at least autarchic. Its challenging thesis is that such a society can endure for a long and terrifying period. Basing itself on the most recent economic experience, it comes to the conclusion that all technical economic problems

that worried the business world can be handled through authoritarian devices. The article attempts to destroy the wishful ideas that fascism must eventually disintegrate through disharmonies of supply and demand, budget deficiencies, or unemployment.

That said, he clarified, 'the study is not confined to authoritarian society alone but conceives the latter as a sub-species of state capitalism, thus raising the question whether state capitalism might not be workable within the framework of democracy rather than terror'.<sup>69</sup> Then followed the aforementioned 'positive' remarks about US democracy that had worried both Neumann and Adorno. In the final short paragraph, Horkheimer relativized the significance of Pollock's essay by noting that it 'outlines the economic structure of state capitalism' and emphasizing that the remaining articles in the issue 'study the links between authoritarian society and the past, as well as the disharmonies that dominate its existing forms'.<sup>70</sup>

## AUSCHWITZ

Within about a fortnight (at most) of the publication of the final issue of the *Studies* and the Institute's commemorative volume for Benjamin, the BBC broke the news of the German genocide against European Jewry to the wider public (though it seems unlikely that somebody who was as well informed and connected and as heavily involved in trying to rescue Jewish relatives and associates from Europe as Horkheimer would not already have had a fairly good idea of what was going on). The impact of the Shoah on Horkheimer and Adorno is well documented. None too surprisingly, it led them to take an even bleaker view of the direction in which the world seemed to be heading. They also became rather less forgiving in their assessment of the role of the German population.<sup>71</sup> They now reasoned that the still very young history of fascism (or state capitalism) on its

own could not possibly account for the 'endless series of inconceivably horrible deeds, the most fiendish acts of organized murder and destruction ever accomplished by any people since the beginning of history' that were now being perpetrated by 'the German nation'.<sup>72</sup>

This explicit reference to 'the German nation' is indicative of a tension, which, from the final years of the war onwards, characterized their assessment of fascism/National Socialism for a while. Confronted with the Shoah, the critical theorists became increasingly preoccupied, even more so and – especially – more explicitly than before, specifically with German National Socialism, on the one hand, while the universalizing tendencies of the *Dialectic of Enlightenment* project also led them to worry very seriously about the possibility that fascism, after the defeat of Nazi Germany, would come to dominate the West in its entirety, not least given the forces it would need to mobilize to fend off Soviet Communism. This is what Adorno meant when he wrote, in his letter to Horkheimer of 9 May 1945, that 'the historical force of fascism ... has moved its abode', and that 'the conflict between the two absolute tickets from which there will no longer be any escape is clearly looming'.<sup>73</sup>

'Ticket thinking' featured prominently in the seventh of the 'Elements of Antisemitism' Horkheimer and Adorno added to the version of *Dialectic of Enlightenment* published in Amsterdam in 1947. They argued that there was a tendency for people no longer to make actual judgements and ideological choices. Instead, they increasingly bought into comprehensive ideological package deals in an effectively automated manner that corresponded to the developmental phase of state capitalism.<sup>74</sup> While many of their observations are compelling, the implication seemed to be that this new mode of 'ticket thinking' marked the universalization of antisemitism and hence of fascism, though it arguably makes much more sense in the context of the administered world. Ultimately, what clearly

emerged from *Dialectic of Enlightenment*, *Eclipse of Reason* and the concept of the administered world was the enormous destruction constantly wrought on human life by modern society even when its potential for fascism was not realized.

## AFTER 1945

Once it became clear, not only that fascism was not in fact taking over the West, but also that the development in many of the Western countries might well be characterized by a previously unprecedented measure of liberal-democratic governance and social redistribution, Horkheimer and Adorno, as far as I can see, conceptualized National Socialism as both an extreme case and as the dysfunctional other of the administered world. Take Adorno's suggestion of 1959 that National Socialism had 'anticipated the current mode of crisis management in a violent form'; it had been 'a barbaric experiment in state control over industrial society'.<sup>75</sup> In an interview published posthumously, nine days after his death, in West Germany's foremost weekly news magazine, *Der Spiegel*, Horkheimer made the same argument.

Fascism ... was the violent anticipation of the universally administered society ... National Socialism was unable to function seamlessly because the instruments for the domination of nature had not yet been perfected. Yet in principle National Socialism had already contrived a fully automated society, as it were – a society without morality and spirit.<sup>76</sup>

As long as the West remained more prosperous than 'the East' (i.e., the countries in the Soviet sphere of influence), 'the fascist variant is more likely to appeal to the masses than the eastern propaganda while, on the other hand, one does not feel pressed to resort to the fascist *ultima ratio*', Adorno wrote in 1959.<sup>77</sup>

Their formulations reflect the complex and potentially paradoxical dialectic they

were trying to address. Strictly speaking, if fascism was the extreme case of the administered world then the evolution of the administered world needed to be stopped in its tracks before it could unfold its potential for fascism again. If, on the other hand, fascism was the dysfunctional other of the administered world then the administered world needed to be defended against anything that might subvert it sufficiently to necessitate a return to fascism. Adorno's frequently (mis-) quoted statement that 'I consider the afterlife of National Socialism *within* democracy potentially more dangerous than the afterlife of fascist tendencies *against* democracy'<sup>78</sup> might suggest that, on balance, he was more worried about fascism as the extreme case of the administered world.

On the other hand, remarks he made in the lecture theatre in 1968 seem to point in the opposite direction. In the same lecture in which he praised Neumann's *Behemoth* to his students as 'the most congruous socio-economic account of fascism to date',<sup>79</sup> he explained to them that he saw a fundamental dialectic at work in the ever more comprehensive integration of society. Adorno suggested to his students that

increasing social integration as a visible phenomenon is generally accompanied by a tendency towards disintegration in the sense that the various social processes that are melded together but for the most part stem from diverging sets of interests, instead of maintaining the measure of neutrality, of relative indifference towards one another that was characteristic of earlier phases of social development, become more and more antagonistic towards one another.

'It seems to me that this is particularly evident', he added, 'in extreme situations in late bourgeois society like fascism'. What, then, Adorno continued, of the current situation, i.e., 1968? One of the potentially counter-intuitive implications of the racket theory is that not ever increasing all-encompassing social conformity and uniformity and state control is the precursor of fascism, but precisely its opposite: the fundamental

disintegration of society and the appropriation of state functions by competing rackets. Adorno therefore argued that the tendency he had previously described as coming to a head in fascism probably did not pertain to the 'more peaceful late bourgeois society' of 1968 because the current 'pluralism we are constantly being told about' was not so much a reality as an ideological claim and 'the various parallel forces are in fact encaptured and integrally determined by the all-dominating social system under which we live'.<sup>80</sup> Put very bluntly indeed one might say: fascism was characterized by great disunity and thus talked all the more about unity; 'more peaceful late bourgeois society', by contrast, talked a great deal about pluralism and diversity but was in fact profoundly integrated and streamlined. In short, it was the continued functionality of what Horkheimer, as we saw, described as a 'fully automated society ... without morality and spirit' that vouched for the fact that society was not threatened by the sort of disintegration to which fascism might be seen as the solution.<sup>81</sup> This account of fascism as both the extreme case and the dysfunctional other of the administered world renders no obvious way out and clearly points towards the continued need for metaphysics and 'theology or whatever one wants to call it'.<sup>82</sup>

The legacy of the Frankfurt School's grappling with fascism/National Socialism, then, is the commitment to dealing with this apparent paradox. We are tasked with pinpointing the potential for fascism wherever it shows itself while at the same time adhering to the principle of *determinate* negation and thus insisting on the very real differences between the potential for fascism and its actual realization. Adorno's new categorical imperative depends not only on a keen awareness of the fact that 'the objective social prerequisites that precipitated fascism continue to exist',<sup>83</sup> but also on the appreciation of what Auschwitz actually was, in other words, of what was so unprecedented and singular about Auschwitz that the need to prevent its recurrence merits a new categorical imperative in the

first place. The facile lumping together of distinct phenomena or their indeterminate negation across the board amounts not to a realization of this categorical imperative but demeans it and obstructs its implementation.

‘The black outlook notwithstanding – on which we were always in agreement’, Adorno wrote in his letter to Horkheimer on 9 May 1945,

there are grounds for joy all the same; on the one hand, because in a world that topples from one catastrophe to another even a short reprieve is a joy; on the other hand, because the utmost dread was still called Hitler and Himmler and while it could recur elsewhere it has not done so yet. Things turned out better than you thought this time and maybe they will also turn out better than both of us think in future.<sup>84</sup>

## Notes

- 1 Theodor W. Adorno, Max Horkheimer, *Briefwechsel* vol. 3 (Frankfurt: Suhrkamp, 2005), 100; Max Horkheimer, *Gesammelte Schriften* vol. 17 (Frankfurt: Fischer, 1996), 633.
- 2 Horkheimer, *Gesammelte Schriften* vol. 17, 467; Herbert Marcuse, *Technology, War and Fascism* (London: Routledge, 1998), 245.
- 3 This was an ongoing concern of Adorno’s. As he wrote in 1959, the development of international relations was among the foremost ‘objective’ factors nurturing the ‘afterlife’ of National Socialism in post-war West Germany: ‘It seems to justify post facto Hitler’s invasion of the Soviet Union. Given that the Western world essentially defines its unity in terms of its resistance against the Russian threat, it looks as though it was sheer folly for the victors of 1945 to destroy the proven bulwark against Bolshevism [i.e., Germany] only to rebuild it again a few years later’ (Theodor W. Adorno, ‘Was bedeutet: Aufarbeitung der Vergangenheit’, in *Gesammelte Schriften* vol. 8 [Darmstadt: wbg, 1998], 560).

- 9 Ibid., 8.
- 10 Ibid., 12.
- 11 Ibid., 14.
- 12 Ibid., 20–21. Neumann argued, even in full knowledge of the German genocide against European Jewry, that antisemitism was merely ‘the spearhead of terror’ because ‘the persecution of the Jews, as practiced by National Socialism, is only the prologue of more horrible things to come’. The Jews were just ‘used as guinea pigs in testing the method of repression’. ‘The extermination of the Jews’, he concluded, ‘is only the means to the attainment of the ultimate objective, namely the destruction of free institutions, beliefs, and groups. This may be called the spearhead theory of anti-semitism’ (Franz Neumann, *Behemoth* [New York: Oxford University Press, 1944], 550–1). See Lars Fischer, ‘Review: Jack Jacobs, The Frankfurt School, Jewish Lives, and Antisemitism’, in *German Quarterly* 89, 1 (2016), 93–7, here 93–6.

- 17 Theodor W. Adorno, ‘Nationalsozialismus und Antisemitismus’, in Adorno, Horkheimer, *Briefwechsel* vol. 2, 539–95, here 541. On the Frankfurt School’s grappling with antisemitism, see my contribution, ‘Antisemitism and the Critique of Capitalism’, in this Volume of the *Handbook*.
- 18 Adorno, *Briefe an die Eltern*, 65–6. I mention this not least in connection with John Abromeit’s interesting suggestion that the relatively positive evaluation of the ‘classical’ capitalist entrepreneur that formed the foil against which they threw the functioning of state capitalism into relief could be understood as evidence of a reconciliation between Horkheimer and his father (John Abromeit, *Max Horkheimer and the Foundations of the Frankfurt School* [New York: Cambridge University Press, 2011], 419).
- 19 See, for example, Horkheimer, *Gesammelte Schriften* vol. 17, 601–2. In *Dialectic of Enlightenment*, the question of the Jews’ association with

- the sphere of circulation featured prominently in the third of the seven 'Elements of Antisemitism'.
- 20 Adorno, Horkheimer, *Briefwechsel* vol. 3, 100–1.
  - 21 *Ibid.*, 139; Horkheimer, *Gesammelte Schriften* vol. 17, 54.
  - 22 See Friedrich Pollock, 'Is National Socialism a New Order?' in *Studies in Philosophy and Social Science* 9, 3 (1941/42), 440–55, here 440, n1.
  - 23 Adorno wrote to his parents on 15 May that the issue would now come out in a matter of days, and on 5 June he inquired whether they had received both the journal and the Institute's commemorative publication for Walter Benjamin (Adorno, *Briefe an die Eltern*, 144, 146).
  - 24 Neumann, *Behemoth*. The preface is dated 23 December 1941. On 19 April 1942, Adorno suggested to his father that he should obtain a copy of Neumann's book from Leo Löwenthal (Adorno, *Briefe an die Eltern*, 138).
  - 25 Max Horkheimer, 'Die Juden und Europa', in *Zeitschrift für Sozialforschung* 8 (1939/40), 115–36; 'The Jews and Europe', in Stephen Bronner, Douglas Kellner (eds.), *Critical Theory and Society* (New York: Routledge, 1989), 77–94. On this text, see my contribution to this Volume of the *Handbook*, 'Antisemitism and the Critique of Capitalism'.
  - 26 See MHA: IX, 12, 1–7.
  - 27 Max Horkheimer, 'Autoritärer Staat', in Institut für Sozialforschung (ed.), *Walter Benjamin zum Gedächtnis* ([New York Los Angeles], n.p., 1942), 123–61; also in Horkheimer, *Gesammelte Schriften* vol. 5 (Frankfurt: Fischer, 1987), 293–319; 'The Authoritarian State', in Andrew Arato, Eike Gebhardt (eds.), *The Essential Frankfurt School Reader* (New York: Continuum, 1985), 95–117.
  - 28 Horkheimer, 'Class Relations'. This text, parts of which were included in *The Eclipse of Reason*, has had a somewhat unfortunate editorial history. The editors of Horkheimer's *Gesammelte Schriften* have published a specially commissioned German translation of the final version (Max Horkheimer, *Gesammelte Schriften* vol. 12 [Frankfurt: Fischer, 1985], 75–104) without, however, taking into account the hand-written comments on that version because, on their understanding, these were only meant to correct the 'clumsy' English. Conversely, Todd Cronan has recently published what he claims is the 'original essay in full and in its original English-language format' online (<http://nonsite.org/the-tank/max-horkheimer-and-the-sociology-of-class-relations>). As far as I can see, he has reproduced the longest of the versions preserved among Horkheimer's papers, which is almost certainly *not* the final version.
  - 29 Theodor W. Adorno, 'Reflexionen zur Klassentheorie', in *Gesammelte Schriften* vol. 8 (Darmstadt: wbg, 1998), 373–91; 'Reflections on Class Theory', in *Can One Live After Auschwitz?* (Stanford: Stanford University Press, 2003), 93–110.
  - 30 Helmut Dubiel, Alfons Söllner (ed.), *Wirtschaft, Recht und Staat im Nationalsozialismus* (Frankfurt: EVA, 1981).
  - 31 [Idea, Activities and Program of the Institute of Social Research], second English-language draft, 22 June 1938, MHA: IX 55, 1, 19.
  - 32 See Eva-Maria Ziege, *Antisemitismus und Gesellschaftstheorie* (Frankfurt: Suhrkamp, 2009), 104–8; Moishe Postone, Barbara Brick, 'Critical Theory and Political Economy', in Seyla Benhabib, Wolfgang Bonß, John McCole (eds.), *On Marx Horkheimer* (Cambridge, MA: MIT Press, 1993), 215–56, here 215–25.
  - 33 Without wanting in any way to feed into the bizarrely decontextualized canard that Horkheimer and Adorno somehow abused Sohn-Rethel or willfully withheld assistance they easily could have provided him with, I would suggest that they certainly did miss a beat in allowing their philosophical differences to outweigh their initial enthusiasm for Sohn-Rethel's extremely interesting analyses of the economy and class structure in Nazi Germany. See Carl Freytag, Oliver Schlaudt (eds.), Alfred Sohn-Rethel, *Die deutsche Wirtschaftspolitik im Übergang zum Nazifaschismus* (Freiburg: ça ira, 2016); Johannes Agnoli, Bernhard Blanke, Niels Kadritzke (eds.), Alfred Sohn-Rethel, *Ökonomie und Klassenstruktur des deutschen Faschismus* (Frankfurt: Suhrkamp, 1973); Christoph Gödde (ed.), *Theodor Adorno und Alfred Sohn-Rethel. Briefwechsel 1936–1969* (Munich: etk, 1991).
  - 34 Franz Neumann, copy of letter to Theodor W. Adorno, 14 August 1940, MHA VI 1a, 21–3. See also Jack Jacobs, *The Frankfurt School, Jewish Lives, and Antisemitism* (New York: Cambridge University Press, 2014), 59.
  - 35 Indeed, in John Abromeit's recent account of Horkheimer's 'turn' to state capitalism, Pollock plays only a rather subordinate role (Abromeit, *Max Horkheimer*, chapter 9).

# Society and Political Form

Alexander Neupert-Doppler

Translated by Niall Bond and Werner Bonefeld

## INTRODUCTION

‘We know only a single science, the science of history’ (Marx and Engels, 1975: 28). This sentence defines the programme of the Frankfurt School’s critical theory. Society, its object, is mainly conceived of as historical and mutable. The question of what the social conditions of capitalism are – and how to conceive of surpassing them – is equally of concern to critical theories of the State. With their point of departure in Marxist thought, two prevailing theoretical currents were formed during the twentieth century. On the one hand, Lenin’s theory of the class state opposes the capitalists’ and the revolutionaries’ States. On the other hand, social democracy considers political States as merely neutral instances. For the former, as Marx and Engels (1996: 35) expressed it in the *Communist Manifesto* of 1848, the State ‘is merely the organised power of one class for oppressing another’. According to this premise, a State cannot be an independent

institution, but is necessarily the committee of a ruling class. For the latter, the State is an independent order, a playground for action; accordingly, the aim of political practice is to implement social reforms within nation states. As Simon Clarke (1991: 4) has shown, form theory can be distinguished from either approach.

If the theory of state monopoly capitalism underestimated the autonomy of the state, the social democratic theory underestimated the limits to that autonomy. What was needed was a more adequate theory of the nature and limits of the power of the capitalist state. It was clear that the state could not be reduced to an instrument of the capitalist class, but nor could it be seen as the neutral terrain of the class struggle.

According to form theory, ‘the class character of the state (is) determined ultimately by the *structural* relationship between the state and the economy, embedded in the *form* of the state determined by its function within the system as a whole’ (5). How has the debate on the state as the political form of

capitalism developed? To what extent has the critical theory of the Frankfurt School made contributions to this debate and what are its consequences for political practice?

The theory of the state as the political form of capitalism also follows from the theories of Marx and Engels, who in their early works had already described the modern State as the 'form in which, the individuals of which society consists have subsequently given themselves collective expression' (Marx and Engels, 1975: 80). As the expression of society, the State is neither independent nor neutral. Politics and the economy, the State and capital, law and exchange, the nation and the world market are not contrasts: they are complementary through their constitution as separate spheres. Historically, the emergence of commodity production and organization of centralized states are processes that transpired at the same time; but how should the logic behind their complementarity be interpreted? In 1923, the Soviet legal scholar Evgeny Pashukanis (1989: 139) expressed the question as follows:

Why does class rule not remain what it is, the factual subjugation of one section of the population by the other? Why does it assume the form of official state rule, or – which is the same thing – why does the machinery of state coercion not come into being as the private machinery of the ruling class; why does it detach itself from the ruling class and take on the form of an impersonal apparatus of public power, separated from society?

For Pashukanis, the answer lies in the function of the State as a (liberal) *Rechtsstaat*, that is, a State that contains the class struggle and regulates competition on the basis of law. The strengths and weaknesses of his analysis of the legal form are treated in Section 1.

However, the functions that a state might take on do not explain the form itself. During the 1930s and 1940s, the contributions of the Frankfurt School – Otto Kirchheimer, Max Horkheimer, Herbert Marcuse, Franz Neumann and Friedrich Pollock – were precisely focused on the decline of some

liberal states. In their view, the rule of law was adequate to a capitalism based on competition; monopoly capitalism expressed itself, however, in the so-called Authoritarian State. The separation of State and Society, the most important definition of the form of the liberal State, collapsed under Fascism and National Socialism, just as it did under State socialism and even during the New Deal in the United States under Roosevelt. The role of critical theory as an intermediary between earlier approaches (such as Lukács' and Pashukanis') and later approaches is dealt with in Section 2.

One fundamental insight adopted by the critical theory from Marx and Lukács is the distinction between the essence of capitalist societies and its forms of appearance. In this argument, the commodity form, which posits human labour power as a commodity, and the legal form, which posits the individuals as legal subjects, express the essence of exploitation and domination in the form of free labour and abstract legal equality. Just as Marx conceives of the forms of commodities, money, capital and interest as forms of definite social relations, the forms of law, politics, the State and the nation are forms of these same relations, too.

What had once been a heterodox position, discussed by the Frankfurt School during its period in exile, became central to the debate about the character of the capitalist State that began in West Germany in the late 1960s and resonated also in France and England (Bonefeld, 2014: 185). Clarke attributes this change in direction to the failure of traditional Marxist State theories which either underestimated the importance of States as class states or overestimated the importance of States as welfare states.

The inadequacy of these theories of the state become increasingly manifest through the 1960s. On the one hand the growth of the welfare state [...] undermined the crude identification of the state with the interests of monopoly capital. [...] On the other hand, the limited impact of the welfare state on problems of poverty [...] undermined

the rosy social democratic view of the state. (Clarke, 1991: 4)

The debate was directed against the State fetishism of social democracy; the subject was ‘the “welfare state illusion” and the contradiction between wage labour and capital’ (Müller/Neusüß, 1971). Functions of the welfare state were therefore relativized in form theory. ‘Once the state has been established as such an autonomous body, endowed with a monopoly of the legitimate exercise of force, it can take on further functions, although it can only perform such functions within the limits of its form’ (Clarke, 1991: 13). The results of this debate are discussed in Section 3.

A typical weakness of critical State theories is the fixation on the State in the singular. Colin Barker has critically observed that both discussions of the *Rechtsstaat* – the State of the rule of law and that of the welfare state – tend to treat ‘the state as if it extended only in singular. Capitalism, however, is a world-system of states, and the form that the capitalist state takes is the nation-state form’ (Barker, 1991: 204). Clearly globalization raises important questions about the character of the national state, which will be discussed in Section 4.

Finally, we arrive at the question of the character of political practice that had not been explored explicitly in critical state theory. While the traditional State theories include clear political strategies, namely the revolution against the bourgeois class state through the proletarian class state or integration into a State of political representation, deemed neutral, critical theory lacks this – direct – connection between theory and practice. This was recognized most clearly by John Holloway and Sol Picciotto. While some contributors to the debate declared that form theory amounted to a fundamental theory of the state, and operationalized Gramsci’s theory of hegemony or Poulantzas’ theory of the balance of forces for actual political analysis, for Holloway (1991: 228) the task consisted

in ‘[d]eveloping much more explicitly certain concepts employed or implied in the best of the recent work on the state: namely the concepts of fetishisation and state form [...]’. The task is not to reject state theory but to draw out and develop the political implications’. The conclusion focuses on the political implications of form theory.

### COMMODITY-FORM AND THE FORM OF LAW: ON *RECHTSSTAAT* AND CAPITALIST COMPETITION

Marx commences his critique of political economy with the commodity as its elementary form, arguing that ‘[t]he wealth of societies in which the capitalist mode of production prevails appears as an “immense collection of commodities”’ (Marx, 1990: 125). The thrust of his critique of the capitalist form of social wealth is formulated in the section on commodity fetishism: ‘The definite social relations between men themselves assume here, for them, the fantastic form of a relation between things’ (165). Marx attributes the fetish character of the commodity form to the capitalist social relations of production. Form analysis is dedicated to uncovering the social content of the capitalist forms of commodity exchange, in which capital and labour appear as formally free and equal subjects of law.

Pashukanis commenced the third chapter of his book, *Law and Marxism, A General Theory*, published in 1923, with the sentence: inasmuch as ‘the wealth of capitalist society appears as “an immense collection of commodities”, so this society itself appears as an endless chain of legal relations’ (Pashukanis, 1989: 85). What aspects of the State as a political form result from this? For Pashukanis, the relations of exchange and the legal relations are complementary. Indeed, he develops Marx’s critique of the commodity form towards a critique of legal form (Neupert, 2013). In this argument, commodity form

and legal form are constituted forms of definite social relations. These social relations do not appear directly. Rather, they appear in legal form and commodity form as seemingly independent relations of law and wealth. The individuals thus appear as legal subjects and economic personifications of a process of capitalist wealth that manifests itself behind their backs. As Marx (1990: 166–7) put it, ‘they do this without being aware of it’.

The circumstance that the social relations appear in the form of independent relations of law and wealth, which assert themselves as seemingly independent objective forces over and through the acting subject, entails form analysis as critique of fetishism. Buckel (2007: 234) writes, ‘social forms require [...] a fetish theory; they are nothing other than congealed human relations, which vanish in their appearance’. Pashukanis’ theory of law can thus *inter alia* be read as a contribution to the critique of fetishism.

The sphere of dominance which has taken on the form of subjective law is a social phenomenon attributed to the individual in the same way that value – likewise a social phenomenon – is attributed to the object as a product of labour. Legal Fetishism complements commodity fetishism. (Pashukanis, 1989: 117)

If the exchange of commodities, relations of law and statehood were mere institutions, it would suffice to analyse their interaction. However, if capitalist society is the common basis of these forms, critique has to reveal their complementarity. This context is what allows for the transfer of social form analysis from the commodity form to the legal form, the implications of which Pashukanis finds in Marx (1990: 178): ‘In order that these objects may enter into relation with each other as commodities, their guardians must place themselves in relation to one another as persons [...]. The guardians must therefore recognise each other as owners of private property [...]. The content of this juridical relation (or relation of two wills) is itself determined by the economic relation’.

Formal legal equality is not just a precondition for commodity exchange, the exchange of commodities itself is its content. In exchange, the different commodities are posited as equal values, and as equivalent values their distinct qualities disappear, just as when different human beings are regarded as equal when considered as legal entities. Critique begins with the contradiction between content and form. ‘The constant sale and purchase of labour-power is the *form*; the *content* is the constant appropriation by the capitalist, without an equivalent, of a portion of the labour of others which has already been objectified, and this repeated exchange of this labour for a greater quantity of the living labour of others’ (730, emphasis added).

What Marx described here is the social relationship of exploitation of the worker by the capitalist, which does not appear in accordance with its essence. Rather, it appears in the form of a legal relationship between the seller and buyer of labour power. In its appearance, exploitation assumes the form of formal legal equality. The contradiction between formal equality and actual inequality constitutes the difference: objects are only equal as commodities; the individuals are only equal as legal subjects. What is implicit in law according to Marx – its foundation in the capitalist social relations of production – ultimately becomes explicit in Pashukanis’ discussion of the relationship between the commodity form and the form of law. ‘Only when bourgeois relations are fully developed does law become abstract in character. Every person becomes man in the abstract, all labour becomes socially useful labour in the abstract’ (Pashukanis, 1989: 120–1). By linking the development of capitalism to the imposition of uniform law, Pashukanis places his theory in a broad historical context. Looking back at the past, he distinguishes modern contractual or criminal law from older orders, such as privileges or kin liability (179). For Pashukanis, the most important characteristics of the legal form are homogeneity and individualization (99–100).

In contrast to pre-modern class privileges, for example, law does not address groups, but individuals. Just as privileges corresponded to feudal forms of property, law now corresponds to capital (123). It is true, he concedes, that the real historical development from a plurality of laws to a homogenous, calculable law 'took place in a far less well-ordered and consistent manner than the logical deduction above might suggest. Yet this deduction alone reveals the universal significance of the historical process' (114).

For Pashukanis (1989), socialism reveals the meaning of historical development. The 'making of human relations into legal relations' (40) that mediate exploitation 'in the form of a contract' (45) would become superfluous, which would lead to 'the disappearance of the juridical factor from social relations' (61). What is of interest to Pashukanis is the meaning of subjective law – the property, contract and criminal law – for commodity exchange. An end to legal form is only conceivable once commodity exchange has been surpassed. It is true that there are dispersed clues to a utopia of public rules, but 'any society which is constrained, by the level of development of its productive forces, to retain an equivalent relation between expenditure and compensation of labour, in a form which even remotely suggests the exchange of commodity values, will be compelled to retain the legal form as well' (63–4). Thus, the question of bringing merely formal legal equality to an end is a matter of socialist construction. The abandonment of objective law can be seen in the notion of a transitional state [*Übergangsstaat*], which implements socialism without consideration of subjective rights. 'The Soviet state does not admit any absolute and untouchable subjective private rights. But it counterposes to this fetish neither some classless principle of social solidarity [...] but the concrete task of constructing socialist society and destroying the last vestiges of capitalism' (35). Pashukanis remains a Leninist.

Pashukanis sees the common grounds for forms of commodity and of law in the economy, but he also concedes that the State can play a role, which brings us closer to the question of the State form. 'The state authority introduces clarity and stability into the structure of law, but does not create the premises for it, which are rooted in the material relations of production' (94). Pashukanis at least explicitly addresses the State's function of imposing legal norms through violence [*Gewalt*]. Without a State administration, finances and an organized army (75), law could not be imposed. Without law, there would be no commodity exchange and without the State there would be no law. While he describes law as a really practised social form, he treats the *Rechtsstaat*, a State governed by the rule of law, as an objective illusion. He thus understands the modern *Rechtsstaat* as a fetish form that is 'separate from the representatives of the ruling class [...] that stands above every individual capitalist and functions as an impersonal force' (141). At the same time, he remains faithful to the idea of the primacy of the real economy. A critique of the State as the political form of the capitalist relations of production is not possible on this basis.

Society doubles itself up into society and state, that is, state is the political form of society. [...] The political state is the premise of the non-coerced, depoliticized exchange relations between the buyers of labour power and the producer of surplus value, who in spite of their manifest inequality pursue their interests in liberty as equal legal subjects, based on the rule of law. (Bonefeld, 2014: 166)

Pashukanis' critique of legal fetishism, focuses attention on some defining aspects of the form of the capitalist State. It is only as a public apparatus that the State can guarantee legal equality between unequal individuals. Other functions, for example regarding equal voting rights or redistribution of wealth, are not yet recognizable in the context of the Russian Revolution or are of no interest to

Pashukanis. That is why he believes he had clarified the starting question which was to open later debates. Because the State under the conditions of free competition exists in the form as a liberal *Rechtsstaat*, it can fulfil its function as a guarantor of legal equality, property and commodity exchange.

For Franz Neumann, the legal theoretician of critical theory, Pashukanis makes the most important contribution to the theory of law and the State. 'Except for the book by Pashukanis, a lawyer from Moscow, *Law and Marxism*, the Communist side made no contribution to State and legal theory worthy of mention either' (Neumann, 1978a: 135). What critical theory took on from Pashukanis – the connection between the form of commodity and the form of law – is recognized in the later debate on the State as an important function of the State. However, Pashukanis had not recognized the State as the political form of definite social relations. Instead, he conceived of it akin to Lenin as a class state. It was possible for the State to discard 'the mask of the constitutional state altogether, revealing the nature of state power as the organized power of one class over the other' (Pashukanis, 1989: 150). The proletarian Soviet State alone – as an openly class state – self-confidently dispensed with the illusion of the *Rechtsstaat*, because it 'acknowledges quite openly and un-hypocritically that it is a class state' (Lukács, 1970: 68). But this abandonment of law through the naked violence of party dictatorship never led to a republic beyond State and society, but instead led to what critical theory was to refer to as an 'Authoritarian State'.

### **THE FORM OF LAW AND THE FORM OF THE STATE – THE AUTHORITARIAN STATE AS A FORM OF MONOPOLY CAPITALISM**

The beginnings of a critical theory of State and Law were marked by disappointment

over the October Revolution. Instead of creating democracy without the State, a State socialism emerged, replacing formalized violence with open violence. In his text on the Authoritarian State of 1940, Horkheimer (1985: 99) observed:

Instead of dissolving in the end into the democracy of the councils, the group can maintain itself as a leadership. [...] Even though the abolition of the state was written on its banner, that party transfigured its industrially backward fatherland into the secret vision of those industrial powers which were growing sick on their parliamentarianism and could no longer live without fascism.

Georg Lukács, whose collection of essays, *History and Class Consciousness* appeared in 1923, like Pashukanis' book, offers more political arguments. Through his analysis of the *Rechtsstaat* as a form of capitalist rule, he offers critical theory its bases, while, however, becoming an apologist of the Authoritarian State in the Soviet Union himself. This is why his contributions have to be dealt with here. For Lukács, the form of law and the institution of the *Rechtsstaat* present the inversion of social inequality as formal equality; he also discussed the obscuring of domination as the fetishism peculiar to the economic and the political forms of capitalist domination. Just as 'the fetish of the pure objectivity of economic relations obscures the fact that they are relations between men ... the – likewise fetishistic – legal form of organised violence distracts attention from its potential presence in and behind every economic relation' (Lukács, 1974: 240–1).

The State itself is the juridical form of violence, which remains obscured as such. Lukács' leitmotiv here is obscuring. When describing the commodity fetish, he writes of its 'reified character' on the one hand and of a 'fiction of the immortality of the categories' on the other (Lukács, 1974: 14). Human behaviour is based on the commodity form, while the conditions themselves appear immutable. As pointed out by Adorno, critique is both an epistemological and a social

critique. Which is why the object of Lukács' critique is primarily the insights advanced by bourgeois philosophy and bourgeois political economy. 'Economy, law and the state appear here as closed systems which control the whole of society by virtue of the perfection of their own power and by their built-in laws', whereas 'their apparent independence of each other, their way of concentrated themselves into self-regulating systems, [is] the fetishistic semblance of autonomy' (230, 231). While dialectical critique recognizes the connection between the forms of commodity, law and the State, their autonomy is nevertheless real. Thus, for him, false consciousness is not a particularity of the bourgeois classes; there is also the danger of the embourgeoisement of the proletarian consciousness. 'Even in the very midst of the death throes of capitalism, broad sections of the proletarian masses still feel that the state, the laws and the economy of the bourgeoisie are the only possible environment for them to exist in' and hold an 'instinctive attitude towards the state, which appears to the man of action as the only fixed point in a chaotic world' (262, 263).

To the extent that the State exists in the form of the *Rechtsstaat*, the fetishism of law, as analysed by Pashukanis, is complemented by State fetishism. If conceived of as an apparatus that stands over the classes, the monopoly of violence appears as a means of social peace that stands over the classes. Violence assumes an independent existence in the form of the state and disguises itself as a guarantor of equality. Inequality appears as right [*Recht*] 'in the mind of the masses' that is characterized by 'nationalist prejudice' and 'illusions about democracy' (Lukács, 1974: 265). Formal legal equality, national community and the political equality in representative democracy form the bases of an objective State fetishism and 'only when this veil is torn aside does historical knowledge become possible' (14). For Lukács, tearing this veil is only possible through the Bolshevik Party's role as the avant-garde.

'The Communist Party must exist as an independent organisation so that the proletariat may be able to see its own class consciousness given historical shape' (326). The problem of fetishism, in which the difference between content and form is consolidated, is to be solved by the Party.

The Leninists Pashukanis and Lukács are in agreement on justified practice. The Soviet State allows for no private rights (Pashukanis), and is an openly class State (Lukács). Instead of veiling social conditions such as domination in production, inequality in law or violence in the *Rechtsstaat*, violence in the revolution is unmasked as the naked violence of one class in keeping another class down. The mask of the *Rechtsstaat* should, in Lukács' view, not be retrieved by the socialist State. On the one hand, this theory appears pragmatic as it fits with the reality of the civil war in Russia, and on the other hand it appears optimistic, because both theoreticians apparently can only imagine the revolutionaries' state as a transition to full, i.e. class- and stateless, communism.

As pointed out by Marcuse (1958: 249), in the Soviet Union as elsewhere, in contrast to its ideology, the state remains 'a superimposed independent power, personal relationships cannot be dissolved into a *res publica*'. Instead of becoming a world republic, State socialism emerges. The development of Stalin's 'socialism in one country' is the starting point of critical theory. According to Horkheimer (1985: 101–2), state socialism

is the most consistent form of the authoritarian state which has freed itself from any dependence on private capital. It increases production at a rate only seen in the transition from the mercantilist period to the liberal era. The fascist countries create a mixed form. Though here too surplus value is brought under state control and distributed, it flows under the old name of profits in great amounts to the industrial magnates and landowners.

One remarkable aspect of Horkheimer's concept of the Authoritarian State is its scope, since it is meant to encompass both the

Soviet Union and fascist countries. To the extent that critical theory understands *Staatlichkeit* – the quality of being a State – as a political form of society, the transformation of the State from a liberal *Rechtsstaat* to an authoritarian State of coercion [*Zwangsstaat*] must also be an expression of social tendencies. This transformation must thus be less a break with than a demasking of violence from on high. ‘The equality of the commodity owners is an ideological illusion which breaks down in an industrial system and which yields to overt domination in an authoritarian state’ (Horkheimer, 1985: 108). With open domination not mediated by the form of law, the fetishism of law that belonged to it is also extinguished. ‘Mediation has now been abolished. Fascism is [the] truth of modern society’ (Horkheimer, 1990: 79).

Horkheimer’s friend Friedrich Pollock was responsible for economics at the Institute. After travelling to the Soviet Union in 1927 and 1928, he developed his concept of ‘State capitalism’ at the beginning of the 1930s. Although it was initially applied to State socialism, he also described German National Socialism – in contrast to Neumann – as authoritarian State capitalism.

Is it useful to label the new order ‘State Capitalism’? Serious objections may be raised against this term. There are already grave doubts as to whether it makes sense to call the National Socialist system a state. The word state capitalism, besides, is possibly misleading because it may be understood to denote a society wherein the state is the sole owner of all capital. This is definitely not the case for National Socialism. Nevertheless, the term ‘State Capitalism’ describes better than any other term four properties of the new system: (1) that the new order is the successor of private capitalism, (2) that the state assumes important functions of the private capitalist, (3) that capitalistic institutions like the sale of labor, or profits, still play a significant role, and (4) that it is not Socialism. (Pollock, 2014: 450)

National Socialism is capitalism and by no means socialism. Changes exist in the concentration of capital and in authoritarian State interventions in the economy, in which

all dictatorships are similar. A characteristic of this new order is rule by ‘administrative orders which have come to supersede the rules of civil law’ (447); classes are ‘fused ideologically in the people’s community’ [*Volksgemeinschaft*] (444).

Pollock’s account has many strong suits – for instance when it analyses the end of classical ownership capitalism and describes the authoritarian ideology of the *Volksgemeinschaft* [the people’s community or ethnic community]. The transition from liberalism to statism also corresponds to global trends in the 1930s and 1940s. However, with regards to State theory, one can express doubts, which Pollock himself addresses by asking whether it makes any sense to call the National Socialist system a State. In doing so, he refers to considerations presented particularly by Kirchheimer and Neumann.

While Pashukanis spoke of the State as a form of a detached apparatus, this definition of its form also includes the monopoly on violence, the general legal order and rational bureaucracy. But all of the above were missing in National Socialism. First, the form of law presupposes the general applicability of laws. A free market economy in the liberal bourgeois meaning also presupposes the calculability of State action. ‘When the state interferes with liberty and property, the interference must also be calculable. It must not be retroactive, for then it would nullify already existing expectations. The state must not interfere without law, for then the interference would not be predictable’ (Neumann, 2009: 443).

A general law for all was abolished with the race laws. Ex post facto laws are also part and parcel of dictatorships. Arbitrary measures are routine, and the rule of law, as Pollock pointed out, was set aside. Such a falling apart of the form of law is what Kirchheimer had been observing in Germany. ‘Under the veil of the community ideology, the system of general legal conceptions equally applicable to all cases falls’ (Kirchheimer, 1941:

456). There were markets and laws, but also a command economy instead of economic freedom and arbitrary rulings instead of equality before the law. Collective rights, for instance that of forming unions, were abolished. For Kirchheimer it was clear that 'under the new system, a legal rule can have only a purely provisional character; it must be possible to change a rule without notice, and, if necessary, retroactively' (466).

Herbert Marcuse contributed to these observations on the end of the *Rechtsstaat* under National Socialism.

The original concept of the law as universally and equally applicable for all was discarded and replaced by a plurality of particular legal forms, one for the German race, one for inferior races, one for the Party, another for the army, a third for ordinary members of the German folk [*Volksgenossen*]. (Marcuse, 1998: 94)

Neumann went even further than Kirchheimer, who had seen the determining factors of the form of law capsize under National Socialism, and even went so far as to deny the existence of an ordered bureaucracy and a monopoly on violence in National Socialism.

Under National Socialism, however, the whole of the society is organized in four solid, centralized groups, each operating under the leadership principle, each with a legislative, administrative, and judicial power of its own. [...] There is no need for a state standing above the groups. (Neumann, 2009: 468–9)

Just as Pollock, he lists big industry, the army, the bureaucracy and the Party as the dominating groups that form more of an alliance than a unitary State. 'A state is ideologically characterized by the unity of the political power that it wields. I doubt whether a state even in this restricted sense exists in Germany' (467). Neumann calls this domination without law and a monopoly of violence an '*Unstaat*' (16) or 'non-state' (vii).

Following his observations, in contrast to the Soviet Union, National Socialist Germany did not amount to State capitalism. Neumann prefers to use the term 'monopoly capitalism',

which is strongly marked by the trusts of big industry. It 'is a monopolistic economy – and a command economy' (Neumann, 2009: 261). In contrast to the Soviet Union, in which State planning was at the service of late industrialization in the race to catch up, National Socialism contented itself with using existing big industry. This difference is also anchored in the ideological goals of either movement. While Stalin wanted to achieve socialism in one country and thereby secure the State's territory, Hitler's ideology of 'vital space' or '*Lebensraum*' was directed against the recognition of territorial borders.

Pollock's prudent definition of State capitalism, in which the State takes on new functions, would be reconcilable with Neumann's theory of monopoly capitalism in National Socialism. However, it does contrast with the comparison of Germany and Russia as Authoritarian States. While Pashukanis and Lukács wished for State socialism as an openly class State, where, however, 'the bureaucracy is a separate class with special privileges and powers' and the State is 'again a reified, hypostatized power' (Marcuse, 1958: 171, 105), National Socialism was lacking 'features of the modern State – the authority of the law, the monopoly on violence and sovereignty. All three of these characteristics no longer prevail in the National Socialist State' (Marcuse, 1998: 94).

While socialism sought to do away with the contradiction between society and (the class) state, between real inequality and formal equality in a union of free people, fascism sought to dissolve the distinction between State and society in another way: ideologically as *Volksgemeinschaft* – the people's community, and in practical terms as the naked domination and immediate disposal of individuals – rather than through the mediation of social forms. Law as formal equality and the neutrality of the monopoly on violence at the basis of the fetishism of both law and the State disappear in the arbitrariness of open violence and in totalitarian access to individuals by collective domination.

In State socialism, the realization of the utopia fails and a new ideology emerges. Fascism as a political form of monopoly capitalism unmasks the earlier judicialized exercise of violence. What is fundamental is the close reciprocal effect between the economic and political forms. For a critique of the State as a form of capital, a manifold distinction emerges, which becomes clearer looking back at private capitalism and its political form of the *Rechtsstaat*. 'The legal freedom of the proletarian, political equality but social and economic unfreedom are the foundations of the bourgeois *Rechtsstaat* or bourgeois state of the liberal rule of law' (Neumann, 1978b: 128f.). But these forms not only disguised domination and 'capitalist calculability', as in Pashukanis and Lukács, but also 'guarantee a minimum of liberty, since formal liberty has two aspects and makes available at least legal chances to the weak' (Neumann, 1996: 138).

Mediating class domination through formal law serves the propertied classes, but at least limits domination through law and the separation of powers. Without exception, critical theory attributes the *Rechtsstaat* to private capital. Monopoly capital in crisis corresponds to the authoritarian interventionist State. It is not a matter of indifference whether the State itself becomes a socialist State-capitalist or whether even the formal neutrality of the State apparatus is destroyed in the non-state of arbitrary violence. In the non-state, 'except for the charismatic power of the Leader, there is no authority' (Neumann, 2009: 470). It was the appropriate form for 'the first Anti-Semitic movement to advocate the complete destruction of the Jews' (111). The disguised violence that critical theory unmasked in the forms of law and the State and wishes to surpass from the vantage of utopian thought is preferable to the open violence of the Nazis. In 1939, Horkheimer, who triggered the debate, did not believe in a return to liberalism.

Perhaps after a long war the old economic conditions will be re-established in individual territories for a short time. Then the economic development will repeat itself [...] Since the failure of the market economy, people have faced, once and for all, the choice between freedom and fascist dictatorship. (Horkheimer, 1990: 92)

Late capitalism is not possible without the strong State, which in one case or the other will intervene economically. The break between the liberal *Rechtsstaat* of the nineteenth century, the subject of Pashukanis' analyses, and the authoritarian State of the twentieth century, regarded by Horkheimer as the trend, also marks the question of the form of politics in subsequent debates. What becomes clear here is that the trend towards the Authoritarian State has not been broken even when it does not appear as an open dictatorship, and even if domination by capital is again being mediated by economic and political forms.

### **FORM OF THE STATE AND FORM OF POLITICS – THE WELFARE STATE AS A POLITICAL FORM OF LATE CAPITALISM**

According to Pashukanis, the analysis of social forms did not mean the detailed description of economic, legal or State institutions, but the theoretical elaboration of their fundamental connections. Just like any other theory, theories of form have to be aware of their scope and their limits. As a critique of their age, they are on the one hand historically specific, and on the other hand they enter intellectual history and can be referred to as such. Just as Neumann in particular took up points made by Pashukanis, and critical theory in general was able to continue referring to Lukács, this tradition continues.

For the German debate on the State, the tradition of critical theory is fundamental. 'The German critique drew theoretically in

the first instance of the traditions of the contemporary Frankfurt School of sociology, which combined Marxism with a sociological tradition descending from Weber' (Clarke, 1991: 6). Weber's concept of the State, inter alia due to Lukács' influence, is a point of departure of critical theory. 'A state is that human community which (successfully) lays claim to the monopoly of legitimate physical violence within a definite territory (Weber, 1994: 310–11). Neumann saw a criterion for the collapse of the State under National Socialism in the dissolution of the monopoly of violence. His concept of law has its roots here, because what capitalism needs according to Weber is 'a law which is as calculable as a machine' (1966: 20). Weber's error consisted in attributing violence to the State alone, thereby overlooking the fact that such violence is an expression of the domination of capital, which is also implicit in the apparent objectivity of capitalist economy.

What is of interest for questions of State theory is a shift that can be seen in the second half of the twentieth century. While the fetish character of the State as a capitalist form appeared in legal equality for Pashukanis, Lukács and early critical theory, the theories of the State of the 1960s and 1970s came to focus on the question of social integration.

Regarding the *State Derivation Debate*, Blanke, Jürgens and Kastendiek (1978: 118–19) made clear that:

[t]he aim of analysis is not, however, to realize in retrospect the 'course of history' but to present the forms in the context in which they stand 'logically', that is, in which they reproduce themselves under the conditions of a particular historically concrete form of society [...] The question of how this formation takes place in detail, how it is transported into structure, institution and process of the state, can no longer be answered by form analysis.

In this argument, the link between commodity form and *Rechtsstaatlichkeit* can be shown; however, individual laws and the particular actions or the functions of the State cannot be derived from it. Nevertheless, social forms provide the framework for such

actions. What the actors of the State must and can do is certainly contingent upon the form of the State. Financing the State apparatus is always dependent upon the valorization of capital. The very possibility of social policy is related to this prerequisite. Although there were already attempts in some countries to maintain social peace by means of social interventionism as early as the nineteenth century, the concept of the 'authoritarian welfare state', employed by Wolfgang Müller and Christel Neusüß (1971: 28) in the continuation of Horkheimer's authoritarian state, only makes sense from the twentieth century onwards. Still, Marx had already pointed to the role of the state in easing the tension between the common good, class interests and capital interests.

For protection against the serpent of their agonies, the workers have to put their heads together and, as a class, compel the passing of a law, an all-powerful social barrier by which they can be prevented from selling themselves and their families into slavery and death by voluntary contract with capital. (Marx, 1990: 416)

Protection is not just a matter for workers. 'The law curbs capital's drive towards a limitless draining away of labour-power by forcibly limiting the working day on the authority of the state, but a state ruled by capitalists and landlords' (348). The State of capital restricts capital for its own sake. Authoritarian States in monopoly capitalism have exceeded the function of setting such limits, typical for the form of the *Rechtsstaat* in private capitalism, as critical theory has shown.

Following on from Marx's critique of fetishism, in their critique of the welfare state of the 1970s Müller and Neusüß speak about the welfare state illusion [*Sozialstaatsillusion*].

Here, the masses appear as objects of public services staking claims to legal entitlement, while the State appears as an administering subject – the goods fall from the sky in a manner of speaking. However, a social theory that proceeds scientifically must assume that the mass of products, before it can be distributed, had been produced by

those people to which they will be (only in part) distributed, produced by the masses on the whole [...] And the State cannot be examined as a 'distributing', 'welfare' and 'social state', but its functions have to be contemplated with a view to the fact that [...] precisely as a 'social state', the State takes on particular functions for the process of reproducing capital because of its contradictory historical development in particular historic stages of development. (Müller/Neusüß 1971: 32)

The welfare state remains a State of capital. The German reality described by them is corporative capitalism. Employers' federations and trade unions regard themselves as social partners, whose compromises are judicialized by the State and secured through redistribution. The welfare state functions amplify the fetishism of the capitalist state form.

The same fetishism can be seen in the form of the state. According to the bourgeois conception [...] the state has always existed since man is by nature a creature of the state [...] The fact that it is the particularization of a specific mode of production (capitalism) is turned on its head. The reification and autonomization of the state is a necessary illusion resulting from the bourgeois mode of production. (Müller/Neusüß, 1971: 57)

The concept of fetishism is far more appropriate here than that of illusion. After all, we live as legal entities and lay claims to State benefits as citizens. Nevertheless, the concept of the welfare state illusion fits to the extent that the critique is not directed against the possibility of social policy as determined by its form, so much as an overestimation of its redistributive capacities.

Mystification [*Verhüllung*] is anchored in the reality of the capitalist circulation of commodities [...]. This sphere is where the illusion of the possibilities of redistribution are founded [...] These illusions founded in the context of the circulation are opposed on the other side by the realistic insight into the narrow limits of State redistribution measures by integrating the sphere of production into the economic analysis of distribution processes. (Müller/Neusüß, 1971: 36)

Today above all, at a time in which European welfare states are being dismantled, and in

regions of the world in which such State redistribution never took place, we should not lose sight of their distinction between social democracy and socialism. Redistribution of wealth within the existing forms does not challenge the Whole. What can be redistributed in a welfare state is money and goods whose existence depends on the valorization of capital. In the end, it is not the natural right to food, clothing, housing and general happiness that has led to the achievement of the welfare state. Just as in the form of law, which guarantees according to Neumann a minimum of freedom, a welfare state guarantees a basic satisfaction of needs, often connected with authoritarian demands on its citizens.

For form analysis, the manner in which social demands are negotiated is of particular interest. While the form of law had already existed historically in the monarchical States of enlightened absolutism, the capitalist form of politics is based on the prerequisite, as Agnoli (2004: 52) put it in his *Transformation of Democracy* of 1967, that 'the power of the State on the one hand and the power of society on the other appear to be separate'.

Here, State-fetishism means the effect of the form of the State, which appears as the 'in point of fact superordinate power, remote from the fray of group strife, that altogether seriously and with great moral earnestness creates general welfare through policies of social compensation' (Agnoli, 2004: 54). With the promise of equality the State gains more weight. Going beyond Pashukanis' analysis of the form of law, Agnoli establishes how the form of politics, that is, the manner in which social demands are negotiated, fits into this context.

The liberal rule of law and even more universal suffrage have contributed to covering things up, because they solemnly sanction (the former in any legal transaction and the latter every four years) the equality of citizens [...] With regard to the list of electable candidates, every one of them has just one vote and is an equal bearer of active suffrage. (Agnoli, 2004: 55)

If the principle of one man one vote in representative democracies, just as equality before the law in the *Rechtsstaat*, appears as a potential counterweight for economic and social inequality, it is in actual fact its complement. This applies to all political actions which 'take the *form* of struggles to establish, or disagreements on how to interpret, rights [...], their *content*, however, is economic, i.e., dictated by movements of production and value realization' (Blanke et al., 1978: 124; emphasis in the original). The trend towards an administrative and welfare state (Agnoli, 2004: 31) is in this respect a consistent follow-up, because the State no longer contents itself with just setting the basic framework for capitalism, but also regulates social crises and conflicts through economic policy, offering attenuation through social policy and channelling through parliament. The commodity form entails a legal form and manifests itself in the form of the state as a seemingly distinct sphere of social organization. The separation of economy and state is innate to the capitalist form of politics, which serves as the interface between state and society.

According to Pashukanis, Neumann and others, law is a means of economic regulation. It mediates the capitalist exchange relations. In the later discussions, law is complemented by politics. Where politics intervene in society as social policy, the *Rechtsstaat* becomes a welfare state, a *Sozialstaat*. The form of the State as a public power and the form of the citizens as legal entities are the prerequisite of a political form of democratic representation, which ostensibly provides for the determination of some abstractly conceived common good by means of election. For Agnoli, the capitalist form of democratic representation channels demands for conditions into acceptance of capitalist domination.

Politics thus become a continuation and confirmation of the economy, and the State becomes a concentrated form of economic compulsion [...] As opposed to being a potential means of emancipation from this compulsion, the political system is

geared to lead the class [tied to work] to confuse its economic and social claims and identify them with representatives of the domination. (Agnoli, 2004: 124)

In contrast to Pashukanis and Lukács, who regard the (proletarian) State as an instrument for surpassing the (capitalist) State, and equally in contrast to Horkheimer and Neumann, who offer theoretical critique of Statism and the collapse of the (liberal) State, the critique of the State in the social movements of the 1960s and 1970s becomes an issue of praxis. Agnoli draws the conclusion that no hope should be placed in the establishment of a welfare state. Because this is not an alternative to capitalism but the political form of corporative capitalism, a truly revolutionary movement has to develop alternative forms, such as councils. Instead, many European countries saw the founding of new left-wing and green parties in the 1980s and 1990s, and those parties did much to contribute to reintegrating the social movements that sprang up in, around and after 1968. Forty years later, Ingo Elbe commented on the debates on politics, form and fetishism:

Through participation in the political sphere of the legislative, on the one hand, the imagined autonomy of representatives becomes a political fetish, proclaiming eternity, autonomy, neutrality and the priority of political participation, while on the other hand, in the course of the process of forming the will of parliament, parliament truly gains autonomy with regard to the particular interests of individuals, groups and classes of bourgeois society. (Elbe, 2008: 338)

One aspect which is dealt with insufficiently in the – German – state debate is the issue of the nation, as laid out in the Introduction to this chapter with reference to Barker (1991). While the forms of commodities, value, money and capital tend both logically and historically towards globalized forms of society, the national framework of the State, law and politics requires explanation. While form theory conceptualizes the State as the political form of definite social relations and as the independent power of social order, which

governs on the promise of a legal equality of an abstract citizenry and which concedes welfare support as a means for protecting the system, 'the limits of state intervention cannot be understood without reference to the limits of the national form of the state' (Clarke, 1991: 53).

## THE FORM OF POLITICS AND THE NATION – THE STATE AS A POLITICAL FORM IN GLOBAL CAPITALISM

Contrary to national ideology according to which the State is an expression of a national community, even older critical theory pointed out that:

The modern state [...] has not been created by the nation, but resulted from the introduction of commodity production, which has preceded the appearance of modern nations. When the product of labour is a commodity convertible into money, this money can be used to build the state and to establish a bureaucracy and standing army. (Neumann, 2009: 100)

Within States which are initially mostly monarchical or absolutist, nationalism is first an ideology of the revolutionary bourgeoisie – an ideology which helped justify the representative State. Not the king and court were conceived of as founding the representative State, but all of the citizens as the nation. Thus, Beilly, the representative at the National Assembly, had the king informed that 'the assembled nation was "no longer taking orders"' (Thamer, 2004: 33). If the common origins of the nation and the State are an ideology, the fusion of the nation state was no coincidence. On this subject, Adorno wrote:

But the nation, the term as well as the thing, is of more recent date. After feudalism perished, a precarious form of centralized organisation was to tame the diffuse combines of nature so as to protect bourgeois interests. It was bound to become a fetish unto itself; there was no other way it might have integrated the individuals, whose economic

need of that form of organization is as great as its incessant rape of them. (Adorno, 1997: 339)

What made it possible for the nation to become a fetish for people was identification with their State. Although there is of course an idea of the nation without the State, for instance in the German ideology of the *Kulturnation*, the unity of the cultural and the national State became the norm in the nineteenth and twentieth centuries. The territorial State was intended to be made to accord with the territory which was being claimed for the nation. The scope of laws referred to this border, and citizens' rights were conceived of as rights of those who belonged to a nation. Politics referred to the framework of a national economy. What is ignored is that capitalism did not originate in a national space and grew beyond it, but was global in its origins.

It was not a general and straight growth from local and regional markets to nationwide internal markets and only then beyond to the world market, but to the contrary, the world market collapsed catastrophically over the structures of agrarian society and its limited markets, then forcibly leading as a consequence and not as a cause [...] to the formation of the structures of the nation state and national economies. (Kurz, 2005: 52)

As for the internationalism of the labour movement, Robert Kurz sums it up as a lip credo, because the 'bias in national identity and the bourgeois nation state have been the most decisive ball and chain to bind the socialism of the labour movement to the capitalist system [...] since at least 1848' (Kurz, 1999: 913). Because reformist labour parties, mediated by law and politics, focus on the State and the nation, they declared their allegiance to those same capitalist forms that, ostensibly, they were combatting. 'The notion of the national state entails the international relations, and these international relations are founded on the world-market relations of price and profit' (Bonefeld, 2014: 152). For the State as a form of bourgeois society, it is thus the case that 'the term

bourgeois society does not stand, and has never stood, for a national society (151). The idea of the State without delimitation from other States, and law without territory, are meaningless, and competition among States is a complement to the principle of competition within society. Can nation thus be conceived of as the definition of the form of the State?

In this context, one particular aspect has to be retained which distinguishes the national form from on the one hand other forms, and on the other hand from nationalism. While the practice of politics, which asserts social claims over law, invariably ‘appeals to the State’s promise of equality’ (Grigat, 2007: 353), in the concept of nation, the inequality between citizens and non-citizens of a nation state becomes manifest. The fact that States and nations can only exist in the plural has two effects, according to Stephan Grigat (248):

In the State fetish, humans are always confronted by a power that they themselves created however unconsciously [...] In a way different from the fetishism of commodity, money and capital, they are keen to serve the power of the state, which is expressed inter alia in nationalism.

While nationalism as an ideology involves elevating just any nation, the form of the nation also has a very tangible material effect on its members. The State fetishism results from the form of the state as a particular instance of society. Nationalism, on the other hand, is merely an interpreting ideology.

For post-war societies of the capitalist West, Marcuse points out that identifying with the nation state is not to be understood as a betrayal of internationalism, but has more deeply rooted causes.

The integration of the largest part of the working class into the capitalist society is not a surface phenomenon; it has its roots [...] in the political economy of monopoly capitalism: benefits accorded to the metropolitan working class thanks to surplus profits, neo-colonial exploitation, the military budget, and gigantic government subventions. (Marcuse, 1972: 6)

However, and as Clarke (1991: 54) observed: ‘the nation state cannot stand above capital, since capital is a global phenomenon’. Nation states compel their populations to be competitive on the world market and they do so as a condition of achieving a measure of social integration. ‘It is the limits of the national form of the state which ensure that the actions of state are confined within the limits of capital, and which equally ensure that the state cannot resolve the inherent contradictions of capital accumulation’ (54). Just like the power of the State and law, exploitation and commodity exchange, capital and the welfare state appear as independent fetishes, but mutually condition one another, the same applies to the nation state and global capital: ‘The global and the national are different-in-unity, there are moments of the social relations of production, which constitute their distinct forms of existence’ (Bonefeld, 2014: 159). What does the domination of forms mean for human emancipation?

