As a consequence of these changes, as Adorno and Horkheimer (1997: xv) make clear, although formal education had once been a privilege that rested upon the exploitation and suffering of a social division of labour (since the wealth appropriated from the production of commodities in the factory paid for the private education and the privileged triumphs of culture), in late capitalism it is the melting-down and selling-off of cultural values themselves as commodities – by the culture and, we could now add, education industries – that generates the capital to purchase new factory and office space for expanded exploitation. The tendency to abolish educational privilege through systems of public education, Adorno and Horkheimer (1997: 160) therefore conclude, 'does not open for the masses the spheres from which they were formerly excluded, but, given existing social conditions, contributes directly to the decay of education and the progress of barbaric meaninglessness'.

The inward assimilation of historical culture via the personal and unique cultivation of the individual, which had been the traditional domain of enlightenment cultivation [*Bildung*], now gives way to the technicized modes of sensibility and behaviour exemplified by instrumental reason, including schematized and depersonalized methods of instruction, which increasingly rely on technological aids (Horkheimer, 1974: 13, 143).

From the mid twentieth century onward, this is paralleled by the spread of so-called progressive pedagogical practices that, along with the declining social status and power of the teaching profession, simultaneously weaken the authority figure of the educator (Adorno, 2005: 177–90). Adorno (2005: 188) confesses to being a reactionary towards new ideas in education, in which 'strictness is

being replaced by a toleration and readiness to help' (Horkheimer 1974: 11). Just as the culture industry piously claims to be guided by its consumers while, through its advertising and editing techniques, it secretly drills its required responses into them in such a way it does the listening for the listener, so seemingly progressive elements within the education industry may be similarly said to perform the thinking for the thinker or the learning for the learner. Lacking the enlightenment moment of self-reflection, the process of socialization connected to *Bildung* loses its association with human reason and freedom and takes on a rigidified necessity once attributed to nature itself (Adorno, 1993: 17–18). Since this crisis cannot be entirely explained by the inadequacies of the educational systems and their teaching methods, pedagogical reforms alone are not sufficient and may even exacerbate this crisis (Adorno, 1993: 15).

## MIMETIC AND RATIONAL EDUCATION

As the possibility of broader social and political transformation receded, the writings of the Frankfurt School focused upon preserving those residues of social life that resisted economic subsumption and, especially within the context of the de-nazification of German institutions, came to place increased expectation on the potential for bourgeois educational forms to change the psychological conditions that permitted the worst excesses of fascism to prevail (Adorno, 2005: 192–4).

Horkheimer insists that one specific psychological mechanism is particularly crucial to learning in 'those early and all but unconscious stages of personal development that determine the individual's eventual character': the 'mimetic impulse of the child' in which 'the whole body is an organ of mimetic expression' (1947: 114–15). While it is impossible to conceive of a system of

education that could fully do away with the coercive psychological mechanisms of reward and punishment associated with paternal education (Horkheimer, 2002c: 111), he envisages the possibility of eliminating this coercion from the later stages of education: 'Cultural progress as a whole, as well as individual education, i.e. the phylogenetic and ontogenetic processes of civilization, consist largely in converting mimetic into rational attitudes' (Horkheimer, 1947: 115). This occurs through the transvaluation of these mimetic impulses, phylogenetically, through religion and then critical reasoning and, ontogenetically, through rational education. This transformation of the mimetic impulses into conscious adaptation eventually permits a form of 'domination' over external objects that Horkheimer had earlier associated with the 'mastery of nature' through scientific knowledge.

As Moisio (2005: 267–8) has elaborated, it is in part the distortion of early forms of mimetic adaptation – positively associated in Horkheimer's work with the private sphere of the bourgeois family – that contribute to the distorted presence of instrumental rationality in later education. Because the mimetic impulse is never fully overcome, though, it 'lies in wait, ready to break out as a destructive force' whenever the rational fulfilment of human potentiality – the promise of happiness – is curtailed (Horkheimer, 1947: 116). The antagonistic social dimensions inherent to education therefore connect individual socialization within the family to the more general tensions of cultivation that Freud had explored in *Civilization and its Discontents*, developed in terms of the mastery of nature by Adorno and Horkheimer in the *Dialectic of Enlightenment*.

According to Adorno and Horkheimer, the enlightened mastery of nature, upon which the progressive and scientific development of civilization depends, originates through a form of mimetic adaptation, an intimate bond of sympathy, similitude or relatedness with things that represents the first

attempts to control and manipulate nature. Enlightenment regresses to myth at the point where enlightened thought ceases to be a means of social emancipation through the mastery of nature and instead becomes a form of domination over the social itself. This occurs in part because enlightened thought forgets or represses its own dialectical entwinement with, and emergence from, nature through the same mimetic impulse it seeks to overcome (Adorno and Horkheimer, 1997: 11). Consequently, enlightened thought must accommodate critical reflection on this element, which Adorno will later develop in terms of non-identity thinking: the 'remembrance of nature in the subject', and so of the reconciliation with nature, by virtue of which it maintains itself *as* enlightened thought (1997: 49, 41).

A 'rational education' would, Horkheimer (1974: 96) writes, permit the possibility of sublimating aggressive tendencies into the more productive outlets of work and knowledge by enabling the capacity for a more critical understanding of wider social causes implicated in individual success or failure. The liberal traits of bourgeois culture which must not only be preserved but extended to all are therefore those that sought to teach each person 'individual self-consciousness, to educate them to the insight that thoughts dwell in everyone, that its dignity imparts itself to all' and that freedom is the freedom to develop one's individual abilities in the context of scientific and technological production, which society needs in its struggle with nature (Horkheimer, 1978: 223, 170, 197–8).

Youth 'must be educated so that it is critical in the face of demagoguery', acquires 'the categories with which to distinguish demagoguery from a truly rational politics' and becomes sensitive enough to any and all persecution that 'something in them should rebel when any individual is not treated as a rational being' (Horkheimer, 1974: 118). Similarly, Neumann (1964: 294–5) is clear that 'if we wish to prevent a demagogue from

using anxiety and apathy' to control society, teachers, students and other 'citizens of the university' must 'suppress our arrogance, inertia, and our revulsion from the alleged dirt of day-to-day politics' and undertake 'responsible educational and political activity' aiming at the humanization of politics and the elimination of anxiety. The concept of freedom involves, Neumann (1964: 203) writes, 'the self-determination of man [*sic*], who must have the possibility of unfolding his potentialities' in terms not just of a negative and juridical freedom from constraint but also a positive and rational freedom stemming from the 'knowledge of external nature, knowledge of human nature, and knowledge of the historical process', as well as the volitional freedom to realize this knowledge. These two concepts of freedom are mutually connected, Neumann (1964: 213–15) insists, since the former is politically necessary for the latter to flourish and since the latter promotes a rational organization of society such that individuals can be politically free. Intellectuals must therefore organize against the bureaucratic tendencies within research activity, defending the principle of academic freedom and struggling for the creation of co-operative communities of research.

In Adorno's (Adorno and Becker, 1999) later writing, this cultivation of intellectual freedom is reconnected with Kant's understanding of enlightenment as the release from self-incurred immaturity [*Unmündigkeit*]. To the extent the education of every individual in political, social and moral awareness fosters the autonomous powers of reflection and self-determination, it is the only foundation of a democratic maturity capable of ensuring the principle of Auschwitz never recurs (Adorno, 2005). The 'only real concrete form of maturity would consist of those few people who are of a mind to do so working with all their energies towards making education an education for protest and for resistance ... for "knocking things down"' (Adorno, 1999: 30–1). This is particularly necessary to supplement the deficiencies of the primary

school system in rural environments, where television programmes and mobile education groups might also be required (Adorno, 2005: 196). This critical theory of education demands 'the self-reflection of thinking ... a thinking against itself' and so 'education toward critical self-reflection', which must include 'critical reflection on pseudo-education [*Halbbildung*], for which culture is essential' (Adorno, 1973: 365; 2005: 193; 1993: 31).

Although Adorno's thought develops the idea of a mimetic remembrance of unreconciled nature further, to the extent this experience remains restricted to aesthetic experience it is largely excluded from Adorno's reflection on rational cultivation through education. In their preoccupation with preserving or retrieving the liberal forms of bourgeois family and of rational education inherited from the enlightenment, Horkheimer, Fromm, Neumann and Adorno therefore have a tendency, despite the sophistication of their thought in many other respects, to undialectically oppose the mimetic and rational elements of education in a linear sequence and so perform their own repression of its mimetic aspect. This at times manifests itself in the (self-avowed) conservatism of their educational attitudes, which can provide a strident criticism of the ongoing deformations of education within capitalism only at the expense of an attendant critique of the liberalism of bourgeois education and consequently of a more dialectical consideration of its disintegration under late capitalism.

### **INTERSUBJECTIVITY: COMMUNICATION AND RECOGNITION**

Subsequent generations of Frankfurt School critical theory, rejecting the Marxist philosophy of history that supposedly 'trapped' Horkheimer, Adorno and others within the

domain of social labour (Honneth, 1993a: xvi, 11–16) and so restricted their vision of social emancipation to the rapidly diminishing action of the proletariat (Honneth, 2007: 65), argued that the idea of universal reconciliation with nature, according to which the first generation often sought to ‘outdo’ a process of expanding reification, must be fundamentally rethought (Honneth, 1979: 46). In particular, the attempt to develop the idea of reconciliation within the framework of the philosophy of consciousness lead Adorno to ‘the surrender of all cognitive competence’ from the domain of science to that of art and artistic production, placing modern art on an equal footing with critical theory in a way that reveals ‘the embarrassment into which critique falls due to the loss of innocence of its consciousness as science’, as Horkheimer had initially conceived it (Habermas, 1984: 384; 1973: 241).

Nonetheless, for Habermas, the first generation’s hoped for resurrection of a dominated nature through the appeal to a non-rational or non-conceptual mimetic capacity usefully suggests the possibility of a ‘relation between persons in which the one accommodates to the other, identifies with the other, empathizes with the other’ and consequently of spheres beyond that of art ‘in which the mimetic capacity gains objective shape’ (Habermas, 1984: 384, 390; cf. Honneth, 1979: 46–57; Benhabib, 1986: 189–90). For Habermas, the *Dialectic of Enlightenment* abandoned the more direct path of recognizing, from the ‘inner logics of different complexes of rationality ... a unity of rationality beneath the husk of an everyday practice that has been simultaneously rationalized and reified’ (1984: 382), and so anticipating a domain of the social – mutual understanding as the promise of communication free from domination – that remained ‘foreign to the tradition of critical theory’ (Honneth 1993a, xii). Here, the idea of reconciliation takes up the idea of maturity – autonomy and responsibility within the rational domain of communication – in such a way that it not

only abandons the metaphysical promise of a reconciliation with nature but is predicated upon the continued scientific and technological mastery of nature necessary for human survival (Habermas, 2000a: 195–6).

This theory of communicative action therefore presents one path to take ‘under historical circumstances that prohibit the thought of revolution’ (Habermas, 2000b: 226). Eschewing the attendant theory of crisis that justifies the possibility and necessity of revolution, Habermas’s (1984: 45, 67–9) materialism generalizes Piaget’s concept of a decentration of the egocentric understanding of the world – the stages of cognitive development characterized in terms of structurally described levels of learning – to provide a social evolutionary perspective upon a world-historical process of rationalization of world-views and lifeworlds. For Seyla Benhabib (1986: 210–12), this is the attempt, after Adorno, to conceive the non-identity of the subject not in terms of an aesthetic ideal but a moral and political one. Benhabib (1986: 214–15) adds that this solution signifies ‘self-actualization’ in the Hegelian sense of *Bildung*, as an ‘educational process in which the capacity for reflection and autonomy are developed’ in such a way that the empirical individual is transcended, and a transsubjective subject is implied in ‘the cumulative logic of the historical process’. Axel Honneth (Honneth and Joas, 1988: 154–5) similarly sees historical materialism transformed, under Habermas, into a ‘theory ... of the educational process that has taken place in the course of the human species’ history’, one that Honneth develops in terms of intersubjective recognition.

To the extent that the terrain of action, as a site of social struggle, becomes reconceived by the second generation of Frankfurt School critical theory in terms of communication or recognition, their work returns to the origins of critical theory within the context of a critical theory of *transmission* that had been passed over in favour of a programme of scholarly *research*. Honneth

(2007: 67) understands Habermas's theory of communicative action as recovering 'the categorial means necessary for a revival of Horkheimer's ideas of social critique', promoting transdisciplinarity not only between the disciplines of research but also between teaching and research.

In Habermas's (1971a: 304–12) writing, the distinct educational and cultural implications of Horkheimer's original conception of a critical theory are developed by exposing the cognitive interests that traditional theory had concealed. Habermas (1971b: 100–1, 53–4) comes to understand the changed constellation of late capitalism in terms of the predominance of the technical cognitive interests of the empirical-analytical sciences ('control over objectified processes' (Habermas, 1971a: 309)) without the concomitant practical and emancipatory interests of the historical-hermeneutical sciences, from which the former has estranged itself. What remains significant for Habermas (1971b: 85–7) is not the retreat from science through the attempt to conceive some alternative relationship with nature, since this technical cognitive interest corresponds to, and cannot be separate from, the logic of purposive-rational action of work itself. Rather, what must be countered is the attendant depoliticization of the public sphere, as the interaction of reciprocal relationships between subjects under intersubjectively comprehensible and binding norms, which therefore excludes from public discussion all practical questions concerning scientific and technical control. Understood in this context, what Habermas (1989: 118) proposes with the 'material critique of science and scholarship' is less the rehumanization of nature, in the sense of universal reconciliation, than the rehumanization of scientific scholarship. The idea of the university must ultimately be based on a scholarship of knowledge directed towards public education and communication: to 'transmit, interpret and develop the cultural tradition of society', influencing the 'self-understanding of the general public' through interpretations

provided by the social sciences and humanities (Habermas, 1971b: 4).

In this, Habermas (1991: 1–4, 160) seeks to recover and repoliticize a bourgeois public sphere that had originally evolved from the world of letters, expanded to promote the enlightened values of critical reasoning through the daily presses, but whose social foundations have 'for about a century ... been caught up in a process of decomposition' and so become replaced by the 'pseudo-public or sham-private world of culture consumption'. With the modern transformation of the liberal constitutional into a social-welfare state, publicity becomes extended to all organizations acting in state-related fashion, including media-controlled subsystems of the economy (Habermas, 1991: 231–2). Whereas once 'you had to pay for books, theatre, concert, and museum, but not for the conversation about what you had read, heard, and seen', today 'the conversation itself is administered' and 'formalized' via 'professional dialogues from the podium, panel discussions, and round table shows ... it assumes commodity form even at "conferences" where anyone can "participate"' (1991: 164).

An attendant colonization of public education occurs through the juridification of schooling, whereby norms and contexts for coordinating action based on mutual understanding become remodelled on the basis of legal principles transposed from the private law of the state (Habermas, 1987: 356–8). As a consequence, 'decision-making procedures' that once treated those involved in the pedagogical process as having the mature capacity to 'represent their own interests and to regulate their affairs themselves' become bureaucratically administered on behalf of those subjects as legal rights that penetrate 'deep into the teaching and learning process' (1987: 371–2). This process produces an abstraction from all particular pedagogic needs and interests that ultimately endangers the freedom and initiative of the teacher (Habermas, 1987: 371), while permitting the integration of education into the system

of social labour, in terms of increasing productivity at the expense of cutting its 'ties to the political, public realm' (1984: 371; 1971b, 5–6).

In his critical development of Habermas's position, Honneth (1993a: xvii) seeks to explain social development not according to an evolutionary logic of rationalization but a 'dynamic of social struggle' located within 'social interactions'. A 'communication paradigm conceived not in terms of a theory of language, but in terms of a theory of recognition', Honneth (2007, 71–2) argues, 'can ultimately close the theoretical gap left by Habermas in his further development of Horkheimer's program'. One way in which social relations of recognition have been improved, Honneth (2014, 241–2) claims, is through comprehensive educational reforms. Although the political discourse of modernity frequently addressed the theme of public education, contemporary philosophy has neglected this insight into the intrinsic association between democratic politics and democratic education: that state-administered education is necessary for students to develop the reflective habits required to participate in democratic procedures. Honneth (2015) insists that a reinvigorated programme of democratic education is therefore required, premised on the confidence that it is possible and necessary for state education to guide rational deliberation, infuse democratic values and goals and enable social recognition, promoting the individual self-respect and self-esteem that permits future citizens to act with self-confidence in the public sphere.

As Fraser and Benhabib point out, however, the struggle for recognition must also address the way social institutes constitute 'institutionalized patterns of cultural value' that prevent parity of participation in social life (Fraser and Honneth, 2003: 29), and so must concern itself with redistribution as well, since struggles 'for recognition can be addressed by changing our cultural patterns of interpretation, communication, and representation' in ways that 'have distributive

consequences' (Benhabib, 2002: 69–70), particularly with regard to schooling. Fraser (Fraser and Honneth, 2003: 81–2) and Benhabib (2008, 2006: 51–8) both focus on the banning of the hijab within public education systems in France and the need to take affirmative steps to ensure the right of minority groups to fully participate without requiring assimilation or exacerbating subordination. Simultaneously, however, 'Schools in democratic society have the special responsibility to prepare the young for citizenship ... the capacity to engage others about how they will live together', Benhabib (2008: 101) argues, and 'any educational system that denies the exposure of children to the most advanced forms of knowledge and inquiry' may, out of 'respect for a minority community's quest to preserve its ways of life', unjustifiably deny the equal right to develop moral and intellectual faculties as a full human being but also limit the social mobility of the young (2002: 123). Although controversies over the hijab generated 'genuine public discourse in the French public sphere', the young women involved were not asked to justify 'their actions with "good reasons in the public sphere"' (Benhabib, 2006: 56–7) and so what Benhabib understands as their attempt to resignify the meaning of wearing the hijab from one of private religious observance to politicized cultural defiance within the public sphere itself was overlooked and a genuine opportunity for social learning passed over.

To the extent that, through intersubjective theories of communicative action and recognition, later generations of the Frankfurt School deepen the theoretical resources for conceptualizing and justifying both the scholarly production of knowledge and the conditions of its communication within the public sphere, their work can be seen as moving beyond the first generation in response to changed socio-economic conditions. This is nonetheless achieved in a way that extends what has been suggested is the sometimes problematically undialectical

distinction between mimetic and rational education and historically generalizes a liberal and uncritical conception of the bourgeois public sphere. Where contemporary critical pedagogy doesn't overlook the Frankfurt School entirely, the predominant influence of the work of Habermas on Anglophone critical theories of education (Ewert, 1991) entails that they tend to repeat these problems.

## COUNTER-EDUCATION

In order to recover and reconstruct the outlines of an alternative trajectory for a critical theory of education, we might retrace the course of intellectual development just described by beginning with Honneth's (1993a: 280–1; 2007: 74–5) criticism of the turn taken by critical theory in developing an account of intersubjectivity directed exclusively at rules of communication to the detriment of analysis of the bodily and physical dimensions of social action, including those involved in labour.

In his early writings, Honneth sought to reconnect the concept of social labour back to a Marxist account of social emancipation by developing a critical understanding of work, in which the workers' subversive efforts to gain control over the work revealed and justified the desire for autonomy over their activity. Honneth (1995b: 16) makes clear that this draws on Marx's early understanding of work not only in relation to economic growth or productivity but also from the position of practical self-development associated with *Bildung*. Here labour involves a formative, socializing and conscious learning process unrecognizable to Habermas (Honneth, 1995a: 44–7), 'in which working subjects become aware of the fact that their capabilities and needs go far beyond the possibilities permitted by the given social structure' and so 'the educational potential of work' might become the practical 'foundation of a theory of social revolution' (1995b: 16, 25).

Although Honneth later develops this position into the more familiar Hegelian critique of the organization of labour on the basis of the need for social integration and recognition already discussed, this early attempt to reconceptualize labour in terms of the production not only of objective products but also subjective learning processes provides a starting point for revising Honneth's interpretation of Walter Benjamin in a way that will connect the latter more closely with the more recent work of Alexander Kluge and Oskar Negt. To the extent that their overlapping philosophical and educational concerns may be attributed to their involvement in the student movements of (for Benjamin) the 1910s and (for Kluge and Negt) 1960s, this also explains a certain intellectual distance from the orthodoxy of, respectively, the first and second generations of the Frankfurt School. Benjamin, whose writings on education have been largely overlooked in the Anglophone reception of his work, provides a concept of education that might be conjoined with the writings of Kluge and Negt, whose own body of work remains perhaps the most interesting and, again in the Anglophone sphere at least, most neglected aspect of the Frankfurt School, to develop an alternative critical theory of counter-education.

According to Honneth (1993b: 85), what 'Benjamin in his early years had in mind ... can, for all its metaphysical accentuation, indeed be rationally reconstructed', pointing to a form of experience in which 'reality appears as a field of reference for intersubjective, lived experiences ... tied to an ability peculiar to human species'. Benjamin's mimetic theory of language, Habermas (2000b: 214–16) claims, 'is correct in supposing that the oldest semantic stratum is that of expression ... one form of the animal instincts that is manifested in expressive movements' and so 'the as-yet-uninterrupted connection of the human organism with surrounding nature'. Honneth (2009: 115–16) elaborates this position in relation to that communicative sphere which Benjamin's

'Critique of Violence' identifies as 'forms of social agreement that arise without any use of violence'. This accords with Honneth's (1993: 92) more general attempt to recode Benjamin's idea of 'messianic power' as a 'symbolic restitution' and recognition of the 'moral integrity' of the victims of the past.

Yet Benjamin's 'Critique of Violence' also suggests an alternative domain of everyday experience in which a divine force is said to actualize itself in present practice: the sphere of education. For a divine violence, Benjamin (1999a: 250) writes, 'is not only attested to by religious tradition but also found in present-day life in ... educative violence, which in its perfected form stands outside the law'. To the extent that Honneth (2009: 123–5), like Habermas, seeks to rationally redevelop Benjamin's account of language as sphere of action free from coercion or violence, he is forced to reject such a conception of education as a 'terroristic', 'theocratic' and 'pathological' justification of corporal punishment, one that reflects elements of the immature Benjamin's involvement in the German Youth Movement and its programme for anti-bourgeois educational reform.

The educative violence that Benjamin associates with a noncoercive form of divine force is postulated from the existence of an anarchic, law-annihilating human violence (as a disruptive or interruptive expression of pure means without coercive end). Although it remains entirely speculative in the essay, this concept of educative violence could be developed in accordance with a contemporary allusion to the pedagogic gaze of the parent as a form of nonviolent control (Benjamin, 1999a: 284–5):

The growing child must be conscious not just of the vigilance of the paternal eye but of what can ensue when the eye brightens or clouds over. This nonviolent control ... has more influence on the child in essential matters than anything else (more than corporal punishment and above all more than the much-vaunted power of example).

If there are significant resonances with Honneth's concept of recognition here, which

already broadens out Habermas's communicative action beyond the linguistic domain, Benjamin's more Romantic notion of the pedagogic gaze constitutes a psychosomatic medium of mimetic interplay between generations, in which both subject and object are mutually transformed. In Benjamin's 'Programme for a Proletarian Children's Theatre', for example, written as the theoretical foundations for Asja Lacis's practical work educating orphaned street children in the Soviet Union, the bodily gestures of the performing child are observed by the adult audience as a 'secret signal of what is to come ... from another world' (203–6).

This observation is nonetheless predicated on the assertion by the educator of what Benjamin (1999a: 487, translated altered) in *One-Way Street* describes as a form of *mastery*, not of the young but of the relationship between generations:

But who would trust a flogging-master who proclaimed the mastery of children by adults to be the purpose of education? Is not education, above all, the indispensable ordering of the relationship between generations and therefore mastery (if we are to use this term) of that relationship and not of children?

The problematically violent mastery of students as the object of education is exemplified not only in the corporal punishment of authoritarian education, for Benjamin (2016: 196–8), but also in the 'new pedagogy, the fun-loving reformism' of progressive bourgeois schooling, which treats children, like commodity-producing European societies toward the rest of the world, as if primitively eager consumers of its own edifying cultural junk. This is also true of the 'antiproletarian education for proletarians' provided by the bourgeoisie and the 'pseudorevolutionary educational idealism' of certain strands of Marxist education (Benjamin, 1999b: 274).

Benjamin's positive notion of a mastery of the educational medium, *against* the mastery of children, takes us beyond the context of non-coercive forms of communication or

recognition. This might be developed in a more practical and contemporary context via Marcuse's (1999: 106, 82) claims concerning 'the tyranny of public opinion' in which 'violence and suppression are promulgated, practiced, and defended' and 'the people subjected to these governments are educated to sustain such practices as necessary for the preservation of the status quo'. The practice of a passive form of tolerance within a framework determined by the authorities and a society defined by institutionalized inequality ultimately serves the continuation of such oppression. The defence of freedom of speech that tolerates all points of view equally and treats even the most misinformed opinion with the same respect as others results in a '*neutralization* of opposites, a neutralization, however, which takes place on the firm grounds of the structural limitation of tolerance and within a preformed mentality' (Marcuse, 1999: 97). Marcuse (1999: 114–15) also sees abstract tolerance manifested within systems of education that understand the self-actualization of the child only in terms of permissiveness without any conception of a liberating kind of repression often necessary to transform psychic elements that permit self-identity, and so 'encourages non-conformity and letting-go in ways which leave the real engines of repression in the society entirely intact'.

Marcuse (1999: 100) therefore speaks of the necessary 'withdrawal of toleration of speech and assembly from groups and movements which promote aggressive policies, armament, chauvinism, discrimination on the grounds of race and religion, or which oppose the extension of public services' and the need to connect political programmes of education with organization within communities. 'Today, education which counteracts the professional training for effective performance for the Establishment – counter-education', he writes (2001: 159), 'is the indispensable weapon of political radicalization'.

Marcuse's concept of counter-education was significant for the development of

Angela Davis's (1998: 316–17) own attempt to link education and liberation in the context of the political and social struggles of the black community. In her earlier writings, she explores how this moment is exemplified in the emancipation from slavery of the African-American social reformer Frederick Douglass, although Davis (2012: 194–7) is later critical of the way in which this early work relied on an 'implicitly masculinist notion of freedom' from the Kantian, Hegelian and Marxist philosophy she had learnt from the critical theory of Marcuse and Adorno, and which served to exclude women from enjoying the full benefits of freedom.

Her later work (2012: 197) draws more fully on Afro-American and Feminist studies to link the philosophical understanding of freedom with histories of black political struggle and 'new ways of producing knowledge and transforming social relations'. While continuing to demand the elimination of institutional racism that excluded, for example, black students from higher education, Davis (1990: 180–1, 2–4) draws attention, for example, to the way in which sexuality could be used to deny the freedom of working-class black women, to how the academy cannot be the only site of political struggle against racism, sexism and homophobia, nor black women students and teachers the only groups that must be defended from attacks intended to deny their freedom, and how access to higher learning is conditioned by wider economic levels of impoverishment that cannot be addressed through educational solutions alone.

Davis's attentiveness to how the subject of education and their subjective awareness of bodily and material dimensions of 'race', gender, sex, sexuality and class might produce not only new kinds of knowledge but also new social relations resonates with Benjamin's demand to rethink the relation between teaching and research. Benjamin (2011: 205) insists on the creative function of the student body as a 'great transformer' of scholarly methods within the university, to

the extent that teaching is 'capable of adapting to new strata of students in such a way that a rearrangement of the subject matter would give rise to entirely new forms of knowledge'. Indeed, the sterility of academic research is attributed to the failure of its pedagogical task of turning teaching into a fruitful activity (Benjamin, 1999b: 459–61). For certain traditional subjects, then, it has become necessary to entirely re-examine the presumed association between teaching and research upon which academic activity is founded, and instead of looking 'to research to lead a revival in teaching ... strive with a certain intransigence for an – albeit very indirect – improvement in research to emerge from the teaching' (Benjamin, 1999b: 419–20).

One model for such a practice can be found in Benjamin's own experiments with radio broadcasting in the late 1920s and early 1930s. Although radio's civic education programmes largely borrowed the existing forms of scholarly dissemination with minor concession to popularity, radio's potential to address unlimited numbers simultaneously in their own homes required a complete rearrangement of the material in line with the interests and questions of the masses. This interplay 'not only mobilizes knowledge in the direction of the public, but mobilizes the public in the direction of knowledge', transforming the substance of knowledge in a way that impacts on the pursuit of knowledge itself (Benjamin, 2014: 370).

These claims could be contextualized in relation to Negt and Kluge's (1993: 147) call for the production of a proletarian *counter-public* sphere: for 'television, this is a matter of a stronger emphasis on educational programming ... in the case of universities, it is one of developing a public media cartel indigenous to higher education; in the case of the unions, an intensification of the unions' own professional training and adult education programs. Since the public sphere as it currently exists has been constituted as a bourgeois public sphere that excludes the experience of workers, Negt and Kluge

(1993: xlviii, 3, 9) claim that their 'political motive is to uncouple the investigation of the public sphere ... from its naturally rooted context ... in the formal characteristics of communication' and reject the idea it might be 'interpreted' or even 'salvaged' through 'reference to the emphatic concept of a public sphere of the early bourgeoisie', modelled on a republic of scholars.

For Fraser (1990: 57–61), the specific form in which Habermas elaborated the concept of the public sphere required 'some critical interrogation and reconstruction', not only because Habermas idealizes the concept of the public sphere by overlooking the way it has been constituted by significant exclusions, especially along gender, 'race' and class lines, but also because he 'fails to examine other, nonliberal, nonbourgeois competing public spheres'. Kluge and Negt argue that the production of a public sphere 'in whose production process the historical movement of dead and living labour allows itself to be converted into experience' (Kluge and Negt, 2014: 129–30) is only possible within the framework of a 'proletarian public sphere' (Kluge and Negt, 2014: 121, cf. Negt and Kluge, 1993) in which the workers can appropriate such an experience because they have already organized some of it themselves. This proletarian public sphere must develop within the historical fissures – 'the rifts, marginal cases, isolated initiatives' – of the concrete constellations of social forces that make up the bourgeois public sphere (Negt and Kluge, 1993: xliii) and so 'does not stand for the working class but for oppressed relationships, for things and interests, which are not expressed ... a process of igniting solidarity among people who might otherwise have very different ideas' (Krause, 2006: 121).

As Habermas and others have already noted, the 'logic of capital drives it to attempt to appropriate the full productivity of labour' (Negt and Kluge, 1993: 20) by developing certain qualities of labour power through the control of preschool and school socialization. In providing a 'political economy of labour

power', Kluge and Negt (2014: 73) therefore focus on labour capacities as 'autonomously protected reserves of labour power' within the libidinal economy of living bodies; reserves which, unknown to consciousness, contain new forms of self-regulation and direction that constitute 'countercapital' (Kluge and Negt, 2014: 108). Seeking to determine the contradiction between capital and labour anew from the side of living labour rather than, as Marx had done, capital, Kluge and Negt's work therefore provides a powerful inversion of theories of human capital that have sought to transform education in the pursuit of economic productivity.

Negt's (1975: 29, trans. in Zeuner, 2013: 142) attention to learning processes similarly focuses on the educational value of the exemplary for enabling 'learners ... to translate, analytical-scientific information into concrete and intelligible, non-scientific forms of language and thought, which in terms of their political and sociological substance can motivate for social action'. Such orientational or concrete thinking aims at the development of societal competencies by encouraging learners to uncover the relations between 'the interest of the learning subjects and the objective world' (Negt, 2010: 215, trans. in Zeuner, 2013: 146). These societal competencies, which resonate with Honneth's early attempt to theorize the educational dimension of labour, provide an alternative to the vocational skills that education for productivity insists upon, permitting learners to understand existing relations within social life and initiate necessary reframing processes to rethink them.

In contrast to progressive engagement through small seminars, Negt speaks of the pedagogic function of large lectures as situations in which 'public thinking' – the gradual formation of ideas while speaking – can be performed that induces 'unburdened listening' to take place in which learners think for themselves in a condition of anonymity without the pressure 'to not only look intelligent but also to say intelligent things' (Krause, 2006: 124). Negt also teaches using

'combinations ... in order to create friction', bringing texts from antiquity into relation with everyday examples from the present (Krause, 2006: 124); quoting texts in a foreign language and not immediately appending the translation in order, like Pestalozzi, to develop a sense of the otherness or alienness of the world, resisting the impatience of universal comprehensibility that only couples what can be rationally understood with what can be rationally understood so as to teach the important pedagogic principle of learning something with the senses so as to understand it later (Negt and Kluge, 1993: 274).

Kluge and Negt (2014: 106–7) offer an example of a primary school classroom where a teacher moves between children working in different groups, in which a form of self-regulated learning has been authorized that brings about 'invisible forms of order'. They insist that 'it is not self-regulation in itself, but the form in which it has been authorized that brings about order', pointing to the necessity of the teacher's authorization – or pedagogic mastery of the relationship – for the forms of student self-regulation that rests on both their 'own knowledge and their concomitant recognition of what the others are doing'. This order could not have been produced by the 'violent command' or regimentation of a traffic policemen, they also argue, 'because he would know nothing of the rules of right-of-way and waiting that are in play', and would only direct children's interests toward the imitation of adult political organization.

In contradistinction to Kant, the enlightenment is 'not about the emergences from immaturity in and of itself' as 'primarily a solitary subjective labour', a transition that occurs at a single point through the power of autonomous, critical thought and speech. Rather, it is something that only emerges 'collectively and as a side effect of multiple instances of paying and receiving attention' (Kluge and Negt, 2014: 382–4). To the extent this pedagogical relationship involves a 'tender force' of reason, its basis is – in contrast to the Kantian formulation of enlightenment

reason – not merely the autonomy of the public use of reason but collective insubordination, and its role is to violate inertia, throw into confusion, and dislodge individual motives (Kluge and Negt, 2014: 382).

What Adorno and Horkheimer characterized as the culture industry can now be conceived as the ‘preindustrial phase of the consciousness industry’ (Negt and Kluge, 1993: 158n19), including programming, advertising, publicity campaigns, traditional and new media, as well as other contexts of communication and learning, which now seeks direct access to the private sphere of individual perception, cognition and experience in order to pre-organize and valorize the raw material of workers’ consciousness in the interests of capital (Negt and Kluge, 1993: xlv). This also means capital continues to stand in contradiction to living labour in a situation whose instability may still contain a politically explosive potential.

Benjamin (1994: 94–5, 1999b: 272–3) consistently insisted that the great error underlying bourgeois education was the tacit belief that children need us more than we need them; with regard to their educational labour, the same learning subjects might now be seen instead as ‘helpers, avengers, liberators’ (Benjamin, 1999b: 273).

# Aesthetics and Its Critique: The Frankfurt Aesthetic Paradigm

Johan Hartle

Frankfurt School critical theory is almost as central to the history of modern aesthetics as aesthetics is to Frankfurt School critical theory: one cannot be thought without the other. On the one hand this means that Frankfurt School aestheticians are amongst the most important modern and contemporary aesthetic theorists. Hardly any modern thinker can compete with the influence and importance of the aesthetic theories of especially Adorno and Benjamin – not only in the academic discussion of aesthetics and art theory but also concerning their impact on players in the contemporary art field, including artists, curators, and critics.<sup>1</sup> This situation is more peculiar than it might seem: while many intellectual fashions have temporarily informed and inspired the artistic or curatorial practices of their time, very few major aesthetic philosophies actually have consequence in the daily business of art and manage to nest there beyond the specific moment and to develop sustainable ‘art field credibility’.

On the other hand, this means that within Frankfurt School critical theory aesthetics has played a major role from the very beginning as a central element of the conception of social research in both analysis and style: the performative understanding of theory was crucial for the first generation of critical theory. In this understanding the question of *Darstellung* was of central importance as theory not only needed to be adequately thought and presented but also placed and performed.<sup>2</sup> Summarizing much of what had been thought and written by then, Adorno’s posthumously published *Aesthetic Theory*, the most developed aesthetic work of the Frankfurt School, suggested this unity of theory with its mode of presentation with its very title.

On a programmatic level, aesthetic research was included in the conception of social research (*Sozialforschung*) from the very beginning. Next to its specific interest in (psychoanalytically informed) social psychology – represented by the trailblazing *Studies in Authority and Family* – Horkheimer’s initial

program for the Frankfurt Institute for Social Research and the idea of an interdisciplinary materialism granted prominent space for the critical analysis of art and culture. From issue one the *Zeitschrift für Sozialforschung* contained the works of literary scholars (like Leo Löwenthal) and musicologists (like Adorno), who presented the sociological (or, materialist) analyses of works of art as a crucial element of the general project of *Sozialforschung*. Advanced by Marcuse's seminal texts on happiness and Horkheimer's essay on mass culture, critical discussions of recent cultural history, of the developments of technological media and visual arts (Walter Benjamin's contributions), of Greek poetry (the contribution of Bowra) and radio music (with Křenek's text) demonstrated the scope of the *Zeitschrift's* discussion. Many of these approaches have either become classical or can be seen as preparatory studies for works that have later become canonical texts of aesthetic theory.

In more than one respect, the *Zeitschrift* is at the center of the constitution of Frankfurt School critical theory as a specific type of discourse.<sup>3</sup> It organized and institutionalized the central discussions of the main protagonists and gave it the most coherent programmatic. It should therefore be the starting place for the reconstruction of the aesthetic paradigm of the Frankfurt School. Particularly in the field of aesthetic and cultural analysis, it helped formulate a materialist methodology that eventually became one of the main paradigms of twentieth century cultural materialism.

This general interest in the broader horizon of culture or, in classical Marxist terms, superstructural phenomena was of course not just a significant aspect of the constitution of the Frankfurt school; it also characterizes the more general development of Western Marxism (Anderson, 1976; Schmidt, 1980: 9f.), with its emphasis on cultural struggles and the historical conditions of subjectivity rather than the persistent hope in economic determinism and historical

teleology. To reflect this shift in Marxist reasoning, Western Marxism has paradigmatically been described as 'dialectic of defeat' (Jacoby, 1981), a theoretical paradigm that had to confront the sphere of culture and 'collective consciousness' to understand the political challenges after the failure of the revolutionary moment of 1918/1919.

In other words, the analysis of ideology and the structure of subjectivity was identified as the new specific task of Western Marxism in reactionary times that left no space for hope concerning the general course of history, along with the need to explore the subjective conditions of political struggle more deeply.<sup>4</sup> Culture, art, and aesthetics were irreducible elements of this ideology-critical analysis. Given the specific understanding of ideology within the discussions of the Frankfurt School (about which more will be said), it is obvious that such analysis of aesthetics as a fundamental element of ideology was always both *in solidarity with* and *critical of* aesthetics, that it treated aesthetics as an element of possible social transformation and of bourgeois self-legitimation.<sup>5</sup>

## POLITICS OF FORM IN TIMES OF FRAGMENTATION

The analysis of cultural, or more specifically, of artistic developments that characterized the approach of the Frankfurt school was inspired by Georg Lukács, the major author of Western Marxism (Merleau Ponty, 1973: 31–58), and particularly by his historico-philosophical analysis of literature. Although Lukács has neither been a member of the inner circle of the Frankfurt Institute, nor even an author of the *Zeitschrift*, his importance for the Institute's discussions can hardly be overstated. It is therefore worthwhile to spend some time on his thought. Lukács's 1916 essay *Theory of the Novel* is a particular historical milestone in the history of leftist cultural criticism; it came, in the words of

Fredric Jameson, 'like a thunderclap in the dialectical awakening of a whole generation of central European intellectuals (very much including Benjamin and Adorno)' (Jameson, 2015: 4). Lukács's starting point was, of course, the Hegelian claim that art reflects the general state of culture in the historical moment and finds its truth precisely in its historicity. From here, Lukács took the Hegelian conception of the historicity of art a step further and applied it to modern (and early modern) literature. Against this background Lukács developed a conception of aesthetic form that would inherit the promise of the classical paradigm of art (as Hegel termed the art of the Greek period, when the aesthetic *ideal* was realized) and that of the ancient Greek epos specifically, in its potential to express the 'extensive totality' and the 'immanence of meaning'. Modern times were, Lukács argued, characterized by a radical rift between the objective world and the individual, a world of 'transcendental homelessness'.

In this light, Lukács emphasizes that 'the novel is the epic of an age in which the extensive totality of life is no longer directly given, in which the immanence of meaning in life has become a problem, yet which still thinks in terms of totality' (Lukács, 1971a: 56). Novels specifically, so Lukács argues, still implicitly worked with the promise of an integrated totality of meaning, with the promise of a world that remains inherently meaningful to the individuals, just as the Greek world would have been according to the German idealist prejudice. They would, however, only maintain this promise formally. While their narratives reflected the reality of a world torn apart, an alienated world, the world of aesthetic form would keep an inherently utopian promise. Art reconstructs the unity of a fragmented world, which is, following the Marxian conception of fetishism, *socially necessary semblance*. Through form (for Lukács specifically the totality of the narrative), art resists the dominant historical tendency and defends the possibility

of the horizon of utopia. Lukács's specific historico-philosophical interpretation of the novel did not only (and in the end, not even so much) inspire further interpretations of major literary narratives. The controversies over the concept of totality characterize much of the further development of the Frankfurt School (see Jay, 1984).

In Lukács's decisively Marxist *History and Class Consciousness* (1923), one finds similar, if rare, explicit remarks on the potential of art and literature to mediate the apparently isolated and abstract realities of the individuals in great literary form. In continuity with the earlier arguments, *History and Class Consciousness* presents the 'principle of art' as a principle, 'whereby man having been destroyed, fragmented and divided between different partial systems is made whole again in thought' (Lukács, 1971b: 139).

The Lukács of 1923 addresses aesthetic concerns far less expressly. Nonetheless, his analysis of commodity fetishism is of equal paradigmatic importance for the aesthetic reflections of Benjamin, Marcuse, and Adorno. Reformulating, in explicitly Marxist terms, Georg Simmel's idea that in modern society money has to be seen as a psychological, and 'even as an aesthetic fact' (Simmel, 2004: 55), Lukács formulated the framework for Marxist cultural critique for generations to come. His holistic perspective on the unity of modern capitalist societies is summed up in the claim that there is 'no problem that does not ultimately lead back to that question [of the commodity form, JFH] and there is no solution that could not be found in the solution to the riddle to the commodity structure' (Lukács, 1971b: 83). In opposition to the overarching logics of reification – the naturalization of social forms due to their atomistic appearance – art is presented as an exercise in mediation, as an attempt to come to terms with social connectivity and historical continuity.

Against the background of such a holistic analysis of the social process, the political relevance of art gained particular relevance.

Lukács's idea was that the historico-political significance of a work was to be found in its formal organization, that, in other words, the political analysis of art could accept the relative autonomy of art without reducing it to historical content. Such an understanding that the formal organization of an artwork could possibly contain a political signature that would – in Lukács's case, by means of aesthetic semblance – reach beyond the contradictions of the historical moment, marked a trailblazing moment for the further development of Western Marxist aesthetics in general, and Frankfurt School aesthetics in particular. This meant that aesthetics would not only be deeply characterized by the general course of history (and thus be part of an extended field of politics) but that it would also have its own specific political logic, one that gestured beyond the dominant developments on the forefront of progress. Aesthetics could therefore appear as a realm of anticipation and unevenness (*Vorschein* und *Ungleichzeitigkeit* in Ernst Bloch's [1974] terms) and a source of non-identity that disclosed hidden emancipatory promises and potentials even and particularly in times of political hopelessness.

Such a reading of political aesthetics was in tension with classical Marxism. The emphasis on the relative autonomy of aesthetic form and the potential of bourgeois art to anticipate a utopian horizon could not easily be reconciled with strict understandings of base-superstructure determinism or with the ideological conditions of working class politics. Indeed, Lukács's early (1916) version of such a politics of form was written at a time when he had not yet made the philosophical step towards Marxism and it was a position he later criticized as a merely 'romantic anti-capitalism' (Lukács, 1971b: x). In his later writings on realism he argued for a strictly Marxian version of aesthetics, which also leveled some of the unevenness between (relatively autonomous) *form* and (historical) *content* that was so central to his *Theory of the Novel*.

Unlike in Lukács's own intellectual development (on which Adorno commented very polemically, see his 'Reconciliation under Duress' [Adorno, 1977]), the tensions between dominant historical tendency and its aesthetic surplus remained influential for the aesthetic models of the Frankfurt School, especially in the articulation of the anti-capitalist potential of the aesthetic. At a deeper level, such disagreement was of a historico-philosophical nature, which had much to do with Lukács's understanding of Hegelian Marxism and the anti-teleological version of history in the theoretical approaches of the Frankfurt School. While Lukács – both aesthetically and politically – hoped to be able to leave his own 'despair' of the 1916 text (Lukács, 1971b: xi) behind, the Frankfurt scholars could never follow his optimism in progress, historical tendency, and a general course of history. In a number of ways, however, the theoretical grounds for formulating such positions were no less Marxist than Lukács's own.

### **HISTORICITY OF EXPERIENCE, REDEPTIVE CRITIQUE, AND POLITICAL STRATEGY**

Although never a member of the Frankfurt Institute's inner circle, some of Benjamin's most important aesthetic texts emerge in direct proximity to the *Zeitschrift*; they were either published in it (like the *Kunstwerk-essay*), were prepared as essays to be published there (like the *Arcades Project*, with its exposé being discussed in the correspondence with Adorno), or were in conversation with the texts published in the *Zeitschrift*. His discussions with Adorno can be said to be amongst the most important places and manifestations of the development of Benjamin's later aesthetic thought. The aesthetic texts of the 1930s, of his 'Marxist period' (see Miller, 2014: 35), can therefore be seen as playing a direct part in the intellectual formation of Frankfurt School aesthetics.

In light of the most polemical critiques of aesthetic ideologies (Jameson, 1981: 64; Bennett, 1990: 146), Walter Benjamin's historicizing approach to the aesthetic question also seems to be most explicitly historical materialist. Benjamin's highly differentiated aesthetics circles less around a normative conception of aesthetic form or semblance and more around the historicization of forms of aesthetic experience themselves. Inspired by – and in some ways anticipating – the discourse of the historical avant-gardes, aesthetically idealist categories like aesthetic semblance or organic totality no longer speak for themselves. Even in his own writing style the modernist idea of montage and fragmentation mark a paradigmatic shift in aesthetic reasoning.

At first sight, Benjamin's aesthetics is characterized by many different approaches to a great number of aesthetic practices, diverse forms of experience, and various techniques of representation. His evaluation of historically specific shapes and shades of the aesthetic often remains ambiguous. It remains difficult to identify any one systematic (or normative) aesthetic position that one could identify as Benjamin's own – a situation that has allowed for a multiplicity of interpretations of his aesthetic thought. The three initial observations (the deeply historical nature of his analyses, the fragmented character of his own aesthetic writings, and the situative, historically specific evaluation of the use of aesthetic practices) prove useful, however, to identify the nature of Benjamin's aesthetic thought. Benjamin's archeological approach to the history of experience, his paradigmatic conception of allegory (which contains much of his understanding of modernism), and his strategic interpretation of aesthetic intervention appear to be the most fundamental of his aesthetic approaches that also keep reappearing throughout his texts. This historicopolitical dimension of Benjamin's aesthetics strongly inherits the Hegelian understanding of the historicity of aesthetic truth – albeit in materialist terms. Mimetic faculty,

storytelling, auratic experience, and phantasmagoria are, in this sense, not necessarily features of the nature of the aesthetic as such (a question of minor importance for a deeply historical thinker like Benjamin), but rather symptoms and signatures of their respective historical context.

As the above suggests, Benjamin's aesthetics is conceptualized in terms of a fundamentally historical understanding of *aisthesis* (perception, experience). The concrete shape of life of a historical situation (the Hegelian *Idee*) becomes concrete in the structure of experience, as much ideologically as materially and practically constituted and thus historically specific. What Adorno, in his famous letter to Benjamin from September 1936, critically described as an 'anthropological materialism', for which the 'human body represents the measure of all concreteness' (Adorno and Benjamin, 2004: 146), is an adequate description, certainly if one considers Benjamin's understanding of the extended body of a social collective, which he found in material culture (cities, architecture, but also in machinery and technical media).

In this sense Benjamin's own version of historical materialism is in line with the considerations that the young Marx had sketched in his Paris Manuscripts, in which he considered the 'forming of the five senses' as the 'labour of the entire history of the world down to the present' (Marx, 1975: 302). Marx, too, saw the aesthetic as a historical construction site for subjectivities organized through material practices and expressed in the structure of the perceptive apparatus. Communist subjectivity, so Marx argued, would also have to deal with the aesthetic formation [*Bildung*] of a new collective sensuality (forming a 'human sense', liberating 'the human nature of the senses'). As we will see later, similar considerations will guide Benjamin in formulating his own communist media aesthetics. In addition to this debt to Marx, Benjamin owed the understanding of the materialized history of perception to the Vienna School of Art History, to Riegl

and Wickhoff specifically, 'who were', as Benjamin writes, 'the first to think of using such art to draw conclusions about the organization of perception at the time the art was produced' (Benjamin, 2008: 23).

To understand such an account of anthropological materialism, however, one must not forget that the historical constitution of perception and the organization of the faculties of experience also involve the production of ideology, the possibility of the supra-sensuous, and the structural necessity of superstition, which Marx, in *Capital*, identified in the structure of commodity fetishism. In commodity fetishism, Benjamin identifies two major approaches that will guide his analyses of the conditions of experience under high capitalism (as in the *Arcades Project* and the texts on Baudelaire): allegorical form and phantasmagoria.

Influenced by Lukács's seminal analysis of reification, Benjamin develops his own terminology. As Marx argued in his fetishism chapter, and as Lukács lucidly presented to his contemporaries, commodities, as objects of exchange, necessarily appeared as bearers of a second, social reality (all the social relations that were inscribed into value), realities that were given a thing-like (reified, *verdinglichte*) reality by the commodity itself. Inspired by the conceptualization of the commodity form, Benjamin's interpretation of allegory, initially presented in his *Origin of German Tragic Drama*, is further developed in the essay on Baudelaire ('On some Motifs in Baudelaire') in the *Zeitschrift* in the 1939/1940 issue. According to Benjamin's conception, allegory identifies the condition of experience under capitalism, rather than the ontological condition of language as such. In classical understanding, allegories (as terminologically opposed to symbolic representation) were arbitrary forms of representation in which the relationship between signifier and signified was not intrinsic or organic but interchangeable. As Benjamin writes: 'Any person, any object, any relationship can mean absolutely anything else' (Benjamin, 1998: 175). The literature of Baudelaire is seen as a

cultural reflection of the general development of experience under conditions of expanding commodification.

Such an historical account of aesthetic experience and representation is not merely a call for historical relativism. It rather allows Benjamin to unveil forgotten and unrealized potentials of human subjectivity. With strong suggestions of isomorphism, Benjamin's history of human experience focuses on the both ontogenetic and phylogenetic changes of the human capacities of perception and representation, sometimes referring to human prehistory, sometimes mobilizing childhood memories. Aesthetic analyses, analyses of historically specific *aesthetic* constellations, are thus nothing less than historical studies in the historical constitution of subjectivity.

Benjamin's account of the history of the species [*Urgeschichte*] and the early development of the individual (childhood) partly converge in accentuating the uneven layers of the historical process and in outlining an unresolved history of the present. Benjamin's archaeological perspective on buried layers of experience that previous generations – or children – might have had access to, is as much melancholic as it is hopeful. If, in his 'Theses on the Philosophy of History', he argues for a redemption of the past (Benjamin, 2007: 254), such redemption also aims for the uncovering of lost and buried human capacities, of the subjective potential of the forgotten victims of the past with whom – *ex post* – to reconcile. Redeeming the past, however, would not only imply the actualization of buried capacities of experiencing and representing other layers of realities: it would also mean awakening from the dreams of the past to realize them.

In this light, it is highly characteristic that Benjamin's unfinished opus magnum, *The Arcades Project*, focuses on the material history of a system of myths (dreams, hopes, projections) that characterizes the foundational period of modern capitalism.

The central concept for grasping the historical nature of experience in a society within

which dream-like realities become effective, is the concept of phantasmagoria. In a phantasmagoria (as the magic lantern, developed in seventeenth century, was sometimes called), a projected image appeared as almost real; quite similar to modern projectors, it gave a transparent image concrete visibility through the use of light beams. For Benjamin, such phantasmagoric reality, as well as the reality of dreams, not only anticipated the development of modern technological imagery (as in cinematography): the aesthetic significance of the bourgeois phantasmagoria for Benjamin consisted in its surplus or anticipation of a utopian future, of unrealized dreams. Importantly, this text also chooses a specific form of aesthetic representation [*Darstellung*] by working with fragments, quotes, a complex system of intertextual links, and a great number of images that are discussed or alluded to (and included in the posthumously published print versions).

If commodity fetishism, in Benjamin's interpretation (Tiedemann, 1982: 26 ff.), was characterized by the reified presence of a second, social layer of reality that was implicitly communicated by commodities, the various ways in which social semblance and ghostly realities brought themselves to the fore in visual culture were central to Benjamin's analyses. Phantasmagoric imagery can, in this light, be interpreted as the 'sensuous manifestation of the idea' in modern times, in which ideas were produced by the logics of commodity production, dream-like expressions of a society's collective unconscious (Cohen, 1993).

The dreams of the high bourgeois past of nineteenth century, of its architecture, streetscapes, imagery and poetry, were to be disclosed, unfolded (as did the surrealists by their appropriations of urban Paris), and realized. Benjamin's conception of phantasmagoria, the reconstruction of the collective dreams that manifested themselves in material culture, was not just an analysis of a contingent moment of historical experience, but also a form of redemptive critique, an attempt to realize the secret dreams of high capitalism.

The first condition, however, for realizing a dream, as Benjamin suggests in his considerations on surrealism, was to wake up. It is specifically this motif that structures his identification with modernist aesthetics from surrealism to film and contemporary photography, especially in the most influential of all of Benjamin's texts, his *Kunstwerk*-essay (*The Artwork in the Age of its Technological Reproducibility*), first published in the *Zeitschrift* in 1936. Mobilizing art against the technological slumber, against the fact that technological progress largely remains unprocessed and expresses the most violent potentials both on an economic and on a psychological level, Benjamin positions aesthetic forces as adapting to the technological conditions of modern culture. The aesthetic (or, more strongly put, strategic) importance of shock is to be seen in this light. Shock experience, the confronting experience of speed and proximity, pierces the veil of aesthetic autonomy. It dissolves the aura, the 'air of sacredness around the image' (Miller, 2014: 42), and turns it into an object of everyday practice. At the same time, it helps to process the daily experience of urban and industrial modernity (Simmel, 1950).

In the essay (and in the key texts that surround it)<sup>6</sup> Benjamin combined a modernist paradigm of art with proletarian aesthetics and anti-fascist strategy. The Artwork-essay does not only historico-philosophically interpret, document, and reconstruct the situation of art and experience, but also takes an explicitly strategic stance. His identification with soberly modernist engineer aesthetics and avant-garde techniques of montage attempts to break the mythical spell that characterized the tradition of autonomous art. However, his text is also a very subtle discussion of contemporary film theory (Arnheim, Kracauer, Balász, etc.), which Benjamin had studied attentively.<sup>7</sup> Here, too, as much as in the analysis of the modern phantasmagoria, modern optical media (film, photography) were discussed as condensations of a general perceptive paradigm of the historical

moment. In this way, Benjamin's aesthetic theory is always also a theory of modern media technology.

In the apocalyptic moment, the advent of European fascism (especially in Italy, Germany, and Spain) – the background against which Benjamin is writing – film and photography identify a moment of rupture, shock, and confrontation with the experiential horizon of the urban proletariat (speed and spatial density: an intensified sensorium). In this way, the potentials of modern optical media identify Benjamin's aesthetic-political preferences and his hope in the potential of contemporary media technology.

Media technology, however, are also a placeholder for the technical productive forces in general. In this way, Benjamin's argument prepares for communist revolution on the level of aesthetic experience: modernist art is expected to do nothing less than to contribute to the capacity of taking control of the technical means of production. If it is to be appropriated politically and juridically (by the proletariat seizing the means of production), technology also needs to be mastered symbolically. Thus, modernist art turns into a training ground for the revolution to come. It confronts the destructive logics of unceasing (imperialist) expansion embodied in unprocessed technological development. And whilst aestheticizing the violent logics of technological development and economic expansion is the cultural logic of fascism, communism's answer is the politicization of modern technologically mediated experience, i.e. the symbolic appropriation of the technological means of production.<sup>8</sup>

## IMMANENT CRITIQUE AND SUBLIMATION

If Benjamin's historical political approach to human perception and experience is the first line of thought characterizing the Frankfurt School's approach to the aesthetics of

politics or the politics of form, the second line of thought is the immanent critique of the bourgeois legacy. A general ideology critical approach to the bourgeois legacy of aesthetic thinking is paradigmatically formulated in Herbert Marcuse's text 'The Affirmative Character of Culture', 'a landmark essay in Marcuse's oeuvre' (Miller, 2014: 119) originally published in the *Zeitschrift* in 1937. Although Marcuse strongly argues for the normative potential of the German classic tradition (Goethe, Schiller), for the indirectly social promise of the organic work of art (containing the image of a reconciled society) his text contains an argument that will later become central for the discussion of the historical avant-gardes (Bürger, 1984, see also the final section).

Marcuse's emphasis, already evident in his aesthetic texts published in the *Zeitschrift* ('On Hedonism', 1938, being the second), is on the possibility of a materially concrete form of collective and objective happiness. In more or less direct ways, his discussion of aesthetics focuses on this issue from day one.

Regardless of the importance of these two texts, Marcuse's theoretical contributions to the *Zeitschrift* (1932–41) were not primarily about aesthetics. His texts famously deal with the decline of liberalism, the conservative ontology of his time and the contemporary relevance of Hegel's dialectics. His text on the affirmative character of culture might nonetheless be the most influential of Marcuse's texts for the further development of Frankfurt School critical theory. It also anticipates Marcuse's deepened interest not only in art and aesthetics, but also in the emancipatory potential of *the aesthetic*, which his later writings strongly emphasize, discussing aesthetics as a radical source for social transformation that reaches beyond the immanence of integrated consumer capitalism. Although Marcuse's evaluation of the value of aesthetic semblance and sublimation slightly changes with changing historical circumstances, in all of these texts Marcuse discusses the potential of art and aesthetics to

transgress the autonomous realm of aesthetic semblance and to transform real life forms in the perspective of the critique of alienation and of objective happiness.

In the specific context of the essay 'The Affirmative Character of Culture' Marcuse discusses the reduction of culture (the good, the true, and the beautiful) to a merely compensational ideology. The classical tradition's conceptualizations of aesthetic form and beauty are interpreted as a virtual harmonization of social antagonisms. Because of their inner, formal organization, artworks contain the promise of a non-alienated world. By virtue of its own semblance character, however, the work indirectly keeps its own utopian promise at arm's length.

Referring back to ancient understandings of culture (2009: 67), which were separated from the necessity of labor 'by an abyss', culture appears as a sphere of fulfilled individual happiness and enjoyment for the few. This legacy, so Marcuse argues, continues in bourgeois culture. Furthermore, the claim to the universal relevance of culture is fully developed in the aesthetics of the bourgeois age. Universalization, however, is achieved by paying the price of social concreteness. Culture withdraws into the realm of abstract freedom, freedom detached from the equal access to culture and its inherent promise to happiness: 'To the need of the isolated individual it responds with general humanity, to bodily misery with the beauty of the soul, to external bondage with internal freedom, to brutal egoism with the duty of the realm of virtue' (2009: 72). Again, aesthetics moves into the realm of semblance.

The bourgeois conception of aesthetic semblance at the same time enacts a form of ideological repression as 'the real gratification of individuals cannot be contained by an idealist dynamic which either continually postpones gratification or transmutes it into striving for the unattained' (2009: 74). It is such aesthetics, such an affirmative conception of culture, that easily falls prey to the anti-liberal tendencies of authoritarian

society, against which the text is written. Not unlike Benjamin's efforts to formulate a politics of perception that would be capable of countering the fascist threat, Marcuse's essay contains his own anti-fascist politics of aesthetics. Contemporary authoritarianism is identified in the essay as the attempt to establish stabilized forms of collectivity ('race, folk, blood and soil', 2009: 93) and to replace 'idealist inwardness' with 'heroic outwardness' (ibid.). By doing so, post-bourgeois culture casts off the 'progressive elements contained in the earlier stages of culture' (ibid.). While classical bourgeois idealism reduces culture to a realm of semblance, individual pleasure, and consolation, and thus remains affirmative in light of a possible transformation of society, authoritarian culture replaces this realm of semblance with explicit and unambiguous significations of collectivity. Marcuse interprets the historical counterparts of bourgeois humanist culture and post-bourgeois totalitarianism as two sides of the same coin, each neutralizing, in their own way, the radical and transcending potential of collective happiness. Beauty, he writes, 'contains a dangerous violence that threatens the given form of existence' (2009: 85).

In light of the political strategies of the day, the political substance of Marcuse's aesthetic politics, to navigate between bourgeois humanism and authoritarian anti-humanism, maintains some historical relevance. What makes Marcuse's seminal article particularly paradigmatic, however – and not only for the development of his own thought but also for a central line of argument in the whole development of Frankfurt school aesthetics – is his *critical strategy*. Bourgeois culture's inherent promise of beauty and happiness, and authoritarianism's false negation of its idealism, are not regarded as 'mere ideology' but rather as a symptom of historical alienation and as reflections of non-alienated conditions of social life. Ideology is thus not confronted and rejected head-on but rather recognized as a bearer of 'objective content' (2009: 73),

which can help to diagnose the social constellation it is part of and provide sources for normative critique. Marcuse's critique of the affirmative character of culture is, in this sense, a model case for the immanent critique of aesthetics, aiming at the sublation [*Aufhebung*] of aesthetics' inherent promise without destroying it. Clearly, the critique of the affirmative character of culture in both of its neutralized forms (bourgeois humanist and authoritarian) also aims to restore the potential of art and culture for social transformation: the critical character of art.

According to Marcuse, the inherent promise of the classical aesthetic tradition finds its proper place only in the emancipatory perspective of materialist philosophy: 'materialist philosophy takes seriously the concern for happiness and fights for its realization in history' (ibid.). It is Marcuse's emphasis on the material conditions for happiness and the challenge of making these conditions sustainable and universal that will also inform Marcuse's later writings on aesthetics. Since Marcuse located this potential at the center of the historical discourse on aesthetics, he was convinced throughout his life that 'every authentic work of art would be revolutionary' (1977: xi) – at least by virtue of its authentic inheritance of the promise to objective happiness and by maintaining the beautiful 'image of liberation' (1977: 6).

It is in his later writings that the critique of society employs a more explicitly psychoanalytical terminology. The rhetorical shift from sublation [*Aufhebung*] to sublimation and the more explicit discussion of psychoanalytical terminology does, however, also imply a shift in the aesthetic and the political perspective. In *Eros and Civilization* (1955) and *One-Dimensional Man* (1964), Marcuse mobilizes his interest in the utopian potentials of classical Weimar aesthetics against a different enemy: the material conditions of happiness are now being discussed against the background of technologically perfected late capitalist consumerism. Art is now meant to mobilize a critical potential, as Marcuse

will call it in *One-Dimensional Man*, against 'repressive desublimation' (Marcuse, 2007: 75), the apparent satisfaction of needs under conditions of broadened commodification.

Much could be said about the ways in which Marcuse rephrases Lukács's original critique of reification in terms of a critique of modern technology and one-dimensional (means–end) rationality (Feenberg, 2014). One-dimensional society is fundamentally a reified society that reduces conscious activity to the fulfilment of particularistic ends, ends that are mutually antagonistic and oppositional. The lack of theoretical comprehension, of reified consciousness, affects the human psyche. Marcuse's employment of psychoanalysis continues on this path. It is explicitly intended to 'break the reification in which human relations are petrified' (Marcuse, 1966: 254). Not only, however, does psychoanalysis embed psychological traits in context and narrative, it also helps Marcuse to articulate the material grounds of happiness in new terms.

In the discussion of the possibility of sustainable collective happiness, it is Schiller's conception of aesthetic education that helps solve the problem of the Freudian tensions of *Civilization and its Discontent*. The aesthetic configuration of social life allows for solving tensions between the pleasure principle and the reality principle, between instrumental rationality and sensuous pleasure. Just as Schiller suggested a playful mediation between rationality and the senses to overcome the threat of rigorist terror (of the barbarians) on the one hand and uncultured rudeness (of the savages) on the other, Marcuse, too, aims to mediate the repression and the direct, uncultured articulation of libidinous energies. In this way, aesthetic education is discussed in close analogy with sublimation and with *Eros*, both distinguished from sheer and blunt sexuality, with Marcuse clearly taking a stand for the liberation of sensuousness. Freedom, he writes, 'would have to be sought in the liberation of sensuousness rather than reason, and in the

limitation of the “higher” faculties in favor of the “lower” (Marcuse, 1966: 190). Even in his late work Marcuse defends such aestheticization as the ‘truth content’ of classical, affirmative, idealist culture.<sup>9</sup>

The radical and activist tone of Marcuse’s aesthetics remains throughout his work, and can nowhere be found as pure and simple as in his last book publication: *The Aesthetic Dimension* of 1977, in which Marcuse presents the ‘encounter with the fictitious world’ as ‘counter-societal experience’ (1977: 44). Through semblance and aesthetic sublimation an alternative reality keeps re-introducing itself to one-dimensional society. The realization of the inherent promise of aesthetics, Marcuse continued to emphasize in 1977, was in the hands of ‘political struggle’ (1977: 58). But the sources for ‘great refusal’ (Marcuse, 2007: 261) were fundamentally aesthetic, particularly when more classical (proletarian) sources of political revolt were nowhere to be seen (cf. Kellner, 1984: 280). Marcuse’s radical politics was a politics of form as well.

## ANTINOMIES OF FETISHISM AND AUTONOMY

A third point of entry to the tradition of the Frankfurt School and its most developed aesthetic theory is the work of Theodor W. Adorno, which discusses and, in some ways, integrates central arguments of Benjamin and Marcuse. Adorno’s aesthetics culminates in his posthumously published *Aesthetic Theory*. Adorno’s theory is prepared, however, in the early essays which Adorno publishes in the *Zeitschrift*. Here, as in his later writings, key motifs of Adorno’s aesthetic writings are the historical separation of advanced from popular art forms and the dialectics of autonomy, oftentimes discussed in terms of aesthetic fetishism. Also, the critique of culture industry, further developed in the *Dialectic of Enlightenment*, have been

substantively prepared by the texts published in the *Zeitschrift* (especially the studies ‘On Popular Music’). A major part of Adorno’s analyses (above all his 1937 text ‘On the Fetish Character of Music and the Regression of Listening’, in which Adorno critically responds to Benjamin’s positive assessment of the destruction of aura, aesthetic autonomy, and traditional art) focus on these two issues, which will structure his work all the way through to his aesthetic theory. They are in some ways derived from the analysis of the commodity form, which, in Adorno’s understanding, determines the ontology of the modern work of art (Martin, 2007: 15f.).

The aesthetic relevance of the commodity is, however, ambiguous. As Adorno emphasizes very strongly throughout his work, the development of music as a free art form (as with any other art form) has been historically contingent on the development of its market character. Having developed autonomy by becoming independent from church and court, however, opened the gates for new forms of heteronomy and new social tensions to be mediated by the (musical) work of art.

It is this discussion that enters Adorno’s *Aesthetic Theory* in terms of the double character of the artwork (alluding to the double character of the commodity in Marx’s *Capital*) as being ‘autonomous’ and ‘*fait social*’. Already in the 1932 text for the *Zeitschrift*, ‘On the Social Situation of Music’, Adorno argues emphatically: ‘The role of music in the social process is exclusively that of a commodity; its value is that determined by the market’ (2002: 391); he continues, ‘The same force of reification which constituted music as art has today taken music from man and left him with only an illusion [Schein] thereof’ (392). Following Lukács’s holistic suggestion that social totality, inherently structured by the logics of the commodity, has fully been realized in modern capitalism, Adorno discusses the question of music in light of the ambiguities of the commodity form and formulates the problem of aesthetic autonomy explicitly in these terms.

But the affinities and tensions between artwork and commodity reach further than this. Adorno regards the artwork as the place of mediation between (abstract) form and materiality, rational composition and mimetic particularity (echoing the tension between exchange value and use value). Given this parallel with the double character of the commodity, it is no coincidence that two of the key dialectical terms of Adorno's *Aesthetic Theory*, *mimesis* and *ratio*, articulate the struggle between the systematic rationality of aesthetic construction (following laws of form and general principles) on the one hand and the attentiveness for the specificity of the material on the other. Here, too, Adorno's conceptualization of the modern artwork echoes the inner tensions of the commodity form. As a result of this process of mediation, the artwork is also potentially a place of resistance against direct utility and thus interrupts the continuity of the commodity process by maintaining its inner legitimacy. Especially as a place of encounter between rationality and materiality (or, classically, 'understanding' and 'imagination', 'sensual drive' and 'formal drive' etc.), Adorno argues in line with the classical aesthetic tradition: the artwork remains as the place of beauty and semblance, as an autonomous object.

But Adorno's dialectics does not stop here: even this potential resistance against (commodified) utilization is itself articulated in terms of fetishization. Adorno writes: 'Artworks that do not insist fetishistically on their coherence, as if they were the absolute that they are unable to be, are worthless from the start; but the survival of art becomes precarious as soon as it becomes conscious of its fetishism' (1997: 228). Following the general argument of the historical emergence of autonomous art through the development of the (art) market, Adorno suggests that it is precisely the ignorance of the social conditions of art production that allows for a radically aesthetic perspective.

As usual, Adorno's argument is antinomical in character as it introduces two

contradicting propositions: on the one hand, the necessary illusion of aesthetic autonomy is built upon the ignorance of the specific social conditions of the artwork. On the other hand, such fetishistic illusion remains necessary especially to insist that aesthetic contents and potentials can reach beyond the immanence of reified society. Or, in the terms of the 1938 essay: 'The more inexorably the principle of exchange value destroys use values for human beings, the more deeply does exchange value disguise itself as the object of enjoyment' (1991: 39). Under conditions of instrumental reason and enforced utility, the reduction of the aesthetic object to its fetish character, the artwork as an 'absolute commodity' (1997: 21)<sup>10</sup> remains as a placeholder for the objects 'no longer distorted by exchange' (1997: 227). Adorno presents, in other words, fetishism in conflict with itself.

Such diagnosis is, to some extent, congruent with the dynamics that Marcuse also introduces in his 1937 article 'The Affirmative Character of Culture'. Separated from direct social utility, reduced to the realm of semblance, art's inherent promise of happiness is at all times threatened with becoming fetishistic, ideological, or, in Marcuse's terms, merely affirmative. But Adorno is, already in the 1930s, far less optimistic concerning the potential for sublating art into social practice than Marcuse, and less willing to subscribe to the autonomy-critical program of the historical avant-gardes than Benjamin.

Amongst the most threatening developments of contemporary authoritarian societies and socially integrated capitalism, Adorno identifies certain versions of popular culture that reduce cultural production to stultifying versions of easy consumption. Biographically, this threat is becoming particularly concrete in Californian exile. Living in close proximity to Hollywood, Adorno is confronted with the emergence of a type of cultural production that strategically produces forms of (deceptively) easy enjoyment. Adorno's conception of popular music and, to a large extent, the concept of the culture

industry are attempts to identify such conditions of marketable cultural production.

Easy and popular enjoyment, cultural goods produced for the market, falsely suggest an accessibility of happiness and pleasure in a world that structurally undermines its very possibility; a world within which the social antagonism makes a life beyond scarcity and the compulsion to work for the major part of the population impossible. Such cultural goods are reduced to their affirmative character and thus betray the aesthetic idea of real happiness. Adorno thus identifies a fundamental rupture in the history of aesthetic enjoyment: 'After *The Magic Flute*', Adorno famously argues regarding the history of music, 'it was never again possible to force serious and light music together' (1991: 32).

In Adorno's aesthetic program – and his aesthetic models are never just reconstructions of the logics of aesthetic production and experience but also always strategic interventions in contemporary cultural production – advanced art needs to include the ambiguity of enjoyment and happiness. The aesthetic *promesse du bonheur* presents itself in its negativity, by way of its impossibility. He formulates: 'Art records negatively just that possibility of happiness which the only partially positive anticipation of happiness ruinously confronts today. All "light" and pleasant art has become illusory and mendacious' (1991: 33). Adorno's aesthetic justification of dissonance and post-tonal composition, or later, the central aesthetic importance of the color black (1997: 39), is strongly inspired by this argument.

To protect the capacity of autonomous art to indicate the potential of happiness, art has to abstain from the illusion of easy enjoyment. For this it has to pay the price of becoming esoteric. The separation of autonomous culture and popular culture is regarded as historically irreversible. It does, however, condition both extremes of the spectrum: just as much as the promise of culture as a collectively lived form of social practice is withheld from autonomous culture, so the

promise of transgressive and unrestricted happiness remains unavailable to the products of culture industry.

This historical rift between the two extremes of culture (autonomous culture and culture industry) ultimately contains Adorno's verdict on the avant-gardes. Although Adorno defends the idea of aesthetic autonomy and insists on the historical legitimacy of aesthetic semblance, his dialectics also presents overly simple interpretations of a modernist aesthetics of autonomy. Modern art, by the force of its own concept, also contains the struggle against its own illusoriness or semblance character; in this sense, too, Adorno conceives it as antinomical by essence. What Adorno coins as the failure of culture (and specifically philosophy) (1973: 3) in not having become practically relevant in reorganizing social life, is, metaphorically speaking, inscribed into the conscience of modern art. Or, as he writes in *Aesthetic Theory*, 'The dialectic of modern art is largely that it wants to shake off its illusoriness like an animal trying to shake off its antlers' (1977: 102). Art's attempt to become effectively real, without reducing itself to culture industry and without sacrificing its potential to insist upon the unrealized potential of happiness, is doomed to fail. Autonomous art remains, in the end, in conflict with itself, no less antinomical than activist forms of avant-gardism or even the products of culture industry.

It is important to be aware of the fact that Adorno's *Aesthetic Theory* is, in its very structure, an attempt to critically react to what he characterizes as 'identity philosophy' by maintaining the 'primacy of the object' (1977: 109, 145, 169, 259, 322f.; cf. Sonderegger, 2011: 414). His theory attempts to become aesthetic itself. It attempts to stay ostentatiously close to empirical, historical, and, most of all, *aesthetic* material. Furthermore, Adorno's writing style mobilizes figures of aesthetic presentation in order to intensify the plausibility of his arguments. Finally, it is also aesthetic theory *in actu* rather than a fulfilled system of aesthetics.

This attempt to emphasize the material and materiality of theory is yet another, partly performative and stylistic, attempt to resist the predominant logic of the commodity form. If the commodity form installs a universal logic of quantification that makes qualitatively different things quantitatively commensurable (in terms of exchange value), Adorno understands aesthetics (both theory and practice) as a place of resistance against commensurability. By the very structure of theory, aesthetics becomes yet another place for mobilizing the qualitative against premature systematization.

## LEGACIES AND CONTINUITIES

In response to the Lukácsian ambition of formulating an aesthetic theory that could confront progressive reification, three main aspects of the Frankfurt School's conceptualization and critique of aesthetics remain: a historico-political theory of *aesthesis*, which allows for specific strategic interventions in the realm of aesthetic discourse (Benjamin); the immanent critique of the classical aesthetic paradigm with its inherent idea of aesthetic sublimation and political sublation (Marcuse); and the dialectical discussion of aesthetic semblance in light of a critique of commodity fetishism (Adorno). All three approaches formulate a politics of form in a situation in which the general course of history – a history of ever-growing commodification – was no longer trusted and in which emancipatory politics are needed to mobilize deviant potentials of social practice. Four main aesthetic-political strategies of such kind come to the fore: the redemption of forgotten layers of the past (1), the immanent critique of the bourgeois legacy (2), the representation of those social forces, who might still be capable of preventing the worst (3), and the unfolding of the inner contradictions of the commodity form (4).

The reach and impact of these aesthetic models is hard to measure. Particularly in

the Anglo-Saxon world, much work has been done towards the reception of Frankfurt School aesthetics by Susan Buck-Morss, Fredric Jameson, Terry Eagleton, Andreas Huyssen, and Peter Osborne. Under contemporary conditions, no serious scholar of continental aesthetics could afford not to process its major claims in one way or another, even though its manifest and explicit politic layer has often had to be downplayed, ignored, or rejected. At the same time, the official development of second generation Frankfurt School critical theory, mainly determined by the institutional political impact of Jürgen Habermas, marginalized aesthetic perspectives in the trajectory of social research. Much of what Frankfurt School aesthetics had epitomized then continued in other theoretical traditions, predominantly poststructuralism.

If not at the institutional center of critical theory in the Frankfurt Institute for Social Research and the Goethe University, the key systematic impulses of the original aesthetic programs nevertheless found their way into the theoretical efforts of second generation critical theorists who formulated their own aesthetic politics.

A key impulse of the first major book collaboration between Oskar Negt and Alexander Kluge (1993) was a direct critique of the lack of cultural theory and aesthetic experience in Habermas's theory of the public sphere. In opposition to the bourgeois public sphere was the proletarian public sphere as a *Produktionsöffentlichkeit*, a public sphere of production. What is interesting in light of the ongoing interest of Negt and Kluge in the historical formation of human experience, are a number of impulses, strongly reminiscent of Walter Benjamin's original aesthetic project. Already, *Public Sphere and Experience* includes the experiential horizon of social production in daily political culture – much like Benjamin attempted with his passionate plea for modern media technology. Their second collaborative book project, *History and Obstinacy* (Negt and Kluge, 2014), also includes extensive discussions of the young Marx's accounts of the

history of sense perception and the aesthetic formation of a human sense. Finally, the fragmentary form, a surrealist montage of texts and images ranging from cosmic history to the history of working class struggles, from planetary and human *Urgeschichte* to childhood, echoes Benjamin's writings, which similarly suggest an isomorphic relation between these various layers. In more systematic terms, the concept of 'self-regulation' (Negt and Kluge, 2014: 106–13; see Martin, 2015) suggests comparable logics of subtle physical and quasi-physical forces (within history as much as the individual), the acceptance of which would allow for various perspectives of emancipation (Negt and Kluge, 1981: 55).

In their own self-understanding, the theoretical contribution of Negt and Kluge to the tradition of the Frankfurt School could predominantly be understood in terms of political theory. One must not forget that Alexander Kluge is amongst the most prolific, influential, and multifaceted filmmakers and authors (and TV-producers) of recent German history, whose work can also be seen as a continuation of Frankfurt School aesthetics (if not cultural politics) *in praxi*.

Marcuse's aesthetic theory might appear as the least influential paradigm of early Frankfurt School aesthetics. Indeed, both the radical posture of an aesthetically motivated 'great refusal' and the strong affinities to Weimar classicism have seen better days. It is the argument of Herbert Marcuse's early essay on affirmative culture, however, that is echoed and further developed in Peter Bürger's path-breaking contribution to the conceptualization of the avant-garde (Bürger, 1984), the influence of which can hardly be overestimated.<sup>11</sup> Bürger's book is indeed an attempt to mediate Walter Benjamin's radical critique of bourgeois autonomous aesthetics and Adorno's affirmative reading of the idea of autonomy in light of the advent of culture industry. Bürger's conceptualization of the historical avant-garde reads like a paraphrasing of Marcuse's critique of affirmative culture. Bürger presents the main impulse of the historical avant-gardes

as a critique of the bourgeois separation of art and life. Avant-gardist artistic politics thus means, for Bürger, to sublimate the inherent promise of autonomous art in real life praxis. What is striking in Bürger's account of the historical avant-gardes is not only the structure of his argument, which is strongly reminiscent of Marcuse – formulating an immanent critique of the semblance of beauty from the perspective of a radically changed life practice – but also the evaluation of the neo-avant-gardes as repeating Marcuse's own position. Regarding the neo-avant-gardes as de-sublimated practices under changed social conditions (as art forms that have institutionally been integrated), Bürger, like Marcuse, explicitly rejects these developments as instances of social integration.

It is important to note that this particular argument provoked the most (and the most influential) criticism of Bürger's account.<sup>12</sup> It is interesting to note that Marcuse's critique of one-dimensional society inspired the work of a conceptual artist like Dan Graham and thus became the source of neo-avant-gardist art itself.<sup>13</sup>

After the successful *Abwicklung* clearing of academic Marxism in German universities, the continued success of Adorno's aesthetic writings is not without irony. Few Adorno scholars accept the categorical role of the commodity form for understanding the ontology of the modern artwork, and few would insist on modern art's capacity to break the spell of a commodified society. The dialectic of aesthetic semblance, however, remains central for contemporary academic debates. Without reflecting the historical ontology of the work of art – its contingency on socio-economic and institutional conditions – Adorno's aesthetic theory appears like an ontological theory of aesthetic experience, aesthetic representation, or aesthetic semblance. Disconnecting Adorno further from Benjamin's efforts to historicize aesthetic experience, aesthetics is presented as a philosophical discipline in its own right, rather than a theory of art under the historical conditions

of late capitalism; it is presented as a *theory of form* rather than a *politics of form*.

Among the second and third generation Frankfurt scholars, Albrecht Wellmer has formulated the clearest version of aesthetic dialectics in his 1984 text, 'Truth, Semblance and Reconciliation'. In line with Habermas's project of a communicative turn of critical theory, Wellmer reformulated Adorno's insistence on the utopian implication of aesthetic semblance as an image of successful communication. Wherever aesthetic semblance alludes to a form of successful signification – and Adorno's negative anticipation of fulfilled happiness is one example – it also implicitly anticipates a form of successful intersubjectivity. Such aesthetic semblance remains dialectical in one respect: wherever the materiality of aesthetic signification is aesthetically emphasized, its realization in intersubjectively shared systems of communication is undermined. Aesthetic experience is thus dialectically bound to intersubjectivity, into which it also introduces a sting of negativity. Wellmer left it to his own successors to develop such a theory of aesthetic experience in dialogue with Derrida's deconstruction,<sup>14</sup> thus completing the separation of aesthetics from social philosophy.<sup>15</sup>

This gesture of depoliticization, now happening to the critique of aesthetic ideology, characterizes much of the development from first generation critical theory to second (and onwards). Somewhere between the contradictory logics of academic theory on the one hand, and artistic practice on the other, much of this original critical impulse has persisted. It can thus still be received, processed, and realized by future aesthetic-political activists, for whom critical theory (unlike traditional theory) was originally written.

## Notes

1 In the art sociological research collected in *Das Kunstfeld* the authors prove the massive popularity of Benjamin (being by far the most popular theorist

of all) but also Adorno, ranked at 8 (Münder and Wuggenig, 2012: 303) more popular than even Deleuze, Butler, or Rancière. See also Hartle (2015) and the exhibition and catalogue of the Frankfurt Kunstverein, fully dedicated to Adorno, in Müller and Schaffhausen (2003). For the artistic impact see also Miller (2014: 4).

- 2 See for instance García Düttmann (2007); about Adorno's and Horkheimer's idea of developing critical theory as conceptual gesture see Schmid-Noerr (1997: 51–88).
- 3 For the importance of the *Zeitschrift* see Schmidt (1980); for the role of Leo Löwenthal as its central coordinator see Schneider (2014: XIV ff., 8 ff.).
- 4 The following threefold structure is partly inspired by the book of Tyrus Miller (2014). To some extent I follow his structure and emphasis of the contemporary legacy of the Frankfurt School's aesthetics. Unlike my text, his book is a contribution to intellectual history and abstains from further-reaching systematic or (theoretico-)political claims.
- 5 Strongly inspired by the Frankfurt tradition, although (of course) not without ironical distance, this twofold approach to the aesthetic ideology is developed by Terry Eagleton (1990).
- 6 The central essays to think of are 'The Little History of Photography', 'Eduard Fuchs, the Collector and the Historian', the review 'Theories of German Fascism', and 'The Author as Producer'.
- 7 In his archive one can see Benjamin's excerpts to these texts.
- 8 This argument against war is formulated in parallel with Rosa Luxemburg's argument in *The Accumulation of Capital*, as Ansgar Hillach has pointed out (1979: 102).
- 9 There are interesting shifts in Marcuse's evaluation of popular and counter-culture between the 60s and 70s. Particularly in the 70s, Marcuse returns to the idea of aesthetic sublimation and rejects the popular and counter-cultural versions of de-sublimation. See Kellner (1984: 352).
- 10 About this concept see Stewart Martin's excellent text (2007). Martin very pointedly discusses the antinomies of the commodity form as the very core of Adorno's ontology of the modern artwork.
- 11 A large part of the discussion of the Neo-Avant-Garde in *October*, arguably the most influential journal of contemporary art criticism of the last 40 years, is an attempt to come to terms with Bürger's criticism. See specifically the introductory formulations to Buchloh's compilation (mind the title!) *Neo-Avantgarde and Culture Industry* (Buchloh, 2000: xxiv ff.).
- 12 See Buchloh (1984); Foster (1996); Bürger (2010).
- 13 See Alberro (1994: 8); Miller (2014: 118).

- 14 The nuances of the difference between Wellmer and Menke are discussed in a footnote of Wellmer (1993: 199).
- 15 As for my own attempt to formulate a politics of form in the aftermath of Adorno without relying on the critical analysis of the commodity form, see Hartle (2006).

# Rather No Art than Socialist Realism: Adorno, Beckett, and Brecht

Isabelle Klasen  
Translated by Jacob Blumenfeld

After Samuel Beckett told Adorno in a conversation in 1967 that Bertolt Brecht had planned on writing an 'Anti-Godot', Adorno jotted down in his notebook, 'My God, what a piece of crap that would have been' (Tiedemann, 1994: 24). This note is not just a disrespectful remark, but points toward a substantive problem that constantly occupied Adorno and fundamentally determined his relationship to Beckett and Brecht: how can art, in a late capitalist world and after the failure of revolutionary hopes, still exist as a site for social truth? After 1945, writes Rolf Tiedemann, art seemed to recant everything 'which she once stood for. Adorno was concerned with nothing more persistently than whether works of art can still come into being at all after the catastrophes that had taken place' (Tiedemann, 1994: 18). The question concerning the possibility of art after Auschwitz is also the background to the controversy between committed and autonomous literature discussed by Adorno. If an absolutized autonomy of art is immoral

because of its distance to social practice, then an immediate social commitment ultimately affirms the condition it criticizes. Only between commitment and autonomy – the two 'positions on objectivity', according to Adorno (1962: 177) – does the life of the artwork unfold. Neither of the two positions should be hypostasized; not just theater, but every form of art has struggled with this demand. This tension has decisively influenced Adorno's view of Beckett's and Brecht's work.

Both poets reflected in their own way on the problems of bourgeois theater in the twentieth century. They thereby artistically drew the consequences of their reflections by dissolving the traditional canon of forms. For Adorno, Beckett's oeuvre is almost paradigmatic of an advanced art, since without peering directly at the social effect, Beckett immerses himself in problems of form, and is thus able to simultaneously lend his works the moment of commitment. Yet Brecht's work, according to Adorno's judgment, fails

precisely where it commits to immediately transforming social practice, neglecting the autonomy of artistic form. Adorno often emphasizes this aspect of Brecht so strongly that Beckett and Brecht become antipodes – a relationship that threatens to conceal the contradictions in Brecht's own work, of which Adorno is quite aware. Adorno certainly sees that Brecht converges with Beckett's intention where commitment affects the artistic form, but he gives this moment much less attention than Brecht's didactic claim and political commitment.

Against the backdrop of Adorno's criticism of commitment, as shown in his essay 'Commitment' of 1962 (section 1), and his concept of autonomous art as unconscious writing of history (section 2), this chapter presents and explains the prominent role that Beckett plays for Adorno (section 3) as well as the criticism of Brecht (section 4). It will be shown, however, that Adorno also perceived elements in Brecht's work that lead to a disruption of artistic form. In addition, how both poets reflected in different ways on the decay of traditional theatrical forms will be made clear. Finally, the precarious position of art between autonomy and commitment will be presented with regard to Adorno's relationship to Beckett and Brecht (section 5).

## ADORNO'S CRITIQUE OF COMMITMENT

Commitment, as Adorno specifies in *Aesthetic Theory*, does not simply seek to improve, but 'aims at the transformation of the preconditions of situations' (Adorno, 1970: 334). This should not, however, be taken too literally. This remark resonates with what Adorno expanded upon in his 'Commitment' essay: even though successful works of art always have the moment of commitment, that is to say, they are grounded by a will to change, this will should nevertheless not be interpreted in

terms of direct political agitation. As soon as this becomes the intention of a work of art, it becomes entangled in the same social injustice against which it is committed. In times when commitment merges with a thoroughly false reality, artistic expression becomes a fraud for not being able to historically develop any social effectiveness; it turns into a substitute for satisfying desires for change, and as a result distracts from the actual social condition.

The lack of distance to a false social practice makes commitment for Adorno as false as the political instrumentalization of art – whether as enlightenment or agitation (cf. Lüdke, 1981: 26). This applies in particular to what Adorno calls 'social' or 'socialist realism', the doctrinal art of the Soviet Union since the thirties. Adorno sees the problem as the inadequate distance from reality, the emphasis on subject matter and the raw empiricism into which works of art are integrated without distinction or criticism, thereby supporting the social status quo. 'The relation of social praxis and art', Adorno writes in *Aesthetic Theory*,

always variable, may well have changed radically once again over the last forty or fifty years. During World War I and prior to Stalin, artistic and politically advanced thought went in tandem; whoever came of age in those years took art to be what it in no way historically had been: a priori politically on the left. Since then the Zhdanovs and Ulbrichts have not only enchained the force of artistic production with the dictate of socialist realism but actually broken it. (Adorno, 1970: 343 et sq.)

That explains the rising allergy of advanced art against everything not artistically formed and empirical. If social criticism is not elevated to form, disregarding social content, then the critical-reflexive moment of art is lost. To this extent: 'Rather no art than socialist realism' (Adorno, 1970: 73).

Art, no different than philosophy, is 'obliged ruthlessly to criticize itself' – 'because the moment to realize it was missed' and 'practice indefinitely delayed' (Adorno, 1966: 3). This means that traditional forms and materials

should no longer be used without question, and calls for the departure from a practice that is 'no longer the forum for appeals against self-satisfied speculation' but 'mostly the pretext used by executive authorities to choke, as vain, whatever critical thoughts the practical change would require' (Adorno, 1966: 3). This idea, formulated by Adorno in the Introduction to *Negative Dialectics*, illustrates why artworks can succeed in denouncing the essential violence of the practical only through its autonomous formal law:

The critique exercised a priori by art is that of action as a cryptogram of domination. According to its sheer form, praxis tends toward that which, in terms of its own logic, it should abolish; violence is immanent to it and is maintained in its sublimations, whereas artworks, even the most aggressive, stand for nonviolence. (Adorno, 1970: 328)

For Adorno, artistic autonomy thus remains historically irrevocable: 'All efforts to restore art by giving it a social function – of which art is itself uncertain and by which it expresses its own uncertainty – are doomed' (Adorno, 1970: 1).

To be sure, Adorno does not equate autonomy with a rejection of any social content. Art would then be both uncritical and lifeless – a wallpaper pattern, as Adorno occasionally remarked. Yet the site of social mediation in the work is not primarily the content of an artwork but its form: 'form – the social nexus of everything particular – represents the social relation in the artwork' (Adorno, 1970: 345). Only through composition and artistic technique can one encounter the social essence. In other words, how people suffer in society speaks in works of art through problems of form, not political positions (Adorno, 1962: 187). Here lies one of the main reasons for the success of Beckett's works and the failure of Brecht for Adorno, as will be shown.

To Adorno, the autonomous work of art counts as the only possible expression of the present state of the world and thus the 'only legitimate art form' (Bürger, 1974: 88 trans. mod). It opposes the 'monstrosity'

[*Unwesen*] of what exists simply by being an unconscious writing of the history of essential social laws. Adorno often modifies this definition, for example, when he calls works of art 'historico-philosophical sundials' [*geschichtsphilosophische Sonnenuhren*] (Adorno, 1957: 46; 1961: 269). In this way, autonomous works necessarily contain the moment of commitment, while those directly engaged with society remain 'socially mute' (Adorno, 1970: 314).

## THE WORK OF ART AS AUTONOMOUS AND FAIT SOCIAL

Even before the sixties, Adorno developed the motif of the work of art as an unconscious writing of history that reflects society in immanent problems of form. In his essay from 1932, 'On the Social Situation of Music', he writes that music will be better the more it progresses with the immanent unfolding of its problems, the purer it stays in its formal language, and the less it allows itself to be limited by the empirical consciousness mutilated by class domination (Adorno, 1932: 393). This idea crucially determines Adorno's attitude to Beckett and Brecht; it's taken up more and more in his later writings on art yet in varied ways, and thus will be looked at in more detail below.

For a work of art to be determined as an *unconscious* writing of history, there must be a common law of motion of art and society. 'Works of art that react against empirical reality', Adorno writes in 'Commitment',

obey the forces of that reality, which reject intellectual creations and throw them back on themselves. There is no material content, no formal category of artistic creation, however mysteriously transmitted and itself unaware of the process, which did not originate in the empirical reality from which it breaks free. Even the avant-garde abstraction [...] is a reflex response to the abstraction of the law which objectively dominates society. (Adorno, 1962: 190)

This determination is also addressed a little more precisely in *Aesthetic Theory*, which says the following about the relationship between art and society:

Art negates the categorial determinations stamped on the empirical world and yet harbors what is empirically existing in its own substance. If art opposes the empirical through the element of form – and the mediation of form and content is not to be grasped without their differentiation – the mediation is to be sought in the recognition of aesthetic form as sedimented content. (Adorno, 1970: 6)

Adorno thus takes constituents of a work of art – the materials, procedures, in short, the aesthetic productive forces – as spiritual sediments of social relations (cf. Schmid Noerr, 1996: 46). In other words, it's still possible to read off them how they have historically emerged. Even though no unbroken accord between artistic labor and social production can be demonstrated, autonomous works as products of social labor communicate in various ways with empirical reality. They have their 'model in social production' (Adorno, 1970: 321 trans. mod). This communication ranges from the procedures, methods, and ways in which the elements of a work of art are joined into a whole to the artistic rationality that prevails within it. Adorno must therefore presuppose the idea of form as sedimented content in order to make plausible why autonomous works of art have binding force at all and why unsolved social antagonisms can return as problems of form (Adorno, 1970: 7).

By concentrating on formal problems, the social essence reveals itself. This is made possible because in the work of art, empirical elements are 'divested of their facticity' (Adorno, 1970: 321). That is to say, works of art do not simply imitate empirical or factual events and reproduce them, but rather follow their own logic. They alienate the factual from the familiar, self-evident context in which it stands. Because of this, works of art both unveil the social essence and show something completely different. For Adorno,

the essential can only be encountered when the 'spell' imposing social relations on all individuals is removed. To this extent, it is understandable when Adorno designates autonomous works of art as 'afterimages of empirical life insofar as they help the latter to what is denied them outside their own sphere' (Adorno, 1970: 5). The liberation of form thus holds enciphered within it the liberation of society (345). In this way, art takes a critical stand, and this is one reason for Adorno's insistence that autonomous art's commitment cannot be read from specific content or materials, but solely through its counterpoint to society: 'By crystallizing in itself as something unique to itself, rather than complying with existing social norms and qualifying as "socially useful", it criticizes society by merely existing, for which puritans of all stripes condemn it [...] Art's asociality is the determinate negation of a determinate society' (308).

This assumption, however, implies that the social content of autonomous works, insofar as they follow purely aesthetic laws of motion, can only be extrapolated by interpretation. For Adorno, the substantiality of autonomous art depends on the extent to which it is capable of embodying social content in its form and the degree to which this content is legible. Then the element of 'partisanship' (Adorno, 1970: 316) is kept alive:

The double character of art – something that severs itself from empirical reality and thereby from society's functional context and yet is at the same time part of empirical reality and society's functional context – is directly apparent in the aesthetic phenomena, which are both aesthetic and *faits sociaux*. They require a double observation that is no more to be posited as an unalloyed whole than aesthetic autonomy and art can be conflated as something strictly social. (Adorno, 1970: 342)

Beckett's and Brecht's works also have this double character – both oeuvres, each in their own way, live off the tension between autonomy and commitment. Therefore, Beckett's art should not be reduced to *l'art pour l'art* that wants to be nothing but an 'idle pastime'

(Adorno, 1962: 177) – Beckett's oeuvre gives a frightful answer to this (Adorno, 1970: 33). Neither is Brecht merely a 'tendency poet' whose works 'assimilate themselves to brute existence' (Adorno, 1962: 177 trans. mod).

## ENDGAME: SAMUEL BECKETT

Adorno connected with Beckett on far more than a few personal encounters. Adorno's 'Trying to Understand *Endgame*' is, however, his only text on Beckett – a planned work on *The Unnamable* remains unwritten, and inferences about the content can only be drawn today from Adorno's notes. Nevertheless, Beckett is always present in Adorno's writings. 'Whenever Adorno mentioned contemporary art in his philosophy during the fifties and sixties', writes Tiedemann, 'Beckett's poetry was always listed. It is hardly an exaggeration to assume an implicit confrontation with Beckett's oeuvre behind each page of *Aesthetic Theory*, whose dedication was intended for the author of *Endgame*' (Tiedemann, 1994: 18). Even in *Negative Dialectics*, Adorno's magnum opus of 1966, Beckett is ubiquitous; the motifs from Adorno's 'Trying to Understand *Endgame*' are expressed in extremely condensed form in the chapter 'Meditations on Metaphysics'. Explicit references to Beckett are also not lacking. Beckett's presence in Adorno's works is due to the fact that both share a certain historical experience. 'In the pale-gray light of *Endgame*', as Gunzelin Schmid Noerr writes, Adorno recognized 'his own view of culture after Auschwitz as a "rubbish heap" that has made even reflection on one's own damaged state useless' (Schmid Noerr, 1996: 40). With 'Trying to Understand *Endgame*', however, Adorno wanted to bring awareness to this lack of self-reflection in the face of horror, especially in light of the predominant reception of *Endgame* by the bourgeois public, for whom the displeasure at

earthly existence and the resignation of subjectivity seemed 'indeed impressive, but not enough for a full evening' (Schmid Noerr, 1996: 20).

For Adorno, understanding *Endgame* means above all understanding its unintelligibility, 'concretely reconstructing the meaning of the fact that it has no meaning' (Adorno, 1961: 243). Although other interpretations are possible and have been widely presented, Adorno is primarily concerned with tracing the social content of Beckett's poetry. This poetry is able to give artistic expression to the experience that no single overarching sense of meaning or social totality can be maintained in light of the catastrophic course of history. Beckett's means of art are advanced insofar as they articulate the social experience of the loss of meaning in aesthetic individuation, not as a universal statement, but rather tangibly in the organization of the artistic material (Schmid Noerr, 1996: 47). In *Endgame*, artistic form and the content of social experience converge almost paradigmatically. Beckett, like no other, *artistically* drew the consequences from the historical situation without lapsing into ideological demonstrations (only Paul Celan is mentioned by Adorno occasionally in this regard). This is certainly one of the main reasons why he is so important to Adorno. Although 'the catastrophe' in *Endgame* as well as in Beckett's other works is presupposed, it is not pronounced. The unspeakable has become so *a priori*, writes Adorno, that it must be kept nebulous. The violence, however, is mirrored in the fear of mentioning it (Adorno, 1961: 245). Letting in nothing but his own experience, Beckett achieves precisely what Adorno calls the 'unconscious writing of history' for his epoch.

'Artists of lower status', writes Tiedemann, still want to distill meaning from meaninglessness; Beckett instead formally draws the consequences. According to Tiedemann, the determinate negation of content becomes the formal principle in *Endgame*. Beckett puts traditional aesthetic categories on trial,

especially the work of art as a coherent context of meaning (Tiedemann, 1994: 18). Both the traditional idea of aesthetic substance as a unity of what appears and what's intended, as well as the meaning and the dialogical sequence of spoken words and sentences, which have traditionally determined drama, become an illusion 'the less events can be presumed to be inherently meaningful', as Adorno writes in 'Trying to Understand *Endgame*' (Adorno, 1961: 242).

*Endgame* completes the disintegration of dramatic form through reducing individual experience to merely subjective meaning up to silencing it altogether:

Through its own organized meaninglessness, dramatic action must model itself on what has transpired with the truth content of drama in general. Nor does this kind of construction of the meaningless stop at the linguistic molecules; if they, and the connections between them, were rationally meaningful, they would necessarily be synthesized into the overall coherence of meaning that the drama as a whole negates. (Adorno, 1961: 242 et sq.)

No new form follows from Beckett's criticism of dramatic form, only parody. This illustrates Beckett's advanced consciousness of form, for he takes into account the progress of artistic control over materials with the determinate negation of previous forms of art (Schmid Noerr, 1996: 48). 'In its emphatic sense', writes Adorno, 'parody means the use of forms in the era of their impossibility. It demonstrates this impossibility and by doing so alters the forms. The three Aristotelian unities are preserved, but drama itself has to fight for its life' (Adorno, 1961: 259). Beckett does not dissolve the traditionally closed world of drama – the unity of plot, place, and time. Rather, he shows its absurdity in a historical situation that no longer allows for coherence.

In this respect, *Endgame* proves indeed to be an examination of the dramaturgical corpse. The announcement 'that there are no more pain killers' (Adorno, 1961: 260) functions as a substitute for the catastrophe. Teichoscopy allows a glimpse to the outside,

but presents nothing moving, only 'gray'. Even the category of hero is destroyed in *Endgame* by parody. The name 'Hamm', Adorno writes, abbreviates Shakespeare's hero, Hamlet, 'the name of the now liquidated dramatic subject, that of the first dramatic subject' (Adorno, 1961: 267) – even Beckett himself couldn't talk Adorno out of this interpretation (Tiedemann, 1994: 19). What emerges from Adorno's interpretation is the impotence of the subject after its historical end in the extermination camps of the Nazis; the individual, as Adorno writes in *Negative Dialectics*, was reduced to a specimen and even the last and poorest possession left to him was expropriated: death (Adorno, 1966: 362). 'The grimacing clowns, childish and bloody, into which Beckett's subject is decomposed, are that subject's historical truth' (Adorno, 1970: 339) – namely, that the subject regresses to a mere 'whatchamacallit' [*Diesda*] (Adorno, 1961: 246), to rubbish, 'organic garbage' (Adorno, 1961: 266). The anti-heroes of *Endgame* no longer act from freedom; they only know the impotence of decisions that have no consequences. The ration of reality and characters in *Endgame*, according to Adorno, is identical with what historically remains of the subject:

and what is left of the subject is its most abstract characteristic: merely existing, and thereby already committing an outrage. Beckett's characters behave in precisely the primitive, behavioristic manner appropriate to the state of affairs after the catastrophe, after it has mutilated them so that they cannot react any differently. (Adorno, 1961: 251)

This mutilation extends from their bodies, which consist only of torsos and no longer function properly, to the fact that Nell and Nagg live in waste bins, up to their names, which are merely abbreviations. For Adorno, Beckett's 'final history of the subject', recapitulates as farce what men once wanted to be; 'a vision of which they were deprived as much by the course of society as by the new cosmology, and which they nevertheless cannot let go of' (Adorno, 1961: 271).

CLOV (*absorbed*): Mmm.  
 HAMM: Do you know what it is?  
 CLOV (*as before*): Mmm.  
 HAMM: I was never there. (Beckett, 1958: 128; cited in Adorno, 1961: 273)

'The subject', Adorno scribbled on Beckett's *Unnamable*, 'does not yet exist, it would be utopia' (Tiedemann, 1994: 48). In this respect, *Endgame* also has no logical context of action – for that's inconceivable without a subject as a bearer. It follows, however, its own 'staggering logic' (Adorno, 1961: 265 trans. mod). The individually presented situations are emancipated from any overarching context and from the dramatic nature of the characters; they are instead placed in an autonomous context, although their model comes from empirical situations. However, their associative sequence synthesizes them into a form in their own right, where 'one sentence draws after it the next sentence or the reply, just as in music a theme motivates its continuation or its contrast' (Adorno, 1970: 338). Deprived of any instrumental and psychological context, the situations depicted can spontaneously assume a specific and compelling expression, 'that of horror' (Adorno, 1961: 253). In his notes for 'Trying to Understand *Endgame*', Adorno remarks that, in empirical existence, there are innumerable situations which assume an expression of their own when detached from their pragmatic context: 'An old man takes a nap and pulls a handkerchief over his eyes. Completely harmless in natural life: the horror that emanates from it when isolated in a tableau vivant' (Adorno, 1994: 159).

Along with sense, the possibility of meaning, and the acting subject, the meaning of language disappears too. Beckett, writes Adorno, transforms language into an instrument of its own absurdity:

The objective decay of language, that bilge of self-alienation, at once stereotyped and defective, which human beings' words and sentences have swollen up into within their own mouths, penetrates the aesthetic arcanum. The second language of those who have fallen silent, an agglomeration

of insolent phrases, pseudo-logical connections, and words galvanized into trademarks, the desolate echo of the world of the advertisement, is revamped to become the language of a literary work that negates language. (Adorno, 1961: 262)

Linguistically, too, logic staggers:

HAMM: Open the window.  
 CLOV: What for?  
 HAMM: I want to hear the sea.  
 CLOV: You wouldn't hear it.  
 HAMM: Even if you opened the window?  
 CLOV: No.  
 HAMM: Then it's not worthwhile opening it?  
 CLOV: No.  
 HAMM  
 (*violently*): Then open it! (*Clov gets up on the ladder, opens the window. Pause.*) Have you opened it?  
 CLOV: Yes. (Beckett, 1958: 123 et sq.; cited in Adorno, 1961: 265)

The senselessness of an action, Adorno points out, becomes the reason for doing it. In order to convict discursive language of its own absurdity, Beckett's absurd logic negates the meaningfulness of the fact that language has been historically nothing else but an instrument of domination (Adorno, 1961: 265).

In his worldless works, Beckett is realistic insofar as he expresses the truth about the world. In a television discussion on Beckett with Walter Boehlich, Martin Esslin, Hans-Geert Falkenberg, and Ernst Fischer, Adorno opposes the thesis presented by Georg Lukács of the 'worldlessness of representation' in avant-garde art, at whose peak Lukács places Beckett's *Molloy*. When the distortion of human personality is driven too far or universalized, so that people no longer recognize themselves in it, art loses touch with reality; Lukács criticizes this tendency in *Realism in our Time* (Lukács, 1964: 31 et sqq.). For Adorno, however, Beckett is just being realistic, showing what the world makes out of people – and thus he follows in the radical legacy of the avant-garde and naturalism: 'a disenchanted world, the illusionless, "*comment c'est*"' (Adorno, 1994: 177), as Adorno writes in his notes on *The Unnamable*. Take Émile Zola, for example, who uses literary

means to depict his epoch in all its ugliness and brutality, analytically presenting people's dependence on social laws with the truthfulness of sober and expressionless photography. In the *Rougon-Macquart* series, Zola meticulously illustrates the physiology of human life on the margins of society, right up to the 'revolt of the nervous system stretched to the breaking point' (Zola, 1867: 2). Zola, like a doctor in the dissecting room, uses language as a diagnostic tool for the purpose of positivist precision. 'Naturalism', Adorno calls it, 'is still illusionistic in its form, as though saturated with the toxin of meaning [...] Beckett gets rid of that, and precisely in so doing distances himself from the photographic-realist façade' (Adorno, 1994: 177). Beckett too 'so to speak, photographed the society in which everything has a function from the bad side' (Tiedemann, 1994: 91). He had the gaze of a doctor on the living from the dissection room (Adorno, 1994: 177). Indeed, when the gaze is not merely directed to the surface, what's portrayed is the social essence, revealing itself as a 'monstrosity' [*Unwesen*]. Beckett completely strips the last remnants of illusion and meaning away from the physiology of human life: what remains are reminders of bare, natural conditions – food, drink, disease, physical harm. With Beckett, as Adorno commented in his *Lectures on Aesthetics* from 1958/59, only naked nature remains, to which humans have descended in the course of the historical 'mutilation process' (Adorno, 2009: 128).

That is why Adorno recognizes 'real commitment' in Beckett's works (Tiedemann, 1994: 21). Accordingly, Adorno writes in *Aesthetic Theory*: 'Greece's new tyrants knew why they banned Beckett's plays, in which there is not a single political word' (Adorno, 1970: 319). As Adorno expressed in the television conversation mentioned above, resistance stirs against advanced art because people understand very well when they are being attacked. 'Beckett's things' have such indescribable force because they confront the defining historical and social contents of the time, and not merely surface phenomena (Adorno et al., 1994: 87). As a

result, they inspire a moment of hope. But Beckett's absurd theater shows the age as it is, and thereby denies all hope:

HAMM: Did your seeds come up?

CLOV: No.

HAMM: Did you scratch round them to see if they had sprouted?

CLOV: They haven't sprouted.

HAMM: Perhaps it's still too early.

CLOV: If they were going to sprout they would have sprouted. (*Violently.*) They'll never sprout! (Beckett, 1958: 98; cited in Adorno, 1961: 245)

At the same time, however, it appeals to readers and viewers to grasp the world as changeable. Beckett knew, as Walter Boehlich said in conversation with Adorno, that there is no hope, but also that he could neither live nor write without it (Adorno et al., 1994: 107). Adorno writes,

Excretions become the substance of a life that is death. But the imageless image of death is an image of indifference, that is, a state prior to differentiation. In that image the distinction between absolute domination, hell [...] and the messianic state in which everything would be in its right place, disappears. (Adorno 1961: 274 trans. mod)

The possibility of truth is kept open when the counterimage arises from the stiffness of death. In *Negative Dialectics*, Adorno writes:

Beckett has given us the only fitting reaction to the situation of the concentration camps – a situation he never calls by name, as if it were subject to an image ban. What is, he says, is like a concentration camp. At one time he speaks of a lifelong death penalty. The only dawning hope is that there will be nothing any more. This, too, he rejects. From the fissure of inconsistency that comes about in this fashion, the image world of nothingness as something emerges to stabilize his poetry. (Adorno, 1965: 380 et sq.)

Adorno's thinking also holds the 'fissure of inconsistency' open – and in that way, he's close to Beckett. For the sake of hope, Adorno philosophizes in a deliberately aporetic way in order to maintain precisely this contradiction between the meaningless of reality and the perspective of reconciliation (Schmid Noerr, 1996: 53).

CLOV: I love order. It's my dream. A world where all would be silent and still and each thing in its last place, under the last dust. (Beckett, 1958: 120; cited in Adorno, 1961: 274)

## DIDACTIC POETRY: BERTOLT BRECHT

The relationship between Adorno and Brecht is certainly marked by mutual antipathy. In Brecht's *Journals*, there is no lack of disrespectful remarks about the members of the Institute for Social Research – 'formerly frankfurt, now hollywood' (Brecht, 1973: 510) – with whom he sometimes met in Californian exile for discussions concerning art and society. And for Adorno, as his letters show, Brecht was a 'wild man' (cf. Wiggershaus, 1986: 192) with a 'dull nature' (Adorno and Kracauer, 2008: 259) and harmful influence on Walter Benjamin, whom he encouraged 'to believe in the proletariat as if it were the blind world-spirit' and was on the verge of turning into a '*Wandervogel* gone mad' (Adorno and Horkheimer, 2003: 131 et sq.; cited in Muller-Doohm, 2003: 219). Brecht's proximity to party communism, as shown in the doctrine of the learning-play [*Lehrstücke*], was another reason for Adorno's distance (Scheit, 2011: 5).

Nevertheless, Brecht, one of the 'greatest formal artists of the 20th century' (Burdorf, 2001: 1), was not merely a 'sparring partner' for Adorno to test his own philosophical work (Klein et al., 2011: 381). Peter Bürger draws attention to the fact that the reasons for the rejection can be derived from Adorno's concept of art itself, especially the motif of the artwork as an *unconscious* writing of history. Brecht, on the other hand, forms the connection between art and society with 'the highest possible degree of consciousness'. In this respect, Bürger is right to assert that there's no place for a writer like Brecht in Adorno's aesthetic theory, and thus he can't be adequately recognized by Adorno

(Bürger, 1974: 87). However, works such as *Saint Joan of the Stockyards* can also be interpreted with regard to Adorno's aesthetic of autonomy or rather the theory of the artwork as an unconscious writing of history. According to Burkhardt Lindner, the radicality of the play lies in its 'poetic addition', the autonomy of which goes beyond action and can't be assimilated. This supplement is the violence that underlies all culture (Lindner, 2001: 273). This violence drives the text forward and subverts it, insofar as the play is a parable on the failure of culture, which Adorno certainly perceived as well (Lindner, 2001: 276). In *Negative Dialectics*, for example, the reference to a speech by Mauler in *Saint Joan* is quite clear; Adorno, considering the repression of violence underlying all culture, writes: '[Culture] abhors stench because it stinks – because, as Brecht put it in a magnificent line, its mansion is built of dogshit' (Adorno, 1966: 366).

Despite this reference to Brecht, especially at a central point in *Negative Dialectics*, Adorno did not at any point examine in detail how Brecht too exposes the traditional idea of drama and the notion of meaningfulness as illusory. Neither did Adorno perceive how Brecht reflects this insight through the disruption of artistic form. In his writings, he only rudimentarily deals with Brecht's work in differentiated ways. Otherwise, he treats him in terms of committed literature. However, this attitude towards Brecht is also understandable in light of the fact that in the 1960s, Adorno wanted to intervene in discussions about art and politics that threatened to turn in favor of a decidedly political art. It's clear from his correspondence with Walter Benjamin that he also counts Brecht in the unified front against *l'art pour l'art*, to which Adorno would like to oppose his own position (Adorno and Benjamin, 1994: 65). In Adorno's essay 'Commitment', Brecht's desire to educate people towards an attitude is related to Jean-Paul Sartre's concept of committed literature. Adorno thus ascribes little importance to the breaks in Brecht's

development, even though when confronting the National Socialist horror, he deviated from the attitude of his learning-plays and the aesthetics of the earlier 'epic theater' (Scheit, 2011: 4). This aesthetic is pointless when faced with the formation of a German national community. Brecht did not, however, give any theoretical account for this break (cf. Scheit, 2011: 6).

Adorno's critique begins where Brecht instrumentalizes his art for a political purpose, thus spoiling it. By placing doctrine over form and universal statements over individual experience, the plays become abstract, and neglect the reality they wish to change. The lyrical voice, writes Adorno, 'had to swallow chalk', when Brecht, in despair over the violence of social relations, adopts a practice he has every reason to fear: 'Even Brecht's best work was infected by the deceptions of his commitment' (Adorno, 1962: 187). Brecht, however, in the context of the expressionism debate conducted in the Moscow journal *Das Wort* during 1937–8, warned against falling into the monstrosity of a naked 'contentism', as he liked to call it. Yet Adorno still sees Brecht, because of his obligation to unadorned truth and the ideal of simplicity, falling into a realism that misses the essence of reality. Due to its processuality, this essence cannot be depicted as an immediate fact by 'dragging it straight out of its camouflage' but rather only through citing it 'imageless and blind, in a single crippled life' (Adorno, 1962: 183). Brecht's 'picture-book technique' wants to make this essence theatrically appear, and thereby misses it (Adorno, 1962: 186). For Adorno, Brecht falls behind an already attained artistic level when he does not follow an autonomous artistic development, but rather uses forms for the sake of a political purpose, and thus adapts them to this goal. What's often referred to as Brecht's avant-gardism, along with the reception of artistic forms already handed down, runs the risk of becoming regressive.

With his conception of 'epic theater', Brecht wanted to denounce the art of

bourgeois society, which he detested. To the question, 'Is drama dead?' he replied: 'If you ask a hundred and twenty-year-old, if life at all makes sense, then he will tell you, especially when he has lived badly: little' (Brecht, 1967: 104). At the same time, he did not want to abolish theater at all, but to innovate it. Adorno's observation that Brecht was more interested in the theater than in changing the world definitely has its kernel of truth here (Adorno, 1969: 275). Brecht abandons the classical conception of Aristotelian drama. Instead of empathy and illusion, he sets on training the argumentative intellect in the theater, presenting unadorned the phenomenon of alienation in capitalist society. Ultimately, he sees this presentation as the aim of theater.

Adorno criticizes Brecht for wanting to expose the fiction of appealing to humanistic values such as the good, truth, and beauty, and wanting to represent the opposition between individual and society in a way that eliminates dramatic character and subjective mediation. When people are depicted directly as agents of social processes and functions, then the objectivity that the plays want to distill is falsified (Adorno, 1962: 185). On the one hand, the abstractness of what's expressed is directed at the individual. From this perspective, Brecht seems to follow Nietzsche's pitiless imperative: 'if something is falling, one should also give it a push' to act (Nietzsche, 1883: 168). And unlike Beckett, who develops the universal out of individual experience and reflectivity, Brecht's demand for education toward a universal attitude is doomed to fail since society does not have an overarching subject that could guarantee it. On the other hand, Brecht also misses the social essence. In *Saint Joan of the Stockyards*, as Adorno writes, Brecht is not able to reveal the essential processes of capitalist society which the play wants to show. The more he concerns himself with immediate facts of reality, the less he is able to show this essence: 'Mere episodes in the sphere of circulation, in which competitors maul each other, are

recounted instead of the appropriation of surplus-value in the sphere of production, compared with which the brawls of cattle dealers over their shares of the booty are epiphenomena incapable of provoking any great crisis' (Adorno, 1962: 183). Furthermore, in *The Resistible Rise of Arturo Ui*, the true horror of fascism is conjured away, since it's presented as the accidental undertaking of a band of gangsters, like a misfortune. Because of his political commitment, Brecht cannot show that fascism is rooted in social relations themselves – and this also degrades his own doctrine (cf. Adorno, 1962: 184).

There's a gap between Brecht's claims and the aesthetic form, making him incapable of fulfilling his own norm: 'The political falsehood stains the aesthetic form' (Adorno, 1962: 186). This is because the demand for realism can only refer to the fundamental experience of reality to which the author adds his construction, as Adorno argues in his text on Lukács, 'Extorted Reconciliation'. Realistic observation and formal laws of aesthetics must be connected. On the one hand, this lack of connection shows itself to Adorno in Brecht's unambiguity and ideal of simplicity, his 'infantile simplification' (Adorno, 1958: 222), which falls short of the 'truth [that] involves innumerable mediations' (Adorno, 1962: 186). This is evident from the abstract and unsound character of the plays. On the other hand, the plays are dramatically unmotivated and, in terms of social conditions, misconstructions, since Brecht withdrew both the aesthetic design and the moment of 'imagery' (Adorno, 1962: 183 trans. mod). Adorno's criticism can be summed up in the following: Brecht artistically portrays the abstract essence of reality in a merely superficial way, without actually being able to express what he intended. His technique of reduction would be legitimate only in autonomous art, for example in Beckett, who brought people to their abstract substratum in order to show social suffering, something Brecht also wanted to express (cf. Adorno, 1962: 185). Adorno thus refers to Brecht's didactic poetry as a 'manipulative technique' (Adorno, 1970:

329), coercing what's artistically expressed until it bends into shape. In contrast, the ambiguity of autonomous artworks can inflame both thought and insight, and thus does justice to what's expressed.

At the same time, however, Adorno notes that Brecht's artistic force goes beyond the official credo of his theses. Such force accrued to him, paradoxically, only through political commitment: 'It is futile to try to separate the beauties, real or imaginary, of his works from their political intentions' (Adorno, 1962: 186). This is futile because the primacy of doctrine over form becomes its own moment, and as a result opposes the illusory character of form, which it has always based on its claim to present aesthetic meaning: 'The correction of form by external conditions, with the elimination of ornament in the service of function, only increases its autonomy' (Adorno, 1962: 185). With such remarks, Adorno traces a more universal political significance in Brecht's work than that which Brecht himself claimed to be pursuing (Scheit, 2011: 1). Yet Adorno leaves this brief remark behind and concentrates on the critique of Brecht's didactic intentions.

In *Aesthetic Theory*, by contrast, Adorno pursues the contradictions in Brecht's work, and views them with regard to the disintegration of form, something that Beckett's plays also reflect. A different concept of commitment emerges from this perspective, one close to Beckett as well. Just like the correction of form by external conditions increases its autonomy, Adorno claims in *Aesthetic Theory* that because of Brecht,

the artwork gained self-consciousness of itself as an element of political praxis and thus acquired a force opposed to its ideological blindness. Brecht's cult of practicality became an aesthetic constituent of his works and it is not to be eliminated from what in his work stands at a remove from the realm of causal contexts, namely their truth content. (Adorno, 1970: 329)

This doesn't concern the doctrine Brecht represents – all the theses could be more

succinctly understood through theory, Adorno admits – but the translation of his insights into aesthetics, his ‘transport through the aesthetic monad’ (Adorno, 1970: 169 trans. mod). Through Brecht’s vehemence, these insights can become more than they pretend to be.

In his plays, theses took on an entirely different function from the one their content intended. They became constitutive; they made the drama anti-illusory and contributed to the collapse of the unitary nexus of meaning. It is this, not commitment, that defines their quality, yet their quality is inseparable from the commitment in that it becomes their mimetic element. Brecht’s commitment does for the work what it gravitates toward on its own: It undermines it. (Adorno, 1970: 335)

Adorno suggests this undermining in *Aesthetic Theory* but doesn’t really carry it out (cf. Scheit, 2011). He confines himself to the statement that the ‘plight of form’ manifests in the difficulty of the conclusion, a problem which came to a head in Brecht: ‘Once having shaken itself free of convention, no artwork was able to end convincingly, and the continued use of traditional endings only simulate the temporal convergence of the particular elements with the concluding instant as a totality of form’ (Adorno, 1970: 201). Yet Adorno refrains from analyzing the conclusion of even a single play by Brecht. According to Scheit, the ‘frightening chaos’ at the end of *Mahagonny* or the ‘sententious conclusion’ of *The Good Person of Szechwan* would offer good cases for in-depth investigations (Scheit, 2011: 2). Even *Saint Joan* presents a merely apparent solution, an aesthetically suspended conclusion that expresses the impotence of commitment:

In the impossibility of playing the old game to the end with force as if it were the last time and just as little in playing it as a final game, the will to break the course of the world is preserved. That is why art is frightened by its impotence. In the words of Joan: ‘The noise of the factories has started again, you can hear it. / Another chance to stop it / has been wasted’. (Lindner, 2001: 285; Brecht, 1932: 119)

In an open letter to Ralf Hochhuth in 1967, there is once again a comment by Adorno

regarding Brecht’s undermining of form. It reads:

Brecht had the right instinct in *Fear and Misery of the Third Reich*, when he exhibited its character in the populace and not in the rulers. In return, he had to give up the traditional pathos of tragedy and make use of episodic form, perhaps at the expense of what is genuinely dramatic, a consequence of the phoniness that has taken over the subject, its social semblance. (Adorno, 1967: 243)

By displacing the political drama from its subjects to its objects, however, Brecht did not go far enough. Beckett’s ‘human stumps’ are more realistic in terms of showing just how far human beings have been made into objects of society (Adorno, 1967: 243).

## ART BETWEEN AUTONOMY AND COMMITMENT

In a discussion where Brecht was also present, Adorno stated that only cultural moments that reject the principle of utility have the intention of pointing beyond what exists, and only the art which refuses practice has a moment of transcendence, in the sense of a classless society (Horkheimer, 1985: 578). Afterwards, Brecht noted in his work journal: ‘i’m listening to SCHÖNBERG’S “theme with 7 variations” on the radio when the bell rings. a bloodless young-old woman stands in front of the door: “can I ask you for a busfare?” I quickly give her 10 cents and continue listening to the romantic work with its pre-established harmony’ (Brecht, 1973: 695). This episode contains, *in nuce*, the controversy about committed and autonomous artworks: it points to the danger of autonomous art having no social consequences. Adorno himself also saw this danger. Autonomous works have a tendency to become ideological through their rejection of manifest social content. Here Adorno encounters a moral conflict: art should be alienated from the real world and its

interactions, yet because of this, it leaves the world as it is. According to his *Lectures on Aesthetics* from 1958/59, the moral claim to change the world comes into conflict with the specific aesthetics of the intolerability of empiricism. The more adequate the artistic experience, the stronger the context of delusion. There are periods in which art acts as a substitute for other things; for instance, there are situations 'in which radical art can become an alibi for the avoidance of intervening practice' (Adorno, 2009: 195; cf. Adorno, 1970: 116). The criticism of commitment thus becomes wrong as soon as the wish to keep culture pure of society comes to the fore. This attitude ultimately consists in everything remaining as it was, nothing changing at all (Adorno, 1970: 335 et sq.).

For Adorno, art always needs the perspective of real change that the concept of commitment covers. Yet even if he regards autonomous art as the only advanced art, hoping that the shock emanating from it spreads into practice, the controversy about committed and autonomous art remains undecided. In the 'Commitment' essay, Adorno describes this controversy as 'urgent, so far as anything that merely concerns the life of the mind can be today, as opposed to sheer human survival' (Adorno, 1962: 177). It is urgent, because autonomous and committed works rightly criticize each other: 'A work of art that is committed strips the magic from a work of art that is content to be a fetish, an idle pastime for those who would like to sleep through the deluge that threatens them' (Adorno, 1962: 177) – here, the truth of Brecht is settled. 'For autonomous works of art, however, such considerations, and the conception of art which underlies them, are themselves the spiritual catastrophe of which the committed keep warning. Once the life of the mind renounces the duty and liberty of its own pure objectification, it has abdicated' (Adorno, 1962: 177). Without this controversy, art would be negated.

Committed art, necessarily detached as art from reality, cancels the distance between the two. 'Art for art's sake' denies by its absolute claims that ineradicable connection with reality which is the

polemical *a priori* of the attempt to make art autonomous from the real. Between these two poles the tension in which art has lived in every age till now is dissolved. (Adorno, 1962: 178)

In this respect, autonomous and committed works of art cannot be neatly separated, but rather remain often ambiguous. This is true both for Beckett, in which 'rudiments of meaning' always remain, and for Brecht, whose work cannot always be reduced to simplicity and didactic gestures. In the rejection of the status quo, therefore, committed and autonomous art converge.

CLOV: Do you believe in the life to come?

HAMM: Mine was always that. (*Exit Clov.*) Got him that time! (Beckett, 1958: 116; cited in Adorno, 1961: 274)

# Adorno's Brecht: The Other Origin of Negative Dialectics

Matthias Rothe

## ADORNO AND BRECHT: MOVING BEYOND AVERSION

Theodor W. Adorno and Bertolt Brecht: this is how the story commonly goes. The former is repulsed by the unconcerned activism and the vulgar Marxism of the latter; the latter is rejecting the former along with the other Frankfurt School theorists for their 'stilted, abstract language, their elitism, ... their wrong-headedness' (Lyon, 1980: 260).<sup>1</sup> Gene Ray then sums up their relation to one another: 'Bertolt Brecht and Theodor W. Adorno stand for opposing modes and stances within an artistic modernism oriented toward radical social transformation' (2010: 1). He closely follows Susan Buck-Morss, who observed before him: 'Brecht opted for the proletariat, claiming that the artist had to ally himself with the worker's cause ... Adorno insisted that the criterion for art could not be its political effect on the audience' (1977: 34). Adorno's 1962 essay 'Commitment' usually figures as *the* document of their adversity.<sup>2</sup>

This perspective is shaped first and foremost by politics. In 1967, when students took their unease to the streets, ridiculing Adorno's reticence to endorse political action, the German journal *Merkur* published an article by Helmut Heissenbüttel on Adorno's role as editor of Walter Benjamin. Heissenbüttel accused Adorno of having erased all traces of Brecht's materialism and activist politics from Benjamin's writings. Hannah Arendt, Gershom Scholem and many others participated in the controversy. Adorno and Brecht were viewed exclusively through their friendship with Walter Benjamin and through the lens of Adorno and Benjamin's correspondence. Benjamin, conceding fault as well as defending his position when Adorno criticized his closeness to Brecht's materialism, seemed to have been caught between the two and so made their relationship appear fundamentally antagonistic.

Buck-Morss' book *The Origin of Negative Dialectics* (1977), setting the tone for decades to come in North America, is highly critical

of this reading. She thoroughly theorizes Adorno's correspondence with Benjamin, reclaiming for intellectual history what the German debate perceived only as politics. Yet in doing so, she also reproduces and even deepens the constellation of adversity; in fact, she inscribes it into the very origin of negative dialectics (hence the book's title). What the correspondence suggests to her, is a precise time of inception for Adorno's philosophical stance that coincides with the beginning of his friendship to Benjamin: their conversations in Frankfurt and Königstein in 1928 and 1929. These encounters marked nothing less than Adorno's 'conversion' (Buck-Morss, 1977: 23), she writes.<sup>3</sup> Adorno's letters, accordingly, seek to ensure Benjamin's faithfulness with regard to this origin.<sup>4</sup> Buck-Morss names Immanuel Kant, Georg Wilhelm Friedrich Hegel, Karl Marx, Edmund Husserl, Georg Lukács and Arnold Schönberg as influences preparing or following this conversion, yet throughout presupposes Brecht as a hostile factor.

These letters, however, need historicization. Far more than speaking of Adorno's rejection of Brecht, they tell the story of diaspora and political isolation. In such contexts, origins come into existence retroactively. Made the basis for an intellectual history at large, Adorno's own relationship with Brecht falls out of sight. They were part of the same intellectual circles between 1929 and 1932 and particularly close during their exile in Los Angeles.<sup>5</sup> More importantly, the scope and frequency of Adorno's engagement with Brecht is widely ignored. The lens of his correspondence with Benjamin brings only a fraction of it into view. Adorno discussed Brecht's work continuously between 1928 and 1969, in many academic lectures, in public talks, in journal articles and in *Negative Dialectics* and *Aesthetic Theory* (which he considered to be his magna opera).<sup>6</sup> Brecht's 'appearances' in the *Aesthetic Theory* alone, as Karla Schulz notes (1998: 314), rival those of Adorno's acknowledged favourites Franz Kafka, Arnold Schönberg and Samuel Beckett.<sup>7</sup>

This chapter foregrounds some of these discussions, but also Adorno's conceptual engagement with Brecht at places where it is less obvious, and thereby also reassess the Adorno, Benjamin, Brecht triangle. As Burkhardt Lindner remarked – without following up on this insight – an adversarial topology 'is not the only one possible' (1971: 34). The beginning of their relationship, I maintain, was marked by intellectual communion, as Adorno's early reviews of Brecht's works suggest. While both Benjamin and Brecht went in directions that Adorno could not endorse, Benjamin was far more receptive to Adorno's criticism, not least because they shared a philosophical perspective. There are no existing letters between Adorno and Brecht, but Adorno's interventions in Benjamin's work can be seen as also addressing Brecht. While Adorno hoped to rescue Benjamin, or, in his own words, defend him against himself (2015: 455), Brecht, more out of reach, became an opponent. Yet with dialectical contradiction at work, I claim, Adorno was determined, backhandedly, more by such opposition than by approaches in resonance with his own.<sup>8</sup>

## BRECHT AS MODEL

### *The Mahagonny Moment*

Two years after Weimar's hyperinflation, in a society still steeped in misery, Bertolt Brecht and his collaborators turned to a new dramatic subject: the economy, and financial speculation in particular. In the years to come, they produced a great number of dramatic texts meant not only to faithfully record the economic situation at hand, but also to expose its causes. Some remained fragments, such as *Jae Fleischhacker in Chikago* (1925–9) or *The Breadshop* (1926–8), others became defining for Weimar culture, for example *Threepenny Opera* (1928) or *Rise and Fall of the City of Mahagonny*

(1930). These plays tell the story of Brecht's struggle with representation, while also providing a genealogy of Brecht's theatre. It was common practice for Brecht to reflect on questions of form in his journal, public discussions and essays, and, throughout his life, in his poems. One of these poems, part of the *Jae Fleischhacker* project, is entitled *This Babylonian Confusion* (Brecht, 1976: 124–5). Written in 1926, Brecht used it to work through problems he had encountered in trying to adapt – with *Jae Fleischhacker* – Frank Norris' 1903 realist novel *The Pit* for the stage. The novel tells the story of cornering the wheat market through the lens of a speculator's private affairs. Brecht's poem not only discusses Norris' realism, but also performs the course of action that his theatre took in the late 1920s in order to fulfil its self-appointed task: staging the irrationality of capitalism.<sup>9</sup> It reads as Brecht's aesthetic programme:

...  
 The other day I wanted  
 To tell you cunningly  
 The story of a wheat speculator in the city of  
 Chicago. In the middle of what I was saying  
 My voice suddenly failed me  
 For I had  
 Grown aware all at once what an effort  
 It would cost me to tell  
 That story to the not yet born  
 But who will be born and will live  
 In ages quite different from ours  
 And, lucky devils, will simply not be able to grasp  
 What a wheat speculator is  
 Of the kind we know.  
 So I began to explain it to them. And mentally  
 I heard myself speaking for seven years  
 But I met with  
 Nothing but a silent shaking of heads from  
 All my unborn listeners.  
 Then I knew that I was  
 Telling them about something  
 That a human being cannot understand  
 ...

If 'cunning' narration refers to traditional, realistic storytelling – linear progression, going through twists and turns to arrive at a happy end – then this strategy fails in the

poem. Its story is disrupted in favour of commentaries providing explanations on everything taken for granted in a narrative that follows the rules of representational realism: What is speculation? What is profit? How are prices determined? What are the consequences? And so on. The lyrical 'I' hears himself speaking for seven years. The explaining never ends, because its subject is society's functioning, and this totality only comes into view to the degree that the cunning narration disintegrates. This does not mean that the text remains fragmentary. It is kept together by a metanarrative: the story of the failure of storytelling, which is itself told cunningly ('the other day I wanted', 'suddenly', 'I had grown aware'). More importantly, this story has a happy ending. The lyrical 'I' comes to own the perspective of its imaginary audience.<sup>10</sup> And it is this perspective that turns out to have been the cause for the disruption of the storytelling all along when the original addressee is revealed as liberated humanity.

Theodor W. Adorno might not have known Brecht's poem, but his *Minima Moralia* (1951) famously ends on a note that calls upon philosophy to practice what the poem achieves:

The only philosophy which can responsibly be practiced in the face of despair is the attempt to contemplate all things as they would present themselves from the standpoint of redemption ... all else is reconstruction, mere technique. Perspectives must be fashioned that displace and estrange [*verfremdet*] the world, reveal it to be, with its rifts and crevices ... as it will appear in the messianic light. (Adorno, 2005: 247)<sup>11</sup>

After all, he saw the poem's aesthetic procedure at work in Brecht and Weill's *Threepenny Opera* and *Mahagonny*. In particular his first review,<sup>12</sup> comparing *Mahagonny* to the novels of his favourite author Franz Kafka, anticipated the *Minima Moralia* entry verbatim:

The city of Mahagonny is a representation of the social world ... projected from the bird's eye view of

an already liberated society ... Just as in Kafka's novels the commonplace bourgeois world appears absurd and displaced in that it is viewed from the hidden perspective of redemption. (Adorno, 1994: 588)

To be more precise, his review reads as if he had set himself the task to trace the play's realization of the programme laid out in *This Babylonian Confusion*. *Mahagonny* tells the story of Jim Mahoney, who arrives in the city of Mahagonny, which was founded to provide a home for the dissatisfied of all continents. Everything is permitted in Mahagonny, except to be without money. The story, Adorno emphasizes, is told against the backdrop of an emphatic notion of humanity – a life in bliss and freedom – which, as in the poem, is not spelled out. Present circumstances are 'projected onto the untouched white surface of things as they should be' (Adorno, 1994: 588). The story has to measure up against this tacit norm; accordingly, it disintegrates while bringing a totality into view: 'capitalism' or 'the anarchy of commodity production', in Adorno's words (589). The lyrical 'I' of *Mahagonny* is a child, 'an oblique infantile perspective', Adorno remarks (589). The story comes across as 'a fairy tale' and the lack of explanation – over-compensated for in *This Babylonian Confusion* by seven years of speaking – translates in *Mahagonny* into cuts, jumps and absurdities, generating 'crass horror', something that Marxist analysis cannot hope to achieve in the same way, Adorno holds.

Such observations also disclose why Brecht's work was of such interest to Adorno, and why his response to Brecht's work was so enthusiastic in the late 1920s. *Threepenny Opera* and, in particular, *Mahagonny* spoke, on the one hand, to Adorno's encounter with Lukács' Marxism in 1928.<sup>13</sup> The two works visualize, so to speak, the main concern of Lukács' *History and Class Consciousness*, which Adorno came to share: commodification or the unfettered mediation of all social relations by exchange value. *Mahagonny*, Adorno asserts elsewhere with a view to

its depiction of love, forces 'the reification of interpersonal relationships' into striking pictures (Adorno, 1994: 589). On the other hand, *Mahagonny* seems to have offered itself to Adorno as a contemporary successor to Benjamin's *Trauerspiel* [mourning play], which he also discovered in 1928. He adopts Benjamin's model of the artwork's form as revelator of societal contradiction and, passing through the aesthetic construction's inherent tensions, conflicts and contradictions, understands *Mahagonny* as performing a genuinely immanent critique, aiming at the disclosure of an era's constitution.<sup>14</sup> The review works through core themes of Benjamin's *Trauerspiel*. Adorno prominently discusses the figure of the sovereign (the founders of *Mahagonny*), emphasizing, like Benjamin, the intimate connection between violence and law. Jim Mahoney becomes an equivalent to the *Trauerspiel*'s figure of the schemer as he manipulates the city's course. Like Benjamin's Baroque drama, *Mahagonny* knows no hero and is not a tragedy (Adorno, 1994: 590). Most importantly, Adorno turns his attention recurrently to *Mahagonny*'s fragmented form, an aspect that is also key in Benjamin's analysis.

Yet Adorno, through his reading of Brecht, does not simply update the *Trauerspiel*. He turns all of Benjamin's stories into stories of becoming: 'the power of what is coming', he writes, 'shows itself ... in the construction of the present' [transl. changed] (Adorno, 1994: 588). 'Construction' can be read as 'in process', as happening in front of the observers' eyes. The schemer and the sovereign, far from being custodians of a world in continuous decomposition, reappear as characters driving all development. *Mahagonny*'s focus is on the founding of sovereignty and Jim Mahoney drives society's latent anarchy to the fore, both uncovering and realizing it (589). *Mahagonny*'s story, which comes to life through 'a child's eye', emerges in a fragmented and distorted form. '(T)he debris ... is constructively clipped together' (591) by

montage as it runs up against ideas of bliss and freedom. In this way, the present circumstances reveal their own falseness against 'the untouched white surface of things as they should be'. And although *Mahagonny* 'does not present ... a positive standard', Adorno asserts, the idea of a classless society 'shimmers through ... as unclear as a movie projection over which another has been superimposed' (588).<sup>15</sup> In other words: as the verso of the false.

It is in this crucial point – the conception of aesthetic truth – that Adorno sides with Brecht or employs Brecht against Benjamin. Transcendence in *Mahagonny* is the effect of a negative, thin as air, whereas in Benjamin's mourning play it is part of the tension that creates the genre's form and the era's condition: a transcendence confined to immanence. Benjamin's mourning play shows the true state of things: 'the observer is confronted with the *facies hippocratica* of history as a petrified, primordial landscape (1998: 166).<sup>16</sup> *Mahagonny*, by contrast, shows 'the grimace of reality' (1994: 589). The state of things is the false one: the commodity mediated totality. The artwork's critical thrust in Adorno's interpretation is negative. *Mahagonny* makes the present negatable [*negierbar*]. Adorno reconfigures all of Benjamin's concepts for the space defined by Brecht's aesthetic procedure, thereby moving towards a negative aesthetics, negativity through immanence.

Ultimately, his interest was in this procedure and not in the epic theatre, still a new concept at the time. 'Simply referring to epic theatre doesn't tell us much about *Mahagonny*', Adorno writes. Instead, he associates Brecht's work with surrealism: '*Mahagonny* is the first surrealist opera' (591).<sup>17</sup> Theatre proper disappears in a two-fold abstraction. Surrealism, unlike epic theatre, is not confined to a specific medium. It is a cultural movement encompassing many forms of artistic expressions and, in the form of surrealism, *Mahagonny* becomes a 'fractured and intellectual procedure ... sorely needed' (GS 19: 363).

### ***The Actuality of Philosophy: 'This Fractured and Intellectual Procedure'***

Adorno's inaugural lecture 'The Actuality of Philosophy' dates from the same time as his reviews of *Threepenny Opera* and *Mahagonny*. Susan Buck-Morss argues that it not only assembles all the themes of his later philosophy, but also bears the imprint of Benjamin's *Trauerspiel* throughout (1977: 23). It has often been noted, for example, that Adorno's 'constellation' in 'The Actuality of Philosophy' is modelled after Benjamin's 'configuration' in the 'Epistemo-Critical Prologue' to his *Trauerspiel* book (see Müller-Doohm, 2006: 91; Snow, 1977: 115). However, Adorno debates using the term constellation in the course of his lecture, but finally settles on a concept from Brecht's theatre: *Versuchsanordnung* [experimental setting], a 'less astrological and more scientific and up-to-date word' (GS 20: 572).<sup>18</sup>

How did Brecht come into play here? The 'official' occasion was perhaps a collaboration between Adorno, Brecht and Benjamin. Around 1930, Brecht and Benjamin were planning 'to smash Heidegger' (Wizisla, 2004: 77–8). They recruited Adorno for a critique of *Sein und Zeit* [*Being and Time*] to be published in their journal, *Krise und Kritik*. The journal project fell through, yet the collaboration materialized, albeit in a different form.<sup>19</sup> Adorno's 'The Actuality of Philosophy' and Benjamin's 'What is Epic Theatre?', both written at the same time (early 1931), take a strong anti-Heidegger stance.<sup>20</sup> An understanding of Brecht's work as a method offered an ideal antidote to Heidegger's ontological understanding of alienation [*Entfremdung*]: the question of being could be replaced by the question of society. Heidegger's assertion that an unalienated state could be accessed directly and through an individual's affective and subjective anticipation of death could be challenged by the idea that any critique would have to pass through the exposure of the prevailing

representational systems (science, arts, political discourse and so on). Most importantly, Brecht's exploration of societal totality suggests the possibility of politics.

Not surprisingly then, the similarities between Adorno's lecture and Benjamin's essay (originally written for the *Frankfurter Zeitung*, but not published at the time) are striking: Benjamin turns Brecht against the aesthetic programme of naturalism and Adorno turns him against the sciences' assertion of generating truth. Both centrally employ the term *Versuchsanordnung* for these tasks.

'The naturalistic stage', Benjamin writes, 'is entirely illusionistic. Its own awareness that it is theatre cannot fertilize it ... it must repress this awareness so as to pursue undistracted its aim of portraying the real' (1998a: 4). Epic theatre then, because it 'derives a lively and productive consciousness from the fact that it is theatre', can break naturalistic action down into its elements and rearrange them 'as though it were setting up an experiment [*Versuchsanordnung*]' (1998a: 4). The spectator is thereby defamiliarized. Philosophy's assignment, Adorno holds, is likewise the creation of distance or defamiliarization. Its starting point is the questions and answers commonly provided by the sciences. Philosophy has to make scientific findings lose their meaning and break them down into parts to be reorganized: 'Philosophy must thus arrange those elements that it receives from the sciences ... by changing experimental settings [*Versuchsanordnungen*]' (GS 20: 572).

The *Versuchsanordnung* of epic theatre, Benjamin claims, is concerned with 'uncovering conditions'. The audience can recognize the 'devastations of our social order' (1998a: 4). Adorno's *Versuchsanordnung* permits the identification of possible causes of social devastation: once the logic of the sciences has lost its authority, entirely different questions arise: why is it possible to ask the questions that the sciences ask in the first place? What can become the subject of such questioning? Philosophy 'plays' with the elements 'until they form a figure that

is readable as an answer, while at the same time the question disappears' (GS 20: 572). Such an answer is, for example, the emergence of 'the historical figure of commodity' (575). Or, in Foucauldian terms, the sciences' regime of truth becomes apparent. Yet in this all-decisive point – the conception of truth – Adorno again parts company with Benjamin and goes with Brecht. For Benjamin, the idea of a thinking that intervenes [*eingreifendes Denken*], thinking that compels the audience to take an 'actionable' political position, became central around 1930.<sup>21</sup> To that effect, epic theatre, he claims, makes the spectators discover the truth about bourgeois society (it 'reveals' and 'uncovers'). Defamiliarization, in his essay, relies on the deliberate employment of theatrical means. They become tools for truth production. Adorno, by contrast, insists on methodological distance. The 'figure' that offers an answer by displaying the state of commodification, he maintained, is only 'constructed' by the question (575). Adorno's defamiliarization targets its subject in its entirety, for example, the totality of the scientific world. It creates a polemical (hostile) distance to all that exists through the perspective of a (big) question. The question thus – modelled after Heidegger's question of being – obtains a function comparable to the emphatic notion of humanity in *Mahagonny*. And as in *Mahagonny* the story disintegrates, the logic of science loses its grasp in 'The Actuality of Philosophy'. The figure constructed from the resulting fragments does not uncover truth, but, as in *Mahagonny*, truth can 'shimmer through'. In other words, what becomes an experience is the mere possibility of transcendence; truth exists as the reverse of the false (truth cannot reside in the false).<sup>22</sup> The proximity of Adorno's lecture to *Mahagonny* is palpable throughout and the theme of commodification runs as a common thread through them. Already at the beginning, Adorno turns what he saw as Brecht and Weill's surrealism into an assignment for philosophical inquiry: 'only polemically does reality present itself ... as total reality,

whereas it allows for hope only in traces and debris' (555).<sup>23</sup> Brecht's early work, practising an immanent *and* negative critique in artistic form, evidently provided a model for 'The Actuality of Philosophy'. Benjamin relies on a different Brecht: the Brecht of the learning play.

## REFUNCTIONING AND SUBLATING BRECHT

Around 1930, Brecht and his collaborators created a type of theatre that did away with the separation between audience and stage: the *Lehrstück*, or learning play.<sup>24</sup> The first two of these plays, *Lindbergh's Flight* and *The Baden-Baden Lesson on Consent* share a passage, or rather a poem, that frames them and, I would like to suggest, can be read, along the lines of *This Babylonian Confusion*, as an aesthetic programme again. Like in *This Babylonian Confusion*, in the Lindbergh poem too the present comes into view from the perspective of the future and is turned into the past:

At the time, when humanity  
Began to know itself  
We fashioned carriages  
Of iron, wood and glass  
(...)  
Ages long all things fell in downward direction  
(...)  
Only we, we have found the secret.  
Near the end of the second Millennium as we  
reckon time  
Our artless invention took wing  
Pointing out the possible  
Without letting us forget:  
(...)  
The yet-to-be-attained.  
(Brecht, 1997: 23)

The difference between the Lindbergh passage and the 1926 poem *This Babylonian Confusion* is nevertheless significant. The perspective of the future in *This Babylonian Confusion* is tentative and generated out of the present. As Adorno observed in *Mahagonny*,

it is 'the precise projection of present-day circumstances onto the untouched white surface of things as they should be' (Adorno, 1994: 588). In *Lindbergh's Flight*, by contrast, the future is projected back onto the present, which becomes a distant point on the linear timeline of progress. The future generation has taken the floor; they look back from 'near the end of the second Millennium'. Lindbergh's 1927 flight in the play is ritually repeated. The play's story is a progress report. The dialectical figure at work here is not determinate negation, made possible by 'the bird's eye view of a truly liberated society', but negation of negation. The present turned past is to be evaluated according to its contribution to the state of liberation supposedly achieved. Whereas in *Mahagonny* or *This Babylonian Confusion* the audience or reader is distanced as the 'cunning story' falls to pieces, Lindbergh's flight succeeds and distance is collapsed, not only in interpretation, but also de facto as the audience is encouraged to act the story out.

Adorno responded twice to Brecht's post-1930 programme: In *Dissonances* (1956), he associates *Lindbergh's Flight* with the repressiveness of popular sing-alongs, commenting:<sup>25</sup>

The affirmation of activity as such is dubious. It transfers to the realm of art a drilled-in work ethics of incessant, relentless effort, completely failing to recognize that art ... is in its essence antithetical to the business of self-preservation. (GS 14: 81)

A few years later, in his lectures on *Aesthetic Theory* (1959), Adorno is more forgiving:

And after having criticized the position of blind activity so sharply, I would like to also stress, for the sake of justice, its moment of truth: namely that its relation to the artwork is not that of passive acceptance ... insofar as artistic experience consists of a certain form of 'doing', namely an active following along [*Mitvollzug*]. (Adorno, 2009: 189)

Neither his aggressive attack nor his hesitant appreciation tells the entire story. First, although there are many testimonies to

Adorno's post-1933 hostility to epic theatre, I hold that while he turned against the theatre proper and its 'practicism', he largely preserved Brecht's programme. More precisely, Adorno accepted but refunctioned the (new) terminology of epic theatre, applying Brecht's own strategy – refunctioning<sup>26</sup> – to Brecht himself.<sup>27</sup> Brecht coined the term in the late 1920s in the context of his attempt to make use of existing art forms and institutions, such as the opera, for pedagogical purposes. Art's culinary objectives would thus be backhandedly subverted or replaced. Along these lines, Adorno refunctioned Brecht's post-1933 aesthetic programme for a continuation of the *Mahagonny* project: immanent and negative critique. Kafka's novels provided the frame for this.

Second, 'the moment of truth' that Adorno discerned in Brecht's call for action does not mark a change of mind, but, as I will show, points to an even more radical coping strategy: sublation [*Aufhebung*]. From the perspective of Adorno's emerging magnum opus, *Aesthetic Theory*, sublation simultaneously achieved the preservation and destruction of Brecht's aesthetic programme and Brecht's epic theatre finally received Adorno's recognition: it was historicized.

### ***The Kafka Battle: Refunctioning Brecht***

In *Mahagonny*, Adorno recognized, 'just as in Kafka's novels ... the bourgeois world appears absurd' (Adorno, 1994: 388, 114). Elsewhere he noted: 'The absurdity of class privilege is demonstrated (very much like it is in Kafka)' (289). However, when in 1934 Benjamin applies Brecht's terminology to an analysis of Kafka's work, Adorno objects strongly: 'the only thing about the work that strikes me as alien to the material is the adoption of categories drawn from epic theatre' (Adorno and Benjamin, 1999: 70). He criticizes the employment of the term *Versuchsanordnung* – central to his own

thinking only three years earlier – and argues that 'the very form of Kafka's art stands in the most extreme antithesis to the form of theatrical art' (1999: 70). Surprisingly, Adorno's own substantial essay on Kafka – written over a period of 11 years, from 1942 to 1953 – not only uses *Versuchsanordnung* again, but also a large number of other epic theatre terms: distancing and *Verfremdung*; *Gestus*; epic and the episodic. Furthermore, a scene reminiscent of Brecht's 'Street scene, a basic model for epic theatre', is key to his interpretation (Brecht, 2014a: 176).<sup>28</sup> This can be read, I hold, as an attempt to replace Brecht with Kafka and make him redundant.<sup>29</sup> Yet by reading Kafka through Brecht's terminology – for which there was no obvious need, especially given that Brecht's theatre had become the 'antithesis' of Kafka's novels – Adorno in the end preserved and reclaimed Brecht for the project of a negative critique against what he must have seen as the positivity of the *Lehrstück* aesthetic.

With the learning play, Adorno remarks in *Aesthetic Theory*, Brecht reacted to the ineffectiveness of his theatre, wanting to enforce the political impact that his plays could not achieve (1997a: 361). *Lindbergh's Flight* encourages the audience to repeat the ocean flight by speaking and singing the play's lines. The power of the collective that resides in technology and in an enthusiastic global audience is supposed to materialize on stage. Participants should experience the future in the present, a future that appeared to be blocked by the way humankind's productive forces are put to work in capitalism.<sup>30</sup>

In his Kafka-essay, Adorno formulates a pointed rejection of this conception: 'To believe in progress is to believe that there has not yet been any' (Adorno, 1997: 256). Accordingly, he seeks to disrupt the chain of effects envisioned by Brecht's work: the move from political insight, enabled by the play, to action. In his interpretation of Kafka, the recipient is arrested by the encounter with the artwork. Art, again, can become an 'antithesis ... to the business

of self-preservation' (GS 14: 81). It does not induce 'physical' activity. How then do core themes of epic theatre play out under such premises? In the following, I focus on three instances of Adorno's refunctioning of Brecht's theatre: *Gestus*, narrative mode and art's 'real-life models'.

*Gestus* in Brecht, as Benjamin points out in 'What is Epic Theatre?' (1998a [1931]),<sup>31</sup> fragments the cunning narration of representational realism, the stories of individual failings and triumphs, by foregrounding the social and universal [*allgemeine*] dimension of individual behaviour. *Gestus* can be understood as the undoing of expression. Expressions absorb all social circumstances. These disappear in favour of those apparently natural individual emotions on which traditional realism draws. Such expressions are the point of departure of *Gestus*. *Gestus* performs externalization. In other words, through *Gestus* the societal circumstances that produce expressions become visible again and change conceivable: 'the human being is the object of investigation', Brecht writes in 1930, 'human beings both changeable and able to change things' [transl. changed] (Brecht, 2014: 65). Thus in *Gestus*, an understanding of the formative power of social forces coincides with the recognition of revolutionary potential – ultimately the emphasis of many of Brecht's post-1931 works. Social relations, by definition, stand in for the possibility of progress.

In his discussion of Kafka, Adorno reverses this direction. Kafka becomes like Brecht, a critic of capitalism. 'Kafka unmasks monopoly capitalism' [transl. changed] (1997: 256). His *Gestus* also disrupts: 'Form which is constituted through time as the unity of inner meaning is not possible for him', (264) and Adorno – as if reminding Brecht of what he used to practice – sees such disruption as targeting 'the second Babylonian confusion' (248). Hence, as in *This Babylonian Confusion*, the problem is a need to rupture language or narration, 'the configuration of which should

be truth', and so reveal its untruth (248). Kafka's *Gestus* also does this by bringing to bear upon that language 'a universal (*ein Allgemeines*) which has been repressed by sound common sense' (248). Yet whereas in Brecht this universal is human relations on which a better future can be built, Adorno observes that Kafka's force 'is one of demolition [*Abbau*] ... The flight through man and beyond into the non-human – that is Kafka's epic course' (251). The terminal point is 'the bare material existence' (251), which paralyzes every activity: 'The social origin of the individual ultimately reveals itself as the power to annihilate him' (252). It is only through the systematic work of demolition, not though building, that Kafka drafts the image of a better society: 'the wounds with which society brands the individual are seen as ciphers of the social untruth, as the negative of truth' (251).

The narrative mode that brings the *Gestus* (the universal within the individual) to the fore, in Brecht's as well as in Adorno's reading of Kafka, is one of representation. As Brecht puts it, the presentation has to be ostentatious, the showing must be shown and what is presented is thus 'something prepared' (BFA 15: 166). *Lindbergh's Flight* is set up as report; the instructions Brecht gives elsewhere to his actors turn those actors into reporters of how human beings proceed:

This is the exercise: before you show how  
Someone commits betrayal, or is seized by  
jealousy  
Or concludes a deal you look  
at the audience as if to say:  
Now pay attention ... this is how he does it. (BFA  
15: 166)

Those who report are in a sovereign position: their material or their past is at their command and they help the audience understand the possibility for change. In Adorno's Kafka interpretation, no space is opened for sovereign command. Kafka's recipients are not activated or empowered, rather, the universal

exerts authority over them: re-presentation turns into re-cognition: 'The permanent déjà vu' (1997: 251). The recipients take notice of the mode of reporting itself; they become aware *that* the presented has already been 'prepared'. There is activity nevertheless: the activity of interpretation [*Deutung*] (255) by which they can hope to liberate themselves from such re-cognition:<sup>32</sup>

where have I seen that before?'; the déjà vu is declared permanent. Through the power with which Kafka commands interpretation [*Deutung*], he establishes [transl. changed] aesthetic distance ... His texts are designed not to sustain a constant distance ... but rather to agitate his [the reader's, M.R.] feelings to a point where he fears that the narrative will shoot towards him like a locomotive ... Such aggressive physical proximity undermines the reader's habit of identifying himself with the figures in the novel. (245)

What *Lehrstück* and *Schaustück* only achieve separately<sup>33</sup> – absorption of the audience on the one hand and distancing on the other – happens in Adorno's reading of Kafka in one go: aggressive closeness is the effect. This interplay holds readers back instead of activating them. It fixates their attention on the actual artwork, on which Brecht, according to Adorno, turned his back too quickly in favour of politics. For Brecht the problem does not seem to be interpretation, but a lack of a determination to act.

Which insight can be gained by *Deutung*? That action has already failed. What seemed a promising intervention reproduces what it had hoped to overcome. The effects of social integration become palpable: 'Power must acknowledge itself as that which it is', Adorno remarks (269).

Finally, Brecht discusses the various functions of epic theatre by means of a 'natural' setting: a car crash. Adorno too resorts to a traffic accident for the sake of illustration. Brecht's street scene shows the witnesses of a crash involved in the reconstruction of the event. Their report is geared towards a useful account allowing for a further or a different course of action:

One essential element of the street scene must also be present in the theatre scene, if this is to qualify as *epic*: the demonstration should have a socially practical relevance. Whether our street demonstrator is out to show that one attitude on the part of driver or pedestrian makes an accident inevitable where another would not, or whether he is demonstrating with a view to clarifying the question of guilt, his demonstration has a practical purpose. (Brecht, 2014a: 177–8, emphasis in the original)

Adorno's street scene reads as follows:

[U]ncounted witnesses come forward, proclaiming themselves acquaintances, as though the entire community had gathered to observe the moment when the powerful bus smashed into the flimsy taxicab. The permanent déjà vu is the déjà vu of all. (1997: 251)

Whereas Brecht's scenario envisions the future avoidance of catastrophe, in Adorno's street scene the catastrophe seemed to have been anticipated – as if the entire community had assembled to witness an accident to come. Nothing could have been avoided or been done better in the future. Brecht's epic theatre ultimately envisions collective action to remedy social wrongs. Collectivism is clearly also in Adorno's purview: 'Perhaps the hidden aim of his art as a whole is the manageability, technification, collectivization of the déjà vu' (251). Yet in Adorno's street scene, the collective forms itself through an awareness that action is impossible. Adorno's reimagining of Brecht within a Kafkaesque frame foreclosed an (unmediated) turn towards politics.

To the point: Brecht for Adorno is at once object of critique and source of ideas. By virtue of Brecht's own concepts, Adorno develops a politico-aesthetic refutation of Brecht's position: progress and useful actions are turned into stasis and vain attempts. But this refutation is, at the same time, comparable to his treatment of Benjamin, a defence of Brecht against himself. Deliberate or not, Adorno 'repatriates' Brecht's concepts and restores what he must have seen as their original intention.

## ***Aesthetic Experience and the Sublation of Brecht***

The recipient imagined in Adorno's Kafka-essay is simultaneously distanced from and absorbed by the work of art. Adorno's *Aesthetic Theory* theorizes these moments, makes them defining for any aesthetic experience, and Brecht's concepts return in full force within that contemplative realm that constitutes the aesthetic experience. In this work, Adorno concedes Brecht's influence. 'Concession' is not used loosely here, but precisely names his speech act. Adorno's 1959/1960 lectures on aesthetic theory propose Brecht's *Verfremdung* as an aesthetic category that captures the task of any art form:

The world's alienation can be rendered by a work of art only – and I think Brecht recognized something very important here, at least as a theorist – by not presenting the familiar ... as the familiar. Art's task is indeed the *Verfremdung* of the familiar, putting it into a perspective ... which is the perspective of its essence. (Adorno, 2009: 127)

In addition to *Verfremdung*, the assertion that the familiar has to be put into a perspective that permits recognition of the subject's real state of being is a central element of Brecht's aesthetic. De-familiarization, Adorno specifies in *Aesthetic Theory*, generates a distance typical for genuine aesthetic experience, which:

affects the subjective comportment, in that it severs primitive identifications and puts the recipient qua empirical psychological person out of action ... Subjectively, art requires self-exteriorization; this is what was meant by Brecht's critique of empathic aesthetics. (Adorno, 1997a: 243)

In this context, Adorno repeatedly, like Brecht famously before him, employs the term 'culinary' for art that does not aim at distancing its recipients, as well as for aesthetic theory that does not foreground the distance effect.<sup>34</sup> Distance then comes with a demand to decipher, now rephrased 'as a certain form of "doing" which is an active

following along' (2009: 189). Again, Adorno grants Brecht a fundamental insight: recognition of the recipient's activity. This was, after all, already the moment of truth his lectures on aesthetics had identified in the *Lehrstück* programme: the roles of spectators and actors intersect, a continuous and close interplay of thinking and acting generates truth. 'Brecht's postulate of a thinking comportment', Adorno remarks in *Aesthetic Theory*, 'converges, *strangely enough*, with the objective discernment that autonomous artworks presuppose in the viewer, listener, or reader as being adequate to them' (1997a: 242; italics added). It must have appeared 'strange' to Adorno that his understanding of aesthetic experience, so deeply rooted in individual contemplation, overlapped with Brecht's focus on collective practice. He must have felt haunted and perhaps because of that he quickly qualified his observation: 'His didactic style, however, is intolerant of the ambiguity in which thought originates: It is authoritarian' (242).

This distinction, however, misses the point. Adorno glosses over the fact that equivocation, as much as unambiguity, is not the subject of 'thinking comportment', but its effect – the result of actively following along [*Mitvollzug*]. In order to yield such effects, 'authoritarian' demands have to be met. Important works of art 'presuppose' (242) something from the recipients. Not each artwork can, like Kafka's novels, sustain their attention by staging a *déjà vu* in permanence. Thus it is no coincidence that another of Brecht's terms, of *Lehrstück* provenance, found its way into Adorno's discussion: discipline. The recipient, who 'refuses to obey their [the artworks, M.R.] discipline ... is alien to art' (Adorno, 1997a: 355). Or, elsewhere, 'Whoever refuses to reenact the work under the discipline it imposes falls under the empty gaze cast by a painting or poem' (120).<sup>35</sup>

What then became of the original target of his intervention – art's supposed capacity to incite political action – the moment in Brecht's aesthetic to which Adorno objected

most? 'The aesthetic shudder pulls the subject back to itself' [transl. changed] (1997a: 269). Elsewhere Adorno describes: 'this shock is the moment in which recipients forget themselves and disappear into the work ... [T]he possibility of truth, embodied in the aesthetic image, becomes tangible' (1997a: 244). Has art's incitement simply changed direction? Not pushing the subject from truth or insight to collective action anymore, but commencing from the action's cancellation and pushing it toward truth? (In both cases, subjects 'disappear' and 'forget themselves', it could be argued).

Once Adorno generalized his insights from the Kafka-essay, Brecht's entire programme found itself interiorized, seemingly to Adorno's surprise. What remains of Brecht himself is history: he was the playwright and the poet who came closest to the idea of avant-garde (GS 20: 553); he was part of that aesthetic undercurrent running 'from Sturm und Drang and the young Goethe to Büchner and to some of Hauptmann's works up to Wedekind and expressionism' (GS 11: 79). Beckett has inherited his position and Brecht's claim to politics has long been compensated. It sounds almost like praise when Adorno asserts: 'Brecht's cult of practicality became an aesthetic constituent of his works' (1997a: 242–3).

## BY WAY OF CONCLUSION: AFFINITIES

These are the premises that both Brecht and Adorno made the baseline of their thinking and acting: art does the work of critique; it is political through its form; it ages quickly. The work of art has, as Adorno put it, a temporal nucleus. Accordingly, Brecht continuously revised his plays, correcting them on the spot according to the material demands on site, rewriting them according to varying political circumstances. His work is perhaps best described as constitutively unfinished, even his so-called masterworks were

provisional accomplishments. They are set up to fail.<sup>36</sup> Whereas Brecht sought to incorporate the flow of time in his theatrical praxis, Adorno sought to do justice to time by making aesthetic categories contingent on an artwork's ever-changing form: his aesthetic categories are meant to fail too, namely in view of the individual works and any understanding of art has to take this failure as its point of departure. And precisely because Brecht surrendered so radically to time without giving up on form, his work had to become exemplary for Adorno. Yet theatre, more than any other art form, also exposes itself as it intervenes on site. It becomes vulnerable to abuse or blindly reproduces what it acts against.<sup>37</sup> Theatre is practice in a radical sense and remains practice even when it rationalizes its proceedings and develops its own aesthetic concepts as it goes along. It seems to be not least this conflict – a deep mistrust of mere practice on the one hand and an appreciation of art that is 'timely' on the other – that drives Adorno's engagement with Brecht.<sup>38</sup> Adorno's reviews of *Rise and Fall of the City of Mahagonny* and *Threepenny Opera* say nothing about the staging. The *Aesthetic Theory* discusses novels, poems, compositions and paintings. Adorno talks about readers, listeners and beholders, but neither about the stage nor the spectator.<sup>39</sup> Nonetheless, Adorno does not ignore Brecht's theatre; ultimately, his aesthetic categories become its shelter.<sup>40</sup>

## Notes

- 1 Brecht, planning a satire on the ineffectivity and corruption of intellectuals, the so-called Tui-novel, wrote in his work journal on 10 October 1943 'Adorno here. This Frankfurt Institute is a true treasure chest for the "Tui-novel"' (BFA 17: 177), see Erdmut Wizisla (2011: 206) for a discussion of the Tui-novel concept.
- 2 Since the 2000s, this narrative has become increasingly subjected to scrutiny. Sean Carney, for example, calls Adorno's negative dialectic 'a useful supplement of Brecht's dialectics' (2005: 157). Ulrich Plass (2010) juxtaposes Brecht's

- Hollywood Elegien* and Adorno's *Minima Moralia*, arguing persuasively that both employ similar representational strategies. Astrid Oesmann (2005) explores 'mimesis' and 'natural history' [*Naturgeschichte*] as the common ground of Adorno's, Benjamin's and Brecht's theorizing, and speaks of a 'surprisingly broad kinship' between Adorno and Brecht (2005: 8).
- 3 Buck-Morss insists that 'from 1928 on virtually everything that Adorno wrote bore the imprint of Benjamin's language' (1977: 21).
  - 4 The letters' language is persuasive: Adorno admits his great unease with Brecht's role in Benjamin's intellectual life and appeals to Benjamin recurrently to remain faithful to the 'motifs of our philosophical friendship' (Adorno and Benjamin, 1999: 108).
  - 5 Adorno reported more than once to his parents: '(t)he only people who we see quite often are the Brechts, with whom we get along especially well' (Adorno, 2003: 126).
  - 6 Although some discussions of Brecht are brief, they often drive Adorno's argument. Others are lengthy: in a letter to Slatan Dudow, Adorno analyses the relation between epic theatre and film (1937); in a lecture on *Aesthetic Theory* he focuses on Brecht's concept of *Verfremdung* (1959); his lectures on *Moral Philosophy* (2010a: 2012) discuss *Saint Joan of the Stockyards* and *The Good Person of Szechuan* and a talk for Radio Bremen offers an elaborate reflection on Brecht's *On Five Difficulties When Writing the Truth* (GS 17: 253).
  - 7 Adorno used Brecht in yet another way: he let Brecht speak for him. He began arguments with 'as Brecht used to say', some of his articles were prefaced by a Brecht quotation and he dedicated *Negative Dialectic* to Max Horkheimer with a line from Brecht's poem *The Lovers* (which first appeared in *Mahagonny*). Brecht's work was also simply enjoyable reading for Theodor and Gretel Adorno. Gretel Adorno once asked Benjamin to please send Brecht's latest pornographic poems (1999: 274).
  - 8 It should be noted that Adorno continually discussed Brecht against the backdrop of Kant's and Hegel's aesthetic, whose basic premises he shared. He was also attracted to Brecht's theatre because it offered him material for Kant's and Hegel's remediation. Kant's understanding of art as procuring disinterested delight, for example, informed Adorno's turn against Brecht's 'utilitarianism'. The distance between recipient and artwork implied in such an understanding is reconceived by Adorno as Brecht's distance. Hegel's focus on artistic form and his concept of the artwork as an immanently mediating 'construct' is at the heart of his early praise and later criticism of Brecht. These aspects cannot be addressed within the scope of this paper.
  - 9 A discussion of this poem along similar lines, but in a different context, can be found in Matthias Rothe (2016).
  - 10 In his *Introduction to Dialectics* (1958), Adorno formulated such a point of view as follows: 'you could almost say that something like a human being does not yet exist. When applying the concept "human being" to an existing individual', Adorno continued, 'one immediately recognizes the difference. Namely that the individual in an emphatic sense ... does not yet live up to the concept human being' (Adorno, 2010: 103). All translations by the author unless otherwise noted.
  - 11 Adorno's emphasis on the necessity of the construction of perspectives is reminiscent of Brecht's critique of realism in 'The Threepenny Trial' (1931), which Adorno quotes elsewhere (GS 11: 147): 'A simple "representation of reality" says less about reality than ever before ... so, there is in fact "something to build up", something "artificial", "contrived"' (Brecht, 2004: 117).
  - 12 Adorno's reviews of *Mahagonny* and *Threepenny* were unreservedly enthusiastic. He wrote five reviews in total. In the last review, published in 1932, Adorno observed that *Mahagonny* not only maintained its pertinence, but – 'despite the general hunger for being au courant' – had gotten better with Brecht's revisions (GS 19: 363). Discussing *Mahagonny* and the *Threepenny Opera* at some length for the journal of the Frankfurt Institute of Social Research in 1932, he called Brecht and Weill's work 'admirable' and the music 'today the only music of genuine social-polemic impact' (Adorno, 2002: 407). The Schönberg school, of which Adorno had been a member, only came in second. He ended up recommending Brecht and Weill's 'fractured and intellectual procedure aesthetic' methods as a model for all contemporary art (Adorno, GS 19: 363), and illustrating how serious he was about using *Mahagonny* as a model, Adorno began to compose his own opera in *Mahagonny* style in 1932, *The Treasures of Indian Joe* (Schultz, 1998).
  - 13 After Adorno saw *Mahagonny*, he repeatedly called *Threepenny Opera* an accessory to *Mahagonny*. His review of *Threepenny Opera* (1929) ended as his first *Mahagonny* review began – with an emphasis on its redemptive perspective: 'The successful interpretation of what is past, becomes ... a signal for the future, which is visible because the old can now be interpreted' (Adorno, 1990: 133).