## THEORY OF PRAXIS – IN, AGAINST AND BEYOND THE STATE

The central theme to be found in this corpus – from Marx and Engel’s dispersed comments on the form State, through Pashukanis’ and Neumann’s critique of the *Rechtsstaat*, right down to the debates on the limits of the welfare state and the nation state – is the question of the State and emancipation. Pashukanis’ question as to why the State exists as a particular form has been answered. As Joachim Hirsch, who has participated in the state debate since the 1970s, put it:

Yes, this question was clarified. The answer, in brief, was that the State was neither an independent subject nor a neutral instrument that can be used at random by a power wielding group or class [...], but is instead a structural component of capitalism, its particular political form. The capitalist class and exploitative relationships have been formed in such a way that the economically

dominating class cannot dominate politically directly, but can only achieve its domination by means of an instance separated from the classes, the State. At the same time, the State remains subjected to the structural and functional logic of capitalist society. It is not an instance outside capital. The bourgeois State is therefore a class state without being the direct instrument of a class. And this 'separation' or 'relative autonomy' of the State is the basis of the illusion of the State. (Hirsch, 2010)

What has not been resolved, however, is still the political consequences of the critique of the state as the political form of society. In accordance with Pashukanis' and Lukács' ideas, law and politics can only become superfluous as forms of capitalism through the surpassing of capitalism. They thus agree with Lenin's theory of the class state, which is never neutral, including during the period of transition to communism. 'The proletariat needs the state, not in the interest of freedom but in order to hold down its adversaries, and as soon as it becomes possible to speak of freedom the state as such ceases to exist' (Lenin, 2015: 126). Nevertheless, as Marcuse argued, state socialism did not overcome the authoritarian character of the state. Horkheimer and Neumann even warn us that naked violence without legal form is worse. A pragmatic response to this can be found in Hirsch's account. It is true that the 'peculiarisation of the State is the decisive foundation of the fetishism of the State' (Hirsch, 2005: 59), but 'the State is not only an abstract fetish. It is also a field of social struggle' (Hirsch, 2003).

Hirsch objects to the social democratic illusion of State neutrality, but considers it worthwhile to engage in politics. After all, the commodity form of labour does not determine its price, and the form of law does not per se determine the content of laws. Fights over wages and election outcomes shape the manner of capitalist society. In this context form theory is important to guard against illusionary expectations. However, Hirsch's scheme presupposes subjects who are aware of their subjugation to abstract social forms and confirm this through their praxis.

What remains unclear in this strategy of (subversive) hibernation is how the horizon of critical theories of the State can survive. That horizon can be recalled through Marx's description of the Paris commune: '[The commune] was a Revolution against the State itself' (Marx, 1986: 486). It is 'the reabsorption of the State power by society as its own living forces instead of as forces controlling and subduing it, by the popular masses themselves, forming their own force instead of the organized force of their suppression – the political form of their social emancipation' (487). Of course, this form only existed as a breaking out of existing forms.

Holloway defends the position of not postponing the break with fetish forms to a revolutionary future, but to transform it into praxis. 'The task, therefore is [...] to develop [...] forms of organisation which stand in opposition to the fetishised and fetishising forms of bourgeois politics and economics' (Holloway, 1991: 258). He recognises that tangible struggles that might lead to social movements and new forms of organization are subject to dangers of integration. 'Struggles are channelled into political and economic forms, neither of which leaves room for raising questions about the structure of society as a whole' (Holloway, 2002: 94). Parties and trade unions have been tailored to the existing mode of society: they posit laws and collective agreements and have to want the State. After all, fetishism is not simply an illusion, but an expression of day to day contradictions. 'We create and re-create [the state] by paying taxes, by obeying the laws, by voting in elections' (Holloway, 2010: 134). For Holloway (2002: 92), '[t]o criticise the state means in the first place to attack the apparent autonomy of the state, to understand the state not as a thing in itself, but as a social form, a form of social relations'.

This critique of the state ultimately refers to the utopia of another reality. If indeed the State is not the opposite of capital, not a neutral means but the political form of exploitative and violent capitalist society, this raises

the question of a fundamentally different perspective. Hirsch uses concepts such as 'association' and 'federation' as fundamentally distinct modes of 'living together' (Hirsch, 1998: 105). The critique of the state entails also critical theory's distinction between the violence of the State and capital disguised in economic and political forms and the naked violence beyond such forms practised today by lynch mobs, Islamists or war lords. Horkheimer's (1985: 99) disappointment over the revolution which failed to '[dissolve] in the end into the democracy of the councils' points as a critique to an impeded future, because if 'there was anything in the twentieth century akin to a concrete utopia, that was the utopia of the councils' (Negt, 1976: 462). The councils were a means, the practical anticipation of a project of human emancipation. Weber himself laid out the criterion of this project: 'If there existed only social formations in which violence was unknown as a means, then the concept of the "state" would have disappeared'. Weber recommended calling this 'anarchy' (1994: 310).

# The Administered World<sup>1</sup>

Hans-Ernst Schiller  
Translated by Lars Fischer

Horkheimer and Adorno first publicly introduced the term ‘administered world’ during a radio discussion with Eugen Kogon in 1950.<sup>2</sup> The term became more widely known when it featured in the subtitle of Adorno’s collection *Dissonanzen. Musik in der verwalteten Welt* [Dissonances. Music in the Administered World], published in 1956. The notions associated with the term have deep roots in the previous evolution of critical theory. This concerns the theory of state capitalism developed by Friedrich Pollock and the concept of reason discussed especially in Horkheimer’s *Eclipse of Reason* but also in numerous essays written in the 1930s and 1940s. With his essay ‘Some Social Implications of Modern Technology’ of 1941, Herbert Marcuse also contributed to the genesis of the concept. In *One-Dimensional Man*, he arrived at conclusions similar to those of his colleagues: ‘The world tends to become the stuff of total administration’.<sup>3</sup> The term is nevertheless associated primarily with Horkheimer and Adorno. In developed class

societies, the crucial underlying notion suggests, ‘administration’ becomes a form of domination characterized by a formalizing, quantifying and categorizing mindset and an instrumental praxis. It proliferates across all sectors of society, from the sphere of production via the state bureaucracy to the culture industry, and also shapes the relationships of the individual to itself and to others. This form of administration creates an administered world.

## BACKGROUND IN THE EVOLUTION OF CRITICAL THEORY I: PLANNED ECONOMIES AND STATE CAPITALISM

Already in the first essay with which Pollock staked his claim as one of the pioneers of emerging critical theory, published in 1932, he was concerned with ‘the colossal enterprises in industry, trade, and finance’.<sup>4</sup> He was particularly interested in the incremental

abrogation of market mechanisms reflected in the fact that states had to avoid the collapse of economic giants. The phrase 'too big to fail' may have been coined only in the crisis of 2008 but the concept had already been applied in 1929 and the years that followed. The need to create a new social order based on a planned economy engineered with the means of 'total organization' – rather than the partial organization characteristic of capitalism – resulted not from any inherent economic necessity but from the barbarous means and boundless profligacy required to maintain capitalism and develop it further.<sup>5</sup> Planned economies depended on the 'centralized direction of the economy' and a unified 'analysis of demand'.<sup>6</sup> Moreover, it was predicated on 'mass production in large enterprises' and technological and organizational advancement. This included 'the improvement of the means of communication, the development of statistical methods and technical mechanisms for their deployment, which only a decade ago would have seemed to amount to an inconceivable mechanization of bookkeeping'.<sup>7</sup> Pollock did not suggest that within a planned economy every single enterprise had to be subjected to central tutelage. That it was 'possible to fuse the principles of centralization and decentralization' was the crucial point.<sup>8</sup>

Against the backdrop of the Great Depression, Pollock wondered about the degree to which it was possible to introduce elements of planning while maintaining capitalist relations of ownership.<sup>9</sup> Was it possible, in other words, for the incremental replacement of the market by state intervention and the increasing significance of planning in the large enterprises to gel into a capitalist planned economy? To his mind, central planning and capitalist relations of property were, in principle, compatible. If 'the power of disposal is ceded to the planning authorities' then ownership of the means of production became 'what in very many cases it already is today, that is, the guarantee of a more or less secure economic

rent'.<sup>10</sup> Pollock was nevertheless sceptical about the prospects of a capitalist planned economy. In no social order to date had 'the receipt of rent at society's expense with no discernible trade off at all been sustainable in the long run'.<sup>11</sup>

Once he developed the ideal-typical concept of state capitalism in 1941, Pollock dropped this questionable line of argument.<sup>12</sup> This concept was designed to encompass the disappearance of the market economy and the assumption of its rationalized regulatory functions by the state planning bureaucracies, the ruling parties, and the large enterprises, on the one hand, and the preservation of the private ownership of productive wealth and the profit motif, on the other. According to this definition, the Soviet order at the time was not a form of state capitalism, nor, when it was expressly mentioned, was it subsumed under this category.<sup>13</sup> With the advent of state capitalism, the 'mechanics of *laissez faire*' were replaced by 'governmental command'. Political means took the place of economic ones.<sup>14</sup> This notion of a 'transition from a predominantly economic to an essentially political era' paved the way for the racket theory subsequently propagated by Horkheimer.<sup>15</sup> Given its contention that economic problems were replaced by administrative ones,<sup>16</sup> the state capitalism concept paved the way for the theory of the 'administered world'. Within the parameters of state capitalism, administration was defined as rational activity undertaken to implement the central plan. Its ideal was 'scientific management' and the principle of rationalization, which entails the economization of each and every individual activity in accordance with the principle of the most economical means, the capture of all resources with the most advanced means of data processing and, of course, the monitoring of all operations by management. The adversaries of the administered world are improvisation, muddling through, conjecture, disorder and waste.

While Horkheimer did adopt the concept of state capitalism in the essays he wrote in

the early 1940s, his fundamental point of reference was the ‘authoritarian state’, which, on his account, existed in two guises: as state capitalism and as state socialism or ‘integral statism’.<sup>17</sup> If one reads Pollock’s essay on state capitalism and Horkheimer’s discussion of the authoritarian state in conjunction, the following forms emerge:

**Table 50.1 Horkheimer and Pollock: State-forms 1941**

authoritarian state		state capitalism	
state socialism (integral etatism)	fascist countries	democratic? (non-fascist)	

While Horkheimer in large part accepted Pollock’s diagnosis – especially regarding the liquidation of the market economy, i.e., of the liberal phase of capitalism – his perspective was markedly more radical. No form of ‘democratic state capitalism’ featured in his account. The only hope lay in the resolute introduction of the council system.<sup>18</sup> It alone might merit the epithet democratic. In authoritarian states, authority was exercised by the bureaucracy. The latter ‘regains the control of the economic mechanism which slipped away from the bourgeoisie under the rule of the pure profit principle’.<sup>19</sup> That Horkheimer did not treat non-fascist forms of state capitalism in his discussion of the authoritarian state is hardly surprising. On the other hand, there can be little doubt that the diagnoses subsumed as characteristic of state capitalism were also meant to apply to those developed countries not run by one-party rule.

In *Dialectic of Enlightenment*, Adorno too adopted the theory of state capitalism. The notion of the administered world was clearly prefigured in the text. Human beings, so the argument went, were reduced to ‘mere objects of administration’. The latter ‘preforms every dimension of modern life including even language and perception ... Alongside the capacity permanently to abolish any form of poverty, impoverishment in the form of the dichotomy between power and powerlessness is also growing beyond measure’.<sup>20</sup>

## BACKGROUND IN THE EVOLUTION OF CRITICAL THEORY II: THE CONCEPT OF REASON

The principle of rationalization connects the notion of the administered world to a theme that was central to critical theory from its very inception, namely, that of reason. Already in his inaugural address as director of the Institute for Social Research of January 1931, Horkheimer identified the ‘nexus between specific existence and general reason’ as the central problem of interdisciplinary social research.<sup>21</sup> This theme pervaded the *Zeitschrift für Sozialforschung* (later *Studies in Philosophy and Social Science*) from its first issue to its last and featured in many of Horkheimer’s as well as Marcuse’s essays. In ‘Philosophie und kritische Theorie (Philosophy and Critical Theory)’, Marcuse identified the concept of reason as the lasting legacy of the traditional philosophy drawn to a close by Hegel. It was the only category within philosophical thought through which it ‘remains connected to the fate of humanity’.<sup>22</sup> His big Hegel book of 1941, *Reason and Revolution*, is also part of this story. Yet, while Marcuse’s emphasis ultimately lay mainly on the history of ideas, Horkheimer was much more clearly interested in the objective reality of reason. Needless to say, Horkheimer too depended on traditional and contemporary thought as a means of theoretical reflection upon reality. Even so, his focus was from the very beginning centred on the historically specific ‘interplay of humans in society’ as ‘the mode of their reason’s existence’.<sup>23</sup> In this context, reason always had a twofold meaning: on the one hand, it referred to the general state of affairs, i.e., the institutions, which individuals, by pursuing their goals, reproduced – such as value, capital, the state; on the other hand, it designated the subjective position in relation to the objectivity of nature and society.

Both aspects were connected, but they were not identical and could be distinguished, to use Horkheimer's terminology in *Eclipse of Reason*, as 'objective' and 'subjective' reason. In modern society, social objectivity took on the guise of the 'anonymous might of economic necessity' to which people had to accommodate themselves.<sup>24</sup> The subjective dimension resulted from the fact that 'the most comprehensive accommodation of the subject to the reified authority of the economy ... is the guise of reason in bourgeois reality'.<sup>25</sup> Yet, that objectivity's appearance as an anonymous and inherent necessity was an illusion. It actually reflected the vested interests of individuals or specific groups: 'Production is not geared to the life of the generality as well as taking care of the needs of the individual; it is geared to the vested interest of the individual and also takes care, if need be, of the life of the generality'.<sup>26</sup> As far as the concept of reason was concerned, the theory of state capitalism implied that the superficial mediation through functional necessities fell away and the vested interests of society became the direct object of accommodation. It was

no longer the objective laws of the market that prevailed in the activities of the entrepreneurs and precipitated the catastrophe. Rather, as resultants whose inevitability in no way falls short of the blindest price mechanisms, the conscious decisions of the managing directors execute the old law of value and thus the fate of capitalism. The rulers themselves believe in no objective necessity, even if they occasionally give that name to their machinations.... Only their subjects acknowledge the inviolable necessity of the development, which renders them yet more powerless with every decreed increase in their standard of living.<sup>27</sup>

In this new constellation, too, the concept of reason retained a critical and normative function. The difficulties of the concept ultimately originated in the fact 'that the universality of reason cannot be anything else than the accord among the interests of all individuals alike whereas in reality society has been split up into groups with conflicting interests'.<sup>28</sup>

Matters were complicated by the insight that paved the way towards the *Dialectic of Enlightenment*: that an intricate, hitherto unresolved nexus existed between social domination, self-control and the domination of nature.<sup>29</sup> The elimination of social domination that forms the utopian vision's point of departure could be achieved only together with a reconciliation of living matter.<sup>30</sup> The realization of reason, then, implied a new relationship not only among human beings but also between human beings and nature. Yet in modern class society the domination of nature was an imperative that had been automatized in the apparatuses of production and domination. Subjective reason, then, was not just the logic of the individual subjects in specific sets of social relations but also the logic of those relations themselves that had taken on a life of their own in the gigantic apparatuses of production. Only this made subjective reason 'the concept of rationality that underlies our contemporary industrial culture'.<sup>31</sup> Subjective reason could disembody itself from the twofold context of objective between reason and recognition of the wilfulness of nature and the realization of a true generality of social institutions.

Subjective reason that failed to do so was what Horkheimer, in *Eclipse of Reason*, termed instrumentalized reason, the guise of reason in the administered world whose crucial characteristic, as Adorno put it, was 'the concentration of ever greater economic and social units to facilitate nescient and baleful sectional ends'.<sup>32</sup> Whether the unquestioned ends that had taken on a life of their own were really as opaque as Adorno claimed is a moot point, however. The fundamental goal underlying those unquestioned and effectively unquestionable ends pursued by the apparatuses of production as well as educational institutions was, after all, still the production of abstract wealth and the exchange value of capital in its general guise as money. Educational institutions contributed to that goal not least by obscuring it. The valorization of value, profiteering, or growth, as it

is euphemistically called, is in no way connected to any concrete form of objectified wealth.<sup>33</sup> It would seem, alas, that Horkheimer and Adorno themselves, during the Cold War, were inclined to obscure this goal. Indeed, this may be the fundamental problem with the concept of the administered world – that it does not give the still constitutive role of the extended production of capital its due.

### ADMINISTRATION AS A MINDSET AND FORM OF DOMINATION

The administration of the administered world is predicated on a mindset that emerged with modern science and first became social reality in the industrial application of technology in the capitalist factory. In *Eclipse of Reason*, Horkheimer portrayed this mindset as subjective reason developing a life of its own. Its characteristics were the principle of utility or instrumentalism and the classification and formalization of its objects. Its purpose was predetermined and supposed to be achieved ‘as completely as possible and with the least effort possible’.<sup>34</sup> It was predicated on the application of legal norms, organizational targets and profit rates, which could not themselves be questioned with the means of instrumental reason. They were realized through the assessment of objects such as the inventory in an enterprise, the personnel, and individuals’ leisure activities. This assessment was predicated on taxonomies superimposed upon humans and goods. One draws by numbers, follows ‘abstract procedure’.<sup>35</sup> The classificatory concepts had to allow mathematical regularities to be construed between the various data. Work processes had to be comprehensively parsed and the time requirements for each step measured and translated into a norm. In the meantime, university bureaucracies raise student data and distinguish funding sources in order to channel student streams and tailor them to targets. State bureaucracies raise data to

assess claims, undertake surveillance or persecute. Commercial administrations chase data on consumer habits to facilitate more targeted advertising and arouse new cravings. Yet time and again all this effort comes up against new constraints. ‘Nothing in the administered world works seamlessly’.<sup>36</sup> Registration and calculation turn out to be Sisyphean tasks. There are always cases that slip through the net, that precipitate the infamous need for yet more regulation, new laws and judgements, new classifications and ever more data. Today’s rationality of administration turns out to be dialectical: through its own dictates it produces the irrational elements that frustrate its calculations. The administered world turns out to be no less unbridled than the production of abstract wealth with which it is intertwined.

The utilization of data and calculations is not the only characteristic of administration as a mode of domination. To be sure, inefficient workers can be sacked and whoever seems suspicious when monitored is likely to be subjected to force. But an inherent nexus also exists between the administrative mindset and the domination of man and nature.<sup>37</sup> This was a particular concern of Marcuse in *One-Dimensional Man*. This form of rationality subjugates by treating living matter that pursues its own goals as a mere object. It is interested exclusively in measurability and regularity within the registered parameters. The formation of modern science marked the decisive step in elevating the domination of nature to a principle. By denouncing the teleological dimension of the *causa finalis* as a form of obscurantism, one was justified in subjugating nature, as matter that had no inherent value of its own, to the ends of production. ‘The quantification of nature’, Marcuse wrote, ‘separated reality from all inherent ends and, consequently, separated the true from the good, science from ethics’.<sup>38</sup> Inadvertently or not, by reducing deadened nature to mathematical regularities in its experiments, science was inherently connected to its technological application.

Marcuse concluded 'that the general direction in which it came to be applied was inherent in pure science even where no practical purposes were intended'.<sup>39</sup> The application of this mindset to human beings in the fields of medicine, psychology and social engineering reduced individuals to mere objects, subsequent corrective measures designed to prevent human beings from ever being treated *exclusively* as objects or means notwithstanding. State and commercial bureaucracies may negotiate their goals but the basic relationship remained one of objectification and reification.<sup>40</sup> The ideology of contract theory was unmasked for what it is when agreements could be coerced and refusal to comply carried sanctions. In the welfare state, too, the employees were subject to targets and evaluations. 'In the medium of technology, man and nature become fungible objects of organization', Marcuse wrote,<sup>41</sup> and 'this is the pure form of servitude: to exist as an instrument, as a thing'.<sup>42</sup>

### THE PITFALLS OF A SUPERFICIAL CRITIQUE OF THE BUREAUCRACY

Since the total rationalization of the administered world is a coercive function of power, a critique merely of the bureaucracy must fall short. When articulated by market liberals this critique primarily serves to weaken the legislature without being able or willing to democratize the bureaucracies (and it in any case focuses only on the state administration). In Adorno's rather neat formulation, 'the bureaucracy is the scape goat of the administered world'.<sup>43</sup> On the one hand, the superficial critique of the bureaucracy fails to appreciate that a good administration, which combats corruption, can benefit society. 'Like procedural law, the abstract procedure, which allows the bureaucrat to process each case automatically with "no respect of persons"', represents an element of justice, a guarantee, given its universal frame of

reference, that arbitrariness, coincidence, and nepotism do not govern man's fate'.<sup>44</sup>

On the other hand, the superficial critique of the bureaucracy fails to recognize that the bureaucracy is intricately connected to the mode of production. As Adorno described the process, 'the technological work process has transcended the critical industrial sector ... and proliferated life as a whole'.<sup>45</sup> The 'links of mediation' that were at play here, alas, 'have barely been exposed by research'.<sup>46</sup> In the meantime, Harry Braverman's study, *Labor and Monopoly Capital*, has filled in some of the blanks. Braverman has demonstrated compellingly how the growing significance of the office and the desire for it to function in accordance with scientific management standards follows from the evolution of the capitalist mode of production. Marx already referred to the 'pettiest spiteful despotism' of capital in the factory work process.<sup>47</sup> Yet Taylorism perfected its execution of control – in the twofold sense of surveillance and domination. Taylorism was 'the explicit verbalization of the capitalist mode of production', a 'science of work', which 'in reality is intended to be a *science of the management of other's work* under capitalist conditions'.<sup>48</sup> For Taylor, 'scientific management' hinged on '*the dictation to the workers of the precise manner in which work is to be performed*'.<sup>49</sup> The experience and skill of the individual workers are thus devalued, the intellectual operations are delegated as far as possible to the planning and labour office in an attempt to create a knowledge monopoly, which can be utilized '*to control each step of the labor process and its mode of execution*'.<sup>50</sup> With the growing need for coordination and monitoring, the demand for clerical work also increases. Bolstered yet further by the requirements of marketing and accountancy, clerical labour 'begins to approach or surpass the labor used in producing the underlying commodity or service'.<sup>51</sup> Crucial to Braverman's account is the insight that the clerical work was organized in accordance with the same principles as production itself.

'The purpose of the office is control over the enterprise, and the purpose of office management is control over the office'.<sup>52</sup> These proven principles spread to the state bureaucracy, which, be it as tax, welfare, educational or military administrations, fulfil economic functions too and, in all of the developed industrial states, have expanded throughout the twentieth century. In the meantime, principles of scientific management have been enshrined through the state bureaucracy in areas of activity which until two or three decades ago were considered unsuited to those principles: university studies, research in the humanities and social sciences, the caring professions and social services. This trend can justly be subsumed under the concept of the administered world, provided one bears in mind the open-ended character of its totalizing momentum.

For Horkheimer and Adorno, this momentum amounted to advancing sociation and social integration.<sup>53</sup> They subscribed to the Marxian theory that, as the domination of nature progressed, individual relations of dependency grounded organically in familial relationships or brute force were superseded by functional relations of dependency, which, like market relations, only emerged through individuals' social activities.<sup>54</sup> To the same degree as untreated nature disappeared or was declared inviolable and enclosed in nature reserves, social relationships were subjected to abstract norms, to the 'alienation of the individual from itself and others'.<sup>55</sup> This development continues as the capitalist production of value takes hold of ever new objects: communication and mobility, health and education, water provision and human genetics, animals and plants. For the reasons examined by Braverman, valorization and commodification, the transformation of the world into commodities, transpired hand in hand with the extension of the bureaucracy. As Adorno put it, 'the integration of society has grown in the sense of an increasing sociation. The social net is woven more and more closely and there are

fewer and fewer areas and spheres of so-called subjectivity that have not been seized directly and more or less comprehensively by society'.<sup>56</sup>

### **SELF-REIFICATION, AUTHORITARIANISM AND THE ATROPHY OF RESPONSIBILITY**

The administered world's sense of totality is demonstrated with particular clarity by its imprint on the individual. The administration of human beings amounts to their objectification and reification. This mechanism is internalized, which leads to the *self*-reification of those compelled to accommodate themselves to the administered world. This was already the subject matter of Adorno's aphorism 'Novissimum Organon' in *Minima Moralia*. As he put it in 1950, 'everyone is their own clerical case worker, as it were'.<sup>57</sup> In his essay of 1967, 'Erziehung nach Auschwitz' [Education after Auschwitz], he offered a condensed account of the kind of person calibrated for reification whom he also identified with the manipulative character previously introduced in *The Authoritarian Personality*. A manic dedication to organizational activity and efficiency, a fetish for technology, and emotional frigidity were among the characteristics of this kind of person. 'People of this kind first make themselves resemble objects and then, if they can, others too'.<sup>58</sup> Developments in the decades since have only confirmed the acuity of this diagnosis of self-reification. One engages in time management, learns to deal with one's feelings, holds 'emotional bank accounts', and crafts the identity one needs in any given context. The term adaptation no longer refers merely to one aspect of the natural process of evolution or to one aspect of the socialization into human society that transpires instinctively through mimetic behaviour. Instead, it has taken centre stage and become a commandment and creed. One has to, and wants to,

conform and this strategy boils down to a principled willingness to engage in self-reification and self-instrumentalization. 'The process of adjustment has now become deliberate and therefore total'.<sup>59</sup>

Since human beings in the modern world are not merely the proverbial cogs in the machine but also subjects that bear responsibility for themselves in the market place, the desire of subjectivity for emotions and identification has to be taken into account. Consequently, the administered world is also the world of the cult of personality, of the principle of individuality. Preoccupation with oneself plays a considerable role. Yet the much vaunted act of taking care of oneself frequently seems lifeless – as Adorno put it, 'the idea of a passionate human being today seems almost anachronistic'<sup>60</sup> – and attaches itself to superficial issues, even when psychological concepts are invoked. For this phenomenon he coined the term pseudo-individualization.<sup>61</sup> In the radio discussion in 1950, Horkheimer uttered a harsh critique of psychoanalysis, which applies with even greater justification today to its cognitive-behavioural competitors: 'In psychoanalysis the process of administration is continued within the human being itself'.<sup>62</sup> On the one hand, the rise of psychology and therapy demonstrated that for many, the process of adaptation was not, after all, as seamless as the functioning of the social machine would require. On the other hand, (psychoanalytic) therapy itself played an integral role in the process of alienation. In the form 'in which it is currently practised', Horkheimer argued, it implied 'that human beings should feel well under the general pressure'.<sup>63</sup>

The totalized administration is also closely connected to the authoritarian character. While Horkheimer and Adorno occasionally felt compelled to relativize authoritarianism in their theoretical accounts of National Socialism, the suggestion that it is a matter of the past that has been pushed back and now leads a mere

niche existence should be rejected. Man in the administered society is the authoritarian character.<sup>64</sup> In the administered world, Horkheimer explained, human beings

always think in terms of those on top and those at the bottom. They immediately classify every person as belonging to a particular class, a particular political party, a particular country, a particular race. They think in terms of black and white. Black is the group, which is not one's own; white is one's own group with which everything is in order and as it should be. They feel a tremendous yearning to belong to one of these groups, which is then the good group. This results from the fact that their ego, their spontaneity, and their will power have become weak and limp and they can only get a sense of themselves when they think of themselves as a member of a strong community.<sup>65</sup>

The nexus between administration and the authoritarian characters lay not just in this mindset, however, but also in the hierarchical organization of bureaucracies. Max Weber had lent bureaucratic obedience the halo of morality:

When a superior authority insists on an order that he considers wrong, the honour of the civil servant lies in his ability to go against his own judgement and nevertheless carry out the order, under the responsibility of the superior, as conscientiously and precisely as though it did conform to his own conviction. Without this truly moral discipline and self-denial the entire apparatus would disintegrate.<sup>66</sup>

Historical experience has shown that this 'honorable' stance of the civil servants can facilitate the most atrocious crimes. Yet under less sinister circumstances, too, the division of labour in the social apparatuses promotes irresponsibility and unscrupulousness. Anyone who has been involved with a social security office and has not become inured yet will be only too familiar with this tendency. Attempts to think beyond one's own immediate remit are considered particularly counterproductive, even when the practised restraint places, say, the wellbeing of a child at risk or undermines arduous individuation processes.

## THE ADMINISTERED WORLD AND THE CULTURE INDUSTRY

Professionalized irresponsibility also features in the cultural sphere. For Adorno this was exemplified by an incident that transpired early in 1952 when he protested against the republication of Heinrich Mann's novel *Professor Unrat* under the title of the successful screen adaptation *Der blaue Engel* [The Blue Angel].<sup>67</sup> From the material he was subsequently sent by the publisher it emerged that all parties involved had really been against the change of title. 'Nobody is responsible', he wrote.

This, in turn, reflects a much more fundamental phenomenon: the evaporation of guilt. The transfer of life to administration not only facilitates the perpetration of any number of atrocities without seeing oneself as a perpetrator. When an attempt is made, just for once, to hold an individual responsible, he can also make his excuses with utter subjective conviction. This effect ranges from seemingly negligible issues, like the changing of the title of a good novel into that of a bad film, all the way to outright atrocities.<sup>68</sup>

As already mentioned, the term administered world became more widely known because it featured in the subtitle of a collection of essays that Adorno published in 1956 as *Dissonanzen. Musik in der verwalteten Welt*. The thrust of the essays was twofold: they took issue with the 'infantilized music' in the Warsaw Pact states, on the one hand,<sup>69</sup> and the culture industry in advanced capitalism, on the other. He criticized the social character of the choral and youth music movement of the 1950s, which hinged on the classification and hatred of deviation, on industriousness and on the hypostatization of community. The administered world demanded 'functional music' [*Gebrauchsmusik*], purposive and streamlined pieces.<sup>70</sup> Horkheimer and Adorno had already stressed the centrality of stereotypy to the administered arts and exposed its diversification – offering something for everyone – as a means of universal capture. The intensifying integration and

socialization of relationships at the heart of capitalist development was particularly palpable in the culture industry. Human imagination was shaped by the dream factories, film and television foremost among them. Somebody who read a book was called upon to reproduce its imagery with his or her own imagination and thus in an individual way. If one watched a screen adaptation one was not only relieved of the imaginative labour but the images attained such force that they inevitably superimposed themselves upon the individual imagination. Subjectivity in the administered world was fundamentally characterized by the atrophy of spontaneity. It endangered the authentic production of art, which had to be wrested from the culture industry. 'The current paralysis of musical forces', Adorno wrote, 'represents the paralysis of all forms of free initiative in the administered world, which is unwilling to tolerate anything outside of itself that is not integrated at least as an oppositional variant'.<sup>71</sup> Indeed, the very way in which institutions used the term culture already bore the imprint of the culture industry:

He who says culture, also says administration [...] The subsumption of phenomena as diverse as philosophy and religion, science and art, ways of living and mores and, not least, the objective spirit of an age under the one term of culture already betrays in advance the administrative glance, which collects, classifies, assesses, and organizes everything from above.<sup>72</sup>

## THEORETICAL PRECURSORS I: MARX AND ENGELS

In terms of the concept's theoretical antecedents, Marx and Engels form the first and principal point of reference for the notion of the administered world. Horkheimer in particular took up the thesis that administration would play an ever greater role and inverted its polarity.<sup>73</sup> The need for a 'board' that 'keeps the books and accounts for a society producing in common' was already

registered by Marx in the *Grundrisse*.<sup>74</sup> This board was supposed to certify entitlements and engage in acts of distribution that could not be re-circulated in the primitive form of money, in other words, that were personalized and could be redeemed only by the board. Even 'after the abolition of the capitalist mode of production but while maintaining social production', a passage in the third volume of *Das Kapital* contended, 'the determination of value continues to transpire predominantly in such a way that the regulation of labour time and the distribution of social labour among the various spheres of production and, not least, the bookkeeping that records all this, become more essential than ever'.<sup>75</sup>

On this point, Engels agreed with his friend Marx: 'The rule over people will be replaced by the administration of objects and the direction of production processes'.<sup>76</sup> Neither did the notion that capitalism would evolve via joint stock companies and trusts into state capitalism which would be the next preliminary step towards a socialist resolution of the conflict between the forces and relations of production diverge substantially from Marx's thought processes.<sup>77</sup> Not that this is a flawless line of argument, but one certainly cannot attribute it exclusively to Engels and then, looking back over the most horrendous decades of the twentieth century, shake one's head in disbelief. And yet, even from the perspective of 1940, this construct seems irredeemably naïve. In 'Autoritärer Staat', Horkheimer quoted Engels's developmental scheme – which ended with the state 'taking over the direction of production' – in some detail.<sup>78</sup> What Engels had failed to see was the possibility that such a state, having become not only the 'ideational' but the actual 'embodiment of the country's entire capital',<sup>79</sup> could draw on repression and the loyalty of the masses to function as an authoritarian state.

The prospects Engels construed seem hopelessly naïve and utopian today:

The capitalist mode of production pushes more and more towards the transferral of the large

socialized means of production into state ownership and thus itself shows the way towards the execution of the revolution. *The proletariat will seize state power and transfer the means of production, initially, into state ownership.* Yet in so doing it will dissipate as the proletariat and annul all distinctions and antagonisms of class and thus also the state *qua* state.... The intervention of state power into social relations will become superfluous in one sphere after another and gradually cease of its own accord.... The state is not 'abolished', it withers away.<sup>80</sup>

The forces of production would lie 'in the hands of the associated producers', and 'the social anarchy of production' that was characteristic of capitalism would be replaced by 'a planned social regulation of production according to the needs of all and of each individual'.<sup>81</sup>

The decisive question, which Engels failed to raise, was that of how one could prevent the administration of objects from becoming the pretext for the domination of people. Its urgency was demonstrated by the development of the Russian Revolution. State socialism became, in the words of Horkheimer, the 'most consistent form of authoritarian state'.<sup>82</sup> Nevertheless, Horkheimer was not oblivious to the fact that integral etatism also held a promise for 'the millions at the bottom'.<sup>83</sup> 'Wherever else in Europe tendencies towards integral etatism are stirring there is a prospect that this time it will not become entangled in bureaucratic domination again', he wrote.<sup>84</sup> Decisive were the actions of the masses themselves: 'The radical change that will put an end to domination will reach as far as the will of those who are liberated'.<sup>85</sup> Everything depended on the actualization of a true democracy in the form of a council system. 'In a new society only the uncompromising independence of the non-delegates will prevent the administration from turning into domination'.<sup>86</sup> In the radio discussion with Adorno and Kogon in 1950, Horkheimer still noted that 'people today are in the grasp of the bureaucracy, but they need not be'.<sup>87</sup>

In the course of the Cold War, Horkheimer abandoned such hopes. He now considered

'the tendency towards absolute administration' and integration inescapable and irrevocable,<sup>88</sup> and dropped the notion of 'self-governance', which had also been the critical vanishing point of Marcuse's concept of bureaucracy.<sup>89</sup> 'As long as its development is not disrupted by catastrophes', Horkheimer explained in 1971, 'society, following its inherent logic, gravitates towards a state in which administration gains ever more significance at the expense of individual spontaneity so that production and the tasks it depends on are no longer reliant upon "free enterprise" but effectively turn into automated processes'. Horkheimer now assumed 'that the path leads inexorably to total administration'.<sup>90</sup>

## THEORETICAL PRECURSORS II: MAX WEBER

The significance of Max Weber for the concept of the administered world is generally overstated. At its core, the concept drew on other sources and it predated the critical theorists' serious engagement of Weber's conceptualization of bureaucracy, which only occurred in earnest in the 1960s. To be sure, they too could not simply ignore Weber's theories. Adorno and Horkheimer praised the renowned sociologist's erudition and intellectual force. The designation 'Weber-Marxism' is nevertheless misleading. It was apparently coined by Jürgen Habermas and has variously been repeated since.<sup>91</sup> Weber-Marxism is a wooden iron that forcibly conflates mutually contradictory elements without allowing their contradictions to be articulated or resolved. On the one hand, Weber's endeavour presupposed theoretical Marxism and he owed important impulses to it. Not least, Marx had pointed to protestant Christianity as the form of religion best suited to the capitalist mode of production.<sup>92</sup> Yet Weber also sought to create a counterweight to Marxism and

maintained a polemical relationship to it.<sup>93</sup> On the other hand, the engagement of Weber by Horkheimer and Adorno, and the same holds true of Marcuse, was fundamentally critical in nature. For one thing, in connection with his studies of protestant ethics they defended the Marxian positions Weber had opposed. They denied that the religious ideas of the Reformation played a 'principal role in the emergence of the bourgeois world'. These ideas had not, in and of themselves, been original. Rather, 'their momentous proliferation from the pulpit can be understood only in connection with the economically determined rise of the bourgeoisie'.<sup>94</sup>

Yet their critical discussion did not hinge merely on the defence of Marx against Weber. It also concerned the core of Weber's theory, his concept of rationality. They did give Weber credit for having predicted the increasing bureaucratization 'with great precision'.<sup>95</sup> Yet for Adorno, Weber's concept of rationality stood on its head, making him a 'trustworthy mouthpiece of his class'.<sup>96</sup> Weber's rationality was defined in utilitarian terms. It hinged on the 'technically most adequate means' without any examination of the objective rationality of the ends.<sup>97</sup> An objectively rational end, for Adorno, would be to maintain and secure the lives of 'the socialized subjects in accordance with their unfettered potential'.<sup>98</sup> Yet in fact, the more the rationality of means was refined and extended, the more life was impoverished and threatened. Provided everything ran 'normally', individual subjective interests were governed by rationality, yet the whole was uncontrollable and crisis-ridden, a game played without a safety net and at the risk of annihilation. 'The rationality of ends and means at the individual level', Adorno noted, 'not only does not balance out the irrationality of the whole but ... actually reinforces it'. Society as a whole continued to be at the mercy of a blind interplay of forces.<sup>99</sup>

Little is gained by responding to Adorno's (or Marcuse's) critique of Weber

with a reference to the fact that Weber also deployed a second concept of rationality. To be sure, to the utilitarian, formal rationality he also juxtaposed a material rationality. Yet on closer inspection, it too turns out to be a matter of subjective discretion. The distinction between material and formal rationality comes nowhere close to the concept of an objective or substantive reason whose frame of reference must be society in its entirety, i.e., the true generality. According to Weber, material rationality is a rationality of values. It makes claims of an ethical, power-political or some other kind.<sup>100</sup> Yet it is impossible to account for the legitimacy of the values in question. When Weber refers to a rationality of values he is concerned with the immanent systematic consistency of values. These criteria can also be applied to values one does not share.<sup>101</sup> Within this scheme, partisanship for alternative values – equality vs. class interests, say, or veracity vs. national supremacy – is ultimately not subject to a rational decision.

Weber's distinction between formal and material rationality, along with the notion of a rationality of values, falls into the realm of subjective reason, then. Of equal concern is his relationship to irrationality. Weber was blind to the irrationality, which, as the Critical Theorists demonstrated in connection with the authoritarianism of leading Reformation figures, inhered in the bourgeois spirit from its inception.<sup>102</sup> Moreover, his rationality of ends was not only compatible with irrationality but itself characterized by a measure of irrationality. It is this nexus that renders the relationship between reason and irrationality dialectical, and it is its non-dialectical character that sets Weber's conceptualization markedly apart from that of the critical theorists who insisted that 'bureaucracy ... is irrational'.<sup>103</sup> This statement, which referred to the tendency of individual functions to take on a life of their own and the self-multiplication of the need for regulation,

can also be generalized. If one takes the basis of economic calculation into consideration, the rationality of ends, applied to the economic realm, is irrational. As things stand, the economic handling of use values presupposes their transformation into exchange values. Yet in the exchange relationship between commodities, the relationships between those who work also appear as those between objects. Weber's concept of rationality, Adorno argued, was naïve because he did not touch on the crucial concern: 'in the world we inhabit, relationships between human beings, due to the structure of the exchange process' were 'reflected back to us, as though they were the characteristics of objects'.<sup>104</sup>

Marcuse presented a detailed critique of Weber's concept of bureaucracy at the 15th Congress of German Sociologists in 1964. According to Habermas, he made quite an impression.<sup>105</sup> Building on the insight that Weber's formal rationality was itself characterized by traits of domination (see the section 'Administration as a Mindset', above), Marcuse focused on the contention that a bureaucracy that proceeds rationally remains dependent on an irrational power that utilizes it. The 'bureaucracy submits to an extra- and meta-bureaucratic power ... When rationality is embodied in the administration and *exclusively there* then this legislative power must be *irrational*. Weber's concept of reason culminates in the irrational concept of *charisma*'.<sup>106</sup> That said, Weber had at least recognized the risk 'that the rational bureaucratic apparatus of administration, by virtue of its rationality, submits to an alien authority'.<sup>107</sup> Just as the progressing domination of nature was subordinate to capital as the self-valorizing value, state (and other) bureaucracies needed a leader. 'Disastrously', Adorno explained in the radio discussion with Horkheimer and Kogon, 'irrationality is rationalized'.<sup>108</sup> Or, as he put it elsewhere, 'rationality ... falls into irrationality's sphere of influence'.<sup>109</sup>

## HABERMAS AND THE 'COLONIZATION OF THE LIFEWORLD'

Jürgen Habermas adopted but also contained the notion of the administered world in his concept of the 'colonization of the lifeworld'.<sup>110</sup> As is well known, the concept of the lifeworld was introduced by Husserl in the context of his reflections upon the *Krisis der europäischen Wissenschaften* [Crisis of the European Sciences]. Habermas appropriated the term in order to construe theoretically a field of action within which communicative action could reside. Communicative action that transpired in the lifeworld was oriented towards common understanding and sought forms of consent that, in the modern world at least, were rationally motivated, i.e., based on arguments grounded in normative regularity, factual veracity and emotional genuineness. Any form of action oriented towards common understanding transpired in what is assumed to be a shared situation. The entirety of assumed commonalities, underlying convictions or notions that go without saying, formed the lifeworld. It was the reservoir that fed the definitions of the situation. These underlying convictions formed 'patterns of interpretation, value and expression' to which Habermas assigned the terms culture and language. They were not, in the first instance, thematic and could not be designated knowledge because knowledge 'stands in internal relation to validity claims and can therefore be criticized'.<sup>111</sup> Yet it could also transpire that the assumption of commonalities was incorrect. In that case, the definitions of the situation themselves were problematized in communicative action.

The fundamental problem with Habermas's social theory springs from the fact that he wants to anchor communicative action and the lifeworld as its practical locus in a specific social sphere that is distinct on principle from the economic and administrative spheres. In the latter, action was strategic and instrumental, and common underlying assumptions

and thought patterns that could turn out to be mutually contradictory did not seem to exist. Conversely, it is something of a stretch to imagine that gainful employment as an activity, though supposedly not communicative, belongs to the lifeworld. As 'performance' it certainly belongs to the functional context of the economic system.<sup>112</sup> Since Habermas does not explicate the distinction between action and performance, one might think of the Marxian distinction between the labour process and the valorization process. Yet one of the presumptions underlying Habermas's theory of communicative action was that Marx's theory of value was incorrect.<sup>113</sup> According to Habermas's colonization theory, the lifeworld (understood in the sense outlined above) was embroiled in defensive action against the intrusion of dictates from the economic and administrative subsystems that have taken on a life of their own.<sup>114</sup> Their imperatives, according to Habermas, were monetization and bureaucratization. By colonization he meant 'the penetration of forms of economic and administrative rationality into areas of action that resist being converted over to the media of money and power because they are specialized in cultural transmission, social integration, and child rearing, and remain dependent on mutual understanding as a mechanism for coordinating action'.<sup>115</sup> The core site of this colonization Habermas saw in the modern welfare state, which guaranteed freedom, on the one hand, but also had an individualizing and atomizing effect, on the other.<sup>116</sup> Habermas also focused on the commercialization of leisure ('mass consumption') and the juridification of relationships within families and schools.

The fundamental problem with this concept resides in the notion that monetization and bureaucratization supposedly confront a lifeworld in which, as Habermas himself reflected and is all too evident from the reality around us, the economic and administrative principles, their 'steering media', throughout modern history have been firmly grounded all along.<sup>117</sup> In *Misère de la philosophie*

[The Poverty of Philosophy], published in 1847, Marx already pointed to the fact that 'things, which until then had only been imparted but never exchanged, given but never sold, acquired but never bought: virtue, love, conviction, knowledge, conscience etc. ... all became objects of trade'.<sup>118</sup> This makes it difficult to argue that juridification and monetization emerged only with the welfare state and thus impinged on the lifeworld from the outside. In fact, these processes asserting modern economic principles have been at work from the outset and shape the attitudes of those they impact. In this context, monetization and juridification are intertwined. As Habermas acknowledged, the power of the economic subsystem over social services, the familiar economization of the social, was implemented by the administration in legal form.<sup>119</sup> Yet in all spheres the economization of the social transpired in at least two phases, which could be identified with the Marxian concepts of formal and real subsumption to the exchange value.<sup>120</sup> The economization of welfare consists not merely in the fact that one now needs to pay for services which are needed regularly, like medical or care services. This has been the case for some time and merely reflects the professionalization of the services. Decisive in the process of economization is the ingress of typically administrative forms of action into the fundamental work processes and their analysis, planning, streamlining and documentation. These are all processes that since the beginning of the twentieth century have constituted the phenomenon of economic rationalization and are well known from large industrial enterprises and their production sites and open-plan offices.

That said, Habermas's social theory – the only influential approach in recent decades, apart from systems theory – can be understood as an attempt to establish the modern lifeworld as an independent sphere geared to rational agreement and capable of resisting the impositions of administration and

commerce, though without questioning them in principle. His approach is plausible insofar as those impositions of monetization and regulation are indeed experienced by the subjects in their everyday lives as something coming from the outside. Yet the distinction, on principle, between the spheres of the capitalist economy, on the one hand, and state administration, on the other, each with their inviolable right, complemented by the lifeworld as a distinct sphere constituted by its own principle of rational agreement, is theoretically questionable.

### THINKING WITH AND BEYOND THE CONCEPT: BAUMAN AND FOUCAULT

Two concepts, developed after the death of the critical theorists, seem to confirm the theory of the administered world but also highlight certain weaknesses. In his *Dialectic of Modernity*, Zygmunt Bauman, while offering a deficient, apparently second-hand account of *The Authoritarian Personality*,<sup>121</sup> comes fairly close to the critical theorists' approach. According to Bauman, the Holocaust was 'a by-product of the modern drive to a fully designed, fully controlled world'.<sup>122</sup> Something similar could occur whenever democracy was abolished and replaced by 'an almost total monopoly of the political state'.<sup>123</sup> For Bauman, the '*pronounced supremacy of political over economic and social power, of the state over the society*' was the decisive factor.<sup>124</sup> The similarities to the concept of the authoritarian state are obvious. Given this supremacy of the state, the instrumental rationality inherent in the modern bureaucracy and the lack of moral responsibility, reflection and impetus fostered by the functional division of labour could take unrestrained effect. Bauman illustrated this by citing an expert on gas vans. 'The bureaucratic mode of action, as it has been developed in the course of the modernizing process', Bauman wrote,

contains all the technical elements which proved necessary in the execution of genocidal tasks.... Bureaucracy is programmed to seek the optimal solution. It is programmed to measure the optimum in such terms as would not distinguish between one human object and another, or between human and inhuman objects. What matters is the efficiency and lowering of costs of their processing.<sup>125</sup>

Here too the affinity to the critique of one-sided rationality formulated by Horkheimer, Adorno and Marcuse is obvious.

What distinguished Bauman's approach from that of critical theory is the absence of a teleological scheme. The authoritarian or totalitarian state features not as the necessary outcome of an inexorable development but as a constant threat that can be counteracted. This corresponds to the historical experience of the post-war era. An additional concern for Bauman was the cooperation of the victims as exemplified by the actions of the Jewish Councils in the ghettos. Above and beyond the distressing example of the Jewish Councils, this behaviour constituted an element of modern sociation illustrated by today's neoliberal welfare legislation with its 'integration agreements', or the 'target agreements' in contemporary universities.

Precisely because of its extremity, the Holocaust revealed aspects of the bureaucratic oppression which otherwise might have remained unnoticed.... Most prominent among these aspects is the *ability of modern, rational, bureaucratically organized power to induce actions functionally indispensable to its purposes while jarringly at odds with the vital interests of the actors.*<sup>126</sup>

The critical theorists did not return to this dimension of administrative domination in the post-war era.

In the late 1970s, Michel Foucault focused on the ideas of German ordoliberalism and sought to ground them in a history of 'governmental rationality' that he pursued back into the eighteenth century. We need not concern ourselves with the wilfulness of his historical derivation and its blind spots, or even his oddly flat discussion of administration.<sup>127</sup>

For our discussion here, the crucial point is that Foucault focused on the market economy, which, according to Horkheimer, Pollock and Adorno should no longer have existed. Although prices were deregulated in West Germany between 1948 and 1953,<sup>128</sup> Horkheimer, Pollock and even Adorno, though he was more careful in his formulations,<sup>129</sup> maintained their position that the market economy had come to an end, and refused to re-examine their diagnosis of the 1930s and 1940s in the light of new developments. There can be little doubt that this mistaken but presumably convenient conviction obstructed the further development of critical theory. While the cultural liberalization from the 1960s onwards caught those who were convinced that the trajectory towards the authoritarian state was inexorable unawares, forms of market-conform individualization against the backdrop of the welfare state were simply no longer taken into consideration. This is all the more remarkable, given that Foucault's theory of the 'entrepreneur of himself'<sup>130</sup> was already anticipated in *Dialectic of Enlightenment*:

The more universally the modern industrial system demands of everyone that they serve it, the more all those who do not belong to the ocean of white trash ... turn into wee experts, becoming employees who need to fend for themselves. As qualified labour the independence of the entrepreneur, which no longer exists, spreads to everyone admitted as a producer ... and forms their character.<sup>131</sup>

That the concept of the administered world requires some adjustment should not detract from its continued heuristic and explanatory functionality. Technological developments have increased the potential for the unfolding of the trinity of registration, calculation and domination further than was remotely conceivable in the middle of the twentieth century. This holds true for labour processes within which digitization has opened up new areas of standardization and control.<sup>132</sup> It also holds true for people's private lives, in which the tyranny of the norm is established by the

welfare bureaucracy and the culture industry. The latter relies primarily on self-help literature, the function of stars and film characters as role models, and the streamlining of the major news outlets. And it holds true, not least, for state security apparatuses, especially for the secret service, with their dystopian capacities for surveillance. In the hand of authoritarian governments they facilitate comprehensive control, intimidation and punishment.

## Notes

- 20 Max Horkheimer, Theodor W. Adorno, *Dialektik der Aufklärung* (Frankfurt: Fischer, 1969), 45. During the Cold War, Horkheimer revised his assessment of the Soviet Union. If in 1941 the Soviet order was classified as a form of state socialism or integral etatism quite distinct from (authoritarian or non-authoritarian) state capitalism, by 1959 it too was subsumed under the category of state capitalism: 'In Russia, however, that state capitalist state of affairs reigns which dictates that, given internal and external pressures, industrialization must transpire more quickly and the people must be made to function with more brutal means than was the case even in England in the early liberal era' (Max Horkheimer, 'Philosophie als Kulturkritik', in *Gesammelte Schriften* vol. 7 [Frankfurt: Fischer, 1985], 81–103, here 91). This line of argument hardly seems plausible, given that there was no private ownership of the means of production in the Soviet Union. Horkheimer's pro-Western partisanship coexisted with this contention that a 'convergence of the two mutually hostile worlds' was in the process of evolving (*Ibid.*, 92).

- 37 The German term for administration, *Verwaltung*, and the term administration, which is also used in German as a Latinate loanword, are directly connected to the concept of ruling/domination. The German term is derived from the Common Germanic 'walten', which means 'to dominate, to be strong'. The term administration draws on the Latin verb *ministrare*, which means 'to serve'. One should surely refrain from drawing ethno-psychological conclusions from the fact that the Germanic term perceives of the power relationship from above and the Latinate term from below. The etymology of the term *Verwaltung* nevertheless goes rather well with the German authoritarian state.

# Commodity Form and the Form of Law

Andreas Harms

Translated by Joseph Fracchia

## INTRODUCTION

The critical theory of the Frankfurt School contains a critique of right and law in capitalist societies. This critique was intermittently connected with Marxist theories of law and Marxist critiques of the law. Eugen Pashukanis's *General Theory of Law*, which first appeared in Russian in 1924, was of particular importance for the development of a critical theory of law. This is true both for the beginnings of critical theory and also for the critical theory of the 1960s and 1970s. In his *General Theory of Law*, Pashukanis derives the form of bourgeois law from the commodity form. He sees the form of law and the form of the commodity as parallel forms of appearance of bourgeois socialization [*Vergesellschaftung*]. The critical theory of the 1960s and 1970s particularly represents an attempt to go beyond Pashukanis's derivation of the form of law from the relations of exchange. Negt and several other authors attempted instead to derive the form

of law from the particularities of the capitalist production process and not just from the process of circulation. And with Habermas, finally, right and law are formal dimensions of communicative action and should therefore be attributed to critical theory only to a limited degree.<sup>1</sup>

The chapter first addresses the foundations of the concept of law in Marx and Pashukanis, in order then to treat critical theory's reception and critique of Pashukanis. For the development of the concept of law in critical theory, the experience of National Socialism was of great significance. This is especially evident in the works of Pollock and Neumann, and Horkheimer and Adorno, too. In connection with this, the next step is to elaborate Adorno's critique of law as a form of bourgeois socialization in which he also presents a critique of Hegel's concept of law. Marcuse, on the contrary, appears to adopt Hegel's concept of law and Bloch seems to want to situate himself positively in relation to idealist concepts of the law.

## THE FOUNDATION OF CRITICAL THEORY'S CONCEPT OF LAW: MARX AND PASHUKANIS

Various authors adduce time and again two passages from the entire corpus of Marx's work as the basis of a Marxist theory of law: on the one hand, the chapter on the commodity in the first volume of *Capital* (1867); on the other hand, the *Critique of the Gotha Programme* (1875). For Pashukanis, as for critical theory, the commodity chapter in *Capital* is definitive. In the *Critique of the Gotha Programme* Marx drafts a two-phase model of transition from bourgeois society towards a communist society. In the first phase the socialist society is still tainted with the 'birthmarks' of bourgeois society and the economic principle of equivalence still dominates; and in the second phase, the principle, 'From each according to his abilities, to each according to his needs' prevails (Marx, 1875). What induced Marx to address the significance of law as a form of social interaction was the program of the Social Democratic Party of Germany (SPD) which was influenced by Ferdinand Lassalle, who wanted to transform the collective working class demands of Social Democracy into demands for rights. Thus Marx countered the program's demand for the 'emancipation of labor' in the sense of a more just distribution of the fruits of labor with the provocative question of whether the given distribution of the fruits of labor is not in fact the only just distribution in the prevailing mode of production (Marx, 1875: 18). Marx, in short, wants to derive law from social conditions, particularly from the exchange of equivalences. And in his *Critique of the Gotha Programme* Marx poses the rhetorical question of whether the conditions of justice do not derive from the economic sphere, and with this question he denies that the legal relations determine the economic relation.

Marx had already developed this general assessment in the second chapter of the first

volume of *Capital*. There he devotes himself to the process of the exchange of commodities and addresses the commodity owners who mediate this process. He characterizes the commodity owners as 'character masks' because they act as the quasi-substitutes for commodities and execute, if unconsciously, the movements of value within the process of commodity exchange. In this passage, Marx posits money as the particular, socially determined use-value that functions as the universal equivalent of all other commodities, and he explains:

Commodities cannot themselves go to market and perform exchanges in their own right. We must, therefore, have recourse to their guardians, who are the possessors of commodities. Commodities are things, and therefore lack the power to resist man. If they are unwilling, he can use force; in other words, he can take possession of them. In order that these objects may enter into relations with each other, their guardians must place themselves in relation to one another as persons, whose will resides in those objects, and must behave in such a way that each does not appropriate the commodity of the other, and alienate his own, except through an act to which both parties consent. The guardians must therefore recognize each other as owners of private property. The juridical relation, whose form is the contract, whether as part of a developed legal system or not, is a relation between two wills that mirrors the economic relation. (Marx, 1976: 178)

This fragmentary excerpt is emblematic for Pashukanis's reception of Marx. Neo-Marxist authors on the contrary attempt to find the basis for a critical concept of law in Marx's very early writings, above all in his critique of the law against the theft of wood, written in 1842, with which he commented journalistically on the debates of the Rhineland Parliament on that issue (Marx, MEW 1: 28–77). For the lawyer Marx, it was essentially a matter of determining whether a law or statute actually fulfills the general concept of law – and in Marx's view the law against wood theft, with its prohibition on gathering firewood that only affected the poor, did not. Ernst Bloch also took up this approach (see later).

In addition to the two passages mentioned above, Pashukanis also relies on Marx's Introduction to the *Grundrisse* (1857–59) in developing his *General Theory of Law and Marxism*. There Marx differentiates epistemologically between a self-propelled form of thought and the real process of the formation of the concrete. In his critique of political economy Marx conceives of, for example, the 'world market' as concrete, as a real object within a given totality of determinations and conditions. Marx thus moves from simple, abstract concepts (e.g. labor) to the concrete. Pashukanis develops his critique of law in a similar manner. He interprets the historical formation of the discipline of legal theory as the constitution of abstract concepts of law such as legal norm, legal relation, and legal subject. For Pashukanis each particular legal content expresses itself in abstract legal norms (Pashukanis, 2003: 47).

Already at this point Pashukanis establishes an implicit differentiation between the form of law and the content of law that is also characteristic of critical theory. In contrast to the question of the just or correct contents of the legal norms, and in distinction to traditional Marxist views about law as an expression of the bourgeois class interests, Pashukanis does not want to understand bourgeois law as an image of the interests of the bourgeois class, that is: he does not want only to establish that certain legal norms correspond to the material interests of a particular class (Pashukanis, 2003: 54ff); rather, he wants to investigate the 'form of law as a historical form' of definite social relations. In his view, all other schools of law fall short of this goal – and that includes theories of natural law and rational law, psychological and sociological theories of law, including Hans Kelsen's theory that Pashukanis assigns philosophically to neo-Kantianism and the tradition of legal positivism, and also the legal theories of 'many Marxists' (54). In any case, he insists, the identification of law with the 'idea of unconditional submission' to an external norm-setting

authority cannot be 'the foundation of the legal form' (109).

Thus, Pashukanis holds that the juridical categories are only apparently universal in character; they present only the legal norms of a historically specific form of society, that is, a commodity-producing society (Pashukanis, 2003: 70). With this approach Pashukanis addresses the modern bourgeois system of law and its self-understanding as a general legal theory; and he accords them a truth and a reality in order then to, say, deconstruct them. He grasps the categories of law through and beyond their ideological character as 'objective forms of thought' that correspond to 'objective social relations' (74) – similar to the categories of political economy that he views as imagined forms 'by means of which the society based on the exchange of commodities conceives of the labour relation between individual producers' (73). Pashukanis clearly recognizes the problem that arises with the development of a concept of law, the problem namely of describing law as an objective form and thereby failing to grasp the particularity of law, the problem of comprehending law as something that is supposed to be an expression of a social relation that it at the same time regulates. According to Pashukanis, law can only present the form of a '*specific* social relation' (79, italics in original). Pashukanis surmises that this specific relation lies in the relation of commodity owners to one another.