- 14 Aesthetic form and its relation to society had been Adorno's obsession since his earliest concert reviews in 1921. At that time, he still conceived of form as convention, a given constraint that the artist needed to manipulate. In the mid 1920s, Adorno began to speak of the construction of form, reducing such rhetorical conventions to the material of departure. Again informed by Lukács' *Theory of the Novel* and German idealism, Adorno understood construction as a process of mediation between particular social 'content' and existing conventions or forms. Constructing or generating forms came to parallel society's mediation between the particular and the general, for example between individual inclinations and interests and societal institutions (Buck-Morss, 1977: 44–5). I thank Richard Leppert for helping me through Adorno's music reviews; see also Richard Leppert's detailed comments on Adorno's writing on music in Adorno (2002).
- 15 Adorno recurrently employs technical terms from film for his analysis: projection, screen, montage and so on. In a letter to Slatan Dudow from 1937, he also claims that epic theatre borrowed a lot of its techniques from film (Adorno, 2003a: 534–5).
- 16 Benjamin's project should be understood in the frame of his attempt to rethink Kant's 'impoverished' concept of experience. He understands the *Trauerspiel* as a specific form of experience and employs Kant's vocabulary throughout, speaking of allegorical intuitions and concepts, identifying antinomies and so on. Within the project of a Kantian critique, a true state of affairs can be revealed, but it cannot be exposed as the false state. Benjamin's famous 'The false appearance of totality is extinguished' (Benjamin, 1998: 176) privileges experience against metaphysics.
- 17 See also Adorno's talk on Wedekind from 1932. Brecht and the surrealist Wedekind, he stated, 'let the underworld of mere material speak' (Adorno, 1992: 278).
- 18 In a letter to Benjamin from 1934, Adorno defined *Versuchsanordnung* as one of the 'categories drawn from epic theatre' (Adorno and Benjamin, 1999: 70). Benjamin introduced the term 'configuration' with astrological metaphors: 'Ideas are to objects as constellations are to the stars' (1998: 34).
- 19 In January 1931, Adorno wrote to Siegfried Kracauer: 'I originally thought to publish the critique of Heidegger in *Ihring*, Brecht and Benjamin's journal *Krise und Kritik*, yet after Benjamin and Brecht have distanced themselves from the project, I have my doubts' (Adorno and Kracauer, 2008: 258).
- 20 Benjamin's essay employs the language of life philosophy: epic theatre accomplishes 'the damming of the stream of real life'; 'Epic theatre makes life spurt up high from the bed of time and, for an instant, hover iridescent in empty space. Then it puts it back to bed' (Benjamin, 1998a: 13). It is through incessant disruption, 'when its [life's, M.R.] flow comes to a standstill' (13), that social conditions are revealed. Any attempt at realignment with life would have to pass through political action. Adorno opened 'The Actuality of Philosophy' with Heidegger. Heidegger exemplified for him the crisis of German Idealism and he returned to Heidegger via Husserl's phenomenology to discuss his failure at length (more than four printed pages).
- 21 Wizisla (2004: 139) shows that Brecht's famous concept of '*eingreifendes Denken*' developed in the context of Brecht and Benjamin's discussion of their journal project.
- 22 Adorno develops, not least through his engagement with Brecht, a radically negative conception of truth. Owen Hulatt (2011: 76) summarizes it as follows: 'Adorno identifies the true as nothing over and above the negation of the pre-given ... this is not to deny that this negation will be informative – the negation of the pre-given (be it sensory, philosophical or cultural) will result in the pre-given being unpacked, and display the full complexities of those grounds which gave rise to its falsity'.
- 23 Adorno's 1962 'Commitment' essay calls Brecht's *Mahagonny* procedure 'polemical *Verfremdung*' (GS 11: 426). Brecht did not use the term before 1936. 'The Actuality of Philosophy' then adopts only the first part of the phrase (polemical) and *Minima Moralia* finally makes the second its own: 'Perspectives must be fashioned that displace and estrange [*verfremdet*] the world' (Adorno, 2005: 247). Adorno's debt to Brecht appears in these appropriations in miniature, so to speak.
- 24 Brecht's play fragment *Fatzer* (1926–9) is widely seen as a decisive moment in the development of the *Lehrstück*. Brecht's struggle with the material of *Fatzer* led him, on the one hand, to demand the story's completion from the audience. On the other hand, he came to own the story's 'incompleteness', writing and rewriting it. Both moments, the audience's involvement and the story's continuous revision, become defining features of the learning play.
- 25 Adorno took issue in particular with a slogan projected on stage during the performance: 'Doing is better than feeling'.
- 26 *Umfunktionieren* is commonly translated as 'repurposing'. I have decided to stay closer to the German in order to preserve the idea of a technical or mechanical procedure.
- 27 Adorno employed the idea of refunctioning in many other contexts as well. In an essay on music

- pedagogy, for example, he demanded 'to make reification apparent in its consequences and to dialectically liberate from it the elements of a good rationality, which might help to refunction reification one day' (GS 18: 809); see also Plass (2010: 69).
- 28 It is very likely that Adorno knew this text, given that they saw each other frequently and also discussed theatre while living in Los Angeles (Wizisla, 2011: 206).
  - 29 There are other indications of Adorno's intention to 'replace' Brecht: he discussed the genealogy of Kafka's critical programme, focusing on two aspects that are widely recognized as seminal to Brecht's aesthetic – expressionism and detective novels.
  - 30 Brecht subscribed to what Dirk Braunstein called, with Adorno, 'the metaphysics of productive forces'. Capitalism's main contradiction is located in the antagonism of productive forces and productive relations; the latter are seen as inhibiting the former, which are perceived as the bringer of progress (Braunstein, 2011: 382–3).
  - 31 Nikolaus Müller-Schöll (2002: 139–84) convincingly argues that Benjamin's concept of *Gestus* retroactively shaped Brecht's own use of *Gestus*, which Brecht had employed only loosely until then.
  - 32 *Deutung* is insufficiently translated as 'interpretation'; it implies a greater distance to the material and already resonates with a *Gestus* of showing. I am indebted to Ulrich Plass for this insight.
  - 33 *Schaustück* refers to Brecht's more traditional plays of the late 1930s. It is worth noting that Brecht was dissatisfied with them. He wrote in his journal that it will be necessary to reconnect them to the highest standard of epic theatre once achieved in the late 1920s by *Fatzer* and *The Breadshop* (BFA 6: 433).
  - 34 'Aesthetics that does not move within the perspective of truth fails its task; usually it is culinary' (1997a: 242).
  - 35 Adorno seems to defend himself against a 'dangerous proximity' to Brecht: 'If the discipline exerted or buttressed by artworks becomes their own lawfulness, they forfeit their crudely authoritarian character vis-a-vis human beings' (Adorno, 1997a: 202). It can be objected that what appears as the works' proper laws as well as the corresponding habits of reception are the outcome of a cultural apparatus that subjects individuals to a far more extensive training.
  - 36 In a poem from 1929, *On the construction of long-lasting works*, Brecht wrote: 'Those destined to be accomplished / Display gaps / The long lasting / Continuously collapse / Those planned big / Are incomplete' (BFA 14: 35).
  - 37 'Much of Brechtian epic theatre', Adorno claimed, was refunctioned 'for the collectivism of the Hitler dictatorship' (1975: 250). In the addendum to *Dialectic of Enlightenment*, Adorno and Horkheimer insisted: 'epic theatre is the response to the art of the masses, mass art's switching consciousness of itself'; the procedure of montage praised in *Mahagonny*, despite all disruptions, comes to resemble the filmic technique of non-resistance' (GS 3: 312).
  - 38 Adorno wholeheartedly dismissed works that, 'subservient to the idol of security, hollow out their temporal nucleus and, inwardly vacuous, fall victim to time: the curse of neoclassicism' (Adorno, 1997a: 177). Instead demanded 'that artworks immolate themselves through their temporal nucleus, devote their own life to the instant of the appearance of truth, and tracelessly vanish' (177).
  - 39 For example when reflecting on aesthetic experience, Adorno spoke of 'the objective discernment that autonomous artworks presuppose in the viewer (*Betrachter*), listener, or reader' (1997a: 359).
  - 40 Beckett's work has a decisive advantage over Brecht: nothing changes from text to stage. Beckett's stage directions are binding.

# Critical Theory and Literary Theory

Mathias Nilges

The ways in which critical theory has influenced literary studies are numerous and complex. Cultural studies, sociological approaches, various political or philosophical criticisms, various formalisms or modes of attention to history, genre, and so on frequently make use of the work of the Frankfurt School and of the theorists more or less coherently grouped under the different generations of critical theorists. But at the heart of critical theory and its development lies a particular theory of literature, and a particular method of literary criticism that is too often forgotten when we bring the work of critical theorists to literary studies. There are a number of ways in which critical theory may be applied to the study of literature, but critical theory also contains a detailed method for literary studies, one that is aimed at studying literature as medium on its own terms. This method for literary criticism is in turn bound up with a critical theory of literature. This chapter will aim to reconstruct the method for literary criticism and the

fundamental definitions that guide its theory of literature that emerge out of critical theory. In order to do so, it will focus largely on the first generation of critical theorists in the context of whose work this specific theory of literature and critical methodology was developed.

The chapter will also seek to illustrate that the development of a literary critical method and specific theory of literature was not simply one facet of the work of a few member of the Frankfurt School who had a more or less consistent interest in literature. Rather, we will see that the way in which T.W. Adorno and Walter Benjamin thought about literature, and the kind of critical praxis to which their engagement with literature gave rise, in turn shaped critical theory itself along with the ways in which its members thought about concepts such as history, form, or (self-) consciousness. In order to survey some of the methodological foundations of a critical theory of literature, which, for reasons of space, will constitute the focus of what follows in

order to hopefully aid further, more detailed study, this chapter will focus on some of the central categories of literary criticism that occupy a crucial role in critical theory: interpretation, form, medium, the status of reader and author, and the relation between the literary work and external, material history. The aim will be to clarify some of our fundamental literary critical commitments that may guide what we do when we bring critical theory to a literary text. The chapter will explore the question of what kind of literary criticism we practice when we seek to do it from the standpoint of critical theory.

While critical theory more widely conceived has had a great international impact on academic practice and debate, its literary critical core arguably is lagging behind. To be sure, dozens and dozens of articles and books of literary criticism have drawn upon concepts and ideas borrowed from critical theory. But even for second and third generation Frankfurt School critics the particular attention to literary critical method and the significance of the literary work that, as we shall see, was so central to the work of the founding members of the Frankfurt School, is no longer visible. What we see frequently in literary criticism is the application to literary texts of concepts and ideas that are borrowed from the canon of critical theory. What we encounter far less frequently, however, are literary critical projects that bring critical theory to a literary text not only on a conceptual level but also with a rigorously developed account of what a critical theory of literature might mean for our method of literary criticism and for our understanding of what literature is and does. As we shall see, this is no trivial matter. The work of both Adorno and Benjamin centrally involves a methodological opposition to the practice of simply bringing a philosophical concept to a text in order to generate a new 'reading'. Both theorists develop specific ways of treating literature and of understanding the relation between critic and literary work, and revisiting these orientations may help us avoid generating a

criticism that may on the surface be committed to the ideas and politics of critical theory but that may bring them to literary texts without any regard for the method for literary criticism that critical theory produced, thus ultimately undercutting the foundations of its own efforts. Critical theory's attention to literature, thus, is not merely a matter of bringing established concepts to literary texts. It is a matter of devising a particular method that treats literature on its own terms, a method that, in other words, is specifically formulated for the task at hand. A literary criticism based on critical theory must therefore also contain and be guided by a consideration of the relation between object and method and of the historical specificity of this relation.

A final introductory note: while the concluding section will briefly turn to the work of Leo Löwenthal, much of this chapter will be dedicated to the work of two main figures: Adorno and Benjamin. This may strike readers who are familiar with the history of critical theory and the Frankfurt School as somewhat strange. After all, Benjamin is often not counted among the core members of the Frankfurt School. But the nature or scale of his direct involvement, I would argue, is less significant for our effort to understand the relation between critical theory and literary theory than is Benjamin's intellectual influence. In particular, when it comes to understanding critical theory's relationship to literature, its development of a particular kind of literary theory and of a specific method of literary criticism, Benjamin's significance cannot be overstated. In fact, even our attempts to understand Adorno's thought on literature and literary criticism would remain incomplete if we bracketed Benjamin's influence on Adorno's thought and work. Even more widely conceived, however, since, as we shall see, the ways in which critical theorists thought about literature shaped the development of critical theory as a whole, we can also see from this perspective that we must consider the impact of Benjamin's literary criticism on the work

of critical theorists and on the development of critical theory itself. This is not to disregard the substantive and numerous disagreements between Benjamin and Adorno and other key members of the Frankfurt School. It is, rather, to focus on the important influences and commonalities without which our picture of a critical theory of literature and literary criticism remains incomplete.

## BENJAMIN AS LITERARY CRITIC

Anglophone academics have occasionally explored Benjamin's role as a literary critic, though by no means as frequently as Benjamin has shown up in academic production as a philosopher or critic of modernist aesthetics, or in the study of culture and media (film photography, and so on). The question that prompts one of the few more recent engagements with his literary criticism, the question that Svend Eric Larsen selects as the title of his essay to which I shall return below, is: is Benjamin a literary critic? That is a strange question to ask, it might seem, because, next to Adorno and Löwenthal, Benjamin is the critic whose work most consistently engages in the study of literature. After all, the core of Benjamin's work is aimed at the study of literature, and it was in the field of literary criticism that he sought to establish himself principally. Michael W. Jennings observes that Benjamin's rapid canonization in the academy following the publication of his selected works was not quite a fulfillment of 'Benjamin's expressed desire to be considered "the premier critic of German literature"', not only because his canonization was followed by a 'swift denunciation', but in particular, Jennings argues, because this denunciation focused largely on aspects of Benjamin's work that had little direct relation to literary criticism: 'Benjamin's mysticism ... his Marxism ... his Hegelianism' and so on (1983: 545). What Jennings stresses already in 1983 as an

important project – evaluating Benjamin's contribution to literary criticism that has thus far not been adequately mapped – remains an insufficiently developed project; only a few critical projects, in the Anglophone academy in particular, have been dedicated to this task. It is possible to suggest, therefore, that the persistence of the question of whether Benjamin was indeed a literary critic has to do with the fact that a disproportionately small amount of time has been spent on the examination of the methodological foundations of Benjamin's literary criticism compared to the widespread interest in Benjamin's work on the philosophy of history or cultural theory more widely conceived, including his work on urban modernity, photography, or film. Larsen, too, suggests that Benjamin's prominence in the Anglophone academy is largely based on the interest in his work that outlines a cultural history of modernity or that is dedicated to broader aesthetic and historical questions. It is also true, as Larsen contends, that his interest in literature itself does not make Benjamin a literary critic (1998: 135–6). But what this does suggest is that, in order to understand both Benjamin's own relation to literary criticism as well as his contribution to this field, we must examine his considerations of literary criticism as a method that are, as we shall see, based upon the development of a specific theory of literature.

In his classic essay on Benjamin's early literary criticism, René Wellek, too, begins by foregrounding the phenomenon of Benjamin's critical reception as a literary critic who is largely not regarded as such. Benjamin, Wellek argues, is largely treated as a philosopher or, at best, as a '*Kulturphilosoph*', which in turn means that it is his later work, as opposed to his earlier work that contains a central focus on literary criticism and is the subject of critics' main interest. Even Hannah Arendt, who describes Benjamin as 'the only true critic of German literature', Wellek notes, poignantly drops this interest in Benjamin as a literary critic and instead proceeds to focus her work on

his aesthetic philosophy (Wellek, 1971: 124). But to ignore this aspect of Benjamin's work, Wellek cautions, 'is to falsify the image of Benjamin', for it 'obscures any attempt to locate him properly in intellectual history' (1971: 124). Therefore, to appreciate Benjamin's work fully is to consider his methodological engagement with literary criticism and theory, an engagement that underpins the development of his thought and critical system more largely conceived. And, in turn, to understand Benjamin's literary critical methodology is also to understand some of the crucial influences and logical foundations that underwrote the development of critical theory itself. A way into understanding Benjamin's critical method, which is at the same time a way into understanding the role of literary criticism and literary theory for the development of critical theory more broadly conceived, is to focus on one of critical theory's foundations: immanent criticism. As we shall see, immanent criticism finds one of its most clear applications in literary criticism. In turn, immanent criticism is a crucial building block of the method of literary study that is developed out of the work of the Frankfurt School.

## IMMANENT CRITICISM AND LITERARY INTERPRETATION

The origins of the immanent criticism are articulated by Max Horkheimer who, as David Held outlines in profoundly helpful detail, associates immanent criticism intimately with the project of critical theory and with the core of critical theory's method. Quoting Horkheimer, Held writes:

Critical theory aims to assess 'the breach between ideas and reality'. The method of procedure is immanent criticism. Immanent criticism confronts 'the existent, in its historical context, with the claim of its conceptual principles, in order to criticize the relation between the two and thus transcend them'. (1980: 183)

'Critique proceeds, so to speak, "from within"', Held stresses, which means, in other words, that critique,

hopes to avoid, thereby, the charge that its concepts impose irrelevant criteria of evaluation on the object. As a result, a new understanding of the object is generated – a new comprehension of contradictions and possibilities. Thus, the original image of the object is transcended and the object itself is brought partly into flux. (1980: 184)

Already in this very basic formulation, we can see some of the foundational ideas that inform a method for literary criticism. From the beginning, critical theory approaches literature via the principle of immanent critique, which is to say that the basic critical treatment of the literary work 'proceeds from within'. The aim to keep the object in flux, to examine it as always bound up with specific historical developments to which it in turn contributes, is paired with the desire to avoid simply bringing a new interpretive lens to a literary work from the outside. Instead of imposing external concepts onto the text in order to generate new readings, any literary criticism based upon critical theory begins by approaching the text on its own terms, from within.

We can begin to see what this implies more concretely by turning to one of Adorno's numerous engagements with the work of Thomas Mann, an essay that exemplifies this basic methodological commitment in part via Adorno's dissatisfaction with some of the dominant contemporary critical approaches to Mann's work. 'In order to understand Thomas Mann', Adorno suggests, we need to pay 'attention to the things that are not in the guidebooks' and that aren't covered in the 'stream of dissertations' that focus on 'the influence of Schopenhauer and Nietzsche' or on academic seminar discussions of 'the problem of death' in Mann (1992: 13). Instead, Adorno suggests,

it is better to look three times at what has been written than to look over and over again at what has been symbolized. Pointing out how much the

writer deviated from the self-portrait his prose suggests is intended to help do that. For there is no doubt that the prose does suggest this. (1992: 13)

What we see here is an attempt to avoid forced readings of a text that are constructed by imposing external concepts upon the text. Instead, Adorno suggests, we ought to treat Mann's work from within, which means to focus on Mann's prose, on the ways in which Mann's texts themselves can be read as formally specific mediations of external reality. One of the basic operations of an immanent criticism of literature, in other words, is a focus on form. This focus on form is visible in Adorno's work more generally. One of the guiding logical principles of his *Aesthetic Theory*, for instance, is a focus on form. Throughout *Aesthetic Theory*, Adorno (1997) returns time and again to the suggestion that history enters the work of art not on the level of content but only on the level of form, and we see this fundamental commitment also in his literary critical method, exemplified in his defense of the formal richness of Mann's work that an immanent criticism of literature seeks to treat from within. Literary critical debate in the twenty-first century has frequently returned to the tension between different modes of reading and mis-reading. We have seen a renewed interest in strategies for and ways of reading, including questions of what we should read, how closely we should read, or how aspects of the 'big data' turn may affect reading practices and our approaches to the literary text and literary archives. And since a number of these debates also include hotly contested propositions or approaches (among the most infamous and widely discussed of which are 'surface reading' or the more recent debates about 'post-criticism'), there is no doubt much at stake in reminding ourselves that immanent criticism allows us to reframe precisely this old tension between text and method in ways that refuse simple binary oppositions such as that between author and reader, closeness and distance, depth or surface.

## FORM AND CONTENT

The attention to literary form, then, is of central importance to an immanent criticism of literature. More generally, Held argues, 'The meaning of Adorno's thought cannot be fully comprehended if one concentrates simply on content at the expense of form' (1990: 210). Adorno's own writing also follows this dialectical logic of form and content, and, as Held reminds us, 'enact[s] his concern with the development of repressive systems of thought and organization' (1990: 210). Adorno's desire for social and cultural theory to reveal the substance of repressive systems, and, as Adorno puts it so frequently, suffering more generally, is therefore not merely a matter of reading the content of objects but rather of investigating the formal mediation of such external forces in and through the text. 'The non-identical, if it is to be revealed', as Held summarizes Adorno's basic insistence with regard to this method, 'must ... be made apparent in the form and the content of a work' (1990: 211). We must therefore conclude, Held argues, that for Adorno 'there is more involved in the reading of a text ... than the gleaning of information' (1990: 211). This is what we can understand as one of the foundational commitments of an immanent criticism of literature: the commitment to reading for form. And indeed, as Fredric Jameson reminds us, it is important to note the continuity here in Adorno's thought in general, since his broader philosophical engagement with (self-)consciousness and the relation between subject and object that guides works like *Negative Dialectics* informs and is in turn informed by his examination of literature. After all, Jameson suggests, Adorno's writings on the question of the relation between subject and object are recast, in the context of his writings on literature and aesthetics, as the relation between form and content (1974: 39).

For Benjamin, too, critical engagements with literature begin by examining the dialectic of form and content. Of course, Adorno

is famously more committed to the centrality of form than was Benjamin – form often remains the main if not sole plane of examination for Adorno, while Benjamin's criticism is largely aimed at the dialectical connection of form and content. But, as suggested above, in order to understand Benjamin's methodological investment in the dialectic of form and content more generally, we must trace the roots of his method to his literary critical writings and thus to some of his earliest work. The critical analysis of art and art criticism that guides his doctoral dissertation examining the concept of *Kunstkritik* (art criticism or critique of art) in German Romanticism establishes Benjamin's concern with method, and his subsequent early work, most notably his examination of the origins of the German *Trauerspiel* (tragic drama), lays the foundations of his attention to the specific ways in which literature and literary forms emerge historically and in turn respond to history (the latter famously being conceived as an ongoing, discontinuous process). And while we can no doubt trace many disagreements between Adorno and Benjamin when it comes to their account of the status of literature and the function and possibility of particular literary forms and genres, what matters for our purposes here are the basic commonalities with regard to method that join their approaches. Central to their examinations of literature, for instance, is the category of medium. This includes a grounding focus on literature as an artistic medium that establishes one of the points of departure that makes possible an immanent criticism of literature that truly treats the literary work on its own terms. A constant in the work of Adorno and Benjamin, therefore, is the concern with the historically specific relations and differences between different artistic media, which underlies both their accounts of the historically specific possibilities and limitations of different artistic media and their particular critical engagement with literature. Very prominent here, for instance, are the various examinations of the historically specific

relation between literature and other, newer or more recent media that we find in the work of both Adorno and Benjamin.

For Adorno, for instance, any consideration of the novel would have to begin by launching an inquiry into its historical status. In Adorno's discussion of the 'contemporary novel' (contemporary with his time, that is), he begins by assessing the changed historical status and function of the novel. 'Just as painting lost many of its traditional tasks to photography', Adorno writes, 'the novel has lost them to reportage and the media of the culture industry, especially film' (1991a: 31). 'This would imply', Adorno continues, 'that the novel should concentrate on what reportage will not handle. In contrast to painting, however, language imposes limits on the novel's emancipation from the object and forces the novel to present the semblance of a report' (1991a: 31). Adorno consequently focuses on the novel form's particular historical labor, in this case the novel's 'rebellion against realism' and against 'discursive language' that Adorno finds most prominently exemplified in the work of James Joyce. Thus, when Adorno examines the novel and its more well known aspects – its engagement with alienation in the modernist novel, for instance – this examination is always carried out primarily not on a topical level or the level of content but on the level of both form (novelistic language) and medium (the novel's historically specific function as an artistic medium is in part determined intermedially, that is, by its awareness of its own medial possibilities and limitations). Adorno's examination of the modernist novel is also always an inquiry into the status of the medium of literature and its particular forms and genres. Adorno here also considers the rise of popular literature, which he associates with a crisis of the novel. The novel's uneasy relation to reporting, for instance, also raises the question of the status of popular forms of reporting in writing: 'the cheap biographical literature one finds everywhere is a byproduct of the disintegration of the novel form itself' (1991a: 32).

## FORM AND MEDIUM

If Adorno does address himself to topics, ideas, or individual concepts, such as alienation, this happens primarily on the level of form, with a parallel consideration of the question of medium. Adorno considers alienation largely insofar as it functions as 'an aesthetic device', for instance, an examination that is at every point committed to tracing the relation between form and history. Alienation, for Adorno, is bound up with anti-realism in the modernist novel, which, as the novel's 'true metaphysical dimension, is called forth by its true subject matter, a society in which human beings have been torn from one another and from themselves. What is reflected in aesthetic transcendence is the disenchantment of the world' (1991a: 32). As a consequence, Adorno argues, exemplifying the ways in which his literary critical method is at every step connected to a reflection on the ontology and function of literature itself, the status of the novel and the novel's future survival is bound up with a necessary reflection on its historical lineage and its present historical position. Both considerations must involve a reflection on the question of form and medium: '*If the novel wants to remain true to its realistic heritage and tell how things really are, it must abandon a realism that only aids the façade in its work of camouflage by reproducing it*' (1991a: 32).

Adorno's inquiry into the politics of the novel begins with a reflection on the question of form and medium, which in a sense also includes an examination of literariness insofar as Adorno's work is committed to examining what makes a novel a novel and what possibilities for the novel we may subsequently trace in the context of a particular historical moment. The political advantage of literature over image-based narrative media such as film, which, Adorno suggests at the outset of this essay, has many advantages over the novel, lies precisely in the novel's medial specificity and its formal advantages.

However, with regard to the politics of the novel, Adorno does not confine his treatment of literature fully to the realm of form but, in the final instance, emphasizes the relation between form and the possibility of transcending the limits of the existing, of the contradictions of external, material reality in the present: 'it is a tendency inherent in form that demands the abolition of aesthetic distance in the contemporary novel and its capitulation thereby to the superior power of reality – a reality that cannot be transfigured in an image but only altered concretely, in reality' (1991a: 36). The latter call is the final political step, the notion that the novel may not be able to change reality but that it may aid in shaping the preconditions for the transcendence of the existing, in part because the novel itself carries out a version of the method that guides Adorno's critical treatment of it: literature, too, carries out the work of immanent criticism and is aimed at a critique of the existing from within that is ultimately aimed at transcendence.

We might thus assume that there exists a fairly large distance between Adorno and Benjamin when it comes to the question of medium. After all, Benjamin famously sees in some of the media that Adorno associates with the crisis of true art, a range of positive political and aesthetic possibilities. And yet, when we turn once more to the underlying methodological foundations of their examinations and disregard some of the more well-known surface tensions, we see important moments of congruency. In *Dead Time*, Elissa Marder traces Benjamin's account of the development of artistic media in relation to the material history of modernity. For Benjamin, Marder argues, the experience of modernity is specifically characterized by a problem of an 'overwhelming increase in external stimuli that prevent the impact of particular experiences from becoming assimilated, processed, and remembered' (2001: 2). Yet, Marder suggests, according to Benjamin this inability to experience all of modernity also gives rise to a multi-faceted

cultural response. The first side of this cultural response is the development of cultural media, 'that are specifically designed to grasp particular experiences in their immediacy' (2001: 2). Examples of such media include television and film. Precisely in this context, Marder shows, the specificity of literature as a medium becomes crucially important for Benjamin:

Benjamin argues ... the more particular experiences are recorded as *unmediated* impressions, the less they contribute to an enduring sense of experience.... Therefore, if 'unmediated' communication cannot transmit the meaning of an experience, it makes sense that Benjamin turns to a highly 'mediated' form of experience – poetry – in order to articulate the specific ways in which this change in experience makes itself felt. (2001: 3)

As opposed to television and film, literature refuses the relation of immediacy and insists upon itself as the medium of mediation. What literature does, therefore, is for Benjamin, as for Adorno, a matter of a formal, medially specific dialectical relation to, and immanent critique of, the logic of material reality. For Benjamin, it is lyric poetry that offers a possibility for working through and critically examining modernity's historically specific 'atrophy of experience' and its 'temporal disorders' (2001: 3). When we ask, therefore, what precisely is the kind of literary criticism that Adorno and Benjamin practice, we can see that they share fundamental methodological commitments that are more substantial than their surface disagreements, for these basic methodological commitments lend a larger cohesion to what we may call a particular kind of literary criticism and literary theory that emerges out of the Frankfurt School and out of critical theory. These fundamental similarities that may prove more helpful than the negotiation of surface disagreements may also caution us not to dislocate individual arguments and concepts from their methodological foundations, in particular if we are invested in producing a kind of literary criticism that is indebted to critical theory and that is a

logical continuation of the foundations of this approach.

After all, Adorno himself warns us time and again that we should not simply bring concepts and sociological or political ideas lifted from a particular tradition to the literary text in order to produce readings via such 'lenses'. Any examination of the relationship between lyric poetry and society, for instance, as Adorno strongly stresses, must not result in what he calls the 'abuse' of lyric works by 'being made objects with which to demonstrate sociological theses' (1991b: 38). The focus on form and medium in history is a safeguard against these illegitimate forms of literary criticism – and they are illegitimate in part because they are not a truly literary criticism of literature. After all, such an approach would reduce a literary text, here a lyric poem, to the status of sociological evidence, a reduction that to Adorno is tantamount to abuse. Instead, Adorno suggests, when we ask questions about the relation between lyric poetry and society, we must begin by asking, 'how the social element in [the lyric poems] is shown to reveal something essential about the basis of their quality' (1991b: 38). This can be clarified by considering a basic question that may seem to be legitimate in literary criticism but that Adorno refuses: the question of how a given text may give us insights about social structures or problems via its representation of a character's experience of these historical conditions. 'The substance of a poem is not merely an expression of individual impulses and experiences', Adorno maintains, echoing his argument regarding the limits of reporting and realism in the modernist novel outlined above. Impulses and experience 'become a matter of art only when they come to participate in something universal by virtue of the specificity they acquire by being given aesthetic form' (1991b: 38). We return here to the centrality of form with respect to the historical specificity of social issues that must be conceived as universal, mediated matters as opposed to matters of individual,

immediate experience. 'The universality of the lyric's substance, however, is social in nature', Adorno argues, concluding: 'only one who hears the voice of humankind in the poem's solitude can understand what the poem is saying' (1991b: 39). The next step for Adorno is to turn to the medial specificity of literature that must determine its critical interrogation: 'reflection on the work of art is ... obligated to inquire concretely into its social content and not content itself with a vague feeling of something universal and inclusive. This kind of specification through thought is not some external reflection alien to art; on the contrary, all linguistic works of art demand it' (1991b: 39). What we see here is another substantive methodological commonality between Adorno and Benjamin, namely the notion that the need for critical interrogation is dialectically bound up with the literary artwork and that this is a foundational aspect of what literature is and what it is able to do.

We shall return to the latter point in more detail below. For now, it is helpful to linger for a moment on the matter of immediacy, which both Adorno and Benjamin consider a crucial problem for both reader and critic and for the work of artistic media. In Adorno and Benjamin the problem of immediacy with regard to artistic media (which, it may be useful to repeat once more, is one of the ways in which literature is able to distinguish itself – as the medium of mediation) is also always bound up with the discussion of immediacy and mediation with regard to the relation between subject and object. That is, the problem of immediacy and mediation in the relation of subject and object also becomes a crucial plane upon which both Benjamin and Adorno explore the question of artistic medium. As Larsen suggests, if we consider this matter, then we are able to appreciate that in Benjamin '*distance* becomes a problem for method as well as for experience' (1998: 139). 'Instantaneous experience must be grasped both from within and without at the same time', Larsen continues, 'for if the

experiencing agent and the interpreting agent are separate, the instant to be interpreted escapes' (1998: 139). This is one account of why the position of the narrator occupies such an important position in the work of both Adorno and Benjamin since, Larsen argues, it is via the narrator that we get a sense of mediation in its purest form in literature. It is one example of how literature refuses immediacy in favor of a mediated, critically examined relation to the object, and it is also in this sense that we must understand the literary critical method with which this logical system is bound up, since the relation to the text is one of mediation that surpasses the contradiction between immediacy and distance. This becomes clear when we examine the position of the reader and of the role of the author in interpretation in Benjamin.

### **BEYOND INTENTION AND EXPERIENCE: LITERATURE, HISTORY, AND MEDIATION**

Like Adorno, Benjamin is profoundly suspicious of the category of experience, in particular with regard to experience as a possible literary critical category (of both narration and reading). This suspicion guides the ways in which Benjamin examines one of the fundamental relationships that informs literary critical practice: the relation between author and reader. Against the Romantic tradition, and, as we saw above, in agreement with Adorno, Benjamin strongly rejects biographical approaches to literature that aim to trace authorial self-expression in the work and that principally define literature as self-expression. Like Adorno, Benjamin also discounts any notion of readerly (immediate) experience as a valid ground for a criticism of literature. Wellek summarizes Benjamin's opposition to this account of literature and its associated critical method as follows: 'a work cannot be derived from life.... Nor does Erlebnis define a work of art. Benjamin

argues even that this concept is “devised by Philistines to make poetry harmless, to rob it of its relation to truth” (1971: 128). But Benjamin goes even further, Wellek argues:

Benjamin rejects with equal emphasis any approach through the reader or his psychology. He dismisses ‘empathy’ or substitution as a mere cloak for what one must assume to be idle curiosity.... In dramatic theory he disagrees with the whole problem of katharsis. Most radically Benjamin formulates: ‘In the appreciation of a work of art or an art form, consideration of the receiver never proves fruitful. Not only is any reference to a specific public or its representatives misleading, but even the concept of an “ideal” receiver is detrimental in the theoretical consideration of art since all it assumes is the existence and nature of man as such. Art, in the same way, assumes man’s physical and spiritual existence but in none of its works is it concerned with his response. No poem is intended for the reader. (1971: 129)

Both author and reader matter for Benjamin principally historically, not on the level of intentionality, self expression, or experience, but rather in ways that replace mediation with the pure immediacy to which categories such as readerly experience are connected. And this is also a matter of formulating a literary critical method that treats literature on its own terms and takes seriously literature’s commitment to mediation and the problematization of immediacy, in particular in the context of capitalist modernity. Benjamin’s early work on Romanticism breaks with Romantic notions of literature and criticism in crucial moments and puts history and immanent critique in the place of Romanticism’s fundamental assumptions, thus giving us a changed version of what Romanticism first developed: a true theory of literature and an associated account of literary criticism. These are important coordinates for understanding Benjamin’s intellectual development and the significance of literary criticism and literary theory for the development of critical theory insofar as the literary shapes Benjamin’s thought and exerts an important influence on Adorno as well as on the development of critical theory proper.

Nevertheless, it must be noted that Benjamin’s conception of history is quite different from the more ‘traditional’ dialectical notion of history that we find in, say, Adorno or Horkheimer. And, indeed, his conception of history has been the object of the most infamous attacks on Benjamin’s work, as Larsen suggests, ‘both by his contemporaries such as Bertolt Brecht and ... Adorno, and later by, for example, Jürgen Habermas, Peter Bürger, and Hans-Robert Jauss’ (1998: 145). But for the sake of his literary critical method, it is important to foreground, and defend, Benjamin’s emphasis on the present as history, which becomes of central importance for the ways in which Benjamin thinks about reading and interpreting literature – and for a literary work’s continued life, which, as we shall see, depends upon critical readings. As Larsen suggests, the conception of history that we encounter in Benjamin’s later writings (say, on the concept of history) find their origin in his examination of German tragic drama. In the latter, Benjamin focuses mainly on the role of the now, of present-time for our conception of history, and his treatment of the significance of the instant and of the moving present for historical process in the more well-known later writings on history and futurity is anticipated in his examination of the instant as literary motif in his early literary critical writings. It is the focus on the ‘here-and-now of the historical subject’, as Larsen summarizes it, which is of central interest for Benjamin. Most significantly, Larsen argues, the ‘instant is perfectly matched by a literary form: the allegory’: ‘as the literary form of the “actual instant” the allegory is opposed to the symbol, intimately related to the “mystical now” which is identical with the “homogeneous time” mentioned in the theses’ (1998: 148). This matters in particular when we consider the political function of literature and indeed of literary criticism as defined in Benjamin’s work. For Benjamin, as Gabriele Guerra shows, any examination of literary history, and indeed the practice of literary criticism in general, is bound up with

an emphasis on the oppositional character of the literary work – an opposition against the work's and the author's own time and to the dominant forces of ongoing history [*laufende Geschichte*] (Guerra, 2015: 246–7). The latter formulation indicates the degree to which history is often understood here as history in the making, as a matter of a historicized examination of the present as history, and it is to this process, Benjamin argues, that true literature addresses itself with great political and epistemological urgency. It is also ideally this process, the process of making history in the present and shaping that which is to come, in which literature may actively participate.

As Held reminds us, 'immanent criticism derives a certain positive character by pointing to the limits and, therefore, the closed-off possibilities, immanent in the existing order' (1990: 185–6). Benjamin's insistence on the oppositional character of literary work is very much in keeping with this formulation of immanent criticism, for we may understand literature's oppositional character in precisely this way, as one manifestation of an immanent criticism of the existing, and it is also in this way that we can understand Benjamin's focus on the present as in keeping with the foundations of critical theory. What we can further see here is the dialectical relationship between literary critical and philosophical method, between reading literature and reading history. In Benjamin's conception of history, as Garloff argues, we can trace the ways in which Benjamin's work in general is informed by a literary critical logic. That is, when Benjamin seeks to trace the 'pre-history of the modern', he does so by making the history of the nineteenth century the object of a literary critical reading (Garland, 2003: 16). Benjamin 'reads history like a text' in a manner that reads historical reality as a matter of hermeneutics by 'establishing a medial continuum between that which existed and the present of reader and critic' (2003: 16). One clearly sees here traces of Romanticism's continued influence on Benjamin, as Garloff stresses, inasmuch

as the historical world is conceived as a readable text, as a "world-text" that constitutes a reality *sui generis*, which gestures toward that which existed in a non-referential, symbolic mode' (2003: 16). What becomes apparent in Benjamin's literary critical examination of history is a core conviction that guides his literary critical method that Garloff describes as an 'anti-empathy-hermeneutics' with which Benjamin seeks to dislocate the 'fiction of a continuum of individual experience, poetic expression, and hermeneutic understanding' (2003: 17).

It is here that we can see in more detail what Benjamin puts in place of readings and forms of literary criticism that are addressed to matters of immediacy or experience. And we can also note a remarkable insistence upon the critical and indeed political stakes of immanent critical readings of literature, not only for criticism itself but also for the continued life of the literary work. Quoting Benjamin, Weliek traces the outlines of this aspect of Benjamin's method and its connection to Benjamin's larger philosophical system as follows:

Criticism searches for the truth content of a work of art ... or, phrased differently, it 'looks for the sisters of a work of art which must be found in the realm of philosophy'. Works of art have a deep affinity with the ideal of a philosophical problem. All beauty is related to truth. But Benjamin insists that this relationship must not be thought of as truth being somehow concealed within a work of art. Benjamin expressly disapproves of the Hegelian 'sensual semblance of the Idea'. Beauty is not a cloak, not a wrapper, not appearance but essence [*Wesen*]. Criticism must respect the veil: it must not attempt to lift it. The critic can only define an analogon of a work of art. The sublime power of truth appears precisely in the inexpressive, a truth which is discovered in the nature of language. (Weliek, 1971: 127)

The job of the critic is not to uncover hidden meanings. Instead, the work of the literary critic as outlined by Benjamin is bound up with Benjamin's insistence on the *Fortleben*, the continued life, that is, of the literary work. Benjamin insists upon a literary

critical praxis and method that is formulated in relation to the object with which it engages and that indeed carries on the work of the object itself. That is, as Garloff suggests, literary criticism is for Benjamin not simply a matter of diagnosing philosophical ideas or concepts, nor is it a matter of judging the literary work's quality or of grasping, understanding, or interpreting authorial intention. Rather, Benjamin conceives of 'critique as the medium of the fulfillment and the potentiating continued life of its object' (2003: 6–7). A literary work in this sense, Garloff continues, is not simply understood by Benjamin as the carrier of meaning or a vessel for ideas that it seeks to communicate. Rather, in keeping with the core logic of critical theory and immanent criticism, a work is understood as the carrier of symbolic meaning that is supplemented by criticism rather than philologically reconstructed by criticism.

Criticism, in other words, is for Benjamin a creative and also a potentiating act, a force which becomes the motor of the potential for meaning, relevance, and thought that the work carries only as abstract, not yet activated potential. As Garloff suggests, Benjamin's method addresses itself to the 'non-intentional layers of aesthetic constructs', to the 'poetic forms of works', in order to unlock their historical content (2003: 14). Form here also becomes a way for Benjamin to distance himself from 'the fiction of "hermeneutic continuity" that grounds understanding' (2003: 15). His focus on form privileges symbolic meaning over intention, which, as Garloff argues, can be understood as a literary criticism committed to representation rather than explanation and interpretation. The latter in particular is an important and possibly all too often ignored aspect of Benjaminian literary criticism, which is not only a specific articulation of a method but also a clear account of the work of the critic: a critic does not explain or interpret the work; rather, she represents it (Garloff, 2003: 15). And it is via this latter operation that we can

understand what Benjamin has in mind when he insists on understanding literary criticism as an active, creative procedure that activates and potentiates symbolic meaning that the work carries abstractly. As in Adorno, the literary artwork needs the literary critic for its continued existence and to live its life fully and continuously.

## **CHALLENGES AND OPPORTUNITIES FOR CONTEMPORARY LITERARY CRITICISM**

Literary criticism in the twenty-first century has seen a renewed investment in the fundamental questions of the discipline, in particular since literary criticism and theory, once again, finds itself in a moment of deep crisis. The question of what literary criticism might look like in the twenty-first century often involves questioning basic assumptions about reading, interpretation, the status of the work of art, and the kind of work that criticism ought to be carrying out. The desire to probe the foundations of the discipline is so strong that in 2016, many critics have begun to discuss the possibility of a 'post-critical era'. In such a climate, we are well served to remind ourselves of the literary critical method based upon critical theory. The account of the relation between the literary work and the work of critic, for instance, is as remarkable as it is relevant in a time in which literary criticism struggles to conceive of a stable ground upon which it may stand. Those persuaded by the logic of critical theory and the literary theory emerging out of the Frankfurt School may wish to revisit the fundamental methodological commitments of this practice in order to find hope in what elsewhere seem to be dark times for literary criticism. To be sure, declarations of crises in literary criticism and indeed crises of literature more generally are not new, and we encounter them with some regularity throughout history. The most recent version of such crises, however, may

lack the positive aspects of previous moments of crisis, which re-shaped and renewed the literary critical landscape much like forest fires restore important nutrients to the soil and make it possible for new, more energetic life to grow and flourish. What we see in recent critical discourse all too frequently, however, is that frenzied attempts to determine what literary criticism may look like in the twenty-first century and how we may define its continued significance and function leave the larger capitalist re-shaping of the university system and of the cultural field unchallenged. The humanities are widely defunded, and scholars of literature are pressed to defend their work and projects within increasingly market-oriented, instrumentalized parameters. In the context, it is not surprising that big-data approaches have become increasingly popular, since they produce broad, empirically grounded 'readings' of literary archives that also stand the chance of attracting substantial sums of external funding while training 'student researchers' in skills that are recognized by the contemporary economy. In such a situation, returning to critical theory's famous critique of the instrumentalization of thought, culture, and critique may yield analyses and strategies that can allow us to formulate true futures for literary criticism that do not simply replicate pragmatic market utilitarianism.

Michael W. Jennings suggests that the special status of Benjamin as a literary critic lies in his engagement with critical theory, however fraught with disagreements and tensions:

The conviction that the work of art must be accorded a privileged status due to its function as the residence of truth in the world lends to Benjamin's career a purpose and tenor we do not ordinarily associate with that of a literary critic. This juxtaposition of epistemological and literary critical interests has led Anglo-American readers in particular to misunderstand the character of Benjamin's work; he is neither precisely a philosopher, nor exactly a literary essayist.... Each of his literary essays describes a philosophy of its object. His career might be said to represent the protracted attempt to articulate the manner in which

literature in general and specific works in particular hold within them the key to man's understanding of the world and the absolute, and to describe a literary critical method adequate to the recognition and revelation of that truth. (1983: 549)

This, in itself always dialectical, approach to literature allows Benjamin to foreground the important oppositional function of literature in the context of a general immanent criticism of the existing that creates the preconditions for its transcendence. And it is here that we can point toward another important methodological commonality between Benjamin and Adorno, one which fuses an immanent criticism of literature with a theory of the literary work's important function. The literary work here is understood as a practical implementation of immanent criticism, a notion of praxis that, as we have seen, emerges out of the dialectical relation between the work of literature and the work of the critic. 'The social interpretation of lyric poetry as of all works of art', Adorno writes, 'may not focus directly on the so-called social perspective or the social interests of the works or their authors' (1991b: 38). 'Instead', he continues, 'it must discover how the entirety of a society, conceived as an internally contradictory unit, is manifested in the work of art, in what way the work of art remains subject to society and in what way it transcends it. In philosophical terms, the approach must be an immanent one' (1991b: 38–9). Thus, as for Benjamin, the oppositional character of the literary work is a matter of both its immanent engagement with the limits of the existing and its refusal of pure immediacy: 'the work's distance from mere existence becomes a measure of what is false and bad in the latter. In its protest the poem expresses the dream of a world in which things would be different' (1991b: 39–40). The lyric's opposition therefore lies in its formal resistance to 'the reification of the world' (1991b: 40).

We may conclude by once again foregrounding the centrality of the category of form and of the focus on immanent criticism, the specificity of media, and the oppositional,

historically and medially specific character of the literary artwork by turning to the limits of precisely this methodological approach which are helpfully probed and ultimately reaffirmed in the work of Leo Löwenthal. In a retrospective essay in which he evaluates his own contribution to literary criticism, Löwenthal lays out for us why his work may be important for the sociological study of literature but why we may not be able to speak of it as committed to developing or advancing a method for or particular kind of literary criticism like Adorno and Benjamin. Looking back over his early writings, Löwenthal writes:

while I in no way feel ashamed of these documents of my youth, I am conscious of their weaknesses. If I were to write them over again, I would certainly be less sure of some of the direct connections I drew between literature and writers on the one hand, and the social infrastructure on the other. (1987: 3)

But unlike Adorno and Benjamin, whose work is driven by the recognition of the lack of attention to the precise ways in which literature may be brought into relation with social and material reality, a recognition that ultimately underwrites the development of a specific method formulated in keeping with the logic of critical theory, Löwenthal remains far less interested in that which lies between the two areas in which he is interested and that he wishes to bring into relation: literature and society. Accordingly, he observes: ‘the writings of my contemporaries have often amazed me because some ... are so concerned with “mediation” that the connections between social being and social consciousness became almost obscured’ (1987: 3). Yet, what Löwenthal discusses as excessive obscurity or ‘unnecessarily complicated and esoteric language’ is, as we have seen, the very commitment that allowed Adorno and Benjamin to formulate a theory of literature and literary criticism in relation to critical theory. Moreover, it is also what makes the relation between literary criticism and critical theory in their work a dialectical one insofar

as their examination of precisely that which lies between, of the forces and forms of mediation, allows them to further develop critical theory as an overarching system of thought and critique. To Löwenthal by contrast, critical theory means, as he stresses, ‘a perspective’ and this is, of course, fundamentally different than what it means for Adorno and Benjamin: a method. However, this suggestion should not be taken to mean that this is simply a failure or shortcoming in Löwenthal’s work. After all, he is very much aware of the shortcomings of his approach to literature. He defends his approach, however, on the grounds of political and historical necessity. Still, he concedes that his work, at times ‘behavioristic, that is, unhistorical’, did not change the fact that ‘sociology of literature in the sense of an analysis of art remains suspect’ (1987: 4). ‘I sense today in Europe an inclination to perceive a work of art merely as a manifestation of ideology’, he continues,

which strips it of its specific integrity, that is, its historically conditioned but also rationally creative cognitive role. To put it in a more provocative form: Marxist literary criticism is not only totally adequate but indispensable in the analysis of mass culture. However, it must be applied with utter caution to art itself and must, as a critique of social illusions, limit itself to the residues which are unequivocally ideological in nature. (1987: 4–5)

Löwenthal himself therefore foregrounds the shortcoming of some of this work and thereby reaffirms precisely some of the fundamental commitments that inform the method that Adorno and Benjamin develop in more detail elsewhere. It is, to put it bluntly, a ‘do as I say, not as I do’ type of moment in Löwenthal’s essay that is as charmingly honest as it is logically illuminating.

## CONCLUSION

By way of closing this chapter, it is worth foregrounding Löwenthal’s account of a sociology of art that, he stresses, must be set

apart from a sociology of mass culture, although the latter is the main focus of his work. In this distinction between mass culture and art and in the insistence on the importance of the latter, we can see not only a set of principles that connect Löwenthal's method back to that elaborated in much more detail by Adorno and Benjamin, but it also serves as a reminder of some of the fundamental aspects of a literary theory and a literary criticism that is developed in concert with critical theory.

'Adorno once said: "Works of art ... have their greatness only insofar as they let speak what ideology conceals. They transcend, whether they want to or not, false consciousness"' (Löwenthal, 1987: 5). The consequence of this suggestion, Löwenthal argues, is important. It means that, crucially, 'literature is not ideology'. All too often, critical theory is taken to be similar to if not congruent with ideology critique, in part because the latter has become one of the stock operations of left-leaning literary criticism. But, Löwenthal argues, this is not what a literary critical approach based on critical theory would pursue: 'we are not engaged in research on ideology; rather, we have to focus our attention on the special truth ... which the literary work imparts' (1987: 5).

What this means, Löwenthal suggests, is not only that this critical method assumes that literature makes legible that which ideology confines to unreadability but also that we must examine literature's particular role as artistic medium in this context. What a literary critical approach based on critical theory does with literature is, therefore, dialectically connected to what it believes literature is and does – it departs from a specific theory of literature, one that is connected to a philosophical focus on epistemology and politics. 'Literature', Löwenthal continues, 'is the only dependable source for human consciousness and self-consciousness, for the individual's relationship to the world as experience' (1987: 5). As a consequence, Löwenthal, like Adorno and Benjamin,

rejects any sociological criticism of literature that simply mines the literary work for sociological evidence. 'Literature is no mere quarry', Löwenthal writes. He continues, 'I reject all attempts to regard literature as a tool to learn data and facts about institutions such as the economy, the state, and the legal system. Social scientists and social historians should be forbidden from regarding literature as a source for raw materials' (1987: 6). To do so, Löwenthal argues, would be to miss literature's true ontology and function: 'literature teaches us to understand the success or failure of socialization of individuals in concrete historical moments and situations' (1987: 6). This suggestion surely has continued relevance today, if only as a note of caution, since so many of our current literary critical approaches are in some form indebted to a sociological critique of literature. In his words of caution, we also find a reminder that although critical theory is aimed at a critique of society and culture it must not simply be conflated with overly sociological approaches to culture and art. Rather, the core of the method and of its literary criticism is to treat art and literature on their own terms, developing a clear theory of literature from which a criticism departs that is aimed at analyzing first and foremost matters of form, medium, and history.

# Cinema – Spectacle – Modernity

Johannes von Moltke

## THE CULTURE INDUSTRY

‘Every visit to the cinema leaves me, against all my vigilance, stupider and worse’. This sentence, which occurs halfway through the fifth aphorism of Theodor W. Adorno’s *Minima Moralia* (2005: 25), would appear to sum up a received notion about critical theory’s engagement with cinema, mass media, and spectacle. According to this line of thinking, spelled out most explicitly in the chapter on the ‘Culture Industry’ in *Dialectic of Enlightenment*, cinema degrades even the most critical subject. More radically and perniciously, the culture industry produces and reproduces the modern subject in the first place. Fusing a non-determinist Marxism with Freudian categories, critical theory lends significant weight to cultural processes of subject-formation. Under the conditions of industrial modernity and especially in the wake of Fascism and the Holocaust, these processes tend increasingly toward conformism and integration from above: the culture

industry systematically subjects its consumers to the imperatives of sameness, the logic of identity and exchange. As this industry’s ‘central sector’ (Adorno and Horkheimer, 2002: 100), film breaks down the vigilance of no less a critical subject than Adorno himself.

Although there are indications that Adorno was also attuned to the pleasurable aspects of this breakdown, as I will suggest in the final section below, the cinema epitomizes for him and Horkheimer a mass cultural form that turns individuals into unwitting consumers not only of the goods advertised through product placement and conspicuous consumption on the screen, but of the capitalist system that keeps them in check. As the cultural manifestation of organized monopoly capitalism, the culture industry subsumes cinema along with magazines, jazz, radio, and television under the commodity form, thereby transferring ‘the profit motive naked onto cultural forms’ (Adorno, 1975: 13). Favoring various kinds of ‘pseudo-realism’

as their representational mode, cinema and television feed into the systematic, totalizing reach of the culture industry to satisfy the false needs of spectator-consumers that this industry generates in the first place; in this manner, it 'endlessly cheats the consumers out of what it endlessly promises' (Adorno and Horkheimer, 2002: 111). As Adorno and Horkheimer put it in the chapter title, the culture industry peddles 'enlightenment as mass deception'. Harnessing all aspects of style, technique, and aesthetics to technology, profit, and an authoritarian notion of culture, the top-down system of the culture industry reinforces social hierarchies even as it levels all aesthetic differences – pseudo-differentiations between A- and B-pictures, Chrysler and General Motors, daytime soaps and 'quality' television notwithstanding.

Cinema, for Adorno and Horkheimer, consequently epitomizes modern media's proximity to propaganda, a term whose meaning in the original German usage oscillates between advertising and political manipulation. This ambivalence is precisely the authors' point: as a manifestation of highly developed capitalism, the culture industry marks the point at which sound business policy and political machination converge. Like advertising, industrial culture is entirely beholden to the commodity form; like propaganda, it constitutes an ideological machine that transforms autonomous subjects into a mass of consumers rid of the freedom and the capability of forming independent judgments: 'the customer is not king, as the culture industry would like to have us believe, not its subject but its object' (Adorno, 1975: 12). Where 'to be entertained means to be in agreement', the authors argue, conformity replaces consciousness (Adorno and Horkheimer, 2002: 115). Spectators become interchangeable consumers who 'must need no thoughts of [their] own' (109) but must ensure the seamless functioning of the machine through unquestioning consumption of its products. In the negative dialectic that binds together the manifestations of culture under conditions

of modernity, the culture industry is the opposing pole to notions of authentic folk art or popular culture – notions that resonate with a positivity as false and misleading as the negativity of a 'pornographic and prudish' industrial culture (111). In the face of this dialectic, according to Horkheimer and to Adorno especially, only a rigorous notion of autonomous art could resist cooptation by the system by virtue of its resolute negativity. 'Ascetic and shameless' (111), such art recognizes the broken world and dares to offer reconciliation only in the most attenuated overtones generated by its demanding form, whereas the culture industry traps its consumers in stimulus-response patterns, offering escapist fare the better to keep them yoked to the factory bench. And yet, even the concept of autonomous art cannot be considered normative or absolute, since it remains tethered to the dialectic beyond which it would gesture. As Adorno famously formulates it, in a 1936 letter to Walter Benjamin in which he commented on the latter's drafts of the 'Artwork' essay: both high and low, both autonomous art and the forms of mass culture to which Benjamin would ascribe revolutionary potential, 'bear the stigmata of capitalism.... Both are torn halves of an integral freedom, to which however they do not add up' (Adorno et al., 2007: 123).

Adorno and Horkheimer's influential account of the culture industry is inexorably totalizing: as any reader of 'Enlightenment as Mass Deception' can attest, the text is relentless in shoring up the image of a fully administered, closed cultural system, from which there can be no escape and whose only logical culmination is in fascism. Both *Dialectic of Enlightenment* and *Minima Moralia* were originally written in Californian exile from the Nazis. Against this backdrop, the bleakness of Adorno and Horkheimer's view of mass media is of course historically contingent; but it is also in keeping with their overall diagnosis of enlightenment as generating its own antitheses – a dialectic that they trace back to the age of myth and forward

into the mythologizing tendencies of bourgeois enlightenment. Consequently, they detect this dialectic even in the most remote corners of the culture industry. Adorno and Horkheimer see even the seemingly harmless laughter generated by cartoons as a regressive response to the sadism with which animated figures treat each other, are flattened, pummeled, run over. Or as Walter Benjamin would put it elsewhere, Disney films from a certain point onwards revealed the ‘cozy acceptance of bestiality and violence as inevitable concomitants of existence’ under modernity (Benjamin, 2008: 130, n30). In the frantic pursuits of cartoon characters, then, Adorno and Horkheimer see the incipient pogrom (Adorno and Horkheimer, 2002: 110), in the invention of radio they already hear the Führer’s voice (129). As the authors put it in a distant echo of Siegfried Kracauer’s contemporaneous argument in *From Caligari to Hitler* (1947), ‘in Germany, even the most carefree films of democracy were overhung already by the graveyard stillness of dictatorship’ (Adorno and Horkheimer, 2002: 99). In the dialectic of enlightenment, even fun ‘is a medicinal bath (*Stahlbad*) which the entertainment industry never ceases to prescribe’ (112). The enlightenment ideals of reason and emancipation yield a rationalized cultural system that ensures complete social control.

In the decades since its inception (first as a set of mimeographed ‘philosophical fragments’ completed in 1944, then as a book published in 1947, and only much later as one of the iconic texts of critical theory),<sup>1</sup> *Dialectic of Enlightenment* has often been reduced to readily repeatable soundbytes: enlightenment as unmitigated disaster leading to fascism, cinema as mass manipulation, audiences as dupes of the culture industry’s spectacle. These are strong claims that gave critical theory an edge of combative ideology critique in the cultural arena during the 1960s, when *Dialectic of Enlightenment* was taken up by the student movements. At the same time, critical theorists would have been

the first to balk at the reduction of complex arguments to bald theses about mass media manipulation; such reductionist accounts could render those arguments all but indistinguishable from a ‘hypodermic needle’ model of mass communication – anathema to the dialectical approach elaborated by Adorno and Horkheimer, who originally had intended to follow up on the ‘philosophical fragments’ with additional material. Of the section on the culture industry, in particular, they noted in 1944 that it remained more fragmentary than the other parts; they had already completed significant work on ‘the positive aspects of mass culture’, suggesting a far more nuanced concept of the latter than the one condensed in received images of Adorno in particular as a mandarin thinker with only disdain for mass culture and the media (Adorno and Horkheimer, 2002: 254, n. xix). By the turn of the twenty-first century, the editors of a volume devoted to ‘rethinking the Frankfurt School’ could consequently observe that ‘reconsiderations of Adorno have proceeded at such a pace that a renovated, re-published and poststructuralist-friendly Adorno (as opposed to the cranky modernist of *Dialectic of Enlightenment*) has become the leading figure of the second-generation Frankfurt School’ (Nealon and Irr, 2002: 2).

The image of the ‘cranky modernist’, however, did have its own efficacy in the reception history of critical theory, and the somewhat one-dimensional notion of the culture industry as pure manipulation came in for revision even by some of the Frankfurt School’s most well-meaning critics. The rise of British Cultural Studies from the 1960s on, for example, and its further elaboration in North America in particular, more or less directly implicated the thesis of enlightenment as ‘mass deception’ in its own challenge to the ‘hypodermic needle’ model of cultural communication. Given the distinct contexts out of which the two schools of thought emerged, it would be wrong to think of Cultural Studies as a direct ‘reply’ to the cultural theories of the Frankfurt School. Nonetheless, the rise

of cultural studies was predicated in certain ways upon the work of the latter – if only by negation and in a ‘particularly difficult’ relationship of ‘skeptical distance’ (Nealon and Irr, 2002: 3). Though many practitioners of cultural studies from Raymond Williams and Stuart Hall onwards shared the materialist and even Marxist bent of the Frankfurt School, and although the two intellectual traditions overlapped in a number of other significant ways as well (cf. Kellner, 2015), the British Marxists and subsequent critics did not adopt the Frankfurt School’s totalizing dialectics, whether Hegelian or negative.<sup>2</sup> Nor did they share critical theory’s totalizing dismissal of the working class as hopelessly coopted by the system. Responding to post-Fordist developments in capitalism, the more socio-logically oriented studies of the Birmingham Centre for Cultural Studies implicitly also displaced the Frankfurt School’s model of the culture industry. In its place, Cultural Studies developed more differentiated notions of cultural encoding and decoding on the part of audiences that were increasingly conceptualized as active (Fiske, 1989; Hall, 1993).<sup>3</sup>

As I have already begun to suggest, however, such critiques of Adorno and Horkheimer’s model of culture did not come only from the outside, as it were, but were formulated within the context of critical theory itself. On cinema and modernity, on the spectacle of the culture industry, critical theorists did not speak with one voice – particularly if one includes here two of the most articulate contributors who were never *de facto* members of the Institute for Social Research, but who are today generally considered key figures in this intellectual tradition: Walter Benjamin and Siegfried Kracauer.<sup>4</sup> From their influential writings emerge related but different conceptualizations of cinema, spectacle, and modernity that crystallize around the configuration of media and a complex notion, yet to be defined, of experience. Taking these contributions into account – which have been gaining increasing attention ever since the rediscovery of Benjamin’s writings during the 1980s and 90s,

and more recently with the revaluation of the full breadth of Kracauer’s work – we can then also return to Adorno to reconsider various nuances in his assessment of technological media that the more well-known theorization of the culture industry and its reception have tended to occlude. Here, too, recent scholarship has opened significant revisionist avenues.

## **EXPERIENCE AND TECHNOLOGICAL REPRODUCIBILITY: WALTER BENJAMIN**

‘One of the oldest motifs of Critical Theory’, notes Detlev Claussen, is ‘the experience of the loss of experience’ (2008: 7; cf. also Jay, 2005). It is a motif central not only to Adorno’s aesthetic and cultural theory, but also to the work of Walter Benjamin in particular. In essays such as ‘The Storyteller’ (Benjamin, 2006b), ‘The Work of Art in the Age of Its Technological Reproducibility’ (Benjamin, 2008), and ‘On Some Motifs in Baudelaire’ (Benjamin, 2006a), as well as in his unfinished work on the Arcades project, Benjamin considers it axiomatic that under conditions of modernity, ‘experience has fallen in value’ (Benjamin, 2006b: 143). In this regard, Benjamin’s writings contribute, in Miriam Hansen’s words, to a ‘theory of experience in the age of its declining communicability’ (Hansen, 1987: 186).

What exactly did it mean for experience to be on the decline, and what were the impediments to its communication? Has not the concept of experience in fact become increasingly ubiquitous, the quintessential object of our mobile, urban, and cosmopolitan modernity, in which we chase after ever new thrills and sensations that we collect in order to assure ourselves of having truly lived (Greif, 2016)? In order to understand how Benjamin and the Frankfurt School arrive at the diagnosis of an ‘increasing atrophy of experience’ (Benjamin, 2006a: 316), and

in order to understand the specificity of this diagnosis in its relation to cinema and other media of modernity, we need to distinguish with Benjamin between two different notions of experience. This distinction is facilitated in the German language by the fact that it has two different words to designate *Erlebnis* and *Erfahrung* as fundamentally different kinds of experience. Benjamin associates the former with fleeting, momentary impressions, with the impact of a shock or thrill. These short bursts of affect, which arguably define our contemporary, commonplace concept of experience (cf. Greif, 2016), lack what is central, by contrast, to the emphatic notion of experience as *Erfahrung*: a longitudinal temporal aspect that ‘accompanies one to the far reaches of time, that fills and articulates time’ (Benjamin, 2006a: 331). As *Erfahrung*, experience becomes a temporal medium in which memory and history are woven together. ‘Where there is experience in [this] strict sense of the word’, writes Benjamin, ‘certain contents of the individual past combine in the memory with material from the collective past’ (Benjamin, 2006a: 316).

This emphasis on the historical dimension of experience consequently also entails an insistence on its more-than-individual quality as a site (or, again, a medium)<sup>5</sup> for the dialectical encounter between subject and object. Experience in this sense is not simply a subjective capacity to register sense data as if on a blank slate, for ‘[t]he relation to experience ... is a relation to all of history; merely individual experience, in which consciousness begins with what is nearest to it, is itself mediated by the all-encompassing experience of historical humanity’ (Adorno, 1984: 158). As Miriam Hansen, one of the most important commentators on media and experience in the Frankfurt School, put it: experience as *Erfahrung* is ‘that which mediates individual perception with social meaning, conscious with unconscious processes, loss of self with self-reflexivity’; with Benjamin and Adorno, she consequently defines experience ‘as the capacity to see connections and relations (*Zusammenhang*); ...

as the matrix of conflicting temporalities, of memory and hope, including the historical loss of these dimensions’ (Hansen, 2004: 12–13). Benjamin himself formulates this dialectic in countless and varied discussions of experience in relation to color, childhood, language, writing, storytelling, and more (cf. Jay, 2005: chapter 8). In these discussions, the emphatic notion of *Erfahrung* tends to imply ‘a point of indifference between subject and object, an equiprimordiality prior to their differentiation’ (Jay, 1998: 51) or, as Jürgen Habermas put it in an early appraisal of Benjamin: in experience (*Erfahrung*), the object metamorphizes ‘into a counterpart. Thereby a whole field of surprising correspondences between animate and inanimate nature is opened up, wherein even things encounter us in the structures of frail intersubjectivity’ (Habermas, 1979: 45–6).

These two qualities of experience – its temporal reach into memory and history, and its dialectical mobilization of subject–object relations – come under threat in modernity, according to critical theory. Whether through the loss of orality or the loss of aura, modernization shifts the balance away from narrative *Zusammenhang* and toward mere information, and consequently from *Erfahrung* to *Erlebnis*. Technological media – and cinema, in particular – are integral to this process. But unlike Adorno and Horkheimer, who consider the culture industry symptomatic at best (and instrumental at worst) in the creeping reification wrought by capitalist modernity, and who hold out hope only for the most demanding forms of autonomous art, Benjamin locates responses to the loss of experience *within* modern media culture as well.<sup>6</sup> While the author of the ‘Artwork’ essay is keenly aware of Fascism’s power to aestheticize politics through spectacle, he attributes ‘social significance’ to film, which – in a far cry from Adorno and Horkheimer – he deems ‘the artwork most capable of improvement’ (Benjamin, 2008: 109). Alienation and reification provide the context for Benjamin’s media theory as much as for *The Dialectic of Enlightenment*, to be sure; but Benjamin

(and Kracauer, too, as we shall see) allows for the fact that as an apparatus, the cinema makes possible 'a highly productive use of the human being's self-alienation'. For Benjamin, who insists at every turn on the historicity of the senses, the rise of photography and film in modernity index a profound shift in the human sensorium and consequently to aesthetics conceived as a matter of sense perception (*aesthesis*). In this context, cinema becomes a training ground on which to adjust to the progressive loss of 'aura' in modernity, to familiarize ourselves with the increasing penetration of the human world by technology or 'second nature', and to practice new modes of seeing. Famously considered by Benjamin the purveyor of our 'optical unconscious' (Benjamin, 2008: 117), film serves 'to train human beings in the apperceptions and reactions needed to deal with a vast apparatus whose role in their lives is expanding daily' (108). Viewed from this perspective, the loss of aura – of which cinema is both the engine and the index – is but a facet of modernity's 'disenchantment of the world' (Max Weber). The concomitant loss of experience, then, would not be cause for lament but would be welcomed as productive and progressive.

Miriam Hansen has noted the 'belated' character of Benjamin's 'Artwork' essay, which she locates in the fact that Benjamin still invests the cinema with avant-gardist hopes at a period when for other critical theorists the advances of capitalism and fascism alike have squashed any residual cause for optimism (Hansen, 1987: 182). Against the bleaker diagnoses of the 1940s, Benjamin allies himself with both Dada and Brecht in embracing the cinema's destruction of aura and its political, mass-oriented functions. This position brings him into explicit conflict with Adorno who, in the above-mentioned important exchange of letters about the 'Artwork' essay, accuses Benjamin of romanticizing Chaplin, the proletariat, and popular culture more generally (Adorno et al., 1977: 110–41). Demanding 'more dialectics' (124), Adorno chides Benjamin for

investing Mickey Mouse, the cinema, and the laughing audience with excessive emancipatory potential at the expense of high art and aesthetic autonomy. At stake in this correspondence is again the question whether to embrace or lament the profound cultural shift that becomes particularly palpable in the cinema – and whether to welcome the latter as a medium of shocks and thrills (*Erlebnis*) or to hold it responsible, *pars pro toto*, for the loss of experience (*Erfahrung*) in modernity.

In the correspondence, Benjamin does concede several of Adorno's points. Indeed, as Hansen has shown, Benjamin harbors considerably greater ambivalence on this issue than the combative, Brecht-inspired stance of the 'Artwork' essay would lead us to believe (Hansen, 1987). While he clearly welcomes the politicization of the aesthetic with Brecht, in several other writings Benjamin simultaneously invests hope in a re-auratization of modernity. Hansen traces this hope in the way Benjamin develops notions of innervation, play, mimesis, and physiognomy (Hansen, 1987; Hansen, 2012: 130–204). These concepts are as central to Benjamin's media theory as the vaunted loss of aura, and they combine to suggest the possibility not only of losing but also of regaining an emphatic form of *Erfahrung* at the movies. 'Although film as a medium enhances the historical demolition of the aura', Hansen writes, 'its particular form of indexical mediation enables it to lend a physiognomic expression to objects, to make second nature return the look, similar to auratic experience in the first' (1987: 209–10). In this more nuanced view of Benjamin's work on cinema, the latter holds out the promise 'that it might give the technologically altered sensorium access to a contemporary, materially based, and collective form of reflexivity that would not have to surrender the mimetic and temporal dimensions of experience' (2012: 161). In other words, Benjamin theorizes cinema not only as the *locus classicus* for the destruction of aura but also as a site for the reconfiguration of experience in modernity. At stake, then, is the question

of whether cinema can also be a medium *of* experience rather than simply the medium of its destruction: can we expect from the cinema, in other words, the re-integration of fragmentary *Erlebnisse* (including, notably, the shocks and thrills produced by cinema's own techniques of cinematography and montage) into a coherent, enduring form of *Erfahrung* – whether aesthetic or political, social or individual? And can the cinema help to dissolve the rigid opposition of subject and object? Can it become, in other words, a site where 'even things encounter us in the structures of frail intersubjectivity' (Habermas, 1979)?

To the degree that Benjamin's essays and letters begin to suggest affirmative answers to these central questions, his writings on media arguably communicate as closely with the writings of Siegfried Kracauer as with those of Adorno, the importance of the correspondence with the latter notwithstanding. For it is Kracauer who will eventually formulate a full-fledged theory of film that culminates explicitly in a strong notion of experience – reformulated in relation to the representation of reality – as the medium's defining term. In another significant departure from the culture industry paradigm, according to which modern media function precisely to 'strip away' experience (Adorno and Horkheimer, 2002: 135), Kracauer will argue that cinema 'incorporate[s] aspects of physical reality with a view to making us experience them' (1997: 40). Rather than a mere symptom of modernity and an instrument of late capitalism, cinema appears to Kracauer as the antidote to a prevailing sense of abstraction. Cinematic spectatorship becomes a site for experience regained.

## CINEMA AND EXPERIENCE: SIEGFRIED KRACAUER

This is the position that emerges, in any event, from Kracauer's late work (though it was decades in the making, *Theory of Film*

was completed in 1960, only six years before his death). Though there are strong lines of continuity in Kracauer's thinking,<sup>7</sup> these develop over a lifetime of crossing disciplinary and national borders, from his early training as an architect in Germany to his work as an émigré scholar in the United States. He does occasionally try to avoid being pigeonholed as a film critic and theorist, to be sure; but thinking about the medium remains central to his work from his copious film reviews in the *Frankfurter Zeitung* during the 1920s through his final, posthumous publication, which draws extensively on his own insights about film as a template for thinking about (the writing of) history. Kracauer is the only one among the first generation of critical theorists, in other words, who can claim any significant expertise in matters of cinema. One of the leading film critics of the Weimar Republic, he goes on in American exile to write two of the most influential books in the history of so-called classical film theory: *From Caligari to Hitler: A Psychological History of the German Film* (1947) and the above-mentioned *Theory of Film: The Redemption of Physical Reality* (1960).

Kracauer's work on these books is preceded by a decade-long career in film and cultural criticism at the *Frankfurter Zeitung*, as well as by his eight years in French exile, during which he continues watching, thinking about, and working on film – as well as on the related questions of spectacle and propaganda. Kracauer scholarship has grappled with the continuities and ruptures that characterize this work, tending to separate out the materialist, occasionally even Marxist-influenced writings of the late 1920s and early 1930s (see e.g. Mulder, 1985) from the far more muted politics of the texts written in the United States during the Cold War (see e.g. von Moltke, 2015). And in several respects it does indeed remain difficult to reconcile the dialectical concepts of abstractness and rationalization in landmark essays such as 'The Mass Ornament' (1996a) and

'Photography' (1996b) with the flat-out critique of ornamentation in the *Caligari* book or of abstraction and the scientific world view at the end of *Theory of Film*. Whereas the earlier work was guided by a desire to push through the surface expressions of popular culture by means of a socially committed ideology critique, the two film books would appear to develop comparatively undialectical, normative frameworks to criticize Weimar cinema as proto-fascist, and to extol neorealist cinema as redemptive, respectively.

And yet, underlying these apparent discontinuities and reversals is an abiding sense of the promise of cinema – coupled, to be sure, with an acute sensitivity for illiberal, if not totalitarian, abuses of the medium. One way to grasp these continuities is to note the persistent concern with alienation in the cinema. In his earliest film reviews, Kracauer spells out the power of cinema to estrange our perception of reality; photographic media as well as early cinematic forms such as slapstick or the kinetic chase scene, he insists here, are alienating in both senses of the word – taking spectators away from their lived reality, but thereby also laying bare that reality in its ideological construction. This is the upshot of the 1927 essay on photography, which concludes with the suggestion that film has a unique power to 'stir up the elements of nature' (Kracauer, 1996b: 62). With the advent of photographic media, in other words, the world presents itself for the first time in history 'in its independence from human beings'. A similar argument underpins the famous essay on 'The Mass Ornament', which formulates a dialectical theory of spectacle and mass culture in terms of rationalization and abstraction (Kracauer, 1996a): the epitome of the rational, objectifying organization of humans – whether workers on the factory floor, gymnasts in the sports stadium, or the Tiller Girls on the vaudeville stage – the mass ornament yields an abstract, geometrical pattern. As such it both alienates us from outmoded notions of individuality and interiority and intimates a different, enlightened

order, in which the rational organization of society would become, in Kracauer's terms, humane and concrete. Hence Kracauer's conclusion that 'the *aesthetic* pleasure gained from ornamental movements is *legitimate*' (79; emphasis in original): in the geometrical abstractions of their forms, spectacle and popular culture allow insight into the process of rationalization, which has enthroned abstract *ratio* in place of the rational telos of enlightenment: *Vernunft*. The solution, then, cannot be to turn back the clock to pre-enlightened notions of organic tradition, myth, ritual, or what Benjamin termed aura; like Adorno and Horkheimer, whose argument 'The Mass Ornament' anticipates by two decades, Kracauer sees the dialectic of enlightenment to lead inextricably *through* the mass ornament. Unlike Adorno and Horkheimer, however, he considers the abstraction, reification, and alienation of popular culture to be 'legitimate' in that they point the way forward. Capitalism's 'core defect', Kracauer consequently claims, is that 'it rationalizes not too much but rather *too little*' (1996a: 81; emphasis in the original).

This position is formulated during the 1920s and prior to the rise of Hitler, to be sure. Kracauer would become more skeptical about the emancipatory potential of the ornament in his writings during the 1930s and 40s. The two key texts here are a long essay entitled 'Totalitarian Propaganda' that he writes in Paris during the 1930s for the Institute for Social Research (which, however, declined to publish it in its journal<sup>8</sup>) and *From Caligari to Hitler*, the 'psychological history of the German film' written in New York. The two texts are linked: the propaganda analysis provides the backdrop for Kracauer's analyses of 'wartime communications' in New York, which in turn feeds into his re-viewing of Weimar cinema as 'premonition' of Hitler. Here, the dialectical promise of the ornament yields to an alarmed assessment of cinema's power to yoke ornamentation to mass deception and tyranny. Once he studies Nazi propaganda films, including Leni Riefenstahl's

infamous *Triumph of the Will*, Kracauer also re-evaluates the films of the Weimar era, now detecting in them anticipatory versions of the paralysis and terror that he finds in totalitarian propaganda. Here, too, alienation has become total.

And yet, by the time the world emerges from Fascism (albeit into the Cold War) and Kracauer completes *Theory of Film*, cinema's powers of alienation have regained some of their capacity to help point (popular) culture out of the entanglement of enlightenment's dialectic. Even though *Theory of Film* is written from a completely changed geopolitical vantage point and with knowledge of the Holocaust, the book insists, like the earlier essays, on the productive aspect of cinema conceived as a 'product of complete alienation' (Kracauer, 1997: 15). The difference is that *Theory of Film* now links alienation to a renewed valorization of experience after its virtual erasure by war, genocide, and the atom bomb – if not the culture industry. Cinema, in Kracauer's theoretical *summa*, provides a site for working through alienation and regaining – if not 'redeeming' – experience in an increasingly abstract, cold war world. Inspired by Italian neorealist films such as Rossellini's *Paisà*, Kracauer sees film as a conduit for reconnecting with reality. 'We literally redeem [the] world from its dormant state', Kracauer writes, 'by endeavoring to experience it through the cinema' (1997: 300).

## **TOWARD A CRITICAL MEDIA THEORY: THEODOR W. ADORNO REVISITED**

Given the distance that apparently separates Kracauer and Adorno on the issue of cinema, spectacle, and popular culture (with Benjamin situated somewhere in between), it comes as something of a surprise that, late in his career, Adorno does appear to concede aspects of Kracauer's argument in an article entitled 'Transparencies on Film' (Adorno,

1981/82). Occasioned by an encounter with the early works of what would become known as the New German Cinema, the article happens to appear in *Die Zeit* just a week before Kracauer's death in late November of 1966; its debt to the older critic is explicit, as Adorno attributes to Kracauer 'the most plausible theory of film technique' (200). In doing so, he alights on the importance of experience at the heart of cinema. Whereas the (co)author of 'Enlightenment as Mass Deception' had considered cinema 'the central sector of the culture industry' (Adorno and Horkheimer, 2002: 100), inimical to experience and diametrically opposed to any substantive notion of the aesthetic, he now argues for an aesthetics of film based precisely 'on a subjective mode of experience which film resembles and which constitutes its artistic character' (Adorno, 1981/82: 201). Adorno's own elaboration of this defining characteristic bears a striking resemblance to Benjamin's definition of the 'aura' that has supposedly withered, along with experience, under conditions of modernity: 'A person who, after a year in the city, spends a few weeks in the mountains abstaining from all work, may unexpectedly experience colorful images of landscapes consolingly coming over him or her in dreams or daydreams. These images do not merge into one another in a continuous flow, but are rather set off against each other in the course of their appearance, much like the magic lantern slides of our childhood. [...] Such movement of interior images may be to film what the visible world is to painting or the acoustic world to music. As the objectifying recreation of this type of experience, film may become art' (Adorno, 1981/82: 201).

Adorno's concession that, rather than annihilating experience, film may in some respects be its medium opens up possibilities of reading his mandarin aesthetic theory against the grain, as a theory of cinema and the media as well. A number of critics have begun to do just that in recent years, noting the breadth of Adorno's engagement

with audiovisual media and technological reproducibility well beyond the canonical treatment they receive in *Dialectic of Enlightenment* and *Minima Moralia*. This has to do partly with the recovery of certain biographical aspects of Adorno's work: both Thomas Wheatland and David Jenneman have usefully located Adorno in the specificities of American exile, and the latter in particular has rightly insisted that 'during this period, Adorno immersed himself fully in American culture', and in America's 'myriad forms of entertainment and communication' (Jenneman, 2007: xv/xvii; cf. Wheatland, 2009). Reconstructing Adorno's extensive work on radio and his involvement in a social scientific film experiment, Jenneman is able to show that 'Adorno's relationship with Hollywood and the filmmaking community was much closer and more complicated than has previously been acknowledged' (xxxiii).

Amy Villarejo, in turn, has followed through on this observation with a detailed re-reading of one of Adorno's other texts on mass media, the 1954 essay 'How to Look at Television', first published in the *Quarterly of Film, Radio and Television* (today *Film Quarterly*; Adorno, 1954). Turning to Adorno with the intention of 'thinking about what critical theory and queer theory have to say to one another on the terrain of culture' (Villarejo, 2013: 49), she discovers a surprisingly careful reader of mass cultural texts – one who 'acknowledge[s] the gendered nature of the programming that he analyzes', who tends to perform 'extremely careful textual analyses', and who reads television with a 'very accurate sense of audience' (36). Attributing to some of Adorno's observations a 'proto-feminist inclination' (51), Villarejo is able to tease out a differentiated reading of television and its 'pseudorealist' bent. This is particularly evident in Adorno's treatment of identification not simply as a question of positive or negative representations of identity, but as a matter of programming, seriality, and ultimately the apparatus of television itself, which facilitates a form of 'psychoanalysis

in reverse'. Villarejo finds the essay's analysis of stereotyping to be similarly nuanced. Where 'Enlightenment as Mass Deception' had hammered home the role of stereotyping in spreading the culture industry's pervasive ooze of sameness and standardization (see e.g. Adorno and Horkheimer, 2002: 119), Villarejo shows Adorno here to be arguing that stereotypes can also 'become vehicles for social participation, exchange, and recognition, even if they retreat into the abstractions he criticizes' (63). A TV show from the 1950s such as *Our Miss Brooks* can activate those stereotypes and put them into circulation in a chain of queer significations and mechanisms that includes not only stereotypes, but also banter, innuendo, double entendre, and slang (64). This is a deliberately revisionist account of the mandarin critical theorist who ostensibly dismisses television, mass media, and the culture industry from his perch atop modernist high culture. Instead, Villarejo finds in 'How to Look at Television' a complex model of the medium that 'refutes a commonly held sense of Adorno's writings as presuming a monolithic mass duped by a centralized, rationalized culture industry' (64).

Perhaps the most sustained and thought-provoking re-reading of Adorno's media theory, however, comes from Miriam Hansen. In her posthumously published work on the place of cinema and experience in the works of Adorno, Benjamin, and Kracauer, Hansen joins the emerging argument that Adorno's 'engagement with film ... was more comprehensive and complex than commonly assumed' (Hansen, 2012: 208). In order to trace that engagement, Hansen turns not only to the canonical texts on film, the culture industry, and television, but also to Adorno's life-long concern with other technologically based media such as radio and the gramophone, and to his treatise on film music, co-authored with Hanns Eisler, *Composing for the Films*, which was published in the same year as Kracauer's *From Caligari to Hitler* (Adorno and Eisler, 1947). In addition, she usefully notes that a text such as

‘Transparencies on Film’, which she considers Adorno’s ‘most extensive statement on the question of film aesthetics’ (1981/82: 210; see also Hansen 1981/82), must itself be read in the context of the aesthetic theory Adorno was elaborating at the same time (though it would only be published posthumously in 1970; see Adorno, 1997). In rereading these different aspects of Adorno’s work together as part of an avowedly ‘recuperative project’ (Hansen, 2012: 250), Hansen concludes that Adorno ‘could have thought – and occasionally did think – that film had a privileged role to play in discussions on modern art’ (211).

A central insight to emerge from Hansen’s new constellation of Adorno’s texts concerns the relation between technique and technology in technological media. By their very definition, the latter would appear to prioritize the technology at the expense of inner-aesthetic technique, whose autonomy from extrinsic forces (such as technological reproduction, indexicality, or the demands of ‘pseudorealism’) Adorno considered a prerequisite for authentic art. In the normative terms of Adorno’s aesthetic theory, technique – the ‘conscious free control over the aesthetic means’ (Adorno, 1997: 213) – trumps technology. Now, although the yoke of the culture industry would appear to offer dim prospects for the ‘conscious free control’ of anything other than profit, Hansen is able to show that Adorno’s writings do allow for various degrees of autonomy and for the assertion of ‘the aesthetic means’ even under conditions of technological reproducibility. Examples include the treatment of film music as a counterpoint to cinematic narrative (*Composing for the Films*), the ‘radical naturalism’ of cinema (*Minima Moralia*), and the ‘associative stream of images’ favored by the Young German Filmmakers and various New Waves in the 1960s (‘Transparencies on Film’). In working out the apparent contradiction between a technological a priori and the assertion of autonomous technique, Adorno thus moves the discussion of film out of the confines of the culture industry and its

ideology critique, and – like Benjamin and Kracauer before him – into the realm of aesthetics. He now allows for the possibility that ‘while film, by its immanent logic, tries to rid itself of its artistic character – almost as if the latter violated its aesthetic principle – in this rebellion it is still art and expands the notion of art’ (Adorno, ‘Die Kunst und die Künste’, cited in Hansen, 2012: 221).

Hansen explicitly guards against the idea that this ‘recuperative’ reading of Adorno amounts to a full-fledged theory of film on par with the far more coherent projects of Benjamin and particularly Kracauer. To the degree that Adorno contributes to a critical theory of cinema, he does so on explicitly aesthetic grounds, with a view to ‘expanding the notion of art’. While this is certainly in keeping with the tendency of classical film theory – Benjamin had famously argued that ‘the invention of photography [and consequently of cinema] had ... transformed the entire character of art’ (Benjamin, 2008: 28) – the question of film as art also represents a step back from the culture industry chapter, which had opened up perspectives, however bleak, on the cultural and socially embedded study of film and media. As the discipline of film studies leaves behind a prolonged phase of institutionalization, in which it focused primarily on questions of art and the logic of the film ‘text’, critical theory may yet take on renewed relevance – reconceptualized as a contribution not simply to film aesthetics, but to a broader theory of media. As our media landscape undergoes rapid and profound technological shifts and the long century of cinema draws to a close, Walter Benjamin, in particular, has been re-read from this perspective (cf. Kang, 2014; Somaini, 2016); this is also the perspective Dudley Andrew has in mind when, in an authoritative overview of the ‘core and flow of film studies’, he notes that critical theory warrants renewed attention (Andrew, 2009). Pointing out the belated impact of critical theory on (Anglo-American) film studies as a discipline, Andrew suggests that the former may now

help to put the latter into perspective. 'Critical theory put film in its place, so to speak, and interrogated film from that place. Perhaps its impact could only be felt when American film studies began to realize that media was integral to a discipline no longer bounded by dates or by specific technologies' (909). In their focus on the relation between media and the senses, on the experiential dimension of film, and on the technological *a priori*s of modernity, Adorno, Benjamin, and Kracauer were media theorists *avant la lettre*.

## Notes

- 1 On the history of this book and its argument, see Schmidt, 1998, as well as the editorial matter in Horkheimer, 1987, 423–59.
- 2 Leaving this theoretical shift for readers to trace, Simon During's influential *Cultural Studies Reader* gives Adorno and Horkheimer's 'Culture Industry' chapter pride of place in introducing the first section of the anthology – which concludes with Stuart Hall's reflections on 'Cultural Studies and its Theoretical Legacies'. See also Nealon and Irr, 2002: 3.
- 3 This is to say nothing of other, more recent developments in media theory, where anti-hermeneutic approaches in the wake of Friedrich Kittler have been premised explicitly on a wholesale rejection of the Frankfurt School (cf. *Grey Room*, 2007; Kittler, 2010; Siegert, 2015).
- 4 Both have recently been the subject of important and substantial biographies that carefully chart their relations with the Frankfurt School. See Eiland and Jennings, 2014 and Später, 2016.
- 5 On Benjamin's idiosyncratic notion of 'medium', see Somaini, 2016.
- 6 'If one considers the dangerous tensions which technology and its consequences have engendered in the masses at large – tendencies which at critical stages take on a psychotic character – one also has to recognize that this same technologization has created the possibility of psychic immunization against such mass psychoses'. (2008: 118).
- 7 Kracauer himself asserts as much in his claim, included in the posthumous *History*, that he harbored a lifelong interest in minutiae, in 'the rehabilitation of objectives and modes of being which still lack a name and hence are overlooked or misjudged' (Kracauer, 1969: 4); for a differently angled assertion about the continuity of Kracauer's particular commitment to notions of humanism and enlightenment, see von Moltke, 2015.
- 8 Although the typescript that Kracauer sent to Adorno and Horkheimer in New York is considered lost, the editors of Kracauer's collected works were able to painstakingly reconstruct a complete version of the text from a surviving manuscript and Kracauer's systematic bibliographical work. See Kracauer, 2012.

# On Music and Dissonance: *Hinge*

Murray Dineen

And now let us turn to a matter decisive for the deepest understanding of National-Socialist theories of race. During the many thousands of years it took for the system of humanity [*menschliche Ordnung*] to arise, all the various positions described herein – which, taken as a whole, make up what we call a world perspective [*Weltanschauung*] – are harmonized in the individual races. The racial inheritance [*Erbgut*] thus harmonized produces – against racial distinctions – certain unfolding developmental tendencies and boundaries, and these are of a completely determinate nature. Every race has its own task in this regard, but the exercise of determining such distinctions is of no concern to us here. We know one thing, however: the system of humanity is holy. Those groups of men who believe they can contradict such a system will become estranged from what we call ‘life’. They will vegetate. They will become the products of certain developments. *Rasse und Musik*.<sup>1</sup>

There is music to Adorno’s prose, a blend of sonority with allusion that connotes music behind the words.<sup>2</sup> Built in hinge-like fashion, it emerges in the form of contrasting pairs – *copula* – in expressions such as the following, taken from *Minima Moralia*:

‘*Wahr sind nur die Gedanken, die sich selber nicht verstehen.*’ (1996b: 216). Fortuitous translation sometimes accentuates this musical quality, capturing the conjoining of sound and meaning, the contrast between *thought* and *understanding*: ‘*True thoughts are those alone which do not understand themselves*’ (Adorno, 1974: 192). Liberal translation brings out the rhythmic balance (as dactyls in dimeter): *True thoughts alone/ Do not understand themselves*. As does paraphrase with sonorous alliteration: *The criterion for truth is the capacity for self-misunderstanding*. Although it is seldom entirely consonant or harmonious, there is music to Adorno’s prose.

Schoenberg produced good ‘musical prose’, as he called it (meaning actual musical notes arranged in a fashion similar to prose).<sup>3</sup> Paired contrast of harmony and melody is the central paradigm by which he described Western European classical music.<sup>4</sup> Balanced pairing is ubiquitous in that repertoire. In truth it is a grand homogenizing vehicle,

harmonizing in both figural and literal sense the diverse idioms in the language of what is called 'classical music'. Adorno fell heir to the tradition of formal pairing in his composition studies with Alban Berg (Schoenberg's student) in Vienna in 1925.

There are limits, however, to Adorno's use of Schoenbergian paradigms. Schoenberg's musical aesthetic was idealist, calling for a consonant and unitary perspective.<sup>5</sup> Adorno's musical prose does not depend upon consonance but on dissonance of idea – the dissonance struck between 'truth' and 'lack of understanding' in the quotation above. The effect is to produce a balance built upon imbalance, equilibrium based on disequilibrium, sonorous consonance betrayed by conceptual dissonance.

I shall use the term *hinge*, after Adorno's use of the German *Scharnier*, to describe these dissonant pairs in Adorno's writings.<sup>6</sup> In *Negative Dialectics*, Adorno describes the negative dialectics of non-identity as a hinge. Negation determines the non-conceptual in the concept through a form of reflection that changes direction as if swinging around an axis: 'To change this direction of conceptuality, to give it a turn toward nonidentity, is the hinge [*Scharnier*] of negative dialectics'<sup>7</sup> (1973b: 12).

The hinge takes on material form in the paired disequilibrium found in much of Adorno's prose. Adorno brings forth a concept ('truth') and then swings around immediately so as to confront it with its conceptual converse ('lack of understanding'). The two form a pair superficially like that of Schoenberg's paradigm. But with a moment's reflection we see that the two do not fit together – cannot be made to fit together – except as paired incommensurates. As incommensurates they cannot be led to a cadence, their contrasting characteristics cannot be erased, folded limply into stasis. Their contradiction is too fundamental to be resolved into unity, except by negation.<sup>8</sup>

Consider the renowned first sentence of the *Introduction* to Adorno's *Negative Dialectics*:

'Philosophy, which once seemed obsolete, lives on because the moment to realize it was missed' (1973b, 3). The comma marks a hinge; it sets up the antipathy between the adjective *obsolete* and the verb construction *to live on*. Philosophy was once obsolete, [*hinge*] so philosophy lives on by obsolescence. Once the subject matter of eternal truth, philosophy now lives on freed from the claims to eternal truth that rendered it obsolete. There is a slapstick – Chaplinesque – quality to Adorno's prose: heading off in one direction it meets square in the face with its walking stick aimed forcefully in the opposite direction.<sup>9</sup> In the remainder of this chapter I shall rely upon 'hinge' as a theoretical framework. To avoid the pedantic use of *hinge* in quotations, I shall prefer instead a diagonal enclosed in parentheses as follows: [/].

The roots of the hinged construction are beyond consideration in this chapter. Let it suffice to say they lie in the contradictions of the bourgeois consciousness and in the transfiguration of labor as producer of capitalist wealth, value as more value, as Marx discerned it after Hegel. Thus Marcuse cites several constructions from Hegel's *Jenenser Realphilosophie*:

Mechanization, the very means that should liberate man from toil, makes him a slave of his labour. 'The more he subjugates his labor, [/] the more powerless he himself becomes....The more mechanized labour becomes, [/] the less value it has, and the more the individual must toil'. (1960: 78–9)<sup>10</sup>

In Adorno's hands, the construction becomes often biting in tone, but the fundamental antagonistic relation of mechanization (and capital) to labor is preserved.

So too the full extent of the construction and its various forms lies beyond discussion here, except to note that it appears to have been cultivated by Adorno as he wrote for publication.<sup>11</sup> The sketch published as *Beethoven: The Philosophy of Music* (1998a) rarely offer hinges. The following is a notable exception: 'With regard to construction it will be decisive to identify the moment

of negativity in the perfection of the middle works, [/] a moment which took the music beyond this perfection' (1998a: 99). As the sketch nears completion, Adorno turns to the hinged construction:

Art-works of the highest rank are distinguished from others not through their success – for in what have they succeeded? – [/] but through the manner of their failure. For the problems within them ... are so posed that the attempt to solve them must fail, [/] whereas the failure of lesser works is accidental, a matter of mere subjective incapacity. A work of art is great [/] when it registers a failed attempt to reconcile objective antinomies. That is its truth and its 'success': [/] to have come up against its own limit. In these terms, any work of art which succeeds through not reaching this limit [/] is a failure. (1998a: 100)

This leads to a final grand statement – both in concept and expression – of the hinged idea *success* [/] *as failure*:

This theory states the formal law which determines the transition from the 'classical' to the late Beethoven, in such a way that the failure *objectively* implicated by the former is disclosed by the latter, raised to self-awareness, cleansed of the appearance of success [/] and lifted, for just this reason, to the level of philosophical succeeding. (1998a: 100, emphasis added)

The presence of hinged construction attests to the degree of musical fluidity with which Adorno can express his ideas. Detecting hinged constructions, we know that Adorno is in full voice.

In Adorno's German, the hinge often takes the form of the *je...desto...* construction, often translated as *the more...the less...* The following is taken from the Schoenberg essay in *Prisms*:

The more [Schoenberg's music] gives its listeners, [/] the less it offers them. It requires the listener spontaneously to compose its inner movement and demands of him not mere contemplation but praxis. (1967: 149–50)

There are in fact two hinges at work here, one per sentence. Consider the terms *more* and *less*: Schoenberg's music gives more [/]

and in doing so gives less. Consider *contemplation* and *praxis*: Schoenberg's music requires of its listener less contemplation; [/] it requires more work, ultimately requires *praxis*, contemplation's antipode.

The hinge in both these instances is the unstated concept of *work* – or with greater precision, *labor* (in the sense noted above with reference to Marcuse). The more the worker labors in the growth of capital, the less their labor is valued. The worker cannot go to a concert – certainly a concert of Schoenberg's music (indeed any concert associated with the accumulation of capital) – without being forced to work, and the more they work to gain understanding the more Schoenberg's music gains currency – cultural capital. The worker in the guise of listener is forced by Schoenberg 'to compose' the form of the work, to compose its 'inner movement', so difficult to discern in Schoenberg's dissonant oeuvre. This is not leisure. Instead, Schoenberg's music confronts the ossified notion of leisure in capitalism by means of hinged negation. Schoenberg's music turns the contemplative search for musical truths into labor.<sup>12</sup>

As noted, Schoenberg's tonal frame of reference – balanced musical contrast ending in a unitary expression of tonality – cannot be stretched to encompass Adorno's prose. If it could, then the two contrasting elements poised around a hinge would collapse into banal synthesis. Adorno's dissonant expression would become a limpid consonance worthy of a Hallmark greeting card: 'True thoughts alone, lead to understanding'. Instead, by its hinged, reflexive examination of 'truth', Adorno's proposition provokes a conceptual 180-degree turn: an immanent contradiction emerges as truth – truth juxtaposed negatively against understanding. In Adorno's hinged world, truth undercuts itself through understanding.

Hitherto, philosophy sought to close the door on questions of truth and understanding. Finding it shut, Adorno wrests it open. Again and again, the hinged door slams – shut,

open, shut, open. Adorno's negative dialectics operates as if produced by a wind in the night at a remove just far enough to disturb our sleep but obviate doing anything about it.

## SCHOENBERG'S HINGED MUSIC

Schoenberg saw his music as perfectly synthetic. On the one hand, he contrived a historical synthesis by casting himself as the inheritor of Bach, Brahms, and Wagner. On the other, he saw his music as eternally German, embodying a national identity.<sup>13</sup> His synthetic music embodied universal ahistorical musical ideas [*Gedanken*] in absolute musical shapes [*Gestalten*] unprejudiced by relationship to material matter or form.<sup>14</sup>

Adorno was perennially suspicious of such 'hapless generalizations'. Like Beethoven's late works as noted above, Schoenberg's music rendered an immanent historical verdict: the only possible musical synthesis was [/] that such a synthesis was no longer possible. All truly synthetic musical works took the impossibility of synthesis as their subject: such a work was necessarily 'a failed attempt to reconcile objective antinomies' (1998a: 100).

Looking to establish a new means for presenting musical materials as expressive content, Schoenberg contrived 'atonal' and 'twelve-tone' compositional styles. Both styles, however, express the impossibility of a synthetic musical content.

In Schoenberg's so-called 'atonal' works, from about 1911 to 1919, opp. 11 and 19 notably, the composer attempted to breathe life into musical creation by means of a drastic autonomy in musical form. With the piano pieces op. 11 and op. 19 in particular (alongside the Second String Quartet), Schoenberg undertook a fundamental rethinking of musical harmony and tonality.

By their brevity and compression, the Six Small Piano Pieces, op. 19, are exemplary in this regard. For the layperson and expert

alike, there are no readily discernible tonal patterns. Schoenberg makes only the slightest reference to the internal dynamics of 'classical' or 'traditional' tonality and form. It is possible to argue that these are replaced by new tonal dynamics. But to do so is to miss the point: these pieces express the impossibility of musical form [/] by formal means. They bristle, argue, hover – but go nowhere. The fourth piece is most representative, for it comprises a mere thirteen measures of music. Its most salient features are the three sweeping gestures from high to low that move across the keyboard. But precisely what tonal gravity drives this descent lies beyond rational comprehension. For the expert and the average listener alike, it is possible to detect something going on, but impossible to say what that is by means of tonal syntax and grammar.

The opus 19 pieces are rooms without windows or doors, without entrance or egress. In truth, they belong to the long tradition of musical miniatures for the piano, with precedents in, for example, Chopin's Preludes, and Schubert's *Moments Musicaux*. But unlike those keyboard miniatures, tonal musical form is gone. In celebrating op. 19, we celebrate the persistence of a long tradition of expressive keyboard miniatures, [/] alongside the destruction of its expressive tonal foundation.

Schoenberg believed otherwise. He sought to continue the expressive tradition of Brahms and Wagner, thus assuring the continued superiority of German music for the foreseeable future. But as musical rooms without entrance, his music allowed no verification of content – stylistic tradition or national orientation. Thus Schoenberg's claims were at once both without basis [/] and irrefutable. Branded as *entartete Kunst* by the Nazis, Schoenberg's claims were overturned immanently: without rational access to musical content, there was nothing preventing the Nazi aestheticians from branding the works anti-German, and denying vociferously any comparison to Brahms or Wagner.

Pared beyond the minimum, the historical content of these works becomes a verdict of unprecedented breadth: the issue of the eradication of content encompasses the total history of music [/] by denying it. As Adorno puts it in *Perspectives of New Music*, these works require a new philosophy, a philosophy of new: 'Today a philosophy of music is possible only as a philosophy of new music' (2006: 13). Anti-historical in this sense, these works become by default the music of the 'present'; they are 'new music' since they cannot reside in the past they deny. Being thus by default a music of the present (since there is nothing authentic but the present), they negate the authentic category so fundamental to 'classical music', the category of historical timelessness – of ageless musical truth.

In terms of the traditional criteria of authenticity (which we shall turn to at greater length in a moment), Schoenberg's atonal works are inauthentic. But in hinge-like fashion, they derive a new authentic historical identity as anti-historical music, as authentically inauthentic. Their new authenticity is achieved through negation. The situation is thus: present day music can be written [/] only by denying the historical criteria for a musical present.

Schoenberg's music is eternally German but only through the immanent negation of Schoenberg's clearly moribund *Völkisch* myth of German national identity. Ironically, the rise of nationalist German fascism confirmed the new German identity of these works [/] by attempting to destroy them.

Seeking traditional forms of authenticity in Schoenberg's atonal works, his listeners are forced to look outside the works for historical justification, precisely the thing these works – by being only and exclusively new music – deny. In seeking historical justification thus, his listeners come to a sublime understanding of the immanent historical truth of these incomprehensible works [/] by misunderstanding them.<sup>15</sup> To return to the maxim at the beginning of this chapter, Schoenberg's listeners demonstrate a comprehensive

understanding of how truth can be affirmed through misunderstanding. With uncompromising instinct, they know how the search for free and spontaneous contemplation of music can be turned into the labor of negation. The antinomy immanent here calls to mind that most horrible phrase '*arbeit macht freie*'.

In the twelve-tone works that appear around 1923, Schoenberg attempted to restore the equilibrium of form and content of diatonic tonal music, again by appeal to extreme means. Schoenberg sought to recreate tonal formal tensions between chromatic pitches by ordering them as a tone row.<sup>16</sup> In any tone row, all twelve chromatic pitches must be sounded before any given pitch can be repeated. The order in which each of the twelve chromatic pitches sounds will differ from row to row, however.<sup>17</sup> Each row is understood as part of a row 'matrix', this comprising an original or 'prime' row, with forms related to prime by transposition, inversion, retrogression, and all combinations thereof.

Schoenberg held that a twelve-tone row had an expressive internal kinetics, like that of seven-pitch diatonic tonality. But this is impossible on two accounts. On the one hand, the sheer number of tone rows and their serial variations available to the composer (twelve factorial) creates an expanded [*erweitert*] tonality well beyond the comprehension of the listener. On the other, all the compositional potential of the tone row is contained within the row itself and its forms, and not within a compositional inspiration [*Einfall*] particular to a single work. Any given row can be used in countless works. Once the row is settled on, the composer has nothing more to develop in the way of tonal materials. Their sole task is to place the predetermined pitch successions of the row in such a way as to create a seemingly unique musical object.

For Adorno, the twelve-tone procedure rendered its own historical verdict. By serial abstraction, it obscured any historical record such as that found in the developing material of classical music. In classical tonality the

number and kind of tonalities was determined historically by evolving material constraints (such as tuning and temperament) and by the growth of a bourgeois audience capable of a requisite musical sophistication. By means of its pitch materials (melody, harmony, timbre, and even rhythm) each diatonic work located itself in terms of a historical continuum of developing tonality: thus the difference between Bach and Brahms is evident in the way each composer interprets an evolving musical grammar and syntax according to the materials available and the capacities of their audience.

As noted, however, the formal potential of the twelve-tone row was as good as infinite to the contemporary music listener and thus materially abstract. If a twelve-tone work was subject to historical-material developments, its history was unavailable to its audience. As Adorno put it, such developments were settled on the composer's worktable long before the work met its audience.<sup>18</sup> In summary, the twelve-tone work does not present to the listener an evolving historical relationship linked to concrete musical materials. Instead, the individual work is merely an articulation of an abstract row idea, timelessly absolute in its ontology.

Thus in his twelve-tone music Schoenberg arrived ironically at much the same windowless rooms as he produced in his atonal works. Twelve-tone tonality is present historically in all works in the same way, past, present, and future. Being thus completely abstract, the twelve-tone technique is ahistorical – it destroys material history – much as did the atonal pieces of op 19.<sup>19</sup>

In lieu of contemplating twelve-tone music in the disinterested fashion he preferred, Schoenberg's listeners (those who bothered to listen intently) set to work deciphering the twelve-tone row and its forms, much to the composer's ire. This results in superficial listening, called 'row fetish', where the expert listener counts the row pitches. Ironically, Schoenberg's expert listeners went after the abstract twelve-tone idea, thus abandoning

the individual expressive idea Schoenberg sought to revive after classical music.<sup>20</sup>

Along these abstract lines, Schoenberg's atonal and twelve-tone works are inauthentic art. Contrived in the composer's mind as authentic, they negate authenticity by the very nature of their material, which is indecipherable and lies remote from historical-material relation. Whatever subjective residue lies in the composer's conception of the work is estranged by the opacity of atonality or by the abstraction of the twelve-tone idea. Despite his descriptions thereof, it is as if Schoenberg conceived atonality and the twelve-tone method unwittingly out of the estrangement and abstraction of his own situation. Schoenberg, attempting to immerse himself in the waters of authentic German *Völkisch* nationalism, situated himself on an island just downstream from Robinson Crusoe.

## AUTHENTICALLY INAUTHENTIC

Taking into account Adorno's hinged perspective, we turn now to the term *authentic* [*authentisch* or more often *eigentlich*] and its antonym *inauthentic* [*nicht authentisch* or *uneigentlich*] as they might apply to Adorno's music criticism. At the heart of bourgeois musical aesthetics lies an ideal notion of authenticity, that a work of music is the concrete and particular realization of abstract and eternal musical verities.

Lydia Goehr has described the museum-like institutions this produced, notably the *Werktreue* concept. Therein she describes the mindset of musical romanticism: 'Composers enjoyed describing themselves and each other as divinely inspired creators – even as God like – whose sole task was to objectify in music something unique and personal and to express something transcendent. Bizet described Beethoven not as human, but as a God' (1992: 208). From this perspective, an authentic composer, such as Beethoven, has both a special insight into eternal musical

truths and the capacity to realize such truths in characteristically individual forms. Schoenberg is an exceptionally forceful exponent of such authenticity, the details of which are worked out in the essay collection *Style and Idea*, in particular the essay 'New Music, Outmoded Music, Style and Idea'.

I myself consider the totality of a piece as the *idea*: the idea which its composer wanted to present.... *An idea can never perish*.... One thinks only for the sake of one's idea.... An idea is born; it must be moulded, formulated, developed, carried through and pursued to its very end. Because there is only 'l'art pour l'art', art for the sake of art alone. (1975: 122–4, emphasis in original)

In the context of musical modernism, the traditional concept of *authentic* – the notion of a pure musical verity – carries with it the antonym *inauthentic*. To a modern musical sensibility – either reactionary (Schenker, Pfitzner) or progressive (Busoni, Ives) – life has lost its state of grace. Without grace, music is an inauthentic expression of humanity. Schoenberg, in this regard, is not a modern – neither reactionary, nor progressive. He firmly believes in the possibility of a modern authentic grace, the possibility of a concord between an eternal musical idea and its concrete representation as singular musical *Gedanke*.

Nor is Adorno strictly a musical modern. The very notions of an authentic musical state of grace and its demise would be highly suspect to him. Instead the contradictions immanent in a concept of musical grace will emerge as a negating concord – a second authenticity. If there is a singular musical *Gedanke* to Adorno's aesthetic, it is the idea that musical authenticity is possible only as the negation of musical authenticity. Thus he can say of Mahler:

[I]t is only in the moment of inauthenticity [*des Uneigentlichen*] that the lie of authenticity unmask[s], and Mahler has his truth [*Wahrheit*].... From inauthenticity the irreplaceable essence is distilled – a meaning that would remain absent if the particular were to be entirely and genuinely identical with itself. Objectively Mahler's music

knows, and expresses the knowledge, that unity is attained not in spite of disjunction, but only through it. (1992: 32–3, translation altered)

The basis for this is a fundamental ontological insight, derived of Heidegger's reflections on death, of which only a glimpse is to be had from the following:

For the ontologist, whole-being cannot be the unity of the whole content of real life but, qualitatively, must be a third thing; and thus unity will not be sought in life as something harmonious, articulated, and continuous in itself, but will be sought at that point which delimits life and annihilates it, along with its wholeness. (1973a, 146)

From this perspective, music criticism involves three states. The first is the bourgeois state of authenticity exemplified by Schoenberg. The listener is presented with an authentic object for leisured contemplation. The second is a state of negation produced when bourgeois musical idealism meets the realities of class difference arising under the aegis of developing capitalism. Such a state is made readily apparent to the average listener the moment a work of Schoenberg is played. The third is a state of critical recognition. It prizes bourgeois music as a vehicle for the understanding that bourgeois truths do not understand themselves: '*True thoughts [being] those alone which do not understand themselves*'.

Adorno's first task is to reveal the negation implicit in the traditional concept of musical authenticity, and thereby to reveal such authenticity as inauthentic. He does so, for example, by questioning the fundamental nature of musical reception: given that the composer does their work authentically, then there should be nothing left for the bourgeois listener to do but listen. As Adorno notes in Schoenberg's case, however, the listener must 'work for their leisure'. Since it involves the collaboration of the listener, this renders the work of the composer as inauthentic, as fragmentary and thus false.

Through negation, Adorno produces a second state, an ironic critical perspective,

a critique of the falsehood implicit in bourgeois authenticity: 'You came here to be entertained, but, hah! Herr Schoenberg put you to work!' Were Adorno to stop here, he might be called merely a good ironist, seated comfortably on the balcony of Lukács' Grand Hotel Abyss, mocking the straights.

But there is a *telos* to Adorno's music criticism, a truly critical approach to music. Music is not merely ironic; it is a symptom of the broad malaise of labor and leisure in modern capitalism, the symptoms of which are not readily available even to the most technically advanced bourgeois mind. By means of music, the parlous state of truth in modern capitalism can be understood by critical thought, albeit negatively.

In essence, Adorno's ultimate task is the constitution of a third, critical state of musical analysis, coming after bourgeois authenticity and its negation. His aim is to describe a new musical authenticity, a fully critical vision of music under capitalism in all its variety, with which to replace the naïve authenticity of bourgeois musical aesthetics. Such a vision would become the point of departure for praxis – an authentically critical musical situation (and thus an exit from Lukács' famous balcony).

Recall our initial hinged quotation: 'True thoughts alone [/] do not understand themselves'. The definition of *authenticity* with which Adorno closes his *Philosophy of New Music* is written in much the same key: 'Perhaps that art alone would be authentic that would be [/] liberated from the idea of authenticity itself, of being thus and not otherwise' (2006: 158). In essence, every authentic construction in music will produce its own reversal. Every authentic construction will become thus inauthentic – 'liberated from the idea of authenticity'. Expressed in terms of antonyms, every authentic work will become liberated from itself by first becoming inauthentic.<sup>21</sup>

From this perspective, Schoenberg's music is an authentic representation of its time. It is not authentic in the composer's naïve

bourgeois terms. Instead, its authenticity is produced in spite of and by that selfsame naïve conception. It negates Schoenberg's idealist and timeless naïvety. *True thoughts are those alone which do not understand themselves*: the truth of Schoenberg's music lies in its revolutionary capacity to not understand itself.

This concept of a dialectically transformed authenticity, an authentic inauthenticity, is key to the theoretical framework adopted here, but it owes a debt to Max Paddison's chapter 'Authenticity and Failure in Adorno's Aesthetics of Music', in the *Cambridge Companion to Adorno* (2004). In the context of Adorno's music criticism, Paddison arrives at a revision of *authentic* as *inauthentic*, as authenticity reestablished after negation.

For Paddison, the pre-modern authentic is based upon the idea of a real and original musical work, a unique entity along Adorno's lines of 'being thus and not otherwise'. The principal condition for 'being thus and not otherwise' is autonomy in intent and in practice: the authentic artwork exists in-and-of-itself.<sup>22</sup> Being absolutely self-contained (*l'art pour l'art* as Schoenberg states), it is thus authoritative. Beethoven is an authentic and authoritative composer producing works that cannot be otherwise, a blend of *urtext* and genius. In this regard, he and others like him are held by bourgeois musicology to be fundamentally timeless, noumenal, directly in touch with truth.

To this definition, Paddison adds the caveat *failure*, and his definition of *authentic* begins a slow pirouette toward the *inauthentic* as if around a hinge. The inauthentic is produced by contrivance and fakery, and by external determinants, not by an original creative impulse. Thus it is a counterfeit, and lacking unique identity, it is capable of mass reproduction (2004: 201).

The consistency of artworks is the aspect that enables them to share in the truth, [/] but it also implicates them in falsehood (Adorno, 1976: 242, cited in Paddison, 2004: 211).

And:

At this level the consistency of the work and its integrated totality, its truth and authenticity, put forward initially as universal principles, are seen as false, as illusory, as *inauthentic*. (2004: 211)

Paddison reckons this new, second stage, inauthentic paradigm as ‘after Auschwitz’. Thus it is by nature reflective, measuring everything by that most horrific watermark, the high tide of Nazi fascism.

His second stage, however, contains within it a new credential. After Auschwitz, truly authentic musical works bear both the responsibility for and the scars of past terrors. Thus they are historic, conditioned by the past. Being historic in this reflective sense, their inauthenticity would compromise the fundamentally non-historical nature of the bourgeois musical authentic. (As Adorno puts it, in *The Jargon of Authenticity*: ‘Yet history does intrude on every word and withholds each word from the recovery of some alleged original meaning, that meaning which the jargon is always trying to track down’ [1973a: 8].) Thus authenticity surrenders all claims to rising above the whiles of history: ‘After Auschwitz, the authentic works are the failures ... “the authentic artists of the present are those in whose works there shudders the aftershock of the most extreme terror”’ (Paddison, 2004: 199, citing Adorno, 1998b: 48). To reiterate, this is a reflexive hinge: after Auschwitz, any truly authentic artwork [/] must fail to be authentic in the old way. Branded by Auschwitz, no work thereafter is authentically unique. All works are but variations upon extreme terror, a music in which the same shockwaves still reverberate. As our epigraph suggests, National Socialism sought to reduce the effects of these shockwaves by racial ‘harmonization’ and the evolutionary elimination of dissonant elements.

Paddison puts this in broad perspective. In customary usage in bourgeois music criticism, *authentic* implies both a singular purity and a correspondence. The authentic artwork must correspond to a true and unique identity,

thus be true to itself (reflexive), while being true to a pure and immutable musical idea (and thus be refractive). To the bourgeois musicological mind, the inauthentic work, on the other hand, will distort its relation to self, through mass reproduction for instance, or distort its origins, by appeal to the extra-musical. The inauthentic work will serve a false master – as mere ‘style’ without direct relation to idea (in Schoenberg’s sense) or as a commercial success, a ‘sell out’, a sop to convention. The measure of authenticity in a musical work is thus solely an internal, purely musical thing (*l’art pour l’art*), a unique correspondence refracting some eternal musical idea. Thus any material – harmony, rhythm, tonality – will be suitable for art, as long as an authentic correspondence to some ultimate and ideal true identity (‘being for itself’) is observed.

Adorno, however, holds that a composer is not free to choose the material of a work without some regard to historical appropriateness. Instead the work will refract the material condition of the world in its content and materials. Paddison puts it thus: ‘Adorno’s position was that the composer’s choice was severely limited by the historical stage reached by the material and ... not all possibilities were actually made available. Indeed, he insisted that the material itself made historical demands on the composer to which the composer had no choice but to respond’ (2004: 205).

Both the work and the process of selection will show the nature and limitations of the composer’s consciousness. Even the most technically progressive composer – Schoenberg being Adorno’s example – will sport a regressive consciousness, should they choose to ignore material history.

This puts the onus on the critical listener to discern the hinged authenticity of the musical material. As Paddison puts it:

Authenticity for Adorno is therefore also associated with a modernist, fractured relationship between the individual and the social, the internal structure of the artwork and the external conditions with which it functions, a relationship which

imputes a high degree of self-consciousness and self-reflexivity to the work of art at a structural, technical level. (2004: 199)

He places this under the rubric ‘ideological’: ‘The ideological moment of all art can also be seen as “authentic”, in that it acts as a critical commentary on the real material relations of society, whether it wishes it or not’ (2004: 211). At the heart of his reading is a dual state – authentic, and ideological:

What this reading attempts to clarify is a complex problem in Adorno’s aesthetics: that the autonomous, individual work of art can be simultaneously ideological (i.e. a manifestation of false consciousness, illusion, self-deception) and authentic (in the sense of being a form of critical cognition, of critical reflection). Adorno formulates the problem thus:

The fact that society ‘appears’ in works of art both in an ideological and a critical manner is apt to lead to historico-philosophical mystification. Speculative thought is easily duped into thinking there is a pre-established harmony between society and works of art, courtesy of world spirit. Their true relationship is different, however. (2004: 215–16, citing Adorno, 1984: 335)

The reversal of authentic as inauthentic is more than ideology, however. It has a fundamental ontic quality, one with direct implications for Adorno’s music reception. The material nature of every musical work, certainly in late capitalism, is founded on a hinge-like reversal that brings together authenticity and its opposite in a synthetic antagonism, so as to produce a third state, that of authentic inauthenticity.

The authenticity of a musical work as a bourgeois absolute, in-and-of-itself, is joined in hinge-like fashion with its inauthentic antipode, the work’s material nature as shaped by external, historical factors. The combination of the two creates a hinged synthesis, a negative dialectic. We might express it thus:

Authentic works of music appear as absolute and thus self-contained shapes [*Gestalten*] that realize eternal musical verities [*Gedanken*]. [I] But in doing so, they express their precise historical moment by suppressing their history and material basis.

Or with a greater simplicity:

The only truly authentic work of music is based upon the traditional concept of musical authenticity [I] framed by the material inauthenticity of modern musical history.

‘After Auschwitz’, or simply in the climate of material modernism, to produce an artistic thing in-and-of-itself, as Schoenberg thought to do, would be inauthentic. To produce, however, a modernist artwork that fails necessarily ‘after Auschwitz’ would be an antinomic success – *authentically inauthentic*. According to Adorno, this is what Schoenberg did, in spite of his best intentions. Responding to the need for fresh musical works shaped by the material necessities of music in late capitalism, Schoenberg produced rationally authentic atonal and twelve-tone works, [I] whose authenticity could not be rationally deciphered with reference to historical material terms. Schoenberg’s works are truths known by estrangement from themselves. Adorno sets the mark thus, in the broadest terms possible (not simply for music):

As the thinker immerses himself in what faces him to begin with, in the concept, and as he perceives its immanently antinomial character, he clings to the idea of something beyond contradiction. Antithesis of thought to whatever is heterogeneous to thought is reproduced in thought itself, as its immanent contradiction. (1973b: 146)

## LATE BEETHOVEN

The essays ‘*Missa Solemnis*, Alienated Masterpiece’ and ‘Late Style in Beethoven’ are perhaps the most opaque of Adorno’s writings on music.<sup>23</sup> Our aim here is to apply the theoretical framework proposed in this chapter – Adorno’s hinge-like constructions linked to the tri-partite scheme of authenticity – to their elucidation. In essence, Adorno argues that late Beethoven derives a critical authenticity from the renunciation of bourgeois musical subjectivity. This is done in

hinge-like fashion: using all the compositional means available to him as the master of subjective expression in music, [/] Beethoven renounces musical subjectivity.

To understand the late period, we must revise the customary appreciation accorded Beethoven's middle-period music. The middle-period works are received customarily as the exemplars of authentic classical music. They were understood as such in their day, and continue to be so. The late-period renunciation of subjectivity in Beethoven would appear contradictory, then. To the bourgeois mind, middle-period Beethoven is the very apex of the rising individual musical subject. His accomplishment is a classical *Parnassus* achieved by way of Bach, Haydn, and Mozart. The middle-period works elicit the rubrics of 'absolute', 'Romantic', and 'psychological'. Referred to as 'heroic', they connote a singular and thus subjective courage in the face of adversity. Beethoven's middle-period symphonies in particular affirm the capacity to express the absolute self as Romantic subject matter.

The middle-period works, however, support a class that distinguishes itself by myths of absolute disinterest and the subjectivity of superior intelligence, and which claims as its just rewards the accumulation of capital at the expense of the laboring class. Middle-period Beethoven is inauthentic in this regard. It is neither absolute nor authentically subjective. Instead, it expresses middle-class subjectivity. It serves as a vehicle for class division and the reinforcement of the bourgeoisie. Seen in this light, it is music applied to the goal of class division. And as applied music, it negates those absolute pretensions it would pretend to espouse.

Adorno saw this uncritical perspective as dependent upon a spurious conception of totality, the 'affirmative element' in the middle period. The unqualified affirmation of Beethoven's oeuvre negates the historical material fact: middle-period Beethoven is bourgeois music through and through. Drawing on Rose Rosengard Subotnik's

work (1991), I noted Adorno's suspicions in this regard:

Classicism is a deception. Adorno calls it the 'self-deception of totality'.... Only the works of the late style are truly objective: 'Beethoven's last works are *the* objective answer'. Beethoven's middle-period work is a manufactured falsehood.... For Adorno the late style responds to a suspicion sown by mediation: 'To the musical experience of the late Beethoven the unity of subjectivity and objectivity, the roundedness of the successful symphony, the totality arising from the motion of all particulars, in short, that which gives the works of his middle period their authenticity, must have become suspect'. As Adorno puts it: 'He saw through the classic as classicism. He rebelled against the affirmative element, the uncritical approbation of Being, inherent in the idea of the classical symphony.... He must have felt the untruth in the highest aspirations of classicist music: that the quintessence ... is positivity itself'. (Dineen, 2011: 65–6)

From Adorno's perspective, Beethoven's middle period is inauthentic, a contrived representation of synthetic unity. In the late works, however, Beethoven defines his subjective musical will [/] as the power to destroy this inauthentic musical subjectivity.

The opaque quality of the late works responds to the inauthenticity of the middle-period style. Lengthy sonata forms, expressive melodies, expanded tonalities – the late quartets and sonatas carry forth the innovations that lend the middle period its veneer of radical subjectivity. But the late works – the *Missa Solemnis* in particular – take up this radical content in such a manner as to show the middle period's conventional foundations, as conventionally bourgeois.<sup>24</sup>

In its current, uncritical state, musicological criticism misses the real issue by referring to the late style works as enigmatic. From a material class perspective their meaning as works of material musical criticism could not be clearer. They fight against the pigeonhole the bourgeois critic would place them in – as middle-period heroism transformed into bathos. The enigma here lies not with the music but rather resides in the limitations of the critic's mind, given as it is to flights

of fancy fed by an aesthetic of immaculate conception.

Adorno picks up the notion of *understanding* in terms of truth and understanding. Writing about the industry of traditional Beethoven criticism, he says:

After all that has been written above, it might appear that the *Missa* characterized in all its uniqueness, could now be understood. But the dark quality of the work, perceived as such, does not brighten without further analysis. *To understand that one does not understand is the first step toward understanding but is not understanding itself.* (2002: 579)

That is to say, most critics stop after declaring the enigma of the late works. To gain true understanding, they should not fault the work but examine the enigma of their own criticism.

Against the forces of classicization, late Beethoven pushes back by exploding musical subjectivity, shattering it into 'shards' as Adorno puts it. Thus Beethoven 'alienates' music from bourgeois thought. In doing so, the late works, notably the *Missa Solemnis* (called an 'alienated masterpiece' by Adorno), create authenticity afresh, but in the form of a critique of the inauthenticity fundamental to bourgeois music making. The authentic critique of subjectivity therein is an enigma to the bourgeois mind, a cul-de-sac from which there is no egress by means of bourgeois consciousness. (This included Beethoven's consciousness. Despite renouncing subjectivity through all the musical means available, Beethoven, as bourgeois subjectivity's greatest exponent, could not pass the threshold of conscious renunciation.)

Certain ideas presented in the '*Missa*' and 'Late Style' essays are familiar to us, such as the notion of extraordinary musical labor, of effort expended on the part of the listener. In light of late Beethoven, we can see these ideas as elements in the renunciation of an inauthentic subjectivity. Thus Adorno refers to the critic Kretzschmar's 'chief difficulty' with the *Missa* 'with reference to the large

number of short musical images which require the listener to organize them into a unity'. As Adorno put it, Kretzschmar was 'at least' onto something: 'Kretzschmar has at least named one of the alienating symptoms which the *Missa* exhibits' (2002: 571). The *Missa* moves in a direction that will lead to Schoenberg's twelve-tone music, toward making the listener's labor a fundamental part of the musical commodity. Thereby, bourgeois listeners are alienated from the musical work (or challenged to surrender their bourgeois subjectivity).

At the heart of our attempt to elucidate Adorno's late-style essays lie three essential ideas framed in three enigmatic quotations. While not rife with hinged constructions, the very thoughts themselves are of a hinge-like quality.

Adorno prefaces the first of these passages with the following: 'The human idea asserts itself ... only by virtue of convulsive, mythic denial [/] of the mythical abyss' (2002: 577). For Adorno, the late style denies the abyss created by bourgeois subjectivity, an abyss carried out to mythical proportions (the grand heroism of the symphonies) so as to obscure its falsehoods. The inauthenticity of such an abyss as false heroism cannot be denied by simple, rational argument. In order to destroy the bourgeois myths of music, Beethoven must create an opposing vehicle of comparable mythical proportion while using bourgeois technical means. This presupposes an 'indifference' in technique – as if the bourgeois techniques of musical composition were to be stripped of their class purposes, while retaining their technical basis. Adorno establishes a notion of grand mythic proportion in classical music, the approach to an infinite nothingness through extreme compression.

In its aesthetic form the work asks what and how one may sing of the absolute without deceit, and because of this, there occurs that compression which alienates it [the work] and causes it to approach incomprehensibility. This is so perhaps because the question which it asks itself refuses

even musically the valid answer. The subject then remains exiled in its finiteness. The objective cosmos can no longer be imagined as an obligatory construct. Thus the *Missa* balances on point of indifference which approaches nothingness. (2002: 578)

Here Adorno refers to an 'absolute' forced into exile by the finite nature of bourgeois objectivity. If there was an authentic absolute in music, it has been exiled, sequestered, pushed to one side by false representation. The absolute, like truth, cannot be known except as that which one cannot know, given the limitations of one's class consciousness. As a good bourgeois, one cannot pretend simply to 'sing about' such an absolute without raising charges of deceit. By simply singing – addressing the absolute in contrived bourgeois terms – one would attempt to mask its incomprehensibility, and thus fail the untruth in the work's truth.

To such false bourgeois representations of the absolute, the *Missa* is 'indifferent', says Adorno. The *Missa* acknowledges such representations, but treats them as spurious, as flawed, not worth countenancing except by distancing oneself from them.

The subject of the *Missa*, then, is the mythical failure of bourgeois musical thought. The latter is worthy only of indifference, of getting over it, *ita missa est*. As Adorno says: 'Unity transcends into the fragmentary.... The gap between both becomes obvious and makes the impossibility of aesthetic harmony into the aesthetic content of the work; makes failure of aesthetic harmony [/] in a highest sense a means of success' (2002: 581).

To know true freedom, the musical subject gives up its autonomy in favor of 'heteronomy', as Adorno calls it. Only by freely alienating itself from subjectivity – by 'pseudo morphosis' with alienation and alienated forms – will the autonomous subject succeed:

The autonomous subject, that subject which otherwise cannot know itself capable of objectivity, secedes from freedom to heteronomy. Pseudo morphosis to an alienated form, at one with the expression of alienation itself, is supposed to

accomplish what otherwise would be incapable of accomplishment. (2002: 581)

The late works are archaic in a fundamental sense (and not merely by allusion to archaic forms such as fugue, addressed by conventional musicology). They take the middle period in its entirety as their horizon, as the archaic point of reference. And they pose the question: is all bourgeois music archaic, and if so, is music making still possible? Style in late Beethoven (and late Bach as well as Schoenberg) is not forward looking, not concerned with the present, but retrospective. The question is not 'What is possible?' but rather 'What is *still* possible?':

The aesthetically fragile in the *Missa Solemnis*, the denial of conspicuous organization in favor of an almost cuttingly strict question as to what is at all still possible, corresponds in deceptively closed surface to the open fractures which the last quartets demonstrate. The tendency to an archaization which here is still tempered, is shared by the *Missa* with the last style of almost all great composers from Bach to Schoenberg. They have all, as exponents of the bourgeois spirit, reached the limits of that spirit without, however, in the bourgeois world ever being able to climb beyond it on their own. (2002: 581–2)

This critique of the late works runs completely counter to customary musicological thought. Whereas Adorno depends upon historical material frameworks, musicologists customarily address Beethoven's late-style works in terms of subjectivity expressed as 'biography and fate'. As Adorno puts it:

The usual view explains this with the argument that [late works] are products of an uninhibited subjectivity, or, better yet, 'personality', which breaks through the envelope of form to better express itself, transforming harmony into the dissonance of its suffering, and disdaining sensual charms with the sovereign self-assurance of the spirit liberated. In this way, late works are relegated to the outer reaches of art, in the vicinity of document. In fact, studies of the very late Beethoven seldom fail to make reference to biography and fate. It is as if, confronted with the dignity of human death, the theory of art were to divest itself of its rights and abdicate in favor of reality. (2002: 564)

Appeals to biography and fate are extraneous to the actual work of music criticism. Authentic criticism should address the material of the artwork – the historically determined material quality of the artwork, its determinate form. Authentic criticism, however, is displaced by evocations of subjective spirit and suffering.<sup>25</sup>

A similar thread is spun in Adorno's description of Bach's angry devotees and their musico-critical jurisprudence, in the essay 'Bach Defended against His Devotees', in *Prisms* (1967). In the process of defending Bach's music against 'inauthentic' performance, Bach's actual music is set to one side. It is sequestered, as Adorno put it above, in the 'vicinity of the document', the *Gesamtausgabe* or grand critical edition which sits like a volume of trial precedents on a lawyer's bookshelf. For his devotees, Bach's music exists solely as a point of reference. Like a set of laws, it is referred to only when broken. It serves solely as a means to determine performance infractions, as leisure turned again into work, the labor of jurisprudence. For the devotee of late-style Beethoven, as described by Adorno, the actual music is likewise set to one side by musicologists. It exists solely as a yardstick to measure reconciliation to impending death – Beethoven's death.

The 'usual view' of *late style* in Beethoven is *ad hominem*: the meaning of the music is determined by the subjective person of the composer. Beethoven was entering the final phase of his life, *ergo* the arcane style of his late works. But if biography were the substance of music criticism, then, as Adorno tells us, 'every notebook of Beethoven's would possess greater significance than the Quartet in C-sharp Minor' (2002: 564).

Rather than reflecting biography and death, the late works and their vaunted style are refractory, bending light away from the subjectivity of the composer. Adorno expresses this as follows, in his customary hinged style:

The power of subjectivity in the late works of art is [/] the irascible gesture with which [subjectivity]

takes leave of the works themselves. It breaks their bonds, not in order to express itself, but in order, expressionless, to cast off the appearance of art. (2002: 566)

The late works do not express bourgeois subjectivity. They are instead the detritus pushed aside by a new heteronomous subjectivity that achieves wholeness by failure. As noted, Adorno called them 'splinters', remnants that express the impossibility of subjectivity under the regimes of capitalism: works are ' – no longer, at this point, an expression of the solitary I, but of the mythical nature of the created being and its fall' (2002: 566).

In summary, Beethoven carried on composing in his late style with all the power and facility of the middle period. In doing so, however, he showed that power and facility for what it had become, a mythical falsehood. Only a technically accomplished bourgeois composer like Beethoven could envision the contradictions of musical subjectivity in bourgeois nineteenth-century Vienna so as to arrive at an authentic material critique of musical subjectivity. In this regard, Beethoven resembles Schoenberg, who, in *Style and Idea*, recounts the following: 'In the army, a superior officer once said to me: "So you are this notorious Schoenberg, then". "Beg to report, sir, yes", I replied. "Nobody wanted to be, someone had to be, so I let it be me"' (1975: 104).

## CONCLUSION

Surely in Adorno's thought, there existed some musical Arcadia, above the tides of negative dialectics. Given a lack of evidence in Adorno's writings, let us posit such a world as a thought experiment. In our Arcadia, veracity is ever dependent upon the awareness of dialectics: every truth is maintained in terms of its provisional opposite in a continual process, as transient intransigence. In this Arcadia, the wind blows freely through the windows and doors of every musical work.

Adorno's world, however, was no Arcadia, but a world filled with fascist terrorism. We often forget how this extended to music.<sup>26</sup> We are tempted to envision the musical object of terrorism to be as forceful and violent as the state itself, thus aggressively loud, assaulting the ears much as police truncheons assault protestors, along the lines of Carl Orff's *Carmina Burana*. As our epigraph suggests, however, the music of the Nazi state was designed not to confront dissent directly, but instead through harmonization. It was to assert a grand racial homogeneity – *Volk* – in response to the fractious Weimar republic. In this regard, its singular adherence to one aesthetic was authentically contrived, as authentically *Völkisch*, as a veracity rooted in the falsehood of a true German people. Musical fascism depended for its force more upon threats to its purity – upon the specter of racial impurity – than on purity itself. But it kept these largely quiet, the specter lurking in the dark, a threat to be drawn out from time to time as a warning. In public, fascism preferred a homogeneous face.

In this way, Nazi Germany lacked any vehicle for discerning immanent negation. Under its oppressive harmony, authenticity could be neither questioned nor verified. The creation of a *Völkisch* culture extended not only to production but also to its laudatory and uncritical reception. Thus, in *The Jargon of Authenticity*, Adorno could speak of 'authentic's talk' and a 'cult of authenticity' (referencing Heidegger) and link it to fascism:

Prior to any consideration of particular content, this language [the jargon of authenticity] moulds thought. As a consequence, that thought accommodates itself to the goal of subordination even where it aspires to resist that goal. The authority of the absolute is overthrown by absolutized authority. Fascism was not simply a conspiracy.... Language provides it with a refuge. Within this refuge a smouldering evil expresses itself as though it were salvation. (1973a: 5)

Surely this was what Adorno bore in mind when speaking of a culture industry, meaning thus an industry of both production and

reception – the two united under the rubrics of *folk* and *race*. Given that Nazi music criticism could not countenance the possibility of an inauthentic aesthetic, there could be no third authentic stage based on an objective assessment of music as cultural-industrial ideology. Such criticism was not allowed in any official Nazi organ.

Musical rooms in Nazi Germany were thus designed without doors or windows, without entrance or egress. And without hinges. Their contents lay firmly sealed behind a façade. A critical musical content was thus rendered inconceivable, either by a grand homogenizing vehicle that silenced criticism from without, or by windows, doors, and walls so thick and immovable that no plaintive cries could penetrate to the mercy of the outside world.

## Notes

- 1 Waldmann, 1939: 18. Translation is this author's.
- 2 'Every poem is music – a determined, persuasive, reliable, enthusiastic, and crafted music', Oliver, 1998: ix.
- 3 Schoenberg's model was Brahms. See the essay 'Brahms the Progressive', in Schoenberg, 1975.
- 4 See Schoenberg, 1967. Schoenberg's principal model is the first eight measures of Beethoven's F Minor Piano Sonata, op. 2, no. 1, which he called the 'sentence form'. But compare the balanced pairing in the familiar 'Frère Jacques, Frère Jacques', followed by 'Dormez-vous, Dormez-vous?', or 'Three blind mice, three blind mice', are paired with 'See how they run, see how they run'.
- 5 Schoenberg's idealism is a constant in all his speculative essays, especially those collected in *Style and Idea* (Schoenberg, 1975, see for example p.132). The late Patricia Carpenter wrote at length in this regard. See her edition of Schoenberg's *Gedanke Manuscript*, with Severine Neff and Charlotte Cross, as Schoenberg, 2006. And see Carpenter, 1984, on Schoenberg and Kant.
- 6 This usage of *hinge* was raised at an Adorno seminar held during the annual meeting of the American Comparative Linguistics Association at Providence, Rhode Island in 2012. I am indebted to Gerhard Richter, among other participants, for helping to sharpen the idea in the seminar's colloquy.
- 7 'Diese Richtung der Begrifflichkeit zu ändern, sie dem Nichtidentischen zuzukehren, ist das Scharnier negativer Dialektik'. Adorno, 1975: 24.

- 8 In this sense, Adorno's musical prose might be called *dissonant*.
- 9 See Adorno, 1996a, and 2002: 51, on Chaplin.
- 10 Citing Hegel, *Jenenser Realphilosophie*, I: 237.
- 11 Compare, for example, *Lectures on Negative Dialectics* (2008) and *Negative Dialectics* (1973b). The former is largely devoid of hinge, while the idiom fills the latter with dissonant music.
- 12 Compare Hardt and Negri (2000): 217, on 'increasingly immaterial forms of affective and intellectual labor power...'
- 13 See Schoenberg, 1975: 173.
- 14 On Schoenberg's relation to politics, see Dineen, 2009.
- 15 See the reference to the 'sublime understanding' of Mahler's jackass in Adorno, 1990: 149, and see Dineen, 2011: 9.
- 16 See the two essays entitled 'Composition with Twelve Tones', in Schoenberg, 1975: 214–49.
- 17 And the pitches of the row can be played individually as a melody, or (in imitation of harmony) they can be combined to sound at the same time.
- 18 See the chapter 'Technique' in Dineen, 2011: 73–101.
- 19 For this reason, Schoenberg introduced antiquated forms such as the gigue and the 'sentence form' into his twelve-tone works. See Spinner, 1960.
- 20 See Schoenberg's riposte to Richard Hill in *Style and Idea* (1975: 213–14).
- 21 The potential this has for redeeming Adorno's oft-disparaged remarks on popular music cannot be explored here, but see Dineen, 2011: 34–49. Compare Adorno, 2002: 71: 'The differences in the reception of 'classical' music and light music no longer have any real significance'.
- 22 Hanslick, 1986 and Clive Bell, 1916 are often taken as a point of reference for this position.
- 23 Both are reproduced in Adorno, 2002. Compare Said, 2006.
- 24 See Said, 2007: 245: 'Beethoven, who stands for the newly triumphant bourgeoisie'.
- 25 Compare Sullivan, 1960.
- 26 See Evans, 2005: 187–218.

# Art, Technology, and Repetition

Marina Vishmidt

## INTRODUCTION

The Frankfurt School's contribution to debates in the politics of cultural production and reception are widely acknowledged as among the most significant in Western Marxist critical theory, often standing in for, if not eclipsing, the whole of their project, especially in the sphere of Anglophone scholarship. This fascination often pivots around issues of art and technology, as the recent edited collection of Walter Benjamin's radio programmes attests.

Deemed particularly indispensable are Theodor W. Adorno's, as well as Adorno and Max Horkheimer's, writings on the 'culture industry'; Adorno's texts on music; and his posthumous *Aesthetic Theory*. The list would also include numerous Walter Benjamin publications, prominently 'The Work of Art in the Age of its Technological Reproducibility', 'Little History of Photography', 'The Author as Producer', and his writings on Baudelaire, the commodity, and urban modernity in

shorter essays and in the extensive research notes for the *Arcades* project. These authors, albeit the best known and most analysed, do not comprise the whole range of critical writing on art and culture by theorists who were associated with the Frankfurt School /Institute for Social Research [Institut für Sozialforschung]. There is Siegfried Kracauer, who focused on film, as well as on Weimar-era popular culture more broadly, and the relation of its characteristic forms and subjectivities to industrialization and inflation, as in the collection of essays titled *The Mass Ornament*. There are also Herbert Marcuse's contributions in *Eros and Civilization* and *The Aesthetic Dimension*. Significant interlocutors included figures such as Karl Korsch, Ernst Jünger, and Alfred Sohn-Rethel, as well as Martin Heidegger – a thinker principally opposed by the majority of the Frankfurt School writers, but whose traces can be found in the thought of Herbert Marcuse, an erstwhile student.

The salient motif that runs through all these writings is an inquiry into the position of art in capitalist social relations. The inquiry takes the shape of a non-dogmatic assessment responsive to social, technical, and historical currents that impact on the ‘aesthetic forces’ and ‘aesthetic relations of production’, in Adorno’s terms. Art is viewed both as exceptional to the prevalent forms of social and economic production, exploitation, and domination in capitalist modernity, and as fully integrated into them, thus tracing a founding contradiction for art as a social form in this historical epoch. Art can be the source of emancipatory drives, albeit ones always exposed to capture by reactionary interests located in the market (Adorno and Horkheimer) or on the spectrum of Fascist politics (Benjamin). The terms of these arguments are elaborated in a complex dialogue with precursors in Western philosophy and philosophical aesthetics such as Kant and Hegel (as well as authors such as Nietzsche and Simmel for Benjamin in particular) but they unfold chiefly within a Marxist problematic, both in terms of categories and the political outlook, and through a dialectical approach carried out both at the level of concept and method.

The three structuring topics of this chapter will be the relationship between art and technology in the work of the Frankfurt School, including the notion of art as itself a type of technology; repetition as a dynamic in the field of art, and as a cultural logic more broadly, with reference to associated notions such as aura, singularity, and reproduction; and the currency of central categories of the critique of political economy, such as use value and exchange value, for the field of artistic production in capitalist society.

## REPETITION AND REPRODUCTION

The set of questions assembled under the category of ‘repetition’ in the research and

publications of the writers associated with the Frankfurt School encompasses subjectivity, fetishism, authenticity, modernity, the commodity, myth, transgression, and innovation. Repetition is viewed as a cultural logic that acts as a bellwether for how the productive forces of monopoly capitalism (the term most often used by Theodor W. Adorno to refer to the historical period elsewhere designated as ‘industrial’, ‘Fordist’, or even ‘late’ capitalism) are reflected, refracted, and stalled in the space of cultural production. For Adorno in particular, the main arena of application for the theme of repetition was the analysis of music, including *Philosophy of New Music*, the notes published as *Towards a Theory of Musical Reproduction*, the essays on jazz, and ‘On the Fetish Character of Music and the Regression of Listening’. These texts deploy arguments around repetition to alternately defend and dismantle hierarchies of ideas around ‘serious’ and ‘light’ music, the commercial and the avant-garde. The essays on jazz in particular have been noted for their rhetorical bravado, with one critic recently noting that this ‘writing is polemical, and not remotely dialectical’ (Ross, 2014). In these texts, Adorno develops a set of preoccupations around repetition as regression, often by juxtaposing what he sees as two strains of innovation in modernist composition represented by Schoenberg and Stravinsky. These two composers are placed in dialectical relation, embodying polarized tendencies in the single context of Western modern music. Schoenberg represents an experimental tendency associated with development, singularity, and appeals to difficulty in listening that evoke a strong subjective response, whereas Stravinsky is an archaizing modernist, dallying with myth and folklore, whose music has the opposite effect of drawing audiences into a fascinated acquiescence to a dramatic but essentially static and unchangeable present. Schoenberg is an exponent of serialism, in which repetition is a technique used to

foster an appreciation of the non-identity of identity – an important concept for Adorno that will be taken up later in the mapping of debates around mimesis and ‘non-similarity’. There is also a historical thesis related to this assessment as, for Adorno, Schoenberg’s progressivism is embodied in the necessity of the twelve-tone technique coming out of previous technical developments in what he calls ‘serious’ (rather than what he sees as the empty marketing term ‘classical’) music, a technique which is adequate to its time. Stravinsky, conversely, by using modern techniques to refashion motifs from popular, folk, dance, as well as modern classical music, anticipates later critical theory diagnoses of the conservatism of postmodernism, inasmuch as his work is deemed to be giving in to mass taste rather than trying to push it further. It thus offers a superficial patina of transgression, dwelling on erotic display, ritualistic violence, and timeless human passions in a work like *The Firebird* ballet. However, the themes are mirrored in the music itself, whose repetitions and permutations negate temporality and development and, for Adorno, end up affirming reactionary patterns in contemporary culture.

Reaction is here understood as an unwitting reproduction of the economic forces consolidating capitalist homogeneity and social brutality at the level of that which is ostensibly supposed to transcend it: culture (and this transcendence he will identify as a crucial part of the ideology it is poised against). Repetition is the main vehicle which embeds reaction in the structure of modern music, habituating listeners to a kind of mythic pseudo-individualization through its address to the real, the everyday, and even the timeless. Moreover, it carries with it a kind of frenetic ‘pseudo-activity’ that Adorno links to the neurotic reflex of repetition compulsion in Freud. Thus, musical restlessness is for Adorno a sign of impotence (in his writing on jazz, which Adorno will blatantly associate with ‘castration’), passivity, and

indeed catatonia: ‘In certain schizophrenics the autonomisation [*Verselbstaendigung*] of the motor apparatus after the collapse of the “I” leads to the unending repetition of gestures and words: one already sees something of this in one overcome by shock. Thus Stravinsky’s shock-music stands under a repetition compulsion, and the compulsion only causes further damage to that which is repeated’ (Adorno, 2006: 178). This de-subjectivation is encountered on a mass scale with the hegemonic popularity of jazz, perhaps the most well-known target of Adorno’s denunciation under the colourful pen name of ‘Hector Rottweiler’, though the limitations of his sample are generally less known, confined as it mostly was to swing and big band standards. Jazz is defined as the sonic equivalent of a fully administered society – it has no history, no variation, no internal logic except that of profit and domination, the mechanical reproduction of a regressive moment and the leisure-time extension of assembly-line rhythms. Its improvisations are shallow, relying on a steady metronomic backbeat, its authenticity spurious, with the traces of African-American grassroots culture subsumed by meretricious white commercialism. Jazz as a stage of expression for modernist individuality and archaic collectivity is equally simulated and emptied out, in Adorno’s view. The syncopated rigidity of technique, however virtuoso, ensures jazz’s ‘perennial sameness’ and encapsulates, for Adorno, the whole problematic of repetition as the cultural logic of stasis and regression under an ever-renewed commodity aesthetic. These are the rudiments of the thesis that will subsequently be elaborated in the ‘Culture Industry as Mass Deception’ chapter of Adorno and Max Horkheimer’s *Dialectic of Enlightenment*, with its verdict of the totalitarian nature of mass-produced or industrialized culture as secured by the ‘element of repetition’, which is the consolidation of the rule of identity over non-identity and the engine of enlightenment’s reversion to myth:

But the more the illusion of magic vanishes, the more implacably repetition, in the guise of regularity, imprisons human beings in the cycle now objectified in the laws of nature, to which they believe they owe their security as free subjects. The principle of immanence, the explanation of every event as repetition, which enlightenment upholds against mythical imagination, is that of myth itself. (Adorno and Horkheimer, 2002: 8)

Repetition plays a rather more complex and productive role in the project of Walter Benjamin, whose writing covers a range of approaches to repetition as a critical idiom, from the studies on Baudelaire and the Parisian arcades as the fulcrum of modernity to the texts on film and photography. Concepts such as phantasmagoria, the ever-same of fashion, and a partial use of eternal recurrence are arguably more heuristic variations of Adorno's suspicion of repetition as central to the logic of commodity fetishism – the ever-new as eternally the same. On the other hand, notions such as 'expertise' (the rational empowerment of workers rather than evidence of technocracy) and the significance of technological reproducibility for the possibility of proletarian (and anti-fascist) aesthetic experience are evidence that for Benjamin repetition came in a variety of forms and served a number of diverse purposes. Repetition in the emancipatory register was closely linked with reproduction for Benjamin. Repetition is a structural and technical aspect of reproduction, which has far-reaching social effects in a system premised on mass production, consumption, and distribution of (cultural) commodities. Reproduction has, at least tendentially, a de-mystifying effect which is, again, at least tendentially (and Benjamin would waver in the strength of his commitment to this tendency) in the service of progressive goals. 'The Work of Art in the Age of its Technological Reproducibility' testifies to this, although several of its premises are already present in the earlier 'Little History of Photography', and it has often been framed as the outpost of a later and more affirmative Cultural Studies approach to mass culture as

a contrasting current of what is portrayed as the Frankfurt School's 'cultural pessimism'. The justice of such a framing will be discussed in the next section, along with a more in-depth outline of the arguments of both 'Work of Art' and 'Little History'. For present purposes, it can be noted that reproducibility is key to Benjamin's analysis of contemporary, technologically based artwork on the basis of its embeddedness in systems of mass distribution, but also to his analysis of how reproduction affects the ontology of the artwork itself. On the one hand, reproductive technologies such as printing, recording, and photography bring the artwork into proximity with the viewer; no longer unique in time and space like the temple relic or the painting in a museum, it 'meets the viewer halfway'. It is indeed the prerogative of the mass public, especially the proletariat, to want to encounter cultural objects at as close a range as possible, on their own terms. On the other hand, the apotheosis of this drive for proximity and proliferation as the dynamic of culture in modernity is the film, the mass medium par excellence, for which reproduction is intrinsic: like photography, film is not just a reproduction system but a medium which is inherently reproducible (there is no such thing as a unique print; the economics of film production mean that many copies have to be produced and shown in many places; finally, film is constructed of many identical stills on a film reel which have to be shown in sequence to produce the illusion of movement). It thus entails the most direct emancipation of the work of art from the cultic value specific to the aura (uniqueness of existence in time and place). Uniqueness and irreproducibility as the hallmark of the aura – which can describe natural objects as much as devised ones – have generated much exploration in later projects of critical aesthetics, with art theorists in the 1970s and 80s such as Craig Owens and Douglas Crimp, as well as a number of critically inclined artists, picking up on Benjamin's political arguments in favour of reproducibility in order to dismiss

the relevance of painting and sculpture in favour of more ephemeral and technologically mediated forms such as installation, photography and film. More recently, Fredric Jameson has written on the 'aesthetics of singularity' to discuss how much contemporary art tends towards a horizon of 'eventalization', repeating the priority of time over space that financialized globalization has inscribed on an epochal scale over the neoliberal era. A correspondence is projected here between the unique occurrence in time of event-based contemporary art and the uniqueness of the tailored financial instrument.

Even from this short precis, the difference between Adorno and Benjamin's views on repetition becomes apparent. For Adorno, repetition almost always stands for stasis and reaction, and the analogous term for his use of repetition is 'regression'. In Benjamin's more sanguine view, repetition is more ambiguous, and the accompanying category is 'reproduction', which, especially when it comes to the role of political aesthetics, is on the side of progress, or, more accurately, helps to redefine progress so that it addresses social as well as technological development. The differences come to the fore in a correspondence conducted between the two in 1937 concerning the prospect of the publication of 'The Work of Art' essay in the journal of the Institute for Social Research, which was at the time based in New York in exile from Nazi Germany, while Benjamin was in his own exile in Paris. Published in the *Aesthetics and Politics* anthology, as well as in volumes of selected correspondence, the letters see Adorno taking issue with several points relating to the shared interest in the dialectics of reproduction and repetition. For Benjamin, repetition, replication, and reproduction were all aspects of the socialization of art that heralded the demise of aura, and brought it into the sphere of mass politics as radical culture. A point of ambiguity picked up by Adorno here was that Benjamin's argument that mass reproduction did away with the cult value of art was vitiated somewhat by

the cult value of the commodity, a shift which was plain to see in Hollywood cinema with its glamour, glitz, and fabricated icons. In this light, Benjamin had himself touched on the notion of capitalism as a 'dreamless cult' in the early essay 'Capitalism as Religion'. In summary, the cultural and aesthetic phenomena that Benjamin would endorse as dialectical negations of their analogues in capitalist social relations of production are deemed by Adorno to be neither dialectical or negative enough; for him they are simply extensions of those industrial analogues and their forms of structural violence. This will be picked up from another angle in the following section's discussion of technology. It will be important to note here, however, that Benjamin had another critique of repetition that relied on a less sanguine take on reproduction, one which he shared with his close interlocutor Brecht and which Siegfried Kracauer would also espouse, in a different key. This can be framed shortly as scepticism towards the claim of photography (and, by implication, film) to represent reality – a representation which Benjamin saw rather as the *reification* of reality, as the critique of *Neue Sachlichkeit* (New Objectivity) found in 'The Author as Producer' and 'Little History' evidences. Here we see an artistic technique that ends up confirming reality through its aim to deliver up an unvarnished reflection of it, and thus reconciling the viewer to the elements of that reality, be they shop windows or the abject poverty of urban slums. This is a critique which would be taken up in the 1970s and 1980s by critical realist photographers and writers such as Allan Sekula and Martha Rosler. Further, as Brecht notes and Benjamin agrees, no documentary image of, for example, a factory can tell us much about the dynamics and contradictions of capitalist society. Rather than such neutralizing reproduction, Benjamin cites Brecht, arguing that 'something must in fact be built up, something artificial, posed' at the level of content, while the relations of artistic production must themselves be transformed and socialized.

Common to both Adorno and Benjamin's thinking around repetition and reproduction (as well as regression) is their engagement with the aesthetic-philosophical concept of mimesis. Having its roots in Aristotle's theories of drama and Plato's poetics, the concept of mimesis arrived with Adorno and Benjamin via German Romanticism and played a substantial role in their formulations of the aesthetic, making strong appearances especially in Benjamin's early work such as the essay 'On the Mimetic Faculty' and his habilitation thesis, *The Origin of German Tragic Drama*. It also occurs regularly in Adorno's work, including the late *Aesthetic Theory* and throughout *Dialectic of Enlightenment*. Mimesis refers to nonsensuous similarity, the register of emulation and play which short circuits an instrumental and dominant approach of humans to nature. For Benjamin, magic and proto-sciences such as astrology are mimetic insofar as they discern reflections between the cosmos and aspects of human society and physiology. However, the best example of nonsensuous similarity is language. While mimesis has gradually and inevitably decayed, as we shall see in the next section, it returns anew in the relationship between human societies and their technologies. Perhaps it is more apt to say that the faculty of mimesis has been transformed, and that it is as historical as it is anthropological. Benjamin writes:

'To read what was never written'. Such reading is the most ancient: reading before all languages, from the entrails, the stars, or dances. Later the mediating link of a new kind of reading, of runes and hieroglyphs, came into use. It seems fair to suppose that these were the stages by which the mimetic gift, which was once the foundation of occult practices, gained admittance to writing and language. In this way language may be seen as the highest level of mimetic behaviour. (Benjamin, 1978: 336)

This is a theory of reflection, of cognition as determined by similarities, correspondences, and socially encoded affinities between the very remote and the interior as constitutive of

communication, which is in turn constitutive of subjectivity. Thus repetition is located at the basis of language, and thereby of culture and art as emulations by social individuals of phenomena 'out there'; they strive to understand the phenomena of nature in the act of mimesis by bringing them into the symbolic circle. Adorno's deployment of mimesis, as is typical of his approach generally, is characterized by a more sharply dialectical view. He accepts the account of mimesis as a mode of enacting a nonsensuous similarity that is in contrast to the subordination of nature that confirms the irrational rationality of Enlightenment – the domination and exploitation of internal and external nature by the calculating subject. It is in the artwork that the entanglement of play and domination stages a concept of mimesis as *aesthetic rationality*. Art represents a historical advance towards rationality from its 'dark precursors' in magic and ritual: 'The survival of mimesis, the nonconceptual affinity of the subjectively produced with its unposited other, defines art as a form of knowledge and to that extent as 'rational'. Adorno goes on to append a further dimension to the quasi-anthropological concept of mimesis in his formulation of 'mimicry'. As in the contemporaneous writing of Surrealist and taxonomist Roger Caillois, Adorno takes the apotropaic behaviour of the prey blending in with its environment as a strategy of panic rather than wise adaptation, and extends this to an analysis of fearful conformity both in aesthetics and in social behaviour. If mimesis is (equivocal) play, the Kantian purposiveness without a purpose in the space of art, mimicry is the pathology that invites catastrophe as it tries to ward it off by submission to or identification with its agents. Adorno and Benjamin meet on this second dimension of mimesis, with both glimpsing possibilities in the unmediated identification with the triumph of exchange. This comes across in Benjamin's writing on 'empathy' or 'fellow feeling' [*Einfühlung*] with the commodity or with exchange value: gamblers, financiers,

and crowds at nineteenth-century Great Exhibitions alike learned to identify passionately with exchange value as such, rather than with the useful or sensory elements of commodities. For Adorno, it is art as the 'absolute commodity' which guards the portal to disenchantment and ultimately redemption which the simultaneity of use and exchange in other commodities succeeds in blocking.

'Redemption' is also a key category for Siegfried Kracauer, whose work by 1960 was dedicated to outlining a theory of the 'repetitive art' of film as an important vehicle of realism (as it photographically registers an event which actually happened somewhere, scripted or not) capable of renewing faith in empirical reality (resonating with Gilles Deleuze's later writing on cinema, which argues in similar terms for film as capable of restoring faith in 'the world', albeit in different philosophical terms). However, it is acknowledged that Kracauer's most substantive work on the cultural logic of repetition transpired over three decades earlier, in the Weimar-era essays collected under the title of *The Mass Ornament*. He engaged with the ascendant visualization technologies of photography, film, and mass spectacle, such as the Tiller Girls (geometrically synced formation dance troupe that were Weimar Germany's equivalent to the Rockettes), in terms recognizable to readers of Adorno and Benjamin, appreciating the propensities of the new mass cultural forms both for normalizing stupefaction in the face of spectacle and for closing the coffin lid on the hegemony of elite aesthetics. In a language more immediate and journalistic than either of his Frankfurt School colleagues, Kracauer would similarly note the ubiquity of expertise and seriality, and the progressive potential of distraction as a resubjection of the collective in the experience of the cinema, an argument similar to that of recent theorists of media and attention such as Jonathan Crary, who notes the dual emergence of autonomization and control in the visual technologies of the

nineteenth century. Likewise, Kracauer signalled repetition as the modality suitable for art in a time of industrial production and universal quantification, with the Tiller Girls as strict equivalents (but with an erotic surplus) of factory labour on the after-hours stage: 'The hands in the factory correspond to the legs of the Tiller Girls. Going beyond manual capacities, psychotechnical aptitude tests attempt to calculate dispositions of the soul as well. The mass ornament is the aesthetic reflex of the rationality to which the prevailing economic system aspires'.

## TECHNOLOGY, ART, NATURE

Many of the debates on the role of technology in the corpus of Frankfurt School critical theory have tended to focus on Walter Benjamin's 'The Work of Art in the Age of its Technological Reproducibility'. This is not surprising, if we consider that the text directly engages with the implications of technology for aesthetic and social transformation in a manner rare among the publications associated with this group, and has been one of the most widely circulated and diversely interpreted of all their texts, for reasons relating to its subject but also the history of its publication and appeal to a range of intellectual and artistic constituencies. In what follows, I will recapitulate some of the key themes of the essay before placing it in the context of Benjamin's critical trajectory and in relation to the work of some of his peers and later interlocutors.

'The Work of Art' essay saw its initial publication, after extensive revision, in the Institute for Social Research's *Zeitschrift für Sozialforschung* in 1936, translated into French in the character of a dispatch from Paris, where Benjamin was resident at the time. It was subsequently revised twice, and the third version was the authoritative one until recently when the second version (also from 1936) became more widely available.

This is the version which is now deemed closest to Benjamin's original intention for publication. The essay undertakes a genealogy of the socio-economic position of art through the optic of singularity and multiplicity. Art is seen to evolve from an object of religious ritual, carrying with it 'cult value', to an institution with relative autonomy – hence marked by 'exhibition value' – in the secular, capitalist modern era in the West, finally to emerge as an instrument of political and aesthetic socialization with the rise of cinema and mass media. The primary lens of analysis is the nexus between technological and social progress, secured by the evolution of film as a mass art in the age of mass politics, with both the good (communist) and evil (fascist) dimensions of the phenomenon. Like 'The Author as Producer', the essay is poised to intervene on the side of the anti-Fascist struggle at a time when defeat was already tangible, though not yet as decisive as it was by 1940 when Benjamin wrote the 'Theses on the Concept of History'. Participation in aesthetic experience, made possible by technologies of reproduction, and the participation of the masses in self-determination – the abolition of relations of private property – were seen as inextricably linked. Crucially, such technologically enabled aesthetic experience, centrally film, embraces and to some extent compensates for the corporeal and mental impacts of modern life, with the innumerable shocks and syncopations of urban space and industrial labour. Here appears once more the 'mimetic comportment' that cuts across so much of the critical approaches to the aesthetic in the writers of the Frankfurt School, as Benjamin evokes the cinema of rapid-fire editing and dispassionate observation both evoking and liberating its viewers from assembly lines and aptitude tests. Technology is figured here as a *pharmakon* that inflicts the damage and offers the cure. It reminds the subject that she is not only a passive victim of its rationalizing brutalities but also a consumer and participant in the kinds of democratizing currents the 'kino-eye' of

Soviet cinema or the voices of workers in mass media publications put into reach. Also important here is the positive reading of 'distraction' as opposed to 'identification' as a relationship to the media image, one which Benjamin endorses in terms familiar from Bertolt Brecht's framing of epic theatre.

In the constellation drawn by Benjamin, film is the apex of the irresistible tendency carried by technologies of reproducibility such as lithography, offset printing, and photography since the nineteenth century, and earlier still, with woodcuts, the printing press, and the craft industries of antiquity. Techniques of reproduction act to demystify obsolete but still effective (and to that degree equivocal, if not toxic) concepts in culture such as tradition, eternal value, or creative genius – notions eclipsed by modernity that movements such as Fascism did not hesitate to invigorate in their chthonic political mythologies of greatness and exclusion. Key here is the proliferation of copies which render the original irrelevant. The forgery of an artwork would only reinforce the authority of the original, whereas the original cannot stand up to its mass reproduction, as an image or a recording. Thus all reproductions, regardless of their technical or formal qualities, lack aura, that is, uniqueness in time and space. They hasten the decay of aura and the static and exclusive notions of authenticity, authorship, and property it contains – in Pierre Bourdieu's terms, its class-related 'distinction'. While Benjamin does mention that certain reifications and commodifications can strive to recreate aura, such as the spurious iconicity of film stars, the argument has been made, already in Adorno's response to the text, that Benjamin underrates the extent to which aura is a socio-economic rather than technological artefact – a criticism only borne out by the tremendous expansion of the art market and film industry alike in subsequent decades. However, Benjamin attempts to maintain a dialectical balance between determinism and the speculative in his account, noting the countertendencies of the decline of

the aura, such as industrialization, capitalization, and the mass spectacles that ultimately habituate the popular masses to the 'aesthetic pleasure' of their own destruction in war.

An important aspect of the essay's argument is the discussion of the subjective and psychic layers of technologized aesthetic experience. The factor of 'shocks' has already been noted, with Benjamin pursuing a theme elaborated in his writing on Baudelaire, that of the rupture of perception heralded by the modern city and consumption: 'Technology subjected the human sensorium to a training of a highly complex sort ... There came the day when film corresponded to a new and urgent need for stimulation. This shock-like perception comes into play as a formal principle in film' (Benjamin, 2007: 175). Here we encounter a consistent theme in Benjamin's analysis, that of the historical character of the human sensorium, an idea which emerges in historical materialist thought as 'the *forming* of the five senses is a labour of the entire history of the world down to the present' (Marx, 1974: 96). Another theme, pursued since 'Little History of Photography', is the one of the 'optical unconscious' – the camera's ability to plumb aspects of perception unavailable to everyday vision, just as psychoanalysis discloses aspects of emotional life normally out of reach for the subject, further demystifying the real. The scientific and medical significance of these technologies of vision rivals its artistic import for Benjamin; nonetheless, he notes the astonishing consequences in 'The Work of Art'. Everyday life appeared claustrophobic before the cinematograph opened it up with its changes of speed and scope:

Our bars and city streets, our offices and furnished rooms, our railroad stations and our factories seemed to close relentlessly around us. Then came film and exploded this prison-world with the dynamite of the split second, so that now we can set off calmly on journeys of adventure among its farflung debris. With the close-up, space expands; with slow motion, movement is extended. (Benjamin, 2002: 117)

To understand what was at stake in 'The Work of Art' essay's hopeful politics of technology, we must attend to a conceptual pairing which scholars such as Esther Leslie have highlighted: Benjamin's formulation of 'first' and 'second' technology (Leslie, 2000: 132–66). Departing from Georg Lukács' influential notion of 'second' nature (the reified social relations mediated by the commodity form), Benjamin proposed that there was a 'first technology', which is instrumental, crafted as it is by humans to control and dominate the forces of nature, and a 'second technology', which is open to historical needs and which would be rather a means of reconciliation between humanity and nature. 'Second technology' is an index of social development, which is to say that humanity may fail to develop the social forms that match the complexity of the technologies at its disposal. The outcome of this misalignment is almost inevitably war, an analysis Benjamin applied to World War I and to the inter-war period of rearmament that preceded the global slaughter of World War II. Central to the notion of second technology as a space of development for human social and affective capacities is the notion of mimesis as a mediating *Spielraum* between human and non-human nature. Leslie argues that the transition between cult object and mass artwork can be mapped onto Benjamin's characterization of the determinism of the first and the contingency of second technology in the concepts of *semblance* and *mimesis*, which Adorno would also develop at some length in his aesthetic theory:

Semblance is the most abstract – but therefore the most ubiquitous – schema of all the magic procedures of the first technology, whereas play is the inexhaustible reservoir of all the experimenting procedures of the second [...] what is lost in the withering of semblance and the decay of the aura in works of art is matched by a huge gain in the scope for play [*Spiel-Raum*]. (2002: 127)

We can thus see that for Benjamin, as for Adorno, there is the imprint of the 'aesthetic

forces of production', which denote at the same time the role of technology in artistic form and the historically mediated development of the senses – the sensory being the original connotation of *aesthesis*. From here, we can move to examine Theodor W. Adorno's engagement with art as a technology. The equation of art with technology makes sense in the first instance insofar as the phrase captures one of Adorno's main parameters for art's domain: the *aesthetic* domination of nature, implying both the violence of form over the material it shapes, and the index of an artwork's adequacy to its period of production. Although the question of technology vis-à-vis the reproduction of the artwork, predominantly as it registers the sphere of music, occurs relatively frequently in Adorno's writing, it is in the unfinished and posthumously published *Aesthetic Theory*, and to an extent in *Dialectic of Enlightenment*, that it is addressed most extensively. For Adorno, partially in dialogue with Benjamin, the aesthetic forces of production could fall out of sync with the general productive forces, but this is because the forces of production in art, though seemingly behind in rationalization and efficiency, are actually ahead in terms of material imagination and experimental scope. For Adorno, this is due to a key tenet of what he defines as materialist aesthetics: the artist embodies the social forces of production without being bound by them due to the specific position in the social *relations* of production occupied by art: 'the artist works as social agent, indifferent to society's own consciousness. He embodies the social forces of production without necessarily being bound by the censorship dictated by the relations of production, which he continually criticizes by following the rigors of his *métier*' (Adorno, 2013: 58). This then marks a certain dissociation between use value and technical development which can be explained in terms of the difference between the relations of production that obtain within and that obtain outside of art – a difference oriented around the respective influence of the subject:

There are historical moments in which forces of production emancipated in art represent a real emancipation that is impeded by the relations of production. Artworks organized by the subject are capable *tant bien que mal* of what a society not organized by a subject does not allow; city planning necessarily lags far behind the planning of a major, purposeless, artwork. (2013: 45)

The subjective content of the aesthetic forces of production, then, is what gives them their edge. This likewise accounts for the degree of modernity of any particular artwork, where modernity measures the adequacy of technical means to the differentiation of experience, not least the *crisis* of this experience (again echoing Benjamin in his diagnosis of the loss of experiential density in modernity). Hence, as Peter Osborne notes in a general discussion of the term, for Adorno 'modernity' is a critical and not a chronological category.

The bulk of the discussion of technology in *Aesthetic Theory*, however, is around the category of 'construction' which mediates the technical and expressive means in the making of any artwork. For Adorno, art has to reckon with advanced technology in its concept and construction, internalizing the challenge of social standards of production in its concept rather than boxing technology in to subject matter. Art has to reckon with the fact that the industrial organization of society penetrates social and subjective, and not just economic, life, thus running counter to all those who would see in the space of art a refuge or recompense for a fully rationalized, administered social world. The current state of the productive forces poses an internal problematic for artistic production, rather than a trivial external parameter confined to the moments of fabrication or exhibition, or an index of fashion to be superficially appropriated. However, Adorno's line on technology's relationship to the artwork is quite distinct from Benjamin's. Whereas Benjamin is interested in how social infrastructures and technical means of production affect one another, and concretely reshape the ontology

of artworks in turn, Adorno is more interested in the prospects technology generates for the autonomous artwork understood as a 'plenipotentiary' for, rather than (as 'The Work of Art' suggests) a practical instrument of, emancipated social experience. For Adorno, in one of his many suggestive (and among his more enigmatic) conceptual turns, the subject itself is a 'congealed technology' which came into use at a certain time and will just as certainly become outmoded. At the same time, this subject cannot be overlooked but must be retained as a dialectical category to be enlisted in the project of its own overcoming, as the introductory pages of *Negative Dialectics* emphasize. Moreover, neither emancipation, particularity, nor indeed aesthetic experience are thinkable without the subject. As Miriam Hansen has written, while for Benjamin, the potential antithesis within the system is generated 'by the internal logic of the productive forces, i.e. technology', for Adorno, it 'rests with the category of the subject, however historically emptied out and ideologically manufactured it may appear' (Hansen, 1982: 92). No less does the subject congeal *as* technology in artworks, by which Adorno means that the more independent of subjective influence an artwork is imagined to be, foremost by its maker (the chance procedures of Surrealism or, more aptly, the aleatory methods of John Cage or Fluxus), the more it evidences, if only in negative imprint, the role of subjective decision. Technology in this way becomes the site of elaboration of the aesthetic forces of production as encounter between the subject, its historical moment, and the artwork: an artwork using the most up-to-date technologies can still be regressive if it adopts a traditionalist stance at the level of its concept.

Picking up on the themes explored above with Benjamin's thesis of first and second technology, as well as the arguments outlined in *Dialectic of Enlightenment*, we see here a concept of technology as a human activity that is not opposed to nature so much as a modality of liberation for both (human and

non-human nature alike), a process that can be unfolded in the laboratory space of art. A liberated technology would be an index of rationality that has overcome its irrational side – domination, exploitation, control – and aims for a reconciliation between humans and nature which the 'purposeless purpose' of the artwork can materialize through subjective experience. In this sense, art is de facto a technology allowing us to envision an emancipated time. Art is bound up with the pressure of domination, both in its mandated control over heterogeneous social and physical materials, and its existence as an alibi for a society of pervasive reification and unfreedom. Yet it mobilizes technique 'in an opposite direction than does domination', in alliance with the undirected space of mimesis which secures art both as play and as a form of (more-than-rational) knowledge. Mimesis acts to distil the opposing forces in art between expression and objectification, conveying the artwork's immanent logic through the density of its technical procedures. Significantly, this is what separates autonomous art absolutely from the culture industry, which uses technology as part of a rationalization process like any other industry – albeit on somewhat diversified, idiosyncratic, and residually entrepreneurial bases – and in this way sacrifices what distinguishes an artwork spiritually, technically, and aesthetically from the rest of social life, truly cementing a totalitarian grasp over the imaginary of capitalist social life, as well as hinting at a deeper moral torpor: 'The idea of "exploiting" the given technical possibilities, of fully utilizing the capacities for aesthetic mass consumption, is part of an economic system which refuses to utilize capacities when it is a question of abolishing hunger' (Adorno and Horkheimer, 2002: 111). By the mid 1960s, however, Adorno would come to a more nuanced assessment of film – one of the lynchpins of the culture industry in earlier texts – with his advocacy of the New German Cinema of his former student Alexander Kluge, among others. This assessment brought him to revise his former

identification of cinema with the heteronomy exerted by technique – the very same reproductive technology that for Benjamin tied the medium inextricably to mass politics, and for Adorno to big business, and was thus a medium bound by the law of value rather than to a self-legislating artistic telos. Adorno proposes, then, that it is possible to see these two dynamics in conflict rather than in fixed hierarchy, as with any other artistic medium. The conflict is mediated by the potential of a dissident cinematic collective (comprising filmmakers and film viewers) which does not approach film as spectacle but as a passage through subjective interiority, closer to ‘imageless thought’ and writing.

## USE AND EXCHANGE

As may have already become evident, Marx’s concepts of ‘use value’ and ‘exchange value’ were highly relevant for the variant of materialist, politicized cultural analysis performed by the Frankfurt School, and these were closely linked, as shown above, with questions of technology as it shaped the forces and relations of aesthetic production. For both Adorno and Benjamin, there is a continuity of interest in ‘empathy with exchange value’ as a sort of productive alienation. For Benjamin, this signifies the forms of ‘training’ undergone by populations in the nineteenth and early twentieth centuries, an era of ascendant imperialism, financialization, and consumerism. Figures such as the flaneur represented the Kantian attitude of disinterest cut with the capitalist subjectivity of detached, ephemeral investment in images, things, and people. The secret pedagogy of this ‘empathy’ is loss of tradition and the sway of social abstraction which tended towards the emergence of a revolutionary proletarian subject, in terms familiar from ‘the Communist Manifesto’ – a radicalizing process of disenchantment, commodity society as a ‘waking dream’ or ‘phantasmagoria’ that must be

critically engaged with and excavated by the radical critic if the dreaming collective is ever to awaken. It prefigures utopia even as it embodies ideology. Adorno viewed this dialectic otherwise, as earlier noted, believing the proletariat to be largely subsumed to the teleologies of work and nation already by the 1930s when the communist movement had been quashed in Germany, and, after the war, bought off by Marshall Plan ideologies of plenty and democracy (a Cold War scenario to which Adorno, as well as the Institute for Social Research, had a complicated relation). He continued to hold out hope for the reconstitution or, more optimistically, transvaluation of the subject in aesthetic experience that resembled empathy with exchange value to the degree that the non-identity offered by the artwork to the viewer was materially based on a type of identity: identity with exchange value. The artwork was principally useless and thus constituted an ‘absolute commodity’. As pure exchange value, then, it helped to demystify the dual nature of the commodity which sustained the fiction that capital was as interested in social use as it was in profit and was thus a benign social system. Both Benjamin and Adorno also had a more prosaic version of ‘empathy with exchange value’, noting how as the commodity economy developed, the price of commodities became the chief fascination for the buyer, whether or not she could ‘afford’ it. The symbolic value of a commodity becomes the source of its fetishism beyond any use or enjoyment its possession could materially bestow, as Adorno notes in an aside on the desirability of expensive concert tickets over any specific performance they might give admission to. Thus all commodities tend to be hollowed-out of any use value and to be filled with consumer desire; not only, and perhaps not even mainly, artworks. As Susan Buck-Morss notes, ‘[I]f the social value (hence the meaning) of commodities is their price, this does not prevent them from being appropriated by consumers as wish images within the emblem books of their private

dreamworld. For this to occur, estrangement of the commodities from their initial meaning as use-values produced by human labor is in fact the prerequisite' (Buck-Morss, 1989: 181). For both Adorno and Benjamin, this estrangement could be progressive insofar as it disclosed the 'real relations' of capitalist social life, as emphasized by Marx in his discussion of the spread of social abstraction. Empathy with the commodity could have radical consequences, though it was Benjamin who would deem empathy with the commodity to be a source of libidinal energy that could be actualized in a revolutionary direction.

Benjamin, however, would develop another vector in his thinking around use and exchange value for the agency of art and literature in social change, a line discernible in the focus on the use value of media infrastructure ('reproduction') for social emancipation in the 'Work of Art' essay, but also in the use value of the artist and intellectual in 'The Author as Producer'. In this essay, originally delivered as a talk at the Institute for the Study of Fascism in Paris in 1934 (and prefigured in contemporaneous essays such as 'The Present Social Situation of the French Writer'), he considers the need for the cultural producer to not just reflect on her position *with regard to* the productive relations of her time, but on where she stands *within* them, that is, how she can use her position to intervene and organize, in the first instance with other cultural workers and then in the relations of production more generally. Any work, no matter how radical in content, sees that content traduced by the all-consuming mechanisms of the market, and any political sentiments, no matter how radical, are traduced by the intellectual's distance from the struggles to which she may seek to lend her critical support. Benjamin wants to hold on to a conception of an intellectual or artist's specific skills and tasks and how these may be used to support social movements (as in Foucault's notion of the 'specific intellectual'), yet at the same time see how they

may be generalized: in the transgression of the social division of labour that separates art and politics, the reification of the useless and useful, theory and practice. Such a division can only serve conservative ends, especially in turbulent moments like Europe between the wars. Moreover, he wants to think about the dialectic between proximity and *estrangement*, as in the work of his friend Bertolt Brecht, who fervently believed theatre had a role to play in the workers' movement. This was not through simply affirming its slogans or programmes, but through working to provoke alienation – the 'estrangement effect' – from bourgeois dogma at the level of stagecraft and actors' behaviour.

For Adorno, however, such an approach as Brecht's was already far too affirmative, instrumentalizing the ontological distance art entertained to the brutal instrumentality of capitalist social life – or what he called its 'negativity' – ending up with an affirmation of use value as conceived and practised in this very life and not opening up a path beyond it. For Adorno, this constituted 'praxisism' – the notion that art or cultural production can and should be useful, for social change if not for society – and supplied the diagnosis Adorno would later use to excoriate Brecht for returning to East Germany after the war and putting his talents at the service of the state, as well as his own students for clamouring to apply the insights of critical theory to revolutionary strategy. In fact, art has to shun any imperatives that do not originate from its own aesthetic logic, even if this paradoxically cements its status as legitimating alibi for the continuing rule of those imperatives: 'Art's asociality is the determinate negation of a determinate society. Certainly through its refusal of society, which is equivalent to sublimation through the law of form, autonomous art makes itself a vehicle of ideology: The society at which it shudders is left in the distance, undisturbed'. Yet, '[t]o evaluate art according to the standard of necessity covertly prolongs the principle of exchange, the philistine's concern for what can be gotten for

it' (Adorno, 2013: 308, 341). Consequently, it was hermetic modern artworks that fully embodied opacity and resistance as key elements of their modernity, such as the plays of Samuel Beckett, the tales of Franz Kafka, or the music of Arnold Schoenberg, which, regardless of their ultimate approbation by the cultural establishment, give insights into the possibility of emancipated subjectivity, if only with the greatest obliquity and ambiguity. For Adorno, the artwork's capacity for figuring social change is entirely immanent to its construction as a work, as a 'windowless monad' that refracts the outside world but in principle denies it. It has virtually less than nothing to do with the relations of production that the artist or writer operates within, as these are *prima facie* irredeemably distorted by the constraints of the market or the state. The role of the artwork is rather to hold on to and exacerbate the antagonism between its vision of society, and subjectivity, as it could be, and what it really was. 'If artworks are in fact absolute commodities in that they are a social product that has rejected every semblance of existing for society, a semblance to which commodities otherwise urgently cling, the determining relation of production, the commodity form, enters the artwork equally with the social force of production and the antagonism between the two' (2013: 321). This summarizes Adorno's understanding of how the artwork occupies a conflictual space between autonomy and heteronomy. Far from the conservative notion of artistic autonomy – 'art for art's sake' – this is an idea of autonomy produced by and thoroughly steeped in heteronomy, that is, the socially effective, determinate form of value: exchange. Exchange value is the dominant force on both sides, yet spirit has more room to move in the thoroughly fetishized space of the artwork without an atom of use value to conciliate it.

In sum, the question of value in the work of the Frankfurt School authors was frequently read through how the patterns of mass industrial production in the era of

monopoly capitalism would extend to culture, just as they nourished the cultivated individual subject in the nineteenth-century age of liberal capitalism. For Adorno, notably, the analysis of art's value relations would be deeper and more comprehensive, touching on the ontological relationship between the form of art and the form of value. Yet his cultural analysis is more widely canvassed than his aesthetic theory, given its more 'accessible' and programmatic character – and just as often dismissed for those reasons, with much of the dialectical force of that work left aside. We can note the striking correspondence between Adorno and Horkheimer's analysis of the culture industry as the analogue of factory production in the realm of the spirit and Kracauer's discussion in *The Mass Ornament*, where value production is shown to be its own end both for corporations and for the large-scale enterprise of commercial culture. It is autotelic, not in the sense of autonomous art or 'art for art's sake' but in the sense of profit for profit's sake. Like a corporation, mass cultural spectacles are thoroughly integrated in all their functions but without any grasp of a purpose beyond themselves, and this comes to describe the whole of late-capitalist social organization:

Like the mass ornament, the capitalist production process is an end in itself. The commodities that it spews forth are not actually produced to be possessed; rather, they are made for the sake of a profit that knows no limit. [...] Everyone does his or her task on the conveyor belt, performing a partial function without grasping the totality. Like the pattern in the stadium, the organization stands above the masses, a monstrous figure whose creator withdraws it from the eyes of its bearers, and barely even observes it himself. (Kracauer, 1995: 78)

## CONCLUSION

The conceptual constellations that have been sketched in this chapter around the terms art, repetition, technology, use value, and exchange value hold layers of nuance and

lines of resonance with other concepts in the work of the Frankfurt School authors which it has been possible to indicate if not exhaustively describe here. The interested reader can refer to other chapters in this Volume to find further material on those points, and ones which may, no doubt, be framed through other perspectives and scholarly inquiries. The conclusion will thus indicate some perspectives and philosophical projects that resonate with the conceptual constellations of Adorno, Benjamin, and Kracauer, sketched above. These thinkers also remain prominent influences for practitioners who want to develop rich and dialectically reflected lines of opposition in the often all too affirmative bounds of contemporary culture, and contemporary art in particular. A well-known figure who has framed his project in archetypally Adornian terms is the United States artist, activist, writer, and publisher Paul Chan, who attempts to think through the conditions of artistic practice under current social and political conditions in terms both uncannily familiar to Adorno's hypotheses in *Aesthetic Theory*, and ones filtered through the intervening years of postmodernism and notions of the technological sublime. A typical dialectical reflection might read, 'Objective forces manifest in art today as subjective acts without an actual subjectivity, to express the power of inhumanity to define what is most human' (Chan, 2009). We could also consider the return to questions of reproduction and reproductive labour in feminist discourses manifesting in the spaces of politics, art, and the academy which can echo Benjamin's valorization of reproduction over uniqueness, its challenge to the sovereignty of the auratic art object, and its 'exhibition value' in favour of the impure, the derived, the everyday, and the invisible, albeit with an emphasis on questions of gender and race which were not explicitly within Benjamin's purview. Likewise, questions around use value in contemporary art, explored by theorists and exponents of 'social practice' and 'useful art' such as

Grant Kester, Shannon Jackson, Stephen Wright, and Tania Bruguera, while leaving something to be desired in terms of the dialectical complexity which attended Benjamin's optimism, espouse the idea that art can exceed its institutional bounds (including its in-house habits of institutional critique) and become a technique in the building of social movements and community bonds – an approach very much reliant on the 'mass reproduction' of images and information afforded by digital media.

Wider theoretical and political resonances are also of interest. We can map, for example, Benjamin's speculative approach to repetition onto Gilles Deleuze's writing on 'difference and repetition'; or the evocative concept of 'aura' onto Derrida's notion of the metaphysics of presence. The idea of 'art as a techology' can be articulated with Foucault's theories of social institutions and discourses as operational forces, or 'technologies'. The sovereignty of art's autonomy – from use – in Adorno's aesthetics echoes intriguingly Bataille's 'base materialism' (the sovereignty of the useless and discarded), which itself converges with Benjamin's 'ragpicker' technique in the *Arcades* project of mining the bygone and outmoded for the revolutionary sparks that may yet be contained there. Similarly, we can pick up on Benjamin and Kracauer's guarded approval of mass forms of cultural reproduction insofar as they are fatal to the mystifications of 'auratic art', and focus it on the role of 'reproductive labour' in breaking down the mystique of (also artistic) production from a feminist standpoint. From there, we can also connect to the renewed debates around 'usefulness' in contemporary artistic practice in light of shifts in forms of support and experience driven by wider social dynamics such as global economic austerity and the pervasiveness of the digital. Finally, the proximity between mimesis, second nature, and Benjamin's writing on first and second technology have found a lively echo in recent debates between scholars such as Jasper Bernes (*Endnotes*) and

Alberto Toscano, which coalesce around the question of the role of present-day technologies in a communist future. There are myriad strategic no less than political dimensions to such questions, and the prismatic materialism of Frankfurt School critical theory has much to tell us as we again face a darkening social horizon.

# On Ideology, Aesthetics, and Critique

Owen Hulatt

## INTRODUCTION

This essay examines the connection between art, ideology, and pathologies of reason. And this in itself requires justification – why think that there is a connection between such radically disparate domains? For critical theory, of course, these domains are not simply connected, but deeply interrelated in such a way that they mutually determine one another. Indeed, for one significant strand of critical theory the artwork is a means of criticizing ideology, and for revealing deep-seated misdevelopments and pathologies in our form of reason and society. Much ink has been spilled on the specific claims which have been advanced regarding these interconnections and artwork-based critiques, with special reference to the work of Walter Benjamin, Ernst Bloch, Georg Lukács, and, above all, Theodor Adorno. But, in this chapter, I am less concerned with these writers' specific claims than with the idea that is their precondition – that art can be critical at all.

Why has critical theory, at least in its first generation, been so enamoured with this idea? Is it cogent? And is it still applicable today? I will focus on the work of Theodor Adorno, whose work on aesthetics far surpasses that of his contemporaries in depth, complexity, and ambition. Many of the issues we will find in his work will be of importance to other writers of his time who made use of similar interpretive strategies, but I cannot here pursue these parallels in detail.

## HISTORICAL GROUNDS

Critical theory stands in the lineage of post-Kantian critical philosophy.<sup>1</sup> While we cannot here trace this historical relationship too deeply, a thumbnail sketch is of use in getting to grips with the reasons for Adorno's confidence that art is – in quite literal terms – a source of knowledge and social criticism. To grasp this point, we need to look again at

the puzzle raised above – on what grounds are art, social criticism, ideology, and forms of rationality seen as connected? Why should the latter be able to show up in, and be criticized by, the former?

The philosophical arguments which legitimate seeing these apparently separate conceptual domains as interconnected are complex, and largely stem from a number of features in the critical project more generally. It is far beyond the remit of this chapter to lay out this history in full, but an incomplete narrative can be given.<sup>2</sup> For one strand of post-Kantianism, increasing emphasis was given to the determining role of inter-subjective relationships in constituting self-consciousness. Much could be said here about the critical role of Fichte in introducing institutional and inter-subjective content into the transcendental preconditions of experience, but in the context of Adorno's account of art, it is Hegel that provides the most important explanatory link. For Hegel, the categories of one's thought were an expression of an underlying, trans-subjective process, which socio-historically determined the limits and nature of what was thinkable. While reason drew its features – and internal contradictions – from this process, it was not identical to it. And hence, this process – together with its contradictions, its problems, and its potentials – could have a determining influence on other areas of human life besides reason and philosophy itself. In other words, the problems which beleaguered reason were not only present in reason itself; they were reflections of features of the deeper process that structured reason itself. And these features of that deeper process could show up in the other areas of human life which drew on and gave expression to this process. Art was a paradigm case of one of these 'other areas' of human life; and it was art which was seen as, at varying historical points, mirroring, exceeding, or falling behind reason's capability to work through the contradictions of the process which underwrote them both.

For Hegel, then, art and reason both feed into and are fed into by a mutually underlying process. As this process – *Geist* – is a historical, developmental process, the relationship between problems of reason and features of art alters across time. What the artist is capable of doing is firmly constrained by when the artist is working; and the same constraint operating on the artist is at work elsewhere, in determining the possibilities of reason, ethical life, and so on. Hegel's is a *content-centred* aesthetics. *Geist* determines and shows up – to differing levels of explicitness – in the content and form of both art and reason. Accordingly, the various media of *Geist* (art, religion, and philosophy, for example) share the same content, and at different stages in the development of *Geist* they are capable of exceeding each other in their realization of that content. For Hegel, the content of art is thus intrinsically linked to and reflective of extra-aesthetic developments, and deficiencies. And so, the idea that art might interact with problems of genuine importance to philosophy and reason makes immediate sense; both art and reason are immersed in and determined by the same process, and so beset by and able to intervene in the same problems contained within that process.

With Hegel's extension of the critical project, a hermeneutic connection is made between what are, *prima facie*, entirely distinct domains; artistic form, socio-historical content, and rational problematics. And this opened the possibility to see art as a form of knowledge. So, Hegel provides a simple and neat set of structures which can allow for art and social pathologies to be inter-penetrative. There is a subtending process which underlies them both, and which shows up in and determines them. For Hegel, this subtending process is developing – continually improving humanity's comprehension of its own freedom, and progressively clarifying and pacifying the relationship between mind and world. And this process is ultimately more developed in reason than art; for Hegel, art in modernity came to forfeit the developmental

edge of *Geist*, and began to lag behind philosophy and religion.<sup>3</sup> *Geist* is a story of – among other things – increasingly adequate and explicit cognitive relationships between subjects and the objective world; accordingly, while art for a time comes to prominence as the most sophisticated statement and resolution of the goals and problems of *Geist*, it is finally superseded by religion and philosophy, as these goals and problems reach a level of discursive complexity no longer capturable by art, but must be taken up and carried further by reason, which has the conceptual complexity required to carry them further.<sup>4</sup>

Adorno drew on both Hegel and philosophies preoccupied with the notion of a ‘totality’<sup>5</sup> more broadly, and gave them a simple inversion. Suppose art and reason are indeed mutually underpinned by a process, but that – contra Hegel – this process is *agonic*; it does not develop, but degenerates; it does not progressively disclose the world, but rather progressively occludes it. Adorno replaces the metaphysical construct of *Geist* with the post-metaphysical idea of a ‘dialectic of enlightenment’,<sup>6</sup> a deepening crisis in the instrumentalization of reason, and its exclusion of non-abstract facts and experiences. For Adorno, as for Hegel, reason has developed and intensified this background process more than art. But as Adorno’s background process is one of degeneration, Adorno does not see reason as superseding art; reason has rather passed further along the stages of a harmful pathology. It falls to art to serve as a preserver of what is being lost. Art exhibits, but does not merely submit to, the deficiencies and pathologies by which Adorno understands reason to have been increasingly defeated.

Just as Adorno inverts the process/totality optimism found in the sources on which he draws, so too does he invert the idea that concepts and objects fall into a progressively more adequate relationship. Rather, for Adorno, reason increasingly abstracts away from, and hence fails to capture, the objects with which it deals. This

tendency – sometimes referred to by the catch-all term ‘identity thinking’<sup>7</sup> – has ostensibly reached such a pitch that all concepts ineluctably falsify their objects. This sorry state of affairs only compounds the crucial and unique role of art, to which falls the only opportunity to express problems in this underlying process/totality without having this expression falsified by the faulty tools of language and concepts. Art for Adorno comes to occupy an entirely central position; art can express entirely without falsification the ostensible problems with the world, and its form of reason. Art is less distorted by the contradictions of the social totality than reason; art lags behind reason and thereby preserves contact with the world in a way which reason increasingly does not.

In sum, for Adorno the relationship between art and reason is as follows. Both art and reason are informed by, and connected to, an underlying collection of processes (namely, the social totality). These processes are pathological – they are pathological in the sense of being mis-calibrated, tending towards the frustration, rather than realization, of human potential. The pathological nature of these processes finds realization in, among others, social pathologies (the generation of a social whole which tends towards the harm and even elimination of its constitutive members), and in epistemic pathologies (the progressive closing off of proper epistemic access to the world). Adorno’s account of the enabling conditions and origin of this pathology are intricate and complex – it ultimately stems and draws its nature from a move towards instrumentalization and abstraction which finds its origins at the very beginning of human culture.<sup>8</sup> Reason intensifies and succumbs to this pathology; art, by contrast, does not (fully) succumb, and so can critically reflect and make visible the often concealed faultiness of reason and rationality. It falls to art – like philosophy – to *express* rather than discursively *state* the falsity of reason. To *state* the falsity of reason would be to make use of concepts and conceptual

structures – as well as pre-set forms of judgement, inference, and justification – which Adorno claims irrevocably and ineluctably render false all claims and judgements which make use of them. The falsity of reason cannot be stated, then, as such a statement would have to be made via the very concepts and rational processes which have been made pathologically incapable of stating the truth.<sup>9</sup> To *express* the falsity of reason, by contrast, is for a philosophical text or artwork to embody or show the failure of concepts in a way which is not fully capturable in discursive terms. (This curious idea of non-discursive expression is a difficult one to fix; however, we will enter into it in some more detail further below.)

Adorno's account of the relationship between art and knowledge is superlatively complex, depending on an intricate critical picture of various interlocking structures of various types (social, cognitive, conceptual, somatic) and balancing a number of modes of description which are not obviously compatible (including the genealogical, historical, polemical, and musicological). In this respect, Adorno very likely represents the termination of one current in critical philosophy, expanding out the conditions of the possibility of features of human life to the very limits of cogency, embracing and claiming reciprocal causal interrelation between a dizzying array of phenomena and structures. This is responsible for much of the enjoyment and interest which can be found in reading Adorno, as it throws up no end of interesting technical problems in considering the cogency, or possibility, of its underlying structure. I have, however, explored these technical problems in Adorno's account in this way elsewhere.<sup>10</sup> What I would like to do here instead is to consider what Adorno's analysis of art is *for*. Quite beyond technical issues in critical philosophy, we might consider whether Adorno's account of art is true *now*; whether it provides a means of comprehending art's current place in the world and – if not – whether it can be modified to do so.

The primary function of an aesthetic theory – even and especially where it claims aesthetics is intertwined with political and philosophical problems – is to elucidate actual art. Accordingly, we are obliged to examine how things stand with contemporary art, reason, and society. Let us examine whether Adorno's aesthetic theory remains relevant, and remains capable of finding and elucidating an informative connection between art and reason; and whether the structural preconditions for Adorno's claims about the criticality of art still obtain.

## ADORNO'S ACCOUNT OF ART NOW

As Espen Hammer notes in his recent work on Adorno's modernism, Adorno largely had a blind spot for contemporary developments in the visual arts which had already showed signs of the kind of fragmentation which some would term post-modernism.<sup>11</sup> This 'fragmentation' consists in the multiplication and untethering of approaches to artistic construction from pre-set or canonical compositional rules. Adorno, unbeknownst to himself, flags up this blind spot in *Aesthetic Theory*. He writes of Picasso, and his stamping of newspaper fragments into his work:

[Philosophy's] labour of Sisyphus is that it must reflect the untruth and guilt that it takes on itself, thereby correcting it when possible. It cannot paste its ontic substratum into the text; by speaking of it, philosophy already makes it into what it wants to free itself from. Modern art has registered dissatisfaction with this ever since Picasso disrupted his pictures with scraps of newspaper, an act from which all montage derives. The social element is aesthetically done justice in that it is not imitated, which would effectively make it fit for art, but is, rather, injected into art by an act of sabotage.<sup>12</sup>

We see here Adorno's implicit autonomism; the importing of heteronomous material into the artwork can never be imitative, but always abrupt, 'injected ... by an act of sabotage'. Indeed, Adorno takes it that the autonomy of

the artwork strictly prohibits that an artwork explicitly imitates the world external to it. In this way Adorno dispatches any attempt to directly work the heteronomous, and criticism of the heteronomous, into the artwork. It is Adorno's claim that accomplished, successful art is constructed purely along formal lines, a 'windowless monad'<sup>13</sup> which foregoes any simple reflection of the world outside it. Rather, the artwork's criticality stems from a kind of formal compositional force found in the aesthetic materials themselves, whose demands alone the artist must follow.<sup>14</sup>

But this is of course beside the point. If art is a movable concept, about which the only thing that is self-evident is that 'nothing concerning art is self-evident anymore',<sup>15</sup> then we must read its constitution off the face of the artworld as we now find it. And what we find is that the formalistic experimentation which the newspaper was pasted into has waned. For Adorno, the direct pasting of the newspaper was only an opportunity to prove and test the power of the formally closed artwork to radically rework material from the external world, to strip it of its extra-aesthetic meaning and give it a role in the formally closed artwork, where it took on a radically new meaning. However, now we find that this act of 'pasting' – of allowing the world outside the artwork to show up directly, unchanged in the artwork – has become utterly central to modern art, and much of modern art cannot be understood without it. We now find that closed, autonomous artworks are no longer possible, and the direct importing of material from the extra-aesthetic world has taken on a new function. These 'pasted' or imitated parts of the external world retain their meaning from the extra-aesthetic world, and as a result the artwork is unclosed, does not conceal and complicate its meaning through formal innovation, but rather offers it to us directly.

To wit, artworks are now unclosed; if they were once windowless monads, their hermetic seal has now been punctured. To take two simple examples, we have Mark Wallinger's Tate entry *State Britain 2007*,

which perfectly replicated Brian Haw's Parliament Square placards from his protest against the Iraq War; or Ai Weiwei's S.A.C.R.E.D., consisting of six hyperrealist dioramas narrating the artist's arrest and imprisonment by the Chinese Government in 2011. Wallinger's *State Britain 2007* directly interpolates, without significant mediation, an act of political protest, and places it on display. In doing so, it bears its socially critical content substantially on its face, without the need for oblique, formal artistic means of producing social criticism. Wallinger and Ai Weiwei's artworks are irreducibly political, in no way capturable by attending primarily to their formal qualities, and held, at least by some, as artworks of considerable accomplishment. The relationship between the artwork and the world external to it is entirely open; the artwork does not only follow the demands of its own material but reaches quite directly into the world. And the converse is also true; the art appreciator is not rebuffed by the kind of non-representative formal complexity often characteristic of modernism, but explicitly invited in by the artwork's use of unambiguously meaningful materials. Adorno's emphasis on the artwork's hermetically closed autonomy leaves him with no obvious means of responding to these kinds of art. As Hammer puts it,

One final problem with Adorno's account of material is that it seems to contain few or perhaps no resources for thinking about art that wilfully ignores whatever demands may seem to be arising from the material. Examples of such art might be minimalism in music; video and installation art; land-art ... and indeed much of the often dematerialized, site-specific, or non-medium-specific art that rose to prominence in the 1960s and 1970s ... [and] continues to dominate the contemporary art world.<sup>16</sup>

The question now is, given the expansion of art's engagement with heteronomous content, what does this mean for art? Now that it is ungoverned by a canon, and under no compulsion to adhere to formally complex conventions of convention, it can directly import

critical heteronomous content. An artwork is under no compulsion to re-work or formally manipulate the external world – indeed, it can import parts of the external world directly as ready-mades or through collage, including parts of the external world which have discursive, directly political and socially critical content. This being so, is it in a better situation – with regards to its criticality, its connection to social content, or its quality, all of which were intertwined, for Adorno – or worse? After all, critical theory is selective – it is only ‘authentic art’ for Adorno which has the ability to engage and break the pathologies of reason external to it. Perhaps these kinds of art are no longer available. Perhaps we should not deny that there is art, but should deny there is any art worth having. This latter thought is not foreign to Adorno, whose theory often touches on a possible end of the possibility of autonomous, meaningful art.<sup>17</sup> But, again, this is couched in terms of a formalism, and a modernism, which we are now even less obliged to accept as necessary compositional demands than at the time of Adorno’s writing. Let us consider the state of contemporary art a little more, which is now no longer explicable in terms of modernist and formalist theories of composition and reception, and see what might remain of the criticality of the artwork.

We might note at the outset that art, by virtue of the puncturing of its hermetic seal, has in many ways lost its canon. The field of compositional possibilities is entirely open; while previous artworks might serve as reference points or inspirations, they cannot serve as determining *demands* on the artworks that come after them. With the loss of a canon – of causal, formal consequences of the interrelation between the past and future seen as a continuous history, no matter how imaginary – comes a delocation of aesthetic meaning. Wagner’s use of the unresolved dissonant ‘Tristan Chord’ is, objectively and necessarily, a building on, reference to, and extension of Beethoven’s ‘resolved’ use of these dissonant resources in his *Opus 31*. These works

stand within a continuous narrative; namely one of the ongoing formal expansion and development of compositional resources. By contrast, the reference of post-modern artworks to their forebears is *not* necessary; it is rather contingently selected by the artist, for contingent reasons which are provided to us in the exhibition catalogue. Here we see the loss of compositional weight of the canon; an artist is now free to interrogate it, and does so without objective compulsion, or indeed any need.<sup>18</sup>

We can in fact see in art itself, the symptoms of a great stress and strain which this hollowing out of a common system of meanings has created. Much of the consequence of this is the denuded search for common, universal structures of meaning. The plastic arts exhibit this tendency most readily, and perhaps have suffered the loss of a canonical anchoring most keenly. We might consider here the work of Anthony Gormley, which implicitly and relentlessly fastens onto the ineradicable horizon of common meaning which representations of the body will always carry with them. It is a matter of taste as to whether this is humane or manipulative, but the hermeneutic gambit here is clear. As a horizon of common significations of meaning and a compositional past is weakened, a clear response is to scuttle backwards into unassailable complexes of ahistorical meaning. We also find this tendency in land-art (we might consider Andy Goldsworthy’s use of natural materials and forms; Richard Long’s creation of ‘line’ artworks through walking; Robert Smithson’s creation of large-scale earthworks), which likewise seems to present itself as moving towards a putative basic layer of meaning. We find similar universalizing moves, through appeals to ostensibly basic forms of meaning, in other kinds of plastic composition. The work of Anish Kapoor, for example, evinces a kind of sensuous formalism, which yields entirely to what Adorno would have termed the ‘culinary’ appreciation of art (culinary appreciation being an exclusively hedonic and sensuous mode of

art appreciation directed towards drawing pleasure from the surface level properties of an artwork).<sup>19</sup> More broadly, the marked increase in the use of larger scale in plastic artworks is used as a blunt and immediate means of impressing a meaning and content on its viewer, simply by dint of its physical presence. Whatever the virtues of these works themselves, there is here a visible, and increasingly desperate, trajectory of flight away from a problem; namely, the evacuation of a hospitable, objective, and communal sphere of meaning.

This is by no means the only, or even predominant, response to this problem. The other main response moves in the opposite direction; rather than fleeing the 'emptied middle', it seeks to fill it. Here we find the peculiarly modern case of the artist with an expansive, and almost entirely private, personal iconography. Dali represented one of the earliest and most lurid examples of this modern tendency, in which artworks were filled with signifiers only comprehensible in tandem with the artist's own declaration of their meaning (see Dali's frequent use of ants, which symbolized decay, due to Dali's *private* childhood encounter with decomposing animals being consumed by insects; compare this with Manet's use of the frog in *Le Dejeuner sur l'herbe*, which derives its meaning from the *public* slang term for prostitute, '*grenouille*').

The evacuation of the canon, then, amounts to an evacuation of a common compositional core. It also enervates any kind of compositional necessity, in the context of which an artist's autonomy, or originality, can be understood. This is a problem for, as well as a feature of, modern art. As Arthur Danto, writing about a different kind of end of art, from a different set of commitments, wrote:

As Marx might say, you can be an abstractionist in the morning, a photorealist in the afternoon, a minimal minimalist in the evening. Or you can cut out paper dolls or do what you damned please. The age of pluralism is upon us. It does not matter any longer what you do, which is what pluralism

means. When one direction is as good as another direction, there is no concept of direction any longer to apply.<sup>20</sup>

But what is the significance of this for critical theory? Art, for Adorno, reflected society by virtue of being compelled, via constraints on its compositional processes, in such a way that an oblique imprint of that society was left on it. If art is no longer externally compelled and constrained at all by compositional genres, social and artistic conventions, formal demands, or the canon, it would seem that the artwork begins to bear an arbitrary or frictionless relationship to its external world. And this would entail that socio-critical content could not be communicated to the artwork – or at least, not in the same way as before.

## THE EMPTIED MIDDLE

For Adorno, artworks were characteristically puzzle-like in nature.<sup>21</sup> The artwork formally manipulated contents which had significance beyond their mere formal properties. When Beethoven introduced a rogue element to his *String Quartet in F Major* sonata, irreducible to the pre-set demands of the sonata form, this was for Adorno no mere compositional quirk, but rather signified a criticism and revelation of a core feature of society in general, and reason in particular:

In the totality of its form, Beethoven's music represents the social process. In doing so it shows how each individual moment – in other words, each individual process of production within society – is made comprehensible only in terms of its function within the reproduction of society as a whole [...] Beethoven's music is Hegelian philosophy: but at the same time it is truer than that philosophy. [...] Logical identity as immanent to form – as an entity at the same time fabricated and aesthetic – is both constituted and criticized by Beethoven. [...] At this point a precise analysis of the D major passage from the slow movement of the great String Quartet in F Major [op. 59, 1: third movement, bars 70ff] must be given. [...] when the recapitulation fails to appear it is made clear that formal unity is insufficient [...]<sup>22</sup>

Analyses like these make sense – are possible – if and only if there is a unified continuity between forms of artistic composition (which Adorno believes, lending this common progress within a common problematic the term ‘aesthetic technology’<sup>23</sup>), and a unified social whole which relates to that unified continuity (which Adorno also notoriously believes to be the case, terming it a ‘social totality’).<sup>24</sup> The former condition has been broken off. There is not a centralized body of concerns and practices titled ‘art’ (or even less ambitiously ‘painting’, ‘poetry’, etc) which a social totality can determine and show up in. Rather we have a vast collection of forms of artistic practice at the peripheries, with an emptied hermeneutic middle which could have united them.

The artwork generated meaning, for Adorno, through its autonomy. Indeed, autonomy was for Adorno an absolutely crucial feature of the artwork; by virtue of being autonomous, it acquired a standpoint from which to resist and criticize the encroaching heteronomy of the society external to it. However, aesthetic autonomy is an intrinsically corrosive, relational feature. As Horowitz puts it,

[I]f autonomy in art is the work's refusal to let anything outside itself determine its form, then the autonomous work is just the appearance of that refusal [...] But this of course entails that the work is bound irredeemably to what does not determine it; it is constrained to show what does not constrain it. [...] [I]t must visibly negate something and can only appear as the negation of that thing.<sup>25</sup>

To be critical, then, the artwork rejects; and the ongoing possibility of this rejection is conditioned by what it rejects. When Wagner introduced dissonance into his compositional scheme, he was not only following on from Beethoven's continued opening up of compositional resources in his late period, he was also rebuffing and resisting the ‘culinary’ appreciation of Beethoven which increasingly dulled its edge. Dissonance was challenging. But, even in Adorno's time, social

heteronomy was finding ways of instrumentalizing heteronomy, and making it marketable, as for example in the popular jazz of his time:

To be sure, dissonances occur in jazz practice, and even techniques of intentional ‘mis-playing’ [*Falschspielens*] have developed. But an appearance of harmlessness accompanies all these customs; every extravagant sonority must be so produced that the listener can recognize it as a substitute for a ‘normal’ one. While he rejoices in the mistreatment the dissonance gives to the consonance whose place it takes, the virtual consonance simultaneously guarantees that one remains within the circle.<sup>26</sup>

This trajectory, of the normalization of dissonance, has at our time become more than completed. Popular music bristles with dissonance, to the extent that it is difficult to discern without effort. (One need only consider the use of tritone intervals as a mechanism for generating tension or emotional excitement, found in as diverse musical examples as *West Side Story*'s ‘Maria’, the theme-tune of *The Simpsons*, and film scores.) The preservation of art's autonomy, then, is a process of art emptying itself out, continually shrinking away from the heteronomous world (of commercial art, popular music, etc). And this is of course a finite business, as Adorno perceived.<sup>27</sup> The artwork has only so many compositional strategies and resources to throw overboard; it cannot empty itself infinitely, but must sooner or later find itself with nothing further to sacrifice. A deeper way of understanding the narrative above about canonicity, then, is in terms of autonomy. When the world external to artwork has completely absorbed and instrumentalized all of the compositional strategies left to the artwork, how can it preserve its autonomy? What remains?

The answer is: ‘nothing’. The critical autonomy which Adorno privileged has been obviated. Every last gasp of compositional radicality has been re-used and exhausted. Art, through staying true to both its autonomy and its canon, has destroyed both. It has

continually shrunk away from heteronomy until its own compositional rules became unsatisfiable. Adorno noted that art threatened to 'fall silent' – and if art had continued to insist on its autonomy, this would have come to pass. Instead, autonomy itself, and the conservation of the canon that was sustained by this autonomy, was jettisoned.

The progressive chain of increasingly autonomized artworks has been broken off, and the artwork must now seek its meaning elsewhere. The kinds of hermeneutics of suspicion which Adorno, Benjamin, and Bloch wielded so effectively are now obviated. For art to have common pathologies with society, both art and society must be minimally unified entities which can relate to and determine each other in the appropriate way. But with the uncoupling of meaning from some determinate anchor, it is no longer clear how this would be possible. With this emptied middle, artworks can be constructed in any way whatsoever, draw on any content whatsoever, and relate to society in any way whatsoever.

This is most fatal when we consider the central role, in Adorno's account and those like his, of art's expression of a critical stance in relation to social and rational problematics. When there is no centre of gravity in artistic composition – no necessary canon, compositional schema, or limits on what is acceptable as a compositional choice – the artist's choice cannot be understood as a refusal, criticism, or expression of the limits of pre-set formal units or demands. It was just these pre-set formal units or demands which Adorno identified with pathologies of reason and society, as mirroring the occlusive and dogmatic nature of concepts and social structures;<sup>28</sup> and it was in refusing and manipulating these that most often art could be true, by expressing the falsity of these demands, and the social problems they stand for. The conflict between autonomy and the externally imposed is utterly central to the idea of art working through or improving on that self-same conflict in reason (reason's struggle in reaching its own autonomy and throwing off the constraints of

dogmatism and ideology). When art is emptied of its compositional constraint, such a conflict cannot be generated; and expression of the same problems facing reason cannot be achieved, either. There is no longer a set of compulsions which can be rejected, so as to display and achieve autonomy. So not only has art degenerated into fragments, which can no longer maintain the kind of causal contact necessary for Adorno's account, but art has also lost the formal preconditions needed for the kind of critical expressivity which Adorno and those like him need to find in art. This leaves us with the question of whether critical theory's old strategy of seeing the artwork as true and critical is now – if it ever was – workable. For the reasons I have recounted above, I do not believe it is.

## A NEW CRITICAL LOOK AT THE ARTWORK

The question remains of how an artwork might be able to interact with, to critique, ideology, forms of thought, and other social pathologies. In one sense, the answer is apparent – an artwork is now free to be whatever it wants. Adorno once wrote:

Although judgments may occur in it, the work itself does not make judgments ... If the discursive element takes primacy, the relation of the artwork to what is external to it becomes all too unmediated and the work accommodates itself even at those points where, as in Brecht, it takes pride in standing in opposition to reality.<sup>29</sup>

But if the autonomy of art is no longer historically possible, this is no longer binding. An artwork may simply constitute a philosophical or political text or gesture, and be exhibited; it may advance explicit political, philosophical, or social judgements. And indeed, this has happened, as we have discussed above.

We of course find this response dissatisfying, precisely because such an artwork

is without significant effect. Precisely by virtue of being exhibited, it appears bloodless and divorced from its stated function of effecting a change in the world surrounding the artwork itself. The contemporary prevalence of the art installation can perhaps be understood as a reaction against this, an attempt to preserve not only the content, but the force of the artistic critique in the external world. As the artwork's strategies are continually co-opted and vitiated by the world external to it, the temptation to intervene directly in the world and dictate the conditions of its own effect and interpretation are clear. The installation not only represents, but brings about a critique of or visible change in, the world itself; the installation is a palpable intervention, no matter how limited, into the world which surrounds the artwork. As laudable as this attempt is, it is in no small measure undermined by the institutionalization of art (installations are most often installed, after all, in galleries), and above all by the comparative inability of the artwork to intercede in and overpower the society external to it, to counter-act that society's ability to absorb and re-interpret it.

Despite the evacuation of the hermeneutic centre, the threat to art remains the same as it was for Adorno – it must find a novel means of presenting criticism while evading absorption by that which it criticizes. For Adorno, this criticism was possible through autonomous formal experimentation, taking place against a unified backdrop of an objective canon. Autonomous formal experimentation was, as Adorno himself perceived, a limited and short-term response to the problem. The artwork continually evacuated itself of whatever content society succeeded in absorbing and placing to use; and it has now emptied itself entirely (as Adorno himself anticipated<sup>30</sup>). It remains now to be seen whether some critical art might be possible which foregoes the now impossible and ineffective closed, formal autonomous approach.

## CRITICISM WITHOUT JUDGEMENT

For Adorno the artwork expresses no judgement, but it affords to the art appreciator a formal complex which engages and criticizes the form of judgement. In other words, the artwork is for Adorno *judgementally germane*. Combined with Adorno's commitment to autonomy as a precondition for these judgementally germane productions, the thought emerges that for Adorno, ideology is characteristically a form of maladapted judgement; as are, more obviously, the pathologies of reason and society he criticizes. Art's autonomy is a resistance to a judgementally malformed world; and, hence, creates a properly ordered whole which invites properly ordered judgements. This judgemental propriety of the artwork was predicated on a resistive autonomy which is no longer available. However, Adorno also has a conception of the artwork's criticality, somewhat more muted, which provides a means of seeing the critical function of the artwork in a quite different light. This is his notion of non-representational expression more generally.

Expression, for Adorno, is a means by which the artwork can grasp and display the nature of the society external to it. Crucially, however, this expression is non-representational. Adorno most often understood this expression as the expression of normative complaints, or somatic suffering.

[E]xpression is scarcely to be conceived except as the expression of suffering – joy has proven inimical to expression, perhaps because it has yet to exist, and bliss would be beyond expression – expression is the element immanent to art through which, as one of its constituents, art defends itself against the immanence that it develops by its law of form [...] Art is expressive when what is objective, subjectively mediated, speaks, whether this be sadness, energy, or longing. Expression is the suffering countenance of artworks.<sup>31</sup>

In these respects, the expressivity of the artwork was critical by virtue of that which it was expressing. Namely, given states of suffering which – or so Adorno believed – contained an

intrinsic normative demand which was effective without the need for any further normative justification.<sup>32</sup> Here, then, the subject of expression was capable of having critical power in relation to forms of judgement. As somatic states of suffering have – so Adorno claims – intrinsic normative weight, their expression amounts to an irresistible rebuff to any judgement that the world – and the form of reason which underwrites the world – is adequately realized and free from pathology. Suffering informs us that how things are, should not be so; and thereby has an ineliminable critical power in relation to structures of judgement.

Quite apart from Adorno's dubious claims about the intrinsic normative power of states of suffering – and the artwork's ability to express them – Adorno is here operating with a needlessly denuded conception of expressivity. Expression need not only be a literal expression of some given pathic state; we can also conceive of expression as giving oblique expression to experiential states, as expressing alternative relations in which phenomena might stand.<sup>33</sup> What might find expression is some *experiential ordering*, some structured presentation of objects of experience which find themselves ordered and arranged in a means which breaks with our conventional means of grasping and using them.

For Adorno, ideologies, or indeed rational and social pathologies, were most often understood as kinds of occlusion, or covering.<sup>34</sup> And, indeed, it was the job of art, like philosophy, to bring about a revealing of that which was concealed; an 'identification of the non-identical'.<sup>35</sup> While this uncovering could only be accomplished by a highly complex set of paratactical critiques (in the case of philosophy), or formalist experimentation (in the case of art), it is nonetheless the case that we find here a vertical model of critique. We have the criticized form of reason, which culpably abstracts away from the lower-level and more genuine state of affairs of the world. Here, it is the job of the artwork to forcibly acquaint the former with the latter;

to drag abstract concepts back down to the terrain of the real, where they will founder on those 'non-identical' features which they rose above, and are incapable of accommodating. This 'vertical' model, then, is characteristically about interceding in judgements, and attempting to repair the explanatory connection between forms of judgement and the objects they have lost contact with. The expression of suffering was one means of forcibly dragging abstraction down to the level of the particulars which it – in Adorno's view – was causing harm to.

By means of exploiting Adorno's notion of expression, however, we could instead make use of a horizontal model. On a horizontal model, we do not seek to judgementally connect concepts with some exterior set of excluded facts about the world – in other words, we do not seek to bring concepts into contact with 'non-identical' states of affairs which those concepts had culpably failed to capture. Instead, we confine ourselves to the realm of semblance and appearances themselves, and give expression to alternative ways in which those appearances could be organized and ordered. But what do we mean by this? As a first pass, we can say simply that we mean that the artworks can recast the relational properties which obtain experientially between phenomena. They can invert or modify relations of prominence, of compossibility, of entailment, and of significance. They can force the insignificant to appear entirely significant, to break relations of entailment between phenomena which appeared to us necessary, and set up relations of entailment where in our present social reality none exist. This makes palpable to the art appreciator the existence of other alternatives. Art demonstrates that our intuitively experienced world, with its relationships of apparent necessity, compossibility, and entailment, is in fact genuinely and constantly revisable.

This amounts to a criticality of the artwork only where we reveal possibilities where none were meant to exist. In other words, when the officially necessary is shown to be,

in fact, contingent. The creation of the false appearance of necessity is entirely key to Adorno's understanding of the operation of both ideology and identity thinking. In either case, we are misled into seeing the field of possibilities as standing in a single way, and as standing in this way necessarily. If an artwork can demonstrate alternative possibilities of ordering, this in itself would serve as a rebuff to these kinds of implicit ideologies to which we are subject.

The important question now is: how would this be *socially* critical? It is obviously true that artworks can place phenomena in different relational positions, and present alternative norms, patternings, and orderings in relation to those artistic phenomena. But how is this intended to intercede in ideologies, social pathologies, or pathologies of reason? To make sense of this, we will need to recast ideology, and pathologies of reason also, as no longer (merely) consisting in a vertical relationship which requires judgemental adjustment, but as also having a horizontal complement which art could expressively intervene in and demonstrate as contingent. In other words, we need to see ideologies and failures of reason as judgemental errors which are not exclusively combatable through vertical critique, which seeks to forcibly bring together the abstract form of judgement, and the real facts it has culpably excluded.

To make sense of this, we need only claim that cognitive practices and misdevelopments, as well as manifesting judgemental failures, also make claims derivative on those judgemental errors, which amount to a claim of complete accuracy, or necessity, about the relational layout of the experiential world. In other words, structures of judgement also entail structures of *appearance* and *semblance*. Ideologies and epistemic pathologies operate with an implicit assurance of the complete adequacy between concepts and the world. Just this, of course, is what Adorno liked to call 'identity thinking' – the belief in a rigid and irrevocable match-up between conceptual structures and the world itself. But

identity thinking – committed to the existence of a perfect fit between concept and object – entails that the relational properties which obtain between those concepts should likewise show up in relations of semblance between those objects subject to those concepts. And by adverting to and manipulating those relations of semblance – in showing them to be non-necessary and open to change – we can therefore show that the concepts which back them are likewise contingent, and fail to perfectly fit the world they are applied to.

We can express – give non-judgemental semblance to – a variety of pictures of the world, of its relational layout, which appear cogent and workable. And this serves not as proof that there is some non-identical 'beyond' or 'concealed' by concepts, but rather only that the world as we implicitly experience it, and conform to it, is revisable. Hence, ideology (understood as a misleading picture of necessary conditions) and malformed systems of thought remain vulnerable to criticism through the artwork, by virtue of their derivative semblances being able to be disconfirmed through the artwork's ability to tease out and express alternative relational layouts of appearance.

Examples of this kind of horizontal criticism can be found most easily in literature, where we are confronted with people behaving in ways we take to be puzzling; where relationships of apparently necessary entailment between action and response are broken, or distorted into causal lines we find unexpected and difficult to comprehend. We might consider here Dostoevsky's *The Idiot*, in which the main character reliably and continually fails to exhibit the responses that seem demanded from the actions of others; the work of Beckett and Kafka (valued by Adorno, of course, for different reasons), in which inter-personal relationships lose their natural flow and become the continual imposition of interpretive puzzles (Kafka's *The Castle* is an especially clear example of this). We might consider similar examples, where human figures are shown in apparently absurd or non-naturalistic

patterns of action, response, and significance in other media (in film, for example, we could consider Andrei Tarkovsky's *Stalker* and *Andrei Rublev*; Aleksei German's *Hard to Be a God*). Here we find quite easily traceable pictures of alternative forms of human relationship, reaction, and structure. But the same is also true in media which take up no explicit attempt to depict human figures or themes. In Kandinsky's intentional distortion of our reception of perspective in *Bustling Aquarelle*, or Schoenberg's relentless engagement and frustration of our melodic and rhythmic expectations in his *Five Piano Pieces* (Op. 23), we find the ordering of our experience and sensory modalities intentionally disarmed and confronted with alternative lines of explanation, causation, and combination. We find here a display of possibility; and, as has been said, the display of possibility suffices as critique when one's opponent (ideology; instrumental rationality) arrogates complete necessity to itself.

In closing, it should be admitted that this is a comparatively more meagre power we allot to the artwork than that which Adorno sought to give to it. We now find that artworks amount to expressive thumbnails of some possible relational contours, which serve only to loosen the apparently necessary relations of significance, entailment, and prominence, which are found in our everyday lives. This criticism essentially amounts to a kind of affordance of alternative viewpoints; a way of acquainting us with radically distinct means of ordering the experienced world. This presentation of relational possibility – the possibility of seeing things as structured differently – cannot hope to undo judgmental maladaptations, nor 'identify the non-identical'. What remains is an ability to counter poorly calibrated forms of judgement at a lower level, the level of derivative semblance, where alternative outcomes and structurings can be gestured towards and played out.

For us, then, the artwork's criticality is an altogether attenuated thing, compared with that which Adorno hoped to attach to it.

We find ourselves forced to give it a denuded and weakened function, capable at best of gesturing towards – but never defeating – false ideologies and forms of judgement. This more denuded function is, however – to repeat myself once more – historically produced, generated by the completion of a process of autonomization which Adorno himself, in pointing it out, realized was already hurtling towards its end point.

- 15 Adorno, *Aesthetic Theory*: 1.
- 16 Hammer, *Adorno's Modernism*: 191.
- 17 See my 'Hegel, Danto, Adorno, and the End and After of Art'.
- 18 We might ask here what is responsible for this dis-integration of the canon, the loss of formal compositional restraint, and the concomitant breakdown of the modernist form, or at least the breakdown of the connection between modernism and the canon that preceded it. This development has been produced by the reciprocal conflict and struggle between artistic autonomy and the heteronomizing processes of the society external to it. This will be covered below, in the section 'The Emptied Middle'.

- 19 Adorno, *Aesthetic Theory*: 121.
- 20 Danto, *The Philosophical Disenfranchisement of Art*: 114–15.
- 21 Adorno, *Aesthetic Theory*: 160.
- 22 Adorno, *Beethoven: The Philosophy of Music*: 13–14.
- 23 Adorno, *Aesthetic Theory*: 76–7.
- 24 Adorno, *Negative Dialectics*: 47.
- 25 Horowitz, 'Art History and Autonomy': 274.
- 26 Adorno, *Essays on Music*: 306.
- 27 'What can only appear negatively mocks a resolution that it recognizes as false and which therefore debases the idea of the beautiful. Beauty's aversion to the overly smooth, the pat mathematical solution, which has compromised art with the lie throughout its history, becomes an aversion to any resultant, without which art can be conceived no more than it can be without the tensions out of which it emerges. The prospect of the rejection of art for the sake of art is foreseeable. It is intimidated by those artworks that fall silent or disappear' (Adorno, *Aesthetic Theory*: 69).
- 28 As Max Paddison puts it, 'At the level of the aesthetic, sublimated/repressed social antagonisms and internalized socio-cultural norms (including the process of rationalization itself) are displaced into the arena of the artistic material. The stage on which the conflict now plays itself out is the *structure* of the work of art, in the tension between mimesis and rationality, expression and construction, as the *immanent dialectic of the material*' (Paddison, *Adorno's Aesthetics of Music*: 147, emphasis mine).
- 29 Adorno, *Aesthetic Theory*: 129.
- 30 'When according to history's verdict the unity of process and result no longer succeeds; when, above all, the individual elements refuse to mold themselves to the ever latently preconceived totality, the gaping divergence tears meaning apart [...] If artworks are alive in history by virtue of their own processual character, they are also able to perish in it [...] Ultimately their development is the same as their process of collapse' (Adorno, *Aesthetic Theory*: 235).
- 31 Adorno, *Aesthetic Theory*: 145–6.
- 32 'All pain and negativity, the moving forces of dialectical thinking, assume the variously conveyed, sometimes unrecognizable form of physical things ... The physical moment tells our knowledge that suffering ought not to be, that things should be different. "Woe speaks: 'Go'"" (Adorno, *Negative Dialectics*: 202–3).
- 33 We can see an analogy here with Clewis' account of the non-representational expression of the Kantian sublime, 'A Case for Kantian Artistic Sublimity': 169–70.
- 34 '[Ideology is] the surreptitious acquisition by indirect things of a directness vested with the authority of absolute, unimpeachable, subjectively evident being-in-itself' (*Negative Dialectics*: 82). 'The unity of that which general concepts cover differs fundamentally from the conceptually defined particular. The concept of the particular is always its negation at the same time; it cuts short what the particular is and what nonetheless cannot be directly named [...] the particular [is indissoluble] in the cover concept' (*Negative Dialectics*: 173).
- 35 Adorno, *Aesthetic Theory*: 29.

The SAGE Handbook of  
Frankfurt School  
Critical Theory

**SAGE** was founded in 1965 by Sara Miller McCune to support the dissemination of usable knowledge by publishing innovative and high-quality research and teaching content. Today, we publish over 900 journals, including those of more than 400 learned societies, more than 800 new books per year, and a growing range of library products including archives, data, case studies, reports, and video. SAGE remains majority-owned by our founder, and after Sara's lifetime will become owned by a charitable trust that secures our continued independence.

*In memoriam*

Moishe Postone

Moishe Postone died on 19 March 2018. Words fail to express the sadness felt and the loss encountered. Amidst the misery of a time made abstract, a time of value for valorisation's sake, Moishe showed us what it means to think against the grain. He was *ein guter Mensch*.

## **VOLUME 1: KEY TEXTS AND CONTRIBUTIONS TO A CRITICAL THEORY OF SOCIETY**

1	Introduction: Key Texts and Contributions to a Critical Theory of Society <i>Beverley Best, Werner Bonefeld and Chris O’Kane</i>	1
<b>PART I THE FRANKFURT SCHOOL AND CRITICAL THEORY</b>		<b>17</b>
2	Max Horkheimer and the Early Model of Critical Theory <i>John Abromeit</i>	19
3	Leo Löwenthal: Last Man Standing <i>Christoph Hesse</i>	39
4	Erich Fromm: Psychoanalysis and the Fear of Freedom <i>Kieran Durkin</i>	55
5	Henryk Grossmann: Theory of Accumulation and Breakdown <i>Paul Mattick</i>	72
6	Franz L. Neumann’s <i>Behemoth</i> : A Materialist Voice in the <i>Gesamtgestalt</i> of Fascist Studies <i>Karsten Olson</i>	89
7	Otto Kirchheimer: Capitalist State, Political Parties and Political Justice <i>Frank Schale, Lisa Klingsporn and Hubertus Buchstein</i>	105
8	The Image of Benjamin <i>David Kaufmann</i>	123
9	Dialectic of Enlightenment. Philosophical Fragments <i>Marcel Stoetzler</i>	142
10	Herbert Marcuse: Critical Theory as Radical Socialism <i>Charles Reitz</i>	161
11	Theodor W. Adorno and Negative Dialectics <i>Nico Bobka and Dirk Braunstein</i>	179

<b>PART II</b>	<b>THEORETICAL ELABORATIONS OF A CRITICAL SOCIAL THEORY</b>	<b>197</b>
12	Ernst Bloch: The Principle of Hope <i>Cat Moir</i>	199
13	Georg Lukács: An Actually Existing Antinomy <i>Eric-John Russell</i>	216
14	Siegfried Kracauer: Documentary Realist and Critic of Ideological 'Homelessness' <i>Ansgar Martins</i>	234
15	Alfred Seidel and the Nihilisation of Nihilism: A Contribution to the Prehistory of the Frankfurt School <i>Christian Voller</i>	252
16	Arkadij Gurland: Political Science as Critical Theory <i>Hubertus Buchstein</i>	268
17	Alfred Sohn-Rethel: Real Abstraction and the Unity of Commodity-Form and Thought Form <i>Frank Engster and Oliver Schlaudt</i>	284
18	Alfred Schmidt: On the Critique of Social Nature <i>Hermann Kocyba</i>	302
19	Oskar Negt and Alexander Kluge: From the Underestimated Subject to the Political Constitution of Commonwealth <i>Richard Langston</i>	317
20	Hans-Jürgen Krahel: Social Constitution and Class Struggle <i>Jordi Maiso</i>	335
21	Johannes Agnoli: Subversive Thought, the Critique of the State and (Post-)Fascism <i>Stephan Grigat</i>	351
22	Helmut Reichelt and the New Reading of Marx <i>Ingo Elbe</i>	367
23	Hans-Georg Backhaus: The Critique of Premonetary Theories of Value and the Perverted Forms of Economic Reality <i>Riccardo Bellofiore and Tommaso Redolfi Riva</i>	386
24	Jürgen Habermas: Against Obstacles to Public Debates <i>Christoph Henning</i>	402

**PART III CRITICAL RECEPTION AND FURTHER DEVELOPMENTS 417**

- 25 Gillian Rose: The Melancholy Science 419  
*Andrew Brower Latz*
- 26 Bolívar Echeverría: Critical Discourse and Capitalist Modernity 433  
*Andrés Saenz de Sicilia*
- 27 Adolfo Sánchez Vázquez: Philosophy of Praxis as Critical Theory 448  
*Stefan Gandler*
- 28 Roberto Schwarz: Mimesis Beyond Realism 465  
*Nicholas Brown*
- 29 Aborted and/or Completed Modernization: Introducing Paulo Arantes 479  
*Pedro Rocha de Oliveira*
- 30 Fredric Jameson 498  
*Carolyn Lesjak*
- 31 Moishe Postone: Marx's Critique of Political Economy as Immanent Social Critique 514  
*Elena Louisa Lange*
- 32 John Holloway: The Theory of Interstitial Revolution 533  
*Ana Cecilia Dinerstein*
- 33 Radical Political or Neo-Liberal Imaginary? Nancy Fraser Revisited 550  
*Claudia Leeb*
- 34 Axel Honneth and Critical Theory 564  
*Michael J. Thompson*

**VOLUME 2: THEMES**

- 35 Introduction: Key Themes in the Context of the Twentieth Century 581  
*Beverley Best, Werner Bonefeld, and Chris O'Kane*

**PART IV STATE, ECONOMY, SOCIETY 587**

- 36 Society as 'Totality': On the Negative-Dialectical Presentation of Capitalist Socialization 589  
*Lars Heitmann*
- 37 Society and Violence 607  
*Sami Khatib*

# Notes on the Editors and Contributors

## THE EDITORS

**Beverley Best** is an Associate Professor in the Department of Sociology and Anthropology, Concordia University, Montreal. She is the author of *Marx and The Dynamic of the Capital Formation: An Aesthetics of Political Economy* (Palgrave Macmillan, 2010). She has published articles on ideology and the value-form, value and the fetish character of finance, Marx and the aesthetic, the dialectic of affect, and dialectical method in the work of Fredric Jameson and Raymond Williams. Her current research project is a study of the perceptual economy of capital as elaborated by Marx in volume three of *Capital*. She is Vice President of the Marxist Literary Group, [www.marxistliterary.org](http://www.marxistliterary.org).

**Werner Bonefeld** is a Professor in the Department of Politics, University of York (UK). Recent book publications have included *The Strong State and the Free Economy* (Rowman & Littlefield, 2017), *Notes from Tomorrow: On Reason, Negation and Certainty* (Aakar Books, 2015), *Critical Theory and the Critique of Political Economy* (Bloomsbury, 2014) and with Chris O’Kane he co-edits the book series *Critical Theory and the Critique of Society* (Bloomsbury). Recent journal articles have included work on Adorno and the critique of economic objectivity, abstract labor, authoritarian liberalism, German ordoliberalism, and on the political theology of European monetary union. His work contributed to the development of Open Marxism. He is a co-founder of the CSE Trans-Pennine Working Group.

**Chris O’Kane** teaches Philosophy, Politics and Economics at CUNY John Jay. His recent and forthcoming articles and chapters in *Viewpoint*, *Black Box*, *Historical Materialism*, *Perspectives on Henri Lefebvre*, *Logos*, *Capital and Class*, *Review of Radical Political Economy*, *Constellations*, and *The Sage Handbook of Marxism* focus on Marxian and post-Habermasian critical theory, political economy, and the critical theory of contemporary society. He is currently revising his thesis – on social constitution and social domination in Marx, Hegelian-Marxism, and Value-Form Theory – for publication with Brill, and he is editing the selected works of Alfred Sohn Rethel for the Historical Materialism Book Series and with Werner Bonefeld he co-edits the book series *Critical Theory and the Critique of Society* (Bloomsbury).

## THE CONTRIBUTORS

**John Abromeit** is an Associate Professor of History at the State University of New York, Buffalo State, where he teaches courses on modern German and French history and modern European intellectual history and historiography. He is the co-editor of *Herbert Marcuse: A Critical Reader* (Routledge, 2004), *Herbert Marcuse: Heideggerian Marxism* (University of

Nebraska Press, 2005), and *Transformations of Populism in Europe and the Americas: History and Recent Tendencies* (Bloomsbury, 2016). He is the author of *Max Horkheimer and the Foundations of Frankfurt School* (Cambridge University Press, 2011). His articles and reviews have appeared in *Constellations*; *Theory and Society*; *Theory, Culture and Society*; *Radical Philosophy*; *The Journal of Modern History*; and *The American Historical Review*.

**Felix Baum** lives in Berlin and is active in a very marginal political milieu influenced by both the Frankfurt School and Council Communism, amongst others. He occasionally writes for *Brooklyn Rail* and tiny German publications.

**Riccardo Bellofiore** is Professor of Political Economy at the University of Bergamo. He teaches History of Economic Thought and Monetary Economics (in Italian) and Macroeconomics and International Monetary Economics (in English). He is a member of the International Symposium on Marxian Theory and of the editorial committee of the Marx–Engels Complete Works (MEOC), in Italian. He is the editor (with Tommaso Redolfi Riva) of *Ricerche sulla critica marxiana dell'economia*, an Italian collection of the most important articles by Hans-Georg Backhaus.

**Aaron Benanav** is a Collegiate Assistant Professor and Affiliate Faculty in the History Department at the University of Chicago. His book, forthcoming with Verso, is titled *A Global History of Unemployment since 1949*. He also edits the journal *Endnotes*, along with several others in Europe and the United States.

**Jasper Bernes** is author of a scholarly book, *The Work of Art in the Age of Deindustrialization* (Stanford University Press, 2017), and two volumes of poetry, *Starsdown* and *We Are Nothing and So Can You*. Together with Juliana Spahr and Joshua Clover, he edits *Commune Editions*. He teaches at the San Francisco Art Institute and lives in Berkeley with his family.

**Nico Bobka** lives in Frankfurt. He is currently pursuing a dissertation project on Theodor W. Adorno's dialectical critique of ontology and the so-called ontological need at the Free University of Berlin.

**Dirk Braunstein** is Scientific Assistant at the Institute for Social Research in Frankfurt, where he is researching the work and the teachings of Adorno.

**Shannon Brincat** is a Senior Lecturer at the University of the Sunshine Coast, Australia. His research focuses on international relations theory; recognition and cosmopolitanism; dialectics; tyrannicide; climate change justice; and Critical Theory. He has been the editor of a number of collections, most recently *From International Relations to World Civilizations: The contributions of Robert W. Cox* (Routledge, 2017), *Dialectics and World Politics* (Routledge, 2015), and the three-volume series *Communism in the Twenty-First Century* (Praeger, 2013). He is also the co-founder and co-editor of the journal *Global Discourse*.

**Andrew Brower Latz** is the Head of Religion and Philosophy at The Manchester Grammar School and the author of *The Social Philosophy of Gillian Rose* (Wipf & Stock, 2018). He co-edited, with Marcus Pound, the *Telos* Special Issue on Gillian Rose (173, Winter, 2015), and, with Arseny Ermakov, the book *Purity* (Wipf & Stock, 2014). His other publications include 'Ideology Critique Via Jurisprudence: Against Rose's Critique of Roman Law in Kant'

(*Thesis Eleven* 133.1, April 2016); ‘Gillian Rose and Social Theory’ (*Telos* 173, Winter 2015); ‘Towards a Rosean Political Theology of Recognition’ in *Misrecognitions: Gillian Rose and the Task of Political Theology* ed. by Joshua Davis; ‘Andrew Shanks’ Civil Theology’, *Political Theology* 13.1 (2012), 14–36; ‘Creation in the Fiction of Marilynne Robinson’, *Journal of Literature and Theology* 25.3 (2011), 283–296.

**Nicholas Brown** teaches in the departments of English and African American Studies at the University of Illinois at Chicago.

**Hubertus Buchstein** is Professor for Political Theory and the History of Political Ideas at Greifswald University, Germany. His research interests primarily center around democratic theory, the history of political science as a discipline, and critical theory. He is the author of books about public and secret voting, about modern democratic theory, about the use of lotteries in political decision making, about right-wing extremism in Germany and about German academic emigres in the US during the period of Nazi-dictatorship. From 2009–12 he was president of the German Political Science Association. In the academic year 2018/19 he will be Theodor-Heuss-Professor at the New School for Social Research in New York. He is currently working on a 6 Volume edition of the *Gesammelte Schriften* of Otto Kirchheimer.

**Tom Bunyard** teaches in the Humanities Department at the University of Brighton. He has recently completed a book on Guy Debord’s relation to Marx and Hegel, and is currently working on issues related to the philosophy of history.

**Vincent Chanson** is a PhD student of Philosophy at Nanterre University. His research interests focus on critical theory, critical Marxism, and aesthetics. With Frédéric Monferrand and Alexis Cukier he co-edited ‘La réification. Histoire et actualité d’un concept critique’ (La Dispute, 2014).

**Matthew Charles** is a Senior Lecturer in Cultural and Critical Theory at the University of Westminster in London. He is a member of the Institute for Modern and Contemporary Culture and was part of the editorial collective of the journal *Radical Philosophy* from 2009 to 2017. His research focuses on critical theories of modern and contemporary culture and education. He is the author of *Modernism Between Benjamin and Goethe* (forthcoming with Bloomsbury), co-author with Peter Osborne of the Stanford Encyclopedia of Philosophy entry on Benjamin, and has contributed to special issues on Benjamin and education in *boundary 2* and *Pedagogy, Culture and Society*.

**Greig Charnock** is Senior Lecturer in International Politics at the University of Manchester, where he teaches international political economy, the politics of globalization, and critical social theory. His most recent research has engaged the ‘open Marxism’ approach with critical theories of the production of space and in analyses of crisis formation and management in Spain. He is co-author of *The Limits to Capital in Spain* (Palgrave, 2014), co-editor of *The New International Division of Labour* (Palgrave, 2016), and has published articles in such journals as *Antipode*, *Society and Space*, the *International Journal of Urban and Regional Research*, *Historical Materialism*, *New Political Economy*, and *South Atlantic Quarterly*. He is a member of the editorial board of the journal of the Conference of Socialist Economists, *Capital & Class*.

**Christopher Chen** is an Assistant Professor of Literature at the University of California at Santa Cruz. Chen has published poetry, essays, interviews, and reviews in *boundary 2*, *The South Atlantic Quarterly*, *The Routledge Companion to Literature and Economics*, *The New Inquiry*, *Crayon, 1913: A Journal of Forms*, and the *Los Angeles Review of Books*. He is completing a book-length comparative study of contemporary black and Asian American experimental writing.

**John Clegg** is a PhD Candidate at NYU Sociology and is an editor of the journal *Endnotes*, along with several others in Europe and the United States.

**Joshua Clover** is a Professor of English Literature and Comparative Literature at University of California Davis. He is the author of six books, including *Riot.Strike.Riot: The New Era of Uprisings* (Verso, 2016). He has collaborated with Juliana Spahr, Jasper Bernes, Tim Kreiner, Christopher Chen, Wendy Trevino, Abigail Lang, Els Moors, Chris Nealon, Michael Szalay, Sarah Posman, Annie McClanahan, and others. He is a founding editor of *Commune Editions*.

**Amy De'Ath** is Lecturer in Contemporary Literature and Culture at King's College London. Her criticism has appeared in *Women: A Cultural Review*, *Anguish Language*, *Metamute*, and elsewhere. With Fred Wah, she is the editor of a poetics anthology, *Toward. Some. Air.* (Banff Centre Press, 2015), and her most recent poetry publication is *ON MY LOVE FOR gender abolition* (Capricious, 2016). She is currently at work on an academic book, *Unsociable Poetry: Antagonism and Abstraction in Contemporary Feminized Poetics*.

**Murray Dineen** has been a member of the School of Music at the University of Ottawa since 1991, where he currently teaches music theory, history, and aesthetics. His research interests address both disciplinary music topics (such as the history of music theory and the study of counterpoint) as well as interdisciplinary matters involving music – primarily criticism and literary theory, but also human kinetics and musical expertise. In 2011, he published a book on Adorno and music, *Friendly Reminders: Essays in Music Criticism after Adorno* (McGill-Queens University Press). His most recent publications include a translation of a Marxist treatise on music published in Vienna in 1935, in *Polygraph: An International Journal of Culture and Politics* 25 (2016). He has received research funds from the Social Sciences and Research Council of Canada. An honorary lifetime member of the Canadian University Music Society, he has edited Canadian and international journals devoted to music studies.

**Ana Cecilia Dinerstein** is Associate Professor of Sociology in the department of Social and Policy Sciences, University of Bath. She has written extensively for academic and non-academic audiences on issues of labour subjectivity; urban, rural and indigenous movements; autonomous organizing; Argentine and Latin American politics; Open Marxism, decolonial theory, social reproduction and the current uses of utopia and Ernst Bloch's philosophy of hope. She was editor of *Capital & Class* (2000–5) and is a member of the editorial board of *Work, Employment and Society*, and the scientific advisory board of *Revista Sociología del Trabajo* (Madrid). She is Research Partner of the Transnational Institute's 'New Politics Project' (2016–20, Amsterdam), and Creator and Convenor of the international research networks 'Labour in Transition' (LATII-Net) and 'Women on the Verge'. Her main publications include *The Labour Debate* (ed., Routledge, 2002), which has been translated into Turkish (2006) and Spanish (2009), *The Politics of Autonomy in Latin America: The Art of Organising Hope*

(Palgrave Macmillan, 2015), and *Social Sciences for An-Other Politics: Women Theorising without Parachutes* (ed.)(Palgrave Macmillan, 2016).

**Kieran Durkin** is a Marie Skłodowska Curie Global Fellow at the University of York, UK and the University of California, Santa Barbara, undertaking the first comprehensive study of the Marxist humanist tradition. His wider research interests centre around the exploration of the possibility of resurrecting a robust radical humanism for contemporary social theory and practice. The first manifestation of this research programme was his monograph *The Radical Humanism of Erich Fromm* (Palgrave Macmillan, 2014), which was shortlisted for the British Sociological Association's Philip Abrams Memorial Prize in 2015. He has also written the first dedicated study of the intellectual relationship between Erich Fromm and Theodor W. Adorno (*New German Critique*, forthcoming).

**Nick Dyer-Witthford**, an Associate Professor in the Faculty of Information and Media Studies at the University of Western Ontario, is the author of *Cyber-Marx: Cycles and Circuits of Struggle in High Technology Capitalism* (University of Illinois, 1999) and *Cyber-Proletariat: Global Labour in the Digital Vortex* (Pluto Press, 2015), and he also writes on the video and computer game industry, the uses of the internet by social movements, and theories of technology.

**Ingo Elbe** studied philosophy, history and social psychology at the Ruhr-Universität Bochum and obtained his doctorate in 2008 at the Free University of Berlin for a thesis on the reception of the work of Karl Marx in the Federal Republic. From 2007 to 2012 he was a lecturer at the Institute of Social Sciences of the Technical University of Braunschweig and from 2011 to 2014 at the University of Applied Sciences Düsseldorf. In 2015, he completed his habilitation at the Institute of Philosophy of the Carl von Ossietzky University Oldenburg with a thesis on paradigms of anonymous rule. Elbe was a visiting professor at the Department of Political Science of Gießen University in the winter semester 2017/18. He is a lecturer and research assistant at the Institute of Philosophy of the Carl von Ossietzky University Oldenburg and Chairman of the Bochum non-profit association Institute of Social Theory. Book publication include *Marx im Westen. Die neue Marx-Lektüre in der Bundesrepublik* (Berlin: Akademie Verlag, 2008) and *Paradigmen anonymer Herrschaft. Politische Philosophie von Hobbes bis Arendt* (Würzburg: Königshausen & Neumann, 2015).

**Frank Engster** wrote his PhD thesis on the subject of time, money, and measure. His areas of interest lie in the different readings of Marx's critique of political economy, the logic and history of money, and the connection between money, measurement, time, and (natural) science.

**Lars Fischer** is an Honorary Research Associate in the UCL Department of Hebrew & Jewish Studies. He has taught at King's College London, UCL and Cambridge. He served as Councillor of the Royal Historical Society from 2012–15 and as Secretary of the British Association for Jewish Studies from 2010–12. His publications include a monograph on *The Socialist Response to Antisemitism in Imperial Germany* (Cambridge University Press, 2007) and a short study on the nexus between antisemitism and racism, "A difference in the texture of prejudice". *Historisch-konzeptionelle Überlegungen zum Verhältnis von Antisemitismus, Rassismus und Gemeinschaft* (Grazer Universitätsverlag, 2016). He edits the website of the critical theories of antisemitism network and is founding editor of the *H-Commons network H-Music* (<https://networks.h-net.org/h-music>). He lives in Berlin.

**Benjamin Y. Fong** is an Honors Faculty Fellow at Barrett, the Honors College of Arizona State University, a director of the Society for Psychoanalytic Inquiry, and author of *Death and Mastery: Psychoanalytic Drive Theory and the Subject of Late Capitalism* (Columbia University Press, 2016).

**Samir Gandesha** is an Associate Professor in the Department of the Humanities and the Director of the Institute for the Humanities at Simon Fraser University. He specializes in modern European thought and culture, with a particular emphasis on the nineteenth and twentieth centuries. His work has appeared in *Political Theory*, *New German Critique*, *Constellations*, *Logos*, *Kant Studien*, *Philosophy and Social Criticism*, *Topia*, the *European Legacy*, the *European Journal of Social Theory*, *Art Papers*, the *Cambridge Companion to Adorno* and *Herbert Marcuse: A Critical Reader*, as well as in several other edited books. He is co-editor with Lars Rensmann of *Arendt and Adorno: Political and Philosophical Investigations* (Stanford University Press, 2012). He is co-editor with Johan Hartle of the 2017 books *Spell of Capital: Reification and Spectacle* (Amsterdam University Press) and *Aesthetic Marx* (Bloomsbury Press).

**Stefan Gandler** received his DPhil from Goethe Universität, Frankfurt in 1997. He is Professor of Social Theory and Philosophy at Universidad Nacional Autónoma de México, Universidad Autónoma de Querétaro. He has been an invited professor at Goethe Universität (2001–2), University of California Santa Cruz (2009–10), and Tulane University, New Orleans (2015–16). He is also a member of *Sistema Nacional de Investigadores*, Mexico (highest category 3). He is the author of *Peripherer Marxismus* (Argument 1999), *Frankfurter Fragmente* (Peter Lang 2013), *El discreto encanto de la modernidad* (Siglo XXI Editores 2013), *Fragmentos de Frankfurt* (Siglo XXI Editores 2009/2011/2014), *Materialismus und Messianismus* (Aisthesis 2008), *Marxismo crítico en México* (Fondo de Cultura Económica 2007/2009/2015), and *Critical Marxism in Mexico* (Brill/Haymarket 2015/2016), of academic articles in 7 languages and 15 countries, and the editor of *Modernidad y diferencia* (M.A. Porrúa 2010) and *Teoría crítica: imposible resignarse* (M.A. Porrúa 2016). Gandler works on the possibility of overcoming the Eurocentric limitations of the Frankfurt School, confronting its critical theory of society with contemporary socio-theoretical debates in Latin America, constructing a critical theory from the Americas.

**Stephan Grigat** is a Lecturer at the Institute for Political Science, the Institute for Philosophy, and the Institute for Jewish Studies at the University of Vienna. He is the 2017–18 Research and Teaching Fellow at the Centre for German Studies at the Hebrew University of Jerusalem, and was the 2016–17 Visiting Professor for Israel Studies at the Moses Mendelssohn Centre for European-Jewish Studies at the University of Potsdam, the 2015–16 Visiting Professor for Critical Theory at the Justus-Liebig University of Gießen, and the 2007–2017 Academic and Executive Director for the NGO ‘STOP THE BOMB – Coalition for a Nuclear-free and Democratic Iran’. He received his PhD in 2006 from the Free University of Berlin. He is the author of *Die Einsamkeit Israels. Zionismus, die israelische Linke und die iranische Bedrohung* (Konkret, 2014) and *Fetisch & Freiheit. Über die Rezeption der Marxschen Fetischkritik, die Emanzipation von Staat und Kapital und die Kritik des Antisemitismus* (ça ira, 2007). He is the editor of *AfD & FPÖ. Antisemitismus, völkischer Nationalismus und Geschlechterbilder* (Nomos 2017) and *Iran – Israel – Deutschland. Antisemitismus, Außenhandel und Atomprogramm* (Hentrich & Hentrich 2017).

**Richard Gunn** lectured on political theory at the University of Edinburgh from 1975 to 2011. He currently writes and researches on an independent basis. His personal website (<http://richard-gunn.com>) contains papers dating from the 1980s to the present.

**Andreas Harms** works as a lawyer in Berlin and has dealt intensively with legal theory and Marxist legal criticism.

**Johan Hartle** teaches Political Aesthetics at the University of Arts and Design, Karlsruhe, and Art Theory at the China Academy of Arts, Hangzhou. He has held research fellowships at the University of Amsterdam, the Hebrew University, Jerusalem, and the Università Roma Tre, and he has taught at the Rietveld Academy, Amsterdam, the Academy of Fine Arts, Münster/Westphalia, and several other art schools. His publications include *Der geöffnete Raum. Zur Politik der ästhetischen Form* (Wilhelm Fink, 2006) and *DADALENIN* (Edition Taube, 2013, edited with Rainer Ganahl), as well as *The Spell of Capital. Reification and Spectacle* (Amsterdam University Press, 2017) and *Aesthetic Marx* (Bloomsbury 2017), both edited with Samir Gandesha. Hartle's fields of research are Marxist aesthetics and cultural theory, the history of Red Vienna (Otto Neurath), Frankfurt School critical theory (Adorno/Benjamin; Negt/Kluge), the aesthetico-political (Rancière), and questions of contemporary political ontology (Spinoza).

**Lars Heitmann** studied Politics and Sociology at the University of Bremen. His publications include *Absoluter Wert und allgemeiner Wille. Zur Selbstbegründung dialektischer Gesellschaftstheorie* (transcript, 2005) and, as editor (along with Hanno Pahl), *Kognitiver Kapitalismus. Soziologische Beiträge zur Theorie der Wissensökonomie* (Metropolis, 2007) and *Gesellschaftstheorie der Geldwirtschaft. Soziologische Beiträge* (Metropolis, 2010). He was a scientific collaborator on the interdisciplinary study on the meaning of security at the Leibniz University of Hanover and associate lecturer at the Universities of Bremen, Hannover and Bielefeld. He currently contributes to the interdisciplinary research project Society after Money, University of Bonn.

**Christoph Henning** is a Junior Fellow at the Max Weber Centre for Advanced Cultural and Social Studies, University of Erfurt. His latest books include *Philosophy after Marx: 100 Years of Misreadings and the Normative Turn in Political* (Brill, 2014), *Theories of Alienation* (Junius, 2015, in German), *The Political Philosophy of Perfectionism* (Campus, 2015, in German) and *Marx und die Folgen* (Metzler, 2017). He has edited several volumes on political philosophy and related topics, the most recent (with Hartmut Rosa) being *The Good Life beyond Growth* (Routledge, 2017).

**Christoph Hesse**, Research Assistant in Media and Communication Studies at the Free University of Berlin, formerly lecturer in Film Studies at the University of Mainz and visiting scholar at the School of Visual Arts in New York, is currently working on an edition of the correspondence between George Grosz and Hermann Borchardt. He is the author of a comprehensive study of German exile cinema in the Soviet Union in the 1930s and 40s (*Filmexil Sowjetunion*, edition text+kritik, 2017), co-author of a textbook on the history of film styles (*Filmstile*, Springer VS, 2016, with Oliver Keutzer, Roman Mauer, and Gregory Mohr), and co-editor of a three-volume anthology of letters to Brecht in exile (*Briefe an Bertolt Brecht im Exil*, De Gruyter, 2014, with Hermann Haarmann). Since 2014, he is also a member of the editorial board of the Journal for Critical Social Theory and Philosophy (*Zeitschrift für kritische Sozialtheorie und Philosophie*, De Gruyter).

**Jan Hoff** is a historian and political scientist from Germany. He received his PhD at the Free University Berlin in 2009 and his Habilitation at the University of Kassel in 2016. His books include *Marx global* (Akademie Verlag, 2009) about the international reception of Marx's critique of political economy and *Befreiung heute* (VSA Verlag, 2016) about the history and present of theories of emancipation inspired by Marx. He has taught at the Universities of Innsbruck (Austria), Kassel (Germany) and Munich.

**Philip Hogg** studied Philosophy, Modern History and Political Sciences in Freiburg, Basle, and Durham. He wrote his doctoral thesis on Adorno's philosophy of language at Goethe University, Frankfurt. Since 2011 he has been a research assistant (since 2013 as a PostDoc) at Carl von Ossietzky University Oldenburg, where he is a member of the Adorno Research Center.

**Tom Houseman** is Senior Lecturer in Political Economy at the School of Social Sciences, Leeds Beckett University, UK. He completed his PhD, on Adorno and the concept of poverty, in 2011 at the University of Manchester, and teaches critical theory, political economy, development and decolonization. His research interests focus on Adorno and epistemology, especially concerning positivism and the politics of measurement in international development.

**Owen Hulatt** is a Lecturer at the University of York's Department of Philosophy. His research interests include Adorno, Spinoza, Aesthetics, and Social Theory. He is the author of *Adorno's Theory of Philosophical and Aesthetic Truth* (Columbia University Press, 2016).

**Anselm Jappe** is the author of *La Société autophage: capitalisme, démesure et autodestruction* (La Découverte, 2017), *Guy Debord* (University of California Press 1999; PM Press 2018), *Les Aventures de la marchandise. Pour une nouvelle critique de la valeur* (Denoël, 2003, La Découverte, 2017), *L'Avant-garde inacceptable. Réflexions sur Guy Debord* (Lignes, 2004), *Crédit à mort* (Lignes, 2011, translated as *The Writing on the Wall*, Zero Books, 2017), and *Contro il denaro* (Mimesis, 2013). He has contributed to the German reviews *Krisis* and *Exit!*, founded by Robert Kurz, which developed the 'critique of value'. He teaches in the Fine Art Schools of Sassari and has been Visiting Professor in various European and Latin American universities. He also lectured at the Collège international de philosophie (Paris).

**Scott Jenkins** is a director of the Society for Psychoanalytic Inquiry. He holds a BA from Reed College and lives in Philadelphia, Pennsylvania.

**Dennis Johannßen** is Visiting Assistant Professor of German Studies at Brown University. He studied Cultural Studies, German Literature, and Philosophy at Leuphana University Lüneburg and at the University of California, Berkeley, and he completed his Ph.D. in German Studies at Brown in 2017. He published articles on the Frankfurt School, Heidegger, Leibniz, and philosophical anthropology, and he is currently working on a book about rhetoric and transgenerational trauma in twentieth-century German literature and film.

**Julia Jopp** lives in Berlin. Her research focuses on materialist epistemology, especially the concept of validity in Hegel, Marx, Critical Theory, and the so-called New Reading of Marx.

**David Kaufmann**, a graduate of Princeton and Yale Universities, is Professor of English at George Mason University. He is the author of *The Business of Common Life* (1995), *Telling Stories: The Later Works of Philip Guston* (2010) and *Reading Uncreative Writing* (2017). He has published a number of articles on the Frankfurt School, literary theory and contemporary poetry, as well as a full century of reviews and features on everything from Bugs Bunny and Allen Sherman to contemporary utopianism and books about dogs. He lives with his family in the suburbs of Washington D.C.

**Sami Khatib** taught at Freie Universität Berlin, Jan van Eyck Academie Maastricht, American University of Beirut and Akademie der bildenden Künste Vienna. He is a founding member of the Beirut Institute for Critical Analysis and Research (BICAR). Currently, he is a postdoctoral researcher at Leuphana Universität Lüneburg. He is author of the book *‘Teleologie ohne Endzweck’: Walter Benjamins Ent-stellung des Messianischen* (Tectum, 2013).

**Amy Chun Kim** is a Postdoctoral Fellow in the Society of Humanities and History of Art at Cornell University. She holds a J.D. from Yale Law School and Ph.D. in the History of Art from the University of California, Berkeley. She has published essays on abstract art in the interwar period and on the problem of constitutional democracy in critical theory. Her book, *Ideologies of Pure Abstraction: Modernism between Paris and Moscow*, is forthcoming from Verso. She is also working on a new book project, *The Nomos of Urban Space*.

**Isabelle Klasen** lives in Mülheim an der Ruhr. She studied philosophy, German philology and sociology at the Ruhr-Universität in Bochum and works in the fields of aesthetics and critical theory. She also is an artist and co-founder of the art society ZeitgenossenSchafft. Currently, she works as a teacher and as a lecturer at the Ruhr-Universität and the Hochschule für bildende Künste in Essen.

**Lisa Klingsporn** works as a researcher at the chair for Political Theory and History of Ideas at Greifswald University, Germany. Her field of interest centers around critical theory and the relation of politics and law, as well as feminist theory, especially the work of Judith Butler. Her dissertation is concerned with the reception of Otto Kischheimer’s work in the US and Germany. In this regard she is currently studying the method of reception theory as an instrument to analyse political thought.

**Gudrun-Axeli Knapp** was Professor of Sociology and Social Psychology at the Institute of Sociology and Social Psychology, Leibniz University of Hannover. From 1999 until 2009, she was the Director of the Interdisciplinary Programme in Gender Studies at the Faculty of Philosophy. She has published articles on feminist issues in various journals and books and has edited and co-authored several books on developments in international feminist theory, recently with a focus on social theory and interlocking structures of inequality and dominance.

**Hermann Kocyba** is senior researcher at the Institute of Social Research and lecturer at the department of social sciences of Goethe University in Frankfurt. His dissertation on the problem of contradiction in Marx’ critique of political economy (“Widerspruch und Theoriestruktur. Zur Darstellungsmethode im Marxschen ‘Kapital’”) was supervised by Alfred Schmidt. It was Schmidt, too, who encouraged him to engage in the debate about Althusser, Lévi-

Strauss, Lacan, Foucault and Deleuze. As a result, however, Kocyba – unlike Schmidt – felt fascinated by the possibility to read them not as antagonists of critical theory, but as sources of a renewal of critical thinking. – His actual theoretical work is focused on the conflict between economy and democracy, his empirical research is focused on labor relations, working conditions and democracy deficits within European Institutions, especially within the European Central Bank.

**Elena Louisa Lange** has studied Philosophy and Japanese Studies in Hamburg and Zurich, where she received her PhD in 2011. She now works as Senior Research Associate and Senior Lecturer at the Institute for Asian and Oriental Studies, University of Zurich. Since 2009, she has taught classes on intellectual history, Japanese philosophy, Marxism, and modernity. She has co-edited books on modern Japanese philosophy (*Begriff und Bild der modernen japanischen Philosophie*, Frommann-Holzboog, 2014) and *Concepts of Philosophy in Asia and The Islamic World, Vol. 1: China and Japan* (Brill, 2018), published articles on recent debates in Marxian value theory, and is currently working on a critical study of the Japanese Marxist Uno Kōzō. She regularly gives lectures and conducts workshops on Marx's *Capital*.

**Richard Langston** is an associate professor of German literature at the University of North Carolina at Chapel Hill and the author of *Visions of Violence: German Avant-Gardes after Fascism* (Northwestern University Press, 2007), a co-editor of the *Alexander Kluge-Jahrbuch* (Vandenhoeck & Ruprecht, 2014–), the lead translator of Kluge and Negt's *History and Obstinacy* (Zone Books, 2014), the editor of *Difference and Orientation: An Alexander Kluge Reader* (Cornell University Press, 2018), and the author of a forthcoming monograph on Negt and Kluge entitled *Dark Matter, in Defiance of Catastrophic Modernity* (Verso).

**Claudia Leeb** is an Assistant Professor in political theory at Washington State University. She is the author of *The Politics of Repressed Guilt: The Tragedy of Austrian Silence* (Edinburgh University Press, 2018), *Power and Feminist Agency in Capitalism: Toward a New Theory of the Political Subject* (Oxford University Press, 2017), *Working-Class Women in Elite Academia: A Philosophical Inquiry* (Peter Lang Publisher, 2004), and *Die Zerstörung des Mythos von der Friedfertigen Frau* (Peter Lang Publisher, 1998). She has articles published in Political Theory, Contemporary Political Theory, Theory & Event, Perspectives on Politics, Constellations, Social Philosophy Today, The Good Society, Philosophy & Social Criticism, and Radical Philosophy Review. She has also contributed several book chapters to anthologies on early Frankfurt school critical theory.

**Carolyn Lesjak** is Associate Professor of English at Simon Fraser University and is the author of *Working Fictions: A Genealogy of the Victorian Novel* (Duke University Press, 2006). Currently she is completing a book on the material basis of character in Victorian literature and culture and its relationship to notions of the common(s).

**Klaus Lichtblau** Since 2004 Klaus Lichtblau has been a full Professor in the Department of Sociology, Goethe University in Frankfurt. He is author of *Theorie der bürgerlichen Gesellschaft* (Focus, 1978), *Kulturkrise und Soziologie um die Jahrhundertwende* (Suhrkamp, 1996), *Georg Simmel* (Campus, 1997), *Das Zeitalter der Entzweiung* (Philo, 1999), *Die Eigenart der kultur- und sozialwissenschaftlichen Begriffsbildung* (VS Verlag für Sozialwissenschaften, 2011), and *Zwischen Klassik und Moderne* (Springer VS, 2017). At present he is working on a book about the different versions of Max Weber's sociology.

**Christian Lotz** is Professor of Philosophy at Michigan State University. His main research area is Post-Kantian European philosophy. His book publications include *The Art of Gerhard Richter. Hermeneutics, Images, Meaning* (Bloomsbury Press, 2015/17), *The Capitalist Schema. Time, Money, and the Culture of Abstraction* (Lexington Books, 2014/16), *Christian Lotz zu Marx, Das Maschinenfragment* (Laika Verlag, 2014), *Ding und Verdinglichung. Technik- und Sozialphilosophie nach Heidegger und der Kritischen Theorie*, edited with H. Friesen, J. Meier, and M. Wolf (Fink Verlag, 2012), *From Affectivity to Subjectivity. Husserl's Phenomenology Revisited* (Palgrave, 2008), and *Vom Leib zum Selbst. Kritische Analysen zu Husserl und Heidegger* (Alber Verlag, 2005). His current research interests are in classical German phenomenology, critical theory, Marx, Marxism, aesthetics, and contemporary European political philosophy. His website is: <http://christianlotz.com>.

**Jordi Maiso** teaches philosophy at the Complutense University of Madrid. He studied at the University of Salamanca, where he received his doctorate with a thesis on Adorno. He has been research grant holder at the University of Salamanca, the Free University of Berlin, and the Center for the Research of Anti-Semitism at the Technical University of Berlin, and he has worked for several years at the Institute of Philosophy of the Spanish National Research Council (CSIC). His main interests are critical theory, critique of political economy, and analysis and critique of modern capitalist society, mainly focusing on issues such as the culture industry today, antisemitism and the politics of resentment, and the social constitution of subjectivity. He is member of the editorial board of the review *Constelaciones. Revista de Teoría Crítica* and a founding member of the Sociedad de Estudios de Teoría Crítica.

**Inara Luisa Marin** received her PhD in philosophy and psychology at the University of Paris Diderot (Paris VII), with a dissertation on psychoanalysis in Critical Theory—from Erich Fromm to Axel Honneth. She has clinical experience both in private practice and in public institutions, including the clinics at La Maison de Santé d'Épinay and the Association En-temps. In her postdoctoral research at the Brazilian Center for Analysis and Planning (CEBRAP), she addressed the possibility of actualizing the relation between psychoanalysis and critical theory through the concepts of anxiety and autonomy. She currently works as a psychoanalytic clinician, as a researcher – developing intersections among critical theory, psychoanalysis and feminist theories – and also as an associate professor the Philosophy Department of the State University of Campinas.

**Ansgar Martins** is a graduate student working on the philosophy of Siegfried Kracauer at Frankfurt University. His research focuses on Critical Theory, philosophy of religion, twentieth-century Jewish intellectual history, and Western esotericism. Among his publications is a monograph on Adorno's Jewish sources (*Adorno und die Kabbalah*, 2016). He is also a co-editor of *Der Schein des Lichts, der ins Gefängnis selber fällt. Religion, Metaphysik, Kritische Theorie* (Neofelis Verlag, 2018).

**Paul Mattick** is the author of *Social Knowledge* (Hutchinson, 1985), *Art in Its Time* (Routledge, 2003), and *Theory as Critique: Essays on Capital* (Brill, 2018), among other writings.

**Christos Memos** is a Lecturer in Sociology in the Department of Sociology Abertay University, Dundee. His research interests include critical social and political theory, political sociology, and economic sociology/critical political economy. He is the author of *Castoriadis and Critical Theory: Crisis, Critique and Radical Alternatives* (Palgrave, 2014).

**Cat Moir** is a Lecturer in Germanic Studies at the University of Sydney. She is an intellectual historian specializing in the history of ideas in the German-speaking world in the nineteenth and twentieth centuries. Her research is particularly concerned with how ideas shape and are shaped by political histories and ideologies. She is currently completing her first book, *Ernst Bloch's Speculative Materialism: Ontology, Epistemology, Politics, 1934–1939*, which explores the intersection between politics and metaphysics in Bloch's philosophy.

**Johannes von Moltke** is Professor of German Studies and Screen Arts and Cultures at the University of Michigan, where he teaches film, cultural studies, and critical theory. He is the author of *No Place Like Home: Locations of Heimat in German Cinema* (2005) and *The Curious Humanist: Siegfried Kracauer in America* (2015). Other publications include *Siegfried Kracauer's American Writings* (edited with Kristy Rawson, 2012), *Culture in the Anteroom: The Legacies of Siegfried Kracauer* (edited with Gerd Gemünden, 2012), and *Siegfried Kracauer's Grenzgänge: Zur Rettung des Realen* (edited with Sabine Biebl and Helmut Lethen, 2018).

**Frédéric Monferrand** holds a PhD in Philosophy from Nanterre University. His research interests focus on critical theory, critical Marxism, and social ontology. With Vincent Chanson and Alexis Cukier he co-edited 'La réification. Histoire et actualité d'un concept critique' (La Dispute, 2014).

**James Murphy** is currently writing his dissertation in the Philosophy Department at DePaul University and teaching as a Clinical Instructor of Business Ethics for the Department of Management at Loyola University. His research focuses on German Idealism, Marxism, early modern political theory, psychoanalysis, and fascism, and his other published work takes up the problem of violence in Frantz Fanon and the libidinal underpinnings of self-identity in Locke's social-contract theory.

**Patrick Murray** is Professor of Philosophy at Creighton University in Omaha, Nebraska. He is the author of *The Mismeasure of Wealth: Essays on Marx and Social Form* (Brill, 2016) and *Marx's Theory of Scientific Knowledge* (Humanities, 1988) and the editor of *Reflections on Commercial Life: An Anthology of Classic Text from Plato to the Present* (Routledge, 1997). He is working on *Capital's Reach: How Capital Shapes and Subsumes*, and with Jeanne Schuler he is co-authoring *False Moves: Basic Problems with Factoring Philosophy*. He is a member of the International Symposium on Marxian Theory (ISMT). His research interests centre on the relationship between capitalism and modern philosophy and include the British empiricists, Kant, Hegel, Marx, and the Frankfurt School.

**Mark Neocleous** is Professor of the Critique of Political Economy, Brunel University, and the author of numerous books, the most recent of which is *The Universal Adversary: Security, Capital and the 'Enemies of All Mankind'* (Routledge, 2016). His work revolves around the mechanisms for managing capitalist modernity through the logic of 'police', 'security', and 'war', and the relationship between this logic and reactionary shifts in political order. This also involves the nature of the political imaginary: how the state has been imagined through categories associated with human subjectivity, how enemies have been imagined as monstrous, and how we imagine our political relationship with the dead. He is currently working on the idea of security as an autoimmune disease.

**Alexander Neupert-Doppler** studied Philosophy, Political Science and History at the University of Osnabrück, where he received his doctorate in 2013 for his work on the concept of ‘state-fetishism’ in (neo-)Marxist theories of the state. He is the author of the books *Staatsfetischismus* (LIT 2013) and *Utopie* (Schmetterlingsverlag 2015). Together with Lisa Doppler he translated Herbert Marcuses Paris lectures into German language and edited them with Peter-Erwin Jansen under the title *Kapitalismus und Opposition* (2017). He is also the editor of *Konkrete Utopien* (2018). Neupert-Doppler works as an education officer for the Socialist Youth of Germany/Falcons in Hannover.

**Mathias Nilges** is Associate Professor of English at St. Francis Xavier University. His essays have appeared in collected editions and journals such as *American Literary History*, *Callaloo*, *Textual Practice*, and *Postmodern Culture*. He co-edited the books *Literary Materialisms* (Palgrave, 2013), *Marxism and the Critique of Value* (MCM, 2014), *The Contemporaneity of Modernism* (Routledge, 2015), and *Literature and the Global Contemporary* (Palgrave, 2017). He has completed a monograph titled *Still Life with Zeitroman: The Time of the Contemporary American Novel*.

**Pedro Rocha de Oliveira** holds a PhD in Philosophy from the Pontifical Catholic University of Rio de Janeiro. He is Associate Professor at the Philosophy Department of the Federal University of the State of Rio de Janeiro. His research interests include the critique of political economy, critical theory, the dialectics of capitalist development, early modernity and critical criminology.

**Karsten Olson** is a doctoral candidate at the University of Minnesota in the department of German, Scandinavian, and Dutch. He is the author of ‘Historical-Sociology vs. Ontology: The Role of Economy in Otto Kirchheimer and Carl Schmitt’s Essays Legality and Legitimacy’, published in the *History of the Human Sciences*, and his research interests include, critical theory, eighteenth-century moral and economic philosophy, democratic constitutional law, and surveillance and social control. His work-in-progress dissertation is a comparative study of figures of the crowd as they appear in philosophical and theatrical works of the eighteenth and twentieth centuries.

**Charles Prusik** received his PhD in Philosophy from Villanova University in 2017. His dissertation focuses on the critical theory of Theodor Adorno and the political economy of neoliberalism. His research specializes in the Frankfurt School, as well as the history of economics and sociology. He has publications in the areas of political economy and aesthetic theory, and is an instructor of philosophy and ethics.

**Anders Ramsay** was born in 1954 in Malmö, Anders Ramsay studied sociology, philosophy and economic history at the University of Lund, where he completed his Dr Phil (‘Upplysningens självreflexion. Aspekter av Thodor W. Adornos kritiska teori’); and in 1987–8 he was a DAAD scholar at the J.W. Goethe University, Frankfurt. He has undertaken various teaching assignments in sociology since 1995, including at the University of Örebro and the University of Gothenburg, and he has been a Senior Lecturer in Sociology at Mid Sweden University since 2017.

**Charles Reitz**, Professor of Social Science and Philosophy at Kansas City Kansas Community College (retired), has published *Philosophy & Critical Pedagogy: Insurrection &*

*Commonwealth* (Peter Lang, 2016), *Crisis and Commonwealth: Marcuse, Marx, McLaren* (Lexington Books, 2013), and *Art, Alienation and the Humanities: A Critical Engagement with Herbert Marcuse* (SUNY Press, 2000). With Peter-Erwin Jansen Reitz he co-edited and published *Herbert Marcuse's Paris Lectures 1974 at Vincennes University* (CreateSpace Independent Publishing Platform, 2015). Reitz studied at Canisius College (Buffalo, New York), the University of Freiburg, and the State University of New York at Buffalo (PhD, 1983). He served for five years as president of his faculty association (Kansas-NEA) and for five years as campus Director of Intercultural Education. He is a charter member of the International Herbert Marcuse Society and served for six years on its Board of Directors.

**Tommaso Redolfi Riva** is an independent researcher. He graduated in Philosophy at the University of Pisa and has a PhD in History of Economic Thought from the University of Florence. He won a grant from the University of Bergamo for a research on the Italian debate (1968–83) between philosophy and (critique of) political economy. He has published several articles on Marx, Marxisms, and the *Neue Marx-Lektüre*. He is the editor (with Riccardo Bellofiore) of *Ricerche sulla critica marxiana dell'economia* (Mimesis Edizioni, 2016), an Italian collection of the most important articles by Hans-Georg Backhaus.

**Josh Robinson** teaches Modern and Contemporary Poetry and Literary and Critical Theory in the Cardiff University School of English, Communication and Philosophy and is an affiliated professor of the University of Haifa. Ze co-edited *Marxism and the Critique of Value* (MCM, 2014) and *Contemporary Marxist Theory* (Bloomsbury, 2014). Hir recent publications include 'Speculation upon Speculation; or, a Contribution to the Critique of Philosophical Economy', in *Credo, Credit, Crisis: Speculations on Faith and Money* (Rowman and Littlefield, 2017), and *Adorno's Poetics of Form* in the SUNY Series in Contemporary Continental Philosophy (State University of New York Press, 2018).

**Matthias Rothe** is Associate Professor of German at the University of Minnesota. He works on critical theory, Brechtian and contemporary theatre, and expanded aesthetics. His publications include 'The Temporality of Critique. Bertolt Brecht's Fragment "Jae Fleischhacker in Chikago"', *Brecht Yearbook* 40 (2016); 'Sohn-Rethel, das Theoriekunstwerk', *Merkur* 70 (801) (2016), and *The Frankfurt School: Philosophy and (political) Economy* (co-edited with Bastian Ronge), *History of the Human Sciences* 29 (2) (2016).

**Eric-John Russell** is a doctoral candidate at the Centre for Research in Modern Europe Philosophy in London. His dissertation examines the ways in which Hegel's *Wesenslogik* and *Begriffslogik* together with Marx's critique of political economy appear within Guy Debord's *The Society of the Spectacle*. He is a founding editorial member of *Cured Quail*.

**Frank Schale** is Scientific Assistant at the institute for political science at Chemnitz University of Technology, Germany. He earned his doctorate with a thesis on Otto Kirchheimer. His research interests lie in the fields of intellectual history and history of science in the 20th century, especially in social and legal theory. He is currently working on a comparative study of changing political theory from German Empire to post-war Germany.

**Gerhard Scheit** is an independent scholar who lives in Vienna. He has published widely on Marxism, critical theory, and antisemitism, with a special interest in theatre studies and

musicology. Inter alia, he edited three volumes of the collected works of Jean Améry, published by Klett-Cotta. He co-edits the journal *sans phrase. Zeitschrift für Ideologiekritik*.

**Hans-Ernst Schiller** studied philosophy, history, sociology and German literature in Erlangen and Frankfurt (Magister in 1978 with a thesis about Marx; Dr Phil in 1981 with ‘Metaphysik und Gesellschaftskritik’ about Ernst Bloch, published in 1982). He has been Professor for Social Philosophy and Ethics at the University for Applied Studies in Düsseldorf since 1996. He published numerous articles and essays and the books *Bloch-Konstellationen. Utopien der Philosophie* (zu Klampen, 1991), *An unsichtbarer Kette. Stationen kritischer Theorie* (zu Klampen, 1993), *Die Sprache der realen Freiheit. Sprache und Sozialphilosophie bei Wilhelm von Humboldt* (Königshausen&Neumann, 1998), *Das Individuum im Widerspruch. Zur Theoriegeschichte des modernen Individualismus* (Frank&Timme, 2005), *Ethik in der Welt des Kapitals. Zu den Grundbegriffen der Moral* (zu Klampen, 2011), and *Freud-Kritik von links. Bloch, Fromm, Horkheimer, Adorno, Marcuse* (zu Klampen, 2017). Schiller is the co-editor of *Staat und Politik bei Horkheimer und Adorno* (Nomos, 2014) and the editor of *Staat und Politik bei Ernst Bloch* (Nomos, 2016). Recently edited with Rüdiger Dannemann and Henry Pickford: *Der aufrechte Gang im windschiefen Kapitalismus. Modelle kritischen Denkens* (Springer, 2018).

**Oliver Schlaudt** is Associate Professor at the Philosophy Department, University of Heidelberg. His main research interests centre upon the philosophy of the natural and the social sciences, with a special focus on measurement and quantification.

**Roswitha Scholz** is a Graduate of Social Pedagogy (FH). At university, she studied at the Faculty of Philosophy, focusing above all on sociology, pedagogy, and philosophy. She has published in numerous Left magazines and anthologies. Her book publications include *The Gender of Capitalism: Feminist Theory and the Postmodern Metamorphosis of Patriarchy* (Horlemann 2000/11), *Differences of the Crisis – Crisis of Differences: New Social Criticism in the Global Age in the Context of ‘Race’, Class, Sex, and Postmodern Individualization* (Horlemann 2005). Her areas of work include feminist theory and radical social critique of form, intersectionality theories of knowledge, and the ‘Zeitgeist’.

**Andrés Saenz de Sicilia** is a Visiting Lecturer in Philosophy at the University of Roehampton and Central Saint Martins as well as tutor at University College London (UCL). He received his PhD from the Centre for Research in Modern European Philosophy (CRMEP), Kingston University, London in 2016, for a thesis on the concept of subsumption in Kant, Hegel and Marx. He has written for *Radical Philosophy* and *Language Sciences*, and has a monograph on the topic of subsumption forthcoming with Brill in 2019. He has translated several essays by Bolívar Echeverría and is currently preparing the first English-language collection of Echeverría’s writings.

**Marcel Stoetzler** is Senior Lecturer in Sociology at Bangor University. He works on social and political theory, intellectual history, and historical sociology. His publications include *Beginning Classical Social Theory* (Manchester University Press, 2017), the edited volume *Antisemitism and the Constitution of Sociology* (University of Nebraska Press, 2014) and *The State, the Nation and the Jews. Liberalism and the Antisemitism Dispute in Bismarck’s Germany* (University of Nebraska Press, 2008). His work has been published in the journals *Sociological Inquiry*, *European Journal of Social Theory*, *Nations and Nationalism*, *Patterns*

of *Prejudice, Sociology, Journal of Classical Sociology, European Review of History, Philosophy and Social Criticism, Historical Materialism, Feminist Theory, The European Journal of Women's Studies, fast capitalism* and the blogs *OpenDemocracy* and *History & Policy*. He is an editorial board member of *Patterns of Prejudice* and a fellow at the Centre for Jewish Studies at the University of Manchester.

**Amy Swiffen** a faculty member in the Department of Sociology and Anthropology at Concordia University, Montreal.

**Michael J. Thompson** is Associate Professor of Political Theory, William Paterson University. He was educated at Rutgers College, Humboldt Universität, and The Graduate Center, City University of New York. His recent books include *The Domestication of Critical Theory* (Rowman & Littlefield International, 2016), *The Palgrave Handbook of Critical Theory* (Palgrave Macmillan, 2017, as editor), *Hegel's Metaphysics and the Philosophy of Politics* (Routledge, 2018) and *The Perversion of Subjectivity: The Eclipse of Autonomy in Modern Society* (Stanford University Press, 2018).

**Sebastian Truskolaski** is Assistant Professor in the Department of Germanic Studies at Trinity College Dublin. His articles on Adorno, Benjamin, Kafka and related themes have appeared in journals such as *German Life and Letters, Radical Philosophy*, and *Studies in Social & Political Thought*. Together with Jan Sieber he edited *Discontinuous Infinities*, a special issue of the journal *Anthropology & Materialism* on the philosophy of Walter Benjamin (2017). Together with Sam Dolbear and Esther Leslie he edited and translated *The Storyteller*, a collection of Benjamin's experimental prose (2016). Together with Paula Schwebel he is currently working on a translation of Adorno's correspondence with Gershom Scholem (forthcoming).

**Asha Varadharajan** is Associate Professor of English at Queen's University, Canada. She is the author of *Exotic Parodies: Subjectivity in Adorno, Said, and Spivak* (University of Minnesota Press, 1995). Her writing and public speaking engage the broad sweep of postcolonial, cosmopolitan, global, secular, rights, migration, and development debates. Her most recent essays have appeared in *Cultural Studies, College Literature, Kunapipi, University of Toronto Quarterly, TOPIA, CSSAAME*, and *Modern Language Quarterly*. She has contributed chapters to books on human rights, biopolitics, and intercultural discourse. The most fun she has had lately was writing her essay on Eric Idle for the *Dictionary of Literary Biography*.

**Alfonso Galileo García Vela** has a PhD in Sociology and he is a research professor at the Department of Postgraduate Studies on Sociology of the Instituto de Ciencias Sociales y Humanidades 'Alfonso Vélaz Pliego' of the Benemérita Universidad Autónoma de Puebla. In 2017 he was a Visiting Scholar at The Department of History in The University of Chicago. With Massimo Modonesi and María Vignau Loría, he co-edited *El concepto de clase social en la teoría marxista contemporánea* [The Concept of Social Class in Contemporary Marxist Theory] (UNAM-BUAP-La Biblioteca, 2017), and with Fernando Matamoros, Manuel Garza, and Eduardo Bautista Martínez, he co-edited *A Diez Años de la Lucha de la Asamblea Popular De Los Pueblos De Oaxaca (APPO)* [Ten Years after the Struggle of the Popular Assembly of the People of Oaxaca (APPO)] (UABJO-MAPorrúa, 2016). His fields of research and teaching are sociology, theories of the state, the critical theory of the Frankfurt School, modernity theories and Western Marxism.

**Marina Vishmidt** is a writer. She is a Lecturer in Culture Industry at Goldsmiths, University of London and runs a Theory seminar at the Dutch Art Institute. Her work has appeared in *South Atlantic Quarterly*, *Ephemera*, *Afterall*, *Journal of Cultural Economy*, *Australian Feminist Studies*, and *Radical Philosophy*, among others, as well as a number of edited volumes. She is the co-author of *Reproducing Autonomy* (Mute, 2016, with Kerstin Stakemeier) and is currently completing the monograph *Speculation as a Mode of Production* (Brill, 2018).

**Sergio Tischler Visquerra** is Research Professor at the Department of Postgraduate Studies on Sociology of the Instituto de Ciencias Sociales y Humanidades ‘Alfonso Vélaz Pliego’ of the Benemérita Universidad Autónoma de Puebla. He coordinates the research group ‘Subjectivity and Critical Theory’ with John Holloway. His books include *Memoria, tiempo y sujeto* (F&G, 2005), *Tiempo y emancipación. Mijail Bajtín y Walter Benjamin en la Selva Lacandona* (F&G, 2008), *Imagen y dialéctica. Mario Payeras y los interiores de una constelación revolucionaria* (F&G, 2009), and *Revolución y destotalización* (Editorial Grietas, 2013). He co-edited the books *What Is to Be Done? Leninism, Anti-Leninist Marxism and the Question of Revolution Today* (Ashgate, 2002, with Werner Bonefeld), *Marxismo Abierto. Una visión europea y latinoamericana. Vol. I, II* (Universidad Autónoma de Puebla/Herramienta, 2007, with John Holloway, Werner Bonefeld and Alberto Bonnet), *Negativity & Revolution. Adorno and Political Activism* (Pluto Press, 2009, with John Holloway and Fernando Matamoros) and *Zapatismo. Reflexión teórica y subjetividades emergentes* (Universidad Autónoma de Puebla/Herramienta, 2008/2015, with John Holloway and Fernando Matamoros).

**Frieder Vogelmann** is Postdoctoral Researcher at the Institute for Intercultural and Interdisciplinary Studies (InIIS) at Bremen University. He studied philosophy, mathematics, and cognitive science at the University of Freiburg before doing his PhD in philosophy at the University of Frankfurt. He is the author of *The Spell of Responsibility* (Rowman & Littlefield International, 2017) and co-editor of *The Birth of Austerity. German Ordoliberalism and Contemporary Neoliberalism* (Rowman & Littlefield International, 2017). He has worked on the history of the concept of responsibility, on Michel Foucault, and on the concept of critique in critical theory. Recent publications have appeared in the journals *Constellations*, *Distinktion* and *Deutsche Zeitschrift für Philosophie*. His current work is focused on the effectiveness of knowledge and a praxeological understanding of philosophy.

**Christian Voller** studied Cultural Studies, History and Literature in Frankfurt/Oder, Berlin, and Bochum. Currently he is working on his PhD on figures of the autonomy of technology (working title: ‘Die Selbstherrlichkeit der Technik. Ein Topos der Moderne’). His research focuses on Marxist philosophy, the Frankfurt School, critical theory, and reactionary modernism. Since 2014 he has been a Research Associate at the Institute of Culture and Aesthetics of Digital Media at Leuphana University of Lüneburg.

**Adrian Wilding** is a Fellow of the Großbritannien-Zentrum, Humboldt-Universität zu Berlin. He has written and translated widely in the field of critical theory.

**Michelle Yates** is Assistant Professor of Cultural Studies and Humanities in the Department of Humanities, History, and Social Sciences at Columbia College Chicago. She received her PhD in Cultural Studies from the University of California at Davis. Her work is situated in the environmental humanities at the intersection of critical theory, film and media, and gender

and sexuality. She has published in peer review journals such as *Antipode* and *ISLE: Interdisciplinary Studies in Literature and Environment*. She is also the Co-Director of the Chicago Feminist Film Festival.

**José A. Zamora** is a tenured Researcher at the Institute of Philosophy of the Spanish National Research Council (Madrid). He has directed numerous research projects, including the current Social Suffering and Victim Status, for which he is a principal researcher. He is president of the Iberoamerican Society of Critical Theory Studies and is co-editor of *Constelaciones. Revista de Teoría Crítica*. His publications include, among others: *Krise – Kritik – Erinnerung. Ein politisch-theologischer Versuch über das Denken Adornos im Horizont der Krise der Moderne* (Lit-Verlag, 1995) and *Theodor W. Adorno: pensar contra la Barbarie* (Trotta, 2004; Portuguese trans. Nova Harmonia, 2008), and he is editor of *Justicia y memoria: hacia una teoría de la justicia anamnética* (Anthropos, 2011) and *Las víctimas como precio necesario* (Trotta, 2016), among others. His areas of research are Critical Theory, philosophy after Auschwitz, social suffering, political theologies of modernity and political philosophy of migrations.

# Acknowledgement

We are indebted to Neil Larsen for involvement in the early stages of shaping the handbook and for his guidance and advice on the tradition of critical theory in Latin America and Wertkritik.

# Introduction: Contexts of Critical Theory

Beverley Best, Werner Bonefeld,  
and Chris O'Kane

Volume 3 is entitled 'Contexts of Critical Theory'. It brings together two distinct contributions. First, it discusses how critical theory emerged and developed in dialogue with and through the critique of other traditions and discourses, some of which it appropriated and transformed such as Marxism and psychoanalysis, others by way of challenging, critiquing or indeed polemically rejecting them. Second, it explores how critical theory lives on in a variety of contemporary contexts, likewise either by illuminating them critically, or negating them conceptually, or opposing them polemically. Volume 3 comprises three sections on the contexts of its emergence, the contexts of its later development, and finally on the elements of critical theory in the contemporary critique of capitalism and in contemporary social and political movements and theories, including feminism and gendered dynamics of social reproduction.

This Volume reaches back to Volumes 1 and 2 in that it provides theoretical context for the emergence of critical theory,

its further developments, and themes. The specific contributions and stance of critical theory developed through the critique of alternative approaches and by means of interdisciplinary argument and approach. Reality is always already-experienced reality mediated by thought. In this manner reality is a cognitive category that expresses social experience in theoretical terms. The dialogue with and critique of other traditions and discourses is therefore more than just a scholastic exercise of theoretical positioning and fine-tuning of a distinctive theoretical approach. Rather it is the development of theoretical understanding and insight into reality by means of immanent critique. It is through dialogue and critique that theory deepens its understanding of, and judgement on, the prevailing conditions of human-social existence, its conceptuality, dynamic and necessities, however contradictory and antagonistic this existence might be. The exploration of the contexts of critical theory thus reaches back to the key contributions in

Volume 1, adds an explanatory framework to the key themes of Volume 2, and establishes the contemporary character of the critical theory tradition, its rationale and immanent critique of contemporary social objectivity, probing the conditions of its 'transformability' [*Veränderlichkeit*], as Krahel put it.<sup>1</sup>

## PARTS AND CHAPTERS

Part VI, 'Contexts of the Emergence of Critical Theory', contains chapters that chart the development of critical theory as a critique of and in relationship to Marxism, Psychoanalysis, Council Communism, Positivism, Humanism and Existentialism, Neo-Kantianism, Sociology of Knowledge, art theory, Philosophy of Language, and Weberianism.

Frankfurt School Critical Theory emerged in the 1920s as a heterodox Marxist critique of political economy against the then-prevailing orthodoxy of the Second and Third Internationals. The characterization of orthodoxy has to do with its positivist manner of theorizing and its endorsement of historical materialism as the theoretical oracle of a supposedly quasi-mechanical unfolding of history, as Benjamin argued in his *Theses on the Philosophy of History* (1940). It was further characterized by its scientific approach to social objectivity, economic standpoint and political worldview. According to the then-orthodoxy, capitalism is the transition to socialism by means of the state. Jan Hoff's chapter expounds the critical theory critique of the Marxist orthodoxy and establishes its distinction from this tradition. The chapter conceives of critical theory as a reconstruction of Marxism as a critical social theory. The following chapter by Felix Baum introduces the council communist tradition and charts the significance of Karl Korsch's work for the founding of critical theory. Pollock in particular, and Horkheimer too, held close links to council communism and bemoaned its decline. Marcuse and Mattick, who was

a leading proponent of council communism, disputed the character of working class incorporation into the institutions of post-war capitalism. According to Marcuse, Mattick's objections to his *One-Dimensional Man* (1964) were the only 'solid' ones.

Anders Ramsay explores the dispute between critical theory and positivism, from Comte via the Marxist inclined Vienna Circle to the positivism dispute in the 1960s. For critical theory positivism obstructs a critical approach to society because it takes the social phenomena at face value without questioning its social contents. Yet, as became evident in the positivism dispute, positivism deals with posited reality, not idealized alternatives or fetishized social constructions, and for this reason positivism is an initial element of critical thought. Oliver Schlaudt explores the Frankfurt School's reading of sociology of knowledge, in particular the founding contribution by Karl Mannheim and his ostensibly Marxist-leaning theory of ideology. Schlaudt continues to explore Boltanski's more recent 'break' with Bourdieu, a rehearsal once again of the distinction between critical theory and sociology of knowledge. Sociology of knowledge attempted to understand the relationship between knowledge and society and establish the historical character of mind and life. It requires from the sociologist self-awareness of his or her standpoint of analysis. Critical theory rejects 'standpoint' thinking as ideological in character. For critical theory, reflexivity entails thinking through the social object whereas for sociology of knowledge it entails thinking about the object from different standpoints. Critical theory thus charges sociology of knowledge with providing 'sociological accounts' of society from a variety of plausible standpoints and perspectives, without in fact touching society by thought. Klaus Lichtblau deals with the importance of Weber for critical theory. Originally, Georg Lukács set out to connect Marx's analysis of the commodity with Weber's diagnosis of the age of bureaucratic rule. Later critical theory considered Weber's insights into instrumental

rationality as decisive for the patterns of rule and behaviour in developed capitalist societies. However, although much could be learned from Weber's sociology, its development of a formal framework of basic sociological concepts or types cuts short social critique. Lichtblau focuses on receptions and discussions of Weber in the works of Horkheimer, Adorno, and Marcuse, concluding with Habermas's studies of Weber's work.

Philip Hogg explores the connection between critical theory and the philosophy of language. The linguistic turn of critical theory is conventionally attributed to Habermas's communicative action, in which language and linguistic speech acts are the means of reason. However, the philosophy of language was decisive also for the critical theory of Benjamin and Adorno. In their understanding language is not a socially independent category of reason. They emphasize the historical dimension of language. For them language does not transform the social relations. It expresses them. The critique of society is therefore also critique of language. Inara Luisa Marin's chapter explores Freudian psychoanalysis and the emergence of Freudian Marxism within critical theory, especially in the work of Fromm and Marcuse. She also discusses the later reading of Freudian psychology by Honneth. She argues that in abandoning Freudian drive theory, Honneth falls into a biologism that ceases to provide an account of social relations. By doing so, Honneth undermines what is critical about critical theory and ends up reaffirming a normative model of social critique. For Marin a critical theory of psychoanalysis is fundamentally the analysis of the inner physiology of bourgeois society. Dennis Johannssen's chapter examines the engagements of critical theory with humanism and philosophical anthropology from Walter Benjamin to Ulrich Sonnemann's *Negative Anthropology* (1969). Although the members of the first generation rejected the concept of an invariant human nature, they developed compelling ways to analyze and interpret the restrictions

and limitations that antagonistic societies impose on the human being. In this context, critical theory proposes the concept of a 'negative humanism' that takes its cue not from what is essentially human, but from what is inhumane and has to be abolished. In contrast to Fromm and Marcuse, Adorno spurned anthropological assumptions of any kind, while interpreting in a dialectical fashion how human beings are restrained and negated under the conditions of repressive societies. *Negative Anthropology* demanded a 'permanent anthropological revolution', seeking to demonstrate the impossibility of any conclusive knowledge of the human being. In the final chapter of this part, Jasper Bernes examines the concept of participation in art in critical theory and assesses its significance for its aesthetics. Within critical theory and beyond, many of the debates about the status of art turn, explicitly or implicitly, upon this concept. Though the debates between Theodor Adorno, Walter Benjamin, Georg Lukács, Bertolt Brecht and others are often discussed through concepts such as autonomy, totality, and mimesis, this chapter argues that we might usefully reorganize our understanding of such debates by thinking through the links between aesthetic and political participation. Articulated in this manner, continuities between critical theory and other theorizations – such as those of the Situationist International – become visible. The chapter assesses the potent critiques of participation as an aesthetic and political ideology as well as the impasses that participatory theory and practice encounter over the course of the twentieth century. These impasses are shown to be especially prominent within the social movements and cultural practices of the new century.

Part VIII, 'Contexts of the Later Developments of Critical Theory', charts the development of critical theory in relationship to Situationism, Feminism, Autonomist Marxism, Neo-Hegelianism, Cultural Studies, post-colonialism, Open Marxism and post-Marxism. Anselm Jappe

interrogates the relationship between the concept of the 'culture industry', which was developed by Adorno and Horkheimer in the 1940s, and Guy Debord's 'spectacle', which he developed in his key situationist text *The Society of the Spectacle* (1967). According to Jappe the similarities between the two concepts are striking. Both concepts build on Marx's critique of the commodity form. The distinction between them has to do with the judgements about the critical role of art in bourgeois society. Whereas Debord argues that art can no longer play a critical role, and instead must either be 'realized' in everyday life or find itself transformed into another form of 'spectacle', Adorno holds that the 'autonomy' of art must be defended as a last refuge from the barbaric forces of capitalism. The following chapter by Vincent Chanson and Frédéric Monferrand explores the connection between autonomist Marxism and critical theory focusing on the early workerism of Raniero Panzieri and Mario Tronti and later elaborations by Antonio Negri. Both traditions are indebted to Lukács's *History and Class Consciousness* (1923) and its theory of reification, and develop distinct interpretations of this text, from Pollock to Panzieri and from Tronti to Adorno. They differ in terms of their accounts of the possibility of emancipatory praxis, which is most clearly brought out later in relation to Negri and Krahll whose texts nevertheless were most influential for the development of autonomy in the 1970s. Christos Memos introduces theoretical developments that fall under the title Open Marxism starting with Axelos's original use of the term in the 1950s, the work of Agnoli from the late 1960s to the later contributions by Simon Clarke, Werner Bonefeld, Richard Gunn and John Holloway. Open Marxism is distinguished by its negative critique of capitalist society. According to Memos, it continues to advance the critical purposes of the early Frankfurt School, both as critique of traditional theory, especially the prevailing positivism and scientism in the Marxist tradition, and as a project committed

to human emancipation. Memos emphasizes that both traditions are characterized by their understanding of class as a negative category of social practice. Christian Lotz presents a critical overview of central issues in 'Post-Marxism', which he discusses as a set of distinctive theoretical conceptions of the social and philosophical vision of society, theory, and politics. Lotz argues that the core of Post-Marxist thought can broadly be defined by how critical philosophers (such as Mouffe, Laclau, Honneth, Castoriadis, Lefort, Gorz, Negri, and Badiou) have moved away from a Marxian critique of political economy as a critical theory of constituted social forms. Instead, he explains, most Post-Marxists argue that the political sphere and a multiplicity of social struggles are more fundamental than the social-economic structure of society. It thus identifies the social subject as an independent agent that is capable of politics independently from the mode of production that governs its social reproduction.

Tom Bunyard examines the interrelations, echoes and distinctions that can be identified between critical theory and cultural studies. Concentrating primarily upon its British and American instantiations, the chapter outlines the emergence and development of cultural studies, and, drawing on Horkheimer's seminal definitions of 'traditional' and 'critical' theory, places its central ideas in relation to those of Frankfurt School Critical Theory. Gudrun-Axeli Knapp explores the early Frankfurt School tradition of critical theory in order to establish why it proved so cumbersome for a broader reception by feminists. She holds that for contemporary feminist critique a re-inspection of its theoretical stance might be fruitful. Leaving aside the continuing relevance of Adorno's and Horkheimer's epistemology and critical methodology, she emphasizes two specific reasons for this. Firstly, and in the light of contemporary socio-political transformations, there is its insistence on the 'innately coercive character of capitalist society' (Negt/Kluge). The Frankfurt School critique of capital as social

relationship is decisively non-economistic in character and allows for the elucidation of the psychodynamics of socially induced forms of 'feral self-preservation' (Adorno). Secondly, critical theory represents a historically oriented way of thinking that can account for its own function and situation in society.

Richard Gunn and Adrian Wilding place Axel Honneth's thought within the context of academic political theory's adoption and domestication of the notion of recognition. By exploring the meaning of recognition in Hegel and Marx, the traditional character of Honneth's version is indicated and recognition's original revolutionary implications highlighted. Reviving a revolutionary notion of recognition, the chapter concludes, may contribute to a much-needed renewal of critical theory. Asha Varadharajan interrogates the traditions of Frankfurt School critical theory in conversation with the contemporary discourse of human rights and the critique of development. In particular, she examines the concerns of post-colonial theorists, specifically Edward Said, and the critical theory of Theodor Adorno to ascertain distinctions and common grounds. She argues that in particular Horkheimer's and Adorno's *Dialectic of Enlightenment* (1944) offers valuable resources for posing the kind of questions that might animate the future of post-colonial studies.

Part VIII is the final part. It contains contributions about the elements of critical theory in the context of contemporary social and political movements and theories. In particular, it explores the manner in which critical theory operates as a force of negative reason within and against a variety of contemporary movements and contexts, Foucauldian notions of biopolitics, international relations theory, theories of space and urbanity, anti-imperialism, the internet and digital culture industry, environmentalism, feminist theories of social reproduction, false solidarity and rackets, capitalist crisis, contemporary anti-capitalism and social struggle. Frieder Vogelmann explores Foucault's concept of 'biopolitics'. Although the debate about this

concept is prolific, voices from the Frankfurt School tradition in critical theory have been absent from it. Vogelmann's chapter makes this good. He argues that Foucault's model of critique in which 'biopolitics' finds its conceptual home is very similar to that of the early Frankfurt School's model of critique. In a first step he relates Foucault's subtle distinction between a critical and a descriptive conceptualization of 'biopolitics' to Horkheimer's famous distinction between critical and traditional theory. He then connects Foucault's and Adorno's model of critique. Both, he argues, conceive of critique as a diagnostic practice of the present, which produces an *effective* knowledge about the conditions of emancipation. By paying attention to these affinities the understanding of the meaning of 'biopolitics' is changed from a conventional description of neoliberal governmentality towards critique of contemporary conditions. Shannon Brincat's chapter looks at the way in which the discipline of International Relations (IR) was subjected to a radical critique of its epistemology, ontology, and methodology, through the introduction of the themes and methods of the Frankfurt School in the 1980s. The theory that emerged, Critical International Relations Theory (CIRT), exposed the deep relation between the dominant approaches to IR theory and the interests of power they served in world politics. Many scholars in CIRT have since engaged with broader, normative questions of the purposes and interests of IR theory and the possibilities for advancing human emancipation. Brincat examines some of the key themes in this emancipatory approach based on intersubjectivity, dialogue, coexistence, and social equity, and identifies some of its limits, outlining the future tasks for critical theorizing in IR.

Greig Charnock explores geographical concepts of space and urbanity as categories of a critical social theory. The chapter introduces Neil Smith's notion of the production of space, which he develops in a dialogue with Alfred Schmidt's notion of the

production of nature. This sets the framework for the elaboration of Henri Lefebvre's theory of 'the production of space'. Lefebvre's theory parallels the critical theory of the Frankfurt School insofar as it subjects traditional theories of space and urbanity to critique on a human-social basis. The chapter expounds Lefebvre's contribution to the analysis of space as a social product, his theory of urbanization, and his writings on the politics of space, before reviewing significant criticisms of that contribution. For a critical theory of space and urban form Lefebvre's work is ground-breaking. The chapter by Marcel Stoetzler develops a critical theory of anti-imperialism. Frankfurt School critical theory aims to formulate a critique of the capitalist mode of production that includes the phenomena typically addressed as 'imperialism'. It rejects the traditional notion that 'imperialism' is an object in its own right that is to be distinguished from the capitalist mode of production, and that imperialism could thus be fought 'as such'. The chapter establishes the ways in which the concept of 'imperialism' is used in the writings of Marx as well as in the texts of some of the canonical writers of critical theory. It is argued that the critical theorists' Marxian usage of the term prevented the emergence of a concept of 'anti-imperialism' in their writings: 'imperialism' was for them, as for Marx, simply an aspect of capitalism. It thus criticized imperialism without recourse to the concept of 'anti-imperialism'. The chapter argues that the concept of 'anti-imperialism' implies the reification and fetishization of 'imperialism' as a seemingly independent term of social objectivity.

Nick Dyer-Witheford revisits Horkheimer and Adorno's account of the culture industry for a critique of today's *digital* culture industry. As Dyer-Witheford points out, Horkheimer and Adorno were writing in wartime North America where computers and networking were already emerging. Over the next fifty years, digital technologies incubated within the military-industrial-academic

complex, diffused into every aspect of production, circulation and financialization, and created a cybernetic capitalism. Early popular adoption of the Internet was disruptive for established media and seemed to contradict pictures of impregnable cultural control. Amidst a wave in networked counter-cultures and *alterglobalist* resistance, critics declared Horkheimer and Adorno's critique obsolete. However, after the dot.com boom and bust, Dyer-Witheford argues, internet capital has consolidated itself under the business model of Web 2.0, with Google and Facebook as its flagships. Search engines and social networks lead a new wave of commodification. Furthermore, this reaffirmation of capitalist cultural control is now itself being convulsed as the network outcomes of the financial crash of 2008 and the subsequent recession hit home. Michelle Yates contributes on Environmentalism and the Domination of Nature. She examines critical theory's conceptualization of capitalism's domination over nature, from Max Horkheimer, Theodor Adorno, and Alfred Schmidt to the work of contemporary scholars like John Bellamy Foster and Paul Burkett. In this literature, domination over nature is situated in social mediation, specifically that labor mediates and determines the human relationship to nature. She argues against the anthropological notion of labor, a notion of labor *per se*, which treats labor in capitalism one-dimensionally. In this context she explores insights from the works of Norbert Trenkle and Moishe Postone about the abstract character of labor in capitalism. It is in analysing this abstract dimension that the historically unique character of capitalism's domination over nature can be unveiled.

Roswitha Scholz explores the value form analysis of *Wertkritik* as a way of moving feminist critical theory forward from its focus on gender relations towards a theory of social form, exploring gender relations as form-determined. With recourse to the work of Horkheimer and Adorno she expounds the meaning of social form and explains it

as critique of patriarchy. Her contribution warns both against apologetic accounts of the Enlightenment that endorse equality without regard to specific social contents and against the tendencies of counter-Enlightenment thought in contemporary identity politics. She presents value form analysis as critique of identity. The chapter by Amy De'Ath makes connections between key works in queer Marxism, value-critique, and social reproduction feminism to argue that gendered social relations are form-determined by capitalism's imperative towards the production of surplus-value. De'Ath's contention is that analyses of gender based on a critique of reification, while productive in several ways, fall short of accounting for the relationship of gender to capital's general laws of motion, and thus for gender's continued existence. Instead of locating the production of gender at the level of exchange, De'Ath argues that gender's relation to capital accumulation must be conceptualized through the opposing and mutually constitutive dialectic of production and circulation. This point has significant consequences for social reproduction feminism because a focus on the reification of gender at the level of exchange necessarily excludes a consideration of how gender is produced through reproductive activities that are defined by their unpaid and unsubsumed status – in other words, their *dissociation* from exchange.

Gerhard Scheit assesses the contemporary meaning of the term racket. Critical theory adopted this term to designate the continued or reconstructed relations of personal dependency in conditions that had ostensibly abolished that dependency: the rule of law and the social relations of capitalism. The juxtaposition of rackets to the law also opens up a new perspective on the law. It is no coincidence that in the legal sphere the term racket refers to illegal economic practices and criminal methods that frequently run alongside contractual agreements or replace them and that must be combatted to maintain the rule of law. When the concept

of the racket is applied to the issue of state sovereignty, the very principle of legality is called into question, as was explained by Max Horkheimer in his analysis of societies 'that organize themselves along totalitarian lines'. Joshua Clover tackles the term subsumption, which is a term of art within Marx's critique of political economy that has had a complex reception history. It is subdivided into *formal subsumption* and *real subsumption*. These terms designate changes to the production process during the transition to, and ongoing development of, capitalism. These changes in the character of subsumption mediate the metamorphosis of human making into capitalist labor. Subsumption expresses the compulsion towards ever-greater productivity and accompanying changes, imparting a directionality to the history of capital often identified as modernization. Because of this historical dynamic, subsumption is intimately related to efforts at periodization that compass orienting strategies of accumulation, the changing relation between capital and labor, and the possibility of capitalist crisis. This entry provides an expanded definition, reviews publication and reception history, and assesses in particular the rise of 'subsumption narratives' after the Second World War wherein periodization, relations of production, and crisis come to the fore. It concludes with a theoretical synthesis of subsumption and capitalist crisis.

Amy Chun Kim writes about 'the figure of crisis' in critical theory. At its emergence the Frankfurt School sought to expose the contradictions of capitalism in the face of dramatic and potentially irreversible defeats of the labor movements in the West. The chapter surveys the understanding of 'crisis' in critical theory from its early conceptions via Habermas's arguments for greater democracy under welfare state capitalism to more contemporary contentions over where the focus of an adequate critique of capitalism should lie. The last is to be understood more generally as a debate between those interested in the 'value form' of social relations – the

abstract social logic of capitalism – and those working on the theorization of capitalist crisis. Chun Kim's overview underscores the relevance of the legacy of Adorno and Horkheimer today. How might their work be adapted to account for the inequality, precarity and stagnation that characterize the latest phase of capitalist development? Charles Prusik develops a critique of neoliberal economics through Adorno's concept of natural history [*Naturgeschichte*], in order to articulate the formation of what he defines as neoliberal 'second nature'. Through engagements with economic history, he demonstrates how the neoclassical, and neoliberal economic traditions have naturalized the concept of the free market in their relevant notions of value, efficiency, and competition. Drawing from Adorno's materialist engagements with Karl Marx and Alfred Sohn-Rethel, he develops the category of commodity fetishism in order to grasp the logic by which the self-regulating market appears as the subject of social coordination. Through engagements with Friedrich Hayek's critique of socialist calculation and the emergence of information sciences, he analyzes the reconceptualization of markets as information processors, as well as organisms of self-development. By delineating the logic by which the self-regulating market emerges as a natural process of immanent self-determination, Prusik's chapter demonstrates the way in which capitalist social relations and institutions of coercion are legitimated through their appearance as natural necessity.

The final two chapters explore contemporary arguments about human emancipation and conditions of misery. Sergio Tischler Visquerria and Alfonso Galileo García Vela focus on the contemporary potential of emancipation and revolution. Their argument emphasizes the importance of zapatismo as an alternative to classical ideas of revolution and emancipation. Within the Marxist tradition two distinct ideas of revolution are present; one stresses the importance of the party and taking state power, and the other rejects

the centralism of the communist party and focuses instead on the autonomy of struggles and the creation of new forms of social reproduction that are referred to as communizing. They develop their argument for autonomy through a critical reading of the works of John Holloway, Theodor Adorno, and Walter Benjamin. The final chapter is by Aaron Benanav and John Clegg. They conclude the *Handbook* by surveying the contemporary crisis of capitalism, both economic and political. The chapter specifies the ways in which our era differs from that of the post-war critical theorists, both in the contours of class struggle and the potentials for emancipation. On the basis of these differences, Benanav and Clegg question the usefulness of much of the theoretical legacy of the earlier generations of critical theorists. They offer their own twenty-first-century 'return to Marx', reading his original theory of immiseration (dismissed by many during the post-war economic boom) as a precocious theory of deindustrialization, and spell out the implications of this reading for the understanding of capitalist crises and the potentials of emancipation.

## Note

## ACKNOWLEDGEMENTS

We are most grateful to our translators who worked wonders in translating from German, French and Spanish into free-flowing English. Jacob Blumenfeld translated 'Feminist Critical Theory and the Problem of (Counter)Enlightenment in the Decay of Capitalist Patriarchy' by Roswitha Scholz, and 'Frankfurt School and Council

Communism' by Felix Baum. Adrian Wilding translated 'Critical Theory and the Philosophy of Language' by Philip Hogg, and 'Constellations of Critical Theory and Feminist Critique' by Gudrun-Axeli Knapp. Niall Bond translated 'Critical Theory and Weberian Sociology' by Klaus Lichtblau. Lars Fischer translated 'Rackets' by Gerhard Scheit. Memphis Krickeberg translated 'Workerism and Critical Theory' by Vincent

Chanson and Frédéric Monferrand. Donald Nicholson-Smith translated 'The Spectacle and the Culture Industry, the Transcendence of Art and the Autonomy of Art: Some Parallels between Theodor Adorno's and Guy Debord's Critical Concepts' by Anselm Jappe. Anna-Maeve Holloway translated 'On Emancipation ...' by Sergio Tischler Visquerra and Alfonso Galileo García Vela.

PART VI

# Contexts of the Emergence of Critical Theory

*This page intentionally left blank*

# Marx, Marxism, Critical Theory

Jan Hoff

In contemporary ‘Critical Theory’, Theodor is often seen as a ‘cultural critic’ or a ‘music theorist’, whereas Max is reduced to ‘having played the second fiddle’. This became especially clear during the ‘Adorno year’, 2003, when commentators in the (German) mainstream media wrote long articles about Adorno, which by and large ignored the relation of critical theory to Marxism. In distinction, this chapter elaborates the character of this relationship. It argues that at its foundation critical theory developed as a heterodox alternative to the positivist turn in Marxian thought.

This chapter is divided into seven sections. We first take a brief look at traditional Marxism, because this provides the historical background of critical theory – although this was a background Horkheimer referred to in a specifically critical way. Secondly we take a brief look at the Frankfurt Institute for Social Research in its ‘Grünberg era’. As a third point, the political views of the young

Horkheimer are summarized which leads us to the fourth point – Horkheimer’s critique of (and alternative to) Marxist historical determinism as formulated in *Dämmerung*.<sup>1</sup> In the fifth section the link between 1937 (‘Traditional and Critical Theory’) and 1867 (*Capital*) is examined. In the sixth section Horkheimer’s critique of a deterministic interpretation of history is taken up again, this time in the context of his 1940/42 essay ‘Authoritarian State’. Finally, we have to mention some of the post-World War II developments including the critical standpoint put forward by Adorno’s disciple Hans-Jürgen Krahl. The main aim of this final section is to show that critical theory was built, at least to a large extent, on Marx’s critique of political economy and a related political standpoint of emancipation. Therefore the points of critique towards traditional Marxism – especially concerning the deterministic and objectivistic view on historical development – must also be highlighted.

## TRADITIONAL MARXISM

Marxism as a relatively coherent 'scientific' world-view developed in the period that began with Friedrich Engels' work on his book *Anti-Dühring* (1876) and the 1891 Erfurt Program of the German SPD. Marxism, therefore, is something different from the theory of Marx, although the former was developed out of the latter in a rather complicated process.

While Marx's own field of study was very comprehensive, ranging from the obvious political economy to history and from geology to mathematics, Marx himself had never formulated and elaborated a positive system of knowledge like the one that was put forward by his friend Engels in *Anti-Dühring*. The spectrum of topics dealt with in *Anti-Dühring* range from 'philosophy of nature' and the principles of dialectics to political economy and socialism. This approach paved the way for the transformation of Marx's critical theory into a comprehensive and systematic world-view.

In the late 1870s and the 1880s – the period of the 'Sozialistengesetz' – this type of Marxism was successfully disseminated in the SPD, while proponents of positions close to Dühring, Lassalle or Anarchism were either pushed out of the party or relegated into the background. In Karl Kautsky's theoretical contribution to the Erfurt Program of 1891 Marxism was codified as the official party ideology. However, this programmatic claim of Marxist 'orthodoxy' coexisted with the pragmatic and reform-oriented part written by Eduard Bernstein.

The deterministic and objectivistic tendencies in the historical outlook offered by traditional Marxism have been criticized many times. We will later see how Horkheimer formulated a convincing critique of this feature of traditional Marxism in *Dämmerung*. His critical viewpoints concerning this question will be presented in detail in fourth and fifth sections of this chapter. Another element of traditional Marxism that was criticized by

Adorno and Horkheimer was the epistemological position of 'Abbildtheorie'. Other problematic features of traditional Marxism consisted in the reading of Marx's method of exposition in *Capital* as a 'logico-historical' progression, in the reformulation of Marx's crisis theory as a theory of breakdown (although many traditional Marxists did not share this reformulation<sup>2</sup>), and in the construction of a theory of immiseration of the working-class and a growing class polarization. (It was exactly this construction that Bernstein protested against in the 1890s 'Revisionismusstreit'.) However, the protagonists of 'critical theory' were not the first Marxist theorists that left aside the 'dialectic of nature'. The same can be said of Lukács' *History and Class Consciousness*.<sup>3</sup>

While it is true that the core member of the Frankfurt School paved the way for later productive developments in Marxist theory by critically questioning central elements of traditional Marxism, the relevancy of Adorno's and Horkheimer's thought to a reinterpretation both of Marx's critique of political economy and of the development of the capitalist mode of production should not be overstated. Perry Anderson's 1976 book, *Considerations on Western Marxism* is flawed in many ways,<sup>4</sup> but his critical assessment of Horkheimer and Adorno seems to point in the right direction: while Marx had moved from philosophy to politics and economic theory (or the critique thereof), Western Marxism developed exactly in the opposite direction. Horkheimer and Adorno played a considerable part in this theoretical reorientation towards philosophy, in turn reversed by some of their disciples like Backhaus and Reichelt who reoriented themselves towards a serious study of political economy and the Marxian critique of political economy.

In the context of these developments in Marxist theory and although Horkheimer and Adorno developed important criticisms of traditional Marxism, one considerable reservation has to be stated: they did not engage in the critique of political

economy producing anything comparable to Hilferding's *Finanzkapital* or Luxemburg's *Akkumulation des Kapitals*. The critique of political economy that is at the very centre of Marx's thought, did not figure prominently in their theoretical work. A systematic exploration of Marx's critique as a critical social theory was only developed by some of their students, including Alfred Schmidt and especially Hans-Georg Backhaus and Helmut Reichelt, from the late 1960s onwards.

### **THE FRANKFURT INSTITUTE: 'A MATERIAL BASIS FOR MARXIST RESEARCH'**

The year 1923 was one of political turmoil in Germany. It was not only the year of the Hitler-Ludendorff-Putsch, the failed coup that should have led to a 'March on Berlin' (inspired by Mussolini's 'March on Rome'). The year had started with the Occupation of the Ruhrgebiet. French and Belgian troops occupied Germany's industrial heartland, because Germany could not afford its Versailles Treaty reparation payments. Hyper-inflation reached its peak. The nationalist 'Black Reichswehr' attempted the Kùstrin putsch. The communists joined the SPD-led governments of Thuringia and Saxony, before these governments fell because of President Ebert's 'Reichsexekution'. The Reichswehr invaded these states in central Germany. The communist uprising in Hamburg failed. One of the results of the KPD's political disaster was the replacement of Brandler and Thalheimer as KPD-leaders in the following year, when the left faction of Ruth Fischer and Arkadi Maslow took over the party's leadership.

It was also an important year for Marxist theory in Germany. It was the year that Lukács' *History and Class Consciousness* as well as Korsch's *Marxism and Philosophy* were published. Both texts can be read against the background of a radically critical attitude

towards the way Marxism had been interpreted in the period of the Second International. An important event for the historical development of 'Western Marxism' is probably much less known in the English-speaking world: the 'Marxist Work-Week' [*Marxistische Arbeitswoche*] conference located in the Thuringian forest in spring 1923.

About 20 intellectuals (most of them quite young at that time) met to discuss Marxist theory and to prepare the foundation of a Marxist-oriented 'think tank' for social science. The meeting was initiated by Felix Weil who had planned to found and fund such an institute in the preceding year. Other notable participants were: Karl Korsch, who held a talk on Marxist methodology; two Hungarian Marxist philosophers, Georg Lukács and Bela Fogarasi; Korsch's and Lukács' Japanese disciple, Kazuo Fukumoto, who wrote texts on Marx's methodology and became the political leader of the Japanese Communist party after the return to his home country; and Karl August Wittfogel and Franz Borkenau, who later worked for the Frankfurt Institute. Adorno and Horkheimer were not present during this meeting, but Friedrich Pollock was.

When the Institute – autonomous in its research, but affiliated to the University of Frankfurt – was founded in 1924, the Austro-Marxist economic historian Carl Grünberg (editor of the *Grünberg-Archiv* journal and previously the teacher of Otto Bauer and Rudolf Hilferding) became the first Director. However, the Frankfurt Institute was not the first academic institute with a strong Marxist orientation. The Ohara Institute in Osaka that employed many young researchers with sympathies for Marxism, had been founded in 1919. The Moscow Marx-Engels Institute dated from 1923. During the 1920s the Frankfurt and the Moscow institutes cooperated within the project of the publication of the *Marx-Engels-Gesamtausgabe* (MEGA). The first volume of this edition, containing early Marxian writings up to 1844, was published 1927/29.

However, in historical retrospective, the late Horkheimer played down the role of the *MEGA* edition in the Institute's history.<sup>5</sup>

Grünberg himself was an outspoken proponent of Marxism and socialism. According to him, the Institute's main tasks should consist of: research on the workers' movement, but also on counter-revolutionary political movements; questions concerning social policy; and the intensive study of social theory, including socialist thought. Bela Fogarasi's letter to David Rjazanov, the Director of the Marx-Engels Institute, points to the way the Frankfurt Institute was perceived by the intellectuals of the left: 'The institute is a material basis for Marxist research'.<sup>6</sup> The Institute was inaugurated in June 1924.

The explicitly Marxist profile of the Institute's research agenda was emphasized by the employment of the Polish economist Henryk Grossmann, who had emigrated from his home country to Frankfurt in 1925. Grossmann's formulation of a Marxist theory of capitalist accumulation, crisis and breakdown was published as the first volume of the Institute's book series.<sup>7</sup> Grossmann remained a member of the Institute until 1948. Another notable Marxist-oriented researcher at the Institute was Friedrich Pollock, who had been a friend to Horkheimer since adolescence. Pollock had finished his PhD thesis on Marx's theory of money in 1923.<sup>8</sup> It is not easy to assess to what extent Adorno's reading of Marx was influenced by Pollock and Grossmann. Adorno's biographer Stefan Müller-Dohm argues that Adorno never had a close relation to Grossmann,<sup>9</sup> whereas Hans-Georg Backhaus remembers Adorno referring to him as 'my teacher'.<sup>10</sup>

In 1931, due to Grünberg's serious illness, Horkheimer took over the position of Director. Georg Klauda critically stated that under Horkheimer the Institute basically turned away from Marxism.<sup>11</sup> In my opinion, Klauda's statement is an exaggeration. However, similar to Korsch, Horkheimer was aware that Marxism had entered a period of a critical, crisis-ridden condition.

Apparently, around 1930 Horkheimer had planned to write a book with the title 'Crisis of Marxism'.<sup>12</sup> It should have been published as a volume of the Institute's book series, but this project was never realized.

## THE POLITICAL VIEWS OF THE YOUNG HORKHEIMER

What about the young Horkheimer's political views and his relation to Marx and Marxism? Considering that Alfred Schmidt is right to locate the decisive step within Horkheimer's transition to Marxism in the period of his 'Privatdozentur',<sup>13</sup> it should still be noted that Horkheimer's interest in and contact with Marxist theory can be traced back to a much earlier period of his life.

It is well known that both Horkheimer and Pollock were located in Munich during the November revolution and the brief period of the Bavarian soviet republic (1919). They shared sympathies with the revolutionaries, but refrained from direct political involvement.<sup>14</sup> Horkheimer's early relation to Marx and Marxist theory was reconstructed by Hans-Joachim Blank, a disciple of Adorno and Horkheimer.<sup>15</sup> According to this study, Horkheimer was a reader of revolutionary literature, like Bucharin's political writings, economic and political texts of Luxemburg, and declarations by Liebknecht and others. Adorno, who had been in contact with Horkheimer since the early 1920s, called Horkheimer a 'communist' in a 1924 letter.<sup>16</sup> At this time, Horkheimer devoted his energy to studying the materialist conception of history. In 1926 the *Marx-Engels-Archiv* journal published important extracts from the 'German Ideology'. Horkheimer was eager to read and use this new material for his lectures and writings.<sup>17</sup>

In 1928/29 Horkheimer worked on an epistemological critique of Lenin's *Materialism and Empiriocriticism*, pointing to the naïve shortcomings of the 'reflexion theory'

[*Abbildtheorie*] of consciousness (GS 2, ca. 180) – a criticism that can also be found in the late Adorno's *Negative Dialectics*. Besides this critical assessment of Lenin's philosophical work, Horkheimer offered a lecture on Hegel and Marx during the 1928/29 semester. Horkheimer also kept himself informed about the contemporary developments in Marxist theory, from Lukács' *History and Class Consciousness* to the Grossmann–Sternberg controversy on imperialism.<sup>18</sup>

Horkheimer's essay collection *Dämmerung*,<sup>19</sup> written between 1926 and 1931, suggests that Horkheimer had already occupied himself with the study of *Capital*, because he refers to the concept 'reserve army' and to Marx's theory of the rising organic composition of capital in the course of capitalist accumulation. The essay on the impotence of the German working-class contains an interesting assessment both of social democracy and of the German Communist Party.

Horkheimer argues that the German working-class faces the problem of its political impotence because of its inner division between the employed and the unemployed. This social and economic division seems to be reflected on the political level. In this context Horkheimer points to the rivalry between the reformist SPD and the revolutionary KPD. Horkheimer states that the former party suffers from the erosion of revolutionary consciousness, whereas the latter one lacks 'the knowledge to prepare the revolution on the practical and theoretical level'. However, 'within both parties exists a part of those forces the future of mankind depends on'.<sup>20</sup> Horkheimer's relation to the two rival working-class parties reflects a combination of sympathy and criticism. However, it is significant that Horkheimer did not deal with the emergence of political alternatives to the SPD and KPD, represented either by the smaller left-winged socialist parties like Sozialistische Arbeiterpartei Deutschlands<sup>21</sup> or KPD-Oppeposition,<sup>22</sup> or by even smaller groups like the council-communist 'Rote Kämpfer'.<sup>23</sup>

It should also be noted that Horkheimer used a pseudonym for *Dämmerung*. In 1938 Korsch wrote in a letter to the council communist Paul Mattick that Horkheimer 'developed closer ties to my, to our political standpoint. But he is not ready at all to represent his views in public'.<sup>24</sup> This statement could be related back to the cautious attitude Horkheimer had already developed by the 1920s and early 1930s.

## THE CRITIQUE OF DETERMINIST MARXISM, PART I (*DÄMMERUNG*)

One of the most outstanding essays in *Dämmerung* is titled 'Skepsis and Morality'.<sup>25</sup> As a background one should recall that historical determinism is a well-established feature of traditional Marxism. The Marxist orthodoxy of the SPD also left little room for the ethical component of Marxism. One of the most famous examples for this tendency is Hilferding's sentence that, 'like its theory, also the politics of Marxism is free from value-judgements'.<sup>26</sup>

Horkheimer's ideas differ from these viewpoints. He describes socialism as a better form of society. Its elements of construction are present in capitalism and the tendencies of capitalist development. However, socialism does not automatically 'follow' from the economic laws of capitalism (laws which were, by the way, explained correctly by Marx, in Horkheimer's view). According to Horkheimer, socialism is 'desirable', but because this social order does not 'follow' from Marxist theory, one has to 'fight' for it. Horkheimer stresses that – on the subjective level – the position of each person to socialism represents his/her degree of individual morality. When 'it is said that Marx and Engels did not "prove" socialism, not pessimism but the commitment to practice which theory needs, will follow. Marx unveiled the law of the dominant inhuman order, and pointed to the levers that must be used to create a more human one'.<sup>27</sup>

Later on in the text, Horkheimer points out the perspective of revolutionary practice: 'Should socialism be improbable, it will require an all the more desperate determination to make it come true. What stands in its way is not the technical difficulty of its implementation but the apparatus of domination of the ruling class'.<sup>28</sup> For Horkheimer the idea of the 'inevitable necessity' of the development to socialism seems to be rather harmful:

The illusion that the advent of the socialist order is of the same order of necessity as natural events is hardly less of a danger to correct action than is skeptical disbelief. If Marx did not prove socialism, he did show that capitalism harbors developmental tendencies which make it possible. Those interested in it know at what point they must attack.<sup>29</sup>

Horkheimer's own position can be explained as a practice-oriented alternative to the tendencies towards passivity within the 'revolutionary attentism' of the pre-1914 social-democracy.<sup>30</sup> 'The socialist order of society is not prevented by world history; it is historically possible. But it will not be realized by a logic that is immanent in history but by men trained in theory and determined to make things better. Otherwise, it will not be realized at all'.<sup>31</sup>

However, it should be noted that Horkheimer was not the only socialist in this time period who was very sceptical of the determinist view of history and the historical optimism attached to the notion of an inevitable 'necessity' of proletarian revolution. The left-wing socialist intellectual Walter Loewenheim (1896–1977) shared a similar kind of hesitation. The Dutch socialist Henriette Roland Holst (1869–1952) can also be named in this context as can the anarchist socialist Gustav Landauer (1870–1919), who might have made a strong impression on Horkheimer during the time of the Bavarian soviet republic.

Like Landauer and Holst, Horkheimer was an *ethical* socialist. This becomes obvious when he describes the contemporary social

structure of the capitalist society and includes striking remarks about the suffering of the exploited.

At the top, the feuding tycoons of the various capitalist power constellations. Below them, the lesser magnates, the large landowners and the entire staff of important co-workers. Below that, and in various layers, the large numbers of professionals, smaller employees, political stooges, the military and the professors, the engineers and heads of office down to the typists. And even further down what is left of the independent, small existences, craftsmen, grocers, farmers *e tutti quanti*, then the proletariat, from the most highly paid, skilled workers down to the unskilled and the permanently unemployed, the poor, the aged and the sick.<sup>32</sup>

But Horkheimer is well aware of the specifically international character of capitalist society, especially in its 'imperialist' phase of development. In the layer below

we encounter the actual foundation of misery on which this structure rises, for up to now we have been talking only of the highly developed capitalist countries whose entire existence is based on the horrible exploitation apparatus at work in the partly or wholly colonial territories, i.e., in the far larger part of the world. Extended regions in the Balkans are torture chambers, the mass misery in India, China, Africa boggles the mind. Below the spaces where the coolies of the earth perish [krepien] by the millions, the indescribable, unimaginable suffering of the animals, the animal hell in human society, would have to be depicted, the sweat, blood, despair of the animals.<sup>33</sup>

It might be more difficult to summarize Adorno's political position and its development during the 1930s. However, there are indicators that suggest he was a vehement critic of the Soviet Union from a Marxist standpoint. In a text documenting a discussion between Horkheimer and Adorno, the latter one pointed out in 1939 that he regarded as a necessity 'to achieve the better society by force in Russia'.<sup>34</sup> The context of this quote suggests that Adorno thought about a socialist-proletarian revolution against the Stalinist regime. Earlier he had complained (in a letter to Horkheimer) about the

‘unspeakable trial against the Trotskyists’, referring to the first Moscow Trial.<sup>35</sup> The music theorist Heinz-Klaus Metzger (1932–2009), who came in contact with Adorno only after the war, told me that he once asked Adorno about his opinion on the Soviet Union. Metzger remembered Adorno’s reply that one should read *La Révolution trahie*.

For Adorno, faithfulness to Marxism could not mean to preserve traditional Marxist theory. Faithfulness to Marxism must imply its radical development beyond the theoretical status quo: ‘Everybody says that Marxism is obsolete (*erledigt*). In contrast to this we say: no, it is not obsolete, but it is decisive to remain faithful to it. However, really being faithful to it entails the further development of the dialectical process (*die Weiterbewegung des dialektischen Prozesses*)’.<sup>36</sup>

### CRITICAL THEORY: THE LINK BETWEEN 1867 AND 1937

What is critical theory? In my opinion, Kornelia Hafner points in the right direction when she describes ‘Critical Theory’ as a ‘Deckbegriff’, a concept that ‘covers’, encompasses and develops the theoretical succession from Kant to Hegel and from Hegel to Marx.<sup>37</sup> ‘Critique’ in this context implies critique both of society [*Gesellschaftskritik*] and of consciousness [*Erkenntniskritik*], both rooted in Marx’s critique of political economy. It was Alfred Schmidt, a disciple of Horkheimer, who stressed the ‘double nature’ of Marx’s concept of critique which aims both at capitalist society and the forms of consciousness that spring from capitalist forms and relations.<sup>38</sup> In this context, Marx’s critique of fetishism, reification and inversion [*Verkehrung*] is of central importance, an importance Adorno recognized.

Among Marx-scholars it is very common to refer to Marx’s main theoretical project as ‘critique of political economy’, but it must not be forgotten that during twentieth-century

traditional Marxism this specifically ‘critical’ characteristic was often ignored – like in the Soviet Union and in Eastern Germany, where Marx’s project was sometimes superficially conceptualized as ‘Marxist political economy’ or even as the ‘political economy of the working-class’.<sup>39</sup> In his letter to Lassalle on 22 February 1858, Marx himself pointed out: ‘The work I am presently concerned with is a Critique of Economic Categories or, if you like, a critical exposé of the system of the bourgeois economy. It is at once an exposé and, by the same token, a critique of the system’.<sup>40</sup>

‘Traditional and Critical Theory’, 1937 – including the postscript – is a text of programmatic character. According to Horkheimer, theory in the traditional sense (as inaugurated by Descartes) shapes the specialized sciences in contemporary academic life and aims at sustaining the reproduction of contemporary society. This is Horkheimer’s most basic definition. In contrast, critical theory conceives man as the producer of historical forms of life in their totality, and aims at emancipation of man out of enslaving relations/conditions [*Verhältnisse*].<sup>41</sup> Interestingly, Horkheimer indicates that this critical theory was obviously not developed by himself, but had existed – as he wrote in 1937 – for 70 years.<sup>42</sup> This means Horkheimer’s locates the beginning of critical theory in 1867, the year volume one of *Capital* was published. On the next page, Horkheimer refers directly to the critique of political economy and to the element he regards at its core: the reversal [*Umschlag*] of economic concepts into its opposite, considering that ‘just exchange’ develops into injustice, ‘free economy’ into dominance of monopoly, productive work into the stabilization of relations that erode productivity, the reproduction of life into the misery of peoples. Marx’s *Capital* focuses on the historical development of totality. Horkheimer concludes that theoretical and practical critique of the economy, not critique of cultural decay, is the most important element of critical theory.<sup>43</sup>

It is not difficult to identify the element of crucial importance in Horkheimer's reading of Marx: the economy, at first connected to categories linked to freedom and equality, reverses [*schägt um*] in a sphere of relations shaped by exploitation and domination. There are striking examples of similar ideas in Marx, for instance in the *Grundrisse*, a text Horkheimer did not and could not know at this time. However, he probably knew this passage from *Capital*:

This sphere that we are deserting, within whose boundaries the sale and purchase of labour-power goes on, is in fact a very Eden of the innate rights of man. There alone rule Freedom, Equality, Property and Bentham. Freedom, because both buyer and seller of a commodity, say of labour-power, are constrained only by their own free will. They contract as free agents, and the agreement they come to, is but the form in which they give legal expression to their common will. Equality, because each enters into relation with the other, as with a simple owner of commodities, and they exchange equivalent for equivalent. [...] On leaving this sphere of simple circulation or of exchange of commodities, which furnishes the 'Free-trader Vulgaris' with his views and ideas, and with the standard by which he judges a society based on capital and wages, we think we can perceive a change in the physiognomy of our dramatis personae. He, who before was the money owner, now strides in front as capitalist; the possessor of labour-power follows as his labourer. The one with an air of importance, smirking, intent on business; the other, timid and holding back, like one who is bringing his own hide to market and has nothing to expect but – a hiding.<sup>44</sup>

One can go even deeper into the question of Horkheimer's reading of Marx's critique of political economy by referring to a text written two years before 'Traditional and Critical Theory'. The essay 'On the Problem of Truth' was published in the *Zeitschrift für Sozialforschung* and allows us to have a look at Horkheimer's concept of Marx's dialectical presentation in *Capital*.<sup>45</sup> Horkheimer claims that the specific nature of this dialectical presentation must correspond to the specific characteristics of its object. What Horkheimer, as a reader of *Capital*, has in mind is a stringent derivation within an interconnection of

economic categories leading from the abstract concept of the commodity to value, to money, to capital and its historical tendencies. However, the idea of a 'closed cognitive interconnection [of categories]' [*geschlossener gedanklicher Zusammenhang*], in which 'every thesis necessarily follows from the first premise' [*jede These notwendig aus der ersten Setzung*],<sup>46</sup> points to a rather one-sided interpretation of Marx's dialectical presentation of economic categories. Horkheimer describes Marx's method as an attempt to develop 'the theory as a logical presentation of immanent critique' [*die Theorie in der geschlossenen Gestalt eines in sich notwendigen Gedankengangs*]. According to Marx himself, this understanding is one-sided, at least if we take the term 'geschlossen' [closed] seriously. Marx was aware in his 'Urtext' from 1858 that 'the dialectical presentation is right only when it knows its own limits', which implies a break with the idea of a dialectical presentation of a context of logical immanence.<sup>47</sup> Of course, the Horkheimer of 1935 did not know the 'Urtext', which should only be published a few years later together with the *Grundrisse* manuscript. What exactly this sentence from the 'Urtext' means for the dialectical presentation in *Capital* has been discussed numerous times by Marx-researchers.<sup>48</sup>

Thus it becomes obvious that Frankfurt School 'critical theory' owes its theoretical fundamentals to Marx's critique of political economy. However, Adorno's and Horkheimer's engagement with Marx's works and manuscripts was limited in scope and intensity. During the 1930s Horkheimer participated in discussions on Marx's critique of political economy. Questions were raised concerning Marx's method, his theory of value, the theory of accumulation and crisis, and regarding the tendency of the profit rate to fall.<sup>49</sup> However, these discussions also illuminate the limits of Horkheimer's interpretation of Marx: neither did he comprehend the exact relation of the categories 'value' and 'exchange-value', nor was

he able to refute Engels' logico-historical interpretation of Marx's method of presentation.<sup>50</sup> Additionally, Korsch mentioned in a letter Horkheimer's 'illusionary' project [*Lebenslüge*] to write a definite book about dialectics.<sup>51</sup> Adorno's occupation with the commodity form (including his discussion with Alfred Sohn-Rethel<sup>52</sup>) is well known. But Adorno's understanding of Marx seemed to be limited, too – at least in the view of those readers of Marx who stressed the coherent interconnection of the critical analysis of economic categories within the three volumes of *Capital*. Hans Mayer complained in a letter to Horkheimer that he found a tendency in Adorno 'to isolate the problem of commodity fetishism out of the whole ("ensemble") of *Capital*, to make it absolute, and therefore to keep restricted to volume 1 instead of progression to the "total process"'.<sup>53</sup> In the 1970s, Hans-Georg Backhaus stated that Adorno and Horkheimer had 'reflected the foundation of critical theory within the labour theory of value only in a methodologically insufficient way'. Backhaus accused his teachers of having neglected Marx's value-form analysis. Backhaus continues: 'Despite the basic concepts of Marx's theory of value are conceived by Adorno and Horkheimer as transcending value-theory as an economic subject, they invested surprisingly little effort and precision into the interpretation of those concepts that were fundamental to "Frankfurt" sociology and philosophy'.<sup>54</sup> Even Dirk Braunstein, who attempts to (re-)construct 'Adorno's critique of political economy', has to admit that Adorno 'very often lagged behind [Marx's] economic knowledge'.<sup>55</sup>

Let us continue with another element of Horkheimer's 1937 essay, the relationship between the critical theorist and the proletariat.<sup>56</sup> The social situation of the latter constitutes no guarantee for a 'correct' conscience. Horkheimer reflects the social differentiations within this multi-layered class. Personal and class interests may fall apart in many proletarians. The theoretical practice of the critical theorist 'belongs' to the

development of the proletariat, Horkheimer continues; but the critical theorist should never give up a critical distance. So he 'thinks for' the oppressed [*unterdrückte Menschheit, für die er denkt*]. However, his thought can, at times, be in contrast to the assumptions that dominate the proletarians' views. The relationship between the critical theorist and the proletarian masses represents a complicated, mediated connection like a bond that sometimes is endangered to break. However, both types, the proletarians and the critical theorist, are needed in the socialist struggle for emancipation. The separating elements of this relation have nothing to do with the 'class origin' of the individual critical theorist, Horkheimer emphasizes. They reflect, instead, the complex social differentiation within the proletariat itself that can lead to the integration of considerable parts of the proletariat into the bourgeois social order. At this point one could remember Horkheimer's earlier text 'Die Ohnmacht der deutschen Arbeiterklasse' (see above).

At the end of his essay<sup>57</sup> Horkheimer makes another remarkable point. He constructs a community [*Gemeinschaft*] of critical theorists, striving for the radical transformation of society, tied together by 'uniting recognition' [*verbindende Erkenntnis*] and the bond of a 'strictest possible reception of critical theory' as the condition of the historical success of this transformation. Before the revolution [*vor dem allgemeinen historischen Umschlag*] truth can be in the hands of a small number of thinkers. But 'history teaches', Horkheimer continues, 'that such ostracized yet obstinate groups, even neglected by the oppositional parts of society, can become the leading force ["zur Spitze werden"] in the decisive moment, due to their deeper insight'.<sup>58</sup> It is likely that Horkheimer uses rather cryptic language to reaffirm the Bolshevik model of revolution, basing him on an 'avant-gardist' (or even 'sophocratic') theory of revolution. The party, however, seems to be substituted by the community of critical theorists.

In my opinion this conception of Horkheimer's has to be viewed critically. As Adorno's disciple Krahel (see below) would observe, neither Marx nor the Marxists have solved the problem of the conditions of constitution [*Konstitutionsbedingungen*] of revolutionary consciousness; they could not, therefore, convincingly formulate a mediation between the inner dynamic of the accumulation process of capital and the subjective preconditions for a revolutionary situation. Horkheimer, too, cannot provide an answer. Instead, he reformulates an avant-gardist conception of a hierarchical relation between conductors (the critical theorists) and the conducted (the proletariat).

In the year of publication of Horkheimer's essay he was also involved in intensive discussions on economic theory and the developments of contemporary capitalism. Together with Grossmann, Gumperz and Wittfogel, Horkheimer debated questions of monopoly capital, imperialism, and methodological aspects of *Capital*.<sup>59</sup> According to Horkheimer, monopoly capitalism should be understood as a concrete historical phenomenon, located on another level than the 'core structure' [*Kernstruktur*] of capitalism that was exposed by Marx in *Capital*. Unfortunately, Adorno did not participate in this debate. The discussion at the Institute on the most recent developments of capitalism (and of its relation to the state) was continued in the years to come, to a large extent inspired by Pollock.<sup>60</sup> This was reflected, for example, by a text of Horkheimer that we will look at now.

## THE CRITIQUE OF DETERMINIST MARXISM, PART 2 ('AUTHORITARIAN STATE')

Although it was already mentioned that Horkheimer did not produce anything comparable to Hilferding's *Finanzkapital*, he indeed devoted serious study to the recent

trends of capitalist development. In this context we can have a look at a rather short text written in the early 1940s, which is interesting insofar as it constitutes another critical assessment of determinist Marxism.

According to Horkheimer, the most recent phase of capitalism is shaped by the dominance of great trusts that gain independence from banks. The 'dorado' of bourgeois existence, the sphere of circulation, is losing importance. (This argument had already been made by Horkheimer in 'The Jews and Europe'.) In its stead, Horkheimer contends that the state has become increasingly important as an economic agency. He regards this new period as a capitalist system that has successfully transcended the 'market economy'. The modern and repressive 'authoritarian state' forms the decisive element of 'state capitalism'. Surplus value is created by exploitation of workers under state control, but profit is still appropriated by the class of industrialists.

This 'state capitalist' form is different from the social formation Horkheimer calls 'integral etatism', though Horkheimer also sees some similarities. It is obvious that in this context he has the Soviet Union in mind. Private capitalism is abolished, but the immediate producers remain wage labourers, exploited proletarians. The factory regime has spread over society as a whole. This form of bureaucratic dominance is repressive but instable, because the existence of this bureaucracy forms an obstacle to economic productivity.

Horkheimer's analysis of both 'state capitalism' and 'state socialism' (another term he uses for 'integral etatism') serves as the background for another critical commentary on the determinist conception of history. On this point, the text 'Authoritarian State' is a continuation not only of 'The Jews and Europe', but also of *Dämmerung*: a central aspect of traditional Marxism is criticized once again.<sup>61</sup> Horkheimer calls the assumption that history develops according to a 'fixed' law a 'metaphysical error'. This criticism is directed at the schematic 'fatalism' of both

Hegel and Marx. The deterministic conception of history differs both from the revolutionary's viewpoint and from the perspective of Critical Theory. From the standpoint of the revolutionary, social development is always 'mature' enough for significant change. The standpoint of critical theory must be the confrontation of history with the possibilities concretely visible in historical development.