His depiction of the law parallels Marx's depiction of the 'immense collection of commodities' in which the wealth of capitalist societies appears (Marx, 1976: 125); Pashukanis characterizes bourgeois society as 'an endless chain of legal relations' (2003: 85). Legal norms belong to the society from which they spring (see Pashukanis, 2003: 85–6). For that reason, the law is only right, and therefore at all relevant, as an 'objective social phenomenon' (87). Here, he takes up the most obvious, the property relation, as the 'lowest level of the legal superstructure', and he sees this, following Marx, as

an expression of the relations of production (90–1). For Pashukanis, the state is the second level to be derived from the relations of production. This derivation corresponds to his rejection of understanding law purely as a relation of ought.

Against this background Pashukanis puts the concept of the legal subject at the center of his analysis. The legal subject is for him both the ‘atom of legal theory’ (Pashukanis, 2003: 109) and also the expression of that freedom in commodity-producing societies. As he puts it, ‘property becomes the basis of the legal form only when it becomes something which can be freely disposed of in the market’. In contrast to natural law and rational law, the concept of the (legal) subject is not to be developed out of some general idea; rather, and corresponding to Marx’s unfolding of the commodity form in *Capital*: social relations deriving from the capitalist production process assume the form of things, and the commodity is transformed from a ‘concrete multiplicity of useful attributes’ into ‘simply a material shell of the abstract property of value’ (111–12). Following Marx precisely in this regard, Pashukanis insists that the exchangeability of commodities that is formed behind the backs of the actors presupposes a conscious act of will. The ‘reified’ social relations establish and require ‘a particular relationship between people with products at their disposal, or subjects whose “will resides in those objects”’ (112, citing Marx, 1976: 178).

In the ‘abstract human labor’ that is congealed in the commodity, the concrete relation between person and thing appears only as the abstract will of the property owner; thus, ‘all concrete peculiarities which distinguish one representative of the *genus homo sapiens* from another dissolve into the abstraction of man in general, man as a legal subject’ (Pashukanis, 2003: 113). But if ‘objects dominate man economically ... then man rules over things legally, because, in his capacity as possessor and proprietor, he is simply the personification

of the abstract, impersonal, legal subject, the pure product of social relations’ (113). For Pashukanis, therefore, both the commodity-producing society as well as its legal theory abstract the category of the legal subject from the exchange act: ‘In the act of alienation [*Veräußerung*], abstract property right materializes as a reality’ (123). Finally, Pashukanis attributes the social phenomenon that rule manifests itself in the form of subjective legal Rights to the same social processes that objectify the product of labor as economic thing: Pashukanis therefore compares law with a ‘mystical’ attribute of value and complements Marx’s commodity fetishism with a legal fetishism (117).

At this point, we will not pursue Pashukanis’s further elaborations of penal and public law nor of morality and punishment. However, given his classification of public law as the law of lesser quality, as a secondary law ranking behind the more original civil law, it is necessary to illuminate his concept of the state. Pashukanis recognizes that the legal relations under the conditions of commodity-producing societies presuppose a ‘condition of peace’ (Pashukanis, 2003: 135). Only in commodity-producing societies is the ‘state machine’ realized as an ‘impersonal general will’, as the ‘power of right’ (143). This fusing of the state with the ‘abstract objective norm’ leads Pashukanis back to the precondition of the market, namely: the existence of free and equal legal subjects. Their interaction precludes the use of immediate force. Pashukanis is also known for his thesis about the withering-away of the state that he also developed by relying on Marx’s *Critique of the Gotha Programme*, in which communism as an ultimately stateless society is taken as the goal to be finally attained after a transitional socialist phase. Lenin took this up even more schematically in *State and Revolution* ([1917] 2014), with especial emphasis on the take-over of the bourgeois state for the realization of socialism and later communism. For Pashukanis, the transition from socialism to communism

means not only a 'withering away of the categories of bourgeois law', but rather more generally the 'disappearance of the juridical factor from social relations' (Pashukanis, 2003: 61). According to Pashukanis, and in line with Marx's view in the *Critique of the Gotha Programme*, the 'narrow horizon of bourgeois law' will be overcome once the transitional socialist period has run its course and the 'form of the equivalent relationship has been finally dispensed with' (61, 63).

## RECEPTION AND CRITIQUE OF PASHUKANIS

Pashukanis's major work experienced two waves of comprehensive reception and critique: initially after the appearance of the first German-language translation (1929; English 1951) and his murder under Stalin in 1937; then again, but not until the end of the 1960s. Both waves must be sketched here because of their relations to critical theory.

Outside of critical theory, and with regard to jurisprudence as the theoretical and historical background of Pashukanis's work, Hans Kelsen is of particular interest; even before his major work *Pure Theory of Law* ([1934] 1967), Kelsen had already developed his methodological standpoint in *General Theory of Law in Light of a Materialist Conception of History* (*Allgemeine Rechtslehre im Lichte materialistischer Geschichtsauffassung*, 1931). In this essay he criticized Marxist theory of law, above all in the form that Pashukanis gave it. Epistemologically, Kelsen posits a categorial separation between Being and Ought, and he proceeds on the assumption that the approach to knowledge produces the object of knowledge. This leads him to a strict differentiation between, on the one hand, the question of whence the validity of law originates, and on the other, the question of the rationale or justification of a given (concrete) legal content. Kelsen rejects natural law theory or rational philosophy of law

as unhelpful. Kelsen understands the concept of the legal subject only as an attributed point of the norm, and thus also in his early work, *Boundaries between Legal and Sociological Method* (1922). Clearly, Kelsen was a theoretical antagonist not only of Pashukanis, but also of other critical theory thinkers. The links between Pashukanis and critical theory were established by Georg Lukács and also by the lesser-known Karl Korsch.

Korsch was a lawyer and a professor of law, but because of his political involvement with the SPD and later the Communist Party of Germany (KPD) he was subject to an occupational ban (*Berufsverbot*) in the Weimar Republic. After 1923, he also helped mold the beginnings of the Frankfurt School at the Institute for Social Research. Korsch is considered an undogmatic Marxist who, next to Lukács, exercised a not insignificant influence on Western Marxism. Korsch reviewed Pashukanis's *General Theory of Law and Marxism* (Korsch, [1930] 1966). Korsch criticized his work for equating the form of law and the form of the commodity. He insisted on a fundamentally differentiated, critical use of the base-superstructure scheme that he thought he had found in Pashukanis's work. The economic relation, Korsch argued, is fundamental, while legal and also political relations, on the other hand, are derived from the economic. Korsch particularly criticized Pashukanis for an alleged fixation on the sphere of circulation and instead treated the sphere of circulation as only a part of the total social relations of production. Korsch wanted to analyze this relation and to explain law on this basis. In this regard, Korsch points to Lukács who, in a few short passages in his essay 'Reification and the Consciousness of the Proletariat' (1923), established the reification of jurisprudence and elaborated this notion as follows (Lukács, 1971: 107ff).

For Lukács, a form-content problem emerges in natural law even before the reification of jurisprudence. The concepts of form and contents in this context are reminiscent of Pashukanis's concept of legal form.

For Lukács, the form-content problem is above all a matter of strategies of justification of natural law at the emergence of bourgeois law. In any case, Lukács finds this problem of natural law resolved through the insistence that the ‘formal equality and universality of law, that is, its rationality’ determines at the same time the contents of law. Lukács briefly confronts various schools of jurisprudence and philosophy of law, which he sees as paralleling the rise and frictions of the bourgeoisie as a class. He views these schools as reflexes of the changing needs and interests of the bourgeoisie or, if one will, as the ideological superstructure and self-description of certain historical phases of commodity-producing societies. Lukács finds fault with the new ‘critical’ theories of law of his time for which the adjective ‘critical’ is intended to invoke a relation to Kant, and insofar as these theories of law can be considered neo-Kantian. Like Pashukanis, Lukács’s critique is aimed particularly at Hans Kelsen for wanting to exclude from jurisprudence its social context and the social-scientific aspects. In Lukács’s view, Kelsen treats law as a ‘formal system of calculation’. Lukács rejects Kelsen’s attempted ‘epistemological clarification’ of the subject of law because it does not contain any explanation of the ‘problem of the genesis of law’. Lukács sees the individual sciences as not in the least capable of solving the conundrum of a transcendental material substratum, that is, the mystery of totality. Finally, Lukács advances the thesis that one cannot find in bourgeois society either *the* or *a* basis of validity for formalistically constructed concepts.

The formalistic construction of concepts that Lukács criticizes are actually to be found in Kelsen’s theory of law. Thus the critiques of both Pashukanis and Lukács aim in a similar direction, even if they were not explicitly coordinated. They aim at Kelsen’s denial of the social totality that is the precondition and foundation of every legal relation; they scrutinize the concepts and the conceptual systems of the commodity-producing society;

and they do so on the understanding that law manifests the social totality in its particular form. Their ideological critique focuses on the manner in which Kelsen interprets the social relations between owners of commodities as natural properties, leading to their reification and fetishization. They thus raise the question of the social validity of law that, according to Kelsen, cannot be determined as such. It can only be derived from the normative order itself or from a highest norm, but that does not stand in any relation to a social totality (as Kelsen later argued in *Pure Theory of Law*, 1934).

In this regard, Korsch’s critique of Pashukanis does not quite seem understandable, especially his critique both of Pashukanis’s alleged fixation on circulation as the original source of the rationale of law and also of his simplified use of the base-superstructure scheme. Korsch’s critique is unjustified, for Pashukanis too attempts to take a view of the totality, that is, he does not consider ‘only’ circulation while disregarding production as a part of the circulation of capital.

Pashukanis’s work was discussed more deeply and more comprehensively in the Neo-Marxism of the 1960s. Indeed, it became the core text for the conceptualization of a new critical theory of law. The extensive literature in German-speaking as well as European and North-American regions cannot be reviewed here (but see Head, 2008); some exemplary attempts from the field of the critical theory of the Frankfurt School can be mentioned. In this respect, the critique of Pashukanis ran in part parallel to the critique of ‘dogma of the continuity and unity of Marxism’ (see, for example, Paul, 1972: 202). Adducing Bloch’s *Natural Law and Human Dignity* (which will be considered separately below), Paul identifies his critique of law as a ‘transcendental critique of ideology’, which, he argues, had already come to the fore in Marx’s time as a critique of law as an ostensibly independent system of rules. Rejecting the writings of the late Marx, Paul (like Böhler, 1971)

also subdivides *General Theory of Law and Marxism* into critical-emancipatory and scientific-deterministic parts, the latter characterized by the assumption of progressive social evolution proceeding along the lines of quasi-natural laws. Paul wants to connect positively to Pashukanis's argument against the so-called general theory of law as a relatively recent discipline in jurisprudence, to which Pashukanis attributes a 'principally ideological function' of an institutionalized 'formalization or juridification of the life-world, and with which its relation to wage labor is veiled. Paul thinks, however, that Pashukanis neglects the research perspective of legal theory and lets a formal analogy with Marx's analysis of the commodity suffice. But Paul's error here consists of not recognizing that Pashukanis's critique of fundamental legal categories was not aimed at exposing bourgeois law as an incomplete and therefore unjust law; it was aimed rather at criticizing this particular form of law, that is, because of the universality of the commodity-form, an objectively necessary appearance, but one that conceals the social totality.

Norbert Reich, on the contrary, sees in *General Theory of the Law and Marxism* a theory of civil law, which moreover ascribes to law only a bourgeois reality. He therefore essentially views Pashukanis's work with skepticism (Reich, 1972: 155). Reich's sharpest objection is directed at the withering-away thesis: the 'actual problematic content' is Pashukanis's negative evaluation of the law during the transitional period, during socialism, and therewith his 'utopia of law' (Reich, 1969: 155). For Reich therefore, since Pashukanis understands law only as bourgeois law, he can only conceive of the law of the transitional period to communism as a moribund bourgeois law. He thus concludes that Pashukanis cannot acknowledge jurisprudence as an autonomous science. Law and legal theory have for Pashukanis only a limited reality, namely: exclusively within bourgeois society (Reich, 1972: 30). Reich's evaluation here is thoroughly correct,

for Pashukanis, basing himself on Marx, declares: 'Only when bourgeois relations are fully developed does law become abstract in character. Every person becomes man in the abstract, all labour becomes socially useful labour in the abstract, every form of work becomes socially useful work in general, every subject becomes an abstract legal subject' (Pashukanis, 2003: 101).

In the 1970s, Oskar Negt temporarily occupied himself with the Marxist theory of law. His short essay '10 Theses on a Marxian Theory of Law' (1975) was most influential. In it Negt bases himself on Marx's critique of political economy and seeks to derive the law from the sphere of production. He understands law as a subdivision of the total production- and reproduction-cycle of capital: production, distribution, circulation, and consumption. Negt also emphasizes the overall significance of production in relation to circulation. Legal norms, he insists, are no longer to be explained according to a principle of immaculate origin; nor does the idealized legal person exist (any longer), for this person has lost its autonomy. Negt assumes that the realization of the promise of emancipation that was originally inscribed in the legal order of bourgeois society requires the dissolution of this order in order to redeem its promise. Negt views law as an element of fully developed commodity production in which labor power itself has assumed the form of a commodity and in which state holds the monopoly on violence. In differentiating his position from Pashukanis's, however, Negt locates the origin of law, not in the sphere of circulation, but in the sphere of production; with Marx he argues that the capitalist production process is the starting point of analysis, and not circulation which mediates the relations of production. Negt thus conceives of exchange as a means of mediating the capitalist form of wealth, that is, the production of surplus value: the commodity labor-power is exchanged for a wage in order to produce surplus value. The exchange value of the commodity labor-power is the socially

necessary labor-time required for its reproduction and the wage presents an exchange between equivalent values. As Marx had already argued, surplus value does come about in an exchange between equal values. It comes about through the employment of labor power in production. For its buyer, the utility of labor power, its use-value, lies in its capacity to produce a value greater than its own. According to Negt, moreover, innate to surplus value production is the inversion of the equivalent exchange relations between the buyers and the seller of labor power. Indeed, it creates an objective illusion that as such does not arise in the exchange of other commodities.<sup>2</sup>

### **LAW AND STATE IN MONOPOLY CAPITALISM AND NATIONAL SOCIALISM<sup>3</sup>**

In 1937, Franz Neumann, who had earlier argued for the establishment of a social state of law [sozialer Rechtsstaat] that was to achieve the objectives of social freedom as laid out by the SPD (Neumann, [1930] 1967), interpreted National Socialism as the suppression of the bourgeois rights of freedom and equality and of rational law in general (Neumann, [1937] 1978). In exile in 1936, he submitted a second doctoral thesis in English (Neumann, 1986) which argued that the main characteristic of the legal state comprises a definite abstract form of law that made the conduct of the economic relations predictable, but that concealed the existing relations of power [*Herrschaftsbeziehungen*], while nevertheless guaranteeing a minimum of personal and political freedom. Neumann then interpreted National Socialism as the decay of the liberal legal state and of government on the basis of a non-directive, abstract form of law. Neumann already saw the social foundations of legal equality endangered by processes of economic concentration in the Weimar Republic. And in National Socialism

he viewed law, insofar as it can be spoken of as such, as a means for the advancement of particular social interests through legal entitlements, be it in the form of concrete statutory measures and/or through the interpretations of general clauses to suit the preferences of the NSDAP. Because it lacked a general rule of law, Neumann denied the existence of right [*Recht*] in National Socialism. More generally, however, he established a positive conception of modern law, which he established through a close analysis of the concepts of the legal state [*Rechtsstaat*] and the general character of law.

Friedrich Pollock analyzed National Socialism as a particular form of capitalism. In contrast to Neumann, Pollock did not explicitly address the concept of law nor its particular characteristics. But he too took National Socialism's abrogation of the guarantees of freedom and equality as the object of his critique. In so doing, he developed the concept of state-monopoly capitalism that he formulated through a critique of National Socialism as a political order. He describes it as a system of totalitarian state-capitalism, which goes beyond state-monopoly capitalism. In this respect, National Socialism is a new socio-economic system (see Pollock, 1942: 440, 448, 449). It comprises a series of new rules in place of the hitherto prevailing economic methods and modes of functioning (Pollock, 1941: 200ff.). The constitutive elements of this new formation involve state planning and also state regulation of prices or price policies, the subordination of various branches of capitalist interests to the general plan, and the scientific control of production. He conceives of the National-Socialist state as a totalitarian state which is founded on a war economy that is characterized by general mobilization and founded on weapon production. Finally, Pollock poses the question of what a world-wide realization of totalitarian state-capitalism would look like. In analogy with the abolition of slavery in the United States, he explains that a slave-holding society cannot exist in conjunction with a social

form that is based on free wage-labor. For Pollock, in short, free wage-labor is in a specific sense linked to the existence of law and the legal state. It is on the basis of this observation that he argues that the foundation of the form of law is the equal and free subject of the commodity exchange relations.

For the understanding of legal form, Horkheimer's 1937 essay 'Traditional and Critical Theory' is of particular relevance, especially its epistemological reflections. These amount to an ideological critique of jurisprudence akin to the arguments put forward by Pashukanis and Lukács. Horkheimer bases himself expressly on Marx and the categories he developed – commodity, value, and money – and refers to the 'regulatory effects of exchange' (Horkheimer, 2002: 225). His conceptualizations include the concept of social class, and for the 'liberal period' he establishes that 'economic predominance was in great measure connected with legal ownership of the means of production' (234). In contrast to that earlier period, Horkheimer sees the later 'concentration and centralization' of capital to be characterized by the separation of the legal ownership from the management of the company (235). In conditions of monopoly capitalism, the relative autonomy of the individual is abolished. In fact, as emphasized by critical theory, the social relations make themselves manifest as relations between economic things; the economic explanation of social phenomena prevails.

In his later essay, Horkheimer subjects the Western concept of reason to critique – although this seems to have already been pushed *ad absurdum* by the advancing catastrophe of National Socialism. At issue is the question whether it is worthwhile to retain the concept of (bourgeois) reason at all. In the French Revolution reason was connected with human rights. Since then, the development of the capitalist social relations changed its meaning to instrumental rationality. Only 'rationalistic behaviour' has remained (Horkheimer, 1978: 28). For Horkheimer,

the trajectory of law can be interpreted in a similar manner. Just as the concept of reason asserts itself in late capitalism as a technocratic and functional term, the law which at first embodied bourgeois notions of human rights, the legal state, democracy, and equality now asserts itself as an expression of the given conditions of material production.

## ALIENATION IN MODERN LAW

After the Second World War, critical theory remained stamped by the experience of National Socialism and the Holocaust; and this is especially true of the works of Adorno and Horkheimer. In the *Dialectic of Enlightenment*, and especially in 'Elements of Antisemitism', Adorno and Horkheimer interpreted the modern, not religiously motivated antisemitism in National Socialism likewise as an expression of the liquidation of the freedom and equality of the bourgeois subject – but also as a subject of circulation, of commodity exchange (Adorno and Horkheimer, 2002: 137ff). As Neumann and Pollock had already done, Adorno and Horkheimer interpreted the National-Socialist regime as a non-state ['Unstaat'] that had mutated into a reign of lawlessness and in which the (bourgeois) state and the fascist party each struggled for the realization of its own claim of totality. According to their interpretation, it was out of this opposition between a totalitarian state and a totalitarian movement that a new social form was developed during the Second World War – one in which the ruling groups would directly control the population without the mediation of the at least rational apparatus of force that had hitherto been called the 'state'. In addition to violence, they also included propaganda as a means of the realization and maintenance of this condition.

These comments from Adorno and Horkheimer follow on from those of Neumann and Pollock. However, they must

not be interpreted only against the background of National Socialism and the decay of the liberal and/or socially reformed bourgeois state from which it emerged. They must also be seen in relation to what they perceived as the failure of social revolution. The simultaneous regression of reason and rise of superstition that they witnessed go hand in hand with a regression of law. Pollock's and Neumann's interpretations of the fateful transformation of the old bourgeois state in National Socialism is functional and thus falls within the framework of classical interpretations of National Socialism: the state is presented either as an arduously accomplished legal and social state that protects the individual, or it is presented as an instrument empowered by the bourgeoisie, its means of ruling. Adorno and Horkheimer, however, do not commit themselves as to whether the state should be considered a neutral instrument that stands between the (antagonistic) interests of bourgeoisie and working class.

With their critique of reason and knowledge, Adorno and Horkheimer take a rather different approach, also relevant to their concept of law, when they explain:

The abstract self, which alone confers the legal right to record and systematize, is confronted by nothing but abstract material, which has no other property than to be the substrate of that right. The equation of mind and world is finally resolved, but only in the sense that both sides cancel out. The reduction of thought to a mathematical apparatus condemns the world to be its own measure. What appears as the triumph of subjectivity, the subjection of all existing things to logical formalism, is bought with the obedient subordination of reason to what is immediately at hand. (Adorno and Horkheimer, 2002: 20)

Adorno aims this critique at positivism; then later, specifically in the *Negative Dialectics* (1966), he aims it at law [*Recht*]. In the context of his confrontation with Hegel in his later works, Adorno makes a series of comments. He views law [*Recht*] as a phenomenon of late-bourgeois society that, as part of the whole, symbolizes the question posed in

*Negative Dialectics*. In his lectures on negative dialectics, Adorno describes his work as the concept of a philosophy that 'does not presuppose the identity of being and thought, nor does it culminate in that identity. Instead it will attempt to articulate the very opposites, namely the divergence of concept and things, subject and object, and their unreconciled state' (Adorno, 1965/66: 15ff.). In *Negative Dialectics*, Adorno turns the concept of the 'non-identical' against the positivist conception of science. In his argument, the positivist conception of science presupposes the identity of an object with its concept, that is, it treats object and concept as identical: an Identity, however, based solely on the assumption that the (measureable) commonalities of the different objects, presents in fact their essence. This identification of the social object cuts something out, that is: the non-identical that can never be fully grasped with abstracting thought. He therefore considers identity thinking as part of the social context of illusion [*Verblendungszusammenhang*]. That is to say, Adorno cannot develop the Hegelian dialectic in a direct manner because he does not accept that the negation of the negation results in something positive. Negative dialectics is not in any way affirmative. Rather, the non-identical posits an entirely unreconcilable contradiction within the identity of the social object. Thus, in Adorno's critique of modern law:

Law is the primal phenomenon of irrational rationality. In law the formal principle of equivalence becomes the norm; everyone is treated alike. An equality in which differences perish secretly serves to promote inequality; it becomes the myth that survives amidst an only seemingly mythologized mankind. For the sake of an unbroken systematic, the legal norms cut short what is not covered, every specific experience that has not been shaped in advance; and then they raise the instrumental rationality to the rank of a second reality *sui generis*. The total legal realm is one of definitions. Its systematic forbids the admission of anything that eludes their closed circle, of anything *quod non est in actis*. These bounds, ideological in themselves, turn into real violence as they are sanctioned by law as the

socially controlling authority, in the administered world in particular. In the dictatorships they become direct violence; indirectly, violence has always lurked behind them.

That the individual is so apt to find himself in the wrong when the antagonism of interests drives him into the legal sphere – this is not, as Hegel would persuade him, his own fault because he is too benighted to recognize his own interest in the objective legal norm and its guarantors. It is the fault of the constituents of the legal sphere itself. (Adorno, 2004: 309)

Following a brief discussion in which he contrasts Hegel's arguments in 'Law and Morality' with the real world of law and morality, Adorno continues decisively:

Every positive, substantially elaborated doctrine of natural law leads to antinomies, and yet it is the idea of natural law which critically maintains the untruth of positive law. Today it is the reified consciousness that has been retranslated into reality and there augments domination. Even in its pure form, previous to class content and class justice, that consciousness expresses domination, the gaping difference between individual interests and the whole that is their abstract aggregate. From the outset, by subsumption of everything individual under the category, the system of self-made concepts that serve a mature jurisprudence to cover up the living process of society is opting in favor of the order imitated by the system of classification. [...] The more consistently the legal norms are worked out, however, the greater their incapacity to absorb what essentially defies absorption. (Adorno, 2004: 310–11)

To begin by interpreting this last sentence: Here Adorno understands law in bourgeois society with its differentiations in content (the material, goals, and contents of the laws) and its formal differentiations (actual material institutions such as a constitutional court or the separation of powers as a system of government) as symptomatic of both the abstractions of late-bourgeois commodity-producing society and the power of abstraction that it places on the individual. Not only does Adorno's non-identical vanish in the manifestation of law; additionally, law, as a system abstracting from social relations, must necessarily be geared to certain

characteristics of individuals, which belong to them as the objectified subjects of late-bourgeois society. Only in this way can Adorno speak of the irrational rationality of the system of law, because law accords to each individual rights and duties. On this point the individuals are presumed to be equal – and it is precisely therein that Adorno finds the silencing of the particular that characterizes each individual. The individual does not experience any justice through the formal principle of equivalence that defines the circulation of commodities. And law cannot offer justice to the individual either. Here Adorno differentiates between the presumed equality of all individuals (at least the equality in the capacity of being a legal subject) on the one hand and on the other hand the given concrete legal contents of norms. Because he recognizes that the focal point of modern law is its tendency to abstract from the real, Adorno recognizes too the real force of legal structures and finds them not all too distant from the immediate force of a dictatorship. In so doing, Adorno nevertheless differentiates between the forceful abstraction through law and its unjust contents. From the outset Adorno goes well beyond traditional Marxist interpretations: class justice and class law exist of course for him in the sense of a concrete historical molding of the contents of law tailored to certain interests of the bourgeois class or individual groups. However, beyond that he recognises the negative dialectic of law. In this manner the shortcomings of law are not coincidental, mere expressions of the assertion of class power. In fact they are necessary shortcomings which present definite social relations in the form of the legal object.

In Adorno's interpretation, the legal ideas of the natural law theories presume the existence (historically in opposition especially to the 'unfree' feudal order) of a claim to freedom and equality as a natural human quality that presents itself in particular concrete historical modes. Furthermore, he understands the independence of the legal system

as a particular process of abstraction. He even conceives of the law as a 'constitutive abstraction' from individual interests. In fact, he does not even see equity come into play any longer as a corrective in modern law.

Turning against Hegel, Adorno argues against a reconciliation of the subject and the objective legal order, of conscience and legal norm, of particular and universal. For Adorno, irreconcilability is not only a problem of modern law, and especially not a problem only of the economy in which the subjects appear as 'character masks' (Adorno citing Marx); the problem lies rather in the fact that individuals are always already exposed to objective forces in all areas of life, including the psyche. In this respect, the 'universal makes sure that the particular under its domination is not better than itself' (Adorno, 2004: 312). Adorno therefore sees modern law as a particular mode of the universal, with its supremacy and its power to subject its own rule the particular, that is: the individuals with their notion of their own particularity, with their own subjective illusions. Thus in Adorno too we find a linkage between modern law and the individuation of Men as universal principle (see 312). Finally, in his confrontation with philosophical nominalism, and although Adorno himself did not express this explicitly, a connection can be established between the law or 'jurisprudence' as a phenomenon of bourgeois society and the critique of the 'positivist epistemological ideal' that does not tolerate any contradiction, least of all an 'immanent contradiction', a point that holds especially with regard to a method that, according to Adorno, suppresses that which it is supposed to comprehend (313, 314). In this respect, the individual experiences society as an objectivity that precedes consciousness.

Adorno's metaphorically rich descriptions of law recall those of Pashukanis, who initially construed bourgeois law similarly as a component, or even as *the* particular component of the modern. For that reason, Pashukanis characterized law as '*ratio scripta*' of the commodity-producing society'. On this plane, these explanations are not

yet differentiated from the modern sociology of Max Weber, for example. Pashukanis, however, goes beyond sociology in that he simultaneously formulates a critique of law and a critique of ideology, especially of law as a fetish. This is ultimately aimed against the objective illusion of bourgeois society [*Verblendungszusammenhang*] that presents social relations as natural or given by nature; more precisely formulated and with Marx's support, the value-abstraction subsists in the social individual as a legal subject. Adorno similarly recognizes the power of social objectivity in modern law: the universal always takes precedence over the particular. This objectivity of the universal appears both in the factual differentiations of law with particular legal contents (for example, the labor law protection against termination) and institutions (for example, the social security system) for which the workers' movement had struggled for at least a century; and it also appears in the objective assumptions of law, especially the assumption of Men as legal subjects. In this respect, modern law establishes the mode of individuality; it is through law that every individual appears in his or her putative particularity. That is, the particular not only presupposes the universal, it also appears in it; in the case of legal form the particular appears in its abstract capacity of being a legal subject.

However, with the example of law that he adduces as *pars pro toto* of the shameless character of late capitalism and its irresolvable irrationality, Adorno limits himself to these descriptive elements. For him, there is no solution. This is in contrast to Pashukanis and Lukács, who anticipate the end of law as a historical phenomenon with the abolition of the capitalist mode of production – even if Pashukanis's theses especially are derived from a thoroughly mechanistic argument about the abolition of the commodity form and therewith of the legal form. Not addressed by Adorno in this regard is the question of what is the peculiarity of law, what makes it a phenomenon of 'irrational

rationality', and what the critique of ideology and consciousness entails as a judgment on existence. Adorno sees the bourgeois metaphysical promises as ultimately unfulfilled; they can be fulfilled neither by the institution of law nor by other forms of mediation in bourgeois society. And he concludes that the stronger the law functions as the principle means of the administered world and differentiates itself in the name of freedom and equality (which is ultimately the same as universalizing Men as a legal subject), the clearer it becomes that law fails in its double meaning as a principle of sociability and as metaphysical invocation of the autonomy of the subject.

### THE 'SALVATION' OF THE LEGAL SUBJECT

Herbert Marcuse's reading of especially Hegel's *Philosophy of Right* is a good starting point for further elaborating the foundations of a concept of law for critical theory (Marcuse, 1960: 183ff.). Marcuse understands Hegel's system as a whole as a link between philosophy and social theory and recognizes that Marx's critique of political economy reformulates several motives of Hegel's *Philosophy of Right*. Marcuse interprets Hegel's dialectic as one that culminates in the affirmation of the given; the Marxian dialectic by contrast is 'negative' in the sense that the given must be abolished and transcended. Marcuse mostly paraphrases Hegel's *Philosophy of Right*, but he also interprets it in a particular manner. He views Hegel's *Philosophy of Right* as ultimately a philosophy of the state that would lose its 'progressive character' with the fate of the society itself (Marcuse, 1960: 184). Hegel places the will, or the subject of will [*Willenssubjekt*] at the beginning and mid-point of his philosophy of law, and derives the entire sphere of law from the free will of the individual. In this argument the legal

form subsumes the particular, that is to say, it entails a tendency towards abstraction. Yet, at the same time, it presents the assertion of the particular will as a 'limited ego'. The concept of the mutual recognition of freedom is essential for Hegel, for the act of (legal) appropriation can only be complete when others acknowledge this act (Marcuse, 1960: 185). In these exemplarily adduced figures of thought from Hegel's *Philosophy of Right* we can recognize Marx's commodity owner without whom the commodities would not succeed in getting to the market, and whose reciprocal recognition as exchange positing subjects is, Marx argues, also the foundation of property rights. In this respect, Hegel sees the universalized free will as the precondition of private property.

Hegel's interpretation of the state on the other hand is characterized by the fact that the subjectivity that is evident in, and developed through, reciprocal recognition culminates in an 'all-powerful state' (Marcuse, 1960: 200). Marcuse does not share Hegel's justification of either the state or the family. He does, however, agree with Hegel's description of the 'rabble' as an existing contradiction of bourgeois society (206). For Hegel, the contradictions are to be solved through the political institutions of society, through legal security, police, and cooperation. The rights of property express themselves in legal form. Marcuse criticizes this conflation of right and law, especially the fact that the rule of law is aimed at the 'universal person' but not at the concrete individual (207). Nevertheless, he finds a certain reconciliation in the contradiction between right and law.

For example, man enters into contracts, exchange relations, and other obligations simply as the abstract subject of capital or of labor-power or of some other socially necessary possession or device. Accordingly, the law can be universal and treat individuals as equals only in so far as it remains abstract. Right is hence a form rather than a content. The justice dispensed by law gets its cue from the *general form* of transaction and

interaction, while the concrete varieties of individual life enter only as a sum-total of attenuating or aggravating circumstances. The law as a universal thus has a negative aspect. It of necessity involves an element of chance, and its application to a particular case will engender imperfection and cause injustice and hardship. These negative elements, however, cannot be eliminated by extending the discretionary powers of the judge. The law's abstract universality is a far better guarantee of right, despite all the shortcomings, than is the individual's concrete and specific self. In civil society all individuals have private interests by which they are set against the whole, and none of them can claim to be a source of right.

It is true at the same time that the abstract equality of men before the law does not eliminate their material inequalities or in any sense remove the general contingency that surrounds the social and economic status they possess. But by the force of the fact that it disregards the contingent elements, the law is more just than the concrete social relations that produce inequalities, hazard and other injustices. Law is at least based on a few essential factors common to all individuals. (Marcuse, 1960: 207–8)

In contrast to Adorno, Marcuse adheres to right as law with all necessary abstractions from the particular. Here, too, Marcuse differentiates himself from Pashukanis, with whose major work, Marcuse's bibliography makes clear, he was familiar. Marcuse sees the essential characteristic of law in the form of law and therewith in its capacity for abstraction; not, however, in its politically conditioned contents, which are dependent on particular interests. As a form, Marcuse understands right (in this regard synonymous with law) insofar as it does not recognize the particular individual, but rather a contract-making subject endowed with a free will. Inasmuch as law is universal, and thus abstract in form, it treats individuals as equals – which for Hegel entails their recognition as property owners. Equal rights stands for the right to private property (Marcuse, 1960: 208). Marcuse defends right and law.

He considers them as institutions of fundamental equality even though they do not lend themselves to the achievement of a concrete material equality.

At this point it is worth looking briefly at Ernst Bloch's *Natural Law and Human Dignity*, published in 1961. Bloch's account is based on the humanist contents of Marx's work and develops a concept of justice for late capitalism – at least, that is, its critical intension. Ultimately, however, he relies above all on ideas of natural law and rational law for the development of a concept of a socialist society. Bloch's account can be understood as a transition from the critique of law and Horkheimer's and Adorno's skepticism about law to the Neo-Marxist accounts of the 1960s and 1970s, which I introduced at the start with reference to the work of Paul and Böhler. Bloch recognizes a discrepancy between the ideals of the bourgeois revolution and the reality of a profit-driven society (Bloch, 1986: 175–6, 187). His account develops certain elements in the young Marx's critique of law, for example his writing about the law against wood theft. But Bloch also relies on Pashukanis and similarly recognizes a certain 'fragility' in the theoretical justification of this kind of public law compared with the theoretical-philosophical derivation of private laws. According to both Pashukanis and Bloch, private law belongs to the sphere of commodity circulation. It mirrors the recognition of the claims and rights of individuals among one another as proprietors of commodities and money. Bloch considers public law to be built out of 'significantly less solid material' (*bedeutend unsoliderem Material*) even in the 'democratic heyday of the bourgeoisie' (1986: 218).

In contrast especially to Pashukanis, Bloch remains a defender of subjective public rights, however weak they might be. In this context, he criticizes the liquidation of subjective rights in Stalinism. In this manner he connects with Pashukanis's own tragedy: in his later writings Pashukanis increasingly denied the existence and justification of subjective

rights, yet he was himself paradoxically a victim of Stalin's purges. Bloch also criticized the notion of a working class in whose will right and also morality are supposed not only to merge, but also to disappear, and ultimately, as a superstructural phenomenon, to blend together completely with the political (Bloch, 1986: 240). Bloch develops Lukács's and Pashukanis's critique of Kelsen and finds that in Kelsen's legal theory the legal subject is all but eliminated (147). In Bloch's argument, the origin and the content of law preclude the postulate of purity that Kelsen attributed to it. For Bloch, too, 'the legal subject within bourgeois society is a universal abstract, hypostatized possessor of commodities' – which is why the material substratum of law must not be suppressed and ignored. That is, theory must not limit its concern to the purity of a system of norms (147; translation slightly altered). Bloch reasserts Pashukanis's and Lukács's ideology critique of modern jurisprudence. However, he does not share Adorno's skepticism towards law. Indeed, he hoped for a socially and technologically improved future – with a substantially renewed law.

Jürgen Habermas is the most recognized figure of the so-called second generation Frankfurt School thinkers. His work on legal philosophy developed from *Knowledge and Human Interest* (1971) and *Theory of Communicative Action* (1981) towards his major work on the philosophy of law, *Between Facts and Norms*, which appeared in 1992. This later work does not stand in a direct relation to his earlier texts. In *Knowledge and Human Interest*, Habermas still argues 'critically' insofar as he conceives of philosophy in emancipatory terms beyond the natural-science model of knowledge. In *Between Facts and Norms*, Habermas develops his argument of the *Theory of Communicative Action* and asserts initially that the law is a means of limiting the strategic action about which the actors themselves had agreed (Habermas, 1996: 26–7). He initially differentiates between legal rules and their legitimate efficacy, and further between legality

and legitimacy. Codification of the legal rules means that the actors temporarily ignore the question of legitimacy in favor of setting the formal rules of the game, guarding against arbitrariness. In this first step, Habermas separates the validity of law from its legitimacy. Since the validity of the legal rules contain a normative claim, Habermas identifies legal norms as both punitive laws and as laws of freedom (29–30). Legitimacy derives from the discursive formation of opinion and will among the freely associated persons.

Modern law, for Habermas, is ultimately the most important mechanism of social integration. He gives, however, no answer to the question of why the social context should be regulated by law at all, and not in some other way. His reflections are rather based on empirical observation and historical analyses and on the pre-assumptions of the philosophy of language. Like Max Weber, Habermas seems to limit his explanation of the constitution of the legal form to the dissolution of the premodern life-worlds and traditions. Punitive law tailored to legal procedure can only unfold its socially integrative powers if the individual addressees of legal norms understand themselves in their collectivity as the rational authors of these norms. Habermas sees the motivation for norm-conforming behavior as coming from either the recognition, on the part of the addressees of law, of the rationality and therewith the legitimacy of a norm, or because the factual enforcement of law by means of sanctions forces people into compliance. Habermas and his students like Klaus Günther are satisfied with formal explanations that rest on a procedural theory of justice. He delivers not a critique of modern law, but rather its justification.

## SUMMARY AND OUTLOOK

No specific concept of law can be attributed to critical theory – regardless of whether the term critical theory is strictly limited to the

authors surrounding Adorno and Horkheimer and the earlier Frankfurt Institute, or whether it is used to designate a certain current of critical social theories related to Marx. Nevertheless, in the critical theory tradition there is a recurring critique of the bourgeois ideology of legal freedom and equality, the concept of the legal state, and above all criticism of the failed promises of law and justice in bourgeois society. Finally, the system of law was perceived, above all by Adorno, as the expression par excellence of an alienated modernity.

Pashukanis stands at the beginning of a critical theory of law, even if he, as a theoretician of the Soviet state, cannot be incorporated into the historical context of Frankfurt School critical theory. But by way of Korsch, among others, his writings found entry into the theoretical basis of the narrow circle of critical theory; and his work later, in the so-called neo-Marxist period of the 1970s, found considerable resonance and positive reception. Pashukanis's reading of Marx can first of all be understood as a critique of bourgeois models of science and knowledge, but not, however, as a critique of the separation between the bourgeois postulates of freedom and equality on the one hand and the legal reality on the other, nor as a critique of law as a principle of social justice. His critiques of bourgeois ideology, like those of Lukács, are exemplarily evident in his critique of Kelsen's legal theory. In distinction to Kelsen's argument about an immanent structure of law, Pashukanis argues that law forms part of the social totality of the capitalistically constituted relations of social reproduction. For Pashukanis the commodity form is of decisive importance for the understanding of the bourgeois rule of law.

In the writings of the authors of the so-called first generation of critical theory, the analysis of legal form is not systematic and based on the commodity exchange relations. The one exception to this account is Oskar Negt's much later analysis of legal form. He locates its foundation in the sphere of production, instead of the sphere of circulation.

All in all, a thorough critique of law as the legal form of definite social relations cannot be found in critical theory. Arguments by Bloch and his followers in the 1970s fall back onto traditional schemes arguing that the postulates of rational law and natural law call for the completion of the bourgeois revolution, realizing the demands for human emancipation. Marcuse connects law to the decision making of a subjective will. Bloch attempts to recharge the law positively with a concept of justice. Neumann and Pollock, on the contrary, explored it through an analysis of capitalist development: against the background of the rise of National Socialism and a capitalism described as monopolistic, they traced a change in the function of law and identified a decline of the legal state. For Neumann and Pollock, the form of law and the principles of the legal state are accomplishments of modernity that have to be defended. For Adorno and Horkheimer, National Socialism stood for the liquidation of equality and freedom, including especially the universality of the law in general and therewith the legal subject.

Adorno points, however, beyond this critique. In *Negative Dialectics* he considers modern law as having the role of a *pars pro toto* in the alienation of the subject – this is because modern law creates a double reality that is alien to the supposed actual one. Here Adorno is less interested in the question of the internal contradictions of law, but rather in an existing fundamental contradiction in modern forms of the subject as a subject of Rights; for law, however concrete and specific in its recognition of social interests, is not in a position to give the subject what it needs. Adorno finds the reason for this in the fact that the non-identical cannot be conceived of through commodity form and form of law; nor can it be grasped through capital's valorization logic. He therefore sees in modern law an instance of the destructiveness of the modern. The autonomization of law as a seemingly independent power remains incomprehensible. What alone remains 'comprehensible is the laws of autonomisation' (Adorno).

## Notes

- 1 On Habermas, see Henning in Volume 1, Chapter 24, of this *Handbook*.
- 2 Other language discussions of Pashukanis were similar and can be summarized as follows: Pashukanis understands all the legal relations as relations between the owners of commodities and therewith constricts the concept of law to the capitalist exchange relations. From a systematic viewpoint, Pashukanis works on the plane of circulation and from a historical viewpoint on the plane of simple commodity-production. He does not integrate the production of surplus value into a functional view of modern law (see for example: Collins, 1984: 108ff.; Cotterell, 1976: 111–19; Fine, 1979; Warrington, 1981: 1–22). At the same time, Pashukanis's approach was developed further in various ways, for example by Balbus (1977: 571–88) and Picciotto (1982: 169–80). For recent work on Pashukanis in English, see Michael Head, *Evgeny Pashukanis: A Critical Reappraisal* (2008) and in Italian see Carlo Di Mascio, *Pašukanis e la critica marxista del diritto borghese* (2013). The debate about a materialist theory of right and Pashukanis's importance therein is not closed, see for example, Sonja Buckel, *Subjektivierung und Kohäsion: Zur Rekonstruktion einer materialistischen Theorie des Rechts* (2007).
- 3 This discussion makes no pretense of completeness; the works of Walter Benjamin and Otto Kirchheimer cannot be addressed here, and Alfred Sohn-Rethel can only be mentioned.

# Walter Benjamin's Concept of Law

Amy Swiffen

## PART I: BENJAMIN'S CRITIQUE OF VIOLENCE

This essay aims to clarify the relevance of Walter Benjamin's concept of law for contemporary socio-legal theory by providing an exegetical account of the text 'Critique of Violence' (1978). The Critique was written against a backdrop of political turbulence in post-WWI Germany. The theme of law's relation to violence upon which it dwells speaks to the context of parliamentary breakdown and political violence that plagued the country in the lead up to the rise of fascism. What interested Benjamin was the conditions of possibility for 'legal violence', by which he meant the use of legitimate or sanctioned violence (e.g. criminal law power).<sup>1</sup> By 'law', Benjamin meant European law based on a Westphalian model of state sovereignty. The question he pursued in this context is what are the conditions of possibility for legal violence, Answering this question

led him to a formulation of a concept of law defined as a relation of violence.

The influence of the text in Anglo-American legal and political theory really began when it was translated in 1978. Since then it has played an important role in debates on the limits of democracy and the ethics of political violence, for thinkers including Jacques Derrida (2002), Giorgio Agamben (1998, 2005), Judith Butler (2006, 2012), and Slavoj Žižek (2008, 2016).

### *Beyond a Means/Ends Evaluation of Violence*

One of the compelling things about Benjamin's text is its unique approach to legal theorising, which attempts to consider the phenomenon of legal violence autonomously, that is, without reference to any external criteria of evaluation and irrespective of any particular case. One point of entry into this approach is the way Benjamin

frames how two opposing traditions of legal theory known as positive law and natural law each evaluate legal violence. Natural law is premised on the idea that law exists *sui generis*, as an objective entity with specific properties (Pavlich, 2011). Historically, natural law approaches have often drawn on ancient Greek concepts of natural justice and/or the classical perspectives of St. Augustine and Thomas Aquinas, who presupposed a Christian God as giver of a natural law that human beings participate in by virtue of the capacity for reason. More recently, natural law thinkers have moved away from the idea of a divine law-giver in favour of affirming human nature or the inner morality of law itself as the source of legal authority (Finnis, 1980; Fuller, 1969). In general, natural law perspectives tend to make the assumption that the authority of law is derived from some inherent principles or processes that define law as such. Forms of law that do not approximate this authority (variously understood) cannot be properly called 'law' (Kainz, 2004).

What interested Benjamin was the naturalist perspective on violence, which he argued regard violence as 'a product of nature, as it were, a raw material' (Benjamin, 1978: 278). From this perspective, violence has no meaning in itself, rather, it is material or instrument that can be used as a means to legal ends when it is appropriate to do so. He offers examples of this naturalisation of violence, notably 'Darwinistic philosophy', which regards violence as the 'only original means, besides natural selection' (278). When it comes to evaluating legal violence, therefore, a naturalist perspective would look to the ends to which it is put. If the ends are just and the violence used is rationally designed to achieve them, then the violence is legal as well.

Benjamin's objection to this approach is the limited nature of the evaluation of violence. By looking at whether the ends of the violence are just/legal, it is possible to evaluate legal violence in a particular case but it

is not possible to evaluate the law's use of violence 'in principle' (278). In other words, a 'criterion of ends' cannot justify the law's use of violence per se. As Benjamin notes, such a perspective has difficulty addressing the question of whether legal violence can be unjustified even when the ends are just, or whether legal violence can be justified even if the ends are unjust. In response, Benjamin wishes to develop 'more exact' criteria that would be capable of discriminating among uses of violence 'within the sphere of means themselves without regard for the ends they serve' (277).

To pursue this possibility he turns to positive law, which historically emerged in response to natural law conceptions of political power based on the divine and/or patriarchal authority in the family. Legal positivism reframed the concept of law as a rationally purposive activity, and in so doing separated the question of morality from legal analysis. The early positivist accounts of Thomas Hobbes, John Austin, and Jeremy Bentham attempted to define law as a social construct and a product of history. In Austin's words, from this perspective the existence of law is one thing, its merit or demerit another (Austin, 1954: 185).

The positivist approach has been reformulated in various ways since the original 'command theories' of Bentham, Austin, and Hobbes. For example, Hans Kelsen incorporated the concept of norms in *The General Theory of Law and State*, writing that 'legal norms can have any kind of content and be valid' (Kelsen, 1945: 113). H.L.A. Hart focussed on how rules constituted by a social order generate legal authority (Hart, 1961; see Pavlich, 2011). In this sense, positivism separates the question of the justness of legal ends from the analysis. In other words, it makes a distinction between sanctioned and unsanctioned violence 'indendently of their cases of application' (Benjamin, 1978: 279).

Despite their opposition both natural law and positive law also share a 'common

dogmatic assumption' that just ends can be attained by justified means and justified means used to achieve just ends (278). Benjamin asks, what if it were the case that justified means on the one hand and just ends on the other were in irreconcilable conflict? Not only would the opposition between natural law and positive law disappear, but neither would be in a position to shed light on the question. Benjamin argues that what is required is a standpoint outside of both positive law and natural law, which is to say, outside of means/ends reasoning completely.<sup>2</sup> Benjamin finds positive law a preferable starting point in this regard because it makes a distinction: between forms of violence 'within the sphere of means themselves', thus making it possible to begin to speak of different kinds of violence (279). The most basic distinction is between legal and non-legal violence. Benjamin notes that in European law the private use of violence that is generally considered outside the bounds of legality, regardless of whether the ends are just or overlap with legal ends. There is a tendency 'to deny the natural ends of individuals in cases where they could be usefully pursued with violence' (238). Legal orders tend to establish 'in all areas where individual ends could be usefully pursued by violence, legal ends that can be realised only by legal power' (238). Benjamin argues, this tendency suggests that the law regards non-legal violence as a threat, 'not because of the ends it might pursue but by its mere existence outside the law' (239). In other words, there is something about the existence of violence outside of the legal field that is threatening to a legal order. Legal orders have an 'interest in a monopoly of violence', not because of justice or for efficacy in achieving legal ends, but seemingly as an end in itself (239).

### ***The Dual Function of Violence***

Yet, Benjamin notes there are situations that seem to contradict this interpretation,

specifically cases where the law allows violence that is normally unsanctioned. One of these cases is the right to strike. Benjamin argues that a strike, though it is an omission of action, should still be considered violence. As he writes, in a strike a 'moment of violence is introduced ... in the context of a conscious readiness to resume the suspended action under circumstances that have nothing to do with this action or only superficially modify it' (1978: 281). In other words the work stoppage is a means to the end of compelling the owner to negotiate. It is a form of extortion used to secure the ends of workers. Thus, with the right to strike a legal order allows violence whose ends are 'natural and non-legal' (282).<sup>3</sup>

The picture becomes even more complex when we consider that though with the strike power the law 'acknowledges a violence whose ends, as natural ends, it sometimes regards with indifference', however, in a crisis situation of a general strike it will 'confront [the violence] inimically' (282).<sup>4</sup> A general strike is of course a large scale action that transcends particular industries and workplaces. For example, the Winnipeg General Strike of 1919 involved 35,000 workers in a city of 200,000 going on strike for six weeks. The strike ended when the North West Mounted Police used violence to break it up, killing two workers in the process, injuring thirty-some, and arresting hundreds (Silver, 2003). Benjamin describes the seeming contradiction in the law's response to the strike power as a reflection of the fact that the violence of the strike is both inside and outside the law.

The strike power is not an 'isolated' or 'fortuitous' example: in this regard something similar is seen in military violence, which is understood as 'the most natural' means for asserting sovereignty and 'paradigmatic' of all violence used for natural ends (Benjamin, 1978: 282). Military violence is characteristic of war and normally considered to be operating outside the law.

Benjamin points out a series of exceptions to this, however, including legally compelled military service. With conscription, the law subordinates the lives of individuals to that of the state and sanctions military violence even though its 'natural ends may conflict with legal ends' (240). In this sense, military violence and the strike power are examples of violence that are both inside and outside the law. Thus, Benjamin argues that violence is not 'as it first appears', merely a means to an end; it also has the potential to modify and change the law (282). With conscription and the right to strike, legal orders make exceptions for violence that is normally prohibited in order to ward off an even greater violence, which Benjamin suggests has a 'lawmaking' capacity (284). What concerns a legal order is not violence that is used as a means to an end; what it fears is violence that is able to legitimate, change, or make a claim to law.

Thus, Benjamin argues that violence has two functions from the perspective of a legal order. It has a 'law-preserving' function, which is when violence is used to protect and maintain the law (284).<sup>5</sup> It also has a law-making function, which Benjamin suggests is at the origin of every legal order. These two forms of violence can be conceptualised separately in that law-making violence is typically 'required to prove its worth in victory' (think of war, revolution, or conquest), while law-preserving violence is 'subject to the restriction that it may not set itself new ends' (think of the criminal law power and public health legal responses) (284). However, they are not fully distinct. As Benjamin writes,

The function of lawmaking violence is twofold, in the sense that lawmaking pursues as its end, with violence as the means, what is to be established as law, but at the moment of instatement does not dismiss violence; rather, at the very moment of law-making, it specifically establishes as law not an end unalloyed by violence but one necessarily and intimately bound to it, under the title of power. (295)

Law-making violence founds law and remains operative within it as a preserving

force. At the same time, however remote law-making violence may seem from the present it remains latent within every act of law preserving violence. From the perspective of history, therefore, law appears as a dialectic of law-making and law-preserving violence. Together the two forms of violence reflect the 'duality in the function of violence' relative to law (284). This duality is implied in Benjamin's discussion of the strike power and military violence. The law makes an exception for these forms of violence under specific circumstances to preserve the law in the face of its law-making power.

### ***Violence and the Origin of Law***

Given Benjamin's conclusions about the relationship between law and violence the significance of the death penalty takes on great importance. He argues that where the 'highest violence' occurs in a legal system, the origins of law 'jut manifestly and fearfully into existence' (1978: 286). In the death penalty, the law-preserving and law-founding functions of violence appear in upmost proximity. It is useful to note that the death penalty was the subject of considerable debate when Benjamin wrote the Critique of Violence, with a few states having already abolished it.<sup>6</sup> One of the central issues of the debate was whether the death penalty was a necessary deterrent or an inhumane punishment. Benjamin felt that both arguments missed the point. The purpose of the death penalty is not deterrence, or else it would be important for a legal system to apply it in all appropriate cases.<sup>7</sup> In reality, lethal punishment is applied with considerable 'uncertainty' (285). Equally, anti-death penalty arguments that invoke the right to life are 'uninformed' about the nature of law's relationship to violence (242). They do not see that an attack on a legal order's use of lethal violence is not an attack on this or that particular law, but an attack on the 'law itself in its origin' (242; see Azoulay, 2009).

Following this reasoning, Benjamin argued that the decline in the use of the death penalty was a reflection of a historical dimension of the law's relationship to violence as it manifests in European and colonial legal orders. Benjamin writes, 'all law-preserving violence, in its duration, indirectly weakens the law-making violence represented by it. [...] This lasts until either new forces or those earlier suppressed triumph over the hitherto law-making violence and thus found a new law, destined in its turn to decay' (1978: 300). In other words, as law-making violence becomes remote from law-preserving violence (in the sense of space and time), it becomes a weaker legitimating force. The decline reason is of the death penalty is related to the fact the subject of legal violence 'knows himself to be infinitely remote from the conditions in which fate might imperiously have shown itself in such a sentence' (286). From such a perspective, legal violence appears pernicious and as 'something rotten in law' (286). In this sense, the death penalty can function as an index of the decay of a legal order.

Benjamin periodises the form of law with the emergence of state-administered legal systems (see Hostettler, 2009). Under classic monarchical forms of government, he suggests that because legal legitimacy was tied to the body of the monarch, which provided a category 'determined by place and time' for evaluating legal violence (Benjamin, 1978: 287). The legality of violence was evaluated in relation to its connection to the body of the monarch. In contrast, modern legal orders are characterised by a constitutional division of powers in which the conditions of legality are 'elevated by no such distinction' (287). Either because of temporal or geographic distance, a legal orders lose awareness of the violence that is represented and enacted in them. Modern legal orders are 'destined' to decay, according to Benjamin, because 'consciousness of the latent presence of violence in a legal institution disappears' (288).

Benjamin suggest a symptom of this decay is that law-making violence no longer

appears to be 'crowned by fate' (286). He refers to the myth of Niobe as an example of what he means with idea of violence crowned by fate. Niobe had 14 children with Amphion, a half god and co-founder of Thebes. She boasted of the size of her family to Leto, who bore Zeus' children, Apollo and Artemis. In response to her boasting, the gods killed all of Niobe's children. When she discovers her children are dead, Niobe asks Zeus to turn her to stone, which he does (Cook, 1964: 6–30). What happened to Niobe is an example of violence crowned by *fate*. Niobe's boasting 'calls down fate upon her not because her arrogance offends against the law but because it challenges fate' (Benjamin, 1978: 294).

The notion of 'fate' that Benjamin is invoking is written in ancient in Greek as '*atē*', which can be translated as 'fateful doom' (Krell, 2005: 13).<sup>8</sup> *Atē* was the gods' response to *hubris*, the human error of pride, which represented not a moral error, but a transgression into the realm of the gods (Lacan, 1992: 259). Niobe crossed this limit in claiming credit for something (the size of her family) that was beyond her control. Having crossed this line, her guilt lay in the mere fact of her humanity. Thus, the violence directed at Niobe's children is not a punishment for a crime, but an immediate manifestation of 'the frontier between men and gods' (Benjamin, 1978: 295). Benjamin suggests that law-making violence is akin to this kind of mythic violence in that it 'establishes a law far more than it punishes for the infringement of one already existing' (294).

However, the association with ancient myth brings to light a problem with law-making violence in the modern context. In Greek myth, mythic violence was 'crowned by fate' in the sense that it came from the realm of the gods. In the modern context, however, mythic violence is no longer guaranteed by the gods and absent this transcendent seal 'turns into decay' in the sense that it is not sanctioned only 'under the title of power' (288). Law-making violence appears

as 'bloody power over mere life for its own sake' (297). This is the principle of all state-based violence and 'what is guaranteed by all lawmaking violence' (295).

## PART II: DERRIDA'S CRITIQUE OF THE CRITIQUE

At this point, Jacques Derrida's commentary on Benjamin's 'Critique of Violence' in the essay 'Force of Law: The "Mystical Foundation of Authority"' (2002) is important to address as it unpacks some of the implications and assumptions structuring Benjamin's arguments. At the same time, much of the contemporary uptake of Benjamin's essay is responding in some way to Derrida's reflections in 'Force of Law: The "Mystical Foundation of Authority"' (2002). The focus in that essay is twofold: first, Benjamin's seeming assumption that a relation of violence is able to transform itself into law, and second, his implication that law's origin lies in a historical moment of violence. Derrida's method is to deconstruct the various oppositions that Benjamin develops (e.g. law-making/law-preserving violence) by showing how they cannot be rigorously opposed and are in a relation of 'differential contamination' (2002: 272). For instance, he highlights that Benjamin's formulation implies that law-preserving violence works retroactively to signify the law-making violence 'on behalf of which it will claim to have been speaking from the beginning' (269). At the same time, law-making violence supposedly serves as the legitimating force for law-preserving violence, which implies that it precedes it. This means that law-making violence is both past and present at the same time. It also means that it is never complete in some sense as it is only constituted as law-making from the perspective of law-preserving violence that is to come. Far from being a discrete origin point, therefore, law-making violence is 'a call for self-preserving repetition' and that '[p]reservation in turn refounds' (Derrida, 2002: 272).

Note that Derrida's reading does not refute Benjamin's concept of law so much as reframe it as a perpetually incomplete dialectic of violence supplemented by a performative self-referentiality. This performative dimension of law's relation to violence is 'the mythical foundation of law', and 'inscribes the possibility of repetition at the heart of the originary' (272). The notion of 'iterability in originality' implies that a legal order is threatened from within by the violence that founds it (275). By identifying the performative function of the relation between law and violence that Benjamin describes, Derrida tries to show that the process of law-making never ends, and as a result the authority of law is always incomplete and open to being otherwise.