### POST-WORLD WAR II POLITICAL POSITIONS AND THE NEW LEFT CRITIQUE OF THE FRANKFURT SCHOOL

The relation of the New Left, especially the West German New Left, to Adorno and Horkheimer has been discussed before.<sup>62</sup> The critique should be interpreted against the background of strong similarities between critical theory and New Left Marxism. There is little doubt about the strong influence of critical theory on the understanding of Marxism among New Left theorists. This concerns, among other aspects, the critical attitude towards the 'Diamat' orthodoxy and towards an epistemologically questionable 'Abbildtheorie', which considers theory a mirror image of reality.

A dialogue between Horkheimer and Adorno from 1956 shows that the founders of critical theory had not given up discussing political questions after World War II.<sup>63</sup> On the one hand, Adorno states that we 'do not live in a revolutionary situation, and actually things are worse than ever. The horror is that for the first time we live in a world in which we can no longer imagine a better one'.<sup>64</sup> On the other hand, Adorno still emphasizes that he always wanted to 'develop a theory that remains faithful to Marx, Engels and Lenin'.<sup>65</sup> Yet despite his plea for a socialist party 'with a strictly Leninist manifesto',<sup>66</sup> Adorno was very well aware that theory should not be subordinated to a mere instrument of praxis. There were also several occasions in

the decade to follow when Adorno tried to explore the complex relationship of theory and praxis.<sup>67</sup> For Adorno, praxis will suffer if the autonomy of theory is denied.

However, the elements of political pessimism in Adorno's and Horkheimer's thought were stronger than ever in the post-World War II period of capitalist restauration and restabilization. While Horkheimer polemized against left radicalism [*gegen den Linksradikalismus*],<sup>68</sup> Adorno begins his 'Negative Dialectic' with the statement that 'the moment of realization of philosophy was missed',<sup>69</sup> implying that the Marxian idea of 'realizing' philosophy in the context of revolution<sup>70</sup> is no longer a political possibility.

On the purely theoretical level, Horkheimer maintained a certain degree of 'faithfulness' towards Marx and his theory. In a 1968 interview he stated: 'Today I still think that we cannot really understand society, how it exists without that theory, without Marx's analysis'.<sup>71</sup> Backhaus' notes originating from Adorno's 1962 lectures and Adorno's 1965 discussion with Sohn-Rethel show that Marx's theory of value was still of utmost importance for the late Adorno's views on capitalist society.<sup>72</sup> There can be no doubt about the strong impression of Adorno's reading of Marx on the young generation of leftist theorists in Frankfurt. For example, Ernst Theodor Mohl remembers when, as a young social scientist, his view on Marx fundamentally changed after Adorno introduced him to the chapter 'The Fetishism of Commodities and the Secret thereof'.<sup>73</sup>

On the political level, however, and especially concerning questions of international politics, Horkheimer became more and more supportive of the bourgeois order. In 1967, Horkheimer put American war efforts, including the contemporary one in Vietnam, into the context of a 'defence of human rights'.<sup>74</sup> During the 1960s, the fear of a Chinese expansion became even irrational: Horkheimer talked about 'the Chinese on their way to the Rhine' and 'the hell of Chinese global domination';<sup>75</sup> Adorno explained his terrible

nightmare about ‘countless people [...] a mixture of riff-raff and monstrosities’ with the dangerous possibility that a pro-Chinese wing of the Italian Communist Party might emerge.<sup>76</sup>

With the advent of the student revolt in 1967/68 a completely new situation emerged. Adorno was now criticized by New Left theorists either related or unrelated to critical theory, by some of his own disciples as well as by opposing intellectuals like the libertarian socialist Johannes Agnoli.<sup>77</sup> Adorno’s relation to the student revolt could be described as rather ambivalent.<sup>78</sup> Adorno did not surrender to the political pressure put on him by his students. Therefore, he did not participate in their political activism. However, his opinion towards the revolt was not hostile, either; at least not until the escalation of the conflict during the occupation of the Frankfurt Institute.<sup>79</sup> Adorno simply would not and could not accept the verdict of ‘resignation’ that his ‘activist’ critics brought up in this situation. ‘We older representatives of what the name “Frankfurt School” has come to designate have recently and eagerly been accused of resignation’, Adorno complained shortly before his death in 1969. ‘Whoever only thinks, removes himself, is considered weak, cowardly, virtually a traitor’.<sup>80</sup> According to Adorno, the misguided political ideal of a unity of theory and practice quickly turns into ‘a prohibition of thinking’.<sup>81</sup> There can be no doubt, in my opinion, that Adorno was absolutely right to defend himself concerning this issue.

After Adorno’s death, the Frankfurt student leader and Marxist theorist Hans-Jürgen Krahl published his text ‘The Political Contradiction in Adorno’s Critical Theory’.<sup>82</sup> Krahl was both a disciple and a critic of Adorno. Krahl reflects how much the student movement owes to Adorno and his historical role. The criteria of emancipation; the theory of mystification, reification and fetishism; the emancipatory core of Marx’s critique of political economy: all these aspects were taught by Adorno. However, Krahl criticizes Adorno both on a theoretical and on a

practical/political level. Firstly, he charged that by theoretically abstracting from historical praxis, late critical theory was in danger of developing back into traditional theory and its forms of contemplation. Secondly, he argued that since Adorno was deeply shaped by the experience of fascism, both in his biography and in his thought, he was fearful of the danger of a fascist reassertion of monopoly capitalism and that this prevented him from supporting political practice directed against monopoly capitalism: the socialist attack from the left would trigger fascist terror as a response. At this point, Krahl continues, the political confrontation between Adorno and his students followed.

After Adorno’s and Horkheimer’s deaths a decisive bifurcation in Frankfurt School thought took place. Separated from and in opposition to Habermas’ theory,<sup>83</sup> a Marxist wing continued to exist and tried to develop Marxist theory further as critical to social theory. In this context the work of Alfred Schmidt and Oskar Negt, and Hans-Georg Backhaus and Helmut Reichelt is the most important.

The chapter argued that the founders of ‘Critical Theory’, especially the younger Horkheimer, were heavily influenced by Marx himself and by Marxism. Horkheimer explicitly criticized certain key aspects of ‘traditional Marxism’. His critique focuses on epistemological questions and especially the then-prevailing Marxist conception of historical development. Indeed, Horkheimer was of central importance for the later development of a critical theory reading of Marx’s critique of political economy, which elaborated central themes of Marx’s thought through his and Adorno’s reading of Marx.

# The Frankfurt School and Council Communism

Felix Baum

Translated by Jacob Blumenfeld

If the Frankfurt School, as Alfred Sohn-Rethel maintained, ‘derived from the German revolution that never happened’, which after the First World War ‘should have occurred and tragically failed’ (Sohn-Rethel, 1990: 10; 1978: xi et sq.), then certain affinities with German–Dutch council communism are to be expected. Council communism emerged in the post-war turmoil as an attempt to avert the failure of the revolution, which brought it into opposition not only to social democracy, but also to Bolshevism shortly thereafter. Following a brief period of mass appeal, council communism shrank to a theoretical enterprise, which, like the Frankfurt School, was still capable of critically comprehending the catastrophic course of history, yet could no longer intervene in it. Like the critical theory from Frankfurt, council communist critique became a message in a bottle. Its guiding principles – rejection of Leninism and all purportedly socialist regimes, self-activity of the proletariat, the construction of a society without wage labour and the

state – gained importance again around 1968. Even if a councilist revolution in the form envisaged a hundred years ago is not to be expected, many reflections of its advocates still hold true.

Council communists rarely appear in literature on the Frankfurt School. One exception is Slater (1977), according to whom one may ask, ‘not without some justification (...) whether Council Communism could perhaps be a concrete embodiment of many of the principles of the Frankfurt School’ (73). As a follower of Lenin, Slater does not mean this as a compliment. He depicts the council communists as blue-eyed spontaneists, who ‘similar to Horkheimer (...) did not point out the soviets’ own responsibility for the collapse of the revolutionary wave of 1918–19’. The Frankfurt School, like the council communists, ‘did not affirm the Leninist concept of the party (...) absolutised the soviet-system, and waited for a new revolutionary upsurge’. However, closer cooperation failed due to the ‘idealism’ (75) of the Frankfurt School.

Although biased and partly just wrong – the council communists did not idealize the actual councils and the Frankfurt School did not outright reject Lenin's concept of the party – Slater strikes upon an affinity also reflected in their interactions. In the 1930s and 1940s, Paul Mattick<sup>1</sup> and Karl Korsch,<sup>2</sup> the two driving forces behind *International Council Correspondence (ICC)*,<sup>3</sup> a council communist journal published in America, often dealt with the exiled Institute for Social Research (IfS) and wrote smaller contributions for the *Zeitschrift für Sozialforschung (ZfS)*. Korsch even hoped with good reason to collaborate on the book about dialectics planned by Max Horkheimer, which eventually became *Dialectic of Enlightenment* (1944). Ultimately, however, the Institute always kept their distance from the left-wing radicals. Nevertheless, Horkheimer's (1940) essay 'Authoritarian State', a summary of council communist views enriched with reflections on the philosophy of history, testifies to their influence. The fact that this remained an intermezzo was not due to any Frankfurt 'idealism', but to the further course of history. In the early 1940s, the mass murder of European Jews became the centre of reflection for the Frankfurt School. While bourgeois democracy appeared as a refuge for freedom, their hopes for proletarian revolution vanished. Twenty years later, the paths of the two tendencies crossed again when Mattick started a controversy with Herbert Marcuse over his book *One-Dimensional Man* (1964).

In the following, the council communist current from 1918–19 until the 1970s will be presented. The Frankfurt School enters at the point when they come into contact with them. Finally, a few general considerations about the relationship between the two tendencies are made.

## **COUNCILS AS REALITY AND AS PROGRAMME**

Appearing for the first time in the Russian revolutions of 1905 and 1917, workers' and

soldiers' councils shook the German Reich from November 1918 onwards. Starting in Kiel, where sailors refused to fight in a hopeless battle, the councils soon seized the entire country, briefly wielding de facto power; the German Empire collapsed. But as easily as the councils gained power, so could the social democrats wrench it back again. Their representatives had the majority in the councils, which already in December 1918 renounced power in favour of electing a National Assembly. The councils were integrated into the state as industrial committees with a mere right to co-determination.

For the left radicals who later became known as council communists, the councils still held out promise for a revolution that would not be carried out by workers' organizations as a political seizure of power, but by the workers themselves. Not by decrees of nationalization, but by means of collective direct action they attacked the system of property; it became conceivable to abolish the separation of producers and means of production, not just juridically but factually. Established on the basis of production, but capable of managing all of society, the councils thus pointed beyond the separation between politics and economics, characteristic of bourgeois society and the labour movement within it. They were considered a bridge to a future in which an egalitarian-horizontal system of directly elected and recallable delegates would replace the state (Pannekoek, 1947: 44–50). What had remained embryonic in the Paris Commune seemed to have gained a much more favourable foundation in the age of large-scale industry.

With this programme, the council communists went far beyond the actual council movement. Emergent council communism was never a mere reflection of actual practice; rather, it wanted to overcome the movement's weaknesses. The council communists attributed the councils' voluntary renunciation of power to a lag of consciousness behind what had become possible and necessary. Although large parts of the proletariat had

demonstrated an ability to act autonomously, '[p]arliamentary and Trade Union traditions' were still too strong (Canne Meijer, 1938: *New Conceptions*, para 3). They had to be attacked.

The conflict between new forms of struggle and traditional ones also came to the fore at the founding congress of the KPD, the Communist Party of Germany, at the end of December 1918. Against the will of Rosa Luxemburg, the delegates decided to call for the withdrawal from the trade unions and boycott the elections to the National Assembly. They counted on the nascent autonomous factory organizations to be the incubators of a council revolution. The spokesperson of this line was Otto Rühle,<sup>4</sup> later one of the most famous council communists. However, under the growing influence of Moscow, the KPD leadership rapidly distanced itself from the left radical consensus and in autumn 1919 excluded those adhering to it, thus losing about half its 80,000 members. In April 1920, the excluded members founded the Communist Workers' Party of Germany (KAPD).

With initially 38,000 members, the KAPD already marked the international zenith of the councilist movement. Together with its smaller sister party KAPN in the Netherlands, it briefly tried to form a left radical International in opposition to Moscow – with little success. The party was a manifestation of the fact that a relevant minority of workers wanted to push the social-democratically pacified revolution of 1918 further. The revolutionary factory organizations, which in 1920 formed the General Workers' Union (AAUD) closely linked to the KAPD, temporarily included 300,000 workers. There were frequent revolts and short-lived 'council republics', for instance, in Bremen and Bavaria. Not by chance, the KAPD was founded immediately after the Kapp-Putsch of March 1920, during which the workers, mobilized by the trade unions to a general strike, continued the struggle in places even after the defeat of the anti-Republican

putschists. The 50,000 armed workers of the Red Ruhr Army had to be put down by the armed forces of the Weimar Republic in tough street battles.

Council communism was the culmination of a critique of the old workers' movement that can be traced back to the era before 1914. Some of its leaders, such as Anton Pannekoek,<sup>5</sup> Hermann Gorter<sup>6</sup> and Rühle had already been active in pre-war social democracy, increasingly pushing against its organizational form, without questioning social democracy as such. Pannekoek, in a debate with Karl Kautsky, the head of the Marxist centre in German Social Democracy, advocated combining mass strikes and extra-parliamentary actions on the one hand, and participation in trade unions and parliament on the other (Pannekoek, 1912). It was only under the impact of war and mass unrest that this position radicalized into a rejection of the old organizations. Though maintaining that trade unions and parties generated an elite stratum closely interwoven with the bourgeois state and hence interested in the continuity of order, hostile towards any action beyond legality, this did not amount to a moral critique of betrayal. Rather, the 'counterrevolutionary potential' of the trade unions 'cannot be destroyed or diminished by a change of personnel, by the substitution of radical or "revolutionary" leaders for reactionary ones. It is the form of the organisation that renders the masses all but impotent [...]' (Pannekoek, 1920: part V). Similarly, the rejection of parliamentarianism

did not proceed from any immature illusion of quick, easy victory, but from the proletariat's need to emancipate itself from its psychological dependence upon parliamentary representatives – a necessary reaction against the tradition of social democracy – because the way to self-activity could now be seen to lie in building up the council system. (Pannekoek, 1920: part IV)

For the old workers' movement, the growth of their own organizations was synonymous with the advent of socialism; in the council

communist perspective, it was exactly the opposite. The councilists noted that Marx, whom they initially considered as an almost infallible authority, had also pursued a democratic-gradualist politics, but at a different point in time. During the ascending period of capitalism that allowed for reforms, such a line was not only possible, but also necessary because the proletariat had not yet grown to a size that would enable it to take revolutionary action. As Gorter noted, the First International, led by Marx, consisted of *national* organizations that successfully fought for gradual improvements. As a result, over time the 'revolution became theory and reform became practice' (Gorter, 1915: para 51). The nationalism of the working class was based on this exclusive orientation to 'immediate advantages', which extended to endorsing colonial policy and finally culminated in world war (Gorter, 1915: para 110).

Although organized as a party, according to their programme the KAPD was 'not a party in the traditional sense', but aimed at the 'elimination of any policy of leaders' (KAPD, 1920: para 1). This anti-authoritarian orientation, anticipating 1968, did not amount to spontaneism: the power of the old organizations was not due to manipulation by leaders, but adequately expressed the consciousness of the masses. As the KAPD programme stated: 'The psychology of the German proletariat (...) shows very distinct traces of a long-standing enslavement to militarism, and is characterised by a real lack of self-awareness', a consequence of the 'parliamentary cretinism' of social democracy and of the 'absolutism of the union bureaucracy (...). These subjective elements play a decisive role in the German revolution' (KAPD, 1920: para 4).

Contrary to the Bolshevik self-image of being destined to lead the working class by its unwavering adherence to revolutionary principles, the council communists accused the KPD of nothing less than opportunism since it opposed the 'new principles' that rejected parliamentarianism and trade unions in favour of short-term success:

The one current seeks to revolutionise and clarify people's minds by word and deed, and to this end tries to pose the new principles in the sharpest possible contrast to the old, received conceptions. The other current attempts to draw the masses still on the sidelines into practical activity, and therefore emphasises points of agreement rather than points of difference in an attempt to avoid as far as is possible anything that might deter them. The first strives for a clear, sharp separation among the masses, the second for unity; the first current may be termed the radical tendency, the second the opportunist. (Pannekoek, 1920: part II)

The task of the party was primarily to critique and elucidate, while the industrial organizations of the AAUD were responsible for practical class struggle.

This endeavour crashed. After the 'March Action' of 1921, an armed workers' revolt in the central German industrial region around Halle whose expansion miserably failed, left radicalism experienced a rapid decline, with many splits following state persecution. As early as 1920, a dispute broke out about the KAPD's right to exist alongside the unions. A fraction around Rühle saw this as a perpetuation of the classical dualism of party and unions, accusing the KAPD of a 'policy of leaders' with the same vehemence that the KAPD levelled this accusation against the KPD, and thus founded the General Workers' Union – Unitary Organization (AAU-E). In 1922, the KAPD split into two: while the so-called Essen tendency saw participation in wage struggles as a departure from the revolutionary maximum programme, the Berlin tendency held fast to it. Practically, the main difference was that the purist Esseners sank even more quickly into insignificance than the pragmatic Berliners. Due to the stabilization of the economy beginning in 1923 and because of endless sectarian splits, council communism no longer existed as a relevant force by the second half of the 1920s (Bock, 1976).

In the 1930s, council communist discussions primarily centred around the publications of the Dutch Group of International Communists (GIK), who emerged from

the KAPN in 1926 and kept contacts with Germany, as well as into the ICC in America, with whom the GIK closely cooperated.<sup>7</sup> The organizational question lost importance. Mattick retrospectively noted that ‘all theoretical divergences’ over it ‘had no practical meaning’, since the KAPD, AAU, and AAU-E did not differ in practice, remaining all “‘ultra-left’ sects’ (Mattick, 1978: 107). Henk Canne Meijer<sup>8</sup> stated that the unions held ‘an idea close to that of revolutionary syndicalism, which looked forward to seeing all the workers join their unions’. But today, ‘no longer was the ‘organized’ class struggle to depend on an organization formed previously to the struggle’ (Canne Meijer, 1938: The KAUD, para 2). In the council communist conception of the 1930s, independent groups for ‘critique and propaganda’ and spontaneous struggles of the class take the place of parties and unions: ‘the enterprises, public works, relief stations, armies in the coming war’ provided a sufficient basis for organized action (Mattick, 1939: 84–5). As a pole of critique, the groups inherited the KAPD’s role rather than the unions’. Nonetheless, the farewell to the party-form was consistent insofar as a party which neither aimed at electoral participation nor at seizing power strictly speaking had no reason to exist.

In contrast, the critique of political economy gained in importance. First of all, a debate developed between Pannekoek, Korsch, and Mattick over the theory of capitalist collapse by IfS member Henryk Grossmann (1929), which was vigorously defended by Mattick; essentially, however, the debate was less concerned with Grossmann’s prognosis than its practical significance (Korsch et al., 1973). As Mattick admitted in retrospect, it did not lead ‘to any notable result’ (Mattick 1973a, 16), since for Pannekoek ‘the emphasis on the objective untenability of the capitalist system (...) seemed to diminish the active role of the proletariat’ (Mattick 1973a, 13). This role, however, was not disputed by any of the parties. More interesting rather is how Pannekoek himself remained captured by

a historical determinism, for he conceived the much emphasized ‘will of the working class’, as ‘not free, but is itself completely determined by economic development’ (Pannekoek, 1934: Historical Materialism, para 9). Korsch, who regarded the inevitability of collapse as a ‘*meaningless question in this generality*’ and was interested only in ‘very limited forecasts sufficient for practical action’ (Korsch et al., 1973: 97 et sq.), recognized the futile nature of the dispute. It was only fruitful insofar as Grossmann’s theory would later serve as Mattick’s point of departure for his critique of Keynes (see section ‘After 1945: Mattick’s Critical Theory’).

Furthermore, the break with traditional conceptions of socialism became clearer in the 1930s. The old workers’ movement had drawn the message from *Capital* that, through the growing concentration of capital, culminating in monopoly, the bourgeois mode of production itself led to the threshold of socialism, the realization of which merely required the state takeover of large enterprises thus created. Thus the workers’ only role was to bring their own party to power in order to carefully manage the productive forces in the interests of all. As Mattick wrote:

However divided the old labour movement may be by disagreements on various topics, on the question of socialism it stands united. Hilferding’s abstract ‘General-Cartel’, Lenin’s admiration for the German war socialism and the German postal service, Kautsky’s eternalisation of the value–price–money economy (desiring to do consciously what in capitalism is performed by blind market laws), Trotsky’s war communism equipped with supply and demand features, and Stalin’s institutional economics – all these concepts have at their base the continuation of the existing conditions of production. (1939: 80)

While the 1920 KAPD programme recalled the list of demands from the *Communist Manifesto*, the GIK was now thinking about ‘another economic system, where the means of production, the products of labour power, do not take the form of “value”’ (Canne Meijer, 1938: Communist Society, para 8).

Elsewhere, they stressed that communism develops not only when ‘the workers have won the power in society’ (Canne Meijer, 1935: Class Struggle, para 2), but already in their struggles – for example, in wildcat strikes, which produce new forms of interaction and could lead to the appropriation of buildings and means of production. At the same time, a more concrete blueprint for a new society seemed indispensable to them, the absence of which was now seen as partly responsible for the failure of the council movement. *Fundamental Principles of Communist Production and Distribution* (GIK, 1930) was intended to remedy this shortcoming. Based on Marx’s *Critique of the Gotha Program*, the GIK sketched out a post-capitalist economy, in which the calculation of labour time is pivotal for planning production as well as allocating distribution. They saw the best guarantee for preventing the emergence of a new exploiting class, as in Russia, in the exact calculation of what was due to the individual according to the measure of time worked. The bulk of the text served to prove that producers themselves could precisely calculate this by accounting. Although motivated by egalitarianism, *Fundamental Principles* restricted Marx’s vision of overcoming the logic of exchange in general to areas such as health care and education. For many years, the text remained authoritative for this tendency.

## FROM RED OCTOBER TO RED FASCISM

The Russian experience left its mark not only on *Fundamental Principles*. The confrontation with the October Revolution, Lenin, and Bolshevism takes up much space in council communist literature. In the initial enthusiasm about the Russian revolution, the KAPD tried to join the Third International. When the Bolsheviks supported the course of the KPD and when Lenin sharply attacked

Pannekoek and Gorter in ‘*Left-Wing Communism: an Infantile Disorder*’ for their anti-union and anti-parliamentary line, this was considered a disagreement that could be settled.

Gorter’s (1920) ‘Open Letter to Comrade Lenin’ accepted the Bolshevik strategy as adequate for Russia, but defended the dissenting council communist line with respect to the different circumstances in the West. While the Bolsheviks were supported by only a small industrial proletariat, a huge impoverished peasantry, and faced a weak adversary, it was precisely the reverse in Western Europe: a much larger proletariat, without allied peasants, opposed a much stronger capitalism. The importance of ‘leaders’ – whose necessity for Gorter at this point was as clear as that of a disciplined party – was correspondingly less: everything depended on the ability of the proletariat to break away from the deeply rooted bourgeois culture and act independently. Gorter took issue solely with the presumption of the Russian strategy being stipulated for Western Europe as well. When the Bolsheviks insisted on just that at the Second Comintern Congress (1920), demanding the KAPD to unite with the KPD, Pannekoek formulated for the first time the fear that the compulsion to find ‘a *modus vivendi* with the capitalist world’ could bring Soviet Russia into permanent opposition with the world revolution (Pannekoek, 1920: Afterword, para 4). After the Third Congress (1921), the KAPD withdrew in resignation.

The GIK later came to a much more negative conclusion. In their ‘Theses on Bolshevism’ (GIK, 1934), it is no longer about different strategies on the way to the same goal, but about the bourgeois character of the Russian revolution from the very outset. This made the struggle against Bolshevism one of the ‘first tasks’ of a revolutionary re-orientation (§67):

The economic task of the Russian Revolution was, first, the setting aside of the concealed agrarian feudalism and its continued exploitation of the peasants as serfs, together with the industrialization

of agriculture, placing it on the plane of modern commodity production; secondly, to make possible the unrestricted creation, of a class of really 'free laborers', liberating the industrial development from all its feudal fetters. (§7)

Politically, the task of the Russian Revolution was the destruction of the absolutist state in favour of modern administration. But these essentially bourgeois aims had to be enforced precisely against the weak bourgeoisie, who were aligned with tsarism. In the view of the GIK, the Bolsheviks accomplished this as representatives of the petty-bourgeois intelligentsia. With tactical skill and an absolute claim to leadership, they marched off workers and peasants as foot soldiers for their coup. The GIK determined their interests as contradictory: contrary to the rudimentary communist class politics of the numerically weak proletariat, the peasants wanted only to divide the large estates among themselves as small property owners. This 'two-class basis' of Bolshevism conditioned the independence of the new state power against both. The fact that the result was 'state capitalism', as Lenin temporarily admitted, was historically inevitable, but it also coincided with the Bolshevik ideal of a 'bureaucratically conducted state economy' (§49). The slogan of 'all power to the soviets' was therefore pure tactics; the Bolsheviks regarded the soviets instrumentally 'as organs of insurrection' and not 'as organs of self-government of the working class' (§39).

In light of the repression of all emancipatory efforts of the Russian proletariat, bloodily condensed in the crushing of the Kronstadt revolt in 1921, Lenin's organizational model of the leadership-party was severely criticized by the council communists in countless texts.<sup>9</sup> Yet this was primarily aimed at the debates in the *Western* workers' movement, because they saw no basis for a revolutionary alternative in Russia itself. Even Trotsky was just a 'failed Stalin' (Huhn, 1973). For the Bolsheviks the abolition of the capitalist mode of production is possible only after a certain degree of development, reflected

in the proletarianization of the majority of the population. After 1917, their approach shaped the entire twentieth century: it was not through social revolutionary movements in the metropolises that Marxism became effective, but as a legitimization ideology for national movements in the periphery. The GIK already observed how the Bolsheviks tried to export their model in Asia and discovered the 'national question' for themselves (GIK, 1934: §50–6). Forty years later, Mattick criticized the New Left for their identification with anti-imperialist movements of the Third World, whose 'prototype' was Russia and which could achieve 'at best only partial release from foreign exploitation but not the conditions of socialism' (Mattick, 1978: ix).

In the context of the early 1930s, the council communists used terms like 'state capitalism', 'state socialism', and 'state communism' synonymously, to determine the character of the Soviet Union, which they understood as a 'more advanced type of capitalist production' (GIK, 1934: §58–9). In reality, all these categories existed there only in a deformed way (see Aufheben, 1999). Appropriate to the concept of 'state capitalism' was that wage labour continued and was massively expanded; this was politically decisive for the council communists. While bourgeois revolutions produce politics and economics as separate spheres, they both fused in Russia in a way that undermined the law of value as a blind control mechanism. It was precisely this fusion of state and economy that spawned the phenomena which allowed the council communists to speak of 'red fascism'. As Mattick remarked about the Soviet Union: 'By adding control over the economy to the political control of the government the totalitarian rule over all of society emerges in full' (Mattick, 1947: 70). Here, too, the council communists took a position completely marginal in the left: neither was it taboo for them to name the similarities between Bolshevism and fascism, nor did it lead them to swear allegiance to Western democracy in

the spirit of totalitarianism theory. Pannekoek wrote on Russia and Nazi Germany:

The similarity of political forms and methods of government (...) strikes the eye at first sight. In both the same dictatorship of leaders, assisted by a powerful well-organized and disciplined party, the same omnipotence of the ruling bureaucracy, the same absence of personal rights and free speech, the same levelling of spiritual life into one doctrine, upheld by terrorism, the same cruelty towards opposition or even criticism. (1947: 179)

Taking into account the chronology, Rühle said: 'Hitler became Lenin's and Stalin's best student. Following the example of the Bolshevik state, he shaped and constructed the fascist state in his own image' (Rühle, 1940: 84 et sq.). At the same time, there was a tendency to mechanistically derive a universal fascization from the growing concentration of capital. According to Mattick, Bolshevism, fascism, and Western capitalism were in 'all essential aspects (...) identical and represent only various stages of the same development' towards 'a "fascist" world economy' (Mattick, 1978: 71). This perspective informed many council communist analyses of the 1930s and 1940s.

## FASCISM, DEMOCRACY AND WAR

When the German workers' movement was defeated without a fight in 1933, the council communists saw their critique confirmed.<sup>10</sup> The SPD 'had become only a façade behind which was such a rotten (...) building that it fell into ruins at the first strike of the enemy', as did the 'pseudo-revolutionaryism of the KPD', which turned their adherents into 'blind instruments', while the trade unions tried to 'submit entirely to national socialism' (Pannekoek, 1933: 442–6). Added to this were 'the nationalistic adventures' of the KPD: 'Ten years of competition with Hitler for the title to real nationalism turned the workers themselves into fascists' (Mattick, 1935: 27). The problem, however, was more fundamental.

Both wings of the workers' movement had significantly abetted Nazism through their statism: Bolshevism with 'its example of state dictatorship' and social democracy with its – albeit democratically understood – 'idea of State socialism' (Pannekoek, 1947: 157). To this extent, the course towards National Socialism was not set in 1932/33, but already in 1918/19, when its potential opponents were defeated by the Social Democrats in coalition with the right-wing Freikorps, and a 'republic without republicans' arose. In light of 'the growth of martial law and emergency power', Korsch considered this a 'preparatory phase' of National Socialism, which then came to power completely legally (Korsch, 1940a: 13).

It was during these years that the contacts between the Frankfurt Institute and council communism, represented by Mattick and Korsch, were most extensive. 'Horkheimer', Korsch wrote to Mattick in 1938, 'has (...) come very close to my, our political standpoint in recent years' (Korsch, 2001: 683 et sq.). In those years, Horkheimer wrote his most radical texts, which he later distanced himself from. The council communist influence is especially clear in 'The Jews and Europe' (1939) and 'Authoritarian State' (1940), where Horkheimer saw both the Soviet Union (about which he had been ambivalent for a long time) and Nazism as manifestations of a general trend towards statism to which he opposed the anti-authoritarian system of councils. By taking fascism as the necessary consequence of the irreversible bankruptcy of the liberal market economy, he declared meaningless any purely democratic anti-fascism that aims at restoring the status quo: 'To appeal today to the liberal mentality of the nineteenth century against fascism means appealing to what brought fascism to power' (Horkheimer, 1939: 91). While 'a generalizing sociology suffered from the fact that it was practiced primarily by people of the middle and upper middle classes who differentiate too conscientiously', the 'millions below learn through their experience from childhood on that the

various phases of capitalism belong to one and the same system. Authoritarian or liberal, society for them means hunger, police control and the draft' (Horkheimer, 1940: 104). The *ICC* recommended 'The Jews and Europe' as 'the best short exposition of fascism' (*ICC*, 5.1, 1940: 10).

A text that obviously influenced Horkheimer were the theses by Heinz Langerhans published in *ICC* in 1935.<sup>11</sup> As a student of Korsch and colleague of the Institute, Langerhans represented another bridge between the two currents. In his theses, he stated that capital and the state were being melted 'by the world crises into a single armor-plating, to the end of assuring their continued existence. From the automatic subject Capital with the sponsor State as a special organ has grown the unified state-subject Capital' (Langerhans, 1935: 9). The driving force was the immensely increased productive forces, which already in 1914 could only erupt in war, and would do so again, according to Langerhans' clear-sighted forecast, around 1940, in order to accomplish 'the special work of any crisis: destruction of value' that can no longer be valorized (8). Precisely thereby, 'the pre-supposition for crisis' is once again placed within the crisis, and competition – internally suspended through cartelization – is transposed onto the international level, therefore producing the 'Twilight of Autarchy' (10). Langerhans spoke here of a general tendency, though he obviously had Nazism in mind when he described how the 'state-subject Capital seizes the monopoly on class struggle. The breaking up of all class organs of the workers is its first accomplishment. A ruthless social-pacification process is introduced with the aim of "organically" incorporating that part of capital represented by wage labor into the new State' (9). Thus, 'the only possible social reform has [been] won against the workers' (12).

In 1935, Korsch objected to Langerhans, claiming that the capacity for pacification was 'damagingly overrated' and the 'sharpened class struggle of the workers' was ignored

(Korsch, 1935: 20). A few years later, however, he saw fascism as 'a non-socialist and undemocratic but plebeian anti-reactionary counter-revolution' (Korsch, 1940a: 14), and came closer to Langerhans insofar as he now saw the difference between fascism and traditional reactionaries precisely in its ability to integrate the working class: 'The fascist counter-revolution rather tried to replace the reformist socialist parties and trade unions, and in this it succeeded to a great extent' (Korsch, 1940b: 32). While council communist interpretations of National Socialism were hardly uniform, they mostly went beyond the image drawn by the Third International of a dictatorship of big business over the German working class by taking seriously its efforts to win over workers by means of ideology and social engineering. Even though the deprivation of workers' rights was beyond dispute, the 'national community' was more than a mere propaganda lie. Pannekoek described the pseudo-anti-capitalist features of National Socialism as a 'revolt of German against American capital, against the rule of gold', which masquerades 'as the new reign of labor' with considerable effect. The forced national community meant 'the end of the pitiless fight of all against all, (...) that everybody will have his place assigned, an assured existence, and that unemployment, the scourge of the working class, disappears as a stupid spilling of valuable labor power' (Pannekoek, 1947: 145, 147–8). The Nazi state also curtailed the liberties of private companies considerably and could thus present itself 'as the power that curbs capital' (149).

With regard to the exact relationship between politics and economics in National Socialism, there was as little unanimity among the council communists as there was among the exiled Frankfurt Institute. There, Franz Neumann vehemently argued with Friedrich Pollock, whose thesis that under state capitalist National Socialism, 'the profit motive is superseded by the power motive' (Pollock, 1941: 207) Neumann attempted to

refute in his major study *Behemoth* (1942). Korsch agreed with him: 'Neumann shows that in spite of the transition from free competition to monopolistic rule and an increasing interference of the state, the present German economy has pertained the essential features of a genuine capitalist economy'. It is 'based, now as before, on private ownership in the means of production', and 'it is still the profit motive that holds the machinery together' (Korsch, 1942: 47–8).<sup>12</sup> In this sense, he also accused Langerhans of blurring the political-economic differences between Bolshevik Russia and Nazi Germany when he described them as 'not of a fundamental nature' (Korsch, 1935: 20; Langerhans, 1935: 9). Mattick, on the other hand, emphasized more strongly the independence of the state, which had developed 'its own vested interests'. It could 'become the most important monopoly and within the framework of imperialistic rivalries combine all power in society in one hand, and thus begin to "plan" the nation' (Mattick, 1941a: 20). Although he did not deny the continued existence of the profit motive, he basically followed Horkheimer's claim that Nazism means 'the end of political economy' in terms of the further validity of categories such as 'exchange of equivalents, concentration, centralization, falling rate of profit, and so on', once 'the practice of methodical violence' takes the place of blindly operating mechanisms (Horkheimer, 1939: 83). Domination, once disguised, now appeared openly. The fascists

could not help unmasking the exchange relations as the relation between classes – one controlling, the other controlled – because they themselves rose to power by political struggles, not by grace of an economic law. (...) All capitalistic categories today are reproduced not in their fetishistic form but in their actual character. (Mattick, 1941a: 17, 20)

Regardless of such differences, the council communists at that time still shared an astonishing confidence in history. Ruthlessly scrutinizing the decline of the old workers' movement, they were certain that a new, truly

revolutionary one would emerge. In this respect, Horkheimer did not follow them even in his most radical writings, but attacked any such confidence with almost existential despair: 'Theory explains essentially the course of destiny'. 'The belief that one is acting in the name of something greater than oneself is bankrupt. Not a few Marxists paid homage to it'. 'As long as world history follows its logical course, it fails to fulfil its human destiny' (Horkheimer, 1940: 109, 112, 117). By contrast, Rühle claimed: '*History does not make mistakes*'. He declared that fascism, by eliminating the old organizations, had done the proletariat 'an enormous world-historical service': 'Did not we, since 1918, demand the disappearance of parties, parliament, trade unions, etc.?' (Rühle, 1939: 180). Though less harsh, Pannekoek also drew a certain hope from the fact that fascism, by destroying the 'old party divisions' in the proletariat, had restored its 'natural [!] class unity' (Pannekoek, 1936: 13). Korsch, on the other hand, in the spirit of Horkheimer warned against indulging 'comfortable illusions about a hidden revolutionary significance' of history in a bad Hegelian manner, as expressed for instance in the triumphalist slogan of the KPD: 'After Hitler, Our Turn!' (Korsch, 1940b: 34). But even he was not free from this. Following Langerhans (1940), who had discovered an affinity between the 'shock-troop principle' and the council principle, Korsch wrote that out of the 'fear of the emancipatory effect that a total mobilization of the productive forces' in military form 'would be bound to have for the workers', the rulers were afraid of unleashing a truly 'total war'. This demonstrates 'the impasse from which capitalism cannot escape even in its present rejuvenated fascist and counter-revolutionary form' (Korsch, 1940b: 35–6, 41).

It was presumably this historical confidence that prevented the council communists from perceiving the full extent of Nazi barbarism. This is where their path diverged from the exiled Institute, for whom from the early 1940s onwards the unprecedented

aggressiveness of Nazi antisemitism became far more important than all questions concerning the relation between the state and economy. In August 1940, Adorno wrote to Horkheimer that he could 'no longer ignore thinking about the fate of the Jews (...). It often seems to me as if all that we have been accustomed to seeing in the proletariat has now been transferred onto the Jews in terrible concentration' (Adorno, 1940: 764). In 'The Jews and Europe', Horkheimer had still derived antisemitism from the alleged liquidation of the sphere of circulation, understood it as an 'economic expediency' and predicted its 'end', since it belonged to the 'ascendant phase of fascism'. Even 'the hope of the Jews, which attaches itself to the Second World War' seems 'miserable' to him, since this war would only lead the world 'further into authoritarian-collectivistic ways of life' (Horkheimer, 1939: 89–92). In *Dialectic of Enlightenment* (1944), by contrast, Adorno and Horkheimer conceived of antisemitism as a delusional ideology, in which the national community projected the exploitative essence of the system onto 'the Jews' (Horkheimer and Adorno, 1944: 153). As the dimensions of the German policy of extermination became clearer, Horkheimer's emphasis on the continuum between authoritarian and liberal forms of capitalism from his left radical writings of 1939/40 faded away. Without illusions about the motives of the Allies, several members of the Institute practically supported the American war effort.

In council communist texts, antisemitism appeared on the margins, at best. Korsch remarked how in fascism a 'rational goal-directed state practice' combined with 'a completely irrational state mythology (represented by the nation, the race, and the mass)' (Korsch, 1932: §1.3), and that the repressed class struggle is presented as the work of an 'interested band of Jewish or other racially foreign agitators' (Korsch, 1935: 19). But such remarks remained marginalia. Pannekoek, who unlike Rühle, Mattick, or Korsch had lived under German occupation himself, came closest to

grasping the particular features of National Socialism. In *Workers' Councils*, largely written during the war, and published for the first time in 1947, he devoted a separate chapter to National Socialism as a form of fascism 'far more important' than the Italian variant, and recognized its 'central doctrine' in race theory, which aimed at the 'deliberate extermination' of the Jews (Pannekoek, 1947: 154). In general, he had an eye for distinctions. The bourgeois freedom of the individual, 'to be sure, often was no more than an ambiguous form, but it was something. National socialism took away even this semblance of liberty. (...) So it had to disappear; without liberty man cannot live' (158). However, just as Pannekoek had already pointed out the beginning of the persecution of the Jews in 1933, but had rejected calls for a boycott against Germany as a path to 'another 1914' (Pannekoek, 1933: 449), such insights had no practical impact.

In the Second World War, the council communists rejected Trotsky's demand that Stalinist Russia be defended as a merely 'degenerated' workers' state. 'Anti-fascism' served the international alliance policy of Russia, which stifled the class struggle – and had been realized in the Spanish Civil War as a suppression of the social revolution through 'Moscow fascism' (Mattick, 1937). In any case, world politics was quicksand: it was impossible to figure out who would ally with whom against whom. Central to the council communists was the assumption that the era of liberal-democratic capitalism had come to an end, and that the war would also turn the last democracies fascist. Yet while just as in the First World War it was necessary to refuse taking any side, the constellations had changed. 'None of the revolutionary slogans of the last war can be immediately applied', noted Korsch in 1941. The former call for 'transformation of the capitalist war into a civil war' was now obsolete, since the 'present war (...) has been a veritable civil war on both a European and a world-wide scale'. '*Down with the imperialist war!*' now fitted 'perfectly with the tendencies

of the bourgeois appeasers and isolationists'. 'Defeat of one's own country!' had become 'a practical policy of that substantial part of the ruling class in various European countries that preferred the victory of fascism to the loss of its economic and political supremacy' (Korsch, 1941: 2–3). Mattick soberly realized that the 'question as to what the "labor movement" should do in regard to the war' is 'artificial (...), for there is no labor movement which could raise it in actuality' (Mattick, 1941b: 61).

### AFTER 1945: MATTICK'S CRITICAL THEORY

The feared universal fascization did not take place either. Instead, after 1945, the Western world experienced a period commonly known as 'the three golden decades'. The thesis of an unstoppable monopolistic liquidation of democratic-liberal capitalism, temporarily shared also by Horkheimer, Pollock, and Neumann, too, proved to be wrong. Already in *Workers' Councils*, Pannekoek was implicitly moving away from the thesis of fascization; he now understood bourgeois democracy as 'the adequate political form for rising and developing capitalism' and described not any fascism, but 'American democracy' as 'still the strongest force of capitalism' (Pannekoek, 1947: 133, 135).

The upheavals around 1967/68 brought greater interest to council communism once again. It had a strong influence on the restless *Situationist International* (1957–72), for example. Its internationally renowned representatives were now Mattick and former GIK member Cajo Brendel.<sup>13</sup> Brendel carried on classical council communism unaltered, leaving no doubt until his death that the future belonged to the self-emancipating working class. He reacted to the disappearance of the councils – they appeared one last time in Hungary in 1956 – by equating them with wildcat strikes: through them, 'spontaneous resistance (...) enters more and more onto the

historical stage' (Brendel, 2001: 8). Mattick took another path. His remark that 'workers' self-initiative and self-organization offers no guarantee for their emancipation' could also be directed against Brendel (Mattick, 1978: xi). In his post-war writings, the historical optimism receded. While Pannekoek's or Gorter's Marxism sometimes displayed features of a world-view, for Mattick only the critique of political economy was relevant. Marx had 'talked a lot of nonsense, not because he was a babbling idiot, but because he lived in another world with other problems (...) In Marx, I really only care about this one idea, the discovery of immanent contradictions in the capitalist system of production' (Mattick, 2013: 105).

Starting from these contradictions, Mattick in his main work, *Marx and Keynes*, tried to conceptualize the post-war constellation, which though far from a universal fascism, no longer corresponded to classical liberalism. Already during the 'golden decades', Mattick debunked the idea that the 'mixed economy' guaranteed stability through clever political management. He showed that the public demand propagated by Keynes does not provide a solution to the problem of declining profitability, but is itself dependent on the private economy, as it is financed by taxes or by the anticipation of future taxes in the form of growing public debt. Though state intervention can compensate for economic downturns in the short term, it remains impotent against the fall of the rate of profit, rooted in the rising organic composition of capital. Prosperity after 1945 was not due to some new Keynesian expertise among those in power, but to the gigantic destruction of capital caused by the Depression and World War, which enabled capital to expand again along the same old cycle of recovery, boom, and crash. But for the same reasons, according to Mattick, this prosperity could not last. The return of crisis in the 1970s proved him spectacularly right.

This assessment also underlies Mattick's critique of Marcuse's *One-Dimensional Man*. By no means did Mattick contradict

Marcuse's gloomy picture of a state-pacified 'society without opposition', but rather agreed 'with all his observations' on ideology in advanced industrial society. This even extended to Marcuse's notion of an integration of the proletariat: 'Marx says somewhere that "the proletariat is revolutionary, or it is nothing". Presently it is nothing and it may well be that it will continue to be nothing' (Mattick, 1972: §XII, para 12). To Mattick, however, this was not settled. His objection, therefore, was kindled by Marcuse assuming this constellation to be permanent, which led him to declare marginal groups in the metropolises and movements in the Third World as the spearheads of liberation. Though with a critical intention, Marcuse reproduced the belief in a crisis-free capitalism, which could secure mass loyalty through constant technical progress. Following his argument in *Marx and Keynes*, Mattick rejected this assumption and expressed doubts about the revolutionary potential of marginalized groups: 'The sporadic rebellions of despair by small minorities are easily handled by the authorities representing the smug majority, which includes the mass of the proletariat' (Mattick, 1972: §XII, para 14). Only the proletariat's change of heart in the wake of renewed crises offered a faint hope: 'If there can be no working class revolution, there can be no revolution at all' (Mattick, 1972: §XII, para 25).

Nevertheless, Mattick took *One-Dimensional Man* to be 'one of the most important and most beautiful books written in recent times' (Mattick, quoted in Roth, 2015: 275), while Marcuse considered Mattick's objections as 'the only solid and real criticism' of his book. In letters to Mattick, however, he essentially reaffirmed his position. Even if the post-war conditions were only 'transitory' ('but how long is transitory?! *A la fin on y meurt ...*'), it seemed that 'a (for the system) tolerable balance' between the state and private economy would also be possible for the long-term. And since only 'plain misery' drives people to revolution, 'the end of the system' will not be ushered in by the

industrialized countries, but rather by 'the life and death struggle with the backward neo-colonial countries, whose people are today really the heirs of the proletariat – the only ones who have nothing to lose but their chains'.<sup>14</sup>

Against the fetishization of the old working class, Mattick also emphasized the changed character of the proletariat: 'The industrial proletariat of a hundred years ago has meanwhile swollen to an amorphous mass of wage-receiving occupations and professions, all of which are dependent on the vicissitudes of market events' (Mattick, 1972: §XII, para 19). This social condition, not industrial employment, essentially defined the proletariat, which had grown immensely since the time of Marx. More clearly than in earlier council communist writings, Mattick called for the 'abolition of the proletariat' and not its victory, and also distanced himself from the old GIK conception of socialism (Mattick, 1972: §XII, para 30). As early as 1938 Korsch had already confessed to him that he thought 'worse and worse about the "Dutch" socialization program', in which he recognized an abstract idealization of the capitalist law of value; the calculation of the consumption quota due to the individual would 'soon lose all meaning without exchange and wage labour!' (Korsch, 2001: 651, 657). In his introduction to a reprint of *Fundamental Principles*, Mattick (1970) now saw a 'weakness' of the GIK model in that the calculation of labour time should also be applied to distribution. The GIK's appeal to Marx holds true 'only insofar as that thought is applied to a phase of socialist development within which the principle of the exchange of equivalents still prevails, a principle which will come to an end in socialism' (Mattick, 1970: para 17). In light of the high development of the productive forces in industrialized countries and the fact that 'more than half of all capitalist production as well as the unproductive activities associated with it (...) only make sense in the irrational economy of capitalist society', communist production

enables a surplus in which ‘any calculation of their individual shares of average socially necessary labor time would be superfluous’ (Mattick, 1970: para 19). In *Marx and Keynes*, Mattick regarded such calculation as ‘ridiculous’, and emphasized that the development of socialism was not a matter of ‘an always greater equality in “exchange”’ (Mattick, 1969b: 331).

While Mattick here belatedly took up Korsch’s position, their fundamental understandings of Marx increasingly diverged after 1945. Korsch regarded Marx’s critique of political economy as valid, but less and less decisive. This difference had already occurred in the debate over Grossmann’s theory of capitalist collapse in the early 1930s, in which Korsch advised against searching ‘for a “revolutionary” crisis theory per se, just as in the middle ages one searched for the philosopher’s stone’ (Korsch, 1933: §I, para 1). Korsch was more interested in contemporary proletarian action than future forecasts of how capital would evolve according to its own laws. From his point of view, what Marx’s thought had gained over time in ‘scientific character’ had been lost in the orientation to practice. He noted this defect already in the 1930s and 1940s: Marx’s relationship to the state had remained ambiguous, and the ‘umbilical cord between Marxism and Jacobinism was never cut’ (Korsch, 1939: §VI, para 1). In 1950, Korsch radicalized this criticism with his ‘Ten Theses on Marxism Today’ in which he called for a break from the ‘Marxism which claims to monopolize revolutionary initiative as well as theoretical and practical direction’, and insisted on recognizing other currents like anarchism as equally important. In addition, he urged to let go of Marx’s ‘overestimation of the state as the decisive instrument of social revolution’ as well as his ‘mystical identification of the development of the capitalist economy with the social revolution of the working class’ (Korsch, 1950: §7). In line with council communism, Korsch maintained the goal of the ‘control of the workers over the production

of their own lives’ just as firmly as he held to the critique of Bolshevism as a mere ‘ideology’ (Korsch, 1950: §10). But he detected the seeds of this ideology already in Marx himself.

In a late reply, Mattick saw little value in this critique. What Korsch dismissed as ‘mystical’, he judged as the strength of Marx’s theory. Developed during the ascending phase of capitalism, when a proletarian revolution had not yet been possible, Marx had already envisaged the self-abolition of the proletariat. Bolshevism for its part did not suffer from a ‘mystical identification’ of capitalist development and revolution, but, on the contrary, attempted to skip this development through putschist means. It was not Marx who ‘whisks away from the present movement the real emancipation of the working class and puts it back into the indefinite future’ (Korsch, 1950: §7). The movement itself had shown no revolutionary intentions, and so contrary to Korsch, it was precisely ‘the “pure theory” of social revolution, alienated from practice’, to which later radical movements could connect (Mattick, 1973b: 198). For the failure of those movements after 1918, however, Mattick could not point to any ‘objective’ reasons either. He could only note the ‘unwillingness’ of the masses for revolution, and draw a ‘truly sad record’ of the workers’ movement in the twentieth century (212).

## CONCLUSION

Starting off as revolutionaries, the council communists soon involuntarily became isolated critics, whose mockery as reclusive-purist ‘friars of Marxism’ is strikingly reminiscent of the accusations made against the Frankfurt School’s ‘ivory tower’ (cf. Brendel, 2008: 34). Both shared a growing distance to all currents of the established workers’ movement; they preferred the lack of practicality to a false practice. In the face

of world-wide counterrevolution and the foul peace of the post-war era, both council communists and the Frankfurt School adhered to the basic principles of Marx's critique against its misappropriation as the halo of state-socialist despotism. On the Frankfurt side, this is especially true for Adorno after the Second World War, who noted in 1968 that although 'the system's resilience has been confirmed' in Keynesian state interventions, 'so, indirectly, has the theory of its collapse' (Adorno, 1968a: 123). Furthermore, he regarded the 'harmony' between classes as probably 'not so permanent' as is pretended 'by the assured obsolescence' of Marx's critique: 'In crisis situations, social conflict may be realised as one of classes; whether once again in the forms of the administered world remains to be seen' (Adorno, 1968b: 186). This coincided with Mattick's views. Marcuse's new left approach to anti-imperialist movements in the Third World was by no means representative of the Frankfurt theorists, who were no longer a closed 'school' at this point. Similar to the council communists, Adorno recognized nationalism above all in such movements.

Despite all the similarities before, during and after Fascism, however, both currents reacted differently to the failure of the revolution. The leitmotiv of the council communists was the potential power of the class, while for the Frankfurt School it was more and more the real powerlessness of the individual. But as Mattick's broad agreement with Marcuse's diagnosis of the times shows, this is not an insurmountable contradiction, but rather aims at a better future in the first case, and a depressing present in the second. The council communists kept a close eye on the activity of the proletariat, which increasingly vanished from the horizon of the Frankfurt School: the only contribution in the *ZfS* on the Spanish Civil War, which might have halted the lemmings' march to fascism and World War, came from Korsch. Meanwhile, the Frankfurt School with its critique of ideology and culture analyzed the reflection of domination in the individual

much closer than the council communists, who remained focused on the critique of political economy and class conflicts. Rühle's programme for an anti-authoritarian psychology, very close in intention to the Frankfurt School, met with widespread incomprehension and rejection from his comrades.

On the relation between critique, consciousness, and practice, there existed conflicting views within council communism, which were correspondingly close to or far from those of the Frankfurt School. Pannekoek's distinction between a 'radical' and an 'opportunistic' tendency in the workers' movement meant that the battle of ideas was not an idealistic spectacle beyond the actual class struggle, but essential to its revolutionary unfolding. The organization remained indispensable to him as the vehicle for a critique of ideology. On the other extreme, for example, Brendel displayed an unshakable trust in the class, which on the basis of its 'everyday experience', had a 'clearer concept' of its oppression than all who wanted to instruct it and thereby ignore what the class 'will be forced to do' (Brendel, 1978). Adorno's critique of left-wing 'Hurrah-optimism' was aimed precisely at such a conjunction of workerism and metaphysics of history, which holds that every 'attempt radically to alter this consciousness [of the worker] by withholding assent to it is considered reactionary. Suspicion falls on anyone who combines criticism of capitalism with that of the proletariat'. The fact that Adorno rejected such optimism also by pointing out the 'lack of any spontaneous resistance by the German workers' to National Socialism once again shows the different significance that the latter had for both currents (Adorno, 1951: 113). Council communism moved between 'Hurrah-optimism' and critique of the proletariat. With Mattick's sober post-war writings, it comes very close to critical theory. Subversive endeavours today should draw on both currents in order to at least maintain the level of reflection achieved in the twentieth century.<sup>15</sup>

## Notes

- 1 Mattick (1904–81) came from a working class left-wing family in Berlin; he was politicized during the revolution of 1918/19, trained as a metal worker, and was a member of the KAPD youth. In 1926, he emigrated to the United States, and was active with both the Industrial Workers of the World (IWW) and the autonomous unemployed movement in 1930s Chicago. During this time, he also corresponded with Henryk Grossmann, whose *The Law of Accumulation and Breakdown of the Capitalist System* (1929) was formative for him. Mattick was the driving force behind *International Council Correspondence*, and remained until his death one of the most prominent advocates of council communism. See the biography by Roth (2015) and the biographical interview with Mattick (2013).
- 2 Korsch (1886–1961) was a jurist and philosopher, successively a member of the SPD, the USPD and the KPD, from which he was excluded in 1926 because of left-wing deviations. He wrote *Marxism and Philosophy* in 1923 and is considered the spiritual father of the 'Marxistische Arbeitswoche' gathering in the same year, in which Georg Lukács, Felix Weil, Karl August Wittfogel, and Friedrich Pollock participated, all of whom belong to the immediate prehistory of the Institute for Social Research. In 1933, he emigrated from Germany, and lived in the United States from 1936 onwards, where he collaborated closely with Mattick. Korsch first became associated with council communism in the early 1930s, often advocating 'unorthodox' positions in this framework.
- 3 Published from 1934 to 1943, the magazine was later renamed *Living Marxism and New Essays*.
- 4 Rühle (1874–1943) was a publicist and educator for the SPD in the Reichstag from 1912 to 1918; he came to the KAPD via the Spartacist League and KPD, and in 1921 split to the AAUE. Influenced by his wife, Alice Rühle-Gerstel, Rühle became interested in Alfred Adler's individual psychology in the second half of the 1920s; he wrote numerous publications on psychology and pedagogy. In 1932, he emigrated to Prague, and in 1935 to Mexico, where the Rühles became friends with the Trotskys. He was a member of the Dewey Commission, which cleared Trotsky of the accusations raised against him in the Moscow show trials.
- 5 Pannekoek (1873–1960) was a renowned astronomer, going from the Dutch SDAP via the left-wing split SPD to the KPN and finally to the KAPN. As a teacher at the Berlin Party School of the SPD (from 1906), he was an important link between Germany and Holland. He was only marginally involved with the GIK. Pannekoek was perhaps the best-known representative of council communism, having written *Workers' Councils* (1947), a standard work of the tendency. On Pannekoek, see Brendel (2001).
- 6 Gorter (1864–1927) was a well-known poet, and like Pannekoek moved from social democracy to council communism. He participated in the Spartacus uprising in January 1919 and later in battles in the Ruhr.
- 7 There, during the Great Depression, the council communists also continued to develop activities in the independent movement of the unemployed, until they were booted from traditional left-wing organizations. The New Deal's social legislation also defused the situation somewhat. In 1936, Mattick wrote a detailed study for the IfS, but never published it (Mattick, 1969a; see also Roth, 2015: 166 et sq.).
- 8 Canne Meijer (1890–1962) was initially a metal worker, and later a teacher; he was active in the KAPN starting in 1921, and later a driving force in the GIK.
- 9 Pannekoek also showed in *Lenin as Philosopher* (1938) that the latter did not move beyond eighteenth-century bourgeois materialism. Korsch tried in vain to place a review of the book in the *ZfS*.
- 10 Council communism made a huge practical impact on events through the action of an individual: the Reichstag fire starter, Marinus van der Lubbe, came from their ranks. The reactions in the council communist milieu ranged from glorification to sharp condemnation (see Bourrinet, 2003).
- 11 Langerhans (1904–76) was a social and political scientist, excluded from the KPD for 'Korschism' in 1926. He received his PhD in 1931, with Horkheimer among his supervisors. He was arrested in 1933 as a member of the *Red Fighters*, sentenced to jail, then detained in Sachsenhausen concentration camp, and finally pardoned in 1939 in the course of an amnesty on the occasion of Hitler's 50th birthday. Korsch and the Institute worked together to help him enter the United States, where he lived from 1941 to 1956. He was later a professor at various universities in Germany.
- 12 For the most part, however, Korsch vehemently criticized *Behemoth*. In his eyes, Neumann's characterization of the Nazi regime as a non-state and a break with the previous republic amounted to an idealization of Weimar (Neumann was a Marxist social democrat). But since Neumann derived this break precisely from the impossibility of a democratic mediation of class antagonism in the crisis since 1929, Korsch's harsh polemic is surprising.

- 13 Brendel (1915–2007) was a journalist, and joined the GIK in 1934. After the Second World War, he was active in the council communist group *Spartacusbond*. After their split, he published the journal *Daad en Gedachte* until shortly before his death. His understanding of class struggle and revolution is exemplified most clearly in Brendel (1971).
- 14 Marcuse to Mattick, 25 October 1967 and 29 December 1965. The letters are in the Mattick papers in the IISG, Amsterdam. Thanks to Gary Roth for providing me with them.
- 15 Traces of both council communism and the Frankfurt School can be found today in the journals *Endnotes* (English), *Internationalist Perspective* (English/French), and *Kosmoprolet* (German).

# Positivism

Anders Ramsay

Positivism and the critique of positivism becomes an issue in the history of critical theory on two occasions: first, in the 1930s, when Horkheimer and Adorno enter into a discussion with the Vienna Circle of logical positivism, and later in the 1960s when Adorno debates the critical rationalism of Karl Popper. To critical theory the critique of positivism becomes important not only because it is an issue in the philosophy of science. Positivism is also viewed as an obstacle to a critical approach to society, limiting the analysis to what is quantitative, measurable and empirically observable. In this chapter, I will first sketch the tradition of positivism in social science and the relation of Marxism to positivism. I will then introduce Horkheimer's central essay from the 1930s and its twofold critique of positivism's epistemology and politics. This discussion ended with a complete break between the Frankfurt School and the Vienna Circle. The positivist dispute of the 1960s between Adorno and Popper is then presented. It did

expose some common ground between Adorno and Popper, but also important differences. Popper's alternative to positivism is too limited and has not left the scientific ideal for social sciences behind. Adorno also advocates a concept of critique that unlike Popper's critical rationalism is also a critique of society, not just of theories.

## THE TRADITION OF POSITIVISM

Positivism, as a scientific philosophy based on sensory experience, has its forerunner in eighteenth-century empiricism, but as a current in modern thinking it dates back to the French philosopher Auguste Comte, his teacher Henri de Saint-Simon and his English contemporary John Stuart Mill. In addition to calling his doctrine positive philosophy or positivism, Comte, in the mid-nineteenth century, defined sociology as the scientific study of society. Hence, sociology and

positivism are intimately connected from the beginning. Indeed, for the Frankfurt School, sociology as science 'is a child of positivism' (Institut für Sozialforschung, 1956: 9). For Comte, central to positive science was finding law-like regularities in human history. During the nineteenth century, positivism came to represent the idea that the social sciences and the humanities should look to the successful natural sciences as a model for guaranteeing the most reliable and useful results. Scientific method should be empirical, anti-metaphysical and draw its conclusions according to formal logic. The close relation between positivism and sociology remained steady through the nineteenth century with thinkers like Herbert Spencer and Vilfredo Pareto. The most influential and ambitious positivist programme for sociology and anthropology inspired by Comte, however, was founded and carried through in France by the turn of the nineteenth and twentieth centuries by Émile Durkheim, who emphasized the particular nature of social facts and demanded that sociology investigate imperative social currents. Despite the success of the natural sciences in the nineteenth century, its hegemony was challenged by reactions to positivism that on the contrary defended the distinguished character of humanities and letters, such as neo-Kantianism and hermeneutics (Lane, 2003).

The attempt to formulate and develop a general positivist programme, not just for sociology, continued with even greater organizational and propagandistic force in the twentieth century. About a decade before the programme of a critical theory of society was formulated at the Institute of Social Research in Frankfurt, the group of scientists and philosophers known as the Vienna Circle formulated a programme for a united science, also known under the names of logical empiricism, logical positivism or neo-positivism. Several of the members of the Vienna Circle were natural scientists or mathematicians, or, like the leading figure Otto Neurath, a sociologist with a natural scientific ideal of science.

The group understood itself as the beginning of a movement and connected itself to like-minded thinkers all over Europe. Like the members of the Institute, most of the members of the Vienna Circle were politically left-oriented and of Jewish origin, and when in exile after 1933, despite their differences in outlook, the two groups tried to find forms for mutual dialogue and cooperation. This attempt, however, ended after a few years and since then the divergences between the groups have become more prominent.

Some of the members of the Vienna Circle had sympathies for Marxism. The fact that despite this common ground the two groups could not agree, reflects an ambivalent relationship to natural science and positivism in the Marxist tradition. Marx and Engels had a genuine interest in the natural sciences, and Marxism as it developed after the death of Marx expressed the typical nineteenth-century belief in technological and scientific progress. This trait was particularly prominent in Engels' influential interpretation that dominated the labour movement before the First World War. In this understanding of Marxism, strengthened by Engels' interest in finding dialectical laws in nature, history was seen as governed by quasi-natural laws, similar to what positivism was trying to uncover. On the other hand, Marx (who dismissed Comte's positivism) was schooled in Hegel's philosophy that stressed the active part in subjectivity. In his 'Theses on Feuerbach' (1845), he objected to materialism in that it had so far not conceived reality from the point of 'sensual human activity, practice' (Marx, 1845: 5). This critique of materialism opened up an anti-positivist current in Marxism that became more visible with the Frankfurt School.

## THE FRANKFURT SCHOOL CRITIQUE OF POSITIVISM

With Georg Lukács' *History and Class Consciousness* (1923) the Hegelian heritage

in Marx's thought was rediscovered and an anti-positivist Western Marxism was conceived. In Lukács' book, the idea of an interest-free knowledge is rejected. The situation of the proletariat gives it a privileged position to understand society as a totality. The Frankfurt School carried on this tradition of the critique of value-free science. It has sometimes been criticized for using the concept of positivism in a much too general sense. In works like *Dialectic of Enlightenment* (1944) and *Eclipse of Reason* (1947), it seems as if an all-encompassing positivism has taken hold of reason and rationality. However, the members were aware of the tension between the general meaning of positivism and its meaning for particular writers. Adorno stresses this point when he writes about Durkheim. Positivism for Durkheim, for whom science amounts to 'observe, compare, classify' (Adorno, 1967: 246), means something else than it does for the Vienna Circle, and something else again for Ludwig Wittgenstein. (Here Adorno most likely has in mind the early Wittgenstein of *Tractatus*.) Still, despite the difficulties in giving positivism an exact meaning, Adorno defends a general use of the concept of positivism. Such a general understanding of positivism advocated by Adorno, draws on the meaning of the positive as 'the existing, the actually given' (Adorno, 1967: 246), that is, as posited by society directly, in its immediacy. Since there are writers who affirm the natural scientific model as a general model of science, and who do not want to use the concept of positivism at all, avoiding using it would, according to Adorno, imply a ban to mention it and an apology for what is intended with the concept (Adorno, 1967: 246–7).

Adorno's reservation against any apology for positivism signifies the fundamentally critical stance of the Frankfurt School towards positivism. Critique of positivism is a recurring theme in critical theory. Already in his inaugural lecture as *Privatdozent* in Frankfurt, before he was a member of the

Institute, Adorno mentions 'the scientific philosophies' as one of the contemporary currents that cannot solve the problem philosophy runs into when it has failed to grasp in thought the totality of reality (Adorno, 1931: 325f.) The scientific currents differ, however, from the various idealistic attempts, such as neo-Kantianism, *Lebensphilosophie* or new ontological projects like Heidegger's, in that they have given up the question about the constitution of reality and simply take the given for granted, securely grounded in the results of the natural sciences (Adorno, 1931: 327). The problem that a natural scientific ideal implies affirmation of what is given is a recurring theme when critical theory criticizes positivism. This does not mean that critical theory rejects the results of the natural sciences, or that it accepts the division between the natural sciences and the humanities (Horkheimer, 1932: 307), in the way that hermeneutics or other philosophical currents that are critical of positivism too.

## HORKHEIMER'S ESSAY ON THE LATEST ATTACK ON METAPHYSICS

Horkheimer, in his introductory speech upon assuming the position of director of the Institute of Social Research, also brought up the critique of positivism by social philosophy (Horkheimer, 1931: 27), and in his articles in *Zeitschrift für Sozialforschung* he developed his own critique. When Horkheimer went from calling his and the Institute's approach 'materialism' to the 'critical theory of society', the critique of positivism was simultaneously sharpened in the long, important article 'The Latest Attack on Metaphysics' (Horkheimer, 1937a). The article was preceded by extensive discussions with Adorno (see letters in Adorno and Horkheimer, 2003; cf. Dahms, 1994: ch. 3) that certainly strengthened Horkheimer's anti-positivism. Although it is in Horkheimer's name, it was their first extensive cooperation and marked Adorno's growing influence.

In *Dialectic of Enlightenment* and *Eclipse of Reason* the critique was further intensified and developed regarding positivism as an expression of the overall tendency of instrumental reason. Positivism here is the moment of final decay and self-destruction of enlightenment, already inherent in enlightenment itself, that makes any connection to the results of modern science impossible to the authors (Horkheimer and Adorno, 1947).

Horkheimer explicitly emphasized in the introduction to the annual volume of *Zeitschrift für Sozialforschung* that contained 'The Latest Attack on Metaphysics' that this critique did not exclude discussion and cooperation between the Institute and members of the Vienna Circle: 'Critique of the positivist school does not prevent us from recognizing and promoting their scholarly achievements' (Horkheimer, 1937b: 107). This statement refers to discussions that were carried out in the Institute in New York a year earlier with, among others, Neurath (Dahms, 1994: 81–96). An article by Neurath was also published in the Institute's journal (Neurath, 1937). In August 1937 Adorno and Benjamin delivered a report to Horkheimer from Paris on their participation in the 'Congress for the unity of science' in organized discussions with leading members of the Vienna Circle. One subject of the discussions on this occasion was Horkheimer's recently published 'The Latest Attack on Metaphysics' (Adorno and Horkheimer, 2003). When Horkheimer launched this sharp criticism against positivism, all members and dialogue partners of the Institute certainly did not appreciate it, and the article meant the end of 'diplomatic relations' with Neurath and his circle (Dahms, 1994: 174ff.) even though individual contacts with members continued. While in the United States, the Institute's members continued to cooperate with scholars who were influenced by the positivism of the Vienna Circle, most notably the psychologist Marie Jahoda and the sociologist Paul Lazarsfeld.

## SCIENCE AND METAPHYSICS

'The Latest Attack on Metaphysics' begins with the discussion of the relation between science and metaphysics in bourgeois consciousness and bourgeois philosophy. This relation occupied Horkheimer already in his early studies of Kant, in his dissertation (Horkheimer, 1922) and in his *Habilitation* (Horkheimer, 1925). In Kant the contradiction between science and metaphysics 'appear[s] in its most highly developed form' (Horkheimer, 1935: 280; cf. Abromeit, 2011: 309), but later bourgeois philosophy has not managed to solve it. Instead, it lives on in a recognition of spirituality and even occultism that exists side by side with scientism in several philosophical systems (Horkheimer, 1935: 281). This duality is also a recurring theme in critical theory, such as when Horkheimer discusses Bergson's *Lebensphilosophie* (Horkheimer, 1934). But in 'The Latest Attack on Metaphysics' the critique also concerns the relation between positivism and politics, the reduction of science to social behaviourism, the political impotency of positivism, and the entwinement of power and the positivist understanding of reason, a theme that later returns in *Dialectic of Enlightenment*.

The aim of the essay is not to defend metaphysics against positivism. Both are in themselves obstacles to actual thinking. The contradiction between metaphysics and science is not new but with logical positivism it has taken a new turn. Science and metaphysics exist side by side as a dichotomy and a contradiction and cannot be easily reconciled (Horkheimer, 1937a: 108). Metaphysics poses questions about human existence that are useless to science. Whereas science has its roots in the human confrontation with nature (Horkheimer, 1937a: 109), questions about such things as the soul, substance and immortality cannot be answered by science. Still metaphysics lives on. Science, when it makes nature an object of manipulation, shows that it is meaningless and contradicts

metaphysics. But this opens the need for an ideology that does not leave man alone in a desperate state, devoid of meaning. Official bourgeois consciousness is in this sense not on the same level as bourgeois science (Horkheimer, 1937a: 110).

Modern thinking has made efforts to handle this contradiction. Since Descartes there has been the notion of two substances (Horkheimer, 1937a: 111). On the one hand, man lives in the finite world of senses, and on the other hand she has a soul and has a part in a higher order. These different substances can be united in different ways; they are either actions founded in transcendental powers, or they have transcendental consequences. In either case, science doesn't have to be denied and can be connected to a higher meaning.

Horkheimer notices how a certain naiveté can be observed among some of the most prominent scientists who address this contradiction, such as Max Planck, who tried to solve it by talking about a 'spiritual world' which is also conditioned by natural occurrences. Simultaneously Planck tries to preserve free will with incoherent reasoning about causal determinations of other wills, while one's own will is free. This type of reasoning is typical of a worldview assembled by science and metaphysical beliefs that are not oriented to questioning the dominant order, but rather to finding peace and balance between the inner self and this outer order (Horkheimer, 1937a: 112).

There are two extremes according to which the ways to reach this harmonization may be grouped, according to Horkheimer (1937a: 112). The one extreme expressed itself in typical currents during the years after the First World War, such as philosophy of life [*Lebensphilosophie*] and existential philosophy. For those new metaphysics, science is a technique subordinated to true insights of what humankind really is. They express dissatisfaction with what befalls humans in capitalist society, where there is a constant threat that any person could become superfluous. Positivism, on the contrary, is hostile

to all such illusions and only recognizes knowledge based on pure experience in the severe form it is made in natural sciences (Horkheimer, 1937a: 114). This ideal is not new; it can be found both in thinkers that still held on to metaphysics, like Descartes and Spinoza, but also in the early positivists, like Comte and Spencer, whose thinking still had traces of a metaphysical worldview. Modern positivism, on the contrary, is signified by a scientific ideal of exact mathematical formulation and an ambition to predict the probability of an event in history with the same exactness as in nature. Although this is not yet possible in this view, it is only a matter of waiting for future results within special sciences. Metaphysics is superfluous nonsense and what man needs to know about himself he can learn from psychology and biology.

## POSITIVISM AND POLITICS

Horkheimer's critique of positivism combines epistemological and political critique. Positivism in its present form understands itself as apolitical and whatever opinions its adherents have, like the Vienna Circle, which consisted mostly of socialists, are external to the theory. According to Horkheimer, the history of positivism makes it attractive to anti-fascists. Not only did positivism struggle against metaphysical concepts, it also struggled against the authoritarian, organicistic concepts of state and society represented by fascism, where state and society, unlike in liberalism, are one. Although, today, positivism is more about eliminating problems in natural science and mathematics, its more glorious anti-fascist past still exerts attraction (Horkheimer, 1937a: 115). But present-day positivism has lost its political potentiality, since it has given up its connection to an independent, individual truth-seeking subject. Logic has taken the place of independent thinking. Experience is no longer based on the criteria of individual perception, but

on a preconceived judgement on perception that ties it to a scientific system based on protocol sentences about what is given, not sense perception as such (Horkheimer, 1937a: 115–8). The future only enters through induction (Horkheimer, 1937a: 120); only what is already a fact will occur. New historical tendencies or new thoughts have no place in science (Horkheimer, 1937a: 117). The highest authority for empiricism is recognized science which becomes an apparatus for ordering facts, what for Hegel is the activity of understanding [*Verstand*]. Ideal or social practice have nothing to do with science and no interests outside of science are allowed to criticize it. A critical theory, in contrast to traditional theory, has an interest in changing society (Horkheimer, 1937c). Such interests may, however, not interfere in the objectivity of science. A widespread current in social sciences after the war, such as social behaviourism (Horkheimer, 1937a: 125), is viewed by Horkheimer as the culmination of the logic of positivism. Since the concept of subject is rejected, only tendencies that can be estimated as regularities may be observed. Where acts of will are viewed as analogous with causes in nature, the relation between thinking and acting is comparable to a physical occurrence, like a brick falling on the head and the head getting hurt (Horkheimer, 1937a: 125). Such an epistemological view of the subject also makes the political actions of subjects incomprehensible to science as anything but physical reactions.

## THE POSITIVIST DISPUTE

In America the members of the Institute witnessed the continuing hegemony of quantitative research inspired by the kind of positivism criticized in Horkheimer's article. After the war this trend was unbroken, but the Marxists of the Frankfurt School were not alone in their critique. Voices were raised

against the consequences of the influence of positivism from different strands in social sciences and philosophy. The British historian of political philosophy, Peter Laslett, famously declared in 1956 that 'political philosophy is dead' (Lane, 2003: 338) because of the influence of positivism. From within analytical philosophy, Ludwig Wittgenstein's turn away from his earlier convictions inspired Peter Winch to the anti-positivist *The Idea of a Social Science and its Relation to Philosophy* (Winch, 1958). Although the Frankfurt School's critique of positivism was of a different kind, the climate was more open and after the Institute had actually crucially contributed to establishing empirical research and quantitative methods in the post-war Federal Republic, albeit with reserve, Adorno could now vent his dialectical position in an open confrontation.

The so-called positivist dispute, beginning in 1961 at a conference of the German Sociological Association in Tübingen with a debate between Adorno and Karl Popper, contributed decisively to making critical theory known for its critique of positivism. The debate continued after the first round between Adorno and Popper with contributions throughout the 1960s in the leading German journal *Kölner Zeitschrift für Soziologie* by Jürgen Habermas (1963, 1964), Hans Albert (1964, 1965) and Harald Pilot (1968). What is of interest here are the contributions by Adorno and Popper, since they can be read as a continuation of the debate of the 1930s and the critique formulated by Horkheimer at that time.

Although the debate has become known as the positivist dispute, critical theory here encountered a different kind of thinking from classical positivism in the critical rationalism of Popper, who had, as he points out himself, been criticizing the positivism of the Vienna Circle for several decades, since the publication of his *Logik der Forschung* (1934), from a position that he himself characterized as 'realist and anti-positivist'

(Popper, 1976: 290). Popper was therefore not content with playing the part of the positivist in the discussion. In this sense, since there was no self-identified positivist in the debate defending positivism per se, the debate has been described as 'a Hamlet without the prince' (Giddens, 1974: 18). When the book that finally collected the instalments of the discussion appeared (Adorno et al., 1969), Popper expressed a deep dissatisfaction not just with the debate itself, but with his own contribution and the way it was presented (Popper, 1976: 291). Ralf Dahrendorf, commenting on the discussion, had the impression that the two symposiasts were in agreement, while actually hiding profound differences (Dahrendorf, 1962: 146). To a certain extent this is true. Adorno did not consider Popper a logical positivist and they were in agreement on several points, not only in rejecting logical positivism, but also with respect to the relativism of the sociology of knowledge of Karl Mannheim, where there is no longer any way to tell truth from untruth (Adorno, 1962: 136–7).

However, what neither Dahrendorf nor later commentators noticed, but what is crucial to understand about the discussion between Adorno and Popper, about the similarities as well as the differences between their positions, is the imbalance between the two participants to what extent they had prior knowledge of the other's position. Adorno was actually familiar with Popper's position and on one occasion even expressed a great appreciation of it in the 1930s. In the predominantly negative report he wrote with Benjamin and sent to Horkheimer in August 1937 from the Paris conference, Adorno mentions, in passing, that 'Popper has in his book already prognosticated the total breakdown of the school ...' (Adorno and Horkheimer, 2003: 562). 'The school' was the Vienna Circle and 'the book' was Popper's *Logik der Forschung* (later known under its English title *The Logic of Scientific Discovery* (1959)), which Adorno had read at the time of the Paris conference.<sup>1</sup> Adorno's

prior acquaintance with, and estimation of, Popper's position as a critique of logical empiricism is not explicit anywhere in the original debate (Adorno, 1962) since Adorno did not refer back to it; this may have given the impression that Adorno did not know Popper's work beforehand, which he actually did. However, in his later comment on the debate in the long introduction to the book-publication (Adorno, 1969), he did come back to it.

There is nothing known about any explicit previous statements from Popper on Adorno or the Frankfurt School. Popper did not reveal any prior knowledge of the work of his opponent and proudly declares in his comment to the debate that he 'never regarded' the Frankfurt School 'as important' (Popper, 1976: 289). He obviously considered Adorno to be 'Hegelian or Marxist' (Popper, 1976: 288). Popper had written two books wherein he attacked Marx and Hegel, *The Open Society and Its Enemies* (1945) and *The Poverty of Historicism* (1957), and took for granted that the Frankfurt School could be attacked with the arguments he had developed in these works, which he deplored that he had not done (Popper, 1976: 289). This indicates that he did not know the Frankfurt School's interpretation of Marx and Hegel, and that he subsumed Adorno's position under the one he had outlined elsewhere in his critiques of Marx and Hegel. Popper thought his position on the logic of the social sciences was not adequately understood by his opponent, but he had himself no understanding of Adorno's position.

This difference in the preconceptions of each other's position is crucial to understand how Adorno's answer to Popper's paper in Tübingen is a mixture of both appreciation and critique. Adorno understood that the arguments developed against positivism by himself and Horkheimer in the 1930s were still valid (Adorno, 1969: 25), but he now had to respond to a position which he both appreciated as an internal critique of logical positivism, and felt did not go far

enough in light of his own dialectical position. If Adorno's critique was not very well received by Popper, it was probably due to a lack of understanding of Adorno's form of critique of other philosophies. Adorno makes use of the method that he learned early on when reading Kant together with Siegfried Kracauer and later employed in works such as his books on Husserl (Adorno, 1957) and Hegel (Adorno, 1963). Philosophical texts were not read simply for the epistemological argument and scientific judgement, 'but as a kind of coded text out of which the historical situation of the spirit could be read' (Adorno, 1964: 389). Texts are products of society and, not unlike works of art, they unintentionally express a truth about social repression, social contradictions and social norms. This truth must be interpreted and is part of a theory of society, which it presupposes. This method of reading texts probably contributed to misunderstanding and discordance on the part of Popper. Adorno appealed to autonomous thinking, true philosophy. He was also aware of the risks of positions that label themselves dialectics. They cannot claim to be any kind of privileged thinking, neither are they a particular subjective capacity, or some kind of intuitionism (Adorno, 1969: 10). Positivists, on their side, must abstain from the attitude of not understanding and dismissing everything that does not correspond to their criteria of meaning (Adorno, 1969: 11).

## POPPER ON THE LOGIC OF THE SOCIAL SCIENCES

The debate started with Popper's paper, 'The Logic of the Social Sciences' (Popper, 1962), which took the form of 27 theses and a concluding suggestion that presents his critique of logical positivism and his own theory of critical rationalism. Logical positivism's understanding of the scientific method is the first target of Popper's paper. For logical positivism, only two kinds of propositions

are meaningful: analytical and empirical. Analytical propositions are tautologies (such as 'all bachelors are unmarried') and may be verified without any empirical evidence. This rules out metaphysical statements that can neither be verified logically or empirically. Empirical statements are those that can be verified by empirical evidence, through observation, and are left to scientific investigation. In this way, logical positivism could establish a demarcation between science and metaphysics. To the logical positivists then, the inductive method of observation and measurement of facts is the foundation for a unified science of natural and social sciences (Popper, 2002).

Popper, like the positivists, also starts from 'the overwhelming progress of the natural sciences' (Popper, 1962: 103) but calls logical positivism's understanding of the scientific method an example of 'the misguided and erroneous methodological naturalism or scientism which urges that social sciences should finally learn from the natural sciences what scientific method is' (Popper, 1962: 107). According to Popper this is a misunderstanding, a widespread 'myth of the inductive character of the natural scientific method' (Popper, 1962: 107). He is just as concerned as Adorno that misguided naturalism has spread in the social sciences. What is misguided, however, for Popper, is the understanding of scientific method as the method of verification, not the idea that social sciences should learn from natural sciences. He does not reject the natural sciences as a model of science, but presents another interpretation of the scientific method common to natural and social sciences. This is described not as the method of observation, but as the method of testing proposed solutions for problems (Popper, 1962: 105).

The textbook version of Popper's critical rationalism poses a method of falsification against positivism's method of verification, as an alternative criterion of demarcation. The scientific method is, according to Popper, about testing theories and attempting to prove

them wrong. If they survive the test, they can be accepted until further evidence can be produced against them. (In his paper, however, neither of the terms falsification nor demarcation are actually used.) Popper begins his contribution to the debate with the 'Socratic' (Popper, 1962: 103) contradiction between knowledge and ignorance and the concept of a problem. With every new step forward in knowledge we also discover our great ignorance and new problems. The tension between knowledge and ignorance is central to the logic of knowledge: 'No knowledge without problems – no problems without ignorance' (Popper, 1962: 104). From this it follows that knowledge does not, like logical positivism claims, start from observation and collection of data, but with the discovery that something is not in order with our supposed knowledge and the supposed facts; in other words, knowledge starts with a problem; Popper, 1962: 104f.). The method of solving problems is here called the critical method or the method of trial and error [*kritizistisch*], since proposed solutions are criticized and either temporarily accepted or rejected, but never verified. Rejected solutions may be considered again in light of new facts, and accepted solutions may later be rejected. As is the case for the method of verification, positive verification is not available (Popper, 1962: 107).

Against the inductive logic of verification, Popper poses deductive logic, the theory of the validity of logical inference (Popper, 1962: 115), which is the theory of rational criticism (Popper, 1962: 116). It is also a theory of truth and falsity, since if the premises of an inference are true, then the conclusion is true, and if the conclusion is false, then not all premises are true (Popper, 1962: 115). Deductive logic transmits truth from the premises to the conclusion, and in the case of falsification, retransmits falsity from the conclusion to the premises (Popper, 1962: 115–6). In this way the deductive method eliminates logical contradictions from theories and, for Popper, a theory is synonymous with a deductive system.

In addition, for Popper, all problems investigated by social science are theoretical problems. Even if the starting-point is always 'serious practical problems such as poverty, illiteracy or political repression', practical problems will lead 'to premeditations, to theorizing and thus to theoretical problems' (Popper, 1962: 105). There is no such thing as a thing-in-itself of a scientific subject: 'A so-called scientific subject is only a conglomerate of problems and attempted solutions. What is real are the problems and the scientific traditions' (Popper, 1962: 108).

### ADORNO ON POPPER'S RESTRICTED CRITIQUE OF POSITIVISM

Adorno's objections to Popper concern his concepts of problem, method and critique. The goal for Popper's critical method is to eliminate formal logical contradictions from scientific theories. Popper certainly considers himself a realist; to him, there is an independent, external world. But his concepts of problem and critique only concern theories, not the external world. And his concept of method in a significant way does not break with positivism and has some peculiar positivist traits. These are the issues on which Adorno concentrates in his reply to Popper.

In his introduction to the published debate, Adorno recognizes Popper's thesis that 'there is no such thing as a pure observational science, but only sciences that theorize more or less consciously and critical' (Popper, 1962: 119), that contain 'something like a common denominator' (Adorno, 1969: 31) for their positions. He agrees with Popper in his critique of positivism, both with respect to a misguided naturalism, and with respect to the thesis on the primacy of the problem before observation. But he also insists that it is necessary to go much further in this critique than Popper is willing to. The discovery of a problem, a contradiction between our knowledge and reality, is not only a supposed

contradiction between subject and object that can be ascribed to the subject alone and solved with increased knowledge and clearer formulations. The contradictions are found in reality [*die Sache*] (Adorno, 1962: 129), in the material we work with. It is the object of sociology, society in itself, that is a problem in the emphatic sense. To Popper 'a problem is something merely epistemological and for me at the same time something practical, in the last instance a problematic condition of the world' (Adorno, 1962: 129). According to Adorno, if we restrict the concept of problem to theoretical problems we risk fetishizing science in pure logical formalism, where facts only obey logical principles. (For Adorno, examples of this logical formalism are found in the formulations of Alfred Tarskis or Edmund Husserl.)

But Popper's concept of a problem is also restricted in the sense that it is atomistic when it postulates that sociology should only concern itself with what can be broken down to individual problems and individual solutions. Thus it will inhibit social scientific thinking. Adorno asks explicitly whether a work like Marx's *Capital* in that case should not be considered a work of social science, since it does not contain problems and solutions in Popper's sense (Adorno, 1969: 53). It points, instead, to irrationalities and contradictions in society and poses the question of the breakdown of capitalism, a problem that cannot be simplified to a deductive inference. Society itself is the context that is presupposed when it comes to problems in society and it cannot be broken down to testable hypotheses. With this natural scientific ideal of simplification serious problems are transformed to pseudoproblems that do not conform to the prescribed method of trial and error (Adorno, 1969: 52).

This is how Popper, despite his important critique of logical positivism, by holding on to what he understands as the scientific method modelled after natural sciences, still has something in common with positivism and is found guilty of scientism. As

with the latter, he advocates the primacy of method over the object of investigation. Popper is well aware that countless examples of sociological research suffer from lack of relevance and interest when they follow the primacy of the method and not the problem (Adorno, 1962: 130). If contradictions are real and not just theoretical, method must also be informed by reality [*die Sache*] rather than scientific ideals (Adorno, 1962: 130). Popper, like the positivists, becomes guilty of formalism when he prescribes a method a priori for the social sciences. Methods cannot just be adapted from the natural sciences for the social sciences since the problems of society cannot be grasped with the form of the hypothesis. When contradictions are eliminated in theory, real, objective contradictions that can be objects of research are also eliminated and the object of social science is falsified. Society to Adorno is 'contradictory and yet determinable; simultaneously rational and irrational, a system and yet fragmented; blind nature and yet mediated by consciousness' (Adorno, 1962: 126). Hence reality resists cognitive ideals that strive for simple coherent explanations; society is 'not consistent, not simple, not neutrally left to the capriciousness of categorical formulations'. Often an ideal of clarity and exactness is invoked in social science that is a threat to obtaining knowledge of society (Adorno, 1962, 126). If sociological method does not take the character of its object into account, it is at risk of falling into another contradiction, 'between its own structure and its object' (Adorno, 1962: 126). Therefore, for Adorno, the Socratic wisdom of abundance of knowledge and boundless ignorance that opens Popper's contribution expresses this difference between society as object and the traditional inductive understanding of method. The contradiction between method and object will hardly be resolved with an epistemology which, like Popper's approach, however critical, still gives prominence to its own methodology before the structure of the object.

## TWO CONCEPTS OF CRITIQUE

Since Popper and Adorno both identify their positions with the epithet 'critical', they agree in their emphasis on the concept of critique. This is one point where it would seem as if they might converge. However, similar differences, like those concerning problem and method, appear when it comes to the aims and scope of their notions of critique. Dahrendorf notes in his comments on the discussion that whatever congruity there may be between them, it is superficial. His summary of the difference between the two thinkers is quoted approvingly by Adorno. Popper's concept of critique is 'without any substantial determination; a pure mechanism of the provisional confirmation of general statements of science: "We can not ground our propositions", we can only "expose them to critique"' (Dahrendorf, 1962: 146; cf. Adorno, 1969: 31). To Adorno, critique and a critical theory of society entails 'developing the contradictions of reality through knowledge of them' (Dahrendorf, 1962: 146; cf. Adorno, 1969: 31).

As has already been shown above, Popper's concept of critique is more or less identical to his deductive method. Critique is directed towards proposed solutions for problems. Solutions must be formal, logical, coherent and endure empirical tests according to the deductive method. Pure deductive logic, formal logic is 'an organ of critique' (Popper, 1962: 116). The logical contradiction as an instrument for logical critique is objective and guarantees scientific objectivity. Thus Popper's concept of critique, just like his concept of problem, only concerns the logical coherence of theories.

Popper stresses that he is critical of the misguided naturalism of the positivists. Nonetheless, he found his own concept of critique in a naturalistic way. In his comment on the debate, he explicitly states:

We may start from Darwinian evolution. Organisms evolve by trial and error, and their erroneous

trials – their erroneous mutations – are eliminated, as a rule, by the elimination of the organism which is the 'carrier' of the error. It is part of my epistemology that, in man, through the evolution of a descriptive and argumentative language, all this has changed radically. Man has achieved the possibility of being *critical of his own tentative trials, of his own theories*. These theories are no longer incorporated in his organism, or in his genetic system: they may be formulated in books, or in journals; and they can be critically discussed, and shown to be erroneous, without killing any authors or burning any books: without destroying the 'carriers'. (Popper, 1976: 292)

Popper's concept of critique is thus an imitation of nature's evolution, as understood in a Darwinian way, in the form of discourse but without the cruel consequences of nature.

This concept of critique does not aim at a critique of society, but only at attaining scientific objectivity through the elimination of false theories. Critique is an inner-scientific affair between scientists. Despite modelling his concept of critique on nature and natural science, Popper is conscious of differences between natural and social sciences. He does not, like logical positivism, believe that individual scientists can completely liberate themselves from their values, but still argues that science must be value-free. It is, however, important to

be conscious of the fact that objectivity in the social sciences is much harder to achieve (if it can be achieved at all) than in the natural sciences; [...] only in the rarest cases can the social scientist free himself from the value system of his own social stratum and so achieve even a limited degree of value freedom and objectivity. (Popper, 1962: 107)

Mutual criticism among scientists creates a tradition that guarantees scientific objectivity. What we usually call scientific objectivity 'lies only in the critical tradition [...] the objectivity of science is not the individual matter of various scientists, but a social matter of their mutual critique [...] It is therefore dependent on a whole series of social and political circumstances which make this critique possible' (Popper, 1962: 112). However, despite this emphasis on

social circumstances, Popper considers that 'such minor details as social or ideological position of the scientists' (Popper, 1962: 113) will in the long run not have any importance.

Adorno sees the key role of the concept of critique as a crucial step away from positivism and the doctrine of the primacy of observation, but just as with the concept of problem, goes further than Popper. He recognizes that Popper's concept of critique is not completely alien to his own: 'Insofar as [Popper] identifies the objectivity of science with the critical method, he raises it to the organ of truth. No dialectician today would demand more' (Adorno, 1962: 134). But Popper's concept of critique is 'pure cognitive [...] or subjective' (Adorno, 1969: 31). It is not a question of a confusion of different meanings of the same word, but an actual ambiguity. For dialectics, thought necessarily strives towards grasping reality [*die Sache selbst*]. Critique of contradictions in theory must necessarily also become critique of reality. Popper's formalism asserts itself again when he insists upon a pure cognitive concept of critique. However, critical reason is the same in both instances. Critique is not purely epistemological, but also a critique of the non-identity between concept and object.

Cognitive criticism, of knowledge and especially of theorems, necessarily also examines whether the objects of knowledge are what they claim to be according to their own concept. Otherwise it would be formalistic. Neither is immanent criticism only purely logical but always substantial as well – the confrontation of concept and reality. (Adorno, 1969: 31)

The concept of critique hence refers back to Popper's starting point, when he claims that we always deal with real problems, but which he later shuts off from when he claims that we only work with theories.

This is also the limit of Popper's critique of logical positivism. A critical sociology as a critique of society will be inhibited by such a reduction to facts that follows from

the dismissal of solutions, in the name of social neutrality, that do not stand the critical test. This is where Adorno refers back to *Logik der Forschung*, where Popper concedes that so-called protocol sentences, the basis for objectivity according to logical positivism, are not inviolable (Adorno, 1969: 36). Such a concession takes critique further since it means that the reference to protocol sentences, 'simple observations, are pre-formed by society' (Adorno, 1969: 36). This opens up for a critical sociology:

There are sociological theorems, which, as insights into the mechanisms of society that operate behind the facade, in principle, even for societal reasons, contradict appearances to such an extent that they cannot be adequately criticized through the latter. Criticism of them is incumbent upon systematic theory, upon further reflection but not, [...] for instance, upon the confrontation with protocol statements. Therefore, facts in society are not the last thing to which knowledge might attach itself, since they themselves are mediated through society. (Adorno, 1962: 132)

If facts are not the last instance of knowledge, theory acquires a different role than what it does for Popper; 'it is the telos, not the vehicle of sociology' (Adorno, 1962: 133). Theory to a critical sociology is not something to be tested to see if it fits scientific logic, but is a goal in itself. We learn to know reality through theory, wherefore theory and reality cannot be separated. Contradictions in propositions can with a theoretical analysis be traced to structural contradictions that in turn cannot be eliminated by logic (Adorno, 1962: 136).

## IS THE CRITIQUE OF POSITIVISM STILL TIMELY?

What is left of the critique of positivism? The position of the Vienna Circle, as it was criticized by Horkheimer, hardly has any adherents today. The members themselves abandoned the more orthodox version of logical positivism,

such as the criterion of demarcation or the idea of a unified science. With Thomas Kuhn's *The Structure of Scientific Revolutions* (1962), which appeared at the same time as the positivist dispute and which sparked an even more enduring debate, a post-positivism has come to dominate the theory of science, with insights such as the theory dependence of facts and the social dependence of the objectivity of scientists. Still, this discussion has moved within the tradition of natural sciences and has not affected the self-understanding of the social sciences as deeply as the Frankfurt School's critique of positivism and others did in the 1960s.

Traces of positivism, however, still live on in some corners of analytical philosophy. From some representatives of the current, despite the internal critique and attempts at rapprochement and dialogue with so called continental philosophy, demands for clarity and rejection of whatever does not fit into the analytical ideal can still be heard and have even gained a certain popularity (such as Frankfurt, 2005). An ideal of simplicity and cleanliness, the latter expressed as a dismissal of 'bullshit', follows logical positivism in putting up a barrier against any complexity and mediation when it comes to understanding and explaining society (Beck and Crooman, 2016: 93). Such expressions of a resurrected positivism under new names will also tend to reanimate the critique.

## Note

- 1 The report, titled 'Kongreß für Einheit der Wissenschaft (Logische Positivisten)', signed 'Paris, 4. August 1937', by 'Wiesengrund' and 'Benjamin', was not published until 2003 in the appendix to the first volume of Adorno's and Horkheimer's collected correspondence (Adorno and Horkheimer, 2003: 560–70). The source of the document is the Theodor W. Adorno Archive. Even such a meticulous work as Dahms (1994), who partly builds on archival research, has not had access to the document. (The title *Logik der Forschung* is not mentioned in the report but the editors estimate that it is the book referred to by Adorno.)

# Critical Theory and the Sociology of Knowledge: Diverging Cultures of Reflexivity

Oliver Schlaudt

## INTRODUCTION

Sociology of knowledge has been an important point of reference for critical theory. The prominent place Max Horkheimer granted to it in his seminal paper 'Traditional and Critical Theory' (1937) illustrates this well. While Horkheimer puts much effort into analyzing 'traditional theory', and into providing an accurate description of it, his treatment of 'critical theory' is completely different: he offers neither a definition of critical theory nor a guide on how to think critically. Instead he introduces critical theory mainly by discussing examples and counter-examples. The Critique of Political Economy and the sociology of knowledge are Horkheimer's (1937: 262–3) first two examples. They thus play a crucial role in the text. While the former seems to exemplify for Horkheimer what critical theory is, and thus serves as a model for critical theory, the latter is an example for an approach

which seems to come close to, and indeed was confounded with, critical theory, but, according to Horkheimer, differs substantially from it. The discussion of the sociology of knowledge, which is present in a great number of texts from the Frankfurt School, probably had a twofold function: it was of didactic use for introducing the reader to critical theory, but moreover it was also crucial for the self-reflection of the Frankfurt School and the School's demarcation within the intellectual landscape of the pre-war period. Yet recent developments in critical theory, such as Boltanski's 'break' with Bourdieu, still seem to be related to the distinction between sociology of knowledge and critical theory.

The chapter analyses the Frankfurt School's reading of sociology of knowledge, in particular the founding contribution by Karl Mannheim, and identifies the differences between critical theory and a positivist sociology of knowledge. In a concluding remark, we will try to spell out these

differences in terms of diverging interpretations of 'reflexivity'.<sup>1</sup>

## SOCIOLOGY OF KNOWLEDGE

### *On Sociology of Knowledge*

At the time of critical theory's emergence, the sociology of knowledge was also a relatively young discipline. If we omit the question of the latter's alleged 'forerunners' we can identify the study on 'Primitive Classification' by the French sociologist Émile Durkheim and his nephew Marcel Mauss, first published in 1903, or, in the German-speaking world, the contributions to the volume *Versuche zu einer Soziologie des Wissens*, edited by Max Scheler in 1924 as the first substantial contributions. This volume contained in particular an essay by Wilhelm Jerusalem, entitled 'On the Social Conditions of Thinking and of the Forms of Thinking'. Jerusalem's essay is purely programmatic and does not present any empirical research, but its title already provides a good working definition of the sociology of knowledge. The sociology of knowledge, in particular sociology of scientific knowledge (SSK), contrary to sociology of science, does not restrict itself to the study of the social organization of science and its institutionalization, but claims that also knowledge itself, its form and its content, is socially conditioned or determined. Hence the opening paragraph of David Bloor's now classical introduction to SSK, first published in 1976:

Can the sociology of knowledge investigate and explain the very content and nature of scientific knowledge? Many sociologists believe that it cannot. They say that knowledge as such, as distinct from the circumstances surrounding its production, is beyond their grasp. They voluntarily limit the scope of their own enquiries. I shall argue that this is a betrayal of their disciplinary standpoint. All knowledge, whether it be in the empirical sciences or even in mathematics, should be

treated, through and through, as material for investigation. (Bloor, 1991: 6)

This definition still conforms to the way Wilhelm Jerusalem framed the task of a sociology of knowledge some 50 years earlier. The name of Jerusalem also points to the milieu of Viennese intellectuals of the 1920s, who shared an interest in the sociology of knowledge. Without exaggeration – though in need of further precision – it can be said that one element of Austro-Marxism, as it was coined at that time in Vienna, consisted in equating the programme of historical materialism with sociology, and in particular the critique of ideology with the sociology of knowledge (Goldmann, 1958). Indeed the sociology of knowledge, insofar as it offers a causal explanation of knowledge in terms of social factors, traces back the ideas which men form 'about their relation to nature or about their mutual relations or about their own nature' to 'their real relations and activities, of their intercourse, of their social and political conduct', as Marx and Engels put it in *German Ideology* (which was first published in parts in 1904/05; the first complete edition followed in 1932).

### *Horkheimer and 'Sociology of Knowledge'*

Given that in a certain strand of Marxism ideology critique was identified with the sociology of knowledge, it is not surprising that Horkheimer paid special attention to it when framing his ideas on critical theory. However, when Horkheimer or others close to the Frankfurt School mentioned the 'sociology of knowledge', they did in general not refer to the entirety of the approaches subsumed in this discipline. Instead they had something much more specific in mind. Indeed, in their writings they referred more or less exclusively to the Hungarian-born sociologist Karl Mannheim who completed his main work *Ideology and Utopia* in 1929 at Heidelberg

and became professor of sociology and political economy at the University of Frankfurt in 1930 (his office was actually located in the building of the *Institut für Sozialforschung*). Not only Horkheimer but also Herbert Marcuse reacted to the publication of *Ideology and Utopia* by publishing extensive reviews.<sup>2</sup> In 1937, Adorno too wrote a critique of Mannheim for *Zeitschrift für Sozialforschung* which however remained unpublished, 'out of consideration for the plight of the émigrés', as Müller-Doohm (2005: 520–1) supposes. Adorno returned to this critique several times during the following decades, in talks as well as his lectures on sociology (cf. Jay, 1985). In all these texts, the sociology of knowledge is practically identified with the work of Karl Mannheim.

Karl Mannheim's relation to the various strands of Marxism was ambiguous. He was acquainted with György Lukács from their common hometown Budapest where they co-founded, alongside others, the *Sonntagskreis* in 1915 (Karádi and Vezér, 1985, cf. also Löwy, 2002). Mannheim paid special attention to the publication of Lukács' *History and Class Consciousness*, which he regarded as the 'most profound and significant of all [attempts to elaborate the dialectic method]' (Mannheim, 1952: 124). Mannheim drew much from Marxist philosophy, but, as we will analyse in more detail below, he also distanced himself from Marxism and criticized it as biased. The irritation caused among Marxist intellectuals by Mannheim's ambiguous position is well illustrated by Otto Neurath's review of *Ideology and Utopia* where he described Mannheim as a 'bourgeois Marxist', i.e. a bourgeois thinker who no longer bluntly rejected Marxism but adopted the Marxist vantage point and then, turning Marxist criticism against itself, claimed to show its one-sidedness and incompleteness.<sup>3</sup> Mannheim indeed thought of his own account as a modification or an enhancement of earlier approaches to a (Marxist) critique of ideology. It is not astonishing, then, that he was attacked from all political camps,

not only from critical theory, but also from conservative intellectuals.<sup>4</sup>

## KARL MANNHEIM'S APPROACH TO SOCIOLOGY OF KNOWLEDGE

### *Ideology, Symmetry, and Reflexivity*

Karl Mannheim defined his own position with reference to what he conceived to be the Marxist 'critique of ideology', i.e. the attempt to criticize 'false consciousness' in terms of class relations and social interests. Insofar as the Marxist critique of ideology equated social influences with error and bias, to put it into more contemporary terms, Mannheim was right to think of this approach, first, as *asymmetric*, because it was restricted to false consciousness, and, second, as *irreflexive*, because it was restricted to the adversary.

Mannheim's aim was to establish a symmetrical and reflexive style in sociology. 'Symmetry' means extending the sociological investigation to all items of discourse, regardless of whether they are evaluated as true or false. 'According to this view, human thought arises, and operates, not in a social vacuum but in a definite social milieu. We need not regard it as a source of error that all thought is so rooted' (Mannheim, 1929/1954: 71). Thus, by virtue of the principle of symmetry, the sociology of knowledge can study how claims 'emerge in the course of historical development out of the complex social process' (ibid.: 75) without evaluating them as false because of their social origin. Moreover, as a result of the principle of 'reflexivity', which demands the application of sociological analysis to the analyst himself, the theory of ideology is transformed into a sociological account of knowledge:

As long as one does not call his own position into question but regards it as absolute, while interpreting his opponent's ideas as a mere function of the social position they occupy, the decisive step

forward has not yet been taken. [...] A] general form of the total conception of ideology is being used [reached] by the analyst [only] when he has the courage to subject not just the adversary's point of view but all points of view, including his own, to the ideological analysis. [...] With the emergence of the general formulation of the total conception of ideology, the simple theory of ideology develops into the sociology of knowledge. (ibid.: 68–9)

Mannheim's sundering of the traditional link between social influence and distortion can be regarded as a major achievement in the 'positivist' camp. As Helen Longino points out, even today proponents of an alleged 'social' epistemology continue to 'explicitly equat[e] social forces with "bias"' (Longino, 2002: 56). Despite his sociological determinism Mannheim was thus not compelled to subscribe to what is called today an 'equal validity thesis', i.e. the thesis that all claims, because of their social determination, are equally false or equally valid (as Lukács objected later in his polemical *The Destruction of Reason*, Lukács, 1954: 501, and as also Adorno seemed to suppose in *Negative Dialectics*).

### **Particularism, Synthesis, and 'Privileged Standpoint Epistemology'**

All those who (1) equate social influence or determination with error and bias, (2) hold the intellectual sphere to be entangled with practical life (as it was suggested by Marx in the 'Theses on Feuerbach'), and yet (3) stick to the possibility of knowing and insight (insight in the functioning of society but in particular in society's influence on knowledge), have to subscribe to what might be called a 'privileged standpoint epistemology'. Such an epistemology holds that a privileged vantage point exists that provides unbiased insight into society, regardless of whether it is held that such a privileged standpoint somehow completely escapes from social determination, that social forces somehow neutralize each other at

that special standpoint, or that social forces somehow favour or catalyze insight at that special standpoint.

Standpoint epistemology was common among Marxist philosophers of that time. Ernst Bloch for example defended a rather simplistic version of a standpoint epistemology, arguing that only the proletariat is able to grasp reality because it is the only class not having the interest to veil the real situation:

what objectively distinguishes the proletarian 'ideology' from others is the fact that it is the *material interest* of the proletariat not to develop any veiling of reality, but rather to gain insight into the real driving forces and the real tendency of this reality; while it was likewise the material interest of all earlier classes that false consciousness should be formed and its limits should not be exceeded. (Bloch, 1935/1991: 264)

Bloch thus believed the proletariat really to escape from the mystifying effects of ideology. For him, a vantage point free from social determination existed, but access to it was socially restricted.

Lukács also formulated a standpoint epistemology, but his version was a more refined one. Following Marx's 'Introduction' to *A Contribution to the Critique of Hegel's Philosophy of Right* from 1844, Lukács held that the interests of the proletariat are identical to those of the whole society. That is, the proletariat is the only class for which the gap between particular and general interests does not exist or collapses. The reason for this is that, according to Marx, the *particular* interests of the working class, due to the latter's material poverty, are reduced to the very basic and in this sense *universal* human needs. As a consequence, the proletariat is the only class that, though still driven by its particular interests, is able to take possession of the social power of society without however establishing a new class society (as the bourgeoisie did when freeing itself from feudal regimes):

In the formulation of a class with *radical chains*, a class of civil society which is not a class of civil

society, an estate which is the dissolution of all estates, a sphere which has a universal character by its universal suffering and claims no *particular right* because no *particular wrong*, but *wrong generally*, is perpetuated against it; which can invoke no *historical*, but only *human*, title; [...]; a sphere, finally, which cannot emancipate itself without emancipating itself from all other spheres of society and thereby emancipating all other spheres of society, which, in a word, is the *complete loss* of man and hence can win itself only through the *complete re-winning of man*. This dissolution of society as a particular estate is the *proletariat*. (Marx, 1975, vol. 3: 186)

Note that Marx's point in the quoted passage is a purely practical one without any epistemological implications. It is not due to special insight that the working class, according to Marx, has the proficiency to establish a free and non-hierarchical society, but due to its specific social conditions. The working class in particular does not escape the determination of action by particular interests. But due to its special social condition, its particular interest is identical to the general interest of mankind. Thus when Lukács added in *History and Class Consciousness* that the 'self-understanding of the proletariat is therefore simultaneously the objective understanding of the nature of society' (Lukács, 1923/1971: 149; cf. Mannheim, 1952: 218), this *prima facie* is an element alien to Marx's framework. It seems however that in Lukács, contrary to Bloch, the proletariat is not automatically endowed with this kind of insight into society, but only insofar as it realizes the 'unity of theory and practice' as a revolutionary subject (Mannheim, 1952: 69, 225), i.e. when it becomes the 'mirror and motor of the historical and dialectical process' (ibid.: 39). In 'Traditional and Critical Theory', Horkheimer seemed to agree with Lukács' account, adding only that the critical theoretician becomes an ally of the working class, i.e. that his analyses of social contradictions does not only describe the historical situation, but becomes a stimulating factor for change (Horkheimer, 1937: 269).

Surprisingly Mannheim also subscribed to standpoint epistemology, despite the axiom of reflexivity. We have seen that Mannheim had disentangled social influence and bias and thus could have done without such an epistemological foundation (as does the contemporary positivist sociology of knowledge). Yet standpoint epistemology emerges on a meta-level in Mannheim from his theory of 'particularism' which I will turn to next.

We have seen that according to Mannheim social influences are not equated to distorting factors in the production of knowledge. From this it does not follow, though, that Mannheim thought of these factors as epistemologically neutral (as seems to be the case in contemporary positivist approaches in the sociology of knowledge, in particular SSK). Rather, according to Mannheim, social determinants act like spotlights, playing the double role of creating light *and* shadow. They highlight certain aspects of reality while keeping others from sight. Historical 'systems of meaning' thus 'furnish an appropriate expression' of their specific historical situation (Mannheim, 1929/1954: 76). Mannheim calls this phenomenon the 'particularism' of historical standpoints. It might equally well be called 'perspectivism'. This epistemological framing reflects Mannheim's 'liberal' or 'bourgeois' positioning. He staggers between two views, each of them incompatible with the Marxist views of his contemporaries: first, that there is no 'absolute' point of view ('with the eyes of god', Mannheim, 1952: 225) and that any quest for an absolute truth 'is merely a sign of the loss of and the need for intellectual and moral certainty, felt by broad sections of the population who are unable to look life in the face' (Mannheim, 1929/1954: 77); and second the conviction that the whole picture can only be grasped from a vantage point that succeeds in integrating the whole set of possible standpoints (e.g. liberal, conservative, socialist, and even fascist, cf. ibid.: 132–3). The 'totality' should then be revealed in the 'synthesis' of all particular, but complementary, standpoints.

In any case, as Mannheim stresses in the sense of his aforementioned relativism, such a synthesis can never be more than provisional, ephemeral, and, of course, relative:

A demand for an absolute, permanent synthesis would, as far as we are concerned, mean a relapse into the static world view of intellectualism. In a realm in which everything is in the process of becoming, the only adequate synthesis would be a dynamic one, which is reformulated from time to time. (ibid.: 135)

Quite telling is Mannheim's answer to the question of who can be the 'bearer' of the synthesis. He thought that this could only be provided by the 'socially unattached intelligentsia' (the '*freischwebende Intelligenz*', a term of Alfred Weber's) 'a relatively classless stratum which is not too firmly situated in the social order' (ibid.: 137). According to Mannheim, the intelligentsia is thus a socially heterogeneous group the unit of which is constituted solely by the members' commonly shared cultural values:

Although they are too differentiated to be regarded as a single class, there is, however, one unifying sociological bond between all groups of intellectuals, namely, education, which binds them together in a striking way. Participation in a common educational heritage progressively tends to suppress differences of birth, status, profession, and wealth, and to unite the individual educated people on the basis of the education they have received. (ibid.: 138)

Mannheim thus clearly advocates a variety of a 'privileged standpoint epistemology' according to which a certain vantage point is needed to disentangle the causal strands, tying consciousness to its historical context, and to sort of escape the forces of society. But his version is a more sophisticated one insofar as it is situated on a meta-level. For, as we saw, he granted a 'particular' view of the whole to each party and only the approximation of totality in a meta-synthesis called for a privileged standpoint, which Mannheim identified with that of the 'socially unattached intelligentsia'. However, in this context 'socially unattached' does not mean

intellectuals are not exposed to social influences – of course they are, at least as individuals – but that in the social community they form all of the possible different social determinants merge and provide access to any point of view:

Not, of course, that it [the stratum of the intellectuals] is suspended in a vacuum into which social interests do not penetrate; on the contrary, it subsumes in itself all those interest [...]. The individual, then, more or less takes part in the mass of mutually conflicting tendencies. [...] Precisely through the cultural attachments of this group, there was achieved such an intimate grasp of the total situation, that the tendency towards a dynamic synthesis constantly reappeared [...]. (ibid.: 139–40)

This view seems optimistic, if not naïve. To put the objection more to the point we can refer to Bourdieu's critique of the Mertonian school in the sociology of science and object to Mannheim that his view comes close to a *teleological* or *finalist* view insofar as everything takes place *as if* the community of the intellectuals was designed for gaining objective insight into society (cf. Bourdieu, 2002). In any case Mannheim's affirmative stance vis-à-vis the intellectual community is directly opposed to the critical attitude of the Frankfurt School. Whereas in the Mannheimian framework the intellectual can rely on the architecture of his community, endowing him with a privileged standpoint, critical theory demands 'consciousness of its own entanglement with the "false" world of economic inversion' (Bonefeld, 2014: 69).

To close this section, it should finally be mentioned that the contemporary positivist sociology of scientific knowledge could easily give up the search of a privileged standpoint. SSK restrains itself to the first step in Mannheim's scheme, to a particularistic (though scientific) view of its object of investigation, and is not interested in synthesizing particular views into a totality. So SSK can without further ado renounce a privileged standpoint and pursue their study under the title of 'reflexivity', now understood as a purely formal postulate:

If the condition of reflexivity is to be satisfied it ought to be possible to apply this whole account to the sociology of knowledge itself without in any way undermining it. This is certainly possible. There is no reason why a sociologist or any other scientist should be ashamed to see his theories and methods as emanating from society, that is, as the product of collective influences and resources and as peculiar to the culture and its present circumstances. (Bloor, 1991: 44)

## CRITICISM OF MANNHEIM FROM CRITICAL THEORY

It is evident that critical philosophers must have felt an urgent need to reply to Karl Mannheim. For not only did he present a positivist sociology of science as the legitimate inheritor of the critique of ideology (as did also Max Adler and whom must already have annoyed them); he also turned this approach against Marxism itself and pretended to lay bare its restricted perspective on history and society. There was thus a double motivation for reaction.

The reactions from authors close to the Frankfurt School were nevertheless quite heterogeneous, ranging from complete rejection to partial approval and even to inspiration. In what follows I will group the critical reactions according to their main concerns: positivism, reflexivity and symmetry, and the problem of validity.

### *Positivism: Horkheimer I and Adorno I*

In his first reaction, from 1930, Horkheimer concentrated on Mannheim's claim that the synthesis of partial views may lead to a less partial, though still not absolute, grasp of the social and historical totality. Horkheimer posited, without further explication, that at this point the sociological investigation of metaphysical worldviews might itself turn into metaphysics (Horkheimer, 1930/1982:

479). Horkheimer did not explain this criticism, but we have already seen that Mannheim's account at least looks somewhat teleological. Horkheimer's later commentary on the sociology of knowledge in 'Traditional and Critical Theory' concentrates on Mannheim's positivism. This commentary is clear, but very short, and does not really help us understand with any degree of clarity the distinction between critical theory and traditional theory. Rather, Horkheimer simply emphasizes that the sociology of knowledge, insofar as it is isolated from critical theory, is neither opposed to conventional academic science nor does it claim to be distinct from it in any way. It is just one discipline among others—Ironically, it is exactly this that contemporary sociologists of scientific knowledge put forward for their defence against the accusation of being self-refuting, idealist, or pseudo-scientific. 'My suggestion,' David Bloor replied once to one of his critics, 'is simply that we transfer the instincts we have acquired in the laboratory to the study of knowledge itself' (Bloor, 1981: 207). So while critical theory, at least in its early days, thought of itself as opposed to the academic sciences, the current sociology of science struggles for a place within the circle of academically recognized disciplines. (We will come back to this ambiguous status of SSK.)

Adorno's commentary from 1937, published in 1953, spells out what Horkheimer might have had in mind when opposing critical theory to positivism, or at least what is commonly identified with a critical approach. He concentrated his attack on Mannheim's bottom-up empiricism which lacks a sophisticated idea of experience and is thus led to systematically overestimate 'appearances', thus not being able to distinguish what is pure façade from what is fundamental (Adorno, 1937/1986: 17). Adorno fleshed out this overall attack, taking the notion of society as an example (ibid.: 19). Positivistic bottom-up empiricism can only attain a purely formal notion of society as the most general abstraction in its field of investigation. From this

point of view, 'society' is only a name for the purely formally conceived whole of all socialized men. Critical theory, on the contrary, starts from a material [*inhaltlich*] notion of society, that is, from a concrete theory of society's reproduction (including an account of its internal tensions and 'contradictions' which follow from its concrete mode of production and reproduction). In this approach the single 'facts' of experience, as they show themselves, are not taken as irreducible, but are rather gauged against the overall theory of social reproduction and possibly are further analysed.

### ***Reflexivity and Symmetry: Horkheimer II and Marcuse***

In his first reaction from 1930 Horkheimer also addressed himself to problems of social boundedness and truth. He correctly characterized Mannheim's attempt to establish a symmetric and reflexive approach in sociology of science, but it seems that he did not correctly assess the epistemic consequences in the Mannheimian framework. Rather it seems that Horkheimer continued to equate social influences with error or bias, and as a consequence thought that Mannheim's reflexive and symmetric turn necessarily discredits, and raises doubts about, Marxism (Horkheimer, 1930/1982: 488, 491).

This view however was not common to all critical authors. Herbert Marcuse had published a review of *Ideology and Utopia* one year before Horkheimer, in 1929. Despite a fundamental dissent in regard to many aspects, Marcuse's review is much more sensitive to Mannheim's methodological and formal achievements. He recognized in particular Mannheim's reflexive turn, applying the Marxist critique of ideology to itself and thus revealing its time-bound character. Contrary to Marxist critiques of Mannheim, and contrary also to Mannheim's own intention, Marcuse warmly welcomed this move, giving it again an unexpected twist. When

Mannheim related Marxist 'ideology' to the (historically conditioned and partial) standpoint of the working class, Marcuse thought he,  *nolens volens*, reestablished the original tie to its original political context, thus defending it against both revisionist and 'transcendental' reinterpretations (the latter is a reference to Max Adler's Austro-Marxism). According to Marcuse, Mannheim then reminds us that Marxism, contrary to Adler's interpretation, had never been intended as a 'universally valid sociology', but as the 'concrete theory of proletarian practice' (Marcuse, 1929/1982: 461). Marcuse's more critical remarks seem to join Horkheimer's and Adorno's attack on Mannheim's positivism. He complained that Mannheim regarded the different historical epochs as monolithic and incapable of further analysis, whereas in reality these stages were connected and transcended by forces acting within them. Feudalism, early capitalism, and so on had only in appearance been stable formations, and the task of sociology would be to analyze the underlying forces to which the epochs owed their relative stability for a time, but which eventually also sealed their fate.

### ***Validity: Sohn-Rethel and Adorno II***

Adorno resumed his criticism of Mannheim in his lecture 'Philosophy and Sociology', held at the University of Frankfurt in 1960 (Adorno, 2011). The target of his attacks on Mannheim however had considerably shifted compared to his remarks from 1937. He now concentrated on Mannheim's 'reductionism'. Rather than reducing intellectual phenomena to social interests, Adorno suggested, he should have offered a sociological account of their 'immanent logic' (Adorno, 2011: 287, 289). These comments are allusive and difficult to understand. However, I think that their meaning becomes much clearer when they are seen as a reference to Alfred Sohn-Rethel's remarks on Mannheim (on

Sohn-Rethel and his influence on Adorno see vol. 1, chapter 17 of this collection).

The Marxist philosopher of science Alfred Sohn-Rethel became acquainted with Mannheim as a PhD student under Emil Lederer's supervision at Heidelberg in the 1920s. As Lederer reveals in his final report on Sohn-Rethel's PhD thesis, Mannheim was a great 'pedagogical help' during the work on the thesis (Sohn-Rethel, 2012: 189). Sohn-Rethel also assisted at the 'joint seminar' of Alfred Weber and Karl Mannheim, the starting point of which was the publication of Lukács' book *History and Class Consciousness* (Mannheim, 2001: 109). It seems that Mannheim was of great importance for Sohn-Rethel, and, though there is no explicit discussion of Mannheim in Sohn-Rethel, the latter's own approach can be seen as a reaction to Mannheim's.

In his own work, Sohn-Rethel sought to modify Mannheim's approach in a twofold way. First he criticized Mannheim's reluctance vis-à-vis extending his sociological approach to mathematics and the mathematical sciences.

On the one hand, all phenomena contained in the world of consciousness, whether past, present or future, are understood historically as time-bound and dialectic. On the other hand, questions of logic, mathematics and science are seen as ruled by timeless standards. Is a Marxist thus a materialist as far as historical truth is concerned but an idealist when confronted by the truth of nature? Is his thought split between two concepts of truth: the one dialectical and time-bound, the other undialectical, consigning any awareness of historical time to oblivion? (Sohn-Rethel, 1978: 2–3)

Sohn-Rethel does not mention Mannheim in this quotation, but I think it is obvious that he refers to him, for Mannheim indeed granted an 'immanent logic' to mathematics and the mathematical sciences, escaping the social boundedness (Mannheim, 1952: 135).

Sohn-Rethel's second modification picks up the issue of 'immanent logic' and validity. We have already seen that Mannheim's symmetrical approach does in fact not imply

any kind of 'equal validity thesis', for social influences are not equated with sources of error. As a consequence, the sociological investigation remains neutral with regard to the question of validity. Hence the name 'non-evaluative sociology' in Mannheim. Sohn-Rethel, on the contrary, thought that a historical-materialist account of knowledge should not be confined to relating knowledge to its social causes, but should also attempt at explaining its validity in terms of its social causes (Sohn-Rethel spelled out this idea in a text written in 1937; cf. 1989: 204). A model for such an analysis might be seen in Marx's critique of political economy. Indeed, in *Capital* Marx attributed 'social validity' to the concepts of 'bourgeois economy':

The categories of bourgeois economy consist of such like forms. They are forms of thought expressing with social validity the conditions and relations of a definite, historically determined mode of production, viz., the production of commodities. The whole mystery of commodities, all the magic and necromancy that surrounds the products of labour as long as they take the form of commodities, vanishes therefore, so soon as we come to other forms of production. (Marx, 1975, vol. 3: 87)

It seems to me that Marx does not intend to deny the validity of the categories of political economy but rather to stress that it only obtains within a definite mode of production.<sup>5</sup> Though Marx's critical analysis reveals that 'value' is a disguised social relation rather than an autonomous ontological realm governed by its own irreducible laws, this does not mean that commodities do not *objectively* have a value in capitalist societies. In this sense Marx, in the quotation above, indeed gives an account of the 'immanent logic' of capitalist economy.

Without going into deeper detail (the reader will find a more extensive discussion in Volume 1, Chapter 17) Adorno's comment on Mannheim in his 1960 lecture might well have Sohn-Rethel's criticism in mind: Mannheim actually reduced the intellectual realm to social interests instead of

understanding its immanent logic in social terms and, in particular, why it is that an autonomous intellectual sphere emerged in history (Adorno, 2011: 289).

## Summary

Let us try to sum up to what the distinction between a critical theory of society and the sociology of knowledge, and in particular Karl Mannheim's approach, amounts to, according to the preceding analysis:

(1) Critical theory does not think of itself as pure theory but rather as entrenched within the social relations that it sets out to comprehend, and it is from this that it derives its epistemic status. Truth and objectivity are not understood in terms of 'disinterestedness' and fidelity to 'facts'. Rather, they challenge positivist epistemology from a political perspective. Mannheim, on the contrary, did not refer at all to the political role of the sociologist; for him the epistemic value of the sociology of knowledge was ensured by the architecture of the intellectual community. In Austro-Marxism the value of sociological theories was related back to politics, but not in the same manner as in critical theory. Political action was rather conceived instrumentally as a science-based 'social technology'.

(2) Critical theory focusses its attention on societies' concrete mode of production and reproduction, and demands that all singular empirical findings, including concerns of intellectual life, be interpreted in this context. In Mannheim there is no such theoretical insistence on the historically specific forms of the social organization of the metabolism with nature. Mannheim's notions of society and of historical epochs seem in fact to be bluntly positivist. Austro-Marxists in turn accepted the need of such a theory of society but stressed its empirical and inductive character. It is clear that critical theory disagreed on this point, but the epistemic fundamentals of the 'dialectical' or 'conceptual' approach often enough remained nebulous.

(3) Critical theory opposes the social 'reduction' of intellectual phenomena, as Adorno put it, i.e. the blunt denial of the 'immanent logic' of intellectual phenomena. From a critical perspective, the 'immanent logic' of truth claims has rather to be understood in terms of the social conditions they can be related to in a sociological analysis. In this respect, Mannheim has indeed little to offer. He might only have put forward the claim of 'particularism', i.e. the idea that some social groups are more apt than others to grasp certain 'aspects' of the social reality of their time. Austro-Marxism on the contrary probably subscribed to the idea of explaining the 'immanent logic'. However they did so by giving it a transcendental turn. Indeed Max Adler focussed on the social conditions of knowledge and science (hence his notion of a 'social apriori', cf. Adler, 1936/1975).

## CONCLUSION: POSITIVIST AND CRITICAL SOCIOLOGY

In the light of the foregoing analysis it is clear that a positivist sociology of science cannot claim the heritage of historical materialism. But does it follow from that that the sociology of science has no critical lesson to tell and simply blends in 'the usual business of the positive sciences', as Horkheimer (1937: 263) put it? At a second and closer glance, this discipline's place in academia might appear less unambiguous. This is what I will explore in this concluding section.

I already mentioned the precarious standing of the sociology of science, which is often violently attacked by philosophers and scientists. In actual fact, it is easily conceivable that the relationship of a positivist approach in the sociology of knowledge to both the other scientific disciplines and society as a whole carries many more tensions. This seems especially to be the case for the 'strong programme' of the Edinburgh School in the sociology of scientific knowledge, which

has always been under severe attack by both scientists and philosophers. Ironically, these tensions might have their origins nowhere else but in the very characteristics of the scientific enterprise, even if it is understood in positivist terms. When Robert K. Merton analyzed the social functioning of science he identified what he called 'organized scepticism' as one of its institutional values and he also signalled that this institutional attitude can cause conflicts between the sciences and other social institutions:

Science which asks questions of fact, including potentialities, concerning every aspect of nature and society may come into conflict with other attitudes toward these same data which have been crystallized and often ritualized by other institutions. The scientific investigator does not preserve the cleavage between the sacred and the profane, between that which requires uncritical respect and that which can be objectively analyzed. (Merton, 1973: 277–8)

It is almost trivial that this scientific attitude may conflict with religious or political institutions. But it is interesting to see that this characteristic also carries the potential of a conflict *within* the sciences, and it seems that this is exactly what happened when the sociology of science entered the scene. When David Bloor, a sociologist from the Edinburgh School, tried to understand the harshness of the critiques directed against his work, he picked up Merton's remark and suggested that in modern societies science and the production of knowledge occupy the place of the 'sacred':

If science is indeed treated as if it is sacred does this explain why it should not be applied to itself? [...] This is the answer to the puzzle that science is most enthusiastically advocated by precisely those who welcome least its application to itself. Science is sacred, so it must be kept apart. [...] This protects it from pollution which would destroy its efficacy, authority and strength as a source of knowledge. (Bloor, 1991: 47–50)

Sociology of science, relating science back to its 'social conditions of production' (Bourdieu, 1975), would thus bring the

sacred into contact with the profane. Hence the idea of contamination and harm. Bloor's analysis surely does not give a satisfying critical account of the apparent conflict insofar as it does not permit us to understand why in our society the attributes of the sacred and the profane are respectively ascribed to scientific knowledge and society. Why does modern society think of knowledge as something 'above-and-beyond' itself? In any case it becomes clear that the social conditions of knowledge production indeed are a kind of a blind spot, if not a taboo, of our society, and its identification absolutely is of relevance for a critical theory of knowledge. Positivist sociology of knowledge *nolens volens* stumbled over this taboo and continued to turn the knife in this wound. Hence the especially vague political connotations of SSK, which has always attracted liberal-minded scholars (and vice versa many of the violent criticisms, in particular the most recent ones from the camp of 'new realism', e.g. those of Boghossian (1996), launching vitriolic attacks against 'post-modernism' and 'multiculturalism', have unmistakable political overtones).

There thus seems to be a hidden subversive heritage in the positivist sociology of science, despite its efforts to prove innocuous and to become an established academic discipline. From this perspective, Pierre Bourdieu can be seen to have accepted the challenge to carve out and to revitalize this subversive heredity of sociology of science. He explicitly claimed to fulfil at least the above-mentioned conditions (2) and (3) for critical thinking, i.e. he explicitly aimed at accounting for the 'objective truth' of scientific knowledge in terms of the 'social conditions' of its production, and he explicitly attacked the 'positivism' of 'official sociology' (Bourdieu, 1975). Perhaps Bourdieu even subscribed to condition (1), i.e. non-neutrality as a condition of insight. In any case he systematically analyzed the 'rhetoric of scientificity' with a view to unmasking 'official sociology', and in particular political sciences, 'a false science serving to produce

and maintain false consciousness' (Bourdieu, 1975: 39). In the spirit of reflexivity, Bourdieu did not content himself to unmasking 'official sociology', but extended his analysis to 'radical' ideology which he suspected to be a 'thinly euphemised expression of the interests of those dominated in the scientific field' (ibid.: 40). According to Bourdieu, the dominated unknowingly help 'demarcate the field of legitimate argument':

Despite their conflict [...] the conservatives and their 'radical' opponents are objective accomplices who agree on the essential point: from the one-sided points of view which they necessarily adopt on the scientific field, by opting, unconsciously at least, for one or the other of the opposing camps, they are unable to see that control or censorship are not effected by any specific institution but by the *objective relationship between opposing accomplices* who, through their very antagonism, demarcate the field of legitimate argument, excluding as absurd, eclectic, or simply unthinkable, any attempt to take up an unforeseen position [...] (ibid.: 39–40)

How can a truly scientific sociology of science (i.e. a sociology opposed to the 'official' one) escape from this setting? For Bourdieu the answer lies in taking into account its own role in the constitution of the scientific field:

[T]he particular difficulty which sociology has in conceiving *science scientifically* is related to the fact that sociology is based at the very bottom of the social hierarchy of the sciences. [...] A scientific sociology of science (and the scientific sociology which it helps to make possible) can only be constituted on condition that it is clearly seen that different representations of science correspond to different positions in the scientific field, and that these representations are ideological strategies and epistemological positions whereby agents occupying a particular position in the field aim to justify their own position and the strategies they use to maintain or improve it, while at the same time discrediting the holders of the opposing position and their strategies. Every sociologist is a good sociologist of his rivals; the sociology of knowledge or of science is no more than the most irreproachable form of the strategies used to disqualify rivals, until it ceases to take as its object the rivals and their strategies and turns its attention to the complete system of strategies, i.e. the field of positions within which they are generated. (ibid.: 40)

It can clearly be recognized that Bourdieu, in contrast to the positivist sociology he attacked, did not settle for a purely formal interpretation of reflexivity as is common in SSK, demanding the pure applicability of sociology to itself. He in fact *applied* sociology to itself, situating it not only above but also within the rivalry of 'ideological strategies'. He thus surpassed the demands of the positivist sociology of knowledge, giving a more radical meaning to the postulate of reflexivity. He indeed applied it in an almost *autophagous* fashion. And yet he stayed behind a wholehearted critical reinterpretation of reflexivity insofar as he restricted his focus to academia. He reestablished the link between sociology and class struggle, but focussed only on power relations *in academia*. The 'social conditions' of sociology, i.e. the former 'transcendental unconsciousness' the sociologist shall now become aware of, remain restricted. They only comprise those conditions which allow the sciences to produce 'supposedly transhistorical truths' as the result of a historical process of research. Though working on a critical account of this historical process, modelled by Bourdieu on a capitalist scheme in his theory of symbolic capital, he ignores the ways the sciences in general and sociology in particular are 'entangled' (Bonefeld, 2014: 69) with the working of capitalist societies.

Bourdieu's restriction of the meaning of reflexivity, and thus also of criticism, seems to be at least one dimension of the dissent between him and Luc Boltanski. Renewing the theme of 'critique' in sociology, the latter explicitly denounced a sociology having its own accomplishment as its single aim (Boltanski, 2009). Widening the sense of reflexivity in this way extends beyond a reflexive style of academic research, or a pure reflexive but still contemplative stance of the researcher, for it confronts the sociologist with the role he *volens nolens* plays in society. As seen from this vantage point, the sociologist cannot choose between 'value-free' science and ideology, between political quietism and engagement. He rather realizes

the political role of sociology and then opts for a policy, affirmative or subversive. Boltanski opts for the latter and accordingly defined the aim of sociology as 'rendering reality unacceptable'.<sup>6</sup>

We finally come to understand that the differences between the unequal twins, the sociology of knowledge and critical theory, might best be grasped as centred around diverging cultures of reflexivity. In each case, positivist, Bourdieusian, and critical sociology, reflexivity is not a bonus but is linked to the epistemological status of sociological theory. But reflexivity is spelled out in differing ways. In the framework of positivist sociology, reflexivity is reduced to the mere possibility of applying sociology of knowledge to itself 'without in any way undermining it' (logically, not politically). This is a purely formal postulate. Bourdieu on the contrary asked for 'a specific kind of epistemological vigilance' in sociology (Bourdieu, 2001: 174). Reflexivity is no longer understood as a mere possibility but rather is 'embodied in collectives which have so much incorporated it that they practise it as a reflex' (ibid.: 220). In critical theory, finally, reflexivity extends beyond a pure attitude of the scientist or a style of research but commits the researcher to the project of emancipatory politics.

## Notes

- 1 The account is confined to purely methodological issues. As far as I know there was only one attempt by the *Institut für Sozialforschung* to contribute substantially to sociology of knowledge, beyond theoretical discussion. In 1934, the *Institut* published the book-length study *The Transition from the Feudal to the Bourgeois World Picture* which they had commissioned Franz Borkenau to write. In this study Borkenau tried to relate the rise of mechanistic philosophy to the social organization of early manufacture and to social struggles in the sixteenth and seventeenth centuries. The *Institut* considered Borkenau's approach as neither Marxist nor accurate and charged Henryk Grossmann to write a response in order to distance the *Institut* from Borkenau's work (cf. Freudenthal and McLaughlin, 2009: 26, 247).

- 2 The discussion provoked by Mannheim's book is documented in Meja and Stehr (1982: vol. 2).
- 3 Neurath (1930/1982); in a similar fashion Ernst Bloch judged that Mannheim picked up ideas from Lukács and 'made them suitable for a bourgeois use' (Bloch, 1935/1962: 286).
- 4 Cf. e.g. his controversy with the conservative Ernst Curtius, analyzed in Hoeges (1994).
- 5 I draw on Heinrich (2006: 381 et sq.).
- 6 *Rendre la réalité inacceptable* (Boltanski, 2008; cf. also Heinrich, 2006: 380–4, on Marx's notion of 'critique').

# Critical Theory and Weberian Sociology

Klaus Lichtblau  
Translated by Naill Bond

## INTRODUCTION

That Max Weber's work would one day play an important role for the development of Critical Theory or for the Frankfurt School of Sociology was anything but a matter of course. And it was certainly not planned to from the outset. In his book, *Geschichte und Klassenbewußtsein* [*History and Class Consciousness*], published in 1923, Georg Lukács attempted to use Weber's work for further developing a critical theory of society. He did so by trying to establish a clear close connection between Marxian analysis of commodities and Max Weber's diagnosis of his age that bureaucratic rule was the fate of modern society. The reification [*Verdinglichung*] of consciousness and the increasing predomination of purposive rational action or a 'formal' rationality in the capitalist world, according to this understanding, are thus two sides of the same coin.<sup>1</sup>

Max Weber himself promoted this interpretation of the world wide process of

modernization that had commenced in western Europe and North America because in his *Vorbemerkung* [preliminary remark] to the *Gesammelte Aufsätze zur Religionssoziologie* [Collected Articles on the Sociology of Religion] he wrote that he saw the particularity of Western culture in universal history as lying in a specific form of 'rationalism', the principle of which lay in formal rational organization and concomitant 'calculability'. Accordingly, there are meaningful correspondences or 'elective affinities' between modern science, 'modern' capitalism and the modern legal-bureaucratic form of authority and the related type of highly specialized humans [*Fachmenschentum*].<sup>2</sup> He furthermore believed he perceived a close historical relationship between the emergence of modern industrial capitalism and the mercantile economy policy of the absolute states of modern Europe. The alliance between the monarchy and the bourgeoisie was not only directed against the privileges of the aristocracy through the estates; it was also a

platform on which politics and the economy were able to work together in promoting the modern market economy. In Weber's eyes, it was nevertheless a historically precarious balance that could at any time give way to the predominance of the bureaucratic administration of a central power, whatever its form.<sup>3</sup>

When the staff of the Frankfurt Institute for Social Research had to emigrate to the United States of America after the Nazis took power, in contrast to other German emigrants to the United States, they apparently did not carry Max Weber's work in their luggage. It is true that there are traces of their reception of Weber that go back to the 1920s. However, these incipient attempts at establishing a well-founded position on Weber's work were so sporadic that it is impossible to gain an overview of them retrospectively. Instead, we have evidence that the most important representatives of emerging Critical Theory had apparently spent the early years of their emigration doing things that were more important to them than studying Weber's work at all thoroughly.

This attitude is characterized by the pertinent quote of Edward A. Shils, who later worked for Talcott Parsons and described the 'Frankfurt gang' 40 years after his personal experiences dealing with the group of German exiles as 'a very mean lot', or more precisely as

terribly edel, radical, cliquish, self-promoting. They were spreading their pernicious *Kritische Philosophie*, i.e. fancied up Marxism as well as they could. I used to go to their seminars at 429 West 117th Street. I never heard Max Weber mentioned there in the year 1937–8, and I cannot recall any of them writing about Weber. ... Horkheimer had no interest in Weber, nor did Marcuse, nor Adorno, nor Pollock. Even Wittfogel, who was then one of them, and thus very close to communism, did not pay attention to Weber in his *Wirtschaft und Gesellschaft Chinas* (1927). At least, I don't think so.<sup>4</sup>

It is all the more astonishing that the 'Frankfurt gang' were to play a leading role at the Weber Conference organized in Heidelberg in 1964 by the German Society for Sociology on the occasion of the hundredth birthday of Max

Weber. Herbert Marcuse read a paper on 'industrialization and capitalism' at the event, offering the assembled critical theoreticians a springboard which was later to be used inter alia by Jürgen Habermas, who was particularly attentive to Max Weber's work when he elaborated his theory of communicative action.<sup>5</sup> However, the present chapter is not primarily about Jürgen Habermas and his various intellectual conversions, but the importance of Max Weber's work for Critical Theory, the development of which is closely related to the history of the Frankfurt Institute for Social Research. More precisely, I shall be looking at Max Horkheimer, Theodor W. Adorno and Herbert Marcuse's readings of Weber's work. First, I shall look at Horkheimer's relationship to Weber. This is related both to his earlier sojourn in Frankfurt and his life in exile, and I shall also refer to the *Dialectic of Enlightenment*, which he wrote together with Adorno. Then I shall try to reconstruct Theodor W. Adorno's reception of Weber. In doing so, I shall focus particularly on the lectures and seminars he held in Frankfurt following the Second World War. Finally, I shall dwell on the Sociologists' Congress in Heidelberg in 1964, which was the apogee of Critical Theory's attempts to deal with Max Weber's work. Here, I shall focus on Herbert Marcuse's 'Industrialization and Capitalism'. Furthermore, I shall also make a brief comment in this context on Jürgen Habermas' statement for discussion following Talcott Parsons' lecture on 'determination by value [*Wertgebundenheit*] and objectivity in the social sciences', marking the beginning of his own studies of Max Weber's work, which were to occupy him for several years.<sup>6</sup>

## MAX HORKHEIMER'S RELATIONSHIP TO MAX WEBER'S WORK

In the summer semester of 1926, Max Horkheimer held his lecture entitled 'Introduction to Contemporary Philosophy'

followed by a colloquium. He subsequently revised the manuscript on which the lecture was based and prepared it for publication, which however only took place posthumously.<sup>7</sup> In this lecture, he elaborated on the south-west German movement of Neo-Kantianism, as represented by Wilhelm Windelband and Heinrich Rickert. In particular, the 'system of values' elaborated by Rickert appeared to him to be too formalistic and inappropriate for creating a '*Weltanschauungslehre*' – a new doctrine for a world view for the present age – as had been undertaken by Max Scheler and Karl Jaspers.<sup>8</sup> However, Horkheimer did not see the reduction of philosophy to a purely 'formal' discipline as a disadvantage.

In particular, he regarded Max Weber's methodological principles as worthy of discussion. This particularly concerned his thoughts on the 'logical' problems of the modern cultural and social sciences. In particular, Weber's 'humility with regards to all material questions of value' appeared at the time to Horkheimer to be a great advantage. Horkheimer furthermore declared in this context that he would use the following colloquium to 'explain at least the bare necessities on the philosophical position of this significant thinker'.<sup>9</sup> We do not know whether this in fact took place and if so, in what form. This is particularly a pity inasmuch as Weber was later massively criticized by important representatives of Critical Theory for dispensing with a *normative* justification of value orientations. At any rate, here it becomes clear that Horkheimer was interested especially in Weber's *methodological position* at the time.

In his inaugural address in Frankfurt in 1931, Horkheimer only mentioned Max Weber by name on one occasion. He was explaining how the modern sociology of knowledge founded by Vilfredo Pareto made a distinction between two different 'concepts of reality', thus undermining the claim for an 'objectively valid truth' made by the philosophy of history. It is true that Karl Mannheim, who had already taken over the chair for

sociology at the University of Frankfurt from Franz Oppenheimer, was not mentioned by Horkheimer in his inaugural address. However, it is clear that Horkheimer was less concerned with Max Weber's work than with Mannheim's 'relativism' with regard to *Weltanschauung*.<sup>10</sup>

That Horkheimer was particularly interested in Max Weber's methodology later on becomes clear in some of his writings during his asylum in the United States in which he spoke of Weber briefly. In his programmatic essay on 'traditional and critical theory' of 1937, in which he opposed the ideal of knowledge of the natural sciences, influenced by Newton's mechanics, to Marx's programme for criticizing political economy in the Hegelian tradition, he briefly alluded to Max Weber. He saw Weber as a representative of 'deductive' thinking which was usual in natural sciences and had been elevated by so-called 'logical positivism' to a norm for all the disciplines of the empirical sciences.<sup>11</sup> In this essay, Horkheimer also briefly dealt with Weber's position in the German debate on value judgements and decisively distanced himself from Weber's abstinence in acknowledging the significance of practical value orientations for scientific knowledge. While anticipating the later 'positivism debate' in the sociology of the Federal Republic of Germany, Horkheimer drew a conclusion that called into question the ideal of objectivity of a 'traditional' understanding of science radically: 'There is no theory of society, including generalising sociologists', that does not include political interests, the truth of which should be decided on in tangible historical activity rather than in apparently neutral reflection void of acting and thinking'.<sup>12</sup>

In *Eclipse of Reason*, published in 1947, Horkheimer presented a more radical critique of Weber. This radicalization is closely linked to the *Dialektik der Aufklärung*, which he wrote together with Theodor W. Adorno and which also appeared in 1947. Here, Horkheimer made a fundamental conceptual distinction between 'rationality'

[*Rationalität*] and 'reason' [*Vernunft*] which has repeatedly been used by various representatives of Critical Theory for founding their own position and is also the basis for Jürgen Habermas' theory of communicative action and his own critique of Weber. Max Weber's work was increasingly accorded attention by various representatives of Critical Theory. For Weber's emphasis on the uniqueness of Western rationalism in universal history appeared to them as too one-sided to be able to rise to the challenge of a critical theory of society oriented around the measuring rod of reason [*Vernunft*] since Hegel and Marx. The distinction Weber expressly emphasized between 'purposive rationality' and 'value rationality' disappeared into the background or remained unnoticed. Instead, Weber was accused by the principal representatives of Critical Theory of having a 'one-dimensional' understanding of 'reason' within the meaning of 'purposive rational action' that Weber allegedly claimed to dominate in universal history as well as of 'formal' rationality. However, Weber saw the particular position of purposive rational action in his *methodological* founding of a Sociology of Understanding as lying primarily in *heuristic* interpretation.<sup>13</sup> And his own understanding of 'rationality' and 'rationalization' is far more nuanced than the usual perceptions of the chief representatives of Critical Theory.<sup>14</sup>

At any rate, when criticizing instrumental reason, Max Horkheimer did not quite overlook the fact that Weber himself emphasized the polysemy of the concept of 'rationalism'. Only Horkheimer was primarily focussing on the difference between *functional* rationality on the one hand and *substantial* rationality on the other. In doing so, he referred to Weber's distinction between *formal* and *material* rationality as used both in his 'sociology of law' and his 'sociology of the economy'.<sup>15</sup> The opposition between 'functional rationality' or *instrumental reason* on the one hand and 'substantial rationality' or *substantial reason* on the other increasingly replaced the

distinction Horkheimer had made between 'traditional' and 'critical' theory:

The difference between this connotation of reason and the objectivistic conception resembles to a certain degree the difference between functional and substantial rationality as these words are used in the Max Weber School. Max Weber, however, adhered so definitely to the subjectivistic trend that he did not conceive of any rationality – not even a 'substantial' one by which man can discriminate one end from another. If our drives, intentions, and finally our ultimate decisions must a priori be irrational, substantial reason becomes an agency merely of correlation and is therefore itself essentially 'functional'. Although Weber's own and his followers' descriptions of the bureaucratization and monopolization of knowledge have illuminated much of the social aspect of the transition from objective to subjective reason (...), Max Weber's pessimism with regard to the possibility of rational insight and action, as expressed in his philosophy (...), is itself a stepping-stone in the renunciation of philosophy and science as regards their aspiration of defining man's goal.<sup>16</sup>

Although Max Weber had at this point at the latest been definitively dismissed by Horkheimer and Adorno as an arch positivist or a 'positivist at heart',<sup>17</sup> over the following period his work served as a theoretical frame of reference for leading representatives of Critical Theory which they could work off with greater or lesser success.

This also applies to the *Dialectic of Enlightenment* written by Horkheimer and Adorno, whose dialectical understanding of 'Enlightenment' is also indebted to their readings of Max Weber. For Horkheimer's and Adorno's historical philosophical construction is closely related to Weber's theory of the 'disenchantment of the world' drawn from Weber's sociology of religion. Both the interpretation that 'myth' contains an aspect of 'enlightenment' and the interpretation that from a certain point 'enlightenment' turns back to 'mythology' are to be found in Max Weber, though using somewhat different concepts, even if Horkheimer and Adorno explicitly relate Weber's expression 'disenchantment of the world' to the 'programme of enlightenment'.<sup>18</sup>

It is no coincidence that Horkheimer and Adorno equate this 'disenchantment of the world' with the 'eradication of animism'.<sup>19</sup> For according to Weber, 'magic' takes on the place of 'myth'. Magical formulae of controlling the world are for him the first 'rational' attempts of human beings to change the form of the world according to their specific needs and interests. They already contain an element of 'calculability' which is the point of departure for the process of 'rationalization' in universal history. With the emergence of the great ethical religions of salvation, this process is accompanied by a process of 'intellectualization', which in individual cultural areas led to the formation of various world sets.<sup>20</sup> For Weber, the unique development of the Western world was so significant because it not only led to the breakthrough of industrial capitalism and a formal legal type of authority, but also because it contained a process of *Selbstaufhebung* [self-annulment] of 'Western rationalism'. These 'paradoxes of consequences' had already been expressly emphasized both in Weber's '*Zwischenbetrachtung*' of his essays on the economic ethics of world religions, *Wirtschaftsethik der Weltreligionen* as in his lecture on 'Science as a Vocation'. The only difference between Weber on the one hand and Horkheimer and Adorno on the other is that in this respect Weber wrote of the 'return of the gods' while the latter preferred the formulation that the enlightenment suddenly turned into 'mythology'.<sup>21</sup>

### THEODOR W. ADORNO'S RECEPTION OF MAX WEBER'S WORK

The beginnings of Adorno's reception of Weber have not yet been clarified in relevant secondary literature. However, there is a manuscript from Adorno from the year 1937 which has survived as a corrected galley-proof of the *Zeitschrift für Sozialforschung*, though it was not published in it and thus is

of no significance in the history of the reception but no doubt of significance in the history of the origins of Adorno's work. The manuscript in question is Adorno's essay 'New Value Free Sociology', which was published post-humously in 1986 in his *Gesammelten Schriften* and which he had written on the occasion of the publication of Karl Mannheim's book, *Mensch und Gesellschaft im Zeitalter des Umbaus* in 1935. In this essay, Adorno constructs a 'Weberian' school, in which he places Karl Mannheim alongside Karl Jaspers and Ernst Troeltsch.<sup>22</sup> Even if the essay is primarily devoted to the book by Karl Mannheim, it divulges the tenor which was to determine Adorno's relationship to Max Weber.

Incidentally, this tenor resembles that expressed in Georg Lukács' book, *Die Zerstörung der Vernunft* [*The Destruction of Reason*] published in 1954.<sup>23</sup> Adorno also saw in the ethos of science espoused by Max Weber a stage of decadence of the bourgeois principle of reason. For Weber's 'claim to objectivity and rationality' is restricted, according to Adorno, to a pure 'attitude' [*Haltung*] or to science as a 'vocation' [*Beruf*].<sup>24</sup> In this respect, Adorno alluded to a 'second positivism' through which the 'liberal intelligentsia' withdrew from its original claims to a critique of knowledge [*Erkenntniskritik*] and a critique of society [*Gesellschaftskritik*] in a spirit of resignation, explicitly emphasizing the 'regressive consequences of the Weberian following'.<sup>25</sup> Even though he rejects making Weber's work and Weber's desideratum of a 'value-free' science immediately responsible for the alleged disappearance of the 'bourgeois' intelligentsia he was implacable in his judgement of Weber's sociology of understanding [*Verstehender Soziologie*]:

What has been said against Mannheim also applies to Max Weber, the head of the school. The method he employs can only make the appearance of a balance of theory and fact in a situation in which the theory is of the same origin as its own facts: the 'ideal types' only apply to a reality which

corresponds to such an extent to the classificatory concepts that the concepts can leave everything to self-correction so as to be sure of understanding society. This possibility, which was already an illusion in Weber, who by no coincidence continuously tried to confirm it in his constantly renewed logical approaches, is now in obvious decline.<sup>26</sup>

In the following period, Adorno continuously emphasized the alleged parallels he found between the 'relativism' espoused by Max Weber and that espoused by Karl Mannheim. This becomes apparent in his essay, 'A Contribution to the Teaching of Ideologies' ['Beitrag zur Ideologienlehre'] which appeared in 1954. In substance, it is closely related to the seminar on 'Max Weber's scientific theoretical writings' held by Adorno with Horkheimer in the summer semester of 1954 in Frankfurt am Main, of which some seminar proceedings [*Seminarprotokolle*] have survived.<sup>27</sup> In this essay, Adorno only alludes to Weber's work in passing, as it happens in his contrasting research on ideology with social theory, whereby Weber's work is definitively placed in the context of 'positivistic sociology'. For the latter

denied the existence or at least the possibility of knowing [*Erkennbarkeit*] a total structure of society and its relationship to the spirit or the mind [*Geist*] and required that no principle but only the ideal types subjugated to the research interest should guide unprejudiced enquiry into what was respectively primary and secondary.<sup>28</sup>

Adorno claims that Max Weber's writings on the *sociology of religion* had paved the way for Karl Mannheim's *sociology of knowledge*, because Weber had put forward a 'sociological relativism', contenting himself with proving 'purely empirical relationships between society and the spirit or mind [*Geist*]',<sup>29</sup>

In the seminar Adorno held with Horkheimer on Max Weber's scientific methodology [*Wissenschaftslehre*] in 1954, new central leitmotifs of Adorno's critique of Weber emerge, which he continued to develop later in his lectures on philosophical

sociology and in the seminar he held in the winter semester of 1963–4 on Max Weber's main sociological work, *Wirtschaft und Gesellschaft*. The central point was the conceptual form Weber advocated – ideal types – as well as the related issue of 'understanding' in sociology. Furthermore, the 1954 seminar also treated the desideratum defended by Weber of a 'value free' science, which was increasingly to become the centre of criticisms of Weber in Frankfurt. Because Max Weber reduced the problem of value to the theoretical 'value relationship' underlying scientific knowledge, the function of the knowing subject which was still *constitutive* in the transcendental philosophy of Immanuel Kant is reduced to purely 'subjective' arbitrariness. Moreover, the question Kant raised as to the 'object' lost its sense, thereby transforming epistemology to a doctrine of scientific method [*Methodenlehre*], incapable of uncovering the veil of reification [*Schleier der Verdinglichung*].<sup>30</sup> Because Weber also leaves value orientations to the field of subjective arbitrariness, the 'danger' arises 'of leaving what is specific and unique to chance'.<sup>31</sup> Moreover, Weber does not see that every subjective judgement contains an 'objective structure'. His separation of the 'is' and the 'ought' is an arbitrary decision, even if his attempt to 'emancipate the social sciences from missionary moralising' was right.<sup>32</sup> Even if in this context Adorno thinks he has found a 'positive aspect' of Weber's thinking, and disqualifies his 'epistemology' as 'hostile to theory', he was prepared to acknowledge that what Weber had achieved as a researcher went further 'than the concepts with which he thought; for instance, what he said about the relationship between Protestantism and capitalism or about bureaucracy was theory and was different from his epistemology'.<sup>33</sup>

Adorno's ambivalent relationship to Weber's work continued in the following sessions of his seminar. In this context, a minor controversy between Horkheimer and Adorno is of interest. The issue was

the logical status of the ideal type used by Weber. Horkheimer put forward the position that Weber's programme amounted to 'making sociology superfluous and transforming it into history'. Adorno, by contrast, argued that Weber sought to translate 'historical basic concepts' into 'formal sociology', i.e. into 'invariants'.<sup>34</sup> While Horkheimer put forward his view that there was no 'correct thinking' without an 'aspect of relativism', thus coming surprisingly close to the position of Karl Mannheim in his sociology of knowledge, Adorno continued to insist, following Hegel, on the 'substantiality' or 'objectivity' of conceptual knowledge.<sup>35</sup>

In his lecture on 'philosophy and sociology' held in the summer semester of 1960 in Frankfurt, Adorno went into greater detail on his criticism of Max Weber. In doing so, he recommended his audience buy the separate print of *Basic Concepts in Sociology* [*Soziologischen Grundbegriffe*] that had just been published by Mohr Siebeck in Tübingen, so as to inform themselves 'what we are talking about when we are talking about sociology'.<sup>36</sup> Adorno's homage to Max Weber's work is to be found in a comparison with the foundation of modern sociology by Emile Durkheim. The concept of 'understanding' plays a central role. For Durkheim had recommended interpreting social facts as 'things', while Weber was of the opinion that all apparently 'objective' structures could be attributed to the 'subjectively meant meaning' which the individual social actors associated with their action. In this context, Adorno paid tribute to the accomplishments of the German tradition of *Geisteswissenschaften* in which since Wilhelm Dilthey's work, 'understanding' had been elevated to the methodical foundation. In so doing, he appreciated Weber's efforts at liberating the concept of 'understanding' from a narrower psychological interpretation, and by heuristically emphasizing 'purposive rational action', having placed what was really 'socially' interesting into the centre of modern sociology.<sup>37</sup> For 'rationality' was, on the one hand, something

that could be understood inasmuch as it could be understood with regard to action theory. On the other hand, this concept refers to an objective social context which could not be grasped by the 'subjectively meant meaning' of individuals and thus approached what Durkheim called 'social facts'. Adorno saw this as proof that Durkheim's position that society was something 'incomprehensible' included 'an extraordinarily true aspect, because it takes account of the compulsive and "reified" character of society'.<sup>38</sup>

Within Adorno's reception of Weber, the seminar he held on a 'discussion of selected chapters of Max Weber's *Wirtschaft und Gesellschaft*' in the winter semester of 1963–4 is of particular importance. This very well documented seminar took place in the context of Adorno's personal preparation for the fifteenth German Sociologists' Congress in Heidelberg in 1964, dedicated to Max Weber's work during Adorno's term of office as president of the *Deutschen Gesellschaft für Soziologie*. The following subjects were concentrated on in this seminar for advanced students [*Hauptseminar*]:

- (a) The relationship between Weber's methodology and his material sociological analyses;
- (b) Weber's analysis of the various forms of community, with a thorough discussion of the specificity of the community of the home [*Hausgemeinschaft*] and the 'political community';
- (c) Weber's sociology of rule, focussing on charismatic and bureaucratic rule;
- (d) Weber's sociology of the city and the underlying typology of cities;
- (e) Finally, the relationship between the concept of class and that of stratus, while Adorno particularly elaborated on the status of 'honour' as a sociological category.

The corresponding programme of the seminar shows to what extent Adorno's grappling with Max Weber's work had advanced, even if it is apparent that the seminar ignored the parts of *Wirtschaft und Gesellschaft* devoted to the sociology of religion and the sociology of law.<sup>39</sup> In this context, we can only look at

a few aspects of Adorno's appreciation of this monumental work. They do serve to clarify how important Max Weber had become for him in his conversation which allowed him to elaborate a timely critical theory of society.

With regard to the relationship between theory and methodology, Adorno again put forward his view that the historical and sociological analyses of Weber's were more important than the methodological positions he advocated. Once again, Adorno's discussion of Weber's position was restricted to freedom from value judgements in the empirical scientific disciplines as well as his concomitant understanding of 'theoretical value relation', as developed by Weber in his essay on objectivity of 1904 following Heinrich Rickert. Adorno saw this as a renunciation of social theory to the benefit of a purely formal methodology, which because of the asserted 'separation of fact and value judgement' was bound to lead to a 'positivistic interpretation'.<sup>40</sup> Adorno acknowledges that Weber was right in emphasizing the importance of 'cultural values' underlying the quest for knowledge in selecting objects of research. Nonetheless, this conception was too 'subjectivist', as the concept of cultural value was 'merely a descriptive category for what has normative character in a culture'.<sup>41</sup> The 'entirety of society' was to be found in the prevailing normative ideas of an epoch.<sup>42</sup> Weber had deliberately overlooked this, thus choosing to ignore the central role of 'normativity' in the methodological foundation of his sociology, although this was 'to a great extent the investigation of forms of behaviour that made value judgments'.<sup>43</sup> Thus, the 'Kantian question of constitution' is, according to Adorno, replaced by methodology and a radical philosophical quest for knowledge is abandoned.<sup>44</sup>

In contrast to his *methodological* views, the ideal types used by Max Weber in his *historical* analyses were, according to Adorno, of lasting value. This applies both to his typology of rule and to his 'typology of

cities' underlying Weber's investigations into universal history. At the same time, Adorno took a position against Weber's purely typological treatment of the forms of rule, because such a purely typological treatment contradicted 'their dialectical movement in history' according to Adorno.<sup>45</sup> It is true that in the case of 'charismatic authority', Weber had addressed a dynamic moment. But this ideal type in particular could 'not be saved since it presents relationships and processes in reality as irrational which in fact to the contrary should be called very rational'.<sup>46</sup> Adorno asserts that the tension between 'rationality' and 'irrationality' in such a form of concept formation becomes particularly obvious. Moreover, it runs the risk of being abused as an ideological concept by modern totalitarian mass movements assembling around a corresponding charismatic 'leader': 'This danger is all the greater since this form of irrationality merges with positivist value freedom and thus contains no immunity to abuse. In contrast, one should promote a rational sociology, which like Freud in psychology is capable of leading everything irrational to a rational solution'.<sup>47</sup>

When discussing charismatic rule in the seminar, a reference in substance was made to the ideal type of 'legal-bureaucratic rule' also used by Weber, which was dealt with thoroughly in the following sessions. For Weber had brought the 'charismatic leader' in as a contrast to modern bureaucracy and seen in it the only possibility of preventing the bureaucratic rigidification of the Western world in the form of 'Chinese petrification' and a concomitant new '*fellahin*'. The implications of this construction of fundamental concepts for the theory of revolution were explicitly underlined by Adorno. Nevertheless, he saw in charismatic rule over an administrative apparatus the danger of promoting a 'static' understanding of revolution 'inasmuch as despite individual changes society as a whole remains intact'.<sup>48</sup> Typical for such a revolutionary procedure was thus, as in the Bolshevik transformation of Russia and its

decline into a Stalinist rule by violence, the 'switch-over from a propensity towards social critique to a propensity of apologies'.<sup>49</sup> It was decisive for Adorno, whether one should 'consider or objectify these phenomena as aspects [*Momente*]'.<sup>50</sup> If one objectifies the phenomena, the concept formation would turn into reification [*Verdinglichung*] and not do justice to what Adorno, in the footsteps of Hegel, invokes as the 'effort to define the concept' [*Anstrengung des Begriffs*].

### THE HEIDELBERG SOCIOLOGISTS' CONGRESS OF 1964

With regards to *epistemology* as the theory of science, figurative worlds separate Adorno's understanding of 'grasping' [*Begreifen*] and the sociological categories developed by Max Weber for purely 'heuristic' purposes. Adorno enjoyed being coy with paradox formulations such as when he plays on the contrast between Emile Durkheim's and Max Weber's founding of modern sociology, claiming that the crux of the matter was in fact to understand what according to Durkheim 'could not be understood', namely 'society'. This nevertheless should not make access to the insight he obtained through work that Weber's work should be primarily understood as an intellectual 'field of force' [*Kraftfeld*] rather than purely as a 'historic monument'.<sup>51</sup>

This was the best possible preparation for Adorno's participation at the Sociologists' Congress of 1964 in Heidelberg which took place during his tenure as president of the *Deutsche Gesellschaft für Soziologie*. At the event, he held no lecture apart from a brief talk during the official reception of participants at the Congress in the Königssaal in Heidelberg Castle. Nevertheless, while preparing the congress, Adorno ensured that two prominent Weber critics from the circles of the 'Frankfurt School' took the floor as speakers or participants in the discussion: namely

Herbert Marcuse and Jürgen Habermas. Moreover, Max Horkheimer officially took over the moderation of the discussion, which took place immediately following Talcott Parsons' lecture on 'freedom from values' [*Wertfreiheit*] and objectivity'.

Because the preparations and the related intrigues surrounding this sociological congress have long been worked through in the literature,<sup>52</sup> in the present context we shall focus particularly on Herbert Marcuse's lecture on 'industrialization and capitalism', which was at least significant with regard to its reception. Then I shall go into the statement Jürgen Habermas read following Talcott Parsons' lecture on 'freedom from values and objectivity'. Thereafter it was mostly Habermas who was to place the discourse on Weber in the Frankfurt School at a hardly surmountable level of abstraction and who, at least in this sense, has not had a 'legitimate successor'.

Herbert Marcuse chose the topic of 'industrialization and capitalism' in consultation with Adorno. In the same year, Marcuse's book, *The One-Dimensional Man. Studies in the Ideology of Advanced Industrial Society* appeared, setting the theoretical frame of references for his critique of Weber in Heidelberg.<sup>53</sup> But there is another book that might have inspired Marcuse's lecture and which had been published ten years earlier by Aufbau-Verlag in Berlin, namely the monumental study of *The Destruction of Reason* by Georg Lukács. We cannot determine unequivocally to what extent Marcuse's understanding of Weber had been influenced not just by *Geschichte und Klassenbewußtsein*, but also by this later work of Lukács'. The fact is that in his chapter on Weber in *The Destruction of Reason*, Lukács had broached all the subjects that were playing a central role in the reception and critique of Max Weber's work in Critical Theory.<sup>54</sup> At the centre of Marcuse's paper at the Heidelberg Congress of 1964, we also find the full tension between 'rationality' and 'irrationality' that pervades throughout Weber's work.

Here, Marcuse alludes to one phenomenon of 'Western rationalism', which Weber calls 'formal rationality' and the importance of which for a materialist theory of society is explicitly emphasized by Georg Lukács in his book *Geschichte und Klassenbewußtsein* of 1923. Similarly to Lukács' book on *The Destruction of Reason*, now the 'irrational' character of modern capitalism and its age is placed at the centre of analysis, but far more emphatically. In his lecture, Marcuse particularly addressed the following points:

- (a) Weber's postulate of 'freedom from values in science' pursued the 'aim of making science free to accept binding values which are imposed on science from outside'.<sup>55</sup> In his inaugural lecture in Freiburg in 1895, Weber even explicitly called for placing German political economy and a concomitant national social policy at the service of 'imperialist aims'.<sup>56</sup>
- (b) Although Max Weber spoke of a 'rationalization' of many social fields, this 'bourgeois' form of rationality suddenly switches to its opposite at two central places. The first is the threat of the 'liberal' manifestation of modern capitalism through the 'rule of economic and political monopolies'.<sup>57</sup> Marcuse saw this danger both in the tutelage of capitalist companies by a burgeoning state bureaucracy and in the creation of joint stock companies and with the emergence of major trusts, the 'subjugation of the whole under its calculating managers'.<sup>58</sup> The other threat to the 'age of liberalism' was to be found in 'Caesarist' trends in modern mass democracies. According to Weber, state bureaucracy requires leadership through a charismatically gifted politician, who cannot come from the administration since political decisions are withdrawn from the logics of administrative acts. With the increasing dependence of political 'leaders' on the 'plebiscitary' agreement of each people, however, this system of rule runs the risk of promoting political 'decisionism' at the expense of 'calculability'. Through this, the 'spurious character of modern mass democracy' becomes apparent.<sup>59</sup>
- (c) The 'formal' character of Western rationalism promotes a purely 'technical reason'.<sup>60</sup> In this context, Marcuse even used the term 'technological veil', which conceals the assertion of particular social interests.<sup>61</sup> However, this is used

to denounce the utopian thought of a 'qualitatively *other* historical rationality'.<sup>62</sup> By equating technical, economic and bureaucratic rationality with *reason*, a structure of rule over society as a whole is legitimized, which is presented as having 'no alternative'. In point of fact, however, certain 'purposes and interests of the rule' are already integrated into 'the construction of the technical apparatus. Technology is a historical societal *project*: in it, prospects are explored as to what a society and the interests which dominate in it are considering doing with the people and the things'.<sup>63</sup>

In writing this, Marcuse had more acutely expressed many motives of the reception and critique of Weber which can also be found in Lukács, Horkheimer and Adorno, and can thus be regarded as characteristics of Critical Theory. When we compare the reception of Weber by Lukács, Horkheimer and Adorno, however, Herbert Marcuse's paper in Heidelberg appears very poor. This is particularly due to the recurrent equation of 'reason' and 'rationality', which really makes no sense at all, at least with regard to Weber's use of the language. For Weber used the word 'reason' as good as never. And Weber for good reason held no brief for counterfactual talk of 'reasonable circumstances' [*vernünftigen Verhältnissen*], which is to be found not just in Marcuse but also in other representatives of the 'Frankfurt School'. It is to be assumed that he would have relegated such terminology to obscurantism or modern doctrines of *Weltanschauung*, since personal value judgements are always related to it, and Weber felt that such value judgements could not be generalized at least with regard to discourse.

But the legitimacy of value judgements is the crux not just of Marcuse's critique of Weber, but also that of Lukács, Horkheimer, Adorno and Habermas. For they constantly insinuate that with the postulate of freedom from values in empirical and analytical sciences, Weber had opened the floodgates for ideological and political 'irrationalism', because he did not regard normative issues

as 'capable of being demonstrated as true'. When Marcuse uses the term, 'reason' in his paper in Heidelberg – a term that has to be read and construed in the context of Georg Lukács' formula *The Destruction of Reason* in the age of European imperialism – he is implying that reason can indeed be founded on discourse. Jürgen Habermas later attempted to reformulate the critique of reason through timely philosophy by referring to the 'linguistic turn' achieved by modern philosophy of language. To what extent he had managed to do so continues to be debated today. At any rate, he spent decades trying to achieve this claim at a high intellectual level and in recent years has received many international prizes for doing so.

It is, however, impossible to say that Herbert Marcuse's paper in Heidelberg in 1964 was a success. Instead, Marcuse implied that everyone knew what was meant by the concept, 'reason'. Marcuse equated the notion of reason with the term Weber preferred, 'Western rationalism', though he regarded the modern form of bureaucratic rule as the 'transition from theoretical to practical reason', i.e. to the 'historic form of reason'.<sup>64</sup> However, in his Heidelberg paper, Marcuse did not succeed in demonstrating a convincing relationship between the 'destruction of reason' and the development of 'formal rationality' within the meaning of the principle of 'calculability' in the most varied fields of society. Or how else should we interpret formulations of his such as the 'unfolding of capitalist rationality' becomes the 'irrationality of reason'?<sup>65</sup> As we have pointed out, Georg Lukács had still written of the 'destruction of reason'. This diagnosis was, however, directed towards a context of pure *intellectual history*. For when have 'reasonable' circumstances existed in the history of humanity?

However, in this context, Marcuse's aim was not a narrative of a history of the fall, as is the case both of the *Dialektik der Aufklärung* and the *Zerstörung der Vernunft*, in which Weber's diagnoses of the 'disenchantment

of the world' or the 'bureaucratic rigidifying' of 'liberal' capitalism played a central role. Instead, by equating 'formal rationality' with 'bourgeois' or 'capitalist reason', Marcuse tried to bring a possible escape route into play which was closely oriented to Martin Heidegger's critique of technology. Just as for Heidegger, he was looking for a new 'project' in the history of humanity in which the 'technological a priori' underlying modern science and technology as well as modern capitalism and bureaucracy would be suspended and replaced by a new and now mimetic way humans would treat 'nature'.<sup>66</sup>

Four years later, Jürgen Habermas put this speculative philosophy of technology developed by Herbert Marcuse in its place on good grounds, and here made a relativizing presentation of Marcuse's position as one of 'technology and science as ideology'.<sup>67</sup> His own statement which he read out in reference to the paper Talcott Parsons delivered at the 1964 Congress in Heidelberg was concerned with quite different questions. It is telling that at the time they were purely methodological, just as in the publications by Max Horkheimer and Theodor W. Adorno of around the same time. At least at this point of time, Critical Theory had dispensed with a discussion of the *contents* of Max Weber's work, although Marcuse had been the first of the proponents of Critical Theory to attempt very publicly to take Weber seriously as a social theoretician against his own 'logical' understanding of his methods.

Habermas' central objection to Weber and Parsons concerned the methodological problem of 'understanding'. Habermas argued that Weber's sociological work was torn between the heuristic meaning of 'understanding motivations' of acting individuals on the one hand and 'understanding' objective social contexts of meaning on the other. However, Weber tried to withdraw the latter form of understanding from empirical analytical sciences through his postulate of freedom from values. However, these 'objective' references to meaning at the same

time had an epistemological significance through the meaning Weber emphasized of 'theoretical value references' or 'value ideas', terms he had adopted from Heinrich Rickert. 'Value structures' and 'motivation structures' [*Motivationsgefüge*] in Weber's thought were, however, completely divorced from one another and therefore not 'mediated' according to Habermas. However, the point was precisely to integrate the 'contents of meaning that had been passed down' into the analysis, as those contents served as the basic interests in the quest for knowledge of research in the cultural and social sciences.<sup>68</sup>

In doing so, Habermas had addressed a central point which is also expressed in the brief position taken by Max Horkheimer in Heidelberg in 1964. In this context, Horkheimer expressly stressed that his problem with Max Weber's postulate of freedom from values in the empirical analytical sciences consisted in the fact that the postulate led to an abdication of *philosophical* knowledge.

According to Horkheimer, this resigned position is closely related to the 'regression of liberalism' seen around 1900 as well as to the increasing domination of 'big business' [*der großen Konzerne*].<sup>69</sup> This is why only an adequate 'theory of society' would be able to avoid the reduction of modern sociology to a formal framework of sociological 'basic concepts' or 'categories'.

Adorno also took up this thought in the speech he gave at the official reception of the participants at the fifteenth German Sociological Congress in Heidelberg Castle. But in contrast to Horkheimer, he expressly pointed to the relevance of Weber's sociological studies for *social theory*, which he again divorced from Weber's *methodological* premises. For Weber's thesis of the increasing 'solidification of bureaucratic rule' had anticipated the trend to an 'administered world'.<sup>70</sup> However, this statement had to be read against the grain so as to prevent 'sociology, throughout the world' from having 'the tendency to be transformed into social

engineering [*Sozialtechnik*]'.<sup>71</sup> Thus, much could still be learned from Weber's sociological work, even though it should not be followed slavishly.

In this regard, Adorno offered a highly instructive point which was to occupy Jürgen Habermas to a vast extent in his own reception of Weber over the following years. For Adorno explicitly said,

It is clear that the concept of rationality would be the most important for Max Weber to move him beyond the relationship between the means and the end in which he had remained spellbound. Perhaps we should take on as the legacy of Max Weber: through unswervingly reflecting with one's judgement to contribute a little to a reasonable arrangement of the world.<sup>72</sup>

## EPILOGUE

Over the following period, Adorno showed reverence towards Max Weber's work. In two Frankfurt lectures – 'Philosophical elements of a theory of society' of 1964 and 'Introduction to sociology' of 1968 – he went into Weber's work in detail. He made reference to the 1964 Weber Congress in Heidelberg and explicitly mentioned Max Horkheimer and Herbert Marcuse, with whom he felt the greatest theoretical affinities.<sup>73</sup> He praised Weber exuberantly as 'one of not just the most knowledgeable but also intellectually most productive sociologists' who 'lived in the German tradition' and in whose works 'things are far more difficult than they would initially appear'.<sup>74</sup> Although he continues to rank Weber among the 'positivists', Adorno took him increasingly more seriously with regard to *social theory*. Nonetheless, he asserted that one had to read Weber's monumental work 'against the grain' in order to break open his 'anti-theoretical standpoint'.<sup>75</sup> He wrote that this was particularly true of Weber's ideal types as concept formation, which according to Adorno 'necessarily suddenly switches over to theory formation or cannot dispense with theory'.<sup>76</sup>

Once again, Adorno points out not Weber's *methodological* understanding of his own work was decisive, but what he had in point of fact 'done' in his *universal historical* studies. For in those studies he worked with constructions of development history that could be understood as dialectical 'laws of motion' of society. This particularly applied to Weber's typology of rule, the three types of legitimate authority of which Adorno sought to understand in a corresponding 'dynamic' sense.<sup>77</sup> While doing so, he situated Weber's work near the cyclical understanding of history of Oswald Spengler, which according to Adorno is also expressed in Weber's diagnosis of the emergence of a new 'steel hard casing of submission' [*stahlhartes Gehäuse der Hörigkeit*]. One thus might read Weber's work as an 'unconscious legate of the old cyclical theories of society'.<sup>78</sup> But does this not also apply to the work Horkheimer and Adorno wrote together, *Dialektik der Aufklärung*?

  - 34 *Ibid.*, p. 5.
  - 35 *Ibid.*, pp. 3 and 6. The changes of Horkheimer's view on this subject can be seen when we compare this to his inaugural lecture in Frankfurt in 1931. Then, he sought to surmount 'relativism' in world views.
  - 36 Adorno, *Nachgelassene Schriften*, section IV, vol. 6: *Philosophie und Soziologie* [1960], edited by

- Dirk Braunstein, Berlin: Suhrkamp 2011, p. 17. Here, Adorno refers to Max Weber, *Soziologische Grundbegriffe*, Tübingen: Mohr Siebeck 1960.
- 37 Ibid., pp. 95–7.
- 38 Ibid., p. 98 f. Adorno later did justice to the fact by distinguishing between the unintelligibility of society and reflection on society. The former is the reason for which we have to appeal to the concept in such way to break open the 'reified' character of social conditions through reflexion. The point is to understand the unintelligible and to deduce social circumstances 'from circumstances between people' (Theodor W. Adorno, article on *Gesellschaft* [1965], in: *Soziologische Schriften I*, op. cit., p. 12).
- 39 This emerges from the surviving documents for the seminar which can now be found preserved in the university archives of the Goethe University in Frankfurt (cf. # Critical Theory and the Philosophy of Language<sup>1</sup>

Philip Hogg

Translated by Adrian Wilding

## INTRODUCTION

From its beginnings up to the present day, language has played a central role in critical theory. Walter Benjamin's early essay 'On Language as Such and on the Language of Man' and Jürgen Habermas's *Theory of Communicative Action* differ widely in both methodological and thematic terms, yet both explore the resources through which language can offer an emancipatory critique of capitalist society. The differences in philosophical approach of the respective critical theorists can be traced to the philosophy of language which each confronted in their day. If Benjamin's reflections engage with motifs from the Kabbalah, with Karl Kraus's language criticism<sup>2</sup> and, at least implicitly, with the emerging analytical philosophy, Adorno's works on language develop their philosophical and ideology-critical form by confronting both Martin Heidegger's linguistic ontology and early analytical philosophy, particularly that of Rudolf Carnap and Ludwig

Wittgenstein, and can be traced back to his wider critique of positivism. Jürgen Habermas's turn to a theory of communication, by contrast, takes its inspiration above all from John Austin's speech act theory,<sup>3</sup> while engaging more recently with new theories of semantics, for example those of Robert Brandom, and ideas from linguistic anthropology, for example those of Michael Tomasello.<sup>4</sup>

In the past, a certain discrimination has marked the reception of critical theory's language-philosophical works, resulting in Benjamin's and Adorno's contributions to a philosophy of language receiving scant attention (cf. Hogg, 2017; Müller, 2012): Habermas's communication-theoretical version of critical theory was taken as a benchmark, in comparison with which the works of Adorno, Benjamin, and Horkheimer were viewed as remote from linguistic and communicative concerns. The reason for this lies in a specific decision about exactly what in language is relevant for philosophy and

social theory: since Habermas criticized earlier critical theory primarily for its inadequate conceptualization of intersubjectivity and adopted in his own theorizing elements of a philosophy of language which presents language as intersubjective social practice, it was exactly these speech-act theories and pragmatist ideas that were judged to be linguistically and social-theoretically relevant. Correspondingly, the early critical theorists' philosophies of language were seen as outdated because they had primarily understood language not as a medium for the intersubjective realization of rationality and communicative action but also as a medium of subjective and artistic expression, as a medium of world-disclosure as well as domination, as an object of critique as well as a medium of critique. It is true that Adorno recognizes intersubjective communication as a philosophically relevant aspect of language, but, in contrast to Habermas, he never used this idea for a paradigmatic refounding of critical theory as a theory of communication. Early critical theory already contained works on intersubjective communication, but since these did not fit the later paradigm of communication, they received hardly any theoretical attention after the communicative turn. Looking back today on the history of this reception one can ascertain that while critical theory since Habermas has produced a highly differentiated and theoretically fertile understanding of language as communication, this same development has led to a significantly narrower comprehension of language than that with which the early critical theorists operated (cf. Seel, 2016). In the pages that follow I sketch, by means of an exposition of the ideas of Benjamin, Adorno, and Habermas, the many layers that make up a critical theory of language, exploring both the obvious differences as well as the often overlooked commonalities between these authors. Adorno's language-philosophical works will receive the most attention, because there the Benjaminian motif of 'reconciliation' is retained and certain pragmatist

and intersubjectivist motifs from Habermas are anticipated.

## WALTER BENJAMIN: LANGUAGE AND RECONCILIATION

Walter Benjamin's reflections on the philosophy of language, like those of Adorno, are to be found not only in his systematic works but also in shorter pieces that deal with concrete problems. Even when Benjamin's individual language-philosophical works have diverse motives, his central theme can be seen to consist in a critique of the idealist construct of language as an instrument of subjective mediation. Instead of conceiving language starting out from the subject, as the subject's means of communication, Benjamin conceives language as that moment of reality in which subjectivity and objectivity in general first find common ground. The origin of this idea is already to be found in Benjamin's 1916 essay 'On Language as Such and On the Languages of Man' (Benjamin, 2004a), whose motifs are taken up and modified in his later works. As the title of this essay – unpublished in Benjamin's lifetime and known only to a small circle of friends and acquaintances – suggests, Benjamin understands language as including not only human language.

The existence of language, however, is coextensive not only with all the areas of human mental expression [*menschlicher Geistersäußerung*] in which language is always in one sense or another inherent, but with absolutely everything. There is no event or thing in either animate or inanimate nature that does not in some way partake of language, for it is in the nature of each one to communicate its mental [*geistigen*] contents. (Benjamin, 2004a: 62)

For Benjamin, every thing, whether living or inanimate, has a spiritual [*geistigen*] content which it communicates [*mitteilt*] in this way: every thing ceaselessly communicates with all other things and with humanity. A thing is

no mere dead material but in its spirituality [*Geistigkeit*] is understandable and interpretable. That every thing communicates with other things and with humanity means simply that it manifests itself as something definite [*etwas Bestimmtes*], that in its definiteness it is in need of interpretation. The definiteness of the thing, that manifests itself for humans in that thing's need to be interpreted, is the expression in language of that thing's spiritual nature. If the thing is treated as a mere material occurrence lacking a spiritual nature, it cannot, so Benjamin maintains, be understood at all.

There exists for Benjamin a continuous communicative relationship between humans and things, a form of communication that cannot be interrupted and which is to be conceived as a language-theoretical version of a perfectly reconciled world. This communication of mental [*geistige*] contents is what Benjamin ultimately calls 'language'. Human language is therefore not the only language; human speech takes place in a world in which every thing communicates its spiritual nature in language. This communication of things is, for Benjamin, the prerequisite for man being able to understand and determine things at all (2004a: 63). As humans we can understand something of things only if we understand them as communicating, that is, if we assume that they have something to say to us and to tell us.

The linguistic being of things is their language; this proposition, applied to man, means: the linguistic being of man is his language. Which signifies: man communicates his own mental being *in* his language. However, the language of man speaks in words. Man therefore communicates his own mental being (insofar as it is communicable) by *naming* all other things ... *It is therefore the linguistic being of man to name things.* (2004a: 64)

Against the background of this notion that things communicate their nature in their language, the naming of things can be seen as humans' attempt to understand the language of things.

Benjamin distinguishes his conception of human language from what he calls the

'bourgeois conception of language' where 'the means of communication is the word, its object factual, and its addressee a human being' (2004a: 65). The medium, object, and addressee in this bourgeois conception of language are independent of each other, Benjamin argues, and remain external to both the spiritual [*geistigen*] nature of humans and that of things. Language here would be merely an instrument with which and by which something is expressed that already exists independently of it. If language exists only as an instrument used by humans, it is understood anthropocentrically. The result is that things are denied participation in language, which ultimately reduces them to objects of instrumental action. This insight, one that will also prove significant for Adorno's philosophy of language (cf. Adorno, 2007), is directed primarily against a conception of language as a system of signs that exist in opposition to both their meanings and the world to which they refer, each relating in an arbitrary fashion.

In order to emphasize how his own view contrasts with the bourgeois conception of language, Benjamin undertakes an interpretation of the Book of Genesis, a text which runs parallel to his own conception 'in presupposing language as an ultimate reality, perceptible only in its manifestation, inexplicable and mystical' (Benjamin, 2004a: 67). According to the biblical creation story, God created the world by speaking and God completed his creation by bestowing a name upon every created thing. For humans, things are ultimately cognizable because God has given them a name. When humans listen to the language of things, they can give them the names that befit them. In contrast to the word of God, which is creative, human language involves mere cognizing: it cognizes in things the word of God, by calling things by their names. The 'Fall of the spirit of language' (71) occurs when the inhabitants of this paradisiacal state of perfect communication with things come to know 'good and evil', that is, when they eat from the tree

of knowledge. In the paradisiacal state, this knowledge is nevertheless 'nameless' and 'void', since it knows no evil and thus no distinction between good and evil. In leaving this state, however, human beings break off their magical communicative connection to things, and the language they speak remains forever external to the things themselves.

In stepping outside the purer language of name, man makes language a means (that is, a knowledge inappropriate to him), and therefore also, in one part at any rate, a mere sign; and this later results in the plurality of languages. (2004a: 71)

Although human language after the Fall no longer expresses the unity of humans and things, there still remains the task, according to Benjamin, of hearing the language of things and of translating it into human words. While in paradise the success of this translation was guaranteed, this is not the case in human languages. In the foreword to his 1923 translation of Charles Baudelaire's *Tableaux Parisiens*, 'The Task of the Translator' (2004b), Benjamin adheres to the notion that even after the Fall from a paradisiacal language of naming, all human languages aim at exactly this 'pure language'. Whereas in 'On Language as Such and On the Languages of Man' the translation of the language of things into human language stands in the foreground, i.e. an epistemological problem, 'The Task of the Translator' develops Benjamin's perspective by placing center stage the question of the relation of the various human languages to one another and to the objects to which they refer.

Whereas all individual elements of foreign languages – words, sentences, associations – are mutually exclusive, these languages supplement one another in their intentions. This law is one of the fundamental principles in the philosophy of language, but to understand it precisely we must draw a distinction, in the concept of 'intention', between what is meant and the way of meaning it. (2004b: 257)

While the words used to refer to a specific object differ across the various empirical languages, the object in question – what is

'meant' – remains the same. 'Bread', 'Brot', 'pain', 'ekmek', for example, are different ways of 'meaning' [*meinen*] the same object. Since the same object is represented in different empirical languages with different words, and no single language ever captures the object in its entirety, pure language functions as the language which all the various empirical languages complement, and in which language and things find common ground. For Benjamin the translation of a work from one language into another thus has the function of enhancing language: the language into which one translates should be enhanced by the language from which one translates. In translating, one should enhance the meaning of the language of the translation by means of the language of the original, so that the translation approximates pure language. Thus Benjamin is ultimately opposed to any fixation on the representative function of language, an idea he suggests is espoused only by bad translators and which forms a cornerstone of modern representationalist theories of language, as these developed after John Locke.

By contrast, works by Benjamin from the early 1930s, specifically 'Doctrine of the Similar' (Benjamin, 2005a) and the reworked text 'On the Mimetic Faculty' (Benjamin, 2005b) present a mimetic conception of language which is built, at least in fragmentary form, on anthropological foundations. At the origins of human history, our mastering of nature forced us to make nature similar to ourselves. If our imitation of nature consisted at first in the production of similarities between human products and natural objects, which, moreover, had been admitted into a context of magical ritual practices, Benjamin today finds only 'minimal residues' (721) of these mimetic practices. But these point less to the disappearance than to a transformation of the mimetic faculty. Language is now the one place that the mimetic faculty has occupied in the course of the historical rationalization of human practices, only that language is unable, due to its own abstractness, to produce sensuous similarities. Instead, it produces

non-sensuous similarities. In explaining this notion Benjamin makes clear reference to his reflections on the relation between individual empirical languages and pure language from 'The Task of the Translator': 'For if words meaning the same thing in different languages are arranged about that signified as their center, we have to inquire how they all – while often possessing not the slightest similarity to one another – are similar to the signified at their center' (Benjamin, 2005a: 696). Language should express and represent what it refers to, but it can do so only in its own forms; it cannot possibly be sensually similar to a particular object. That language is sensually dissimilar to its objects means in the last instance nothing other than that the relation between language and object is neither an arbitrary nor a representative one but one in which language and object are bound together by historical human practice. Nevertheless, the mimetic aspect of language cannot, for Benjamin, be understood independently of its 'semiotic' side. 'Rather, everything mimetic in language is an intention which can appear at all only in connection with something alien as its basis: precisely the semiotic or communicative element of language. Thus, the literal text of the script is the sole basis on which the picture puzzle can form itself' (2005a: 697). Benjamin does not invert the representationalist conception of the relation between sign and signified but shows us that in this relation the mimetic aspect of language must appear – i.e. that aspect by which language is linked to the world in a way other than the representative – if the enhancing character of individual languages in their relation to pure language is to be understood.

### **THEODOR W. ADORNO: COMMUNICATION AND EXPRESSION**

From their beginnings, Theodor W. Adorno's reflections on the philosophy of language show Walter Benjamin's influence; they nevertheless

develop decisively from the discussions with Max Horkheimer which led, among other works, to their collaborative *Dialectic of Enlightenment* (Adorno and Horkheimer, 1997). In his 'Theses on the Language of the Philosopher' (Adorno, 2007), published posthumously but written in the early 1930s, Adorno takes up Benjamin's critique of the 'bourgeois conception of language':

Philosophical language, which intends truth, knows no *signa*. Through language history wins a share of truth. Words are never merely signs of what is thought under them, but rather history erupts into words, establishing their truth-character. The share of history in the word unfailingly determines the choice of every word because history and truth meet in the word. (2007: 35–6)

Language, so Adorno is convinced, is a sedimentation of the historical practice of humans. If therefore linguistic signs appear as detached from historically and socially mediated objects and human practices, this is the expression of a specific socio-historical situation in which human practice as a whole is affected by reification. Adorno's reflections on the philosophy of language thus have as context a philosophy of history: the independence which capitalist society gains over those who live within it is the result of an historically relentless process of formalization of reason, wherein reason threatens to become more and more a mere instrument for the domination of nature (cf. Bernstein, 2004: 7). For linguistic practice this means that language itself serves to coordinate social domination, so that linguistic statements refer to their objects not as specifics and particulars but merely as examples of a universal. Objects are then relevant as exemplars of a universal only insofar as they are identical with that universal, not in their particularity. Adorno then hypothesizes that this is a feature of conceptual language as such: it must necessarily identify objects with concepts, otherwise as humans we would be incapable of making sense of a world in which we are supposed to understand each other and orient ourselves. He is referring

here simply to the function that concepts must occupy as general terms in predicative statements. Without this function, i.e. without predication and identification – one can neither think nor speak.

In *Dialectic of Enlightenment* this function of language is explained in terms of a philosophy of history and an anthropology: for humans to free themselves from their natural environment, language needed to become a means for dominating nature. This liberation from nature, however, was, according to the authors, attainable only at the price of humans being schooled in shared social practices, which in turn contributed to the maintenance of prehistoric domination. This dialectic of freedom and domination characterizes language as language, and neither the moment of freedom nor the moment of domination can be explained independently of each other (cf. Hogg, 2014). Adorno held to this notion even in his later work, even though he would more finely differentiate it in terms of a theory of meaning and aesthetics. Instead of explaining linguistic meaning and concepts solely referentialistically, by relating non-linguistic objects to corresponding linguistic utterances and concepts, or by understanding meaning and concepts inferentialistically from the juxtapositions in which they stand, Adorno develops – specifically in *Negative Dialectics* (Adorno, 1973) but also in a series of shorter works – a ‘constellative’ theory of concepts. According to this theory, concepts as such refer to non-conceptual reality, but never as isolated individual concepts, rather always in concrete linguistic contexts that Adorno calls constellations:

In truth, all concepts, even the philosophical ones, refer to nonconceptualities, because concepts on their part are moments of the reality that requires their formation, primarily for the control of nature ... Dissatisfaction with their own conceptuality is part of their meaning, although the inclusion of nonconceptuality in their meaning makes it tendentially their equal and thus keeps them trapped within themselves. The content of concepts is immanent to them, as far as the mind is concerned, and transcendent as far as being is concerned. (Adorno, 1973: 11–12, trans. amended)

Conceptual and linguistic contents are thus determined in the same way that concepts in linguistic constellations refer to nonconceptual reality.

According to Adorno, in order for concepts to have a certain content they must be used repeatedly in the same way. In this manner, conceptual content is enriched and differentiated in the historical course of a concept’s use. Socially dominant ways of usage emerge, but these can always only update a certain part of the meaning of the respective concepts, leaving other aspects unaffected. To use language in a socially shared way allows a speaker to participate in social life, but, according to Adorno, at a price: the individual’s expression of their experiences is predefined by what is socially recognized and socially intelligible. Philosophy’s critical task with respect to language is thus, for Adorno, to dissolve the dominant modes of linguistic usage of concepts into the moment of their historical formation, while connecting each moment to others. According to Adorno, changed forms of linguistic practice are to be created which would allow for a changed access to reality, and thus ultimately the possibility of changing reality itself. By bringing concepts into changing constellations, and thus learning something new from each issue it interprets, philosophy, through its own form of linguistic representation, should contribute to this change in humans’ theoretical and practical relations to the world.

Philosophy’s critique of language, is not here directed against language and concepts as such, as was the case with Fritz Mauthner (see Hartung, 2012: 139–78), but against the specific form of their socially and historically produced determinations. Thus it cannot dispense with the identification involved in judgments and propositions, but it must focus on what remains silent in ordinary linguistic practice.

Dialectically, cognition of non-identity lies also in the fact that this very cognition identifies – that it identifies to a greater extent, and in other ways,

than identitarian thinking. This cognition seeks to say what something is, while identitarian thinking says what something comes under, what it exemplifies or represents, and what, accordingly, it is not itself. (Adorno, 1973: 149)

For Adorno, this motif is what connects philosophy with art. Of course there are differences between the two fields – the language of philosophy aligns itself with the objects it wishes to determine and to present, while art is oriented primarily by its own laws – nevertheless both seek to unsettle the fixed definitions which by necessity exist in ordinary language. Since art is not constrained to impart anything definite about specific objects and circumstances it is, at least measured against ordinary linguistic practice and the language of the sciences, unintelligible: ‘Prior to questions of narration about the world, concepts as such have something hostile to art about them; they represent the unity as sign of what they subsume, which belongs to empirical reality and is not subject to the spell of the work’ (Adorno, 1992: 99). Instead of reproducing in its works the ordinary meanings of words, linguistic art attempts to free those semantic and aesthetic aspects that are needed for the respective context of a work. This, according to Adorno, does not lead to the disappearance of the ordinary meanings of words; on the contrary, the semantic and aesthetic surplus of words, which is decisive for a work of art, can only be developed in relation to ordinary meanings: ‘it is not that artworks differ from significative language by the absence of meanings; rather, these meanings through their absorption become a matter of accident. The movements by which this absorption of meaning occurs are concretely prescribed by every aesthetically formed object’ (Adorno, 1999: 124). Art and philosophy thus offer language possibilities that typically remain unused in everyday language. Although Adorno is a decided critic of the tendencies of everyday language to become mere catchphrase and jargon (cf. Adorno, 2003), he does not discard everyday language and

communication as such, as Habermas suggests he did (Habermas, 1987: 516). Questionable for Adorno is, on the contrary, the idea that everyday language contains the possibility of interpersonal speech – where speakers mutually elucidate a matter in hand while mutually recognizing each other (see Adorno, 1974: 37; Hogg, 2017). This is never or only rarely achieved, counters Adorno, and not due to everyday language itself but because it is bound up with social mechanisms of domination. This becomes clear in Adorno’s argument with Heidegger’s critique of ‘idle talk’ [*Gerede*] in *Being and Time* (Heidegger, 2010) and which merits a brief discussion.

Heidegger defines ‘idle talk’ as having the following characteristics:

one understands not so much the beings talked about; rather, one already only listens to what is spoken about as such. This is understood, what is talked about is understood, only approximately and superficially. One means *the same thing* because it is in the *same* averageness that we have a common understanding of what is said. (Heidegger, 2010: 162)

Heidegger, like Adorno, makes clear that everyday language inserts itself between the speaker and the subject matter such that understanding becomes oriented not to the matter itself but to the average understanding expressed in idle talk. Adorno concurs broadly with Heidegger’s view when he says that ‘the business of communication and its formulas cut in between the matter and the subject, and blind the subject against precisely that which all the chatter is about’ (Adorno, 2003: 82).

However, Heidegger emphasizes at the beginning of his analysis that the concept of idle talk ‘is not to be used here in a disparaging sense ... Terminologically, it means a positive phenomenon which constitutes the mode of being of the understanding and interpretation of everyday *Dasein*’ (Heidegger, 2010: 161–2). His explanations are not intended as a critique of idle talk, though it

is easy to understand them in this way. While Heidegger clearly renounces negative normative evaluations of idle talk, the rhetorical forms in which he discusses it implicitly convey such evaluations:

The groundlessness of idle talk is no obstacle to its being public, but encourages it. Idle talk is the possibility of understanding everything without any previous appropriation of the matter ... Thus, by its very nature, idle talk is a closing off since it omits going back to the foundation of what is being talked about. (163)

For Adorno, the problem with Heidegger's theory lies primarily in the fact that it views the negativity of idle talk not as an historically and socially determined form of linguistic communication but as a type of being of everyday existence [*Dasein*], i.e. as an ontological determination. Where Adorno conceives idle talk within the framework of a philosophy of history and social theory, Heidegger ontologizes it. The 'closing off' of a subject matter which idle talk induces is for Heidegger not something that everyday human existence [*Dasein*] can rid itself off or change. At the same time, idle talk is not the only possible form of world-concealment; Heidegger will set alongside it 'genuine discourse' [*echte Rede*] whose presupposition is 'an authentic and rich disclosedness' of *Dasein* to itself (Heidegger, 2010: 159). This disclosedness of *Dasein* – and with it the world – is achieved however only when *Dasein* distances itself from the 'speaking a lot about something' (159) and begins to determine its own ontical and ontological constitution. This form of consciousness is admittedly not everyday but it is also an 'existential possibility' of *Dasein* (158), a possibility therefore which belongs to *Dasein* as *Dasein*. Only when *Dasein* grasps this possibility can it gain a different access to a subject matter than that determined by the averageness of idle talk. This access, which the term 'genuine discourse' is meant to convey, nevertheless behaves quite other than in a neutral way; it 'subdues' [*schlägt nieder*]

idle talk (159, trans. amended). Heidegger thereby reveals that he understands idle talk to be a deficient form of linguistic practice, one which, as ontological determination, is simultaneously unavoidable and unchangeable. It can only be subdued by 'genuine discourse', which itself is also an ontological determination, so that the vanishing point of Heidegger's implicit criticism of idle talk is not a changed everyday linguistic practice, one which would no longer define access to a subject matter and to the world solely on the basis of custom, but the permanent subjugation of an ontologically anchored linguistic practice – idle talk – by another ontologically anchored linguistic practice – genuine discourse.

Adorno's critique comes in precisely at this point. 'The mobility of words unquestionably continued their degradation from the beginning ... But without mobility language would never have become capable of that relation to the matter at hand, by whose criterion Heidegger judges communicative language' (Adorno, 2003: 85). For something like 'genuine discourse' to exist, i.e. a form of linguistic expression in which the speaking subject articulates their experiences in a way adequate to the matter at hand, it is necessary to have social communication – the 'mobility of words' – since only thus can subjects exchange their various perspectives on a matter in their various modes of expression. Here, linguistic modes of expressions differ only in order to allow the particular matter to be determined specifically. That this is inadequately achieved in everyday communication under late capitalism is, for Adorno, less down to language than to the social relations of which language is a moment. Precisely this point is overlooked by Heidegger, Adorno argues. Heidegger 'condemns idle chatter, but not brutality, the alliance with which is the true guilt of chatter, which is in itself far more innocent' (83). Heidegger's implicit critique of idle talk is abstract in that it isolates such talk from the social domination of which it is a

moment, and condemns its 'groundlessness' and fungibility. From Adorno's perspective, by contrast, idle chatter or everyday linguistic practice make visible the historically and socially determined condition of subjectivity. Hence Adorno criticizes Heidegger in the last instance for having dehistoricized everyday communication under capitalism by making it an ontological determination of *Dasein*.

This mischief has arisen and is to be got rid of; we do not need to bemoan it and leave it in peace as if it were the essence of *Dasein*. Heidegger rightly perceives the abstractness of chatter 'as such', which has emptied itself of any relationship to its content; but from the aberrant abstractness of chatter he draws conclusions as to its metaphysical invariance, however questionable that may be. (82, translation amended)

In this way Adorno's reflections on communication display an idea that will also play a decisive role in his epistemology and social theory, namely the priority of the object. Subjects engaging in communication are, on the one hand, concerned with expressing themselves in a way appropriate to the particular object of experience, while on the other hand they must mutually grant each other the same freedom of expression which they themselves take. In the back and forth exchange of their individual experiences of an object, subjects increase the possibility of the most comprehensive possible experience of that object. In this way, intersubjective communication, in which the priority of the object is observed, serves subjects' mutual enlightenment. That communication in late capitalism serves less to promote mutual enlightenment than the maintenance of social domination is precisely down to the fact that it does not respect the priority of the object and that language is removed from the objects concerned and the experiences of subjects. Here Adorno anticipates certain of Habermas's reflections on communication theory. For the early Habermas, so it is for Adorno: fulfilling the potential of communication is bound up with a rational organization of society. As long as this society

remains unrealized, communication can only be understood negatively, since it falls short of its own possibilities (cf. Hogg, 2016). For this reason the language of philosophy and the language of art can each deliver only in limited ways an anticipation [*Vorschein*] of the fulfillment latent in everyday language. Since Adorno's philosophy of language is built on the idea that the historical life of humans has been sedimented in language, and that this historical life took on catastrophic forms in the National Socialist's war of extermination in the twentieth century, Adorno's reflections are also an attempt to find a linguistic form of representation which is able to express the injustice that has been done, and at the same time to intervene critically wherever linguistic forms of representation are chosen which gloss over or silence the past. Thus he adheres to Benjamin's reflections on reconciliation in the philosophy of language while at the same time criticizing the linguistic practices of late capitalism where communication's enlightening potential remains unfulfilled. To this extent he anticipates one central idea of Habermas's work (cf. Morris, 2001).

## JÜRGEN HABERMAS: COMMUNICATIVE ACTION

One cannot overestimate the significance of Jürgen Habermas's magnum opus the *Theory of Communicative Action* (Habermas, 1984, 1987) for critical theory, social and legal philosophy, as well as sociology. But already in his 1965 Inaugural Address at the University of Frankfurt, Habermas formulated an idea that would be fundamental to his later work, and which bears similarity to reflections in Adorno's theory of communication:

The human interest in autonomy and responsibility is not mere fancy, for it can be apprehended a priori. What raises us out of nature is the only thing whose nature we can know: *language*.

Through its structure, autonomy and responsibility are posited for us. Our first sentence expresses unequivocally the intention of universal and unconstrained consensus. (Habermas, 1971: 314)

That the structure of language supplies the necessary criteria for accomplishing a critical normative reconstruction of capitalist society is the thesis that Habermas would elaborate in the following years (cf. Habermas, 1986) and give systematic form in his *Theory of Communicative Action*. The reason why he reconfigures critical theory in terms of a language- and action-based theory of communication is, so he himself argues, that Adorno's and Horkheimer's version of critical theory ran into methodological problems which made it impossible for them to implement the 'programme of an "interdisciplinary materialism" in whose name the critical theory of society was once launched in the early thirties' (Habermas, 1984: 385–6). In order to revive this program it was necessary, according to Habermas, to make a paradigm shift from the philosophy of consciousness to the theory of communication and so make philosophy compatible with social scientific practice. Accordingly, Habermas's philosophy of language, as developed in the *Theory of Communicative Action*, is situated within a theoretical framework that is directed toward grasping the rationality of intersubjective social relations, to which end Habermas undertakes a critical engagement with Max Weber's concept of rationality and draws upon the already communicatively oriented concepts of George Herbert Mead and Émile Durkheim. The references to Hegel and Marx that were typical of early critical theory thereby lose significance.

Habermas begins his investigations with the question of what can legitimately be called 'rational'. His answer is: the linguistic utterances and actions of persons and these persons themselves. Linguistic utterances and actions involve an implicit knowledge which provides the reason for the respective utterances and actions. For Habermas,

linguistic expressions and actions must be differentiated according to the respective discursive realm or part of the world to which they refer, and he stresses the relation between the meaning of a linguistic utterance and its validity, where an utterance's meaning can only be understood if it is also understood why it is supposed to be true. 'One can understand reasons only to the extent that one understands *why* they are or are not sound, or why in a given case a decision as to whether reasons are good or bad is not (yet) possible' (Habermas, 1984: 116). This truth-semantic feature is supplemented by a 'use' theory of meaning wherein the meaning of a linguistic expression consists in the way it is used. However, Habermas is primarily concerned with those forms of linguistic utterances with which validity claims can be raised. 'Not all illocutionary acts are constitutive for communicative action, but only those with which speakers connect criticisable validity claims' (305). Thus, firstly, linguistic expressions take effect as statements about objects in the objective world. Such statements make a claim to be *true*. Secondly, linguistic statements can refer to the social world, that is, to something that is negotiated between subjects and which must be valid for the subjects involved. Such statements raise the claim of normative *correctness*. Thirdly and finally, linguistic statements can refer to what the speaking subject feels. Such statements relate to the subjective world and raise claims to *truthfulness*.

Three different worlds open up here: an objective world to which we refer with statements which claim the validity of truth; a social world to which we refer with statements which claim the validity of normative correctness; and a subjective world, to which we refer with statements which claim the validity of truthfulness. For Habermas, since speech acts are differentiated according to their worldly references, actions which cannot be classified primarily as speech acts must also be differentiated according to their reference to something in the world. Thus, firstly,

teleological actions, which simply seek the appropriate means to reach an end, refer to the objective world in which they wish to intervene. Here the acting subject merely follows an intention directed toward a specific goal. Secondly, subjects can be guided in their actions by norms which are valid in the social world and which they regard as binding upon them and upon all other subjects concerned. Here Habermas speaks of norm-regulated action, the execution of which requires that the subject be able to distinguish the objective world from the social world. Thirdly and finally, the subject can present other subjects with something of themselves, i.e. something from their subjective world, and let themselves be guided by how this world is perceived by others. Habermas calls this form of action 'dramaturgical' action.

Habermas gains these insights by studying the actions of subjects as they are performed in modern societies and by inquiring into the rules and norms which underlie them. In order for them to challenge the conditions of their lives, subjects living in the modern capitalist world must therefore be able to distinguish between the validity of their linguistic statements and actions with regard to the three worlds mentioned. With their statements and actions, a subject raises different validity claims for each of the respective three worlds. Since a subject's speech and action claim validity, members of modern societies commit themselves to making their statements and actions criticizable by other subjects and to substantiating and justifying those statements and actions. The type of justification will differ according to the respective form of the validity claim. Now social life is not performed in such a way that the respective spheres of action – the objective, the social, and the subjective worlds – are strictly separated from each other and one form of action is to be found in only one sphere. Rather, Habermas makes these distinctions only in order to enable subjects, in their interrelationships, to make themselves transparent to the demands and

claims they make. Communicative action is understood correspondingly as that social process in which all participating subjects 'refer simultaneously to things in the objective, social, and subjective worlds in order to negotiate common definitions of the situation' (Habermas, 1984: 95). In doing so, the subjects involved may only demand consent for their statements and proposals for action if no other participant involved and affected by them dissents with good reasons. The only compulsion that governs in communicative action is what Habermas calls 'the unforced force of the better argument' (Habermas, 1984: 28, trans. amended). For Habermas, every subject who has been socialized in a modern society is potentially capable of participating in processes of communicative action and ensuring that the coordination of social action takes place in a communicative manner. This means that all subjects must be involved in all decisions which directly or indirectly concern them, which is nothing less than an idea of a radical democracy. This idea, Habermas suggests, is what language itself aims toward: 'reaching understanding is the inherent telos of human speech' (Habermas, 1984: 287). Understanding, which has been achieved in communicative action between the subjects, also possesses a context-transcendental force; argumentative communication is not to be understood as having validity merely in specific situations or contexts (cf. Habermas, 1984: 35f.). Linguistic action is therefore concerned with those criteria which can be used to assess whether the social relations of a society are, in the communicative sense, rationally arranged. This represents the fundamental moment of Habermas's theory, an approach he has described as 'formal pragmatism'. By reconstructing the forms in which speech acts raise context-transcending validity claims, critical theory acquires normative standards which are located in the subject's speech acts themselves and thus in social reality. Theory thereby gains access to the real actions of subjects.

Soon after its appearance, the *Theory of Communicative Action* prompted wide-ranging and heated debate, centering on the one hand on Habermas's critique of the philosophy of consciousness, with which he founded his paradigm shift to communication theory, and on the other, the universalistic claims of formal pragmatism. Habermas, however, subsequently devoted himself less and less to elaborating those aspects of his work that touched on the philosophy of language in the strict sense. Likewise he did not subject 'the real prevailing life-conditions to a staunch critique of pathology and estrangement' (Celikates and Pollmann, 2006: 98). In fact, he merely applied the normative criteria obtained in the *Theory of Communicative Action* to present conditions and devoted himself to explicating the moral and legal-theoretical implications of his magnum opus, shaping the course of subsequent political, legal, and moral philosophy, particularly in the form of 'discourse ethics'.

Since the start of the twenty-first century Habermas has undertaken a renewed examination of questions raised by anthropology and the philosophy of religion, turning his attention once again to a series of themes in the philosophy of language that had already played a role in the *Theory of Communicative Action*. Starting from an engagement with the work of anthropologist Michael Tomasello, who locates the evolutionary origins of human communication in the prelinguistic gestural communication of primates and the action-oriented and socially synthesizing effects these generate, Habermas has begun to revise his thesis that the linguistification of the sacred is a feature of modernization and rationalization (cf. Habermas, 2012: 7–95). Whereas in the *Theory of Communicative Action* Habermas assumed that 'the rational-motivational binding force of good reasons, which is the decisive factor for the action-coordinating function of linguistic communication, can generally be attributed to the promulgation of an initially ritually secured basic understanding' (13), he now proposes

that the 'binding force of good reasons' should be considered more differentiated in its evolutionary formation with regard to the validity claims of truth, normative correctness and truthfulness. Normative content, and thus validity claims for normative correctness, which were supposed to control and coordinate social actions, were shared in the form of ritual actions before they were linguistically shared, and 'had first to be detached from their ritual encapsulation and then transferred to the semantics of everyday language' (14). In the form of rituals, Habermas recognizes that pre-linguistic human practices have a greater socially binding force than he took them to have in *Theory of Communicative Action*. Habermas has thus returned to a topic which had already been explored by Adorno and Horkheimer in the first chapter of *Dialectic of Enlightenment*: the connection between language and the genesis of the subject from the perspective of natural-history and philosophy of history. If critical theory's differentiation of the communication-theoretical aspects of the philosophy of language was accompanied by a narrowing of the concept of language, Habermas himself now tries to counteract this, by expanding his concept of language in the ways examined above.

## CONCLUSION

An overview of the works of Benjamin, Adorno, and Habermas shows that critical theory contains a multitude of reflections on the philosophy of language, each theorist's work building in part on the other while also diverging from their predecessor. What the three theorists discussed have in common is that they find a significant critical potential in language for the rightful organization of society, even when each interprets and exploits this potential in different ways. Where for Benjamin, language was to be understood as the place where humans exist

in a reconciled relationship with themselves and with things, and he explicated this potential by reverting to theological motifs, Adorno attempted to critically discern in language, i.e. in the linguistic practices of everyday life, philosophy and art, the historical status of the relationship between subjectivity and society. Holding on to language's liberating potential, i.e. its potential for reconciliation, Adorno concentrated above all on showing how the organization of society prevents this potential from being socially realized. Habermas, while developing his philosophy of language in opposition to what he saw as the 'philosophy of consciousness' of the early critical theorists Benjamin and Adorno, and via a constructive adoption of linguistic-analysis approaches, also retains the motifs found in his predecessors. The 'unconstrained consensus' (Habermas, 1971: 314) at which every linguistic utterance ultimately aims, is the form which Habermas calls the liberating potential of language, and which he then attempts more precisely to define by means of his system of validity claims, so that critical theory can remain capable of intervening in scientific and social discourse, which was its original purpose. However, in contrast to Benjamin and Adorno, Habermas completely neglects the sphere of linguistic art, so that when it comes to propositional speech, while he may have a much more differentiated concept of language than his predecessors, in terms of language's aesthetic and rhetorical aspects of language, his conception remains much narrower than the comprehensive conceptions of Benjamin and Adorno. The subsequent transformation of critical theory into a theory of recognition, on the other hand, takes place almost entirely without language-philosophical reflections (cf. Hogg and Deines, 2016b). What remains of the communicative turn in contemporary critical theory is to a large extent merely the focus on intersubjectivity; language-philosophical considerations play almost no role. While recognition theory attempts to

make material social conflicts fertile for social philosophy without paying attention to the linguistic form in which these conflicts are conducted, Habermas concentrates primarily on the formal requirements of communicative practices, without taking sufficient account of their material conditions and the subjects involved in them. Adorno's philosophy of language could now serve as the source for a language-philosophical *extension* of the recognition-theoretical transformation of critical theory, since Adorno assumes that the social life of humans has historically been sedimented in language and that the way people treat each other can be read precisely in their linguistic practice. Recognition theory, which is mainly concerned with normative questions, could be extended in such a way that subjects' material linguistic forms of expression can be more precisely examined as a medium of recognition (cf. Kuch, 2016). Contra Habermas, it is possible to bring to light in linguistic communication the real social life-process with all its crises and distortions, without isolating in a formal-pragmatic way the norms operating therein. Again contra Habermas, one can conceive language (as does Adorno) as a material practice of socialized subjects, and contra Honneth, as a material form in which recognition and misrecognition are accomplished. Contra both thinkers, one must (with Adorno) nevertheless hold on to the idea that the redemption of the liberating potential of linguistic practice can be achieved not through language alone but first through a fundamental transformation of social relations. For this reason Adorno's philosophy of language remains negative, as critique of language and of the society which is expressed in it.

## Notes

- 1 This text develops key insights of an earlier publication that appeared in 2015 under the title 'Die sprachkritische und sprachsoziologische Tradition', in Kompa (2015: 69–79).

- 2 Karl Kraus (1874–1936) was one of the most significant Austrian writers and language-critics. In the journal he edited, *Die Fackel*, he confronted the politically and ideologically dangerous positions around him by exposing the flawed use of language by contemporary literati, politicians, and writers. His most important works include *The Last Days of Humanity* (Kraus, 1986), which deals with the intellectual and political dilapidation of Austria and Europe before and during the First World War, and the *Third Walpurgis Night* (Kraus, 1989), in which he confronts national socialism. For Benjamin and Adorno, Kraus's language-critical works were, in terms of aesthetics and ideology-critique, of the utmost importance.
- 3 John L. Austin is considered the founder of the philosophical theory of speech acts. His work *How To Do Things With Words* (Austin, 2002), written in the 1950s, made human speech philosophically comprehensible as a form of practice. His theory was developed further by John Searle, but also critically by Judith Butler.
- 4 Michael Tomasello is an evolutionary anthropologist whose work centers on the development of human thought and speech out of the gestural communication and practice of primates. For recent publications, see e.g. Tomasello (2009 and 2014).

# Psychoanalysis and Critical Theory

Inara Luisa Marin

This chapter analyzes the relationship between Critical Theory and psychoanalysis. Critical Theory has two fundamental principles: the orientation toward emancipation and the critique of ‘traditional theory’. Both of them provide not only for a diagnosis of society’s historical circumstances [*Zeitdiagnose*], but also allow us to distinguish between identifiable emancipation potentials in capitalist societies and the obstacles which block these potentials.

Since its inception in 1923, the goal of the Institute for Social Research [*Institut für Sozialforschung*] was to broaden discussion among Marxist thinkers beyond both established disciplinary divisions and dogmatic postures of official Marxist doctrines at that time.<sup>1</sup> The attempt at interdisciplinarity included the integration of psychoanalysis into critical social theory and the development of a critical theory of psychoanalysis, wherein the contributions of Max Horkheimer and Erich Fromm are central. The version of psychoanalysis elaborated by Fromm marks a transformation of this discipline into social

psychology.<sup>2</sup> Fromm’s social psychology placed psychoanalytical categories firmly into a historical context, expounding them as categories of definite social relations. Indeed, the Frommian version of psychoanalysis led to the progressive abandonment of Freud’s libido theory. It was on this point that Horkheimer and Fromm started to part company, leading to Fromm’s break with the Institute in 1939.

In the *Dialectic of Enlightenment* Horkheimer and Adorno retrieved and reformulated key themes of Freud’s drive theory. Indeed, Freudian notions of fear, anxiety, horror, and terror became central to a psychoanalytically enhanced critical theory of society. The psychoanalytical framework was of decisive importance for the understanding of why the ‘impulse’ for and reality of emancipation appeared to be blocked.

In the 1940s, psychoanalysis takes a central place in Critical Theory, which it retained for the next 30 years. The historical context for the integration of psychoanalysis into Critical Theory is Nazism.<sup>3</sup>

Although psychoanalysis continued to have a central presence in Jürgen Habermas' *Knowledge and Human Interests* (1968), it soon vanished, to all intents and purposes, from Habermas' work from then on. The focus of social diagnosis shifted away from Nazism toward the Welfare State and questions of legitimation. As a consequence of this shift, theories of language and communication became central to Habermasian critical theory, especially in *The Theory of Communicative Action* (1981), which would be substituted again later on by a theory of law in *Between Facts and Norms* (1992). After Adorno's and Horkheimer's analysis of the blockage of emancipation, Habermas relocates its possibility to the field of intersubjective relations of communicative action.

After Habermas, these intersubjective relations have been reformulated as relations of recognition. In his *Struggle for Recognition* (1996) Alex Honneth reintegrates psychoanalysis into critical theory and sees it as an explanatory device for the contemporary diagnosis of intersubjectivity. Nevertheless, in Honneth's work psychoanalysis ceases as a distinguishable account of the social relations. In fact, despite the fact that his theory of recognition deals with intersubjective relations, his usage of psychoanalyses reaffirms ontogenesis as a normative model of social critique.

The chapter starts with an account of the central role of psychoanalysis in *Dialectic of Enlightenment*, which amplified the regressive character of society in distinction to its – blocked – emancipatory potential. Then the chapter explores the manner in which Critical Theory presents a deep psychology, another name for Freudian psychoanalysis. It includes interpretation of texts by Freud in order to shed light on what I consider to be psychoanalysis' critical potential. Finally, the argument turns to Social Sickness and Ego, which explores Axel Honneth's conceptions, such as the difference between normality and normativity, intersubjectivity and emancipation in order to consider the problem of social

pathologies from a viewpoint other than that of biologism. I hold that regardless of my critique of Honneth's approach, it articulates a number of questions and challenges that must be addressed by those who remain committed to the interdisciplinary character of Critical Theory.

## SOCIETY AND REGRESSION<sup>4</sup>

We will take the highly celebrated *Dialectic of Enlightenment* as the reference for the theme of society and regression. In Germany, in the early twentieth century, Marxist theory was not suspect of the concept of rational action and considered that workers would act according to what were supposedly their own interests, insofar as the development of the productive forces would establish the objective conditions for overcoming capitalist society. Instead of socialism, however, it was National Socialism that came to the fore in 1933, destroying the labor movement that collapsed almost without a fight. As Wilhelm Reich states, 'at the crossroads between "socialism and barbarism", it was in the direction of barbarism that society first proceeded'.<sup>5</sup> How can this regression be explained? This is the question that Critical Theory confronted and tried to answer with recourse to psychoanalysis, which seemed to offer explanatory insights into the omnipotence of bourgeois ideology, including what Reich saw as the irrational political behavior of the German working class at that time.<sup>6</sup>

Until the writing of *Dialectic of Enlightenment* Horkheimer and Adorno followed a philosophy of history inspired by Hegel, Marx, and Lukács, according to which they considered the unfolding of an emancipatory rationality along the development of productive forces. Even though an increasingly instrumental form of science, culture, and morality prevailed, modern capitalism and bourgeois culture still had an emancipatory potential. The critique of ideology would demystify the established relations of unreason

in support of emancipatory praxis. With Nazi domination and the exhaustion of revolutionary possibilities, this type of ideology critique had become historically obsolete because it lacked an empirical referent which theory could summon in support of praxis.

Furthermore, this referent – that is, reason and the objective rationality of the productive forces of human labor – was now considered to be the heart of domination itself. Reason, which had appeared as a project of human emancipation, had not just vanished. It had in fact turned against itself as a means of domination. Thus, reason no longer held the promise of liberation from prejudices and mythologies. Rather, it had become a mode of control over nature and Man, and over itself, too. The philosophy of history which had inspired notions of reasons as the means and ends of progress toward a future liberated humanity had run its course. Progress appeared in the form of an acute regression of ever-increasing domination.

In the context of Nazi barbarism, the critique of political economy as a philosophy of history fell into disrepute and ceased as the organizing center of Critical Theory. In its stead, psychoanalysis came to the fore as a central category of interdisciplinary research and it remained there for the next two decades. The central text is *Dialectic of Enlightenment*. In this work, psychoanalysis provides the main categories for the analysis and comprehension of domination.

In *Dialectic of Enlightenment* Adorno and Horkheimer attributed a central place to reflection on the relation between myth and enlightenment, stressing that tradition opposed reason to myth: 'Enlightenment's program was the disenchantment of the world. It wanted to dispel myths, to overthrow fantasy with knowledge'.<sup>7</sup> Against this opposition the authors suggest another interpretation that insists on a complicity between myth and enlightenment: 'Myth is already enlightenment, and enlightenment reverts to mythology'.<sup>8</sup> In order to develop this proposition they go back to the adventures

of Ulysses in Homer's *Odyssey*. Here, we find myth in Homer, although its narration is already a sign of escape from myth. For Adorno and Horkheimer, Ulysses' story is that of the appearance of subjectivity, a birth which is fundamentally *ambivalent*: on the one hand we have the relief of escape; on the other, the fear of uprooting. This reflection on origins, always returning to myth, inaugurates for subjectivity a founding history, which the Enlightenment exemplifies. Liberation as a distancing from its origins is ambivalent at best, that is, the promise of reason remains tied to the conditions of unreason from which it derives its claim for liberation. Indeed, myth is the condition of reason and reason's promise of liberation carries within itself the force of its own delusion. Myth is the premise of reason to which it is bound. Myth thus blocks the desire for emancipation, and reasserts itself as premise of desire. Reason reverts to myth as the foundation of its origins. The derivation of liberation from existing conditions of unreason does not emancipate reason from unreason. It rather makes unreason appear as reason, leading to a relapse into mythical powers and submission to them: this is how in Adorno's and Horkheimer's argument Enlightenment returns to mythology, from which it could never escape.

Why does this occur in such a way? In the course of his adventures, Ulysses reinforces and consolidates his ego. He cannot simply enjoy this new freedom, because it is comprised of many dangers: he must set limits to himself in order to overcome danger. In this renouncement, he acquires his identity, bidding farewell to the joyful archaic unity of external and internal nature, as it is only at the cost of a *repression of their internal nature* that humans learn to dominate external nature. This figure of thought provides the model for both faces of enlightenment progress: renouncement – the split between ego and its own nature, which becomes anonymous in the Id – is the consequence of the introversion of sacrifice. In this gesture of

self-preservation against external danger lays the origin of this movement of freedom qua domination.

This general argument is anchored in three fundamental elements of Critical Theory: first, a new diagnosis of the present (developed to a great extent by Friedrich Pollock in his *State Capitalism: Its Possibilities and Limitations*);<sup>9</sup> second, a new interdisciplinary arrangement, reflecting political economy's loss of centrality; and third, the articulation of the general problem concerning the foundation of this perspective, in which psychoanalysis has a decisive role.

In the introduction to *Dialectic of Enlightenment*, Adorno and Horkheimer thus argue as follows:

While we had noted for many years that, in the operations of modern science, the major discoveries are paid for with an increasing decline of theoretical education, we nevertheless believed that we could follow those operations to the extent of limiting our work primarily to a critique or a continuation of specialist theories. Our work was to adhere, at least thematically, to the traditional disciplines: sociology, psychology, and epistemology. The fragments we have collected here show, however, that we had to abandon that trust.<sup>10</sup>

This passage makes clear, political economy is not to be replaced by another discipline as the principle of enquiry. Instead interdisciplinarity itself becomes the principle of enquiry. Thus, it is possible to hypothesize that Adorno and Horkheimer replaced the previous model of critical thought with what we could call a new 'space of interdisciplinary dialogue'. At its center is a 'critique of instrumental reason', the basis of which, I argue, can be found in Freudian drive theory. This hypothesis allows us to put forward a more general problem of the foundation of this critique without entangling us in a paradox. In the introduction of their book, Horkheimer and Adorno affirm that:

The aporia which faced us in our work thus proved to be the first matter we had to investigate: the self-destruction of enlightenment. We have no

doubt – and herein lies our *petitio principia* – that freedom in society is inseparable from enlightenment thinking. We believe we have perceived with equal clarity, however, that the very concept of that thinking, no less than the concrete historical forms, the institutions of society with which it is intertwined, already contains the germ of the regression which is taking place everywhere today.<sup>11</sup>

According to our interpretation, this aporia should be understood as the expression of an objective repression of society. The most familiar theses of *Dialectic of Enlightenment* are those in the introduction, such as: 'The critical part of the first essay can be broadly summed up in two theses: Myth is already enlightenment, and enlightenment reverts to mythology'.<sup>12</sup> We have already highlighted the second thesis, the return to mythology: 'the cause of enlightenment's relapse into mythology is to be sought not so much in the nationalist, pagan, or other modern mythologies concocted specifically to cause such a relapse as in the fear [*Furcht*] of truth which petrifies enlightenment itself'.<sup>13</sup> The first thesis, in turn, which stated that myth is already reason, is explained in the opening of the first essay of the book: 'Enlightenment, understood in the widest sense as the advance of thought, has always aimed at liberating human beings from fear and installing them as masters. Yet the wholly enlightened earth is radiant with triumphant calamity'.<sup>14</sup>

This theoretical insight takes us directly to Freud, particularly to the text 'Beyond the Pleasure Principle'. The dialectic that is posed here is one that operates between mimetic behavior and self-preservation, resulting in the expulsion of mimesis from the rational field and its repression in such a way that the exclusive claim of self-preservation to determine the rational is fulfilled.<sup>15</sup> In the purely natural scope of its existence the species finds itself in 'absolute danger' [*absolute Gefahr*]. Even though already mediated by anxiety [*Angst*], the moment of danger is not avoided: it shows itself as 'terror' [*Schrecken*]. According to Horkheimer and Adorno:

The oldest fear [*Angst*], that of losing one's own name, is being fulfilled. For civilization, purely natural existence, both animal and vegetative, was the absolute danger [*absolute Gefahr*]. Mimetic, mythical, and metaphysical forms of behavior were successively regarded as stages of world history which had been left behind, and the idea of reverting to them held the terror [*Schrecken*] that the self would be changed back into the mere nature from which it had extricated itself with unspeakable exertions and which for that reason filled it with unspeakable dread [*Grauen*].<sup>16</sup>

The dialectic that takes place here – resulting from the domination of internal and external nature – starts with anxiety about a threatening and essentially unintelligible nature. This anxiety requires an internalization of the threat, a determination of the dangerous object in order to neutralize it. This neutralization appears as fear [*Furcht*]. Fear indicates that the successive attempts of internalizing the anxiety-inducing threat could never remove it completely. It is no longer possible to internalize external nature and its threats without any traces. This is the impossibility, along with its scars, marks and wounds that never disappear, that Horkheimer and Adorno name ‘fear’ [*Furcht*].

This schema is clearly borrowed from Freud's *Beyond the Pleasure Principle*, even though it is modified to suit Horkheimer and Adorno's arguments. As we can read in *Beyond the Pleasure Principle*:

‘Fright’ [*Schreck*], ‘fear’ [*Furcht*] and ‘anxiety’ [*Angst*] are improperly used as synonymous expressions; they are in fact capable of clear distinction in their relation to danger [*Gefahr*]. ‘Anxiety’ describes a particular state of expecting the danger or preparing for it, even though it may be an unknown one. ‘Fear’ requires a definite object of which to be afraid. ‘Fright’, however, is the name we give to the state a person gets into when he has run into danger without being prepared for it; it emphasizes the factor of surprise.<sup>17</sup>

Comparing both theoretical schemes, one can see that Horkheimer and Adorno rely on Freud to establish the general framework that moves from primitive ‘danger’ to the ‘fear’ of an entirely ‘enlightened’ world. But the

differences are as important as the similarities: if Adorno and Horkheimer use Freud to build this ‘negative’ philosophy of history, they do not share Freud's analysis of a distinction between ‘real anxiety’ and ‘neurotic anxiety’.<sup>18</sup> Contrary to Freud, Horkheimer and Adorno consider it an impossibility ‘to bring danger to conscience’, as it is objectively blocked by a social organization (the ‘administered world’) in which repression is a second nature elevated to the condition of a functioning mechanism of a flawless domination: ‘Enlightenment is mythical fear radicalized’.<sup>19</sup>

If we do not sustain an interpretation of the Freudian statement ‘*Wo Es war Soll Ich werden*’ [*Where the Id was, the Ego shall be*] in a classical sense, Horkheimer and Adorno's objections go even deeper, especially when they refer to the social order. As Adorno wrote in a Notebook in 1941:

Freud represents drive processes as a kind of equivalents exchange. But the drive exchange schemata, which Freud presents, are no longer valid as soon as the I has no longer the power of disposition over the many drives that are subordinated to it. When collective subjects form, the whole drive economy together with the pleasure principle is overridden. In his most advanced works, especially *Beyond the Pleasure Principle*, Freud saw something of this, but did not draw the consequences.<sup>20</sup>

Even while rejecting the Freudian drive scheme and against the background of their ‘negative’ philosophy of history, Horkheimer and Adorno reach a conclusion fundamental to Critical Theory. In opposition to the second Freudian drive theory, they return to the forefront what Freud had set aside. Reason, insofar as it is the objective process of the individual as presented in *Dialectic of Enlightenment*, ends up reduced to self-preservation, which, at least for now, takes the place of the Ego and confuses the narcissistic mechanism, preventing it from becoming aware of instrumental reason.

This is precisely what we find in a decisive passage of *Dialectic of Enlightenment*, where

Horkheimer and Adorno discuss the internalization of domination in the form of the individual's relation to her or his own body:

In the relationship of individuals to the body, their own and that of others, is reenacted the irrationality and injustice of power as cruelty; and that irrationality is as far removed from judicious insight and serene reflection as power is from freedom. In Nietzsche's theory of cruelty, and still more in the work of Sade, the extent of this connection is recognized, while in Freud's doctrines of narcissism and the death impulse it is interpreted psychologically.<sup>21</sup>

According to our reading, this is a better way to interpret the idea that, 'Not only is domination paid for with the estrangement of human beings from the dominated objects, but the relationships of human beings, including the relationship of individuals to themselves, have themselves been bewitched by the objectification of mind'.<sup>22</sup>

Even if both authors go far with psychoanalysis, one can ask if it is far enough, a question that arises from the following statement: 'Just as myths already entail enlightenment, with every step enlightenment entangles itself more deeply in mythology. Receiving all its subject matter from myths, in order to destroy them, it falls as judge under the spell of myth'.<sup>23</sup> Psychoanalysis allows us to diagnose as insurmountable<sup>24</sup> the element represented by the constellation of anxiety, but it should also show how this element shifts. From the point of view of psychoanalysis it is not possible to affirm how the repetitive cycle between myth and enlightenment can be broken, nor how or when it is going to shift. However, even if we cannot predict its direction, we can at least say that it is going to shift.

## PSYCHOLOGY AS CRITICAL THEORY

Psychology as critical theory is the psychology of the depths, that is, psychoanalysis. Psychoanalysis is the attempt to grasp the

unconscious in order to understand passions and human psyche. In other words, psychoanalysis' critical role takes the form of Freudian diagnosis.

*Civilization and Its Discontents* is a late text (1929) wherein Freud sketches a theme that runs through all his work: a sometimes silent, sometimes explicit tension between the individual's realizations and the demands of the group. This section explores the tension in explicit terms in order to establish a clear conceptual frame for psychoanalytical doctrine, bringing psychoanalysis' critical potential to the fore. Even if this tension has been reformulated several times with respect to Freud's writings – either in biological or metapsychological terms, or even according to different viewpoints (economic, dynamical, and topographical) – our reading does not focus on the epistemological clarification of Freudian developments, which is not to say that such a clarification is not important. For the purposes of this text, the critical potential of Freud is the key question: what are the ethical and political dimensions of psychoanalytic discourse as unveiled by Freud?

In *Civilization and its Discontents* Freud (1989) argues that with the birth of civilization (or culture) humans turn from animals into rational beings. The more repression perpetuates itself, the more civilization advances and progresses; civilization seems to follow this single dynamic forever, one that involves both exploiters and exploited. As Freud understands it, the opposition between individual and society is immutable, and in light of this irreconcilable character Freud denies and defends civilization at the same time. He denies it by claiming that overcoming the state of nature is impossible; he defends it insofar as civilization is responsible for producing cultural goods, and insofar as it is impossible for humans to live under the dominance of the pleasure principle. Since sublimated drives originate culture, Freud considers the struggle for existence to be eternal and relentless, as it is with the conflict between the pleasure and the reality principles.<sup>25</sup> In other words,

psychoanalysis posits the actualization of discontent in the construction of the social and the individual. This is, in general terms, the so-called Freudian cultural pessimism.

Let us now turn to the drive problematic in Freud. It has become a convention to divide Freud's work in two different moments according to the variation of drive theory which underlies them. The first moment posits the idea of a conflict between two drive types: sexual and self-preservational (the latter would later be called Ego drives). In the second moment the conflict shifts to a tension between life drive (Eros) and death drive (Thanatos). This shift aims toward evincing the unbinding character which constitutes the death drive. This unbinding character assumes the clinical form of the repetitive compulsion; a compulsion that displaces the pleasure principle as the only principle of intelligibility of psychoanalytic theory, that is, as the sole organizer and regulator of psychic causality.

With the death drive, Freud proposes a 'beyond'<sup>26</sup> the pleasure principle, in contrast to the first model of high and low excitements, lived as pleasure or displeasure. This first model is maintained by Freud until 1895, having at its core the quantitative hypothesis presented in his *Project for a Scientific Psychology*. This model is also pervasive in all of Freud's metapsychology, supplying the qualitative terms for capturing the economic and dynamic accounts of the libido. The shift undertaken by Freud – from the pleasure principle to the death drive – adds topographical consideration to the quantitative and qualitative problematic. The first Freudian topographic model of the psyche has three instances: the conscious, the preconscious, and the unconscious. This model is reformulated after the introduction of the death drive and is subsequently expressed as a division between the Ego, the Id, and Superego. This shift has the Freudian maxim *Wo Es war soll Ich werden* as a corollary.

This is an important and revealing maxim in that it solicits different interpretations

among the critical theorists of the first generation. For Fromm, the Ego takes the place of the Id and the emancipation of the Ego from the unknown forces of Id is possible. For Horkheimer and Adorno, the total displacement of the Id by the Ego is not possible and the emancipation of the Ego from the Id will always remain incomplete. For Marcuse,<sup>27</sup> the relation between the Ego and the Id is dialectical, and emancipation, even if as a utopia, is necessary.

The specificity of the critical aspect of psychoanalysis resides precisely in envisioning more than the proposition of a worldview or an entrenchment of the discipline in the clinic. Above all, the critical aspect intends to put in evidence how the Freudian doctrine is rooted in history. That is, Freud is concerned with the construction of a clinical-theoretical corpus rooted in the relation of the human subject to the world. The choice of the term 'diagnosis' reflects precisely this intention of revealing this interest for the human subject conceived under the prism of its insertion into a world of definite social relations. Thus, 'diagnose' should be understood in its etymological sense, as able to recognize, as the search for that which is not transparent in the relation of the subject with her or himself and with the representations of the world surrounding this subject. From a Freudian perspective, diagnosing is to aim for the return of what is repressed in the form of the symptom that replaces it. In present-day terms, it consists in searching for what is dysfunctional in intersubjective and intrapsychic relations. The critical account does not intend in any case to create a worldview. Rather, Freud's timeframe of diagnosis, far from being a closed one, takes into account the historical dimension and, therefore, has an unfinished character. The very idea of a diagnosis implies, fundamentally, an *opening*.

In order to avoid any misconceptions that might be formed from the idea of an opening – such as the possibility of having no clear aim – we should consider as open the statement according to which a diagnosis

forcefully presupposes a normative reference: to criticize compels us to mobilize a shared reference and, therefore, a norm. The normative reference does not come from Freudian developments; it comes from philosophy where reason incarnated in the form of an autonomous subject is seen as transparent to itself and as posing its own rules from the scientific-medical *ratio*, which considers the normal to be the norm. Freud's greatest discovery is precisely this 'beyond reason' we call unconscious, in which an opacity always subsists, the very opposite of *philosophic ratio*. The search for a normative reference in psychoanalysis would be, strictly speaking, strange or even hostile to it.<sup>28</sup>

## SOCIAL SICKNESS AND EGO

My approach to the theme of social sickness and Ego will be indirect. The purpose is to briefly examine how Axel Honneth uses psychoanalysis in his work up until the 2000s. I hold that his ontogenetic use of psychoanalysis undercuts the critical potential of this discipline in the field of critical theory. In addition I also show a new tendency in Honneth's more recent work, a 'biologizing' one, so to speak, which shows up especially in his 2014 text 'The Diseases of Society: Approaching a Nearly Impossible Concept'. In this paper Honneth reconstructs Alexander Mitscherlich's attempt – and also Freud's, in a certain sense – to justify the use of the term 'pathological' in reference to the subject of society. For Honneth, Mitscherlich's justifications are insufficient. According to Honneth the comprehension of society requires that one thinks of society as though it were a living organism. I will discuss the groundings of Honneth's theory and its relationship to psychoanalysis, but my approach will be more oriented toward a presentation of Freud's interpretation of the passage from nature to society (or from the biological to the social) instead of a deep reconstruction of

Honneth's arguments. Thus, we intend to show how the Freudian articulation goes beyond that offered by Honneth.

Although psychoanalysis (as well as psychology, generally) is not fully elaborated in Honneth's works, his approach to Critical Theory, especially from 1992 onward, contains a number of formulations which, however tentative, provide sufficient ground for critical engagement. Further, in *Struggle for Recognition*, in which he develops his now famous recognition paradigm, Honneth affords psychoanalysis a central position in Critical Theory's interdisciplinary constellation. The objective of Honneth's approach is to provide social psychology with a critical foundation. For this purpose the work of Georg Herbert Mead<sup>29</sup> and Donald Winnicott<sup>30</sup> is of special importance to him.

Honneth's approach to psychoanalysis does not put into question the narcissistic ego, and its overcoming is no longer a goal for a critical theory of society. This abandonment results from a partial reading of Winnicott's notion of the transitional object, which Honneth views as a break with Freudian drive theory, and not as an extension of it. This is related to a large extent to the fact that, as shown above, Honneth views psychoanalysis as an account of intersubjectivity. It demonstrates the primacy of recognition. For Honneth, therefore, the psychoanalytic account provides a foundation for social critique as thinking in normative orders. For this purpose, Honneth sets Freud and the Freudian orthodoxy against the relational model of object relations theory.<sup>31</sup> In Honneth's view, Freud neglected the relation with the other, intersubjectivity, and thus disregarded the communicative model of interaction. As a consequence, Freud's contribution remained restricted to the drive model.

Two things must be taken into account as an answer to this statement. First, contrary to Honneth, it is possible to articulate object relations theory and the drive model in a dialectical fashion without opposing one to the other. Both models can be complementary,

especially because they were built according to the clinical developments of Freud and Winnicott.<sup>32</sup> Second, it seems that a statement such as Honneth's contributes mainly to further misunderstandings rather than to a clarification of the problem. It would be useful to remember that at the time of Freud's writing psychology far from ignored the relational issue of the orientation toward the other – this was, in fact, a predominant issue. Freud's contribution was precisely to put in evidence other instances such as the Id and drives as the materialization of the unconscious. The unconscious was seen as a constitutive factor of Ego formation, of personality, that which is in conflict with everything that sets a limit to its search for satisfaction. Thus, Honneth's view that Freudian psychoanalysis does not take into account the relations with the external world and the role of reference people seems strange, to say the least. We know that Freud begins *Beyond the Pleasure Principle* with the war neurosis, an issue which is nothing other than that of *trauma*, and which refers precisely to an experience originating in the external real world that remains unfathomable to the subject – this experience drives Freud, so to speak, to a reformulation of his drive theory. Therefore, Honneth's view that Freud's works fail to take into account the relations which constitute the subject in its relationship to the external world seems entirely misconceived.

Moreover, Honneth's emphasis on the relational model does not prevent him from falling into the trap of a narcissistic conception of the subject (Ego), which, in a certain sense, is opposed to the intersubjective assumptions of recognition theory. The radicalization of the intersubjectivity principle applied to socialization concepts silences the traumatic dimension of intersubjective relations. This turn is not only problematic with regards to the formation processes of the Ego, which Honneth conceives of in terms of child development psychology, but also with respect to the role psychoanalysis should play in a critical theory of society. In

Honneth's non-Freudian model, overcoming the narcissistic ego is no longer an objective because narcissism no longer appears as a problem of, nor as an obstacle to, the practical movement of emancipation. In recognition theory the non-Freudian appropriation of psychoanalysis leads to a monist theory of the subject, according to which, as paradoxical as it may seem, emancipation can be thought as a *realization of the narcissistic Ego*.

Such a conception is quite removed from the approach of the first generation of critical theorists and their appropriation of psychoanalysis. Psychoanalysis cannot serve as an ontogenesis articulated to a normative model of social critique; it is, rather, a means of understanding the obstacles that block the reasonable organization of society, of emancipation. The dialectical method in psychoanalysis proceeds from the pathology toward the universal, from neuroticization to normality, from pathology to reason's project of emancipation. From this conception, psychoanalysis helps to identify the obstacles without removing them and without guaranteeing normativity's moral progress or its practical anchorage. It demonstrates that the model of a 'normal' subject inhabiting a world permeated by neurosis is an impossible ideal. Psychoanalysis allows Critical Theory to reconstruct a possible explanation for modern capitalist societies' blockages and pathologies. Thus, Critical Theory's diagnosis is mirrored in Freudian drive theory, revealing the latter's critical potential. These are the grounds for Adorno's, and also Marcuse's, strong criticism of Eric Fromm, Karen Horney, Harry Stack Sullivan, and many other theorists from the 'revisionist' school, which is rejected because it leads to the abandonment of Freud's drive theory.<sup>33</sup> Adorno and Marcuse stress the impoverishment that such an abandonment would bring to a critical theory that is associated with a 'monist'-reduced psychoanalysis. This 'revisionist' perspective rejects the death drive principle or, in other words, the specific element along with the life drive that founds all

of Freud's late elaborations. Honneth, despite his efforts to the contrary, does not offer a worthwhile alternative to his predecessors' insights.

But one could still ask whether Honneth's ontogenetic use of psychoanalysis is necessarily condemned to an idealist perspective that refuses to see the role of the narcissistic ego. The perspective developed by Jacques Lacan is helpful in dealing with this question. Lacan's conception of recognition is strictly linked to the concept of misrecognition. In contrast to Honneth, Lacan's notion is therefore not premised on reconciliation and universal civility. It is premised on conflict. Nevertheless, it is also the case, that the concepts of identification, misrecognition, and recognition display in fact affinities; that is, recognition entails the pathology of misrecognition, and misrecognition entails recognition as its civilized resolution. Even though these terms are not posited explicitly as such by Honneth himself, his ontogenetic application of psychoanalysis recognizes the narcissistic ego and in this manner it summons the individuated individual as self-seeking. That is to say, by implication recognition is premised on misrecognition. Despite itself, his theory promises reconciliation and recognition as either mutually beneficial at best, or under duress at worst. Indeed, once the question of normativity is translated into the field of psychoanalysis, we are tempted to reduce it to a question of *normality*. There are no guarantees that psychoanalysis can contribute to Honneth's normative order of universalized standards of recognitive reason without undermining the very basis of his project.

Many critical interpretations of Freud insist on his reference to biologism.<sup>34</sup> When Freud first alluded to a biological reason with respect to the drive duality – which led him to distinguish between Ego drive and sexual drive – he established a corresponding difference between hunger and love – that is, he introduced the idea that the same erogenous zone can be invested in different ways.

By doing so, he established that the relationship of the subject with its culture and with nature cannot be of the same order. The former requires mediation whereas the latter is immediate. By following Freud's clues one can reconstruct this mediation. My analysis of the role of biologism in Freud insists on the idea of *anaclysis* [*Anlehnung*]: biologism intervenes insofar as it is attached to the sexual functions, an idea that appears only in the second part of *Introduction to Narcissism*:

The first auto-erotic sexual satisfactions are experienced in connection with vital functions which serve the purpose of self-preservation. The sexual instincts are at the outset attached to the satisfaction of the ego-instincts; only later do they become independent of these, and even then we have an indication of that original attachment [*Anlehnung*] in the fact that the persons who are concerned with a child's feeding, care, and protection become his earliest sexual objects: that is to say, in the first instance his mother or a substitute for her.<sup>35</sup>

Here we can observe how Freud conceives the passage from the biological to the psychical: the latter *is attached* to the biological. We have then an idea that goes back to the *Three Essays on the Theory of Sexuality* and that is represented by the concept of support [*stützen*] or *anaclysis* [*Anlehnung*]: if something must be supported by something else in order to be itself, this implies that both of them are distinct. One can only come into being making use of the other. If human sexuality requires support for its development it is because it is poorly sustained. The notion of *anaclysis* allows us to move from the biological to the psychical, and this 'new psychic action' takes the form of narcissism; it also organizes all the partiality of the drives in one image. *Anaclysis* allows Freud to consider a genesis of sexuality, opening the way to an organization of the body from helplessness [*Hilflosigkeit*], that is, the biological dependency of the child in relation to its mother or person of reference. In other words, the experience of pleasure is also supported by the experience of a maternal other.

If we follow Freud strictly we can see how the subject organizes the parts of its body that have a biological function such as feeding and care. Thus, the determination of the erogenous zones also depends on anaclysis.

Consequently, Freud cannot be accused of neglecting the other and of having a monadic conception of the subjectivation process. Anaclysis does not presuppose a state of symbiosis between mother and child; the central idea of anaclysis is that human sexuality is poorly sustained. Thus, we come to the idea of helplessness, the idea of a first traumatic experience of the subject that sees itself 'thrown into the world'. This is the first trauma that characterizes human sexuality: the characteristic of human sexuality is that the biological cannot do this work alone if the other is not there beforehand. With these explanations it should now be possible to understand why the continuous passage from the biological to the social, or from nature to society, does not occur. They also allow us to understand why this passage is always a mismatch, a continuity that always imprints itself in a discontinuity.

When we compare Honneth's solution to that of Freud, we notice that his attempt does not go as far as Freud's because it falls in a biologism without considering the notion of anaclysis, which poses a dialectic between the realm of biology and that of the human, allowing passages between them. Honneth becomes stuck in one of the poles of this conflict, namely, that of biology; we cannot infer anything else from his 2014 text 'The Diseases of Society: Approaching a Nearly Impossible Concept', which he concludes quite laconically: 'Without rehabilitating this organic conception that has long since been declared dead, I fear the thesis that societies also can be stricken by diseases cannot be justified'.<sup>36</sup>

With all its paradoxes and theoretical reformulations, Freudian psychoanalysis still has much to offer a critical theory of contemporary society. This is why Axel Honneth's attempt at reformulation is of interest, as

well as deserving of critique. In order to further develop an effective collaboration between psychoanalysis and Critical Theory we should interrogate the appropriateness of the ontogenetic perspective for a critical theory of society, and one should not endorse biological perspectives that debunk Critical Theory method *par excellence*, that is, the dialectic.

## Notes

- 1 These groups were increasingly dogmatic. It seems easy to judge the ideological dogmatism of the Third International, but this was not so evident in the 1920s. A clear example of this is Georg Lukács' book *History and Class Consciousness* (1923), which initiated Western Marxism and which would later be condemned by its own author after the massive rejection it received from the communist movement.
- 2 The fact that Fromm was a psychoanalyst and also a Marxist oriented sociologist played an important role in his integration into the very select group of researchers of the IFS. See Jay (1973, especially chapter 3). Also Funk (2000: 72).
- 3 This holds not only for the already mentioned *Dialectic of Enlightenment* (1944) but, also for Herbert Marcuse's *Eros and Civilization* (1955) and the research project on Authoritarian Personality.
- 4 The analysis presented here of *Dialectic of Enlightenment* was developed with Marcos Nobre. See Nobre and Marin (2012). A French language version was published as 'Une nouvelle anthropologie. Vers une lecture psychanalytique de l'unité critique de La Dialectique de la Raison'. *Illusio*, no. 14/15: 259–76, January 2016.
- 5 Reich (1970: 9).
- 6 'Rationally considered, one would expect economically wretched masses of workers to develop a keen consciousness of their social situation; one would further expect this consciousness to harden into a determination to rid themselves of their social misery. [...] the thinking ("consciousness") of the worker would be in keeping with his social situation. The Marxists called it "class consciousness". We want to call it "consciousness of one's skills", or "consciousness of one's own responsibility". The cleavage between the social situation of the working masses and their consciousness of this situation implies that, instead of improving their social position, the working masses worsen

- it. It was precisely the wretched masses who helped to put fascism, extreme political reaction, into power' (ibid.: 10).
- 7 Horkheimer and Adorno (2002: 1).
  - 8 Ibid.: xviii.
  - 9 In the early 1940s, Friedrich Pollock proposed an analysis of capitalism that questioned some central aspects of Marx's diagnosis. With his idea of 'State Capitalism', Pollock states that the primacy of the economic has been replaced by the primacy of the state. In State Capitalism, the market is a political event. Pollock distinguishes between an 'authoritarian form', presented by Nazi Germany, and a 'democratic form', which exists only as a possibility. Accepting Pollock's central thesis, Adorno and Horkheimer introduced the formula of an 'administered world' [*verwaltete Welt*] to highlight instrumental reason's domination over nature.
  - 10 Horkheimer and Adorno (2002: xiv).
  - 11 Ibid.: xvi.
  - 12 Ibid.: xviii.
  - 13 Ibid.: xvi.
  - 14 Ibid.: 1.
  - 15 'The reason that represses mimesis is not merely its opposite. It is itself mimesis: of death' (ibid.: 45).
  - 16 Ibid.: 24.
  - 17 Freud (1961: 6). In *Inhibitions, Symptoms and Anxiety*, Freud (1925–6: 165) states this more precisely as 'anxiety [*Angst*] has an unmistakable relation to *expectation*: it is anxiety *about* something. It has a quality of *indefiniteness and lack of object*. In precise speech we use the word 'fear' [*Furcht*] rather than 'anxiety' [*Angst*] if it has found an object'. In the original it reads: 'Die Angst hat eine unverkennbare Beziehung zur Erwartung; sie ist Angst *vor* etwas. Es haftet ihr ein Charakter von *Unbestimmtheit* und *Objektlosigkeit* an; der korrekte Sprachgebrauch ändert selbst ihren Namen, wenn sie ein Objekt gefunden hat, und ersetzt ihn dann durch *Furcht*' (Freud, 1999: 197–8).
  - 18 'Real danger is a danger that is known, and realistic anxiety is anxiety about a known danger of this sort. Neurotic anxiety is anxiety about an unknown danger. Neurotic danger is thus a danger that has still to be discovered. Analysis has shown that it is an instinctual danger. By bringing this danger which is not known to the ego into consciousness, the analyst makes neurotic anxiety no different from realistic anxiety, so that it can be dealt with in the same way' (Freud, 1925–6: 165).
  - 19 Horkheimer and Adorno (2002: 11).
  - 20 The German original reads: 'Freud stellt sich die Triebprozesse als eine Art von Äquivalententausch vor. Die Tauschschemata des Triebes, die Freud aufstellt, gelten aber nicht mehr, sobald das Ich nicht mehr die Verfügungsgewalt über die ihm unterstehende Triebmenge hat. Wenn sich Kollektivsubjekte bilden, dann ist die ganze Triebökonomie mitsamt dem Lustmechanismus ausser Kraft gesetzt. Freud hat in seinen avanciertesten Arbeiten, vor allem in *Jenseits des Lustprinzips* etwas davon geahnt, aber nicht die Konsequenz daraus gezogen' (Adorno and Horkheimer, 2004: 454).
  - 21 Horkheimer and Adorno (2002: 193).
  - 22 Ibid.: 21.
  - 23 Ibid.: 8.
  - 24 'In myths, everything that happens must atone for the fact of having happened. It is no different in enlightenment: no sooner has a fact been established than it is rendered insignificant'. Further, 'The "unshakable confidence in the possibility of controlling the world" which Freud anachronistically attributes to magic applies only to the more realistic form of world domination achieved by the greater astuteness of science. The autonomy of thought in relation to objects, as manifested in the reality-adequacy of the Ego, was a prerequisite for the replacement of the localized practices of the medicine man by all-embracing industrial technology' (ibid.: 7–8).
  - 25 As a clarification of Freud's vocabulary, it is possible to think of a mirroring between psychoanalysis and philosophy. In general terms, the pleasure principle would correspond to something like the Hobbesian state of nature, in which men are guided by their passions. The reality principle would correspond to the establishment of civil society.
  - 26 *Beyond the Pleasure Principle*, Freud's text from 1920 where he first presents the new drive duality.
  - 27 Marcuse is not discussed in this chapter. See however Marin (2016).
  - 28 For our reading of Freud the question of normativity is hostile to psychoanalysis, but in the history of Critical Theory we have works that deal with normative referents in the figure of Erich Fromm. See Jacoby (1997).
  - 29 George Herbert Mead was an American philosopher of decisive importance for sociology and social psychology. Along with James, Pierce, and Dewey, Mead was part of a theoretical current of American philosophy known as pragmatism. Mead's works are read and interpreted by Honneth under the influence of Hegel and his intersubjective innovation. Honneth revisits this Hegelian insight, with the help of Mead, in his formulation of the social foundations of intersubjective communication. Mead shares with the earlier Hegel the intuition that the socialization process should be understood through the

- individuation process. Mead introduces a distinction between the entities that constitute the driving forces of human action: the *I* and the *Me*. The formation of individuality is then considered as the product of a tension between these forces. See *Mind, Self and Society: From the Standpoint of a Social Behaviorist* (Mead, 1962).
- 30 Donald Winnicott was a British child psychoanalyst who was neither affiliated with the tradition associated with Melanie Klein, nor with the tradition associated with Anna Freud. Winnicott's importance for Honneth lies in the way Winnicott emphasizes the environmental factors of the subjectivation process, differing from Freud, who mainly stressed the internal motivations that form the psyche. Winnicott's approach is informed by the logic of the interwar period when psychoanalysis was losing interest in notions of the father, Oedipus and patriarchy, in favor of motherhood and the feminine. According to Honneth, Winnicott's psychoanalytical formulations are a translation of Hegelian concepts and Winnicott's work influences Honneth's conception of the first sphere of recognition, that of love and affective relations. For Honneth, Winnicottian psychoanalysis serves as the empirical proof of Mead's reading of Hegel, according to which the stages of recognition follow a determinate direction. See *Playing and Reality* (Winnicott, 2005).
  - 31 The so-called object relations theory actually comprises a variety of positions. In general terms, 'object relations' signals an opposition to Freud and Melanie Klein who posit the intrapsychical character of the relation between subject and object. The common ground for psychoanalysts associated with the object relations school is the idea that the object exists as something real apart from the relation, and not merely as an internal object. Winnicott shares this position, according to which the object relation is a relation to a real object, an object that is characterized by its environment.
  - 32 As in Winnicott's (2005) *Playing and Reality*.

# Humanism and Anthropology from Walter Benjamin to Ulrich Sonnemann

Dennis Johannßen

## INTRODUCTION

Over the course of the twentieth century, the notions of humanism and anthropology became increasingly problematic. From Walter Benjamin to Ulrich Sonnemann, the writers and philosophers associated with the Institute for Social Research accompanied this process in a distinctly critical fashion, yet with significantly different emphases. Between the mid 1910s and the late 1960s, they formulated a critical theory of society and culture that rejected the idea of an invariant human nature. At the same time, they studied the restrictions and limitations that repressive and antagonistic societies impose on the human being. Engaging with various philosophical currents from transcendental philosophy to Marxism, psychoanalysis, and phenomenology, the first generation of the Frankfurt School criticized assumptions about ‘human essence’ that justified a world based on identity thinking and the principle of exchange. To

counter such assumptions, they proposed interventions in anthropological discourses that work toward a less coercive and dehumanized social order.

The following reconstruction begins with a genealogy and outline of the anthropological problematic as encountered by the Institute’s founding members. The second section presents Benjamin’s linguistic destabilizations of traditional humanist and anthropological discourses. Section three turns to Max Horkheimer’s critique of philosophical anthropology and bourgeois humanism, which provides, together with Benjamin’s efforts, the basis for the School’s subsequent engagements. Tracing the afterlife of Benjamin’s and Horkheimer’s responses, the fourth section portrays the anthropological implications of Erich Fromm’s and Herbert Marcuse’s works, while section five discusses the notion of ‘negative anthropology’ in the writings of Theodor W. Adorno and Ulrich Sonnemann.

## THE FRANKFURT SCHOOL AND THE 'ANTHROPOLOGICAL PROBLEMATIC'

Most forms of humanism rely on a specific understanding of the human being and its essence or nature. Jürgen Habermas (1973: 89–90; also Marquard, 1971, 1992) distinguishes three ways of studying the human being. *Anthropology*, in the broadest sense, is concerned with the practices, condition, and development of the human species, often in close conversation with ethnology and human biology. *Philosophical anthropology*, in the narrower sense, designates the various ways of posing, responding to, and reflecting on the question 'What is the human being?' The early members of the Frankfurt School employed the term anthropology primarily in this understanding. Thirdly, *Philosophical Anthropology* refers to a German school of thought associated with, among others, Max Scheler, Helmuth Plessner, and Arnold Gehlen (Fischer, 2008).

Before Plato's ironic definition of the human being as the 'two-legged animal without feathers' and Aristotle's more serious determinations as *zōon politikon* and *zōon logon echon*, translated into Latin as *animal rationale*, Homer's epithets for the human being were, as Jacob Grimm (1984: 7, 25n6) points out, 'οἱ μέρορες [*hoi méropes*], μέρορες ἄνθρωποι [*méropes ánthrōpoi*] or βροτοί [*brotōi*] from μέρομαι [*meíromai*] or μερίζω [*merízō*], who divide, articulate their voices. Essentially however,' Grimm continues, 'this sound articulation depends upon the upright gait and stance of men,' since, 'ἄνθρωπος [*ánthrōpos*], having man's face or aspect, points to this upright position of the countenance'. Historically, philosophical anthropology is either considered to be as old as thinking itself, because humans have always asked themselves what they are, or seen as a response to modern philosophy's more recent crisis after having lost many of its central themes to disciplines such as psychology and sociology (Blumenberg, 2006:

484–5; also Schnädelbach, 1984: 220). Odo Marquard (1971: 362) argues that both of these extremes conceal anthropology's actual genesis in the late eighteenth century.

Kant formulated the specifically modern anthropological question. In the *Critique of Pure Reason* (1998: 415 [A347/B405–6]), he excluded empirical psychology 'as a species of physiology' from transcendental philosophy, because it 'would perhaps explain the appearances of inner sense, but could never serve to reveal such properties as do not belong to possible experience at all'. Although he subsumed empirical psychology under 'applied philosophy', Kant argues that 'one must still concede it a little place (although only as an episode) in metaphysics. It is thus merely a temporarily accepted foreigner [*Fremdling*], to whom one grants refuge for a while until it can establish its own domicile in a complete anthropology' (1998: 700 [A848–9/B876–77]; trans. changed). In this transitional state, empirical psychology transformed into Kant's *Anthropology from a Pragmatic Point of View*. Although this anthropology claimed to be merely pragmatic, it holds an important place in Kant's system. In the introduction to his lectures on ethics, Kant states that 'practical philosophy' and 'anthropology [...] are closely connected, and morality cannot exist without anthropology, for one must first know of the agent whether he is also in a position to accomplish what it is required from him that he should do' (Kant, 1997: 42).

In his lectures on logic, Kant (1998: 677 [A805/B833]; 1992: 538) adds a fourth question to the three he listed in the first *Critique*: 'What can I know?' (metaphysics), 'What should I do?' (morals), 'What may I hope?' (religion), and: 'What is man [*der Mensch*]?' (anthropology). 'Fundamentally, however,' Kant adds, 'we could reckon all of this as anthropology, because the first three questions relate to the last one'. Blumenberg (2006: 501) notes that this addendum is 'problematic and much more difficult than it

seems'. It indicates that, for Kant, empirical psychology became more than an 'episode' in metaphysics. His pragmatic anthropology, asking not 'what nature makes of the human being', but 'what he as a free-acting being makes of himself, or can and should make of himself' (Kant, 2007: 231; also Brandt, 1999; Stark, 2003), puzzled and inspired many philosophers, including various members of the Frankfurt School.

In Hegel's (2007: 29–141) systematic philosophy, the 'Anthropology' chapter occupies an odd, but important position, namely, the transition from the philosophy of nature to the philosophy of mind. Hegel seeks to demonstrate 'the emergence of spirit from nature', which he describes as the victorious 'struggle of spirit against its corporeity' (Lucas, 1992: 132, 135). In *Dialectic of Enlightenment*, Horkheimer and Adorno (2002: 42) criticize this 'victory' as the 'denial of nature in human beings'. Although Alexandre Kojève (1969: 48) proposed an anthropologically informed interpretation of Hegel's *Phenomenology of Spirit*, Hegel himself seems to have struggled with integrating the anthropological question in accordance with his dialectical method (Fetscher, 1970: 25).

Marx's writings are one of the Frankfurt School's preeminent sources regarding the anthropological problematic. In the *Economic and Philosophic Manuscripts of 1844*, first released in the Soviet Union in 1927, Marx (1988: 75–7) describes labor as the activity that produces human consciousness. This description gave rise to the interpretation that, while different forms of labor result in different stages of human self-realization, or 'anthropogenesis' (Avineri, 1968: 85), the constitutive function of labor itself remains unaltered by history. Leo Kofler (1967: 28; my trans.) characterized this formal anthropology as the 'science of the unchangeable preconditions of human changeability'. Taking Marx's later works into account, Alfred Schmidt (1971: 68) presents labor as the 'living interaction' between nature and humanity, which

commodity form turns into the abstract relations of a 'dead and thing-like reality'. Marx (1978: 145, 144), however, had already criticized the understanding of the human being as mere 'genus' [*Gattung*] in the 'Theses on Feuerbach', instead proposing to understand labor as 'practical, human-sensuous activity'. Louis Althusser (2005: 227) maintained that Marx's early anthropological work, embodied in the 1844 *Manuscripts*, is opposed to the more mature, sociological view of *Capital*, which focuses on the social and political transformation of the labor process. Yet Marx adhered to his early conviction that the human being does not yet exist because restrictive forms of society hinder the unfolding of its 'species-character' (Bien, 1984: 67–8, 210–11), an idea that permeates the works of the Frankfurt School's first generation.

Martin Jay (1972: 289, 292, 295) argues that the critical theory of Horkheimer and Adorno differs in two pivotal respects from 'humanist' as well as from Althusser's 'scientific' Marxism. Because of their skepticism toward identity theory, Adorno and Horkheimer never 'read society as a manifestation of the creator-subject'. Unlike Marcuse and Fromm, however, they also 'never de-historicized labor into man's "ontological" activity'. These divergences are the 'primary reasons', Jay (1972: 296) suggests, for why Critical Theory 'cannot be included among the variants of Marxist Humanism'. Inquiries into the relationship between Critical Theory and Philosophical Anthropology (Ebke et al., 2016) indicate that the anthropological problematic exceeds the debates about Western Marxism. Perceived as a 'blind spot of Critical Theory' (Weiland, 1995) from the perspective of Philosophical Anthropology, (Weiland, 1995), the anthropological question has co-shaped the outlook of the Frankfurt School from the beginning.

It was of particular importance for the early Frankfurt School that, in the wake of Kant's critical philosophy, anthropology

and philosophy of history were perceived as being mutually exclusive (Marquard, 1992: 125, 128–34; Blumenberg, 2006: 485–8). The moment one turns to the human being's invariant nature, one turns away from the realization of freedom in history, and vice versa. Marx's (1988: 102) sentence that 'communism, as fully developed naturalism, equals humanism' seeks to reconcile this tension. Rather than reconciling nature and history by conflating them, Wilhelm Dilthey (1977: 116) suggested that every historical epoch is the distinct 'expression' of the 'relative uniformity of human nature'. This view gave rise to the distinction between 'formal' (or 'weak') and 'substantial' (or 'strong') anthropology, which became important, in varying degrees, for Horkheimer, Marcuse, and Fromm. In *History and Class Consciousness*, Georg Lukács excluded anthropological assumptions from dialectical materialism because they limit the human being's historical changeability, agreeing, in this respect, with Horkheimer and Adorno. Allowing the human being to 'become frozen in a fixed objectivity', Lukács (1971: 186–7) warned, 'is the great danger in every "humanism" or anthropological point of view'.

Another key aspect of the anthropological problematic that shaped the Frankfurt School's responses unfolded between logic and psychology. In a review from 1894, Frege (1972: 336) pointed out that Husserl's *Philosophy of Arithmetic* is vulnerable to the charge of psychologism, the view that the laws of thinking are reducible to empirical psychology. This charge motivated Husserl to provide a basis for 'pure logic' by analyzing the structures not merely of human consciousness, but of consciousness as such. In 1931, Husserl feared that the recent advances of psychology and anthropology could undermine his transcendental project, which led him to dismiss Scheler, and implicitly also Heidegger, in his lecture 'Phenomenology and Anthropology'. Inquiring about the origins of Husserl's concern, Blumenberg (2006: 22; my trans.) traces the immediate

beginnings of Philosophical Anthropology back to Scheler's essay on sympathy from 1913, in which, as Blumenberg claims, 'for the first time the relationship between ontology and anthropology was established as a "realism" that does not begin with epistemology anymore'.

In 1927, Heidegger (1996: 46) introduced the formulation 'anthropological problematic' [*anthropologische Problematik*] to indicate that the human being became a problem, not only as the object of science and philosophy, but also as a term and question; as the being that asks for and tries to understand and describe itself. Heidegger (1996: 45) rejects philosophical anthropology for conceiving of the human being only through the lens of Aristotle's metaphysics, or, theologically, as the being 'that goes beyond itself'. He emphasizes that his 'existential analytic of Dasein comes *before* any psychology or anthropology, and certainly before any biology' (Heidegger, 1962: 71), suggesting that fundamental ontology can provide the basis for 'working out fully the existential a priori of philosophical anthropology' (1962: 170). These remarks not only caused Plessner (1985: 328) and Husserl (Breeur, 1994: 13; also Husserl, 1981) to charge *Being and Time* with practicing philosophical anthropology in an unacknowledged manner, they also increased the Frankfurt School's skepticism toward ontology's renewed efforts to provide absolute principles.

Heidegger insisted that the anthropological reading of *Being and Time* is a misunderstanding. Between 1936 and 1938, he demanded to release the human being 'from the fetters of "anthropology"' (Heidegger, 2012: 67), and, in the 'Letter on "Humanism"' (1946), he declared that the word 'Dasein' meant from the beginning that 'the human being occurs essentially in such a way that it is [...] the clearing of being' (Heidegger, 1998: trans. changed, 248), rather than a privileged way of understanding its meaning. The tensions between *Being and Time* and Heidegger's later writings encouraged poststructuralism's

subversions of anthropology and humanism, especially a series of works by Michel Foucault (1989, 2008) and Jacques Derrida (1978, 1982), which complement and challenge the interventions of the Frankfurt School.

While Scheler and Heidegger negatively delimited the Frankfurt School's relation to philosophical anthropology, the other positive reference besides Marx is psychoanalysis. The members of the first generation were confronted with the choice of integrating Freud's 'heavy' theory of the drives, which relies on assumptions about the human being's biological constitution and animalistic past. Emphasizing Eros's ultimate superiority over the 'death drive' offered strong support for the belief in humanity's intrinsic striving for emancipation, an idea that Horkheimer, Fromm, and Marcuse embraced to different degrees. Adorno and Sonnemann, by contrast, refused such assumptions because they preclude the radical openness of society's future development. Instead, Adorno incorporated 'lighter' anthropological elements such as Freud's belief in the fragmentary and antagonistic constitution of the individual, which expresses, as Jay (1972: 302) notes, 'one aspect of the non-identity of man in an unreconciled totality'.

Between Freud and Marx on the one hand, and Scheler and Heidegger on the other, Blumenberg (2006: 32–3, 30) describes two conflicts that reappear throughout the following sections. The first arises between critics who fear too much essence from philosophical anthropology, so that the human being cannot change radically enough in history, and others who worry about too little essence, so that what is truly human can be treated arbitrarily and with disrespect. The second conflict unfolds between interpreters who accuse Western philosophy of never having seriously inquired about the concrete 'bearer' of science and theory, and those who insist that philosophy must provide an understanding not only of the human being's contingent self-understanding, but of any form

of consciousness, world, or language. These conflicts shape the discourses of philosophical anthropology to the present day, including the Frankfurt School's various interpretations and interventions.

## **BENJAMIN: ANTHROPOLOGICAL MATERIALISM AND THE HISTORY OF PERCEPTION**

Benjamin was one of the first to register the renewal of anthropological thinking during the mid 1910s. He rarely engaged directly with the terminology of philosophical anthropology, but his interpretations contain unexpected and still unexplored perspectives on the relationship between Critical Theory and anthropology.

In 'On Language as Such and on the Language of Man' (1916), Benjamin criticizes 'the bourgeois conception of language' according to which 'the means of communication is the word, its object factual, and its addressee a human being' (Benjamin, 1996a: 65). Challenging this conception, he proposes a broader understanding of language as a 'medium' in – not through – which the spiritual essence of a thing communicates itself (1996a: 63). In human language, an elevated sub-category of language 'as such', things are named through cognition [*Erkenntnis*], which led to the hubristic 'chatter' of judgment and assertion. The 'judging word expels the first humans from Paradise' (1996a: 71), ensnaring them in a perpetual history of guilt. Benjamin's gesture can be seen as anthropomorphizing nature, a danger that did not escape Adorno's critical attention. At the same time, it destabilizes humanity's place in the order of things, resembling Heidegger's later understanding of language (Arendt, 1968: 204–205; Seel, 2002).

Around 1918, Benjamin discerned in Kant's epistemology 'unreflected relics of an unfruitful metaphysics' (Steiner, 2010:

229; my trans.), endorsing Husserl's attempt to undercut 'the relation of knowledge and experience to human empirical consciousness' that Kant overcame 'only very tentatively' (Benjamin, 1996b: 103). These comments pertain to Benjamin's search for a 'sphere of total neutrality in regard to the concepts of both subject and object' (1996b: 104), a sphere that he finds in a radically transcendental and non-pragmatic understanding of language. In a diagram titled 'Anthropology' (c. 1918), Benjamin explores this sphere by distinguishing 'elementary concepts of a metaphysical, historico-philosophical theory of the human being' (Benjamin, 1991b: 64; Benjamin, 1991c: 672; my trans.). These concepts rest on the principal distinction between body [*Leib*] and language, while the 'individual', located in the center of the diagram, is the result of their relation, rather than a primary category (Duttlinger et al., 2012: 22). In the related 'Outline of the Psychophysical Problem' (c. 1922), Benjamin seeks to further dissolve the mind-body dualism by distinguishing a third element: 'mind', 'body', and 'corporeal substance' [*Körper*]. In this elusive fragment, he proposes a positive, yet self-destabilizing anthropological definition: 'The system of [...] possible competences [*Zuständigkeiten*]' for assigning meaning to perceptions, he writes, 'is human nature' (Benjamin, 1996c: 399). Based on this system of competencies, Benjamin's 'Outline' blurs the border between language and perception, unsettling categories such as 'pleasure' and 'pain', 'nearness' and 'distance', and 'dream' and 'waking consciousness'.

Beginning to integrate an unorthodox materialist vocabulary, Benjamin (1999d: 217) argues that 'the metaphysical materialism, of the brand of [Carl] Vogt and Bukharin' cannot be transferred without rupture into the 'anthropological materialism' evinced by 'the experience of the Surrealists', adding that materialism should not be founded on 'abstract matter or the cosmos', but on the 'bodily collective' (Benjamin, 1991a:

1041; my trans.). Continuing this thought in the notes to the *Arcades Project*, he outlines a conflicted 'history of anthropological materialism' (Benjamin, 1999e: 633) in Germany and France. 'Anthropological materialism', he writes, 'is comprised within dialectical materialism', while its Surrealist version is 'refractory to Marxism' (1999e: 591, 698; trans. changed). Rather than relapsing into pre-critical materialism, Benjamin seeks to reintroduce the sensual registers of the human collective neglected by overly positivistic forms of Marxism (Kittsteiner, 1998; Wohlfarth, 2011; Khatib, 2012). This mobilization of anthropological categories is reflected in his remarks about the 'poverty of experience', which he describes as a poverty of 'human experience [*Menschheitserfahrung*] in general' and 'a new kind of barbarism' (Benjamin, 1999a: 732). This 'positive concept of barbarism' has strong anti-humanist overtones; the destruction of 'classical humanism' creates space for another, 'real humanism' (Benjamin, 1999b: 454; trans. changed). Neither Horkheimer nor Adorno failed to hear these overtones, which echo key moments of Marx's critique of bourgeois humanism.

After beginning to work more closely with Horkheimer and Adorno, Benjamin (1994: 372) tried to construct a 'strained and problematic [...] bridge' between 'the way dialectical materialism looks at things' and his 'particular stance on the philosophy of language', a bridge he admittedly never completed (Scholem, 1981: 209). This bridge was supposed to relate the metaphysical elements of his early understanding of language to the revolutionary materialism that he discerned in the writings of the Surrealists, but precisely how he intended to relate them remained unanswered. Extensive reviews of ethnological and sociological literature on language (Benjamin, 2002b) eventually led Benjamin to propose a renewed mimetic understanding of human language as a historically sublimated 'canon [...] of nonsensuous similarity' (Benjamin, 1999c: 721; also

Menninghaus, 1995: 60–77). His essay ‘On the Mimetic Faculty’ (1933), which links the emergence of human languages to the earliest forms of animal mimicry, begins with one of Benjamin’s strongest ontological and anthropological assumptions: ‘Nature produces similarities’, he writes, and ‘the highest capacity for producing similarities [...] is man’s’ (1999c: 720).

In the following years, Adorno repeatedly criticized Benjamin’s ‘anthropological materialism’. In Adorno’s eyes, this materialism’s ‘undialectical ontology of the body’ renders it ‘profoundly romantic’ (Adorno and Benjamin, 1999: 146–7, 283; Reijen, 2006). Adorno’s complaint that Benjamin gives ‘conspicuous individual features from the realm of the superstructure a “materialist” turn by relating them immediately, perhaps even causally, to certain corresponding features of the substructure’, has a socio-epistemological basis. Benjamin, however, attempted to rethink immediacy and mediation [*Vermittlung*] in terms of language. For Adorno, ‘anthropology’ signifies a naturalist reduction of spirit – a monistic conflation of the mind–body dualism – while Benjamin employs the notion to explore a realm that precedes and transcends the bifurcation of sensibility and understanding.

Benjamin’s anthropological materialism is an integral part of what he describes in 1938 as his contribution to the work of the Frankfurt Institute, namely, his studies of ‘the historical variables of human perception’ (Benjamin, 2002a: 310). These variables, condensed in his mimetic understanding of language, co-constitute the ‘bridge’ he envisioned between dialectical materialism and his early theory of language. Benjamin’s peculiar entwinement of anthropology and philosophy of history surfaces in ‘The Work of Art in the Age of its Technical Reproducibility’ (1935–6), where his anthropological notion of perception works as the driving force behind the essay’s aesthetic and political concepts (Lindner, 2012: 371–92). The same notion of perception underlies the ‘*weak* messianic power’ that gathers the

sensuous and affective ‘understanding’ of the past to interrupt the historical continuum of guilt and violence (Benjamin, 2003: 390; also Honneth, 1993).

## **HORKHEIMER: NEGATIVE HUMANISM AND THE ANTHROPOLOGY OF THE BOURGEOIS ERA**

Horkheimer explicitly engages with philosophical anthropology in a series of essays from the 1930s (Abromeit, 2011: 248–82). These works reveal a ‘negative anthropology’ that Jay (1973: 56) describes as ‘an implicit but still powerful presence’ in Horkheimer’s earlier thinking. When Horkheimer returns to the issue during the 1950s, his views have changed, casting the School’s internal tensions regarding anthropology in sharper relief.

In his early essay ‘History and Psychology’, Horkheimer (1993b: 121) proposes to integrate a ‘differentiated group psychology’ as an auxiliary science for Critical Theory. This proposition breaks with Hegel’s exclusion of psychology from the philosophy of history, abandoning the security granted by the metaphysical interpretation of history and society characteristic of orthodox dialectical materialism. In his critique of what he considers to be philosophical anthropology – Scheler and Heidegger – Horkheimer denies almost all essence of the human being; almost, since an absolute denial would again result in a trans-historical, metaphysical position. Instead, he develops a historical psychology of human beings as they are under the social conditions of the present. This psychology studies

the extent to which the function of the individual in the production process is determined by the individual’s fate in a certain kind of family, by the effect of socialization at this point in the social space, but also by the way in which the individual’s own labor in the economy shapes the forms of character and consciousness. (1993b: 121)

Because Heidegger's notion of historicity is 'too narrow' to capture the variety of social groups, Horkheimer suggests transforming the 'doctrine of being within man [*Lehre vom Sein im Menschen*]' along with 'all kinds of philosophical anthropology from a static ontology into the psychology of human beings living in a definite historical epoch' (1993b: 112–13; trans. changed).

Horkheimer proposes a similar transformation with respect to Dilthey's belief that 'the unitary human essence originally given in every individual unfolds itself in its various aspects in the great historical cultures' (Horkheimer, 1993b: 126). More uncompromisingly than Marcuse and Fromm, Horkheimer considers this unitary essence to be a metaphysical residue that has no place in critical psychology (1993b: 127). Neither the structure of economic transformation, nor the individual's mental dispositions remain stable. Only the premise that all concepts have to be derived from the historical present and the observation that certain 'motifs' run through history offer some orientation. Based on these premises, Horkheimer (1993b: 128) distinguishes periods of consolidation and dissolution. The dispositions of some groups gravitate toward new social relations even before the change occurs, while others remain bound to the obsolete relations even after their transformation.

In his 'Remarks on Philosophical Anthropology' (1935), one of the earliest critical discussions of the anthropological problematic, Horkheimer proposes to integrate a certain interpretation of philosophical anthropology as another auxiliary discipline. While he continues to oppose the view that 'a constant and unchanging human nature functions as the foundation for an epoch' (Horkheimer, 1993c: 151), Horkheimer now proceeds to criticize the idea that a power independent of the human being dictates the historical process (1993c: 153). He rejects the attempt of Scheler's *Man's Place in Nature* (1928) to show how 'all the specific achievements and works of man [...] arise from the basic

structure of human existence', which, in Horkheimer's eyes, perpetuates the idealist project of establishing 'absolute principles that provide a rationale for action' (1993c: 154). For the same reason, he dismisses Heidegger's efforts to provide a deeper meaning for human existence by introducing notions of 'authentic' life and death.

Horkheimer argues that philosophical anthropology, like phenomenology, derives an ideal 'ought' from values found in a unified essence. Critical Theory, rejects such positive normativity. 'A theory free from illusions', Horkheimer (1993c: 159, 156–7) writes, 'can only conceive of human purpose negatively, and reveals the inherent contradiction between the conditions of existence and everything that the great philosophies have postulated as a purpose'. This negative conception promotes the humanist belief in the 'unfolding of human powers' without projecting ideals into the future. It also implies, however, that the 'denial of an unchanging, constant human nature' cannot be absolute. For Horkheimer, Critical Theory has to recognize 'that happiness and misery run constantly through history; that human beings as they are have their limits and deserve consideration; and that there is a price to be paid for overlooking those limits' (1993c: 175).

In 'Egoism and Freedom Movements: On the Anthropology of the Bourgeois Era' (1936), Horkheimer demonstrates his materialist integration of psychology and anthropology by presenting egoism as a psychological trait that is meaningful only with respect to the social conditions of a specific historical period. 'The badness of egoism lies not in itself but in the historical situation; when this changes, its conception will merge with that of the rational [*vernünftigen*] society' (Horkheimer, 1993a: 108). Horkheimer's analysis reveals that anthropological doctrines such as Hobbes's and Rousseau's condemn egoism, while social reality forces the isolated individual to internalize the demand for happiness articulated in these doctrines. Bourgeois humanism 'shows a double face'

(1993a: 98); it glorifies the human being's self-determination, while its actual power to determine its situation is so limited and unequally distributed that the denied realization of freedom returns as the idolization of the modern leader, endowed with the magical qualities of self-determination that the individual lacks.

Horkheimer is convinced that 'the practical but also the theoretical solution to the anthropological question can be attained only by the progress of society itself, and [...] no philosophy and no clever education methods will be adequate to this problem' (1993a: 108). Anthropological doctrines have only diagnostic value as precipitations of the various historical attempts to distort and cover up the contradictions of social reality. Critical Theory interprets the discrepancies between what these doctrines proclaim and the results of concrete historical and psychological analyses. These discrepancies help understand the present's tendencies to transgress oppression and deprivation, but do not allow for any inferences about the future.

Although Horkheimer continued to study up-to-date ethnological literature during his work on the *Dialectic of Enlightenment* (Wiggershaus, 1995: 321–2), after World War II and the publication of *The Eclipse of Reason* (1947) his tone became more sober, and his critique of anthropology less empirically grounded. In 1952, he noted under the title 'Negative Humanism': 'The essence of the human being cannot be determined, but surely that which is inhumane; not what is good, but what is not good' (Horkheimer, 1988: 200; my trans.). Truth can be approached exclusively through the process of determinate negation. Traditional concepts mobilized against each other by nation states have to be destroyed; the positive can only be found 'in the negation of what is merely preliminary or became a fetter long ago' (1988: 200; my trans.). Surprisingly, around the same time he and Adorno defended Freud's 'biological materialism' against the proponents of 'revised psychoanalysis'

(Horkheimer, 1948: 111; Adorno, 1972; Wiggershaus 1995: 271, 502), a determinism that they simultaneously criticized in the works of Fromm and Marcuse.

In 'The Concept of Man', a text originally written for Plessner's *Festschrift* from 1957, Horkheimer (1974: 11) compares the way in which ontological philosophy speaks about existence to the 'critical view of the human being' that emerged from Kant's philosophy. In the light of the transcendental ideas, finite existence is imbued with the hopeful task of realizing a just moral order. This 'utopic element', preserved in the difference between the finite and the infinite, 'has disappeared from the relation between being and concrete existence [*Dasein*]' (1974: 16). 'Quite differently than in the context of critical philosophy, to speak about man today is to engage in the endless question of the ground of man and, since in ontological philosophy ground supplies direction, in the endless quest for an image of man that will provide orientation and guidance' (1974: 13).

Horkheimer lost faith in negating bourgeois humanism through empirical research and historical psychology alone. Instead, he appealed to the quasi-theological ideas of 'the highest good and absolute justice' (1974: 10) to distinguish humanity as it is from another humanity, capable of using the technologies of the present to realize these ideas. In existential ontology, Horkheimer still discerns nothing but superficial depth and resignation, and his discussions of youth, gender relations, labor conditions, and urban life demonstrate the kind of concreteness that existential ontology, in his eyes, could not achieve. The antagonistic social totality determines the character of the human being, he concludes, until 'the rational spontaneity proper to society becomes the transparent principle of the individual's existence. [...] In other words, society becomes rational only to the extent that it fulfills the Kantian hope' (1974: 36–7).

When the photography exhibition 'Family of Man' came to Frankfurt in 1958, Horkheimer (1989: 31) argued in his opening remarks that

the pictures complement the ideas of enlightened philosophy. The exhibition would allow millions of visitors from all over the world to experience the 'sameness' [*Selbigkeit*] of humanity within the vast ethnographical and geographical particularities of the depicted situations and practices. This allegiance to the ideals of the Enlightenment, which falls prey to Horkheimer's own early critique, is challenged, in different ways, by Fromm's and Marcuse's versions of humanist Marxism as well as by the negative anthropology of Adorno and Sonnemann.

### MARCUSE AND FROMM: SPECIES BEING AND HUMANIST PSYCHOLOGY

Fromm and Marcuse differ from the rest of the first generation by maintaining a more positive formal anthropology, derived in large parts from their interpretations of Marx's *1844 Manuscripts*. Marcuse (1973: 29) wrote one of the first commentaries on these manuscripts, emphasizing Marx's 'discovery of the historical character of the human essence'. Man's 'existence is a "means" to the realization of his essence', he continues, 'or – in estrangement [*Entfremdung*] – his essence is a means to his mere physical existence. [...] It is precisely the unerring contemplation of the essence of man that becomes the inexorable impulse for the initiation of radical revolution'. Alienated labor blocks the realization of human essence until this barrier is eliminated by 'total revolution'. Marcuse's version of Critical Theory supports this process through reflection on the human being's unfulfilled potentials, as indicated by its contradictory existence under capitalism.

In 1948, Marcuse (1948: 322) published the Frankfurt School's most comprehensive critique of Jean-Paul Sartre's existentialism, reproaching it for its ontological concept of human essence. That Sartre's demonstration of the subject's absolute freedom 'is ontologically correct and a time-honored and

successful feature of idealism only proves the remoteness of this demonstration from the "réalité humaine". [...] Behind the nihilistic language of [Sartre's] Existentialism lurks the ideology of free competition, free initiative, and equal opportunity', a concealment resulting from the 'fallacious identification of the ontological and historical subject' (1948: 323–4). According to Marcuse, Sartre ignores that the subject freely chooses class positions, nationalities, and ethnic identities that are produced by an antagonistic historical process. Reiterating Marx's basic conviction, Marcuse concludes that the human being's 'concrete historical existence, is not (yet) the realization of the *genus man*', or species being [*Gattungswesen*], since the 'historical forms of society have crippled the development of the general human faculties, of the *humanitas*' (Marcuse, 1948: 334).

During the years leading to the student movement of 1968, Marcuse replaced his Hegelian concept of reason and his ontological vocabulary with Freud's metapsychology. As he argues in *Eros and Civilization* (1955), reason is the resolution of the dynamic struggle between Eros and Thanatos in favor of Eros's emancipation (Marcuse et al., 1978: 36). This interpretation indicates that Marcuse was willing to embrace and formulate elements of a positive anthropology that were spurned by other members of the first generation such as Adorno and Horkheimer (Jay, 1973: 56, 74). In the *Essay on Liberation*, Marcuse (1969: 7–23) demands a 'biological foundation' for socialism, a 'new anthropology, not only as theory, but also as form of existence', resulting from 'the emergence and development of vital needs for freedom' (Marcuse, 1967: 15; my trans.). This 'biological dimension' he considered necessary for the masses to stand up and demand that the objectively available means of production are no longer used as instruments of domination, but as means for the realization of freedom.

Fromm disagreed even more strongly with Horkheimer and Adorno over Critical Theory's interpretation of Freud, which was

an important reason for his dismissal from the Institute in 1939 (Wiggershaus, 1995: 265–73). In the following decades, Fromm turned to Marx's early writings in order to develop a humanist social psychology. In *Marx's Concept of Man*, which includes the first complete English translation of the 1844 *Manuscripts*, Fromm (1966: 58) argues that 'in spite of certain changes in concepts, in mood, in language, the core of the philosophy developed by the young Marx was never changed', and that understanding Marx's critique of capitalism is only possible 'on the basis of the concept of man which he developed in his early writings'. Like Marcuse, Fromm finds this core in the idea of realizing the human being's true potentials by overcoming alienated labor.

Unfolding his interpretation, Fromm (1966: 24) argues that Marx distinguished, like Dilthey, between 'human nature in general' and 'human nature as modified with each historical period', and based on this distinction between 'constant' and 'relative' drives. Examples of the first kind are hunger and sexual desire, which cannot be changed as such, but only in their form and directionality. The prime example of a 'relative' appetite is the drive for enrichment and accumulation, which, as a specific historical modification of the primary drives, can vanish entirely. These distinctions seek to bring out Marx's 'contribution to humanistic depth psychology', a contribution in which Fromm (1970: 47) sees the potential to correct the 'mechanistic parts' and social blind spots of Freud's psychoanalysis.

Wiggershaus (1995: 60) notes that Fromm's social psychology eventually rests on circular reasoning, which he tried to escape by adopting a 'messianic humanism'. The seamless workings of society did not allow for changes in the living conditions, while only such changes could transform the comportment of the masses. Reflecting on the theoretical implications of this dilemma, Jay (1972: 299–300) suggests that Fromm's Marxist humanism could only fully emerge

after he had freed himself from the 'pessimistic elements' of psychoanalysis such as libido theory and its biological determinism.

Although Fromm and Marcuse agreed with the rest of the early Frankfurt School that humanity creates itself and makes its own history, they adhered to the assumption that the human being's fundamental drives condition and underlie historical change. Their willingness to grant ontological status to the process of 'anthropogenesis' distinguishes them decisively from Horkheimer, Adorno, and Sonnemann, creating a productive tension among the members of the first generation.

### **ADORNO AND SONNEMANN: NEGATIVE ANTHROPOLOGY AND ANTHROPOLOGICAL REVOLUTION**

Adorno rejects anthropological assumptions more decisively than any other member of the School. Despite his overall dismissal, however, he practiced an implicit negative anthropology himself. By observing and interpreting the habits, language, and character traits of individuals and groups in comparison with what is ascribed to them as universal qualities, he follows Horkheimer and Benjamin in illuminating the dim intimations of a truly human comportment among what he sees as an increasingly damaged and dehumanized life.

In his first habilitation thesis, Adorno (1973a: 175; my trans.) tellingly remarks that 'Kant's anthropology' – and the philosophical importance it grants to empirical knowledge – 'is still far from being sufficiently appreciated'. Related comments in *Kierkegaard: Construction of the Aesthetic* (Adorno, 1989: 26, 33) distinguish Kierkegaard's psychology from both ontology and anthropology, indicating that, for Adorno, the anthropological problematic is closely tied to the concept of existence. This concept, he recapitulates later, 'impressed many as a philosophical approach,

because it seemed to combine divergent things: the reflection on the subject – said to constitute every cognition and thus every entity – and the concrete, immediate individuation of each single subject's experience' (Adorno, 1973b: 123). This combination is characteristic of philosophical anthropology's deceptive ontological circumvention of epistemology, Adorno argues, since the tension between constitutive subjectivity and particular experience is not merely an epistemological problem that can be solved by focusing on the 'whole' human being; it has objective social and historical reasons. 'The principle of domination, which antagonistically tears apart society', he writes with a side glance to Marx, 'is the same principle which, spiritualized, brings about the difference between the concept and that which is subjugated to it' (1973b: 48; trans. changed). Rather than conflating constitution and experience in a holistic notion of existence, dialectical thinking has to consider the human being as a social category of reflection.

In his early lectures and seminars, Adorno explores critical alternatives to existential ontology. In 'The Idea of Natural History', he juxtaposes Benjamin and Lukács to dialectically overcome the contradiction between nature and history, which is also at the heart of the anthropological problematic since Kant. According to the logic of extremes that Adorno (1984: 117) found in Benjamin's works, nature can be deciphered as history where it is considered to be most 'natural' (or mythical) and vice versa. From this lecture until his last comments on this question, Adorno (1973b: 359–60) follows Benjamin in interpreting 'decay' [*Verfall*] – the 'secular category pure and simple' – as the moment of commensuration between nature and history. Regarding the question of philosophical anthropology, this means that only a dialectical optics and critical language that traces finitude's dependencies on transcendence can discern possibilities of non-violent reconciliation amid the human being's antagonistic life under capitalism.

In *Negative Dialectics*, Adorno (1973b: 124; trans. changed) articulates a complete theoretical refutation of philosophical anthropology. 'We cannot say [*angeben*] what the human being is. Today, it is a function, unfree, regressing behind whatever is attributed to it as invariant [...]. To decipher the essence of the human being by the way it is now would sabotage its possibility'. Adorno's claim that philosophy cannot determine the human being springs from his conviction that invariants limit historical possibilities; a claim that he supports by criticizing metaphysical monism. We cannot say what the human being is because such assertions totalize over the intrinsically fractured and conflicted condition of the individual. For Adorno, criticizing concepts like 'man' or 'existence' means 'wrestling them away from the spell of monistic construction out of a single principle' (Adorno, 1986: 262; my trans.). No anthropology seems to escape Adorno's verdict. He even dismisses 'so-called historical anthropology', which ascribes 'becoming' and 'openness' as qualities to the human being, as an attempt to 'pass off its own indefiniteness' as positive knowledge. 'That we cannot tell what man is,' Adorno (1973b: 124) concludes, 'does not establish a particularly majestic anthropology; it vetoes any anthropology'.

Despite this verdict, Adorno (1974: 18) contends in *Minima Moralia* that from 'the narrowest private sphere [...] follow considerations of broader social and anthropological scope; they concern psychology, aesthetics, [and] science in its relation to the subject'. This description reflects his early comment about the unrealized potentials of Kant's anthropology. *Minima Moralia* is a strong example of Adorno's attempts to trace residues of a truly human life amid the barbaric regressions of Western culture. In discussing themes such as friendship, labor conditions, and dwelling [*wohnen*], he brings out the increasing difficulty of relating in a respectful way to oneself and others. The reason is that the coldness and rigidity of the

social sphere forces the individuals to retreat into the most occluded regions of life where their humanity is in constant danger of withering away.

Adorno interprets the individual's actual constitution as the precipitation of the abstract laws that govern society as a whole. From this perspective, the 'essence' of the individual appears as the sedimentation of universal principles. Because the individual is 'in the strict sense [...] a monad, representing the whole in its contradictions' (Adorno, 1967: 77), understanding the social process requires analyzing how these principles are mirrored in the minutest cells of the social fiber, where they virtually produce the individual as just another commodity. 'With the dissolution of liberalism', for example, 'the truly bourgeois principle, that of competition, far from being overcome, has passed from the objectivity of the social process into the composition of its colliding and jostling atoms, and therewith as if into anthropology' (Adorno, 1974: 27). In view of this conception, Stefan Breuer (1985: 34, 50; my trans.) argues that Adorno's 'negative anthropology' is his 'genuine contribution to the development of dialectical social theory'. Whether or not it is the 'organizing center' of his work, as Breuer contends, Adorno's 'turn toward second nature' challenges his own verdict over anthropology. Like Benjamin and Horkheimer, Adorno opens *Critical Theory* toward the interpretation of particular social phenomena. His 'Physiognomy of the Capitalist Form of Life' (Honneth, 2005) deciphers the individual as both the constituent of the whole and the manifestation of its organizing principles.

Adorno's (2003: 69; my trans.) posthumously published 'Notes on New Anthropology' demonstrate the extent of his concern with the 'new human type, forming under the conditions of monopoly and state capitalism'. These notes pertain to the fragments of the *Dialectic of Enlightenment*, which, according to Horkheimer and Adorno's (2002: xix) preface, 'relate to a dialectical

anthropology'. In the 'Notes', Adorno suggests that, in his epoch, the human being's 'fundamental constitution [*Grundbeschaffenheit*]' underwent such radical change that even the basic assumptions of psychoanalysis are rendered obsolete (Adorno, 2003: 62, 69–82; my trans.; also Coomann, 2017). Accordingly, in his *Lectures on Negative Dialectics* (Adorno, 2008: 46), he emphasizes the importance of 'dialectical anthropology' for understanding why the 'revolutionary practice', which his generation expected, 'did not happen and why it *could* not happen'.

Ulrich Sonnemann was a psychologist, philosopher, writer, and friend of Adorno's who fled to the United States in 1941. After his return to Germany in 1955, he became loosely connected to the Frankfurt School (Schmied-Kowarzik, 1999: 34). In his book *Negative Anthropologie* from 1969, he argues for the 'determinate negation of the possibility of any non-contradictory positive anthropology', and for the 'inference [*Erschließung*] of what is human from its denial and absence' (Sonnemann, 1969: 227; my trans.). The fallacy and malicious consequences of assuming that the human being can be the object of positive science is exemplified by the complementary failure of the 'two main versions of anthropological determinism', Marxism and psychoanalysis (1969: 87; my trans.). Both are trapped, according to Sonnemann, in a circular monologue due to their unreflected anthropological assumptions; Marx's social philosophy because of its unacknowledged 'interiority' – the presupposition of a potential 'real' human being, which in truth depends entirely on its present condition – and Freud, because he neglects the social determinations of the history of the mind, epitomized by the naturalization of the drives. Marxism and psychoanalysis fail in the moment they are confronted with each other, revealing a shared defect: the restriction of human spontaneity (Sonnemann, 1969: 87–8).

Sonnemann (1969: 21; my trans.) insists that positivism blocks 'spontaneity that acts,

through thinking, in history'. The attempt to criticize this restriction conceptually as well as in the realm of language makes *Negative Anthropologie* a largely unexplored document of the student movement (Mettin, 2016), complementary in many ways to Foucault's archaeologies of the human sciences. (Tellingly, both authors wrote on Ludwig Binswanger's existential psychology in the mid 1950s.) In his review of *Negative Anthropologie*, Adorno (1986: 262–3; also Edinger, 2017) reads Sonnemann's (2011: 361–3; my trans.) call for a 'permanent anthropological revolution' as a continuation of Horkheimer's early engagement with anthropology, acknowledging the book's effort to 'defetishize' the ontological fundaments of Marx and Freud. What distinguishes Adorno's and Sonnemann's negative anthropology from the approaches they criticize is their refusal to 'define itself in any fixed way', while 'de-emphasizing', without completely denying, the 'autonomy of man' (Geroulanos, 2010: 12; Jay, 1973: 65, 266).

## CONCLUSIONS

The critical humanism of the Frankfurt School crystallizes around a series of struggles regarding the potentials and limitations of negative anthropology. After Benjamin unsettled the bourgeois understanding of 'human language' and the antithesis of nature and history, the members of the first generation were confronted with the decision to embrace or reject the more or less substantial anthropological underpinnings of historical materialism and psychoanalysis. While Horkheimer, Marcuse, and Fromm were willing to ascribe an immutable demand for happiness and self-realization to the human being, Adorno and Sonnemann attempted to reject all anthropological assumptions, examining instead the human being's practical and theoretical negations and deprivations under

capitalism. As the members of the first generation developed their versions of critical theory, Heidegger's existential ontology and Scheler's Philosophical Anthropology repeatedly forced them to reflect on the anthropological implications of their own works and approaches.

In *Beschreibung des Menschen*, Blumenberg indicates that at the heart of the struggle between Neo-Marxism and philosophical anthropology resides the question as to how much essence we are willing to ascribe to the beings that we are ourselves. If 'human nature' is considered to be entirely contingent, human beings deserve as much suffering as they deserve happiness, which leaves hardly any shared grounds for distinguishing between repressive and emancipatory forms of social organization. On the other hand, the more ontological qualities we attribute to the human being, the more we tend to generalize over ethnical, gender, class, and other differences, threatening to relapse into the dogmatic bourgeois humanism that Critical Theory opposed in the first place. Finding effective and versatile vocabularies to balance the demands of critical humanism and negative anthropology is one of Critical Theory's ongoing challenges to the present day.

# Art and Revolution

Jasper Bernes

In the twentieth century, Marxist theories of art turned upon a number of important themes – totality, autonomy, mimesis – recorded in the historical literature and frequently debated even now. Mutually entangled, these concepts produce familiar oppositions: Theodor Adorno's modernism against Walter Benjamin's avant-gardism, György Lukács's realism against Bertolt Brecht's didactic theater. We may, however, reorganize our account of these critical concepts and the art and literary movements they take as their objects through a study of a less shopworn concept the above-mentioned terms imply: participation. Avant-garde and modern art movements conceived of themselves as emancipatory, in part, by imagining themselves enablers of mass cultural participation, aspiring to a totalizing abolition of the barriers of skill that prevented proletarians from participating in art as makers or writers and the barriers of access that prevented them from participating as viewers or

readers. Frequently, these movements aimed to abolish altogether the division between cultural producers and cultural consumers. The most prominent twentieth-century Marxist critics of art, Benjamin, Adorno, and Lukács in particular, developed their ideas in large part by reflecting critically upon these movements and the potentials and problems that such aspirations introduced. Though Futurism, Dada, and Surrealism are particularly important to such discussions, no single artistic figure looms as large here as Bertolt Brecht. A sophisticated Marxist theorist in his own right, Brecht becomes for many of these writers a metonym for the avant-garde as such, and Benjamin, Adorno, and Lukács often articulate their differences from each other by way of Brecht. Participation looms large in these debates in part because of its importance for Brecht's 'epic theater', designed to recruit the participation of audiences, if not as actors or writers then as critical interlocutors.

## MARXISM AND SELF-ACTIVITY

From the earliest moments of their association, the communist theory Karl Marx develops independently and with Friedrich Engels distinguishes itself from nineteenth-century socialism and communism by its emphasis on 'self-activity' (Marx and Engels, 1976). As the declaration of the First International described it, '[t]he emancipation of the working class must be the work of the working class itself' (Marx and Engels, 1989: 262). As opposed to the didactic and moral socialisms of their day, Marx and Engels saw the working class as capable of self-organization and self-education, developing the tactics and strategies necessary for the revolutionary overthrow of society without the intervention of extrinsic authorities or leaders. In this view, history is the unfolding of self-organized class struggle, and militant intellectuals such as Marx and Engels simply reflect, catalyze, and disseminate forms of awareness and consciousness already immanent within those struggles. Marx illuminates his anti-didactic theory of self-activity and self-organization in an early letter:

[We] do not confront the world in a doctrinaire way with a new principle: here is the truth, kneel down before it! We develop new principles for the world out of the world's own principles. We do not say to the world: Cease your struggles, they are foolish; we will give you the true slogan of struggle. We merely show the world what it is really fighting for, and consciousness is something that it *has to* acquire, even if it does not want to. (Marx, 1992: 208–9)

Though Marx never elaborates this theory of self-activity with regard to art or literature, later writers will. If the masses are capable of creative, rational activity, independent of whatever moral, political, or aesthetic education they receive from life experience, then an art and literature should take account of this, looking with skepticism on the barriers that prevent mass participation in the enjoyment or production of art. Artists might, in fact, address themselves positively toward

these mass creative capacities and negatively toward the institutions and other social forces that prevent their expression.

Perhaps the most lucid early account of these social and aesthetic energies can be found in the work of Walter Benjamin. Among the Frankfurt School accounts most sympathetic to the avant-garde movements that adopted these positions, Benjamin's essays of the 1930s, reflecting in part on the Soviet avant-gardes of the 1920s, make explicit the connection between emancipatory politics and participation. In 'The Work of Art in the Age of its Technological Reproducibility' (1935), Benjamin attaches the 'mass existence' of technically reproduced art, such as film, to the 'mass movements' of his time (Benjamin, 2008: 22). Whereas many of the writers – Guy Debord, Theodor Adorno – discussed in the following pages will identify film and other mass media with passive consumption, Benjamin links mass reproduction to an appropriative and perhaps expropriative frenzy on the part of popular subjects: 'the desire of the present-day masses to "get closer" to things, and their equally passionate concern for overcoming each thing's uniqueness [*Überwindung des Einmaligen jeder Gegebenheit*] by assimilating it as a reproduction' (22). For Benjamin artworks are riven by two contradictory measures of value – on the one hand, a cult value, which attempts to remove artwork from circulation, and values it according to its distance from perception, and on the other, an exhibition value, in which that artwork is valued the more it is made available (25–6). Technologically reproducible artworks inaugurate an era in which exhibition value triumphs over cult value, introducing forms of art designed for mass rather than restricted audiences and produced by growing numbers of people. These new technologies are mass media in a number of senses: first of all, anybody might be the subject of such arts – 'any person today can lay claim to being filmed' – but also the growth of the press turns readers into writers through such things as 'letters

to the editor'. The result is an overcoming of the barriers of expertise that have heretofore excluded proletarians. The emancipatory character of these transformations is clear to Benjamin:

Thus, the distinction between author and public is about to lose its axiomatic character ... At any moment the reader is ready to become a writer. As an expert – which he has had to become in any case in a highly specialized work process, even if only in some minor capacity – the reader gains access to authorship. Work itself is given a voice. And the ability to describe a job in words now forms part of the expertise needed to carry it out. Literary competence is no longer founded on specialized higher education but on polytechnic education, and thus is common property. (34)

Benjamin thus sees the participatory overcoming of the aesthetic division of labor – the division between writers and their publics – occurring as a result of the technical division of labor within capitalist industry. This illuminates one of the complexities of the concept of participation, which may mean the overcoming of all barriers – in other words, a situation in which anyone can participate in any activity – or rather a reorganization of the relationships of parts to wholes and the absorption of individuals into a differentiated division of labor. The Latin derivation of the term is formed from the roots for 'part' and 'take' – as with the verb 'partake' – and thus concerns the relationship of parts to wholes. A part may partake or participate in the whole in a differentiated and unequal way.

Benjamin quotes this very passage in a later essay, 'The Author as Producer' (1934), concerned with similar questions. There, he argues that an emancipatory art practice must overcome the divisions between the arts and between various artistic labors. Writers such as himself must 'take up photography', Benjamin says:

Technical progress is for the author as producer the foundation of his political progress ... [O]nly by transcending the specialization in the process of intellectual production – a specialization that, in the bourgeois view, constitutes its order – can one

make this production politically useful; and the barriers opposed by specialization must be breached jointly by the productive forces they were set up to divide. The author as producer discovers – even as he discovers his solidarity with the proletariat – his solidarity with certain other producers who earlier seemed scarcely to concern him. (Benjamin, 1996: 775)

Though he is vague about the precise relationship between the division of artistic labor and the division of labor more generally, he identifies class struggle as the catalytic element of this overcoming, suggesting that the 'state of the class struggle determines the temperature at which' the boundaries between genres and forms break down, 'entering the growing, molten mass from which the new forms are cast' (776).

## THE ANTINOMIES OF PARTICIPATION

For Benjamin, no single figure better emblemizes the new participatory aesthetic and the overcoming of artistic boundaries and the artistic division of labor than Brecht, whose collaborations with musicians such as Kurt Weill and Hans Eisler united music and literary language. Benjamin uses Brecht's term *Umfunktionierung* – usually translated in English as 'refunctioning' – to describe the recasting of the artistic division of labor. By uniting word and music, Brecht and Eisler's didactic short plays, such as *The Measures Taken*, 'effect[ed] the transformation ... of a concert into a political meeting' and 'eliminate[d] the antithesis ... between performers and listeners' (776). Brecht's theater was anti-illusionistic, first and foremost, opposed to the Aristotelian conventions of theater in which characters were primarily the objects of the audience's empathic feelings: 'epic theater ... appeals less to the feelings than to the spectator's reason' (Brecht, 1964: 37). Brechtian theater 'turns the spectator into an observer but arouses his capacity for action ... forces him to take decisions'.

The chief instrument here is what Brecht called the alienation effect [*verfremdungseffekt*], an anti-illusionistic practice in which the gap between character and actor was intensified. Defamiliarized, the objects and scenes presented force audiences to reflect on their meaning rather than accept them as mimesis of action. Unlike later formulations of a participatory art, in which meaning is entirely elaborated by the audience, the active role of the audience in epic theater sits in tension with the didactic character of the scenes, especially in the learning-plays [*Lehrstücke*] such as *The Measures Taken*, where the actions of characters are presented in the form of lectures or overlaid with such. The didactic and the participatory are brought together, in Brecht's plays, in the oft-repeated figure of the trial, implicitly placing audiences in the place of judge or jury and asking them to evaluate, rationally, the polemical material with which they are confronted.

Some of Brecht's critics, Adorno most forcefully, felt that the didactic character of his work essentially overrode the claims to audience participation, making the plays into a delivery vehicle for Bolshevik dogma with emancipatory trappings (Adorno, 2007: 182–3). If this critique is correct, then the participatory becomes a powerful mechanism of domination, recruiting viewers or readers in such a way that they feel themselves to have independently decided upon an outcome determined in advance. In Adorno's letters to his friend Benjamin, responding to 'The Work of Art in the Age of its Technological Reproducibility', he 'doubts the expertise of the newspaper boys who discuss sports and suggests that 'the laughter of the audience at the cinema is anything but good and revolutionary; instead it is full of the worst bourgeois sadism' (Jameson, 2007: 123). His letters express his wish 'to hold [Benjamin's] arm steady until the sun of Brecht has once more sunk into exotic waters'. Throughout his writings on art, Adorno uses the term participation in primarily a negative sense, to mean the subordination of the individual

person or work of art to social or other forms of heteronomy.<sup>1</sup> For Adorno, the emancipatory character of the work of art is vouchsafed chiefly by its resistance to external forces. The social work it does is not through its direct participation in society but by its resistance to such participation:

Art becomes social by its opposition to society, and it occupies this position only as autonomous art. By crystallizing in itself as something unique to itself, rather than complying with existing social norms and qualifying as 'socially useful', it criticizes society by merely existing, for which puritans of all stripes condemn it. There is nothing pure, nothing structured strictly according to its own immanent law, that does not implicitly criticize the debasement of a situation evolving in the direction of a total exchange society in which everything is heteronomously defined. (Adorno, 1997: 225–6)

The mark of the authentic artwork is non-participation and negativity. If the work of art turns toward the viewer directly, attempting to provoke action or reflection, it risks either engaging in instrumental domination of its audience or subordinating itself to the evaluative schema that viewers bring to the work of art. At the same time, this autonomy can never be expressed as a simple positive feature of the work of art, lest the omnipresence of heteronomy be belied. Adorno proposes a dialectical account of autonomy and heteronomy: 'If art cedes its autonomy, it delivers itself over to the machinations of the status quo; if art remains strictly for itself, it nonetheless submits to integration as one harmless domain among others' (237). It is precisely in this fraught space of heteronomy and autonomy that art's emancipatory value can be found, not through any instrumental effects, but as a kind of placeholder: '[o]nly what does not submit to that principle [heteronomy] acts as the plenipotentiary of what is free from domination; only what is useless can stand in for the stunted use value' (227).

Adorno's powerful defense of aesthetic autonomy amounts to a wholesale rejection of any attempt to overcome the boundaries that prevent mass proletarian participation in the

arts, as makers or as viewers. In the face of an 'all-powerful system of communication' artworks 'must rid themselves of any communicative means that would perhaps make them accessible to the public' (243). The rebarbative character of modern art – as protest against the instrumentalization of culture – vouchsafes forms of free aesthetic experience beyond the 'false needs of a degraded humanity', but any attempt to actually make these forms of experience available in a durable way destroys them. Artworks thus remain marked, ineluctably, 'by the guilt of the separation of physical and spiritual labor' (227). The debate between Adorno, on the one hand, and Benjamin and Brecht, on the other, reveals not only two opposed concepts of artistic participation, but also two dangers inherent within twentieth-century art movements. Brechtian participation can become a vehicle for dogma and domination, disguised by a pseudo-democratic formalism. Adornian autonomy, though, is at best a stalling measure, defending the thin forms of freedom permitted to a small number of people within bourgeois society against a future catastrophe in which even these possibilities vanish. The position makes sense for an aesthetic philosophy 'crippled by resignation before reality', where 'praxis, delayed for the foreseeable future' offers little chance of reorganizing, in any emancipatory way, the social division of labor that is the basis of art's guilty autonomy (Adorno, 1981: 3). The differences between these positions in a certain sense derive from their optimism or pessimism about the possibilities for social revolution as well as the historical period in which they emerge. Written during the 1930s, before the extent of the Stalinist counter-revolution was evident, Benjamin's essays as well as Brecht's works assume that art and social revolution were in a mutually defining relationship and that revolution was still possible. Adorno's most prominent essays date from the post-war period, and look back on decades marked by Stalinist and fascist counter-revolution, on the one hand, and the triumph of post-war US-dominated capitalism, on the other.

## POST-WAR

One solution to the antinomies of aesthetic participation was to radicalize it, evacuating the Brechtian model of its didactic character. This was often the position taken up by neo-avantgarde and other post-war treatments of the concept, adapted for an era much more skeptical about the usefulness of authorities, intellectual, cultural, or otherwise. Take, for example, the influential theories of the 'writerly' text developed by Roland Barthes, in which the goal of the writer is no longer the conveyance of 'authoritative' meanings but instead the provision of a polysemic field out of which readers produce their own meanings. 'The goal of literary work (of literature as work)', Barthes claims, in the manifesto-like opening pages of *S/Z*, 'is to make the reader no longer a consumer, but a producer of the text' (Barthes, 1975: 4). His immediate referent here was the *nouveau roman* of Alain Robbe-Grillet and others, but the influence of such conceptions on post-war literary production as well as post-war literary theory was immense. Cognate developments emerge in the visual arts, whether by emphasizing the phenomenology of encounter between viewer and artwork, as in minimalism, or by actively involving audiences, as in the 'do-it-yourself' art of Fluxus and the participatory enactments of Happenings. In many of these examples, the participatory form of the artwork is itself its content, and the political values that were, in Brecht, attached to particular contents are formalized. Participation is in and of itself a good.

The formalistic character of post-war experiments in participatory art made them radically portable. Indifferent to context and stripped of the didactic contents of the Brechtian construction, participatory structures could be and were adapted to numerous civic, corporate, or cultural institutions from the 1960s onward. As argued in my book, *The Work of Art in the Age of Deindustrialization*, the hostility that the political movements of the period expressed toward hierarchical and

authoritarian structures derives, in some part, from the vocabularies and grammars of participation developed within the arts and reproduced by a fascinated mass media (Bernes, 2017: 10–19). The resistance that workers offered management in the 1960s – at least as far as the advanced capitalist countries are concerned – often centered on qualitative rather than quantitative demands. These usually consisted of calls for a greater participation in decision-making, for a democratization of the workplace, for more varied and creative work, for greater autonomy, and even for workers' self-management. Models from the arts had a particular purchase in part because of the very forms of autonomy that, as Adorno describes above, accrue to art in modernity. Art became the other of labor, and art work a form of labor that was non-labor – free, self-directed, creative. Participatory models were useful to corporations – and civic institutions, as is clear from things like community policing initiatives – not only because they warded off potential unrest but because they allowed firms to shed unprofitable managerial layers. As an end in itself, artistic labor is also something one does without regard to its material rewards, and despite the initial demands from which they emerged, these models were used as ways to get people to work harder and longer for less money.

Adorno may seem to get the last word here, given the sad fate of these participatory constructions (which contemporary arts still display somewhat naively and often with little awareness of the uses to which these models have been put). Surprisingly, however, Brecht's commitment and direct, referential politics – which Adorno thought were capitulations, in form if not in content, to social heteronomy – seem now, in retrospect, to inoculate his works from the sort of uses to which the participatory constructions of the post-war period were put. Participatory formalization itself is what allows for the uptake of these models, and Brecht's communist didacticism may have warded off, if only for a short time, the recuperation to come.

Today, participatory models of action are ubiquitous. This is especially visible in the case of contemporary information and communication technology, which emphasizes 'interactivity' and allows for all manner of customization and personalization by users. Notably, the pioneers of this technology were, in many instances, influenced by the participatory aesthetic experiments of the 1960s (Turner, 2006: 41–68). Unlike broadcast media, which depend upon unidirectional signals, the new media involve a dialectical interplay between transmission and user action, undoing clear divisions between producers and consumers. This is especially true in the case of so-called Web 2.0, in which media firms provide 'platforms' (Facebook, Twitter, YouTube) for user expression, communication, and elaboration. In this case, the erstwhile viewers of television and radio become producers of content and therefore participants. From the beginning, these new technologies were attended by significant claims for their emancipatory potential, inasmuch as they could overcome the monopolization of media by powerful conglomerates and vested interests, allowing for new forms of volunteer and amateur production, whether in the areas of journalism or art. Many were quick to point out, however, the various ways in which such amateur energies were being exploited by the companies that controlled these platforms or acted as the distributors of the products and services generated therein and therefrom (Terranova, 2000).

By the 2010s, as a new 'sharing economy' emerged in which 'disintermediating' companies profited from the profusion of new participatory forms of labor, both paid and unpaid, such critiques were widely accepted. The generalization of these critiques occurred alongside a continued valorization of the participatory within political movements and the arts. Many of the movements that emerged in the wake of the economic crisis of the later 2000s and early 2010s were distinguished by their eschewal of traditional organizational

structures – unions and parties – and models of leadership, and their reliance on informal, horizontal structures involving mass participation and mass decision-making. From the Arab Spring in Egypt and Tunisia, to the ‘movement of the squares’ and the Occupy movement in Europe and the United States, direct democracy and participatory organization was the order of the day, often formalized as ‘consensus’ decision-making, whereby nearly complete accord between all participants was the (admittedly impossible) goal. Organized outside of traditional political structures and relying, in many cases, on the facilities of new digital media, such movements did, on occasion, give way to more formal structures such as political parties (SYRIZA in Greece, Podemos in Spain). They also precipitated strong critiques of the formalistic character of participatory democracy, which was felt to bracket political content, neutralize important political dissent, and create a situation felt by many to be as oppressive and anti-minoritarian as more conventional authoritarian structures, such that the individual or small group was effectively forced to reconcile with the larger collective. Movements organized on this basis were unable to settle on a course of action or unifying objective, and in some cases turned inward, losing any sense of direction. For some, this meant the necessity of a return to traditional structures such as party or union, and the need for strong leaders (Dean, 2012: 1–23). For others, however, the impasses of the current conjuncture result from the collapse of the workers’ movement and workers’ identity, which was the basis for the programmatic unification of earlier political movements (*Endnotes*, 2013). Therefore, attempts to overcome this impasse by reverting to prior modes of organization will fail. One must find a way through disorganization by way of disorganization.

As far as evaluation of participatory form is concerned, all of these critiques return us to the question of content or, perhaps, function. Participation in what? Participation with

whom? To what end? In Benjamin’s ‘The Work of Art in the Age of its Technological Reproducibility’, he distinguishes between those mimetic works of art, such as paintings, which require concentration on the part of an individualized viewer, and the works which, conversely, viewers themselves absorb and which are received in ‘a state of distraction and through the collective’ (Benjamin, 2008: 40). Architecture, he writes, is the ‘prototype’ of the latter, inasmuch as buildings can be interacted with in numerous ways. And yet, paradoxically, we might imagine architecture as the most inflexible and indeed authoritarian of forms, given its association with political or economic power and rigid materials. Flexibility of use depends, it seems, on an inflexible production. In ‘The Author as Producer’, the distinction Benjamin introduces is between ‘the mere supplying of a productive apparatus and its transformation’. Without a doubt, Benjamin imagined that the arts could be made more like architecture, in order that they align with the emancipatory, mass-oriented politics of his day. Artistic solidarity with the workers’ movement demanded more than the contribution of an emancipatory content to a non-participatory and non-emancipatory apparatus. But attention to the side of production allows us to see how architecture resists transformation and directs the free actions of users despite their ability to select from a range of uses. The truly participatory architecture would, like the barricades of nineteenth-century uprisings, be built and rebuilt according to the energies and imaginings of its user-builders.

## THE DIVISION OF LABOR

We might sum up the conclusions of the preceding sections as follows: the participation of viewers and audiences in the work of art almost always depends upon relatively immutable frameworks and infrastructures in which viewers and audiences have no say; to

the extent that participatory works naturalize or occlude these frameworks they may be thought of as the buttresses and bulwarks of a veritable aesthetic ideology, one that obstructs any reckoning with domination as it actually functions. In his critique of the emancipatory pretensions of contemporary digital technology, Alexander Galloway argues that the rhizomatic, horizontal, participatory interactions of the World Wide Web depend upon highly centralized and codified infrastructures run by a small number of institutional players (Galloway, 2004). In the case of digital technology, the participatory character of the object or service is a function of its use by the consumer, rather than its production. There is a division of labor, in other words, between producers and consumers that occludes the site of production and the inflexibilities engendered there. This occlusion occurs because the participatory *use* but not manufacture of an object leads users to believe they have overcome the division between producers and consumers altogether, as in the case of 'Web 2.0', where users are simultaneously content-providers. As should be clear from the discussion above, what Galloway says of the ideology of participation in digital technology is true of aesthetic participation as well.

The problematic of participation is therefore bound up with that of the division of labor, and particularly the 'reification' that Lukács attributed to the capitalist division of labor. For Lukács, capitalism fragments the organic labor processes of precapitalist societies, replacing integrated production of finished objects with various kinds of intermediate detail work (Lukács, 1972: 88–9). The consequences of such rationalization are extreme, since 'the fragmentation of the object of production necessarily entails the fragmentation of its subject'. As the specific qualities demanded by the labor process are abstracted from 'the human qualities and idiosyncrasies of the worker' the result is that 'his activity becomes less and less active and more and more contemplative'. It becomes,

to translate into the terms of the above, less participatory. This is what Lukács terms reification, the objectification of formerly free-flowing, open-ended human capacities under the reign of the commodity form. Reification affects all classes within capitalism but for the bourgeoisie the process is especially deleterious, as reification in such a case concerns not just specific labor powers but cognition itself. The reified cognition of the bourgeoisie thus produces a series of philosophical antinomies (between subject and object, freedom and necessity, individual and society, form and content) that more or less encapsulate the history of modern philosophy. Proletarians experience these antinomies as well, but are given a way to transcend them and transcend false immediacy through their practical engagement with the object-world. While the bourgeoisie cannot know itself as objectified, because it is the bourgeois mind itself that is objectified, the physical domination of workers leaves their mind free 'to perceive the split in [their] being'. The 'consciousness of the proletariat' is therefore the consciousness of an object that sees itself as object, consciousness of the rift between subject and object but also, in turn, the rifts of the division of labor. De-reification, in this sense, requires not only an overcoming of the passive, objectified forms of action which capitalism engenders but also an overcoming of the fragmentation of the labor process. In his insistence on the insoluble link between capitalist fragmentation of the labor process, on the one hand, and the passive, objectified character of human action, on the other, Lukács makes possible a critique of those participatory enactments that still depend upon a division of labor.

Lukács was an enormous influence on the thinking of Guy Debord and his conspirators in the Situationist International (SI hereafter), a thinker and a group notable for building a communist aesthetic and political practice around an explicit critique of the social and artistic division of labor. Their project was an overarching 'critique of separation', detailing

the many ways that proletarians are separated from each other and rendered passive, in the workplace and elsewhere, so that they may be integrated by the active constructions of capital and what Guy Debord described as 'spectacle'. Against this society of generalized non-intervention and separation, the SI proposed interventions into everyday life that they called 'situations'.

The situationist goal is immediate participation in a passionate abundance of life, through the variation of fleeting moments resolutely arranged ... Situationists consider cultural activity, from the standpoint of totality, as an experimental method for constructing daily life, which can be permanently developed with the extension of leisure and the division of labor (beginning with the division of artistic labor). (Situationist International, 2004: 61)

The accent of this critique falls not just on the world of wage labor and artistic practice, but political milieus themselves: 'A revolutionary association of a new type will also break with the old world by permitting and demanding of its members an authentic and creative participation ...' (Situationist International, 2006: 112). They therefore inveigh against pedagogical art or politics based upon the 'unilateral transmission of a revolutionary teaching', instead basing their sense of revolutionary possibilities on a spontaneous tendency toward revolt already present within the youth of the age (112). Importantly, the SI targets not just the division of social labor but the division between art making and social labor: 'The next form of society will not be based on industrial production. It will be a society of *realized art*.' The integration of art and social production will overcome the industrial division of labor as well as the division between free and compelled activity. The theorization of participation that we find in the SI does not imagine a reform of the existing mode of production, such that workers are allowed to participate in corporate decision making, much less a participatory transformation of the art system; rather, they envision the liberation of aesthetic energies, broadly

distributed among proletarians, that might be the basis of a revolutionary overthrow of the capitalist mode of production. What emerges from the rubble will be based upon the activation of those creative energies and oriented toward the participation of all, but that is something different than the recruitment of worker participation (or reader or viewer participation) in an already constituted system.

From 1960 until the events of May 1968, in which many members were involved and which more or less spelled the dissolution of the group, the SI turned away from engagements with artists and interventions in the art world and dedicated itself entirely to political theory and activity, while still retaining a broadly aesthetic theory of revolution, where revolution would be put 'in the service of poetry', in the service of aesthetic experience and creative freedom, rather than the other way around. Through an interrogation of anarchist and Marxist theory, and through their interaction with Socialism ou Barbarie, a post-Trotskyist group that had turned toward council communism, they developed a 'councilist' perspective on the revolution, in which workers' and students' councils would direct the revolution. Workers would seize control of the means of production directly and dispose of its products as they saw fit. However, the SI never really reckoned with the possible contradictions between a worker-directed system and the society of *realized art* they imagined. In the views of Gilles Dauvé and the group Theorie Communiste, who emerge after the SI, as part of a general revival of ultraleft ideas, the SI managed to expose the flaws within council communism without overcoming them (Dauvé, 1979; Simon, 2015). Whereas council communism views revolution as the emancipation and affirmation of labor through the seizure and eventual self-management of the means of production, the SI counters this affirmed labor by examining it in the unfavorable light of creative activity. The goal for the SI is not to liberate the

toil but to abolish it altogether. And yet, for *Theorie Communiste*, the SI never moves beyond a critique of labor and toward a critique of capital as such, instead imagining, in various incomplete theorizations, that the overcoming of the division of labor and art can be had either by the cultivation of a particular subjectivity (an attitude toward labor) or by a simple extension of the development of the productive forces (Simon, 2015: 382). They therefore avoid thinking about whether or not the division of labor is baked into the very industrial machinery they would make the basis of their society of realized art. In truth, as their critics note, the overcoming of labor as passive, compelled activity would require a total reorganization of the means of production at a technical level. As Marx notes in *Capital*, the large-scale machinery of the factory implies ‘the separation of intellectual faculties of the production process from manual labor, and the transformation of those faculties into powers exercised by capital over labor’ (Marx, 1990: 548). A change in ownership would not rectify such dehumanization, which is part of the technical arrangement of the factory. Abolition of labor would require placing social production on another footing altogether. Posing the problem of non-participation in aesthetic terms, as the SI does, occludes an understanding of the real basis of domination, and forces an engagement with the problem on a superficial level. This is perhaps clearest in the visions of the Situationist city produced during their artistic period. In Constant’s Situationist city, titled *New Babylon*, the city’s industrial infrastructure is secreted underneath the street level, which is therefore transformed into an open plane for free-floating encounter. This does not overcome the need for industrial infrastructure, however, but merely renders it and whatever labors it involves invisible. Literalizing the opposition between base and superstructure, productive forces and social relations, Constant’s utopia preserves the division between spaces of freedom and unfreedom.

## THE CRITIQUE OF SELF-MANAGEMENT

The SI was part of, and to a certain degree responsible for, a general revival of the thought and practice of the historical ultraleft – council communism in particular. The critiques of the SI summarized above find their roots in the years after 1968, when important communist theorists such as Jacques Camatte, Gilles Dauvé, and others confronted the perspective of the historical ultraleft – emblemized in the work of Anton Pannekoek and Paul Mattick – with the left communist thought of Amadeo Bordiga. Part of a broader left opposition within the Communist International during the 1920s, Bordiga conceived of the communist party as a class party that was not, at the same time, a mass party; in his view, the legitimacy of the party was not gained by the participation of proletarians, by its numerical incorporation of the proletarian masses, but by its doctrinal commitment to communist revolution (Bordiga, 2003a, 2003b). The party was an offensive and ultimately administrative instrument and therefore attempts by socialists and communists to opportunistically reposition the party such that it enabled mass participation, by for instance weakening its programmatic commitments, were wrong-headed. At the time, revolutionary developments in Germany and Italy were proceeding according to the council form, as proletarians spontaneously took over their workplaces and formed councils to determine what to do next. This was the great headwaters of council communism. In Bordiga’s essay, ‘Seize the Factory or Seize Power?’, written in 1920 while this council movement was raging in the north of Italy, he commended the militancy of the workers and their turn from the defensive tactic of the strike but suggested the workplace takeovers would not accomplish anything if the occupiers did not gather together their force for an assault ‘aimed directly at the heart of the enemy bourgeoisie’ (Bordiga, 2003c).

Later, Bordiga would develop a more robust critique of all forms of proletarian self-management, indicating that it was the enterprise-form itself and not the management of the enterprise by capitalists that made it into an instrument of exploitation:

The independent, local enterprise is the smallest social unit which we can think of, being limited both by the nature of its particular trade and the local area. Even if we concede, as we did earlier, that it was somehow possible to eliminate privilege and exploitation from within such an enterprise by distributing to its workers that elusive 'total value of the labour', still, outside its own four walls, the tentacles of the market and exchange would continue to exist. And they would continue to exist in their worst form at that, with the plague of capitalistic economic anarchy infecting everything in its path. But this party-less and State-less system of councils prompts the question – who, before the elimination of classes is accomplished, is going to manage the functions which are not strictly concerned with the technical side of production? And, to consider only one point, who is going to take care of those who are not enrolled in one of these enterprises – what about the unemployed? In such a system, and much more so than in any other cell-based commune or trade union system, it would be possible for the cycle of accumulation to start all over again (supposing it had ever been stopped) in the form of accumulation of money or of huge stocks of raw materials or finished products. Within this hypothetical system, conditions are particularly fertile for shrewdly accumulated savings to grow into dominating capital.

The real danger lies in the individual enterprise itself, not in the fact it has a boss. How are you going to calculate economic equivalents between one enterprise and another, especially when the bigger ones will be stifling the smaller, when some will have more productive equipment than others, when some will be using 'conventional' instruments of production and others nuclear powered ones? This system, whose starting point is a fetishism about equality and justice amongst individuals, as well as a comical dread of privilege, exploitation and oppression, would be an even worse breeding ground for all these horrors than the present society. (Bordiga, 1976)

Many of the ultraleft groups and writers that followed the SI utilized the Bordigist critique to purge council communism of its

emphasis on self-management while still retaining its commitments to spontaneity, self-organization, and the self-activity of the proletariat (almost entirely absent in Bordiga's dogmatic, party-oriented, and idealist presentation). Thinkers such as Gilles Dauvé and journals such as *Troploin*, *Négation* and others put forward the idea of revolution as communization, which would involve not the affirmation of the proletariat through self-management but its self-abolition, unmaking the productive resources of capitalism and replacing them with new means and new relations through which people would meet their needs directly, without the need of money, the wage, the state, or centralized administration.

Through a double-sided critique of council communism and Bordigism, these groups effectively resolve the antinomy – between proletarian self-management, on the one hand, and refusal of labor, on the other – which the SI posed but could not resolve. The revolution will involve the self-organizing action of proletarians from below, but these proletarians will not hypostasize the productive forces and their place in it through an affirmation of labor; instead they will engage in a total transformation of both the relations and forces of production of capitalist society. In one sense, revolution as communization cannot be thought by way of the logic of participation, since none of the institutions upon which one might make participatory demands would remain after such a revolution. In another sense, however, such a state of affairs would be more participatory than any imaginable, inasmuch as the members of such a society would have freedom of access and opportunity, allowing engagement in every aspect and activity imaginable. The desire for meaningful creative activity and social empowerment that underlies participatory demands remains, implicitly or explicitly, as proletarian motive, at the same time as these groups imagine a new route for its unfolding, avoiding the trap of self-management.

## CONCLUSION

Abandoning self-management, the communitization perspective allows for a critique of political formalism and a new emphasis on political content while still retaining an underlying vision of proletarian self-organization. Participatory relations may be desirable, but one must ask: participation in what? To what purpose? With what overall function? In the light of this critique, Adorno's view of participation as heteronomy becomes thinkable in a newly radical manner: it is fully possible for people to actively participate in their own domination, for people to self-manage their suffering and exploitation, and in fact capitalism may find it desirable to reorganize social relations in this manner. In judging political movements and revolutions, one must consider form and content both. We live in a society in which information technologies and the social arrangements they permit, allow people to participate in all manner of activities that might have been closed to them 30 years ago. And yet, the character of this participation is anything but free, predicated on deep-seated logics of social control and surveillance maintained by corporate conglomerates and the repressive apparatus of the national security state. One participates, but one also generates, at every turn, information about one's habits that is used to channel that participation in directions the media owners and their clients will find profitable. In social movements, informality gives way to the 'tyranny of structurelessness', in which individuals and pre-existing social formations can opportunistically exploit the fluid character of social relations; the formalistic participatory models that might control this opportunism end up being as constricting and anti-minoritarian as the centralist political formations they are designed to replace. In art, too, participatory models have become a technics of redevelopment, recruitment, and surveillance that interface directly with non-profit organizations, states, and corporate sponsors.

The participatory persists as a flavor and tone within contemporary capitalism, but dissatisfaction with it is by now general. Calls for a return to traditional models of authority or leadership seem, however, to fall on deaf ears, and the social movements of the twenty-first century continue to unfold by and large without centralized organization and without the leaders and structures one would expect in an earlier era. Likewise, arguments to reorganize art around older values – such as absorption, intentionality, or mastery – in opposition to the participatory seem unlikely to produce a general trend within visual art or literature. While Adorno's critique remains pertinent, it is unclear how it could be made into the basis for contemporary aesthetic activity. Indeed, it is Brecht's didactic and committed participatory aesthetic that remains the most incompatible with the formalistic experiments of contemporary exponents of the participatory. Both authors, therefore, were correct in their way but neither is capable of offering a way forward. The desire for meaningful action and creative expression mobilized by the participatory forms of the past century cannot be made to go away. At the same time, it appears that, within capitalism, no social form can absorb this desire without at the same time betraying it. We can add this to the long list of reasons to be done with capitalism once and for all.

## Note

- 1 See e.g. the following usage of the term from *Aesthetic Theory*: 'That artworks are offered for sale at the market – just as pots and statuettes once were – is not their misuse but rather the simple consequence of their participation in the relations of production' (Adorno, 1997: 236).

# The Spectacle and the Culture Industry, the Transcendence of Art and the Autonomy of Art: Some Parallels between Theodor Adorno's and Guy Debord's Critical Concepts

Anselm Jappe

Translated by Donald Nicholson-Smith

Our focus will be a comparative analysis of the contributions of Theodor W. Adorno and Guy Debord, author of *The Society of the Spectacle* (1967) and main theoretician of the Situationists.<sup>1</sup> It is about objective parallels, not about direct influence: no book of Adorno's was translated into French before 1974, by which time Situationist theory had already been worked out; similarly, we can be sure that Adorno never became aware of Debord's work.

Adorno and Debord are among the pre-eminent exponents of a social critique centered on the concept of *alienation*. Both regard alienation not as some vague dissatisfaction with 'modern life' but rather as an antagonism between humanity and forces that humanity has itself created but that have now entered into opposition to it in the guise

of independent beings. This process is none other, for them, than the transformation of the economy from a means into an end, a transformation brought about by the conflict between exchange-value and use-value. Hence quality is subordinated to quantity, ends to means, and men to things, while a historical process is set in train that obeys economic laws alone, eluding any kind of conscious control.

This calls for some preliminary remarks. Both authors base their theories largely on Karl Marx's categories: less on what was by then the best known of them, that is to say class struggle (even if the search for 'new forms of class struggle' remains strong in Debord), but very much on the category of 'exchange'. 'Exchange' means for them not just circulation of products between men, but a specific capitalist phenomena: the use-value

of goods – their true human dimension – is subordinated to what one can get in exchange for it, and that is money in a capitalist society. ‘Exchange’ signifies for Adorno as for Debord a mode of production which is not directed to the satisfaction of human needs, but only to the accumulation of an abstract wealth which can be considered an inversion of means (the production of goods and services) and ends (the satisfaction of needs and desires). When products exist mainly for exchange, they are ‘commodities’, in Marx’s theory, and it is only in a commodity-based society that ‘the economy’ installs a dictatorship over the whole society. What is meant by ‘the economy’ is not, of course, material production as such, which obviously cannot be dispensed with, but the organization of that production as a separate sphere to which the rest of life is subordinated. It must be noted that the autonomization of the economy is in fact the consequence and phenomenal form of the triumph of value and abstract labor in social life.<sup>2</sup>

Let us first consider the central role played by the categories of ‘exchange’ and ‘economy’ in our authors’ analyses of alienation. What Debord calls ‘the spectacle’ is, precisely, the economy ‘developing for itself’ and bringing human beings totally ‘under its sway’ (SS §16) – the phenomenon whereby ‘the very powers that have been snatched from us reveal themselves to us in their full force’ (SS §31).<sup>3</sup> In this, the supreme form of alienation, real life is increasingly deprived of quality and broken up into activities that are fragmentary and separated from one another, while *images* of that life become detached from it and form an ensemble. This ensemble of images – the *spectacle* in a narrower sense – takes on a life of its own. As in the case of religion, activities and possibilities appear as separate from the individuals or the society that actually engender them; in the spectacle, however, they appear to be not in heaven but on earth. Individuals find themselves cut off from everything of concern to them, their only contact therewith mediated

by images chosen by others and distorted by interests other than theirs. The fetishism of the commodity, as described by Marx, meant the transformation of relationships between human beings into relationships between things; those relationships have now become relationships between images. The downgrading of social life from *being* into *having* continues with the reduction to *appearance* (SS §17), as human beings become mere spectators passively contemplating forces that are really theirs, without any power to affect them. The spectacle is the most recent manifestation of political power, which, though it is the oldest form of social specialization (SS §23), has only in recent decades achieved such a degree of autonomy as to be able to subject all social activity to its dictates. In the spectacle, where the economy transforms the world into the world of the economy, ‘the principle of commodity fetishism [...] is absolutely fulfilled’ (SS §36) and ‘the commodity completes its colonization of social life’ (SS §42). The generalization of the rule of the commodity and of exchange entails ‘the loss of quality so obvious at every level of the language of the spectacle’ (SS §38); that abstraction of all particular qualities which is the basis and consequence of exchange ‘finds perfect expression in the spectacle, whose very *manner of being* concrete is, precisely, abstraction’ (SS §29).<sup>4</sup>

Adorno too minces no words in stigmatizing the ‘universal domination of mankind by exchange-value [...] which a priori keeps subjects from being subjects and degrades subjectivity itself to a mere object’ (ND, 178), for under the reign of exchange ‘All qualitative moments [...] are flattened’ (ND, 88), and everything is ‘maimed’.<sup>5</sup> Exchange is ‘the bad foundation of society in itself’, and the

abstract character of exchange-value goes hand in hand, before any particular social stratification, with the domination of the universal over the particular and of society over its members. [...] The reduction of men to the status of agents and bearers of commodity exchange conceals the

domination of man over man. [...] The system as a whole is founded on the following principle: each must submit or perish.<sup>6</sup>

The fetish-character attaching to the commodity extends 'its arthritic influence over all aspects of social life' (DE, 28). Whereas use-value is 'stunted' (AT, 227), what is consumed is exchange-value (AT, 21).<sup>7</sup>

Inasmuch as the spectacle relies largely on film, sports, art and so on, it is remarkably reminiscent of that 'cultural ideology' which Adorno and Horkheimer, in their *Dialectic of Enlightenment*, had the opportunity to describe at the moment of its inception. A more detailed comparison between these two ideas may be useful here, for it will demonstrate not only their relevance today, but also their close affinity, despite their having been arrived at separately in very different surroundings and at very different periods. According to Debord, the spectacle as 'ideology in material form' has replaced all specific ideologies (SS §213); according to Horkheimer and Adorno, social power is much more effectively expressed by means of the seemingly non-ideological culture industry than by means of 'stale ideologies' (DE, 136). The content of the culture industry is not an explicit apologia for a particular, allegedly flawless political régime; rather, it is the continuous presentation of what exists as the sole possible horizon. 'To demonstrate its divine nature, reality is always repeated in a purely cynical way. Such a photological proof is of course not stringent, but it is overpowering' (DE, 147–8). For Debord, writing in 1967, 'All [the spectacle] says is: "Everything that appears is good; whatever is good will appear". The attitude that it demands on principle is the same passive acceptance that it has already secured [...] by its monopolization of the realm of appearances' (SS §12); 12 years later he noted that the spectacle no longer makes even that promise, and now merely says 'It is so'.<sup>8</sup> The culture industry is no more the result of 'an evolutionary law of technology as such'

(DE, 121) than the spectacle is 'the inevitable outcome of a technical development perceived as *natural*' (SS §24). And just as the culture industry 'impresses the stamp of sameness on everything' (DE, 120), the spectacle is a process of trivialization and homogenization (SS §165). Adorno and Horkheimer realized early on that 'amusement under late capitalism is the prolongation of work' (DE, 137), that it reproduces the same rhythms as industrial labor and that it too teaches 'obedience to the social hierarchy' (DE, 131). For Debord, 'the leading edge of the system's evolution' is increasingly oriented toward 'a realm of non-work, of inactivity. Such inactivity, however, is by no means emancipated from productive activity' (SS §27). The culture industry is a sphere where lies can be 'reproduced at will' (DE, 135); the spectacle a sphere 'where deceit deceives itself' (SS §2). In the spectacle, even 'truth is a moment of falsehood' (SS §9); in the culture industry even the most evident propositions, such as the claim that the trees are green, or the sky blue, are nothing but 'so many cryptograms for factory chimneys and service stations', that is to say, figures of the false (DE, 149). The spectacle is a veritable 'colonization' of everyday life (SI, 6/22; SIA, 70), so designed that no needs can be met save through its mediation (SS §24). Horkheimer and Adorno likewise describe how, as early as the 1940s even in the most everyday kinds of behavior and in the most normal forms of expression, such as variations in tone of voice according to occasion, or the way romantic relationships are conducted, people strive to adapt to models imposed by the culture industry and advertising (DE, 167). The culture industry is more than a way of advertising particular products, for it promotes products in general, and society per se it can shift with the greatest of ease from soap advertising to propaganda for a *Führer* (DE, 156–60). The spectacle, for its part, is 'an apologetic catalog' for 'commodity production in general' (SS §65). It is the 'epic poem' of the strife in which commodities engage before their

human spectators, a strife in which, even if particular commodities 'wear themselves out', the commodity-form as such becomes ever stronger (SS §66). Thus, when politics becomes one commodity among others, 'Stalin, just like any obsolete product, can be cast aside by the very forces that promoted his rise' (SS §70).

The basis of the culture industry, as of the spectacle, is the spectator's identification with the images presented to him, and his consequent renunciation of life lived in the first person. All who fail to win the world trip offered as a prize in a magazine contest are offered photographs of the countries they would have visited (DE, 148); 'the diner must be satisfied by the mere reading of the menu' (DE, 139). Images so overrun real life that the two spheres become indistinguishable, and the illusion comes to prevail 'that the outside world is the straightforward continuation of [the world] presented on the screen' (DE, 126). These observations closely echo Debord's assertion that 'lived reality suffers the material assaults of the spectacle's mechanisms of contemplation' (SS §8), or his claim that when the real world is transformed into mere images (as when a country is reduced to photographs), then 'mere images are transformed into real beings' (SS §18); reality becomes an extension of cinema. As early as 1953, Adorno wrote that television 'holds the possibility of smuggling into [its] duplicate world whatever is thought to be advantageous for the real one', for it 'obscures the real alienation between people and between people and things. It becomes a substitute for a social immediacy that is being denied to people'.<sup>9</sup>

Here Adorno's words anticipate Debord's almost to the letter. It is clear what distinguishes our authors from many of their contemporaries who pondered the same reality and described it, more or less subtly, as 'consumer society', 'mass society', and so forth: Debord and Adorno both realized that they were confronted by a false form of social cohesion, an unacknowledged ideology

designed to create consensus around Western capitalism, a way of ruling society, and, lastly, a technique for preventing individuals, who were just as ripe for emancipation as the state of the productive forces would allow, from becoming aware of that fact.<sup>10</sup> According to Debord and Adorno, the infantilization of the spectator is no mere side-effect of the spectacle and the culture industry, but the embodiment of their anti-emancipatory goals: for Adorno, the ideal of the culture industry is to reduce adults to 'the level of twelve-year-olds';<sup>11</sup> for Debord, 'the need to imitate that the consumer experiences is a truly infantile need' (SS §219).