### *Divine Violence*

At this point, another element of Benjamin's Critique of Violence becomes relevant to address, one which is located beyond the law-making and law-preserving relation that has been described so far. Near the end of the Critique, Benjamin asks, 'what kinds of violence exist other than all those envisaged by legal theory' (1978: 293)? In other words, what kinds of violence exist other than the categories described above (legal violence, non-legal violence, law-making legal violence, and law-preserving legal violence)? This question leads to the possibility of a third form of violence termed 'divine violence', which Benjamin describes as 'pure' violence in that it is not related to means/ends logic in any way (297). To explore the idea, Benjamin returns to the example of the strike, this time focussing on the idea of a proletarian general strike drawn from the work of Georges Sorel (1908/1999). Sorel distinguished between a proletarian general strike and a political general strike based on the idea that a political general strike does not challenge state power nor does it intend to replace the state. Instead, it is a means to an end of more limited goals. A true proletarian general strike puts forward plans for 'no

definite project of future social organization but instead confronts men with a catastrophe' (Sorel, 1999: 46, n.31). As Benjamin writes, it 'announces its indifference towards material gain through conquest by declaring its intention to abolish the state' (Benjamin, 1978: 291). This means that the political and proletarian general strike represent different forms of violence according to Benjamin, a political strike is 'alloyed' violence in that the withdrawal of work is a means to an end (289). It is an instrumental use of violence to achieve workers' goals. In contrast, a proletarian strike is 'unalloyed' violence in the sense that it makes no definite demands. It is an end in itself; it is 'pure means' in this sense (289). This notion of purity Benjamin attempts to capture with the concept of divine violence. He likens it as well to the violence represented by the biblical injunction against killing (thou shalt not kill), which would seem to be quite different from a general strike. Yet, it is another example of pure means according to Benjamin. He writes, the commandment exists 'not as a criterion of judgement, but as a guideline for the actions of persons or communities who have to wrestle with it in solitude and, in exceptional cases, to take on the responsibility of ignoring it' (298). This implies the imperative does not command action but leaves open how it is to be applied, including when it might be refused. Like the proletarian strike, therefore, the first commandment is 'pure' in the sense that it has no end besides its own actualisation.

Alloyed and unalloyed forms of violence have very different relations to law according to Benjamin. Mythical violence binds life to law; in contrast, divine violence is boundary destroying. He writes that 'if mythical violence brings at once guilt and retribution, divine power only expiates; ... if the former is bloody, the latter is lethal without spilling blood' (297). Benjamin also suggests that divine violence acts on behalf of what he terms the 'soul of the living' (298). He elaborates, 'man cannot, at any price be

said to coincide with the mere life in him', implying that divine violence corresponds to a dimension of life that exceeds biological existence (298).

### ***Derrida on Divine Violence***

Like all the oppositions in Benjamin's Critique, however, Derrida finds that the opposition of divine violence and mythic violence also does not completely hold. To address this he steps outside the text and refers to events that occurred after Benjamin's death in 1940. The preface to 'Force of Law' wonders what Benjamin would have had to say 'on the subject of the "final solution"' (the Holocaust) (Derrida, 2002: 260). The essay's postscript returns to the question with the concepts of mythical and divine violence in mind. On the one hand, Derrida suggests that the final solution could be understood as the extreme example of the mythic violence of law: a legal order that went 'all the way to its own limit' in the attempt to found and preserve itself (296). As a form of mythic violence, Benjamin would have put divine violence in opposition to the final solution. However, Derrida argues that the deconstructability of the distinction renders this placement problematic.

Derrida suggests it is possible to 'recall the uniqueness of the "final solution" from a place other than this space of the mythological violence of law' (2002: 295). What is 'almost unbearable' in Benjamin's text is the temptation to think of the holocaust 'as an uninterpretable manifestation of divine violence' that is 'annihilating, expiatory and bloodless' (298). He continues, the Nazi legal order 'kept the archive of its destruction ... with a terrifying legal, bureaucratic, statist objectivity and ... it produced a system in which its logic, its logic of objectivity, made possible the invalidation and therefore the effacement of testimony and of responsibilities' (2002: 296). What Nazism attempted to do was to 'exclude the other witness; to

destroy the witness of the other order' (296). Derrida asks, can such an act be seen to be 'of a divine violence whose justice is irreducible to law, of a violence heterogenous to the order of both law and right ... or of the order of representation and myth' (296)? The possibility that one could answer affirmatively interpret the holocaust as 'an expiation and an indecipherable signature of the just and violent anger of God' is terrifying for Derrida (298). For this reason, he parts ways with Benjamin writing that the concept of divine violence resembles 'too closely, to the point of spectacular fascination and vertigo, the very thing against which one must think and act, do and speak' (298). In wake of Benjamin's 'Critique of Violence', Derrida concludes the challenge is not to embrace divine violence but to 'think, know, represent for ourselves, formalize, judge the possible complicity among [Benjamin's discourse] and the worst (here the "final solution")' (298).

### PART III: RESPONSE TO DERRIDA'S CRITIQUE

With Derrida's rejection of the concept of divine violence in mind we can now turn to how Benjamin's concepts of law and of divine violence have been taken up in social and political theory. Each of the three thinkers discussed below respond to the questions that Derrida's deconstruction poses in different ways. Each thinker also draws on similar aspects of Benjamin's critique to develop their argument that is, the relation between law and violence, between law and guilt, and the force of the first commandment. Each one is also willing to embrace the possibility of divine violence in ways that Derrida was not. Butler and Agamben focus on Benjamin's references to 'mere life' and 'sacred life', though in very different ways. In contrast, Žižek attempts to specify the meaning of divine violence by

drawing on Lacanian theory and the concept of the *passage à l'acte*.

#### Butler

In *Parting Ways* (2012), Butler discusses 'Critique of Violence' and particularly the idea of divine violence, which she characterises as the possibility of a 'violence against violence' that could redeem 'sacred life' at the expense of 'mere existence' (2012: 82). What does this formulation mean? To begin, Butler agrees with Derrida that Benjamin's conception of law-making violence does not come into being naturally, nor can it be justified by any existing instance of law-preserving violence. She agrees that in Benjamin's concept of law every act of legal violence works to reinscribe 'the founding act in a regulated way' (71–2). In other words, a legal order is sustained by the enactment of law-preserving violence as a performative reiteration of its origin in violence. However, she disagrees with Derrida's rejection of divine violence, arguing that it can be separated from what she describes as Benjamin's 'messianic-Marxist' embrace of destruction (76). Instead, she argues that it holds the promise of 'a noncoercive' form of violence (70; see Ball, 2016). Much depends on what exactly 'noncoercive violence' could mean. To shed light on this, it is useful to consider how Butler reconciles Benjamin's refusal to categorically reject killing (the deal-breaker for Derrida) with the ethical commitment to nonviolence that is implied by his critique of 'bloody' mythic violence. This can be seen in the way she interprets Benjamin's references to Sorel's concept of the general strike.

In her discussion of the political and proletarian strike, Butler points out that for Sorel, 'the [proletarian] general strike has a character of *infinity*', (Sorel, 1999: 46, n.31). She takes this to mean that a general strike is 'pure, immediate, unalloyed violence' in that it refuses the basic imperative required

to reproduce capitalism, which is working under the division of labour (Butler, 2012: 86). As noted above, Benjamin characterises a strike as violence in the form of omission, a refusal of action. In the context of a proletarian general strike, such refusal 'brings the legal system to its knees' because it renders the foundation of the capitalist system inoperative (Butler, 2012: 86). In Butler's language, it refuses the repetitions of implementation by which the law preserves and instates itself as law across time' (90–1). The point is not to demand certain policies of the state, or even to replace the state with something else, but to 'negate the state itself' (95). In this sense, a true proletarian strike would be catastrophic but not bloody.

Butler argues that this kind of pure violence is non-coercive because it does not come from outside and impose itself on a situation. It is wholly immanent to the legal order that it also threatens. For example, the proletarian general strike exceeds the capitalist system but also can exist only by virtue of the capitalist system. The violence of a proletarian general strike negates the very condition of possibility of the proletarian class itself. Its violence lies in the recursive turn of deposing the division of labour itself. Whether blood is shed in the course of the strike is incidental to its violence. Divine violence therefore becomes historically embedded in that its character is determined by the particular social and political order in which it occurs. With this interpretation, Butler attempts to reconcile the ambiguity that troubles Derrida by taking Benjamin's claim that divine violence is 'bloodless' to mean that it is self-directed and strikes at its own capacity for action. Under this definition, the 'final solution' could never qualify.

Implicitly addressing Derrida's hesitation in this way, Butler's goes on to consider how divine violence undoes the coercive force of a legal order at the level of individual subjectivity. Based on her interpretation of a proletarian general strike, she suggests that divine violence involves 'freeing oneself

from the bonds of guilt upon which legal regimes rely' (2012: 95). This idea is further illuminated through her interpretation of the Niobe myth. Recall, Benjamin's point in invoking the story was that the violence of *até* is similar to law-making violence in that it is a manifestation of a limit more than a punishment. In that context, Benjamin also writes that the 'idea of man's sacredness gives grounds for reflection that what is here pronounced sacred was, according to ancient mythic thought, the marked bearer of guilt: life itself' (251). Butler focusses on this notion of life as the bearer of guilt and elaborates, 'Law thus petrifies the subject, arresting life in the moment of guilt.... The punishment produces the subject bound by law – accountable, punishable, and punished' (2012: 78). Thus, Niobe's metamorphosis into stone represents the internalisation of guilt, which is a form of subjectivation that constitutes the legal subject as always already subject to the law.

Divine violence, she suggests, must be understood in relation to this form of legal subjectivity and the ethics proper to it which is driven by a desire to be free of guilt and thereby free of the law:

The desire to release life from a guilt secured through legal contract with the state – this would be a desire that gives rise to a violence against violence, one that seeks to release life from a death contract with the law, a death of the living soul by the hardening force of guilt (82).

In fact, divine violence is a manifestation of this desire, which is created by the legal order itself.

The ultimate responsibility for divine violence lies with mythic violence itself. In contrast to Derrida, who refuses to embrace the idea of 'pure' violence, Butler's interpretation acknowledges the possibility of bloodshed and killing but locates the responsibility for it with the legal order that gives rise to the desire behind it. She writes, 'what is done for the sake of "the living" may well involve the taking of mere life' because 'Divine

power ... can only do its act if mythic power has constituted the guilty subject, its punishable offense, and a legal framework for punishment' (2012: 80, 81). In this sense, B envisions divine violence as a violence that is self-negating and motivated by desire to release life from guilt.

## **Agamben**

The relationship between life and law implied in Benjamin's critique is also central to Agamben's theory of sovereignty, which develops what Agamben characterises as 'the irreducible link uniting violence and law' that Benjamin laid bare (1998: 63). In particular, he develops the link between sovereignty the idea of bloody power over mere life. Agamben argues that the essence of political sovereignty is a relation to 'pure bare life' in a legal state of exception (1998: 164). A 'state of exception' is when the law's authority remains in force, but the rule of law is suspended, typically through some type of sovereign decision reflected in an executive order or decree. In a state of exception, legal norms that would mediate the relationship between life and law in the usual case (e.g.: political and civil rights) are suspended.

Agamben argues that the power is the heart of the authority of law. Sovereignty is in the power to make such an exception to determine whether life is included in the law as a legal subject or whether to exclude it from legal protection and include it as bare life (164). The link between law and violence creates a zone of indistinction between law and violence within the law itself. Agamben's references to divine violence place emphasis on the fact that if life is captured by the law in a state of exception, divine violence represents an 'existence outside the law' (2005: 53–4, 64 and 1998: 64–5). For Agamben, Benjamin's concept of divine violence attempts to 'ensure the possibility of a violence that lies absolutely

outside and beyond the law and that, as such, could shatter the dialectic between law-making and law-preserving violence' (2005: 53).<sup>9</sup>

Agamben's take on the status of 'purity' in Benjamin's concept of divine violence is to go to other texts where Benjamin discusses the idea. In 'On Language as Such and The Language of Man' (1978), Benjamin elaborates how human life is inseparable from communicative language and that language as a means of communication is the 'medium' of our being (Agamben, 1999: 33). However, Benjamin states the 'weakness' of human language lies in the fact that it cannot bring the form of this relation to expression (Agamben, 1999: 33). Only a 'pure' language of names could express the linguistic being of the human being, that is, only a pure language could express our 'way of meaning', or the way that human beings exist in language (1978: 314–32). This relates to Benjamin's concept of divine violence in that pure language is not another language outside of or beyond human language. Rather, pure language is revealed in human language by exposing it as such. Thus, purity is not to be understood as something beyond the human, nor as an intrinsic property of a subject (Agamben, 2005: 62). Rather, the possibility of 'communication itself immediately' is something that is revealed within human language as its incapacity (2005: 62). Similarly, pure violence is 'the exposure' of the relation between law and violence (62). It 'neither posits nor conserves violence' itself (65).

Agamben argues that an example of this 'pure' action can be seen in the short story by Herman Melville, 'Bartleby the Scrivener' (Agamben, 1998: 47). In the story, the narrator runs a law office and employs a man named Bartleby, who one day, upon being asked to help proofread a document, replies, 'I would prefer not to'. From that moment on, Bartleby performs fewer and fewer tasks, always responding with the same phrase: 'I would prefer not to'. Eventually, he is fired

and asked to leave, to which he responds he would prefer not. Bartleby will neither leave the offices nor do any work and his boss feels he cannot force him to go. He thinks of a friend who committed a murder in his private office, but cannot bring himself to use violence. Finally, he moves his law office to get away from Bartleby. However, soon the new tenants come to him for help because Bartleby is still there. He prefers not to leave. The narrator returns to the old offices to find Bartleby has been taken to prison. He plans to visit him only to discover that he has starved to death on account of preferring not to eat.

Agamben suggests that Bartleby's non/action can be understood as pure in Benjamin's sense because it immediately 'writes its own passivity' (1993: 37). It is not a means to an end (e.g. it is not being done to elicit a response from his boss) and it does not communicate a message. There is no mediation between means and ends. It seems to be done simply for its own sake. Agamben suggests the key element that makes Bartleby's preference not to analogous to divine violence is that it takes its own potentiality as its object (37). It is like a proletariat strike in the sense that the refusal to work renders the conditions of its own possibility inoperative. Bartleby's refusal similarly occurs at the level of his own existence. Both actions actualise their own potential to not be.

Thus, Agamben could be said to agree with Butler that divine violence implies an action that is internally/self directed in some sense, but there is a difference that is reflected in his discussion of Benjamin's reference to the first commandment, which draws on two comments made in other texts on the relationship between scripture (the Torah) and justice: one is in a letter to Gershom Scholem and the other in an essay on Kafka. To Scholem, Benjamin writes, 'the Scripture without its key is not scripture but life' and in regards to Kafka he writes, 'the law which is studied but no longer practiced is the gate to justice' (Benjamin in Agamben, 2005: 63). Agamben argues that in these statements Benjamin suggests a figure

of law after divine violence, that is, after the law's current relation to violence has been deposed. For Butler, therefore, the force of the first commandment is associated with the ethical desire of the subject of law that defines divine violence. Whereas for Agamben, the first commandment is an example of law after the nexus of law and violence has been deposed by divine violence. His reading of Benjamin suggests that law exists after divine violence, but in a form that does not wield bloody power over mere life.

Agamben has attempted to develop the idea of law without violence in various. This idea animates what Antonio Negri has characterised as his more utopian writings, such as the *Coming Community* (1993) and *Means without Ends* (2001). In these works, he elaborates the idea of 'playing with the law' and 'whatever being' as forms of relating to a law without force/violence (see Swiffen, 2009). He does not say much about what divine violence might look like beyond the discussion of Bartleby. His focus is on the possibility of 'another use of law' after divine violence (2005: 64). For instance, he suggests another use of law could be similar to how children 'play with disused objects', which does not restore them to their 'canonical uses', but frees them from them 'for good' (Agamben, 2005: 64).

## Žižek

To varying degrees, it seems that Agamben and Butler want to distance the concept of divine violence from bloodshed. Butler and Agamben both define divine violence as a form of self-negation that cancels out its own being. Butler allowed that bloody violence could be part of such action, though the moral culpability for it lies with the form of law that presupposes a subject off/to law. Žižek uptake of divine violence takes a different approach. When asked in an interview what is Benjamin talking about with the concept violence he replied: 'Revolution – that

is, a moment when you take the "sovereign" (this is Benjamin's word) responsibility for killing someone' (2007). He continues: 'I'm sorry, but Benjamin is pretty precise', he is talking about 'that moment when you take ... responsibility for killing someone' (2007). To understand where these statements are coming from it is necessary to turn to Žižek's treatment of the question of divine violence in *Violence* (2008) and *Against the Double Blackmail* (2016).

In *Violence*, Žižek does not shy away from the ambiguity of that made Derrida step away. He acknowledges the proximity of the idea of 'pure' divine violence and extreme forms of mythic law-founding violence. In both cases, violence is neither an expression of a crime or its punishment, or a sacrifice to a higher purpose (2008: 198). However, Žižek introduces a further distinction within this category of pure violence. He writes, 'Divine violence is thus to be distinguished from [mythic violence], *as well as* from pure violence as anarchic expression' (emphasis added, 201). To develop this distinction, Žižek draws on psychoanalyst Jacques Lacan's notion of the *passage à l'acte*, which is characterised as 'an impulsive movement into action which cannot be translated into speech or thought and carries with it an intolerable weight of frustration' (2008: 76). Such 'movement into action' is not rooted in any kind of socio-economic protest or assertion of religious fundamentalism. It is not a symbolic message or meaning to be communicated, but an immediate attempt to gain visibility outside of any symbolic order.

An example Žižek explores is the riots in suburbs in France in 2005, which lasted for three weeks and involved burning cars and buildings. A significant segment of the participants were the children of African immigrants and their actions took place in the context of growing tensions over youth unemployment and police harassment. As Žižek describes, the participants were 'a social group composed of French citizens [that] saw itself excluded from the social and political space of citizenship' (2008: 77). However, he argues that the

riots were not a means of achieving inclusion or convey a meaning, but actions oriented to gaining an immediate visibility. If the main premise of the riots was that the participants are French citizens but not fully recognised as such, the actions were an end in themselves: 'we're here, no matter how much you pretend not to see us' (77). Žižek writes, the riots had no larger 'positive vision.... They were neither offering a solution nor constituting a movement for providing a solution'.... The medium itself was the message' (78). This type of action is 'blind;' *l'acte*, the violence bears witness to 'the lack of the symbolic order reflected by the participants' own 'inability to locate the experience of their situation within a meaningful whole' (76, 81; see also 2016: 39).

To support the distinction between divine violence and anarchistic expression, Žižek draws from the Lacanian idea of the symbolic order (the big Other) as constituted by lack that is perpetually disavowed and he associates it with the internal limit of mythic law that Benjamin described. Recall, the dialectic of law-making and law-preserving violence that constitutes mythic law undermines itself over time, according to Benjamin. Žižek's formulation implies the 'big Other' appears much like the Greek notion of fate and the realm of the gods in the ancient world: as an objective reality that transcends the subject. Lacan argues that our symbolic reality is sustained by a relation to a limit or impossibility of recognition within this order upon which the coherence of our subjectivity is maintained. Žižek suggests that the Paris riots immediately embodied this lack in the context of French society through the manifestation of useless violence. In this way, Žižek makes a link between the useless violence of a *passage à l'acte* and the pure violence without end described by Benjamin. In Lacanian theory the *passage à l'acte* is fundamentally reactive. It is a 'catastrophic suicide' where the source of violence is also 'the site of the impotence' of the symbolic order (2008: 201).

In *Against the Double Blackmail*, Žižek discusses the 2005 Paris riots again, this

time in connection with the unrest in 2014 in Ferguson, USA. The residents of the town of Ferguson took to the streets in response to the police shooting of Michael Brown, an unarmed African American teenager suspected of robbery. As Žižek writes, 'the poor black majority of the town took the killing as yet more proof of systemic police violence against them' (2016: 35). He characterises their 'violent demonstrations' as an 'exemplary' case of divine violence (37). He writes, 'what strikes the eye is the total absence of any positive utopian prospect ... [they] are motivated and sustained by a vague call for justice' (37). Žižek goes on, 'does not the same hold [for] the French suburban riots of 2005, when we saw major outbursts of public violence?' (38). They are similar in that 'the 2005 revolts in France were outbursts with no pretensions to vision. There were no particular demands made by the protesters in the Paris suburbs. There was only an insistence on recognition, based on a vague, non-articulated, resentment' (38). However, they are also different in that Žižek suggests that the case of Ferguson the action 'is active, it imposes, enforces a vision' (213).

In general, it is the gesture of manifesting the lack in the symbolic order that distinguishes what Žižek calls the 'zero-level' violence of the *passage à l'acte* (2008: 81). The difficulty is there are no criteria to identify an act of divine violence. As a result, its status is radically subjective and involves the assumption of a singular responsibility of a decision 'with no cover from the big Other' (202). It is this radical dimension of subjective responsibility that distinguishes Žižek's reading of divine violence.

In response to Derrida's hesitation over the possibility of a divine violence that is unjust, Žižek responds, we must 'simply accept the fact that divine violence *is* brutally unjust: it is often something terrifying, not a sublime intervention of divine goodness and justice' (2016: 40). He continues, 'there is nothing noble or sublime about what Benjamin calls

divine violence – it is "divine" precisely on account of its excessively destructive character' (41). What is most difficult to accept about divine violence is 'precisely [this] meaninglessness' (39). Thus, in contrast to Derrida who rejects the concept for this reason, and to Butler who argues divine violence is a form of non-violence, and to Agamben who prefers to focus on the idea of a law without violence, Žižek embraces the possibility of the very worst, suggesting that taking on such responsibility is part of the structure of divine violence as such.

## CONCLUSION

The relevance of Benjamin's 'Critique of Violence' lies in the concept of law that it develops, which is unique in the way that it identifies a relation to violence as constitutive of legal authority. In attempting to define the conditions of possibility of legal violence, Benjamin reveals a form of law that is inseparable from violence. He identifies bloody power over human life at the foundation of modern European and colonial legal orders. The question that is difficult to answer is what was Benjamin's position on the question of justice in this context. Can it occur only through the enactment of 'pure' violence outside of legal and moral frameworks? In deconstructing the conceptual oppositions that Benjamin elaborates, Derrida highlights the undecidability of this question and ultimately rejects the concept of divine violence. The other commentaries discussed above reacts in different ways to the radical implications of the concept.

One important thing that Derrida's reading brings to light that Butler, Agamben and Žižek each recognise is the performative aspect of legal violence within a historical framework. Benjamin's concept of law as a dialectic of violence is supplemented by Derrida's demonstration of how law is not grounded

in a historical origin but instead constituted through an originary iterability that is never complete and never finished. Butler takes up this analysis and it informs the core of her reading of divine violence. Yet, she also tries to redeem the concept by defining it as a form of inwardly directed violence animated by an ethical desire to free life from the law. The cause of such desire is the way the subject is always already subject to the legal order itself, which by implication bears the moral responsibility for the bloodshed that may come along with undoing it. She embraces the concept of divine violence half-way, wanting to shift part of the responsibility for its enactment from the subject and onto the law. Žižek's position seems to be that Divine violence in some sense requires a subjective assumption of the possibility that made Derrida shy away. Agamben does not spend a great deal of energy working out the ethical implications of divine violence, preferring it seems to focus on the utopian possibility of a law without violence that he argues is suggested by Benjamin's reference to the first commandment.

## Notes

- 1 The German word *Gewalt* originates from the Old High German verb *waltan*, which roughly translates into 'to be strong', 'to dominate', or 'to master'. In modern German *Gewalt* covers a variety of meanings, including violence, force, coercion, power, and authority. As Étienne Balibar notes: 'the term *Gewalt* thus contains an intrinsic ambiguity: it refers, at the same time, to the negation of law or justice and to their realization or the assumption of responsibility for them by an institution (generally the state)'.
- 2 Benjamin argues what is needed are mutually independent criteria both of justified means and of just ends, but he brackets the question of the criterion of justness in the essay, and focusses exclusively on 'the justification of certain means that constitute violence' (279).
- 3 Extortion involves obtaining material benefit through the use of 'threats, accusations, menaces or violence' of such a nature that they compel 'an individual, organisation, or business entity'

to give up something of value they otherwise would not (Criminal Code of Canada, RSC 1985, c C-46).

- 4 It is interesting to note that prior to the legal definition of the right to strike, workers had essentially unlimited freedom to strike (Tucker and Fudge, 2010).
- 5 Benjamin's typology of violence on this point can be paralleled to what legal theorists have called 'constituent' and 'constituting' power (see Sieyès, 2002). For example, in democratic legal orders constituent power is often associated with 'the people' and the enactment of the constitution. Constitutional government is a constituted power generated from the consent of the people as constituting power (Loughlin and Walker, 2007).
- 6 By 1921, Venezuela (1863), San Marino (1865), Portugal (1867), Costa Rica (1877), Ecuador (1906), Uruguay (1907), and Columbia (1910) had all removed the death penalty from their criminal law (Kronenwetter, 1993).
- 7 Benjamin's position anticipates contemporary research into the ineffectiveness of the death penalty in preventing crime (see Erickson and Gibbs, 1978 and Radelet and Ackers, 1996).
- 8 An example is Oedipus, who unknowingly killed his father, married his mother, and brought a curse upon Thebes. The myth of Antigone is another example. The play ends not only with Antigone's suicide, but the suicide of the wife and son of the king of Thebes.
- 9 Agamben suggests that the notion of divine violence was instrumental to the development of Carl Schmitt's concept of sovereignty, which is characterised as the power to declare a state of exception (Agamben, 2008). He argues that Benjamin and Schmitt were engaged in a metaphysical debate over the identity of pure violence. On the one hand, Benjamin sought to isolate and define a form of violence that was autonomous from law. On the other, Schmitt sought to fully assimilate violence into law through the concept of 'bracketing' war in the sovereign decision (Schmitt, 2006, 100). In contrast, for Benjamin pure violence is always necessarily outside of law.

# Security and Police

Mark Neocleous

The history of bourgeois modernity is a history in which security occupies centre stage. This is clear from both the long tradition of bourgeois political thought and the extensive reiteration of security by contemporary politicians: from Thomas Hobbes to David Cameron, so to speak. From Hobbes we get the idea that the only solution to the insecurity of the state of nature is a contract exchanging our obedience to the Leviathan for the security it is expected to offer; the state takes centre stage as the provider of the one thing all humans are said to desire. From Cameron we get the idea, delivered in his 2015 Christmas message to the nation, that ‘if there is one thing people want at Christmas, it’s the security of having their family around them and a home that is safe’. From Hobbes’s account of why we flee the state of nature through to Cameron’s account of what we all want for Christmas: security.

The extent to which security is the leitmotif of bourgeois modernity is evident in the fact that in a so-called ‘age of rights’, security

is often presented to us as *the* most fundamental of all rights. According to the United Nations, the fundamental rights of all human beings are ‘life, liberty and security’. This claim repeats the revolutionary discourse of rights in the eighteenth century, and one thinker who noticed the implications of such a claim was Karl Marx. In his exchange with Bruno Bauer over ‘the Jewish question’ in 1843, Marx runs through the various declarations of the rights of man announced in the late eighteenth century, along with the constitutions which tended to follow such declarations. Marx points out that the rights in question, though revolutionary in some (liberal) ways, are still nonetheless the rights of a member of *bourgeois* society, ‘of egoistic man, of man separated from other men and from the community’. ‘Let us hear what the most radical Constitution, the Constitution of 1793, has to say’, he suggests, and then notes Article 2 of that Constitution: ‘These rights ... are: equality, liberty, security, property’. Marx works through these ideas. Liberty,

for example, is 'the power which man has to do everything that does not harm the rights of others', according to one Declaration, or 'being able to do everything which does not harm others', in another. J. S. Mill would later confirm this in his articulation of the 'harm principle' in *On Liberty*, but Marx treats it as nothing less than the 'right of ... separation, the right of the *restricted* individual, withdrawn into himself'. The practical application of this right to liberty is man's right to private property, Marx notes, 'the right to enjoy one's property and to dispose of it at one's discretion ... without regard to other men, independently of society'. This 'right of self-interest ... makes every man see in other men not the *realization* of his own freedom, but the *barrier* to it'. Such observations essentially launch Marx's well-known critique of rights discourse through the rest of his work, but note what he says about security at this moment. Citing Article 8 of the French Constitution of 1793 – 'security consists in the protection afforded by society to each of its members for the preservation of his person, his rights, and his property' – Marx makes the following comment: 'Security is the highest social concept of civil society, the concept of *police*, expressing the fact that the whole of society exists only in order to guarantee to each of its members the preservation of his person, his rights, and his property'.<sup>1</sup> Marx has put his finger on the core ideological concept of bourgeois modernity.

It is perhaps one of critical theory's most significant failings to have not taken up Marx's suggestive observation about security as the supreme concept of bourgeois society. Marx himself makes little of his own observation, and yet it would seem to offer the basis of a challenge to the whole problematic of 'security' within bourgeois order. On the one hand, his observation explodes the tedious debate that takes place within 'traditional' theory about any 'balance' between security and liberty: it is quite clear from any reading

of the history of bourgeois thought that security overrides liberty every time, as evidenced by the fact that Thomas Hobbes, John Locke, Adam Smith, Adam Ferguson, Jeremy Bentham, Montesquieu, David Hume, Thomas Paine and many other liberal thinkers ultimately hold the view that liberty 'consists in security or in one's opinion of one's security', as Montesquieu puts it.<sup>2</sup> Liberty has been so bound up with security in the liberal mind that it is essentially subsumed under the idea of security. On the other hand, Marx's observation allows us to see that the permanent disturbance of all social conditions and relations that attends the constant revolutionising of capitalist production<sup>3</sup> means that capital is fundamentally an order of *social insecurity*, but one which simultaneously gives rise to a *politics of security*.

If we take seriously a comment Marx makes in his debate with Ruge, that the main task before us is not to change the world in the way envisaged by some socialists but, rather, the *ruthless* critique (or even, depending on translation, *reckless* critique) of all that exists, including and especially politics, law and religion,<sup>4</sup> then we might say that for us right now the target of such a ruthless and reckless critique has to be that new hegemonic category – one might even call it a political religion – named 'Security'. Such a *critique of security* requires understanding security not as a universal value but as a mechanism of domination deployed by state and capital, part and parcel of the wider politics of fear which underpins bourgeois modernity. Far from being something that could ever be genuinely achieved, security exists for the opportunities it offers to get things done in its name. Security is a mechanism to mobilise, discipline and punish. In other words, security is a power for the fabrication of social order, which is the very reason why security points always to the concept of police and why the *critique of security* folds into a *critical theory of police power*.<sup>5</sup>

## SECURITY: CAPITAL (OBEDIENCE)

Capital creates insecurity, and insecurity creates a demand and desire for security. To this demand and desire, capital responds with all its usual flair and creativity. Security is therefore highly productive for capital.

To be productive for capital, security must first be translated into the materiality of the commodity. Marx notes that as soon as something emerges as a commodity it changes into a thing which transcends sensuousness, in such a way that gives the commodity a mystical value. If this is so for the commodity in general, then commodities presented in security terms are at an added advantage as they appear to serve the satisfaction of a very basic, and yet also very indeterminate, human need. But Marx's point is that commodity production *per se* is far from obvious and trivial. And tracing the contours of the production of security commodities takes us to the heart of the process whereby security becomes fetishistically inscribed in commodified social relations. This is the basis of the security industry. The expression 'industry' here refers not only to the connection between security and the commodity form but also to the rationalisation, distribution, production and consumption of security. It likewise incorporates that self-portrait of state power, the spectacle of security.<sup>6</sup>

The security industry does not engage in security because of an interest in actually eradicating insecurity. But neither does it do so because it is interested in 'social control' or 'surveillance'. Rather, it has a far more mundane interest: making a profit. To make a profit the security industry must *sell* security. And to sell security it must play on fears and insecurities, must generate further fears and insecurities, and must pander to the idea that our fears and insecurities are very real and must be dealt with in some way. The security industry therefore interpellates consumers as both *sovereign* subjects ('the customer is king') and as *fearful* subjects ('the customer is insecure'). And the customer must

be reminded time and again of just how insecure they are, revealing more than anything the extent to which capital has found a way of dominating and terrorising human beings within their very hearts and souls. This is one reason why struggles against 'security measures' alone are always so limiting: without connecting security to capital, such struggles never address the basic antagonism of bourgeois society.

The security industry is thus where capital and security come to contemplate themselves in a world of their own making, playing a key role in the fabrication of the much wider culture of fear and insecurity that is used to shore up both state and capital. Where the security state uses fear and insecurity to sustain support for the national security project, the security industry turns fear and insecurity into the consumption of commodities. Where the security state thus perpetually offers more and more 'solutions' in the form of new security policies, the security industry offers 'solutions' in entirely commodified forms, as more and more commodities are simply marketed as solutions to one insecurity after another. The security industry thus mobilises, organises and exploits a purported human need to reinforce the logic of both security and the commodity form across the face of society.

To the extent that both capital and the state live off the production of fear and insecurity, they must also ensure that security is something never really achieved. Behind the slogan 'Security now!' lies the real double-sided message: on the one hand, 'Security with the next security product' (the message from capital); on the other hand, 'Security with the next security measure' (the message from the state). Yet both the security industry and the security state perpetually cheat us of what has been promised. The promissory note is endlessly prolonged, revealing that, ultimately, the promise is illusory: all that is confirmed is that the real target will never be reached. Security is revealed as an illusion. But it is an illusion that has forgotten that it is

an illusion. In this sense, security is totalitarian, manipulating the idea of a fundamental need in such a way as to preclude effective opposition against the whole.<sup>7</sup>

Part of security's power lies in its demand that we passively accept all the things done in security's name and all the things state and capital want us to take most seriously as needing securing: property and propriety, capital and commodity, law and order. Security believes in itself and demands that the world should believe the same.<sup>8</sup> Security wants us to believe that nothing other than that which is called security is good, or at least that whatever else might be considered good is nowhere nearly as good as security itself. Moreover, it wants us to believe that that which is good must be secure. Security thereby subjugates living humans to security itself. In so doing, it masks the real impoverishment of human life. Worse, it functions in such a way that this impoverishment is understood as the very thing that needs to be secured. If the main task of ideology is to get us to believe that 'the bourgeois way of thinking is the normal way of thinking',<sup>9</sup> that the key bourgeois concepts are in fact 'common sense' and that this social order is somehow natural, then security is ideology par excellence, integral to the system of manipulation and domination which now encloses the world, one which relies more than anything on subjects becoming dependent on and then articulating for themselves a set of ideas that end up animating them as well as dominating them. This is a domination in which each individual trembles lest they be found guilty of transgressing the boundaries imposed by security and its demands, and despite the fact that they believe that their own need and desire for security is itself natural. This is why security is so demanding: it is nigh on impossible to unravel the demands that security imposes on us and the immense labour that security incessantly performs on us, a labour that in turn produces new demands on us as subjects, new norms by which we are measured, new targets towards which we

should be striving, new mechanisms through which hopes and dreams are to be thwarted.

Much of this can be witnessed in the phenomenon that has been described as neoliberalism. A great deal can and has been made of the ways in which neoliberalism involves a transformation of the individual, seeking to realise capital's ultimate goal 'to confiscate the soul'.<sup>10</sup> 'Economics are the method; the object is to change the heart and soul', as Margaret Thatcher once put it.<sup>11</sup> Taking such a claim seriously means reading neoliberalism not simply in terms of its *destructive power*, for example in destroying certain kinds of rights and institutions, but also in terms of its *productive power*: in its ability to *create* new kinds of social relations, new ways of living and new political subjects. Now, the literature on the new neoliberal subject recognises more than anything that what is being produced is an entrepreneurial self and a productive subject: a monetised, atomised and calculating subject that is required and expected to endlessly perform as a neoliberal subject in the social realm as well as in the marketplace.<sup>12</sup> But this production of new subjectivities is also very much an *orientation of the subject around security*. The obligation to work on oneself as a neoliberal subject includes an obligation to work on oneself as a subject of security; the entrepreneurial-subject is to also be a security-subject. Neoliberalism thus forges new political subjects through security, operating for security and organised around security. In other words, security-conscious neoliberal subjects.

Because the neoliberal subject is expected to be an *active* subject, this activity is also meant to respond to the demands of security as well as the demands of capital. As is well known, under neoliberalism it is no longer enough for us to simply work, earn our money, go home and spend it. Rather, we are meant to *believe* in the work we are doing and to *actively show that we believe in it*, identifying with the organisation and signing up to the company's mission, vision and values.

Neoliberalism manipulates and recasts our subjectivity such that we not only continue to interiorise the bourgeois norms of self-possession and self-management, but that we also increasingly feel obliged to *show* that we have interiorised them, to the extent that the neoliberal workplace increasingly comes to be regarded as a kind of ‘community of desire’, as Frédéric Lordon puts it. And yet this poses a problem for capital, which constantly questions the worker’s desire. In Lordon’s example: the employee-subject swears that they have no other passion than the manufacture of yoghurt, our company’s business, but *can we really believe them?*<sup>13</sup> The answer has to be no, and so the desire must be constantly expressed, measured and assessed, since it is always in danger of fading. A similar point might be made about the neoliberal security state: the citizen-subject swears that they have no other interest than the security of the social order, but *can we really believe them?* The answer must again be no,<sup>14</sup> and so the desire must also be constantly expressed, measured and assessed, since it is always in danger of fading. Herein lies the basis for all the actions we are now being trained to undertake as security-conscious neoliberal subjects, such as learning ‘resilience’ and being constantly ‘prepared for emergency’. And the more frantically entrepreneurial we become in terms of thinking of ourselves as subjects of security, the more passive and obedient we become towards security itself. The entrepreneurial-security subject is simultaneously the obedient-subject. As with so many aspects of neoliberalism, what is of most interest is its disciplinary moment, and at the heart of this lies the logic of security and its conjunction with capital. The explosion and expansion of security in the last two decades is conventionally connected to the problem of terrorism (the ‘war on terror’), but it might just as easily be connected to the attempt to engrain neoliberalism into the hearts and minds of political subjects. Security has become a neoliberal mobilisation regime.

Part of the illusion of security is that we are meant to bow down before it without even asking what it is or how it came to be granted such a status. To exist without reply, security seeks to nullify all dissent and suppress any rebellion *even before such dissent and rebellion have begun*. Any objections or resistance to any of the policies – not least the economic policies – being carried out by the powers which claim to exercise security on our behalf are met either with security measures of the most coercive kind or with the expectation that reason must abase itself before it, all our critical faculties set aside as security and its leading defenders tell us to shut up, listen and obey. Those arguing against austerity, for example, are treated first and foremost as a threat to national security. Thus far from security being emancipation, as some people working in the academic sector of the security industry like to claim *and which is the very belief that security wants us to hold*, the articulation of security as an overarching principle of politics – the idea, in other words, that security is the absolute foundation of all politics, or that security has to be the starting point for any political thought, or that security is the grounds on which we must accept the protection of the state, or that what all of us would most like for Christmas is security – is nothing less than the articulation of a demand for obedience. Security is in this sense central to the containment of social change, nothing less than the principle and process of pacification, if by ‘pacification’ we understand not simply the military crushing of resistance but, rather, the *fabrication of social order*.<sup>15</sup> This is the heart of the police idea, to which I turn below, but it has been historically true of the whole project of security from its inception – the invention of ‘social security’ in the early 1930s and then ‘national security’ in the late 1940s evidence of the state’s recognition of the ability to get things done in the name of security, from reordering the social world to reordering the international world<sup>16</sup> – and is proving to be

equally true of security as it plays out in the current conjuncture.

What does this obedience in the name of security produce? The answer is not difficult: obedience itself. Obedience produces obedience, as Michel Foucault once commented about what he called ‘pastoral power’.<sup>17</sup> It reproduces itself as a system of obedience. That is, one accepts the principle of security in order to become obedient and one reproduces this state of obedience in a striving for the mythical state of security. The ultimate goal is that one manages oneself in the way that a security operative would have us be managed. This is the very point to which Hobbes alludes in the final paragraph of *Leviathan*, it is the very same point ventriloquised by all contemporary politicians when they speak the language of security, and it is the point implicit in much of the discourse and policies surrounding terrorism, which is the very reason why so much anti-terror legislation concerns itself not so much with terrorists but rather with the obedience of the population in general.<sup>18</sup> Obedience thereby becomes a permanent way of being, and we are encouraged to believe that obedience is essential to the security of the subject. Obedience becomes fundamental to the principle of *raison d'état*, demanded by the state for security reasons, and our training in obedience a training of and for political order. And, given the security–commodity nexus, what we are being made obedient for is nothing other than the domination of our lives by capital.

Security, then, demands that we bow down to security. It demands that we feel secure in our insecurity as bourgeois subjects but also insecure in our security as bourgeois subjects. It demands that we commit ourselves not to making history but, rather, to the eternal recurrence of the same: to securing capital and the state rather than anything against it or opposed to them. Like capital, security wants us to believe that it is our fate. In this regard we might refine a point made in the 1930s by Max Horkheimer when he commented that those who do not wish to talk about

capitalism should keep quiet about fascism: those who do not wish to talk about capitalism should keep quiet about security.<sup>19</sup> But might there not be another more telling point to make, about fascism itself, connected to the idea of a *mobilisation in the name of security*, and which requires us to refine Horkheimer’s point in another way? Namely that those who do not wish to talk about security should keep quiet about fascism.

## SECURITY: FASCISM (LIBERALISM)

First and foremost, any mobilisation in the name of security takes place through practices of information and suspicion. Witness here the ‘If You See Something, Say Something’ campaign in the US Homeland Security project. This campaign is in one sense intended to help the state move beyond the problem of ‘racial profiling’, but in so doing it expanded the problem exponentially: if threats to security can no longer be defined by a fact of racial otherness, they must nonetheless still come from somewhere or someone. Or, rather, they can come from anywhere and anyone. And so we must all keep watch. As articulated by State Secretary Janet Napolitano in 2011, the process is designed ‘to inform and empower a broader, more inclusive range of people and institutions to become a part of the homeland security architecture of our country’.<sup>20</sup> If *you* see something, say something, because *you are part of the security architecture* and must therefore act accordingly.

The video on the ‘If you see something ...’ website plays heavily on the idea that citizens should act on anything suspicious, even when they think it might not be anything of real concern. This is the police logic inherent in security: anything slightly ‘out of order’ is by definition suspicious and thus to be regarded as a security threat. This logic is played out elsewhere. In the UK, for example, virtually everyone is to now be a kind of

security officer, often in the guise of immigration informant. For example, academics must report on international students so that Universities and Colleges can supply details about the students to the Home Office, while marriage registrars must notify the Home Office of any marriages which they think are 'suspicious'. More generally, the UK Home Office encourages its citizens to report anything or anyone they think suspicious to the Home Office Intelligence Management System (in 2013 some 75,000 reports were sent in). The Home Office webpage states: 'If you suspect that someone is working illegally, has no right to be in the UK or is involved in smuggling or other criminal activity, we want to hear from you'. It then assures people that they can submit information anonymously if they so wish but also that any information they give remains confidential. Security demands that citizens are to become the intelligence officers of the modern world.

At the same time, however, slogans and suggestions along the lines of 'if you suspect someone' and 'if you see something, say something' are also meant to be understood in a slightly revised form: 'if you *do* something, someone will be watching you'. After all, if *you* are part of the security architecture, then *so too is everyone else*, and so you can expect your neighbours, colleagues, family, friends and lovers to be watching you, just as you are meant to be watching them. Hence you will be reported if you are a 14-year-old taking a home-made clock to school, a four-year-old trying to say the word 'cucumber' and being misunderstood as saying 'cooker bomb', or a traveller speaking Arabic on a plane, to give just three recent examples.<sup>21</sup> Not only do we never know when we are being watched, but in the name of security we must also act as watchmen. This is the intensified culmination of a world in which security is the supreme concept: every human subject is a suspicious person. More to the point, every human being is a suspicious person in both senses of the term, for the phrase 'suspicious person' has a double-meaning. 'I am a suspicious person'

connotes being inclined to suspect: I am a person who has suspicions. But 'I am a suspicious person' also connotes giving grounds for suspicion: I am a person who is suspected by others. The suspicious mind is policed by the person with a suspicious mind, and we are all in both categories. Security now demands that we play this doubly suspicious role, as security operative and potential terrorist, amateur detective and budding conspirator. The outcome is the debasing of any attempt at human solidarity, as every citizen is now also meant to be a collaborator with the security regime.

Such debasing is central to any political movement which places security at its core, for it allows such a movement to step easily from security to exclusion, from exclusion to expulsion, and from expulsion to extermination. Despite all the talk about security being a human right, security being a fundamental need, security being emancipation, one thing is clear: security politics is first and foremost a politics of exclusion. Security is cultivated and mobilised by enacting a set of exclusionary practices. Conversely, exclusion is cultivated and realised on security grounds. This is why texts on security are always texts about exclusion, implicitly if not explicitly. The mutual presupposition of exclusion through security measures and security through exclusion practices has a long history, underpinning as it does all the historic practices through which civil society and borders – both internal as well as external – have been policed, of how the working class was originally excluded from the body politic, and of how this class along with the dangerous classes, the urban poor, the racially inferior, the threatening immigrant, the sexually deviant, the politically oppositional and the colonial subject have been administered in ways excluding them from certain spheres of civil society and the state, certain occupations and careers, certain powers and pleasures.

All of which is to say that political mobilisation in the name of security will always be a mobilisation of a deeply authoritarian kind.

This is the very reason that security is a fundamental feature of fascist discourse and practice: it is no accident that fascism calls its operations 'security measures', enacts mass 'security confinement' in 'security camps' and exercises its power through 'security police'. The kind of work carried out in the name of security has a kind of elective affinity with fascism, enabling a series of quick and easy moves made from security to exclusion to expulsion to extermination.<sup>22</sup> If we take the mass murder of six million as the culmination of fascism, then we can follow one eminent historian in thinking of the Holocaust as *the fusion of anti-Semitism with security issues*.<sup>23</sup> It is therefore no exaggeration to say that any revival of fascism will come through a political mobilisation in the name of security, and that any such mobilisation will start (has started?) with the exclusion of marginal and minority groups.

Yet maybe there is an even more telling point to make: that any such revival of fascism would hardly be necessary given all the things that can be done for 'security reasons' in the name of liberalism and the capitalist state. Security confinement, imprisonment without trial, torture, rendition, summary execution, suspension of liberties and rights that are never then reinstated, the introduction of new emergency powers that are never then lifted, war declared but never ended: it is now clear that all these things and many more are made possible in the name of security, without needing to institute a fascist regime. And if the response to this is that nothing close to the Holocaust would ever be perpetrated by liberalism, note the following story told by one ex-security operative who had spent many years working for one of world's largest 'security agencies'. In 1991, John Stockwell worked out that the CIA project in Angola which he had helped to engineer had resulted in the deaths of over 20,000 people. He then decided to do some maths.

Coming to grips with these US/CIA activities in broad numbers and figuring out how many people have been killed in the jungles of Laos or the hills

of Nicaragua is very difficult. But, adding them up as best we can, we come up with a figure of six million people killed – and this is a minimum figure. Included are: one million killed in the Korean War, two million killed in the Vietnam War, 800,000 killed in Indonesia, one million in Cambodia, 20,000 killed in Angola – the operation I was part of – and 22,000 killed in Nicaragua.<sup>24</sup>

Six million dead at a minimum estimate and not counting either those killed in the name of security by other regimes in the same period or those killed in the quarter of a century since. Not 'The Six Million', as those murdered in 'security camps' in the name of the Aryan race are known, but another six million murdered in 'security operations' by liberal states. This is security as the slaughter bench of history.

## SECURITY: POLICE (LABOUR)

Marx's astute observation that security is the supreme concept of bourgeois society is followed by him with an equally astute follow-up connecting security with the concept of police. His comment is a reminder of the extent to which we are told that the police power is exercised in the name of security. But it is also a reminder of the fact that we need a far more expansive concept of police than that found in police studies, criminology and mainstream theory, all of which fall back on the same old tired assumptions and clichés: that 'police' refers straightforwardly to the organ of state charged with enforcing law and order and that the main arguments to be made about this institution concern how to make it more democratic, less discriminatory or less militarised.

What was once known as police science was nothing less than a central means of understanding and sustaining the exercise of state power; this is one reason why Hegel, who also grasps the fundamentally antagonistic nature of bourgeois society, places the police power at the heart of his philosophy of

right. Such a science picks up on the fact that 'police' refers to the legislative and administrative regulation of the internal life of a community to promote general welfare and the condition of good order, encapsulated in phrases such as 'police and good order' or 'good police and order', the contemporary versions of which are 'law and order' or 'public order'. In its concern with order, police holds an incredibly broad compass, overseeing and administering a necessarily large and heterogeneous range of affairs, to the extent that police is in some sense without parameters. The police power sees to everything that might be necessary to maintain order within a community. This is why in its origins the police mandate extended to the minutiae of social life, including the means of comfort; public health; food and wine adulteration; expenses at christenings, weddings and funerals; sumptuary law; Sunday observance and the behaviour of citizens at church or during festivities; the maintenance of roads, bridges and town buildings; the regulation of the provision of goods and services; the performance of trades and occupations; religion, morals and manners; the behaviour of servants towards their masters; and, of course, security. The point already made about contemporary security measures – that anything slightly 'out of order' is by definition suspicious and thus a security threat – is thus at the heart of the police power and traceable to its very origins.

In the fourth volume of his *Commentaries on the Laws of England*, published in 1769, William Blackstone deals with a 'species of offences which especially affect the commonwealth', which he calls offences 'against the police and oeconomy'.

By the public police and oeconomy I mean the due regulation and domestic order of the kingdom: whereby the individuals of the state, like members of a well-governed family, are bound to conform their general behaviour to the rules of propriety, good neighbourhood, and good manners; and to be decent, industrious, and inoffensive in their respective stations.<sup>25</sup>

Note that the issue is not crime, but order, in the sense that the police ensures that manners, behaviour, propriety and industry are conducted *properly*; the police oversees the proper. Lest one think that Blackstone's comment is archaic and out of date, his general claim still rings true despite the liberal revolution of the late eighteenth century which broke the police power into various components of state power in general ('medical police' became 'social health' and then 'the health service', for example; the police of poverty became 'welfare' and, more tellingly, 'social security'; questions of food adulteration are handed over to organs with names such as the 'Food Standards Agency'). Thus a police treatise supposedly far more 'modern' than Blackstone's and written well after the functional differentiation of police powers, Ernst Freund's *Police Power* (1904), opens by noting that of all the state powers, 'the police power is the most comprehensive, and therefore necessarily the vaguest'. He continues: 'The term police has never been clearly circumscribed. It means at the same time a power and function of government, a system of rules, and an administrative organisation and force'.<sup>26</sup> It is for this reason that all of the key concepts of the police power – 'security', 'safety', 'law and order', 'public morals', 'keeping the peace' – are necessarily broad and ambiguous, because the mandate of good order requires that police powers are necessarily so.

The police power in this sense has its own special standing, as the chapter on 'Police Affairs' in Peter the Great's 'Regulation of the Main Municipal Administration', 1724, put it.

The police has its own special standing, namely: it facilitates rights and justice, begets good order and morality, gives everyone security from brigands, thieves, ravishers, deceivers and the like, drives out disorderly and useless modes of life, compels each to labor and to honest industry, makes a good inspector, a careful and kind servant, lays out towns and the streets in them, hinders inflation and delivers sufficiency in everything required for human life, guards against all illnesses

that occur, brings about cleanliness on the streets and in houses, prohibits excess in domestic expenditures and all public vices, cares for beggars, the poor, the sick, the crippled and other needy, defends widows, orphans, and strangers according to God's commandments, trains the young in sensible cleanliness and honest knowledge; in short over all these the police is the soul of the citizenry in all good order and the fundamental support of human security and comfort.<sup>27</sup>

The *special standing* of the police power is partly the basis for its claim to be *the soul of the citizenry in good order*, and in this role the police power lays claim to be *the very foundation of human security*. This is how the police power comes to intervene at any moment anywhere, 'for security reasons', even when those 'security reasons' are far from apparent to the rest of us. It is also how the police power comes to act when something has been declared 'disorderly'. It is not enforcing the law that drives the police power, but enforcing order; not the eradication of crime, but the eradication of disorder. Slogans such as 'crime prevention' and 'law enforcement' are little more than rhetorical legitimations for the exercise of the state's political administration of civil society through police power. It is this that renders police power a 'formless ... nowhere tangible, all-pervasive, ghostly presence in the life of civilized states'.<sup>28</sup>

Police is therefore best understood as an *activity* rather than an institution, a *process* rather than an organisation. At the same time, however, the activity of keeping order and the process of ensuring security is underpinned by a far more specific concern: to 'compel each to labour and honest industry', as Peter the Great's 1724 reform has it. In other words: work. The police power involves a set of apparatuses and technologies not only constituting political order in general, but constituting the law of labour in particular.<sup>29</sup> This much is clear from the very first police science, as Foucault notes when he writes that the question Colbert asked in the seventeenth century remains pertinent today: 'Since you have established yourselves as a people, have

you not yet discovered the secret of forcing all the rich to make all the poor work? Are you still ignorant of the first principles of the police?'<sup>30</sup> Thus when Blackstone defines police as the regulation and order of the kingdom whereby the citizen-subjects are made to conform to the rules of industry as well as propriety and decency, the implication is clear: the police exists to make people work. The police power constitutes wage labour. There is no market without police power. Police power is at the heart of the making and remaking of the working class.

Recognising this fact goes some way to explaining why it is that the state spends far more time and energy policing the proletariat than the bourgeoisie.<sup>31</sup> It equally explains why it is that prisons are disproportionately peopled by members of the working class. But more than anything it goes some way to explaining why 'offences against the public order' (as Blackstone calls them) such as 'vagabondage' and 'vagrancy' are so central to police treatises and legislation.

'The Vagrant Act is specially intended to reach [the] class of idlers'. So said Christopher Tiedeman in his 1886 *Treatise on the Limitations of the Police Power*, one of the leading law texts in the field for many years. 'A wanderer through the land, without home ties, idle, and without apparent means of support, what but criminality is to be expected from such a person?' And yet it is not so much the potential crime committed by actual vagrants that is important but, rather, the opportunities afforded to the police power by the category 'vagrancy' itself. People can be arrested under vagrancy laws 'on mere suspicion' and 'the whole method of proceeding is in direct contradiction of the constitutional provisions that a man shall be convicted [only] after proof of the commission of a crime'. In contrast, the vagrant 'may never have committed a crime, but he is arrested on the charge of vagrancy, and ... the burden is thrown upon the defendant to disprove the accusation'. The important point being registered by Tiedeman, one reiterated

in more or less every legal text on the police power, is that vagrancy law allows the prosecution and persecution of people simply on the basis of 'a status or condition' and largely on the grounds of suspicion. 'In connection with the punishment of vagrancy, provision is made for the punishment of ... *any suspicious person who cannot give a reasonable account of himself*'.<sup>32</sup> The UK's Vagrancy Act of 1824, for example, was the ultimate catch-all legislation, with its centrepiece being Section 4, still in operation, which enables people to be arrested and punished for being 'a rogue and vagabond', for being 'idle and disorderly', for 'wandering abroad', living in a tent, lodging in a barn or in the open air, or for just plain 'not giving a good account of himself or herself'. Vagrancy legislation is the ultimate form of police legislation: it criminalises a status rather than an act (the offence of vagrancy consists of being a vagrant); it serves to justify an arrest made when no other grounds for arrest exist; it gives utmost power to the discretion of the police officer; and it seeks not to punish a crime as such but, rather, to eliminate what are regarded as threats to social order. Most importantly, it is vagrancy law that has been instrumental in creating a class of labour.

Vagrancy law was of course central to the process of 'primitive accumulation' and the violent separation of labourers from any means of subsistence other than the wage. This is why Marx spends so much of Volume 1 of *Capital* dissecting 500 years of vagrancy law. It is also why vagrancy is regarded by the ruling class as a crime against capitalist order; a kind of *urcrime*, from which all other crime stems. ('The vagrant has been very appropriately described as the chrysalis of every species of criminal', notes Tiedeman; 'the comprehensive definition [of vagrancy] affords the means of dealing with the criminal elements of the population and keeping them ... under restraint', notes Freund.)<sup>33</sup> Suppress vagrancy to get people to engage in some kind of 'lawful calling'. Suppress vagrancy and people will be put to work.

In this light we might re-read the section on 'primitive accumulation' in Volume 1 of *Capital* as an *extended discourse on the police power*. It realises, in a roundabout way, Marx's observation in 1844 that the concept of police nestles alongside security as the supreme concept of bourgeois society. I suggest that it also provides the basis for what should be one of critical theory's foundational claims about police power: not only is there no market without police power, but that very power turns out to be central to the constitution of wage labour. Just as security needs to be understood through its integral links with capital, so police power needs to be understood through its integral links with labour. In the name of bourgeois security, police power is *class war from above*. The fact that police discourse is replete with the language of war and bourgeois ideology obsessed with the permanent police wars being fought against crime, drugs and disorder reminds us that the fabrication of bourgeois order *is* war: a police war and the class war, one and the same.<sup>34</sup>

The more total a concept becomes, the more unimaginable the means by which those living under its spell might break that domination. Such is the nature of security. The more total an activity becomes, the more unimaginable becomes the means by which those living under its spell might break that domination. Such is the nature of police. We are meant to obey the demand for security in the way that we are meant to obey the police power: as if there is no alternative. But to imagine a world without police is to imagine a world without capital, which is in turn to imagine a world not organised around the logic of security. The immense difficulty of such imagining is indicative of the extent to which security monopolises the terms of political debate, reinforcing the police power; it is indicative of the extent to which police power saturates the social world, reinforcing our submission to security; and it is indicative of the extent to which security and police reinforce our submission to capital.

- 14 The answer has to be 'no' because to unreservedly believe anyone is committed to the security of the social order would be to rest assured that this person is not and never could be a security threat. But no-one can ever genuinely occupy that position. This is why even the politicians who run the system are placed under surveillance. This fact is true of all states, but in 2012 the Hungarian state took it one step further with a new national security law that required government officials to 'consent' to being placed under surveillance. The officials were told that their phones would be tapped, their homes bugged and their emails read, but that this would happen only for 60 days each year. The beauty of the move was that they were not to know which 60 days. Hence they would have to behave as *though they were always being watched*. In other words, they would have to behave in such a way as to *avoid being considered a threat to security*.

- 18 It is now clear that whatever complicated history 'terrorism' has had, one of its main functions now is to reinforce the logic of security. This is why those criticisms of the terrorism industry which point to its irrationality, along the lines that more people in the US are killed by bee stings or in bathtub accidents than they are by terrorism, and which therefore suggest that a more rational security policy would focus on, say, teaching people how to avoid bee stings or bathtub accidents, miss the point entirely: the point of the terrorism industry is not to make us more secure but, rather, to turn us over to the logic of security in its entirety. The point of the terrorism industry is to *make security unanswerable*. This is why the terrorism industry must be seen as part of the security industry, as we noted above.

- 34 Because it is fought in the name of security, this is a war that goes by the name of 'peace', a peace violently constituted and forcefully maintained, but masked by the repertoire of police ideology ('community policing', 'serving the people', 'keeping us safe', and on it goes).

# On the Authoritarian Personality

James Murphy

## INTRODUCTION

The authoritarian personality – or, in some cases, the authoritarian character – was a category deployed by the Frankfurt School in the early twentieth century to name the relationship between the effects of late capitalist society on the personality structure of individuals and the rise of fascism in the industrialized west. Introduced by Erich Fromm in the 1920s in order to try and make sense of why the German working class switched so quickly from the left to the right after the failure of the German Revolution, the concept quickly came to occupy a prominent position in the glossary of terms with which the developing Frankfurt School for Social Research sought to examine the causes of fascist political forms. It was essential that this attempt take place on ‘social-psychological’ terrain. Figures such as Herbert Marcuse, Max Horkheimer, Leo Löwenthal, and Theodor W. Adorno drew on this term in particular, to shift the object of

criticism in the broad critique of fascism unfolding in the mid twentieth century, from the content to the social and libidinal conditions of conscious experience. At the same time, it helped provide a common vocabulary with which to consider psychological phenomena, such as sadomasochism, from a sociological vantage point and vice-versa. This was the purpose of one of the Frankfurt School’s first collaborative works, entitled *Studies on Authority and Family* and published in 1936. The study sought to develop a social-psychological explanation for the loss of internalized authority or ‘conscience’ among masses of salaried workers and framed that explanation in terms of what they called the ‘crisis in the family’, or the child’s terribly de-centering experience of an absolute conflict between the law of the father and the law of the state.