Despite these parallels, however, Adorno and Debord are completely at odds when it comes to the role of art. Both bring to their accounts of modern art the concept of a contradiction between the possible uses of the forces of production and the logic of capital's self-valorization. Both see modern art – and specifically its formal development – as embodying an opposition to alienation and to the logic of exchange. Yet Adorno and Debord came in the 1960s to epitomize two diametrically opposed views on 'the end of art'. Adorno defended art against those who sought to 'transcend' it in favor of a direct intervention in reality, or who preached 'commitment' in art; Debord was meanwhile announcing that the time had come to *realize in life* what had hitherto been merely *promised in art*. Debord nevertheless saw the *negation* of art, through the transcendence of its separation from life's other aspects, as a continuation of modern art's critical role, whereas for Adorno the critical function of art was guaranteed precisely by its separation from the rest of life. In what follows we shall attempt to explain how it was that the two authors arrived, despite a common starting-point, at opposite conclusions; we shall also see that Adorno ends up, in spite of himself, espousing the thesis of the exhaustion of art.

Debord maintained from the beginning of the 1950s that art was *already dead*, and that

it must be 'surpassed' by a new form of life and revolutionary activity – a form that would at once *preserve and realize the content* of modern art. An explanation of the fact that art once had a great part to play, but can no longer do so, is set forth in sections 180–91 of *The Society of the Spectacle*. There, Debord brings out the fundamental contradiction of art: in a society riven by separations, art's function is to represent the unity that has been lost and the social totality. But just as the notion that a part of the totality can replace the totality itself is manifestly contradictory, so too is culture once it becomes an autonomous sphere. It is precisely in its role as a replacement for what is missing from society – for dialogue, for a unity of life's different moments – that art must refuse to be nothing but the *image* of those lacks. Society has relegated communication to the cultural realm, but the progressive dissolution of traditional communities, from the *agora* to working-class neighborhoods, formerly the seedbeds of communication, means that the arts now register only the *impossibility of communication*. The process of destruction of formal values, from Baudelaire to Joyce and Malevich, testifies to art's refusal to be the fictive language of a now non-existent community; it also testifies to the necessity of *rediscovering* a common language that can support real 'dialogue' (SS §187). Modern art reached its acme, and came to an end, with the Dadaists and the Surrealists. These contemporaries of 'the proletarian revolutionary movement's last great offensive' (SS §191) strove, albeit imperfectly, to abolish *and* to realize art. The twin defeat of the political and artistic avant-gardes in the inter-war period brought the 'active' phase of art's decay to a close (IS, 1/14). Art had now arrived at the same point reached by philosophy with Hegel, Feuerbach and Marx: it now understood itself to be a form of alienation, a projection of human activity into a separate entity. Henceforth anyone who wished to remain faithful to the true *meaning* of culture could do so only by denying it *qua* culture,

and realizing it in the theory and practice of the critique of society. Thus the decay of the arts continued after 1930, but it now had a different significance. The self-destruction of the old idiom, once detached from the necessity of finding a new language, was coopted in 'defense of class power' (SS §184). The impossibility of all communication was recognized as a value in its own right, to be hailed joyfully or accepted as an unchanging fact of life. Such rehashings of the formal destruction of art as the Theater of the Absurd, the *nouveau roman*, the new abstract painting, or Pop Art no longer expressed history's dissolution of the social order: these tendencies stood for nothing but a flat copying of what exists invested with the objectively positive value of an 'unadorned claim that the dissolution of the communicable has a beauty all its own' (SS §192).

Adorno likewise acknowledges that by becoming autonomous and detaching itself from its practical function, art is no longer an immediate social fact and is now separate from 'life'. For him, however, this is the only way for art genuinely to contest society. Bourgeois society has created an art that is *necessarily* antagonistic to that society, regardless of its specific content (AT, 7–8, 12, 225–6). Art comes eventually to question its own autonomy, and begins to betray 'signs of blindness' (AT, 1). Adorno recognizes that art's crisis is so acute that 'not even its right to exist is self-evident any more' (*ibid.*); 'the revolt of art ... has become a revolt against art' (AT, 3). But when he evokes the thesis that 'the age of art is over; now it is a matter of realizing its truth content', he is certainly not in line with Debord's thinking on the matter. Indeed, he ends his thought by declaring such a conclusion 'totalitarian' (AT, 251). Adorno never had the opportunity to become acquainted with the Situationists' ideas, or to respond to them, but there is every reason to assume that had he done so, he would have assimilated their critique of art to that of the *contestataires* of 1968 whom he described as wanting to promote 'street battles' as a new form of beauty

and as recommending ‘jazz and rock-and-roll instead of Beethoven’ (AT, 319). Although the attack on art mounted by such people was in Adorno’s view far less original than they supposed (AT, 251, 319–20), he still looked upon their attitude as a very dangerous one, expressing ‘ego-weakness’, ‘an incapacity for sublimation’, or simply a ‘lack of talent’, which was ‘below, not above, culture’ (AT, 251). Adorno took this challenge to art to task, not on the grounds that it was an attack on the existing social and aesthetic status quo, but rather on the grounds that it was in harmony with that status quo, and indeed with its worst tendencies. A ‘demise of art’ so conceived would thus be ‘a gesture of conformism’ (AT, 319), because ‘the abolition of art in a half-barbaric society that is tending toward total barbarism makes itself barbarism’s social partner’ (AT, 251). Aspiring to realize the pleasure or truth attendant upon art directly, on the social plane, in no way runs counter to the logic of exchange, which expects of art, as of anything else, that it serve some kind of *utility*. For Adorno, art always embodies a social critique—even hermetic art, even art for art’s sake – precisely because of its autonomy and its ‘asocial’ character. He speaks explicitly of the antagonistic position that art takes toward society, a position it occupies only in its capacity ‘as autonomous art’. Likewise for him ‘there is nothing pure, nothing structured strictly according to its own immanent law, that does not implicitly criticize [...] a situation evolving in the direction of a total exchange society’ (AT, 225, 226). The art work owes its critical function to the fact that it ‘serves’ no purpose, neither the growth of knowledge, nor immediate gratification, nor yet a direct intervention in praxis. Adorno rejects all attempts to reduce art to any of these aims. ‘Only what does not submit to that principle acts as the plenipotentiary of what is free from domination; only what is useless can stand in for the stunted use-value. Artworks are plenipotentiaries of things that are no longer distorted by exchange’ (AT, 227).

Adorno and Debord thus reach opposite conclusions on the end of art. Since their respective theories have the same starting point, this is something that needs to be explained. Both of them discern the contradiction between the forces of production and the relations of production as also in play within the realm of art. Despite their differences, the two adopt the same attitude with respect to the unfolding of economic and technological potentialities. Neither idealizes or rejects this development; rather, both see it as a *precondition*, which will eventually abolish itself, of a liberated society: ‘The economy’s triumph as an independent power inevitably also spells its doom, for it has unleashed forces that must eventually destroy the *economic necessity* that was the unchanging basis of earlier societies’ (SS §51). The development of the forces of production is now so far advanced as to allow humanity to emerge from what Adorno calls ‘blind self-preservation’, and what the Situationists call ‘survival’, and accede at last to authentic life. What prevents this are the relations of production, or in other words the existing social order; in Adorno’s view, ‘given the level of productive forces, the earth could here and now be paradise’ (AT, 33), whereas in actuality it is in the process of becoming an ‘open-air prison’.<sup>12</sup> Production relations founded on exchange condemn society to endless subjection by the imperatives of survival, creating what the Situationist Raoul Vaneigem calls ‘a world where the guarantee of freedom from starvation means the risk of death from boredom’.<sup>13</sup>

The reduction of life to mere ‘survival’ should also be understood in a broader sense, as meaning the subordination of the content of life to apparent external necessities. An example would be the refusal of city planners to entertain any proposals for a really different kind of architecture on the grounds that ‘people need a roof over their heads’ and that a great deal of housing is urgently needed (IS 6/7). As the Situationists put it in 1963:

The old schema of the contradiction between productive forces and relations of production should

certainly no longer be understood as an automatic short-term death sentence passed on capitalist production, as if this were bound to stagnate and become incapable of further development. But it should indeed be understood as a death sentence (yet to be executed, with whatever arms may be required) passed upon those niggardly and dangerous forms of development which this self-regulating production system is planning, the sheer magnificence of possible development notwithstanding. (IS 8/7; SIA, 104)

The economy and its organizers have served a useful function by liberating society from 'natural pressures', but society must still be 'liberated from [these] liberators' (SS §40). It is present-day social hierarchies which, in order to perpetuate themselves, ensure survival but bar life.

For their part, Horkheimer and Adorno write that 'By subjecting the whole of life to the demands of its maintenance, the dictatorial minority guarantees, together with its own security, the persistence of the whole' (DE, 31). The whole 'dialectic of enlightenment' turns on the fact that *ratio* fails to deploy its liberatory potential because from the outset it finds itself threatened by the overwhelming forces of nature and is therefore obliged to concentrate entirely on combating and subjugating those forces as far as it can. This struggle continues even once physical survival is no longer in jeopardy, thus subjecting humanity to fresh mutilations that are now not natural but social in origin: 'But the more the process of self-preservation is effected by the bourgeois division of labor, the more it requires the self-alienation of the individuals who must model their body and soul on technical apparatus' (DE, 29–30). The gigantic accumulation of means does not in itself suffice to make life richer, argues Adorno: 'A mankind which no longer knows want will begin to have an inkling of the delusory, futile nature of all the arrangements hitherto made in order to escape want, which used wealth to reproduce want on a larger scale'.<sup>14</sup> Debord says much the same thing: 'The reason there is nothing *beyond* augmented survival, and no end to its growth, is

that survival itself belongs to the realm of dis-possession: it may gild poverty, but it cannot transcend it' (SS §44). In criticizing the blind mechanism of economic laws and discussing the necessity for society's capacities to be brought under conscious control, Debord and Adorno sometimes even use the same references. Thus Debord writes, 'By the time society discovers that it is contingent on the economy, the economy has in point of fact become contingent on society. [...] Where economic id was, there ego shall be' (SS §52). Adorno attributes a comparable coming to consciousness, precisely, to art: 'Where id is, there shall ego be, says modern art along with Freud'.<sup>15</sup>

Adorno's entire aesthetics is predicated on the idea that the contradiction between the potential of the productive forces and their actual use can also be found in art. It makes sense to speak of 'aesthetic forces of production' because art too is a form of domination over objects, over nature: it does not leave these as they are, but makes use of a set of procedures and techniques, which it gradually refines and improves, in order to transform them. This is especially true of modern art, which does not confine itself to copying reality but restructures it completely according to its own rules – one has only to think of cubist and abstract painting, or of the suspension of the rules of ordinary experience in modern literature. The mastery of objects in art does not aim to subordinate nature, but to reinstate it: 'Through the domination of the dominating, art revises the domination of nature to the core' (AT, 138). As 'the social antithesis of society' (AT, 8), art presents society with examples of a possible use of its means that would enable it to relate to reality in a non-dominating, non-violent way: 'By their very existence artworks postulate the existence of what does not exist and thereby come into conflict with the latter's actual nonexistence' (AT, 59). Whereas material production is directed exclusively toward quantitative accumulation, art must represent such qualitative aims as the individual's

happiness, which scientific rationality looks upon as 'irrational' (AT, 43, 289, 331). By virtue of its 'uselessness', its wish to be solely for-itself and to elude the laws of universal exchange, the artwork frees nature from its role as mere instrument or means: 'It is only through the nonfungibility of its own existence and not through any special content that the artwork suspends empirical reality as an abstract and universal functional nexus' (AT, 135). This is not necessarily a conscious process. So long as art hews fast to the laws of its own development – and the radicalization of the avant-gardes was an instance of precisely that – it will reproduce within itself the level of development of the extra-aesthetic forces of production without, however, falling under the constraints that the relations of production impose in the normal way (AT, 43–4). An art whose techniques remain backward relative to the point reached at a given moment in the development of artistic productive forces is thus 'reactionary', and cannot offer an account of the complexity of the problems of the moment. This is one of the reasons for Adorno's condemnation of jazz, but it applies equally, for instance, to 'socialist realism'. Formalist art, by contrast, quite apart from any 'political' content it may have, expresses the evolution of society and its contradictions. 'The campaign against formalism ignores the fact that the form given to content is itself a sedimented content' (AT, 144). It also ignores the fact that 'Incomparably deeper and more socially relevant experiences can be sedimented in the *how* of a painting than in faithful portraits of generals or revolutionary heroes' (AT, 150).

Debord also uses the concept of 'aesthetic productive forces', and he too makes the parallel between these forces and extra-aesthetic productive forces the basis for his defense of the formalist tendency of art up until 1930, of which art's 'self-transcendence' was the historical outcome. Like Adorno, Debord sees art as the representation of social potentialities: 'What is termed culture reflects, but also

prefigures, the possibilities for the organization of life in a given society'.<sup>16</sup> And, again like Adorno, he postulates a link between the liberation of these potentialities in art on the one hand and in society on the other: 'We are trapped, in the cultural sphere also, by relations of production that stand opposed to the necessary development of productive forces. We have to demolish these traditional relationships, along with *the theses and fashions that they foster*'.<sup>17</sup> The realm of aesthetic productive forces had indeed experienced a rapid and inexorable development in which each innovation, once achieved, made its own repetition useless. Around 1955, *Potlatch*, the bulletin of the Debord group, variously asserted that painting after Malevich was breaking down doors already open (215), that the cinema likewise had exhausted its groundbreaking potential (139), and that onomatopoeic poetry on the one hand and neo-classical poetry on the other signaled the end of poetry itself (209). This 'vertiginously accelerated evolution' was henceforward 'running on empty' (178). In other words, the deployment of aesthetic productive forces is now complete, because the parallel deployment of extra-aesthetic productive forces has crossed a decisive threshold. This has made possible a society no longer entirely dedicated to productive labor, a society with the time and the wherewithal to permit 'play' and the pursuit of 'passions' – the pursuit, one might say, of that society's 'ends'. Art as simple *representation* of such possibilities, and as substitute for passion, has thus been transcended thanks to scientific progress, already responsible for making religion superfluous.<sup>18</sup>

At that time, Debord was not particularly suspicious of the development of productive forces per se, judging that the decisive issue is not the *content* of new technology but the matter of *who* will make use of it, and *how*. He identifies the domination of nature with freedom,<sup>19</sup> because it broadens the subject's activity, and he directs his critique at the backwardness of superstructures, of morality and

art, as compared with technological advances. Debord deems anachronistic not only traditional art but also the entire organization of human desires in the form of art. The role that art once played, but can no longer play, is to help adapt life to the particular state reached by the forces of production.<sup>20</sup>

In Adorno's work this line of thinking is complicated by the dual aspect that he ascribes to the forces of production. His critique does not confine itself to the subordination of productive forces to production relations, after the fashion of the Marxist tradition, nor to that growing autonomy of material production as a separate sphere – the economy – which is Debord's central theme. For Adorno, all material production, since it implies the domination of nature, is a subset of the general category of domination, and as such cannot be the bearer of freedom. The domination of nature has ever and always meant both a liberation of mankind from dependence on nature and the introduction of other forms of dependence. Adorno accentuates now one and now the other of these aspects. Thus in *Dialectic of Enlightenment* the quantitative procedures of science and technology are seen as themselves forms of reification, whereas in 1966 Adorno wrote – alluding, perhaps, to Heidegger's then-fashionable critique of 'technological thinking' – that the tendency toward totalitarianism

should not be attributed to technology as such. [Technology] is merely one form of human productive power, an extension of the human arm even in the case of cybernetic machines, and hence but one moment in the dialectic between forces and relations of production, and not some third, demonic independent entity.<sup>21</sup>

In the same year he observed that 'with the expansion of the natural sciences, reification and reified consciousness also brought about the possibility of worldwide freedom from want' (ND, 191–2). Apropos of the twentieth century, Adorno asserts that it is impossible to speak of an opposition between forces and

relations of production: being substantially homogeneous as forms of domination, all have finally been fused into a single 'block'. State control of the economy and the 'integration' of the proletariat have been the decisive developments in this process. And, to return to the aesthetic question, under such circumstances art must not simply follow in the wake of the forces of production, it must also criticize their 'alienating' aspect.

If for Adorno art can continue to fulfill its 'disalienating' role, whereas for Debord it no longer can, this is largely because Debord takes alienation to mean the violation of subjectivity, whereas for Adorno subjectivity itself can easily become a form of alienation; indeed, in his later works, Adorno evinces a good deal of skepticism about the concept of alienation. Debord's conception of alienation is strongly influenced by the notion of reification, as developed by Georg Lukács in *History and Class Consciousness*, first published in 1923. Reification in Lukács's account is the phenomenal form of commodity fetishism, whereby the commodity as an 'ordinary, sensual' thing is invested with the characteristics of the human relationships that presided over its production. The extension of the commodity and its fetishism to the totality of social life causes human activity, which in reality is process and fluidity, to appear as a series of things that have been wrested from human control and follow no laws but their own. There is no modern problem, according to Lukács, 'that does not ultimately lead back to [...] the riddle of the commodity-structure'.<sup>22</sup> Everything, from the fragmentation of production procedures that seem to unfold quite independently of the workers, to the very structure of bourgeois thought, with its opposition between subject and object, led man to contemplate reality in a passive way that turns it into 'things', 'facts', and 'laws'. Forty years before Debord, Lukács described this human condition as that of a 'helpless onlooker'.<sup>23</sup> Later, Lukács repudiated these theories of his on the grounds that they repeated an error of Hegel's and

treated all objectivity as alienation. Debord was not unaware of this danger, and several times drew a distinction between objectification and alienation. For example, he opposed time, which, 'as Hegel showed [...] is a *necessary* alienation, being the medium in which the subject realizes himself while losing himself', to 'the alienation that now holds sway', which Debord describes as a 'spatial alienation' that 'radically severs the subject from the activity that it steals from him' (SS §161). In many respects, nonetheless, Debord's critique of the spectacle seems to resuscitate the need for an identical subject-object, as when he evokes 'life', understood as a fluid state in contradistinction to the spectacle's 'congealed form' (SS §35), or its 'visible freezing of life' (SS §170). We should not therefore be too surprised if from time to time Debord's critique of the commodity becomes a critique of the 'things' that reign over human beings. Neither Debord nor the Lukács of *History and Class Consciousness* doubt that a 'healthy', non-reified subjectivity could exist. Both authors discern such a subjectivity in the proletariat, but both hesitate in their definition of the proletariat between sociological and philosophical categories. In any event, the subjectivity in question is threatened *from without* by bourgeois ideology, or by the spectacle, but is in principle capable of resisting that threat.<sup>24</sup>

For Adorno, by contrast, it is 'subjectivism' and the subject's tendency to 'devour' the object (ND, 22–3) that alienate the subject from the world. Subject and object do not form some ultimate unsurpassable duality, nor may they be reduced to an ultimate unity, such as 'being'; rather, they 'constitute one another' (ND, 174). But according to Adorno the objective mediations of the subject are more significant than the subjective mediations of the object,<sup>25</sup> since the subject never ceases to be a form of existence of the object. To put it more concretely, nature can exist without man, but man cannot exist without nature. The subject-object as conceived of by Lukács is for Adorno an extreme expression

of those 'philosophies of identity' whose categories are means whereby the subject attempts to appropriate the world. The object is identified by means of categories set up by the subject, with the result that its identity, its status as *individuum ineffabile*, is lost, and it is reduced to identity with the subject. Such 'identifying thought' has knowledge of a thing only inasmuch as it fixes that thing as an exemplar of a type; it thus finds only what it has itself previously supplied and can never know the real identity of the object. The 'good' objectivity that gives objects back their independence stands in sharp contrast to an objectivity that indeed 'reifies', transforming man into a thing and the product of labor into a commodity-fetish. It is the identity imposed by the subject that deprives modern man of his 'identity'. 'The principle of absolute identity is self-contradictory. It perpetuates nonidentity in suppressed and damaged form' (ND, 318). In a world where any object is equivalent to the subject, the subject becomes a mere object, one thing among others. The negation of the identity of objects in favor of the identity of a subject that wishes to recognize itself everywhere as itself is linked by Adorno, albeit in a rather vague way, with the principle of equivalence, with abstract labor and with exchange-value. The reification that actually exists results from aversion to the object *tout court*, just as alienation results from the repression of what is different or alien: 'If the alien were no longer ostracized, there hardly would be any more alienation' (ND, 172), whereas at present 'the least surplus of nonidentity feels to the subject like an absolute threat [...] because it pretends to be the whole' (ND, 183). A unity of subject and object did not exist in the past: man never emerged out of some essence or *in-itself* (ND, 191) by the same token, the goal for the future is not an 'undifferentiated unity of subject and object', but rather 'the communication of what is differentiated'.<sup>26</sup> It should nevertheless be borne in mind here that these observations of Adorno's are directed at philosophies such as those of

the existentialists. His strictures are not particularly pertinent to the Situationists, who indeed take the spectacle to task for depriving subjects of the opportunity to lose themselves in events: 'Social alienation, though in principle surmountable, is nevertheless the alienation that has forbidden and petrified the possibilities and risks of a *living* alienation within time' (SS §161).

We can now better understand why Adorno defends art: he feels it can contribute to the supersession of the subject's dominance. Only in art can subject and object be 'reconciled'. In art the subject is the main productive force (AT, 42, 192) it is only in art, as for example in Romantic music, that the subject can freely develop itself and master its material without doing violence to it (which always, in the end, means doing violence to itself). Thus art is the 'representative' of that 'real life'<sup>27</sup> which is a condition of freedom from 'operation, planning, having one's way, subjugating', a condition wherein '*[ne] rien faire comme une bête*, floating in water and looking peacefully at the sky [...] might take the place of process, act, fulfillment [...]'.<sup>28</sup> True artistic praxis resides in just such a non-praxis, just such a rejection of instrumentality and of that much vaunted 'communication' which for Adorno is no more than a reciprocal acknowledgment of empirical subjects in their mere 'being-so' [*Sosein*]. The true subject in art must be the work and that which speaks through the work, and neither the artist nor the recipient subject, for 'communication is that adaptation of spirit to utility whereby spirit is made into one commodity among the rest' (AT, 74). Rimbaud, prototype of the avant-garde, was in Adorno's view 'the first artist of the highest importance who rejected communication' (AT, 316). 'Art now reaches people, moreover, solely by way of the sort of shock that strikes a blow against what pseudo-scientific ideology calls communication; art for its part achieves integrity only when it refuses to play along with communication' (AT, 321).

For Debord, the task of art was to augment the subject's activity and facilitate its communication. The prerequisites of such communication were assembled, for instance, under ancient Greek democracy. Their dissolution has resulted in the present absence of 'the prerequisites of communication *in general*' (SS §189), and the evolution of modern art has reflected that dissolution. The spectacle is defined as 'independent representation' (SS §19) and as 'the communication of the incommunicable' (SS §192). In 1963 *Internationale Situationniste* stated somewhat peremptorily that 'Wherever there is communication, there is no State' (IS 8/30; SIA, 115), and as early as 1958 Debord wrote that 'all forms of pseudo-communication must be brought down to utter destruction, so that one day a real, direct communication may be achieved' (IS 1/21) – no longer through art, but through a revolution that incorporates art's content.

It is worth recalling that the difference between Adorno's ideas and Debord's relates less to the question of what would be desirable in itself than to the question of what is actually possible at the present moment in history. Both Adorno and Debord criticize the relegation of rationality to the detached realm of culture. Adorno evokes 'the guilt [culture] incurred by isolating itself as a special sphere of spirit without realizing itself in the organization of society'.<sup>29</sup> And he too admits that, in a very general sense, 'in a society which had achieved satisfaction [...] the death of art [would] be possible'.<sup>30</sup> Or again: 'It is not inconceivable that humanity, once realized, would no longer need a closed, immanent culture' (AT, 320). He views this prospect as an extremely distant one, however, and although he acknowledges that art is simply a representation of something that is lacking (AT, 2), he adds that for the time being making that lack manifest must suffice, since it cannot be remedied: 'Whoever wants to abolish art cherishes the illusion that decisive change is not blocked' (AT, 251). What goes for art goes too for philosophy, 'which once seemed obsolete

[but] lives on because the moment to realize it was missed' (ND, 3). Even revolution does not strike Adorno as an impossibility; rather, it is no longer opportune: 'The proletariat to whom [Marx] appealed was not yet integrated into society: it was rapidly sinking into destitution, whereas on the other hand societal power did not yet command the means to assure overwhelming odds for itself in the event of any serious conflict'.<sup>31</sup> Until 1920 there was still a slight chance for revolution, and in this connection Adorno speaks in 1969 of 'What fifty years ago for a short period of time in the eyes of those who nourished the all too abstract and illusory hope for a total transformation might have appeared justified – that is, violence [...]'.<sup>32</sup> Adorno does not look upon art as too 'high' to have the individual's happiness as its aim, and, like Debord, he sees it as embodying a *promesse de bonheur*.<sup>33</sup> Unlike Debord, however, he does not believe this promise susceptible of direct realization; to the contrary, he considers that 'art must break its promise in order to stay true to it' (AT, 311).

With regard to the period from 1850 to 1930, Debord shared Adorno's convictions concerning the value of pure negativity. He believed, though, that a shift to the positive had become possible, not because of any improvement in social conditions, but because the *prerequisites* of such an improvement were now present. Adorno, on the other hand, assumed that any such conciliation in social reality was presently impossible and that there was no choice but to be satisfied with its evocation in great works of art. We are thus confronted by two opposing interpretations of the possibilities and limitations of modernity. In 1963, an optimistic editorial in the eighth issue of *Internationale Situationniste* was devoted to 'the new protest movement'; in the same year, Adorno was evoking 'a historical moment [...] where a praxis that would refer to the totality appears to be blocked everywhere'.<sup>34</sup>

This divergence does not hinge simply upon differing assessments of the situation

during the 1950s and 1960s; it also reflects profounder differences in the way in which the historical process itself is conceived by Adorno on the one hand, and Debord on the other. The concepts of exchange and alienation determine the rhythm each author assigns to historical transformations. For Debord, as for Lukács, alienation arises from the predominance of the commodity system in social life; it is thus associated with industrial capitalism, and has not existed for more than about two hundred years.<sup>35</sup> Within such a relatively brief period of time, changes occurring in the space of a decade may naturally assume great importance. By contrast, the changes of even a whole century can carry little weight for Adorno, whose yardsticks for measuring events are 'the priority of the object' and 'identity'. By 'exchange' he does not in the first instance mean the exchange of commodities embodying abstract labor – the origin of the preponderance of exchange-value over use-value on the social plane – but rather a suprahistorical 'exchange in general' that coincides with the entire *ratio* of the West. The antecedent here was the kind of sacrifice that sought to win the favor of the gods by means of an offering that soon became purely symbolic; this fraudulent aspect of sacrifice foreshadowed the fraud inherent to exchange. According to Adorno exchange is 'unfair' because it suppresses quality and individuality, and it did so long before it came to consist in the appropriation of surplus labor in the unequal relationship between labor-power and wages. Exchange and the Western *ratio* concur in the reduction of the multifariousness of the world to mere differing *quantities* of an indistinct substance, be it spirit, abstract labor, the numbers of mathematics, or science's matter devoid of quality.<sup>36</sup>

One gets the general impression that for Adorno the particularity of different historical periods fades in the face of the working of certain unchanging principles that have obtained since the beginning of history, such as domination and exchange. In *Dialectic of*

*Enlightenment*, the historical genesis of identifying concepts is ascribed to a very ancient epoch. Whereas 'the shaman's rites were directed towards the wind, the rain, the serpent, or the demon in the sick man, but not to materials or specimens' (DE, 9), the division between the thing and its concept had already begun in the animistic period with the distinction between the tree in its physical presence and the spirit that dwells within it (DE, 15). Logic arose from the earliest relationships of hierarchical subordination (DE, 21), and the identification of things by means of their ordering by kind begins with the 'I' that remains identical through time. 'Unity is the slogan, from Parmenides to Russell. What is continually insisted upon is the destruction of gods and qualities' (DE, 8) – which means that the same 'reason' applied in the Presocratic period applies today. For Adorno, therefore, it ought to be well-nigh impossible to surmount reification, for he sees it as rooted in society's very deepest structures. He refuses, however, to treat it as some kind of anthropological or ontological constant: 'It takes untruthfulness to push reification back into Being and into a history of Being, to mourn and consecrate as "fate" what might perhaps be changed by self-reflection and by the action it kindles' (ND, 91). The wall between the subject and the object is not an 'ontological wall', but a wall built by history, and it can be transcended on the historical level: 'If no one any longer had part of their living labor withheld, rational identity would be a fact, and society would have transcended the identifying mode of thinking' (ND, 147).

Despite such assurances, it remains unclear how reification could really be overcome, if indeed, as Adorno argues, it resides in the very structure of language: even the copula 'is' conceals the principle of identity, that is to say, the identification of a thing by means of its identification with another thing that it *is not* (ND, 100–104, 147–8). In predicative sentences, the object in question is identified by virtue of its 'depreciation [to] a mere

sample of its kind or species' (ND, 146). If the 'identical I' already contains a society divided into classes,<sup>37</sup> and if thought in general is 'complicit' with ideology (ND, 148), then finding the 'way out' that Adorno seeks promises to be a laborious quest. Meanwhile Adorno also seems to locate whatever hope the future may hold outside concrete history, in a 'state of reconciliation' that he compares to a religious state of 'redemption' (AT, 6).

Adorno seems occasionally to suggest that revolution, and the realization of philosophy, were real possibilities around 1848. Subsequently the fusion of the forces and relations of production stripped all progressive value from the development of the productive forces, nullified any prospect of revolution, and even set in motion a kind of regressive anthropogenesis. Since that time, only art has experienced progress. 'That according to Hegel art was once the adequate stage of spirit and no longer is' – this is also Debord's view – 'demonstrates a trust in the real progress of the consciousness of freedom that has since been bitterly disappointed. If Hegel's theorem of art as the consciousness of needs is compelling, it is not outdated' (AT, 208). Regression to barbarity and a definitive triumph of totalitarianism are in Adorno's view ever-present dangers, while the positive role of art is to represent at least the possibility of a different world, of a free deployment of the forces of production. Art thus takes on the aspect of the lesser evil: 'Today the thwarted possibility of something other has shrunk to that of averting catastrophe in spite of everything' (ND, 323). Adorno notes an invariability in the avant-gardes: for him, Beckett plays more or less the same role as Baudelaire. He attributes this stagnation to the seamless permanence of the situation described above – the situation, precisely, of modernity. He conceives of modern art not only as a historical phase but also as a kind of category of spirit. He acknowledges this himself, writing that the tendency of modern art to represent industry only by putting it in brackets 'has changed as little as has the

fact of industrialization for the life process of human beings; for the time being, this grants the aesthetic concept of the modern its peculiar invariance' (AT, 34).

Modernism emerged as something qualitatively new, something different from exhausted models; for this reason it is not purely temporal; this helps to explain why on the one hand it acquired those invariable features for which its critics gladly indict it and why, on the other hand, the new cannot simply be dismissed as being obsolete. (AT, 271–2)

The Situationist distinction between an active, critical phase in the formal decomposition of traditional art, and a second phase characterized by the empty repetition of the first, ought, therefore, to clash with Adorno's position in that it assumes a possibility of a radical change in society that for Adorno has become inconceivable. In point of fact, however, Adorno seems to have some doubts of his own regarding the permanence of modern art. His defense of modernism is always based on the same figures: first and foremost Kafka and Schoenberg, and then Joyce, Proust, Valéry, Wedekind, Trakl, Borchardt, Klee, Kandinsky, Masson and Picasso; his philosophy of music reposes almost exclusively on the Vienna School (Schoenberg, Webern and Berg). When Adorno speaks of modernity, he is referring in fact to the period from 1910 to 1930, and especially to expressionism, and thus to the moment considered by the Situationists to be the pinnacle and end of the unity of art. With the exception of Samuel Beckett and a very few others, artists and tendencies that emerged after the Second World War receive scarcely more consideration from him than they do from the Situationists. Even though he had 24 years to observe post-war artists, Adorno either ignored them, as he did, for instance, Yves Klein, Pollock or Fluxus, or condemned their efforts, as in the case of the 'happening' (AT, 103). Pierre Boulez has recalled that, in the 1950s, his generation of composers saw Adorno as representing a musical movement of the past, while Adorno himself was full of

doubts concerning this new generation, and wrote of 'the aging of the new music'.<sup>38</sup> The phenomenon that Debord described as the destruction of already decayed structures 'over a low flame' so as to derive some further advantage from them<sup>39</sup> was also targeted by Adorno: 'If a possibility for innovation is exhausted, if innovation is mechanically pursued in a direction that has already been tried, the direction of innovation must be changed' (AT, 22).

In Adorno's view the deployment of society's productive forces has unquestionably reached the point of being simply an end in itself. It is hard to see, however, why such a stagnant situation, when it lasts for over a century, should not eventually throw the development of *aesthetic* productive forces into the same stagnation. These forces might well continue to evolve for a time even in the absence of a corresponding development at the level of society overall, but the process must surely have some limit. The fact is that Adorno was perfectly aware of the serious crisis facing modern art and skeptical of the meaningfulness of a great deal of the artistic experiments of the 1950s and 1960s. Nor was this awareness contradicted by his passionate defense of Samuel Beckett, whom the Situationists by contrast cited as an example of complacent acceptance of nothingness. It should be noted that Adorno described Beckett as representative of the last stage of art, not as evidence of art's vitality. With the benefit of hindsight, one might be tempted to treat the difference between the two views as reducible to the simple question of whether the activity of the 'last artists' should be placed in the 1930s or in the 1950s.

In 1952 Debord, then 20 years old, first showed his film *Hurlements en faveur de Sade*.<sup>40</sup> For the first half-hour of this film the screen is empty, alternately white and black, while the soundtrack is made up of a collage of miscellaneous texts; the final 24 minutes leave the audience in complete darkness and silence.<sup>41</sup> It is a curious fact that in this

film of Debord's we encounter every feature that Adorno admired in modern art, and especially in Beckett: the absence of communication; the deliberate frustration of the spectator in his expectation that the work will serve to 'mollify alienation' (AT, 170) and his exposure to the maximum reification possible; and a strictly enforced 'prohibition on images'. The film even conforms with Adorno's prescription as to color: 'To survive reality at its most extreme and grim, artworks that do not want to sell themselves as consolation must equate themselves with that reality. Radical art today is synonymous with dark art; its primary color is black' (AT, 39). And yet it is precisely here that one may discern the great difference between Debord and Adorno: for Debord, who can hardly be accused of excessive modesty, his film was the extreme point of negativity in art, due to be followed by a new positivity. For Adorno such a development was impossible, since 'negation may reverse into pleasure, not into affirmation' (AT, 40). In 1963, apropos of Debord's film, *Internationale Situationniste* noted that 'the real action of the negative avant-garde' had never been 'an avant-garde of pure absence, but always a *staging of the scandal of absence* intended to invoke a desired presence' (IS 8/19). In the same article, the fact that the audience at the première of *Hurléments en faveur de Sade* became furious and disrupted the film was deemed a successful outcome, for it meant that the spectators had refused their role as consumers and escaped from the logic of the work of art. The Situationists ridiculed almost all the artistic production of their contemporaries, dubbing it 'neo-Dadaism' and denouncing it as 'comfortably ensconced in insignificance'<sup>42</sup> and as an 'apologetic trashcan art' (IS 9/41; SIA, 144).

In response to the question whether or not the last decades have in fact produced works of value, both Adorno and Debord offer statements that are essentially little more than personal opinions. Thus Adorno delights in the notion that 'The making of every authentic

work contradicts the pronouncement that no more can be made' (AT, 251), while Debord declares dispassionately, in his preface to the 1985 reprint edition of *Potlatch*, that 'the judgment of *Potlatch* concerning the end of modern art seemed very excessive in the context of the thinking of 1954. We now know [...] that since 1954 not a single artist, anywhere at all, has emerged who could be considered worthy of the slightest attention'.<sup>43</sup>

## Notes

- 1 The ideas of the Situationist International are not always identical with those of Debord. We cite them here, however, when there is no significant difference.
- 2 It should be noted that Adorno's and Debord's critical uses of the concepts of 'exchange' and 'economy' – which have a common root in Lukács's *History and Class Consciousness*, as I shall explain later on, but that each of them has elaborated independently – was an important break with traditional Marxism, for which 'exchange' and 'economy' were neutral categories which could be either used in a 'bourgeois' or in a 'socialist' mode. Nevertheless, their reference to these categories of Marx's critique of political economy shows also important limits. They overlook the fact that exchange-value is only the phenomenal form of *value* which is created by the abstract side of labor. Stressing the 'exchange' dimension, they implicitly locate the origin of value (but the question is not clearly raised) in the *circulation* sphere, not in that of *abstract labor*. This last is not well understood either by Adorno or by Debord, and this often leads them to relapse involuntarily into traditional Marxist views. In this chapter, I lay out the problem in the terms they use themselves. For a criticism from the viewpoint of the 'critique of value' I refer the reader to my *Guy Debord* (Berkeley: University of California Press, 1999), and especially to my *Les Aventures de la valeur. Pour une nouvelle critique de la valeur* (Paris: Denoël, 2003).

Donald Nicholson-Smith (New York: Zone Books, 1994), citations being to section (§) rather than page number, and thus valid for all editions; IS = *Internationale Situationniste* (1958–69), the journal of the group of the same name, citations being to issue number and page; AT = Theodor W. Adorno,

- Aesthetic Theory* [1970], ed. Gretel Adorno and Rolf Tiedemann, trans. Robert Hullot-Kentor (Minneapolis: University of Minnesota Press, 1997); DE = Max Horkheimer and Theodor W. Adorno, *Dialectic of Enlightenment* [1947], trans. John Cumming (London: Verso, 1997); ND = Theodor W. Adorno, *Negative Dialectics* [1966], trans. E. B. Ashton (New York: Continuum, 1973); SIA = *Situationist International Anthology*, ed. and trans. Ken Knabb (1981). Sometimes the English translations quoted have been modified.
- 4 In recent years the term 'society of the spectacle' has been widely used in a journalistic context to refer to the tyranny of television and the like, but Debord himself held the view that the 'mass media' were merely the spectacle's 'most stultifying superficial manifestation' (SS §24). According to Debord, the global structure of all existing societies including those in Eastern Europe, was 'spectacular' – a particularly bold thesis in 1967.

  - 33 Debord, *Potlatch*, p. 205.
  - 34 Theodor W. Adorno, 'Introduction to *Eingriffe: Neun kritische Modelle*' [1963], in *Critical Models*, p. 4.
  - 35 This does not necessarily imply any positive judgment of earlier societies, which experienced other forms of alienation.
  - 36 We see here that the confusion between value and exchange-value, which is clearly a very specific problem of Marx's theory, neglected by

nearly all Marxists, can lead to important consequences: the core of capitalism, and of capitalism alone – namely the fetishistic transformation of human activity into ‘value’ – becomes for Adorno just a particular case of the suprahistorical category of ‘exchange’, based on giving-and-taking-relationships of all kinds, even those with the gods.

37 See Adorno, ‘On Subject and Object’, p. 258.

38 ‘Du Domaine musical à l’Ircam’, interview with Pierre Boulez by Pierre-Michel Menger, *Le Débat* 50, May–August 1988, p. 259.

39 Debord, *Potlatch*, p. 273.

40 The script of this film is in Guy Debord, *Oeuvres cinématographiques complètes* [1978] (Paris: Gallimard, 1994); English translation by Richard

Parry, ‘Howlings in Favor of Sade’, in Guy Debord, *Society of the Spectacle and Other Films* (London: Rebel Press, 1992) and by Ken Knabb, ‘Howls for Sade’, in Guy Debord, *Complete Cinematic Works* (Oakland, CA, 2003).

41 In view of the date, this film may be considered an important step in the radicalization of modern art. Debord asserts that the painter Yves Klein was present at the screening and that the film was the inspiration for Klein’s later monochrome paintings (Guy Debord, *Considérations sur l’assassinat de Gérard Lebovici* (Paris: Gérard Lebovici, 1995), p. 46; trans. Robert Greene (Los Angeles: Tam Tam Books, 2001)).

# Workerism and Critical Theory

Vincent Chanson and Frédéric Monferrand  
Translated by Memphis Krickeberg

Workerism and the Frankfurt School of Critical Theory played a crucial part in the development of the 1960s Italian and German extra-parliamentary left. Both attempted to reactivate the meaning of the Marxian concept of 'critique'. This chapter explores the conceptions of critique developed by these two traditions in order to establish a critical dialogue between them.<sup>1</sup>

Frankfurt School Critical Theory, with *Dialectic of Enlightenment*<sup>2</sup> as its fundamental text, intends to account for the *failure* of the post-1917 revolutionary period, for the rise of authoritarian and fascist political phenomena as well as for the processes of mass culture and integration which characterize its concept of late capitalism. Critical Theory thus represents a tradition rooted in a foundational paradox, i.e., the will to maintain the emancipatory inspiration of critical reflexivity as elaborated in *Traditional Theory and Critical Theory* by Horkheimer while simultaneously acknowledging the closure of political hope and the disappearance of the

historical subject that had been destined to realize it.<sup>3</sup> In contrast, workerism proposes to reopen the question of historical and political antagonism. Indeed the mutations of post-war Italian capitalism, characterized by a massive influx of labour power from Southern Italy in the big factories of the North then in full Fordist restructuring, inspired the members of *Quaderni Rossi* and later of *Classe operaia* to relaunch an inquiry into the class composition of the proletariat in order to establish its revolutionary potential. The emergence of the unqualified 'mass-worker', alien to workers' traditions and identities, hostile to traditional forms of political organization, signalled the irruption of a new type of antagonist subjectivity as well as the beginning of a new cycle of struggle which workerism sought to theorize.

To put it in starkly contrasting terms, melancholic reflections on the 'end of hope' in the wake of 1917 on the one hand, attempts to relaunch the revolutionary movement on the other: Frankfurt Critical Theory and

workerism seemingly belong to different worlds. Should we conclude therefore that dialogue between these two traditions is impossible and satisfy ourselves with opposing historical pessimism to the theory/practice of antagonism? We do not think so. One could for example recall that a text such as *Dialectic of Enlightenment* contributed to the intellectual formation of many *operaisti*, or that *Intellectual and Manual Labour*, a work in which Alfred Sohn-Rethel, a close collaborator of the Institute for Social Research, attempts to derive the categories of the understanding from the forms of commodity exchange, was translated and published by the Institute for Political Science of Padua where Antonio Negri and his friends elaborated the guiding hypotheses of workers autonomy.<sup>4</sup> We could also emphasize the proximity of certain philosophical themes elaborated by Walter Benjamin, Theodor Adorno and Mario Tronti, all of whom rejected the idea of history as progressive<sup>5</sup> and compare the workerist practice of ‘worker’s inquiry’ to the empirical studies carried out by the Institute for Social Research on employees and the authoritarian personality.<sup>6</sup> But we feel that it is primarily the shared intellectual and political matrix of these traditions that allow for a dialogue between Critical Theory and *operaismo*.

## THE LUKÁCSIAN MATRIX

Workerism and Critical Theory’s elaborations are rooted in a common matrix: that of 1920s west-European Marxist tradition of Korsch and, more fundamentally, Lukács. We argue that workerism and Frankfurt Critical Theory represent two possible developments of the two main theses articulated by Lukács in his 1923 seminal work: *History and Class Consciousness*.<sup>7</sup>

In the main article of *History and Class Consciousness*, ‘Reification and the Consciousness of the Proletariat’, Lukács

articulates a critique of capitalism as a reified social totality with a theory of revolutionary praxis. On the one hand, he assigns to theory the task of exposing the various processes through which social relations present themselves as a ‘second nature’, that is, as entirely reified and thus as seemingly removed from any attempt at revolutionary transformation. It is this critique of reification that Critical Theory develops. But, on the other hand, Lukács also explains that the proletariat is the producer of our world and the collective subject of its historicity while at the same time the victim of its workings and the object of its reproduction. For Lukács, therefore, the proletariat represents the only class capable of knowing and transforming the world. And it is the subversive potential of the subjective contradiction entailed in labour-power – as the productive power of capitalist development and as the disruptive power of its further progress – that workerist theories explore.

However, Lukács’ two theses can seem contradictory: if society is totally reified, how can one even imagine transforming it? His solution lies in his conception of political organization. For Lukács, the party is the true consciousness of the false totality. It materializes the knowledge of reification that the proletarians could objectively acquire according to their position in the social relations. Through its actions and slogans, it presents the workers with the image of the political autonomy they can aspire to. By assigning a historical goal to the class, it participates in its very constitution as a political subject. But in order to do so, and inasmuch as revolutionary consciousness is unequally developed among them, it has to be relatively separated from the spontaneous movements of the workers. But this speculative interpretation of Leninist vanguardism seems to merely displace the contradiction between the critique of reification and the theory of proletarian revolution. Indeed, Lukács does not ask nor explain why the party, which is part of the reified totality it aims at transforming, is not itself affected by reification.

With the bureaucratization of the communist movement in the aftermath of the October revolution, it will not be possible to repress this contradiction any longer. This is why we can sum up the *problematique* workerism and Critical Theory inherited from Lukács as follows: given that the latter's 'Leninist' conception of political organization has fallen into crisis, how can one simultaneously criticize the process of reification of all spheres of life under the logic of capitalist wealth, that is value as surplus value, money as more money, and keep open the possibility of an antagonism sufficiently strong to break up the reproduction of the reified social relations and establish an emancipated society? Reification and antagonism represent the two conceptual indicators we will use to explore workerism and Critical Theory.

To that end, we begin by examining how Raniero Panzieri and Friedrich Pollock applied Lukács' idea of an extension of the capitalist logic to the whole of society. Then we consider the conclusions that Mario Tronti and Theodor Adorno drew from their diagnoses. Finally we compare the treatment by post-workerism of the themes of reification and antagonism with the theses developed by Hans-Jürgen Krahl in *Konstitution and Klassenkampf* [*Constitution and Class Struggle*].

## STATE CAPITALISM AND NEOCAPITALISM: THE TOTALITARIAN TURN OF CAPITALISM

The importance of Georg Lukács' *History and Class Consciousness* in twentieth-century thought lies in his synthesis of two major currents of thought which deal with the epochal transformations brought about by industrialization and the concomitant rise of the bureaucratic state in western societies: the *Kulturkritik* developed by Georg Simmel and Max Weber on the one hand, and the social critique represented by Marxism on

the other. For Lukács indeed, capitalism is not just characterized by the exploitation of the 'free' labourer but, also, by a tendency towards the solidification of social relations. The reifying effects of this development express themselves in the type of rationality mobilized by science and philosophy as well as in the way individuals become mere character masks (Adorno) of autonomized social functions. In other words, for Lukács, capitalism is not reducible to a form of 'economy': it constitutes a real historical world, a total system which deeply transforms all aspects of human existence.

The Lukácsian intuition that capitalism should be conceived of as a totality is fundamental to the theory of 'state capitalism' developed by Friedrich Pollock in the 1940s. It is also fundamental to the theory of 'neo-capitalism' that was elaborated at the beginning of the 1960s in the pages of *Quaderni Rossi* by Raniero Panzieri, a thorough reader of both Lukács and Pollock.

### **Friedrich Pollock: The 'Statification' of Capital and the Primacy of Politics**

With the concept of 'state capitalism', Pollock seeks to systematize the understanding, shared by numerous representatives of 'Western Marxism',<sup>8</sup> that all developed countries, ranging from Nazi Germany, western democracies (including New Deal Keynesianism in the United States), to the Soviet Union, are heading, to various degrees, towards forms of 'administered capitalism'. Presented as a simple 'ideal-type', state capitalism is actually understood to constitute a new *phase* of capitalist development. From a technical point of view, state capitalism first implies the development of industrial production on a massive scale as well as the elaboration of basically Keynesian policy tools for adjusting production and consumption, thereby precluding the possibility of economic crises. From an institutional point

of view however, state capitalism is characterized by the separation of capitalist property from the function of management as well as by the concomitant transfer of the economic functions of the individual capitalists to the state which acts as a 'collective capitalist'. Pollock thus conceives of the market as a form of mediation between production and consumption characteristic of liberal capitalism and argues that this market-mediated form of social reproduction is in the process of giving way to bureaucratic planning. Commodities no longer objectify the socially necessary labour time required for their production – *abstract labour* – but instead the political requirements of population control, *concrete domination*.<sup>9</sup> This diagnosis constitutes the objective basis of the dystopia of Western rationality that Adorno and Horkheimer elaborate in their *Dialectic of Enlightenment*, according to which the totalitarian character of domination in late capitalism represents the original domination of external and internal nature in the form of quasi systemic processes.

However, contrary to what Adorno and Horkheimer suggest in the *Dialectic of Enlightenment*, for Pollock capitalist planning does not imply the complete depoliticization qua *integration* of the social conflict, but its *displacement* from the economic sphere to the political-bureaucratic sphere. In state capitalism, the main contradiction does not necessarily appear in the form of the class antagonism between labour and capital but rather in the form of an opposition between the state and a society that has been reduced to 'an integrated unit comparable to one of the modern giants in steel, chemical or motorcar production'.<sup>10</sup> When the whole of society transforms itself into a factory organized by the state, class struggle transforms itself into a conflict between those who have at their disposal the political means of coercion and those they govern, or pretend to govern, a conflict whose major issue can be summed up as follows: who decides which needs deserve to be satisfied

and upon the way and means of satisfying them?

### **Raniero Panzieri: Neocapitalism and Workers' Centrality**

In 'Surplus-Value and Planning', Panzieri adheres faithfully to Pollock's analyses when it comes to thematizing economic planning in what he calls neocapitalism. He identifies as neocapitalist in character the scientification of the production process, the growing importance of finance capital in the accumulation cycle, including the regulation of competition through formation of monopolies and financial concentration of credit in the form of big banks. According to Panzieri, these phenomena render obsolete the opposition between 'the anarchy of the market' and the 'factory despotism' on which the identification of communism with planning had traditionally rested.<sup>11</sup>

For Panzieri however, these transformations do not suggest its mutation into a statist mode of production. Instead they allow us to grasp what is specific about capitalism as a coherent and unified mode of production; not competition but planning. Building upon the analyses of cooperation developed in chapter 14 of *Capital*, Panzieri indeed reminds us that capitalism does not become socially dominant before having subsumed the process of production in real terms, that is, by totally restructuring it to achieve conformity with the requirements of valorization. The paradox of real subsumption is that it mystifies the historical specificities of the capitalist mode of production. When the valorization process transforms the labour process into a process of valorization, the material means of production seem to become 'natural' embodiments of value. Similarly, the technical rationality as well as the despotic organization of cooperation reified in the machine system present themselves as the trans-historical conditions of the development of the productive forces. In this perspective, the

identification of socialism with the liberation of productive forces from the fetters imposed upon them by the relations of production turns out to be nothing other than the political reflection of real subsumption: a second-degree fetishism.

In fact, as Panzieri explains, the main vector of real subsumption is planning. Capitalist planning has to be conceived of as the immediate unity between the alienation of the worker's cooperative capacities in the machine system on the one hand, and the appropriation of those capacities by the capitalist on the other. Hence, whereas for Pollock capitalist planning depoliticizes the relations of production, for Panzieri it constitutes on the contrary a form of class struggle that is intrinsically political i.e., it characterizes the economy as entirely antagonistic. Thus as the different 'workers' investigations' conducted by the *Quaderni Rossi* group showed, workers are led by their daily experience not only to demystify the reified forms of capitalist valorization but, also, to organize their own resistance beyond individual revolt or trade unions organization. In conclusion, the extension of despotic planning from the factory to society, from the process of production to the process of circulation, makes factory struggles (workers' counter-planning in the workshop) appear retrospectively as the fundamental condition of capitalist crisis.<sup>12</sup>

## POLITICS OF THE NON-IDENTICAL

Both Pollock's theory of state capitalism and Panzieri's analysis of neocapitalism point towards the emergence of new forms of social negativity in administrated capitalism. Within this theoretical-political constellation, Adorno's intervention proves to be deeply original as it consists in conceiving of negativity as such under the category of the 'non-identical', independently of its subjective incarnations: 'in the unreconciled

condition, non-identity is experienced as negativity'.<sup>13</sup>

### ***Theodor Adorno: Administered World, Real Abstraction and Damaged Life***

A number of texts and conceptual elaborations of Adorno discuss the Pollockian idea of a historical period characterized by state domination and bureaucracy. In 'Late Capitalism or Industrial Society' Adorno writes,

Contemporary society exhibits, in spite of all assertions to the contrary, as its dynamism and increase of production, static aspects. These include the relations of production. These are no longer merely the property of the owner, but of the administration, all the way to the role of the state as total capitalist.<sup>14</sup>

Ever since *Dialectic of Enlightenment*, Horkheimer and Adorno defend the thesis of a life totally administered in late capitalism. A thesis which tightly connects the critique of rationality (as instrumental rationality, as the logic of objectification and mutilating subsumption) to the critique of capitalist forms of socialization (commodity exchange as the space of social synthesis, as the mode of social interactions instituting a regime of domination of abstract-value). 'The critique of society, Adorno writes, is a critique of knowledge and vice versa',<sup>15</sup> so that the categorical abstraction of philosophical discourse reflects the abstraction operated through the process of exchange. Thus, Adorno's and Horkheimer's theoretical apparatus aims at no less than thinking through the isomorphic rationality and the social logic of exchange, thereby conferring to the hypothesis of total administration its full philosophical significance. One and the same process of reduction through equivalence, quantification and objectification takes place here:

The [exchange] principle, the reduction of human labour to the abstract universal concept of average

working hours, is fundamentally akin to the principle of identification. [Exchange] is the social model of the principle, and without the principle there would be no [exchange]; it is through [exchange] that non-identical individuals and performances become commensurable and identical.<sup>16</sup>

In his sociological writings, Adorno concretizes this thesis: the cultural industry, consumer society, the bureaucratic control of mass movements, the integration of all singularities under the regime of commodity abstraction lead him to a conception of the social in which phenomena of standardization and homogenization play a leading role. Capitalism is not only characterized as a system based on exploitation but also as a devalued, mutilated and damaged 'life form'. Henceforth the notion of 'administered world' has to be interpreted as an actualization of the Lukácsian critique of reification. From this perspective, notwithstanding its Pollockian accents, the Adornian notion of 'administered world' cannot be merely reduced to the thesis of the primacy of political domination. Indeed, as indicated by the above quote, Adorno maintains a conception of domination based on the capitalist social relations of production and their appearance in equivalent exchange relations that are governed by law. Reification thus appears as a modality of the abstract form of social domination imbedded in the logic of value production. And correlatively, the 'non-identical' appears as what is mutilated by social abstraction, and as what resists the false totality.

What Adorno opposes to reification is indeed not social and political antagonism, as in Lukács or Panzieri, but the 'non-identical'. Inasmuch as social antagonism is innate to the false world, the only way to disrupt the false totality is to consider negativity as the resistance of the heterogeneous. Negativity, for Adorno is less related to a 'strategic' problematique than to a conception attached to the *micrologic* paradigm. Indeed, for the author of *Minima Moralia*, the inversion of the figure of the revolutionary producer into

the figure of a mass consumer as well as the internalization of capitalist ideology into the social psyche entails fabrication of the individual as a consumer beyond class. Whereas Adorno's contemporary Marcuse, on the basis of a similar diagnosis, concludes that social conflict has been externalized towards marginal, counter-cultural figures,<sup>17</sup> Adorno embarks on a phenomenology of damaged life whose challenge resides in capturing those rare moments of negativity which resist capitalist modes of subjectivation (for example the autonomous work of art or what Adorno calls 'knowledge Utopia', which he conceives of as a form of 'critical-epistemic' messianism). Paradoxically, Adorno's reluctance to interpret the various events and upheavals of his time (student revolts, counter-culture, anti-imperialist and feminist struggles) as manifestations of a revolutionary conjuncture positions him as a coherent Marxist. Indeed, if it is true that late capitalism has completed the totalization and mutilation of experience, then no *praxis* can claim any emancipatory privilege. With his rejection of activism, Adorno confronts us with a dilemma which, according to Hans-Jürgen Krahl, the traumatic experience of fascism prevented him from tackling:<sup>18</sup> 'how can a capitalist society come into contradiction with the production process of capital?'.<sup>19</sup>

### **Mario Tronti: Capitalist Totality and Worker Partiality**

Tronti's *Workers and Capital*, published at the same time as *Negative Dialectics* (1966), reformulates the Panzierian description of neocapitalism in a quasi Adornian manner.<sup>20</sup> It is true, Tronti explains, that social experience is from now on entirely determined by the mediations through which capital reproduces itself as a social totality. For the Italian philosopher, 'the social' is indeed not the contrary to 'the economic'. 'The social' is what materializes constant capital

(the infrastructures, urbanity, including means of transportation and communication) and what unifies the cycle of capitalist accumulation. To take but three examples: commodity exchange connects all individuals with each other as sellers and buyers, schools socialize labour-power and the family reproduces it. Hence, for Tronti, society objectifies itself in the form of social capital:

At the highest level of capitalist development, the social relation is transformed into a moment of the relation of production, the whole of society is turned into an articulation of production, that is, the whole of society lives as a function of the factory and the factory extends its exclusive domination to the whole of society.<sup>21</sup>

The term social capital thus connotes a transformation of the capitalist production relations into society at large, into a social factory. Tronti thus speaks about the emergence of an 'organic' unity of 'capitalist production and bourgeois society'.<sup>22</sup> His reading of capitalist transformation appears as a politicized version of some of Adorno's arguments. As Tronti points out, capitalist objectification of social experience implies a socialization of capital to the extent that the latter tends to identify with society 'in general' and therefore disappears in the experience of society as a historically specific mode of production. But this process of fetishization of the social relations contains a moment of truth: when workers painfully experience their existence as character masks of 'variable capital' in their daily social life, they become totally alien to society as well as to themselves as mere carriers of labour power. From this perspective, the integration of the proletariat into the social reproduction of capital cannot be unilaterally conceived of as disempowering. In fact, it also implies an increasing vulnerability of capital to the different forms of social refusal practised by workers (political organization, sabotage, absenteeism, illegal actions) as well as to various subversive actions by which proletarians negate themselves as mere

personifications of valorization. Tronti's account thus suggests that the Frankfurt School critique of mass consumption, cultural industrialization and their reifying effects needs to be complemented with an analysis of the composition of the mass-worker and its antagonistic potential, for 'within the class, only the "alienated" worker is truly revolutionary'.<sup>23</sup>

From an Adornian perspective, however, we should recognize that when the universal realizes itself in the form of total domination of value, the identification of the proletariat with a 'universal class', as put forward by Lukács, loses all of its critical force. It is precisely for this reason that Tronti claims that the proletariat cannot be revolutionary whenever it conceives of its actions as expressing some kind of general interest against the private interest of capital. On the contrary, it becomes revolutionary when it asserts its particularity, its partiality in its confrontation with capital. Consequently, in this struggle what is at stake is the struggle of the worker against its capitalist identity as a personification of labour power. This struggle, then, presents a form of self-negation.<sup>24</sup> This self-negation amounts to the affirmation of its *non-identity* in and against the capitalist objectification of social totality. It is then and only then that damaged life can be recomposed into an antagonist class.

## BEYOND POST-WORKERISM?

From Lukács to Tronti via Pollock and Adorno, a common thesis comes to the fore that 'the more that capitalist production develops, the more the capitalist form of production grasps all the other spheres of society, invading the whole network of social relations'.<sup>25</sup> This thesis can be developed in two directions.

The analogy between factory and society can first be taken literally. This implies extending the Marxian category of

'productive labour' to all social practices and consequently subsuming the most heterogeneous social strata in the concept of 'working class'. This solution was adopted by workers' autonomy groups under the concept of 'social factory' in the 1970s and further developed in post-workerism. But, it is also possible to study the different fragmentations produced within the proletariat by the extension of 'the capitalist form of production' to the 'network of social relations'. This is the path explored by Adorno's student Hans-Jürgen Krahl in his *Konstitution und Klassenkampf*.<sup>26</sup>

### **Antonio Negri: Social Factory and 'General Intellect'**

Antonio Negri's major contributions to workerism fell into the interval between the foundation of *Potere Operaio* in 1969 and its dissolution in 1974. In his hands the nebula of 'autonomy' branches out into two main directions: on the one hand, it stresses the correlations between the institutional transformations of the state and the restructuring of the capitalist mode of production; on the other, these transformations point towards the coming of a new antagonistic subject. Concerning the former, Negri examines the growing integration of transnational firms and states that transforms the state into a sort of transmission belt of global capitalist rationality. From texts such as *Crisis of the Planner-State* or *Proletarians and the State*, one can thus retrieve the Pollockian image of a vast collective capitalist despotically exploiting a society that has long since transformed into a vast (global) factory.

For Negri, the emergence of multinational enterprises and their impact on nation-states corresponds to a restructuring of the mode of production not yet qualified as 'post-Fordist' but already characterized by the externalization of production, the rise of services and telecommunications and

flexibilization of labour-power beyond the neocapitalist political economy as analyzed by Panzieri and Pollock, too.<sup>27</sup> All these phenomena lead to a dissemination of cooperation previously concentrated in the factory throughout the whole territory. Hence, Negri argues that this 'productive unification of the social'<sup>28</sup> results in the emergence of a new 'class composition': the 'socialized worker' composed of figures such as the scientist employed by the petrochemical plant of Porto Marghera, the female worker recently hired at the assembly line of Fiat to replace formerly specialized workers now turning to independent entrepreneurship or home-based work, the unemployed youth, the precarious but highly qualified student alongside other actors from counter-cultural movements.<sup>29</sup> For Negri, the unity of this 'socialized worker' is not sociological, but political: all the characters that compose it tend to engage in the same antagonistic practices such as absenteeism, sabotage or the refusal to pay electricity bills or rents ('self-reductions'). Inasmuch as these practices are practices of autonomization from the capitalist relations of production, they need to be unified by a 'party of autonomy' whose function is to establish a real proletarian counter-power in Italian cities: 'Within this jungle of the social factory [...] the vanguards can construct focal points of insurrectional struggle around which the masses of the exploited can reassemble'.<sup>30</sup>

Post-workerism's central hypotheses can all be found in Negri's texts drafted during the 1970s. The 'Empire' or the 'Multitude' have indeed replaced the 'Planner-state' and the 'socialized worker' but a shared diagnosis unifies the contemporary elaborations of Antonio Negri and his comrades with the programmatic texts of *Potere Operaio*: inasmuch as all social practices are now productive practices, social labour has transcended the command of the law of value which now only survives in parasitic forms of political control. As explained by Carlo Vercellone, we have therefore moved to a new *phase*

of capitalism – ‘cognitive capitalism’ – characterized by the coming hegemony of immaterial labour in the process of capital valorization. ‘Immaterial labour’ designates all those activities which – irrespective of the branch of social labour division – mobilize social knowledge accumulated by and within social totality (the ‘General Intellect’). In this new phase of capitalism, accumulated value does not primarily objectify the quantity of labour time expended in production, but rather the quality of knowledge invested by workers during the process of production. To the extent that acquiring knowledge depends on a whole complex of relations which individuals accumulate during their social life, capital will tend to retire from production and satisfy itself with privatizing the collective product of cooperation through patents, rents or stocks.<sup>31</sup>

Notwithstanding its undeniable theoretical and political interest, this picture of contemporary capitalism requires critical scrutiny. From the point of view of the critique of political economy, this depiction of contemporary capitalism tends to understand capital not as a social relation but as an instrument of control externally imposed upon an autonomous process of production. From the point of view of a political critique of economy, this conception of capital consequently leads the cognitivists to identify the development of the productive forces with a tendency towards the abolition of capitalism and hence to a reassertion of a certain technological determinism which Panzieri had originally opposed. Finally, as already emphasized by Sergio Bologna in *The Tribe of Moles*, the homogenization of differentiated labour processes which capital subsumes in the figure of the ‘socialized worker’ or the ‘multitude’ can prove counterproductive for identifying and going beyond the different cleavages which decompose the proletariat.<sup>32</sup> Insofar as the international division of labour – which articulates both high-tech firms and industrial exploitation, neo-slavery and flexible wage labour – reflects itself in every social

formation, workers are structurally divided along revenue, qualification, gender and race lines. Thus, any attempt to understand and possibly transcend these cleavages calls for a differentiated analysis of real subsumption of the social within contemporary capitalism. To this end, we now turn to Hans-Jürgen Krahl’s contribution.

### **Hans-Jürgen Krahl: Dialectics and Organization**

An emblematic figure of the new West German student left and ‘notorious’ disciple of Adorno’s, Krahl tried to elaborate a differentiated concept of capital as a constituted social totality. As leader and main theoretician of the SDS (*Sozialistischer Deutscher Studentenbund*), he embarked on a critical dialogue with Adorno that culminated in his single posthumously published book (a collection of articles, that was introduced and edited by Detlev Clausen) which was rapidly translated into Italian and played a central role in the development of the ‘autonomia’: *Konstitution und Klassenkampf*. From his various reflections assembled in these articles, it appears that the Adornian conception of the negative as non-identity or that Tronti’s localization of antagonism within the confines of the factory prove to be one-sided. Opposed to these two ‘reductionisms’, Krahl intends to reevaluate the antagonist potential of labour as it expresses itself in different instances of the social totality. This perspective situates him uniquely at the point of articulation between Critical Theory and workerism.

Committed to thinking through and organizing the student struggles, Krahl poses a decisive question: can one apprehend the form of anti-authoritarian consciousness which emerges at the time as a form of class consciousness?<sup>33</sup> His answer is quasi workerist in method because it amounts to understanding late capitalism from the standpoint of the new forms of

radicality it generates. It comprises three moments.<sup>34</sup> Krahel first explains that the student movement corresponds to the emergence of the figure of the collective worker on the political scene. If this is the case, he continues, then the collective worker is the form of subjectivity which is implied by the integration of intellectual labour (be it in scientific research or in university education) in the process of capital reproduction. It is precisely this integration of the intellect to production, concludes Krahel, that makes the student movement a form of expression of the dialectic of reification and self-realization specific to the 'dual character of labour' (concrete and abstract labour) identified by Marx.<sup>35</sup>

Although Krahel shares with post-workerist theoreticians the diagnosis of the growing subsumption of knowledge under capital, creating the so-called knowledge industry that characterizes contemporary academia, he distinguishes himself from post-workerism by claiming that this process is not related to a logic of *homogenization* of all spheres of social totality, nor to a *universalization* of proletarian experience and subjectivity but rather to a *diversification* of the forms through which the capital/labour contradiction manifests itself. Indeed, for the author of *Konstitution und Klassenkampf* this contradiction exists nowhere else than in the different conflicts it generates. Workers' struggles are only one expression of capitalistic conflicts and are in no way privileged expressions of the social antagonism, which also entail student or feminist struggles. Insofar as the 'collective worker' is not an unequivocal 'Subject' but a set of contradictory subjectivities, Krahel's elaboration enables us to reformulate strategic problems in contemporary terms: how can we ensure the convergence of different social struggles on the basis of their respective autonomy? Tackling this problem collectively is likely the big task ahead for anyone wanting the traditions of workerism and Critical Theory to flourish and grow at their intersection.

## THE GHOST OF LUKÁCS AND THE QUESTION OF ORGANIZATION

We began our inquiry on the relationship between workerism and Critical Theory by relating both traditions to Lukács' articulation of a critique of reification with a theory of revolution. As a conclusion, we would like to emphasize that both traditions tried, although differently, to articulate anew reification and antagonism rather than unilaterally develop one aspect of Lukács' theoretical construct at the expense of the other. Indeed, from Pollock to Adorno, Critical Theory always complements its analyses of capitalist society by an attempt to track the elements of negativity which disrupt the bureaucratic totalization of the social world. And, from Panzieri to Tronti, workerism always interprets the transformations of capitalism from the standpoint of the antagonist subjectivity these transformations depend on. Without acknowledging that negativity and conflict is irreducibly part of the false reality of capital, no critical thinking is possible.

Since Lukács, the question is thus: how to organize this negativity and what is its most appropriate organizational form? We argued that the elaborations of workerism and Critical Theory stem from the crisis of the Leninist answer that Lukács gave to this question. But this crisis does not imply the abandonment of any inquiry about the political organization of antagonism and the organizational means of the struggle for revolutionary ends. From his reflexions on the 'party of autonomy' to his contemporary appeal to a 'becoming-Prince of the multitude',<sup>36</sup> Negri indeed never stopped looking for political forms which could institutionalize the disseminated resistances capital generates along the whole network of social relations. As the example of Krahel shows, the Frankfurt School is no stranger to such political concerns. *Konstitution und Klassenkampf*, we argued, is to be read as a treatise on the dialectics of fragmentation and unification of the proletariat produced by the

capitalist totalization of the social world. The question of political organization thus seems to haunt anyone who, following Lukács and his successors, seeks to elaborate a ruthless critique of the present while keeping the hope of a better future open.

# Open Marxism and Critical Theory: Negative Critique and Class as Critical Concept

Christos Memos

Revolutionary transformation has a tradition that must continue. (Horkheimer, 2007: 104)

Dialectics opens concepts. It focuses on social contents and does so by moving within their social forms. It is tasked with subverting the economic categories by revealing their social basis. (Bonefeld, 2014: 68)

## INTRODUCTION

‘Every age’, according to Walter Benjamin, ‘must strive anew to wrest tradition away from the conformism that is working to overpower it’ (1969: 255). In this astute observation, Benjamin opposes any kind of falsification and forgetting of the struggles against exploitation and repression. He emphasizes the dangers of dogmatism, orthodoxy and conformism that, have repeatedly stifled the advancement of radical and emancipatory movements and, by extension, the interests of the oppressed. He lays the groundwork for a subversive thought that

seeks to draw a line of demarcation between critical social theory and the survival of positivism – of whichever variety. Benjamin’s perspective succeeds in encapsulating the work of the early Frankfurt School that has provided the anti-capitalist movement with valuable resources upon which to draw in the fight against positivism. Rejecting the appearance of social and economic relations as supposedly natural phenomena, they were critical of any naturalization of society, and adamant in their denunciation of evolutionary conceptions of history and the philosophy of progress. Critical theory’s conceptualization of society aimed to reveal the social world as the product of sensuous human activities. In doing so, its critical intention was not to attempt to humanize inhuman conditions, but to abolish social injustice with the aim of creating a society of the free and equal. However, during the complex progression of the twentieth century, reason often became ‘a poor ally of reaction’ (Horkheimer, 1972: 271). Reason was

‘forced to live in the shadows’ (Agnoli, 2003: 28), thereby renouncing its purpose to undertake incorruptible criticism and to fight barbarism in all its varieties. In other instances, as Agnoli (2003: 29–30) noted, with a biting irony, love prevailed: love for global justice, love for freedom and the democracy of the markets, love for the rights of man, for constitutional patriotism, communicative action, systems and life-worlds. In other examples, love was expressed for party loyalty, for workers’ parties and their leaders, for unconditional discipline, subordination to the party line and to ideological monolithism. In contradistinction to this affirmative, constructive love, the early and radical Octavio Paz, in his *Piedra de Sol* [*Sunstone*], supplies us with a different, subversive meaning of love: ‘to love is to battle, to open doors, to cease to be a ghost with a number forever in chains, forever condemned by a faceless master’ (1991: 37). To love means to fight, refusing to ‘turn the mill that squeezes out the juice of life, that turns eternity into empty hours, minutes into prisons, and time into copper coins and abstract shit’ (1991: 39).

This chapter argues that in the ongoing battles to unlock doors and open up concepts and fissures, with a view to opening up history itself in order to pave the way forward for class struggle, the Open Marxist tradition continues to advance the critical purpose of the early Frankfurt School, and of critical theory, in the direction of critical confrontation with traditional theory and positivism. Maintaining a critical strand, that originally manifested as critique of traditional theory, and of the prevailing positivism and scientism in the Marxist tradition of the Second and Third Internationals, Open Marxism constitutes the most recently renewed attempt to critique mechanistic interpretations of Marxism and any form of evolutionism, as well as naturalized conceptualizations of history and society. More precisely, the chapter focuses on the ways in which the Open Marxist tradition carries forward critical

theory, with regards to negative critique and the critique of political economy as critical social theory. Through a consideration of ‘exposition, interpretation and contextualisation’ (Clarke, 1994: 12), this chapter follows the development of Open Marxism: from Axelos’s original and critical use of the term in the 1950s, to Agnoli’s work of the 1980s, to the work of Clarke, Bonefeld, Gunn and Holloway – developed within the framework of the Conference of Socialist Economists (CSE) – since the 1990s. It will argue that the evolution of the Open Marxist tradition has to be understood as a process of interaction with socio-historical reality. Taking into account the complex history of the Open Marxism tradition, and the changes to the meaning of ‘Open Marxism’ that occurred over time, it argues, in line with Schmidt, that ‘historical process is constitutive for the theoretical process and modifies its categories’ (1981: 70). The second section argues that what makes Open Marxism specific, and constitutes common ground throughout its development phases, is its use of critique as a *negative* and *destructive* critique. This section scrutinizes the notion of critique, establishes connections, and identifies key differences in the thought of the members of this particular Marxist tradition. Finally, the chapter focuses on the elaboration of the critique of political economy as critical social theory seen in the CSE Open Marxist School, and discusses that school’s conception of social practice as a critique of the notion of class.

## MARXIAN THEORY AS AN OPEN-ENDED PROJECT

The close of the Second World War signalled a period of intense intellectual ferment in France. Liberal political institutions were heavily undermined and strongly criticized, and past intellectual traditions, such as ‘analytical rationalism’, were challenged and

forcefully disputed. The establishment of German military authority in 1940 and the role played by the resistance movements during the years of German occupation led to a turn in intellectual discourse towards the critical philosophical tradition, whose conceptual framework was regarded as a highly suitable tool for the undertaking of in-depth analysis of the events and preoccupations of the time. In this context, a renewal of interest in Hegel's work, in particular, and primarily, in *The Phenomenology of Spirit*, and in the radical interpretation of that work as supplied by Kojève and Hyppolite, occurred alongside a growth of interest in Marx's early writings, and especially in his *Economic and Philosophical Manuscripts of 1844*. Additionally, Husserl and Heidegger were brought into the emerging critical dialogue, or, were read in conjunction with Marx's Paris manuscripts. Hence the French intellectual landscape witnessed the emergence of a variety of philosophical strands, such as Hegelian Marxism, Heideggerian Marxism, Freudo-Marxism, Phenomenological Marxism and Existentialism. Opposed to the economism of the Second and Third Internationals, these schools of thought sought to locate the philosophical content of Marxism at the epicentre of their endeavour to renew Marxian theory and overcome its limitations and shortcomings. Nonetheless, despite the flourishing of these disparate versions of Marxism, each of which claimed to provide a non-dogmatic reading of Marx's work, the ideological power that the orthodox Marxism of the French Communist Party exerted over French political and intellectual developments remained powerful and dominant. Under these circumstances, and leaving Jean-Paul Sartre and the journal *Les Temps Modernes* aside, the journals *Arguments*, *Socialisme ou Barbarie* and *Internationale Situationniste* created a public forum for the critique of dogmatism and orthodox Marxism and functioned as a laboratory for the development of critical and radical ideas.

More specifically, the journal *Arguments*, which began publishing in 1956 and folded in 1962, developed into a critical space for theoretical debate that sought to transcend the sectarianism of the Left and strove towards an 'opening up of Marxism towards new intellectual currents and new social phenomena' (Poster, 1975: 212). *Arguments* was edited principally by scholars who attempted to simultaneously remain affiliated to the Left, being mostly ex-communists, and to maintain a critical perspective, while also adopting a critical distance from the Cold War period's anti-communist hysteria. *Arguments* brought together, as editors or contributing authors, intellectuals – such as Edgar Morin, Jean Duvignaud, Pierre Fougeyrollas, Maurice Blanchot, Gilles Deleuze, Roland Barthes, François Fejtö, Henri Lefebvre and Kostas Axelos – who sought to think beyond 'orthodox Marxism' and to formulate counterarguments to the ideological use of Marx. Axelos joined the editorial board of *Arguments* in 1958, and from 1960–2 acted as its editor-in-chief. He conceived of *Arguments* as a collective project, with the goal of elaborating an 'open Marxism, of a revised and corrected Freudo-Marxism and finally, a post-Marxism and post-Heideggerian thought' (Elden, 2005: 27) and he emphatically stressed that Marx is not 'an orthodox Marxist' (Axelos, 1976: 302). Contradicting Althusser, Axelos emphasized that Marx's thought, which evolved in stages, must be seen as a unitary process, as 'there are not two Marxes, the early and the late, the youthful and the mature', but rather, 'two periods integrally bound together' (Axelos, 1976: 45). In his view, 'one cannot propose a one-dimensional approach and reading of Marx. If someone did so, she would be dogmatic' (Memos, 2009: 134). Nonetheless, Axelos's analysis of Marx's thought, and in particular his exposition and interpretation of Marx's concept of alienation, is almost exclusively concerned with Marx's early writings, and principally with the *Economic and Philosophical Manuscripts of 1844* – he

pays far less attention to the study of *Capital*. Axelos grounded his interpretation of Marx in the Paris *Manuscripts of 1844*, since they contain the ‘central point’ of Marxian thought, retaining a ‘place of absolute centrality’ and being ‘richest in ideas of all Marxian and Marxist writings’ (1976: 46, 45). Axelos’s adoption of this approach is rooted in his opinion that transcending the deformation of Marxism necessitated an opening up of Marxist thought, and he coined the term ‘Open Marxism’ (Axelos, 1957). In Axelos’s own words:

By using the term ‘Open Marxism’, I meant a theoretical current – which never came into being as a movement – and which, in opposition to Marxism-Leninism-Stalinism-Maoism, did not render Marxism an ideology of power, but attempted to pose fruitful questions and demystify the so-called ‘existing realizations’. Lukács and Korsch made an effort, but their contemplative measures were limited. Any kind of action, political or non-political, cannot be defined *a priori*. (Memos, 2009: 133)

The core of Axelos’s approach stemmed from his position that ‘more than science, it is technique that affects Marx’s enterprise’ (1976: 19). Marx’s technicism constituted a significant part of what can be called the dogmatic element in his thought, and led to the forestalling of many lines of critical thought. It also made possible the reification of Marx’s thinking and the development of orthodox and closed Marxism. Closed Marxism took on various forms, including sects of Marxist-Leninist, Stalinist and Trotskyist persuasions and the established ideology of bureaucratic regimes, all of which promoted the technicist elements of Marx’s work. In consequence, technicism became dominant in both the theory and historical realization of orthodox Marxism, and the sectarian ‘-isms’ prevailed, thereby transforming Marxian thought into systematized theory and reactionary dogma. Axelos’s undertaking to overcome the metamorphosis and closure of Marxism entailed the deployment of a mode of thinking that sought to

broaden horizons and to render Marx as more problematic a thinker than is actually the case. This is a discourse that foregrounds questioning thought and complex enigmatic responses. Drawing upon Heraclitus’s poetic thought, Axelos’s Open Marxism is principally articulated as a project that seeks to open up Marx’s more original and creative thinking (e.g. the concept of alienation) by entering it into a productive dialogue with other thinkers, including Hegel, Nietzsche and Heidegger (Axelos, 1966), with the aim of bringing it back to a ‘much more basic wandering’ (Axelos, 1970: 107). Axelos paid particular attention to reading Marx in conjunction with Heidegger, since, despite the considerable incompatibilities in their respective work, Axelos was impressed by what he perceived to be a ‘concurrent affinity – between what Marx calls *alienation* and Heidegger *oblivion of Being*’ (Memos, 2009: 135). Therefore, in his work on Marx and Heidegger, Axelos sought to elaborate a future thought, one that could think through them and eventually ‘beyond them’ (Axelos, 2015b: 37).

In the late 1960s, renewed interest in radical politics and the resurgence of social, anti-capitalistic and anti-authoritarian movements facilitated the revival, and continuation of, the legacy of critical Marxism and the Frankfurt School’s discursive traditions. In Germany, this renewal found expression, in part, in the re-assessment, and further development of, Marx’s critique of political economy by the ‘new reading of Marx’ – as instigated by Alfred Schmidt, Hans-Georg Backhaus and Helmut Reichelt – or, as a supplemental strand of the critique of political economy, and critique of the political, and of the state, undertaken primarily by Johannes Agnoli. In his influential *Die Transformation der Demokratie* [*The Transformation of Democracy*] in 1967, as well as in his other critiques of politics, Agnoli interrogated the transformation of ‘parliamentary democracy’ into a representational mode of political power and domination, and supplied us with

a profound critique of the form of the capitalist state. In contrast to Axelos, Agnoli's devastating assessment of 'constitutional oligarchy' and parliamentarism (Agnoli, 2012a: 208) resulted not from situating Marx's work in a 'productive dialogue' with Nietzsche or Heidegger – but rather, his critique of the transformation of democracy and the institutionalization of a radical opposition derived from his 'productive dialogue' with Left communism, anarcho-syndicalism and revolutionary syndicalism (Agnoli, 2012b: 153). In his debate with Ernest Mandel with regard to the meaning of Marx's 'critique' (Agnoli and Mandel, 1980), and against the background of Althusser, in 1977, publicly announcing a crisis in Marxism – which sparked impassioned debates in France and Italy – Agnoli employed the term 'Open Marxism' in an attempt to distinguish his own critical reading, and use of Marxian thought, from that of 'Orthodox Marxism' (1980: 7). For Agnoli, Marx is concerned primarily with the categories of 'critique and destruction' (1980: 148) and his critical project of social emancipation amounted in no sense to a *Weltanschauung* [worldview]. By underscoring the unity of theory and practice, Agnoli's Open Marxism indicates that concepts and categories remain open and incomplete in that the 'heresy of reality' and the unpredictability of class struggle question the validity of the meaning of concepts. (Agnoli and Mandel, 1980: 9, 148; and Bonefeld, 1992: 84). History is not construed according to pre-established concepts and norms; it is, rather, the case that, as Open Marxism argues, critique connects conceptualization and unpredictability, opens theory up to the practice of definite social relations, and opens up practice to theory (Bonefeld, 1992: 85).

A few years later, in 1991, the demise of the USSR and the disintegration of soviet Marxism denigrated all the existing versions of 'closed' and traditional Marxism. This was not simply another crisis of Marxism, of a sort that put into question its validity – the 'end of history' was announced, and the triumph of

the global-market society was seen as eliminating any alternatives to capitalism. Against a backdrop of necrology, renunciation of radical praxis and ideas, withdrawal and pervasive pseudo-consensus, eventually – as a consequence of the deep dissatisfaction with disintegrating Marxist orthodoxies and dogmas – a resurgence of strong interest in critical, open forms of Marxism came about. Traditional versions of Marxism were severely criticized and the historical tendency to uphold the party and the state as means of emancipation, and instruments of revolution, was discredited and rejected. In Britain, and specifically within the work of the members of the Conference of Socialist Economists (CSE), this process of reassessment fostered the development of a critical strand that owed much to a critical Marxist tradition elaborated, inter alia, by Luxemburg, the early Lukács, Korsch, Pannekoek, Rubin, Pashukanis, the early Frankfurt School, Rosdolsky, Johannes Agnoli and the tradition of 'autonomist' Marxism (Bonefeld et al., 1992a: xii). This discursive development crystallized, in the form of the work of a group of critical theorists, under the rubric of 'Open Marxism' who included, among others, Simon Clarke, Werner Bonefeld, Richard Gunn and John Holloway. As distinct from Axelos's understanding of the term 'Open Marxism', *openness* in this context referred to the 'openness of Marxist categories themselves' (Bonefeld et al., 1992a: xi). That was an 'openness on to practice' and had as its initial assumption 'the class antagonism between capital and labour' (Bonefeld et al., 1992b: xi). This openness to the unpredictable, antagonistic character of social reality underlined the Open Marxism's acceptance of the inevitable incompleteness of concepts and categories. Contrary to the traditional Marxist separation of theory and practice, and its reproduction of the dualism between subject and structure, Open Marxism holds that object and subject, objectified structures and class struggles subsist in, and through, an internal relation. This entails that class struggle is viewed as

‘the movement of the contradiction in which capital, itself, consists’ (1992b: xii) and the concept of class is grasped ‘not as a matter of grouping individuals, but as a contradictory and antagonistic social relation’ (1992b: xiii).

Open Marxism does not propose a complete, definitive interpretation of Marx – it aims, rather, to open up a space for a theoretical and practical critique that seeks to pave the way forward, towards a defetishized and emancipated social world. Along with numerous individual and collective publications, the richness and diversity of theoretical and political discussions within the Open Marxist discourse were best exemplified by the three-volume work entitled ‘Open Marxism’, which was published between 1992 and 1995. Together with Holloway’s (2005[2002]) *Change the World without Taking Power* and Bonefeld’s *Critical Theory and the Critique of Political Economy* (2014), they provided the basic outlines for a radical rethinking and re-examination of fundamental Marxian concepts and Marxist categories, rejecting, at the same time, the dogmatism, orthodoxy, determinism and positivism that marked the initial phases in the development of Marxist thought. Open Marxism’s critical undertaking was associated with the journals *Capital and Class* and *Common Sense* (1987–99). In contrast to Axelos’s focus on Marx’s early writings, Clarke, Bonefeld, Gunn and Holloway examined Marx’s work in its entirety. It can be argued that they uncovered a ‘young’, ‘new’ Marx in the ‘mature’ Marx. Their individual contributions are varied and one must not overlook the disparities in the approaches. And these differences do affect the content of their intellectual trajectory and their critical endeavour. However, there is a discerned common foundation to the work of these authors, which, along with its other shared features, result in Open Marxism’s distinctiveness. In his article entitled ‘Open Marxism’ with which Bonefeld (1987) launched the first issue of the journal *Common Sense*, one can identify

the key concepts that determined the future character of what came to be regarded as the CSE Open Marxist School: ‘crisis’, ‘class struggle’, ‘critique and destruction’, ‘demystification’, ‘openness of categories’ and ‘the principle of doubt’. More specifically, the negative character of Open Marxism’s critique, that is, their radical rethinking of the meaning of critique not as a normative and constructive, but as *negative* and *destructive* critique, has defined the common ground of the Open Marxist tradition from the work of Axelos up to the present day. The following section focuses on the subversive character of their critique, which enables connections and mutual lines of development to form alongside points of individual departure.

## DESTRUCTIVE CRITIQUE, NEGATIVITY AND SUBVERSIVE REASON

Marx and Engels envisaged the radical transformation of capitalist social relations through revolutionary, practical-critical activity by the ‘proletarian movement’, which they regarded as ‘the self-conscious, independent movement of the immense majority, in the interest of the immense majority’ (Marx and Engels, 1991: 44). As such, the creation of this radical movement would rely ‘solely and exclusively upon the intellectual development of the working class, as it necessarily had to ensue from united action and discussion’ (1991b: 33). Independent, united action and intellectual growth are the fundamental premises for the movement’s further quantitative and qualitative improvement. The prerequisites to these premises are freedom of expression and independent critical thinking, which are more needed at moments of danger and defeat, and against the survival of positivism that has over and over again predominated the struggles for human emancipation. This independent, living movement of the people becomes aware of its own essence in the process of

class struggle itself. It is in, and through, the unfolding of class struggle that such a movement breaks the continuum of history by the deployment of 'courage, humour, cunning and fortitude' (Benjamin, 1969: 255) and never forgets 'its hatred and its spirit of sacrifice' (1969: 260). Within the long, continuous and autonomous process of social struggles, subversive cunning and refusal – fuelled by rage and hate – constituted the springboard for an ongoing, penetrating criticism of capitalist relations. Yet, during the course of the twentieth century, a tendency towards theoretical conformity overpowered the various existing dogmatic and mechanistic versions of Marxism, and resulted in a less critical and subversive, and more affirmative, Marxist discourse. In contradistinction to Marx's own critical thinking, traditional Marxism was now reduced to mere 'ideology', sterilizing and preserving theory as a codified set of 'holy canons'. The notion of 'orthodoxy' was introduced into the socialist movement, and Marxism turned into a 'scientific *Weltanschauung*', thus becoming a complete(d), and closed, theoretical system. The institutionalization of Marxism reduced it to a reformist and established ideology marked by fatalism, positivism and technicism. The socialist movement transformed from a revolutionary class-struggle movement into a political and social reform movement, and Marxism ceased at this time to develop as a living, and subversive, body of theoretical work.<sup>1</sup>

This transformation, from pro-actively subversive, to fatalistic, entailed the 'positivization' of Marxian thought, in conjunction with the loss of Marxism's radical and critical character, and constituted what Adorno explicitly berated as a 'widespread [...] anti-critical spirit [...] in those whose interest should lie in critique' (Adorno, 2005: 286). Demands for 'positive', 'constructive' and 'responsible' critique neutralized the impact of that critique by limiting the terms of its aims and scope from the outset. Marxist tradition and modes of 'heretical' thought lost

impetus. Appeals to positivity resulted in a debasement of intellectual critical purpose and rendered it 'a mere ornament to the material base which it claims to transcend' (Adorno, 1967: 21). Hence, Axelos, in his work, calls for a ceaseless interrogation, questioning and problematizing of Marx's thought in order to make sense of and to overcome the positivization of critical discourse and the crisis in Marxism. He argues that the crisis is unfolding on three levels: on an economic level, at which Marxism has appeared seemingly incapable of resolving or effectively eclipsing the economic problems of capitalism; on a political level, at which Marxism has failed to solve the question of political power and to address it in a radical way – on the contrary, instead of recycling political power, Marxism has *recycled revolution*, by seizing upon its aftermath as an opportunity to establish new forms of authority – and thirdly, the crisis is obvious on a philosophical level, since Marxism has abandoned radical and questioning thought. On this point, Axelos notes that 'Marxism does not place itself in question sufficiently enough and does not ask radical questions' but, rather, it has remained 'determined by that which it claimed to negate' (Axelos, 2015a: 148, 149).

One of Axelos's basic assumptions is that Marx's critical confrontation with the thought of Hegel, Smith and Ricardo aimed not to supply us with an improved philosophy of history, or a better and alternative exposition of political economy. Marx's purpose was to introduce 'philosophical and historical *criticism* into philosophy and economy' (1976: 57). In pursuing this end, Marx's critical endeavour points towards 'concreteness and freedom from mystification' (1976: 56). Following Axelos's view, Marx introduces us to the 'movement of the negativity that runs through universal history' and at the same time, he opens himself 'to the future that lies at hand, which, through its negativity will in turn generate what more distantly is yet to come' (1976: 333, 335). For Axelos, Marx's

thought encompasses negativity, but this negativity has been blocked, since Marx's original work was systematized into the various Marxisms, and as a result, became reified and objectified itself. In Axelos's understanding, this process sidelined Marx's revolutionary elements and constricted the inherent openness of his theorizing. The problems posed and the questions addressed by Marx did not remain open. On the contrary, the internal contradictions of his thought were pacified and concealed by the reduction of Marxism to an ideology and apologetic doctrine. The freeing of the Marxian thought, according to Axelos, entails the releasing, reactivation and putting into action of its very negativity. It postulates the need to 'put the negative to work' (Axelos, 1982: 67), and favours the significance of critical and negative thinking, which is '*calling everything in question and keeping the question open*' (1982: 67).

Axelos's critique of Marx's early writings, however, remained restricted insofar as it did not take into account Marx's criticism of fetishism, and failed to fully conceive of Marx's critique of political economy and economic categories. He sought to activate and make effective the function of negativity, but he did not elucidate what exactly constitutes this movement of negativity. Categories and concepts, such as truth and power, do not derive their value from the social relations in which they occur. Instead, it appears that in Axelos's account their validity derives from the questioning process itself, which is hypostasized and fetishized as an end in itself, while the social relations and social conditions of productions are neutralized (1982: 68). Instead, for critical theory, concepts are socially valid and 'even the most abstract categories [...] are valid only in the context of specific relations' (Schmidt, 1981: 36–7). In Axelos's theorizing, negativity and questioning thought reveal themselves, in an abstract and ahistorical manner, as being part of the 'game-playing' of the world, which in turn constitutes the essence of being. Thus, the meaning of his negative critique is not made

explicit. Neither does he explain with clarity the object of his critique, nor his explicit purpose. He persists in his efforts to proceed towards broadening horizons and opening up closed systems, but his stance remains contemplative and his engagement with the material world and social reality, which feature primarily in his writing as references to 'technology', is limited, failing thus to achieve 'the changing of philosophy into a philosophy of changing the world' (Bloch, 1976: 9). The issue regarding the *constitution* of the world remains untouched, and Marx's critical undertaking is not understood as a theory of struggle against capitalism. This implies a misunderstanding and disregard of Marx's work as a critique of economic categories, and Axelos's critical approach to Marx unfolds as a philosophical critique. His attempt to read Marx alongside Heidegger left his planned project – a comprehensive critique of philosophy, of political economy and of politics – ultimately underdeveloped, and embedded in the speculative.<sup>2</sup>

In the Open Marxist tradition, Agnoli's work sees Marx's critique of political economy as an unfinished project – not only in the sense of an ongoing need for further development of this critique, but also from a perspective that maintains that Marx's thought must be complemented with a critique of the political. Agnoli's (2003) critique of the political developed alongside the distinction he drew between 'destructive' and 'constructive' critique, which has functioned as a touchstone for his critical and subversive work. Akin to Adorno, he argues that the notion of constructive critique acts as a servant of existing powers and state institutions. It enhances trust and confidence to the established order, while, at the same time, seeking to reconcile social contradictions by institutionalizing and integrating any form of radical opposition. Constructive critique encourages responsibility, and contributes to political stability. It endorses the normative values of capitalist society and seeks to improve the existing political system by accepting the rules of

parliament. Social and parliamentary responsibility has led to the pacification of social conflict and the transformation of the Left. Agnoli's notion of critique amounted not to a critical political science, but to a critique of politics. Though critical political science still provides significant negative material for reflection, it ends up being an endless process of protesting for the humanizing, beautifying and reforming of capitalist institutions, without revolt and without any genuine anti-capitalist agenda (Agnoli, 2012c: 197). Opposed to scholarship that produces constructive critique, Agnoli vindicated the meaning of critique as *destructive*, and a *negative* undertaking. Destructive critique reaffirms the very essence of critical thought, and has played a vital historical role in 'provoking insubordination and destroying horrors' (2003: 26). For Agnoli, the purpose of critique is refusal, negation and subversion – both practical and theoretical – of a world that lacks freedom and equality, a world of capitalist misery. His negative, destructive critique, then, is a negation of all conditions of exploitation, humiliation and coercion. It is a subversive and destructive critique of capital and its state, which challenges existing social relations of domination and finds its positive moment in the creation of different relations, the 'society of the free and equal', and not merely in the improvement of existent capitalist power relations. In turbulent and miserable times, as Agnoli argues, a concrete project of emancipation only with the negative potential, – a 'subversive science' – can effectively coexist (2012c: 200).

One of the tenets of the strand of Open Marxism that emerged in the early 1990s was that 'the central category of openness is that of critique' (Bonefeld et al., 1992a: xiii). Expanding on Agnoli's negative critique of the political, and under the influence of Adorno's work – especially his *Negative Dialectics* – Bonefeld further elaborated the meaning of critique and in doing so advanced both critical theory and the legacy of Adorno. Based on a critical deployment of the 'new

reading of Marx' (see Bonefeld, 2014), he spelled out the political and social implications of Marx's critique of political economy as a critique of economic categories. Along with Clarke, Holloway and Gunn (with all their differences), Bonefeld maintained that critique is not to be regarded as a means of demonstrating alternative Marxist economic theory, and its superiority to classical political economy (2001: 54). As Simon Clarke has maintained, the term 'Marxist political economy' is 'a contradiction in terms, since Marx always referred to his work as a "critique of political economy"' (Clarke, 1994: 10). Marx criticized not only bourgeois political economy, but also the very notion of 'political economy'. Viewed this way, as Holloway noted, Marx's own understanding of the concept of 'science' does not imply a search for objectively 'correct' knowledge. Rather, it amounts to 'the movement of criticism', which finds form as a double movement: 'an analytical movement and a genetic movement, a movement of going behind appearances and a movement of tracing the origin or genesis of the phenomenon criticised' (Holloway, 2005[2002]: 109).

For the Open Marxism thinkers of the CSE, the meaning of critique amounts to a critique of economic categories, one that challenges the unreflected presuppositions of economics. Its scope is to decipher the social constitution of the objectified economic forms and show that economic categories such as money, profit, rent, wage and capital are inverted social relations, which appear as independent self-acting economic forces. The purpose of critique, then, is neither to discover economic laws nor to define social reality by registering and classifying facts. It does not seek to explicate one economic phenomenon with reference to another, but to comprehend each phenomenon as a form, or mode of existence of the actual relations of life (Bonefeld, 2014, 2016). However, whereas for the 'new reading of Marx' and for Backhaus in particular, critique is developed from an 'anthropological' standpoint

with the intention of demystifying economic categories on a human basis (Backhaus, 2005: 28), for Bonefeld the starting point for an *ad hominem* (see Adorno) critique is ‘neither economic nature nor anthropology but the “definite social relations” that manifest themselves in mysterious economy forms’ (Bonefeld, 2014: 8). Critique questions the outward appearance of economic things, and its objective must be the disclosure of economic categories as *social categories*, by revealing their ‘essence’ – that is to say, by ‘deciphering them as human social forms, not of Man as an “abstract individual”, but of Man as a member of a definite form of society’ (2014: 39). In this respect, for Open Marxism, conceptuality does not mean an application of theory to practice, with a view to analyzing reality from the outside as objective, external observers. The ‘form analysis’ entails a dialectical, internal and reciprocal relationship between theory and practice, where ‘practice is theory-inclusive just as theory, for its part, is practice related’ (Gunn, 1987a: 41). In distinction to Axelos’s abstract negativity, theory and theoretical concepts are held here, then, to be practically *reflexive*, as they perceive their own validity in their ‘practical and social constitution’ (Gunn, 1987a: 42). As Bonefeld has succinctly put it, ‘validity is a social category. Only for society can something be valid and have validity’ (Bonefeld, 2014: 25).

The concept of ‘social form’ is at the core of the Open Marxist critical tradition. By investigating the social constitution of economic categories, Open Marxism seeks to understand why definite social relations (content) acquire the ‘forms’ (appearance) of state, parliament, money, capital and so on. Gunn conceives of social phenomena and structures as ‘forms’, assumed during the processes of class struggle, as ‘appearances’ or ‘modes of existence’, of the contradictory movement of antagonistic social relations and, especially, capital–labour relations (Gunn, 1987b: 60; 1992). Capitalist forms appear, for Open Marxism, as self-established

economic entities, which render invisible the constitutive role of human social practice. Actual social relations are reduced to mere by-products of economic forms. The world of economic abstractions and economic categories assert themselves as ‘perverted forms’ of definite social relations. Relations between individuals appear in their perverted form of economic objectification, in the apparently independent movement of coins and economic forces. These inverted and distorted forms (e.g. state-form, money-form or capital-form), are forms through, and in which, class antagonism subsists – they must be deciphered, therefore, in order to reveal their social origins. According to Bonefeld, ‘there is only one world, and that is the world of appearances’ – that is to say, society as a relation of objectified economic forms – and ‘this appearance is real’ (2016: 63). The world of appearance must be decoded in order to unveil its constitution within social relations. The purpose of negative critique, then, is not to ponder fetishized economic things, but to think ‘out of these things’ (Bonefeld, 2014: 10). Instead of aiming to criticize the ‘thing-in-itself’, it chooses to interrogate the ‘definite social relations that express themselves in the form of a relationship between things’ (Bonefeld, 2014: 37). In other words, the critique of political economy ‘thinks out of, and in and through, “the existent” society. In order to understand things, one has to be within them’ (2014: 38). Its objective is to discover the social constitution of these reified things, to grasp the social relations that result in the existence of these objectified things, and then disappear by denying themselves in the appearance of economic objectivity.

For Open Marxism, conceptuality does not just mean the process of deciphering the hidden essence of things in human practice. It also involves a process of disclosing their contradictory constitution and movement. At the same time, critique is immanent to its social context, criticizing both the ‘perverted social existence and the perversion through

which it itself exists' (Bonefeld et al., 1995: 3). According to Adorno, for negative critique to proceed dialectically would involve thinking 'in contradictions, for the sake of the contradiction once experienced in the thing, and against that contradiction' (Adorno, 2003a: 133). Open Marxism gives particular emphasis to the concept of contradiction and holds dialectics as 'signalling a unity of opposites and movement of contradiction' (Bonefeld et al., 1992c: xiv). In this sense, it understands criticism as an 'assault on identity' (Holloway, 2005[2002]: 106) and argues that if Marxism is a "theory of" anything, it is a *theory of contradiction*' (Gunn, 1994: 53). For Gunn and Holloway, in opposition to the various schools of traditional Marxism, Marxism is not regarded as a theory that aims to supply a theory of society and an interpretation of the objective laws of capitalist society. Marxism should not be reduced to a theory of capitalist domination and the study of the function and reproduction of existent structures. Instead, for both these writers, Marxism must reclaim its lost negativity and become a theory *against* society, a theory that intends the destruction of capitalist society (Gunn, 1992, 1994; Holloway, 1993: 19, 2005[2002]: 135–6). As a subversive negation of capitalist social relations then, Open Marxism provides a thorough and radical critique of the various perverted social forms, and seeks to reveal the social content, the essence, hidden under the surface of this 'topsy-turvy world'. Human practice is enslaved, and rendered invisible by the very nature of what it has created and produced. The producers are governed by their own creation, and dominated by abstract economic forces and laws. The creators appear as derivatives of an inverted world, one that acquires an eternal quality by presenting itself as wholly natural, and constitutive of actual social relations.

Revealing the social genesis of a world governed by coins, things and economic abstractions, Open Marxism's negativity amounts primarily to a critique of fetishism,

an approach that deciphers and conceptualizes the convenient 'forgetting' of societal constitution. The theme of fetishism is central to Open Marxists' critique of capitalistically organized social relations, despite the differences that exist regarding the interpretation of fetishistic categories within this body of work as a whole. For Holloway, the concept of fetishism is at once a '*critique of bourgeois society, a critique of bourgeois theory and an explanation of the stability of bourgeois society*' (2005[2002]: 51). He argues that in the world of capitalist relations, commodities and things rule, and human creativity is rendered invisible. There is an inversion between subject and object, people and things and, as a consequence, social relations are themselves fetishized. Following the critical tradition, Holloway does not consider fetishism as a closed and static concept. According to Horkheimer, 'tension characterizes all the concepts of the critical way of thinking [...] the critical acceptance of the categories which rule social life contain simultaneously their condemnation' (Horkheimer, 1972: 208). Holloway's work unfolds in a processual, dynamic analysis of the notion of fetishism and makes a distinction between 'hard fetishism' and 'fetishization-as-process' (Holloway, 2002a: 29). He conceived of fetishism as a process – that is, as fetishization, the constant struggle between fetishism and anti-fetishism – and as an open, contradictory category. In his words:

The concept of alienation, or fetishism, in other words, implies its opposite: not as essential non-alienated 'home' deep in our hearts, but as resistance, refusal, rejection of alienation in our daily practice. It is only on the basis of a concept of anti-alienation or anti-fetishism that we can conceive of alienation or fetishism. If fetishism and anti-fetishism coexist, then it can only be as antagonistic processes. Fetishism is a process of fetishisation, a process of separating subject and object, always in antagonism to the opposing movement of anti-fetishisation, the struggle to reunite subject and object. (2002a: 31)

From Clarke's (2002) point of view, Holloway uses Marx's vocabulary from *Economic and Philosophical Manuscripts of 1844* in his

interpretation of *Capital*. Alienation is not the same as fetishism, and Holloway, in his analysis, seems not to distinguish between the terms reification, alienation and fetishism. Rather, he uses the three terms synonymously. As Holloway has argued, ‘although people are, in their species characteristic, practical creative beings, they exist under capitalism as objects, as dehumanised, as deprived of their subjectivity’ (2002a: 29). In Clarke’s view, Holloway ‘bases his rejection of capitalism not on a critique of capitalist exploitation but on a romantic aspiration to reclaim creativity from capitalist labour’ (2002: 41). In his reply to Clarke, Holloway maintains that Marx’s early and mature writings are equally concerned with the dehumanization and objectification of people under capitalism: ‘The young Marx speaks of “alienation”, the older Marx speaks of fetishism, but both concepts refer to the same objectification of the subject’ (Holloway, 2002b: 62). On the other hand, Bonefeld holds that the *ad hominem* critique of the fetishism of the commodity form does not amount to a ‘fuzzy humanism’, but rather focuses on the ‘actual social relations of a definite form of society’ (2014: 39). As he has argued: ‘Man is always objectified Man. Subjectivity means objectification. To be an object is part of the meaning of subjectivity. The issue that the critique of fetishism brings to the fore is not the subject’s objectification but its reified mode’ (2014: 63). In this line of thought, Bonefeld expresses his view that ‘the fetishism of commodities does not disguise the “real” social relations of capitalism. Rather, the fetishism of commodities expresses the “real” social relations in the form of capital as the automatic subject of bourgeois society’ (2014: 54).

### **THE CRITIQUE OF POLITICAL ECONOMY AS A CRITICAL SOCIAL THEORY: ON CLASS AND STRUGGLE**

The fetishism of commodities amounts to a process in which capitalist social relations

manifest themselves as being abstract economic forces. The ‘new reading of Marx’ has made a valuable contribution to the task of unpacking the ‘natural’ appearance of economic objectivity and in showing the ways in which social relations are inverted, and reshaped into reified economic forms that assume a mantle of inevitability, and of necessity. Yet, according to Bonefeld, the ‘new reading of Marx’ does not ‘explain the social character of economic objectivity’; after all, ‘What is objectified?’ (Bonefeld, 2014: 10). Because it did not seek to expound the ‘fundamental categories’ of ‘class and labour’ (2014: 41, 42), the critical work of the ‘new reading of Marx’ was incomplete. Elaborating upon the critique of economic categories as a critical theory of social constitution, the CSE Open Marxist School ‘substitutes the critique of the actual social relations for a logical development of the value form as some secularized thing that is valid in-itself’ and builds upon a ‘critical theory of abstract labour, class and class antagonism’ (2014: 42). Open Marxism theorists developed the critique of political economy into a critical social theory of economic objectivity, one that includes not only critique of economic form but also of the political form of a society. A key aspect of this critique is its refutation of positivistic and ‘scientific’ pretensions, which it finds within the various strands of traditional Marxism. During the radical debates conducted by the Conference of Socialist Economists (e.g. see Clarke, 1991a), Open Marxism’s ideas flourished – and this theoretical-critical activity was never conducted in isolation from political questions and concerns. Most importantly, these scholars’ critical analyses centred on the determining role of class struggle, as they saw that a purely logical exposition of economic categories dismisses the relationship between capital and labour, and class antagonism from critique of political economy. Arguing against traditional Marxist theories, which proposed the notion of a ‘Marxist economics’,

Holloway notes that they conceive of economic categories, such as value, price, crisis and so on, 'as having an objective validity which does not depend on class struggle' (Holloway, 1995: 161). For the CSE Open Marxism School, the deciphering of the social basis of economic categories reveals that these relations are contradictory and antagonistic and that, therefore, class struggle acts as a constitutive precondition of objectified economic forms.

By addressing the issue of economic objectivity and its class character, Open Marxism views class struggle as the content of concepts, as the constitutive essence concealed within economic and political categories. Social individuals become invisible in the movement of economic quantities and, as a consequence, class relations disappear in the exchange of economic things. Therefore, the notion of class cannot be adequately conceptualized at the mere, basic level of appearances and levels of reliance upon revenue sources as means of classifying people into the various social classes. Marx's critique of the 'Trinity Formula' (capital – profit, land – rent, labour – wage) involves a rupture with the world of appearances and the conceptualization of class as a group of people, or a structure. According to Clarke, a class 'is not an interest group, defined as a coalescence of individuals with a common *interest*, but is an inseparable part of a relation of production and as such is analytically prior to the individuals who comprise it' (1978: 41). Class relations are the 'logical and historical presupposition of capitalist production' (Clarke, 1991b: 118), that is to say, a *precondition* of the specific relations of domination and exploitation that unfold between the capitalist and the workers in the realm of production. In his critique of Althusserian Marxism, Clarke has argued that class is not a 'thing' but a definite social production relation, and that class relations between capital and labour acquire specific economic, ideological and political forms, which are '*historically developed forms of the relations of production*'

(Clarke, 1980: 53). They constitute a contradictory unity of diverse and specific forms of social relationships. As such, class relations, which are grounded in the extraction of surplus value occurring in the production process, 'are not purely "economic" but are, in class societies, multidimensional power relations which are expressed in particular ideological forms' (1980: 53).

In an influential article, Gunn also argues against a traditional and 'sociological' conception of class. Class is neither a group of individuals classified together according to their common socio-economic trait, nor a 'place', that is, a 'structure' in which individuals are located in relation to the fixed position they occupy within the social landscape. For Gunn, the terms 'class' and 'class relation' must be understood as undifferentiated – as class is always a 'class relation of some historically particular kind' (Gunn, 1987c: 15). Further, he sees class relations as the aggregate of social relations, which must be understood as production relations. In other words, the antagonism between capital and labour is not merely an economic, but a social relationship. Within these social relations, the classes do not confront each other as pre-established entities and structurally pre-determined categories. In an active, dynamic and unpredictable process, class struggle defines and constitutes the formation of class. Developing his argument, Gunn maintains that class is a relation of struggle, and therefore, 'class struggle is class itself' (1987c: 16). Being an antagonistic struggle, class relation, that is, the capital–labour relation, does not seek to fit people into groups or pigeonholes. As a fluid relationship, it is independent of individuals, yet also constructs their lives, as it subsists in and through them. In short, it permeates their lives. As Gunn puts it, class relations structure the 'lives of different individuals in different ways. It allows the line of class division to fall through, and not merely between, the individuals concerned' (1987c: 17). Running through individuals, fragmenting

individuals' lives and as a result, their existence, in the individual and collective senses, becomes contradictory. Being contradictory, class divides and fragments members of the working class, whose 'feet remain mired in exploitation even while his or her head [...] breathes in bourgeois ideological clouds' (1987c: 17). In many different ways, Gunn's contribution offers a number of insightful and intriguing comments, but failed to adequately set out the theoretical and political implications of his approach. What is of particular note is his attempt to argue against traditional Marxist class analyses, which viewed class as an 'object' and conceptualized class and class struggle in a rather instrumentalist manner. From that perspective, by breaking with traditional and positivist interpretations of classes as 'social groups', he offered a critical conception of class and class struggle, thereby opening up space for a more in-depth treatment of the subject informed by negative dialectics. Besides, as Tischler has put it, 'if class is viewed as an object, then revolutionary dialectics as negative dialectics cannot exist' (2002: 178).

Extending Gunn's perspective and building on Adorno's own critical theory, Bonefeld aims at offering a critique, and not a theory, of class. From the standpoint of critical theory, Bonefeld argues that 'class is not primarily a category of consciousness. It is a category of a perverse form of social objectification' (2014: 114). As he succinctly put it, 'Marx's critique of political economy does not derive the existence of classes from class-consciousness. He analyses the manner in which society organizes its social reproduction' (2014: 117). For Bonefeld, social theory is critical when it makes sense of society from a starting point of recognizing its social constitution, thus investigating society from within its mode of subsistence and from the standpoint of struggle and contradiction. From this vantage point, he has pointed out that 'class is not an affirmative category, but a critical concept' (2002: 66). Capitalist society is fundamentally antagonistic and torn by

contradictions. Adorno pointed out that society is reproducing itself because of its contradictions and opposing interests. Mankind survives and 'preserves itself not despite all irrationalities and conflicts, but *by virtue of them*' (Adorno, 2006: 50). The antagonistic class relationship between the rulers and the ruled, between capital and labour, reproduces the system and assists it in extending itself as 'society stays alive, not despite its antagonism, but by means of it' (Adorno, 2003a: 320). In this struggle between antagonistic forces, opposing individuals act as personifications of specific and definite class relations and class interests. In this process, to exist as a seller of labour power and to 'be a productive labourer is not an ontologically privileged position' (Bonefeld, 2016: 69). As Marx argues, and Bonefeld frequently reminds us, 'to be a productive worker is therefore not a piece of luck, but a misfortune' (Marx, 1990: 644). As a negative and critical concept, then, class is part of a reified society and belongs to a perverted world of social relations, being an 'objective category of the false society' (Bonefeld, 2014: 100). As part of the perverted appearance of social relations, class is experienced as a 'living contradiction. Contradictions cannot be classified' (2014: 107). Struggling in and through this contradiction, labourers share a common class experience, that is, their separation from the means of production and the compulsive selling of their labour power, which creates the conditions for 'class unity and collective action' (2014: 114). On the other hand, as Bonefeld forcefully remarks, economic compulsion denotes the 'common class experience of labour market disunity, as each individual seller of labour power competes against the other for employment as the condition of gaining access to the means of life' (2014: 115).

On this, Holloway argues that 'we do not struggle *as* working class, we struggle against being working class, against being classified' (Holloway, 2002a: 36). Holloway, viewing attempts to define the working class

as subordinated to capital, as part of the traditional 'understanding' of the working class, considers class as process, as a dynamic concept. In this line of thought, classes are not pre-constituted, fixed, static entities. Their existence cannot be separated from their constitution. Rather, classes are in a constant process of being constituted, as people are subjected to an unceasing process of classification and reclassification. This in turn entails that class struggle 'is the struggle to classify, and against being classified' (2005: 143). In this struggle, the working class battles against labour and against being working class, in order to emancipate itself. In this respect, according to Holloway, the working class 'can be considered revolutionary only to the extent that it exists not only in but also against-and-beyond itself as working class' (Holloway, 2010: 118). Holloway surmises that class struggle is unfolding within capitalist society, and at the same is moving forward in a direction that leads *beyond* this society. The issue at stake, as Bonefeld notes, is 'what this "beyond" might be. The class struggle for subsistence does not foretell the future. It does however entail a profound judgment on the existing relations of social wealth' (2014: 118).

Class struggle constitutes part of the rationalized irrationality of the capitalist reality as long as it continues to feature within the framework established by the Trinity Formula, principally seeking, merely, to ameliorate exploitation within the labour process. This struggle can be viewed as one that operates inside the perimeters of the perverted capitalist social reality, from where it satisfies itself with demands for a 'just' wage and trade union recognition; such struggles implicitly accept the reality and structures of capitalist society and assist in the continuing reproduction of the 'cold inhumanity of free wage labor' (Adorno, 2003b: 94), driving society into a situation of 'permanent transition or unchanging change' (Adorno, 1961: 45). Integrated class struggles perform a reproductive and stabilizing

function within capitalism, and in that sense, as Adorno put it, 'all history is the history of class struggle because it was always the same thing, namely, prehistory' (2003b: 94). At issue, then, for Open Marxism is how to end the prehistory of class struggle and how to present Communism as a movement, constructed from a synthesis of previous political and critical experiences and struggles, which fights for a classless society of the 'free and equal' rather than for a rationally organized socialist economy of labour (Bonefeld, 2015: 239–42). The unfolding of the Open Marxist tradition, in a continuing critical dialogue, develops questions inherited from the early Frankfurt School, and advances critical social theory as a result. From this perspective, Marcuse's argument gains a new significance:

All development of the productive forces by the established society would perpetuate and increase the productivity of destruction and repression, and that this fatal link could be broken only by the praxis of a class whose vital need was, not the perpetuation and amelioration but the abolition of the established society. And this abolition would be liberation: freedom appears first as negation; the 'positive' definition remains an X, an open variable – just: self-determination. (Marcuse, 1972: 214)

## Notes

- 1 For critical discussions of traditional and world-view Marxism, see Bonefeld and Tischler (2002) and Holloway (2005).
- 2 It is in the work of Karel Kosik that we see Axelos's original aims undertaken with critical rigour and executed with vehemence, although Kosik's legacy resides in undeserved obscurity. Kosik's *Dialectics of the Concrete* represents the finest example of his critical interpretation of Marx and his combined reading of phenomenology and Marxism. Kosik argued that 'Marx's *Capital* is not a theory but a theoretical *critique* or a *critical* theory of capital' (1976: 112) and maintained that economics and economic categories cannot be properly comprehended without addressing and replying to the basic question: 'how is social reality formed?' (1976: 117). 'Marx's theory', Kosik asserted, 'is a critique of economics' and

this critique 'exhibits the real movement of economic categories as a reified form of the social movement of people' (1976: 115). According to Kosik, the economic world appears as a collection of natural, self-evident and autonomous phenomena, which constitute the world of the *pseudoconcrete*. Economic categories, then, must be grasped as 'phenomenal forms' (1976: 108), 'forms of being' or 'existential determinants' (1976: 114), which conceal the *essence of things*: the structure and the material reality of existence, and the world of human praxis. In the *pseudoconcrete* world of economic categories, the distinction between phenomenon and essence disappears. A dialectical theory of society needs, therefore, to demystify and deconstruct the *pseudoconcrete* and its apparent independence, in order to render essence perceptible. Such a theory must seek to reach the concrete and to demonstrate economic categories as derivative and mediated phenomena of social praxis and human social relations, organized in an historically specific and concrete manner. 'Economics', Kosik opined, 'is the objective world of people and of their social products; it is not the objectual world of the social movement of things' (1976: 115).

# Post-Marxism

Christian Lotz

## INTRODUCTION: WHAT IS AT STAKE IN POST-MARXIST THOUGHT?

The task of presenting a critical overview of all the movements, writers, and academic schools that, in a broad sense, have been connected to twentieth-century (Western) Marxism, is quite impossible. This is not just a matter of space; it is also a conceptual problem. On the one hand, the term 'Post-Marxism', refers us to thinkers who followed classical Western Marxism and in one way or another tried to overcome it. On the other hand, 'Post-Marxism' can also refer to a set of systematic issues, problems, and demands. This entry is based on the latter approach to Post-Marxism as a set of theoretical and conceptual moves. As a consequence, this entry does not follow Therborn (2008) who uses 'Post-Marxism' as an empirical term that brings together everything written after the First World War in the left tradition of thought.<sup>1</sup> Similarly, more recent attempts to

redefine the field in this manner, such as theories of intersectionality, feminist theory, post-colonial theories, and identity politics will not be discussed.<sup>2</sup> Moreover, the turn toward the symbolic and language (in its connection with psychoanalysis), which is especially crucial for the French intellectual post-war world, will not be discussed, as this background could fill an entire book length study.<sup>3</sup> Instead, primary attention will be paid to what should be considered the core of Post-Marxism in relation to Marxist and Non-Marxist critical theory, namely, its conception of the social. This shift is of importance for its overall philosophical vision of society, theory, and politics.

The systematic approach can broadly be defined by how French and German philosophers (at least those who are taken here to be main representatives of Post-Marxism, such as Mouffe, Laclau, Honneth, Castoriadis, Lefort, Gorz, Negri, and Badiou) have moved away from a Marxian utilization of the capitalist social form in terms of

political economy and that which is polemically called by the popularizers of Post-Marxism, Laclau and Mouffe, 'economism'. Economism, which they identify with the classical Marxist position, is the idea that political struggle, democracy, and political movements need to be exclusively analyzed in socio-economic terms. In theories labeled 'economism', as Laclau and Mouffe put it, 'political struggle is itself only a superstructural fact, since it does not constitute reality but is simply the expression of a process inscribed in history from its inception' (Laclau and Mouffe, 1981: 18). Put differently, 'according to such a perspective [i.e., an economist perspective, C. L.], political struggle is seen not as being constitutive of the social order, but as being a mere "superstructure" of an inexorable economic process' (17). The rejection of economism implies the rejection of Marx's critique of political economy and the rejection of a critical theory of society, which then, in turn, leads, in Post-Marxism to 'a "Copernican revolution" in Marxist theory' (17; for this, see also Choat and Rekret, 2016). According to this view, the political no longer is conceived of as a superstructural effect; instead, put in Gauchet's words, 'the political constitutes the most encompassing level of the organization [of society], not a subterranean level, but veiled in the visible' (quoted in Breckman, 2013: 151). Consequently, giving up on a critical theory of society leads to the Post-Marxist claim that we should no longer assume that our contemporary world is in any social or economic sense united or a coherent whole. Instead, it is characterized by political or normative struggles and conflicts on *all* levels of society which can no longer be synthesized into a unity. As Laclau puts it concisely in a summary of his contribution to Post-Marxism: 'One consequence of our analysis is that we have to assert the primacy of politics in the structuration of social spaces' (Laclau, 2006: 112).

Given this main struggle of how to conceive the political in relation to society as

a whole, it becomes clear immediately that Post-Marxist ideas are to a large extent rooted in political and social experiences after 1945 in Europe, such as the failure of the French and Italian Communist party, the exhaustion of the East-European socialist project, the downfall of the Soviet Union and the GDR, the development of welfare states, the stabilization of representative democracies in Europe, the development of the European Union, as well as the events in Hungary, Prague, and May 1968 in Paris. Moreover, these ideas are also rooted in the development of the neoliberal era, which began with the Thatcher and Reagan administrations in the Great Britain and in United States, and which was extended by social-democratic governments under Blair, Schröder and Clinton, which, in turn, lead to a destruction of traditional labor organizations and, through the embracement of global capital, to the fast arrival of post-industrial social structures in Europe and the United States. Moreover, new international left perspectives (Laclau and Mouffe, 1987: 106), new left movements, as well as of the importance of identity for these political movements and social theory had to be acknowledged. In the context of these changes and in accord with the overall liberal-democratic and centrist turn in most Western countries, most Post-Marxists gave up the idea of a fully liberated society, which is opposed to a model of philosophy that, as Adorno has it, perceives and judges the existing world from the standpoint of redemption. As Laclau and Mouffe nicely put it (and which can equally be found in Foucault, Honneth, Habermas, and others), 'the myth of the transparent and homogenous society – which implies the end of politics – must be resolutely abandoned' (Laclau and Mouffe, 1987: 106). Equally abandoned, according to this view, should be the desire of classical Marxists to assume the emergence of a collective subject without fundamental divisions. As Mouffe puts it, 'there will always be antagonisms, struggles and divisions of the social, and the need for institutions to deal

with them will never disappear' (Mouffe, 2013: 84). Thus, thinking about political movements in a pluralistic context is more central for most Post-Marxists than thinking about the possibility of a revolutionary party (with, perhaps, the exception of Badiou).

As a consequence of moving away from Marx's critique of political economy and of the aforementioned real political and social developments, Post-Marxist philosophers shifted the ontological framework of their theories and evaluations of contemporary social changes and political events. The latter move is crucial not only for understanding how their *thinking* changed, but also since the underlying conceptual displacements tend to be overlooked by readers who understand Post-Marxism only as a loosely connected set of 'ideas'. However, looking back onto the development of left theory during the last 50 years reveals a surprisingly coherent picture. As already indicated, Post-Marxist philosophers tend to argue that the social-economic structure of society, i.e., that which Marx called the relations of production, are no longer a proper basis for thinking about social reality and the *being* of society. Consequently, their thinking of *what society is* changed, and, as such, it can easily be contrasted with how critical theory and the Frankfurt School, at least to some extent, conceive of the world. Instead of focusing on a theory of society as the *primary* level of human reality, Post-Marxist philosophers, including so-called second and third generation Critical Theory, tend to argue that social reality is either based on language and, hence, meaning (Habermas, Mouffe/Laclau), or on norms and ethics (Habermas, Honneth), or on the political (Mouffe/Laclau, Lefort, Badiou), or on power (Foucault). As we will see, the move toward making either normative or political struggle the substance of social reality is decisive, since it leads to a universalized conception of struggles, conflicts, and antagonisms. As a consequence of this move, most Post-Marxists reject that which in the literature

sometimes is taken to be a Marxist dogma, i.e., the assumption of a 'law of value', which is most visible in Hardt/Negri and Gorz, as well as that which is conceived of as Marx's preference for 'productivism' (Baudrillard, Castoriadis, Habermas).<sup>4</sup>

In sum, I follow commentators, such as Choat and Rekret (2016) and Wallat (2010), who claim that the main feature of Post-Marxist thought is the divorce of the political from the critique of political economy (as introduced by Laclau and Mouffe in Laclau and Mouffe, 2001). However, in addition, I want to broaden the perspective in this entry by indicating that other central concepts used in recent attempts to redefine, leave, or overcome classical Marxism, such as normativity and power, are also important to be considered for grasping main philosophical shifts of the last 50 years.<sup>5</sup> As a consequence, in my view newer Frankfurt School proponents, such as Honneth and Habermas, can also be subsumed under the term 'Post-Marxism'.

In order to get a sense of the overall direction of Post-Marxist philosophies in contrast to critical theory and Frankfurt School theorizing, the following should be used as a guideline: Post-Marxists moved away from three central elements of Marxist and Frankfurt School thought, namely, (1) the concept of class, (2) the concept of capital as the concept of societal unity and its accompanying task of a social theory, and (3) a dialectical understanding of the relation between the socio-economic and the political sphere.<sup>6</sup> Instead, Post-Marxism shifted toward (1) the concept of antagonisms and conflict, (2) the concepts of difference and openness (and the rejection of the task of a theory of society), and (3) a hierarchical and dual model of human reality, within which the existing social organization is the effect of either norms, or politics or power struggle. Let me briefly outline the main shift, before I go into more detail.

Laclau and Mouffe put it succinctly by claiming that 'the first condition of a radically democratic society is to accept the

contingent and radically open character of all its values – and in that sense, to abandon the aspiration to a single foundation’ (Laclau and Mouffe, 1987: 102). Since they reject a single foundation for the pluralization of social conflicts and political struggle, Laclau and Mouffe also reject a single theoretical framework that could provide us with (a) a theory of society as a totality and (b) a single ‘mechanism’ for understanding the plurality of political struggles from an underlying logic. As a consequence, a dialectical theory of social reality in the Marxian and Hegelian tradition is no longer feasible to understand contemporary society and politics, and, in addition, it can no longer function as a framework for political praxis based on the concept of class conflict. Laclau’s and Mouffe’s arguments are straightforward: since contradictions are logical and since we are asked to give up the dialectical concept of social reality, they propose to develop a concept of ‘antagonisms’ that no longer can be subjected to a hierarchical ‘meta’-frame that ultimately would remove these antagonisms as a *constitutive* factor of social reality and turn them into an *effect* of social reality (see Laclau, 2006: 105). According to Laclau’s and Mouffe’s reading of Marx and classical Marxism, the pluralization of antagonisms has been reduced by classical Marxism to an underlying a priori framework, which led to a covering up of the *reality* of political struggle. Accordingly, classical Marxism no longer can be used to understand political movements that are based on diverse national and global contexts, on identity politics or on movements based on sexual identity, gender, or race. As a consequence, their attempt of pushing Marxism toward a new stage is centered in re-thinking the concepts of difference, conflict, struggle, and so on. The political becomes the center of Post-Marxist theory, and the concept of struggle loses its dual logic. As Dick Howard puts it, ‘because the political transcends the society that it constitutes, it can never be incarnated (by the proletariat, the party, or any social institution);

it can only be represented because, in itself, it must always remain “an empty place”’ (Howard, in Breckman, 2013: xiii). Society is now conceived as a ‘multiverse’ of struggles in which no representative logic exists that can express the ‘negative’ status of the pluriverse as *the real*. Put in Derridean terms, *differance* is inscribed in the roots of social constitution and can no longer be reduced to a unitary logic. In this version society becomes a black box that can no longer be caught and fenced in by theory and philosophy. Given this, and although we might see some connections to Adorno’s concept of non-identity, we immediately understand that Post-Marxist theory is uninterested, if not hostile, to the Frankfurt School that (though with some hesitations) did not give up a conception of society as a coherent whole that can be grasped on the level of *its own* constitution, i.e., not as an effect of something else. One of the central hinges for reconstructing social totality in the tradition of critical theory and Marxian political economy is, of course, capital as the overall determining social form of social relations under capitalism. It comes as no surprise that almost all Post-Marxist theorists, with perhaps the exception of Žižek, have given up on the idea that we need to assume an underlying principle and social form that determines the unity of capitalist social organization and enables everything and everyone to be *integrated* into *one* system. In fact, due to the pluralization of political struggle, which is now taken to be the *ground* of the social, society itself appears to be fragmented, plural, and a system of differences that can no longer be unified as ‘one’. As Lefort succinctly puts it:

Whoever dreams of an abolition of power secretly cherishes the reference to the One and the reference to the Same: he imagines a society which would accord spontaneously with itself, a multiplicity of activities which would be transparent to one another and which would unfold in a homogeneous time and space, a way of producing, living together, communicating, associating, thinking, feeling, teaching which would express a single way of being. (Lefort, 1986: 270)<sup>7</sup>

As we can see here, the influence of Derrida's deconstruction and post-metaphysical thought on Post-Marxism, which also includes the rejection of Althusser's attempt to save Marx's theory, should not be underestimated.

With the rejection of critical theory as a critical theory of society, Post-Marxists, such as Laclau and Mouffe, reject the idea that there could be a political representative of this totality, such as the party. As Murray and Schuler put it, 'for Post-Marxists, the epistemological use of "totality" actually invites some Party to reserve for itself the standpoint of the Absolute, take the reins of society, and direct it according to its "scientific" vision' (Murray and Schuler, 1988: 330). Independent from the question of whether the idea of a revolutionary party is obsolete, it is important to note that we *do* find a coherent reformulation of the relation between theory and praxis in Post-Marxist thought. The experiences of the later twentieth century, especially the development of plural political movements, is intrinsically connected to the theoretical re-formulations of society and politics. In its rejection of critical social theory, Post-Marxist thought is not alone: anarchists, such as David Graeber and Noam Chomsky, are equally hostile to theory and theorizing society. For them, in opposition to philosophers such as Adorno and Marx, society is a transparent reality, which does not need to be reconstructed philosophically. As such, these movements tend to dismiss the entire problem of fetishism on the level of the commodity form, and they are equally uninterested in money and capital. It comes as no surprise, then, that the central issue of fetishism and the in-transparency of capitalist social organization and its own mystification as *the* source of (abstract) domination does not play any important role for Post-Marxists, such as Laclau, Mouffe, Foucault, Honneth, Habermas, Badiou, or Rancière. As a consequence, domination is no longer localized on the level of society and, instead, it is conceptualized as a form of intersubjectivity.

Put differently, society tends to become replaced by sociality.

## POST-MARXISM: ONE ATTEMPT OF GRASPING IT

### *The Primacy of the Normative*

Contemporary Habermasian critical theory has turned its back on classical critical-theoretical concepts, including class. Indeed, in the wake of Habermas' theoretical turn toward communication and language, it gave up a unified theory of society. As Habermas argued, (1) the production paradigm must be replaced with the communicative action paradigm (Habermas, 1989: 89), (2) the theory of society with the lifeworld/system distinction, (3) the focus on ontology and epistemology, most visible in Adorno, with a pragmatic theory of linguistics and communicative action, (4) the priority of social-economic considerations with a theory of normativity. The latter is especially important since it shifts the entire basis of critical theory toward considerations of morality, justice, fairness, recognition, and so on, that make up either the transcendental framework for discourses and communicative claims (Habermas) or the framework of intersubjective recognition (Honneth).<sup>8</sup>

Honneth's sharp move away from early critical theory is most visible in one of his more recent publications on democratic ethics. He argues that the entire framework of modern societies, under which he also subsumes the capitalist market, is framed and made possible by recognitional relations. This update of the Hegelian concept of recognition underlies, according to Honneth, all market exchanges as well as the institutional structure, including the family and the political apparatus. Independent from how we think about this neo-Hegelianism (Honneth, 2011), we need to see that Honneth has an entirely different vision of social reality than

traditional critical theory and Marxism, insofar as he argues that normativity is the true basis of society. Given this basic assumption, although Honneth does not acknowledge the ontological implications of his theory, he stands opposed to the French traditions in Post-Marxism, since he argues that the normative framework also underlies and determines political struggle. As he puts it in a very telling phrase, his approach to society is based on a concept of 'reality constituting ethics' [*wirklichkeitsbildender Moral*] (Honneth, 2013: 358). However, since he argues that society cannot be grasped on the level of *its own* constitution, he defends a similar position to other Post-Marxists who claim that the political is the ground of the social. In Honneth, the ground of the social is the ethical.

Honneth's position is nicely visible in a recent article on Marx in which he argues that the concept of capital can be reduced to a normative relation and that that which Marx called an *antinomy* between capital and labor should be taken as a conflict of normative claims. The 'capital relation', as he puts it, is 'shot through' with normativity (Honneth, 2013: 359). He thereby no longer acknowledges that the conflict between labor and capital is *constitutive* for capitalist society; instead, it is reduced to one conflict among many other social and psychological conflicts. Moreover, as Honneth claims, the 'temporal schema of a non-stoppable and uninterrupted expansion of capitalist valorization interests' (356) is unable to render understandable the dynamics of modern societies that are based, he claims, on normative progressions and advancements, such as consumer protections, the welfare state, and improved working conditions. Progress in these areas, Honneth argues, can no longer be conceptualized with the tools of critical theory, since its epistemology does not give us access to the normative struggles for recognition that are multidimensional and cannot be derived from one principle.<sup>9</sup> With the rejection of a constitutive unity of

society, a theory of society in the tradition of Marx and Adorno goes out the window, too. Categories, relations, concepts, and political economy move into the background of Honneth's theory and, instead, intersubjective relations move into the foreground. In short, the analysis of sociality replaces society. As a consequence, instead of analyzing social totality with the concept of value, Honneth, though in a different fashion than other Post-Marxists, falls back onto idealist assumptions, the most important consequence of which is that capitalism is no longer analyzed as a historically specific unity and, instead is based on a *universal* normative background and a plural definition of normative conflicts that run through all levels of social constitution.<sup>10</sup> Though this relation seems at first surprising, we can see how Honneth, although he focuses on the ethical instead of the political, comes very close to the vision of social reality that Laclau and Mouffe offer by what they call the 'multiplicity of conflict zones' (Laclau and Mouffe, 1981: 18). Similarly, Laclau and Mouffe claim in *Hegemony and Socialist Strategy* that 'the economic space is itself structured as a political space' (Laclau and Mouffe, 1987: 94), the position of which is, on the one hand, close to Honneth (who claims that the economic space is shot through with what he calls 'normative claims') and, on the other hand, even Foucault (who, as we will see further down, claims that the economic space is shot through by power relations).<sup>11</sup>

Although Marx and Adorno would not have doubted that normative (or political) conflicts make up social progress, they would have denied the claim that we can base our theory of society on conflictual claims by social agents; instead, capitalist society as such would be conceived as the framework *in which* these normative conflicts unfold and find their limits. This framework as a *totality* is denied by most Post-Marxist philosophers, and, consequently, they also reject the need for a dialectical theory of society.

### ***The Primacy of the Political***

One of the most prominent representatives of Post-Marxism, although his philosophy to a large extent is opposed to Laclau and Mouffe, is Alain Badiou's Maoist political thinking and his attempt to make philosophy political again by radicalizing the concept of truth.<sup>12</sup> Badiou's theory of reality is based on his concept of 'event'. According to Badiou, events are those moments in time through which entire areas of our reality are restructured and based on different principles than before. Events can only retroactively be determined and they cannot be instrumentally planned. Badiou argues that there are four 'realms' of reality in which truth events can occur: art, love, science, and politics. Whenever 'the' truth changes in these areas, reality becomes restructured. For example, one could argue that the modern revolutions with their bourgeoisie principles are an event in the history of politics, insofar as we no longer can understand ourselves as 'pre-modern' subjects. Who and what we are as political agents is, whether we acknowledge it or not, determined by the horizon that the modern revolutions have initiated and under which we are still defined as political agents. Events trigger 'truth procedures' that define some organized ways in which a truth can be followed up, organized and actualized. For the sake of this entry, it is important to note that the social-economic is not on the list of truth related events, according to Badiou's ontology. In short, reality restructuring events and the installment of new 'meta'-truths come about through politics, but not, however, through the event of capital, as one might want to argue from a social-economic standpoint. As a consequence, the political as a truth-related realm of reality and the realm in which humans are defined as subjects (of a specific political framework and as agents), is introduced as the primary realm of being and the root of all (possible) changes, insofar as they are not science, art, or love related. Politics is, then, the ontological ground of the

social. As Oliver Marchart demonstrates, for Badiou politics defines the reality, but it cannot be translated into social relations (Marchart, 2010: 160). Seen from Badiou's standpoint, social and economic relations are therefore always only the consequence of political revolutions. It comes as no surprise, then, that for Badiou (a) classes only exist in concrete practical confrontations, but are nothing in themselves, and (b) Marxism is neither a philosophy nor a theory, but primarily a political praxis:

Marxism [...] is neither a branch of economics (theory of the relations of production), nor a branch of sociology (objective description of 'social reality'), nor a philosophy (a dialectical conceptualization of contradictions). It is, let us reiterate, the organized knowledge of the political means required to undo society and finally realize an egalitarian, rational figure of collective organization for which the name is 'communism'. (Badiou, 2012: 8)

This reduction of Marxism to politics is especially visible in Badiou's rather sporadic references to capital, capitalism, and other categories of society in relation to empirical data, which thereby denies that we are in need of a *theory* of capital, as, for example, Adorno would argue. Capitalism, for Badiou, is a 'regime of gangsters' (Badiou, 2012: 12). According to Badiou, theorizing about capitalism remains within the existing paradigm, as it only analyzes what is taken to be untruth, whereas Marxism as a praxis (already) exists outside of the existing paradigm.

Since Badiou defines Marxism as a political praxis, his writings on how contemporary society could be overcome are defined in terms of ideas and subjects. According to Badiou, social reorganization is based on the 'force of an idea' (Badiou, 2012: 15) as an a priori condition, namely, the force of the idea of communism, which runs through the entire philosophical history. The communist idea can 'interpellate' individuals, the consequence of which is that they turn into subjects (of the idea). Agency is constituted, according to this model, through the

subjection of individual bodies to the truth who then, as quasi-militants, reorganize the reality in accordance with the idea. Indeed, according to Badiou, the political subject is 'a militant of this truth' (Badiou, 2010a: 3). According to this quasi-religious model of political agency, individuals now belong to a new order of humanity (Badiou, 2010: 35).

Although Rancière's Maoism is not as strong as Badiou's, some of his positions regarding radical democracy come close to Laclau and Mouffe, and his shift toward the ontology of the political can be located in close proximity to Badiou's ideas.<sup>13</sup> According to Rancière, democracy should be understood as an anarchist concept in the sense of an 'ungoverning' element in all government and as a 'non-foundation' that founds *all* attempts to organize social reality. Again, politics becomes the true ground of the social and it loses its social form. All political governing of society is forced to control the democratic and uncontrollable foundation that underlies and threatens political control. Society, as Rancière argues, becomes 'bracketed' by events of democracy. As a consequence, democracy as a *possibility* of the breakdown of the control mechanisms of society refers to fundamental instability of the entire social order. Rancière's turn to the political and his turn away from Marx's critique of political economy, as in Badiou, lead to the reappearance of historically universal concepts and to the rejection of the concept of class: 'The power of the people is not that of a people gathered together, of the majority, or of the working class. It is simply the power peculiar to those who have no more entitlements to govern than to submit' (Rancière 2006, 46; for a critique of such a position, see Wood: 1998). Rancière offers a radical version of the 'political autonomy' theorists by claiming that the political as the 'groundless ground' of society does not depend on *any* social, ethical or historical forms:

comes to assist and to rival it. It is not based on any nature of things nor guaranteed by any institutional form. It is not borne along by any historical necessity and does not bear any. It is only entrusted to the constancy of its specific acts. (Rancière, 2006: 97)

The problem with this position is not that it reintroduces a strong concept of politics; rather, the problem with this vision is, as in Badiou, that it is unable to conceptualize the political agent as a *historically specific* and social-economic agent who can only *be* a political agent because its being is social.<sup>14</sup>

Badiou's and Rancière's substantializing of the political can also be found in Lefort and Castoriadis. Lefort was very influential for the French discussion, and his definition of the political can be seen as paradigmatic. He writes: 'the *political* refers to the social ensemble itself, for the entire collectivity is affected by conceptions of the nature of power and the mode of the exercise of government' (Lefort, 2007: 113). As Breckman has it, 'Lefort urged us to see that social conflict can only be defined as representing an internal division, a division opening within and defined by a single milieu' (Breckman, 2013: 150).

In a similar fashion, Castoriadis detects in Marx a 'naïve contempt for the political question' (Castoriadis, 2008: 197) and a naïve belief in the disappearance of politics once the relations of productions would be revolutionized and collectivized. According to Castoriadis, Marx did not understand the full force of the political realm as a realm of freedom and equality since he underestimated the role of power in societies. In short, in search of a radical praxis and in search of a revolutionary subject after the downfall of traditional Marxism, Post-Marxist thinkers such as Castoriadis see Marxism as an obstacle to new ways of thinking about society and a different future. He criticizes traditional Marxism by arguing that its focus on theory, sciences, and laws cannot help us understand contemporary society. Socialism, as he argues,

Democracy is as bare in its relation to the power of wealth as it is to the power of kinship that today

is not in classical Marxism understood as a historical and political project of people and its praxis; instead, it conceives of society as the result of an objective historical movement (Castoriadis, 2014: 76). Castoriadis's position has immediate ramifications for the concept of class in his thinking, since he claims that the concept of class can no longer be determined by its relation to the relations of production alone. As a consequence, he identifies traditional Marxism with its political effects in the twentieth century and, given these twentieth-century failures of the left, he argues for a strong concept of social autonomy that is based on the idea that an autonomous society (which he no longer calls 'socialism') is a society that determines its own institutional reality as the result of its own collective actions and is able to make corrections whenever it realizes faults or different needs (Castoriadis, 2014: 55). Seen from this mix of Kantian and anarchist ideas, Marxism as a doctrine becomes on *all* levels and institutions of society a 'massive restriction' of human self-regulation (Castoriadis, 2014: 77), 'self-administration' (Castoriadis, 2014: 78), and 'participatory democracy' (Castoriadis, 2012: 82). Again, this idea is best expressed by Laclau and Mouffe:

We have rather to conceive society as a complex field, crossed by a diversity of political struggles, in which the multiplicity of subjects must be recognised and accepted if we are one day to achieve a truly liberated and self-managed society. (Laclau and Mouffe, 1981: 22)

Finally, for Castoriadis, truth must be liberated from fixed knowledge and ought to become the 'free movement of people in a free realm' (Castoriadis, 2014: 61). Castoriadis himself connects the emergence and strength of the concept of self-administration to the events of 1968 (Castoriadis, 2014: 153). As in Laclau and Mouffe, any metaphysical framework of thought should be abolished, and since dialectics is ultimately rooted in metaphysics, dialectics has to go, too.<sup>15</sup>

### ***The Primacy of Power***

Treating Foucault as a Post-Marxist is contentious, insofar as Foucault's work is not only characterized by many changes, but Foucault distanced himself from Marxism and showed contempt for academic Marxists. However, Foucault appeared in public with many masks, and a more generous reading of Foucault reveals that Marx's critique of political economy is present in many of Foucault's analyses of the modern disciplinary institutions, such as the hospital, the schools, and the prisons, i.e., his work in the 1970s. The recently published lecture courses during this period of his thinking, such as *The Punitive Society*, in which Foucault develops a first version of what then became *Discipline and Punish*, shows an uncanny closeness to many issues that Marx dealt with in volume one of *Capital*. Due to Foucault's rather narrow reception as a 'Post-modernist' this important aspect of his work can easily be overlooked. Equally important is his appropriation of Althusser's concept of ideology (Althusser, 2014) and his further development of an institutional and spatial theory of knowledge. For example, in the lecture course *The Punitive Society* as well as in some writings on biopolitics, Foucault is concerned with the production the human body as a human body that must be prepared and 'inserted' into the disciplinary framework in the seventeenth and eighteenth centuries.

The adjustment of the accumulation of men to that of capital, the joining of the growth of human groups to the expansion of productive forces and the differential allocation of profit, were made possible in part by the exercise of bio-power in its many forms and modes of application. The investment of the body, its valorization, and the distributive management of its forces were at the time indispensable. (Foucault, 1990: 141)

In other words, the subjection of the labor process to money and the wage form required the subsumption of the human body to the process of valorization (for this, see also

Macherey, 2015). After the first historical upset by capital the production of migrating bodies had to be controlled (vagabonds, homeless, etc.).

Foucault analyzes the *constitution of social reality* through the body. For example, the history of handwriting, as Foucault shows in *Discipline and Punish*, can be conceived of as a disciplinary process that produced the effect of different 'spatial' and bodily configurations and different social relations, which, in turn, had to be in place in order to bring about the subjection of labor to capital. Accordingly, for Foucault, knowledge is tied up with the body, the topic of which has been totally missed by critical theory, since social formations are rarely analyzed by Frankfurt School philosophers as embodied processes. As Foucault argues, capitalism

would not have been possible without the controlled insertion of bodies into the machinery of production and the adjustment of the phenomena of population to economic processes. But this was not all it required; it also needed the growth of both these factors, their reinforcement as well as their availability and docility; it had to have methods of power capable of optimizing forces, aptitudes, and life in general without at the same time making them more difficult to govern. If the development of the great instruments of the state, as *institutions* of power, ensured the maintenance of production relations, the rudiments of anatomo- and bio-politics, created in the eighteenth century as *techniques* of power present at every level of the social body and utilized by very diverse institutions (the family and the army, schools and the police, individual medicine and the administration of collective bodies), operated in the sphere of economic processes, their development, and the forces working to sustain them. (Foucault, 1990: 141)

Moreover, Foucault understands the production of knowledge in the form of ideology and in the form of social relations as a material process, which also includes architecture and geography. For example, in his analysis of power relations he includes the architectural form of prisons, and he is very interested in understanding how time and space became productive along with the historical

emergence of the wage form. As such, despite his intellectual turns and the fascinating breadth of his work, Foucault can be read in the framework of Marxism.

Although power in Foucault is a heavily debated topic and though he is not always clear about the ontological ramifications of his concept, seen from a Marxian background and the topic of embodiment, it becomes clear that Foucault moves power onto *one level* with the social-economic determinations and relations of production. As Balibar has convincingly argued, Foucault shares with Marx the anti-liberal position that power relations are prior to contractual relations (Balibar, 1992: 50).<sup>16</sup> Furthermore, power, as Foucault shows, is the force that reorganizes the social relations in accordance with the new social-economic principle of capitalism, which is the wage-form.<sup>17</sup> What Foucault attacks are certain caricatures of base and superstructure in which power is solely located in the superstructure of society. According to Foucault, following Althusser's concept of structural causality, power should be analyzed on the level of social relation and not from 'above' or independent from it. As a consequence, power is something that is never 'power over' or simply oppressive; instead, it is the very struggle that *organizes* the relations in accordance with its overall form (value).

In this way, Foucault makes the same move as other Post-Marxists by arguing that the political has been reduced to the social in Marxism and that we would do well to rescue political relations as relations of struggle as a topic on its own by analyzing it on what Foucault famously calls, in *Discipline and Punish*, the 'micro-analytic of power'. According to Foucault, then, all social-economic relations are political, insofar as every reorganization of the social is connected to the struggle between power and 'counter-power'. But this relation is not one-dimensional; instead, it is a pluriverse of relations that cannot be rescued by a dialectical theory of society. This all-pervasive concept

of the political also explains Foucault's closeness to Maoist movements. Since power is all-pervasive, power relations always *transcend* the social relations in which they are expressed and which they organize.

We can see here that that which Foucault worked out in hundreds of essays and interviews, becomes then finalized and popularized in Laclau and Mouffe. As they put it,

The Gramscian concept of the war of position implies a rupture with such a conception, a rupture which finds its theoretical source in the notion of the integral state. For if the articulations of the social whole are political articulations, there is no level of society where power and forms of resistance are not exercised. Since these articulations do not come from a single and necessary source, there can be no absolute and essential location of power, but rather a multiplicity of dimensions and struggles, whose unity – or separation – are constantly being re-defined. (Laclau and Mouffe, 1981: 20)

Although the transcendence does not occur external to existing society, as in Badiou, power always escapes the attempt to fix it in social categories, such as class, gender, or race. Put simply, power cannot be grasped as a unified principle; for power underlies those categories and brings their organization about without being determined by them.

## CONSEQUENCE: THE REJECTION OF CAPITAL AND THE LAW OF VALUE

All Post-Marxists reject that which has been (unfortunately) called the 'law of value', i.e., Marx's labor theory of value. The main proponents are, on the one hand, André Gorz (2004), and, on the other hand, Hardt and Negri (especially Hardt and Negri, 2001: 280–304). Gorz, although often not considered as a Post-Marxist philosopher, was one of the first, with Postone (1996, 2015), who understood Marx's philosophy of labor not necessarily as a critique of alienated labor and communism as a state of unalienated labor. He argues that Marx's philosophy is in

truth a critique *of* labor and a critique of wealth connected to labor and production, the thesis of which is most prominently featured in Marx's so-called 'Machine Fragment' in the *Grundrisse*. Given the further processes of automatization, the intellectualization of labor, ecological issues, the general importance of knowledge for production and the increasing unimportance of fixed capital for wealth, Gorz argues that the labor theory of value loses all of its meaning, and with it, at least to some extent, Marx's general philosophy, too. Even before Hardt and Negri, Gorz takes on 'immaterial labor' as the central issue for a Post-Marxist theory of the economy and contemporary society: 'Underpinning the capitalist knowledge economy, we find, then, an anti-economy in which the commodity, commodity-exchange and money-making don't apply' (Gorz, 2010: 13). Gorz's general thesis, which Hardt and Negri also support, is simple: immaterial labor and the centrality of subjectivity and knowledge for contemporary capitalism, points to the end of the attempt to privatize and to subsume everything for surplus value production. Since, as these philosophers argue, knowledge is intrinsically social, cannot be privatized, and belongs to the commons (Gorz, 2010: 36), capital is left with *power* and strategies to enclose knowledge. On this view, control societies are societies in which capital can no longer make labor more productive and, instead, tries to control it. Value, according to these Marx readers, is based on labor and is a measure, and, since immaterial aspects of labor products can no longer be measured, the labor theory of value becomes obsolete: 'by "immaterial labor"', as Negri explains, 'we mean the ensemble of intellectual, communicative, relational and affective activities which are expressed by subjects and social movements' (Negri, 2008: 62). Communism is already around the corner, and we are observing the last attempts by capital to go against its own downfall. Consequently, we can celebrate and declare critical theory a thing of the past.

Capitalism is now identified with 'limitless control' (Castoriadis, 2012: 83) of individuals, which no longer allows individuals to identify an overall meaning in contemporary society. Similarly, Negri and Hardt argue that under conditions of its dissolution capital turned into pure forms of control, insofar as the category of value can no longer be applied to the contemporary form of capitalism in which *measurable* labor no longer determines the value of commodities. As Negri has it, we are 'in a situation where *labour time* on the one hand and, on the other, the *criterion of measure* of this time (and hence the law of value) becomes less and less important as *central quantifying elements of production*' (Negri, 2008: 63). As a consequence, and this connects Negri and Gorz to other Post-Marxists, political relations (outside of their class determination) become again very important for understanding social relations, although, to be fair, Negri's analyses always move in close proximity to political economy:

When the entire paradigmatic framework of labour is changed, when labour comes to consist of a totality of knowledge borne and put into production by mass intellectuality, then political control comes to be exercised through war. (Negri, 2008: 65)

It is clear that the current shift toward a network society, which implies a 'socialization of production' (Negri, 2008: 64), as well as the 'internet of things' produces many problems for capital's ability to come up with new strategies to enclose the common, such as patents and intellectual copyrights. Once the products become more and more driven by digital technologies and information, commodities can be reproduced at almost no cost, which, in turn, reduces their marginal utility to zero and, ultimately, makes it almost impossible for capital to squeeze more profits out of labor power. According to Hardt and Negri, biopolitics in the form of control of entire populations, is the consequence (Negri, 2008: 71).

As a result, Hardt and Negri can be moved close to Laclau, who argues that the 'objectivist theory of history' was based (among other things) on the internal contradiction of surplus value production as well as on the assumption that the profit rate of capital will decline over time and bring capitalism to an end: 'The labour theory of value, on which it was grounded, was shown to be plagued by all kinds of theoretical inconsistencies' (Laclau, 2006: 104).

## CONCLUSION

Two concluding comments are in order: first, many of the Post-Marxist figures who have been discussed in this chapter seem to have a somewhat narrow understanding of the later Marx as an 'economic' philosopher who no longer can tell us much about our contemporary world. Second, given this, it is also crucial to understand why in more recent work done by academic Marxists who do *not* want to give up the Marxian heritage, a 'different' and 'new' Marx emerged that is most visible in the German school of the so called 'new Marx reading' (Backhaus, Heinrich, Reichelt), the re-envisioning of critical theory (Bonefeld), the Italian readings of Marx (Finelli, Fineschi), ecological Marxism (Saito, Foster, Burkett), and readings that deal with globalization and international issues (Padella, Anderson). These new readings move away from the classical understanding of Marx's critique of political economy as a theory of a specific mode of production to a wider understanding of Marx that includes all spheres of society.

Recent popular movements that are based on 'flat' political structures and that are directly influenced by Laclau and Mouffe, such as *Podemos* in Spain, can be traced back to a long intellectual left tradition after the Second World War, and should be seen in the light of the intellectual world of Post-Marxist thought. As Laclau and Mouffe have

it, 'the political subject, the agent of this outcome, can no longer be conceived of as the simple product of an infrastructural logic' (Laclau and Mouffe, 1981: 19). As such, any attempt to pose critical theory as an alternative theoretical paradigm should equally think about whether it can be accompanied by different forms of political praxis. The rejection of any hierarchical organization of contemporary left politics leaves us with the Badiouan question of whether a mass movement can be organized in a way that differs from the party conception of organization. It should not surprise us that contemporary left movements no longer look for traditional Marxist language to describe their struggles and no longer conceive of critical theory as something that helps them to understand the society within which they live. Accordingly, it comes as no surprise that, as Laclau and Mouffe have it, 'any reformulation of socialism has to start today from a more diversified, complex and contradictory horizon of experiences than that of 50 years ago' (Laclau and Mouffe, 1987: 80). We are living in a historical period in which 'new generations, without the prejudices of the past, without theories presenting themselves as "absolute truths" of History, are constructing new emancipatory discourses, more human, diversified and democratic' (80).<sup>18</sup>

However, even if this situation is undoubtedly true, we should be concerned with the tendency of Post-Marxism to reduce society to an effect of pluralized social struggles, since this leads to the assumption that we can think about the political or the ethical without determining from where, how, and what is at stake *as a whole*.

## Notes

- 1 One of the most insightful and detailed discussions of Post-Marxism as a whole is without doubt Breckman's (2013) *Adventures of the Symbolic*. Breckman, in contrast to almost all other commentators, in my mind correctly, also includes lengthy discussions of Lefort and Castoriadis.

- 2 On this, see Kouvelakis and Bidet (2008).
- 3 For a general discussion, see Breckman (2013). Baudrillard's work on the symbolic dimension of commodity culture and his critique of 'productivism' was very influential during the 1980s (for this, see Baudrillard, 1981).
- 4 Though I disagree with these two claims about Marx's theory, for the sake of this entry, I will not discuss this critique in more detail.
- 5 Engster (2013) and Wallat (2010) are too narrow since they leave out of their pictures of Post-Marxism feminist Marxism, theories of intersectionality, or, most importantly, works by Lyotard and Baudrillard. The best systematic approach to the philosophical questions raised by Post-Marxists, at least in my mind, is the work by Oliver Marchart (2010, 2013).
- 6 For this, see also Wallat (2010). As Wallat also points out (279), the concept of radical democracy, which gets pluralized and historically universalized in Laclau and Mouffe, loses its socio-economic specificity, the consequence of which is that the analysis of the state as a *unifying* force in capitalism gets lost. This stands in stark contrast to (early) critical theory and the German Marxist tradition after 1968. For this, see also Bonefeld (2014). For Badiou, the state is implied in all 'true' politics as a negative praxis, but his concept of state remains empty and becomes an equally universally unspecific placeholder for existing orders. As such, Badiou's concept of the state remains socially empty.
- 7 It would be interesting to contrast the French tradition in political philosophy with Adorno's philosophy of non-identity. Adorno's epistemological concept of non-identity implies an ethics, but its political ramifications remain unclear. For two different readings of Adorno, see Wellmer (1985) who moves Adorno closer to a theory of (post-)modernity, and Bonefeld (2016) who tries to push Adorno back to Marx. One should note though that there is an unfortunate tendency in the recent literature on the Frankfurt School, at least in my view, to remain silent on political philosophy altogether.
- 8 This and the following subsection are loosely based on what I have developed in Lotz (2014, 2016). How foreign these approaches are to Adorno's theory, can be seen nicely when we contrast Habermas and Honneth's basic assumptions about the being of society with what Adorno says in his instructive *Introduction to Sociology* (Adorno, 2002: 32). As we can see here, Adorno claims that we need to base our analyses on a constitutive principle, which, for him, is the exchange principle. As a consequence, following the logic of constitutive principles, Adorno also assumes that this principle establishes a unity and

- integration, against which his *Negative Dialectics* are posited.
- 9 As a consequence, Honneth declares early critical theory as a project of the past (for this, see Honneth, 2007).
  - 10 Choat and Rekret detect a similar problem in Laclau, since they argue that Laclau cannot solve his oscillation between his ontology of the social and the foundational role of antagonisms (which is universal) and the historicity of social formations (for this see Choat and Rekret, 2016: 284 and 285). Similarly, Wallat argues that Laclau and Mouffe do not offer a proper theory for understanding the specific form of the political (Wallat, 2010: 272). In my view, Heidegger's and Badiou's ontologies offer a way out of this problem by historicizing ontology itself, although for both philosophers the social-economic is of no importance for their ontologies of the 'event'.
  - 11 Two comments are in order: first, this position has been left behind by critical theory inspired by Lukács' early attempt to define each element of a social totality as an element of its totality and its form, as well as, to some extent by Marx himself. As Marx has it in his arguments against this Hegelian position, 'what is forgotten, finally, is that already the simple forms of exchange value and money latently contain the opposition (and inequality, C. L.) between labour and capital. Thus, what all this wisdom comes down to is the attempt to hold fast to the simplest economic relations, which, conceived independently, are pure abstractions; but these relations are, in reality, mediated by the deepest antagonisms, and represent only one side, in which the full expression of the antagonisms is obscured' (Marx/Engels 2005: 173). As Wallat points out, Marx never held the position that we can separate the logic of capital from political struggles that Post-Marxists, such as Laclau and Mouffe, ascribe to him (Wallat, 2010: 278). This thesis is also confirmed by Foucault, who detects in the process of formal and real subsumption in Marx's *Capital*, power relations on the same level as the social-economic.
  - 12 Badiou is not the only philosopher who argues for the primacy of the political. The theories of Rancière, Laclau/Mouffe, and Lefort/Castoriadis are equally influential, though it seems as if Lefort and Castoriadis have a smaller readership in the Anglo-American context. The unpopularity of Castoriadis might also be related to his undogmatic spirit and wide intellectual horizon. Castoriadis moves easily between left-wing revolutionary thoughts and the entire history of Western thought.
  - 13 For more on the different conceptions of democracy in Post-Marxism, see Zakin (2014).
  - 14 We should also note that Post-Marxist thought has led to very interesting re-readings of Marx. The best example for this is Abensour (2011), who tries to reveal that democracy can be understood as an anarchist (and Machiavellian) concept in Marx.
  - 15 Many of his ideas have anarchist roots and have moved into recent theories of democratic socialism, workplace democracy, and economic democracy, as it was developed by Erik Olin Wright, Richard D. Wolff, and David Schweickart. As Castoriadis further argues, an autonomous society cannot exclusively be achieved by a different political praxis, but it also needs a different form of how a society *imagines* itself as society, which led him to develop a theory of social imagination that still awaits its appropriation by contemporary critical theory, insofar as the analysis of the culture industry as a theory of the knowledge that capitalist society produces about itself could be easily connected to Castoriadis' idea that every society needs to *produce* an imagination of itself as that which determines itself as social reality. Accordingly, one would need to think about a different form of social imagination and ask whether the answer given by Frankfurt School thinkers, such as Marcuse and Adorno, that art and aesthetics can function as the place for envisioning a different world is sufficient.
  - 16 For the confrontation between her agonistic model of politics with the liberal tradition in Habermas and Rawls, see also Mouffe (2005).
  - 17 As Poster (1984: 95–120) argues, Marxist takes on prison development have reduced it to the issue in class and missed Foucault's broader claim that class is an *embodied* structure. Foucault's dismissal of the state as a unifying structure that belongs to capitalism and its form, moves Foucault closer to Post-Marxism (for this and his relation to Poulantzas, see Smart, 1983). A very good analysis of the problem of class in Foucault can be found in Bidet (2015).
  - 18 We can see here that, although Lyotard is rarely mentioned, the Post-Marxist framework is heavily indebted to Lyotard's famous diagnosis of the (post-modern) age as being characterized by the downfall of all meta-narratives that formerly defined philosophies of history (Lyotard, 1984).

# Critical Theory and Cultural Studies

Tom Bunyard

## INTRODUCTION

The aim of this chapter is to address some of the connections, differences and tensions that can be discerned between Critical Theory and Cultural Studies. This requires a few brief qualifications. Firstly, one cannot discuss the relationship between such broad and varied bodies of thought without making problematic generalisations. Consequently, and whilst I shall try to nuance the remarks that follow as much as I can, it will need to be taken as read that a good deal of work within both traditions differs from the themes and trends that this chapter will describe. Secondly, and in order to make that problem more manageable, these two fields will need to be narrowed to some degree. When referring to Critical Theory, I shall be primarily concerned with the latter's first generation, and thus with writers such as Adorno, Benjamin, Horkheimer and Marcuse; when looking at Cultural Studies, I shall concentrate on the history and characteristics of its

British iterations. This focus on British Cultural Studies is not due to chauvinism on my part, but rather follows from the fact that Cultural Studies' most seminal and defining forms first emerged within the British context of the 1950s, 1960s and 1970s. The debates and problematics that shaped its development exemplify many of the issues that have informed Cultural Studies' often vexed relation to Frankfurt School Critical Theory: a relationship that has been greatly informed by the differing conceptions of modern culture associated with these two bodies of thought.

From the 1930s onwards, writers associated with Critical Theory contended that modern culture was becoming progressively assimilated and restructured by capitalism. This, they held, was having deleterious effects upon both culture and upon those who consumed it. In their view, society had become marked by a tendency towards mechanistic rationalisation, which had resulted in a culture characterised by conformity and

complacency. This had become all the more alarming in the aftermath of the Holocaust: for having proved so amenable to domination and barbarity, modern society needed to be condemned, and its culture recognised as a stupefying, debilitating influence upon humanity's capacity to attain a less degraded condition. The 'mansion' of culture thus needed to be recognised as having been 'built of dogshit' (Adorno, 1990: 366).

In sharp contrast, most of the work that has been conducted in the tradition of classical Cultural Studies has tended to view modern culture not as a calamity, but rather as the site of emancipatory struggle. Popular culture is not seen simply as a locus of domination, but rather as a space of both consent *and* resistance: as a site of hegemonic contestation, wherein meanings and ideological formations are continually negotiated and challenged by both the producers and receivers of cultural messages. This then means that culture is seen to be inherently *political*, for once it is understood in this manner, culture becomes a space in which modes of struggle both for and against established forms of power are continually conducted.

The distinction drawn here is overly simplistic, but it should serve to indicate why proponents of these two fields of thought have often held each other at arm's length. For writers associated with Cultural Studies, Frankfurt School Critical Theory (and Adorno in particular) has become associated with an outdated Marxian cultural elitism. Conversely, some scholars of Critical Theory have viewed aspects of Cultural Studies as effectively endorsing capitalist culture. The differences between these views derive, in part, from the twists and turns that shaped the development of British Cultural Studies, which involved the adoption of positions that contrast with those that characterise first-generation Critical Theory. For example, there is an obvious distance between Adorno's bitter despondency regarding the effects of mass culture (e.g. 'every visit to the cinema leaves me ... stupider and worse' (Adorno, 2005: 25))

and the outright celebration of popular culture that Cultural Studies adopted towards the end of the 1980s. Perhaps the most extreme illustration of that short celebratory period can be found in John Fiske's *Reading the Popular* of 1989. Where Adorno and Horkheimer talked of a 'mechanically relentless control mechanism' (Adorno, 2002: 64), marked by consumption and fetishism, Fiske boldly described shopping centres as spaces of subversion (Fiske, 2002: 17); and where Marcuse complained of a society in which 'people recognise themselves in their commodities' (Marcuse, 1970: 24), Fiske presented a televised game show, in which contestants guessed the price of commodities for cash prizes, as a source of feminist liberation (the show, he claimed, took 'skills and knowledges ... out of the devalued feminine sphere of the domestic' and gave them a 'carnavalesque inversion' (Fiske, 2002: 21)).

Such views are easily ridiculed when viewed from a broadly Marxian perspective. However, the approach to modern culture from which they arose should not be dismissed quite so readily: for as I shall propose below, that approach may be of some relevance when considered in connection to our modern social and political context, and indeed when viewed in relation to the impasses into which first-generation Critical Theory eventually fell.

In this regard, it may be useful to underscore the gravity of the political engagement that informed the development of the Gramscian conception of culture that I sketched above. Just as Gramsci's interest in hegemony was informed by Italian fascism, so too was British Cultural Studies' turn to Gramscian thought informed by the rise of the right in the 1970s and 1980s. Serious attempts were made to theorise how and why Thatcherism had been so successful; and whilst the responses offered certainly did not ignore the changing socio-economic climate of the time, they they also pointed out that the political right had been particularly adept at re-framing the meaning of key terms and ideas

(‘democracy’, ‘freedom’, ‘choice’, etc.). This implied that subsequent attempts could be made to challenge and re-position these meanings (McRobbie, 2005: 22). During the 1970s and 1980s, therefore – and thus during the period in which many of this tradition’s core ideas were established – British Cultural Studies was attempting to operate as a critically and concretely engaged political project. It was not intended to function purely as means of interpreting the social world, but was also attempting to change it. Given that our own historical moment seems clearly marked by a drift towards new forms of ‘authoritarian populism’, the ideas that were advanced during this period of research may well merit attention today. That said, I shall also suggest that there are aspects of the Cultural Studies tradition, and indeed of contemporary Cultural Studies in particular, that may seem rather more dubious.

## ORTHODOXY AND ACCEPTANCE

There are a number of significant points of correspondence between aspects of Cultural Studies and Critical Theory. For example, early British Cultural Studies emerged from a frustration with traditional Marxism similar to that which motivated the writers of the Frankfurt School. It has also been consistently marked by a concern with the ways in which power operates within modern society, and by an orientation towards the pursuit of emancipatory political change. Furthermore, both Critical Theory and Cultural Studies have often shared a similarly inter-disciplinary and anti-dogmatic ethos. Indeed, just as it is somewhat problematic to talk of a ‘Frankfurt School’ of Critical Theory (Finlayson, 2007: 627), so too is it questionable to refer to a ‘Birmingham School’ of Cultural Studies (associated with Birmingham University’s celebrated Centre for Contemporary Cultural Studies). In fact, Stuart Hall, one of the most prominent and influential figures within that

period of Cultural Studies research, once remarked that references to a ‘Birmingham School’ only served to remind him ‘of the arguments we used to have in Birmingham that we were never one school’, and of the fact that there was no desire ‘to create that kind of orthodoxy’ (Hall, 1996a: 149). Nonetheless, such an orthodoxy does seem to have taken root within some aspects of Cultural Studies.

Hall’s remarks were made in the late 1980s, in response to a growing tendency within Cultural Studies towards its institutionalisation and codification as a discrete academic discipline. Semiotics, theories of ideology and post-structuralist ideas had once been selected as tools from amongst a range of other possible approaches, and had been employed as means towards furthering an open-ended political project. Yet due in part to Cultural Studies’ growing prominence within academia, this set of tools had started to coalesce into a distinct, recognisable methodology. This was fostered by Cultural Studies’ gradual spread overseas, where it was adopted, particularly in America, as though it were a discrete, established doctrine. At the same time – and whilst a broad commitment to notions of liberation certainly remained in place – the direct connection to concrete politics that had characterised some of the most significant Cultural Studies work of the 1970s and 1980s started to subside. Hall was thus concerned that Cultural Studies was turning into a relatively settled body of thought: one that was certainly suited to describing modern culture, but which had become rather less invested in changing the latter than had once been the case.

These issues would become further complicated during the 1990s, as a result of British government policies concerning the supposedly socially regenerative and wealth-creating attributes of art and culture. Cultural Studies flourished as an academic discipline, and its university departments became increasingly closely tied to employment within the so-called ‘creative industries’.

Such connections have since become firmly established: academic Cultural Studies has become interwoven with media studies, and students who pursue such courses are now often schooled in ideas suited to work within advertising, industry and the media.

This entails a departure from critical theoretical concerns that could be phrased as follows. If Cultural Studies can be said to have evolved a relatively firm body of methods and precepts; and if that resultant set of ideas serves to produce knowledge suited to the continued operation of the existing social order, and which does not seriously challenge the latter (as is the case, for example, if it serves as a training ground for industry); then it could be construed as an instance of what Horkheimer referred to as *traditional* theory, as opposed to a form of *critical* theory. In brief: it seems possible to argue that whilst some of the aspects of Cultural Studies that I referred to above might accord with the characteristics of a *critical* theory, its subsequent development brought it much closer, at times, to the status of *traditional* theory. In order to develop that claim, we need to look at Horkheimer's seminal definitions.

## TRADITIONAL AND CRITICAL THEORY

Horkheimer's 'Traditional and Critical Theory' essay of 1937 begins by contending that theory involves subsuming facts under conceptual structures that afford the explanation and interpretation of those facts. He then goes on to argue that traditional theory is characterised by the use of largely unquestioned theoretical structures. Because they are taken for granted, the modes of thought and relation to the world that they entail are effectively naturalised. Traditional theory operates in this manner, according to Horkheimer, because its conceptual structures are shaped in such a way as to be

fruitful for particular kinds of knowledge, which are oriented – however tacitly – towards particular kinds of results. These results are suited to the pursuit of goals that accord with the needs and nature of a given social context. Thus, as Horkheimer puts it: if the 'properties' of a theory are 'seen as advantages, this very fact points beyond itself to the fundamental characteristics of social action at that time' (Horkheimer, 2002: 195).

In consequence, traditional theory tacitly serves and perpetuates the social context in which it is situated. It also accustoms those who employ such theory to that same social order, whilst masking its own ideological contextuality. Because it does not address or examine the degree to which its conceptual frameworks accord with the extant social world, it has no engagement with its own specificity to the historical moment that it serves and naturalises. Instead, it merely confronts the world through fixed contexts and categories, making sense of that world in a manner that suits the operational schema of the society from which such theory arose. In this regard, and as Horkheimer pointed out, traditional theory is somewhat analogous to Kantian philosophy: for it too subsumes contingently given input under a fixed conceptual framework, the ultimate unity, purpose and operation of which remains beyond the perspective afforded by that same framework (Horkheimer, 2002: 203).

How might this relate to our concerns? The answer is simply that some of the criticisms that have been levelled at contemporary Cultural Studies, from positions sympathetic to Critical Theory, can be seen to echo these themes. According to Slavoj Žižek, for example, 'the field of Cultural Studies, far from actually threatening today's global relations of domination, fit[s] their framework perfectly' (Žižek, 2001: 226). Or, as Esther Leslie once put it, whilst echoing Horkheimer: Cultural Studies has evolved into a parody of Kantianism; a parody 'in which the object is slotted into a framework of categories such

as gender, race, identity (and its flipside difference), language, culture, space, time' (Leslie, 1999: 123), and in which that object is thereby interpreted in a manner that does not truly contest the nature of the society in which both theory and object reside. Modern Cultural Studies, in other words, has been cast as a body of thought that is certainly able to produce knowledges and skills suited to conduct within the extant social order, but which does not seriously challenge the latter in any fundamental sense.

Horkheimer's notion of traditional theory owes a good deal to Max Weber, but it also echoes some of the claims that Lukács made in his highly influential *History and Class Consciousness* of 1923. Similarly to Horkheimer, Lukács described capitalist society as having engendered a mode of thought that both reflects and perpetuates a socially conditioned inability to grasp the historical contingency of capitalist society. Such 'bourgeois thought', Lukács claimed, views the social world as largely unchanging. Like Horkheimer, Lukács illustrated this point by way of reference to Kantian philosophy: 'bourgeois thought', he claimed, tends to treat the world as a *given*, addressed by a consciousness that simply *interprets* that which it confronts. Such thought is certainly suited to the pursuit of individual ends within the existing social structure, but it ultimately suits the requirements of an effectively sovereign economic system. This is because its limited perspective fails to take full cognisance of the sense in which the social world is not just a given object that stands at one remove from the consciousness that contemplates it, but rather the result of the potentially transformative collective agency of human subjects (Lukács, 1971).

One can find much the same view in Horkheimer's essay. Like Lukács, Horkheimer presented traditional theory as an approach to the world whereby individuals try to adapt to reality without fully grasping the fact that the world that they confront is really the result of their own social activity. In other words,

traditional theory understands and categorises a given social world in accordance with the needs *of* that same world. Through doing so, it breeds a degree of conformity *to* that world, and thereby occludes the sense in which the latter is in fact contingent upon its continued acceptance by its inhabitants. As we will see towards the end of this chapter, it is rather hard not to be reminded of these views when one considers some of the more instrumentalised aspects of contemporary media and cultural theory.

In contrast to such forms of thought, *critical* theory, according to Horkheimer, would recognise that social reality is mutable, and that it is the product of social activity. It would not bring human beings into tacit alignment with a world that they have themselves created, but would instead foster emancipation from their subordination to that world's effectively autonomous logics. In this regard – and as Horkheimer pointed out – critical theory would function in a manner that bears direct relation to Marx's critique of political economy (Horkheimer, 2002: 206n). If political economy can be understood, from a Marxian perspective, as the flawed, limited self-consciousness of bourgeois society, then a *critique* of political economy would aim to address and lay bare the presuppositions and normalised assumptions that characterise that consciousness. Similarly, if traditional theory can be understood as operating within the extant framework of modern society, then critical theory is engaged in addressing the unquestioned assumptions that characterise that framework. By extension: critical theory must then be a kind of *practice*, insofar as it is oriented towards liberating human agents from their own inadvertently self-imposed domination. Rather than forming part of the existing social order, such theory must be oriented towards the latter's transformation: for 'the kind of theory which is an element in action leading to new social forms is not a cog in an already existing mechanism'. Rather than forming part of the existing social order, it

must instead be part of a struggle against that order; it cannot be 'self-sufficient and separable from the struggle' (Horkheimer, 2002: 216). Consequently, a genuinely critical theory cannot take its role and position in society for granted, but must self-consciously assess its own relation to the existing order.

The following sections of this chapter will argue that many of these ideas can be mapped onto the problematics that informed the development of British Cultural Studies.

## THE ORIGINS OF BRITISH CULTURAL STUDIES

Raymond Williams, a formative figure in British Cultural Studies, once pointed out that 'culture' is 'one of the two or three most complicated words in the English language' (Williams, 1988: 87). In the past, the term had been associated with cultivation, and thereby with refinement; hence its connection to sources of 'cultured' intellectual and aesthetic appreciation, such as high art, music and literature. In its more modern usage, however, 'culture' tends to be identified with a people's way of life. Cultural Studies is generally closer to the latter view, and its initial emergence, in the 1950s, was greatly informed by frustration with earlier perspectives that associated culture with refinement and improvement. We should begin, then, by looking at such views, and perhaps the best place to start is with Matthew Arnold.

Arnold was a nineteenth-century English critic and poet, who held that the role of cultural criticism was to 'cultivate what is best and noblest' (Arnold, 1992a: 591) in people. Through doing so, criticism would help 'to keep from man a self-satisfaction which is retarding and vulgarising', and thereby 'lead him towards perfection, by making his mind dwell upon what is excellent in itself, and the absolute beauty and fitness of things' (Arnold, 1992b: 597). Cultural criticism,

therefore, should concentrate on the improving, uplifting qualities of the high arts, on the grounds that the dissemination of such values could assist the improvement of humanity in general. Arnold's ideas thus informed and echoed the nineteenth-century liberal view that art, poetry and high culture could help to remedy the degraded conditions of the working classes.

The notion that high culture might form a bulwark against barbarity can also be found in the work of F. R. Leavis, whose *Mass Civilisation and Minority Culture* of 1930 sought to respond, from a conservative perspective, to the aspects of mass society that began to alarm Adorno during that decade. Leavis claimed that the minority of individuals within society who are capable of fully appreciating high art and literature 'constitute the consciousness of the race' (Leavis, 2005: 34). In his view, such elite, cultivated culture, and the ability to engage in its appreciation, was under threat from 'the processes of mass production and standardisation' (Leavis, 2005: 35). Faced with the radio programmes, pulp literature and magazines that had begun to flood society, Leavis warned, in terms that echo Adorno and Horkheimer, that 'a standardised civilisation' was 'rapidly enveloping the whole world' (Leavis, 2005: 37).

British Cultural Studies has, however, almost always been marked by a longstanding antipathy to anything that resembles such cultural elitism. Some of the primary roots of this rejection of elitist values (and, by extension, of its longstanding antipathy to any Adornian readiness to describe the consumers of cultural products as 'infantile' and 'forcibly retarded' (Adorno, 2002: 46–7))<sup>1</sup> can be found in one of the originary texts of British Cultural Studies: Richard Hoggart's *The Uses of Literacy*, which appeared in 1957. Hoggart's book certainly echoed the view that modern society was under threat from the corrosive effects of a standardised, mass-produced culture, which had grown increasingly pervasive since Leavis' time. Yet rather than viewing high culture as the

last bastion of defence against that encroaching threat, as Leavis had done (and as Adorno had done too, albeit in a very different and nuanced manner), Hoggart focussed on the often-neglected merits of the working class communities in which he had grown up. With an admirable absence of romanticism, although with a slight trace of conservatism, he argued that the close communities and old, organic social relations that could still be detected within England's Northern industrial towns were being broken down. '[W]e are moving towards the creation of a mass culture', he claimed, and 'the remnants of what was at least in parts an urban culture "of the people" are being destroyed' (Hoggart, 2006: 9–10).

Importantly, Hoggart rejected the view that the working classes could be construed as dupes, and that they had been led astray and infantilised by the new 'mass culture'. So too did Raymond Williams, who was at pains to stress that the members of the Welsh working class community within which he had grown up were not dazzled by the glamour of popular culture, but rather retained a strong capacity for critical discernment. It would be a serious mistake, Williams claimed, to view the denizens of such a culture as incapable of conducting any kind of critical assessment of the meanings, products and entertainments with which they were confronted. Williams also foregrounded the view, which had already been present in Hoggart's work, that 'culture' need not designate a collection of prized books and paintings, but rather referred to a mode of life. In 1958, Williams famously argued that 'culture is ordinary' (Williams, 2002: 92): that it needed to be understood as 'a whole way of life', and that the activities and interactions that composed it were articulated via the 'common meanings' produced by 'a whole people' (Williams, 2002: 95–6). Williams' work thus introduced some of the key themes that would run throughout much of the work that followed: namely, the emphasis on culture as a locus of constructed meaning; the

view that individuals within a culture are able to critically address, contest and create these meanings; and indeed the further view that an orthodox Marxism could not accommodate such ideas. This latter point would also be inflected by the work of E. P. Thompson, who argued, in his *The Making of the English Working Class* of 1963, that class cannot be understood as an economic category, but should instead be seen a culture formed by human relationships through time.

The work of Hoggart, Williams and Thompson lies at the origin of British Cultural Studies, which grew and coalesced further following Hoggart's founding of Birmingham's Centre for Contemporary Cultural Studies (CCCS) in 1964. These early years were also very much informed by the New Left, which had been given a good degree of impetus by the Soviet invasion of Hungary in 1956. A desire for distance from the so-called 'actually existing communism' of the East; frustration with an ineffectual mainstream labour politics; a concern with the need to break away from an orthodox interpretation of Marxism; all of these aspects of the New Left greatly inflected the emergence of British Cultural Studies, and became key themes when Hall took over the directorship of CCCS in 1968.

## SHIFTING MEANINGS

The struggles around black power, gay rights and feminism that are often grouped together under the heading of '1968' certainly fostered greater degrees of social equality. Capitalism, however, ultimately proved quite commensurable with these demands. These efforts towards liberation were gradually accommodated through the emergence of a mode of capitalist society that placed an increased emphasis on *individual* liberty, and which responded to the 1960s more hedonistic and utopian demands with a new-found emphasis on consumer desire, variety and

distraction. Assisted by the slow demise and growing disrepute of the old, traditional left, these circumstances led to a condition of greater social atomisation and fragmentation (Gilbert, 2008a: 21–2). Thus, whilst the struggles identified with 1968 were successful in some regards, the era that followed was a disaster for the political left. In Britain, this was compounded by the rise of right-wing popular politics.

As was indicated above, the work pursued by Hall and others during the 1970s and 1980s sought to address the reasons for, and possible responses to, this new state of affairs. One of the most important instances of such analysis was *Policing the Crisis* of 1978: a text that analysed a racially inflected bout of hysteria in the press concerning muggings, and which thereby investigated the changing nature of the political and economic circumstances of the time. It showed that popular unrest was being steered by the right-wing press and politicians into an antipathy towards immigrants, unions, and to the left more broadly.

The theoretical resources that would be employed as means of addressing this state of affairs drew on the advances that Gramsci, Althusser and semiotics afforded over a more traditional Marxian understanding of culture and ideology. With Althusser, one could address the relative autonomy of ideology vis-à-vis an economic base; with Gramsci, one could cease to view ideology as a top-down mode of control, and instead see social attitudes in terms of a constant struggle for hegemony; from semiotics, one could take a set of conceptual tools suited to the analysis of those contested cultural messages and norms.

Steps towards this position were taken in 1973, with Hall's 'Encoding and Decoding in Television Discourse' essay: a text that emphasised the politicised nature of cultural discourse, and which stressed that audiences might interpret messages in a manner opposed to that which was intended by the senders of such messages. Semiotics had become particularly important by the late

1970s, when Dick Hebdige produced his *Subculture: The Meaning of Style* (1979): a book that argued that youth subculture involved subversive interventions into society's dominant system of meanings. Cultural Studies was thus moving towards the conception of culture sketched at the outset of this chapter: a view according to which culture could be seen not simply as a site of ideological domination and control, but rather as a space of political contestation, wherein meanings and messages could be contested as elements of hegemonic struggle.

It is perhaps important to note here, given the nature of the positions that would later emerge within both Cultural Studies and Critical Theory, that such contestation was *not* envisaged as a 'mere "discursive" operation' (Hall, 1996b: 41). Work such as this certainly led to Cultural Studies' later and enthusiastic appropriation of post-structuralist ideas, but for Hall at least, cultural meanings and symbols did not float 'in language or ideological representation alone' (Hall, 1996b: 41): instead, 'reality exists outside language', although it is 'constantly mediated by and through language' (Hall, 2001: 95). Although ideological formations were not held to be reductively tied to an economic 'base', they were nonetheless seen to pertain, in more or less adequate ways, to the economic structure of society. The aim of a hegemonic cultural politics would then be to 'articulate' these ideological formations to concrete realities in a manner that might assist social change. 'No ideological conception can ever become materially effective', Hall claimed, 'unless and until it can be articulated to the field of political and social forces and to the struggles between different forces at stake' (Hall, 1996b: 42).

## THE GRAND HOTEL ABYSS

Having now reached what was, arguably, the defining period in the evolution of British

Cultural Studies, we should pause here in order to take stock. Despite important differences, elements of this work certainly chime with aspects of Critical Theory. Although Hall and others sought to remain within 'shouting distance' of Marxism (Hall, 1996c: 265), they stressed at the same time that a radical consciousness could never be mechanically generated by the economy or assumed by the theorist (views associated with the very traditional and orthodox conception of Marxism that they sought to reject). This work also incorporated a high degree of self-reflexive awareness of its location within its own object of enquiry. Above all, it was not intended to operate as a purely academic and socially descriptive exercise, but was instead motivated and formed by a drive towards social change. Yet when viewed from a perspective sympathetic to the concerns associated with first-generation Critical Theory, this vision of culture, and of counter-hegemonic intervention, is by no means unproblematic. It can be seen as a form of capitulation to a world in which truth and falsehood were becoming floating signifiers, and in which politics was beginning to be shaped by opinion polls (Norris, 1993: 6–7). In addition, its pragmatism could also be seen to tacitly normalise both social democracy and the supposed need to steer potentially compliant masses towards particular political goals. One might also wish to voice objections to its theoretical legacy, given that work such as this opened the door to Cultural Studies' later willingness to locate some kind of liberatory potential in practically any aspect of mass culture.

It follows, from our earlier discussion of Horkheimer's notions of critical and traditional theory, that if a body of theory were to accept and endorse capitalist culture, it would, presumably, amount to an instance of *traditional* theory. Could this assessment apply to the views described above? As we will see shortly, Cultural Studies would later undergo a period of theoretical debate in which fierce defences were offered for the

pleasures and supposedly emancipatory virtues of commodity consumption. These discussions were certainly predicated upon the views described above, but even so, it would be a serious mistake to view all Gramscian Cultural Studies as an elaborate apology for capitalist culture. Work in this vein has tended to be marked by critical engagements with the ways in which social structures are maintained through culture. Insofar as it is thus concerned with contesting the tacit naturalisation of a given social order, it can be framed not as an instance of traditional theory, but rather as according with some of the attributes that Horkheimer ascribed to critical theory.

It might seem that a stronger case could be made if one sought to reproach this period of Cultural Studies for its ties to social democracy, given that the latter was viewed with deep suspicion by some critical theorists (Benjamin, for example, spoke of the 'conformism which has been part and parcel of social democracy from the very beginning' (Benjamin, 2005: 258)). For first-generation critical theorists, the disastrous nature of modern society meant that reform was untenable: attempts to make its intolerable conditions more tolerable would only serve to acclimatise its inhabitants to their domination.

However, Adorno and Horkheimer tended to avoid direct reference to 'revolution', and also rejected the view that theory should operate in the latter's instrumental service (Finlayson, 2007: 654). Rather than conceiving revolution as a social remedy, efforts were directed towards developing a notion of utopia that would illuminate the failings of the present. Ideas such as these led Critical Theory into an impasse. This is because both a messianic, redemptive notion of revolutionary change, and withdrawal from a purportedly damaged, broken world, can court the danger of collapsing critical theory into traditional theory: for if less drastic forms of political change and engagement are rejected, one is left in a position of potential inaction; a position of lordly, etiolated separation from

which the world can be condemned en bloc. Such a purely condemnatory relation to capitalist society could only be *contemplative*, in Lukács' sense of the term, no matter how much it involved railing against reification. Indeed, for the Lukács of 1962, some of the key proponents of Critical Theory seemed suspiciously content to merely observe and lament the world's miseries.

A considerable part of the leading German intelligentsia, including Adorno, have taken up residence in the 'Grand Hotel Abyss' ... a beautiful hotel, equipped with every comfort, on the edge of an abyss, of nothingness, of absurdity. And the daily contemplation of the abyss between excellent meals or artistic entertainments, can only heighten the enjoyment of the subtle comforts offered. (Lukács, 2006: 22)

We will return to this apparent impasse later. Suffice it to say here that whilst Critical Theory can certainly afford trenchant criticisms of some aspects of Cultural Studies, those who work within the tradition of Critical Theory may have something to learn from classical Cultural Studies' readiness to engage and intervene with culture and politics. There is, however, perhaps rather less to be gained from the more celebratory accounts of mass culture that would be advanced in the years that followed.

## POPULAR PLEASURES

British Cultural Studies' subsequent evolution was greatly informed by its encounters with the feminist, post-colonial and queer concerns. Some of these encounters were quite jarring (Hall, 1996c: 269), as they involved critically addressing the degree to which Cultural Studies had retained and normalised the assumptions of the society that it inhabited. In 1989, for example, Paul Gilroy criticised Raymond Williams' unintended proximity to racist discourse in *There Ain't no Black in the Union Jack* (Gilroy had already contributed to *The Empire Strikes Back: Race and Racism*

*in 1970s Britain* (1982), and would go on to write his influential *The Black Atlantic* in 1993). Feminism and gay issues had been similarly important throughout the 1970s. Cultural Studies' engagements with such issues were also facilitated by its readiness to adopt aspects of 'post-modern' theory, which was becoming increasingly prevalent within Anglophone academia at this time. This encouraged the 'shouting distance' that Cultural Studies had maintained with Marxism to grow fainter, as the influence of writers such as Foucault, Derrida, Lacan, Baudrillard and Lyotard pushed that distance even further.

At the same time, the success and growing prominence of Cultural Studies was facilitating its increasing acceptance into the academy. This came with obvious advantages, but it also fostered the tendency, which we saw Hall object to earlier, towards the disciplinary codification of what had previously been an open-ended and inter-disciplinary project. According to Hall in 1986, semiotics was becoming an established methodology. Althusser's thought was being shorn of its Marxist connotation, and Gramsci's conception of hegemony was being treated as if it simply meant ideological domination (Hall, 1996a: 149). Cultural Studies was turning into a discrete, recognisable academic discipline, in which its former political dimensions were being gradually eclipsed by a purely theoretical commentary upon modern culture (Hall, 1996c: 273–4).

This is not to deny that Cultural Studies continued to engage with political issues, as racism, sexism, homophobia and domination would remain key concerns. The point, rather, is that such issues were now being addressed within an institutional context that was itself situated within a capitalist social formation that had proved itself more than capable of accommodating feminist, anti-racist and gay demands (Gilbert, 2008a: 49). To what extent, then, could the Cultural Studies to which this gave rise lay claim to the status of *critical theory*? Perhaps very little, if all it offers is a mode of quasi-critical commentary

that does not seriously challenge the seeming inevitability of social relations that are predicated upon commodity exchange. Cultural Studies had evolved a relatively coherent conceptual framework by this time, but if all that framework affords is a mode of interpreting the world that effectively leaves the latter untouched, then it must surely come closer to the status of *traditional* theory. This issue seems particularly pertinent when considered in connection to some of the work on consumption that was produced during the 1980s and 1990s.

As noted earlier, Cultural Studies had long been marked by the view that hegemonic consensus is never final, and that total ideological domination does not exist. If cultural meanings are indeed fluid, then elements of mass culture can be re-purposed (buying a safety pin might constitute capitalist conformity; wearing it through one's nose might signify refusal and opposition). Furthermore, if culture is understood in terms of hegemonic consensus, then cultural phenomena may exhibit both progressive and regressive attributes. The roots of these ideas go back a long way. For example, Angela McRobbie, who joined CCCS in 1974, studied the ways in which cultural products marketed towards teenage girls not only construct forms of femininity, but also respond to and incorporate feminist concerns. In 1979, Richard Dyer's 'In Defence of Disco' argued that disco, despite its glossy and polished aesthetics, played an important part within gay culture. Popular music might well be a commodity, he argued, but its status in this regard does not prevent it from creating important loci of potential change: 'The anarchy of capitalism', he claimed, 'throws up commodities that an oppressed group can take up and use to cobble together its own culture' (Dyer, 1979). Such views are obviously very far removed from those of Adorno, whose irredeemable blindness to the black politics of jazz has often been a sore point for Cultural Studies.

The claims made by these writers were typically insightful and pertinent. However,

they gradually led towards the celebratory accounts of consumerism to which I referred at the start of this chapter. Such views were informed by the contention that the outright condemnation of popular culture that had characterised an earlier generation of cultural commentary was no longer relevant. Despite their obvious political differences, both Adorno and Leavis were viewed as cultural elitists: as writers whose claims were irrevocably tied to a period in which capitalism had relied on mass production and consumption, and whose work could not, therefore, address the politics and possibilities that followed from the new conditions and vastly expanded consumer choice of Post-Fordist society (Nava, 1987: 204). Added impetus was provided by the contention that much left-wing and Marxian thought involved a puritanical distaste for the simple pleasures of consumption that could not connect to the concerns of the modern populace, and further assistance to such ideas was also provided by the ambience of Foucauldian notions of resistance, Deleuzian conceptions of desire, and Baudrillard's nihilistic comments on consumer society. As a result, work began to emerge that sought to reclaim consumer culture from the scorn that had been heaped upon it in the past.

Some of the most eloquent work in this vein was presented by Mica Nava, who argued in 1987, whilst drawing on Foucault, and whilst also expressing evident frustration at the patriarchal dimensions of Marxian politics, that consumerism needed to be understood in terms of resistance as well as subjection (Nava, 1987). The 'female' sphere of shopping and consumption, she claimed, as opposed to the 'male' realm of production, had previously been viewed as replete with foolishness and confusion. However, the cultural dimensions of consumption had afforded steps towards female emancipation that needed to be recognised, and Marxian theory had been far too slow to acknowledge this. Similarly, in an essay of 1991, she attacked the critical theoretical notion,

associated with Adorno and Marcuse, that the pleasures, needs and satisfactions of consumerism could be deemed 'false'. Nava attributed a quasi-religious and puritanical dimension to these notions of 'falsity', contending that such judgements had associated 'false' pleasures with material objects and escapism, and thus with a kind of worldly failure to approach the 'authentic' virtues of 'true' political and creative activities (Nava, 1991: 159–60).

Cultural Studies' brief, celebratory fixation on consumerism during the late 1980s would soon be supplanted by more nuanced responses to the pleasures of consumption (see, for example, McRobbie, 1991). Nonetheless, these ideas remain a part of Cultural Studies to this day: in 2010, Nava dismissed 'the pessimistic rhetoric of the Frankfurt School' as 'a now discredited critical framework', claiming that such views express 'disdain for this aspect of modern economic and social life [i.e. shopping and consumption]', and thereby disparage 'those most involved, usually women' (Nava and Lawson, 2010).

## TRUTH AND FALSEHOOD

References to 'false' pleasures and desires can certainly be found in the material that Nava criticised. Marcuse, for example, spoke of 'false needs' (Marcuse, 1970: 21–2), and Adorno talked of the 'false happiness' (Adorno, 2002: 33) that could be found through the fulfilment of such needs. Yet this notion of falsity does not possess the pious, Methodist dimensions implied by Nava, and nor is it predicated upon a fixed human nature, as often seems to be supposed. Marcuse, for example, stated very explicitly that 'false' needs are simply those 'which are superimposed upon the individual by particular social interests in his repression' (Marcuse, 1970: 21). The 'wrongness', 'falsity' and 'perversion' attributed to the

modern world was not seen to follow from the occlusion of a 'natural' human essence, or from some timeless and detached moral principle, but rather from a historically situated demand to rationally implement the possibilities for human emancipation that modern society currently employs as means of maintaining its social order.

In this regard, there is a strong sense in which Critical Theory responded to the inversion of subject and object that had been diagnosed by Marx: a condition wherein human beings had been reduced to the status of mere objects, and in which the objects that they create operate as though they were society's determining subjects. For Lukács, whom we referred to earlier, the rectification of this state of affairs would afford a social condition wherein human agents could become the conscious authors of their own existence: a condition in which the social world would cease to be 'contemplated' as though it were an immutable, detached object, and would instead become a collective project (Lukács, 1971). Lukács described this condition as a state of subject–object identity, and held that this could be ushered in via the agency of the Party. These views were treated with deep and justified suspicion by later critical theorists (Adorno, 2008: 16–17). Yet despite such criticisms, similar views were nonetheless expressed: according to Marcuse, for example, 'a critical theory of contemporary society' should thus analyse society 'in the light of its used and unused or abused capabilities for improving the human condition' (Marcuse, 1970: 9–10); or, to use Benjamin's expression: it should identify the 'weight of the treasure which accumulates on the back of humanity', and 'provide the strength to shake off this burden in order to be able to take control of it' (Benjamin, 1975: 36).

There are two points to be made here. Firstly, it follows from this that it is quite wrong for writers like Nava to contend that the Frankfurt School and their fellow travellers rejected pleasure *per se*, in favour of

some kind of morose asceticism. Rather than rejecting desire, sexuality and hedonism, they sought to reclaim such pleasures from their current capitalist integument, and even expressed explicitly anti-puritan views (Adorno, 1967: 102–3; see also Soper, 1999: 149). The problem, therefore, was not material pleasure, but rather the fact that such pleasure had come to serve an effectively autonomous social system. Secondly, and perhaps more importantly, such a view would seem to fall beyond the perspective enabled by the theoretical paradigms employed by these versions of Cultural Studies. If an outright critique of capitalism is rejected in favour of a more moderate attention to the supposedly progressive possibilities afforded by consumption, any such vision of the end of alienation seems untenable. Such a perspective can only seem to accord with the attributes of a traditional theory.

## THE UNITY OF SUBJECT AND OBJECT

It would be incorrect to contend that modern Cultural Studies has become entirely a-political. The feminist, anti-imperialist and broadly socialist concerns of earlier forms of Cultural Studies all tend to remain in place. However, the explicit connection to political intervention that marked the work of Hall and others seems relatively absent, or to have at least subsided. Generalising to the extreme, it seems possible to contend that relatively traditional forms of Cultural Studies, which follow in that tradition, have become somewhat eclipsed by two rather polarised offshoots. On the one hand, some of the more sophisticated and overtly theoretical elements of modern Cultural Studies now draw on continental philosophy and science in order to describe cultural and technological change. At the other end of the spectrum, cruder forms of Cultural Studies now seem to operate as training grounds for employment in advertising, media and industry. The latter

tendency has been apparent for some time. In 1999, the cultural theory journal *New Formations* published a special issue focussed on the relation between Critical Theory and Cultural Studies. Writing in that edition of the journal, Kate Soper asked the following question: ‘In what sense,’ she asked, ‘does a Cultural Studies approach remain in any radical critical relation to the wider social context if the training it provides is simply going into the creation of more compelling advertising copy?’ (Soper, 1999: 149).

Cultural Studies’ drift towards this position was fostered by Blair’s Third Way politics during the 1990s, which involved the assumption that culture and the arts could assist urban regeneration, boost the economy, and assist the growth of capital. British Cultural Studies thus became increasingly tied to the cultural and creative industries. Esther Leslie has made some particularly pointed remarks concerning this connection. In a short polemical essay of 2006, she argued that Cultural Studies had been steadily remoulded as cultural policy. Writers associated with modern Cultural Studies, she claimed, whilst ‘echoing terms from the cultural theory they absorbed’, now ‘marshal the language of market research and niche marketing, capitalism’s tools for product placement in competitive industries’ (Leslie, 2006). In order to illustrate this point, Leslie quoted from a eulogistic discussion of Britain’s hugely successful Tate Modern art gallery, in which the members of the public who visit the gallery were described as becoming ‘actors’ rather than ‘spectators’. Leslie presented this as an invocation of Walter Benjamin’s ‘The Author as Producer’: an essay in which Benjamin set out a vision of cultural audiences becoming producers of their own culture (Benjamin, 1970). Yet where Benjamin saw this as an aspect of an emergent communism, the text from which Leslie quotes simply praises the Tate as ‘one of Britain’s Coolest Brands’, and describes the participation that it celebrates as the opportunity to identify and associate oneself with that brand (Leslie, 2006). Clearly,

this takes the contemplative attributes of traditional theory to an extreme: for where the latter engages with its object in a manner that renders the subject compliant to that object, we can now find instances of contemporary cultural theory that effectively parody the unity of subject and object described above, insofar such as bodies of theory describe the subject's integration into that estranged object.

Towards the beginning of *One-Dimensional Man*, Marcuse remarks that 'the concept of alienation seems to become questionable when the individuals identify themselves with the existence which is imposed upon them and have in it their own development and satisfaction' (Marcuse, 1970: 26). This seems pertinent when viewed in connection to Post-Fordist society and culture, where work-time, leisure-time and consumption have almost fused into one; and it can seem all more relevant when considered in relation to forms of cultural theory that seem content to describe or even endorse this state of affairs. As an illustration, we might think here of Henry Jenkins' description of a 'participatory' 'convergence culture', inhabited by 'prosumers': individuals who help to create the culture that they consume, due to the degree to which it has become so fully integrated into their activities and enthusiasms. 'Convergence', according to Jenkins, is both a 'top-down corporate driven process and a bottom up consumer-driven process' (Jenkins, 2006: 18): a happy unity of industry and audience, and of commodity and consumer, wherein subject and object become one – albeit in an entirely antithetical manner to that envisaged by Hegelian Marxism.

Jenkins' book is an obviously extreme example, and it would be a mistake to view all contemporary Cultural Studies in these terms (although its decidedly instrumental lessons are now taught on media studies degree courses). As was noted above, much modern Cultural Studies continues to operate in the tradition of the work developed by Hall and the CCCS. However, such work can also

be challenged in a somewhat similar vein, on the grounds that it too could be seen to echo the nature of the conditions that it seeks to describe.

As was also noted earlier, Critical Theory's classical visions of the 'culture industry' have been described as symptomatic relics of a Fordist society marked by mass production and managed consumption. Cultural Studies, on the other hand, evolved as an attempt to grasp the nature of a *Post*-Fordist society, and sought to conceive the exigencies and possibilities of contestation within those new conditions. The development of a Gramscian politics of hegemony, and its later adoption of post-structuralist anti-essentialism, must be understood in that light. However, this development led it to a point at which its typical theoretical stances appear to mirror its own object of enquiry: for where Cultural Studies has viewed Critical Theory as an artefact of Fordism, one could, by the same token, view modern Cultural Studies as a symptomatic reflection of *Post*-Fordism. Its development led it to drift ever further from Marxism, to reject humanism, to embrace post-structuralism, and to cast practically all claims to universality under a deep cloud of suspicion. When this is coupled to its enthusiastic engagements with mass culture, Cultural Studies – despite having developed as a means of theorising neoliberal, *Post*-Fordist society – may in fact echo the all-encompassing 'spectacle' and absence of fixity that characterise that very society. Neoliberalism has cut away and undermined the older modes of organisation, interaction, education and orientation that might have helped to articulate political dissent in the past. The organised, militant political opposition of the past is now long gone, and opposition, today, often seems to have become a confused, inarticulate impetus towards populist revolt, capable of lurching either to the left or to the right in its rejection of that which is perceived to be the status quo. In such circumstances, the need for a politically engaged and critical engagement with modern culture seems more pressing

than ever. But has Cultural Studies' trajectory through structuralism, post-Marxism and post-structuralism echoed neoliberalism's steady erosion of a solid, coherent basis for such opposition? As Gilbert points out, whilst commenting, sympathetically, on the contemporary field of Cultural Studies: the situation today is such that 'if [a body of work] does not assume that social identities are the contingent products of discursive practices, then it is probably not Cultural Studies'; yet 'an anti-essentialist perspective is one that is very easily articulated to a neo-liberal paradigm' (Gilbert, 2008b: 560).

### **CULTURAL STUDIES AND THE IMPASSE OF CRITICAL THEORY**

Neoliberal capitalism is marked by a tendency towards re-fashioning social interaction in terms of the market relations between the buyers and sellers of commodities. If Cultural Studies is to retain some kind of critical purchase on modern society, it must, presumably, address this tendency within society and culture, and pursue the notion that some other form of human interaction might be desirable (Gilbert, 2008b: 563). Frankfurt School Critical Theory seems eminently suited to this. Yet any such dialogue should also be reciprocal, given that Critical Theory is marked by its own problems. Its first generation's concern with the formal character of instrumental rationality led to a relative disregard for the political and personal content of such social forms (and thereby to a questionable account of fascism, wherein the latter's political dimensions were eclipsed by the mechanics of the social whole (Cannon, 2016)). Ironically enough, this fixation on formal, mechanical structure brought it rather too close to the status of a fixed conceptual system. It can also be seen to have argued itself into an impasse. Adorno is a case in point here. By *Minima Moralia* (1951), he had come to the

view that if instrumentality was to be avoided, then praxis had to be rejected (Jay, 1996: 279); the production of critical thought independent from the requirements and exigencies of action thus remained the only option available. This resulted in a paradoxical posture, whereby a Marxian social theorist not only condemned mass culture whilst effectively praising high art, but also stressed the need for change whilst stepping away from instances of transformative action (Bernstein, 2002: 7).

It seems possible to contend, therefore, that if Critical Theory really did consign itself to the Grand Hotel Abyss, then steps towards an exit could be found by drawing on some of the resources offered by aspects of Cultural Studies. Granted, its occasional endorsement of consumption jars with Marxian and critical theoretical concerns, but its ability to locate and explain political possibilities in mass culture deserves to be taken seriously. After all, opposition to the existing state of things cannot simply appear from out of the ether, and whilst it may well be the case that 'wrong life cannot be lived rightly' (Adorno, 2005: 39), we are, nonetheless, situated within a wrong world. In consequence, it seems hard to avoid a degree of 'wrongness' inflecting any incipient efforts to change that state of affairs. Provided that it is accompanied by an awareness of its own inadequacies, an engagement with the ways in which popular culture might serve to generate or sustain possibilities for political contestation hardly seems automatically flawed a priori. It is, therefore, surely possible, from a Marxian and critical theoretical perspective, to draw upon Cultural Studies' insights into the potential for contestation within capitalist culture, so as to address the ways in which opposition to capitalist society might emerge from *within* that same society. Besides, given that our current political climate has become marked by a ready susceptibility to 'authoritarian populism', a synthesis between Critical Theory's insights into such phenomena and Cultural Studies' attendance to its cultural roots may be timely.

## Notes

- 1 Without doubt, Adorno employed a deeply condescending tone when referring to such consumers as 'infantile' and diminished ('the culture industry ... incessantly drills the same formulas on behaviour', and such 'steady drops hollow the stone' (Adorno, 2002: 105)). Yet Adorno also held that one of the key characteristics of this impoverishment was that the obedience generated by such conditions was by no means blindly robotic. Instead, one of the most disturbing aspects of his work is his emphasis on the sense in which people see through the images with which they are presented, and yet go along with them anyway ('the triumph of advertising in the culture industry is that consumers feel compelled to buy and use its products even though they see through them' (Adorno and Horkheimer, 1997: 167)). There is also a sense in which his criticisms of the culture industry operate in a somewhat similar manner to Marx's early views on religion: the problem is not just that the culture industry presents fantasies and falsehoods, but rather that it provides solace for the privations imposed by a flawed world (see e.g. Adorno, 2002: 103, 92, 126).

# Constellations of Critical Theory and Feminist Critique

Gudrun-Axeli Knapp<sup>1</sup>

Translated by Adrian Wilding

## INTRODUCTION

Famously, feminist theory and gender research, which emerged from the feminist movement and the issues it raised, could not easily be connected with existing theoretical traditions. Gender relations – as fundamental ideas and as empirical phenomena – were either completely erased, regarded as subordinate to the analysis of society, or were polarized and affirmed in a functionalistic manner as complementary role-differences. There was and still is a tendency to restrict the concept of gender relations to intimate relations and the family rather than taking a comprehensive view of cultural constructions of difference and the gender-mediated structuring of society as a whole. This also applies to the Critical Theory of Theodor Adorno and Max Horkheimer, who in key passages of their *Studies on Authority and Family* (Horkheimer et al., 1987[1936])<sup>2</sup> and *Dialectic of Enlightenment* (Adorno and Horkheimer, 1979[1944]) spoke of the social

situation of women, femininity and the constitution of bourgeois masculinity. Despite raising a number of proto-feminist issues and insights, these thinkers' androcentric traits make it impossible to join together feminism and Critical Theory without significant revisions to the latter. In the following, I look at what made Critical Theory awkward for a feminist audience and why, according to many feminists, it is still worth engaging with this tradition. Alongside the continuing relevance of their epistemological and methodology-critical reflections, there are two reasons for this. Firstly, in the light of contemporary socio-political transformations, it is important to have theories which insist on the 'innately coercive character of capitalist society' (see Negt and Kluge, 2014: 250–5) and which do so in the spirit of a non-economistic critique of capitalism while at the same time elucidating the psychodynamics of today's socially induced forms of 'feral self-preservation' (Adorno, 1973: 289, amended). Secondly, Critical Theory

represents a historically oriented, self-reflective way of thinking that can account for its own function and situation in society. The historical reflexivity of Critical Theory can also inspire reflections on the dialectic of feminist enlightenment, the flipside of the success of feminist critique.

## NO 'SCHOOL' – MUCH TO LEARN

In a review of his texts from the 1930s sent to the Fischer publishing house in 1965, Max Horkheimer writes that Critical Theory 'knows its concepts as moments of the historical constellation, as an expression of the will to the rightful society, which may express itself in different historical situations and in different theoretical and practical ways but which always remains constant' (Horkheimer, 1988a: 13). Such combining of a diagnosis of the times, political interest in change, and self-reflexive positioning is an essential feature of early Critical Theory. Diagnosis of the times and self-reflection are articulated via the medium of a specific conjunction of the critique of society, knowledge and the subject. Critique, consistent with the notion established in the Hegel-Marx tradition, is not to be imported into society – as in ideas of an ethical 'ought' derived from abstract principles – but is defined instead as determinate negation and immanent critique arising from the relations of tension between social reality and possibility. This presupposes a form of historically grounded social analysis that pays particular attention to conflicts, contradictions and non-simultaneities (Adorno et al., 1976: 120). Its extra-academic emancipatory demands and its consciousness of the historicity not only of objects and their perception but also the concepts formed for analyzing them, distinguishes Critical Theory from disciplinary theoretical techniques and strategies which rely on formulating conceptual systems in the sense of general sociology or developing

sets of ubiquitously applicable formal distinctions.

The Frankfurt School's critique of society (or more broadly, civilization) is directed at the interrelations between social objectivity, subjects' self-relations and their relations with others, which are mediated by an overpowering logic of exchange and identity thinking. The critique focusses on the pathologies of a capitalist society which tends to subordinate everything, including cultural production, to the imperative of valorization. Despite their trenchant criticism of instrumental reason and their diagnostically incisive notion of a 'circle' of individuation and socialization<sup>3</sup> (which brought them the accusation of performative contradiction),<sup>4</sup> Horkheimer and Adorno steadfastly maintained (and for this they needed psychoanalytic theory) that 'historical time and psychical time ... are out of synch' (Claussen, 1988: 41). Critical Theory seeks to determine in its (negative) dialectical reflection the historical configurations of the mediation and differentiation of subjectivity and social objectivity. In 1966, Adorno writes:

Psychology is relevant not only as a medium of adaptation, but also there where socialization finds its limits in the subject [...]. Whether processes of integration, as it seems, only weaken the ego to a minimum, or whether, as in the past, the process of integration can still, or once again, strengthen the ego, is something that has scarcely been questioned with any precision. (Adorno, 1971: 92)

In the contemporary (mostly Foucault-inspired) debate over self-management, governmentality and subjectification under conditions of an intensified marketization of society, one can envisage such questions being taken up, but they would be developed in ways quite different from early Critical Theory. Three paths are usually followed. Firstly, the central claim of early Critical Theory, which defines individual phenomena in terms of their mediation by the overall social context, is scaled back. Rather than thinking about social mediation in terms of Marx's critique of political economy or

variants of differentiation theory or a concept of totality informed by social philosophy, focus falls nowadays more on dispositions of knowledge and power within institutional contexts. Secondly, under the banner of 'the cultural turn', the obstinacy of cultural dispositions and forms of knowledge are taken into account more systematically than in early Critical Theory. Here it is worth remembering that Critical Theory, in contrast to Marxist orthodoxy, already emphasized the social significance of the psychological and the cultural (and was labelled 'bourgeois' for doing so). While certain recent approaches extend the field of cultural analysis in different ways (Reckwitz, 2000), the psychological dimension of early Critical Theory and its enquiry into the dynamics of the drives, tends to get lost. Thirdly and finally, the praxeological-physical dimension of the social is now more strongly developed than in the work of Horkheimer and Adorno, although these two thinkers, whose materialistic impetus was influenced by Nietzsche and Schopenhauer, gave prominent place to the bodily side of subjectivity and the social, along with the somatic dimension of thought and of the critical impulse. It is in almost programmatic terms that *Dialectic of Enlightenment* speaks of a 'subterranean history' running beneath Europe's more familiar past, comprising the fate of the repressed and disfigured human instincts and passions and manifesting itself above all in relation to the body (Adorno and Horkheimer, 1979[1944]: 231–6).

### **THINKING IN DISSONANCES – BINDING STATEMENTS WITHOUT A SYSTEM**

Current talk of the 'Frankfurt School' suggests a uniform doctrine which does not exist and never did. Although Horkheimer and Adorno always emphasized how united they were in their thinking, and exegetes have

repeatedly pointed out their mutual influence on each other, the two figures who left the greatest mark on early Critical Theory were never one. Adorno, in particular, who did so much to shape and develop Critical Theory after his return from American exile, was significantly influenced by the ideas of Walter Benjamin, which ran counter to those of Horkheimer, as Buck-Morss (1977), Jay (1976), Schmid-Noerr (1997) and Wiggershaus (1986) have shown. As early as the 1930s, when Horkheimer wrote about the interdisciplinary research programme of the Institute for Social Research and about the relationship between traditional and Critical Theory (Horkheimer, 1988a, 1988b), Adorno, who was not yet part of the Institute, was sceptical towards the idea of individual sciences taking guidance from social philosophy and attempting to arrive at a theory of society as a whole. For him, there was an irreducible epistemological gap between philosophical interpretation and disciplinary forms of empirical research, which should be taken into account both theoretically and logically (Adorno 1990a). In no way was Adorno rejecting empirical research; on the contrary, he had long engaged in it himself, continually reflecting on the potential and limitations of this form of knowledge. 'No prudent social scientist,' he writes in 1969, 'can dispense with empirical research; not only because, in Germany especially, social speculation ... was severely compromised by such doctrines as race as the decisive factor in the life process', but also because, since the collapse of German idealism, the historical relationship between spirit and facts has been fundamentally altered. Adorno continues: 'Walter Benjamin, certainly no positivist, once said that the power of existence today lies more in facts than in convictions. He thus expressed a consciousness of the presently omnipresent hegemony of being, which the mind cannot cope with other than by satiating itself with what is, with facts' (Adorno, 1990b: 539). Such indications of the historicity of epistemic

constellations of 'mind' and 'facticity' are also highly relevant for present-day diagnoses which want to take account of the power which new media of representation and communication now have in structuring reality. However, with each defence of empirical research, Adorno strongly opposed the idea of making empirical social science, with its surveys and studies of subjective consciousness, into the only acceptable basis of scientific knowledge, into the standard of what is theoretically conceivable and conceptualizable. Over the years, in several thematically wider-ranging studies, Adorno developed his critique of wholistic theories of society that are built upon empirical disciplinary research, presenting epistemological, methodological and historical arguments for his scepticism.<sup>5</sup> For Adorno, society is no formal classification but an historical concept that reflects real social tendencies. The concept of society does not only *speak*, in the nominalist sense, of something other, but in reflecting upon diverse social formations *is* itself other. Under conditions of exchange-value production in capitalist social relations, the term 'society' refers not only to an increasing division of functions and a parallel increase in interdependencies, but also to forms of systemic independence and heteronomy. In this form of socialization [*Vergesellschaftung*], and 'before all specific social differentiation' (Adorno, 1969[1970]: 148, amended), the rule of the general over the particular is manifested, the preponderance of social conditions over the individual. As a process and mediation, society cannot be grasped by the criteria of its immediate givens, nor is it fully revealed by the behaviour and action of the socialized subjects who perform these processes. In an analysis of Max Weber's sociological concept of understanding [*Verstehen*] and Durkheim's rule of treating social conditions as things, Adorno first defends the moment of truth in both approaches before concluding that Durkheim's apparent antithesis to Max Weber 'remains just as partial, because it consoles itself with the postulate

of incomprehensibility just as the other does with the postulate of comprehensibility. Contra both, the task would be to comprehend the incomprehensibility which distorts relations between humans into opaque self-sufficient relations' (Adorno, 1969[1970]: 147, amended). This systemic aspect of late-capitalist society, the 'gravity of social conditions', whose compulsive moment burdens each subject and whose survival involves 'making humans owe their lives to what is done to them' (Adorno, 1969[1970]: 152, amended) is what Adorno calls 'totality'. He explicitly distinguishes this understanding of totality from conceptions of society as a 'whole' or 'Gestalt' in the sense of a 'social atlas' and its theorization as 'wholism' (Adorno et al., 1976: 81).

The fact that without reference to the real totality (which is not immediately synonymous with a total system) it is impossible to think the social, while this totality itself can only be recognized by grasping facts and individual phenomena, lends its weight to *interpretation*, also in sociology. [...] To interpret means primarily to become aware of the totality through the traits of the socially given. (Adorno et al., 1976: 32, amended)

Adorno's procedure of using the 'exact imagination' in a constellatory interpretation of individual phenomena in their mediation by the 'whole', a procedure he presents as mutually illuminating 'ensembles of model analyses', aims to achieve 'binding statements without a system' [*Verbindlichkeit ohne System*] (Adorno, 1973: 29). The form of critique he employs to this end is a continual negative-dialectical reflection on the dissonances 'between thought and reality, between concept and object, identity and non-identity' (Benhabib, 1992: 110). It is a notion of knowledge which reveals not only the results of an intense confrontation with the European philosophical – particularly epistemological – tradition but also the great significance which aesthetics and musical composition have for Adorno's thought. The name Adorno gives to this form of societal analysis goes back to Walter Benjamin – 'physiognomics' – and

involves a conceptual reflection and interpretation that sinks into its historical material, seeking traces and instances of the social whole in individual phenomenon. As a result of historical experience, this can only be a physiognomy which regards the world 'when it shows its most harrowing side' (Wiggershaus, 1986: 346). The new categorical imperative which Nazism imposes upon humans is to 'arrange their thinking and conduct, so that Auschwitz never repeats itself, so that nothing similar ever happens again' (Adorno, 1973: 365, amended). Auschwitz, according to Adorno, who hereby reaches what is in his view an unavoidable conclusion on European modernity under capitalist conditions, is not to be understood as the result of Germany following some special historical path [*Sonderweg*], or as a one-off regression, but as a development in the historical form of enlightened civilization itself: 'Fascism, as a rebellion against civilization, is not simply a repetition of the archaic, but the repetition of the archaic by civilization itself' (Adorno, 1971: 61). This point of departure, which distinguishes early Critical Theory from its later forms, leaves none of the classical concepts of social analysis unscathed: progress, enlightenment, differentiation, individuality, communication, humanity and especially the talk of the modernity of modern society. These are all broken apart, problematized, dialecticized, interpreted against a background of social domination, translated back into the social and cultural history of their emergence, their progression, their contradictions and their failure.

## GENDER IN CRITICAL THEORY

The aspect of domination in relations between the genders along with the constitution of male and female subjectivity is repeatedly discussed in early Critical Theory, albeit without a theory of gender relations being

worked out. Among the ranks of Critical Theorists, it was Herbert Marcuse who publicly and unreservedly expressed his solidarity with the women's liberation movement and its concerns. In his last years of life he often addressed feminism: above all in socialist feminism he saw the embodiment of many of his 'dreams and themes' (Cerullo, 1979: 22). Yet the fact that Marcuse explicitly based his hopes for a subversion of instrumental reason and the ruling performance principle upon ostensibly feminine qualities (receptivity, tenderness, non-violence) was regarded as a flaw in the eyes of many feminists who drew upon early Critical Theory. The supposedly subversive potential of the feminine on which Marcuse gambled (as did certain strands in the feminist movement at the time) seemed to them an affirmation of stereotypical bourgeois ideas from the legitimatory repertoire of women's oppression (Rajewsky, 1967). In contrast to Marcuse, Adorno and Horkheimer had a more ambivalent relationship to feminism, and in public commented comparatively rarely on the topic. Adorno and Horkheimer's theoretical statements on gender relations relate mainly to the family and to the question of the constitution of historically specific psychological dispositions. That said, these statements go beyond the sociology of the family or socialization theories in the strict sense; they gain their specific force and their contours within the framework of Critical Theory's historical diagnoses (themselves underpinned by a social philosophy) and within the context of the problem of emancipatory theory.

For Horkheimer and Adorno, the promise of social emancipation was linked in European history to a form of individuality which, for the first time in the liberal phase of the aspiring bourgeoisie, formed both a powerful ideology and a specific masculine social type. Both thinkers assume the fundamentally ambivalent character of bourgeois culture and self-relationships, an inseparable link between economic self-preservation and

discipline, liberation and oppression. The psychological dispositions and the autonomous and destructive potentials which develop under these conditions take on different forms over time, one being an increasingly perceptible tendency towards a weakening of the ego and the superego.

The work of the Frankfurt Institute for Social Research and the texts of Horkheimer and Adorno touch on various facets of this topic. They explore the philosophical reasoning, the socio-cultural presuppositions, the entanglements, pretensions, illusions and self-delusions of the emphatic (male) subject of Enlightenment and humanism. They also illuminate the social history of the formation of individuality along with the fate of individuality today, its waning forms in today's modern mass societies. In this context, the problem arises of the crisis-ridden transformation of the bourgeois family, which had become hegemonic in the course of the nineteenth century and which, in the form of the post-war nuclear family, spanned class divisions and played a highly significant role, becoming a lived reality for many.

That the heroic epoch of the rising bourgeoisie coincides at least in part with the evolution of the modern gender system, with its emphatic polarization of gender characteristics (Hausen, 1976), its radicalization and normalization of heterosexual role differences and modernized forms of patriarchal domination which would become particular objects of feminist criticism (Beer, 1990; Gerhard, 1978), points to a potential conflict between Frankfurt School and feminist theory.

Confronted with a series of tectonic social shifts which had transformed a market society into a society ruled by industrial monopolies and political cliques, and shocked by the widespread conformism which greeted the monstrously destructive capability of an advanced civilization, the Frankfurt intellectuals posed the question of where, if anywhere, a potential could be found to go

beyond the status quo. Where and how might the inhabitants of the apparently ineluctable world of late capitalism come to have an experience that would remind them that society and its relation to nature could or should be different? In search of potential experiences that might transcend the dominant logics of utility and exploitation they turned above all to art, the utopian dimensions of the imagination and of childhood, along with the family and particularly the mother-child relationship. Horkheimer in particular would frequently claim that such a potential is to be found in the early mother-child relationship and as a result he emphasizes the humanizing moment of the bourgeois family and maternal practice. At best, a human could find there the experience of being an unconditional end rather than a means. The fact that, despite his critique of patriarchal domination and the 'deformations of female nature' which arise historically from women's lack of status as subject, Horkheimer still held to the bourgeois form of gender role-differences, is one of the antinomies in his thinking. In his later – or as Mechthild Rumpf (1989: 23) calls them, his 'uncensored' – notes, Horkheimer writes that 'as a result of a fatherly authority that is not abused, as a result of truly motherly love, which would vanish without the differentiation of male and female tasks and rights, bourgeois families have often represented the symbol of something better' (Horkheimer, 1988c: 165).

Rather than once again detailing the androcentric and maternal-idealizing traits evident particularly in Max Horkheimer's writings, it is more productive to call upon an article by Adorno written in 1955, during what can now be seen as the heyday of the breadwinner plus housewife model, namely 'The Problem of the Family' (Adorno, 1986). This short text, which appeared as an 'auxiliary work' in the final volume of Adorno's *Gesamtausgabe* (GS 20.1), brings together certain motifs already employed in the *Studies on Authority and the Family* (1987[1936]) written by Horkheimer, Fromm, Marcuse and others.

The text contains a succinct description of the contradictory nature of the institution of the family while at the same time revealing the desideratum of a theory of gender relations.

Contrary to the widespread habit of presupposing the family as an ahistorical natural nucleus of society, Adorno emphasizes the thoroughly historical character of the family and that it is an institution bound up with the dynamics and contradictory constellations of society at large. The logics and forms of relationship prevailing in the family, their irrational moments, exist, according to Adorno, in a specific relation of mediation and tension with the socially dominant form of rationality. The principle of a rational society needed the help of irrational institutions such as the family to obtain the appearance of being naturally justified. But the unleashing of productive forces and social dynamics 'did not allow the family, which was immanent and internally cohesive yet ultimately incompatible with these forces, to survive unchallenged' (Adorno, 1986: 305). In post-war (West) Germany, in a period of restructuring and restoration, Adorno noted a crisis in the family, which manifested itself in symptoms such as increasing divorce rates, consciously childless marriages, the high number of 'incomplete' families, and a decline in extended families in the countryside. He sees the crisis neither as a new phenomenon nor as a 'mere symptom of decay and decadence' but as already inherent in the basic structure of the family, whose various facets he explores in a series of theses.

Nowadays the family is 'presented with the bill', Adorno says, not only for the 'crude oppression' which women and children have so often experienced at the hands of the head of household, but also for 'economic injustice, the exploitation of domestic labour in a society which otherwise obeys the laws of the market', as well as 'all those suppressions of the drives which family discipline imposes on its members', without any prospect of compensation from secured and transferable

property, as the liberal bourgeois age at least promised the upper classes (Adorno, 1986: 303).

In the ideologization of the family, Adorno sees a questionable reaction to the 'experience of the decline of familial relations' (Adorno, 1986: 303). The cult of the family, an exaggeration of conventions, and emotional coldness, are all different sides of the same development. It is true that the bourgeois family with its privileged function was always a facade, and scepticism about family ideology had long been articulated within bourgeois society, for example in the youth movement. At the same time, the ideology of the family also embodied the prolepsis of something better. Historically, in ideologies of caring and love, ideas of human dignity and equality became concrete and thus served as reference points for social critique and emancipation (Adorno, 1986: 305). Although Adorno refuses to speculate on the future of the family, it seems clear to him that

the preservation of that in the family which, by sacrificing outdated traits, has proved itself humane, as a condition of autonomy, freedom and experience, will not be easy. That a family of 'equals' can be realized in the midst of a society in which mankind itself is heteronomous, where human rights in a more fundamental and universal sense have yet to be created, is probably illusory. One cannot preserve the protective function of the family and remove its disciplinary features so long as the family has to protect its members from a world in which – be it mediated or immediate – social pressure is inherent, and is felt by every social institution. The family suffers the same affliction as everything particular that struggles for liberation: there is no emancipation of the family without the emancipation of the whole. (Adorno, 1986: 307)

That early Critical Theory linked historical advances in women's autonomy, such as vocational training and a general chance to participate in paid labour, so closely (even logically) to the erosion of the family's substance and protective function, has rightly been criticized in feminist theory. Likewise

criticized was the fact that femininity and motherhood were almost elided, and individuality implicitly aligned with masculinity. The argument that there is 'no emancipation of the family without the emancipation of the whole' may also provoke scepticism, because it seems to underestimate the improvements in women's situation that have already been achieved. From a contemporary perspective, however, it is also clear that this raises a painful issue for feminism. When in 1955 Adorno criticizes the limiting of emancipation to the precarious participation of women in the public sphere and to the imitation of patriarchal principles, today it evokes memories of the fact that the demand for emancipation made by many in the women's movement of the 1970s encompassed more than the admission of women to all levels of education, training, professional activity and political participation. In those days it was not only about creating a bearable 'work-life balance', nor merely about creating opportunities for participation in different spheres of modern society, but about realizing these aims under the condition of a different set of gender relationships in a different society: not so much about women getting a bigger slice of the cake, nor even having a better selection of cakes, but the creation of a whole new bakery! At a time of awakening and questioning of everything that seemed solid, such demands did not only result from a surplus of radical pathos, with which a younger generation sought to challenge the blinkered world of the post-war 'functionalist freeze' (Friedan, 1963). They were also based on the first insights of feminist researchers into the historical co-constitution and interdependence of a specific form of gender relations and society as a whole. It is a feature of the dialectic of feminist enlightenment that with the growing awareness of the complex relationship between changes in gender relations and overall socio-structural change, and the experience of the paradoxical effects of efforts to educate and achieve equality (Fraser, 2009, 2013; Knapp, 2009; Lenz,

2008; Wetterer, 2003), that the need for substantive social change can be more easily justified while the prospects for such change appear more remote.

## FEMINIST ENGAGEMENT WITH CRITICAL THEORY

The founders of sociology, including Marx, Durkheim and Weber, had each noted the separation of domestic economy from business (and thus the potential specialization of functions) as a feature of social progress. A narrative of (European) social modernization typically heard in sociology lectures runs as follows: the gradual transfer of the function of domination from the feudal head of household to the head of state, the emergence and spatial expansion of markets, the development of productive forces, the rationalization of the division of labour and of government, an increasing loss of function of the 'whole household'<sup>6</sup> and the resulting development of a private sphere of the family concentrated around intimacy, generativity, early socialization and predominantly personal forms of work and care, which involve a sexual division of roles and polarized yet complementary psychic dispositions for women and men.

Against the background of this influential narrative, feminist researchers have examined in particular the facticity and the ideological aspects of the separation of public and private, as well as those aspects of the gender role construct which conceal domination and through which class-specific norms gain universal validity. The relationship between patriarchy and capitalism and their interwoven modernization, the masculine, fraternal dimension of the modern state, as well as connections between class, gender and sexuality, were also central themes which fed into women's- and gender studies.

The thematic development of feminist critique has taken on different accents and

emphases in different countries and regions. Nevertheless a transnational, Anglophone, feminist discourse has developed, supported by new technologies of communication, and feminist theories have travelled particularly well across the Atlantic (Davis and Evans, 2011). Some terms and approaches have even taken a 'world tour', for instance the concept of gender and Judith Butler's (1990) treatment of it in *Gender Trouble*, the concept of 'intersectionality' (Crenshaw, 1989; Lutz et al., 2011) and the triad of race, class and gender. Not only the contextualization of political problems and the cultural framing of feminist criticism (Ferree, 2012; Ferree and Tripp, 2006) but also the divergent character of the respective theoretical discourses and their rearticulations in different parts of the world has become a widely discussed phenomenon (Bose and Kim, 2009; Connell, 2007; Griffin and Braidotti, 2002; Knapp, 2005).

When we turn to the feminist debate on Critical Theory, differences between the German and English-speaking discussions cannot be overlooked. It is true that, in Anglo-American feminism, psychoanalysts such as Nancy Chodorow or Jessica Benjamin had already taken up and reworked the socialization theories of the Frankfurt School. But this strand of Critical Theory reception broke off in the course of feminism's cultural turn, which was also a more or less interactionist and post-structural turn. In recent decades occasional anthologies were still being published on the early Critical Theorists and their significance for feminism (O'Neill, 1999), but well-known American feminists such as Seyla Benhabib and Nancy Fraser were becoming more interested in the work of Jürgen Habermas, who had begun to reformulate Critical Theory on the basis of discourse theory and to ground it on systematically reconstructed normative foundations (Meehan, 1995). More recently, however, feminist interest in theorists such as Walter Benjamin and Theodor Adorno seems to have revived again, these two thinkers often seen

as 'postmodernists' *avant la lettre* (Brown, 2006; Heberle, 2006).

In what follows, a specific line of feminist engagement with early Critical Theory will be traced whose outstanding feature is an historical and social-theoretical orientation for which there is no equivalent in Anglo-American feminism. It goes back to Regina Becker-Schmidt, a student of Adorno's, who taught at the Leibniz Universität Hannover. There, in the 1970s, Oskar Negt and other former 'Frankfurters' had formed an alternative centre for Critical Theory, which linked itself closely to Adorno and Horkheimer's work and more or less explicitly rejected Habermas's far-reaching revision of Critical Theory.

Becker-Schmidt took exception to the idealized constructs of polarized gender roles, feminine practices and feminine qualities. These were not only to be found in the texts of her teachers and in mainstream theory but circulated in various manifestations through left and feminist thinking. Against these, Becker-Schmidt proposed the thesis of the '*doppelte Vergesellschaftung*' [double socialization] of women (Becker-Schmidt 1991).<sup>7</sup> A central thrust of the thesis of a double 'Vergesellschaftung' of women was to critique notions of the polarized breadwinner plus housewife model and the corresponding blue vs. pink pattern of gender-typical socialization dominant in society as well as in sociology. Historically and quantitatively speaking, women's employment and subsistence work were not the exception but (albeit in class-specific and socio-geographically varying forms) the rule. Whether in the countryside or in the factory, whether as subsistence work or in other labour relations, an overwhelming number of women had always worked for a living as well as taking on the majority of private care work within the family.

Against this background, it seemed theoretically more appropriate and empirically more productive to assume a dual and contradictory integration of women into processes

of societal reproduction, and then to specify the respective socio-structural manifestations, the class-specific shapes and historical transformations of this involvement.

Becker-Schmidt later developed these considerations into a social theory of the gendered character of processes and constellations of 'Vergesellschaftung'. Her term 'Vergesellschaftung', which she uses in line with early Critical Theory, denotes three different aspects of socialization: firstly the structures of social integration of individuals and groups, secondly the systemic integration and contradictory constellation of societal spheres of practice, and thirdly the dialectics of human animals in becoming individuals and social beings.

With regard to gender, Becker-Schmidt formulates a theorem of a dialectical interweaving of two relationalities which shape the contradictory social situation of women. These two relationalities involve the social relations between the genders on the one hand and the gendered aspects of the historical constellations of societal spheres on the other. Gender relations [*Geschlechterverhältnisse*] are understood as an ensemble of all those social arrangements and structurings – cutting across other social positions and divisions and regardless of their empirical diversity – by which the genders are positioned and related to each other. The focus is on gender classifications, attitudes and relations between men and women in the heterosexually grounded order of polarized gender relations, along with policies and laws, such as the social security system, and institutional regimes, whose programmes, temporal economies and structures all imply and presuppose role differentiations.<sup>8</sup> However, the focus is also on rigid structures of praxis and interaction, such as the various forms taken by the sexual division of labour in the private sphere and in the workplace (Gottschall, 2000; Wetterer, 2002). Their persistence is due not solely to agents' normative beliefs, rational self-interest or will, but also needs to be explained in terms of the

material, institutional and interactional conditions under which motivations develop and practices unfold.

Furthermore, the relationality in question also obtains between different social spheres or subsystems, which are themselves both mediated by and mediate existing forms of gender relations. In the historical-materialist tradition taken in a broad and non-dogmatic sense, upon which some feminist theorists have drawn, the main focus is on connections between market economy and domestic economy (often shortened to the misleading terms 'realm of production' vs. 'realm of reproduction'), state and education systems. Science and law are also usually included in analyses of social statics and dynamics. By different 'spheres' or fields one is not to think of homogeneous, spatially distinct parallel worlds, but rather complex spheres of praxis, which differ in their historically acquired meaning and functions and in their forms of institutionalization. Spheres interrelate in conditions of exchange and dependency, of partial autonomy on the one hand and of intrusion and transgression of boundaries, on the other. Not only in the manner of their internal differentiation but also in the imbalances between the sub-systems and the form of their mutual socialization we find revealed (and concealed) the effects of past and present power constellations and relations of domination (Becker-Schmidt, 2004b: 67).

Drawing methodologically upon Marx and Adorno (Becker-Schmidt, 2004a) and against the background of current issues, Becker-Schmidt investigates imbalances and inversions in the manner in which the historically separated spheres of praxis come together. In this context, she highlights the material paradoxes of division and conjunction, above all when focussing on the social-theoretical context of women's lives (Becker-Schmidt and Krüger, 2009). Her argument identifies a 'construction flaw' in the basic structures of social exchange and which has reached its peak in European

modernity. This 'flaw', concealed by harmonizing interpretations of functional differentiation, consists in the fact that processes of specialization and division tend to conceal the concerns and requirements of different spheres, whose fulfilment is nonetheless necessary for the workings of the whole. The comparatively far-reaching concealment of interests particularly effects the sphere of private reproduction (family, intimate relations, domestic economy) and impacts especially upon women even when it manifests itself in different ways in different countries and different welfare states and in different political situations. This constellation is currently breaking down. Not only personal relationships, including sexuality, but also the provision of care which, in a heterosexual relationship, is expected to be free of charge and to be (indeed usually is) provided by the female, is becoming increasingly inconsistent with the growing demands of market-mediated labour. The latter's temporal structures and forms of rationality are transferred to the private sphere, altering domestic practices but also coming up against the limits of rationalization.

The current erosion of a triad which typified industrial society in many Western countries – a full-time permanent employment contract, a nuclear family based on the breadwinner plus housewife or breadwinner plus female support-work and a supporting welfare state<sup>9</sup> suggests that we are living through a crisis that is affecting the fundamental way in which these three spheres of market, household and welfare state are connected. These developments, which manifest themselves empirically in such symptoms as increased overburdening and exhaustion, and in altered marriage-, divorce- and birth rates, are strengthened by the collaboration of different policies and tendencies: policies of economic deregulation and globalization; labour market crises and loss of trade union influence leading to a weakening of the 'breadwinner's' position even among the middle classes; an increasingly sought-after

but also enforced maternal employment; a reduction of welfare state support and its partial re-privatization; processes of precarious marketization and the social reorganization (including ethnicization, racialization) of parts of the care- and nursing sectors. The 'adult-worker model' which is spreading throughout society as an effect of women's interests in participation and as a success of state policies around equality (Fraser, 2009), but which is also becoming a vehicle for new forms of control, proves to be – at least under present social conditions – incompatible with women's demands for emancipation, which the model presents only in perverted form. Under present conditions, it also proves to be incompatible with the demands of families, or, more generally, the demands of everyone – regardless of age – for a good life. The 'adult worker model' is just as fundamentally (if differently) in conflict with modern society's promises of justice and solidarity as the breadwinner plus housewife model was.

## WHO CARES?

The sociologist Uwe Schimank (2007) has assessed the manner in which the dynamics of boundary incursions between social subsystems has been diagnosed in sociological analysis over the last 20 years. His particular focus is on incursions between spheres of social praxis, which can lead to restrictions in the autonomy of each sphere. Schimank categorizes which social subsystems are viewed as 'victims' in the sociological literature and which are seen as the 'perpetrators' of hostile incursions. While 'victim' status, according to Schimank, is relatively widely distributed in sociological diagnoses, only three subsystems (economy, politics, mass media) regularly appear as 'perpetrators', with the power of the economy consistently viewed as the main culprit. Border incursions which occur at the expense of the *private*

sphere (family, household, intimate relations) are listed only once in Schimank's overview of contemporary diagnoses. This suggests that the private sphere has not yet been widely grasped as a place of central social dynamics and structural conflicts.

This concealment of a basic conflict, which connects back to narrow views of social relations and crises, has a long and multifaceted tradition in sociology. The conceptual erasure of the role of the domestic side of private reproduction in the economy and the neglect of generative reproduction as a necessary part of societal continuity almost exactly parallels the bourgeois-androcentric self-description of the family as a realm of intimacy, of leisure and recuperation from 'hostile life'. If 'economics' refers only to the market-mediated sectors of business, national and world economies and concerns itself only with buying, selling and valorization, then the private element of the necessary delivery of services in their mediation by a specific and problematic organizational form of the gender relation remains invisible. The feminist question with its double meaning – who cares? – refuses to go away.

To simplify somewhat, the structural problem that has emerged in a number of Western countries with the achievement of legal equality, normative change and successful educational opportunities for women could be formulated as follows. In the comparatively short period of time in which the breadwinner plus housewife model could be (and in fact was) realized by a majority of the population across the classes (from the 1950s to the end of the 1960s), the bourgeois-patriarchal gender relationship of the long nineteenth century was articulated and challenged in the short history of the democratic late-capitalist twentieth century. The year 1989/90 saw the end not only of the European post-war period and the phase of 'Organized Modernity', which comprised nation-states in their capitalist and socialist variants (Wagner, 1995), but also of the respective (and in part politically contoured) forms of the gender

order (Dölling, 2003). In this light, what certain sociological diagnoses at the turn of this century termed a successful 'de-traditionalization' of gender relations appears not only to herald the end of a specific form of gender relations, but also the end of the possibility of its modernization. With the increasing visibility of various barriers hindering change to the gender relationship and the persistence of a relationality of private sphere (family, intimate relations, domestic economy) and sphere of employment still imbalanced by a domination which undermines the rhetoric of equality, an arena of social conflicts reopens in which the discrepancy between social necessities, realities, and possibilities will need to be determined anew under radically changing social conditions.

## PROSPECTS

Early Critical Theory distinguishes itself from present-day sociological diagnoses by regarding the sphere of private reproduction (intimate relations, family, domestic economy) as a site of fundamental social conflicts and by recognizing the relevance of these conflicts for society as a whole. Even when some of Critical Theory's statements on gender relations remain aporetic and even repellent, and even though Horkheimer and Adorno failed to formulate an adequate theory of gender relations, the texts of the early Critical Theorists still contain numerous indications of how an analysis of gender could be furthered. In order to make these suggestions fruitful, however, it is important to go beyond the accusation of androcentrism and to reacquaint oneself with the concepts and forms of reflections of the early Critical Theorists in general and Adorno in particular.

The following perspectives provide a basis for such a re-engagement:

In light of the glut of naturalizations and ontologizations in thinking about gender

relations – which has reached new levels with the advance of the biosciences – together with their apparent opposite – a revitalization of notions of human nature’s infinite plasticity and availability – Adorno’s negative dialectical thinking remains important. The full potential of his critique of identity for feminist theory has yet to be explored. Particularly Adorno’s dictum that it is necessary above all to ‘comprehend the incomprehensible’ (Adorno, 1969[1970]: 147), that is, the rationally-irrationally coercive and heteronomous character of social relations, is still challenging and topical. This applies both to questions of sociality as the coexistence of human beings, as well as to questions of society as a systemic constellation of large historical formations. Here, a sociologically concrete determination of crisis tendencies in gender relations and of the relationships between spheres of social practice must go beyond Critical Theory’s framework of analysis. This has implications, on the one hand, for the systematic consideration of various conditions of social differentiation and inequality and their relationship to one another (Collins, 2007). On the other hand, the problem is that many of the most important insights of gender theory and research cannot easily be articulated within the framework of a subject–object dialectic. These would need to be counterbalanced by looking at subject–subject relations and their cultural-theoretical correlations. The fact that the productivity of this proposal cannot ultimately be ascertained by the formal cross-linking of theoretical approaches but only by deeper material explorations and interpretations of social conflicts and crises, should be clear.

Last but not least, for a better understanding of the present, any analysis of the constitutional history of bourgeois-capitalist modernity in Europe and in the Global North must be extended beyond Critical Theory. Europe’s development cannot to be understood in isolation from its cultural, political and economic interdependencies with other parts of the world (Bayly, 2004; Osterhammel,

2009) and their particular forms of modernization. For a critical re-inspection of capitalist modernity, there are currently numerous points of connection to be found in the debates on intersectionality, in the interaction of different forms of social domination, division and differentiation (Klinger et al., 2007; Knapp, 2011), and in postcolonial theory and recent debates about ‘multiple modernities’ (Adams et al., 2005; Boateá and Spohn, 2010; Knöbl, 2007; Schwinn, 2006). A pertinent question to pose today, in the spirit of Adorno and the *Dialectic of Enlightenment*, would be: Which dialectics weave together the socio-political radicalization of ‘difference’ in the nineteenth and early twentieth century with the cultural and institutional assertion of universal values of freedom, equality, justice and solidarity? What is the relation between diversely constituted modes of social inclusion/exclusion and those systemic constraints and forms of abstraction which cross the boundaries between distinct spheres via instrumental rationality and identity thinking and which, according to early Critical Theory, prove essential ‘before all specific social differentiation’ to late capitalist socialization [*Vergesellschaftung*]?

## Notes

- 1 This is an expanded and revised version of a much shorter article that appeared in German in Heike Kahlert and Christine Weinbach (eds.) *Zeitgenössische Gesellschaftstheorien und Genderforschung. Einladung zum Dialog*. Wiesbaden: Springer VS, 2012.
- 2 [Translator’s note: Translations of German language texts are by Adrian Wilding.]
- 3 ‘So we come full circle. Men must act in order to change the present petrified conditions of existence, but the latter have left their mark so deeply on people, have deprived them of so much of their life and individuation, that they scarcely seem capable of the spontaneity necessary to do so’ (Adorno, 1969[1970]: 153).
- 4 The accusation misunderstands the fact that performing this aporia for Adorno is both a conscious means of expression and a medium of knowledge.

- 5 In a text published in 1957 on the relationship between sociology and empirical research (and which in the subsequent 'positivism dispute' would become central to the argument over the concept of society and the relationship between theory and empiricism) Adorno formulates the issue in concise terms: 'Theoretical reflections upon society as a whole cannot be completely realized by empirical findings; they seek to evade the latter just as spirits evade parapsychological experimental arrangements. Each particular view of society as a whole necessarily transcends its scattered facts. The first condition for construction of the totality is a concept of the object [Sache], around which the disparate data are organized' (Adorno et al., 1976: 69). Better suited to an historical diagnosis is the argument that, given the reign of systemic domination, a form of social theory which merely reproduces and mirrors the systematic character of socialization, is impermissible (see, e.g. Adorno, 1990b: 361; Adorno, 1986: 167).
- 6 For an historical critique of the concept of the 'whole household' [ganzes Haus] see Opitz (1994).
- 7 This thesis goes back to a research project undertaken at the Psychological Institute of the University of Hanover at the beginning of the 1980s under the supervision of Becker-Schmidt. The study examined the living conditions and experiences of women engaged in piece work who also had small children and a comparison group of former piece-workers who had given up their jobs due to having children. For a thorough summary see Becker-Schmidt (2004b).
- 8 As Helga Krüger has investigated in innovative ways in her 'Institutional Approach to Gender Research' (Krüger, 2001).

# Critical Theory and Recognition

Richard Gunn and Adrian Wilding

For most of the twentieth century, academic political theory addressed liberal themes. It has operated, that is, with a conception of human individuals as beings who possess an ‘area of personal freedom’ (Miller, 2006: 40–7) – the area itself being clear-cut and hard-edged. Perhaps for this reason, the notion of ‘recognition’ has not found favour in it. Whoever speaks of ‘recognition’ sees individual identity as socially constructed and not as something self-enclosed or atomistic.

This said, the term ‘recognition’ found acceptance in political theory in the last decade of the twentieth century. In an influential article of 1992, Charles Taylor turned to this concept as a means of gaining purchase on multiculturalist issues that, otherwise, liberalism found difficult to touch. Later, in the 1990s and the 2000s, Axel Honneth urged that ‘recognition’ may be seen as a basis on which critical (i.e. left-wing) theory might rest. With Taylor and subsequently with Honneth, the term ‘recognition’ gains an academically

acceptable voice. The present chapter takes issue with this academic consensus.

By and large, our discussion of Honneth (see Section 2) is critical. This said, we start by noting a point on which we agree with Honneth’s views. For Honneth, critical theory rests on a ‘recognitive’ foundation; if the notion of recognition is kept in the foreground, critical theory’s characteristic claims come into view. In what follows, we do not dispute that recognition can play this foundational role. Like Honneth, we see critical theory in recognition-based terms. Our claim is that if Honneth’s (and Taylor’s) views are followed, recognition (and critical theory based on recognition) loses its revolutionary – its truly *critical* – edge. Critical theory risks reverting to traditional – i.e. uncritical – thinking. To show what a *revolutionary* idea of recognition looks like we discuss Hegel’s *Phenomenology of Spirit* (see Section 3) and a selection of Marx’s writings (Section 4). In conclusion (Section 5) we underline how these reflections can help revive a truly

*critical* theory. Firstly, however (Section 1), we provide some background to the recognitive turn in political theory that has paved the way for Honneth's work.

## 1. TAYLOR, RECOGNITION AND MULTICULTURALISM

In his pioneering article of 1992, 'The Politics of Recognition', Charles Taylor notes that 'minority or "subaltern" groups' have campaigned in defence of their social status: campaigning by 'nationalist movements' exemplifies the politics Taylor means. In his view, an analyst or a politician should not address the unanswerable question of whether different cultures have equal value. Instead of becoming distracted by this red herring, politicians and analysts should ensure that the cultures concerned are recognised in an even-handed way (Taylor, 1994: 64). By turning to the idea of recognition, liberalism becomes able to address issues that were previously beyond its conceptual pale.

Our response to Taylor's assertion is a qualified one. It is that a multiculturalist approach is surely preferable – much preferable – to an approach which demeans "subaltern" groups'. But multiculturalism by no means exhausts the emancipatory potential that the concept of 'recognition' entails. We do not intend to close the door on what Angela Davis terms 'radical' (as distinct from 'conventional' or 'superficial') multiculturalism (Davis, 2012: 103–4). However, we urge that multiculturalism turns on a notion of group identity wherein what we term contradictory or 'alienated' recognition is implied. Our claim (developed in Section 2) is that emancipated or, in Hegel's usage, 'mutual' recognition is recognition where individuals' (and not merely groups') freedom comes into its own. It is not that multiculturalist scenarios of emancipation admit of too much diversity but that, in our view, they do not go far enough.

A first ground for disquiet with Taylor's discussion lies in turns of phrase that he frequently employs. In the course of his discussion, we learn that recognition is something that may be *given* or *withheld*, or *demande*d, and that it may be *lacked* or (when lacked) *sought for*; that it may (or may not) be *due*. In the last of these instances – an instance where it is synonymous with *respect* – recognition is understood as a moral desideratum. In the other instances, it is understood as a resource which may be absent or present. Taylor's characteristic turns of phrase portray recognition as a sort of entity (or quasi-entity) concerning which questions of fair distribution can be raised. In short, his phrases draw the notion of recognition onto the conceptual terrain of liberal political theory.

To this comment, a note must be added. Taylor presents his claims as liberal in character – but as conflicting with liberalism of a specifically 'procedural' kind.<sup>1</sup> In the light of the phrases italicised in the preceding paragraph, it is tempting to qualify Taylor's disclaimer: his quarrel appears to be less with proceduralism's restrictions to issues of fairness than with its failure to regard recognition as a resource which should be distributed in a 'fair' way. Read thus, 'The Politics of Recognition' is more closely embedded in recent forms of liberal theory than at first sight appears.

A second ground for disquiet is more overtly political. It concerns the notion of 'distinct cultural identities' – in effect, the unit of analysis which multiculturalism employs. We do not deny that, in the existing world, an individual's sense of identity is mediated through his or her cultural grouping. Nor do we deny that an individual's sense of identity is affected if his or her cultural grouping is viewed in a demeaning way. For us, however, the mediation of identity through distinct groupings (cultural or otherwise) is, itself, a seed-bed of difficulties. Problems arise not merely when a group or culture is demeaned but when individual identity is seen in a membership-based way.

Why, it may be asked, should a membership-based view of individual identity be viewed with suspicion? Our aim is not, here, to rehabilitate an abstract or asocial view of the individual self. It is, on the contrary, to uphold a view of individuality which is social and recognitive through and through.<sup>2</sup> Not the least of our reservations concerning a membership-based view is that – see Sections 2, 3 and 4, below – it denies various potentials which the notion of recognition contains.

Problems with membership-based views of individuality come into focus, we propose, when an individual's relation to his or her cultural group is considered. Two points especially strike us as significant. One is that a group or culture of which an individual is a member stands *over against* the individual concerned. Whilst penetrating deeply into the individual's mind, and affirming its authority, the group is experienced as a predominant feature – sometimes a nurturing, sometimes a suffocating – feature of his or her external world. Individuals who grow up in families experience this in an all-too-vivid way. The other point is that a sense of identity rooted in a group is, at best, incomplete. Only part of individuality is acknowledged. As a *something* – as, say, a *man* or *woman* or *Christian* or *caucasian* – an individual is recognised under a certain category which, although it has a determinate content, applies to a number of disparate individuals alike. So to say, such an individual is divided into *universal* (and acknowledged) and *particular* (and unacknowledged) aspects. Taken together, these points bring into focus an alienation that is not removed if the group concerned is valued in a positive and even-handed way. In order to grapple with *this* alienation, and move beyond it, what is needed is (we claim) a notion of recognition which thinks beyond a world where groupings – for example, cultural groupings – are the order of the day.<sup>3</sup> In a social world where recognition is 'mutual', membership-identity no longer obtains.

Where do these comments leave Taylor's discussion? Certain passages in 'The Politics

of Recognition' reject the view that cultures *qua* cultures have 'equal worth'; Taylor is adamant in rejecting a 'fused horizon of standards' approach (1994: 72, 64). Might such passages be read as questioning a membership-based view of individual identity? Although such a reading may be favourable to Taylor, we caution against adopting it here. Taylor's article does show awareness of alienations<sup>4</sup> that a membership-based notion of identity may entail, but a reader of 'The Politics of Recognition' remains uncertain how argument on such alienation may proceed.

We turn briefly to the literature on multiculturalism and recognition which emerged in the wake of Taylor's discussion. Does such literature contain answers to questions that our own comments raise?

In part, we suggest, this literature raises familiar issues. One such issue is the terms in which recognition is seen. For Emcke and Fraser, for example, recognition is something that may be *claimed* (Emcke, 2000: 484; Fraser, 1997: 129; Fraser and Honneth, 2003: 46); for Tully, it makes sense to say that recognition may be *demanded* or *sought* (Tully, 2000: 473–4; 476). Such turns of phrase – all of which jar on the ears of readers familiar with Hegel's discussion – hint, as we have suggested, at a transposition of 'recognition' from Hegelian onto liberal and analytical-philosophical terrain. One of our aims in the present chapter is to focus on 'recognition' in its *wild* (as distinct from its *domesticated*) state.

In further part, the post-Taylor literature introduces fresh considerations. Two points in particular call for comment here: (a) multiculturalism is understood in a broad fashion as a 'politics of identity and difference' (Markell, 2003: 9; Thompson, 2006: 186) and (b) attention is given to forms of grouping which may or may not be of multicultural concern. For Emcke, for example, group-given identity may be 'chosen' or 'imposed' and must, in other respects, be seen in a 'historical context' (Emcke, 2000: 485, 487).

For Tully and Markell, identities rooted in group membership are transformed by the struggles in which they are upheld (Tully, 2000: 476–9; Markell, 2000: 499). Both writers insist that social and cultural groupings be viewed in a non-fixed and non-given and, so to say, non-essentialist way.

Do these considerations render our comments on alienation and group membership inapplicable? We propose that, since Taylor's ground-breaking formulations, little in the literature has changed. Regarding point (a): the significance of a broadening of multiculturalism into a politics of identity and difference depends on how the term *difference* is to be viewed. If the term is taken to mean, merely, *difference between identities*, the conceptual situation is unaltered. If, by contrast, difference is seen as *more fundamental than identity*, then an element of ambiguity is introduced. *Either* identity which is vested in groups continues to be important *or* – and here comes a fresh possibility – difference is seen as coming into being when group-based identity is set aside. The latter may be Fraser's meaning when she refers to a 'shifting field of multiple differences' (Fraser and Honneth, 2003: 106) but her wording is unclear. Regarding point (b): the question of whether membership identity involves alienation and questions about essentialism are conceptually distinct,<sup>5</sup> at any rate in the all-important sense that a group which an individual has chosen to join, and which has no fixed or given essence, retains an existence that stands *over against* the individual concerned. A group which an individual has chosen to join, and which is not fixed and given, remains (or may remain) one where membership divides an individual into *what is particular* and *what is universal*. No doubt, the fixed and given character of a group may intensify the alienation that membership in it involves. But the source of the alienation lies in the existence of group-based identities themselves.

Besides commenting on the circumstance that groups change through multiculturalist

struggle, Tully and Markell argue for positions which distance themselves from what in our view counts as a recognition-based approach. We do not discuss these larger issues here. Our comments have sought, merely, to demonstrate that weaknesses in Taylor's discussion left a number of unresolved issues in their wake.

## 2. HONNETH AND RECOGNITION

If Taylor and multiculturalism represent a first step in recognition's domestication into political theory, Honneth and debate within critical theory represent a second and still-more-influential stage. Honneth's project, launched in his *The Struggle for Recognition* (originally 1992) is to find in 'recognition' a basis for Frankfurt School-style Critical Theory. At the outset of our comments on Honneth, let us record a point of agreement: we agree wholeheartedly that critical theory can be understood in terms of recognition (Fraser and Honneth, 2003: 111, 237). If the concerns of critical theory are viewed in this manner, their radicality become clear. A critical theory of society and, indeed, social relations per se come into focus if viewed in a recognition-based way.

This vital point of agreement having been noted, disagreement with Honneth and his followers begins. We argue that critical theory can be grounded in recognition *only if* 'recognition' is understood in a non-Honnethian way. The non-Honnethian view of 'recognition' that is required is – so we maintain – the conception of recognition that is already to be found in Hegel's *Phenomenology of Spirit* and, following the *Phenomenology*, in Marx. The sections which follow attempt to substantiate these claims.

At the core of Honneth's work is a claim that recognition, in the present world and, indeed, an emancipated world, is differentiated into 'three social spheres' (Fraser and Honneth, 2003: 137–8). The 'spheres' – which mirror, in

rough outline, the ‘ethical powers’ of Hegel’s *Philosophy of Right* (see Hegel, 1952: §142–7) are ‘The “We” of Personal Relations’, ‘The “We” of the Market Economy’ and ‘The “We” of Democratic Will-Formation’ (Honneth, 2014: chapter 6). The names of these stipulated ‘shapes’ differs in different parts of Honneth’s work and, here, we quote the terms which he favours in part three of his ‘mature’ and systematic *Freedom’s Right*. In his earlier *The Struggle for Recognition*, where the three-way distinction is first set out, his terms are more succinct: chapter 5 refers, simply, to ‘love, right, and solidarity’. But whilst the terminology changes, *The Philosophy of Right*-style typology remains a thread running through his thinking – as his early reference to ‘family (love)’, ‘civil society (law)’ and ‘state (solidarity)’ makes clear (Honneth, 1995: 25).

What should be our response to the notion of ‘spheres’ of recognition? We may wonder about how specific spheres are characterised – is ‘love’, for example, a form of recognition or an affect? Does it involve the reciprocity that, for Hegel, recognition entails? Here we set such questions aside to focus on what we see as the vital issue. Once recognition has been divided into ‘spheres’, as Honneth recommends, can we avoid picturing the spheres as standing over against – and as estranging – individuals who confront them? Just as group identities constrain individuals who are group members, so recognition that is part of a ‘sphere’ must be constrained by the sphere itself. Stated differently: must a sphere-specific view of recognition not mirror, in outline if not in detail, an estranged social world?

Let us agree that central to critical theory is the critique of alienation, a critique deriving from the ideas of Hegel and Marx.<sup>6</sup> How may Honneth’s work be situated in terms of this lineage? Our suspicion is that Honneth’s approach downplays the overcoming – the revolutionary overcoming – of alienation upon which Hegel’s *Phenomenology* and Marx’s writings turn. This suspicion is

heightened once Honneth’s underlying conception of history is considered. For Hegel and for Marx, the most deep-seated change in history is that from ‘history’ proper to existence of a post-historical sort. Or from – in Marx’s terms – prehistorical to truly ‘historical’ being.<sup>7</sup> No previous historical transformation is significant in this way. For Honneth, by contrast, the major event in a history of recognition has already taken place: at the ‘breakthrough to bourgeois-capitalist society’, ‘traditional’ notions of status were ended and the ‘differentiation of three spheres of recognition’ took place (Fraser and Honneth, 2003: 138–40). The form of recognition which is most favourable for freedom and ‘individuality’ is recognition subdivided into Honneth’s aforementioned ‘spheres’ (Fraser and Honneth, 2003: 143). With the emergence of capitalism, and of the ‘modern’ or post-traditional world, recognition has, for Honneth, taken its definitive and most desirable form. Though the rough edges of these spheres may need to be smoothed out, their essential boundaries will not change. What remains ahead, for Honneth, is reformation rather than revolution: not a new manifestation of recognition but a polishing of already established forms.

Here, we note a circumstance which (to some extent) softens the criticism of Honneth that we have made. Whilst Honneth acknowledges his indebtedness to Hegel’s *Philosophy of Right* (Fraser and Honneth, 2003: 143–7), he at the same time expresses a reservation about the notion of ‘ethical powers’ employed in that work. Hegel’s notion is, Honneth contends, ‘over-institutionalised’ (Honneth, 2010: 63). That is to say, in writing about the family, civil society and the state, Hegel (so Honneth maintains) links the form of recognition exemplified in each too closely to the social institution concerned. For example, Hegel’s treatment links love and the dynamic of intimate relations too closely to the bourgeois family of Hegel’s own day. For Honneth, what is important is less the detail of this or that bourgeois

institution than the concept of recognition that (even in its bourgeois instantiation) the institution employs. A reader who works through Honneth's writings in chronological order forms an impression that he wishes to free the idea of 'spheres' of recognition from institutional embodiment and to place conceptions of recognition centre-stage.

How should we respond to such an institutional/conceptual distinction? Does it succeed in freeing Honneth's discussion from the charge that, like Hegel's treatment of 'ethical powers', it is overly trapped in existing institutional forms? Our feeling is that it does not. If this or that institution provides at least a first approximation of a specific recognitive 'sphere', as Honneth maintains is the case, it is difficult to free a sphere-specific account from the suspicion that it does, indeed, follow the outlines of existing institutional forms. It is difficult to picture conceptions of recognition other than as variants of recognition in this or that institutional form. From a phenomenological standpoint, such forms stand over-against the individuals whom they purportedly define. Such a view of recognition consolidates and confirms, rather than criticises, the alienations of the social world that it describes.

The line of critique which we have pressed against Honneth is not, we observe in passing, one unique to the present chapter. Amongst critics of Honneth, Emmanuel Renault presents arguments that most closely resemble our own. Renault is unusual in believing (as we do) that spheres of recognition per se involve alienation. We disagree, however, with Renault's claim that 'institutions' should be seen as 'constitutive of recognitive relations' (2011: 228). Such a remedy intensifies the alienation that it is intended to remedy. Another critic whose line of attack resembles our own is Jean-Philippe Deranty, who wonders whether critical theory's edge is 'blunted' by a spheres-of-recognition approach (Deranty, 2004: 298). And Max Pensky shares our concern about the conception of history – or the periodisation of

history – which Honneth favours. A history where the only decisive revolutionary transformation is one which lies in the past has more in common with Weber than with Marx or Hegel:

Honneth like Habermas demonstrates his extreme indebtedness to the tradition of German sociology from Weber to Luhmann, wherein modernity is to be taken primarily as a process of differentiation. (Pensky, 2011: 138)

Pensky's observation chimes in with our own belief that Honneth thinks of recognition in a less-than-revolutionary way. Modernity, for Weber, is a condition with which a theorist must make at least a grudging peace.

So far, in our present remarks, we have concentrated on Honneth's conceptions of recognition and of history – and found these to be 'less than revolutionary', to borrow the title of one of our earlier articles (Gunn and Wilding, 2013a). There is, however, a further dimension to Honneth's work that makes its less-than-revolutionary character clearer still. In his *Freedom's Right*, the work in which Honneth presents his latest and most systematic discussion of recognition, he follows what he terms the 'methodological procedure of normative reconstruction' (Honneth, 2014: 7). What does he mean by this?

On the face of it, 'normative reconstruction' seems a laudable attempt to restate the notion of immanent critique in its Frankfurt School and Marxian<sup>8</sup> sense. Immanent critique proceeds without a priori ethical standards, instead unfolding its values from the criticised object (here, existing society) itself. However, a closer look indicates that 'normative reconstruction' is subtly but decisively different. 'To normatively reconstruct', Honneth tells us, means analysing 'whether and how culturally accepted values are ... realized in various different spheres of action, and which norms of behaviour ideally prevail' (Honneth, 2014: 64).

Such a procedure, we feel, gets the situation back to front. It asks that the social critic or revolutionary activist starts from (so to say)

the best side (what ‘ideally’ prevails) of what existing society offers, or claims to offer. It succumbs to a danger present in immanent critique: staying so close to the criticised object that it fails to break with or overcome it. In a word, such a procedure can lose its revolutionary edge – and this, we suggest, is what occurs with Honneth’s ‘normative reconstruction’: immanent critique becomes *so* immanent that critique all but disappears.<sup>9</sup>

Is there an alternative way to undertake critique? We suggest there is. It is to focus, as Brecht put it, not on the ‘good old things’ but on the ‘bad new ones’ (cited in Benjamin, 1998: 121). It is to dwell on what, in existing society, is insufferable or horrendous. It is to begin with what Marcuse calls a ‘refusal’ (Marcuse, 1968: 200) or a ‘scream’, to employ John Holloway’s vivid expression (Holloway, 2005: 1). Such expressions point more fundamentally to notions of inversion, resistance, rebellion and revolt (cf. Hardt and Negri, 2012: 31). They point, that is, to a social rupture which is anathema to a methodology that concentrates on society’s best and brightest and most seemingly humane side. Though revolution is destined to draw its values from what is latent in existing society, this process of drawing need not involve looking fixedly on society’s most positive or promising side. It can involve noting harsh juxtapositions and letting contradictions move.

### 3. RECOGNITION IN HEGEL

We have proposed that recognition be understood as a revolutionary (rather than a Honnethian or less-than-revolutionary) category. Where is such a revolutionary concept of recognition to be found? Our answer is that it is already present in the work of Hegel and Marx. The Hegel that we have in mind is the Hegel of the *Phenomenology of Spirit* and it is *Phenomenology*-style recognition that, we claim moreover, figures in Marx. Section 4 of

our chapter discusses certain writings from Marx that, we claim moreover, figures in certain writings by Marx (see the following section on Marx). But here, we suggest a way in which Hegel’s *Phenomenology* may be seen.

We have noted that, in Hegel interpretation, a controversial question is whether Hegel’s earlier writings (including the *Phenomenology* of 1807) and his later writings (including the *Philosophy of Right*, 1821) say similar or different things. Amongst current academic Hegel scholars, the most common view is that the earlier Hegel and the later Hegel form a unity, and that recognition is a theme common to both.<sup>10</sup> For ourselves, we resist the current fashion in Hegel interpretation. Recognition is, indeed, referred to by both the earlier and the later Hegel but, we consider, his treatment of recognition changes significantly over time.

At the core of this change is the circumstance that, whereas the younger Hegel was deeply moved by the French Revolution, the Revolution’s significance dimmed, for him, over time. This is not to say that the later Hegel succumbed to reaction: the *Philosophy of Right* was the work of a ‘liberal reformer’, to employ Frederick Beiser’s useful phrase (Beiser, 2005: 216). In the *Phenomenology*, by contrast, the entirety of human history (or European history at any rate) is viewed as a narrative in which the French Revolution is the culminating act. It is in the ‘sunburst’ of the French Revolution that (Hegel tells us) the *Phenomenology* was written (1977: 7). In Hegel’s later works, the French Revolution receives a mention – it counts as a ‘glorious spiritual dawn’ (1956: 447). But these works do not respond to its challenge in the way that the *Phenomenology* attempts.<sup>11</sup>

Here, our aim is not to supply a detailed interpretation of Hegel but to indicate the Left Hegelian reading of Hegel of which our comments on Honneth form a part. Our concern is, primarily, with the *Phenomenology*’s account of history – and with the mutual recognition which, for the *Phenomenology*, history ends.

In the *Phenomenology*, we consider, history comes into focus in two places.

In chapter 4, which deals with 'self-consciousness', events which amount to *history's beginning* are set forth. These events take the form of a 'life-and-death struggle' (1977: 114) on which human individuals (or 'self-consciousnesses', in Hegel's terminology) embark. In the paragraphs leading up to the 'life-and-death struggle', Hegel's chapter discusses human desire – say, desire for food or survival – and (we consider) Hegel invites the *Phenomenology's* reader to think of the struggle itself as desire-based. However, in and through the struggle, a new issue (and a new human capacity) comes into being: if, at the start of the struggle, humans saw themselves as creatures of desire, at its end they picture themselves as beings who can relate to one another through recognition. The struggle, although it turned on life-and-death issues, ended not in slaughter but in submission – the one who submits becoming the slave of the combatant who wins. The upshot of the 'life-and-death struggle' is a relation of recognition, a master/slave relation, an instance of 'recognition that is one-sided and unequal' (1977: 116).

At this point, we must take stock of the picture of history that the *Phenomenology* presents. It is a history of patterns of recognition which change as social eras come into being. The patterns of recognition differ from one another but have one point in common: from the beginning of history until its end, the patterns are, indeed, of recognition – but of recognition in a contradictory or alienated form. The very first form of recognition – the form which emerges directly from chapter 4's history-founding fight – is, as we have noted, 'one-sided and unequal'. The entirety of *Phenomenology*-style history is, in effect, a 'work' through which contradictions to recognition – or contradictory forms of recognition – are removed. *History ends*, according to the *Phenomenology*, when and only when uncontradicted recognition is achieved.<sup>12</sup>

Here, we should like to enlarge on how, in the *Phenomenology*, contradictory recognition is seen. 'One-sided and unequal'

recognition is one form that contradictory or alienated, recognition takes – but there is a second. Another form which gains widespread currency in history is what we term *role-definitional alienation*. The notion of role-definitional alienation is our attempt to unpack a paragraph in chapter 6 that is, at first sight, baffling. The paragraph reminds us that 'nature displays itself in the ... elements of Air, Water, Fire and Earth' (1977: 300) and a reader responds: what has happened? Has the argument of an admittedly complex book launched into nature mysticism? A moment of thought allows a reader to form a different impression. What has happened in the page concerned is that Hegel is offering an analogy. In the history which unfolds between the Ancient and classical world and which endures until French Revolutionary times, society displays features which are 'similar' to the natural elements of air, water, earth, etc. Society presents itself in 'universal' – but here spiritual [*geistige*] – 'masses' or 'spheres' (1977: 300). What (a reader then wonders) does Hegel mean by spiritual masses [*geistige Massen*]? An answer to this question suggests itself. By *geistige*, Hegel means social and historical, and by *geistige Massen*, the *Phenomenology* means *social institutions*. Hegel's claim is that, in the course of European history, institutions which possess a social weight and quasi-natural inertia have come into being. The point of his analogy is that institutions, insofar as they possess a social equivalent of this inertia, alienate the individual that they confront. Already in ancient Rome, he tells us, the social world 'has the character of being something external' (1977: 294) and, in the post-Roman world, the number of institutions increases but their inertia and externality and, so to say, over-againstness remains. Not until the French Revolution does self-consciousness grasp the fact that it itself is 'the essence of all the spiritual "masses" or spheres, of the real [or practical] as well as of the supersensible [or religious] world' (1977: 356) – thereby bringing a social world

patterned through social institutions (and the role definitions that social institutions involve) to its end.

For the just-quoted passage to be made clear, a detailed discussion of the *Phenomenology*'s section on the French Revolution is needed (1977: 355–63). In the space of this chapter, the discussion which is needed cannot be attempted.<sup>13</sup> In its place, we offer some observations. When Hegel embarks on discussion of the Revolution, he offers an image of crowd activity: in a Revolutionary crowd, he says, 'each, undivided from the whole, always does everything, and what is done by the whole is the direct and conscious deed of each' (1977: 357). The Revolutionary crowd is thus presented as a *group-infusion*, in Sartre's meaning of that term (see Sartre, 1976: 345–63). Another way of summarising Hegel's image is to say that, for the *Phenomenology*, the Revolutionary crowd is a group where mutual recognition prevails. For the Hegel of 1806–7, French Revolutionary freedom is (as evinced in its crowd activity) freedom of a mutually recognitive sort.<sup>14</sup> Of course, crowd activity of the sort to which the *Phenomenology* refers is evanescent – its freedom is transient – and the section of the *Phenomenology* on the French Revolution unfolds the steps, all of which were self-defeating, which the Revolution took to keep recognitive freedom in play. In the French Revolution, as presented in the *Phenomenology*, mutually recognitive freedom is touched upon – never to be sustained in a socially stable way.

Hegel's point regarding the French Revolution is that, its instability notwithstanding, it is an event of a history-ending sort. As a living social principle, mutual recognition has made its appearance – not merely in theory, or in a religious 'beyond', but in a practical and political way. By signifying the appearance of mutual recognition in practice, the French Revolution brings the 'work' of history to its close. In the following section of this chapter, we suggest that Marx carries forward the notion of

mutually recognitive freedom where Hegel (or, rather, the earlier Hegel) left off. Here, we add to our all-too-hasty discussion of the *Phenomenology* some remarks on the notion of mutual recognition itself.

Two points concerning mutual recognition deserve emphasis. One is that recognition as understood by Hegel is not merely cognitive but constitutive as well: by calling recognition constitutive, we mean that recognition is a process which makes a recognised object what it is.<sup>15</sup> The second point is that, where mutual recognition exists, *what is mutually recognised* are the self-determining actions which the recognising individuals perform. The circumstance that, as Hegel tells us, self-consciousness 'exists only in being recognized' (1977: 111) does not mean that Hegel recommends determinism. On the contrary, a world where there is mutual recognition is one where individuals' self-determination is accented and thrown into relief. It is, so to say, a bright field where 'self-consciousnesses [or human individuals] ... enjoy perfect freedom and independence: I that is We and We that is I' (1977: 110).<sup>16</sup>

We draw our comments together by underlining a contrast. The *Phenomenology*, as we understand it, contrasts contradictory recognition and recognition of an uncontradicted and 'mutual' form. In a sequence of crucial paragraphs (1977: 111–12), Hegel outlines what, in his view, recognition involves. These paragraphs, which correspond to what Michael Monahan terms 'pure' recognition (Monahan, 2006: 393), culminates in the sentence: 'they [mutually recognitive individuals] *recognize* themselves as *mutually recognizing* one another'. It is when we turn to experience – and, especially, the experience of history – that one-sided and unequal recognition – or 'the duplication of self-consciousness in its one-sidedness' (1977: 112) – begins. This being so, the argument of the *Phenomenology* is missed, and Hegel's 1806–7 conception of recognition is falsified, if the distinction between contradicted and

uncontradicted recognition is lost sight of. The all-important distinction is not, we think, merely one between 'pure' and 'impure' recognition. Monahan's preferred terminology does not bring out the force of Hegel's meaning. Historical recognition does not become 'mutual' from a process of purification.<sup>17</sup> On the contrary, it becomes 'mutual' through the movement of contradiction and revolution – the French Revolution, or an equivalent upheaval. The social world must be turned upside down.

What is it (it may be asked) to move beyond contradictory recognition, and to aspire through revolution to recognition of a mutual sort? It is to establish a world where the to-and-fro movement of recognition is unimpeded, and where 'one-sided and unequal' recognition is no more. It is, likewise, to prise recognition out of channels which *geistige Massen* have made familiar and where recognition proceeds in formal and institutional ways. In a word, 'mutual' recognition or 'pure' recognition is unstructured recognition – meaning by this not that it is chaotic but that it is recognition that follows its own dynamic, in the sense that a good discussion follows its subject-matter wherever the debate (or, here, the interaction) leads. If recognition goes forward in terms of *geistige Massen*, it tends to be confined by the channels that social role definitions – the role definitions inscribed in such institutions as nations or cultures or ethnicities (as in the multiculturalism debate) involve. Recognition confined by role definitions is formal and takes place within pre-established bounds. Mutual recognition, by contrast, is unstructured not least because *geistige Massen* are no longer dominant. Interactive conversation may consult its own dynamic – and be guided by its own flow.

Our comments on the *Phenomenology* are, in the confines of a single chapter, schematic. They are designed to indicate something of the richness into which a 'Left Hegelian' reading of Hegel may tap.<sup>18</sup>

#### 4. RECOGNITION IN MARX

If a recovery of Hegel's notion of recognition involves cutting through a dense web of recent theory (spun by Honneth and his followers, in particular) a discussion of Marx on recognition faces an even more difficult challenge. Due to longstanding prejudices, the concept of recognition has an 'unmarxist' ring. At best, recognition features at the edges of discussion of Marx on alienation. As worst it is assumed to belong to the Hegelian baggage jettisoned by the 'mature' Marx.

Bound up with such stereotypes is a particularly dogged orthodoxy: for Marx, so this orthodoxy runs, changes in the economic 'base' lead to changes in the legal and political and ideological 'superstructure'.<sup>19</sup> A phenomenon such as recognition, if it fits at all within Marxist theorising, must have a merely 'superstructural' (and thus epiphenomenal) character. Here, we do not discuss the image of base and superstructure – save to note an incoherence that it contains: in picturing an economic base, so-to-say 'superstructural' elements are already present. Regarding the orthodoxy, we offer an observation: despite its incoherence, the model of base and superstructure is widely (if tacitly) employed. All too frequently, an understanding of Marx relies sotto voce on a diluted version of the base-and-superstructure model.

What should be put in place of a base-and-superstructure interpretation? We propose that instead of thinking of Marx as a theorist of base and superstructure, he is to be thought of as a theorist of *recognition*.<sup>20</sup> Our argument brings recognition from the outermost edges of Marx's thinking to its very centre. In our view, social relations are relations of recognition; recognition (by which we understand *Phenomenology*-style recognition) goes, socially, *all the way down*. If our views are endorsed, recognition (which is not, and cannot be, merely economic) explodes the base-superstructure model. Reliance on the orthodox model becomes not merely conceptually impossible, it becomes

redundant. Once *Phenomenology*-style recognition is placed at the centre of Marx's work, and allowed to pervade his discussion, a definitive break with base-and-superstructure thinking can be achieved. Sotto voce and semi-acknowledged dependency on the model of base and superstructure become a thing of the past.<sup>21</sup>

In this section we attempt two things: firstly, to show a continuity between 'early' and 'late' Marx when he invokes 'recognition'; and secondly, to suggest that passages in Marx only make sense if he is understood as drawing on *Phenomenology*-style recognition, that is, a fundamental distinction between contradictory recognition and mutual recognition.

The key 'early' work where Marx invokes recognition is the *Comments on James Mill* (1844).<sup>22</sup> Not the least fascinating aspect of this text is its highly Hegelian analysis of the relation between creditor and debtor, which follows remarkably closely the *Phenomenology*'s discussion of mastery and servitude [*Herrschaft und Knechtschaft*]. Marx presents the creditor-debtor relation in strikingly Hegelian terms: a contradictory mix of 'independence' [*Selbständigkeit*] and 'dependence' [*Unselbständigkeit*] – Hegel's own title for what is usually called the 'master-slave dialectic' (Hegel, 1977: 111). The relation of creditor to debtor, like that of master and slave, is asymmetrical and unstable, premised on power and unequal recognition. It is unstable in part because it is unclear who is dependent upon whom: what if the debtor defaults on his or her debt? Moreover, each of the terms of the relation – creditor and debtor – are individuals who become defined by the relation, their identities and lives determined by the credit system. For Marx the 'bond' of debt defines (subjectively, morally) the creditor and particularly the debtor, whose 'creditworthiness' comes to exhaust his or her identity: they are 'recognised' (Marx uses the term explicitly) solely in terms of their ability to repay (Marx, 1992: 264).<sup>23</sup> In the credit system human individuality – indeed

human morality itself – becomes 'an article of commerce' and 'man himself transformed into money' (Marx, 1992: 264). In other words, credit involves not only *one-sided and unequal recognition* but also *role-definitional alienation*.<sup>24</sup> Thus Marx writes in a passage that is worth quoting in full:

Within the credit system, credit's estranged nature operates under the semblance [*Schein*] of the highest political-economic recognition of man [*der höchsten national-ökonomischen Anerkennung des Menschen*]. It does so in a double way: 1) The antithesis between capitalist and worker, between big and small capitalists, becomes still greater since credit is given only to him who already has it, and is a new opportunity of accumulation for the rich man, or since the poor man finds that the arbitrary discretion of the rich man and the latter's judgment over him confirm or deny his *entire* existence and that his existence is wholly dependent on this contingency. 2) Mutual dissimulation, hypocrisy and sanctimoniousness are carried to extreme lengths, so that on the man without credit is pronounced not only the simple judgment that he is poor, but in addition a pejorative moral judgment that he possesses no trust, no recognition [*Anerkennung*], and therefore is a social pariah, a bad man, and in addition to his privation, the poor man undergoes this humiliation and the humiliating necessity of having to ask the rich man for credit. (Marx, 1992: 264; Marx and Engels, 1968: vol. 40, 449–50, trans. amended)

The 'humiliation' involved in such a relation of dependency is one practical expression of recognitive inequality, and Marx is clear about the moral wrong thereby committed. But it is not the case that Marx's concerns are simply and solely moral. Because also noteworthy in this passage is that 'mutual dissimulation, hypocrisy and sanctimoniousness are carried to extreme lengths'. In other words, under a condition of what Marx terms merely 'political-economic recognition', mutual recognition *turns into its opposite*, becomes mutual dissimulation: trust becomes distrust, honesty becomes dissimulation and even the individual is 'counterfeited' like money. The 'mutual complementing' of an individual's freedom that Hegel spoke of has become instead 'mutual plundering'

(Marx, 1992: 275; Marx and Engels, 1968: vol. 40, 460, trans. amended), the relation between creditor and debtor has become one of 'mutual servitude' [*wechselseitige Knechtschaft*] (Marx, 1992: 277; Marx and Engels, 1968: vol. 40, 462, trans. amended), the dependence of both on an 'alien mediator': money (Marx, 1992: 260). In short, mutual recognition has turned into contradictory recognition.

When we turn to what later works such as *Grundrisse* (1857–8) and *Capital* (1867) have to say about recognition it becomes clear that there is no radical change in outlook on Marx's part; here is no 'epistemological break' (Althusser) but merely a change of emphasis. *Grundrisse* and *Capital* share the aim of the *Comments on James Mill* to expose two forms of contradictory recognition: one-sided and unequal recognition and role-definitional alienation. The relevance of Marx's later works to our discussion lies in their showing not only the credit system but *commodity exchange as such* to consist in contradictory recognition. Where the *Comments on James Mill* showed up the recognitive inequality between – and alienated social roles of – creditor and debtor, *Grundrisse* and *Capital* widen this critique to encompass the roles of capitalist and labourer. Again the semblance of mutual recognition in the language of political economy is Marx's particular target. As with the credit relation, commodity exchange generates a merely formal or apparent recognition between those who exchange ('proprietors'), a recognition whose praises may be sung by political economists but which belies an infernal reality – the inherently exploitative relation of the capitalist to the labourer.

In our view the *Grundrisse* renews the critique of contradictory recognition which preoccupied the young Marx: a situation where individuals have the role of proprietors is a relation of recognition shot through with alienation. It is the same merely 'political-economic recognition' which Marx

referred to in the *Comments on James Mill*. What the *Grundrisse* adds to the early work is to expose the inversion of the liberal axiom that proprietors must be legally free: 'no one seizes hold of another's property by force. Each divests himself of his property voluntarily' (Marx, 1993: 243). As Marx immediately points out, this freedom is semblance: a 'surface process, beneath which, however, in the depths, entirely different processes go on, in which this apparent individual equality and liberty disappear' (1993: 247). When we look behind the appearance of proprietors or persons exchanging on free and equal terms, when we look instead at capital and labour (their 'prerequisite'), this 'equality and freedom ... prove to be inequality and unfreedom' (1993: 248–9).<sup>25</sup>

It is worth noting that, in his reflections on Marx, Honneth staunchly resists this conclusion, invoking notions of 'moral economy' drawn from Durkheim and Polanyi in order to try to show that exchange – even the exchange involved in wage labour – rests on a promise of autonomy for the contracting partners (Honneth, 2014: 178–98). It should be clear how strongly Marx opposes such a view. Marx is a harsh critic of the semblance of mutual recognition where its opposite in fact prevails. His work is a relentless exposé of the reversal of equality and freedom into their opposite, of mutual recognition into contradictory recognition. Conversely, the equality and freedom which flow together in mutual recognition remain for Marx the measure by which actual inequality and unfreedom may be judged. Put another way, mutual recognition is the measure by which contradictory recognition may be judged – and condemned. Marx's immanent critique rests upon no other values than the mutual recognition which capitalism in its very essence undermines; yet in unfolding the contradictions to mutual recognition this critique points forward – in revolutionary manner – to a post-capitalist world.

Turning to *Capital* we find a work where a relation of recognitive inequality is hard

to miss. That exploitation – of worker by capitalist – involves Hegelian ‘one-sided and unequal recognition’ should be clear. Our contention is that in addition to exposing one-sided and unequal recognition, a critique of role-definitional alienation lies at the heart of *Capital*. In what sense? The answer is to be found in the notion of ‘personification’ whereby Marx treats capitalist and labourer as ‘embodiments’ or ‘incarnations’ or ‘bearers’ (he tries out various metaphors) of particular class relations and interests (Marx, 1976: 92). The capitalist *just is* capital personified: only as such does he become ‘respectable’ (Marx, 1976: 739). Likewise, the worker *just is* labour personified: lacking means of production, owning only the ability to work, he or she has become wholly fungible: ‘abstract labour’. Both capitalist and worker are to this extent ‘machines’ or ‘cogs’ in a ‘social mechanism’ (Marx, 1976: 742, 739). To be labour or capital personified is to be an abstraction, with all one’s individual characteristics bracketed out and one’s many-sidedness reduced to a single generalisation.

The implications of this should not be under-estimated. One such implication is that Marx cannot straightforwardly be endorsing or siding with the category of labour.<sup>26</sup> A class is a pole of a one-sided and unequal recognitive relation. It involves, moreover, role-definitional alienation; to be a ‘worker’, to be a ‘member’ of the ‘working class’, is to be recognised in a contradictory way. Hints of this radical line of thought were already present in the *Comments on James Mill* where Marx opposed ‘life’ to ‘labour’ (Marx, 1992: 278). They reappear in Marx’s later work where communism is construed as a form of social existence which would no longer involve labour but instead some wholly new ‘self-conscious activity’. As the *Grundrisse* describes it, ‘the development of the rich individuality which is all-sided in its production as in its consumption, and whose labour also therefore appears no longer as labour, but as the

full development of activity itself’ (Marx, 1993: 325).<sup>27</sup>

A comment on this conclusion is in order. Our recognition-based reading of Marx as a critic of personification is an unorthodox one. That ‘worker’ and ‘capitalist’ are social roles which misrecognise individuals goes barely mentioned in the recent literature on Marx and recognition. The work of Emmanuel Renault is a rare exception. In treating capitalist and worker as ‘*Charaktermasken*’, Marx is (according to Renault) calling attention to the ‘coercive dimension’ and ‘falseness’ of these roles (Renault, 2013: 709).<sup>28</sup> We endorse Renault’s argument and generalise the point: *all* social roles are ‘coercive’ and ‘false’. We add merely the following: that it is a focus upon contradictory recognition (the common preoccupation of Hegel and Marx) which brings the falsity of social roles fully to light.

We conclude this section with an observation on Marx’s relation to Hegel.<sup>29</sup> We have implicitly argued against a commonplace in Marx interpretation, namely that Marx wanted to turn Hegel – who is ‘standing on his head’ – the right way up (Marx, 1976: 103; Marx and Engels, 1968: vol. 23, 27; also Engels, 1946: 39).<sup>30</sup> In fact, putative opposition between the two thinkers looks more like common ground once we study what each has to say about recognition. For the Hegel of the *Phenomenology of Spirit*, the social world is already topsy-turvy and the task of critique is to draw attention to the shifting relation between appearance and essence in a world turned upside down. Critique is no different for Marx. In the above-discussed works it is as if Marx *plays off* the Hegel of the *Phenomenology* (as we have argued, the already-radical Hegel, the Hegel for whom the existing world is ‘inverted’, i.e. contradictory, hypocritical) against the Hegel of the *Philosophy of Right* (the later Hegel for whom the social world seems firmly on its feet). He plays off the thinker who is alive to contradictory recognition and whose thought aims at free, unconstrained, unalienated interaction, against the thinker of ‘reconciliation’

(Hegel, 1952: 12) who believed the modern State had mitigated or even transcended the alienation and inequality in civil society. Marx in effect reminds Hegel that civil society, by his time more clearly visible as the realm of capitalist exploitation, is a realm of inherently contradictory recognition. Capitalism inverts the very principle of mutual recognition that both thinkers hold dear.

## 5. RECOGNITION AND CRITICAL THEORY

The foregoing discussions of Hegel and Marx have been brief but – we hope – sufficient to show how far-reaching and *revolutionary* is the concept of recognition in their work. What we have said shows, by contrast, how domesticated and hidebound this notion has become in Honneth's hands. Honneth's notions of 'recognitive spheres', of 'normative reconstruction' and of a history which all but ends in the transition to modernity are, taken together, ideas that clip recognition's revolutionary wings. Our chapter has attempted to reopen a path to a revolutionary notion of recognition which currently lies hidden behind a tangled undergrowth of liberal and recent Frankfurt School (Habermasian and Honnethian) debate. The task of clearing this path may also be conceived as the recovery of critical theory's original intention. The radicality of critical theory in its original – Horkheimer, Adorno, Marcuse – phase has, we suggest, become obscured to the same degree that Hegel's and Marx's understanding of recognition has been pushed aside.

To survey the terrain of so-called Frankfurt School theory today is to observe a very different landscape to that of the heyday of the Institute for Social Research. That heyday saw an explosion of radical and challenging ideas and – despite the occasional pessimism of a Horkheimer or an Adorno – a lasting commitment to revolutionary perspectives. Such descriptions fit uncomfortably with

recent Frankfurt School theorising. In recent decades a decisive shift has taken place from the philosophies and politics of the Frankfurt School's founders. Honneth's monumental *Freedom's Right* presents itself as renewing critical thought, yet, we fear, provides little more than an intricate philosophical justification for reform over revolution. It seems no coincidence that Honneth's latest book, *The Idea of Socialism*, fires a broadside at Marxism and champions the same core values as the German Social Democratic Party.<sup>31</sup> To us, it becomes ever clearer that Habermas and Honneth have traded in a Marxist philosophy for a social democratic, i.e. a reformist, ameliorist and institution-oriented, worldview.<sup>32</sup>

We began with Taylor's expansion of liberalism into multicultural issues, a view that equated recognition with respect for cultural identities. We showed how uncritical such a view must be towards the alienation involved in cultural identity. Honneth seemed at first glance to offer an alternative to liberalism's problems, but his appropriation of recognition for Frankfurt School thought succumbs to its own severe weaknesses. Standing back, we note that in these various appropriations of recognition the boundaries between critical theory and liberalism have become increasingly blurred. In Frankfurt, we note in passing, the vocabulary of liberal political philosophy seems to have won out over the rich Hegelian-Marxist thought-world in which the early Frankfurt School moved. This has political implications. Despite their difficulty, a book by Adorno or Marcuse could inspire a generation of political activists; it is hard to see the work of their successors having a similar effect. Against the tide, our discussion has attempted to show – via a recovery of the original revolutionary meaning of recognition – how a revival of critical theory might proceed.

## Notes

- 1 By 'procedural' liberalism, Taylor understands the view according to which 'a liberal society must remain neutral on [the question of what is

- to count as] the good life, and restrict itself to ensuring that however they see things, citizens deal fairly with one another and the state deals equally with all' (1994:57).
- 2 We agree with Taylor that an individual's identity 'crucially depends' on his or her dialogical – indeed, recognitive – 'relations with others' (1994: 34). Indeed we find ourselves in broad agreement with various of Taylor's declarations.
  - 3 John Holloway makes the same point in striking terms: 'We rebel because we misfit ... We are anti-identitarian. It means that we don't fit into identities ... the problem with identity politics is that it tends to fit everything into classifications and we don't! This is of fundamental importance – We don't fit in! We don't fit into classifications, into little boxes. We can say, as I think the Zapatistas do, We are indigenous but we are more than that. We can say We are gay but we are more than that. We are women but we are more than that or We are Irish but more than that. But if we don't say "but more than that", then it becomes reactionary. It becomes a conservative statement' (Holloway, 2016: 13–14).
  - 4 Or, so to say, over-againstnesses.
  - 5 How are the terms 'essentialist' and 'non-essentialist' to be understood? Answers to this question differ in Wittgenstein's *Blue and Brown Books* (where questions about essences are explored) and in Althusser's writings.
  - 6 See Honneth's Foreword to Jaeggi (2014a).
  - 7 Whether Hegel thought in terms of an 'end of history' remains controversial amongst commentators. His remark, in the *Phenomenology's* final chapter, that 'until spirit ... has completed itself as world-spirit, it cannot reach its consummation as self-conscious spirit' (1977: 488) suggests that, in that work at least, he thought in such terms. See also Marx (1971: 21–2).
  - 8 For the notion of immanent critique (as distinct from external critique) in Marx, see Marx and Engels (1975: vol. 3, 270).
  - 9 On this point we concur with Rahel Jaeggi: when Honneth takes himself to be undertaking 'immanent' critique he is actually engaged in 'internal' critique, a critique that is unable to free itself from the normative standards of its object, an alienated social world (see Jaeggi, 2014b: 261–8).
  - 10 See e.g. Williams (1997).
  - 11 For an account of Hegel, and the *Phenomenology* in particular, see Gunn (2015). An English-language version of Gunn's account of Hegel is forthcoming.
  - 12 So to say, history as seen in the *Phenomenology* is a story or narrative with a 'happy ending'. We should note that this 'happy ending' – an ending of alienation – is not foreordained. Nothing prevents Adorno's bleak version – a history that leads from the slingshot to the atom bomb – from being the more accurate one (see Adorno, 1973: 320).
  - 13 For more detailed discussion, see Gunn (2015).
  - 14 For historical background to Hegel's formulations, see Rude (1959).
  - 15 Kojève's examples of objects which are made what they are through recognition are medals and 'the enemy's flag' (Kojève, 1969: 6). Though such objects belong in a world of alienation, they sufficiently highlight what 'constitutive' recognition means.
  - 16 Having quoted this moving and challenging passage, still further commentary suggests itself. The 'I that is We and We that is I', to which Hegel refers, exists in a deeply interactive way.
  - 17 Where Monahan's argument does prove useful is exposing the error of an 'agonistic' view that assumes all recognition is *inevitably and inescapably one-sided and unequal*, a view that predominates in Lacan and various postmodern theories.
  - 18 Our discussion has focussed on the *Phenomenology of Spirit* rather than the *Philosophy of Right*. Whilst recognition as a term reappears in Hegel's *Philosophy of Right*, recognition no longer exists there in an unstructured and uncontradicted sense.
  - 19 For the classic statement of the base/superstructure distinction, see Marx (1971: 20–1).
  - 20 Our argument here condenses a much more detailed discussion. See Gunn and Wilding (2014).
  - 21 Andrew Chitty (1998) rightly argues that a focus on recognition upsets a base-and-superstructure reading. Our suggestion is that, if Marx is understood in terms of recognition, the justification for a base-and-superstructure reading disappears.
  - 22 Honneth – understandably – turns to this text at several points in his recent works. The conclusions he draws from Marx, however, are very different from our own.
  - 23 When Lazzarato, in his analysis of the *Comments on James Mill*, refers to the element of 'self-constitution' and 'subjectivation' in the creditor-debtor relation, he unwittingly refers to the constitutive power of recognition (here, contradictory recognition) upon subjectivity (Lazzarato, 2011: 55, 59). An explanation in terms of recognition is missing from Lazzarato's otherwise useful book because he is set upon reading Marx's *Comments* alongside Nietzsche's *Genealogy of Morals* rather than alongside Hegel's *Phenomenology*.
  - 24 See Section 2, above.
  - 25 What in the early work appears as moral inversion appears in the late work as a '*Lichtbild*'. (Marx uses a metaphor from early photography: just as

- a photographic slide inverts reality, so capitalism presents to us a world through the looking glass (1993: 249).) On Marx (like Hegel) as theorist of the 'inverted world' [*verkehrte Welt*], see Helmut Reichelt (2005).
- 26 Marx notes drily that he by no means depicts the capitalist 'in a rosy light'. But it seems to us that he could have added the same about the worker, since both roles involve alienation. Of course one role is more 'comfortably' alienated than the other.
  - 27 From a rich literature on Marx as critic of labour we recommend particularly Holloway (2010: 87–99); Holloway (2015) and Cleaver (2000: 127–31).
  - 28 On another point we find ourselves in agreement with Renault: Marx's use of 'recognition' is indeed 'at odds with the Hegelian connotations of "recognition" on which the contemporary debate draws' (Renault, 2013: 704). But we suggest this is precisely because of the Honnethian assumptions upon which the contemporary debate rests. For us, Marx is best understood in terms of the Hegelian contrast between contradictory recognition and mutual recognition, a contrast whose force is absent in recent debates.
  - 29 That Marx, as Renault (2013) argues, may have received Hegel's ideas on interaction filtered through the work of Feuerbach and Hess seems to us both plausible and intriguing. But for us these lines of lineage are less pertinent than the underlying congruence between Marx's arguments and Hegel's critique of one-sided and unequal recognition and role-definitional misrecognition.
  - 30 Michael Quante has shown that this famous phrase of Marx's is more subtle than meets the eye. Marx does not say that the correct response to Hegel who is 'standing on his head' is to put him 'back on his feet' (this is *Engels'* phrase) but rather to 'turn him inside out' [*umstülpen*]. In German, *umstülpen* is something one can do with clothing, e.g. a jacket or a glove. The two metaphors – putting Hegel on his feet (Engels) and turning him inside out (Marx) – are far from synonymous. As Quante suggests, Marx's 'turning Hegel inside out' may well be a reference to Hegel's own Logic of Essence, Marx merely pushing Hegel's dialectic of essence (inside) and appearance (outside) further. See Quante (2014: 425–7).
  - 31 Freedom, Justice and Solidarity. See Honneth (2015).

# 'Ideas with Broken Wings':<sup>1</sup> Critical Theory and Postcolonial Theory

Asha Varadharajan

## THE FRANKFURT SCHOOL: WHY NOW?

In his 22 September 2014 essay in *The New Yorker*, Alex Ross wrote, 'If Adorno were to look upon the cultural landscape of the twenty-first century, he might take grim satisfaction in seeing his fondest fears realized'. Two years later, Ross would comment, with both rue and bitterness in the wake of the election of Donald Trump, 'I spoke too soon. His moment of vindication is arriving now' (2016). Ross's account of Adorno and Benjamin's 'skeptical ardor' and 'relentless scouring of mundane surfaces' as well as his acuity in characterizing their contribution to thought as a 'dialectic of doubt' resonates with my own passionate dalliance with the Frankfurt School, particularly with Adorno's inimitable brand of philosophical reflection. Ross's invocation of the Frankfurt School in the context of Trump's rise to power highlights once again their indispensable

diagnoses of 'the authoritarian personality' while serving as a reminder of the still prevailing scholarly consensus that they remained 'stunningly silent on racist theory, anti-imperialist resistance, and oppositional practice in the empire' (Said, 1993: 278). Indeed, new aficionados of Critical Theory such as Amy Allen call for 'open[ing] critical theory up to a deep and substantial engagement with the challenges of postcolonialism' (2017: 201), arguing that a 'decolonization from within' must accompany or complement 'a more radical decolonization from without' (2017: 202). Allen endorses what she describes as a radically reflexive and historicized form of immanent critique practised by Adorno and Michel Foucault which simultaneously fractures the social world and systems of thought. In what follows, I elaborate upon Ross's invitation to rethink acquiescence and resistance in moments of crisis and despair and Allen's parallelism between 'decolonial' (185, 202) and Critical Theory to indicate why some of Adorno's writings in

this regard are singularly suggestive for the (diasporic) postcolonial intellectual.

### THE FRANKFURT SCHOOL: WHY STILL?

Adorno's interrogation of 'the contradiction between democratic order and the actual consciousness of those who are kept in a continuing state of minority by social conditions' (1991a: 129), who lack 'the prerequisites for an existence marked by human dignity' (1991a: 126), illuminates the disturbing consequences of a 'callous appeal to the common will' (1991a: 129) even as it explains Ross's attraction to this explanation for the 'boredom' and 'nihilistic glee' as much as 'economic dissatisfaction or racial resentment' that moved a population to vote against its rational self-interest (Ross, 2016) and the media to capitulate rather than dissent. If Ross concentrates on the prophetic and accurate diagnoses of the culture industry that has reached its apotheosis in the figure of Donald Trump, my interest is in the affect and posture of the intellectual Adorno has made his peculiar province. Adorno's sustained interrogation of culture's separation 'from the naked necessity of life' (1991a: 109), as 'the manifestation of pure humanity' (1991a: 108) that disavows its share of 'the guilt of society' (1995: 26) is of a different order than Allen's injunction, following Richard Rorty, that 'we have to start from where we are' (2017: 202). Adorno would, no doubt, applaud this sincere desire to resist the 'ossification' of tradition and the 'self-satisfaction' (1991a: 119) of intellectuals; however, his visceral conviction that culture is 'granted the space in which to draw breath immediately by that power against which it rebels' (1991a: 119) would refuse the distinction Allen makes between decolonization from within and decolonization from without. This distinction is a luxury the (post)colonial subject, intellectual or otherwise, cannot afford.

Allen concentrates on the resources Adorno (and Foucault) offer '*for the crucially important project of de-colonizing critical theory*' (Allen, 2017: 200, my italics). I want to suggest that Adorno had the right instincts where *postcolonial* reflections on ethics and epistemology are concerned too because those reflections also recognize that the promise of decolonization may never be fulfilled and that critique must remain both relentless and interminable.

### EPISTEMOLOGY: 'THE OPEN-AIR PRISON WHICH THE WORLD IS BECOMING'<sup>2</sup>

Indeed, this realization is constitutive for Edward Said's (1978) seminal *Orientalism*. In describing 'Orientalism as a Western style for dominating, restructuring, and having authority over the Orient', Said demonstrates 'the enormously systematic discipline by which European culture was able to manage – and even produce – the Orient ... during the post-Enlightenment period' (1978: 3). Said declares, '*no one* writing, thinking, or acting on the Orient could do so without taking account of the limitations on thought and action imposed by Orientalism' (1978: 3, my italics). It is this unenviable position within the nexus of knowledge and power that (post)colonial subjects continue to inhabit despite decolonization and in the wake of the continued 'immiseration of the postcolonial world' (Spencer, 2010: 207). To my mind, Said's position is of a piece with Adorno's reflections on the 'semblance of freedom' that stymies 'reflection upon one's own unfreedom' (1995: 21). Even if, as Said explains, Orientalism does not determine everything that can be said about or done in and for the Orient, dissent and re-orientation must continue to contend with the network of interests that bears upon the production and management of the Orient. For both Said and Adorno, the moment of hope occurs

when critical reflection does not imagine itself as standing ‘in contradiction to manifest unfreedom’ (Adorno, 1995: 21) but proceeds simultaneously by combining ‘unflinchingly conscious use’ of traditions and institutions with the insatiability of ‘open thinking’ (Adorno, 1991b: 202): neither ‘existing conditions’ nor ‘the ends yet to be attained’ nor even ‘any type of organized force’ can secure open thinking (1991b: 203). It is this dialectical approach to cultural criticism – the ‘critic of culture must both participate in culture and not participate’ (Adorno, 1995: 33) – that makes me resist, instinctively, the currency of the word ‘decolonial’ and not only for its grammatical infelicity. Turning decolonizing (an adverb) into decolonial (an adjective) bleaches critique of conflict and ardour, stringency and impossibility, suppleness and imagination. More damningly, it transforms the dynamic struggle against dispossession into property, a static virtue that can be owned and affirmed. Even if the word ‘decolonial’ is intended to bridge the divide between epistemology and politics, it slips too easily into a definition rather than a practice of anti-colonial epistemology. The unpalatable lesson that Said and Adorno teach is that the standpoint and experience of colonization or marginalization is not enough to overcome its effects, to represent those who cannot represent themselves. For them, the process of decolonization (not the condition of decoloniality) is an aspiration and a necessity; not a guarantee or inevitability. They pursue, in other words, ‘the insolubility of the task itself’ (Adorno, 1995: 32).

## CRITIQUE AND IDEOLOGY

For Adorno, cultural criticism must confront ‘society as appearance’: his consciousness of the reification of the whole such that ideology is ‘as it were, equally near the centre in all its pieces’ (1995: 31), results in a mode

of critique that pursues the logic of the object’s aporias to reveal the antinomies that rend social physiognomy (1995: 30, 32). This distinction from decolonial epistemology is an important one because the aim of the dialectic between immanence and transcendence is not to privilege the standpoint, perspective, experience or perceived marginalization of the subject but to transform both knowledge ‘that penetrates from without and that which bores from within’ (1995: 33) ‘into a heightened perception’ of the object (1995: 32). This method that embodies rather than resolves contradictions, that consistently exposes the gap between epistemological pretension and political reality, is not synonymous with the familiar Gramscian distinction between the optimism of the will and the pessimism of the intellect; instead, as Adorno avers, ‘thought achieves happiness in the expression of unhappiness’ (1991b: 203) rather than remaining content with a mere obedience to praxis. This notion of critique has often been mistaken for a form of intellectual hubris, a refusal to get one’s hands dirty, or even as resignation in the face of catastrophe. On the contrary, Adorno draws upon Marx’s allegorical refraction of history in *The Eighteenth Brumaire* as the force of revolution undermined by the logic of repetition; the cultural critic’s fidelity ‘to a praxis truly involved in change’ (1991b: 202) results in what Robert Spencer describes as ‘an unrelenting focus on the defects of the present’ (2010: 208) and a resistance to evocations of ‘spurious harmony’ (Adorno, 1995: 32). Thus, for Adorno, ‘[w]hoever refuses to permit this thought to be taken from him has not resigned’ (1991b: 203).

This critical obduracy becomes indispensable in the postcolonial world as Spencer describes it – ‘the expectation of environmental collapse and the haunting of our imaginations by images of poverty, violence, disease and failing states’ (2010: 207) – a world indistinguishable from ‘the injustice and (colonial) violence that capitalism brings

in train' (2010: 208). In this sense, the culture industry's responsibility for the ascendancy of Donald Trump (and other variations of right-wing populism and extremism) and the depredations of late or global capitalism are two sides of the same coin. It must not be forgotten that those who voted for Trump were not only the disaffected and alienated but equally those whose annual income exceeded \$50,000 (Henley, 2016). Adorno's dual insistence, pace Walter Benjamin, on culture and barbarism, on the detritus as much as the force of universal history, is of a piece with the 'dialectical agonism' (Hussein, 2002: 6) of Said's adumbration of critical consciousness, his appreciation, late in his career, of Adorno's distrust of all systems (2002: 233). He shares, too, Adorno's awareness that the critic's inescapable 'immersion in the destructive element' (Conrad, 2008: 243) is the condition of his comprehension of the damage it has wrought and of the means to escape its authority. Adorno's analysis of 'capitalism's daunting ubiquity' (Spencer, 2010: 212), however, augments Said's disarticulation of Orientalism (identity thinking in Adorno's scheme) by rendering its representational economy in tandem with the political economy of capitalist modernity. While Said can occasionally detach the weight of Orientalist machinery from the historical and cultural reality/discursive object it signifies and obscures such that it has a life all its own, Adorno's treatment of ideology as equally near the centre in all its pieces makes it impossible to separate discourse and social physiognomy and the originary violence (colonial or capitalist) upon which both rest, however distorted and fractured the resulting mediation and appearance of society.

### CONSCIOUSNESS AND CONSCIENCE: CRITIQUE AS AFFECT

The 'intransigence' (Adorno, 1995: 31) of the dialectical method, particularly in its

immanent moments, is not only a characteristic of its epistemology and politics but also derived from affect and conscience. As Spencer demonstrates compellingly (2010: 213–14), intelligence for Adorno was a *moral* category, answerable to victims of atrocity – of which the Holocaust is only the most egregious example – and designed to avert the perpetuation of suffering and the prevalence of apathy. Adorno's excoriating meditations on guilt and shame (see *Minima Moralia* and *Negative Dialectics*), when he describes himself as a survivor rather than a victim of the Holocaust, are particularly poignant – 'the shame of still having air to breathe, in hell' (1974: 28) – because they express a tormented mode of being that exceeds the casually humane or merely conscientious or sincerely empathetic or even the philosophically rigorous or truthful. Said's own exile from and fraught relation to the intractable fate of Palestine exhibit a similar mix of entanglement and penitence (Spencer's words), but they are tied to the worldliness which garbs his intellectual conduct, the inventory of historical traces that wound and complete his identity, rather than the means by which thought acquires 'the momentum of the general' (1991b: 203). Spencer rightly describes Adorno's emphasis on the moral capacity to feel others' pain and to alleviate their suffering as the antidote to the competitive avarice and cruel indifference nourished by capitalist modernity (2010: 218). However, I believe, with Antonio Vázquez-Arroyo, that Adorno's desire to lend a voice to suffering not only generates a humane sensibility that evokes a world made to the measure of the suffering in it but demands that intelligence 'translate pain into the concept' (2008: 459, my italics). Thus, philosophy's 'moment of truth, as Adorno consistently insisted, is the threat and permanence of catastrophe' (Vázquez-Arroyo, 2008: 458).

I have been struck anew by the apparent contrast and secret pact between Adorno's interpretation of the Holocaust as neither

aberrant nor exceptional and Hannah Arendt's account of the 'ill-defined, general agreement that the essential structure of all civilizations is at the breaking point ... [such that] it can nowhere provide the guidance to the possibilities of the century, or an adequate response to its horrors' (1973: vii). The Holocaust, for Arendt, signifies the appearance of 'absolute evil' (1973: viii) because it cannot be attributed to humanly comprehensible motives. The concealed resemblance between their views begins to emerge when Arendt asserts that the 'subterranean stream of Western history has finally come to the surface and usurped the dignity of our tradition' (1973: ix). For Adorno and Benjamin, the unconscious of Western history is its complement, and Arendt's tale of usurpation is, rather, the Janus-faced story of culture and barbarism. Arendt places the *consecutive* horrors of anti-semitism, imperialism and totalitarianism on an escalating scale of brutality while Adorno sees these iterations of the logic of identity as 'pathological' extensions of the logic of capitalism (Spencer, 2010: 210). Yet, when Arendt looks for 'balanced judgement and measured insight' (1973: vii) that might help one come to terms with the oscillation between progress and doom, optimism and despair, and omnipotence and powerlessness that marks the human condition as she knows it, she rejects 'the spurious grandeur of "historical necessity"' (1973: viii) that might serve as a plausible explanation for the disintegration she witnesses. She argues instead for a form of comprehension that faces up to 'the impact of reality and the shock of experience' (1973: viii), for a conscious assumption of the burden of history in order to resist rather than buckle under its weight.

Here, Arendt performs her own affecting version of the dialectic of immanence and transcendence: attunement to the shock of experience and the horror of the outrageous not only unstitches a reality sutured by commonplaces but leavens the universal experience of driving to one's doom with the awareness 'of what has been happening'

(1973: viii). If Adorno's favoured trope is paradox that revels in the suspended and irresolvable, or antinomy which reveals the antagonism that seethes beneath the reified whole, Arendt's is irony: 'without the imperialists' "expansion for expansion's sake," the world might never have become one; ... without [totalitarianism] we might never have known the truly radical nature of Evil' (1973: viii–ix). The irony of this fortunate fall from innocence to experience becomes the agent of a dialectical transcendence of an extremity that defies comprehension. Arendt declares 'that human dignity needs a new guarantee which can be found only in a new political principle, in a new law on earth ...' (1973: ix). Not only does Arendt trace the genesis of totalitarianism, she also has what Adorno would describe as 'a firm grasp upon possibility' without objectifying itself as Utopia (1991b: 202). The Holocaust urges both Adorno and Arendt to engage in philosophical contemplation in the face of despair but equally to view the world from the standpoint of redemption (Adorno, 1974: 247). Like Benjamin's Angel of History, Adorno's redemptive gaze is a backward glance to the rubble: the unrequited dreams and silenced voices of the vanquished of history (see also Vázquez-Arroyo, 2008: 459) while Arendt's gaze is directed forward – the new law on earth will take its cue from the disintegration it leaves behind. In other words, the new political principle of human dignity, in the spirit of the lacerating irony that underwrites Arendt's hope, needs the obscenity of the Holocaust in order to be(come).

I have been at some pains to show, as does Spencer, that 'it is less what Adorno thinks than how he thinks that is exemplary' for postcolonial theory (2010: 209). Moreover, as Said's discussion of Orientalism as a constraint upon thought and action suggests, Adorno's vaunted Eurocentrism might be beside the point. Whether one considers Eurocentrism as the 'enabling violation' in the production of the colonial subject (Spivak, 2004), conceives of Empire as the

'intimate enemy' (Nandy, 1983), examines the 'split enunciation' from which colonial hybridity proceeds (Bhabha, 1994), or seeks to 'provincialize Europe' (Chakrabarty, 2000), 'Europe' must be construed before it can be denied (Adorno, 1981). As a range of more recent reflections on Adorno and the postcolonial have shown, a careful reading of his writings will elicit pithy denunciations of both racism and colonial violence<sup>3</sup> that reveal neither the wilful blindness nor the motivated silence of which he has been accused (see, for instance, Allen, 2017). Rather than resurrect this stale debate, I have resorted to a detour via his contemporary Arendt to illustrate not only that her writing partakes of his peculiar blend of philosophy and conscience, but that she shares his confidence that 'thinking has the momentum of the general' (1991b: 203). Arendt's account of the unprecedented rootlessness and homelessness that the simultaneous perversion and decline of the nation-state has wrought moves her to envision the Holocaust, a distinctly European phenomenon, as an emptying out of the name of the human in the corrosion of dignity and the displacement of community. Adorno, for his part, renders European modernity synonymous with the perdurability of catastrophe rather than the idea of historical progress and with the guilt that permeates society. While recent historiographies of the trajectory of human rights have denied that the Universal Declaration of Human Rights of 1948 made explicit reference to the Holocaust in recasting human dignity,<sup>4</sup> I want to suggest that the experience of 'nullity' functioned, as Adorno (1974) writes in *Minima Moralia*, as 'the mote' in one's eye that is also 'the best magnifying glass' (50): the UDHR failed to refer explicitly to the event of the Holocaust precisely because it may well have been drafted under the *anxiety* of its influence (see Habermas, 2010: 465). Both Adorno and Arendt are simultaneously aware that the expansionist momentum of imperialism and capitalism entwines 'their' fate with 'ours', making both hope and despair universal.

The stage is thus set for rethinking the relations between normativity and critique, for juxtaposing the historicity of concepts with the realization of their potential in a redeemed world. Allen offers this approach as a blueprint for critical theory in postcolonial times; I follow suit with both desire and scepticism.

### THE 'EXHAUSTION OF UTOPIAN ENERGIES':<sup>5</sup> A BALEFUL VIEW OF CRITIQUE

Allen's disillusionment with the second generation of the Frankfurt School, Jürgen Habermas and Axel Honneth, stems from their endorsement of a 'post-metaphysical, contingent, disaggregated story about modernity as the result of a process of historical learning or social evolution' (2017: 184), an endorsement that ignores the fact that 'the language of progress and development is the language of oppression and domination for two-thirds of the world's people' (2017: 185). For Allen, this approach transforms the moral-political *goal* of progress into a historical fact and forecloses a serious confrontation of the postcolonial condition, a particularly reprehensible move given Habermas's position at the forefront of discussions of cosmopolitanism and human rights and, I would contend, of making the democratic social order constitutive of a cosmopolitical imaginary. Allen cites a range of postcolonial scholars but does not herself develop the *rapprochement* she proposes and retreats, rather surprisingly, to a modest and apologetic self-scrutiny rather than a robust transformation of Critical Theory into the 'something else' to which she gestures (2017: 202).

Postcolonial theory cannot congratulate itself on being the much-awaited riposte to the blithe unawareness of Habermasian critical theory either. Its adherents have been equally adept at 'enjoying a new lease on life

for the way it can be made to emblemize where we all went wrong' (Taylor, 2015: E339), and berating their compatriots for being unable 'to provide the critical theory of history necessary to account for the predicaments of power it [postcolonial theory] attempts to map and theorize' (Vázquez-Arroyo, 2008: 466). Perhaps the most coruscating diagnosis of what ails postcolonial theory occurs in Neil Lazarus's (2011) *The Postcolonial Unconscious* in which he argues that postcolonial theory has transformed emancipatory politics into an epistemology of defeat because it is a 'complex intellectual response' (2011: 9) to the obliteration of Marxism as an enabling political horizon and, simultaneously, to the demise of liberationist zeal. Christopher Taylor describes this situation as the 'crises of accumulation and ongoing imperial aggression' (2015: E340) that have tended to obscure liberationist ideologies from view, and both Arroyo and Lazarus emphasize the disavowal of dialectical thinking in postcolonial theory that, in turn, undermines a(n)ta)gonistic politics. Thus, Critical Theory and postcolonial theory appear, to reframe and reorient one of Adorno's signature observations on totality, 'torn halves of an integral freedom, to which however they do not add up' (Adorno et al., 2007: 123). In other words, if the equation of modernity with catastrophe in the work of the elders of the Frankfurt School has yielded, in the writings of its younger members, to the recuperation of the legacy of the Enlightenment for the still-emancipatory, if incomplete, project of modernity, the enabling horizon of anti-capitalist critique and nationalist liberation in postcolonial theory has ceded ground to a disabling repudiation of master-narratives, even emancipatory ones, and a corresponding pessimism about not only liberatory futures but about the decolonization of the mind.

Even if postcolonial theory cannot serve as a convenient antidote to the ills of Critical Theory, I believe all is not lost. As Taylor argues persuasively, 'the perspective of

postcolonial studies' and, I would add, that of Critical Theory, 'is not isomorphic with that of the state or of capital' (2015: E344), but the significance of burdening both with 'the need to think political possibility through the concrete historical present' (2015: E343) cannot be overstated. Taylor indicates how 'the collapse of the Bandung project and the rise of neoliberal globalization' were 'concomitant with the decimation of the global subject of emancipation' (2015: E344) and insists that this erstwhile 'theoretical and political optic' (2015: E344) should animate any revival of a materialist project of critique against a political horizon of possibility rather than deferral or defeat. I propose that a critical theory in postcolonial times must resurrect the 'repressed, imprisoned, starved, indebted, and simply killed' (Taylor, 2015: E344) collective subjects of emancipation as the foundation of its normativity and global re-articulation, and as the interlocutors *with* whom (see also Allen, 2011), rather than only on behalf of, intellectuals, imperial or postcolonial, fashion their reflexivity and their commitment. As Rainer Forst declares, the opposition between interests and norms, power and morality, and the universal and the historical can only be transcended when 'the language of emancipation' operates 'as a critique of unjustifiable social relations, but in such a way that it subjects this critique itself to criticism' (2014: 676) and when 'the process of *democratization*' rather than being merely or only a reflexive move by 'privileged actors' (2014: 680), is equally generated by those 'who are rebelling against an existing normative order' (2014: 672). Thus, the political principle or new law on earth that will henceforth guarantee human dignity finds its embodiment in the 'emancipatory subject' of Taylor's (2015: E344) imagining, in the "reconstruction" of postcolonial studies' as 'a creature *of* and *against* its time' (Lazarus, 2011: 1–2), and in the restoration of 'justice in the political realm' (Forst, 2014: 680).

## HUMAN RIGHTS: THE NEW FACE OF CRITICAL THEORY AND THE TRANSNATIONAL POLITICAL IMAGINARY

In 'The Continuing Perplexities of Human Rights' Samuel Moyn (2013) concludes that 'human rights are likely to remain the framework and language in which many people debate what sort of justice to pursue, why injustice still wins, and how theory and practice can change for the sake of a better future everyone wants' (112). For Moyn, human rights lack the credentials 'to be our saving truth' but it will not do to 'trash them either, as if some next utopia were on the horizon ... (or as if indicting capitalism or biopolitics sufficed in itself)' (2013: 112). Moyn's deliberately commonsensical phrasing captures what theory and practice across worlds and disciplines have in common as well as marks the shift in contemporary iterations of postcolonial studies and Critical Theory from the critique of domination to the imagination of dissent and the labour of emancipation, from expressing wrongs (lending a voice to suffering in Adorno's terms) to righting them (see Spivak, 2004). Moyn's laconic account nicely evokes the ambivalence with which human rights are regarded – they are our best hope and our last hope and perhaps in the end 'the most we can hope for' (Ignatieff, 2001: 173). Moyn implies that the tendency of critical accounts of the human rights framework to castigate it 'for its failure to transform the world' does not destroy its utopian potential; rather, human rights 'make up a discourse of hope' that serves 'as a stepping stone to something new that could [transform the world]' (2013: 111). Neither postcolonial studies nor Critical Theory is a stranger to such ambivalence – the redemptive moment in both is stained with melancholy – but both are concerned to transform 'faith in utopia ... into responsibility for the ravages of history' (Varadharajan, 1995: 35). I suggest that the nexus of ethics and politics, epistemology and affect, history and normativity in which

Critical Theory and postcolonial studies reside may be both illuminated and transformed by a hazardous and deracinating rather than civil or dialogic encounter with human rights.

The prospect of such an encounter reveals many obstacles, not least because, unlike both the first generation of the Frankfurt School and the multiple incarnations of postcolonial studies in the academy, human rights disavow or renounce their messianic or world-altering character in favour of a certain minimalism: a desire to secure the conditions for any kind of life at all or to place limits on abuses and violations rather than foster significant political change or action (see Ignatieff, 2001). This minimalism explains why human rights are perceived as 'the smiling rationalization for contemporary domination' (Moyn, 2013: 111), but it also makes the predicament of human rights analogous to that of the resignation Lazarus defines as the *raison d'être* of postcolonial studies (see also Brown, 2004). Moreover, the universalism of human rights discourse requires the substitution and displacement of epistemology with/by sentiment and affect: the mobilization of pathos to induce sympathy and of shame to motivate action (Rorty, 1993; Keenan, 2004), the spectacle of suffering that solicits and eroticizes empathy (Hartman, 1997; Sontag, 2004; Hesford, 2011), and the transmission of shock in the tracing of a phenomenology of violence (Scarry, 1985). Thus, the unseating of cognition by emotion and desire by identification returns the focus to the *subjects* of human rights advocacy rather than remaining with the *objects* of their gaze and inscription.

In parts of 'Culture and Administration' that rarely merit discussion in critical scholarship, Adorno remarks acidly on the 'increase in humanitarianism from the perspective of concern on the part of everyone for everyone' (1991a: 119), only to conclude that 'salvation would hardly turn out to be a blessing to the man saved today' (1991a: 120). Even though Adorno is not commenting on the victims of

human rights violations, his discerning elaboration of how the process of becoming 'the object of public welfare, attended and fed and treated with great care' entails being 'torn from his way of life and therewith presumably from the possibility of expressing that which he had once felt to be the purpose of his life in the world' (1991a: 120), deserves to be reckoned with. Adorno's pronouncing himself incapable 'of enthusiasm because the humane blossoms in the midst of inhumane situations' (1991a: 124) and his wry and squirm-inducing conviction that research projects in the West 'on generally valid, absolute values' are conducted 'with the underdeveloped countries in the back of the mind' (1991a: 124) should give human rights discourse and advocacy as well as celebrants of the cosmopolitan world order pause. Adorno has the wit to insist that 'we must have a conscience', but his moral philosophy retains enough modesty to observe that we 'may not insist on our own conscience' (Allen, 2017: 197). His prescience and radicalism in encapsulating the tenor of a range of scholarly objections to the missionary zeal, self-congratulatory exercise of pity, unexamined liberalism and secularism, and insouciant universalism in human rights talk, however, do not appear to be matched by the still moderate and restrained rather than genuinely unsettling self-scrutiny which contemporary proponents of Critical Theory evince or by the pragmatism and compromise that hobble human rights.

After dwelling with the ravaged beauty and disconsolate irony of Adorno's style, and the gnomic joy of Benjamin's, the communicative rationality of the newest generation of the Frankfurt School can feel like arid, even earnest, terrain despite its comforting clarity and its welcome eschewal of sentimentality. The inhabitants of this terrain are more numerous than one might expect and differ in their respective intellectual genealogies. Nevertheless, all of them operate, not necessarily uncritically, within the discourses of democracy, liberalism,

capitalism, development, and cosmopolitanism that frame inalienable human rights and international law and share the belief that the practice of critique and the dream of emancipation are inextricable. At their simultaneously most simple and most complex, they contend that reflective judgement and moral behaviour 'may arise simply out of what it is to be a human being confronted by the suffering of other human beings' (Fine, 2013: 225).

Robert Fine captures the sensibility of post-Habermasian critical theory when he writes that the emphasis on 'the historicity of moral norms, the plurality of coexisting cultures, the relativity of ethical values and the human origins of all law' threatens to destroy a standard against which to evaluate the moral imperatives of the human condition (2013: 223). Following Arendt and Adorno, Fine wants to preserve the egalitarian idea at all costs, arguing that 'the gulf between the *abstract idea* of rights and the *concrete existence* of concealed material interests, political violence, and ethnic prejudices' (2013: 227) should not tempt one to devalue 'the idea of right itself' (2013: 223); instead, 'to denature the idea of right and explore its developmental contradictions' (2013: 233) 'is not the same as the trashing of rights' (2013: 236). For Fine, denaturing rights requires revaluation – not devaluation – (2013: 236). Because Fine imagines 'the idea of human rights' as 'an operative principle of justice' (2009: 8), he affirms cosmopolitanism, or as Kant would have it, 'a Cosmo-political Right of the whole Human Race' (1891: 103), as the principle of the new world order in which 'state sovereignty has been replaced by sovereign equality under international law' (Fine, 2009: 16). The ambiguous or, if one prefers, duplicitous, character of human rights as 'the product of struggles from below and legislation from above' and as capable of being 'instrumentalised in the service of state power and reclaimed as a promise of "civil repair" for the wrongs committed by the state' (2009: 17)

leaves Fine untroubled: the human rights revolution or the fostering of human rights culture is an emergent social and subjective form that 'supplements' rather than 'supplants' the rights guaranteed by the nation-state rather than 'a utopian transition – in the words of Habermas, from a world in which law is in the service of power to one in which power is in the service of right' (2009: 18).

I have deliberately reversed the order in which Fine's essays appeared in print to demonstrate that faith in the idea of rights complements rather than undermines the moral compromises that accompany their political realization. If one essay refuses to let the ideal of rights be sullied by the failures to realize it, the other comprehends those failures by rendering rights contingent rather than absolute. By describing his position as neither optimistic nor pessimistic (2009: 17), refusing to succumb to the temptation to turn rights into an absolute that is doomed to disappoint, and making rights the flawed instrument of a cosmopolitanism in the throes of becoming, Fine 'situates social life outside the sphere of substantive ethical consideration' (2013: 223) and, I would add, political transformation, because reflective judgement witnesses and comprehends a 'radically asymmetrical political-economic order' (2009: 19) rather than combats it. Far from functioning as dialectical negation, critical theory in Fine's approach works in tandem with the minimalism and ambivalence of human rights to indicate that human rights is not only a concept but also has an existence, for better or worse, in the world (2009: 17). This 'perception of a consensus amongst the international community and the knowledge that "something is being done" encourages complacency where complacency has no place' (Schick, 2006: 324). As Kate Schick observes, such a no doubt sensible account of the way of the world prevents distinctions between the 'desire to be seen to observe human rights and thus accorded legitimacy' and 'substantive observance' involving an examination of 'structures underlying human rights

violations' (2006: 323, 324). The human rights culture Fine imagines may well, in Schick's terms, 'obscure rather than expose unpleasant reality' (2006: 325) because it abstracts principles from their promulgation and enforcement, distracts attention from the conditions that inhibit the realization of rights, and assumes a neat transition from the experience of suffering and injustice to a passion for eradicating them (2006: 322, 325). If Fine deploys Adorno and Arendt to turn reflective judgement into a form of moral behaviour, Schick turns to Adorno's attention to suffering, to the psychological and bodily dimensions of experience, to address not only the violence of the social order but its 'profound fragility', the loss, woundedness, impotence, and resentment that mark the experience of the disenfranchised (Schick, 2009: 140). Schick proposes an integration of the traumatic real, a dialectical encounter between the radical contingency of history with its radical continuity so that suffering not only interrupts or disrupts or fragments historical temporality but is itself situated *within* the historical momentum of unity and hope.

## HABERMAS AND HUMAN RIGHTS

The main thrust of post-Habermasian critical theory's interventions in the language and framework of human rights may be described as the challenge 'to the false assumption that the meaning of human rights is exhausted by their misuse' (Habermas, 1998: 169). As Habermas, following Lutz Wingert, explains, 'human rights, which demand the inclusion of the other, function at the same time as sensors for exclusionary practices exercised in their name' (1998: 163). Habermas's interrogation of the crisis of 'legitimation' that has plagued human rights (1998: 157) – the fraught relations between legal entitlements guaranteed by nation-states and moral obligations that encompass the human

community ‘*unlimited* in social space and historical time’ (1998: 158); the reciprocity between private and public autonomy; ‘the communicative conditions for a reasonable political will-formation’ (1998: 160); and the translation, even imposition, of social modernity, egalitarian principles, and constitutional democracy in non-European cultures and politics – has determined the scholarly preoccupations of his heirs such as Seyla Benhabib, Rainer Forst, and Thomas McCarthy (the parallels with Fine should already be obvious). For the purposes of my argument, I restrict my focus to what Benhabib defines broadly as ‘the unity and diversity of human rights to be respected across multiple jurisprudential, religious, and cultural traditions’ (2013: 38), and, I would add, socio-economic formations and asymmetries of power and equality.

In *Minima Moralia*, Adorno writes,

There is some reason to fear that the involvement of non-Western peoples in the conflicts of industrial society, long overdue in itself, will be less to the benefit of the liberated peoples than to that of rationally improved production and communications, and a modestly raised standard of living. Instead of expecting miracles of the pre-capitalist peoples, older nations should be on their guard against their un-imaginative, indolent taste for everything proven, and for the successes of the West. (1974: 53)

Adorno’s comments here are offered in the spirit of the reflexive modernity Habermas prizes, what the latter calls ‘the advantages of occidental rationalism’ (1998: 162). The difference for me lies in the vocabulary they use: pointed in Adorno and deceptively neutral in Habermas. Adorno describes the *conflicts* of industrial society while Habermas refers to ‘the *challenges* of social modernity’ (1998: 163); Adorno distinguishes between pre-capitalist and mature capitalist ones in order to indicate that modernity has been emancipatory for neither even if it may prove beneficial to the West while Habermas highlights the belated modernity of other cultures in their response to challenges that Europe

too was exposed to ‘in its day’ (1998: 163) and has presumably overcome; Adorno implicitly recognizes the asymmetry and non-emancipatory quality of this purported *interrelationship* even if, like Marx, he imagines it as inevitable, while Habermas describes the process as one of exposure and spread and, ultimately, as ‘the hard-to-resist imperatives of an economic modernization that has won approval on the whole’ (1998: 166). Because Habermas declares that Europe ‘in some sense “discovered” or “invented” human rights and constitutional democracy’ (1998: 163) – I recognize the sop to modesty in his use of quotation marks – his acknowledgement of the ‘accelerated and violent’ ‘economic and social modernization’ in developing societies comes with a price tag – ‘the juridification of politics’ (1998: 167). I shall return to the imbrications of law and development; for the moment, I want to suggest that the comparison between European and Asiatic values that underpins Habermas’s argument is a false one because it pits constitutional democracy against dictatorship, privileges adaptation to ‘*the hard-to-resist* imperatives of an economic modernization’ (1998: 166, my italics) over the reassertion of ‘traditional forms of political and societal integration’ (166) *against* such imperatives, and makes a virtue of necessity by alluding to challenges ‘that are no longer simply problems just for Western civilization’ (1998: 169) instead of treating this realization, as Adorno does, as the occasion for stringent rumination on ‘the successes of the West’.

## RIGHTS, JUSTICE, AND ‘COMMUNICATIVE FREEDOM’

I offer this admittedly brief reading against the grain of Habermas’s classic essay because I want to demonstrate the significance of his warning not to confuse the discourse of ‘Western intellectuals’ ‘over their own

Eurocentric biases with the debates in which *members of other cultures* engage them' (1998: 163). Besides, I want to inflect 'reasonable disagreement' (1998: 169), as John Rawls and Habermas understand it, with the arduousness Hanif Kureishi (2005) has made indispensable to the discussion of values in contemporary multicultural societies where 'other cultures' reside in the promise of 'their equally entitled coexistence within the same political community' (Habermas, 1998: 168). Habermas rightly observes that autonomy within the European conception of human rights 'implies a secularized political authority uncoupled from religious and cosmological world-views' (1998: 168) and that the purpose of the principle of tolerance is to generate 'norms of coexistence' (1998: 169). As my earlier discussion of the smugness that escapes the avowed reflexivity of occidental rationalism sought to expose, mutual recognition and understanding cannot serve as tacit *presuppositions* (Habermas, 1998: 169) of cross-cultural dialogue but must instead emerge as its (necessarily fragile) *consequence*. In a world where violence is the norm rather than the violation of norms, 'conversation' such as Kureishi imagines occurs in a world where '[p]olitics is neither the space of technically correctly applied morality nor the prudent creation of order' (Forst, 2014: 674). This attention to the affective texture of ideals and actions rather than only their normative structure reveals why Rawlsian communicative rationality can seem simultaneously drab and shallow in its transactions with difference.

Rainer Forst's writings on 'justice and democracy in transnational contexts' (2014) provide a welcome alternative to the 'unworldly' 'insightful citizens' model of discursive rationality formulated by post-Habermasian critical theory even though he remains within the realm of 'discursive, intersubjective practices' (2014: 674). Forst wants to understand 'how norms and interests intermesh to generate and reproduce power' (2014: 667) within 'the structural injustice of

asymmetrical transnational and international relations, which are the cause of persistent disadvantage and underdevelopment' (2014: 674). Forst shifts the emphasis in international relations to the justification of political order, demanding thereby 'a practice of political justification by those affected as justificatory equals' (2014: 674), and fashioning 'the first political right' as 'the right to be a democratic coauthor of the norms that claim to be legitimate ruling principles' (2014: 675). Forst declares that 'the *dignity* of human beings' (2014: 676) resides in the simultaneously philosophical and practical principle of 'free and equal justificatory authority' (2014: 676) because it is designed to 'respond to a given situation of subjugation' (2014: 679) and takes 'seriously the perspective of those affected who have enough of being kept in leading strings by their government and do not want to be "liberated" or "patronized" by Western countries' (2014: 673). Because the process of political justification takes its cue from those 'rebellious against an existing normative order' (2014: 672), Forst prevents 'the critique of ethnocentrism' from casting human rights as 'a purely Western idea and a possession of the West' thus excluding 'the protestors in non-Western societies who demand human rights from the idea of these rights' (2014: 672). Forst is of course articulating in the discipline of Political Science what has long been Seyla Benhabib's philosophical preoccupation – 'A polity based on the principle of rights respects you as a moral being' (2013: 39) – with rights that encompass not only 'what there *is* but about the kind of world we reasonably *ought* to want to live in' (2013: 39). Both Benhabib and Forst conceive of 'the human agent as an *individual embedded in contexts of communication as well as interaction*' (Benhabib, 2013: 39). Benhabib insists that as 'a moral being capable of communicative freedom you have a fundamental *right to have rights*' and that each person is both 'a generalized as well as a concrete other' (2013: 40) composed of both individuality and common humanity.

Both Forst and Benhabib imagine universalism not as a possession but as an accomplishment, a process of universalization that establishes 'commonality across diversity, conflict, divide, and struggle' (Benhabib, 2013: 40). The difference between their positions might be that Benhabib conceives of identity as always already alterity rather than shaped in the encounter *with* alterity. She argues that communicative freedom necessitates 'integrating perspectives of ego and alter', taking the standpoint of the other in order to understand oneself as 'a doer as well as a narrator' (2013: 41). Because Forst understands international relations or transnational exchanges as the power to affect and be affected, he would not disagree with Benhabib, but his emphasis on the subjected bringing '*the force towards the better argument* to bear against those who exercise such rule or domination' (2014: 678) retains a kernel of (masculinist and conflictual) rationality in contradistinction to the implied (feminized) sentiment and affect in Benhabib's characterization of communicative reason.

It is not difficult to see why these proponents of Critical Theory and human rights advocates would constitute a mutual admiration society because both desire the realization of dignity within and across societies and cultures, refuse to give up on universalism, presuppose equality, symmetrical entitlement, and reciprocity in 'the exegesis of human agency' (Benhabib, 2013: 38), oppose violence in the name of modernization and development, and subjugation in the name of values and traditions. The contextual universalism prevalent in both, however, is not sufficiently distinguished from cultural diversity, from socio-cultural pluralisms that function, as Homi Bhabha argues, as 'epistemological' objects, as objects of 'empirical knowledge' (1994: 49–50). As he goes on to suggest provocatively, cultural diversity 'gives rise to liberal notions of multiculturalism, cultural exchange or the culture of humanity' because it is premised on 'the

recognition of pre-given cultural contents and customs' (1994: 50). The subject of human rights, then, is more often than not the subject of the proposition rather than the subject of enunciation, a semiotic distinction Bhabha would attribute to the production of cultural difference that is dependent upon the subject's 'discursive embeddedness and address, its cultural positionality, its reference to a present time and a specific space' (1994: 53). This attention to 'cultural difference as a process of signification' may be understood as parallel to Benhabib and Forst's definition of discursive agency as consisting of both narration and action and of '*reflexive justification* or *recursive validation*' (Benhabib, 2013: 41) as simultaneously constitutive of communicative freedom. However, the 'formal preconditions' (2013: 41) of equality, symmetry, and reciprocity (Benhabib) and equal justificatory authority (Forst) render the enunciation of cultural difference toothless because they fail to contend with 'a process of signification through which statements ... on culture differentiate, discriminate, and authorize the production of fields of force, reference, applicability ...' (Bhabha, 1994: 50).

The moral thrust or the normative foundation of the writings of Habermas, Benhabib, and Forst accounts for their abstract quality, functioning as they do at a remove from the *praxis* of human rights, all the while insisting on 'realistic utopias', the 'exegesis of agency', and critical realism, respectively. I want to refer briefly to Kamala Visweswaran's (2004) brilliant essay, 'Gendered States: Rethinking Culture as a Site of South Asian Human Rights Work' to address more fully what might be at stake in Habermas's exhortation 'to think and act realistically without betraying the utopian impulse' (2010: 478) and to illustrate why a postcolonial sensibility attuned to the *enunciation* of cultural difference is crucial in the context of human rights. These proponents of Critical Theory argue, quite plausibly, that true recognition of the autonomy of the other

occurs when the 'morally enjoined *concern* for the vulnerable other is replaced by the self-confident *demand* for legal recognition' (Habermas, 2010: 472); thus the pervasiveness in their writings of agency, equality, and justice – 'the respect *demanded* for a status that is *deserved*' (Habermas, 2010: 472). Visweswaran, on the contrary, focuses on how the apparent transparency of statements about South Asian cultures comes to authorize human rights interventions first by differentiating them on the basis of their perceived disproportionate deviance from human rights norms and subsequently defining the content of their cultural diversity as peculiarly 'marked by their crimes against women' (2004: 484). The force-field thus created discriminates between women whose vulnerability evokes concern and whose dignity deserves respect despite being routinely violated and the undeserving nation-states they inhabit which are defined as 'bride-burners or honor-killers' (484) rather than as polities. Rather than examine the place of gender in culture, human rights discourse serves to *engender* cultures. Visweswaran shows that far from human dignity deriving its connotations of self-respect and social recognition from the status of democratic citizenship (Habermas, 2010: 475), human rights work in South Asia exiles women 'from their communities of birth or affiliation' (Visweswaran, 2004: 484) in order to render them objects of care and concern in the international realm. This predicament clarifies the poignancy of Adorno's intuition that becoming an object of concern is accompanied by a singularly cruel deracination that tears one away from the fabric of one's life, but Visweswaran explains that the 'articulate and outspoken women who organize to change the unjust conditions that affect their lives' must *also* distance themselves from the cultures that made them in the human rights atmosphere that assigns 'particular atrocities to cultural norms' (2004: 487). Visweswaran is not, of course, ridiculing the urgency and necessity of human rights work, but pointing, instead,

to how the critique of universalism becomes 'indistinguishable from a form of cultural essentialism that uses gender as the logic of articulation' (2004: 485) and assumes 'an implicit scaling for understanding women's rights cross-culturally' (2004: 486). The irony Visweswaran elaborates is that human rights work, designed to give the 'ostracized and humiliated' 'the assurance that their suffering is not a natural destiny' (Habermas, 2010: 476), has to rely for the validation of human rights on naturalizing 'honor killing' and 'bride-burning' as *the cultural destiny* of nation-states in South Asia. Nowhere in this scenario is the symmetry, reciprocity, and justificatory authority Habermas and his disciples prize apparent; instead, 'the suspicion is reinforced that the program of human rights *consists in* its imperialist misuse' (Habermas, 2010: 477). In hastening towards autonomy and equality, Critical Theory stumbles over 'the savage encroachments of power' (Hartman, 1997: 5) that occur in the name of protection from harm and recognition of the intrinsically human.

### **'EVERYONE GETS FUCKED IN THE DUE COURSE OF TIME'**

When her critics demand, 'Why *can't* you *fucking follow chronology?*', the narrator of Meena Kandasamy's (2015) *The Gypsy Goddess*, responds dryly, 'I can. If you observe carefully, you will not fail to note that everyone gets fucked in the due course of time' (2015: 68). Even as she concedes 'that hate [caste violence] is not always obedient to plot' (2015: 71), she insists that narratives must discern 'the regularity in the randomness' to anchor them 'to the last vestiges of actuality' (2015: 72). Kandasamy's pungent reflection on the narrative idiom in which history writes itself shares the spirit of Adorno's (2006) *History and Freedom*: 'we should not say history *is* continuity or history *is* discontinuity. We must say instead that

history is highly continuous *in* discontinuity' (quoted in Vázquez-Arroyo, 2008: 463). Historiographies such as Moyn's that refuse a teleology in which the current dispensation of human rights can be traced back neatly to the French Revolution, the age of sensibility, the mutations of natural law or even the Holocaust accord with one side of the dialectic of histories of possibility as Adorno and Vázquez-Arroyo understand them – 'no universal history leads from savagery to humanitarianism' – but fail to do justice to the other – 'but there is one leading from the slingshot to the megaton bomb' (Adorno, 1981: 320). Similarly, well-intentioned and tempered treatments of development such as Thomas McCarthy's continue to describe imperialism as 'a curtailed and deformed' *avatar* of the 'nominal egalitarianism and universalism of Western liberalism' (2012: 26). McCarthy's 'realistic' faith in ongoing amelioration of rather than resistance to the effects of 'development' (2012: 31) recalls Habermas's quandary: the call for a cross-cultural dialogue about the shared challenge of modernization impedes 'a departure from the colonial economic and cultural engine through which the modern categories of the human and rights emerged' (Allewaert, 2013: 109) rather than advances emancipation from its depredations.

Even if, as David Scott argues, postcolonial historians have no choice but to trace how 'anticolonial utopias have gradually withered into postcolonial nightmares' (2004: 2), and cannot fail to notice that history 'is a series of paradoxes and reversals in which human action is ever open to unaccountable contingencies' (2004: 13), they grant the shift from anticolonial utopias to postcolonial nightmares the weight and dignity, respectively, of romance and tragedy in order to avoid tipping over, as Moyn and McCarthy in their cautionary utopias do, into a 'normalization of the present' (Scott, 2004: 2). Turning contingency or deformation into a principle of historical development precludes the possibility of recasting colonial pasts and of asking new

questions in and making new demands of the present (Scott, 2004: 7).