Though the basic coordinates of the concept appeared and reappeared in several guises throughout the history of the Frankfurt School (‘character’, ‘libidinal

structure', 'personality structure', etc.), its latest articulation is both the most precise and comprehensive. This last treatment of the authoritarian personality appeared in 1950 with the publication of *The Authoritarian Personality*, a five-year long research project based in Berkeley, California focusing on the prevalence of authoritarian personalities in the United States by Theodor W. Adorno, Else Frenkel Brunswik, Daniel Levinson, and R. Nevitt Sanford.

*The Authoritarian Personality*, published in 1950, was the product of a collaborative social-psychological investigation into the potentiality for fascist sympathies among the American population. The research team was officially co-directed by Theodor W. Adorno, a German philosopher, sociologist, and musicologist known as a prominent member of the Frankfurt School, and R. Nevitt Sanford, an American sociologist at the University of California Berkeley, but included as part of its 'senior staff' a German psychoanalyst named Else Frenkel Brunswik, and an advanced student in psychology at UC Berkeley, and later a professor of psychology at Yale University, named Daniel Levinson. 'The major concern' of the study, the authors wrote in the introduction,

was with the *potentially fascistic* individual, one whose structure is such as to render him particularly susceptible to anti-democratic propaganda. We say 'potential' because we have not studied individuals who were avowedly fascistic or who belonged to known fascist organizations. At the time when most of our data was collected fascism has just been defeated in war and, hence, we could not expect to find subjects who would openly identify themselves with it; yet there was no difficulty in finding subjects whose outlook was such as to indicate that they would readily accept fascism if it should become a strong or respectable social movement. (Adorno et al., 1950: 1)

In other words, the problem facing the research team was to determine how 'likely' it was that fascism would come to the United States. It was therefore essential to establish the specific laws of the personality structure independent of other forces at work in the situation, while also grounding those laws in the dynamic

relationship between an individual and their environment. This required returning to precisely that period of infantile sexuality dismissed by the revisionists so as 'to discover correlations between ideology and sociological factors operating in the individual's past – whether or not they continue to operate into his present' (Adorno et al., 1950: 6).

The study drew direct inspiration from Fromm and others' earlier social-psychological investigations, but also sought to metabolize the many criticisms the early attempts had generated by the end of World War II. For instance, in contrast to Fromm's more socially deterministic conception, they defined personality in the following way:

Although personality is a product of the social environment of the past, it is not, once it has developed, a mere object of the contemporary environment. What has developed is a *structure* deep within the individual, something which is capable of self-initiated action upon the social environment and of selection with respect to varied impinging stimuli, something which though always modifiable is frequently very resistant to fundamental change. (Adorno et al., 1950: 7)

As this passage indicates, the problem was how to see the individual's subjective role in the reproduction of objective social form – how, in other words, the individual was both produced by and productive of social conditions, or how the subject was an 'effective effect' of late capitalism. The authoritarian personality in particular therefore referred to the sort of character structure that authoritarian *societies* demanded of individuals. It was the reflection within the structure of the individual's unconscious of the social process – a process which itself depended on that individual and their character for its existence. It was not therefore that the individual's desires 'produced' authoritarian social forms, nor was it the social form that entirely produced the individual's desires, but rather a constant interpenetration of the two that, nonetheless, tended to draw energy away from the non-identical individual and toward production for exchange.

A few preliminary remarks on the relationship between empirical social research and the authoritarian personality are also warranted, however. As Max Horkheimer argued in his inaugural address upon assuming directorship of the Institute in 1931, the most important problem facing the social sciences in the early twentieth century was that they remained idealist in their approach to social objects. All hitherto existing social theories, he claimed, 'presuppose[d] a complete correspondence between ideal and material processes, and neglect[ed] or even ignore[d] the complicating role of the psychical links connecting them' (Horkheimer, 1972: 12). By reducing the diversity of social phenomena to a single, unified methodological principle, they failed to register the methodological tension between their specific social position and the object on which they reflected, society itself. What would allow this tension to reappear, or what would reopen the tension, would be the introduction of *empirical social research* into the conception of the social whole – specifically, to index the process of social philosophical reflection to the findings of each of the separate sciences. The reason for this, in Horkheimer's view, was that, in each of the separate sciences, reflection on the whole, reflection on what is real or unreal, finds a corrective in 'concrete research on the object' – in physics, for example, the 'laws of physics' are subject to a permanent process of empirical experimentation (or perhaps 'reality testing') to ensure that they do, in fact, correspond to some kind of external reality understood as what-is-other-than-law, or what is other than scientific knowledge. Unlike ontological or positivist frames of inquiry, the separate sciences required an effort of methodological self-correction or self-modification in response to a particular set of findings. One could therefore say that the Frankfurt School under Horkheimer's direction deployed the separate sciences in order to open social theory up to its outside, to the object conceived as what is other-than-thought, as what 'acts upon' thought – even

if most scientific disciplines end up reifying what-is-other-than thought by simply pitting a second self-identity (i.e. 'data') against the first, the methodological principle in need of correction.

Hence 'social research' was social in two respects. First, it took its own position of enunciation as an object of reflection. Empirical social research was both the effect of social forces and itself a social force – it could either mystify the reality of society, as in the case of idealist variants that represent society as an undifferentiated whole, or break silences surrounding unconscious processes and forces such that social progress could become possible (if not actual). Second, it was itself a form of 'social life' insofar as the commitment to the separate sciences required interdisciplinary collaboration at every moment. Each separate science that engaged in concrete empirical research involved a methodological sensitivity to the other of its scientific procedure, yes, but only within its own narrow disciplinary confines. In order for each separate science's concrete sensitivity to the outside to become a truly productive force, it had to be translated into the language of other separate science in an act of philosophical second reflection. One could describe the second generation of Frankfurt School scholars' practice of 'critical theory' as nothing other than this labor of translation.

The authoritarian personality, then, was precisely the sort of concept that simply could not have been constructed without multiple inputs from Marxist social theory and historiography, Hegelian dialectics, Freudian psychoanalysis, and different forms of 'critical and administrative' social research. The social basis for this was that the massification of society was a social process whose tendencies reflected several different 'methodologies'. It involved the quantitative reproduction of qualitatively homogeneous instances over an entire population, but also the 'speculative' process of fetishism, the capture of individual desire by a commodity

form that never appears as such, that always ‘transcends’ experience. Thus a comprehension of the methodological principles – and their evolution – is essential to a full comprehension of the concept itself.

There was, of course, considerable continuity among the many definitions and interdisciplinary approaches to the problem of the authoritarian personality. Horkheimer’s characterization in his short piece ‘Lessons of Fascism’ from 1950 is perhaps the most succinct and comprehensive. It was also one of the most mature definitions, reflecting over 19 years of collaborative research on the problem in several disciplines and contexts. The personality structure of authoritarian individuals, he writes, will be characterized by

a mechanical surrender to mechanical values; blind submission to authority together with blind hatred of all opponents and outsiders; anti-introspectiveness; rigid stereotyped thinking; a penchant for superstition; vilification, half-moralistic and half-cynical, of human nature; projectivity. (Horkheimer, 1950: 230)

Psychologically speaking, then, one can see that each of these character traits possesses a sadomasochistic texture. They all present a specific mode of aggression or of ‘causing pain’ as the object of the instincts, i.e. as the means by which the individual experiences pleasure. This element of the definition is drawn directly from Freudian psychoanalysis; it first appears in his work in the form of ‘libidinal’ or ‘character types’ modeled on the different phases of psychic development, but later reappears in expanded form in Wilhelm Reich’s and Erich Fromm’s writings. As both authors pointed out, the libidinal underpinnings of the authoritarian character are specifically sadomasochistic; what satisfies an authoritarian personality is both to obey and then to be obeyed, or to be punished and then go on to punish others – in short, to delight in the dissolution of the ego into a violent libidinal oscillation between the superego and the id. Sociologically speaking, they reflect the consequences of

the collapse of liberalism into late capitalism and the slow, libidinal violence of the culture industry for individuals and their earliest, most intimate and formative social experiences.

The following entry will therefore examine several different accounts of the social-psychological process, and the specific form of authoritarianism to which it gave rise. It begins with the first concrete application of empirical social (psychological) research in Erich Fromm’s *The Working Class in Weimar Germany: A Psychological and Sociological Study*. From there it moves by way of Herbert Marcuse’s critique of Fromm’s rejection of Freud’s libido theory to the Berkeley Research Team and the *Authoritarian Personality* published in 1950, and elucidates the social metapsychology of the authoritarian personality structure in Adorno and Horkheimer’s fully libidinal conception in *Dialectic of Enlightenment* and ‘Freudian Theory and the Pattern of Fascist Propaganda’. In this way, it is hoped, the historical and methodological life of the concept of ‘authoritarian personality’ can be grasped in its 19-year development, from 1931 up to 1950.

## **SOCIAL PSYCHOLOGY AND THE WORKING CLASS IN WEIMAR GERMANY**

Erich Fromm detailed his particular social-psychological method in his 1931 essay ‘Method and Function of Analytic Social Psychology’, where he argued that psychoanalysis’ contribution to sociology was to provide a vocabulary with which to articulate the individual’s specifically libidinal and unconscious identification with the economic and cultural forms of a given society. Returning to the early Freud, Fromm argued that the ‘self-preservative’ drives, such as hunger, are ‘tied up with material production’ – their specific form is determined directly by the nature of society’s economic relations, the ‘substructure’.

The form of the erotic drives such as love, on the other hand, are largely determined by the 'ideological superstructure', those social relations determined not by the need to survive but by 'those precise satisfactions that are socially available and desirable from the standpoint of the ruling classes' (Fromm, 1978: 480). For Fromm, then, the 'libidinous and largely unconscious behavior' of the individual body numbered among the forces of production that could be productively or unproductively related to all other forces of production, while 'culture' or 'ideology' functioned as the apparatus of capture responsible for ensuring that those libidinal forces remain productively related to the reproduction of society as a whole.

However, Fromm's conception of libido differs from Freud's. Fromm objected to what he took to be the exclusion of social determinations from the account of psychic development, and famously accused Freud of 'biologizing' the process of subjectivization by reducing it to the encounter between instincts located somewhere in the body and the natural world of objects. Rather than decisive childhood experiences of libidinal frustration leading to defense- and reaction-formation, Fromm's notion of character develops in immediate response to the contemporary determinations of the *socio-economic structure* transmitted to the individual via conscious experience. 'Libido' or 'sex drive' only name something like the 'creative openness' of the individual human being's energies – they are what allow for the 'active and passive adaptation of the biological apparatus, the instincts [on the whole], to social reality' (Fromm, 1978: 480). They can do so because both sets of drives are understood to be *part of the socio-economic substructure*, i.e. they are already understood as 'productive'. The only difference is that their product is not the sort of material goods that keep human beings alive (food, water, shelter, etc.) but rather 'ideologies', socially necessary fantasies that ensure the individual's continued contribution of their erotic energies to the reproduction of society as whole (Fromm, 1978: 491).

The social-psychological problem is thus how to understand the relation *between* economic and cultural or ideological relations – in other words, to ask how the individual *comes to enjoy* the socially specific form of the self-preservative process. Fromm's conceptual response is what he calls 'the libidinal structure of society', a forerunner to his later concept of 'social character' that he defines here as 'the "cement", as it were, without which ... society would not hold together' (Fromm, 1978: 493). But in order to verify that this concept had some real concrete purchase on actual individuals, quantitative empirical research was also necessary. If these concepts naming qualitative aspects of 'authoritarianism' could not find a corollary pattern in data drawn from quantitative questionnaires, i.e. questionnaires addressed to the masses themselves, the notion of the libidinal structure, and of the authoritarian personality, would remain abstract.

This was precisely the purpose of *The Working Class in Weimar Germany: A Sociological and Psychological Study*, which began in 1931 and sought to examine the libidinal structure of fascist Germany as it manifested in the psychological structure of individual workers. Fromm's research team set out to determine the exact degree of 'authoritarianism' exhibited by the German working class 'since the triumph of National Socialism revealed a frightening lack of a will to resist among the German workers' parties, in sharp contrast to their numerical strength as indicated by the polls and mass demonstrations prior to 1933' (Fromm, 1984: 42–3). The study employed a combination of questionnaires and direct interviews designed to draw out the 'precise structure of the individual workers' beliefs', the deep emotional commitments framing their conscious perception of themselves and the world. It was therefore not sufficient simply to 'record' the answers to the questionnaires and interview questions; one had also to 'interpret' these answers so as to determine their social significance, i.e. what they revealed about the

individuals' emotional ties to the form of society in which they lived. This interpretive element, which depended on psychoanalytic practices, was precisely what made this study unique in the critique of fascism.

Once recorded, individuals' responses were classified according to 'how individual' or 'how authoritarian' they were. In order to be classified as 'individual', answers had to clearly arise from 'an unprejudiced attitude, which had been formed by experience and was not merely an expression of conformity with a given standard' rather than an attitude that 'relied on stereotypes acquired at school or copied from Mr. Smith or Jones' (Fromm, 1984: 54). Anti-authoritarian types had strong, independent views on the quality (or lack thereof) of a given cultural trend, while authoritarian types, on the other hand, had a distinct penchant for 'stereotyping', or for reducing the complexity of the encounter between their individual life-experiences and cultural phenomena to a pre-existing, socially approved schema. The question of conformity was therefore of paramount importance, for it demonstrated the extent to which those individuals whose conscious opinions were, say, 'socialist' or at least conformed to the publicly stated position of the socialist parties, in fact possessed an authoritarian libidinal structure. To provide another example, the study also focused on many of those individuals who purported to believe that 'war could be abolished by a proletarian revolution' or 'that capitalism was to blame for inflation and Socialism would lead to a better world' nonetheless possessed a 'personal attitude' that 'betrayed the wish to submit to a strong leader and also a desire to dominate the weak' (Fromm, 1984: 225). These sorts of conflicts appeared with sufficient regularity that the research team could designate them as 'syndromes', or bundles of symptoms that correspond to the different character types. In this case, then, the 'authoritarian character', defined by the sadomasochistic desire to submit to strength and dominate weakness, can be broken up into two 'sub-groups' of

the character type, one of which emphasized masochism and the other sadism.

### **THE AUTHORITARIAN PERSONALITY AND THE CRITIQUE OF NEO-FREUDIAN REVISIONISM**

While his early work was indisputably pioneering and revelatory for the Institute, Fromm's increasingly dismissive relationship to the drive theory irritated his contemporaries. Marcuse, Adorno, and Horkheimer rejected Fromm's revision of Freud, which they all accused of rehearsing the kind of idealist social theory with which the Institute sought to break. The problem, as Marcuse wrote in 'Critique of Neo-Freudian Revisionism', published as an appendix to *Eros and Civilization*, was that Fromm and other revisionists like Karen Horney proceeded by 'expurgating the instinctual dynamic and reducing its part in psychic life' (Marcuse, 1974: 240). This allowed the psyche to 'be redeemed by idealist ethics and religion', so that 'the psychoanalytic theory of the mental apparatus can be rewritten as a philosophy of the soul' (Marcuse, 1974: 240). The consequence is that

secondary factors and relationships of the mature person and its cultural environment acquire the dignity of primary processes – a switch in orientation designed to emphasize the influence of the social reality on the formation of the personality. However, we believe that the exact opposite happens – that the impact of society on the psyche is weakened. (Marcuse, 1974: 240–1)

The concept of identification therefore alters its meaning altogether, for it no longer functions as an account of the history of the ego's *constitution* but simply its *modification*. For Fromm and Horney, the ego is present, at least implicitly, from the very outset; it is a condition of psychological development and not its product. 'Individual' and 'environment' must therefore be given at the beginning of psychological development, so that

'libido' simply refers to the individual's susceptibility to the influence of that environment through the sexual instincts' capacity for sublimation. The identification between the two occurs through the simple continuity of lived experience, a continuity grounded in the permanent 'openness' of character to transformation no matter how oppressive the social conditions confronting that individual.

For Freud, on the other hand, identification allows for an account of what Adorno called the 'inner historicity' of the ego, or the way in which the ego develops out of an infantile bundle of auto-erotic impulses into a full self-reflexive agency (Adorno, 2014: 327). As Freud insists in 'On Narcissism', identification thus accounts for both the emergence of the ego in the first place and its later modification in the child's passage from auto-erotic immaturity to full adulthood; it is not simply the means by which instincts transform into a socially acceptable form. Hence the cluster of developmental problems named by the 'Oedipus Complex', which Fromm claimed was simply a naturalized form of the 'patricentric-acquisitive' society, in fact refers to the basic mechanisms by which the ego comes to be. What this process reveals, for Marcuse, Adorno, and Horkheimer, is not that there is something natural about repression or domination, but rather that every social form in the history of human life on earth has developed *by way of* the repression of what is natural, the libido. This is not a natural or necessary property of human beings, but rather a continuously and contingently reappearing facet of human social forms. The ego does not therefore structure the becoming of the self, but is rather itself a moment of that becoming – an effect, and not a ground.

The major difference with Fromm thus arises from the different mechanisms each critical theorist identifies as responsible for the genesis of the authoritarian personality. For Adorno and Horkheimer, the problem of authoritarianism has to do with the unleashing of repressed drives via the regression of

the mature subject to various 'pre-genital' shapes of the libido. There must therefore be a childhood sexuality for the subject to regress too, and hence the mature subject must include the Oedipus Complex in its history if this regression is to be intelligible. The social-psychological problem is therefore to show how the ego can be weakened to such an extent that it can no longer maintain the diversion of libido away from its original Oedipal constellation. These criticisms of Fromm played a crucial role in distinguishing the Berkeley research team's framework from Fromm's, and also help explain much of the reason why the *Authoritarian Personality* differed in its approach and to some extent its conclusions from *The Working Class in Weimar Germany*. Unlike Fromm, the team was concerned with the *possibility* that individuals would become fascists, not the explanation for *why they had already become* fascist. This made all the difference, especially with regard to the question of libido and the role of infantile sexual development.

Rather than considering those life experiences that 'lie in the realm of the personal or the accidental' to be superfluous to the notion of social character, the Berkeley team sought to place these idiosyncratic developments at its center (Fromm, 1978: 483). The libido theory was therefore essential, for, as Adorno emphasizes in 'Types and Syndromes', it is extremely important to recognize that there is just *one* authoritarian personality or 'syndrome', and that therefore 'there exists something like "the" potentially fascist character, which is by itself a "structural unity"' (Adorno et al., 1950: 751). Individuals who possessed an *anti*-fascist character, on the other hand, 'were much more diverse' (Adorno et al., 1950: 1). The difference between them had everything to do with the form libidinal satisfaction had taken for individuals prior to the moment of decision regarding this or that partisan situation. In this way, then, they hoped to show how 'the socioeconomic situation of a particular group' was in fact *constituted* through the personality, and not itself

the primary or most direct determination of the personality itself.

The Berkeley team's questionnaire was strikingly similar to Fromm's. Its first two components also involved interviews and more straightforward questions addressed to participants' conscious experience. But there was also one major addition, the thematic apperception test, which involved a 'projective technique in which the subject [was] presented with a series of dramatic pictures and then asked to tell a story about them' (Adorno et al., 1950: 14–17). This technique allowed the individual to produce a series of results that, 'when interpreted, reveal[ed] a great deal about his underlying wishes, conflicts, and mechanisms of defense' (Adorno et al., 1950: 17). Projection thus became one of the essential components of the construction of the authoritarian personality, and especially the projection of long-forgotten or repressed infantile experiences that played only a diminutive role in Fromm's approach. These results, alongside the responses to interview questions, enabled the team to determine which variables ought to be included in the quantitatively driven questionnaires while, conversely, 'the accumulating quantitative results indicate what ought to be concentrated upon in the interview' or apperception tests. Hence the results of all three tools allowed for a kind of cyclical, self-corrective praxis to emerge that deepened Fromm's original attempt at interdisciplinary social research.

The study became most famous for its development and deployment of the 'F-scale', an opinion-attitude test drawn not from prevailing opinions or popular trends, but rather 'from the clinical material already collected, where, particularly in the subjects' discussions of such topics as the self, family, sex, interpersonal relations, moral and personal values, there had appeared numerous trends which, it appeared, might be connected with prejudice' (Adorno et al., 1950: 222). Hence the F-scale was the most 'self-referential' scale designed by the team, a quality which allowed it to serve a twofold purpose. First,

it would allow for an even *more* indirect approach to prejudices and biases within the individual, for none of its items directly concerned issues of race or ethnicity. Thus it would avoid the distortions introduced by scale items that were 'too explicitly ideological', or that 'might be too readily associated with prejudice in some logical or automatic way' (Adorno et al., 1950: 222). Second, it would allow for a more synthetic approach to the question of the 'total personality' of the authoritarian type, so that, unlike the other thematically specific scales, the F-scale would 'yield a valid estimate of antidemocratic personalities' *on the whole* 'at the personality level' (Adorno et al., 1950: 222–3).

Each of these variables 'were thought of as going together to form a single syndrome, a more or less enduring structure in the person that renders him receptive to anti-democratic propaganda' (Adorno et al., 1950: 228). 'The most essential feature of this structure', the authors continue,

is a lack of integration between the moral agencies by which the subject lives and the rest of his personality. One might say that the conscience or superego is incompletely integrated with the self or ego, the ego here being conceived of as embracing the various self-controlling and self-expressing functions of the individual ... It is a function of the ego to make peace with conscience, to create a larger synthesis within which conscience, emotional impulses, and self operate in relative harmony. (Adorno et al., 1950: 234)

More than anything else, 'ego-weakness', the individual's inability to meet the demands placed upon the psyche by the coercively individualistic and competitive form of liberal democratic society, stood out as the predominant quality of the authoritarian personality. The consequence is a psycho-emotional structure that is 'anti-democratic' to the extent that its capacity to integrate its various psychological levels (id, ego, superego) and thereby *become democratic* has been blocked.

Several different 'sub-syndromes' within the authoritarian personality emerged from

the project, each corresponding to a different mode of ego-weakness. There was the syndrome of *surface-resentment* manifesting a series of 'justified and unjustified social anxieties' unrelated to underlying 'psychological fixations or defense mechanisms'; the *conservative* pattern involving 'acceptance of traditional values' so that 'the individual is largely under the sway of [the superego's] external representatives' and motivated by 'a fear of "being different"'; the *authoritarian* type who 'is governed by the superego', exhibits 'strong and highly ambivalent id tendencies', and is motivated by 'the fear of being weak'; the *tough guy* in whom 'repressed id tendencies gain the upper hand, but in stunted and destructive form'; and finally, the last two, both of whom 'seem to have resolved the Oedipus Complex through a narcissistic withdrawal into their inner selves': the *crank*, whose 'main characteristic is projectivity and ... main fear is that the inner world will be "contaminated" through contact with dreaded reality', and the *manipulative individual* who 'avoids the danger of psychosis by reducing outer reality to a mere object of action', so that 'he is incapable of any positive cathexis' (Adorno et al., 1950: 753).

While the conservative and authoritarian syndromes were the most frequent, the last two, the crank and the manipulative type, were the most violent, for both sought not simply a justification for their hostile feelings toward the other but in fact to *eradicate* the other. The manipulative type in particular, 'potentially the most dangerous' syndrome of them all, was 'defined by stereotypy in the extreme' as well as 'a kind of compulsive overrealism which treats everything and everyone as an object to be handled, manipulated, seized by the subject's own theoretical and practical patterns' (Adorno et al., 1950: 767). The consequence is an extreme 'coldness', even toward the projected objects of one's aggression. For the manipulative type, 'anti-Semitism is reified, an export article: it must "function"'; 'their goal is' thus 'the construction of gas chambers rather than the

pogrom' (Adorno et al., 1950: 768). This type 'is found in numerous business people and also, in increasing numbers, among members of the rising managerial and technological class', so that one could say that the manipulative type represents the *maximal objectification of the subject by the production process*. It is in the manipulative type that the reification of social relations encounters its limit, for their very character-structure is such that their experience of things reflexively reifies them. The manipulative type is a kind of libidinal conduit for pure reification.

### ADORNO AND HORKHEIMER: THE FEAR OF CASTRATION

As has already been mentioned, stereotyping remained one of the central features of the authoritarian personality in both Fromm and the Berkeley research team's approach. 'Stereotypy' broadly speaking is the name for those categories of experience from which all tension has been withdrawn, specifically the tension between the form and the content of the experience itself. Specific differences quickly dissolve into general traits that, cut off from their primary reference point and explanatory intention – particular or partial objects and qualities – become self-referential and abstract. Taken as the basis for relating to others, then, stereotypes motivate an ethics of coldness or even violent 'subsumption' of others under categories of value that place them outside the reach of civil society or basic human empathy.

In *Dialectic of Enlightenment*, Adorno and Horkheimer take up the problem of fascistic stereotyping in terms of 'false' versus 'reflective' projection. All experience, they claim, involves a dialectic of introjection and projection: the subject internalizes various qualities of the object, and then, once they have been so internalized, projects them outwards once again in the form of 'external objects'.

The process resembles that of Kantian 'synthesis', whereby the categories of the understanding are spontaneously combined with intuitive material in order to generate a coherent experience of the world as it exists 'for the subject'. Similarly, for Freud – and for Adorno and Horkheimer following Freud – the world as it is experienced is a result of the subject's projection outward of those elements of objects that have penetrated from the system of perception-consciousness to the deeper mnemonic systems, and then, in accordance with the subject's own libidinal proclivities, reorganized into forms whose coherence depends on the subject's libidinal needs. 'From the traces the thing leaves behind in its senses', Adorno and Horkheimer write,

The subject recreates the world outside it: the unity of the thing in its manifold properties and states; and in so doing, in learning how to impart a synthetic unity not only to the outward impressions but to the inward ones which gradually separate themselves from them, it retroactively constitutes the self. (Adorno and Horkheimer, 2002: 155)

In order to constitute the ego itself, that is, to generate the ego as an object of the drives and therefore an agency capable of intervening in the drives' choice of object and mode of satisfaction, the individual must project the same constancy and dynamism it has introjected from objects into the world in the shape of a 'self'. This object of projection, though an effect of prior processes, itself has the capacity to shape those processes by inhibiting or facilitating the satisfaction of the drives. It is an 'effective effect' of the encounter between the drives and the world.

'Reflective projection' thus involves the subject's constant attempt to submit its own projections to reflection, or to constantly compare those objects of experience it has constituted out of the traces left in its memory to the new impressions entering via perceptive consciousness, thereby 'holding open' its own projections. In other words, reflection on projection holds open the possibility

that its projections are incomplete and in need of revision from the vantage point of the external world, or, more specifically, of what is other-than-thought. This requires that the subject have the capacity to distinguish between those projections that belong to the ego and to conceptual thought and those introjected qualities that belong to the object, or to the specific properties of what is *other than the ego*, what imposes itself on the individual psyche in the form of an alien power. A healthy, strong ego will therefore make it possible for the individual to be self-reflective, or to bring its own unconscious trends and tendencies into consciousness and adopt a critical, thoughtful attitude toward them. In the act of self-reflection,

the antithesis is perceived in the subject, which has the external world within its consciousness and yet recognizes it as other. Reflection on that antithesis, therefore, the life of reason, takes place as conscious projection. (Adorno and Horkheimer, 2002: 156)

'False projection', on the other hand, works in the opposite direction. It reduces the contours of objects to what the ego finds satisfying, thereby shielding the ego itself from the need to alter the conditions of its own satisfaction. Introjection is overtaken by projection, so that all that is introjected is a kind of copy or imitation of the projected object. The consequence is stereotyping, which is the essence of the manipulative type discussed above. For the manipulative type, the whole world is experienced through the lens of an unassailable process of permanent synthesis. Process itself, therefore, comes to function as the category of categories insofar as the manipulative type projects 'manipulability', susceptibility to subsumption, onto the world as its core metaphysical principle. The manipulative type cannot introject any whole or partial object that does not conform to this schema.

The source of the collapse of introjection into projection is a series of overwhelming and threatening impressions from the object that leave the desire for self-preservation

dissatisfied. The ego comes to 'feel' threatened, and therefore to experience the object's threatening qualities as definitive of the object itself. All that comes to be introjected is an increasingly crude object of 'threat', so that what is projected at the level of the ego is not a reflective agent capable of registering the contours of objects but rather a 'powerful' or 'threatening' self characterized by aggressivity and insensitivity toward the world. In other words, the subject loses control over its projections and becomes *paranoid*:

Because paranoiacs perceive the outside world only insofar as it corresponds to their blind purposes, they can only endlessly repeat their own self, which has been alienated from them as an abstract mania. This naked schema of power as such, equally overwhelming toward others and toward a self at odds with itself, seizes whatever comes its way and, wholly disregarding its peculiarity, incorporates it in its mythic web. The closed circle of perpetual sameness becomes a surrogate for omnipotence. It is as if the serpent who said to the first humans 'ye shall be as gods' had kept his promise in the paranoiac. He creates everything in his own image. He seems to need no living thing and yet demands that all shall serve him. His will permeates the whole universe; nothing may be unrelated to him. His systems know of no gaps. (Adorno and Horkheimer, 2002: 157)

The 'stereotype' is thus the substance of the paranoid consciousness, an abstract category through which one violently refracts the diverse qualities of other individuals or the objective world in order to make them accessible to a weakened ego. The paranoiac becomes authoritarian in precisely this aggressive identification of the object with themselves rather than themselves with the object. In this way, the paranoiac compensates their weakened ego by forcing all experiences to assume a narcissistically satisfying form.

Pathic projection therefore weakens the already weakened ego even further, specifically by displacing the true origin of the pathological forces motivating the projection and therefore occluding the very reality whose alteration would alleviate the

paranoiac's anxieties. They find themselves in a self-perpetuating spiral, for the socially tabooed drives whose dissatisfaction undermines the ego's capacity for reflection and whose amelioration might lead to that ego's empowerment are projected into the outside world. 'Under the pressure of the superego', they write,

the ego projects aggressive urges emanating from the id which, through their strength, are a danger to itself, as malign intentions onto the outside world, and succeeds in ridding itself of them as reactions to that outside world, either in fantasy by identification with the alleged malefactor or in reality by ostensible self-defense. (Adorno and Horkheimer, 2002: 159)

These hostile forces, whose danger becomes intelligible to the individual by recalling the threat of castration, therefore elicit a regression to a narcissistic condition in which the integrity of the self becomes a problem. The superego, which ought in a healthy psyche to be a source of strength for the ego, collapses under the weight of the surging impulses emanating from the id and transforms into a conduit for their satisfaction. All resistance to paranoiac projection disappears and it becomes impossible to resist the power of the id's aggressive impulses. 'Pathic projection is a desperate exertion by an ego which, according to Freud has a far weaker resistance to internal than to external stimuli', Adorno and Horkheimer write; 'under the pressure of pent-up homosexual [i.e. narcissistic] aggression the psychic mechanism forgets its most recent phylogenetic attainment, the perception of self, and experiences this aggression as an enemy in the world, the better to master it' (Adorno and Horkheimer, 2002: 159).

The true source of ego-weakness, then – a social order which, although it has largely integrated traditional forms of class-antagonism via the welfare state and the culture industry, remains an essentially class-contradictory one – is projected into the outside world in distorted form: the 'other', the Jew. The paranoid psyche is perfectly

structured for anti-Semitic beliefs, for it is ultimately devoted to the relentless projection of an enemy, an object of the wanton aggression it cannot sustain within its own libidinal economy and for which no member of the community can serve as a suitable object. Hence the Jew-as-other is essential to the emergence of authoritarian personalities and the success of the National Socialist order, for it facilitates the production of the sorts of unconscious energies on which fascist demagogues and leaders prey.

Now that power is no longer needed for economic reasons, the Jews are designated as its absolute object, existing merely for the exercise of power. The workers, who are the real target, are understandably not told as much to their faces; the blacks must be kept in their place, but the Jews are to be wiped from the face of the earth, and the call to exterminate them like vermin finds an echo among all the prospective fascists of all countries. (Adorno and Horkheimer, 2002: 137)

The fascist leader therefore instrumentalizes racist tropes and beliefs so as to ensure that no ego-formations interrupt the flow of energy leading from the bodies of the masses into their own political projects. Ego-weakness is both the means and the end of this process.

To elucidate the specific psychological mechanisms of this social process, Adorno and Horkheimer turn directly to Freud's one overtly social-psychological text, *Group Psychology and the Analysis of the Ego*, which Adorno reconstructed in his 1951 essay 'Freudian Theory and the Pattern of Fascist Propaganda'. The essay takes up Freud's de facto social theoretical problem on his own terms, namely: 'what makes the masses into masses?' The short answer is the individual's specifically libidinal identification with authoritarian leader-figures or, in some cases, 'leading ideas'. These leaders facilitate the disintegration of the individual's *superego*, their independent, internal authority or 'conscience', and replace it with the group ego of the infamous 'primal horde'. This is not at all difficult to do, as the form

of late capitalist production itself militates against the development of a strong ego:

The people [the fascist leader] has to reckon with generally undergo the characteristic modern conflict between a strongly developed rational, self-preserving ego agency and the continuous failure to satisfy their own ego demands. This conflict results in strong narcissistic impulses which can be absorbed and satisfied only through idealization as the partial transfer of the narcissistic libido onto the object. This, again, falls in line with the semblance of the leader image to an enlargement of the subject: by making the leader his ideal he loves himself, as it were, but gets rid of the stains of frustration and discontent which mar his picture of his own empirical self. (Adorno, 1978: 126)

Freud defines the individual's superego as the guiding principle of their character, as the effect of a whole history of sedimented identifications with various authority-figures whose precise constellation constitutes the conscience. Rather than a superego presiding over a unique character or personality structure, the authoritarian looks to identify themselves *entirely* with the leader – quite literally to 'incorporate' the leader (or leading idea) as the frame of their conscious experience, as the principle determining their introjection of various objects and re-projection of them in the form of conscious experience. The result is the 'fascist *community of the people*' that

corresponds exactly to Freud's definition of a group as being 'a number of individuals who have substituted one and the same object for their ego ideal and have consequently identified themselves with one another in their ego'. The leader image, in turn, borrows its as it were primal father-like omnipotence from collective strength. (Adorno, 1978: 126)

This substitution of a group ego for the individual superego is what gives rise to the mass's 'passive-masochistic attitude', the individual's identification with aggressive and hostile forces before which the only rationally self-interested gesture is one of total capitulation. The individual regresses so violently and suddenly that they skip directly over the moment of identification with the

image of their own parents and return to the phylogenetically transmitted experience of the horde's submission to the primal father, a figure of pure hostility and deprivation who had to be killed in order for the brothers of the horde to satisfy their drives. This moment resurfaces in the infant's libidinal development the first time they experience parental anger or disapproval. The parents' body and psyche is so much more powerful that the only choice left to the child is total submission: one loves and invests in the desires of the other precisely because one is terrified of them. This first 'oral' phase of libidinal development is therefore highly *ambivalent*, for the child's relation to the parent is the unhappy unity of two polar opposite drives, one aggressive and one erotic.

This is also why it is essential to grasp the continuity of 'ambivalence' in the development of the paranoid authoritarian personality, for just like the 'ambivalent' form of late capitalism, i.e. its class-contradictory character, the psychological mechanism by which the individual navigates class contradiction is also ambivalent. Once the generalized hostility of the late capitalist social form has weakened the ego and forced its regression to the oral phase, an ambivalent identification with the leader becomes both possible and necessary. And here as well, as Adorno points out, one can see the genius of the demagogue, who need not understand group psychology in order to make use of it because they are themselves exemplary of its techniques and categories. In this case, for example, the fascist leader is *also* narcissistic and aggressively so, so that they personify in their comportment the very hostility toward the individual demonstrated by the form of late capitalism itself. His indifference or coldness toward the paranoid masses is precisely what attracts them to him:

The paranoid element in the devotees responds to the paranoid as to the evil spirit, their fear of conscience to his utter lack of scruples, for which they feel gratitude. They follow the man who looks past them, who does not treat them as subjects but

hands them over to the operations of his many purposes. (Adorno and Horkheimer, 2002: 157)

To be objectified, or more precisely to idealize the source of one's objectification, is of the essence of this ambivalent identification. For that is precisely what occurs: individuals become certain of themselves by supplicating themselves entirely before the source of their uncertainty, the indifferent primordial father. At the same time, however, they sense that the leader's superiority is artificial, superfluous – that they could themselves easily take his place and perform in his stead. Hence they get to feel simultaneously superior to the superlative figure in the group, an unresolved tension internal to the leader-figure that intensifies the sadomasochistic tensions endemic to the authoritarian personality.

This is just one of many tensions or contradictions that the leader maintains at the level of their presentation. Their sheer capacity to continue advocating their views despite their irrationality only contributes to the impression that they are in fact an overarching authority whose strength legitimizes their superiority. The consequence is twofold. First, there is the individual's *idealization* of the leader, who then becomes the object of the narcissistic libido that could find no satisfaction in the individual's own ego. This resolves the contradictions plaguing the ambivalent form of the oral identification. Second, there is an *identification* with all other individuals who have idealized the leader at the level of the ego itself. The individual therefore ceases to view themselves as an individual at all, but rather as one member of an enormous fascist family. Other individuals come to appear as siblings, each of whom falls equally short of the idealized father-figure, and each of whom equally depends on the father-figure for narcissistic compensation. The feeling of power the individual has lost reappears in the experience of the 'mass of individuals' who line up behind the fascist leader, thereby allowing them to elevate the one in whom they

recognize their own weakness to a position of supremacy.

So much, then, for the libido, but this is not all. There is also a need here for an ‘other’ to provide an object for the *death drive* which, due to the collapse in the individual’s capacity for erotic cathexis of the world, has little to check or temper it. Moreover, because the substitution of the group ego for the individual superego precludes the possibility of hating or resenting others who belong to the same group (a hatred which, in Freudian terms, is structurally necessary, since the other members of the group have become ‘siblings’ in the fascistic family and therefore possible competitors for the leader’s [i.e. the parents’] attention), some other ‘other’ must be invented. The racialized other thus emerges as a substitute for the actual others toward whom one would like to be aggressive and absorbs the free-floating feelings of aggressivity in the group. ‘This is the line pursued by the agitators’ standard “unity trick”’, Adorno writes.

They emphasize their being different from the outsider but play down such differences within their own group and tend to level out distinctive qualities among themselves with the exception of the hierarchical one. ‘We are all in the same boat’; nobody should be better off; the snob, the intellectual, the pleasure seeker are always attacked. The undercurrent of malicious egalitarianism, of the brotherhood of all-comprising humiliation, is a component of fascist propaganda and fascism itself. (Adorno, 1978: 131)

The ‘other’ that comes to constitute the object of the mass’s hatred does not therefore truly exist – they are in fact a fantasy projection, an unreal entity that functions as the negative image of the collective dissatisfaction of the death drive among the members of the mass. It is in this sense that the anti-Semite ‘creates’ the Jew, as Jean-Paul Sartre put it. It is not that the fantasy image is not identified with really existing individuals in the world – actually-existing Jews, as it were – but rather that what makes the other the object of mass aggression is not its own properties or qualities, but the

way that these qualities fit into the projected fantasy of satisfying destruction.

## THE CULTURE INDUSTRY AND THE END OF INTERNALIZATION

For Adorno and Horkheimer, the name for the additional element over and above capitalist social relations that contributed to the development of authoritarian personalities was ‘culture industry’, a regime of apparatuses responsible for enclosing or ‘integrating’ individuals’ libidinal energy into the circulation of commodities. The culture industry refers to a non-subjective but intentional social tendency whose essence is the extension of the work process into the leisure time of the individual. ‘Entertainment is the prolongation of work under late capitalism ... the only escape from the work process in factory and office is through adaptation to it in leisure time’ (Adorno and Horkheimer, 2002: 109). It is therefore incorrect, in Adorno and Horkheimer’s view, to describe the function of the culture industry as ‘distraction’ – it is rather *focus*, specifically a focus on the form of cultural objects, which is identical with exchange-value. ‘No stimulant concocted by the experts may escape the weary eye; in the face of the slick presentation, no one may appear stupid even for a moment; everyone has to keep up, emulating the smartness displayed and propagated by the production’ (Adorno and Horkheimer, 2002: 110). The culture industry is a fundamentally leveling force in which it is the production of culture itself rather than any particular cultural object that constitutes the object of the consumers’ libido. Freud calls the pleasure involved in this perpetual state of pseudo-satisfaction *Vorlust*, which can best be translated into English as ‘titillation’. It is not the *actual* satisfaction that comes from the release of tension, but rather the *anticipation* of satisfaction at the level of fantasy that the consumer finds enjoyable.

The culture industry does not sublimate: it suppresses. By constantly exhibiting the object of desire, the breasts beneath the sweater, the naked torso of the sporting hero, it merely goads the unsublimated anticipation of pleasure, which through the habit of denial has long since been mutilated as masochism. (Adorno and Horkheimer, 2002: 111)

Hence what the individual experiences as pleasure is in fact a form of dissatisfaction in which the role of fantasy in healthy psychic activity is inverted: rather than the *satisfactions of hallucination*, the culture industry presents the consumer with *the hallucination of satisfaction*.

The consequence of this tendency is that individuals come to experience a sort of indeterminate or 'absent' authority, a sense that 'they' are doing things to which the individual must conditionally adapt themselves. There is no specific representative of this absent authority; it never steps forth in personified form. Even the rulers come to personify their social function, as in the case of the manipulative, managerial character, so that no subjective independence appears in the whole of the seamlessly integrated production process. There is therefore no possibility whatsoever of this authority reciprocating the individuals' investment in it – it is a purely 'hostile' force that, although it gives shape to the individuals' libido in disciplinary fashion, never enters into conscious experience as a potential object of introjection. The 'rational' choice for the individual, the sensible course of action, is to surrender one's rational faculties altogether and identify completely with the irrational forces with which they're confronted; otherwise they will perish. It is this last point in particular that motivated Adorno to claim that the 'wrong life cannot be lived rightly' (Adorno, 2005: 39), or that there is no rational and justified response to rampant social irrationality.

It is therefore not entirely correct to say that individuals 'identify' with the culture industry, for there is nothing for them to identify with. 'Identification' involves a fundamental

gesture of *internalization*, i.e. integration into the constellation of internal perceptions that are then projected into the world in the form of a 'self'. The culture industry keeps its coercive forces and capacities hidden from those subject to them, so that the idearepresentations of the drives that have been fixed to the production process never enter into the consciousness of the individual – they remain unconscious. Individuals do in fact model their individuality on the culture industry, which is to say that they do nothing to *assert* their individuality against prevailing trends or otherwise cultivate an individual 'style' in the modernist sense. But this has more to do with the repression of the drives than it does with any sort of modification of them through identification – hence the difference between 'suppression' and 'sublimation' mentioned above.

The consequence of the culture industry's (re)production of the individual for exchange is that all individuals reappear as 'little Hitlers', not-yet-fascists who lack the ego-strength to realize their individuality against the homogenizing effects of late capitalism. As a consequence, there is no longer the possibility of recalling the social character of past epochs in order to pit the collective energies of individuals against the form of the production process, as Erich Fromm had hoped to do. All individuals are fully integrated into the relations of production in such a way that any and all resistance will *itself* have to have an individual form; there is no subject of resistance immanent to the relations of late capitalist production, no social position or perspective from which to contradict 'the course of the world, which continues to hold a pistol to the heads of human beings' (Adorno, 1992: 80). Each individual is left in a state of atomized isolation and with feelings of 'coldness' toward all other individuals – it ceases to be possible, in other words, to *feel* the presence of others, to desire them or be desired independent of the homogenizing mediation of the culture industry. The consequence is the authoritarian personality.

## CONCLUSION

The concept of the authoritarian personality, and especially its deployment as a frame for empirical social research by the Berkeley Research Team, directly inspired hundreds of similar studies over the next 50 years. As Joel Meloen points out, more than 2,000 studies were published on the problem of the authoritarian personality, and especially the F-scale, between 1950 and 1990 (Meloen, 1991: 119–27). But the larger insistence on the relevance of the libido theory that marked the sometimes controversial history of the concept was also echoed in a number of different social and philosophical theories through the latter half of the twentieth century. For instance, Gilles Deleuze and Felix Guattari's *Capitalism and Schizophrenia* (1983) returns to the problem of how individuals libidinally invest in their own domination, even if their conception of the libido differed substantially from that of Adorno and Horkheimer (there are, however, several fascinating parallels at the level of their conception of partial objects). Similarly, the *Theory of Bloom*, a text published by several of Giorgio Agamben's students writing for the journal *Tiqun* in France, draws heavily on the critique of separation in terms of libido. But perhaps the most faithful inheritor of the larger framework within which the concept of the authoritarian personality took shape is Slavoj Žižek. He insists throughout his work on the libidinal nature of racism and fascist social relations and especially on the way in which racialized others serve as a means for the displacement and condensation of class contradiction (Žižek, 2009). But Žižek's work rarely if ever references the Frankfurt School's research directly. With regard to theoretical developments that reference the Frankfurt School directly, readers should consult Jessica Benjamin's work on the 'end of internalization' and the consequences of the 'fatherless society' for feminism (see Benjamin, 1977 and 1978).

To speak briefly to other modes of influence, the study also provided an important counterpoint to those critiques of fascism and totalitarianism that sought to oppose them to liberalism, such as Hannah Arendt or Claude Lefort. Adorno and Horkheimer in particular were firm in their conviction that the greatest danger facing humanity 'after Auschwitz' (Adorno, 1973: 362) was not the traces of overt fascism left over at the end of World War II, but rather the fascistic or manipulative tendencies toward authoritarian behavior in liberal democracy itself. Short of a revolutionary reorganization of capitalist relations of production and liberal democratic law and culture, nothing could ensure that the production of authoritarian personalities would not continue uninterrupted beneath the veneer of democracy. This more than anything, Adorno in particular contended, was the danger to be taken seriously when viewing the world from the vantage point of the results of the Frankfurt School's research – a concern that some scholars have also taken up in the form of 'left wing authoritarianism' (see Meloen, 1991).

# Antisemitism and the Critique of Capitalism

Lars Fischer

It would be impossible to overstate how central a role the conceptualization of antisemitism played in the evolution of the Frankfurt School's critical theory. The latter is inseparable from, and incomprehensible without, the former. It is all the more remarkable that the reception of the Frankfurt School's grappling with antisemitism did not begin in earnest until the late 1970s.

Eva-Maria Ziege has shown in her compelling account of the intellectual development of the Frankfurt School (Institute of Social Research) in exile, that the core group around Horkheimer and Adorno by no means abandoned or even attenuated its fundamental Marxist orientation, though it did take an esoteric turn.<sup>1</sup> The conscious elimination of conventional Marxist terminology from the original, privately circulated version of *Dialectic of Enlightenment* prior to its publication in 1947<sup>2</sup> reflects this esoteric turn yet does not indicate that Horkheimer and Adorno abandoned the fundamental critique of capitalism. As Moishe Postone and

Barbara Brick have pointed out, 'the frequently described shift of critical theory from the analysis of political economy to a critique of instrumental reason does not ... signify that the theorists of the Frankfurt School abandoned the former in favour of the latter. Rather, that shift was based on a particular conception of political economy' (on which more in a moment).<sup>3</sup>

It was initially Adorno who alerted his colleagues to the crucial heuristic significance of antisemitism. 'I am gradually finding, not least under the influence of the latest news from Germany', Adorno wrote to Horkheimer on 5 August 1940 (roughly a year before the Nazi regime decided to go ahead with the genocide),

that I just cannot stop thinking about the fate of the Jews. It often seems to me that everything we were accustomed to seeing in terms of the proletariat has been concentrated today with horrendous force upon the Jews. No matter what happens to the [research] project, I ask myself whether we should not say what we want to say

in connection with the Jews, who now represent the counterpoint to the concentration of power.<sup>4</sup>

In the proposal for the research project he mentioned in the letter, Adorno had written that, 'if it is true that one has to understand National Socialism to understand antisemitism, then it is equally true that one has to understand antisemitism to understand National Socialism'.<sup>5</sup>

This was an obvious reference to Horkheimer's 'The Jews and Europe' of 1939, which began with the words: 'Whoever wants to explain antisemitism must speak of National Socialism'.<sup>6</sup> Yet Adorno's reading contrasted sharply with Franz Neumann's contention that 'one can offer an account of National Socialism without attributing a central role to the Jewish problem'. Neumann took it for granted that Adorno himself did not believe otherwise and had suggested so in the proposal merely for tactical reasons. Neumann insisted that antisemitism had 'receded as a central ideological tenet' of National Socialism. Even when writing grant proposals, Neumann admonished Adorno (and, by extension, Horkheimer), 'one should not give up one's theoretical position entirely'.<sup>7</sup>

This disagreement on the significance and meaning of antisemitism can be mapped neatly onto the controversy between Neumann, Gurland and Kirchheimer, on the one hand, and Pollock, Horkheimer and Adorno, on the other, regarding their respective characterizations of contemporaneous capitalism.<sup>8</sup> Confronted with a massive surge in economic centralization, state intervention, social regimentation, populism and political authoritarianism in the interwar period, Pollock argued that capitalism had entered into a new phase, that of state capitalism, in which the market had effectively been eliminated and overall control had reverted to the political sphere (now organized in the form of rackets). While Neumann, Gurland and Kirchheimer continued to insist on the primacy of economic factors in understanding the capitalist order,

Pollock argued for the primacy of the political, and Horkheimer and Adorno adopted his point of view. Horkheimer and Adorno subsequently placed considerable emphasis on the demise of the sphere of circulation as one of the elements facilitating antisemitism not just because they were all too familiar with the conventional association of the Jews with the sphere of circulation but primarily because the elimination of the market played a central role in Pollock's understanding of state socialism. Hence, as Ziege has pointed out, when Horkheimer and Adorno dedicated *Dialectic of Enlightenment* to Pollock, they were acknowledging not only a profound debt of friendship and collegiality but a fundamental intellectual debt too.<sup>9</sup>

Since state capitalism, according to Pollock's understanding, existed both in democratic and totalitarian forms, much of the critique formulated by Horkheimer and Adorno with a focus on National Socialism – and, by extension, most of what they had to say about contemporaneous antisemitism – was in fact meant as a critique of capitalism in general. Taking this background into account, it is evident that the Frankfurt School's two key programmatic texts on antisemitism – Horkheimer's 'The Jews and Europe' of 1939 and the 'Elements of Antisemitism' that conclude *Dialectic of Enlightenment* – by no means develop radically opposed perspectives, as has frequently been suggested. Rather, 'The Jews and Europe', for all its flaws and infelicities, was a stepping stone towards the rather more multifaceted and complex stance developed in the 'Elements of Antisemitism', and a number of thoughts first formulated in 'The Jews and Europe' recur in the 'Elements'. To be sure, Adorno's insistence that henceforth 'what we want to say' could best be said 'in connection with the Jews' rather than 'in terms of the proletariat' does signify a particular acuity and prescience *vis-à-vis* the threat faced by European Jewry, and would have made little sense had it not been for that threat. I would argue, though – and I should state in the interest of

full disclosure that I have changed my mind on this – that Adorno's plea did not amount to a radical sea change. After all, he wanted to say 'what we want to say', and not something fundamentally new, 'in connection with the Jews'.

While it is true that in their account of the evolution and dynamics of antisemitism in the 'Elements of Antisemitism' (and *Dialectic of Enlightenment* as a whole) Horkheimer and Adorno drew on explanatory factors rooted deeply in the history of human cultural and psychic history, their account was neither ahistorical nor did they conceive of antisemitism – or instrumental reason – as unchanging transhistorical phenomena. There may be much to criticize about the ways in which they mediated between long-term continuities and the specificity of individual historical contexts, but they were clearly aware of the need to do so and sought to meet this challenge. This point bears emphasizing since any critique of capitalism must obviously be based on factors specific to capitalism and to capitalism only. However, it need by no means be based *only* on factors specific to capitalism either. As Postone and Brick have pointed out, Pollock, and Adorno and Horkheimer with him, seem to have paid insufficient attention to the sphere of production (rather than that of circulation) and consequently treated labour as a transhistorical category. Yet far from this signalling a departure from the Marxist critique of capitalism, they were, in so doing, in fact hostage to 'a traditional understanding of Marx's critique of political economy'.<sup>10</sup>

Horkheimer and Adorno's reasoning in *Dialectic of Enlightenment*, then, was by no means ahistorical or naively transhistorical. Indeed, one of the great strengths of the account of antisemitism they offered in the 'Elements of Antisemitism' lies in the fact that they viewed its historical evolution and the crystallization of various explanatory factors as an essentially cumulative process. Rather than assuming that various historical forms of anti-Jewish sentiment or practice

had simply been superseded and displaced, or that diverse explanatory factors were mutually exclusive, Horkheimer and Adorno treated them all as having been transcended in the Hegelian sense of *aufgehoben*. To be sure, earlier forms of enmity towards the Jews were not simply perpetuated, they were transformed in the process and their significance and meaning could be dramatically altered as the constellations within which they continued to function changed. However, neither did the loudest form of antisemitism on the market at any given point in time simply supersede all earlier or other forms of anti-Judaism and anti-Jewish sentiment. This dialectical approach to dis/continuities in the evolution of (modern) antisemitism is also well suited to dispelling some of the false dichotomies that currently pervade the debate about the origins and dynamics of contemporary Muslim antisemitism.<sup>11</sup>

At the heart of the Frankfurt School's direct grappling with antisemitism were four texts/projects. These are:

- 1 Horkheimer's article, 'The Jews and Europe', written on the eve of the Second World War, amended slightly to reflect the outbreak of war, and published in the issue of the Institute's own journal, *Zeitschrift für Sozialforschung*, for 1939/40;
- 2 The unpublished, four-volume Labor Study ('Antisemitism among American Labor'), based on a major empirical research project undertaken by the Institute with funding from the Jewish Labor Committee in 1944/45;
- 3 The final section of *Dialectic of Enlightenment*, 'Elements of Antisemitism';
- 4 *The Authoritarian Personality*, one of the *Studies in Prejudice*, published in 1950 and based on a major empirical research project undertaken under the auspices of the Institute that was funded by the American Jewish Committee.

The evolution and interrelatedness of these texts and projects has been expertly reconstructed by Ziege and Jacobs.<sup>12</sup> I will focus primarily on the two more programmatic texts: 'The Jews and Europe' and 'Elements of Antisemitism'.

## 'THE JEWS AND EUROPE'

Horkheimer consciously modelled 'The Jews and Europe' on Karl Marx's 'On the Jewish Question'. Marx's 'On the Jewish Question' was written in two parts. In the much more extensive first part, Marx outlined his understanding of modern society without any meaningful reference to the Jews on whom he focused only in the short second part. 'The Jews and Europe' comprises three sections. The Jews do not feature in the first two sections (making up two thirds of the text), in which Horkheimer presents National Socialism as a totalitarian form of state capitalism. Only in the final section of the text did he come to discuss the situation of the Jews. Clearly, Horkheimer was emulating Marx's attempt to present the question of what the status of Jews should be in society as one integral to the constitution of society as a whole. Gershom Scholem's reaction to 'The Jews and Europe' indicates that this did not go unnoticed. 'It is not enough to take up Marx's essay "On the Jewish Question" (which was already very weak and lopsided a century ago) once again in today's words', he wrote, commenting explicitly on Horkheimer's essay, to Adorno on 15 April 1940.<sup>13</sup>

Readers not familiar with the text can easily assess the bare bones of Horkheimer's line of argument by turning to the abstract published in English with the article.<sup>14</sup> Given that the first two sections focus on a general analysis of National Socialism, most readers are likely to be rather surprised when they arrive at the third section, which begins with the words: 'That is how it is with the Jews' (unless, of course, they are familiar with Marx's 'On the Jewish Question', in which case they will recognize the logic).<sup>15</sup> The Jews who did then appear in the third part of Horkheimer's essay were Jews too desperate or deluded to comprehend that their current ostracization was the logical consequence of the same fundamental rationality that had previously facilitated their emancipation. Just as their emancipation had resulted not from

abstract principles or good will but from the restructuring of society as a whole dictated by the economic necessities of emerging capitalism, so it was the current transformation from liberal to state capitalism that rendered them obsolete and thus made them an ideal scapegoat. As Gerhard Scheit has pointed out, the way in which Horkheimer lays into 'the Jews' in this section is deeply disconcerting. On the other hand, insofar as Horkheimer's critique reflected his deep desperation over the liberal politics of appeasement to which significant numbers of Central and Western European Jews had subscribed, Horkheimer's remarks are not as outlandish or misguided as they may seem to contemporary readers.<sup>16</sup> Where Horkheimer was definitely wide of the mark was in his inference that antisemitism was a feature of fascism on the rise that would become obsolete once it was firmly established. He argued that its purpose was propagandistic: it served to demonstrate that the fascists meant business. Now that National Socialism was secure in Germany, its antisemitism played principally to populations susceptible to fascism in other countries.

'The elimination of anti-Semitism is identical with the struggle against the authoritarian state', Horkheimer concluded. Having appropriated Marx's logic in 'On the Jewish Question' that one needed to talk about society as a whole if one wanted to talk about antisemitism (or the position of Jews in society more generally), what was still missing was the insistence on its inversion.<sup>17</sup> That Horkheimer saw the subsequent development in exactly these terms is evident from a draft of the letter he eventually sent to Harold Laski in March 1941. It contains what is probably the most widely quoted formulation by Horkheimer on this matter: 'As true as it is that one can understand Antisemitism only from our society, as true it appears to me to become that by now society itself can be properly understood only through Antisemitism'.<sup>18</sup> The sentence immediately preceding this statement has drawn less

attention. 'It appears to me as if the old instruments would no longer suffice', Horkheimer wrote, 'not even that treaty [treatise] "Zur Judenfrage"''.<sup>19</sup>

### 'ELEMENTS OF ANTISEMITISM'

The final section of *Dialectic of Enlightenment*,<sup>20</sup> 'Elements of Antisemitism', comprises seven theses, of which six already formed part of the privately circulated version of 1944. Prior to the publication of *Dialectic of Enlightenment* in 1947, Horkheimer and Adorno added a seventh thesis.<sup>21</sup> In the preface, Horkheimer and Adorno acknowledged that they had written the first three theses 'with Leo Löwenthal'.<sup>22</sup>

*Thesis One.* The core contention of the first thesis is easily identified: antisemitism is not an aberration from, but an integral outgrowth of, the existing social order. 'The Jews', Horkheimer and Adorno wrote, 'are today the group that, in practice and in theory, draws to itself the annihilatory urge that the wrong social order brings forth' (197). While the fascist viewpoint was predicated on the assumption that humanity's future depended on the annihilation of all Jews, its liberal counterpart was based on the claim that a united, unitary humanity already existed, in which distinct Jewish features were at best a throwback, soon to be ironed out by assimilation. Consequently, the latter amounted to an affirmation of the status quo and those who propagated it committed what, from the viewpoint of critical theory, was probably the foremost sin, that of 'invoking the finite as infinite, lies as truth' (46). The fascist contention that the fate of the Jews was central to the future of humanity was true in the sense that the fascists had made it true. The liberal claim was true in the sense that social formations were indeed becoming increasingly homogeneous. For while the Jews had scrambled to conform to the standards of liberal bourgeois society by exercising a

high measure of enlightened self control and shaking off the embarrassing traces of their earlier discrimination, the bourgeois order had regressed into the ethnic and racializing forms of community that were now in the ascendancy. Race, Horkheimer and Adorno insisted, was no authentic, natural category but signified a reductionist notion of nature as a solely oppressive force and an obstinate insistence that the particularisms that prevailed under the existing order were in fact universalisms. Consequently, 'the liberal Jews now find themselves at the receiving end of the social harmony to which they aspired', albeit 'in the form of the *Volksgemeinschaft*', Horkheimer and Adorno noted acerbically (199). The bourgeois Jews' fundamental misunderstanding had been the assumption that antisemitism was an aberration from the existing order, when in fact it was its logical outgrowth. Yet, 'the persecution of the Jews, like persecution in general, is inseparable from that social order' (199).

*Thesis Two.* In the second thesis, Horkheimer and Adorno took recourse to Freud's *Culture and Its Discontents* as an interpretative device and portrayed antisemitism as a means consciously deployed by the powers that be to channel discontent in a way that did not endanger the existing order. The attractiveness of antisemitism as a popular movement, they argued, lay in the fact that, for its adherents, it was a luxury. To be sure, there had been some pretense that the expropriation of the Jews could benefit the non-Jewish population materially, but nobody genuinely believed this. The actual benefit derived from antisemitism lay in the fact that it signalled an affirmation of the individuals' rage and destructive urge by the collective. Antisemitism was a luxury because it created a realm in which, for once, individuals were not expected to subordinate their sentiments and desires to considerations of purpose and utility. To the many, it was attractive not although but, rather, precisely because it was ultimately ground- and senseless.

At root, then, antisemitism was an unconscious rebellion against the self-denial, sublimation and rationality the process of civilization had imposed upon humankind. Ultimately, those who blindly lashed out against the Jews were as oblivious to their true motives as were their (Jewish) victims. It is for this reason that antisemitism could serve the powers that be. They deployed antisemitism 'as a distraction, a cheap means of corruption and a terrorist warning'. The 'respectable rackets' (i.e., democratic state capitalism) nurtured it, the 'disrespectable' ones (i.e., fascist state capitalism) practised it (200). Antisemitism was an intrinsic trait of civilization, and one of its rituals. Indeed, contrary to the long-standing libel that Jews engaged in ritual murder, it was the pogroms that were the true ritual murders.

The various political and economic arguments articulated by antisemites were no more than half-hearted rationalizations. Given that neither they nor their victims actually understood their motives, there could be no such thing as genuine antisemitism (in the sense of a substantiated conviction).<sup>23</sup> Hence, Horkheimer and Adorno reasoned rather troublingly, not only the victim groups but also the roles of murderer and victim were, in principle, interchangeable. All that was required for a group to be suitable as a victim group was that it stood out in some way and that it was defenceless. 'The adults for whom baying for Jewish blood has become second nature are just as clueless' as to their reasons for doing so 'as is the youth expected to spill it' (200–1). The powers that be, however, who commissioned the antisemitism and who did know why, 'neither hate the Jews nor do they love their followers' (201). The latter, whose pursuit of their economic and sexual interests was curtailed by the ruling order, could at least give free rein to their hatred (of the Jews). Given that this hatred was in fact displaced, it obviously could never soothe the itch that was actually making them act out and was therefore potentially boundless.

In what sense did the Jews stand out as a defenceless group? Where Jewish emancipation had occurred, the Jews were easily identifiable as the beneficiaries of political liberalism. Yet for the majority of the population, the liberal promise of universal human rights, of happiness even for those who held no power, remained an unattainable ideal and it struck them as a lie and a mockery. Forced to forego the benefits of the liberal promise themselves, they turned on those who did benefit from it. Indeed, wherever they saw a flicker of any of the hopes, desires and urges they were forced to suppress in themselves, they increasingly felt the need to annihilate that flicker.

*Thesis Three.* In the third thesis, Horkheimer and Adorno discussed the issue of the Jews' association with the sphere of circulation and its relevance in explaining (bourgeois) antisemitism. Their line of argument was remarkably close to that of Karl Marx in the second part of 'Zur Judenfrage'. The materialism and hunger for profit of which the Jews were being accused was in fact an integral trait of society as a whole, whose members sought to dissociate themselves from this trait by pointing to the Jews as the supposedly sole representatives of qualities that had in fact come to dominate society in its entirety.

This was not just a propaganda trick. Rather, the Jews had genuinely been placed in a position that made them the visible representatives of capitalist exploitation. Workers were directly confronted with their exploitation not when they received their wages but when they found out how little they could get for those wages; not, in other words, in their dealings with their employers, but when they came face to face with the shop keepers. It was they who acted as 'the bailiff for the system as a whole and took on the odium' of capitalism *pars pro toto* (204). To be sure, Jews were never exclusively responsible for the sphere of circulation, but they had been 'trapped in it for too long for their character not to reflect the hatred they have always had to bear' (204).<sup>24</sup>

Thus far, Horkheimer and Adorno stayed within the frame of reference outlined in the previous thesis. The notion that traces of the wounds inflicted upon the Jews in the past would provoke further aggression from the descendants of the perpetrators is entirely plausible. Yet their line of argument then began to stray disconcertingly towards an actual (rather than an ascribed or projected) identification of the Jews with the sphere of circulation. 'The Jews were colonizers of progress', they contended, 'they carried capitalist forms of existence from country to country and attracted the hatred of those who had to bear the cost of progress. Due to the economic progress that is now their undoing, the Jews have always been a thorn in the side of the artisans and peasants whose status capitalism hollowed out' (204). In truth, they had always continued to be court Jews, even in the age of emancipation, protected by the powers that be only when it served their purposes. The legal equality they had supposedly gained was never more than a privilege that could be, and now was being, revoked again. The transformation to state capitalism rendered the sphere of circulation obsolete, hence the Jews now fell prey to the very progress whose pioneers they had been for so long.

Horkheimer and Adorno did not succeed in formulating this thesis in a genuinely coherent manner. In this respect too, the parallels to 'Zur Judenfrage' are apparent. Like Marx, they blur the line between a critique of the way in which certain traits are commonly identified as supposedly Jewish and participation in that very practice, and they too seem to be too invested in the latter to leave the reader feeling entirely comfortable. By way of a rationalization one might perhaps suggest that these difficulties arose because Horkheimer and Adorno failed to draw a clear enough distinction between historical reasons that explain why the Jews were considered a suitable foil for antisemitic projections, on the one hand, and the contemporary content of those projections, on the other. Yet this rationalization alone cannot

fully explain away Horkheimer and Adorno's relapse behind their own previously articulated insights into the projective nature of antisemitism.

*Thesis Four.* In the fourth thesis, Horkheimer and Adorno turned to the dis/continuities between Christian anti-Judaism and modern antisemitism, a contentious issue among scholars of antisemitism to this day.<sup>25</sup> Given their understanding of the historical evolution of antisemitism as a cumulative process, they were able to offer a more differentiated analysis of this issue than most of their peers – and, indeed, than much of the relevant scholarship since. They proceeded in two steps, explaining first why religious tradition, perhaps counter-intuitively, was still relevant, and then identifying what they considered the principal cause of the anti-Jewish animus within that tradition.

As they pointed out, organized political antisemitism, for the most part, had expressly sought to shift the emphasis away from the religious to national and racial distinctions between Jews and non-Jews. This, they argued, simply reflected the decreasing influence of religion in society: 'Criticizing the Jews for being obdurate nonbelievers no longer sets the masses in motion', they wrote (205). It is noteworthy, then, that Horkheimer and Adorno's reasoning regarding the continued influence of Christian anti-Judaism was developed, not in opposition to, but against the backdrop of the assumptions about secularization widely accepted until the 1980s. Horkheimer and Adorno suggested that the argument needed to be turned from its head onto its feet. The antisemitic ideologues protested too much, indicating just how deeply religious tradition was in fact still ingrained in their ideology. Far from simply being left behind, religion had been transformed into society's 'cultural heritage', and the 'alliance between enlightenment and power'; in other words, its turn from a dialectical and critical to a functional and affirmative force made society oblivious to the true roots of this cultural heritage (206). The yearning and discipleship previously realized in the religious

sphere now found its outlet in the political sphere and directly benefited fascism, not only by helping to create its blindly obedient followers but also insofar as the only content of Christianity that survived this transformation was rabid hatred of the nonbelievers.

Horkheimer and Adorno then moved on to draw the following distinction between Biblical Judaism and Christianity. Understood as a deity capable of subordinating nature, the Jewish god was necessarily abstract and distant. His ineffable power and magnificence was comforting and frightening in equal measure, and the contrast between humankind and god remained absolute, much as god's covenant with the people of Israel and the messianic promise served to mitigate it. Jews, individually and collectively, were expected to lead their lives in accordance with the religious laws but insofar as the Jewish god was both omnipotent and just, the issue of salvation clearly lay exclusively in god's hands and, as such, remained uncertain.

Christianity, by contrast, with its trope of god becoming man in Jesus Christ, had diminished the distinction between god and humankind, suggesting that his majesty was dwarfed by his love for humankind, thus leading to idolatry as the boundaries between the status quo in this world and the promised world to come became blurred. Consequently, mainstream Christianity had come to promise salvation in the world to come to those who followed its prescriptions in this life without actually being able to vouch for the fact that the promise would be kept. Only the 'paradox Christians ... from Pascal to Lessing and Kierkegaard to Barth' had faced up to this lack of certitude and placed it at the heart of their theology. This had made them both radical and tolerant (209). Yet they were the exception. The rule was that Christians therefore depended on the temporal destitution of those who denied that human beings could foresee their salvation with certainty – i.e., the Jews – to reassure themselves of that very certainty.<sup>26</sup> 'The adherents of the father religion', Horkheimer and Adorno wrote, 'are

hated by those of the son as those who know better' (209). Here, as in a number of other instances, far from taking recourse to the indiscriminate obsession with otherness as such that has become characteristic of post-modern thought, Horkheimer and Adorno were at pains to identify specific motives underlying antisemitism.<sup>27</sup>

*Thesis Five.* In the fifth thesis, Horkheimer and Adorno conceptualized antisemitism as an idiosyncrasy, not in the general sense of an individual trait but in the medical sense of an unusual physical response to a stimulus, essentially like an allergy.<sup>28</sup> The 'emancipation of society from antisemitism' – clearly an allusion to Marx's call for society's emancipation from (its) Jewishness, i.e., those qualities commonly attributed to the Jews that were in fact characteristics of society in general – depended on the ability to reflect critically on the actual causes of this spontaneous negative reaction to Jews (209).

Horkheimer and Adorno argued that this idiosyncrasy was ultimately rooted in the repression of primeval forms of mimesis. By this they meant the sort of spontaneous physical response to danger (not being able to move, the hairs on the back of one's neck standing on end etc.) of which an individual was not fully in command. Originally, the most effective form of protection consisted in trying to become invisible to any potential predator by blending into – i.e., by becoming like – one's immediate environment. Yet the process of civilization had required humankind to develop and internalize such a degree of rational self-control that spontaneous mimesis was now considered anathema. For this very reason, however, it had also become an object of repressed desire.

Consequently, in those who were desperately trying to conform and felt all others should do so too, any indication of deviation from the generally expected levels of sensible self control, any sentiments or forms of behaviour that did not conform entirely to the utilitarian rationality of the existing order, aroused both repulsion and envy, both

the desire to imitate and to stamp them out. Those, in other words, who failed to conform, were seen as taking liberties, as demanding privileges, as undermining the existing order. They were in fact aggressors against all those who were more or less managing to conform, and the latter could not but defend themselves against the transgressors. Consequently, any group whose members already bore the traces of violence directed against them in the past, and who therefore could not 'pass', inevitably attracted new violence. 'The cry of pain of the victim who first called violence by its name, indeed, the mere word that references the victim: Frenchman, negro, Jew, lets them intentionally develop the desperation of the persecuted who have to lash out.... The sheer existence of the other is the outrage' (213).

The emotive energy that political antisemitism harnessed was an idiosyncrasy of this kind. The flipside of the antisemites' hatred of the Jews was their persistent desire to imitate them and delve deeply into the Jews' various alleged vices and depraved traits, which served not only to denounce the Jews but also facilitated the antisemites' titillation by allowing them to engage (alleged) forms of human behaviour that were otherwise taboo. In this sense too, antisemitism offered a licence to celebrate what was otherwise strictly prohibited.

As Horkheimer and Adorno saw it, the Jews, rather than repressing mimesis, had transcended it through their ritual observance, rendering them the ideal foil for the return of the repressed in Christian culture, which, as we saw, depended on the Jews for its self-affirmation anyway. Horkheimer and Adorno emphasized that it had become quite immaterial whether Jews actually still bore the traits associated with them. 'Because they invented the concept of kashrut, they are persecuted as pigs' (216). There is an obvious parallel here to Sartre's reasoning, in the first part of his *Anti-Semite and Jew* (written after the liberation of Majdanek and first published in December 1945) that, 'if the Jew did not exist, the anti-Semite would invent him'.<sup>29</sup>

*Thesis Six.* This affinity becomes all the more pronounced in the sixth and originally final thesis, which is in many ways the most developed. Here Horkheimer and Adorno conceptualized antisemitism as a form of pathic projection, which, they suggested, was the exact opposite of original mimesis. Whereas the latter led the individual to become like their environment, pathic projection recreated the environment wholly in the projecting individual's image.

Horkheimer and Adorno emphasized that all perception of reality was ultimately projection. Following Kant, they argued that all perception is inherently already interpretation, in other words, our perceptions of the reality we encounter are fundamentally shaped by our attempt to make sense of that reality. 'Between the actual object and the indubitable sense datum, between inner and outer, there is a gaping chasm, which the subject must bridge at its own peril. To reflect the thing as it is, the subject must give back to it more than it receives from it' (218). Even so, this is not one-way traffic because the reality of which we seek to make sense also conditions the criteria we apply in interpreting it. 'From the traces the thing leaves behind in its senses the subject recreates its external world, the unity of the thing in its manifold properties and states; and in so doing, it retroactively constitutes its self by learning to impart synthetic unity not only to the external impressions but also to the internal ones, as the latter gradually separate themselves from the former. The identical ego is the most recent constant product of projection' (218–19). Consequently, 'the possibility of reconciliation lies neither in certainty untroubled by thought, nor in a pre-conceptual unity of perception and object, but in reflection upon the antithesis between them. The antithesis transpires within the subject, which has the external world within its own consciousness and yet recognizes it as other. Hence, that reflection, the life of reason, takes place as conscious projection' (219).

The Problem, then, was not projection as such but non-reflective projection. If 'the subject cannot return to the object what it has received from it, it becomes not richer but poorer. It ceases to reflect in both directions: since it no longer reflects the object, it no longer reflects on itself, and thus loses the ability to differentiate.... It runs over and atrophies at the same time. It invests the external world', which is reduced to 'a mere occasion for its delusion ... boundlessly with that which is within' the subject itself. 'The compulsively projecting self ... creates everybody in [its] own image' (219, 220, 222), but it 'can project nothing except its own unhappiness', and its lack of reflection prevents it from identifying the immediate source of that unhappiness even though it in fact resides within the self (222).

Horkheimer and Adorno explicitly sought to underpin their concept of pathic projection with specific psychoanalytic tropes. This attempt seems rather hapless, though, given that it abounds in troubling ways with women who 'adore the unwavering paranoid man' (221), homosexuality as a means of 'assimilating one's conscious emotional life to that of a small girl', 'repressing Sodomites' (222), and 'pent up homosexual aggression' (223).<sup>30</sup> This is not to suggest that repressed homosexuality has no role to play in the conceptualization of antisemitism. Current Muslim antisemitism makes very clear that it does. Even so, the way in which Horkheimer and Adorno try to make sense of this nexus is rather disturbing.

More helpful and topical, perhaps, are their musings about the attractiveness of pathic projection to what they called the 'half-educated', a category they distinguished clearly from the uneducated. The half-educated, they explained, hypostatized their partial knowledge as complete knowledge in a desperate and violent attempt to give meaning to a world that made their existence meaningless, and they railed against intellectual pursuits and experiences from which they were excluded, laying society's

responsibility for their exclusion at the feet not of society but of those who were able to participate. Horkheimer and Adorno went on to complain about the way in which education was increasingly being conceptualized in ever more utilitarian terms, thus becoming antagonistic to emancipation, a complaint that would seem to be more topical than ever and yet, given its apparent timelessness, might also point us to the equally timeless vagaries of cultural pessimism.

Against this backdrop, they also began to touch on a development they would later return to in greater detail in the seventh thesis, namely, the way in which the economic transformation to state capitalism impacted on the psyche of those living in it. As more and more economic and social processes became increasingly automated, they argued, individuals no longer needed to make decisions, negotiate inner turmoil and develop a conscience in order to function efficiently.

Horkheimer and Adorno's discussion of pathic projection, as they themselves emphasized, was largely generic. Taking the thesis in isolation, the question thus remained why pathic projection should be directed specifically against the Jews. Given that this was the sixth thesis, one could make the perfectly reasonable argument that this particular issue had been covered several times already and did not need to be discussed again. Yet Horkheimer and Adorno did return to it, drawing attention once again to the Jews' significance in the sphere of circulation. Under the circumstances they had described, they wrote, it came down to 'chance, steered by the party' on to whom 'the desperate desire for self-preservation projects the responsibility for the terror it experiences'. 'Regardless of what the Jews may actually be like, their image, as something obsolete, bears the traits that totalitarian domination cannot but consider its mortal enemy: happiness without power, reward without work, a homeland without frontiers, religion without myth'. Since these traits were in fact highly desirable but could not be affirmed, there remained

only one way of attaining them: 'even hatred leads to union with the object – in destruction' (229).

*Thesis Seven.* The seventh thesis focused principally on what Horkheimer and Adorno called 'ticket mentality', i.e., the way in which, as they saw it, whole populations now increasingly subscribed to entire ideological package deals without ever individually going through the process of forming judgements and developing the convictions integral to the respective package deal. They begun this thesis with the somewhat counter-intuitive claim that 'there are no longer any antisemites' (230). By this they meant not that antisemitism had disappeared but that it had ceased to be an ideology in its own right and instead had become one plank in the fascist package deal. In other words, there were no longer any antisemites in the sense that those who now subscribed to antisemitism did so automatically because it was part of the package deal they had chosen; their antisemitism was in no way based on any sort of involvement with actual Jews or individual thought processes. 'Alongside the crushing of the trades unions and the crusade against Bolshevism', they wrote, anyone inclined to 'give fascism a chance also subscribes to a reckoning with the Jews' (231).

Yet not only the ticket mentality among fascists, any form of ticket mentality – also among the supporters of progressive causes – was harmful, Horkheimer and Adorno insisted. To their mind, the automation of ideological orientations was part and parcel of the transformation to state capitalism (and the culture industry that emerged with it). As industrial production became serial and dependent on the persistently identical reproduction of one particular stereotype, as it were, so did people's attempts to make sense of the world. Where previously some level of individuation had been necessary for both workers and entrepreneurs to play their respective roles, in the age of universal planning and automation, the process by which individuals had previously developed

a personal conscience and sense of responsibility appeared simply as an obstacle to efficiency and a waste of time. All that was now required was that individuals readily slotted into the appropriate ideological package deal and subscribed to the judgements it implied without actually engaging in any sort of active judging or choice. They likened Freud's notion of the human psyche with its complex interaction between the conscious and the unconscious, between id, ego and superego, to the private enterprises characteristic of liberal capitalism prior to its recent transformation. Both were now becoming redundant. Drawing their idea to its logical consequence, Horkheimer and Adorno arrived at the rather paradoxical conclusion that 'ticket mentality does not become antisemitic merely when the ticket is antisemitic, but any form of ticket mentality is antisemitic' (238). Indeed, the specificity of antisemitism was largely lost in this thesis.

As we saw, it had increasingly dawned on Horkheimer and Adorno that it was quite irrelevant whether actual Jews really displayed any of the characteristics the antisemites attributed to them. As they now noted, antisemitism had shown its potential to be just as successful in areas without Jews as it was in areas with dense Jewish settlement. Indeed, the extreme demonization of the Jews by the Nazis had taken place only after they had in fact already become economically obsolete. Yet, with this they returned to the trope that tied antisemitism to attitudes towards the sphere of circulation, which they again proceeded to generalize. 'The administration of totalitarian states that exterminates obsolete sections of the population', they explained, 'is merely the executioner who carries out economic sentences long since passed' (237).<sup>31</sup>

Evidently, then, the Jews were perfectly interchangeable as a target and the hatred directed towards Jews within certain ideological package deals could easily be redirected towards other groups. This very interchangeability, they concluded, offered indubitable

hope that antisemitism would come to an end. Their reasoning at this point seems rather perfunctory and carries little conviction. If I understand it correctly, their line of argument is twofold. As fully automated functioning crowds out all forms of active experience and all encounters with reality, it will also render inaccessible whatever ostensible compensations the existing order may have to offer to those it subjugates. Consequently, as the ticket mentality comes to encompass all walks of life, the groundlessness of its automated reasoning will become so intense, so palpable that anyone who has not lost the ability to think altogether will see truth reflected *ex negativo* in the enormity of its absurdity.

## PERSPECTIVES

The 'Elements of Antisemitism' is a complex, demanding, intentionally fragmentary and genuinely unfinished text. It is also intensely stimulating and richly rewards repeated reading. I have pointed to a number of tensions and ambivalences in the text. It seems highly likely that some of these were unintentional and resulted from the unfinished character of the text. Other tensions, however, Horkheimer and Adorno would surely have considered inevitable. Only if there were a complete identity between concepts and the phenomena they are designed to reflect, would it be possible to come up with a set of theses genuinely capable of neatly combining all conceivable elements of antisemitism in an entirely coherent fashion. Yet Horkheimer and Adorno's critique of instrumental reason hinged precisely on the insistence that concepts and the reality they sought to account for diverged, and that it was in the recognition of this divergence that the potential for subversion resides. Consequently, it is in some ways quite perverse to want to offer a short, apodictic summary of the core assumptions expressed in

the 'Elements of Antisemitism'. So, bridging the 'gaping chasm ... between the actual object and the indubitable sense datum' at my own peril, I would argue that in 'Elements of Antisemitism', tensions and ambivalences in the text notwithstanding, Horkheimer and Adorno established a number of basic criteria for any critical understanding of antisemitism. Among them are (in no particular order) the following closely interrelated assumptions:

- 1 The critical analysis of antisemitism is an indispensable heuristic device for any meaningful critique of capitalism. It therefore has to focus both on the anti-Jewish thrust and the universal implications of antisemitism and cannot be satisfied with an exploration of one to the detriment of the other. The text of 'Elements of Antisemitism' bears witness to the difficulties and tensions this creates.
- 2 Antisemitism is a product of, not an aberration from, the values prevalent in capitalist societies.
- 3 Antisemitism is not primarily a matter of personal attitudes towards Jews but fundamentally a social (and socially mediated) phenomenon.
- 4 Antisemitism is woven into the deep structure of civilization (in the sense in which Freud used the term) and not, for all its manipulative potential, a random impulse that can be summoned at will.
- 5 Antisemitism in any given context needs to be understood as springing from a confluence of long-term continuities and short-term discontinuities; the precise dynamics of that confluence are specific to the individual context.
- 6 Antisemitism is not simply a reflection of a universal and arbitrary desire to engage in othering but, in any given context, draws on specific anti-Jewish as well as other, more generic negative impulses.
- 7 Antisemitism cannot be subsumed as a form of racism. The findings in the section of the Labor Study that compares antisemitism and racism indicate 'a difference in the texture of prejudice'.<sup>32</sup>
- 8 Antisemitism does not reflect actual Jewish/non-Jewish interaction nor even requires the presence of actual Jews.
- 9 The critical analysis of antisemitism depends fundamentally on the ability to distinguish reflective from pathic projection. Epistemology therefore

has a key role to play in the critical conceptualization of antisemitism.

- 10 Antisemites cannot be convinced of the error of their ways by introducing them to actual Jews. The so-called contact hypothesis, in other words, is a fallacy.

The last two points deserve particular attention. Traditional Marxism, to this day, has no epistemological grounding to speak of and its adherents have generally been content with the self-evidently illogical assumption that what one can see must be real. When Lukács – displaying extraordinary genius in reconstructing Marx’s move beyond Hegel without knowing most of the relevant sources that have since come to light – valiantly sought to provide it with one, he was promptly forced to retract it. While it is true that blatant material immiseration can be spotted easily, the fetishes on which the capitalist order hinges would, by definition, not fulfil their functions if they could be spotted with the naked eye. Without putting too fine a point on it, the notion of a direct reflection of reality in human perception would suggest that anybody who only meets nice Jews could never become an antisemite while anybody who meets only unpleasant Jews would be justified in being one; and it would be quite incapable of explaining what happens to people who meet both nice and unpleasant Jews, let alone how people who never meet Jews can be antisemites.

Ziege has suggested that Horkheimer and Adorno’s concept of pathic projection was inspired, not least, by J.F. Brown’s work on the topic.<sup>33</sup> This is an entirely plausible suggestion that underscores her account of the broadening of the Frankfurt School’s horizons in exile and deepens our understanding of Horkheimer and Adorno’s intellectual development in the United States. Even so, they expressly referenced Kant in their discussion of reflective and pathic projection, which is all the more remarkable, given that Kant is subjected to harsh criticism earlier on in *Dialectic of Enlightenment* (and elsewhere in their writings). In short, the epistemological

underpinning of the ‘Elements’ is fundamentally rooted in the legacy of German Idealism, which is surely remarkable for a Marxist project.

Reading the ‘Elements’, or Adorno’s contribution to *The Authoritarian Personality*, many readers are likely to be surprised by how strongly many of Horkheimer and Adorno’s observations still resonate, given that these texts were written some 70 years ago. Even so, as they age, it is inevitable that productive appropriations of the texts that view them as more than simply historical will hinge less on their phenomenological observations and more on their conceptual and epistemological underpinnings. Much recent research on the Frankfurt School’s grappling with antisemitism while in exile has focused especially on the intricate nexus between their philosophical reflections, on the one hand, and the major empirical research projects undertaken under their auspices, on the other. This line of inquiry has been immensely rewarding. Ziege’s endeavour, in particular, to establish long-term continuities and discontinuities between their empirical research projects ranging from the final years of the Weimar Republic to the post-war *Group Experiment* back in Germany, understood as a long line of ‘pilot studies’, has added enormous depth to the debate. Yet this perspective also raises a number of new questions that point in the direction of a more thorough exploration of the epistemology of the Frankfurt School’s grappling with antisemitism.

Horkheimer and Adorno’s model of pathic projection also has important implications for possible anti-antisemitic strategies. As Adorno pointed out very clearly in his contribution to the *The Authoritarian Personality*,

There is no simple gap between experience and stereotypy. Stereotypy ... feeds on deep-lying unconscious sources, the distortions which occur are not to be corrected merely by taking a *real* look. Rather, experience itself is predetermined by stereotypy. The persons whose interviews on minority issues have just been discussed share one decisive trait. Even if brought together with

minority group members as different from the stereotype as possible, they will perceive them through the glasses of stereotypy ... Optimism with regard to the hygienic effects of personal contacts should be discarded. One cannot 'correct' stereotypy by experience; he has to reconstitute the capacity for having experiences in order to prevent the growth of ideas which are malignant in the most literal, clinical sense.<sup>34</sup>

Indeed, Adorno suggested, one needs to think very carefully as to how antisemites could be addressed at all in ways that are not ultimately counter-productive. 'As soon as the existence of a "Jewish problem" is admitted', he wrote, 'anti-Semitism has won its first surreptitious victory'.<sup>35</sup> To the extent that current anti-Zionism is, *de facto*, for the most part antisemitic, these are considerations well worth taking seriously in attempts to combat anti-Zionism and the BDS campaign.<sup>36</sup>

Implicitly, the distinction between reflective and pathic projection also underpins Moishe Postone's 'Anti-Semitism and National Socialism', which has been (and continues to be) the foundational text for some of the most productive critical conceptualizations of antisemitism in the tradition of the Frankfurt School since the late 1970s.<sup>37</sup> Postone characterized antisemitism as a fetish based on the assumption that those aspects of capitalism perceived of as being negative and alienating are not innate to capitalism but extraneous to it, and that they represent a contamination of what would otherwise be a wholly benign form of capitalism, a contamination brought about by the Jews. Postone thus built on Horkheimer and Adorno's discussion of the conventional juxtaposition of productive and exploitative capital and fleshed it out, mapping it on to those between perceptions of use- and commodity-value, and between aspects of capitalism experienced as concrete and abstract. Postone interpreted the Shoah as the ultimate rebellion against the tyranny of abstraction and commodity-value. Unmasked as the personification of this tyranny, the Jews were first dispossessed of anything of use-value – from

their possessions to their hair – and then, having been reduced to 'shadows, ciphers, numbered abstractions', annihilated.<sup>38</sup> One might add that many had their gold teeth removed even after that.

Another ultimately epistemological issue raised by Postone and Brick concerns the locus of critique within Horkheimer and Adorno's reckoning with state capitalism and instrumental reason. 'The disjunction of concept and reality' that forms the (potential) locus of subversion in Horkheimer and Adorno's conceptualization of post-liberal capitalism, Postone and Brick argue, 'hovers mysteriously above its object'. It fails, in other words, to identify a 'self-generating "non-identity" intrinsic' to capitalism's 'forms of social relations that do not constitute a stable, unitary whole'.<sup>39</sup> Closely related is the problematic of individual responsibility for sentiments characterized as flowing from necessary false consciousness or socially pervasive fetishes.

I suspect that these questions could be approached in a rather more differentiated and productive manner by integrating psychoanalytic concepts more fully into the argument. Critical theory's appropriation of psychoanalysis doubtless played a critical role in facilitating its originality yet, as Ziege, among others, has pointed out,<sup>40</sup> this appropriation was patchy and uneven. We have yet to benefit fully from the promise that lay in the integration of Marxism and psychoanalysis. Presumably, psychoanalytic concepts could play a crucial role in explaining how antisemitism, as a projection, represents a form of displacement that springs from the complex web of social relations in which antisemites see themselves embroiled without being causally connected to actual social relations between Jews and non-Jews.

- 20 'Elements of Antisemitism' is in fact followed by roughly 50 pages of notes and drafts but it is the final 'finished' section of *Dialectic of Enlightenment*.
- 21 For more details on the text's evolution and authorship, see Gunzelin Schmid Noerr's epilogue in Max Horkheimer, *Gesammelte Schriften* vol. 5, 423–52.
- 22 Max Horkheimer and Theodor W. Adorno, 'Dialektik der Aufklärung', in Max Horkheimer, *Gesammelte Schriften* vol. 5, 16–238, here 23. Subsequent references to this text will be indicated by page numbers in brackets in the main text.
- 23 This would seem to prefigure their critique of the ticket mentality in the subsequently added seventh thesis.
- 24 Edmund Jephcott, in his translation, has suggested that it was not the Jews but the sphere of circulation that had long been the target of hatred. However, given that the form of the relevant verb is plural [*ertrugen*], it can only refer to the Jews (see Rolf Tiedemann (ed.), Theodor Adorno, *Can One Live after Auschwitz?* [Stanford: Stanford University Press, 2003], 397).
- 25 See Lars Fischer, 'Antisemitism', in Matthew Jafferis (ed.), *Ashgate Research Companion to Imperial Germany* (Farnham: Ashgate, 2015), 143–58, here 143–5.

- 26 There are resonances here of the Augustinian paradigm, i.e., the notion that the survival of the Jews was ordained by god so they could serve as a deterrent, demonstrating what lay in store for those who refused to follow Christ.
- 27 See Gerhard Scheit, *Quälbarer Leib* (Freiburg/Breisgau: ça ira, 2011), 28.
- 28 The term idiosyncrasy does not exist in the German language with the more common meaning it has in English. What Horkheimer and Adorno had in mind is evident from, for example, the following entry in *Brockhaus' Konversations-Lexikon* from 1894: '*Idiosynkrasie* (gr.), a peculiar sensitivity of the organism that hinges not on the strength but the kind of the stimulus. Those affected by experience stimuli differently from those who are healthy. They experience smells that the healthy find repulsive – the smell, say, of burnt feathers or a smouldering wick – as pleasant yet, conversely, find pleasant scents unbearable. Idiosyncrasies affect other senses too (e.g., taste). Some people's deviant behaviour towards certain dishes and beverages also belongs into this context; some people, for instance, regularly break out in hives when they eat strawberries, crayfish or the like' (*Brockhaus' Konversations-Lexikon* vol. 9 [Leipzig: Brockhaus, 1894], p. 512).
- 29 Jean-Paul Sartre, *Anti-Semite and Jew* (New York: Schocken, 1995), 13.
- 30 On this point, see also Ziege, *Antisemitismus*, 121–2.
- 31 For 'executioner', Horkheimer and Adorno used the antiquated term *Nachrichter* (the more common term would have been *Scharfrichter*). Its first syllable reinforced the sense of a temporal gap between the passing of the sentence and its execution (*nach* = after). At the time, it also had the additional connotation of (military) 'messenger'.

# Race and the Politics of Recognition

Christopher Chen

## **INTRODUCTION: THE RECOGNITION PARADIGM AND ITS CRITICS**

What Canadian political philosopher Charles Taylor has called a ‘politics of recognition’ (1994: 70) continues to shape our understanding of contemporary social movements organized around race, indigeneity, religion, gender, and sexuality. Offering an interpretive framework for understanding political demands for group-differentiated rights, protections, and political representation, the ‘politics of recognition’ is increasingly as contested as it is influential. A theory of both social justice and social harm elaborated by avowed inheritors of Frankfurt School critical theory, this theory long ago gave rise to a portable ‘recognition paradigm’ (Fraser, 2003: 13), in feminist critical theorist Nancy Fraser’s words, that cuts across disciplines. From the US civil rights movement to campaigns for indigenous sovereignty, this paradigm understands these movements as seeking public recognition of identity-based

oppression, historical injustice, and group cultural particularity.

This chapter will provide an overview of key debates in the reception history of contemporary theories of recognition when applied to questions of racial politics. In doing so it argues that those theories were marked as much by a ‘cultural turn’ (Chaney, 1994) in humanities and social science scholarship from the 1970s onward as by the institutionalization of postwar US and Canadian social movements that underwrote that turn. One consequence of those joint theoretical and activist origins is that the emergence of the recognition paradigm in the 1990s has come to frame racial injustice primarily in terms of cultural misrecognition. This move, which has drawn ongoing criticism from across the political spectrum, has fundamentally helped to redefine race as group culture. Subsequent critiques of the recognition paradigm reveal an underlying conceptual tension between antiracist political strategies premised upon the affirmation of racial identity on the one

hand, or upon what could be described as the abolition of the racial order on the other.

Recent scholarship on antiblack racism, settler colonialism, and what critic Jodi Melamed and others have called 'neoliberal multiculturalism' (Melamed, 2006) has mounted powerful critiques of some of the key premises of the politics of recognition. Critics of the recognition paradigm contend that it is not merely a neutral description of contemporary social movements. Instead, they argue, the paradigm also functions as a normative framework that can be both internally and externally imposed upon social movements in order to dismiss anti-systemic demands, legitimize institutional and state authority, and narrow the terrain of political contestation.

These emergent critiques have tended to avoid a generalizable conception of either race or racism (Paul Taylor, 2013). For some black studies scholars, race is too broad a concept to capture the specificity of antiblack racism (Sexton, 2008; Wilderson, 2010). For others, race is inappropriate for understanding indigenous groups who are not racially excluded national minorities but sovereign nations forcibly subjugated by settler states (Simpson, 2014). Against this turn away from race as a comparative concept, this chapter will nevertheless retain a more expansive understanding of racial injustice and oppression as integral components of a European colonial enterprise that invented *both* black *and* indigenous racial categories as part of an evolving system of social classification, coercion, dispossession, and population management.

Afropessimist, Indigenous Studies, and Marxist theorists' subsequent attempts to move beyond recognitive politics reveal an underlying conceptual tension between anti-racist political strategies premised upon the affirmation of racial identity on the one hand, or upon what could be characterized as the abolition of the racial order on the other. This affirmation/abolition bind is subsequently narrated through a Fanonian deformed

dialectic of racial nonrecognition, indigenous refusals of settler state authority, or the racially differentiating effects of maldistribution and state-sanctioned expropriation.

## THE CONCEPT OF RECOGNITION: FROM LIBERAL RIGHTS TO CULTURAL IDENTITIES

For Charles Taylor, one of the most distinctive features of recent social movements in the United States and Canada is their demand for the affirmation of marginalized group identities subject to pervasive misrepresentation and devaluation:

[O]ur identity is partly shaped by recognition or its absence, often by the misrecognition of others, and so a person or group of people can suffer real damage, real distortion, if the people or society around them mirror back to them a confining or demeaning or contemptible picture of themselves. Nonrecognition or misrecognition can inflict harm, can be a form of oppression, imprisoning someone in a false, distorted, and reduced mode of being. (1994: 25)

Driven by a need for psychological self-realization that Taylor calls an 'ethics of authenticity' (2008), subjects seeking recognition wish to have deep psychic features of their lived experience affirmed. At the same, third generation Frankfurt School theorist Axel Honneth has emphasized that the lived experience of misrecognition represents a basic form of moral injury (Honneth, 1995). For Taylor, the expression or realization of a sense of authentic selfhood is not a fundamentally isolated process. It is an inevitably dialogical moral ideal, one formed in the context of communal bonds and identity-based social marginalization. Recognition, in Taylor's eyes, names the interplay between psychological self-definition and political demands for institutional and electoral representation. Thus the concept of recognition is, for Taylor, not premised upon models of individual self-interested rational actors that

remain the normative subjects of contemporary liberal political theory.

For Taylor, Honneth, and Fraser, a political theory of recognition offered a conceptual vocabulary to register contemporary social movements' turn away from an older political idiom of class struggle and economic exploitation and toward a concern for identity, difference, and cultural misrepresentation. Grounded in intersubjective theories of identity formation and institutionalized political rights in the work of G.W.F. Hegel, specifically the 'Lord and Bondsman' chapter in the *The Phenomenology of Spirit* and the later *Elements of the Philosophy of Right*, Taylor's and Honneth's theorization of recognition understand political conflict fundamentally in terms of how individuals and groups are accorded or denied respect, esteem, and civic representation (Thompson, 2006). This initial Hegelian elaboration of a politics of recognition as a dialogical process was balanced against a neo-Kantian intellectual tradition organized around cultivation and protection of individual autonomy.

Fraser's writing, in particular, has maintained a distance from the Hegelian tradition that Taylor and Honneth draw upon, and has subjected the recognition paradigm to significant ongoing reconfiguration. Because the initial framing of recognition largely excluded questions of political economy, Fraser has suggested that attention to relations of recognition must always also involve attention to a variety of economic demands that she broadly labels as 'redistributive' (Fraser, 1995; Fraser and Honneth, 2003). Though the distinction is de-emphasized in later work, Fraser has further distinguished between 'affirmative' and 'transformative' remedies for cultural misrecognition and the maldistribution of material resources:

By affirmative remedies for injustice I mean remedies aimed at correcting inequitable outcomes of social arrangements without disturbing the underlying framework that generates them. By transformative remedies, in contrast, I mean remedies aimed at correcting inequitable outcomes precisely

by restructuring the underlying generative framework. The nub of the contrast is end-state outcomes versus the processes that produce them. It is *not* gradual versus apocalyptic change. (Fraser, 1995: 82)

Fraser associates 'affirmative' measures to rectify misrecognition with mainstream multiculturalism and a politics of identity grounded in the celebration and preservation of group culture, traditions, and heritage. For Fraser, 'transformative' approaches to the problem of misrecognition on the other hand tend to destabilize group boundaries and alter the entire distribution of identities within a social field – a process the theorist characterizes as deconstructive in this 1995 article: 'Whereas affirmative recognition remedies tend to promote existing group differentiations', she argues, 'transformative recognition remedies tend, in the long run, to destabilize them so as to make room for future regroupments' (1995: 84).

For all three theorists, institutionalized patterns of misrecognition or, in Fraser's case, the lack of participatory parity in decision-making processes, come to define the specificity of racial injustice. For both supporters and critics of this theoretical framework, institutionalized 'rules of recognition', in James Tully's trenchant formulation (2000: 472), refer to an overarching deliberative process of negotiated inclusion within culturally diverse democratic societies. Such remedial action goes beyond enforcement of antidiscrimination measures to include group-differentiated positive accommodations for Sikh police officers wishing to wear turbans for example, or for indigenous self-government and power-sharing arrangements. For Taylor, the often unacknowledged ethnocentric character of appeals to common humanity and a homogeneous national culture overwrite the cultural particularity of subordinated populations and call for the acknowledgment of cultural difference as a political corrective.

As a theory of justice deeply informed by the impact and history of multicultural policies, the recognition paradigm has faced

criticism for its rejection of ‘common humanity’ (Rorty, 2000: 8); for its laundering or dissimulation of histories of racial domination through a depoliticized rhetoric of cultural diversity (San Juan Jr., 2002, 2007; Lentin and Tittley, 2011); and for its relative neglect of the role of capitalist market dynamics in both sustaining racist ideology and reproducing racial inequality over time (Bannerji, 2000; Darder and Torres, 2004). Finally, critics of the recognition paradigm have also persistently warned of the disciplinary function of institutional recognition which, like liberal rights discourse (Brown, 1995), could be said to construct manageable political subjects, rather than simply affirming or protecting preexisting ones (Markell, 2003; McNay, 2008). As a result, some theorists of recognition have argued for more sharply distinguishing between the politics of identity and the politics of recognition (Thompson and Yar, 2011).

## RECOGNITION, RACE, AND IDENTITY

The recognition paradigm identifies core features of what has come to be known as contemporary ‘identity politics’ (Alcoff, 2006). Yet the widespread association of theories of political recognition with politicized identities illuminates the ambiguous nature of identity itself as an object of recognition and misrecognition (Gleason, 1983; Bernstein, 2005; Brubaker, 2006; Jenkins 2014). The term ‘identity politics’ emerged from black socialist feminist critiques of the patriarchal character of black nationalism and the white middle-class norms structuring second-wave feminism (Springer, 2005). Today, however, ‘identity politics’ is typically contrasted with a politics of class. As such, it typically doubles as a normative judgment of a range of new social movements organized around racial, sexual, and gender oppression. Todd Gitlin (1996) and Arthur Schlesinger (1998), in particular, have

offered influential declensionist narratives of how identity-based political movements contributed to the fragmentation of the US ‘New Left’ beginning in the 1960s (Gosse, 2007).

The theorists who populate this chapter read the politics of recognition as symptomatic of both the theoretical and historical limits of dominant conceptions of racial justice as form of so-called ‘identity politics’. Taking identity as a basic unit of analysis for contemporary antiracist political movements has often obscured as much as it has brought to light. Doing so often conceals an underlying conceptual tension between political demands for the *assertion* of racial identity, on the one hand, and for the *denaturalization* or *dismantling* of these identities on the other. As Nancy Fraser reminds us, calls to either affirm racial difference or eliminate racial inequality are political ideals, premised upon visions of group differentiation or de-differentiation, that can often come into conflict with each other (Fraser, 1997b).

Critics typically trace the genealogy of the term ‘identity politics’ back to a 1977 statement by the Combahee River Collective, a Boston-based black feminist group (Springer, 2005). The meaning of identity advanced in the Combahee statement is embedded, however, within a simultaneously socialist, feminist, and antiracist politics that can be read as a precursor to later theories of intersectionality (Hancock, 2016). In contemporary scholarship and popular usage, ‘identity politics’ is typically a pejorative term distinguished from an ‘Old Left’ socialist or social democratic labor politics (Gitlin, 1997; Kelley, 1997; Bernstein, 2005). Assessing the historical limits of the affirmation of working class identity as anticapitalist political strategy has led some contemporary Marxist theorists to characterize this older labor movement politics as *itself* structured and constrained by a peculiar logic of identity, however (Postone, 1996; Tamas, 2005, *Endnotes*, 2015). As Moishe Postone has argued in terms that paradoxically echo Marxist critiques of contemporary identity-based social

movements, attempts to define the systemic features of capitalist societies are not reducible to a 'social critique from the standpoint of "labor", ... a critique from a quasi-natural point of view, that of a social ontology' (Postone, 1996: 65).

Like the concept of racial difference (Gates, 1999) with which it is often paired, racial identity invokes a range of sometimes contradictory meanings in scholarly and popular discourse. These range from cultural heritage and epistemic standpoint to systems of biological classification and histories of resistance to racism and racial inequality. Race has come to signify both the existential particularity of lived experience and social boundaries that vary considerably over space and time (Goldberg, 2009; Wimmer, 2013; Wolfe, 2016). Political theorists like Barbara and Karen Fields (2012), along with Robert Miles (Miles and Brown, 2003), have noted how the concept of race is the consequence rather than cause of racism. '*Racism* is first and foremost a social practice, which means that it is an action and a rationale for action, or both at once', the Fields contend:

*Racism* always takes for granted the objective reality of *race*, as just defined, so it is important to register their distinctness. The shorthand transforms racism, something an aggressor *does*, into *race*, something the target is, in a sleight of hand that is easy to miss. (Fields and Fields, 2012: 17)

The Fields have controversially argued for the abandonment of race as an explanatory category for political analysis and embraced what can be characterized as racial eliminativism (Appiah, 1985; Zack, 2002). We need not follow them down that path, however, to note how their work draws attention to the ways characteristics imputed to racialized populations, whether positive or negative, come to justify racism and racial inequality. Despite the conclusions the Fields draw from this latter insight, the slipperiness of race as a political signifier means that populations have invoked racial identity precisely in order to challenge racism and indicate

interpellation by 'something an aggressor does' (Fields and Fields, 2012: 17). Nevertheless, in arguing that racial difference does not explain social phenomena but is itself in need of explanation, the Fields have helped to initiate a crucial Copernican turn from race to racism as the object of analysis for antiracist critique.

This raises the question, however, of whether the concept of racism itself adequately describes the sources of racial domination and structured inequality beyond seemingly arbitrary attitudinal prejudices and false beliefs akin to 'witchcraft' (Fields and Fields, 2012: 193). As the Fields themselves point out, racial categories reveal an ensemble of social processes that racially order and segment populations within emergent capitalist social relations (111–48). In this sense their scholarship pushes up against the methodological limits of the concept of racism as ultimately reducible to a form of ideological mystification 'that disguised class inequality and, by the same stroke, impoverished Americans' public language for addressing inequality' (111). 'Probably a majority of American historians think of slavery in the United States as primarily a system of race relations', Barbara Fields famously points out, 'as though the chief business of slavery were the production of white supremacy rather than the production of cotton, sugar, rice, and tobacco' (Fields, 1990: 95–118). Here defining race and racism as ideological, and black chattel slavery through a language of business, positions racism and racial divisions as an epiphenomenal and highly contingent expression of a more historically durable underlying logic of capitalist exploitation. Configuring the relationship between race and capitalism in this manner echoes the opposition between culture and political economy that fundamentally structures the recognition paradigm (Butler, 1997; Fraser, 1997a). The epiphenomenalist account of race offered by the Fields has been a source of ongoing debate within Marxist theory (Reed, 2002; Wood, 2002) as well as contemporary

scholarship on what Cedric Robinson has called 'racial capitalism' (Robinson, 1983) and the political economy of racial domination (Davis, 1983; James, 1992; Du Bois, 2007; Boyce Davies, 2008; Gore et al., 2009; Boggs, 2011; Gore, 2011; Rodney, 2012; Williams, 2014).

## DEFINING RACE/ETHNICITY

Anthropologist Franz Boas's critique of nineteenth-century scientific racism and turn to group culture (Kuper, 2003; Baker, 2010) has continued to inform contemporary definitional debates over the theoretical status of the concept of race, and the relationship between race and ethnicity (Appiah, 1985; Outlaw, 1992; Gooding-Williams, 1996; Hannaford, 1996; Gracia, 2007; Wimmer, 2013; Chandler, 2014; Omi and Winant, 2015). The language of group culture was offered as an alternative to discredited though nevertheless persistent beliefs in inherent racial differences in intelligence, ability, and civilizational achievement. Philosopher Horace Kallen and Chicago sociologist Robert E. Park were instrumental in subsequently developing influential early-20th century accounts of ethnic assimilation and cultural pluralism that took European immigrants to the United States as a primary point of reference. Sociologists Michael Omi and Howard Winant have argued that the work of Kallen and Park consolidated an 'ethnicity paradigm' (Omi and Winant 2015, 21–52) that, despite being taken up by subsequent midcentury scholars like Gunnar Myrdal as the general framework for understanding US racial politics, ignored the specificity of racial group formation. For Omi and Winant, race is irreducible to these early and mid-20th century theories of ethnicity.

Despite slippages in the popular usage of these terms, contemporary critics have generally distinguished between the ascriptive, imposed character of racial difference and

the comparatively more voluntary forms of cultural assertion and belonging associated with ethnicity (Cornell and Hartmann, 2007; Gracia, 2007). Debates continue over whether race can be considered a subcategory of ethnicity or whether these terms represent fundamentally distinct forms of social categorization and political group formation (Bonilla-Silva, 1999; Banton, 2002; Cornell and Hartmann, 2007; Baker, 2010; Wimmer, 2013; Emirbayer and Desmond, 2015; Omi and Winant, 2015). For Stephen Cornell and Douglas Hartmann, for example, race is an intrinsically hierarchical concept, while ethnicity may or may not be (Cornell and Hartmann, 2007). The fundamental distinction between imposed and asserted forms of collective belonging that marks the difference between race and ethnic identity for many theorists is not absolute, however – as racial categories can become ethnicized over time, and ethnic groups can become biologized through shifting theories of racial bloodlines (Kauanui, 2008).

## ORGANIZING DIFFERENCE: RECOGNITION AND MULTICULTURAL STATE POLICY

As the title of Taylor's influential 1992 essay 'The Politics of Recognition' makes clear, the rise of liberal and literary multiculturalism remains a crucial inspiration for theorizing recognition as a key component of racial injustice and its potential remedies in specifically cultural terms. Taylor's essay developed that theory within the context of Canadian multiculturalism as state policy and offered a broad comparative framework for understanding the emergence of multicultural societies across the Global North.

For Taylor, institutions and states need not choose between acknowledging group cultural differences and upholding commitments to difference-blind formal equality. Taylor calls these two primary aims of recognition a

'politics of difference' (1994: 38) and a 'politics of equal dignity' (1994: 38) respectively. Taylor's initial distinction between equal protection and group-differentiated rights immediately provoked debates over whether these rights are fundamentally compatible with liberal principles designed to protect individual autonomy (Taylor, 1994; Benhabib, 2002).

As perhaps one of the most influential theorists of multicultural state policy, Will Kymlicka has pointed out that multicultural state policies are ultimately rooted in 'the increasing recognition of minority rights whether in the form of land claims and treaty rights for indigenous peoples; strengthened language rights and regional autonomy for substate national minorities; and accommodation rights for immigrant-origin ethnic groups':

[T]hese 'multiculturalism policies'...go beyond the protection of the basic civil and political rights guaranteed to all individuals in a liberal-democratic state to also extend some level of public recognition and support for minorities to express their distinct identities and practices. The rise of MCPs therefore goes beyond the broader politics of civil rights and nondiscrimination. 2013: (101)

This combination of political representation and accommodation 'gave organized ethnic groups a seat at the table of public decision making while also giving states a means to shape and discipline those groups to ensure their compliance with overarching state needs for social peace and effective state regulation of economic and political life' (Kymlicka, 2013: 102). For both Kymlicka and Taylor, in short, recognition provides a means by which to harmonize basic individual citizenship rights with demands to protect group sovereignty, cultural autonomy, and political self-determination (Kymlicka, 1996: 2013).

Tracing the origins of US multicultural policy initiatives to educational reform efforts in the 1970s and 1990s, Avery Gordon and Christopher Newfield have noted a similar moderation of earlier antiracist political demands through the institutional translation

of race into culture. '[M]ulticulturalism often avoided race', Newfield and Gordon contend, 'It designated cultures. It didn't talk up racism':

It didn't seem very antiracist, and often left the impression that any discussion of cultural diversity would render racism insignificant. It was ambiguous about the inheritance and the ongoing presence of histories of oppression. It had the air of pleading for a clean start. It allowed 'culture's' aura of free play to attribute a creative power to racial groups that lacked political and economic power. (1997: 3)

A small body of secondary literature has also emerged to situate this turn to culture in educational policy within an era of deepening austerity and state withdrawal from public services, and in particular within a history of the institutionalization of earlier civil rights and black power movement demands (Reed, 1999; Roelofs, 2003; Johnson, 2007; Karen Ferguson, 2013; Dawson, 2015; INCITE!, 2017).

For Alana Lentin and Gavan Titley, multicultural state policies across Europe (Gunew, 2010) have similarly reconstituted race as cultural difference. They, too, view culture as 'a site in which the politics of race can be legitimized and laundered' (2011: 24). For Lentin and Titley, limiting the political demands of racially marginalized populations to the preservation and toleration of group cultural difference has blunted the force of antiracist critique:

For anti-racist critiques of racialized structures and patterns of power and privilege; for 'critical multiculturalist' takes on the patrician Eurocentrism of relations of recognition and tolerance; for activists protesting against the depoliticizing and culturalizing of racial injustice and inequality; for feminists, LGBT activists, youth workers and the secular left protesting against the 'micro-colonialism' of essentialized community leaders and structures of patronage: multiculturalism has, at best, provided attenuated pathways for organization and mobilization, provided the ambivalent political capital of 'recognition', and directed sporadic attention to the historical and political-economic conditions of social inequality. More often it has been seen as a

mode of management and control, securing the legitimacy of the status quo through a deflection of questions of power and inequality into the relatively more malleable economy of cultural recognition. (2011: 14–15)

Contra the Fields, however, in light of the failure of multiculturalism to deliver racial justice in Europe and the UK, Lentin and Titley propose that we recover ‘the analytical and oppositional possibilities of race as a political category in the contemporary moment’ (24).

Political theorist Denise Ferreira da Silva has similarly argued that the contemporary catachrestic substitution of culture for race, part of the legacy of Boasian cultural anthropology, offers a form of ‘moral relief’ (Da Silva, 2007: xxxii) that has allowed critics to avoid confronting global histories of racial domination. ‘[W]riting of racial difference as a signifier of cultural difference’, Da Silva contends, ‘hampers our understanding of how the racial operates as a modern political-symbolic weapon’ (133) while at the same time rendering culture ‘the obvious basis for framing demands for global justice and for punishing the global subaltern as well’ (xix). For Da Silva, the transformation of an earlier specifically national antiracist political subject into a subject of cultural difference constitutes a ‘doomed strategy of emancipation’ (xxxiii). While proper subjects of recognition are produced, the turn to culture continues to represent non-Europeans as ethnographic objects entirely governed by external natural laws ‘in a global space and under an epistemological arrangement already mapped by the racial’ (139). ‘[T]he cultural still authorizes (re)writings of the others of Europe’, Da Silva continues, ‘but now as incarcerated subjects of cultural difference’ (xxxv).

## OFFICIAL ANTIRACISMS AND THE US POSTWAR LIBERAL WELFARE STATE

The politics of recognition has often short-changed such oppositional possibilities,

however. A number of contemporary critics have registered how the neoliberal, workfare-warfare state has become increasingly unresponsive to reformation through a liberal politics of recognition (Melamed, 2011; Reddy, 2011; Roderick Ferguson, 2012). For these theorists and their cohort, limited postwar reforms and a series of regimes of ‘official antiracism’ (Melamed, 2006: 2) in the United States have emerged to redirect the anti-systemic demands of 60s-era antiracist movements from liberal ideals of formal equality to a rhetoric of neoliberal cultural development, representation, and uplift (Yúdice, 2003; Comaroff and Comaroff 2009). Other scholars have situated the rise of liberal multicultural policy in the United States within an overarching narrative of the institutionalization and depoliticization of 60s-era ethnic nationalist, antiracist, women of color feminist, and queer of color social movements (Roderick Ferguson, 2004, 2012; Melamed, 2011).

Jodi Melamed offers one of the most persuasive accounts of how these developments are best seen in terms of what the critic calls ‘neoliberal multiculturalism’ (Melamed, 2006: 2). For Melamed, ‘neoliberal multiculturalism’ represents the culmination of a decades-long project of domesticating the contentious politics of postwar social movements by displacing antiracist political action onto the terrain of elite electoral and cultural representation. This redirection of the energies of postwar social movements represents a concerted counterinsurgency strategy that, in her view, has abandoned progressive redistributive or transformative economic measures. Representing market freedoms as the key to racial progress and a condition of continued political representation, Melamed argues, has subsequently made the simultaneity of anticapitalist and antiracist politics unthinkable.

Melamed’s analysis of neoliberal multiculturalism explicitly counters this disarticulation of racial and economic injustice. Instead, she rethinks US state formation in relation to

successive regimes of 'official antiracism' in the postwar era that supplied moral justifications for US global hegemony. Building on Omi and Winant's influential thesis of a post-World War II 'racial break' (Winant, 2001) that marked the formal end of explicit *de jure* white supremacist state policy across much of the globe, Melamed's analysis moves through three successive periods of official antiracism: racial liberalism; liberal multiculturalism; and neoliberal multiculturalism.

In Melamed's account, the phase of racial liberalism (mid 1940s–1960s) sought to create full integration of African Americans. The economic success of African Americans would, per the logic of this official antiracism, offer proof of US exceptionalism. It would do so, moreover, while naturalizing equal opportunity within capitalist markets as the horizon of civil rights movement demands in order to consolidate the capitalist state. Liberal multiculturalism (1960s–90s), in contrast, turned to culture in order to aestheticize the legacy of earlier antiracist movements and offer up a weak cultural pluralism as evidence of the perfectibility and exceptionalism of US national identity. As Melamed trenchantly puts it:

Pluralism as the horizon for thinking on race matters restricted permissible antiracism to forms that assented to US nationalism and normal politics and prioritized individual and property rights over collective social goals. It reduced culture to aesthetics and then overvalored aesthetic culture all by itself, apart from social and material forces. Thus liberal multiculturalism's stress on representation and cultural recognition screened off differential power, dematerialized conceptions of race, and marginalized antiracisms that addressed material disparities in racial outcomes. (Melamed, 2011: 34)

Finally, neoliberal multiculturalism (2000s to present) brings the cultural logic of group particularity to bear not only upon state-making practices but upon the protection of property rights and the generalization of market principles as an antiracist political project. 'In neoliberal multiculturalism matters of the economy themselves express what

is meant by freedom from the unfair restraint of racism' (Melamed, 2011: 148), the critic concludes.

Both Melamed and sociologist Roderick Ferguson (2012) have called attention to the significant role that universities in particular have played in simultaneously affirming and regulating racial representation in ways that increasingly conform to market imperatives and that often justify deepening economic inequality within and between racial groups. Unlike some contemporary Marxist theorists, however (Žižek, 1997), Melamed and Ferguson are not interested in returning to an analytically purified conception of class conflict so much as holding open a space for the elaboration of materialist antiracisms, feminisms, and queer politics.

## FANON AND NONRECOGNITION

Contemporary black studies scholars have increasingly challenged the pluralist, coalitional logic at the core of liberal multicultural state and institutional policy. Offering a comprehensive theory of antiblack racism dubbed 'Afropessimism', scholars such as Frank Wilderson and Jared Sexton have rejected a liberal multicultural imaginary 'wherein cultural diversity is managed as a depoliticized term of experience' (Sexton, 2008: 247). Both theorists also argue for the structural impossibility of attaining of recognition for black subjects. This cohort returns to the concept of race contra culture as a set of what Wilderson calls ontological positions: whiteness, blackness, and the indigenous 'Savage' (Wilderson, 2010: 23). For Wilderson, Sexton, and other Afropessimist critics, blackness is less as an affirmative ethnocultural identity than a negative social category. On this view, the sacrificial expulsion and subordination of blackness guarantees the coherence of civil society and its subjects. Framing blackness as existential abjection, non-relationality, and non-communicability

has led critic Fred Moten to offer a sympathetic though critical interrogation of Afropessimism's capacity to think the relation between antiblack racism and black subjectivity and political agency (Moten, 2013). For both Wilderson and Sexton, the severity and historical durability of antiblack racism is ultimately grounded, not in colonial domination or capitalist exploitation, but in the psychic pathology of nonblack subjects structured by what Wilderson calls the 'libidinal economy of civil society' (2010: 15). That psychic economy simultaneously conditions a history of nonblack enjoyment of and empathy toward black suffering (Hartman, 1997).

These theorists thus elaborate blackness as a structural category defined primarily through historically durable forms of antiblack racism: gratuitous violence, non-sovereignty, existential abjection, literal and metaphorical fungibility, and what sociologist Orlando Patterson has called the 'social death' (Patterson, 1985) of the slave condition. For Afropessimist theorists, the politics of nonwhite interracial coalition encoded in multicultural ideals fundamentally depend upon a form of permanent structural misrecognition of the singularity of antiblack racism. That misrecognition is enforced through spurious racial analogies that render 'equivalent slavery and other forms of oppression' (Sexton, 2008: 293). Afropessimism's critiques of indigenous studies has occasioned ongoing debates over the historical relationship between black chattel slavery and US settler colonialism (Sexton, 2014; Day, 2015; Coulthard and Simpson, 2016). At the same time, Afropessimism's ontological turn, grounded in a conception of an unchanging and originary libidinal economy of black suffering, has been the target of criticism for its anti-materialist, radically dehistoricized conception of black racialization (Dawson, 2016).

Despite breaking from a prior multicultural logic of coalition, therefore, Afropessimism's ontologization of blackness as a racial position, or perhaps *the* singular racial position,

raises the question of the historicity and internal homogeneity of the category of blackness itself. Considering blackness as a unitary ontological condition of permanent civic nonrecognition faces three broad theoretical challenges. First, the ontological turn raises the question of the relationship between antiblackness and blackness, or between an ascriptive condition and the affirmative heterogeneity of black life (Moten, 2009; Shelby, 2009). Second, accounts of the psychopathological roots of antiblackness have been challenged by scholarship on the changing articulation of black subordination within capitalist social relations (Hall, 1996) from the political economy of black chattel slavery (Oakes, 2016) to the racialization of wagelessness and contemporary surplus populations (Johnson, 2011). This scholarship has often attempted to register the impact of deepening internal economic divisions within black populations on the history of twentieth and twenty-first century black political movements (Reed, 1999; Dawson, 2001; Johnson, 2007; Dawson and Francis, 2015). Finally, treating blackness as an ontological category raises the question of racial unity, and the subsumption of other cross-cutting axes of social differentiation, that has been a persistent object of critique for contemporary black feminist critiques of black nationalism (Collins, 1998; Lubiano, 1998) and theories of intersectionality (Hancock, 2016).

The Afropessimist critique of coalition is premised upon what could be called a politics of structural nonrecognition modeled in the work of Martinican political philosopher Frantz Fanon, who in describing an encounter with a white child offers perhaps one of the most famous scenes of racial misrecognition in contemporary theory (Fanon, 2008b, 89–119). Contrary to Taylor's pastoral view (Charles Taylor, 1994: 65) of the possibility for mutual recognition in Fanon's reading of Hegel, Fanon asserts of the impossibility of mutual recognition under conditions of racial domination. In *Black Skin, White Masks*, Fanon seeks to clarify that in the master/

slave dialectic for Hegel ‘there is reciprocity’ (Fanon, 2008b: 195), but in the context of racial slavery the master does not seek recognition from the slave but rather labor:

The master scorns the consciousness of the slave. What he wants from the slave is not recognition but work. Likewise, the slave here can in no way be equated with the slave who loses himself in the object and finds the source of his liberation in his work. The black slave wants to like his master. Therefore, he is less independent than the Hegelian slave. For Hegel, the slave turns away from the master and turns toward the object. Here the slave turns toward the master and abandons the object. (195)

For Fanon, the slave is imprisoned in a kind of existential inferiority complex and is either resigned to domination or wishes to take the place of the master. Race skews the intersubjective dynamics of the Hegelian encounter between master and slave in a manner that is not simply reducible to a psychological account of misrecognition. Entombed in a predialectical ‘zone of nonbeing’ (Fanon, 2008b: xii) or ‘crushing objecthood’ (Fanon, 2008a: 82), blackness for Fanon is simultaneously a form of invisibility and hypervisibility that forecloses the possibility of mutual recognition or dialectical sublation (Gordon, 2007; Ciccariello-Maher, 2017).

Fanon’s ‘deformed dialectic’ (Sekyi-Otu, 1997: 61) disdains forms of freedom simply granted by the master rather than obtained through struggle and conflict. This process of producing self-consciousness in struggle interrupts the politics of recognition in which the black subject wants to be recognized not as black but rather as white. Fanon historicizes this desire for recognition as itself preemptively structured by racial interpellation. Through his analysis, Fanon implicates the role of colonial education in particular as producing black subjects who desire recognition as whites (Fanon, 2008b: 191–6). ‘Whereas Fanon’s work is often pigeonholed within recognition studies’, George Ciccariello-Maher observes, ‘his emphasis on the zone of nonbeing shows him

instead to have been a pioneering contributor to a powerfully different approach that might be better understood as “nonrecognition studies”’ (Ciccariello-Maher, 2017: 57).

As a core feature of what we might call a racial politics of nonrecognition, Fanon invokes the principle of ‘sociogeny’ (2008b: xv) in order to situate the subjective features of misrecognition within a matrix of social relations structured by colonial violence. Sociogeny, for Fanon, is a principle of material determination that alerts readers to the fact that the psychology of racial objectification he describes cannot be overcome without a transformation of the colonial and capitalist social conditions that ceaselessly reproduce ‘L’expérience vécue du Noir’ (Fanon, 2008a). It is here that Fanon links the disalienation of the black subject’s internalized images of inferiority to political struggles that might radically transform the social structures that serially reproduce the lived experience of race. The absence of reciprocity that defines the racial encounter thus drives the black subject away from the dialectical possibility of mutual recognition. Instead, the black subject is impelled toward a situation in which a racially disalienated self-certainty merges with political self-assertion. For Fanon, the possibility of individual self-determination will become increasingly inseparable from the dynamics of anticolonial movements of national self-determination in which racial, ethnic, and tribal conflict can sometimes play a counterrevolutionary role. ‘Indeed, if the social struggle does not become a national endeavor’, Nigel Gibson observes of Fanon’s later arguments in the 1961 *Les Damnés de la Terre*, ‘it will inevitably degenerate along the retrograde, geographic, ethnic, and racial lines refashioned or simply created under colonial rule’ (Gibson, 2003: 178).

Fanon’s later work offers an ambivalent reading of the role of culture in anticolonial movements. He warns of the colonized intellectual’s fetishistic retreat into the ‘mummified fragments’ (Fanon, 2005: 160) of static traditions, particularly where those fragments

are separated from the continual transformation of cultural tradition through active political struggles. Instead of a nostalgic politics of culture – exemplified, for Fanon, in the specific version of Negritude imagined by the poet and politician Leopold Senghor, who would support the French Union against the Algerian independence movement – Fanon imagines a culture of politics. Crucially, a Fanonian culture of politics is centered on and continually remade by anticolonial movements in the present. ‘The liberation struggle does not restore to national culture its former values and configurations. This struggle, which aims at a fundamental redistribution of relations between men, cannot leave intact either the form or substance of the people’s culture’ (Fanon, 2005: 178). Here Fanon suggests that dynamics of political contention transform both the racial form and content of culture beyond imposed colonial divisions and visions of returning to precolonial traditions. In the course of decolonization, the very centrality of culture as a terrain of political contestation is relativized:

Sooner or later, the colonized intellectual realizes that the existence of a nation is not proved by culture, but in the people’s struggle against the forces of occupation. No colonialism draws its justification from the fact that the territories it occupies are culturally nonexistent. Colonialism will never be put to shame by exhibiting unknown cultural treasures under its nose. (Fanon, 2005: 159)

## INDIGENEITY AND THE COLONIAL POLITICS OF RECOGNITION

In spite of a recurring opposition between blackness and indigeneity in Afropessimist readings of Fanon (Sexton, 2014), some of the sharpest contemporary criticism of what Glen Coulthard has called a ‘colonial politics of recognition’ (2014: 156) have been formulated by contemporary indigenous studies scholarship that has itself drawn on Fanon’s anticolonial analysis. Coulthard (2014),

Audra Simpson (2014), Joanne Barker (2011), and Patrick Wolfe (2016) all argue against the widespread assumption that dynamics of settler colonial dispossession in places such as the United States, Canada, and Australia can be safely consigned to the past.

From a Marxian perspective, political theorist Robert Nichols has emphasized how theories of primitive accumulation need to be revised in the case of indigenous territorial dispossession because settler colonialism does not inevitably lead to the proletarianization of displaced native populations (Nichols, 2015). Within settler colonial contexts, Patrick Wolfe and others have argued that the dynamics of indigenous dispossession are not structured around the need to create a dispossessed class of wage laborers but instead a genocidal ‘logic of elimination’ (Wolfe, 2006: 388):

[A] logic of elimination can include officially encouraged miscegenation, the breaking-down of native title into alienable individual freeholds, native citizenship, child abduction, religious conversion, resocialization in total institutions such as missions or boarding schools, and a whole range of cognate biocultural assimilations. All these strategies, including frontier homicide, are characteristic of settler colonialism. (388)

Coulthard similarly points out that the axis of political contestation for indigenous populations is not centered on wage labor. It is instead situated on struggles over land, natural resources, and the ecological requirements of capitalist development.

Moreover, as Wolfe has argued, settler colonial ‘invasion is a structure not an event’ (Wolfe, 2006: 388) that signals the persistence and historical evolution of forms of extraeconomic coercion that come to define Marxist accounts of primitive accumulation. For this new generation of theorists of settler colonialism, contemporary settler states have come to replace direct strategies of territorial expropriation, displacement, and forced assimilation with what could be described as governance through juridical recognition. Similarly, political ideals of cultural

autonomy, self-determination, and territorial sovereignty are for these critics better realized through a range of alternative political strategies of refusal (Simpson, 2014), political confrontation, and practices of ‘cultural self-recognition’ (Coulthard, 2014: 23) beyond the reach of settler state regulation, though not necessarily beyond the reach of capital (Eisenberg and Kymlicka, 2011).

Recent books by Barker and Simpson focus on the impossibility of reciprocity that structures Native/settler relations of recognition. The impossibility of mutual recognition is acutely revealed in the construction of Native ancestry rules governing ‘blood-quantum’ as institutionalized criteria for tribal membership. Such rules make blood govern resource and land claims, and encase contested and changing Native lifeworlds in oppressive ‘racialized notions of biological-as-cultural authenticity’ (Barker, 2011: 20). For Barker, a politics of recognition within the United States imposes a normative, depoliticized vision of Native cultural identity, one both evacuated of political contestation and frozen in time. ‘[T]he discursive work of Native legal status and rights in US politics has made Native rights contingent on a particular kind of Native’, Barker observes, ‘a Native in or of an authentic culture and identity’ (Barker, 2011: 223).

Explaining why “Recognition” in either a cognitive or juridical sense is impossible’ (Simpson, 2014: 23), Simpson instead elaborates a strategy of refusing state recognition of Native sovereignty and group culture. Instead, Simpson conceives of structurally antagonistic relations between sovereign indigenous nations and settler states. For Simpson this interruptive strategy of refusal, illuminated by her study of the practices of the Mohawks of Kahnawà:ke, is predicated upon the understanding of the ‘deep impossibility of representation and consent within governance systems that are predicated upon dispossession and disavowal of the political histories that govern the populations now found within state regimes’ (2014: 18).

Finally, for Coulthard, any possibility of indigenous self-determination emerges through ongoing struggles against settler colonialism rather than negotiated representation in state institutions. In Coulthard’s account, current Canadian recognition protocols are the outcome of the anticolonial struggles of the 1970s. Those protocols, however, merely enabled the state to change from an entity that reproduced itself primarily through the apparatus of ‘genocidal exclusion/assimilation’ to one of ‘recognition and accommodation’ (Coulthard, 2014: 6). In Coulthard’s analysis – as well as those of Nichols, Wolfe, Barker, and Simpson – the settler colonial state in critical indigeneity studies cannot function as the facilitator of multiculturalism imagined by Charles Taylor. Instead, the contemporary recognition paradigm, and the Hegelian master/slave dialectic which it utilizes, breaks down in the face of colonial domination in which ‘there is no mutual dependency in terms of a need or desire for recognition’ (Coulthard, 2014: 40):

In these contexts, the ‘master’ – that is, the colonial state and state society – does not require recognition from the previously self-determining communities upon which its territorial, economic, and social infrastructure is constituted. What it needs is land, labor, and resources. Thus, rather than leading to a condition of reciprocity, the dialectic breaks down either with the explicit *non*-recognition of the equal status of the colonized population; or with the strategic ‘domestication’ of the terms of recognition leaving the foundation of the colonial relationship relatively undisturbed. (Coulthard, 2014: 40)

## RECOGNITION, REDISTRIBUTION, AND THE RACE/CLASS PROBLEMATIC

While variously critiqued by theorists of settler-colonialism, Afropessimism, and multiculturalism, the turn to understanding racial injustice in primarily cultural terms nonetheless introduced a sharp division between race and political economy. Seemingly intractable

since the 1960s, that division continues to structure debates over the opposition between 'identity' and class politics. Nancy Fraser herself has articulated a powerful challenge to the recognition paradigm's inability to account for the relation between cultural misrecognition and economic inequality (Fraser, 2000, 2003). For Fraser, any normative theory of justice must attend not only to distorted relations of recognition, but also to the redistribution of material resources and opportunities.

Rather than arguing for either recognition or redistribution, Fraser instead advocates for what she calls a 'perspectival dualism' (2009: 84). Such a view equally attends to each dimension of social inequality while acknowledging the inseparability of axes of cultural, status, and class differentiation. For Fraser, the twin poles of recognition and redistribution are irreducible to one another. Instead, together they map a spectrum of social movement demands centered on economic inequality and exploitation, on the one hand, and what she calls 'parity of participation' on the other (Fraser, 2000: 115).

Fraser's elaboration of a more expansive recognition/redistribution paradigm immediately highlights a contradiction for antiracist movements. The institutional affirmation of group difference, on this view, seem to be at odds with redistributive measures precisely aimed to reduce or eliminate group-differentiated inequality. Because there is no intrinsic or necessary relation between the former and the latter, as Fraser has noted, recognitive politics can come to supplant or be pitted against redistributive demands, and vice-versa. Further, antiracist redistributive demands aimed at eliminating racialized economic inequality confront two interrelated challenges. First, such demands may leave underlying 'generative frameworks' (Fraser, 1995: 82) intact that will simply reestablish that inequality over time. Second, demands for the elimination of racial inequality are theoretically compatible with generalized and even worsening economic inequality. As

a result, some critics have argued that antiracist political demands are fundamentally constrained by a discourse of disparity and strict equality of opportunity that presupposes and naturalizes capitalist exploitation (Reed and Chowkwanyun, 2012).

That contradiction opens onto vexed questions concerning the relationships between culture, the economy, class, and social identity. In a recent exchange with political theorist Michael Dawson, Fraser has offered a materialist reformulation of the culture/class problematic at the heart of the recognition paradigm and to account for how racial differentiation is inscribed in capitalist production and social reproduction. Both thinkers have attempted to address the conceptual blindspot produced by associating racial domination with cultural misrecognition rather than for example the structural relationship between economic exploitation and state-sanctioned violence. For Dawson, that focus has displaced much needed attention to mechanisms of 'racial expropriation' (2016: 145) grounded in 'the crucial role played in capital accumulation by unfree, dependent, and unwaged labor'. Reclaiming the concept of race not as a description of biology or group culture but of the entanglement of capitalist exploitation and racialized expropriation highlight the urgent need for contemporary scholars to more precisely delineate how US racial divisions have come to be embedded within a history of global capitalism (Ngai, 2004; Roediger and Esch, 2014; Beckert and Rockman, 2016; Oakes, 2016). For Dawson and Fraser, antiracist politics is thus keyed not only to a discourse of disparity but to sometimes anti-systemic 'boundary struggles against expropriation' (Dawson, 2016: 148) as a permanent feature of capitalist accumulation:

Expropriation in this sense covers a multitude of sins, most of which correlate strongly with racial oppression. The link is clear in practices widely associated with capitalism's early history but still ongoing, such as territorial conquest, land annexation, enslavement, coerced labor, child labor,

child abduction, and rape. But expropriation also assumes more 'modern' forms – such as prison labor, transnational sex trafficking, corporate land grabs, and foreclosures on predatory debt, which are also linked with racial oppression – and, as we shall see, with contemporary imperialism. Finally, expropriation plays a role in the construction of distinctive, explicitly racialized forms of exploitation – as, for example, when a prior history of enslavement casts its shadow on the wage contract, segmenting labor markets and levying a confiscatory premium on exploited proletarians who carry the mark of 'race' long after their 'emancipation'. In that last case, expropriation combines with exploitation, whereas in the others, it appears to stand alone. But in all these cases, it correlates with racial oppression – and for reasons that are nonaccidental. (Fraser, 2016: 167)

As this passage makes clear, what Fraser calls the non-accidental correlation between expropriation and racial oppression raises the question of the logical or historical necessity of this relationship, and how to periodize shifting racial regimes within capitalist history. Nevertheless, this emergent materialist account of race usefully broadens our understanding of racialization processes beyond wage and wealth differentials to include global histories of racialized unfree labor, disposability, and state violence organized by expulsion from or denial of entry into formal labor markets.

## **CONCLUSION: THE AFFIRMATION/ ABOLITION BIND**

Imagining an antiracist politics beyond recognition and a politics of representation has led many scholars to offer sometimes radically divergent alternatives to conceiving of racial justice – from Afropessimist theorists' characterization of antiblack racism as permanent ontological misrecognition (Wilderson, 2010), to Indigenous Studies scholars reimagining of Native sovereignty as a refusal of the terms of cultural authenticity established by settler states (Barker,

2011; Simpson, 2014). In each case, demands to recognize and affirm devalued racial identities risk simultaneously naturalizing and reinforcing state authority, existing institutional hierarchies of power, and constitutively unequal capitalist social relations.

What could be called an affirmation/abolition bind emerges within the history of contemporary antiracist movements contesting or acquiescing to the terms of political subjectivation imposed through relations of recognition and misrecognition. Response to challenges to the recognition paradigm has led one of its initial theorists, Nancy Fraser, to begin to account for how political economy is itself racially organized through what Michael Dawson has called 'racial expropriation' (Dawson, 2016: 145). Fraser joins a number of other Marxist theorists inside and outside of the black radical tradition interested in elaborating the historical relationship between racial domination and the political economy of colonialism, settler colonialism, slavery, and immigration.

The very category of culture has entered into a crisis that has continued to have profound consequences for how racial injustice is understood and addressed. Definitional debates over imposed and asserted identities, and the ascriptive and affirmative character of race and ethnicity, suggest two distinct varieties of antiracist politics organized around the affirmation of racial difference and the end of racial domination. These two historically interconnected visions of racial liberation can also work at cross-purposes and highlight what could be called an affirmation/abolition bind – a rift registered across much recent criticism of cultural pluralist ideals that structure the recognition paradigm. Despite sometimes contending political priorities, both Indigenous Studies (Coulthard, 2013) and Afropessimist theorists (Wilderson, 2010: 337–41) have each attempted to move beyond the politics of both recognition and redistribution by calling what Fanon, after Aimé Césaire, called 'The only thing in the

world worth starting: the end of the world' (2008b: 76). As Glen Coulthard has recently argued, 'For Indigenous nations to live, capitalism must die. And for capitalism to die, we must actively participate in the construction of Indigenous alternatives to it' (Coulthard, 2013). While Afropessimist and Indigenous Studies scholars imagine this end in radically different terms, it is revealing that these scholars shift the terrain of antiracist struggle from the civic affirmation of racial identity to an eschatological vision of the end of a social order fundamentally premised upon configuring racialized populations as disposable.

Recent calls to recognize racial privilege, positionality, or epistemic exteriority reveal the recognition paradigm's continuing descriptive and diagnostic power. The politics of recognition can for example help to theorize the political fungibility of recent demands to recognize that 'Black Lives Matter' emerging from a 2013 US social movement. In particular, the recognition paradigm alerts us to how the demand has been articulated to a range of heterogeneous and sometimes contradictory movement strategies: from increasing racial representation within police departments to a long term vision of the abolition of the carceral state as a mechanism of racial domination (Gilmore, 2007; Keeanga-Yamahtta Taylor, 2016). At the same time, critiques of the recognition paradigm as a form of state-sanctioned 'official antiracism' (Melamed, 2006: 2) illuminate the enormous pressures faced by this movement to appoint elite political representatives and scale back anti-systemic demands to inclusion within the same institutions and economic order that some activists wish to dismantle. The recognition paradigm remains a powerful conceptual tool for mapping heterogeneous strategic orientations *within* antiracist political movements, along with new techniques of state and institutional governance that have evolved in response to past movement challenges.

# Society, Regression, Psychoanalysis, or 'Capitalism Is Responsible for Your Problems with Your Girlfriend': On the Use of Psychoanalysis in the Work of the Frankfurt School

Benjamin Y. Fong and Scott Jenkins

## INTRODUCTION

The possibility of marrying, fusing, or synthesizing Marxist and Freudian problematics was certainly not unheard of before the Frankfurt School pursued it (and, soon after, became associated with that pursuit). In 1923, young Bolshevik philosopher Bernard Bykhovskii pushed Russian psychoanalysts to justify the compatibility of Freud and Marx, a task quickly taken up by M.A. Reisner, Alexander Luria, and A.B. Zalkind.<sup>1</sup> The work of these 'Soviet Freudians', allowed by Lenin and encouraged by Trotsky, unfortunately met heated opposition, and by 1930 'the concept of the unconscious was attacked as though it were an enemy of the state'.<sup>2</sup> Surrealists in France were also finding ways of bringing Marx and Freud together, albeit through a criticism rather

than an affirmation of both. André Breton, for instance, having overcome his doting admiration for Freud, attempted to give psychoanalysis a more materialist grounding in *Les Vases Communicants* (1932).<sup>3</sup> Working both to reform and to apply Freud's ideas after joining the Communist Party in 1928, Wilhelm Reich opened psychoanalysis to social theory through the notion of 'character structure' and employed the theory of sexual repression to explain the unconscious appeal of fascism. Though intolerant of Reich, even attacking him publicly in an editorial of the *Zeitschrift* in 1932, Freud was much more supportive of other analysts who saw the radical political implications of psychoanalysis, including Siegfried Bernfeld and Otto Fenichel. Bernfeld published a number of essays in the 1920s on socialism, Marxism, education, and psychoanalysis,<sup>4</sup> and Fenichel

offered up ‘psychoanalysis as the nucleus of a future dialectical-materialist psychology’.<sup>5</sup>

That being said, the thinkers associated with the *Institut für Sozialforschung* – and here we are thinking in particular of Erich Fromm, Max Horkheimer, Leo Löwenthal, Herbert Marcuse, and Theodor Adorno – rightly deserve their status as natural referent of the term Freud-Marxism. Save for Reich, whose important contributions will be covered below, they did – and to the present day, *have done* – more than anyone to think social and psychic alienation together, to supplement Marxism with penetrating insight into the psychic depths of ideological subjectification, and to critique and historicize Freudianism with an eye toward its ultimate preservation. In what follows, we will first review the different uses to which psychoanalysis has been put in the works of Reich, Fromm, Löwenthal, Marcuse, Horkheimer, and Adorno. Our aim in this section is to provide a concise but comprehensive summary of the contributions of these authors. In the second section, we will look at the reception of this work by two prominent commentators, Jessica Benjamin and Joel Whitebook. In the third and final section, we will then turn to a general assessment of the flaws and deficiencies in the Frankfurt School’s use of psychoanalysis and of the promise that this project still holds for the present.

We offer two points of departure for a reinvestigation of the psychoanalytic component of critical theory: first, we affirm Amy Allen’s claim that ‘psychoanalysis, as the most sophisticated and systematic study of human irrationality developed to date, offers critical theorists the best chance of making sense of the ... forces that attach subordinated subjects to the modes of identity ... that subordinate and wound them’.<sup>6</sup> Marxist social theory depicts an alienating, exploitative, and immiserating society that is all the more horrifying given what it *could be*. At a certain point, appeals to the ‘interests’ of certain parties do not help make sense of the continued viability of capitalist society,

and this is where a sophisticated study of human irrationality seems to us indispensable. Second, psychoanalysis, at its best, is a critical sociology of the family.<sup>7</sup> In a very literal sense, the psyche is, for Freud, nothing but the internalization of early developmental relationships as they are mediated by the kinds of bodies that human beings have. The great accomplishment of psychoanalysis was to have uncovered the ways in which what we call ‘I’ is formed and deformed within the family. Once this family is seen as historically specific and a center of ideological reproduction, psychoanalysis becomes an invaluable tool for understanding subject–object mediation in capitalist society.

## THE USES OF PSYCHOANALYSIS FOR SOCIAL THEORY FROM REICH TO ADORNO

### *Reich, Fromm, and the Early Frankfurt School*

Although Martin Jay’s introduction to the Frankfurt School in *The Dialectical Imagination* makes it seem as if the mixing of Marx and Freud was something of a great surprise in twentieth-century social theory,<sup>8</sup> the disarmingly self-evident nature of the relation of psychoanalysis and Marxist sociology to the early Frankfurt School is clear in several important early texts and statements. Horkheimer’s ‘Traditional and Critical Theory’, as well as his ‘Inaugural Address’, show critical theory conceived as, far from an autonomous form of philosophizing, a mode of mediating different forms of knowledge in both the philosophical and empirical sciences around the questions of the social totality and the possibility of the good society. Marcuse similarly argues that the dissolution of Hegelian philosophy had left reflexive social and human sciences as the legitimate inheritors of German Idealism’s project of self-consciousness and emancipation.<sup>9</sup> For

both, psychoanalysis was one among several sciences of obvious relevance for contributing to an understanding of capitalist society.

Before the relationship between Marxism and psychoanalysis was operationalized in the methods and modes of inquiry of the Frankfurt School, ideological accounts had to be settled between the materialist bases of Marxist epistemology and science and the bourgeois, idealistic character of most psychology. Wilhelm Reich's 1929 article 'Dialectical Materialism and Psychoanalysis' provided a comprehensive précis of the debate as it had developed up to that point, as well as perhaps the strongest statement in favor of psychoanalysis' materialist credentials.<sup>10</sup> Marxists were rightly suspicious that lending too much importance to subjective factors would obscure hard-won insights into the class character of society, and these suspicions were only confirmed by texts like *Civilization and Its Discontents*, which appeared to offer a neo-Hobbesian account of society that presupposed the isolated individual that Marx and other social theorists had unmasked as a product of larger social forces.

That much of the debate throughout the 1920s hinged on the natural-scientific definition of materialism appears in hindsight as an unfortunate consequence of the ideological configuration of the time. While the later formulation of hybrids such as Fromm's 'analytical social psychology' and Reich's 'critical political psychology' and 'sex-pol' depended upon, or were at least cushioned by the legitimation and acceptance engineered by, the earlier natural-scientific argument for compatibility, it is also true that the terms of the earlier debate hampered more productive engagements between psychoanalysis and sociology. The homologies that became central to later syntheses – for instance, the parallel between the postulates that humans are fundamentally governed by unconscious processes (Freud) and social conditions (Marx) – were buried in the early debates. When this debate was finally left behind, a different theoretical as well as methodological apparatus

linking psychoanalysis and social theory matured.

For Erich Fromm, the earliest 'official representative' of psychoanalysis in the Frankfurt School, the study of religion was the training ground for a development of a theory of ideology in which the crucial mediation was provided by psychoanalysis. The opening sentences of his first book, *The Dogma of Christ*, read:

It is one of the essential accomplishments of psychoanalysis that it has done away with the false distinction between social psychology and individual psychology. On the one hand, Freud emphasized that there is no individual psychology of man isolated from his social environment, because an isolated man does not exist. Freud knew no homo psychologicus, no Robinson Crusoe, like the economic man of classical economic theory. On the contrary, one of Freud's most important discoveries was the understanding of the psychological development of the individual's earliest social relations.<sup>11</sup>

Fromm had thus found a counter to bourgeois psychology in Freud, who could explain how social forces were experienced and internalized. *The Dogma of Christ* ultimately concludes that all domination involves the propagation of infantilizing substitute satisfactions, and that with increasing freedom, equality, and maturity, the power of these satisfactions would decrease. Fromm's interpretation of authority relations as holding the masses in a state of dependency subject to libidinal manipulation signaled a clear opposition to the reactionary assumptions of much group psychology and sociology of mass society.

'The Method and Function of an Analytical Social Psychology' (1932) turned the psychoanalytic approach to authority and ideology in Weimar Germany. Perhaps the most consequential aspect of Fromm's approach for later social-psychological research in critical theory was the decisive position accorded to the family as the mediating institution between society and individual:

the family is the essential medium through which the economic situation exerts its formative

influence on the individual's psyche. The task of social psychology is to explain the shared, socially relevant, psychic attitudes and ideologies – and their unconscious roots in particular – in terms of the influence of economic conditions on libido strivings.<sup>12</sup>

'Analytical Social Psychology' was in part a lesson drawn from a lengthy empirical study, begun in 1929 but only published decades later in fragmentary form, on the working and salaried classes in Germany, that paid particular attention to familial experience and attitudes.

While Fromm was preparing the grounds for a productive collaboration of psychoanalysis and social theory, Reich was no less busy developing theories that tightened the relation between society and psyche. His depth-account of character, first elaborated in *Character Analysis* and later deployed in *The Mass Psychology of Fascism*, remained a key concept and descriptive object for Frankfurt School research. Since character was what made sense of repeated patterns of submission and conformity in the individuals produced by capitalist societies, Reich conceived of it as a kind of 'armor' that won for the subject the ability to tolerate harsh conditions of social existence, but only at the price of a loss of the sensitivity and openness to the world and to others that would make change and transformation possible.<sup>13</sup> The specific modes of defensiveness encountered in the psychoanalytic consulting room were thus, for Reich, connected to the psychic substratum of ideological subjectification (i.e. character).<sup>14</sup>

The research of Fromm and Reich in the early 1930s, and their respective insights into the social mediation of family and character, would converge on the concept of authoritarianism. The study of authoritarianism was the site of emergence for another key concept of Frankfurt School psycho-social research: the *mechanism*. Some of the mechanisms typical of the authoritarian character include identification with the dominating figure, which provides a distorted narcissistic compensation

for objective powerlessness; reversal and projection, which allow for the paranoid structure of right-wing politics and its violent scapegoating; and the sado-masochistic oscillation between violent assertions of the will to power and sacrificial gestures of dissolution. Fromm would later interpret all such mechanisms under the rubric of a more general 'fear of freedom', i.e. as regressive responses to a situation in which the individual is untethered from the traditional containment functions of pre-capitalist social community, and not yet, due to capitalist exploitation, provided the material bases or psychic resources for genuine individuation and autonomy.<sup>15</sup>

After the 1930s, Reich and Fromm both underwent marked transformations. Reich developed his own particular brand of 'orgone' therapeutics, characterized by increasingly grandiose claims and peculiar therapeutic practices. By the end of World War II, Fromm's ideas had also considerably altered: in an epilogue to *Eros and Civilization*, Marcuse placed Fromm at the center of a revisionist turn in psychoanalysis that had abandoned the earlier critical perspective. In turning to a more interpersonal theory that made psychoanalysis a promissory note of increased individual autonomy and freedom despite the accelerating irrationality of capitalism, Fromm had, in Marcuse's words, 'resurrected' the creative potentialities of the personality 'in the face of a reality which has all but eliminated the conditions for the personality and its fulfillment', thereby turning psychoanalytic theory into ideology.<sup>16</sup> Fromm's early views, which were built upon the schematism of substitute satisfaction that bound the economic structure of domination to the instinctual drives, was gradually eroded to the position that wrong life can in fact, with the right kind of therapy and ethical exhortation, be lived rightly. It seems, in the end, that Fromm's religious and ethical commitments won out against his critical social theory.

## Löwenthal

Of the thinkers reviewed in this section, Löwenthal is perhaps least associated in the popular imaginary with the Freudo-Marxist moment, yet he is responsible, along with Norbert Guterman, for the most even-handed and cogent application of psychoanalytic concepts that one will find in the collective *oeuvre* of the Frankfurt School. Their 1949 work, *Prophets of Deceit: A Study of the Techniques of the American Agitator*, aims to illuminate the sources of the unconscious appeal of the 'great little man' demagogue whose rhetoric is defined by themes all too familiar to the American public, including the positing of conspiracies; a 'charade of doom'; a hostility toward corrupt government officials, foreigners, and minorities, specifically Jews; and the idealization of an 'endogamic community' of 'simple Americans'.<sup>17</sup> Psychoanalytic concepts appear in discussion of all of these themes, but they are particularly well-used in explaining the unconscious satisfaction involved in the vitriol directed at already marginalized groups, particularly immigrants and refugees. For one, the very instability of the refugee's and the outcast's situation, their lack of a *home*, makes them

symbols of vague unconscious urges, of the repressed contents of the psyche, which, mankind has learned in the course of its history, must be censured and condemned as the price for social and cultural survival. The outcast serves to exorcise the fears as well as the temptations of self-righteous individuals. The hatred for the refugee seems thus a rejection of one's inner potential of freedom.<sup>18</sup>

In other words, at the unconscious level, refugees *deserve* their situation of precarity because their lack of a stable place in society is indicative of their unwillingness to submit to instinctual repression. Labeling them 'parasites' further reinforces their connection to repressed urges: rejecting the parasite, which represents 'that phase in infancy in which the child ... clings to and desires the

mother', allows the follower of the fascist agitator to express 'his subsequent revulsion from this attachment by means of his sadism into which his longing receded after being subjected to serious genital shocks and disappointments'.<sup>19</sup> The natural association of the parasite with filth and disease also elicits a repressed analty: a 'strong believer in the exogenic theory of disease', the agitator relies upon his audience's 'feelings of repulsion to the more obvious manifestations of uncleanness' that they have developed as a result of being coerced as children with 'threats that they will become sick and be punished for their sickness if they violate the rigid hygienic codes'.<sup>20</sup> The 'unclean foreigner' is thus a natural repository for the projection of repressed preoedipal urges and attachments.

In addition to formulating a precise psychoanalytic explanation of xenophobia, *Prophets of Deceit* also addresses the problem of the curious mystique of the agitator, which is attributed to a reactivation of early forms of identification. On the one hand, 'instead of emphasizing the identity of his interests with those of his followers, [the agitator] depicts himself as one of the plain folk, who thinks, lives, and feels like them. In agitation this suggestion of proximity and intimacy takes the place of identification of interests'.<sup>21</sup> In other words, rather than a mature identification with others based upon rational interest, the agitator welcomes an immature identification based upon emotional resonance. On the other hand, the agitator also resorts 'to such traditional American symbols of leadership as the indefatigable businessman and rugged frontiersman' and constructs an image of himself 'as a suffering martyr who, as a reward for his sacrifices, deserves special privileges and unlimited ascendancy over his followers.... One of the plain folk, he is yet far above them; reassuringly close, he is yet infinitely aloof'.<sup>22</sup> What the agitator creates, in other words, is the aura of parental authority and intimacy: close and unassuming, the leader is also powerful and idealized, bearing

all the ambivalence of the relationship to a preoedipal parent.<sup>23</sup>

Löwenthal and Guterman do a great deal more to situate the problem of the appeal of the fascist agitator on psychoanalytic ground – by relating it to ‘the heritage of infantile anxieties’, the projection of ‘disaster on the imaginary enemy’, the ‘gratifying play [of] fantasies arising from repressed destructive impulses’<sup>24</sup> – but their most important lesson is not a psychoanalytic one. For them, the agitator is only able to exploit the unconscious because capitalist subjects suffer from a *malaise* that appears to originate from the depths of the psyche, but is actually a product of modern social developments. The agitator is the worst kind of opportunist in ‘play[ing] upon those disturbing sicknesses of modern life’ that give rise to this malaise, but he is also merely a *symptom* of a ‘world where the individual’s sphere of action is increasingly restricted by anonymous social forces’.<sup>25</sup> In their view, the struggle to attenuate the alienation and immiseration of capitalist society is thus about not merely ‘economic’ justice but also the amelioration of the conditions that make possible fascist agitation.

### **Marcuse**

Whereas Löwenthal and Guterman employed psychoanalysis to make sense of a very particular problem of social theory, Marcuse found radical implications for social theory already at work in psychoanalysis. Two neologisms form the point of departure for his infamous work of 1955, *Eros and Civilization*: the performance principle and surplus-repression. While there are undoubtedly features of physical and human reality that are trans-historical components of any reality principle, the ‘reality’ to which late capitalist subjects accord themselves in the process of ‘maturing’ is an historically specific one defined by competition and alienated labor. To capture this specificity, Marcuse coins the phrase ‘*performance principle*’ in order to

emphasize that under its rule society is stratified according to the competitive economic performances of its members’.<sup>26</sup> The repressive controls over the instincts ‘over and above those indispensable for civilized human association’ demanded by this performance principle are what Marcuse denotes as *surplus-repression*.<sup>27</sup> Dated as both terms have become in certain circles, Marcuse is here only giving specific names to ideas that any responsible social theorist would affirm: that both the ‘reality’ and also the frustrations and anxieties of capitalist subjects are historically specific ones.

Having cut straight to the core of psychoanalytic theory, Marcuse then turns to the central contradiction of capitalist production: that technological advance ‘enhances the scope of material culture, facilitates the procurement of the necessities of life, makes comfort and luxury cheaper, [and] draws ever-larger areas into the orbit of industry – while at the same time sustaining toil and destruction’.<sup>28</sup> Capitalism has always simultaneously made possible and defended itself against a ‘world which could be free’, but for Marcuse, his age was the one in which ‘the discrepancy between potential liberation and actual repression [had] come to maturity’.<sup>29</sup> It was time, he speculated, to start thinking through the possibility of a truly *non-repressive civilization*, one in which our drives do not need to be ‘subordinated to the discipline of work as full-time occupation, to the discipline of monogamic reproduction, [and] to the established system of law and order’.<sup>30</sup> Dealing with the objection that sexuality is fundamentally anti-social for Freud, and thus that freedom from repression would erode ‘lasting interpersonal relations’, Marcuse makes the unfortunate argument that sexuality is ‘self-sublimating’, that it would become socially beneficial all on its own were it not for the excessive repression involved in abiding by the performance principle.<sup>31</sup> All he means to claim here, however, is that a non-repressive society would offer a plethora of sublimated forms for sexuality beyond reproduction and

pseudo-culture. Indeed, in his later work, he would change his terminology and speak instead of a 'lasting *desublimation*' 'manifest in the progressive alleviation and pacification of the struggle for existence, in the growth of refined erotic needs and satisfaction'.<sup>32</sup> This non-repressive desublimation following from an overcoming of the performance principle would allow for a 'free play of human faculties' in which not only the 'receptivity of sensuality' but also the 'spontaneity of reason' would be a 'source of happiness'.<sup>33</sup> In short, we live in a unique moment where happiness and civilization, the drives and reason, pleasure and reality can and *must* be reconciled to an historically unprecedented degree.

Or else! The flip side of Marcuse's supposed 'utopianism' is a dire assessment of what happens if we fail to realize the dialectical possibility inherent in late capitalist society. For one, the revolutionary 'refusal' of repressive sublimation is being channeled into an equally *repressive desublimation*, in which the individual's drives undergo a 'commercial release for business and fun..., replacing mediated by immediate gratification'.<sup>34</sup> Popular culture is, in other words, offering late capitalist subjects the possibility of a domesticated release of instinctual gratification, one that *could* be directed toward political struggle. This 'controlled desublimation', in which 'sexuality turns into a vehicle for the bestsellers of oppression', 'facilitates the acceptance of the misdeeds of this society', and thus works to eliminate the possibility of a non-repressive civilization.<sup>35</sup>

The even more urgent problem inherent in a failure to realize non-repressive civilization lies in a destructiveness that proportions itself to the irrationality of repression. In Marcuse's re-reading of Freudian drive theory (itself derived from the work of Fenichel), Eros and Thanatos spring from 'an originally common root'.<sup>36</sup> The death drive and aggressiveness are only differentiated from Eros and sexuality 'as the result of the trauma of primary frustration'.<sup>37</sup> Marcuse takes this to mean that the frustration involved in the repressive

desublimation and constrained eroticism of late capitalism, one that is enhanced in comparison to how erotic life *could be*, redirects psychic energy toward a powerful destructiveness. This destructiveness is then put to use by instrumental reason toward a compulsive mastery over nature that is demanded by civilization; for this reason, 'destructiveness, in extent and intent, seems to be more directly satisfied in civilization than the libido'.<sup>38</sup> The creation of a non-repressive civilization, so the argument goes, would alleviate the libidinal frustration that is the very source of destructiveness; thus, with 'the gradual elimination of surplus repression', 'an expanding area of destructiveness could be absorbed or neutralized by a strengthened libido'.<sup>39</sup> The urgency of realizing a non-repressive society is thus a question not only of expanding the scope of pleasure but also of snuffing out a planet-threatening destructiveness at its instinctual source.

### **Horkheimer and Adorno**

At the heart of *Eros and Civilization* is a bold historical claim, one that Marcuse shares with his colleagues Horkheimer and Adorno. The claim, often called simply the 'culture industry thesis', is that the forms of media invented and propagated in the first part of the twentieth century (film, radio, television) have annihilated the bourgeois dream of culture and altered the dynamics of the family and of the psyche so as to make the capitalist subject more docile and unthinking.<sup>40</sup> How precisely the culture industry has changed the family structure, and in turn the individual psyche, is the central organizing problem of the shared project of Horkheimer and Adorno, the uncomfortable spur in their sides driving them in different theoretical and methodological directions.

The force of the culture industry thesis can only be appreciated in the historical narrative in which it is couched; thus, to understand the damaging effects of the culture industry,

we must first look at the nature of subject formation before the twentieth century. In the classical bourgeois era, when the aim was to 'tirelessly realize ... the ideal type of *homo oeconomicus*', the 'predominant productive community' of the patricentric family was the norm.<sup>41</sup> In this type of family,

the father's control of his household was doubtless an indispensable condition of progress. The self-control of the individual, the disposition for work and discipline, the ability to hold firmly to certain ideas, consistency in practical life, application of reason, perseverance and pleasure in constructive activity could all be developed, in the circumstances, only under the dictation and guidance of the father whose own education had been won in the school of life.<sup>42</sup>

This is the kind of family that produced the subject of Freud's theories: for this 'old anthropological type',

the ego, the agency of social control within the individual, keeps the drives within the limits set by self-preservation. The areas of friction are large and neuroses, the incidental expenses of such a drive economy, inevitable. Nevertheless, this complex psychical apparatus made possible the relatively free interplay of subjects which constituted the market economy.<sup>43</sup>

In other words, the bourgeois subject was burdened by an excessive guilt and explosively unstable, but at least it was something like an *individual*.<sup>44</sup>

In the age of mass production and the culture industry, by contrast, individuals – in the sense of agents that make decisions based upon 'a painful inner dialogue between conscience, self-preservation, and drives' – no longer exist.<sup>45</sup> In his contribution to *Studies on Authority and the Family* (1936), Horkheimer was content to say that the 'limited family' was increasingly failing to carry out its educational function of producing authority-oriented subjects as a result of bearing a shrunken economic importance, but that the modern family's authority structure can nonetheless 'be strong enough for the father to maintain his position even after its material basis has disappeared'.<sup>46</sup> By the 40s,

however, both he and Adorno were willing to admit that the shell of the bourgeois family had finally caved in, having been penetrated definitively by the culture industry. The new kind of father, socially conditioned for weakness,<sup>47</sup> and mother, icy and brutal instead of warm and comforting,<sup>48</sup> both retain their nominal functions, but they are no longer tasked with producing anything resembling autonomy. With televisions and radios in every home, and movie stars and advertisements bearing the latest sage advice, children are now taught to think within 'the schema of mass culture'. The resulting 'pseudo-individuals' – at different times dubbed new anthropological types, new types of human beings, and authoritarian personalities – think only in stereotypes, want entertainment rather than edification, accept that 'everything is business', and are resigned to agreeing to the world as it is.<sup>49</sup>

The new anthropological type is described psychoanalytically in a variety of ways but *regressed* is probably the best general characterization available: having failed to sublimate primary process energy and to accept the reality principle, the new anthropological type readily pursues unsublimated sexual satisfaction as it is delivered in managed form by the culture industry and thinks in a narrow and paranoid manner reminiscent of the mode of experiencing of preoedipal children. Many interpreters take Horkheimer and Adorno to mean that individuals raised on mass media are lost in fantasied projections like overgrown children,<sup>50</sup> but Adorno in particular emphasizes that the most salient feature of this regression is a *rigidity* with which new anthropological types engage the world, a rigidity represented in a commitment to instrumental rationality and the reality of the status quo. As opposed to old anthropological types, who are rent by the demands of the superego, the id, and reality, and thus able to perceive hesitantly<sup>51</sup> and from different perspectives, new anthropological types are oriented 'straight ahead' and untroubled by a difficult inner dialogue between competing

psychic agencies.<sup>52</sup> Horkheimer and Adorno sometimes describe this rigid unidirectionality as 'ego weakness', and sometimes as 'superego weakness', but the important idea is that a psyche that was previously defined by tension and conflict has been streamlined and flattened.<sup>53</sup> Another way of expressing this same idea in terms closer to Adorno's heart is to say that the psyche is insulated against its own *mimetic* tendencies: oriented straight ahead toward professional tasks and life goals, the new type of human being does not consciously *experience* contradiction and dialectical possibility, and thus cannot engage the capitalist world as it is.

The late capitalist subject does, however, seem to *unconsciously* experience this contradiction, and the result is a blind and manipulable rage. This rage is then processed in 'false projection', which Horkheimer and Adorno describe as the 'reverse of genuine mimesis'.<sup>54</sup> False projection 'displaces the volatile inward into the outer world, branding the intimate friend as foe. Impulses which are not acknowledged by the subject and yet are his, are attributed to the object: the prospective victim'.<sup>55</sup> This rather conventional explanation of anti-Semitism in the fifth chapter of *Dialectic of Enlightenment* is immediately followed by a more troubling claim: that 'there are no longer any anti-Semites.... The anti-Semite's conviction, however mendacious it may be, has been absorbed into the preconditioned reflexes of the subjectless exponents of a particular standpoint'.<sup>56</sup> In other words, contemporary anti-Semitism is less a true xenophobia than it is a natural product of mass culture.<sup>57</sup> It is for this reason that Horkheimer and Adorno were prepared readily to equate American consumerism and German fascism: 'The citizens whose lives are split between business and private life, their private life between ostentation and intimacy, their intimacy between the sullen community of marriage and the bitter solace of being entirely alone, at odds with themselves and with everyone, are virtually already Nazis'.<sup>58</sup>

It is this equation that served as the founding conceit of the most well-known of the Frankfurt School's empirical work, *The Authoritarian Personality*, one among many empirical studies carried out in both Germany and the United States that engaged with the composition of the public sphere. Adorno's *The Psychological Technique of Martin Luther Thomas' Radio Addresses*, for instance, applied the social-psychological account of authoritarianism developed by Fromm and others to identify and describe the devices of seduction of fascist politics. This study often descends from the usual theoretical heights to the level of practical intervention, a gesture present in much of the Frankfurt School's empirical work. At the end of 'How to Look at Television', written in the 1950s for a mainstream American communications journal, Adorno writes:

The effort here required is of a moral nature itself: knowingly to face psychological mechanisms operating on various levels in order not to become blind and passive victims. We can change this medium of far-reaching potentialities only if we look at it in the same spirit which we hope will one day be expressed by its imagery.<sup>59</sup>

Thus, the empirical studies not only drew their inspiration from the original Frankfurt Institute design of a transdisciplinary dialectical mediation of particular forms of knowledge but were also interventions in the public sphere, combining the most prosaic form of inoculatory enlightenment with the esoteric hopes of 'saving critique'.<sup>60</sup> Perhaps the best examples of this public-sphere oriented 'education to maturity' are the so-called 'Group Experiments', carried out collaboratively after the Institute returned to Germany following the War.<sup>61</sup> These studies, which examine the defensive strategies around confronting the Nazi past through protocol-led group conversations, culminated in Adorno's 'The Meaning of Working Through the Past'.<sup>62</sup> This essay exemplifies the multiple communicational tendencies at work in the best research and productions of the Frankfurt School: it is a

work of applied psychoanalysis that extends Freud's idea of *Durcharbeiten* to an entire society, a work of reflective social theory, and a practical, ideological-critical intervention in the public sphere of the Federal Republic.

### WITH FRIENDS LIKE THESE...

The most shocking thing about the reception of the Frankfurt School's use of psychoanalysis is just how paltry it has been. Martin Jay highlighted the 'integration of psychoanalysis' into critical theory in the third chapter of *The Dialectical Imagination*, but the significance he accords it there did not spawn a great deal of interest in this theoretical nexus.<sup>63</sup> Justifying what was in any event already the case, in *Late Marxism* Fredric Jameson questioned the impact of psychoanalysis on the Frankfurt School in claiming that Freud's categories were never 'centrally organizing' as Weber's, Lukács', or Nietzsche's were (a direct contradiction of Horkheimer's assertion that psychoanalysis was 'one of the foundation stones without which our philosophy would not be what it is').<sup>64</sup> Our only guess as to why there has been so little secondary literature here, and thus why Jameson's claim of exaggerated importance would go unchallenged, is that there is a general trepidation or dismissiveness among social theorists about transdisciplinarily engaging the language of psychoanalysis. In this section, we will review the work of Jessica Benjamin and Joel Whitebook (both psychoanalysts with backgrounds in the humanities), who are, almost by default, responsible for the more influential readings of the Frankfurt School's use of psychoanalysis.

In the late seventies, Benjamin formulated a powerful critique of what she dubs the Frankfurt School's 'end of internalization' thesis.

In the present epoch the critical theorists find that authority is directly exercised over individuals rather than internalized – thereby eliminating the

potential for critique or revolt. As a result, the possibility for the formation of a revolutionary subject is foreclosed. In the face of this situation the critical theorists look backward to the form of instinctual control which was the basis for ego development and reason in the past – individual internalization – and argue that only it contained a potential for the formation of a critique of domination. This is the impasse which I refer to as the 'end of internalization'.<sup>65</sup>

Benjamin takes issue with this narrative for many reasons, but for our present purposes, we will highlight two: first, since it is the *father* who is seen as the 'indispensable condition' of instinctual control (as we saw above), the end of internalization thesis represents a 'nostalgic romanticization of paternal authority'.<sup>66</sup> In her view, while Horkheimer had rightly characterized 'obedience as a formal response demanded by a structural role rather than a substantive behavior' in his contribution to *Studies on Authority and the Family*, by the 40s, when he had accepted the demise of the classical bourgeois family, he had idealized old versions of paternal authority and maternal nurturance in order to provide stark relief for the brokenness of the new kinds of fathers and mothers. In so doing, he not only retreated from his more cogent assertion that the authority of the classical bourgeois father lay with economic function rather than moral rectitude, but also callously disregarded the possibility that maternal care encourages autonomy, and thus that 'mutual recognition and nurturant activity ... may guide us in our struggle against instrumental rationality toward a society without the father'.<sup>67</sup>

Second, she takes issue with the idea that the 'impasse is complete'; that, in other words, 'the impact of the mass media, state institutions, professional guidance is so overwhelming that people are now directly manipulated into unthinking conformity'.<sup>68</sup>

This view rests upon an important but questionable methodology and ontological assumption. The assumption is that the active nature of subjectivity

is only brought into being by external pressure, and therefore that it can be extinguished. This assumption breaks with the concept of alienation, which contains the notion that a fundamental need or capacity takes on an objective form which is opposed to, *yet depends on*, the original need or capacity.<sup>69</sup>

On both counts, Benjamin is neither right nor wrong. In the case of the charge of patricentrism, it is true that Horkheimer in particular had an unfortunate tendency to make the simple equation 'father = truth'.<sup>70</sup> That being said, much of 'Authoritarianism and the Family Today', the place where Benjamin notes Horkheimer's theoretical regression, is devoted to a disjunction not between a past familial wholesomeness and a present familial fragmentation but rather between the *reality* of fragmentation and the *fantasy* of wholesomeness. 'The more the family as an essential economic unit loses ground in Western civilization', Horkheimer contends, 'the more society emphasizes its conventional forms'.<sup>71</sup> Thus, the growing child, who receives in reality only 'the abstract idea of arbitrary power' as a father, still 'looks for a stronger, more powerful father' in fantasy (a kind of father which, on Horkheimerian grounds, we have good reason to believe never existed).<sup>72</sup>

In any event, so much of what Horkheimer and Adorno say about the crisis of internalization – the resultant stereotyping, the lack of thinking, the assent to the status quo – has little to do with the father, and to dismiss the whole enterprise as patricentric throws the baby out with the bathwater. To argue, in other words, that the historical problem of the damage done to late capitalist subjects by the imposition of the culture industry on the family is itself a patricentric articulation, is also to say that it is not really a problem; to say, in other words, that the real problem is the problematizers' theoretical lens, which Benjamin recommends should be replaced by one that privileges mutual recognition between subjects. A historical conundrum is tidily avoided with a simple change of

theories, and critical theory thereby returns to traditional theory.

As for the point about direct domination, Benjamin is certainly right that claims about 'ends' and 'completeness' litter the works of Horkheimer and Adorno, but there are two problems with her further contention that this represents a reversal of Marx's problematic of alienation. First, it is not that subjects are delivered 'passively into the grip of external social forces', but rather that the 'active nature' of their subjectivity is manipulated with such psychological sophistication that the possibility of being 'active' in such a way as to undermine the status quo is foreclosed. People act, but they act 'spontaneously according to a "level" determined by indices'; they think, but they think within the 'schema of mass culture'.<sup>73</sup> Horkheimer and Adorno would likely respond to Benjamin's criticisms by saying that the very recognition and nurturance of early life that she so prizes is deftly channeled by a culture industry that 'recognizes' and commends its reliable consumers for their pseudoindividual traits.<sup>74</sup>

Second, it is not clear that either Horkheimer or Adorno ever abandoned the framework of indirect domination. Even in 'Authoritarianism and the Family Today', Horkheimer still asserts the family to be the key site for the production of authoritarianism.<sup>75</sup> Adorno is a more suitable target here, prone as he was toward bold statements, but as Gillian Rose has persuasively argued, the statement that 'consciousness of society is completely reified implies that no critical consciousness or theory is possible'.<sup>76</sup> The thesis of complete reification, like that of an end of internalization, is thus 'unstatable, because if it were true it could not be known'. Adorno presents this impossible thesis 'in order to induce in his reader the development of the latent capacity for non-identity thought – the perspective that the concept is not identical with its object. This is an attempt to prevent the complete reification which is imminent'.<sup>77</sup> In this view, the end of internalization, so long as we understand it,

can only ever be a dangerous diminution of internalization.

\*\*\*

For many years, Joel Whitebook has carried the flag of Freudo-Marxism through various companions and handbooks, and produced what is still the most important work of secondary literature at this intersection, *Perversion and Utopia: A Study in Psychoanalysis and Critical Theory* (1996). Whitebook's aim there is to 'reinvigorate the psychoanalytic dimension of Critical Theory', but one is immediately struck by just how negatively he portrays the initial encounters of these two domains. In a move that sweepingly dismisses the contradictions of capitalism that the Frankfurt School was trying to take seriously, he describes Marcuse's belief that 'the forces of production have developed to the point where surplus repression constitutes by far the commanding share of renunciation exacted in modern society' as 'utterly naïve'.<sup>78</sup> In fact, Whitebook finds almost nothing salutary in Marcuse's project, criticizing 'its search for an uncontaminated first nature, economism, sloppy argumentation and impracticality'.<sup>79</sup> Marcuse is for him more of a cautionary tale than a base from which to 'reinvigorate the psychoanalytic component of critical theory', given 'not just the banal unworkability of utopia but the profound philosophical flaws in Marcuse's position'.<sup>80</sup>

The real danger here lay in a false equation of material scarcity (*Lebensnot*) and necessity as such (*Ananke*) in Freud: even if we were free of surplus repression, Whitebook argues, we would still be lacking, still be finite, still be subject to a constraining and uncomfortable reality.<sup>81</sup> In arguing for 'a struggle against time' and an historically unprecedented reconciliation of the drives and reason, Marcuse encourages an '*omnipotent denial of reality*', a 'pursuit of "integral satisfaction" that disavows the incomplete and conflictual nature of human existence[, which] brings us into the register of omnipotence and therewith raises

the specter of totalitarianism'.<sup>82</sup> Whitebook is thus quite satisfied that 'the political experiences of the last three decades have chastened the utopian sensibility and produced a new appreciation of human finitude – of difference, particularity, and plurality – as well as a suspicion of grandiose projects and the metanarratives that have traditionally been associated with them'.<sup>83</sup>

Whitebook might be correct that Marcuse's utopianism gets grandiose, especially in the discussions of Orpheus, Narcissus, and temporality as such, but he fails to properly register the fact that *any* political project that questions the legitimacy of present reality can be (and typically *is*) accused of infantile regression. The possibility of a world without necessary and dissatisfying labor has been and *should be* a live one for any advanced capitalist society with developed technological capacities: to dismiss the act of thinking through what this means for human potentialities as 'infantile' is the gesture of a conservative too lazy to refute arguments for socialism rationally. Whitebook's near axiomatic 'respect for liberalism, that sober philosophy that harbors no illusions about human perfectability' makes a real engagement with Marcuse's work almost impossible.<sup>84</sup>

Though not as ideologically charged, Whitebook's assessment of Adorno is similarly bleak: conceiving of ego formation narrowly as a process of '*violent unification or forced synthesis*', Adorno believes the '*principium individuationis is violent as such*', and that the autocratic self formed through this violence in turn 'imposes its rigid unification outwardly onto the diversity of external nature'.<sup>85</sup> Overly reliant on drive theory and id psychology, Whitebook's Adorno 'takes the ego only in its defensive aspect, as the opponent of the drives, and does not sufficiently appreciate its synthetic function'.<sup>86</sup> Furthermore, since he 'can only think unity as compulsion', he has nowhere to hang his ideals of autonomy and maturity, and is thus forced endlessly to circle the aporia of subjectivity.<sup>87</sup>

Whitebook believes the ego psychologists, who offer a vision of the ego as mastering without dominating, present a way out of Adorno's theoretical morass.<sup>88</sup> He makes a telling comparison in justifying this move: 'the ego psychologists were compelled to introduce a second dimension, as it were, to correct the instinctual monism of drive theory. Habermas, for similar reasons, introduced the dualistic framework of communicative and instrumental reason to overcome the implicit monism of the early Frankfurt School'.<sup>89</sup> Whitebook's turn to ego psychology could, like Habermas' turn to communicative reason, be seen as a 'solution' to a previous impasse, but it could also be seen as taking the sting out of purposely difficult formulations. To follow Whitebook here, one would have to be convinced, as these authors are not, that Adorno's schizoid alternation between arguing for the preservation and for the ruthless criticism of western subjectivity is a theoretical fault rather than a mimetic presentation of a schizoid reality and a spur to non-identity thinking.

## SHORTCOMINGS AND PROMISES

As should be obvious by now, we find ourselves perplexed as to why precisely the intersection of psychoanalysis and social theory mined by the Frankfurt School should generally be considered obsolete, as it produced a much-needed historicization of psychoanalytic theory; a cogent analysis of fascist agitation; an illumination of the dialectical possibilities, both positive and negative, of late capitalist society; and an historical narrative of capitalist subjectivity that employs psychoanalytic categories to make sense of the demise of the Freudian conception of the psyche. In this final section, we would now like to lay out the general shortcomings of the Frankfurt School's employment of psychoanalysis, as well as hold up what we find most relevant and in need of further development.

As for general deficiencies to be remedied, we will mention four: first, though Jessica Benjamin goes too far in hanging the Frankfurt School with the rope of patricentrism, we agree that far too much is garnered in their work from stereotyped versions of paternal and maternal tendencies. Without misguidedly attempting to undo in theory the reality of the patricentric family, we must be very careful about not reifying gender roles. Recent attempts in psychoanalytic theory to salvage the oedipus theory without the figures of the father and mother, including Benjamin's own theory of the intersubjective 'third', are salutary expressions of very necessary theoretical work.<sup>90</sup> We also agree with Benjamin that there is a lingering nostalgia at work in the formulations of the Frankfurt School. As Robert Hullot-Kentor has recently argued, we ought to think today not about returning to the individual of the liberal era but rather about working through the damaged and regressed subjectivity of the new anthropological type.<sup>91</sup>

Second, the Frankfurt School goes too far, as do psychoanalytic theorists in general, when they unjustifiably transcend the historically specific; when, in other words, they extrapolate from the conditions of the late capitalist subject trans-historical lessons. The 'struggle against time' depicted at the end of *Eros and Civilization* could have been very productively contextualized with something like E.P. Thompson's 'Time, Work-Discipline, and Industrial Capitalism', but Marcuse instead dives headfirst into the kind of philosophical abstraction for which Whitebook takes him to task.<sup>92</sup>

Third, the Frankfurt School was much too reliant on Freud as the beginning and end of psychoanalytic theory: the contributions of Melanie Klein, Anna Freud, Donald Winnicott, Wilfred Bion, Jacques Lacan, and other important psychoanalytic theorists have not been adequately mined for their relevance to social theory. Klein and Lacan are particularly ripe for 'integration': Isaac Balbus and more recently Amy Allen have both started

the project of thinking through the implications of Klein's work for critical theory,<sup>93</sup> and Lacan practically invited comparison in theorizing a 'decline of paternal *imagoes*' that resulted in a new form of subjectivity, what he called the 'subject of science'.<sup>94</sup>

Finally, the gap between the Frankfurt School's theoretical and empirical work was much too wide: though they admirably attempted to translate their philosophy into social scientific terms, much was lost in translation. In *The Authoritarian Personality*, the new anthropological type is opposed to the democratic and autonomous personality, whereas in Horkheimer and Adorno's earlier work on the family, it is opposed to the bourgeois individual. The former thus injects a normative preference into historical analysis in a way that is thoroughly misleading, and that reinforces the incorrect view that the Frankfurt School associated bourgeois individuality with true autonomy.

\*\*\*

The promise we associate with the psychoanalytic project of the Frankfurt School pertains essentially to the hypothesis of the new anthropological type, which is an indispensable starting point for making sense of subjection in late capitalism. What is new and interesting here is not just the idea that subjective experience is objectively determined, the important payoff of Fromm's reconceptualization of the drives and in any event a very old idea; it is rather that late capitalism, the regime of capitalism whose start coincides with the emergence of the culture industry, can be distinguished from capitalism per se by the reformulation of subjectivity in ways that both reduce and enhance alienation. Our alienation from the products we produce, the ways in which we produce them, our species-capacities, and our fellow human beings, produces a basic subjective tension that Marx believes will only be resolved with the overcoming of the contradictions of capitalism. The culture industry partially dispels this tension in

providing outlets for domesticated pleasure, in giving the subject forms of *quick relief* from an existence otherwise dominated by alienated labor. It also *rigidifies* the subject's thinking, and thereby veils objective contradictions. In both ways, the subject is relieved of consciously experiencing an objective alienation, but since alienating conditions are not themselves overcome, the experience of alienation becomes *unconscious*. The new anthropological type fronts fun-loving happiness and adaptable practicality, but underneath this thin veneer the drives seethe, just barely contained. The study of the ways in which these drives find expression – in latching on to fascist agitators, for instance – is the second feature of this project that still holds great promise today. In truth, these two features – the hypothesis of the new anthropological type and the analysis of the social and political fallout of the existence of this type – are of a piece, as the type is formed by conditions that are reinforced by its existence. We only separate them here to mark off two paths of inquiry: one into the conditions that produce subjectivity, the other into the ways in which that subjectivity is then exploited.

Both require some attention after years of disuse. In the case of the former, the invention of the internet and the forms of social media and devices that go along with it undoubtedly require an updating of the culture industry thesis: how, for instance, does using a smartphone differ from watching television? Does it actually provide occasion for more activity, as opposed to the passivity involved in consuming shows, or is that activity a pseudo-activity? Does it reinforce or break down the division between work and play? In ways that generate new dialectical possibilities or not? The replacement of the old forms of news consumption by viral videos and clips from late-night comedy shows spawns a similar line of questions, as do many other developments since the beginning of the culture industry. The changing conditions of the family are particularly important: how do

the stresses of work in the neoliberal world translate in developing psyches? If not care and authority, what *do* parents today represent? These questions are in the social ether today but if the answers are going to continue the historical narrative centered on the new anthropological type, then they must be tackled in reference to the objective contradictions of capitalism as they are experienced by a damaged subject.

As for the second component, fascist rhetoric has, to say the least, entered a new era, and one could imagine a study of Trump's new media assault that pays homage to Adorno's analysis of the speeches of Martin Luther Thomas. The self-reproachful yet thoroughly engrossed way in which *The New York Times* covers his Twitter activity, for instance, speaks to a form of pleasure that we have not begun to understand. Furthermore, the channeling of historically specific rage by fascist rhetoric is only one way in which the drives are manipulated today. The psychopharmaceutical industry was born in response to a need to deal with the unintelligible misery and fragility of late capitalist subjects. Understanding the ways in which drugs organize life today is an urgent problem for a psychoanalytically inflected social theory. More generally, the minefield of irrationality that attends the existence of the new anthropological type can be preyed on in any number of ways: being ever vigilant to its uses and abuses is the best way to stay faithful to the original project of the Frankfurt School.

In all of these lines of inquiry, the Frankfurt School worked toward a truly *transdisciplinary* social science, one that goes beyond the 'interdisciplinarity' of the academic knowledge industry. Their ingenuity was made possible by an unwillingness to 'discipline' their inquiries into fields that speak to the conventions of particular audiences. It is this unwillingness that allowed their work to function as a counterpropaganda in the public sphere, as a kind of *Nacherziehung* [after-education] that undoes the insidious effects of the culture industry in much the same way that

psychoanalysis works on the effect of our personal histories. Like Adorno,

We propose to concentrate on issues of which we are vaguely but uncomfortably aware, even at the expense of our discomfort's mounting, the further and the more systematically our studies proceed. The effort here required is of a moral nature itself: knowingly to face psychological mechanisms operating on various levels in order not to become blind and passive victims. We can change this medium of far-reaching possibilities only if we look at it in the same spirit which we hope will one day be expressed by its imagery.<sup>95</sup>

Finally, the Frankfurt School, as opposed to many psychoanalytic traditions with a political bent, was emphatic about the necessity of social revolution in order to secure the possibility of *Erfahrung*. While psychoanalysis can bring to light the varied ways in which late capitalism forms and exploits psychic subjectivity, it cannot thereby remedy the damage because what is unearthed in analyzing, for instance, a susceptibility to fascist agitation is not a buried and obscure past but rather the unconscious registration of an all-too-apparent present.<sup>96</sup> The essential choice for capitalist society has always been socialism or barbarism; until we achieve the former, psychoanalysis will be consigned to critiquing the latest unpalatable version of the latter.

Late in life, Marcuse made an unfortunately quotable statement: 'Not every problem someone has with his girlfriend is necessarily due to the capitalist mode of production'.<sup>97</sup> He was speaking against the trivialization of the concept of alienation, and his concern seems to have been justified, given the continued expanded use of the term today. But there is a way in which this statement represents a retreat from the radical implications of his and his colleagues' work. The Frankfurt School recognized that capitalism entered a new epoch when an industry devoted to 'pseudo-educating' the general populace through film, radio, and television was born, and that this historical shift had not only profound social, political, and economic implications but also familial and psychic

ones as well. In a very fundamental way, capitalism *is* responsible for the problems in our personal lives: an unreflective narrow-mindedness and a resigned acceptance of fleeting pleasures might be general human tendencies, but they are tendencies that are so encouraged by the culture industry that they have become defining features of subjectivity. The Frankfurt School formulated the uncomfortable thought that thanks to the culture industry, social structure appears at the deepest levels of our psyches, in our pleasures, frustrations, unthinking blunders, and neurotic behaviors. In the tradition of Freud, we hope that the disagreeable is not mistaken for the untrue.

# The Culture Industry

Christian Lotz

## INTRODUCTION

The concept of the culture industry as it is presented in the chapter with the same title in the *Dialectic of Enlightenment*, is the most famous and most widely received and discussed concept in the entire tradition of critical theory and the Frankfurt School. The main reason for the attention that Adorno's and Horkheimer's analysis of the culture industry received and still receives can be seen in the authors' strategy to push the concept of ideology, as it can be found in the early Marx, further into the twentieth century. They do this in order to allow readers to extend the critique of ideology to a wider spectrum of cultural, artistic, and entertainment phenomena. In addition, in its uncanny mix of psycho-social and social analysis of consumer entertainment, the book is one of the most important texts written by philosophers that analyses, within broader speculations about history and progress, the wide-ranging consequences of media

practices, such as film, radio, and television, for a mass society and mass audience. Moreover, its beautiful but sharp formulations, as well as its cool and surgical precision expressed in an aphoristic style, makes the text one of the most fascinating documents of the entire history of the Frankfurt School, if not of the entire twentieth century tradition in (European) critical theory. The concept of the 'culture industry' is the magnifying glass of critical theory, and the *Dialectic of Enlightenment* is its telescope.

The chapter, which in later essays Adorno slightly revised and reformulated, was written at a point in time when Europe faced its darkest horrors and when the main drivers of the enlightenment, such as science, technology, and rationality, turned into the most destructive means of an entire epoch. In addition, the fascist takeover of major areas of the world indicated, as Benjamin has it, the worse failures of the left, most visible in the failure of revolutionary attempts in Europe since the second half of the nineteenth century, which

ended with Hitler in 1933. Finally, new forms of artistic practices, such as photography, film, and radio, turned out to be useful as nasty and murderous tools for fascist propaganda, for the hypnosis of the masses, and for the distribution of the most destructive, anti-Semitic, racist, and genocidal positions created by an authoritarian politics that the world had never seen before. Although this historical context is crucial for getting a sense of the cold distance from which the analyses within the book, which was written during their exile in the United States, are presented by its authors, we would do well to not read the analysis of the culture industry as something that belongs to the past. This is due to the fact that the *Dialectic of Enlightenment* emerged in a world that, on the one hand, is still with us, namely, as state and monopoly capitalism, and, on the other hand, returns on the political scene every day somewhere on this globe, namely, as a threatening arrival of authoritarian politics and its accompanying authoritarian population. The reader is asked to understand the *Dialectic of Enlightenment* as a message in a bottle [*Flaschenpost*] that is addressed to readers who will one day pick up the book and understand that *they* are implicated by what is written in the book, i.e., that the book is written *for us*.

The reception of the *Dialectics of Enlightenment* has had ups and downs since 1947, and it is safe to say that the nature of the reception always depends upon its socio-cultural context. Most standard critiques of the book and its subsection on the culture industry are written from either a post-modern point of view that is bothered by the authors' preference for 'high art', or from the viewpoint of a positivist worldview that can no longer digest philosophical thought, i.e., any thinking without a direct outcome and follow-up assessment. Accordingly, the main charges against Adorno's and Horkheimer's analysis of the culture industry are the following: (1) it is elitist<sup>1</sup>, (2) it underestimates the role of the media for democratic education as well as the force of bourgeois

ideals<sup>2</sup>, (3) it remains entirely negative<sup>3</sup>, and (4) it defeats itself because of its performative-contradictory claims based on a critique of reason while using reason.<sup>4</sup> More serious charges are (5) that Adorno and Horkheimer are Eurocentric<sup>5</sup>, (6) that they rely on a concept of history that is obsolete, and (7) that their thinking cannot escape its historical context and belongs to the past. It comes as no surprise, then, that the main *positive* reception of the concept of culture industry focuses both on the important role of mass entertainment and consumer society from the perspective of the communicative and cultural sciences, as well as on the role of the media for consumption and psychology. As such, at least in most cases, this work sets aside the larger background of Adorno's and Horkheimer's writings on the culture industry, such as the Marxist tradition, the analysis of fascist societies and the fascist state, the role of anti-semitism for capitalist societies, and the connection between the *Dialectic of Enlightenment* and Adorno's *Minima Moralia*, which he wrote at the same time. Given that much of contemporary critical theory, at least as it is represented in the work of Fraser, Benhabib, Habermas, and Honneth, has given up on the Marxist background of critical theory and in general assumes that we have reached a satisfactory level of democracy in the post-war world, this dismissal should not be surprising. Moreover, mistreatments of core elements of Adorno's and Horkheimer's critical theory are found in main commentaries on Adorno's philosophy and social theory. For example, in the *Cambridge Companion to Adorno* (Huhn, 2004), though it is presented as an authoritative source on Adorno and as a major scholarly companion to Adorno, almost the entire volume dismisses central aspects of Adorno's critical philosophy, such as his class-based concept of society and his lifelong faith in political economy. And while some of the contributors to the Adorno companion mention Marx here and there, in general, they dismiss Adorno's Marxian background and instead deal with Weber and Freud.

Moreover, in distinction to Horkheimer and contemporary critical theorists such as Habermas and Honneth, Adorno never gave up on basic principles of Marx's *Critique of Political Economy*, including the conception of dialectics as outlined in Marx's *Grundrisse*, the concept of social totality, and, mediated by Sohn-Rethel, the principle of exchange and 'real abstraction' that occurs within exchange (Sohn-Rethel, 1978). Rather than understanding society as a sphere of discourses, systems, or layers, Adorno held fast to a concept of capitalist social reality understood as the 'totality of the exchange society'. Accordingly, in this discussion I will develop a re-reading of the culture industry chapter in the *Dialectic of Enlightenment*, as well as reflect on the topics of culture and industry in general through the lens of a broader critical theory of society. Against the reductions of the 'culturalist' understandings of the culture industry, I submit that we should reconnect the concept of culture to the concept of society, to the concept of political economy, as well as to the concept of capital. According to my re-reading, the real 'hinge' that holds these concepts and the culture industry together is Adorno's and Horkheimer's attempt to develop a materialist theory of subjectivity in the culture industry chapter by way of turning Kant's concept of schematism into a social-material concept. What Kant presents in the *Critique of Pure Reason* as a 'mechanism' of reason and the pure imagination to synthesize intuitions with a priori concepts becomes in Adorno and Horkheimer the formulation of the culture industry as a mechanism of (capitalist) society to synthesize and pre-structure social experience with prefabricated ideas. Accordingly, the culture industry is not only a social-material concept, but it is understood by Adorno as the *principle for establishing the unity of society*. The latter aspect is important, especially as this goes along with Adorno's interpretation of the transcendental logic in his lectures after WWII (which are usually not read by readers of Adorno who do not have a philosophical background).

Here, schematization of objecthood does not occur in the mind of the subject; rather, it occurs in social reality and is *produced by the capitalist form of consciousness production*. Beside the fact that it comes closer to a genuine philosophical understanding of the chapter, reading the culture industry chapter from this point of view has the following advantages for a contemporary reading of Adorno and Horkheimer's ideas: (1) it reconnects their work with contemporary analyses of abstraction through the digital world, the electronic and brain industries, and new forms of labor; (2) it offers a counter position to the many, pervading positions found in the wide sense of what is often called 'critical theory', i.e., theorists and philosophers who work in the tradition from Deleuze to Butler; (3) it makes the analyses in Adorno and Horkheimer philosophical again; and (4) it moves Adorno's philosophy closer to a contemporary form of Marxism and Marxist analysis of contemporary capitalism, thereby moving away from the 'official' positions offered in contemporary critical theory, from Habermas to Allen.

## REDISCOVERING THE THEORY BEHIND THE CULTURE INDUSTRY

### *The Culture Industry and Social Totality*

'Kultur' in the German tradition differs from its juxtaposition with civilization, which is how the term is used in the Anglo-American tradition. Culture in the German tradition has a wider and deeper meaning for the understanding of individuals and their flourishing *as* individuals and *as cultivated* individuals. While one line of thinking about culture goes back to the humanist tradition, the other line of thinking about culture goes back to the German tradition in aesthetics and its successor in romanticism.<sup>6</sup>

As to the humanist tradition, though this might seem to be remote, we should not

mistake that the humanist tradition and its focus on 'culture' goes back to Ancient and, in particular, Roman thought, which made its way through the German upper high school system, and until recently remained an important element of what it meant to be an 'educated' and 'cultured' person. For example, culture is used in close connection with philosophy, which is defined as 'cultura animi' [cultivation of the soul] and it has an agricultural sense of 'cultivation'. Culture or cultivation refers to the process of helping something to bring out its utmost essence and telos. A plant can only grow and flourish, and thereby become *free*, if it is held in its own possibilities and if it can develop that which lies in it as a definite possibility. Similarly, an individual can only *become* an individual and in this sense free herself *towards* herself when she grows up in an environment that nourishes and cultivates her own inward possibilities.<sup>7</sup> Though Adorno and Horkheimer do not explicitly speak about culture in this sense, and though they would have distanced themselves from any teleological and quasi-biological determinism (which most prominently is featured in Spengler), they indicate through the object of their critique, namely, the culture *industry*, that true culture and true *Bildung* [character formation] can make one free. Accordingly, culture is not simply a process of suppression, as, for example, in Freud. Indeed, a wider and less conservative meaning of 'Kultur' can be reached if we more broadly understand artistic, creative, and aesthetic activities as truth-oriented (and therefore no longer teleologically determined), which enters the picture through the German tradition in aesthetics as a discipline that, negating the orientation towards the sciences, is related to reason, freedom, and education. Culture, in this tradition, is related to autonomy.

According to this romanticist and aesthetic tradition that Adorno and Horkheimer embrace, culture has a threefold structure of being based on autonomy, spontaneity, and criticism (negative distance), which has its

roots in the idea that aesthetics is an autonomous actualization of reason and judgment.<sup>8</sup> As this tradition has it, aesthetic reason and the aesthetic realm are the *true* realms of human freedom, insofar as – at least if we take Kant for a moment as an authority in this – in theoretical judgments as well as in moral judgments human reason is not really free and autonomous, insofar as reason in these areas of human reality is *bound* by the object and bound to objective truth. However, as Kant's *Critique of Judgement* and the entire romantic aesthetics that followed Schiller holds, aesthetics, art, and creative practices are the 'realm' in which human judgment, reasoning, reflection, and critical engagement can come to a full realization of its own possibilities. Put differently, creativity and the arts are the only way in which humans can really *become* free, spontaneous, and autonomous.<sup>9</sup> Given this, it is immediately clear why Adorno made several attempts to contrast culture with administration rather than with civilization (CI: 123; GS 8: 122). Moreover, it also should be clear why, for Adorno and Horkheimer, true artistic practice is *opposed to capital* and how culture is turned into an industry, since the effect of the industrialization as well as the administered culture is *precisely* to void spontaneity, autonomy, and criticism. Within the culture industry, 'pseudoindividuality reigns' (DoE: 125; GS 3: 177). Sadly, this social structure no longer allows the individual to use her productive imagination and creative capacities independent from the objective world; it no longer allows the individual to 'play' with the world, to lay down her highest ideas in art, to become a flourishing individual, and it no longer permits critical distance from the world as a whole. As a consequence, the total integration of individuals heightens, true future oriented and distanced thinking disappears, and aesthetic reason is diminished, if not destroyed. What is left is a cruel, cold, and brutalizing form of morality as well as an all evasive science that, under its technological veil, fixates and defines what *can* be known.

Society as a given fact 'absorbs the truth content' (CI: 65; GS 3: 303), and appropriated by the positivist (social) sciences, turns into something that has no future and remains what it is forever: 'Imagination is replaced by a mechanically relentless control mechanism which determines whether the latest imago to the distributed really represents an exact, accurate and reliable reflection of the relevant item of reality' (CI: 64; GS 3: 301). Without the free appropriation of new rules and without the critical distance of judgments, society becomes a naturalized and reified thing that appears as something external to social individuals. The culture industry, as Adorno's and Horkheimer's argument can be read, affirms this increasing naturalization.

A third sense of 'culture', in addition to the humanist and aesthetic sense of the term, that Adorno and Horkheimer implicitly have in mind comes into play through twentieth-century philosophy and social theory, particularly through the thought of Simmel and Lukács, and suggests that we read the culture industry chapter through the lens of a theory of capitalist reproduction. According to Lukács's early work, which in turn was influenced by Simmel and Neo-Kantian philosophies, and which was read by all members of the early Frankfurt School, 'culture' can be interpreted through an expanded version of Marx's concept of commodity and commodification. Lukács tried to extend the concept of commodity, and what he saw as its being limited in Marx to the products of labor, by arguing that, once we understand commodity relations as constituted by a larger horizon of meaning, commodification can also be understood as reification, which can then be extended to all kinds of social phenomena, such as the arts, language, law, love, and politics.<sup>10</sup> Reification, he argued, extends Marx's basic ideas beyond the realm of production to include the entirety of social activities and products, i.e., culture. This shift is important for two main reasons: (1) it expands the reach of Marxism and Marxist philosophy beyond the narrow realm of labor and production, and

(2) it can more properly argue that 'culture' is not simply an echo or the superstructure above an economic base, but, instead, is a substantial part of the reproduction of the entire system. Culture, in this sense, becomes central for a critical theory that tries to grasp social reality through the lens of political economy. Though Adorno's and Horkheimer's analysis nicely shows how a specific ideological and psychic structure (for example, desires) are produced as empty wishes by the culture industry, they rarely trace this structure back to the fact that it depends upon the structure of production by media corporations and the structure of distribution and consumption (for this, see Wayne, 2003: 61–86). Adorno and Horkheimer primarily focus on the products themselves.<sup>11</sup>

Seen from this perspective, culture is not simply an arena for beliefs, for mental structures, for ideas, or for the construction of body knowledge about society itself; rather, it becomes functional for the reproduction of the *system itself* as a sort of 'super-ideology' that produces and structures thought in a way that is uncritical, equalized, standardized, and unified. Accordingly, for Adorno and Horkheimer, the culture industry is not simply the arena for false beliefs or the formation of a belief system that leads to cognitive distortions, implicit biases, or other forms of cognitive mismatch with reality; instead, the culture industry becomes one, if not *the*, main dimension of society through which capitalist society reproduces itself. Knowledge is here not seen as something external to society or, as a poor reading of Marx has it, as 'superstructure'; rather, knowledge of society and its subjectivity is itself part of its reproduction. This conclusion is very important for understanding the concept of the culture industry, especially given that the majority of the literature still interprets the culture industry as a construction of the knowledge of societal members towards the external reality; the point, however, is to understand the culture industry as a *self*-relation through which societal members gain knowledge of themselves as *societal* members.<sup>12</sup>

## ***The Culture Industry as Social Schematism***

The philosophical dimension of Adorno's and Horkheimer's analysis of the culture industry within the horizon of a theory of capitalist social reproduction is closely linked to the self-relation of this society to itself and the self-knowledge that it produces for its own operations. In a central passage that is not often read because it is not contained in the chapter on the culture industry in *Dialectic of Enlightenment*, the authors write the following:

The true nature of the schematism which externally coordinates the universal and the particular, the concept and the individual, case, finally turns out, in current science, to be the interest of industrial society. Being is apprehended in terms of manipulation and administration. Everything including the individual human being, not to mention the animal, becomes a repeatable, replaceable process, a mere example of the conceptual models of the system. Conflict between administrative, reifying science, between the public mind and the experience of the individual, is precluded by the prevailing circumstances. The senses are determined by the conceptual apparatus in advance of perception; the citizen sees the world as made a priori of the stuff from which he himself constructs it. Kant intuitively anticipated what Hollywood has consciously put into practice: images are precensored during production by the same standard of understanding which will later determine their reception by viewers. (DoE: 65; GS 3: 102)

Here, the authors put to work one of the most important concepts in Kant's *Critique of Pure Reason* in their analysis of the culture industry and mass entertainment. In Kant's *Critique*, 'schematism' is a mechanism that – independent from the empirical appropriation of the world – makes it possible for the human mind to have a 'stable' and given reality at all. According to Kant, and summarized in a very reductive way, the productive imagination produces a pure synthesis of pure intuitions and the rational categories needed to have a reality at all. Since the categories are at the same time the conditions for the intelligibility of *objects as objects*,

i.e., as objects *for* reason, the schematism allows reason to 'project' in advance a structured world *in which* or *through which* all concrete experiences are possible. In another passage, the authors write:

According to Kant, the homogeneity of the general and the particular is guaranteed by the 'schematism of pure understanding', by which he means the unconscious activity of the intellectual mechanism which structures perception in accordance with the understanding. The intelligibility which subjective judgment discovers in any matter is imprinted on that matter by the intellect as an objective quality *before it enters the ego*. Without such a schematism, in short, without the intellectual element in perception, no impression would conform to the corresponding concept, no category to the particular example; thought, not to speak of the system towards which everything is directed, *would be devoid of unity*. (DoE: 64; GS 3: 100; italics, C.L.)

In this passage I highlighted that the schematism itself functions as an 'unconscious' mechanism in the soul before the ego and its rationality can get hold of it. Two things are important in this regard: (1) even if, out of context, this passage reads like a Freudian translation of the epistemological concept found in Kant, a further careful reading reveals that Adorno and Horkheimer reframe the concept of schematism by giving it a social-material meaning; (2) Adorno and Horkheimer stress the fact that in Kant, schematism is important for establishing the *unity* of the knowledge of reality, and, since in Kant the conditions for the possibility of *knowledge* of things are at the same time the conditions for the possibility of the knowledge of *things*, the unity that they have in mind is the *social-material* unity of society *in its self-knowledge*. The social-material transition that Adorno and Horkheimer prepare here, the idea for which they received from Sohn-Rethel's theory of social abstraction (Sohn-Rethel, 1978), is based on the claim that the culture industry is the real-existing social-material schema that establishes the framework of social knowledge *as such*. 'Knowledge as such' refers here to

knowledge that this society – *as a specifically capitalist society* – can generate under these conditions, and to the possibility of knowing itself *as* such a society in its unity. The culture industry, accordingly, stands for the knowledge that capitalist society needs to have of itself in order to allow for all concrete activities that fall under it. Moreover, with respect to individuals it establishes a pre-perceptive frame in which the world as a whole is projected in advance, which ‘censors’ in advance what can be experienced *in* this world. The culture industry establishes a socially a priori harmony between production and consumption. Put in Adorno’s and Horkheimer’s words:

Even during their leisure time, consumers must orient themselves according to the unity of production. The active contribution which Kantian schematism still expected of subjects – that they should, from the first, relate sensuous multiplicity to fundamental concepts – is denied to the subject by industry. It purveys schematism as its first service to the customer. According to Kantian schematism, a secret mechanism within the psyche preformed immediate data to fit them into the system of pure reason. That secret has now been unraveled. (DoE: 98; GS 3: 145)

It is interesting to note that the ‘dreamless art for the people’ (DoE: 98) comes close to a surprising formulation that Marx uses in regard to capital fetishism in his preparatory manuscripts for *Capital*, written between 1861 and 1863. Marx describes the commodity fetishism, which he analyses in this manuscript as interest and capital fetishism, in an astonishing formula, as ‘fiction without fantasy’ (Marx, 1979: 1450).<sup>13</sup> What this means is that in its schematization of what can be meaningfully experienced under capitalism, the culture industry functions in the same fashion as commodity fetishism in Marx, insofar as commodity fetishism is not a subjective form of knowledge or belief; rather, it is the objective and, hence, unconscious praxis tied to the entire exchange and production praxis of valorized labor and commodities. Indeed, fetishism is an ‘objective

fiction’ for which subjective engagement is no longer needed. Similarly, the culture industry is the projection of societal self-knowledge for which experience – as something that escapes the culture industry – is no longer meaningful.

### ***The Main Characteristics of the Culture Industry***

The culture industry as a societal schematism that projects forward a frame for the unity of experience and understanding, ahead of all concrete activity, is characterized by a few noteworthy concepts of social understanding, which are implicitly opposed to ‘true’ culture as something that is based on *uniqueness, non-instrumentality, autonomy, imagination, exceptionality, happiness, transcendence, utopian impulses, needs, beauty, and complexity*. In contrast, the culture industry prefigures sociality as something that is based on *sameness, repeatability, instrumentality, affirmation, empty wishes, and simplicity*.<sup>14</sup> The most important social concept under which everything becomes possible in a capitalist society is *sameness*:

The schematic nature of this procedure is evident from the fact that the mechanically differentiated products are ultimately all the same. That the difference between the models of Chrysler and General Motors is fundamentally illusory is known by any child, who is fascinated by that very difference. (DoE: 97; GS 3: 144)

Sameness is important because it allows us to see more easily the connection to the question of exchange and the real abstraction that is a part of its form. Among many other things, one aspect that is crucial for the viability of the value form in Marx’s *Capital* is that value be based on an abstraction that establishes a universal *exchangeability* of everything with everything. As the authors put it, ‘[w]hatever might be different is made the same. [...] The identity of everything with everything is bought at the cost that

nothing can at the same time be identical to itself' (DoE: 8; GS 3: 28). The quantitative equation that makes commodities exchangeable requires a qualitative dimension that *makes it possible* for commodities to be equated with each other, which, in turn, permits them to be exchanged. Although we do not need to go into all the details of abstraction, wherein abstract labor and value become the universal form that all activities under capitalist conditions take on in reality, it is important to note that Adorno and Horkheimer do not simply operate with an empty opposition of sameness and difference as the speculative structure of modernity (a la Heidegger); instead, as the quotation above shows, Adorno and Horkheimer claim that the framework of sameness from which the culture industry as self-knowledge of capitalist society is derived includes both how it constitutes the identity of products as well as the meaningful horizon for consumption, necessary for capitalist production insofar as autonomous and spontaneous products no longer 'fit' in a valorized world.

The connection between epistemology and social theory as social ontology is also very clearly indicated in other central writings of Adorno: for example, for Adorno, nonidentity is the key concept for what it means to know something *and* the core of social theory as a theory of social reality. Qualitatively different use values are rendered equivalent through a third moment or mediating relation, namely, abstract human labor. In *Negative Dialectics*, Adorno writes, 'the reduction of human labor to the abstract universal concept of average working hours, is fundamentally akin to the principle of identification' (Adorno, 1973: 146). Identity thinking and its accompanying epistemology, hence, are not simply a problem for social theorists and earlier philosophy; rather, it constitutes the *reality* of capitalist social organization. Social epistemology is not only a reconstruction of what and how something like (capitalist) society can be known in and as theory, but it is also constituted *within* society, allowing the basic

concepts of such a theory to function as ontological guiding clues for understanding social *reality*. The critique of identity thinking is therefore *identical with* the analysis and the critique of existing society. Overcoming identity thinking, consequently, is not only a theoretical or academic task, it is at the same time a *political* task. To think from the standpoint of redemption means that we philosophize from the standpoint of a world in which capital is no longer the all-encompassing principle of social structuration. Put differently, the exchange principle is *both* a category that constitutes social knowledge *and* a category that constitutes social reality.<sup>15</sup>

In a similar fashion, the main features that Adorno and Horkheimer attribute to the schema of an industrialized culture are *precisely* those that also characterize the value form and, consequently, capital. Speculatively put, the culture industry is the means through which value is known in the everyday life of individuals socialized in modern societies. Accordingly, we misunderstand the thesis about the sameness of the products of the culture industry if we think of the sameness as one of content; on the contrary, the sameness is an argument about the *form* of cultural products.<sup>16</sup>

The question of sameness has more recently been explored in relation to celebrity culture and the role of fame both for cultural products and for commodities as brands. For example, Taylor and Harris write (2008: 135):

Adorno argued that the culture industry relies upon an unhealthy denial of the marginal nature of the supposed differences between what are essentially the same commodities. The illusion of difference is created by the advertising industry's manufacture of superficial distinctions and purported attributes. This aspect of the culture industry's output is equally true in relation to celebrities and brands. Successfully advertised goods mean that inanimate objects become celebrity products.

The authors illustrate their thesis with reference to tv reality shows and music shows such as *American Idol* or *The Apprentice* (whose starring role, not by chance, was

played by the current US president, Donald Trump, bringing together the branding of himself as a celebrity commodity and fame-power). In these and other examples, celebrity and commodity form are tied together by fame and by what the authors call 'abstract desire' (Taylor and Harris 2008: 138) and the 'politics of banality' (149). The audience is included in 'banality tv' (154) as a participating consumer, and the 'judges' sell the musical products and songs as representatives of the music industry. Moreover, as the authors underline, celebrity culture is closely connected to personality-based politics as spectacle: 'both celebrity culture and the closely related personality-based politics, share the exposure of people's private lives as a distraction from more substantive structural issues – political, social and economic questions – emotional affect replaces political effect' (154).<sup>17</sup>

Closely connected to the category of sameness is the concept of *repeatability*, which, though it follows from the abstract sameness of all things that characterize the products of the culture industry, also differs in one important respect, namely, that its sameness is based on the prevention of *newness* that is already inherent in the value form. '[T]he leveling rule of abstraction', as the authors have it, 'makes everything in nature repeatable' (DoE: 9; GS 3: 29). Products of the culture industry cannot fall outside of the schema, need to be repeatable in principle, and therefore cannot reach real autonomy and spontaneity: 'What is new, however, is that the irreconcilable elements of the concepts of culture, art, and amusement, have been subjected equally to the concept of purpose. [...] Its element is repetition' (DoE: 108; GS 3: 157).

From repeatability and *purpose* we can directly derive the concept of *instrumentality*. The culture industry does not permit a meaningful world in which things are produced, or activities are undertaken, for their inner qualities alone; instead, cultural consumption products are received in accordance with a horizon of assessment through

which everything needs to be 'good for something else' and must be useful for the sake of the overall context of production and capital. Instrumentality should be seen here in close proximity with political economy, insofar as under the universal condition of valorized labor and valorized life everything that humans produce and create has, in the end, only one 'use', namely, to function as a use value for the growth of wealth, i.e., for the self-referential increase of capital and growth of a society that is caught in its mechanisms. As one commentator puts it, '[c]ulture is made specifically for the purpose of being sold; production is subordinated to distribution and the promise of art is thereby dissolved' (Gunster, 2000: 48). As a consequence, everything becomes subjected to the value form, and the culture industry presents us with the knowledge of the value form, and of capital in the form of culture and cultural consumption.

The true function of all cultural products for the commodity and value form and its inherent abstraction, according to Adorno and Horkheimer, is to empty out all wishes and desires that might still be contained in a perverted form in the production of cultural products. 'The culture industry does not sublimate, it suppresses' (DoE: 111; GS 3: 161). Having abstract wishes and desires, however, entails that desires, which under different circumstances would transcend the given reality towards happiness, satisfaction and the fulfillment of needs, become subjected to an empty form (which can then be filled with *any* commodity, or can *repeatedly* be filled with the same commodity). Happiness becomes reduced to the repetition of the same. For Adorno and Horkheimer, canned laughter, enforced fun, and the general gag culture are the best examples of empty repetitions. Laughter becomes the 'instrument for cheating happiness' (DoE: 112; GS 3: 162), nothing is taken seriously anymore, and pseudo-individuality and pseudo-authenticity reign. As the authors state, '[t]he culture industry endlessly cheats its consumer out of what it endlessly promises.

The promissory note of pleasure issued by plot and packaging is indefinitely prolonged' (DoE: 111; GS 3: 161).<sup>18</sup>

As a consequence, society is treated by the culture industry as a given and as a fact. Capitalism is carved in stone. The commodity culture frames all meaning for creative and artistic praxis. The culture industry opens up the same positivistic paradigm as the modern sciences, insofar as everything becomes turned into nature and information. Transcendence, once centered in art and theory, withers away. Everything is what it is.  $A=A$  is the law of value, now made known to every consumer. Products of the culture industry 'are nothing but what they are' (CI: 89; GS 3: 329).

In sum, the ultimate horizon that the culture industry establishes is the socially existing knowledge that belongs to value and the commodity form as existing social relations in their abstract reality. It produces the subjective knowledge of what, objectively, belongs to the value and commodity form. The abstraction that the culture industry carries forward is the commodity fetishism elevated to a general and universal knowledge of this society in its really existing social form.

## EXTENSIONS: CULTURE INDUSTRY AS LIFE INDUSTRY

Adorno's and Horkheimer's treatment of the culture industry is still based on what we might call a 'remainder of subjectivism' in their analysis, if we mean by 'subjectivism' remnants of the idealist philosophy of subjectivity. For example, they still speak of the culture industry as a 'filter' (DoE: 99; GS 3: 147) between the consumer and the world, which, in the context of new forms of production and consumption that we have seen emerging in recent decades, should be modified.<sup>19</sup> Put differently, they assume that there is a subjective 'psychic realm' between intellect and reality. Recent developments have

witnessed the attempt by industries to connect to the mind (electronics, networks), or to life (bio) and the brain (neuro), in order to *directly produce* the mind and brain required for the reproduction of capitalist society. The goal is to make the entirety of life adaptable to the demands of growth and capital, whereby the neurosciences and bio-engineering in connection with the electronic industries are pushing the culture industry onto new levels including human organs, our DNA, and the brain.<sup>20</sup> Through new developments in the brain and life sciences, we are now at a point where the culture industry that Adorno and Horkheimer had in mind (film, radio, tv, advertisement, etc.) becomes less important given that the industries that deal with the entire range of human mental activities and capacities are about to modify these activities and capacities through direct technological modifications and production. These technologies include screens, electronic devices, GPS systems, algorithms, chips, self-ordering refrigerators, and Google-powered glasses. Through these network technologies, a global system of devices and a global internet of things has been established. 'Technologies of the soul' (Stiegler, 2014: 12) and 'programming industries' (Stiegler, 2011: 113) replace the traditional media industries (although they still have the same function) and lead to a '*becoming-commodity of consciousness*' (Stiegler, 2011: 63). The schematism, we might say, becomes implanted where Kant had already located it, namely, *in* the human body and within the human mind. Human organs are powered by technologies that are interconnected through networks, deliver data to digital industries, and make predictions on their own. New 'cultural' products are video games, portable televisions, 3D virtual-reality devices, phone apps, and tracking devices that will be implanted in the body, or developments in the neurosciences that make products marketable by directly controlling consumers. For example, neuroscientific research is used for developing

stimulating systems that can direct consumers' desires without their knowledge. Since these new digital systems keep track of virtually everything, and since they do not forget, they become more knowledgeable than their users. For example, a phone app knows more about the user than the user does about herself. Cultural products in digital and network form can be infinitely modified and placed virtually everywhere; in other words, the *entire* time span and the entire spatial world of individuals can now be occupied by these new cultural products. Again, this scenario goes beyond what Adorno and Horkheimer envisaged, insofar as it will at some point eliminate subjectivity altogether. Consumers' desires will be controlled through 'injections' in the body.

A foreshadow can be seen in the fact that screens are virtually *everywhere* and *always* with us; and behind the surface everything can be traced back to the interest of capital (Stiegler, 2011: 7). Similarly, Jonathan Beller has argued that the products of the culture industry 'are today imbricated in perception itself' (Beller, 2006: 1), which is the effect of the further development of the internet as an all pervasive network of cultural production for the sake of value. As a consequence, the human senses are *produced* and reorganized by new technologies of vision and attention building via the 'incorporation of bodies by capital' (Beller, 2006: 13; for more on this point, also see McLuhan, 1994). What began in the nineteenth century as the 'revolutionizing of the means of perception' (Crary, 2001: 13) has expanded to include digital production. Google is the new Hollywood. Seen from this point of view, film theaters, looked at by Adorno with suspicion because of their mass character, seem to be a romantic thing of the past.

Following Adorno and Horkheimer, Stiegler argues that it is 'libidinal energy itself that tends to be destroyed – that energy of which the objects, which are *those of belief*, are now systematically submitted to calculation in every sphere' (Stiegler, 2013: 65).

This sphere, as mentioned above, goes *beyond* the mental sphere. What is experienced as need, however, is now controlled by mental industries, especially since any desire for something outside of consumption has been taken over by a system of need production. It is no longer simply the case that media technologies take over language (through writing, books, machines, computerization, media, standardizations, etc.); they now take over the whole psychic and sensual apparatus of humans: vision, auditory systems, touch, pain, etc. The whole range of the *noein*, in other words, is in the process of being *produced* by these industries. Consequently, what Adorno and Horkheimer fail to see is that the thesis about the schematization of social objects needs to be supported by a theory of social reproduction and the production of subjectivity required for this reproduction. Towards this end, Stiegler has worked out some aspects of what he calls the 'industrialization of memory' through which subjectivities are produced *before* memory can be externalized (for this, see Stiegler, 2010). Memory, i.e., the access that subjects can gain to themselves and their past, can increasingly *only* be exercised through devices, databases, networks, information technology, etc. Put simply, the (network of) devices always already knows more than the individual. Although libraries also 'know' more than their users, they cannot influence the behavior of individuals in a direct manner. In the case of electronic industries, the individual and the knowledge of her preferences, history, biography, past choices, etc. are connected to each other through the new 'media'. The face-recognition camera in the store will make 'choices' for me and control my desires without me knowing it; my phone, knowing my 'preferences', will guide me to a specific painting in the *Chicago Art Institute*. The problem is not, as Plato once bemoaned, that we forget through externalization; rather, our knowledge is *already* externalized before it confronts the subject. 'Manipulation' of

desires and wishes no longer needs the psyche. The content of our desires can now be created directly. This is a new dimension of industrialized culture; it allows the industries and their fully subsumed sciences to short circuit the ‘cultural’ products that Adorno and Horkheimer had in mind. The identity logic of the culture industry can now directly be produced with screens that function on the level of the brain, i.e., as external mind devices. Similarly, the identity logic of value that Adorno and Horkheimer see operating in the logic of industrialized culture now becomes a ‘global mnemotechnical system’ (Stiegler, 2011: 8) that connects (in principle) every *thing* with every other thing on earth. Global consumption time is now addressed as ‘brain time’ (Stiegler, 2014: 2), and the bitter diagnosis is that this leads to a ‘systematic organization of stupidity’ and the ‘liquidation of all trust and all hope’ (Stiegler, 2013: 67).

Although these new analyses à la Beller and Stiegler are based on an analysis of noetic technologies, we should note that their conclusions are similar to Adorno’s and Horkheimer’s insofar as the integration of individuals into the existing system, and their subsumption to value and commodity form, is still the main consequence of these new developments.

## CONCLUSION

Adorno’s and Horkheimer’s reflections on the culture industry were written in ‘dark times’, and, despite all exaggerations, simplifications, and contemporary extensions, we would do well not to forget that the threat of a fascist world, authoritarian politics, meaningless propaganda, and the production of cultural consumption is with us every day, and, furthermore, that its promises are as empty as they were during the first half of the twentieth century. Given recent political, cultural, and technological developments,

one rather wonders whether, just on a higher level of development, we are in the process of moving back to precisely the same social, economic, and political condition that all early critical theorists endured. Marx’s definition of the proletariat as ‘subject without substance’ – the abstract Cartesian ego – can now be applied to all of us. We are emptied out as consumers and rendered abstract knowers. We consume products that no one needs and we know things that have no real content.

## Notes

- 1 This charge can be found in much Anglo-American literature on how Adorno treats jazz music; however, see a defense of Adorno in Thompson, 2010.
- 2 For these charges, see Habermas, 1985: 138, 145, and 154. In this vein, we should not underestimate that Adorno participated very often in television and radio programs after his return to Germany. In addition, especially the public lectures on topics in education [*Erziehung*] and character formation [*Bildung*] highlight the fact that Adorno’s relation to mass media and public enlightenment is not entirely negative. For example, see his lecture on education after Auschwitz in GS 10.2: 674–690.
- 3 Already in the *Dialectic of Enlightenment* Adorno and Horkheimer look for openings, and especially in Adorno’s later writings it becomes clear that he begins to see the deeper ambivalences of mass entertainment; for this, see Kepler’s contribution in Klein et al., 2011: 257–60.
- 4 For this charge, see the overall thesis in Habermas, 1985.
- 5 For this charge, see, in the larger context of recent Frankfurt School theorizing, Allen, 2014.
- 6 Jameson does not see this historical connection in his threefold conception of culture as a social pattern, everyday life, and creative products (for this, see Jameson, 2007: 17). ‘Kultur’ also has a conservative ring to it in what is called ‘Kulturnation’ [nation of culture] and the political importance of German language and the arts for the ‘German identity’. Although Adorno and Horkheimer cannot be tied to this strand of thinking about culture, it nevertheless would be worthwhile to investigate how they still stick to what could be called a Germany-centered appropriation of the philosophical tradition and of world history.

- 7 We should also not mistake that the 'enemy' philosophers of critical theory, at least in Germany, tried to occupy the terrain of culture, too. For example, Adorno was opposed to a famous book, *Der Verlust der Mitte*, by art historian Hans Sedlmayr; and we should not forget that Martin Heidegger, in an important lecture after WWII entitled *Bauen, Wohnen, Denken*, which deals with architecture and building, refers to cultivation as a way of building and bringing out the essential possibilities in an entity, thereby explicitly bringing out its agricultural sense.
- 8 For more on this argument, see Skees, 2011. In this vein, we should note that Kant refers by 'spontaneity' (1) to the capacity of thought to synthesize objects, (2) to the capacity of the productive imagination [*Einbildungskraft*] to apprehend intuitions, as well as (3) to the foundation for the idea of freedom. Again, we can see that we find a subtle Kantian structure in the culture industry chapter.
- 9 This idea also runs through the (lost) German tradition of elevating museums, artists, language, poetry, and theatre to the level of national education.
- 10 I have argued in a recent essay that Lukács's reading of Marx is a 'productive misreading', since Marx's concept of commodity can already be read as a *social form*, i.e., as something that can shape the entirety of social relations and can therefore turn into the 'culture' of capitalism; for this argument, see Lotz, 2017a.
- 11 In recent decades there has been some research done to unveil the concrete mechanisms and political economy of the media industry (for an overview of this, see Cook, 1996: 27–51; for an overview of cultural economy, though to a large extent uncritical and orthodox, see Armin and Thrift, 2004; for a critical position, see Fuchs, 2015).
- 12 As an example of a misreading of the knowledge production in the culture industry, see Keppler's contribution in the most recent handbook on Adorno in Klein et al., 2011. She interprets the culture industry as a construction of the 'awareness of the complexity and the wealth of societal and individual reality' (2011: 261). In contrast, I would argue that, although her position is not entirely wrong, it reproduces the often misunderstood paradigm of 'false consciousness'. The theory that the media system is establishing a 'false consciousness' can also be found in the US-American left, including in Noam Chomsky's theory of 'Manufacturing Consent'. I try to indicate here that Adorno's concept of 'integration' should be located on the meta-level of establishing social unity and synthesis as knowledge of itself as capitalist society, which is not to be confused with how the media system schematizes information about social reality. In this vein, it would be worthwhile to think more about the relation between the culture industry and Althusser's concept of ideology as the establishment of an 'absolute subject'; for this, see Althusser, 2014. For a further attempt to think about the meta-level integration and the schematization of time and temporality, see my own attempt in Lotz, 2016.
- 13 For more on this, see Lotz, 2017b.
- 14 Seel and Keppler reduce the main features of industrially produced cultural products to manipulation and leveling (Seel and Keppler, 2004: 98). I would argue that they underestimate the 'logical' and schematic aspect of what makes cultural objects in a capitalist system possible. As a consequence, concepts that have a Kantian heritage, such as unity, identity, relation, etc., seem to be more adequate. Seel and Keppler argue against Adorno that there is a moment of non-identity in modern mass culture; for this argument, also see the analysis of consumer culture in Illouz, 1997. Illouz argues that the consumption of love as a commodity still contains an authentic promise.
- 15 For an extension of this idea and its relation to money, see Lotz, 2016.
- 16 For more on this point, see Gunster, 2000: 43.
- 17 For a discussion of the production of *non-communication*, see Baudrillard, 1981 and 1998.
- 18 The structure of promise and desire can also be analyzed with Marx's concept of use value, which the culture industry promises but never delivers (for this, see Haug, 1986).
- 19 The same modification would need to be made to Debord's concept of the spectacle and his thesis that 'the spectacle is capital accumulated to the point that it becomes images' (Debord, 2011: 17).
- 20 In this vein, although he had not yet grasped the full development towards what is now called 'cognitive' capitalism (Moulier-Boutang, 2012), Enzensberger already proposed extending the concept of culture industry to what he calls 'consciousness-industry' (Enzensberger, 1962: 7–17).

# Erziehung: The Critical Theory of Education and Counter-Education

Matthew Charles

The main texts associated with the foundation of the Frankfurt School (Adorno, 1977; Fromm, 2014: 165–201; Horkheimer, 1993; Horkheimer, 2002: 188–243; Marcuse, 2009) develop a distinction between ‘traditional’ and ‘critical’ theory via a conception of research that seeks to transform the established understanding of modern scholarly activity, the relationships between academic disciplines and their associated methodologies, and between academic knowledge and contemporary society. In this sense, critical theory originates as a critique *of theory*, in the sense of the activity of scholarship and research that informs and, with respect to higher education, is considered integral to, modern systems of education.

Central to Max Horkheimer’s (2002a: 190–1) understanding of critical theory is its difference from a traditional conception of theory which, particularly in ‘Anglo-Saxon universities’ from the modern period onwards, conceives of the scholarly production of knowledge according to a model of

the natural sciences that reflects the dominance of industrial production techniques within modern society. In this sense, scholarship is part of humanity’s productive powers (Horkheimer, 2002: 3), for the ‘application of all intellectual and physical means for the mastery of nature’ rests upon the ‘knowledge of man and nature which is stored up in the sciences and in historical experience’ (Horkheimer, 2002: 213, 226). When intellectual production becomes reified as something eternal and natural, however, it leads traditional theory to become unreflective of its own historical and social foundations (Horkheimer, 2002: 194). Horkheimer and others establish the project of the Institute for Social Research as a critical theory that is *materialist* and *dialectical*, in the sense of rejecting the idealist illusion that the cognitive capacities alone are sufficient to grasp, let alone transform, ‘the totality of the real’ (Adorno, 1977: 120, 127–8; cf. Horkheimer, 2002: 242–3; Marcuse, 2009: 100) and of rejecting the empirical facts

of positivistic scientific research as something ‘finished ... indestructible and static’ (Adorno, 1977: 126, 130; cf. Horkheimer, 2002: 199–200).

A number of broad implications for a critical conception of scholarship follow: research must renounce its *systematic* intention (Adorno, 1977: 127, 120), call traditional disciplinary boundaries into question by becoming *inter-* or *transdisciplinary* (Horkheimer, 1993: 1; Adorno, 1977: 130; cf. Osborne, 2011: 15), and foster a *social* mode of practice, in the sense of undertaking ‘permanent collaboration ... in common’ with others (Horkheimer, 1993: 10) and also overcoming the division of labour that detaches academic research from wider society and social life processes (Horkheimer, 2002: 198, 221–4). Renouncing pretensions to disinterestedness, critical theory must speak of what its research means for human and social life beyond the narrow sphere of academic scholarship, concerning itself with human happiness and its realization through the transformation of society (Marcuse, 2009: 100).

These early texts from the 1930s have less to say, however, about the dissemination of such knowledge through the formal activities of teaching and publication and their connection to pedagogical issues of learning and study. In his reflections concerning the ‘transmission of critical theory’, Horkheimer (2002: 241) merely cautions that it is never guaranteed any future ‘community of transmitters’, for this is only assured through an ongoing ‘concern for social transformation ... aroused ever anew by prevailing injustice’. When he does indicate the role of the Institute in supplementing the ‘educational mission’ of the university by fulfilling its teaching responsibilities, there is only the briefest mention given to traditional forms of scholarly dissemination through lectures and seminars (Horkheimer, 1993: 14).

Where these early texts do critically reflect upon education not merely in the sense of the scholarly production of knowledge

but a broader sense of dissemination and socialization, they tend to focus not on formal education or pedagogical techniques but what, from a Freudian-Marxist perspective informed by Erich Fromm, is considered the more significant psycho-social moulding of character that takes place in early childhood within the family. For Fromm (2014: 165–201) and Horkheimer (2002: 47–128), the patriarchal structure of the bourgeois family was crucial to the spirit of capitalist societies to the extent that, regardless of a lack of social standing, the father’s powerful socio-economic authority within the family provided a ‘paternal education’ that accustoms the child to obedience and discretion. This psychological organization of the child into the authority-oriented character placed fundamental limitations on the capacity for critical thought and resistance within formal education, which therefore tends to be disregarded in these early texts. If modern and contemporary education is understood in terms of a fundamental relationship between research *and* teaching, then, much of the first two decades of critical theory therefore cannot be said to provide a critical theory of *education* per se.

## LATE CAPITALISM AND THE EDUCATION INDUSTRY

From the post-war period onward, the first and later second generations of the Frankfurt School became increasingly concerned with diagnosing the transformations within capitalist societies that characterized the new spirit of what they described as late or advanced capitalism and, crucially, the forms of totalitarianism it had given rise to. A number of characteristics are significant in this context: the changed natures of the market following the rise of state and welfare-state forms of capitalism, of labour with the rise of technological automation, and of the family following the decline of the

family wage and the decreasing role of primary socialization. Together, these reflect anxieties regarding economic productivity that, increasingly in the context of theories of 'human capital' and 'the learning society', lead to the unprecedented expansion and development of mass systems of schooling, further and higher education in the second half of the twentieth and early twenty-first centuries, accompanied by the qualitative transformation and what many perceive as the impoverishment of learning, teaching and scholarship itself.

The modern period of European history, Franz Leopold Neumann (1936: 28) suggests, can be characterized by the defeat of liberalism in terms of the shift from a competitive market economy into a monopolistic one and a liberal state into a mass-democratic one. Neumann's (1942: 324–5) analysis of these conditions for the rise of National Socialism points in particular to how the party was required to organize the renewal of its power through the exertion of state machinery, such that schools and universities became subject to increasing control. This control can also be elaborated more generally through his investigations of the bureaucratizing effects of monopoly capitalism upon social institutions and the insidious way this transforms intellectuals into functionaries of the status quo (Neumann, 1953: 932–4).

The increasing necessity for centralized organization, administration and political mediation to stabilize commodity exchange has seen the reciprocal interlocking of civil society and state within a state-regulated capitalism, Jürgen Habermas (1991) argues, which gives rise to a public sector responsible for the state-subsidized production of 'collective commodities' of the material and immaterial infrastructure upon which the private sector belongs (Habermas, 1976: 55–7). This enables, for example, an increase in relative surplus value by heightening the productivity of labour for capital through the development of the technical forces of production (most obviously, for example, public systems of transport and communication).

As industrial work in general became disconnected from the direct exploitation of natural elements through the interposition of intermediating technical instruments, so the need for natural human qualities such as physical strength diminished and the importance of widespread educational and training processes increased (Offe, 1976: 23). Friedrich Pollock (1957: 71; 205–6) believed automation led to the 'very real danger of technological [mass] unemployment' and so the necessity of increasing the average level of intelligence of future workers by radically improving and changing educational facilities from childhood onward. Such education would need to focus in particular on providing a good knowledge of mathematics and science, as well as more specialized training to overcome a shortage of engineers and technicians, but it would also be necessary, given the greater sense of responsibility required to operate within and identify with automated workplaces, to teach people how 'to get more out of life and to be better citizens' (1957: 206). Oskar Negt and Alexander Kluge (1993: 185–6) argue that although capital follows a path of increasing abstraction towards a dead system of accumulated labour, it cannot pursue this without dirtying its hands with the living. Not even late capitalism, with all the technological forces of automation at its disposal, 'would have any use for individuals whose behaviour is reduced to mere reactions' and so it is increasingly required to turn 'human consciousness and contexts of living into its most important raw material'.

For Fromm, Horkheimer and Theodor W. Adorno, the authoritarianism of 'paternal education' within earlier capitalism was connected, as we have seen, to the father's centrality as the principle wage-earner and his dependence on his son for the continuation of his active role in society, a gender order centred, as Nancy Fraser (1994) points out, on the normative ideal of the family wage. Although the majority of children are compelled, under these conditions, to identify with reality

and so submit to the identity of reason and domination, the child who takes what he or she has been taught more seriously than the father himself rebels against the irrationalism concealed in this domination and attempts to live up to the truths of these ideals, resisting the demand to conform (Horkheimer, 1947: 112–13). As Adorno (2005: 186) later adds, this process of internalization of and painful detachment from the ego-ideal of the father figure – necessary for maturity – must be re-enacted a second time with the figure of the teacher.

In Fromm's analysis, however, the 'development of the state capitalist order entails a structural change in the bourgeois nuclear family', as the male loses the economic and patriarchal authority he had previously possessed (Honneth, 1987: 354; cf. Fromm, 2014: 227–9). This has led to the diminishing significance of primary socialization of the child, away from the narrow continuation of the parents' life and, through increasing secondary socialization, towards 'the broader one of producing successful individuals who can stand up for themselves in the contemporary battle of life' (Horkheimer, 1974: 11). These changes weakened the sharper separation between private and public spheres that had been demarcated by distinct figures of social authority and had enabled the traditional bourgeois family to preserve a time and space within childhood of pre-capitalist processes of cultivation and socialization unmediated by the competitive principles of the market (Horkheimer, 2002: 114–15, 124; Adorno, 2009: 153–4; Adorno, 1993: 25).

With the decline of informal education and the rise of public education, every child becomes enclosed from an early age within a system of institutions that constitute 'the most sensitive instruments of social control' (Adorno and Horkheimer, 1997: 149). Key to all these changes, Claus Offe (1973) writes, is the increasing need to increase productivity through the use of bureaucratic workers and civil servants of the welfare state. As an increasing proportion of capital is invested in

fixed infrastructural costs such as technology, the attendant fall of that invested in human labour leads to what Marx characterized as the tendency of the rate of profit to fall, in line with the principle that human labour is productive of the value of commodities. Late capitalism responds to this economic anxiety by attempting, in turn, to increase the productivity of labour. Even where the control of education under National Socialism in the 1930s and 1940s explicitly pursued abhorrent cultural and racial aims, for example, Neumann (1942: 350) points out how in private it emphasized its true aim of promoting education for work: to take 'leadership of all from earliest childhood to the oldest man, not for social purposes ...but from the point of view of productivity'.

As Offe (1984: 95, 99) explains, state power is increasingly required to 'politically regulate who is and who is not a wage-labourer' on the labour market and to transform dispossessed labour power into the commodity form inherent to 'active' wage-labour through education. In particular, 'the teacher expends a kind of labour power which, without itself being a commodity, may have the purpose of educating labour which is a commodity' (Offe, 1973: 110). This is also made possible, Habermas (1976: 55–6) argues, through the 'governmental organization of the educational system, which raises the productivity of human labour through qualification', an example of state investment in 'reflexive labour, that is, labor applied to itself with the aim of increasing the productivity of labor'. This labour is 'not productive in the sense of the direct production of surplus value' but indirectly productive of surplus value to the extent it 'systematically alters conditions under which the surplus value can be appropriated from productive labour' (Habermas, 1976: 56). With the 'systematically managed expansion of the system of continuing education', for example, academic labour shifts from being 'a collective natural commodity' to being 'internalized in the economy cycle' as 'a component of the production process

itself', for 'the state (or private enterprise) now expands capital to purchase the *indirectly productive* labour power of scientists, engineers, teachers, etc. and to transform the products of their labour into cost-cutting commodities' (Habermas, 1976: 56).