I propose a return to Adorno and Max Horkheimer's *Dialectic of Enlightenment* as a potent resource for the critical history of the present (McCarthy's phrase) postcolonial scholars want to write in part because the latter are more likely to thrill to the opening proclamation of *Dialectic of Enlightenment* – 'the wholly enlightened earth is radiant with triumphant calamity' (2007: 1) – than to the edifying consolations of contingency and curtailment. Moreover, the *disappointment* and 'longing' (Scott, 2004: 6) postcolonial subjects feel is in contradistinction to the measured *disenchantment* more characteristic of the epiphanies the Bildungsroman of occidental rationalism generates. It is this longing that turns 'critical judgments about historical tendencies' (Zuidervaat, 2015) into 'unexpected horizons of transformative possibility' (Scott, 2004: 12).

Adorno and Horkheimer describe 'a pattern of blind domination': 'of nature by human beings', 'of nature within human beings', and, in both of these forms of domination, '... of some human beings by others', all three driven by the 'all-consuming engine' of 'an ever-expanding capitalist economy' (Zuidervaat, 2015). This description captures the 'channelling of decolonisation into the formation of the developmental nation state' that Sundhya Pahuja analyses, 'the ever-expanding sphere' 'of increasingly violent, and almost consistently failed, interventions in the Third World' (2011: 3). Pahuja mounts a powerful challenge to humane efforts such as McCarthy's that remain invested in 'a neo-Kantian normative horizon' (2011: 9) and seek to retrieve developmentalism and international law 'for the powers of goodness' (2011: 1). This 'critical faith' (2011: 1) in harnessing the promise of universality on behalf of those 'differentially subjected to the transformative violence' of economic growth 'administered through [the] institutions' of international law (2011: 8) is both naïve and dangerous because it

sidesteps how 'that same promised universality served to constrain, and ultimately to undermine the radical potential of the Third World demands' (2011: 2). J. M. Keynes's epithet for the Third World invitees to the Bretton Woods conference – 'the most monstrous monkey-house assembled for years' – set the tone not only for 'how developmentalism came to pervade international law' (2011: 15) but for how the 'proto-Third World' came to choose economic development 'as the conceptual axis of the inclusion of the non-West' (2011: 18). This moment, Pahuja explains, embedded 'a formal notion of sovereign "equality" as unrelated to conditions of material inequality' (2011: 23). Pahuja traces the replacement of 'Europe' by the 'developed world' in a circular constitution of the West and the rest reminiscent of Orientalism: what was once 'race or civilizational status' is now secured by 'the ostensibly "scientific" measure of Gross National Product' (2011: 38), thus setting in motion 'values of which the West claims to be both exemplar and guardian' (2011: 28) and the doublespeak by which the othered and subjected could be included '*within* the universal without disrupting the assertion of those values *as* universal' (2011: 30). In a complex and unsettling argument to which I cannot do justice here, Pahuja demonstrates how celebrated efforts such as Amartya Sen's (also true of McCarthy, Forst, and Ignatieff) to make development indispensable to freedom, to 'refound the "universal" on more genuinely universal grounds' do not 'quibble with the content and scope of liberal values' but expand them to include the putative Orient and still in a spirit of 'reasoned universalism and cosmopolitan exchange' (Pahuja, 2011: 227). Coupled with a reliance on economic growth for the realization of access to its benefits and in the absence of a 'heterodox economics' (2011: 242) focused on subsistence or survival, Sen merely reinforces the universality and structure of the developmental narrative and, despite himself, attests to 'a successful pedagogy of Empire' (2011: 28).

In order to view Sen in a less unforgiving light, his predicament can be illuminated by scholars such as Talal Asad (1992) and David Scott (2004). They render acculturation synonymous with conquest, identifying colonial subjects as 'conscripts', not 'volunteers', of Western civilization and modernity, respectively. As Scott contends, they are trapped in circumstances in which they cannot choose without fatal cost (Scott, 2004: 14). Sen is therefore not incapable of choice or making the wrong choice; rather, he operates as the object and agent of modernity because modernity is 'itself one of the fundamental *conditions* of choice' (Scott, 2004: 19). The blindness of the triple domination Adorno and Horkheimer delineate, as well as the introversion of sacrifice (the bound Odysseus who can still hear the Sirens) upon which its logic depends, is thus prescient because it reveals not only the unheeding violence of domination but the transformation of 'imposed fate' into 'heroic choice' upon which its success rather than its conquest depends (Asad, 1992: 345).

### 'A DIALECTICAL ENLIGHTENMENT OF ENLIGHTENMENT'<sup>6</sup>

Both human rights and development founder on the imagination of 'subjects who go about being human in radically different ways' because they construct humanity and universality as a status that can be conferred or denied, thus making 'dehumanization ... the measure of the other' (Esmeir, 2006: 1550). The 'play of projection and resolution' (Allewaert, 2013: 102) that constitutes the self as the completion of the perceived lack in the other is commonplace in discussions of *Dialectic of Enlightenment*; however, not enough has been made of the potential contained in its depiction of the 'parahuman' rather than the human, in the figure of Odysseus 'suspended between human and animal (nonhuman) being' and inhabiting a

*horizontal* relation with his putative others.<sup>7</sup> The stage is set for a challenge to ‘colonial anthropologies and natural histories’ that engage in a ‘hierarchal organization of life-forms’ (Allewaert, 2013: 86) and for establishing an alternative ecology rather than only history of modernity. I have borrowed Monique Allewaert’s fascinating discussion of the parahuman because it relies on a fragmentation of bodies in a manner similar to the forcible separation of the bodily and sensory from the cognitive in *Dialectic of Enlightenment* but also because its stress on contiguity and proximity rather than hierarchy moves beyond a rehabilitation of others ‘to the rights of man’ (2013: 86), turning a metaphoric logic of substitution into a metonymic one of displacement. If, as Pahuja argues, the law ‘is the place of the constitutive antinomy’ between the particular and the universal (2011: 32), thinking the suspension of the parahuman might preclude ‘any simple return’ (Allewaert, 2013: 102) to the ‘realm of the human’ (2013: 87) and the law of development.

## ACKNOWLEDGEMENTS

This chapter could not have been written without the generosity and inspiration of Tim Wyman-McCarthy, the resourcefulness of Robyn Carruthers, and the gentle persistence of Beverley Best and Werner Bonefeld.

## Notes

- 1 Adorno (1991a: 130).
- 2 Adorno (1995: 34).
- 3 See Spencer (2010), who notes Adorno’s comments on Vietnam and South Africa, as well as ‘Mélange’ in *Minima Moralia* (1974: 102–103), where Adorno comments on equality and difference in relation to the Jews as well as African-Americans.
- 4 G. Daniel Cohen, in ‘The Holocaust and the “Human Rights Revolution”: A Reassessment’ (2012), argues that, instead of existing in heightened consciousness or being invoked during the

founding stages of the human rights regime, as Michael Ignatieff for instance suggests, the Holocaust was instead memorialised by that regime later in its history.

- 5 Habermas (1986) quoted in Moyn (2013: 106).
- 6 Zuidervaat (2015).
- 7 See Goswami (2013) for a discussion of Adorno’s counter-history of culture’s relationship to nature (107). Her essay focuses on ‘the animal’ and does not discuss *Dialectic of Enlightenment*.

PART VIII

# Elements of Critical Theory in Contemporary Social and Political Movements and Theories

*This page intentionally left blank*

# Biopolitics as a Critical Diagnosis<sup>1</sup>

Frieder Vogelmann

Why include a chapter on ‘biopolitics’ in the *Handbook of Frankfurt School Critical Theory*? Two reasons seem to speak against it: first, there is not a single work concentrating on ‘biopolitics’ from a canonical Frankfurt School-style critical theorist. In spite of the many disagreements in the debate on ‘biopolitics’, its starting point<sup>2</sup> is routinely tracked to Michel Foucault’s conclusion in *Le Volonté de Savoir*<sup>3</sup> that since the late nineteenth century we live in a new era of politics in which ‘the life of the species is waged on its own political strategies’ (Foucault, 1978 [1976], hereafter HS1: 143). The debate on ‘biopolitics’ is still prolific, even though Foucault almost completely ceased to use ‘biopolitics’<sup>4</sup> after *Le Volonté de Savoir*: on the one hand, we find works that directly pick up Foucault’s genealogical enterprise and analyse biopolitics as a dominant form of power in both early and contemporary liberalism where politics has become the ‘politics of life itself’ (Rose, 2007; for an overview see Lemke, 2011

[2007]: esp. chapter 7). On the other hand, ‘biopolitics’ has been turned into a proper philosophical concept: Giorgio Agamben takes biopolitics to produce the ‘bare life’ whose ‘inclusive exclusion’ is sovereign power’s fundamental mechanism (Agamben, 1998 [1995]: 6–9), Michael Hardt and Antonio Negri see biopolitics as the new mode of sovereign power’s ontology in the age of Empire, bringing forth the very subjects capable of resisting it (Hardt and Negri, 2000: 22–30), and Roberto Esposito (2008 [2004]) attempts to do justice to both sides of biopolitics by reading it through the ‘paradigm of immunization’.<sup>5</sup>

Nowhere in this debate do we find a voice belonging to the ‘Frankfurt School’ tradition in critical theory. Even worse – and this is the second reason why ‘biopolitics’ might seem an unlikely candidate for this *Handbook* – *Le Volonté de Savoir* is a frontal attack on analyses of a repressed sexuality like Herbert Marcuse’s (1998 [1956]) *Eros and Civilization*, himself of course a prominent

member of the Frankfurt School. In 1978, Foucault used precisely the argument of *Le Volonté de Savoir* to mark his distance to the Frankfurt School: 'I don't think that the Frankfurt School can accept that what we need to do is not to recover our lost identity, or liberate our imprisoned nature, or discover our fundamental truth; rather, it is to move toward something altogether different' (Foucault, 1998 [1980]: 275; on Marcuse as target, see Foucault, 1980 [1975]; 2001 [1981]: 1016 f.).

Despite these two reasons I argue that the 'stature' of Foucault's model of critique is very similar to that of the early Frankfurt School's model of critique. I do so by closely re-reading Foucault's usage of 'biopolitics' in *Le Volonté de Savoir* and by highlighting two methodological affinities: one relates to Foucault's subtle distinction between a critical and a descriptive conceptualisation of 'biopolitics' to Horkheimer's (2002 [1937]) famous distinction between critical and traditional theory. This affinity becomes visible only when we pay close attention to Foucault's model of critique and the role 'biopolitics' plays in it. Explaining Foucault's model of critique enacted in *Le Volonté de Savoir* will reveal a second affinity between Foucault's and Adorno's model of critique: both conceive critique as a diagnostic practice of the present producing a very special, *effective* knowledge capable of emancipating us from that present. And although both affinities have their limits – they show us similarities in the 'stature' of critique, not in its inner details – they disclose something important in the debate about biopolitics mentioned above: the distinction between critical and descriptive roles of 'biopolitics', made possible by the conception of critique as producing effective knowledge, enables us to understand how 'biopolitics' is supposed to help us criticise our contemporary world – and how this might fail.

I start by arguing that we should understand Foucault's critique as a diagnostic practice of prefigurative emancipation and

briefly sketch the affinity to Adorno's model of critique. This enables us to understand the critical function of 'biopolitics' in *Le Volonté de Savoir* as opposed to the descriptive role of 'biopolitics' Foucault afterwards hinted at. And I argue that this distinction mirrors Horkheimer's famous distinction between critical and traditional theory in two important respects. I conclude with three implications for critical theory drawn from the analysis of the critical function of 'biopolitics'.

## CRITIQUE AS A DIAGNOSTIC PRACTICE

Foucault's model of critique has been subject to a variety of interpretations:<sup>6</sup> prominent readings have focussed on the 'critical attitude' (Foucault, 1997 [1978]: 24) and the ethical dimension of critique as a practice of the self (Butler, 2004 [2001]), on the 'art of not being governed quite so much/like this [*tellement*]' (Foucault, 1997 [1978]: 29) and the subversive dimension of critique as a practice of resistance (Lemke, 2012: chapter 4) or on the genealogical method and the disruptive effects of critique as a practice of revealing the historical contingency of seemingly necessary contemporary realities (Geuss, 2002; Saar, 2008; Koopman, 2013).

Instead, I start from Foucault's account of his approach as an analysis of practices and the 'experiences'<sup>7</sup> they constitute: objective yet constructed realities like madness, criminality and sexuality. Foucault analyses them along the three axes of knowledge, power and self-relations and therefore elaborates conceptual frameworks for each of the three axes. Although developed successively and with an almost flamboyant terminological plurality, they share a certain negativism embodied in three methodological imperatives which Foucault names nihilism, nominalism and historicism (Foucault, 2010 [2008]: 5 f., footnote): the three conceptual frameworks are *nihilistic* because they 'perform a systematic

reduction of value' (Foucault, 1997 [1978]: 51); and they are *nominalistic* and *historicistic* because they reject universals as the guidelines of analysis, asking instead when and how these universals were themselves produced and transformed in the practices which are to be analysed (see Vogelmann, 2017a: 46–50).

If we accept this self-interpretation of Foucault's approach, then its critical power resides precisely in his methodological perspective. Foucault's practice of critique therefore is, first and foremost, a very specific knowledge-producing practice: a diagnostic of the present that produces counter-truths. These counter-truths effect what I shall call a 'prefigurative emancipation': glimpses of desubjugation and desubjectivation. On this interpretation, Foucault's model of critique shares important traits with Adorno's, most notably the fundamental idea of critique producing effective knowledge.

### ***A Diagnosis of the Present***

Understanding the critical activity as a kind of diagnosis follows directly from Foucault's self-interpretation because the three conceptual frameworks of all three axes are utilised as tools to analyse the present.

On the axis of knowledge, Foucault's most important conceptual innovation is his distinction between 'depth knowledge' [*savoir*]<sup>8</sup> and knowledge [*connaissances*] as we know it: whereas knowledge in the sense of *connaissances* are statements to which we can assign a truth value, 'depth knowledge' in the sense of *savoir* consists of the *conditions of existence* (not of possibility!<sup>9</sup>) for a statement such that it can have a truth value. The analysis of practices along the axis of *savoir* therefore is directed at the conditions which must be in place for practices to produce statements eligible for truth values – the conditions of existence for being 'within the true', as Foucault (2010 [1969]: 224) says in reference to Georges Canguilhem. This

methodological shift takes us from an analysis of the truth values of statements to the analysis of the conditions of existence for statements to be able to have truth values – because diagnosing these conditions of existence has a political significance, Foucault (2008 [2004]: 36 f.) claims: it shows us what needed to be done for certain statements to be 'within the true': what struggles had to be fought, what power relations needed to be established and what subjectivities had to be formed. The conceptual framework on the axis of knowledge is designed to enable this critical diagnosis.

We find an analogous 'shift' on the axis of power. As a general concept, power has to be understood as relational, strategic and productive: power is neither a thing possessed, nor contingent on the will of a subject, nor merely a repressive force. Power relations are fragile, exist only when exercised and can incite and induce as well as constrain and repress (HS1: 92–7; 1998 [1982]: 340–5). Most importantly, power must not be reduced to any particular type of power relations, be they juridical, disciplinary or regulatory. Foucault focusses on *how* power relations operate instead of asking whether they are legitimate or not – again, as with knowledge not being analysed in the categories of truth and falsehood, we see Foucault enacting a 'systematic reduction of value' (Foucault, 1997 [1978]: 51). And again, he argues for it by pointing out that freeing the diagnostic concept of power from a narrow 'juridico-discursive' (HS1: 82) understanding enables a critical diagnosis. Hence Foucault insists that '[k]nowledge and power are only an analytical grid' (Foucault, 1997 [1978]: 52), that they are not 'entities, powers [*puissances*] or something like transcendentals' (Foucault, 1997 [1978]: 51) and that they 'only have a methodological function' (Foucault, 1997 [1978]: 51).

Foucault's notion of self-relations again introduces a methodological shift in perspective to enable a critical diagnosis of 'the forms and modalities of the relation to self

by which the individual constitutes and recognizes himself qua subject' (Foucault, 1990 [1984]: 6). Focussing on self-relations and how they are enacted liberates the analysis from two values commonly presupposed: authenticity and autonomy. Foucault's analysis of the practices in which the self is able to participate and influence its own formation is carefully crafted in order to show that the questions whether this self is a 'true self', an authentic or autonomous self, are so pressing to us only because they belong to *our* self-practices. Yet they do not belong to subjectivity *in general* and we should not, in Foucault's view, integrate them in our diagnostic concepts.

Using these three conceptual frameworks of knowledge, power and self-relations, Foucault's critique aims at a diagnosis of the present that renders visible how 'what exists' limits us in our thoughts, in our actions and in our being (Foucault, 1998 [1983]: 449 f.). Revealing these limits and how they are produced in our contemporary practices demonstrates that these limits are not inevitable but can be changed by changing our practices. Hence we need to search for 'weak spots' in those practices currently solidifying our limitations.

Foucault presents his model of critique as an inversion of Kant's critique because it does not search for the universal limits of reason but for the concrete limits of our present, and not in order to safely keep reason inside those limits but in order to emancipate us from them (Foucault, 1997a [1984]: 315; 2010 [2008]: 11–14, 26 f.). Hence Foucault's critique has a difficult relation to truth: the critical diagnosis of the present does not result in a representation of *reality* but attempts to formulate an effective truth that operates *in reality* through its impacts on its readers (Foucault, 1998 [1980]: 242–6) – aiming at 'a transformation of the relationship we have with our knowledge' (Foucault, 1998 [1980]: 244). Such a rupture on the level of 'depth knowledge' [*savoir*], Foucault claims, leads to moments

of 'desubjugation' and 'desubjectivation' – prefiguring our emancipation.

### Counter-Truths

If desubjugation and desubjectivation are to be achieved with a diagnosis of the present, and hence with the production of a specific knowledge, we have to ask: what kind of knowledge is supposed to be so effective? Obviously critique cannot aim at desubjugation and desubjectivation by repeating what we already know. But neither does it suffice to falsify what is commonly supposed to be true. Both operations would still take place at the level of knowledge [*connaissances*] as true or false statements but would fail to address the conditions of existence that determine what statements can have truth-values at all. Critique as a diagnosis of the present must therefore produce counter-truths that do not submit to the rules of the current conditions of existence of true-or-false knowledge (our current 'truth-regime'<sup>10</sup>). The knowledge of a diagnosis of the present must challenge this truth-regime and thus the conditions of existence that grant contemporary knowledge [*connaissances*] its place 'within the true'. For only on the level of 'depth knowledge' [*savoir*] will 'the system of truth and falsity [...] reveal the face it turned away from us for so long and which is that of its violence' (Foucault, 2014 [2011]: 5). Hence it is only on this level that the diagnosis acquires political significance.

Counter-truths make up an 'unwieldy knowledge' that stubbornly refuses to submit to the rules of the existing truth-regime without completely disregarding it. Instead it *toys* with the knowledge [*connaissances*] currently 'within the true' by relating to it on the level of *savoir* and thereby opposing it without disproving it, without taking it to be false. Unwieldy knowledge tries to change the current truth-regime by revealing the political significance of its truths: it

demonstrates what struggles had to be fought and what alternative forms of knowledge had to be subjugated in order to arrive at the solemn truths we are now accustomed with.

Producing counter-truths escapes contemporary truth ‘not by playing a game that [is] totally different from the game of truth, but by playing the same game differently’ (Foucault, 1998 [1984]: 295) because counter-truths contest the conditions of existence of statements to be true or false. Therefore they are neither true nor false according to the present truth-regime – hence Foucault repeatedly speaks of ‘fictions’: if his books challenge the current truth-regime, they are neither true nor false according to this truth-regime but lead readers to relate differently to the book’s subject, to form or at least to anticipate a different ‘experience’ of madness, of criminality, or of sexuality. If critique as a diagnosis of the present challenges the truth-regime by producing unwieldy knowledge, it creates (a glimpse of) a new experience, a new correlation of those three axes.

### ***Désassujettissement: Desubjectivation and Desubjugation***

How are desubjugation and desubjectivation connected to this practice of producing unwieldy knowledge via a diagnosis of the present? The connection can certainly not be too close, for taking the production of unwieldy knowledge to directly liberate us from contemporary power relations and modes of subjectivation would be a gross overestimation of the effects of (academic) knowledge production. Critique is ‘an instrument for those who fight, those who resist and refuse what is’ (Foucault, 1998 [1978]: 236), but it cannot replace those struggles.

Still, we should not underestimate the effects of critique as a diagnosis of the present. Desubjectivation and desubjugation are prefigured by it: Foucault’s critique enables its addressees to anticipate

their emancipation from the limits of our thoughts, actions and beings that the diagnosis reveals.<sup>11</sup> *Desubjectivation* becomes possible because the critique’s diagnosis invites its addressees to change their perspectives on how they establish their self-relations or on the practices of the self they participate in – to the point where they feel they no longer want to be who they are, maybe no longer have to be who they are and ideally do not already have to be someone else.<sup>12</sup> And although the practice of critique aims for an ethos, a critical attitude, we should not interpret it as primarily an ethical practice of the self because the primary aim is to desubjectivate: to place critique’s addressees on the intersection of ‘no longer’ and ‘not yet’ – no longer having the self-understanding they thought was necessary and ‘not yet’ having to have another self-understanding but enjoying a precious (and no doubt short-lived) moment of indeterminacy.

Critique’s aim of *desubjugation* likewise demands that critique must not prescribe what to do. As a diagnosis, critique gives ‘tactical pointers’ (Foucault, 2007 [2004]: 18) for those who fight<sup>13</sup> – tracing the ‘lines of fragility’ mentioned above – but does not *lead* those who fight. Critique is not an alternative form of governing, but aims to make its addressees imagine the anarchic moment of no longer being ‘governed like that and at that cost’ (Foucault, 1997 [1978]: 29). The unwieldy knowledge that critique produces reveals those practices that shape and uphold the conditions of existence of the present truth-regime. Thus, Foucault demonstrates that the necessity of the ‘experiences’ he analyses, of madness, criminality, sexuality, etc., is forged, both real and fabricated. These experiences are made necessary through certain practices which are therefore those practices against which to fight makes a difference not just to those practices.

In sum, Foucault’s critique is a practice of diagnosing the present by analysing practices and the ‘experiences’ they produce along the three axes of knowledge, power

and self-relations. These three axes operationalise his methodological perspective characterised by the three methodological imperatives of nihilism, nominalism and historicism in order to produce unwieldy knowledge or counter-truths: truths which oppose our contemporary truth-regime on the level of depth-knowledge and thereby enable the addressees of Foucault's critique to anticipate thinking, acting and being different – to be desubjectivated and desubjugated, if only for a spell.

### ***The First Affinity: Adorno's Riddles***

Before I show how *Le Volonté de Savoir* enacts this complex model of critique let me demonstrate a certain affinity between Foucault's and Adorno's models of critique on the methodological level. Affinities between Adorno's and Foucault's models of critique have of course been explored, albeit from different angles, for example by focusing on Adorno's and Foucault's shared concern for 'bodily freedom' (Honneth, 1986), on the Kantian heritage of their models of critique (Cook, 2013), or on their view on history (Allen, 2016: chapter 5), to name just a few. My remarks add to this 'comparative spadework' (Cook, 2013: 966) but emphasise the 'methodological' affinity resulting from a similar expectation about the effects of critique's knowledge.<sup>14</sup>

We can start by noticing that Adorno, like Foucault, conceives critique as a diagnostic practice that produces a very specific knowledge: critique, or philosophy in its proper form,<sup>15</sup> is an interpretative practice (Adorno, 1977 [1973]: 126) the task of which is not to give meaning and legitimacy to the reality it interprets but to acknowledge the 'incomplete, contradictory and fragmentary' nature of our present, to make visible the violence reigning supreme, and to 'banish' these 'demonic forces' (Adorno, 1977 [1973]: 126). Critique, in other words, has

to diagnose the present which does not mean simply to map reality but to change it:

Just as riddle-solving is constituted, in that the singular and dispersed elements of the question are brought into various grouping long enough for them to close together in a figure out of which the solution springs forth, while the question disappears – so philosophy has to bring its elements, which it receives from the sciences, into changing constellations, or, to say it with less astrological and scientifically more current expression, into changing trial combinations, until they fall into a figure which can be read as an answer, while at the same time the question disappears. (Adorno, 1977 [1973]: 127)

Adorno understands critique as a practice of diagnosing the present – 'the state of the world rushing toward catastrophe' (Adorno, 2005 [1962]: 13) – and thereby articulating a knowledge that frees us from that present. A successful critique would dissolve the present that gave rise to its diagnosis because of this diagnosis. Again, we would have to ask precisely how we can understand this strikingly effective critical knowledge – a question I cannot pursue here.<sup>16</sup> Yet the parallel to Foucault's perspective on critique and to his expectations towards the knowledge critique has to produce is apparent.

A second commonality in their methodological perspective is the negative conception of emancipation: if critique, by constructing its diagnostic constellations, dissolves the very reality thus interpreted, critique is precisely an emancipating practice in the negative sense of emancipation as 'letting go'. Since Adorno holds that critical theory's 'utopian moment [...] is stronger the less it [...] objectifies itself into a utopia' (Adorno, 2005 [1969]: 292), emancipation cannot be thought of as a positive state of affairs to be achieved. Instead, the emancipation critique strives for is, for both Adorno and Foucault, 'an *Ausgang*, a way out of our infernal present' (Cook, 2013: 974). Thus, Adorno's critique is not meant to tell its addressees what to do or to think – at most it offers a model of practiced resistance as a life

lived less wrongly and glimpses of what an emancipated life might be (Freyenhagen, 2013: 170).

These two similarities in the methodological perspectives of Adorno and Foucault are not meant to turn Foucault into ‘Adorno’s other son’ (Allen, 2016: 163). Yet they remind us of the shared expectation of Foucault and the early Frankfurt School that critique is to produce an effective, unwieldy knowledge that frees us from our present, even if only temporarily.

## THE CRITICAL ROLE OF ‘BIOPOLITICS’

*Le Volonté de Savoir* applies this complex model of critique and ‘biopolitics’ names the unwieldy knowledge of that critical diagnosis – or so I argue. I begin by demonstrating that Foucault uses the methodological perspective outlined above. In a second step, I show that ‘biopolitics’ has a critical function in the final part: it names the counter-truths with which Foucault’s critique intends to prefiguratively emancipate his readers. I argue that Foucault’s development of ‘biopolitics’ into the object of analysis and contemporary work continuing in this direction turn ‘biopolitics’ into a descriptive concept that stands in need of another critical diagnosis. Finally, I draw attention to the affinity of this distinction with Max Horkheimer’s famous differentiation between traditional and critical theory.

### *The Methodology of Le Volonté de Savoir, Parts 1–4*

What is the book’s target? Sexuality, obviously, though not ‘sexual behaviors in Western societies’ but the way ‘in which [...] these behaviors [have] become the object of a knowledge’ (Foucault, 2002 [1977]: 11). His critique is directed against the ‘experience’ of sexuality,<sup>17</sup> its constitutive practices

and the prominent idea of sexuality being repressed by power. This ‘repressive hypothesis’ (HS1: 10) rests on a mistaken view of power and sexuality – yet it is a mistake that pays off:

What sustains our eagerness to speak of sex in terms of repression is doubtless this opportunity to speak out against the powers that be, to utter truths and promise bliss, to link together enlightenment, liberation, and manifold pleasures; to pronounce a discourse that combines the fervor of knowledge, the determination to change the laws, and the longing for the garden of earthly delights. (HS1: 7)

Any analysis relying on the repressive hypothesis must assume that the power most important for constituting our contemporary experience of sexuality is a negative, repressive form of power; that truth is apriori set apart from and against power; and that sexuality holds important truths about us. Foucault’s aim is precisely to overcome all of these three preconceptions. His refutation of the repressive hypothesis (in parts 2 and 3) is directed against the *historical* thesis that sexuality has been increasingly repressed since the seventeenth century, against the *historical-theoretical* thesis that the power relations predominantly take a negative form and against the *historical-political* thesis that the critique of repression is a form of resistance to the power relations that dominate the experience of sexuality (HS1: 12). Instead, he argues that the discourse on sexuality has not been repressed but incited, that repressive power is just one but not the most important form of power exercised in the ‘dispositif’<sup>18</sup> of sexuality, and that speaking the truth about sex has not simply been avoided. On the contrary, ‘we’ have worked hard to establish the conditions of existence to make true or false statements about sexuality, to found the ‘Scientia sexualis’. The will to truth is precisely what characterises ‘our’ experience of sexuality (HS1: especially 67–70).

Only now can Foucault proceed with his positive analysis of the ‘experience’ of

sexuality. After rejecting the juridical analysis of power and introducing his relational, productive and strategic notion of power (the diagnostic concept I have outlined above) Foucault argues that the *dispositif* of sexuality is constituted by four ‘great strategic unities’ (HS1: 103): the hysteresis of women’s bodies, the pedagogisation of children’s sex, the socialisation of procreative behaviour and the psychiatrisation of perverse pleasure (HS1: 104 f.). Sexuality is the ‘experience’ produced in the practices of these four strategies and Foucault contrasts this *dispositif* of sexuality with the *dispositif* of ‘alliances’ (see Table 86.1). Yet the *dispositif* of sexuality has not replaced the *dispositif* of alliances but overdetermines it. The linkage is provided by the family, and psychoanalysis, Foucault claims, rests precisely in this interstice.

This very schematic sketch of Foucault’s argumentation renders visible his methodological perspective. He reconceptualises power by freeing it from the dominant normative framework in which it is usually thought, namely in terms of legitimation. Cutting off the king’s head in political science (HS1: 88 f.) means nothing more (and nothing less) than getting rid of the conceptual analysis of power in juridical terms and thus corresponds precisely with the *nihilistic* ‘systematic reduction of value’ (Foucault, 1997 [1978]: 51).

Conceptualising power strictly relationally operationalises the *nominalistic* methodological imperative: ‘One needs to be nominalistic, no doubt: power is not an institution, and not a structure; neither is it a certain strength we are endowed with; it is the name that one attributes to a complex strategical situation in

a particular society’ (HS1: 93). Hence, power is not an entity or a transcendental category but a diagnostic concept designed to make visible the wide range of very different and ever-changing power relations within society.

Finally, Foucault provides a historical explanation why we have come to analyse power purely in juridical terms. The *historic* dimension of his methodological perspective entails that the concept of power cannot be anything more than a heuristic device leading the historical analysis of concrete techniques, mechanisms and strategies of power at a certain place and at a certain time.

While Foucault develops his concept of power on the methodological level in the book, he presupposes the already existing conceptual tools for analysing knowledge from this methodological perspective throughout. Analysing the ‘will to knowledge’ that drives the discourse on sex and that has constituted sexuality as a domain ‘within the true’ relies on the distinction between knowledge [*connaissances*] and depth-knowledge [*savoir*]. For only if the conditions of existence for statements to have truth-values are not epistemic conditions can we avoid the Aristotelian model in which the ‘desire to know is no more than a game of knowledge in relation to itself, it does no more than show its genesis, delay, and movement’ (Foucault, 2014 [2011]: 16). And only then can we analyse the social struggles in and through which the regime of truth on which our ‘Scientia sexualis’ is founded.

Although the third axes of self-relation is not yet present, Foucault’s methodological

**Table 86.1 Dispositif of allegiance and dispositif of sexuality**

	<i>Dispositif of allegiance</i>	<i>Dispositif of sexuality</i>
<i>Dominant power relations</i>	Juridical power	Disciplinary and regulatory power
<i>Strategic aim</i>	Reproduce stable social relationships	Extend control
<i>Target</i>	Partners and their social status	Bodies and their pleasures
<i>Relation to the economy</i>	Direct: organise inheritance	Indirect: create productive and consuming bodies

perspective operationalised with the conceptual apparatuses on the first two axes is almost fully developed and is designed to analyse sexuality nihilistically, nominalistically and historicistically. Thus we find Foucault enacting precisely the model of critique described above: a nihilistic, nominalistic and historicist diagnosis of sexuality as an 'experience' produced by practices that must be analysed along the analytic axes of knowledge and power. And 'biopolitics' is the name, as I shall argue, of the 'counter-truths' which are produced by Foucault's critique and which are supposed to desubjectivate and desubjugate us from the 'experience' of sexuality. In other words: 'Biopolitics' in *Le Volonté de Savoir* has the critical function of emancipating us from sexuality – or of at least offering us a glimpse of what that might be like.

### ***Biopolitics and Pleasures: Counter-Truths***

Part 5 of *Le Volonté de Savoir*, entitled 'Right of Death and Power over Life', opens with the contrast between sovereign power – the asymmetrical 'right to *take* life or to *let* live' (HS1: 136) – and biopower: a new form of power in 'the West' (HS1: 136)<sup>19</sup> that is first and foremost 'a power that exerts a positive influence on life, that endeavors to administer, optimize, and multiply it, subjecting it to precise controls and comprehensive regulations' (HS1: 136). Although this power has not lost but amplified its ability to kill, its elaborate mechanisms to do so are merely the backside of its incomparably more developed mechanisms to foster and regulate life.<sup>20</sup>

Foucault's readers know the claim that power 'in the West' has fundamentally changed: in *Discipline and Punish*, Foucault argued that disciplinary power mechanisms targeting the individual body to render it docile and productive have become the dominant form of power relations (Foucault, 1977 [1975]: 215–28). Yet

this is but one half of biopower, Foucault now explains: whereas disciplinary power relations 'centered on the body as a machine' (HS1: 139), biopolitical power relations target the body as a living organism understood biologically and regulate processes on the level of the species. Politics no longer takes 'biological life' as a given but fosters, regulates and shapes it on the level of the very processes constituting it as 'living'.<sup>21</sup> Thus we return to Foucault's claim with which I began this chapter: that our present is characterised by the fact that 'the life of the species is waged on its own political strategies' (HS1: 143).

What's sex got to do with it? Sexuality is precisely what links the two poles of biopower: on the individual level, it enables disciplinary micro-practices controlling and optimising the individual body; on the level of the population, sexuality enables regulatory control mechanisms (HS1: 146). The four 'strategic unities' that constitute the 'experience' of sexuality all combine disciplinary and biopolitical mechanisms, Foucault claims:

The first two [of these strategic units; F. V.] rested on the requirements of regulation, on a whole thematic of the species, descent, and collective welfare, in order to obtain results at the level of discipline; the sexualization of children was accomplished in the form of a campaign for the health of the race [...]; the hysterization of women, which involved a thorough medicalization of their bodies and their sex, was carried out in the name of the responsibility they owed to the health of their children, the solidity of the family institution, and the safeguarding of society. It was the reverse relationship that applied in the case of birth controls and the psychiatrization of perversions: here the intervention was regulatory in nature, but it had to rely on the demand for individual disciplines and constraints [*dressages*]. (HS1: 146 f.)

At this point, the *critical* function of the concepts 'biopolitics' and 'biopower' become apparent: the diagnosis of our present as the biopolitical age reveals the 'political significance' of the will to truth that

manifests itself vis-à-vis sexuality and that dominates even the apparent resistance against its repression. All those practices looking for truth within sexuality – whether to ground control over individuals and populations by recourse to the ‘natural facts’ of sexuality or whether to resist the repression of sexuality – are still part of the regime of practices that constitutes ‘sexuality’ as an object of our desire to know that is carefully nurtured and put to use by the biopolitical power relations. Thus, the attempt to deploy ‘truths’ of sexuality against its ‘repression’ is complicit in enabling the biopolitical and disciplinary power mechanism. ‘Irony of this dispositif: it makes us believe that what is at stake in it is our “liberation”’, as Foucault (HS1: 159) writes in the very last sentence of the book.<sup>22</sup>

On my methodological reading of *Le Volonté de Savoir* then, ‘biopolitics’ names those counter-truths of Foucault’s critical diagnosis which challenge the discourse of sexuality on the level of its conditions of existence. They do not attempt to disprove the discourse on sexuality – as untrue or ideological – but reveal the struggles necessary to establish and sustain its ability to form statements with truth-value at all. They enable us to realise that even our strategies of resistance and their theoretical foundations only lead us deeper into what we believe to fight against. The desubjectifying and desubjugating effects of these counter-truths summarily named ‘biopolitics’ derive directly from this opposition on the level of depth-knowledge: for the consequence of accepting Foucault’s diagnosis would be to rid ourselves of all self-conceptions related to the dispositif of ‘sexuality’ and to fight in order to free ourselves from biopower.

At precisely this point, Foucault imagines a future which can no longer understand our will to truth about sex because it belongs to another regime of truth from which our fascination with sexuality, our hopes towards and our demands of it seem strange and astonishing. Foucault does not attempt to depict this

new world but he deems its prefiguration necessary:

[...] we *must dream* [*devons songer*] that perhaps one day, in a different economy of bodies and pleasures, people will no longer quite understand how the ruses of sexuality, and the power that sustains its dispositif, were able to subject us to that austere monarchy of sex, so that we became dedicated to the endless task of forcing its secret, of exacting the truest of confessions from a shadow. (HS1: 159, my emphasis)<sup>23</sup>

Biopolitics thus names the counter-truths resulting from a critical diagnosis that reveals how the dispositif of sexuality limits us in our thoughts, our actions and our subjectivities and how attempts to ‘free’ our own ‘repressed’ sex are driven by the very will to truth that has established the biopolitical and disciplinary power mechanisms shaping our actions and our subjectivities. The critical function of the concept of biopolitics is precisely to show us the full extent to which we are ‘captured’ by the dispositif of sexuality, to estrange us from it and to thereby give us a glimpse of what a truly emancipated life would entail.

### **After La Volonté de Savoir**

Biopolitics quickly vanishes from Foucault’s vocabulary, even though Foucault starts his lecture course in 1978 with the stated intention to study ‘something that I have called, somewhat vaguely, bio-power’ (Foucault, 2007 [2004]: 1) and announces in 1979 that ‘only when we know what this governmental regime called liberalism was, will we be able to grasp what biopolitics is’ (Foucault, 2008 [2004]: 22). The course summary dryly admits that the lecture course was devoted ‘entirely to what should have been only its introduction’ (Foucault, 2008 [2004]: 317), namely the analysis of (neo-) liberalism as a political rationality: as a specific regime of truth of governmental practices (see Vogelmann, 2012; Oksala, 2013).

This does not necessarily mean that Foucault abandoned the study of biopolitics. Some scholars argue that Foucault's notion of governmentality is 'nothing else than the name of a new analytical perspective on biopolitics' (Muhle, 2008: 269, my translation).<sup>24</sup> If we consider 'governmentality' to be a further development of Foucault's 'analytics of power', as he himself suggests (Foucault, 2007 [2004]: 118–20; see Patton, 2015: 113; for an opposing view cf. Fassin, 2010: 185 f., 196), this would continue the argument from *Le Volonté de Savoir* stringently: developing the concept of power in order to analyse sexuality without presupposing the repressive hypothesis left us with the critical diagnosis of biopolitics – and its analysis again is in need of new conceptual tools. So with the methodological perspective offered by the concept of governmentality, we can envision an 'analytics of biopolitics' (Lemke, 2010: 432–4; 2011 [2007]: chapter 9; Rabinow and Rose, 2015 [2006]: 308–23) along the three axes of knowledge, power and self-relations (see Lemke, 2010: 432 f.): on the axis of knowledge, the most pressing question is how 'life' is made knowable. On the axis of power, we have to analyse what is done with this knowledge and what relations of power sustain the 'regime of truth' that supports this knowledge. Finally, on the axis of self-relations, we analyse the impact of this knowledge and of these power relations on the self-understanding of subjects and their constitution.

However, while continuing Foucault's methodological perspective, this changes the status and the function of 'biopolitics': instead of a *critical* concept naming the counter-truths which result from Foucault's diagnosis of the present, 'biopolitics' now is a *descriptive* concept that names the object analysed. 'Biopolitics' was intended to estrange, to prefiguratively emancipate readers from their investment into the truths of sexuality. By taking the conceptual space that 'sexuality' occupied in *Le Volonté de Savoir*, it loses this function – and consequently the 'analytics of biopolitics' must either produce

new counter-knowledge or proceed with a different model of critique.

### ***The Second Affinity: Horkheimer's Critical Knowledge***

Distinguishing between 'biopolitics' as a *critical* concept that names the counter-truths produced by Foucault's diagnostic critique of the dispositif of sexuality and 'biopolitics' as a *descriptive* concept designating the object of critique brings us to the second affinity with Frankfurt School Critical Theory: for it mirrors Horkheimer's famous distinction between critical and traditional theory – or so I claim.

How to understand Horkheimer's distinction is of course itself contested but the following two aspects should be uncontroversial. A first key difference between critical and traditional theory is that the latter aims at *correctly mapping* the world whereas the former aims to *emancipate* and thus to *transform* it (Horkheimer, 2002 [1937]: 197, 208 f., 217, 219). In other words, critical theory has an explicit knowledge-interest that sets it apart from traditional theory which cannot even admit of having a knowledge-interest. According to Horkheimer, traditional theory thus does not only differ in its knowledge-interest but ideologically misconceives its own activity and the knowledge it produces (Horkheimer, 2002 [1937]: 221–4, especially 222).

Second, critical theory conceptualises the historicity of its knowledge differently than traditional theory does. Instead of accepting the received view of a timeless truth to be uncovered by bourgeois science, critical theory recognises that its own knowledge has a 'temporal core' (Horkheimer and Adorno, 2002 [1947]: xi). Although Horkheimer admits that this leads into difficulties he remains adamant that critical theory is 'opposing the idea of an absolute, supra-historical subject or the possibility of exchanging subjects, as though a person could remove

himself from his present historical juncture and truly insert himself into any other he wished' (Horkheimer, 2002 [1937]: 240).

Both differences concern the specific kind of knowledge produced by a critical or traditional theory – critique is again, as in Foucault's model of critique, specified as first and foremost a knowledge-producing practice. Yet the affinity goes beyond this general commonality, for both differences between critical and traditional theory are present in the distinction between 'biopolitics' as a critical and as a descriptive concept. First, using 'biopolitics' descriptively would indeed revert to a mere mapping of a particularly interesting aspect of our present, yet would not amount to a critique – unless the analysis is either supplanted with new counter-truths or is transplanted into another model of critique. Turning the diagnosis 'biopolitics' into the object of critique without providing new unwieldy knowledge transforms the theoretical activity of Foucault's diagnostic practice of critique into an analysis that either must seek another account for its critical force (e.g. by becoming a form of immanent critique) or that ceases to be critical altogether.

The second difference between critical and traditional theory is mirrored by the two usages of 'biopolitics' as well and accounts for the fact that Foucault's critique is not easily repeatable because the counter-truths produced by Foucault's diagnostic practice are tied to the very specific present the critique analyses and to this present's limits of what is or is not 'in the truth'. Thus, repeating Foucault's critique of sexuality by using 'biopolitics' in its critical function today cannot fail to disappoint. For even if we could suppose that the present dispositif of sexuality has remained relatively unchanged, the critical discourse on sexuality has not. Yet if the analysis of a 'repressed sexuality' no longer frames that discourse, a diagnosis to the contrary no longer constitutes counter-truths: statements bordering on the limit of

our truth-regime that oppose that very truth-regime on the level of depth-knowledge. In this sense, Foucault's critique has a 'temporal core' and, like Horkheimer's critical theory, cannot think of itself as timeless truth.

As with the first affinity between Adorno's and Foucault's model of critique, the correspondence between Horkheimer's and Foucault's distinctions concerns the knowledge critique produces. In fact, the distinction between critical and traditional theory relies on the methodological perspective outlined with the first affinity; taken together they constitute a similar 'stature' of critique even though the inner details remain different. Yet it demonstrates an affinity between Foucault and Horkheimer and Adorno that is misinterpreted if we either presuppose the Habermasian reconstruction of the early Frankfurt School or a less systematic account of Foucault's methodological perspective (cf. McCarthy, 1990).

## BIOPOLITICS AND CRITIQUE

My methodological re-reading of *Le Volonté de Savoir* started from the relationship between 'biopolitics' as it appears in Foucault's published work, his model of critique in which the concept is used and the methodological affinities to Adorno's model of critique. These seemingly simple exegetical issues allowed identifying the changed role of 'biopolitics' within the diagnostic critique aimed at prefigurative emancipation and its affinity to Horkheimer's distinction between critical and traditional theory. This in turn leads to three implications for using 'biopolitics' as a concept within critical theory more broadly.

First, saying that 'biopolitics' takes on a *descriptive* role in an 'analytics of biopolitics' as outlined, for example, by Lemke does not accuse this analytic of being an uncritical enterprise. Yet it does mean that 'biopolitics'

as a concept cannot afford the analysis any critical force by itself. If 'biopolitics' assumes the conceptual place of the object under study (the 'experience' in Foucault's terminology), and if the 'analytics of biopolitics' still intends to use Foucault's model of critique, then its critical diagnosis must forge a new set of counter-truths in order to challenge 'apparently natural or self-evident modes of practice and thought – inviting us to live differently' (Lemke, 2010: 434).

This emphasises, second, how demanding Foucault's model of critique is and what a peculiar relationship to truth it has. If critique succeeds in changing our relation to what we know on the level of depth-knowledge, emancipating us from certain truths by revealing how their conditions of existence are forged in and through social struggles, a repetition of that critique cannot have the same emancipatory effect. Hence Foucault's model of critique is not just conceptually demanding because it is committed to philosophically wide-ranging and contentious claims but also because its counter-truths have a 'temporal core': Foucault's model of critique requires a 'philosophical ethos that could be described as a permanent critique of our historical era' (Foucault, 1997a [1984]: 312) – yet it also requires this permanent critique not to repeat itself, for once we have come to accept the counter-truths it offers, these cease to function as *counter-truth*. Tying with the *current* conditions of existence for statements to be able to have a truth-value, these counter-truths lose their ability to prefiguratively emancipate us once they are included within our discourses. If critique is to stay at the limits of what we can think, do and be, it has to acknowledge and transform with its own effects on these limits.

The same holds for Adorno's model of critique and Horkheimer's defence of a critical theory different from traditional theory. The two affinities outlined suggest that in each case, conceptualising critique as a diagnostic practice producing an effective, unwieldy

knowledge is the reason for the high demands placed on critique. One such demand is a philosophical account of truth's historicity without relativising truth – a task that shows where Foucault and Adorno and Horkheimer clearly part ways.<sup>25</sup>

Third, and more concrete, this leads to the much broader question whether an 'analytics of biopolitics' should develop another model of critique. Maybe we could understand the different ways in which Agamben, Hardt and Negri or Esposito have developed the notion of biopolitics precisely as re-deploying it within very different conceptions of critique:<sup>26</sup> within a dystopian critique of sovereignty's hidden structure that makes 'biopolitics' the *target* of critique, within a post-Marxist critique of Empire's absorption of the life-forces of the multitude that sees 'biopolitics' as a *resource* for critique or within a constructive critique of the paradigm of immunisation that emphasises 'biopolitics' *ambivalent* relation to critique.<sup>27</sup> Yet precisely at this juncture, when critical theory develops new and exciting relationships between 'biopolitics' and critique, we might come to appreciate the common 'stature' of Foucault's and Adorno's and Horkheimer's critique with its focus on the knowledge critique produces: for how do these re-deployments of 'biopolitics' account for the wrongness of what they criticise? What truths do we affirm when we base our critique on an opposition between 'life' within and without the reach of 'politics' – for example a life with the inherent capability to escape biopolitics (Mills, 2015: 97 f.)? Having learned our lesson about sexuality, we should not disregard its implications with respect to 'life': what power mechanisms shaped the depth-knowledge enabling us to think and speak of life beyond politics? What counter-truths could we come up with to forge an understanding of life that does not implicate our critique in those power relations? Thinking through this question would offer us, I think, a further glimpse of prefigurative enlightenment.

## Notes

- 1 Thanks go to Daniel Loick for his constructive criticism of an early draft.
- 2 The conceptual history of 'biopolitics' is of course older than its usage in critical theory: see Esposito (2008 [2004]: 16–24).
- 3 Since my reading emphasises the role of depth-knowledge [*savoir*], I prefer the French book title which is also more informative than the English translation *History of Sexuality, Volume 1: An Introduction*.
- 4 In *The Birth of Biopolitics* (Foucault, 2008 [2004]) hardly ever mentions 'biopolitics', being instead an analysis of liberalism as a political rationality – because, Foucault argues, 'the analysis of biopolitics can only get under way when we have understood the general regime of this governmental reason' (ibid.: 21 f.).
- 5 Lemke (2011 [2007]), Campbell (2013), and Folkers and Lemke (2014) provide good overviews from different perspectives.
- 6 See Vogelmann (2017b) for more details.
- 7 'Experience' here means not a subjective episode but the 'correlation of a domain of knowledge [*savoir*], a type of normativity, and a mode of relation to the self' (Foucault, 1997b [1984]: 199 f.).
- 8 I take the term 'depth knowledge' from Hacking (2002 [1981]: 77).
- 9 Foucault's insistence on this difference between conditions of existence and conditions of possibility is most pronounced in Foucault (2010 [1969]: e.g. 116) where he repeatedly distinguishes conditions of possibility as 'principles of construction' from conditions of existence. See Gutting (1989: 242).
- 10 Although Foucault uses the notion of a 'truth-regime' from time to time, he does not develop it conceptually (Weir, 2008: 370–4). I use it as a shorthand for 'conditions of existence for statements to be candidates for truth-values'. For a more general discussion, see Nigro (2015).
- 11 On prefiguration and prolepsis, see Wright (1993: 46, fn. 12), Maeckelbergh (2011: 3).
- 12 Martin Saar's 'genealogical blueprint' captures well what desubjectivation means: 'Tell me the story of the genesis and development of my self-understanding using the notion of power (or related notions, such as strategy, or interest, subjection, submission, exploitation, etc.) in such a way that hearing you talk, I don't want to be as I thought I have to be, and that, hearing you talk, I realize that this isn't necessary' (Saar, 2002: 236 f.).
- 13 In *Security, Territory, Population*, Foucault claims that his work embodies only the following conditional imperative: 'If you want to struggle, here are some key points, here are some lines of force, here are some constrictions and blockages' (Foucault, 2007 [2004]: 18).
- 14 In this respect my remarks are close to Thomas McCarthy's six 'broad affinities' (McCarthy, 1990: 437–41). Yet his interpretation of Foucault and of the Frankfurt School Critical Theory relies mostly on Habermas' conceptions of both, which prevents further dialogue. McCarthy acknowledges that to some extent: see ibid.: 464, fn. 1.
- 15 When Adorno characterises his understanding of philosophy, philosophy and critique are identical. Just one example: 'If philosophy is still necessary, it is so only in the way it has been from time immemorial: as critique [...]' (Adorno, 2005 [1962]: 10).
- 16 For a thoughtful and detailed explanation of Adorno's interpretative method of critique and its connection to epistemological questions, see Christ (2012).
- 17 Looking back, Foucault writes in *The Use of Pleasure*: 'What I planned, therefore, was a history of the experience of sexuality, where experience is understood as the correlation between fields of knowledge, types of normativity, and forms of subjectivity in a particular culture' (Foucault, 1990 [1984]: 4).
- 18 'Dispositif' is rendered incoherently as 'deployment', 'layout', 'organisation' and the like by the English translation – 'unhelpful' (Elden, 2016: 53) indeed.
- 19 For a nuanced critique from a post-colonial perspective on Foucault's Eurocentric genealogy of biopolitics, see Stoler (2004 [1995]).
- 20 Hence, the 'massacres have become vital' (HS1: 137): they can be committed only in the 'name of life' (ibid.). Foucault developed this functional analysis of state racism first in his lecture course *Society Must Be Defended* (Foucault, 2003 [1997]: 254–63). For critique and development of this controversial analysis, see e.g. Stoler (2004 [1995]), Balibar (1995 [1989]: 40–2), Lemke (1997: 224–38).
- 21 'For the first time in history, no doubt, biological existence was reflected in political existence; the fact of living was no longer an inaccessible substrate that only emerged from time to time, amid the randomness of death and its fatality; part of it passed into knowledge's field of control and power's sphere of intervention' (HS1: 142).
- 22 I use my own translation of Foucault's original sentence 'Ironie de ce dispositif: il nous fait croire qu'il y va de notre "libération"' (Foucault, 2001 [1976]: 211) since the English translation is 'free' to the point of distortion.
- 23 Judith Butler famously criticises Foucault's use of the term 'pleasures' because it would contradict Foucault's critique of sexuality as power-ridden dispositif to posit 'a "multiplicity of pleasures" in itself which is not the effect of any specific

- discourse/power exchange' (Butler, 1990: 97). Yet Foucault does not assume pleasures free from any power/knowledge-regime but pleasures of a different regime (a 'different economy of bodies and pleasures') than the regime of 'sexuality'. See Repo (2014).
- 24 Lemke (2011 [2007]: 44–50), Oksala (2013: 61–3), Gros (2015: 259) advances similar claims.
- 25 For Foucault, see Vogelmann (2014), on Horkheimer's and Adorno's account of truth's historicity, see Shomali (2010: chapter 2).
- 26 I thank Valentin Jandt for discussions on this point. In his brilliant BA-Thesis *Politics – Life – Critique* (University of Bremen, 2015, on file with the author), he explores the critical function of the concepts of biopolitics in the works of Foucault, Agamben, and Hardt and Negri.
- 27 There are of course many more developments that reshape the relationship between 'biopolitics' and 'critique'. To mention only a few: Achille Mbembe's concept 'necropolitics' (Mbembe, 2003) as well as Banu Bargu's 'biosovereignty' (Bargu, 2014: 43–54) build on Agamben's re-interpretation of 'biopolitics', focussing on its 'thanatopolitical' side and making it the target of critique. Others explore biopolitics as a source of critical agency or resistance: see e.g. Beatriz Preciado's (2013 [2008]: 352) call for reclaiming 'the right to participate in the construction of biopolitical fictions' or Mike Laufenberg's (2014) 'politics of care' that turns the care about life against its current political occupation.

# Critical International Relations Theory

Shannon Brincat

## INTRODUCTION

In the 1980s the discipline of International Relations (IR) was subjected to a radical critique driven, in large part, by the entry of the ideas of the Frankfurt School (FS) into the field – a field dominated until then by unmitigated positivist assumptions. The new school of thought that emerged, Critical International Relations Theory (CIRT), exposed the deep relation between mainstream approaches to IR theory (specifically neorealism, rational-choice, and liberal institutionalism) and the dominant interests they served in world politics: the maintenance of bipolarity (with favour given to American preponderance), possessive individualism, and world capitalism. ‘Theory is always *for* someone, and *for* some purpose’ (Cox, 1981: 128), this new paradigm claimed – a statement that has since become one of the most quoted in the discipline. With this insight IR theory would never be the same, unable to remain normatively naïve, compelled to give up the

semblance of neutrality and objectivity. In making this intervention, CIRT was a primary catalyst towards the so-called post-positivist and normative-turns in IR theory that are now almost taken for granted. One of the defining legacies of this shift has been how CIRT has since looked beyond positivist (or ‘problem-solving’)<sup>1</sup> approaches to engage with broader, normative questions regarding the purposes of IR theory and the possibility of advancing emancipation. In this way CIRT remains connected to the original ideas of the FS pursuing the question as to why, at the height of humankind’s technological progress, we see its very opposite socially – what Marcuse (n.d.) called the ‘dehumanization and brutalization’ of life. Here, CIRT remains committed to generating the type of knowledge that was of concern to the FS, knowledge to enhance human autonomy across world politics through our collective capacities for self-reflectivity and self-determination (Held, 1980: 255). It is CIRT’s self-reflection and understanding

– our ability to reflect on our history and human capacities and to harness these towards making our shared social life rational or self-determining, rather than living under blind fate or domination – that enables it to pursue this emancipatory interest, or as Hoffman expressed it to ‘critique existing social order and point to its immanent capacity for change and for the realization of human potential’ (1987: 232). During a time of profound economic crises, the rise of right-wing and Islamic extremism, the attacks on reason, the turn away from multilateralism to a dangerous unilateral and highly interventionist world order, and the interlocking environmental crises of climate change and biodiversity loss, this critical approach to world politics is today ever more urgent.

The objective of this chapter is to detail the achievements *and* limits of CIRT<sup>2</sup> in order to identify those areas where further development is required.<sup>3</sup> The first part examines four key themes in which CIRT has contributed to the advancement of IR related to the critique of positivism and the promotion of emancipatory theory, intersubjectivity, cosmopolitanism, and security. This part focuses on some of the key theorists associated with CIRT: Robert W. Cox, Andrew Linklater, Richard Ashley, and Ken Booth, a list that is by no means exhaustive. The second part then explores a number of interlocking problem areas for the future of CIRT including the continuing lack of a genuine transdisciplinary research programme in IR, CIRT’s problematic relation to the ‘philosophy of history’ and Western-centrism, and the limits of its assumed internationalism. The chapter concludes by indicating how, and in which ways, CIRT may help push IR towards a more sophisticated account of intersubjectivity in its social ontology, opening up crucial insights for both the theory and practice for the discipline, and to ground an emancipatory world politics for the future.

## PART 1 – THE ACHIEVEMENTS OF CIRT

### *Beyond the Impasse of Realism and Positivism*

It is little coincidence that both the discipline of IR and the FS emerged during the crisis of the inter-war period, something reflected in their primary interests that parallel in a fundamental way. IR was premised on the question of the causes of international war, specifically the imperialist and geostrategic rivalries that generated WWI. The early FS, on the other hand, was concerned with why the socialist, world revolution had failed to materialize but instead fell to its opposite: the solidarity of the international working-class shattered by international war. The question of why the working class sided with the national bourgeoisie was the inversion of the question of the cause of international war. Horkheimer had even penned the beginnings of a novel on Chamberlain’s willingness to appease Hitler as evidence of the complicity of the ruling classes with fascism as an ‘extension of bourgeois domination’ – an argument more fully developed in his *Dialectic of Enlightenment* (Horkheimer, 2014). However, whereas early IR became concerned with inventing formal structures to pacify world politics (largely built on Kantian thought and Wilsonianism principles institutionalized in the doomed League of Nations), the FS was focused on concrete social relations, ideology/culture, and psychoanalysis, to explain the devolution of class-consciousness and human reason in the form of the barbarism of international war. As to the penultimate question that guides the discipline of IR to this day – how to end *all* war – CIRT has since put forward an alternative answer to the balance of power (realism) or institutions (liberalism), instead anchoring itself in the possibility for human emancipation. Whilst the concept of emancipation has remained vague both in its description and normative prescription throughout

CIRT, it has been retained as the nomenclature for the vision – however general – of the processual reconstruction of world order away from conditions of enslavement towards the collective, self-direction of humankind.

For CIRT, a world divided into states and trapped in the political economy of global capitalism cannot deliver peace or justice to humanity. And yet, just like Marxist theories of imperialism before it, because CIRT located the causes of war within the very nature of capitalism and the international system of capitalist states, it has remained largely excluded from the disciplinary mainstream – especially so in American scholarship. Opposing theories instead refuted the ‘critical turn’, obstructing its revolutionary insights and thereby supporting the stabilization of bourgeois international order by making the international system appear natural and self-perpetuating (Krippendorff, 1982: 27). The challenge for CIRT has been to respond in a way that is both *practical* and *normative*. For the reaction of the disciplinary mainstream to the intrusion of ‘critical’ thought was to re-establish its dominance by attempting to control the contours of debate. The strategy adopted by Robert Keohane, leading theorist of neoliberal institutionalism and former president of both the International Studies Association and the American Political Science Association, was to deliberately narrow the epistemological boundaries of the field by making a cleavage between two distinct camps: the rationalists, all of whom relied on rational-choice theory, and the reflectivists, those who emphasized intersubjectivity, history, interpretation, and the limits of science. For Keohane, it was these critical or ‘reflectivist’ approaches which had to answer to the methods of the rationalists. That is, they had to make their claims ‘testable’ by observation or experiment in the Popperian sense, or risk remaining forever on the margins (1989: 173–4). Later, Keohane and others would go so far as to suggest that critical approaches could not make reliable claims and that they even repudiated the endeavour

of social science (see Katzenstein et al., 1998: 678). Yet CIRT was up to this challenge. In part, this was due to the methods of immanent critique utilized by the FS that enabled CIRT to expose the ideology of orthodox IR theories and their assumptions of the rational actor, free market, and state system, against the social realities of that order – the global inequalities, injustices, and exploitation, that precipitated international conflict. This method had the benefit of remaining fixed within the terms of debate amenable to orthodox IR and the existing realities of world politics, without relying on extraneous moral categories for its critique. In this way, CIRT could ‘*explain* what is wrong with current social reality, *identify* actors to change it, and provide clear norms for criticism and practical *goals* for the future’ (Bohman, 1996: 190, emphasis added). It also provided a means to shift IR towards ontological concerns, not only questions pertaining to the basic actors, structures, and their relations in world politics, but engaging with the very *purposes* which IR theory was meant to serve (Cox, 1981: 128; Cox, 1992).

In many ways Cox’s famous dictum that pushed the discipline to uncover *who* and *what* purposes it served echoed Horkheimer’s much earlier claim that there was ‘no theory of society’ that did not ‘not contain political motivations’ (1972a: 222). Yet despite the fact that nearly all other disciplines in the social sciences had long problematized positivism as reductionist, that it reified social reality as something objective and independent, and that it forgot that its facts were products of socially and historically mediated human consciousness, IR lagged behind safe in its naivety. In particular, it was the legitimizing role played by positivist analysis – through its acceptance of the status quo as the objective reality of world politics and the perpetuation of this system under the ahistorical nature of its analysis – that resulted in a pernicious political alliance between orthodox IR theory and those dominant institutions of world politics that thwarted human

emancipation. Yet, until Cox's intervention, this deeply politicized role played by positivism remained largely unquestioned in IR, cloaked under assertions that this approach alone could explain the world as it 'really is'. Wyn Jones observed that the privileging of the epistemology of positivism had the effect of undermining the truth-claims of those who wished to challenge the provenance of prevailing world order, making other ways of knowing *appear* illegitimate (1999: 90, 6). Instead, CIRT sought to replace the obvious attempts to hide normativity in traditional theories of IR by openly elaborating on its own 'concern for the reasonable conditions of life' (Horkheimer, 1972a: 222). It was this explicit emancipatory interest – 'the emancipation of humanity from enslaving conditions' (Horkheimer, 1972b: 245ff.) – that has remained at the core of the research project of CIRT. With basic precepts from the FS including the shared problematization of positivism, the historical materialist understanding of social transformation, and emancipatory politics defined (broadly) as freedom from slavery towards self-direction,<sup>4</sup> it was possible for CIRT to show the contradictions between the principles and the actuality of bourgeois international society: how it 'excluded' ever larger numbers of people from the happiness that had been made possible by the abundance of economic forces. Whereas Horkheimer and the Institute had reflected on this precondition only within the context of the West, the story was no different when Cox examined the international dimensions of capitalist relations between core and periphery, building on Immanuel Wallerstein's work, or when Hoffman examined the logic of world capitalist economy (1987: 242–3). Yet against the overwhelming deferral to positivist assumptions these relations were largely excluded from IR 'proper' in at least two ways. Firstly, it was widely believed such relations were of no interest to IR that was to instead answer a very narrow question, namely, the seeming inevitability of conflict in world politics under the anarchical

structure of the international system. In the absence of a higher power to mediate the conflicts between states, war was deemed insoluble in an anarchical world of tragedy and repetition. This was the so-called 'parsimonious' theory of Neorealism (Waltz, 2010: chapter 3) that was widely believed to explain the prevalence of war in the absence of other relations or variables, though it made no pretence to further claims. Secondly, in more recent years, the two positivist approaches to IR – Neorealism and Neoliberalism – have since effectively conjoined their normative and research agendas, what Waever (1996) called the 'Neo-Neo Synthesis'. In many ways this alliance continues to echo Keohane's epistemological narrowing of the field under which IR theory is reduced to merely testing the level of cooperation that international institutions can play in world politics.

For CIRT however, the corrective was to bring *values* openly into IR. That is, to expose the deep political linkages between orthodox IR and existing power structures, and to reveal the values that these theories purposively advanced but self-denied under a feigned notion of objectivity. This question of knowledge constitutive interests had, of course, been a hallmark of the FS beginning with Horkheimer's *Eclipse of Reason* where he argued that objective reason – the ethical form of reason – had been lost under the dominance of subjective reason. For him, the reasonable nature of one's actions was now irrelevant in late capitalism. Only the ends that served the purposes of the subject (self-advancement and self-preservation) remained within a form of 'reason' prone to conformity, authoritarianism, and the pursuit of self-interest in the market without concern for the effect of one's actions on others (Horkheimer, 2013). Adorno would use similar arguments to show how such 'reason' is used to justify the oppression of humankind as a necessary price of 'self-preservation' under the 'law of nature' – the Hobbesian ideology that remains so well entrenched in IR to this day, whether

in postulates that allege conflict is endemic to the human condition, or the behaviour of states in the anarchical system. For Adorno, such 'reason' had not contributed to the preservation of our species but served its opposite (Cook, 2014: 21), something the expansion of the nuclear threat or climate change has only intensified – the trajectory of universal history under instrumental reason leading from the 'catapult to the atom bomb' (Adorno, 2008: 629). Here, it is interesting to note that Honneth has deliberately situated *The Struggle for Recognition* in opposition to those philosophical anthropologies that assume the 'war of all, against all' in which social conflict is motivated solely by self-preservation (1995: chapter 1). For Honneth, control through fear, the lynchpin of the Hobbesian imaginary, must be replaced with a notion of struggle towards norms recognized and justified by their social utility for all.

Aside from these early articulations of the purposes of knowledge/reason from the First Generation FS, it was Habermas' (1972) notion of 'knowledge constitutive interests' that has been most influential in CIRT. A host of other commentators have reached similar conclusions.<sup>5</sup> Richard Ashley deployed the concept of knowledge constitutive interests in his early work to defend the 'critical-theoretical alternative' to world politics that was developing through CIRT. Just as the motivations of positivism were located in the political and economic needs of bourgeois society that rewarded knowledge that had instrumental or practical applications and neglected that knowledge whose use-value was not immediately instrumental for production purposes, neorealism performed this role at the level of the international. That is, neorealism sought only to expand the 'reach' of control in the international system, not towards the emancipation of humankind, but for the interests of those dominant forces within world politics at a specific point in time. In reducing itself to an instrument of power, such a theory became nothing but 'an apologia for the status quo' (Ashley, 1984: 228).

Neorealism served as the doctrine for 'the new mandarins', as Chomsky labelled them, those agents that infused the foreign policy offices of Western powers – just like Morgenthau's scholar-adviser had helped define the 'National Interest' for Classical Realism and the US Department of State in the former iteration of realist theory. Like Cox, Ashley distinguished neorealism as problem-solving theory that sought to make the system function more smoothly from CIRT with its orientation to understanding and promoting global change (1981: 208). Rather than control, the latter's interest was in pursuing those immanent possibilities towards openness in which dissidence and marginality, plurality and difference, could emerge in IR and thereby enable CIRT to locate and strengthen resistant practices in world politics (Ashley, 1987: 408–11).

Similarly, Linklater held that knowledge does not arise from the subject's neutral engagement with an objective reality but reflects pre-existing social purposes and interests (1996: 279). Redeploying Habermas' schema in the context of theories of IR, Linklater divided approaches according to their primary interest: technical interests (to control nature and society), practical interests (to create orderly communities), and emancipatory interests (to identify and eradicate unnecessary social constraints). Echoing the FS, for Linklater, knowledge is incomplete if it lacks this emancipatory purpose (1996: 281). It is because of this interest that Linklater believes CIRT provides a superior account of world politics in three ways: the relationship between units (states and other actors) and the international system; the cultural dimensions of world politics, and; its vision for new forms of political community (1995: 242). What is most unique about Linklater's critical project has been how he has challenged those theories that underestimate the human capacity to problematize and transform inherited and seemingly natural social conventions – including the self-perpetuation or immutability thesis of realism

that would lock world politics within an endless cycle of periodic war and conflict. Yet for Linklater, not only is all knowledge purpose-driven; all knowledge involves moral commitments. And even though he finds humanity is only at the start of a 'long collective learning process', he has looked to how social learning in the practical-moral sphere can undergo separate logics of change (2011: 18, 32). In the context of world politics, for Linklater (1982) this process involves questioning all boundaries of exclusion/inclusion and the extension of the harm principle – part of an Elysian 'civilising process' – to distant others (Linklater, 2011). On this emancipatory horizon emerge possibilities for the transformation of political community to greater forms of human solidarity and even the beginnings of an institutional form of cosmopolitan community (Linklater, 1996).

Yet the status of the emancipatory interest has remained problematic. It conflated Freudian and Marxist critiques aimed at the unmasking of personal self-deception and of social-political ideology, respectively. The former involved asymmetries between patient and analyst. The latter, given the collapse of working-class solidarity in late capitalism, maintained an insufficiently intersubjective form of emancipation. This problem was compounded by the fact that CIRT, at least in Cox's seminal paper, had expressed its difference from problem-solving theory in a way that both confused and antagonized. It made it appear as if CIRT wilfully dismissed positivist research, was not interested in solving 'real world' problems, and, that it was the only properly 'critical' approach to the field (Booth, 2007: 242ff.). Most disconcerting was that it made it seem as if CIRT's interest in emancipation did not have to be tied to existing realities so that the School was readily dismissed as a redundant form of idealism, a relic from IR's 'First Great Debate'.<sup>6</sup> Yet to understand the 'two-sided' character of the social totality, something Horkheimer insisted on (1972a: 206–207), positivist social science had to be wedded with an emancipatory interest. What

Horkheimer meant by the 'two-sided' social totality was how, on the one hand, the individual accepts as natural the limits prescribed on his/her activity by capitalist society, and on the other, how society can be made the 'possible object of planful decision and rational determination of goals' – that is, to 'conceive' society 'as will and reason' and make it 'their own world' (Horkheimer, 1972a: 206–207). Positivism was not wrong according to the FS, but incomplete. This was not so much a rejection, but a conjoining of the two approaches. Accordingly, Ken Booth has attempted to counter this widely misunderstood tenet of CT, making central to his research project how CIRT is interested in 'solving problems', specifically, 'tactical or strategic action for emancipatory purposes' (2007: 244). This connects far more closely with Cox's intention, rather than expression, for reclaiming 'normative choice' in social order – that is, defending emancipation as something practical by transcending world order within the range of what is feasible in existing conditions (1981: 136–7, 130). Neufeld rightly surmises that the turn from positivist theory to its enmeshment with a commitment to human emancipation is central to the purposes of the entire 'critical' project of CIRT (1995). Indeed, the real conditions of contemporary international society were such that a 'community of freedom' envisaged by Horkheimer remained possible and it was this material potential that continues to provide CIRT with its 'content'. It was only in bringing in the full capacities of human reason (the union of science *and* philosophy, positivist *and* emancipatory theory) that the unplanned nature of world order that was made to seem a 'fate beyond man's control' by neorealism and other approaches in IR could be overcome.

### ***The Project of Emancipation***

The FS has been consistent in its normative goal of emancipation, however general these descriptions have been, and despite the diverse ways in which each theorist

has pursued the idea. Horkheimer defined emancipation as the ‘general interest’ in the free development, just resource allocation, and equality in community (see 1972a). Marcuse would come to a negativist conception, the Great Refusal (1964: 256–7), that implored the need to overturn capitalist social relations but in a way that seemed beyond historical possibilities. As we have already seen, Habermas initially sought emancipation through dialogical community and yet would later retreat into the liberal state, with all its inequalities. More recently Honneth has turned to the intersubjective ontology of recognition theory to ground emancipation in concrete, historical conditions – something only recently being taken up in IR relating to questions of cosmopolitan political community (Brincat, 2017). By contrast, what constitutes emancipation in CIRT is a notoriously difficult question to pin down. Some writers reject the term outright (Cox), others deploy it, though with little definition (Wyn Jones, Devetak, Ashley, Neufeld), and others have distinct emancipatory concepts such as community (Linklater) or security (Booth). Whilst too vast to cover all such forms here and despite the many differences between them, common to all conceptions is the rejection of emancipation as some blueprint utopia and its replacement with a processual account of enhancing intersubjective relations.

Linklater has pursued the question of emancipation under his unique conception of the ‘triple transformation’ of political community (see esp. 1998). This was premised on his Hieroclean notion that whilst distance should be no barrier to ethical concerns, that the differing obligations between ‘men’ and ‘citizens’ has been the fault-line cutting across world politics (1982). His early and middle work were steeped in Habermas’ theory of communicative action as a means by which a cosmopolitan community could ensure that its social order was built by the participation of all in ‘freely chosen moral principles which further the autonomy of all human beings’ (Linklater, 1998: 22). This quest for

consensus in a rational political community was premised on extending Habermasian discourse ethics (dialogue, inclusion, no certainty of moral position, and a willingness to learn and seek understanding) to the cosmopolitan sphere in a way that could break with unjustified exclusion whilst remaining attuned to cultural difference. The precise character of the institutionalized structures of participation in dialogic community could vary from place to place, and, in different levels of political life – from the local, to the state, to the region, and ultimately, to the cosmopolitan sphere. As such, for Linklater, it is not a question of *subtracting* but of *adding* layers of political community above and below the state to help humanity ‘formulate a common system of rules concerned with managing complex forms of inter-tribal interaction’ (1982: 177). Whilst many have pointed out that this presupposes a liberal subject in a formal public sphere, Linklater has developed an international historical sociology capable of pointing to nascent developments within what he calls ‘cosmopolitanism harm conventions’<sup>7</sup> that constitute evidence of such a ‘move beyond the particularism of the state to a universal society of free beings’ (1982: 167). Similarly, he finds the advancement of harm conventions in human history as not only indications of a ‘global moral consensus’ on the harm principle but something which can be expanded upon in world politics (Linklater, in Brincat et al., 2012: 22–3; Linklater, 2011: 23–4, 34).

In distinction to Linklater, whilst Cox has maintained a Gramscian ‘optimism of the will’ (1996: 527, 531) he has remained sceptical of emancipation, rejecting the term. Despite this, he does hold an ideal vision for the future, something he previously referred to as ‘new multilateralism’ and in his later work as ‘civilizational coexistence’. This vision hopes for a more participatory society (Cox, 1987: 403) alongside ‘social equity; greater diffusion of power among peoples, social classes and genders; maintenance of security in the handling of conflict; and sustainability of the

biosphere' (Cox, 1997: 245). A central concern for Cox has been on a 'plural world' to replace the cultural homogeneity of globalization with cultural diversity. Yet rather than philosophically unpacking these ideals, Cox's work has been more concerned with the conditions necessary for their emergence. Earlier, he emphasized reconstructing civil society and political authority on a global scale from the 'bottom up' (1997: xxvii) and later on a 'suprainter-subjectivity' that could bridge the 'distinct and separate subjectivities of different coexisting civilizations' (1995a: 43). Despite these possibilities, the problem remains one of global hegemony – particularly of the United States and core states – and the contradictions of the global economy in the periphery (1983: 172). For Cox, the task is to somehow build counter-hegemony within these conditions that can resist the very 'framework of bourgeois hegemony' (1983: 166), a task that he understands as uniting counter-hegemonic historic blocs from within national contexts through a long-term war of position (1987: 403). Moreover, Cox points to the many different historical ways of strengthening intercivilizational and intercultural relations as a means of entering into the mental framework of the other, a process by which major centres of political power can meet in dialogue (2001: 105) and achieve some common understanding to lead to the 'mutual and pacific recognition of differences among peoples' (1995b: 11).

Of all the theorists of early CIRT, Booth has been the most comfortable with articulating emancipatory themes, insisting on the need for constant reflection on normative commitments (2007: 242–4). In the early 1990s, independent of reading the FS, Booth advanced the idea of security as emancipation (1991a) and a realistic utopianism as central to pushing the subfield of Security Studies towards tactical or strategic action for solving real problems (1991b). In many ways, his critique of 'traditional' Security Studies mirrored those of traditional approaches to IR that we have already discussed. His 'Critical'

Security Studies (or 'Welsh School' developed with Richard Wyn Jones) was interested in 'articulating the forces of domination, such as global capitalism and national security, which constrained individuals' subjectivities and threatened their physical and emotional security' (Walter, 2017). This 'emancipatory realism' (see esp. Booth, 2007: 249–76) sought to redefine security as a strategy necessary for achieving human emancipation by refining our understanding of power but did so on a moralist foundation that was widely criticized as coopting liberal practices in the name of an emancipatory cosmopolitanism. Nevertheless, for Booth, 'grand theorising in the interest of the human collective and the natural world on which we all depend is a historic necessity' (Booth, 2012: 68ff.) and to ground the concept of emancipation in concrete terms he has relied on a number of practical moves for its realization. His 'Utopian Realism' was the first articulation of such an attempt, seeing in this combination a way that humankind could practically set goals to mediate the anarchical condition of the international system, so that the international community could become the subject of its own history (Booth, 1991b: 536). More recently, he has relied on what can be described as pragmatic and materialist ethics to realize this emancipatory ideal, citing William Lovett's work that pursued political rights through non-violent struggle as an example (see Booth, 2012: 68ff.).

This attempt at bridging CIRT and realism was also pursued by Ashley who joined the latter's concerns with power and the global hegemonic order to help practically realize the project of emancipation. In particular, Ashley sought to build upon the practical knowledge constitutive interest of classical realism (concerned with *understanding*) through his 'dialectical competence model' towards a better understanding of power (1981: 208–209). This model focused on 'competent international practice', that is, practices of power, statesmanship, and crisis, that could lead to emancipatory

transformations. Ashley's dialectical competence model situated the balance-of-power regime not in the abstract system of neorealism (i.e. 'anarchy' and the self-perpetuation thesis this gave rise to), but within the real social, economic, and environmental, conditions on which this regime depended (see Brincat, 2012). Ashley would later delve deeper into this anarchy problematique within IR using the method of the 'Double Reading' (1988). He found that anarchy was the very compass of imaginable possibility, the background 'reality' which anyone concerned with collaboration or cooperation in world politics *must* respect. Anarchy defined 'the condition of possibility' in world politics (1988: 232). Its unquestioned acceptance however, closed off possibilities for the expansion of, and differentiation in, human community, especially notions of mutuality, solidarity, and cooperation. Yet anarchy was an arbitrary political construction – derived from problematic Hobbesian assumptions – and was exposed as something always in the process of being imposed *and* resisted. The task, in part, was for CIRT to retrieve what Ashley and Walker (1990) called 'dissident' voices – those marginalized by the discipline – to give place to new and potentially liberating practices of 'global political seeing, saying, and being' (Ashley, 1988: 229), and thereby develop alternate ways of mediating political authority and political community.

In addition to these earlier, ground-breaking interventions of leading theorists in the 1980s and 1990s, CIRT has since exploded into a variety of engagements across the discipline that consciously adopt the ideas and methods of the FS. Whilst too vast to canvass here, these range from pursuing entirely new approaches to terrorism and security,<sup>8</sup> or problematizing the state,<sup>9</sup> global health,<sup>10</sup> the politics of recognition,<sup>11</sup> on reflexivity and dialectics,<sup>12</sup> environmental politics,<sup>13</sup> and world society and cosmopolitanism,<sup>14</sup> to name but a few key research areas. Two examples of this adoption and expansion of the ideas and methods of the FS

in CIRT will be described in the last section. And yet despite this expansion, CIRT remains at a crossroads in its development as an intellectual and political project through the unresolved presence of an interconnected set of problems related to history and relationality. These must be overcome if this approach is to remain relevant not just to the discipline but to its commitment to emancipation.

## PART 2 – OVERCOMING THE LIMITS OF CIRT

CIRT is a building site in IR theory and yet little has been constructed beyond the First Generation FS and Habermasian approaches. Many have noted previously the conspicuous absence of a discussion of colonialism and capitalist exploitation of peoples outside the West in the narrative of the FS (Steinman, 2004), problems that have been transferred and amplified in CIRT. Compounding this problem is that the methods of the FS cannot be merely 'up-scaled' to the level of the globe, given their sociological analysis was primarily located within the state rather than exploring the relations between peoples across states. CIRT must deal with this legacy that restricts its engagement with 'the international', particularly in historical and relational terms. These interrelated problems revolve around the Philosophy of History, Western-centrism, and 'stagism' – those assumptions behind economic development and statehood that are implied in the teleology of CIRT, however weak its notion of emancipatory 'progress' is. These problems are suggestive of a reversion or complicity between liberal-statism and CIRT that seemingly reneges on the latter's commitment to full, human emancipation.<sup>15</sup> After outlining these criticisms, I will advance a way through this impasse by pursuing a refined intersubjective ontology that can inform a radical and critical analysis of social relations in world politics, one far more advanced than those of mainstream IR.

## ***Problems of History and Other Exclusions***

Many have pointed out not only the universalism implied in CIRT's interest in emancipation but how its theoretical construction is founded almost solely on Western philosophy and modernist assumptions of development. That is, its notion of reason, dialogue, and self-direction upheld particularly by Horkheimer and the early FS as part of a generalizable interest [*Allgemeinheit*] in emancipation, have been relativized in these critiques, shown to be born from a particular cultural milieu that may not speak adequately to the necessarily universalist aspirations implied by 'emancipation'. CIRT has begun to engage postcolonial, racial, and gendered, forms of oppression, though much interdisciplinary and intersectional work remains. For many, this brings into sharp relief the disconnect between CIRT's commitment to emancipation and its inability to understand both fundamental aspects of the realities of domination in late capitalism, and, the immanent tendencies for social change that have been lost under this myopic focus on specific conditions in the West and within the state. The common thrust of such criticisms suggests an urgent need to deal with the problematic legacy of the Philosophy of History that lingers both within CIRT's notion of progress and emancipatory agency – that is, *who* acts and in which ways such actions can be considered *emancipatory*. If CT 'aims at the emancipatory self-clarification of the political struggles of the age' then how can it ignore the theorization of decolonization (Allen, 2015: xiv), or of gender (True, 2012)? Part of this relates to the language of Western rational-moralism that Forst argues may disfranchise those struggling for emancipation but who 'have the wrong, non-European passport to properly speak the language of "European morality"' (2014: 183). Related is how CIRT's commitment to (European) Enlightenment renders it within the same modernist and developmental framework that

postcolonial theorists, in particular, have shown is unilinear, culturally monist, and fortifies a misplaced faith in notions of 'progress'. A critical sociology of world politics that does not engage with the global situatedness of communities remains limited precisely because it abstracts human community away from its global context – and along with it any potential to properly identify the immanent possibilities for human emancipation *in the world*. If CIRT is to take its role as a group of 'Transformative Intellectuals' seriously and thereby contribute to concrete social movements towards emancipation, then it cannot continue to 'mediate uncritically ideas and social practices that serve to reproduce the status quo' (Aronowitz and Giroux, 1985: 39–40). Only in forming a 'dynamic unity' with *all* the oppressed can CIRT give expression to the 'concrete historical situation' and act as 'a force within it to stimulate change',<sup>16</sup> and thereby contribute towards a critical cosmopolitanism or rational human association. This does not issue in some demand for unmediated intersectionality that soon falls to fixed notions of identity but for the dialectical analysis of the question of universal history. In other words, how are we to understand the unfolding of collective, human life within the global context and complexity of social relations between human and nature?<sup>17</sup>

CIRT has been criticized in terms of temporality (Hutchings, 2007: 71ff.), its Western and European centrisms (Hobson, 2007: 91ff.), and its misunderstanding of feminism (Tickner, 1997), but perhaps the most productive expression of its limitations was by Neufeld regarding what CIRT can *learn* from these allied, critical approaches (2012: 173). For Neufeld, it is not just that multivocality and pluralism are politically correct affectations, or, I would add, something that can 'add-on' a colonial or gendered mindset to fill gaps in Western epistemology, but are in fact central for a 'non-coercive and non-dominating' (Said, 2001: 367) approach to emancipation. The failure of the

FS to engage with postcolonial theorists of their time – whether CLR James or Fanon, in particular – raises serious questions about the utility of their critique of ideology, instrumental reason, or late capitalism. A closer engagement could have led to a clearer understanding of development, the erosion of working-class solidarity, and the expansion of capitalism and the state, and perhaps even given alternatives to the emancipatory project rather than the late, pessimistic turn of the First Generation. This alternative history is credible given that the birth of postcolonial critique followed the wake of defeat of class struggle in the West, *and*, the revolutionary nationalism in de-colonized states (Eagleton, 1999: 5). The same (potential) epistemological openings remain true of CIRT today. For example, closer engagements with gender can help overcome what Meger (2016) has identified as a tendency in IR (including CIRT) to neglect geographies and materialities of power. For her, a properly critical approach must re-interrogate social structures (patriarchy, political economy, etc.) and global political economic struggles. Without such engagement CIRT risks being what Thompson (2016) has termed ‘domesticated’, that is, surrendering a concern with domination and alienation to mere ‘neo-Idealist’ themes.

## CONCLUSION

The task, conceived broadly, is to be more attentive to parallel historical processes of emancipation. In CIRT, Martin Weber (esp. 2015) has taken seriously this challenge, attempting to bridge CIRT with postcolonial insights, particularly regarding the nature of development, history, and the subject of world politics. Others have sought to reposition CIRT through a historical rather than philosophical register. For example, Devetak has argued for a longer intellectual heritage than from the ‘FS-to-German Idealism’

narrative. For him, a key limit of CIRT is its reliance on moral philosophy and he has attempted instead to foreground CIRT within a secular political historicism (Devetak, 2014). This re-tracing of historical emancipatory processes within CIRT has led to a greater appreciation of plural enlightenments across different societies and eras that made possible the Western Enlightenment that had remained historically unmediated by the FS. As Cox has shown, contact with non-European cultures and ‘mutual civilizational borrowings’ provided the conditions for successive changes in European thought from which this emancipatory current emerged (1995b: 14). Buck-Morss’ analysis of the revolution in Haiti as the ‘crucible’ for the Enlightenment (2009: 42) further mediates this narrative – pushing our understanding of the Enlightenment away not only from its European moorings but also from its conception as a singular event, disconnected to history and the relations in the world. This revolution took place not in the centres of the West, as assumed in the predicted theories of revolution. For Buck-Morss it therefore challenges our ‘moral imagination’ in the ‘political present’, potentially informing new global thinking and global action (Buck-Morss, 2009: x). The hope is that through these historical retracings, new forms of emancipatory knowledge and action can emerge or be reclaimed. As always, the role of the ‘critical’ theorist remains to provide a ‘liberating ... influence’ in this process of emancipation to help ‘create a world which satisfies the needs and powers’ of all humanity (Horkheimer, 1972b: 246).

CIRT has left an indelible mark on the discipline of IR, highlighting the limits of positivist analysis, exposing the link between knowledge and interests, and thereby the supportive role played by the disciplinary mainstream in maintaining the interests of the most powerful in world politics. This cultural and ideological critique has been perhaps one of its most groundbreaking contributions. Yet it is in its methods, specifically the dialectical

approaches of immanent critique and normative reconstruction, that it has been most innovative. Even though Adorno may yet be proven right that the moment of its realization may have been missed (1981: 3), the vision of emancipation in CIRT remains as a promissory note for critical scholarship that weds historical possibility with the ethical concerns [*Allgemeinheit*] of humanity as a whole.

## ACKNOWLEDGEMENTS

I would like to thank Martin Weber and Tim Aistrophe for comments received on earlier drafts.

## Notes

- 1 This is Cox's nomenclature but resonates clearly with Horkheimer's notion of 'Traditional Theory'.
- 2 Similar accounts have been written. See Linklater (1996) and Honneth (2004: 336–60).
- 3 Whilst CIRT has developed in different ways within German IR, for reasons of length and scope this chapter will concentrate on CIRT in Anglo-American IR.
- 4 I have explored the similarities and differences between Horkheimer and early CIRT elsewhere, especially in the work of Cox (see Brincat, 2016).
- 5 For a collection of such views, see Rengger and Thirkell-White (2007) and Brincat et al. (2012).
- 6 The debate between so-called 'Utopianists' (i.e. liberal internationalists) and Classical Realists (Carr, 1946).
- 7 For example, the Landmines Test Ban Treaty, protections against transboundary pollution, and refugee conventions (Linklater, 2001).
- 8 For example, the work of Richard Jackson, Charlotte Heath-Kelly, Harmonie Toros.
- 9 For example, the work of Kimberly Hutchings.
- 10 For example, the work of João Nunes.
- 11 For example, the work of Volker Heinz, Jürgen Haacke, Thomas Lindeman, Erik Ringmar.
- 12 For example, the work of Shannon Brincat, Matthew Fluck.
- 13 For example, the work of Martin Weber.
- 14 For example, the work of Benjamin Herborth. On cosmopolitanism, the work of Anthony Burke has been prominent, as has Jürgen Habermas' model of global governance (see esp. 2006: chapter 8).
- 15 This is particularly evident in the late work of Habermas but also in parts of Honneth's analysis of the public sphere (see esp. 2014).
- 16 This is, of course, a riff on Horkheimer's positioning of the work of the Institute (see Horkheimer, 1972a: 215).
- 17 This is a question adapted from Buck-Morss (2009: 109).

# Space, Form, and Urbanity

Greig Charnock

*(Social) space is a (social) product.* (Lefebvre, 1991: 26)

By its actions, this society no longer accepts space as a container, but produces it; we do not live, act and work 'in' space so much as by living, acting, and working we produce space. (Smith, 2008: 116)

In its most general sense, Critical Theory aims to *critique* existing society as well as 'traditional' theories of that society: more precisely, it aims to 'penetrate the world of things to show the underlying relations between persons' (Aronowitz, 2015: 106) – to reveal the 'human bottom of nonhuman things' (Horkheimer, 2002: 142). Critical Theory thus attaches to 'critique' a very specific meaning (Bonefeld, 2001). Given that in a capitalistically constituted society, social reproduction is regulated by the production and exchange of 'things' by (formally) 'free' and 'equal' commodity producers, a good deal of Critical Theory's critique has justifiably focused upon the social constitution of *economic* forms, and upon demystifying

common consciousness of economic relations on a human basis (Backhaus 2005; Bellofiore and Redolfi Riva, 2015; Reichelt, 2005). Following Marx and Adorno, Bonefeld (2014: 3) argues for instance that 'the critique of political economy amounts to a critique of ontological conceptions of economic categories, including the category of labour as a transhistorically conceived category that defines the human metabolism with nature in abstraction from society'. A critical theory of capitalist society, in other words, should aim to demystify not only the market as a form of social reproduction based upon fundamental relations of un-freedom and in-equality, but also to expose traditional conceptions of that society as being rooted in unfounded ontological assumptions about humans' relation with nature that are appropriate to the functioning of that society, but which can be shown to be in the service of the ongoing reproduction of definite social relations, and a debasing and destructive social-ecological condition.

The remit of critique in this sense extends to cover social forms and ideologies that are often not considered to be of central, categorical importance to the critique of political economy, *per se* (see Adorno, 2001). As this chapter shows, there is already a well established body of critical social theory that has sought to critique spatial or geographical forms of social organisation – especially the agglomeration and networking of people and productive and consumptive economic activities in cities or urban centres – and those traditional urban theories that reduce such spatial or geographical forms to mere containers or conduits seemingly devoid of a ‘human bottom’.<sup>1</sup> For Neil Brenner, a leading contemporary urban theorist, any properly *critical* urban theory has to ‘differ fundamentally from what might be termed “mainstream” urban theory – for example, the approaches inherited from the Chicago School of urban sociology, or those deployed within technocratic or neoliberal forms of policy science’ (2009: 198). Calling for ‘a much more systematic integration of urban questions into the analytical framework of critical social theory as a whole’ (2009: 205), Brenner envisions a critical-theoretical project inspired by the Frankfurt School, among others, but appropriate to ‘conditions of increasingly generalised, worldwide urbanisation’ in the early twenty-first century:

Rather than affirming the current condition of cities as the expression of transhistorical laws of social organisation, bureaucratic rationality or economic efficiency, critical urban theory emphasizes the politically and ideologically mediated, socially contested and therefore malleable character of urban space – that is, its continual (re)construction as a site, medium, and outcome of historically specific relations of social power ... In short, critical urban theory involves the critique of ideology (including social-scientific ideologies) *and* the critique of power, inequality, injustice and exploitation, at once within and among cities. (2009: 198)

The purpose of this chapter is to establish the basis for a critical theory of space; that is, for an appreciation of how, to paraphrase Neil

Smith, modern society does not exist *in* space but actively *produces* space ‘in its own image’. It expands on the premise of there being a ‘human bottom’ to space and geography that has emerged out of an alienating and contradictory process of social-ecological metabolism, and in so doing expounds the basis for the critique of traditional Western epistemological conceptions and theories of urbanity. As has been recently underlined,

[if] it is no longer remarkable to speak of space, nature, and landscapes as socially *produced*, it is largely a reflection of the extent to which contemporary spatial and geographical thought has been transformed ... in particular with the ideas – or at least the language – of the French Marxist philosopher and sociologist Henri Lefebvre. (Kirsch, 2012: 1042)

In the absence of any definitive Frankfurt School Critical Theory of space and urbanity, the bulk of this chapter therefore consists of an exposition and critical evaluation of Lefebvre’s critical theory of the production of space. Before visiting Lefebvre, however, the chapter first follows the late Marxist geographer Neil Smith in looking for a properly critical-theoretical basis for deciphering spatial forms on a human basis in society’s metabolic relation with nature, and in dialogue with Alfred Schmidt’s pioneering work on a critical theory of the relationship between human labour and nature. This is a necessary detour since the notion of the production of nature, which Smith advances as a result of his engagement with Schmidt’s critical theory, is largely homologous to that of the production of space as originally theorised by Lefebvre. Lefebvre’s contribution is explained with a focus, first, on his critique of philosophico-epistemologies that fetishise space, and therefore make possible the representation of space and the instrumentalisation of spatial modelling that, in Lefebvre’s view, mediates the survival of capitalism and the reproduction of capitalist social relations in and through the urban form. The chapter then explains Lefebvre’s method of spatial

analysis, paying close attention to the contradictory nature of the process of the production of space and therefore to the emancipatory political possibilities inherent to it. The fourth section of the chapter returns to Smith to subject Lefebvre's own 'respatialised critical social theory' to critique on the grounds that it proceeds from unfounded or indefensible assumptions regarding the relations between time, space, nature, and therefore politics. The chapter concludes by reviewing how Lefebvre has nonetheless influenced more recent attempts to develop a critical theory of space under conditions of so-called 'planetary urbanisation' characteristic of the early twenty-first century.

## FROM THE PRODUCTION OF NATURE TO THE PRODUCTION OF SPACE

Within just a couple of years of one another, the British geographer David Harvey and his former student Neil Smith published two books that were to very rapidly transform the discipline of human geography as well as to make an enduringly significant impact on the broader social sciences. With *The Limits to Capital* (Harvey, 2007), first published in 1982, and 1984's *Uneven Development* (Smith, 2008), both authors eyed similar goals insofar as they each sought to challenge basic notions of space characteristic of traditional Western thought and common parlance – that of 'space as field, as a container, or as simple emptiness' (Smith, 2008: 92) – and to advance instead a systematic, Marxian understanding of how capital creates space in its own image. Both hold that geographical space itself becomes an active moment in the production and reproduction of a physical landscape bearing the hallmarks of alienation, exploitation, contradiction, and therefore politics. In *Uneven Development*, Smith surveys a canon of traditional Western thought about nature and space before outlining an original, critical theory of uneven

development in the last two chapters. Harvey's *Limits*, on the other hand, represents his 'explanatory-diagnostic' (Castree, 2006) – allegedly 'neo-classical' (Kipfer et al., 2008: 7) – Marxism, insofar as it consists of a more parsimonious attempt to provide an exposé of the crisis tendencies of the 'capitalist space economy' drawing almost exclusively on Marx's writings on value, production, exchange, and the circulation of capital. On the assumption that Harvey's contribution to the critical theory tradition is demonstrably limited, therefore, I concentrate on Smith in this first section, as providing an appropriate introduction to conceptualising the relation between society and space in terms of distinctively critical, non-traditional theory.

For Smith, an essential preliminary step in the appreciation of how capital produces space at various interrelational scales – from the local to the world market – is to first examine the *production of nature* in capitalist society. This, he underlines, is a reflexively critical endeavour since it must penetrate the 'delusive appearance of things' (Marx, quoted in Smith, 2008: 49), and must question a core tenet of traditional Western thought in which 'nature is generally seen as precisely that which cannot be produced; it is the antithesis of human productive activity' (Smith, 2008: 32). With this in mind, Smith mounts his construction of a theory of the production of nature on the basis of a critical reading of the Frankfurt School and a close reading of Alfred Schmidt's *The Concept of Nature in Marx* (1971), in particular. Ultimately, Smith is unconvinced by Schmidt's dualistic positing of two coterminous natures (one the external object of labour, the other a universal unity of nature and society), and of a resulting thesis he finds at the same time both utopian and, in 'characteristic' Frankfurt School fashion, despairing of 'the inexorable necessity of human domination over nature' (2008: 47; see also Foster, 2000: 245). Yet, Smith also finds much to commend in Schmidt's book. For instance, Schmidt alerts us to the

central importance of the concept of socio-ecological *metabolism* in Marx's own work: the key point being that 'the whole of nature is socially mediated and, inversely, society is mediated through nature as a component of the total reality' (Schmidt, 1971: 79).<sup>2</sup> Smith also picks up on Schmidt's 'useful distinction between "first nature" and a "second nature"' (Smith, 2008: 33), which he subsequently re-fashions in *Uneven Development* so as to claim that 'we must now consider there to be a social priority of nature; nature is nothing but social' (2008: 47), and that 'instead of the domination of nature, therefore, we must consider the more complex process of the *production of nature*' (2008: 48).

For Smith, the term 'second nature' captures the result of the historical generalisation of production for exchange characteristic of capitalism, and subsequently – as part-and-parcel of the completion of the world market – the result of the 'real subsumption of nature to capital' (Smith, 2006). With the development of capitalism as a genuinely worldwide form of social production, 'nature is progressively produced from within and as part of the so-called second nature' (Smith, 2008: 77). While it is true that any physical commodity produced remains subject to the laws of gravity and physics that apply in first nature, that commodity is at the same time an exchange-value subject to the abstract laws of the market and therefore, for Smith, 'travels in second nature' (2008: 79). In search of profit, capital 'attaches a price tag to everything it sees and from then on, it is this price tag which determines the fate of nature' (2008: 78); 'no part of the earth's surface, the atmosphere, the oceans, the geological substratum, or the biological substratum are immune from transformation by capital' (2008: 79). Indeed, for Smith, such was the degree to which capital had subsumed nature in this manner that the distinction between first and second nature was, by the late twentieth century, practically obsolete.

While this universalising tendency of capital to produce second nature on a world

scale carries with it important homogenising tendencies (and Smith here discusses wage-labour, globalised production, the privatised and gendered form of the reproduction of labour-power, and bourgeois consciousness), it is nevertheless one that is rooted in the specifically capitalistic production process and specifically capitalist relations of production. As such, the production of nature on a universal scale is rife with internal contradictions that are manifest in barriers to 'capital's own nature' (to paraphrase Marx, 1993: 410), both in terms of the production of scarcity and 'natural' crises (such as climate change), and in terms of the production of a specific barrier to capital in the form of a global working class which confronts the unity of society and nature in alienated forms on a daily basis – the labour market, the labour process, the wage-form, and so on (Smith, 2008: 84–5).

Having laid out a theory of the production of nature, Smith then turns his attention to the question of space, and the core problematic of *Uneven Development*: namely, how to explain the ongoing production of a highly variegated and dynamic geographical landscape in capital's own image – that is, to decipher *produced* space as means and end of capital's socio-ecological metabolism.<sup>3</sup> Smith's line of argument is unequivocal: 'Unless space is conceptualised as a quite separate reality from nature, the production of space is a logical corollary of the production of nature' (2008: 92). His own theory of the uneven development of capitalism therefore builds upon the argument that the produced space, or socio-ecological landscape, of capitalist 'second nature' emerges out of a determined, incessant 'dialectic of equalisation and differentiation' of the development of capital's productive forces. As capital extends its reach over the whole globe, the landscape is wholly subsumed within and therefore produced by the production of nature and capital's price-tagging of everything, yet consists of myriad particularised spaces/places – at a variety of spatial scales – whose *relative* past, present and future development is conditioned by

geographically specific degrees of the concentration and centralisation of capital, the agglomeration and socialisation of labour-power, and differing degrees of resilience to the perpetual rhythms of accumulation that periodically threaten the devaluation of geographically concentrated fixed capital and localised working classes bearing specific productive and cost attributes. As Smith explains,

the drive towards universality in capitalism brings only a limited equalisation of levels and conditions of development. Capital produces distinct spatial scales – absolute spaces – within which the drive towards equalisation is concentrated. But it can do this only by an acute differentiation and continued redifferentiation of relative space both within and between scales. The scales themselves are not fixed but develop (growing pangs and all) within the development of capitalism itself. They are not impervious; the urban and national scales are products of world capital and continue to be shaped by it. But the necessity of discrete scales and of their internal differentiation is fixed. (2008: 196)

‘Uneven development’, he concludes, ‘is the product and geographical premise of capitalist development’.

### **HENRI LEFEBVRE’S CRITIQUE OF FORMALISM AND OF URBAN FORM<sup>4</sup>**

Smith’s arrival at a general theory of uneven development as a necessary premise and product of capitalist development owes a significant debt to the work of Henri Lefebvre, who first coined the term ‘the production of space’ and theorised spatial forms in largely homologous terms to the production of nature thesis. For Stanley Aronowitz (2015: 133), the Anglo-American academy’s ignorance of Henri Lefebvre while he was alive amounts to ‘a classic case of mis-recognition’, insofar as most failed to appreciate his significance as

the ecophilosopher of the 21st century, for he made the connection between the massive

despoiling of the global ecosystems, the new shape of social time and space and the struggle for the transformation of everyday life which, he claims, is the key to the project of changing life and repairing our collective relationship to nature.<sup>5</sup>

Yet, in recent years, Lefebvre’s work has become incredibly influential in its own right, and his ideas and concepts have become common currency among critical urban theorists.<sup>6</sup>

Prior to the posthumous discovery of the works of Henri Lefebvre by Anglophone scholars since the 1990s,<sup>7</sup> and of his popularisation by Marxists such as Smith, on the one hand, and cultural theorists of ‘post-modernism’ on the other (see Kipfer et al., 2008: 6–10), his reception in France and elsewhere was primarily as someone who wrote about dialectical method and Marx in the Hegelian, humanist tradition common to much ‘Western Marxism’ (Shields, 1999: 109; also Jay, 1984).<sup>8</sup> A hallmark of Lefebvre’s writings is the extent to which they are consistently methodologically minded, the dialectic being the thread that runs through his prolific and thematically varied output over several decades. This is certainly the case with his writings on space, originally published in France between 1968 and 1974. In these, and in addition to arguing persuasively that space should be thought of in dialectical terms of its social production – rather than in purely Cartesian and Euclidean terms<sup>9</sup> – one of Lefebvre’s signal critical-theoretical contributions is to highlight the anti-representational orientation of Hegelian Marxism. That is, his critique of formal logic and epistemology emphasised at once the dialectic’s ability to reconcile social analysis with flux, internal relations, determinate negation, mediation and Becoming, while also exposing the violence or ‘terrorism’ inherent to dominant, representational norms of analysis based upon purely formal epistemologies and methods of formal abstraction.

For Lefebvre, representational knowledge about the world is an abstraction from concrete, lived experience [*du vécu*] and as such

ideological (for instance, Lefebvre, 1991: 230). In various works, Lefebvre reveals the limits to formal epistemology, but also at the level of serviceable representations that have a 'real' and violent effect in the hands of planning agencies and policymakers. In his work on space and urbanism, Lefebvre therefore railed against 'models' – abstract but concretely applicable representations of a projected, planned society in which some kinds of social and spatial practice are condoned and others dismissed as pathological or dysfunctional. Lefebvre is highly critical of the intellectual division of labour characteristic of the modern university system, as well as of the social role of 'techniques, technicians, technocrats, epistemology, and the research of a purely technical or epistemological order' (Lefebvre, 2009: 175) that serve to dissect the total movement of human social praxis, compartmentalise various spheres or activities of everyday life (paradigmatically, in the circuit ... production ... consumption ... production ...), and mould concrete space according to the logic of pure form, recurrence and coherence. To deny particularity and difference, for Lefebvre, is to be dogmatic, and to aim to reduce differences and close the circuit of everyday life is to be implicated in the generalised 'terrorism' of the bourgeoisie (Lefebvre, 2000). He writes 'the physician of modern society sees himself as the physician of a sick social space ... The cure? It is *coherence* ... he will systematise the *logic of the habitat* underlying the disorder and apparent incoherence' (Lefebvre, 1996: 82–3).<sup>10</sup> There is violence intrinsic to such abstraction: 'the "plan" ... does not remain innocently on paper. On the ground, the bulldozer realizes "plans"' (Lefebvre, 1996: 191). In terms of critique, then, Lefebvre is certain that 'to clear a path, we have to destroy the models' (Lefebvre, 2003: 163).

Lefebvre's antidote to traditional epistemologies of urbanity, formal logic, speculative philosophies, Althusserian structuralism, Sartre's existentialism, and Soviet Diamat

was what he repeatedly calls 'metaphilosophy' (see Lefebvre, 2016). At root, metaphilosophy is concerned with *praxis*: 'Production produces man. So-called "world history" or the "history of the world" is nothing but the history of man producing himself, of man producing both the human world and the other man, the (alienated) man of otherness, and his self (his self-consciousness)' [sic] (Lefebvre, 2008: 237). The purpose of critique, for Lefebvre, is therefore to illuminate and decipher human alienation on the basis of praxis (2008: 137); it is to ask: 'How can men [sic] live as they are living, and how can they accept it?' (2008: 30). Lefebvre's own exploration of this question led him to develop his critique of everyday life over the course of four decades, and to his work on the production of space.

The continuities of thought from Hegel and Marx to Lefebvre are evident in the latter's long-term preoccupation with everyday life [*la vie quotidienne*], the practical problem of alienation that arises out of human social practice in the historical form of bourgeois society, and an investigation into the potential for realising an as yet only possible dis-alienated society through praxis. The consideration of the broadest possible notion of production (to include signs, writing, culture, space, etc.) as well as the problem of *re-production* of the mode of production and its associated forms of alienation, is central to understanding Lefebvre's long-term project as best represented by the three volumes of his *Critique of Everyday Life*, published between 1947 and 1981. As Lefebvre writes,

According to Marx's early works ... production is not merely the making of products ... it also signifies the self-production of the 'human being' in the process of historical self-development, which involves the production of social relations. Finally, in its fullest sense, the term embraces *re-production* ... [this] being the outcome of a complex impulse rather than of inertia or passivity; this impulse ... this *praxis* and *poiesis* does not take place in the higher spheres of a society (state, scholarship, 'culture') but in everyday life. (Lefebvre, 2000: 30–1)

This project yielded the substance of Lefebvre's lasting contribution to critical social theory – a theory of social (re-)production in which 'everyday life has become an object of consideration and is the province of organisation; the space–time of voluntary programmed self-regulation, because when properly organised it provides a closed circuit (production–consumption–production), where demands are foreseen because they are induced and desires are run to earth' (Lefebvre, 2000: 72). In recognising this, the dialectic of everyday life builds upon the Marxian critique of alienation, yet, in Lefebvre's view, broadens its parameters beyond the critique of political economy which hinges too narrowly on the question of linear time. 'Workers do not only have a life in the workplace', explains Lefebvre (1988: 78), 'they have a social life, family life, political life; they have experiences outside the domain of labour', and this would suggest, for Lefebvre, a closer examination of how urban form guarantees the everyday domination of the linear time of labour and accumulation over the rhythmic time of biology, ecology, and art (Aronowitz, 2015).

The idea that the sphere of everyday life can explain the survival of capitalism into the late twentieth century – as well as illuminate the role of formal logic, modelling, and social planning as ideology, as we explain later – leads Lefebvre (1976: 21) to his now well-known thesis: that 'capitalism has found itself able to attenuate (if not resolve) its internal contradictions for a century ... *by occupying space, by producing a space*'. Lefebvre reveals that capitalism produces its own (urban) space and, in so doing, creates the permissive conditions for the reproduction of the totality of bourgeois society (an argument that implicated the former communist bloc as much as the West). Time, understood in the abstract as concerning work, the production of commodities and of surplus value, has been 'reduced to constraints of space' – circumscribed and suppressed within the *urban form*. The process

of mediation that re-produces the social relations of production in a contradictory form, according to Lefebvre, is therefore that of *urbanisation*.

In *The Urban Revolution* (2003), Lefebvre explains how the growth of industry and of the forces of production on an increasingly global scale has come to be subsumed by the more encompassing process of urbanisation. In and through the urban-form, capitalism is able to reproduce itself by relativising all particularities – a dialectical necessity Marx identified in terms of the division of labour, the factory system, and so on, but into which Lefebvre introduces spatial determinations and in so doing offers an explanation of the survival of the capitalist mode of production to date. The urban form *totalises* all particular labour and space in an internal and '*centralising*' relationship: 'piles of objects and products in warehouses, mounds of fruit in the marketplace, crowds, pedestrians, goods of various kinds, juxtaposed, superimposed, accumulated – this is what makes the urban urban' (Lefebvre, 2003: 116). There is, according to Lefebvre, 'no urban reality without a centre, without a gathering together of all that can be born into space and that can be produced in it, without an encounter, actual or possible, of all "objects" and "subjects"' (Lefebvre, 1996: 195). Yet despite this intrinsic centralisation, and despite the urban being a creation of socio-ecological metabolism, the urban-form is determined as a 'product' (corresponding to exchangeability and price signals) rather than an '*oeuvre*' – a place of dwelling and of playful, poetic, and artistic sociality and imagination. Perversely, urbanised 'citizens' are concentrated together in bodily proximity like never before, yet they have never been more segregated, alienated, and atomised in their everyday lives. For Lefebvre, nowhere was this constraining and alienated mode of everyday life within the urban habitat more evident than in the state-planned new towns and housing projects erected in many European cities in the post-war period. Here, 'humiliation and the lack of freedom resulting from the presence (and absence) of the centres

of decision-making and social life are keenly felt' (Lefebvre, 1969: 99).

Lefebvre's critique of everyday life places emphasis upon the extent to which, by the 1970s, time had become dominated by space, the growth of the forces of production by the development of the social relations of production,<sup>11</sup> and in the urban-form. Moreover, this reproduction occurs by means of the totalising drive by capital to subsume the entire world to *abstract space* (Lefebvre, 1991; Stanek, 2008), which is 'abstract inasmuch as it has no existence save by virtue of the exchangeability of all its component parts, and concrete inasmuch as it is socially real and as such localised' (Lefebvre, 1991: 341–2). Lefebvre termed this process of global subsumption [*mondialisation*], that of the self-realisation of a spatial totality – of the world 'becoming worldwide', of 'planetary urbanisation' (Lefebvre, 2009).

## THE PRODUCTION OF SPACE AND THE POLITICS OF DIFFERENCE

As a dialectical theorist, Lefebvre is adamant that the urbanisation process also provides clues as to the possibility of a dis-alienated totality that already exists, albeit in the mode of being denied. Analytically, this poses the question of form *and* content. The key here is to recognise that 'urban space–time, as soon as we stop defining it in terms of industrial rationality – its project of homogenisation – appears as *differential*' (Lefebvre, 2003: 37). That is, 'abstract space *is not* homogenous; it simply *has* homogeneity as its goal, its orientation, its "lens"' (Lefebvre, 1991: 287). For Lefebvre the Marxist, the identification of the potentially revolutionary content of the analysis of the production of space and critique of everyday life follows from the insight that the production of space can only proceed via a relational process of homogenisation-differentiation (Lefebvre, 1991: 308, 342; Stanek, 2008: 71–2). Urbanisation

brings human subjects together in space in such a way that is necessary for the reproduction of the social relations of production, but which also exacerbates the contradictions of this abstract space – for example, it creates centres in which 'once groups and classes succeed in meeting face to face, once they come to grips, a free dialogue explodes under the dialectical impetus' (Lefebvre, 2000: 185). Homogenising abstract space is therefore constituted by social relations that simultaneously constitute a 'differential space', which 'is different because it celebrates particularity – both bodily and experiential' (Merrifield, 2000: 176). So, while Lefebvre explains the necessity of urbanisation from the point of view of capital, he also identifies 'the existence of *irreducibles*, contradictions and objections that intervene and hinder the closing of the circuit [of everyday life], that split the structure' (Lefebvre, 2000: 75). For Lefebvre, there is some residuum of human subjectivity and *style* that capital has been unable to subsume, invert or control,<sup>12</sup> and it is this insight which holds the key to understanding the limits to the production of abstract space in an urban-form. Everyday life is, according to Lefebvre, the sphere in which such irreducibles are to be found. It is 'the sociological point of feedback' (Lefebvre, 2000: 32); 'the ill-defined, cutting edge where the accumulative and the non-accumulative intersect' (Lefebvre, 2008: 335); and 'the point of delicate balance and that where imbalance threatens' (Lefebvre, 2000: 32). And, critically, it is the sphere that holds the key to revolutionary action: 'a revolution takes place when and only when, in such a society, people can no longer lead their everyday lives'.<sup>13</sup>

'Urbanisation' is for Lefebvre a determined, dialectical, systematic theoretical category and not simply an empirical, immediate product. In general terms, it is a process in which the determinations 'centrality' (homogeneity) and 'polycentrality' (fragmentation, difference) are mediated, (un-)fixed within the urban-form (Lefebvre, 2003:

119; Rui Martins, 1982: 171). The means of critically analysing urban form as a mediating space which attains a 'certain cohesiveness, if not a logical coherence' (Lefebvre, 1991: 378) is laid out by Lefebvre in *The Production of Space* (1991). Lefebvre outlines a unitary 'spatial triad' consisting of three relational moments, or conceptions of space, which allow the analyst to grasp both the generative, diachronic constitution of urban space as well as to behold, synchronically, the material appearance of socio-physical space at a given time. As one exponent of such a Lefebvrian urbanist methodology summarises, this theory 'has at its core a three-level process of production: first, material production; second, the production of knowledge; and third, the production of meaning' (Schmid, 2006: 169) – corresponding to the three-fold determination of space out of practical, mental, and symbolic dimensions. Lefebvre termed these dimensions; first, the 'perceived space' [*espace perçu*] of 'spatial practice' based in the concrete and networked social and physical infrastructures of production, exchange and social reproduction that materialise under urbanisation. Second, the 'conceived space' [*espace conçu*] of 'representations of space', comprised of 'scientific' and 'official' knowledge that reduces space in functionalist terms – diagnosing its utility and pathology and prescribing models to remould space. Third, the 'spaces of representation', or 'lived space' [*espace vécu*], in which inhabitants and users of the city inscribe their own symbolic content and meaning to space in the course of their everyday lives – producing an elusive space of art, play, imagery, incoherence, inconsistency, and everything that is surplus or residual once the dissection of space by traditional epistemological means has been exhausted (Schmid, 2006: 168–9; see also Merrifield, 1993: 522–5). Put another way,

Urban space is, first of all, material, perceivable space. As such, it is a space of material interaction and of physical meeting that is opened up by networks and information flows ...

Second, ... [w]hat we understand of the city is dependent on the social definition of the urban and thus on the image of the city, on the blueprint of the map, but also on the plan that tries to define and pin down the urban.... Depending on one's perspective – scientific, planning, media, or political – the city is understood to mean different units. All these various definitions are specific representations of space. They describe discursive demarcations of the content of the urban and entail corresponding strategies of inclusion and exclusion. Definitions of the city become a field in which a variety of strategies and interests are employed.

Third, the city is always a lived space as well, a place of residents who use it and appropriate it for their practices. The urban identifies the place of difference: the specific quality of urban space results from the simultaneous presence of quite distinct worlds and concepts of value, of ethnic, cultural, and social groups, of activities, functions, and knowledge. (Schmid, 2006: 169–70)

Lefebvre's analysis of urbanisation, and of the production of abstract yet differential space inherent to this process, points towards a *virtual*, or possible, urban society – one in which cyclical time is no longer subordinated to space, and which is 'based upon the elimination of antagonisms that find their expression in segregation; it must involve differences and be defined by these differences' (Lefebvre, 2000: 190).<sup>14</sup> Lefebvre concluded the means and end of revolutionary praxis in an urbanised world to be 'generalised self-management' [*autogestion*] and the 'withering away of the state' (Lefebvre, 2009: 149): in short, 'the end of politics' (Lefebvre, 1970: 8). Lefebvre (2009: 246) considers the logicians and modellers of space to be 'agents of the state' precisely because they persist despite the fact that the production of space is a contradictory process in which difference cannot be wholly reduced. Chief responsibility for suppressing the realisation of a disalienated urban society through the concretisation of abstract space lies in the Modern State ('the quintessential limiter' for Lefebvre, 2003: 163). The state has, for Lefebvre, assumed ever-increasing responsibility for circumscribing and cohering the

process of urbanisation and sustaining the alienation inherent to programmed everyday life (Lefebvre, 2008: 124–5). For Lefebvre (2009: 174), then, ‘there is a politics of space because space is political’. Lefebvre’s general critique of the process of urbanisation carries along with it a politically focused critique of reductive forms of knowledge, instrumental representations of space – and of their social and political function on an increasingly global (or worldwide) scale. By identifying *autogestion* as ‘orienting’ us to a path towards dis-alienation by means of the end of politics (Lefebvre, 1978: 295), Lefebvre envisions a possible future beyond capitalism (Lefebvre, 1968: 183) – a posture which Aronowitz (2015: 154) claims distinguishes Lefebvre from the Frankfurt School’s pessimistic stance arising out of its refusal of the ideology of progress.

What distinguishes Lefebvre’s critical philosophy from Critical Theory of the Frankfurt School is that it understands that categories such as the ‘totally administered society’ and the ‘eclipse of reason’ are accurate as tendencies, but when taken as a new totality, are one-sided. Lefebvre’s most urgent goal is to recapture genuine experience and free the concrete from its subsumption under the abstract, represented most powerfully by technology and its companion, administration. (2015: 154)

Aronowitz concludes that:

Lefebvre’s philosophy refuses the thesis that the defeats of the past century are permanent and justify the refusal of the intellectual to engage in social and political practice; in this respect, Lefebvre stands with Sartre who insisted that the intellectual must commit oneself to an historical standpoint, even as one recognises the pitfalls. (2015: 154)

## QUESTIONING LEFEBVRE’S CRITICAL THEORY OF SPACE

Kanishka Goonewardena (2008: 131) incisively surmises that Lefebvre’s ‘basic contribution to Marxism’, was to make ‘the simple point that there can be no revolution without

an urban revolution, no urban revolution without a revolution, and neither without a revolution of everyday life’. The pre-eminent critical geographer Edward W. Soja (1980: 215) agreed: ‘[Lefebvre] argues that no social revolution can succeed without being at the same time a conscious, spatial revolution’. Yet Lefebvre’s critique of space, and of his faith in the emancipatory potentialities inherent to the production of spatialities that are saturated with contradiction and therefore political, has been subjected to scrutiny and rejected by some on fundamental theoretical grounds.<sup>15</sup>

As noted earlier, Neil Smith was very much influenced by Lefebvre’s work. He confessed that he remained ‘convinced by the brilliance of his proposal of “the production of space”’ (Smith, 1998: 56), and later maintains in his Foreword to *The Urban Revolution* that ‘Lefebvre was seeing things at the end of the 1960s that many of us, often with his help, came to see clearly only in more recent years and now are still recovering’ (Smith, 2003: viii). Yet Smith also expressed deep-seated reservations about Lefebvre’s version of a ‘respatialised social theory’ (Smith, 1998: 51). In short, Smith accuses Lefebvre of operating with precisely the kind of bifurcation between space and nature that his own work warns against. In Smith’s reading, Lefebvre ‘leaves nature largely unreconstructed’ (1998: 59), much as one of his influences Martin Heidegger did, and such that ‘nature is reduced to a substratum’ (1998: 60). Space takes priority over an external nature, and in Lefebvre’s somewhat bucolic and romanticist vision is lost to time as the production of abstract space proceeds with greater intensity and extensity. For Smith, on the other hand – and as noted earlier, ‘the production of space is integral to the production of nature and fashioned within it. It is the corollary of the production of nature rather than the other way round’ (1998: 61). Ironically, then, Lefebvre’s treatment of nature bears all the hallmarks of the same fetishisms that pervade the traditional

social and environmental sciences insofar as he is apparently unable to comprehend the production of second nature (and beyond, to the extent that ‘the ongoing history of physical intervention ... has already socialised – in beautiful or grotesque form – what there is to be apprehended’, 1998: 62).

Smith then questions the very necessity for respatialised social theory in the first place: ‘Why, to put it most simply, is politics now a question of space?’ (Smith, 1998: 52). In Smith’s reading, Lefebvre mounts a formidable ‘anti-philosophical’ critique of traditional philosophico-epistemological thought and its fetishisation of space, but only to then himself assert dogmatically that space ought to be the ontological centre of properly critical theory of societal development. ‘Lefebvre leans to Hegel’s “end of history” and takes his stand there, on “space” as the product and residue of “historical time”’ (1998: 55). ‘History’ as Marx, Bergson, Husserl, or Lukács knew it therefore disappears in Lefebvre’s theory, to be replaced by a strikingly teleological ‘spatial history’ (see Lefebvre, 1991) in which ‘the history of society is indeed the story of class struggle, ... but of class struggle *for* space’ (Smith, 1998: 57). Smith’s concerns here chime with those of Derek Kerr, writing in the now defunct journal *Common Sense* just a few years earlier. He surmises of Lefebvre’s works (1976 and 1991) that:

Class struggle and history are reduced to abstract time and exist *in* the container of abstract space, while this space has contradictions of its own which can then externally ‘envelop historical contradictions’. But by separating out contradictions of space from those *in* space and by reducing class struggle and history to the latter, it is not clear what constitutes the contradictions of space (Kerr, 1994: 32).

Against Lefebvre, he argues: ‘If social relations are inherently spatial and temporal then there can be no separation in/of dualism’ (1994: 32); furthermore, to ‘displace time by space merely obscures the dynamic and contradictory nature of the capital relation and the ways in which this expresses itself in a

spatially uneven way through ... “the *production of space* in its own image”’ (1994: 34). For Kerr, then:

Marx was *not* limiting himself to time, but to uncovering the contradictory constitution of the capital relation (see Bonefeld, 1993) as it attempts to transform and express itself through spatial and temporal modalities of existence. It is the capital relation that continually attempts to subordinate the whole (space) of society to the abstract logic of linear time, the ticking of the factory clock. This abstract time is not the concrete history of capitalism, but rather is the dominant and contradictory tendency through which that history expresses itself, one which continually attempts to reduce the internally related and qualitative nature of *both* space and time to the quantitative metric of value. As such the form, nature and very existence of ‘capitalist space’ expresses and adheres in and through the contradictory presence of *labour in capital*. This *is* the dialectic, not one of time nor of space but ... a negative dialectic, a dialectic of negation with no certain synthesis ... The history of capitalism *is*, therefore, none other than the struggle over and through space as capital attempts to transform the entire *spatial existence* of society into a machine for the production and *quantitative expansion* of surplus value in terms of the metric of socially necessary labour time. (1994: 32)

Finally, Smith begs of Lefebvre’s work the more practical political question of providing some insight into what an alternative, spatialised politics would look like. In addition to proposing that any viable emancipatory project would have to be based upon a more convincing dialectic of nature than that with which Lefebvre operates, Smith also highlights the inadequacy of Lefebvre’s ‘reproductionism’ – that is, the insistence that whatever crisis might confront the capitalist system and bring an urban politics of difference to the fore would be a crisis of the reproduction of the social relations of production in and through space, rather than a crisis of capital’s necessity to self-valorise on the basis of the exploitation of living labour and its metabolic relation with nature. In the last instance, even if one accepts a reproductionist posture such as Lefebvre’s, it is unclear exactly how *space* per se – rather than the contradictory *socio-ecological* nature of

capital, however mediated – will determine substantive political change. As Smith puts it, ‘where Lefebvre closes in on the political conclusions of his analysis, ... space seems to fall entirely out of the picture ... it is nowhere to be seen. The dualism of space and society lingers on’ (Smith, 2008: 125).

### LEFEBVRE’S LEGACY: FROM THE RIGHT TO THE CITY TO PLANETARY URBANISATION

Notwithstanding the criticisms levelled at his work on space, Lefebvre retains significant influence in debates surrounding urban development, governance, and politics – and his theories and concepts have had a demonstrably enduring impact on critical social and urban theory.<sup>16</sup> For instance, in the wake of urban social mobilisations in 2010 – ranging from the Arab Spring, to the Occupy! movement – commentators and activists sought to make sense of what was happening with recourse to familiar Lefebvrian concepts. David Harvey paid homage to ‘Lefebvre’s vision’ (2012: ix), concluding that: ‘Perhaps, after all, Lefebvre was right, more than forty years ago, to insist that the revolution in our times has to be urban – or nothing’ (2012: 25). Harvey, like many others,<sup>17</sup> attaches great political importance to the notion of the ‘right to the city’ (Lefebvre, 1996) – which Harvey reinterprets as ‘to claim some kind of shaping power over the processes of urbanisation, over the ways in which our cities are made and remade, and to do so in a fundamental and radical way’. Andy Merrifield similarly builds his own theory of urban theory and protest around this Lefebvrian concept, but also argues that Lefebvre forewarned us of the degree to which the substantive realisation of the right to the city – ‘a *new form of centrality and citizenship*’ (2013: 34, italics in original) – would become a pressing need for the majority of humanity under the socio-ecological condition of

‘planetary urbanisation’. ‘Planetary urbanisation is creating a whole new spatial world (dis)order’, he writes (2013: 3). ‘The more the city grows, develops, extends itself, and spreads its tentacles everywhere, [Lefebvre] says, the more social relations get degraded and the more sociability is torn apart at the seams’ (2013: 15).

It would appear, then, that Lefebvre has bequeathed a politically effective lexicon of urbanity to the contemporary scholar-activist. But while Merrifield himself is open to a more experimental, perhaps less systematic, approach to urban theory and politics (see also Merrifield, 2011), others have picked up on Lefebvre’s methodological relevance for research in a world that is, as many suggest, more urbanised than ever before. Neil Brenner and Christian Schmid (2014, 2015), for example, have in recent years sought to subvert accepted ‘mainstream’ definitions and epistemologies of the so-called ‘urban age’ (e.g. UN-Habitat, 2007) in accordance with Lefebvre’s metaphilosophy (Brenner, 2013a: 95; see also Angelo and Wachsmuth, 2015). They posit, as but one of seven theses on an epistemology of ‘the urban’, that:

No longer conceived as a form, type or bounded unit, the urban must now be retheorised as a process that, even while continually reinscribing patterns of agglomeration across the earth’s terrestrial landscape, simultaneously transgresses, explodes and reworks inherited geographies (of social interaction, settlement, land use, circulation and socio-metabolic organisation), both within and beyond large-scale metropolitan centres. (Brenner and Schmid, 2015: 166)

The critical intent of such a critique of existing, ‘methodologically cityist’ (Angelo and Wachsmuth, 2015), epistemologies of ‘the urban’ is to ‘illuminate the manifold ways in which the users of urbanizing spaces produce and transform their own urban worlds through everyday practices, discourses, and struggles, leading to the formation not only of new urban spatial configurations, but of new visions of the potentials being produced and claimed through their activities’ (Brenner and

Schmid, 2015: 178). For Brenner (2013a: 89), and others, Lefebvre's critical theory remains hugely influential as a 'rallying cry' for many wishing to play an active role in reshaping 'the future of capitalism, politics, and the planetary ecosystem', since it posits that 'the urban is thus no longer a site or arena of contentious politics, but has become one of its primary stakes. Reorganising urban conditions is increasingly seen as a means to transform the broader political-economic structures and spatial formations of early twenty-first century world capitalism as a whole'. Foundational work by Brenner and others<sup>18</sup> is already yielding fresh research producing new cartographies and politico-economic accounts of planetary urbanisation – and which seek to subvert the methodological cityism inherent to traditional urban theory (see e.g. Arboleda, 2015; Brenner, 2013b; Kanai, 2014; Wilson and Bayón, 2015).

## CONCLUSION

In the absence of a definitive Frankfurt School theory of space, form and urbanity, this chapter has focused on the theory of the production of space developed by the French contemporary of Adorno and Horkheimer, Henri Lefebvre. Initially by means of a detour to the work of the geographer Neil Smith – who insisted that the production of space is a corollary of the production of nature – the chapter expounded the dialectical relation between humans, nature and space, as developed by Smith in dialogue with Alfred Schmidt's work on human labour and nature, before moving on to Lefebvre. Lefebvre's theory of the production of space – itself spun out of a longer-term preoccupation with everyday life in mid-twentieth-century capitalism – was shown to parallel the Critical Theory of the Frankfurt School insofar as it subjected traditional theories of space to critique in accordance with Marx's insistence that it is the definite social relations between humans that

manifest themselves in social forms, and not nature or history abstractly conceived. The chapter then outlined Lefebvre's contribution to the analysis of space as a social product, his theory of urbanisation, and his writings on the politics of space, before reviewing significant criticisms of that contribution – not least by Smith, who identified weaknesses that can be traced back to Lefebvre's inadequate dialectic of nature and space. Regardless of such issues, the chapter concluded by acknowledging Lefebvre's lasting legacy; first, in terms of the longevity of his key terms and concepts, such as the production of space and the right to the city, but also in his role as a key interlocutor in an emergent literature on planetary urbanisation. By questioning the methodological cityism of traditional urban theory and policy, such work illuminates the degree to which even the ostensibly 'non-urban' world is today subsumed to the destructive process of capital accumulation, rendering the traditional urban–rural distinction problematic in epistemological but also political terms (Arboleda, 2016; Brenner, 2016). As such, it echoes Lefebvre's concern to develop a critique of space and of urbanity that is not reducible to a concern with 'the city' as a mere container, or form of human settlement that poses certain governance problems (such as overcrowding or sanitation and infrastructure) to which technocratic, market-based fixes might be found. Rather, this emergent literature seeks to build upon the theorising of Lefebvre and others so as to highlight the dangers of traditional urban theory's formal methods of abstraction so as to open up more substantive and subversive debate about urbanity, citizenship and social nature beyond the city and on a biospheric, planetary scale.

## Notes

- 1 See e.g. the important appeal to consider the violence of real geographical abstractions by Loftus (2015).
- 2 For useful discussion of the concept of 'metabolism' [*Stoffwechsel*] in Marx's writings, see Foster (2000: chapter 5); and for further discussion of

- the concept in the work of Adorno, Schmidt, and Foster, see Cook (2014).
- 3 Smith's more empirical interest in the 1980s was in advancing a Marxian explanation for how and why localised instances of 'gentrification' were becoming common to many 'postindustrial' inner-cities in the United States and Western Europe.
  - 4 This and the subsequent sections draw upon my earlier work on Lefebvre (Charnock, 2010, 2014; Charnock and Ribera-Fumaz, 2011).
  - 5 Lefebvre's life story makes for fascinating reading. It is often remarked that he 'lived the adventure of the twentieth century' (Hess, 1988; Kipfer et al., 2008: 2). For accounts of Lefebvre's life and work in English, see Elden (2004), Merrifield (2006), and Shields (1999); and for the definitive account of his interest in space and urbanity in particular, see Stanek (2011).
  - 6 See e.g. Peter Marcuse (2009), son of Frankfurt School theorist Herbert Marcuse.
  - 7 This surge in interest in Henri Lefebvre in Anglo-phone social science followed, and encouraged, the first publication of several of his major works in English: notably, *The Production of Space* (1991), *The Right to the City* (published in *Writings on Cities* (1996)), *Everyday Life in the Modern World* (2000), *The Urban Revolution* (2003), three volumes of *Critique of Everyday Life* (2008), and the collection of essays in *State, Space, World* (2009).
  - 8 Stanek (2011: 63, 272) notes how Lefebvre was in various instances engaged in personal dialogue with Georg Lukács in the 1940s and 1950s, and participated in events with the likes of Kostas Axelos, Ernst Bloch, Jürgen Habermas, Herbert Marcuse, and Alfred Sohn Rethel among others in the 1960s.
  - 9 What Dimendberg (1998: 19) terms the paradigm of 'containerism', with its roots in 'the Aristotelian category of *topos*, the *res extensa* of Descartes, Newton's void, and the absolute of Leibniz', and which presupposes that 'space is essentially empty and static, a passive and inert vessel'.
  - 10 See Elden (2004) on Martin Heidegger's influence upon Lefebvre's argument that 'inhabiting [*habiter*] has been reduced to the notion of habitat [*habitat*]'.
    - 11 For Lefebvre's own clarification of these Marxian categories, see *The Sociology of Marx* (1968: 19–20).
    - 12 See Kouvelakis (2008: 711) on Lefebvre and 'modernity': 'the "shadow" cast over bourgeois society by the failure of revolution, at once a compensatory substitute and the ineliminable trace of vanquished hopes'.
    - 13 Such instances are theorised by Lefebvre in terms of 'moments'. 'The moment is a philosophical anticoncept', writes Merrifield (2009: 939), 'an affirmation of *residue*, or remainders, of marginal leftovers, of the power and radicality of the ragged and the *irreducible*'.
  - 14 This conclusion is rendered politically programmatic in Lefebvre's (1970) *Le manifeste différentialiste*. In this, Lefebvre champions a politics of *maximal* difference ('total subversion of the mental and social totality'), and juxtaposes this with the *minimal* difference characteristic of programmed everyday life (which ensures 'the cohesion of a society divided into sectors, levels, aspects, groups and classes of unequal development and in conflict').
  - 15 The concerns of Critical Theory aside, there are several possible objections to Lefebvre's arguments. One might justifiably criticise Lefebvre for merely asserting, and never substantively accounting for, both the salience of the urban problematic and the obsolescence of the critique of political economy (Harvey, 1974: 239). One might also raise concerns about the 'contextual boundedness' of aspects of Lefebvre's work (Brenner, 2008: 242), insofar as his work is of its time (steeped in frustration with everyday life in Gaullist France) and failed to anticipate so-called 'neoliberal globalisation' and the transition to 'post-Fordism'. Alternatively, Lefebvre has been dismissed on Deleuzian grounds as but another Marxist whose 'social critique' has been rendered obsolete by the transformation to flexible capitalism and the transformation of the 'subaltern subjectivity' of the 'liberated individual' (Ronneberger, 2008). Perhaps Lefebvre's most vehement critic, however, was Manuel Castells – a still prominent sociologist – who rejected Lefebvre's thesis on urbanity on Althusserian, structuralist grounds in *The Urban Question* (1979). For an instructive comparison of the urban theories of Castells and Lefebvre, see Gottdiener (1994: chapter 4).
  - 16 For example, see the discussions of how Lefebvre's ideas were appropriated into mainstream urban planning discourse from the 1970s onwards in Gilbert and Dikeç (2008) and Stanek (2011).
  - 17 See e.g. Boyer (2014) and Purcell (2013).

# Critical Theory and the Critique of Anti-Imperialism

Marcel Stoetzler

The rejection of 'anti-imperialism' marks one of the most visible and significant differences between 'Frankfurt School' Critical Theory and most other tendencies of the Marxist left. The dispute on the meaning and relevance of 'imperialism' and 'anti-imperialism' is implicated in related discussions on the critique of nation and state, colonialism and post-coloniality, racism and race, and anti-semitism. 'Frankfurt School' Critical Theory deliberately aims to formulate a critique of the capitalist mode of production that includes the phenomena typically addressed as 'imperialism' without recourse to the concept of 'anti-imperialism'. It takes the perspective that 'imperialism' is an intrinsic aspect of the capitalist mode of production rather than an object in its own right that is to be distinguished from the latter and to be fought 'as such': the concept of 'anti-imperialism' presupposes the reification and fetishization of 'imperialism'.

The present chapter firstly aims to establish the ways in which the concept of

'imperialism' is used in the writings of Marx as well as in the texts of some of the canonical writers of 'Frankfurt School' Critical Theory. It is argued that the Critical Theorists' Marxian usage of the term prevented the emergence of a concept of 'anti-imperialism' in their writings: 'imperialism' was for them simply an aspect of the more general concept of capitalism. The remainder of the chapter engages with some positions formulated in the tradition or under the influence of Critical Theory since the 1960s, broadly conceived, that directly engage with 'anti-imperialism': the latter had in the meantime become a key issue in some of the social movements of the time due to the role played within post-WWII decolonization by Leninism/Stalinism as well as bourgeois-liberal anti-imperialist ideology (Hobson) that had already been one of the sources of the former.

The word 'imperialism' came to be used in the twentieth century in two principal fields: military aggression (imperialist wars, conquests and occupations), and a more general

usage that in fact denotes the global spreading of the capitalist mode of production in all its economic, societal, political and cultural aspects albeit often assumed chiefly to operate through institutions of 'finance capital'. This second meaning resembles the more recent term 'globalization' that has supplanted it in some contexts. The way these two concepts differ in their connotations is illuminating; throughout the twentieth century and still in the present, use of the word 'imperialism' almost without exception signalled rejection and enmity, often moral outrage, as the word evokes images of military and other state-driven violence, while 'globalization' tends to carry more strongly a sense of ambiguity. While both words in fact describe the same process, 'globalization' is more strongly imagined as something inevitable that more often than not invites efforts to shape and reform, rather than oppose it – as in 'alter-globalization' as opposed to 'anti-globalization'. The concept of 'globalization' functions in contemporary mainstream discourses in a manner more resembling the dialectical manner in which Marx thought of capitalist modernity than the term 'imperialism' – a key term of twentieth-century (Leninist) Marxism – used to do.

As Marx took account of the global character and increasing globalization of the capitalist mode of production as one of its defining and *inherent* aspects, he did not need a concept that would specifically address the latter phenomena. At the same time, his theory was more discriminating: while Marx was scathing in his attacks on colonial violence, oppression and exploitation, he generally saw the process of capitalist modernization *as a whole* as the precondition of a historical situation in which humanity would be able to form an emancipated and humane form of society (although not every human group or society had to go through all the same processes). This defining characteristic of the Marxian position also underpinned the Critical Theory of the 'Frankfurt School': capitalism is attacked as a highly intensified

mode of exploitation but welcomed as the destroyer of pre-capitalist (for example feudal and patriarchal) oppression and exploitation and, as its own grave-digger, celebrated for creating the preconditions of the future emancipation of a humanity liberated from the monomaniac compulsion to subject and dominate inner and outer nature in the name of economic self-preservation (labour). The phenomena that many throughout the twentieth century used to address as 'imperialism' need, in the Marxian perspective, to be discussed with this dialectic in mind.

### THE MEANING OF THE TERM 'IMPERIALISM' IN MARX

Marx used the word 'imperialism' rarely and only in what was then its conventional sense, namely as a near-synonym of 'Caesarism' or 'Bonapartism' (Fisch et al., 1982: 181). 'Imperialism' meant in these contexts rule on the basis of alliances of the elites with the lower classes against the liberal bourgeoisie, or indeed against parliament, and governance above particular political parties, modelled on the imperial Roman example (176) and based on centralized state agencies and monopolies (177; Koebner and Schmidt, 1964: chapter 1; on the various usages of the term 'empire', see Leonhard, 2013). The necessity to address the 'social question' and to react to economic crises is also sometimes implied in the term 'imperialism'. On occasion, it meant 'neo-mercantilism' (Fisch et al., 1982: 207). In the English context, the term was typically used for those who wanted to maintain colonialism (178). The aspect of colonialism was not necessarily the dominant one, though, as 'imperialism' referred to a whole range of aspects of governance of empires; its anti-liberal impetus sits uneasily with the fact that colonialism was a key item on the agenda of nineteenth-century liberalism itself (Mehta, 1999; Mantena, 2010).

In an often-quoted passage in *The Civil War in France* Marx describes 'imperialism', discussed by Marx here in the context of the regime of Napoleon III, as 'the ultimate form' of bourgeois 'state power', whereby the state is understood to have emerged initially as a means of bourgeois society's emancipation from feudalism and then, in the course of the consolidation of bourgeois society, turned into 'a means for the enslavement of labour by capital' (Marx, 1971: 72). Imperialism is the end result of this process whereby the state becomes also 'the most prostitute', which seems to mean the most subject to arbitrary and violent (ab-)use.<sup>1</sup> Leon Trotsky remarked that 'this definition has a wider significance than for the French Empire alone, and includes the latest form of imperialism, born of the world-conflict between the national capitalisms of the great powers' (from *The Defence of Terrorism*, quoted in Winslow, 1931: 717). Trotsky pointed thereby to the connection between Marx's use of the term and its twentieth-century meaning. The implication here is that the internal and external aspects of the exercise of state power are closely interrelated, and that there is a 'world-conflict' between 'national capitalisms' that brings forth 'imperialism'. This perspective differs from what arguably would have been Marx's position, namely that 'imperialism', i.e. the dynamic of industrial capitalism, brings forth conflict between what merely *appear* to be 'national capitalisms': in the Marxian perspective, state and nation are dimensions, not instigators of the capitalist dynamic.

Although Marx did not have the concepts of 'imperialism' and 'colonialism' in their twentieth-century meanings, he did address the phenomena that subsequently these concepts referred to.<sup>2</sup> The combination of two characteristics distinguishes the position taken by Marx and Engels from that of other socialists of the time: first, a visceral, revolutionary hatred of any form of 'the old regime'; and second, a continuing effort to figure out how the 'free association' can

slowly, painfully emerge out of the antagonistic but interdependent struggles that the bourgeoisie and the proletariat conduct against the 'old regime' in its various forms, in Europe as elsewhere. The defenders of the 'old regime' are presented as builders of walls: ghetto walls, Chinese walls, culture walls, state border walls. The historical negation of walls, borders, boundaries and identities old and new emerges from within social movements that are antagonistic to aspects of bourgeois society but still constituted by as well as constitutive of that society itself (cf. Horkheimer, 1937). Marx's complex position on British domination of India for example was shaped by his view of the change in the relation between Britain and India that came with the Industrial Revolution: 'While merchant capital and its allies exploit and destroy without transforming, industrial capital destroys but at the same time transforms' because (in Marx's words) '[y]ou cannot continue to inundate a country with your manufactures, unless you enable it to give some produce in return' (Brewer, 1980: 54). Brewer summarizes Marx's position thus: 'British rule in India (a) causes misery, (b) creates the preconditions for massive advance and (c) must be overthrown before the benefits can be enjoyed' (1980: 58). As in the famously 'panegyric' first section of the *Communist Manifesto*, Marx uses in his journalistic writings on India a style that includes 'deliberate juxtaposition of the most exalted praise for material achievements and the shocking images used to bring home the concomitant human misery' (59). The insistence on the dialectical nature of modern, bourgeois 'so-called civilization' (*Manifesto*) as bringing intense misery and exploitation but also the possibility of general human emancipation is key to understanding Marx's comments on anti-colonial struggles. While his view of capitalist modernity was ambivalent, Marx's hatred for 'the old regime' and any form of patrimonialism, caste-thinking, slavery, and authoritarianism (including the modified forms in which they continue to exist *within*

capitalism) was unequivocal. Marx, ever remaining an unreconstructed '1848' revolutionary, responded enthusiastically to any struggle against exploitation and domination that occurred (such as in China, India, the United States, Ireland, Poland, Russia) but also moderated (sometimes throttled) his enthusiasm when dialectical analysis led him to think a struggle failed to further the promise of universal emancipation that he saw could emerge only from within capitalist modernity.<sup>3</sup>

### **'IMPERIALISM' AND 'ANTI-IMPERIALISM' AFTER 1900**

The significantly different meaning that the term 'imperialism' took on in the twentieth century was first clearly expressed by the liberal writer Hobson (1902) and then most prominently by Lenin (1917), in whose writings 'imperialism' became the name of a historical period, or a 'stage' in the evolution of capitalism. Lenin adopted Hilferding's description of *Finance Capital* (1906), in which financial and industrial capital are effectively fused as the dominant political agent in the 'imperialist' period (Fisch et al., 1982: 217). All modern conceptions of 'imperialism', liberal as well as socialist, describe versions of what could be addressed summarily as 'organized capitalism', i.e. the capitalism after the eclipse (since the Great Depression) of 'classical' liberalism. At the same time, capitalism continued to expand in the (long-standing but accelerating) process of what is now referred to as 'globalization', of which colonialism was a principal means. The French 'Bonapartist' state that Marx addressed with the term 'imperialism' was indeed a pioneer of this wider constellation.

Its crucial domestic implications were pointed out by Anton Pannekoek, a leading theoretician of the European labour movement in the years immediately preceding WWI, who argued in 1916 that imperialist

capitalism escalates and generalizes exploitation of various groups in society beyond the proletariat, provoking also a generalization and radicalization of socialist struggles, and renders the perspective of parliamentary struggle for socialist reform all the more anachronistic and implausible as state policy is increasingly decided in institutions other than parliament (Pannekoek, 2012; see also Bricianer, 1978).

'Anti-imperialism' entered the lexicon very soon after 'imperialism' itself, primarily in Britain where it was propagated by a faction of the Liberal party (involving Hobson) and in the United States. An 'Anti-Imperialist League' was founded in 1898 in Boston to defend republican principles and oppose militarism, in particular, at the time of its foundation, the US annexation of the Philippines; it was dissolved in 1920 (Fisch et al., 1982: 189). A key figure was the feminist Jane Addams. Bourgeois anti-imperialism had precedents: in contrast to the three hundred years before the eighteenth century and much of the nineteenth, key thinkers of the Enlightenment movement, including Diderot, Kant and Herder, at least in parts of their work, 'attacked imperialism ... [by] challenging the idea that Europeans had any right to subjugate, colonize, and "civilize" the rest of the world' (Muthu, 2003: 1).

Apart from the publication of Lenin's pamphlet on imperialism of 1917, the most decisive date in the development of socialist anti-imperialism and anti-colonialism was the Sixth Congress of the Communist International of 1928 that adopted the position that imperialism retarded the industrial development of the colonies. Up to this point, many in the communist movement and parties had stuck to the older, Marxian position that expected colonialism in the long run to result in industrialization which in turn it considered a necessary precondition for general human emancipation. Warren describes the 1928 Comintern position as one of the first statements of 'the underdevelopment outlook that was to become the stock

in trade of liberal development-economists after the Second World War' (Warren, 1980: 85). The Comintern position reflects a contradiction that is central to Marxist theory, namely the dialectic between capitalism (and its principal modern political form, the nation state) and emancipation. On the one hand, it strongly affirmed the Marxian notion of the progressiveness of capitalism to the extent that the intense and rapid development of the capitalist mode of production under the name of 'socialism' was promoted, while the worldwide spread of capitalism, under the name of 'imperialism', was blamed for retarding and blocking in the colonies the modernization process that would finally result in general human emancipation. In a de-dialecticizing move, the *benign* side of capitalism that brings development (and therewith the potential of emancipation to be ushered in by a socialist – meaning, in this context, state-capitalist – regime that will at some point in the process turn communist) is split from its *malign* destructive and exploitative side that must be fought as 'imperialism'. The latter (capitalism that refuses to spread evenly) is to be fought by national liberation movements that in the process establish modern nation states, which are the natural environments for the development of capitalism in its progressive guise. This conception reflects but also misconstrues the Marxian dialectic between capitalism and progress, robbing it of its dialectical character: it is a big step from advocating that the labour movement should *exploit* a presently unfolding contradictory historical process (Marx's position) to attempting, by way of political revolution and party dictatorship, to *organize and promote* such a process (the Bolshevik position).<sup>4</sup>

Lenin stated in his 1920 'Draft Theses on National and Colonial Questions', written for the second congress of the Communist International, that in 'the more backward states and nations, in which feudal or patriarchal and patriarchal-peasant relations predominate', 'all Communist parties must

assist the bourgeois-democratic liberation movement', but also 'struggle against the clergy and other influential reactionary and medieval elements' including 'Pan-Islamism and similar trends, which strive to combine the liberation movement against European and American imperialism with an attempt to strengthen the positions of the khans, land-owners, mullahs, etc.' (Lenin, 1920). Apart from the mechanical conception of historical evolution that undergirds this position, it wrongly presupposes that bourgeois nationalists in such countries are genuinely happy to forfeit alliances with clergy, pan-Islamists and other reactionary elements in order to enjoy socialist support. The shift towards support for 'bourgeois-democratic liberation movements' coincided with the Soviet government's 'rapprochement with bourgeois regimes (above all, Turkey and Persia), while communist militants in those countries were shot and imprisoned' (Goldner, 2010: 661).<sup>5</sup>

Another important aspect of the context in which the critique of anti-imperialist ideology gradually emerged is the fact that anti-imperialism was also articulated by the far right. The idea of a struggle between 'proletarian', or 'young', versus 'plutocratic nations' emerged in proto-fascist milieus in Germany, France and Italy during WWI and became a hallmark of the rhetoric of Mussolini and Gregor Strasser among others (Guerin, 2013: 107–108). Their fight against a decadent 'West' was evoked by 'conservative revolutionaries' like Arthur Moeller van den Bruck and Ernst Niekisch in the 1920s; their fascist anti-imperialism was 'nothing but the "foreign-policy version" of fascist anti-capitalism' (Fringeli, 2016: 42). On the opposite shores of the Mediterranean, beginning in Egypt as a response to the abolition of the last Ottoman caliphate by the modernizing Turkish state in 1924, modern Islamism including its jihadist offshoots developed in parallel with, and drew inspiration from the same 'conservative revolution' impulses, including the ultra-conservative version of resistance to 'cultural imperialism', i.e.

liberal modernity. When after the dissolution of the Soviet Union the bourgeois-nationalist regimes of the Near East that had – with Soviet support – combined anti-imperialist ideology with a pretence to some form of socialism disintegrated, the pan-Islamism that Lenin had warned against finally became a prominent phenomenon. German ‘conservative revolution’ and fascist ideas influenced the development of anti-imperialist thought also in Bolivia in the 1930s and 1940s and spread from there to other Latin American countries (Goldner, 2016: chapter 4). By circa 1935 the leaders of the Soviet Union had realized that support for the ‘right of nations to self-determination’ more often than not helped fascists rather than themselves, so they abandoned the notion for almost two decades (Gerber, 2010: 271). It returned in the 1950s to dominate Soviet foreign policy.

### **HORKHEIMER, ADORNO AND MARCUSE ON ‘IMPERIALISM’**

The ‘Frankfurt School’ theorists used the term ‘imperialism’ casually and infrequently, and although the term is never explicitly defined, contextual reading indicates that they used the term in its generic Marxist meaning as exemplified for example by Rosa Luxemburg who saw imperialism as a ‘tendency’ that is inherent to any capitalist society and not specifically related to the emergence of ‘finance capital’ in the sense first described by Hilferding and then made canonical by Lenin (Luxemburg, 1969: 445–6, quoted in Kistenmacher, 2015: 130). Imperialism is one aspect of the capitalist mode of production among others, not the defining essence of its ‘most recent stage’. To put this the other way round, there is no reason to assume that other key descriptors such as the commodity form, the law of value or wage labour are less central in the ‘most recent stage’ of capitalism than before that ‘stage’. In the ‘Frankfurt School’ context, the

word ‘imperialism’ is most often used in connection with the period beginning in the last third of the nineteenth century, in particular the French, British and German polities, as well as with German fascism. In either context it refers to colonialism and military aggression as much as to changes in the domestic structure of imperialistic societies, broadly conceived, in line with the usage of the word in Marx’s writings in the context of French imperialism (‘Bonapartism’). The word also occurs in contexts of classical, in particular Roman, history and early modern colonialism.

The key publication of the Institute of Social Research, the *Journal for Social Research* (1932–1941, in 1939 renamed *Studies in Philosophy and Social Science*) contains numerous references to ‘imperialism’, mostly in its very comprehensive book review sections but also in articles dealing with political-economical issues, such as as in K. A. Wittfogel’s article (4(1): 26–60) on Chinese economic history or Gerhard Mayer’s article (4(3): 398–436) on crisis policy and planned economy (both 1935). Franz Neumann referred to Locke’s liberalism as imperialistic in his essay ‘The Change in the Function of Law in Modern Society’ (1937: 6(3): 542–96; here 544). The last volume of the journal (1941) contains a review essay by Josef Soudek (9: 189–94) of a series of books dealing with international political economy and political relations that includes the third edition of Hobson’s influential book *Imperialism*.

One particularly interesting occurrence is in Herbert Marcuse’s (1936) philosophical essay ‘On the Concept of Essence’ (in vol. 5). Marcuse discusses here a fundamental aspect of Marxian and Critical Theory, the conceptual distinction between essence and appearance. He asserts that the truth content of this distinction depends on the ability of the concept of essence respectively to help explain ‘a given constellation of phenomena or appearances’ (Marcuse, 1936: 27; Marcuse 1968: 74, trans. amended). Marcuse continues:

If the concept that is deemed to be 'essential' to the explanation of such a constellation (e.g. the political power constellation of states in any one particular period, their alliances and antagonisms), such as 'imperialism', makes it possible to comprehend causally the situation both in its individual phases as well as in terms of the tendencies effective within it, then it is really the essential in that manifold of appearances.

Marcuse goes on to argue that a concept of essence that is theoretically true (in the sense just described) then also needs to prove itself to be 'objectively' true in practice: the theory is itself 'a factor in the historical struggles that it aims to comprehend', and only in these struggles 'can the essential theoretical truths be ultimately verified'. It is in this sense that the objectivity of dialectical concepts stems from their historicity. Marcuse does not explicitly state here whether he thinks that 'imperialism' is in fact a concept that is 'true' in this twofold sense, but the fact that he chooses it as an example for his theoretical argument indicates that he holds it to be contentious enough to serve as an illustration of his point: he would not have chosen it if he had thought it to be self-evidently valid.

More than 30 years later, 'imperialism' is similarly used as an example in a related theoretical-methodological argument in a lecture by Adorno, 'Late capitalism or industrial society?'. Adorno remarks sarcastically that those who like to talk about 'reification' are not thereby immune to suffering from 'reified consciousness': 'giving big speeches about concepts such as "imperialism" or "monopoly" with no regard to what these words actually refer to and to which contexts they are pertinent, is as wrong, that is to say irrational, as' its opposite, namely the 'blindly nominalistic' refusal to consider that 'concepts ... might have their objectivity, revealing the fact that the generic exerts compulsion over the individual matters' (Adorno, 2003: 357). Adorno warns his students and colleagues in this lecture that the fetishism of abstract concepts is as detrimental as the ('positivistic') fetishism of facts that is hostile to theory.

Like Marcuse before him, Adorno chose with 'imperialism' and 'monopoly' examples that were widely used at the time as shibboleths, rather than critical concepts richly saturated with sociological and historical knowledge. It can be inferred that Adorno, like Marcuse, did not reject the concept of 'imperialism' nor the critique of the phenomena it refers to, but he clearly saw a danger that the concept becomes a kind of fetish, i.e. an obstacle to rather than an instrument of critique.

One of the classic texts of the 'Frankfurt School' analysis of fascism and antisemitism, Adorno's (1939) 'Fragments on [Richard] Wagner' (in vol. 8 of the *Journal*) refers repeatedly to 'imperialism', using the word in rather unusual ways. 'Imperialism' is here chiefly an aspect of fascism. In this essay, Adorno interprets the gist of Wagner's operatic work as an expression of what he would later diagnose as 'conformist rebellion'. He observes that in Wagner, the god Wotan – identified by Adorno as a 'bourgeois terrorist' – defends (and then betrays) Siegfried's rebellion but only in order to safeguard his 'imperialist world plan' (Adorno, 1939: 4). Also, though, Siegfried is described as an imperialist: 'The antagonists to the [world] order are isolated individuals lacking true empathy and any form of solidarity: Siegfried, man of the future, is a ruffian of stubborn naivety, thoroughly imperialistic' (35). In Wagner's thinking, 'imperial idealism' has done away with the illusion – still maintained by classical, liberal, pre-imperialist idealism – that the fundamental antagonisms of bourgeois society could be reconciled: the bourgeoisie in its imperial shape accepts them as ontological facts and 'fate' (37). Adorno concludes that 'Wagner's work is therefore not merely the willing prophet and keen enforcer of imperialism and late-bourgeois terror', but also contains an element of insight in their own weakness: 'Wagner the irrationalist who plunges from one dream into the next gains consciousness of himself in the process of plunging. ... The imperialist dreams the catastrophic character of imperialism; the bourgeois nihilist comprehends the machinery of

the bourgeois drive to destruction that will mark the epoch following his own' (46–7).

A similarly intriguing comment on imperialism is contained in 'Juliette, or Enlightenment and Morality', the third chapter of *Dialectic of Enlightenment* (Horkheimer and Adorno, 2002). Horkheimer and Adorno quote a passage from de Sade's book *Histoire de Juliette* (1797) in which 'the Prince' argues that 'the government itself must control the population. It must possess the means to exterminate the people, should it fear them, or to increase their numbers, should it consider that necessary' (2002: 70). Horkheimer and Adorno comment: 'The Prince points the path which imperialism, [i.e.] rationality [Ratio] in its most terrible form, has always followed', and continue with another quote from the same text by de Sade: 'Take away its god from the people you wish to subjugate and you will demoralize it'. De Sade's comments (as they predate modern, nineteenth-century nationalism) do not distinguish between a government's treatment of 'its own' or any other people; the brutally modern governmental mentality described by de Sade at the end of the eighteenth century can therefore be related to domestic as well as international politics. The fact that Horkheimer and Adorno identify it with 'imperialism', resonates with the original Marxian understanding of the concept in the sense of 'Caesarism'. Apart from 'cultural imperialism', the recipe recommended by 'the Prince' also anticipates the concept of 'biopolitics' as formulated a few decades later by Foucault (who surely knew de Sade). Further down in the same chapter Horkheimer and Adorno use the word 'imperialist' in a more narrow and conventional sense, referring to the 'imperialist raids' (2002: 79) of German fascism.

Some of the short pieces that constitute Horkheimer's *Notes* from the 1950s and 1960s (Horkheimer, 1974) touch on the issue of imperialism and anti-imperialism, without using these words, though. The text 'One World' from 1956 reflects on the concept

of 'civilization' in a way reminiscent of some of Marx's reflections on colonialism. Horkheimer links here decolonization with the state of things in post-fascist Europe, suggesting that together with colonialism also the progressive aspects of European civilization have been abandoned. His example is the liberal regime of punishment. He writes that in nineteenth-century Europe people came to believe that 'even the most evil murderer needs to be healed' rather than executed (Horkheimer, 1974: 48). 'Barbaric' punishments were thought of as something barbarians did, elsewhere, outside civilization. 'Today the bourgeois fly to Saudi Arabia in a few hours, write magazine reports about the hacking off of a burglar's hand, and continue to negotiate business deals on an equal footing. This feeds back onto their own mentality that has already been made pliable by Hitler and Franco' (48–9). Horkheimer's sarcasm is directed at the dialectic of liberal progress: colonialism exported cruelty abroad and savoured civilization domestically, while its abolition was linked to giving up not only 'the ideology of white man's mission but also the little it had been ahead of the coloured people'. 'This civilization pays for its injustice with its disappearance, it perishes through the horror it once allowed to happen'. Europeans railed about 'barbaric' cruelty only while it suited imperialism, and with direct colonial domination also abandoned even their hypocritical critique of cruelty. The humane essence of civilization had been 'the disgust with the horror' that it had unleashed on those others whom it had claimed to be educating into civilization. A critical stance would regret the loss of the emancipatory aspects of liberal civilization, but be aware that its own imperialism has brought about this loss. The 'barbarism' to be witnessed, for example in Saudi Arabia (that is in fact dependent on Western support) is therefore 'symbolic of what is now dominant in Europe' itself (48): the civilization that was only able to be liberal as a means of distinguishing itself from its colonial victims, was

overcome the wrong way: backwards rather than forwards. The destruction of the precarious liberalism of Western, bourgeois civilization is due to fascism as much as to the kind of society that emerged victorious from the struggle with fascism. It is an indication of Horkheimer's extreme post-war bitterness – as a participant observer of restoration West Germany – at this point that Hitler and Franco are mentioned as if they merely 'made pliable' the bourgeois mind, and as if the post-fascist bourgeoisie's friendly cooperation with Saudi sheikhs was the actual scandal. (Also Horkheimer's implicit suggestion that European civilization as a whole was in the nineteenth century at least somewhat 'ahead of the coloured people' is unconvincing.)

### MARCUSE'S POST-WAR DISCUSSIONS OF IMPERIALISM AND ANTI-IMPERIALISM

Different from Horkheimer and Adorno, Marcuse explicitly discussed the concept of imperialism in the first two chapters of his book *Soviet Marxism* (1971 [1958]), and also commented on imperialism in the last chapter of *An Essay on Liberation* (1969). He notes that discussions of 'finance capital' and 'imperialism' were part of a revisionist tendency in Marxist theory to deal with 'countertrends' to the principal patterns of capitalist dynamics as described by Marx. These were discussed in volumes two and three of *Capital* but were perceived as having remained undertheorized in Marx's writings (Marcuse, 1971: 29). It was widely agreed around 1900 that capitalism had entered a new, 'organized' stage that saw a better paid and more integrated working class, but this observation was interpreted in a variety of ways. A 'reformist' tendency expected 'organized' and more integrative capitalism to provide an improved vantage point from which an increasingly confident working class would be able to build socialism,

whereas an 'orthodox' tendency, especially in its Leninist form, saw in the same processes the reinvigoration of capitalism by a 'labour aristocracy' that was 'corrupted' by 'high wages paid out of monopolistic surplus profits' (1971: 30) and concluded that not the organized industrial working class but 'workers and peasants' in countries not yet developed and 'corrupted' by industrial capitalism would make the revolution (31). Marcuse points out that the Leninist revision of Marxism was based on the assumption that Marxian theory was contradicted, if not falsified by the failure of the capitalist mode of production to have collapsed by the turn of the century. The thesis that Marx underestimated 'the economic and political potentialities of capitalism' (31), which Marcuse rejects, underlies the ideology of 'anti-imperialism'. The critique of Leninist revisionism is therefore at the basis of Critical Theory's rejection of (Leninist) 'anti-imperialism'. The idea that the industrial working class was 'corrupted' and bribed by 'surplus profits' gained in the colonies was based on a narrow and dogmatic conception of what an 'uncorrupted' working class could be expected to do, as opposed to a critical analysis of what its role in evolving capitalist society actually was. Marcuse asserts that 'even prior to the First World War it became clear that the "collaborationist" part of the proletariat was quantitatively and qualitatively different from' a small 'labour aristocracy' and trade unionist 'traitors'. The fact that Leninism nominally retained the idea of the centrality of the working class but considered the latter largely 'corrupted' led to the notion that the party as carrier of 'true' proletarian consciousness needed to impose it onto the former (32). As the Leninist conception adopts from Hilferding the idea that 'imperialism' is the name of a stage in the development of capitalism (although Hilferding's conception of what characterizes this 'stage' is far more open and nuanced than Lenin's), the acceptance of the concept of 'imperialism' in its Leninist sense implies

also acceptance of the underlying idea that capitalism is now *forced* to bribe the working class in the advanced industrial countries lest it collapse: to put this the other way round, successful anti-imperialism (led or coordinated by Bolshevik parties as avant-gardes) would cut off capitalism from this means of last resort and open the way for proletarian revolution. This entire conception rests on uncritical acceptance of the implausible notion of the centrality of those 'bribes', the 'corruption' they allegedly produce, and the necessity of colonialism and imperial military aggression for producing the funds that pay for these 'bribes'. In addition, anti-imperialism (Leninist or otherwise) cannot but endorse, explicitly or implicitly, the notions of 'self-determination of nations' and anti-colonial nationalism. Most forms of Marxism, including Social Democratic 'orthodoxy' in the vein of Kautsky and Hilferding, credit capitalism with much more flexibility, inventiveness and openness to deal with its problems and to extend its lifespan.

After WWI and the failure of socialist revolutions in the industrialized countries, Lenin argued that capitalism – in its developed form as imperialism – survived by splitting the world (minus Soviet Russia) into two camps, namely the victorious countries (chiefly Britain and the United States) that exploit the 'vanquished countries' (chiefly Germany) and 'the East' (Marcuse, 1970: 42–4). Anti-colonial nationalism was vital to this conflict. While colonial imperialism allowed the Western countries to continue to 'bribe' their working classes (preventing the gradual ripening of socialism in these countries that would have been expected otherwise), the conflicts this situation involves also grant the Soviet Union the necessary 'breathing space' to industrialize and to prepare the transition to socialism, basically by developing 'state capitalism'.<sup>6</sup> Marcuse's presentation makes clear that the entire theoretical construction had little if anything in common with Marxian theory, certainly not in the perspective of Critical Theory.

In 'Solidarity', the last chapter of *An Essay on Liberation*, Marcuse describes contemporary US society in terms that are continuous with but also modify the Social Democratic and Leninist analyses that were discussed in the first decades of the twentieth century: it is an industrial, 'advanced capitalist countr[y]' (Marcuse, 1969: 79) where 'the integration of the working class is the result of structural economic-political processes (sustained high productivity; large markets; neo-colonialism; administered democracy) and where the masses themselves are forces of conservatism and stabilization' (80). Such a society cannot anymore 'grow on its own resources, its own market, and on normal trade with other areas. It has grown into an imperialist power which, through economic and technical penetration and outright military intervention, has transformed large parts of the Third World into dependencies'. Marcuse writes that 'its policy' differs 'from classical imperialism' because of the Cold War context that supersedes the requirements 'of profitable investments' (80). By implication, 'classical' imperialism would have been simply about the search for profitable investments. Different from Leninist 'anti-imperialism', Marcuse does not take on board the notion that 'finance capital' plays a particularly important role. A second key difference lies in Marcuse's class analysis: on the one hand, he argues that in the advanced industrial countries the working class cannot be seen as 'the revolutionary subject' as such a subject can only *emerge* in the process of struggle. As no class, or more generally, no category of the population in advanced capitalist society, is anymore located outside society at all, there is no revolutionary subject waiting, as it were, to rebel, being temporarily 'corrupted' or betrayed by trade unionist or any other presumably treacherous elements. On the other hand, he also (by implication) rules out nationalist 'popular front' politics in the 'Third World' countries when he emphasizes that 'a liberal bourgeoisie which would ally itself with the poor and lead their struggle

does not exist' there: the Third World proletariat which is 'predominantly agrarian' is oppressed both by 'the indigenous ruling classes and those of the foreign metropolises'. His main point at this step of the argument is that advanced imperialism (very much like what we would today call 'globalization') has created the necessity to think of the world as one unit:

In any case, by virtue of the evolution of imperialism, the developments in the Third World pertain to the dynamic of the First World, and the forces of change in the former are not extraneous to the latter; the 'external proletariat' is a basic factor of potential change within the dominion of corporate capitalism. (Marcuse, 1969: 80)

Likewise, 'indigenous dictatorships' are ever more supported by 'the imperialist metropolises' (81). Therefore, 'the preconditions for the liberation and development of the Third World must emerge in the advanced capitalist countries': the latter must be weakened from within so much that they abandon their support for the Third World dictatorships. Marcuse asserts, against the notion that the global revolution that would end the capitalist system could be started in the periphery, that '[t]he chain of exploitation must break at its strongest link' (82), namely in the advanced countries. Marcuse takes here the classical Marxian against the Leninist position. However, he appreciates that the Third World guerrilla struggles have a huge *ideological* impact on the New Left in the United States:

The Cuban revolution and the Viet Cong have demonstrated: it can be done; there is a morality, a humanity, a will, and a faith which can resist and deter the gigantic technical and economic force of capitalist expansion. More than the 'socialist humanism' of the early Marx, this violent solidarity in defense, this elemental socialism in action, has given form and substance to the radicalism of the New Left; in this ideological respect too, the external revolution has become an essential part of the opposition within the capitalist metropolises. However, the exemplary force, the ideological power of the external revolution, can come to fruition only if the internal structure and cohesion of the capitalist system begin to disintegrate. (81–2)

Marcuse's references to the Cuban revolution and the Viet Cong as representing 'elemental socialism', morality and faith seem rather odd and are probably unique in the context of 'Frankfurt School' Critical Theory.<sup>7</sup> His assertion of the unity of the capitalist world-system sits uneasily, too, with his argument on the fundamentally different conditions in the advanced and the Third World countries: the Viet Cong and the New Left in the United States could hardly be more different kinds of organizations, so that supporting the former as appropriate to Vietnam (but not at all to the United States) has a patronizing and 'Eurocentric' undertone.<sup>8</sup>

## THE HISTORICAL CONTEXT OF THE EMERGENCE OF ANTI-IMPERIALIST IDEOLOGY AFTER WWII

Two aspects of the world-historical context are chiefly responsible for the enormous spread of anti-imperialist ideology in the post-WWII era: the expansion and consolidation of the Stalinist sphere of power, and the perceived continuity between the anti-fascism of the WWII period and the decolonization in the immediate aftermath of the war. These two tendencies were initially mostly separate phenomena.

In a discussion of the question why anti-imperialism assumed an increasingly central role in the thinking of the journalist Ulrike Meinhof, who developed from a Christian-inspired pacifist to being a founding member of the 'urban guerrilla' group Red Army Faction, Peter Brückner argues that in the immediate post-WWII period there was a widely shared perception of continuity between the fight against fascism and National Socialism, and that against colonialism and imperialism. As a much discussed example he points to the massacre by French troops of thousands of participants in a demonstration for independence in Sétif, Algeria, that took place on the occasion of the celebrations of

the capitulation of the Third Reich on May 8, 1945 (Brückner, 2006: 106; Gerber, 2010: 259). During the independence war (1954–62) the Algerian FLN continuously referred to this highly symbolic event. Similarly, the independence of Vietnam was declared shortly after the capitulation of Japan in September 1945. Subjects from the colonies fought on most fronts during WWII, especially in the French military; Frantz Fanon is an example (Gerber, 2010: 260). Brückner mentions the case of the Algerian communist Jean Farrugia who had been an inmate of Dachau as well as of French prisons in Algeria, and more generally the ‘massive racist terror against Algerian workers’ especially in Paris (Brückner, 2006: 107). The fact that the spread of universalist, anti-fascist ideology raised expectations for independence that were quickly disappointed arguably contributed to the transfer of the prestige of anti-fascist onto anti-imperialist ideology, but also its undermining in the minds of both, the anti-colonial movements in what then came to be called the ‘Third World’ and among left-wing intellectuals in Europe.<sup>9</sup> Another link was the fact that the anti-colonial struggle in Angola was fought against the fascist Salazar dictatorship in Portugal that was supported by West Germany, Spain (under Franco) and France (Brückner, 2006: 116). West Germany was also strongly engaged in South Africa, Angola, Mozambique and Rhodesia, among others.

Given these facts, it is unsurprising, and indeed perfectly legitimate, that protest movements emphasized the continuities between fascism, the continental imperialism of Nazi Germany, the economic international policy of post-fascist West Germany and other Western European states, and colonialism in general. What was a reasonable interpretation of international political economy at the time gradually turned into an increasingly irrational discourse, though, when it was overdetermined by a fetishized, dogmatic concept of ‘imperialism’ that was further enriched by elements of ultra-conservative

and fascist anti-Western ‘critique of civilization’ (‘Kulturkritik’) in terms of greed, decadence, moral decay, societal corrosion, consumerism, individualism, Mammonism, effemination etc.<sup>10</sup> This transformation might have been helped by the increasing importance of the United States in the defence of ‘imperialism’ in Vietnam and elsewhere: the fact that the former bourgeois-democratic utopia of the New World was perceived to be propping up the most reactionary forces of the Old World allowed elements of traditional European anti-Americanism, an anti-democratic ideology with roots in nationalist liberalism as well as conservatism and fascism and antisemitic undertones, to enter the picture (Croquemouches, 2002; Fried, 2012, 2014; Fischer, 2015).

Brückner points to another important shift that resulted circa 1968 in a ‘de-dialecticization’ that was expressed in slogans like ‘Vietnam is everywhere’. In critical discussions of the time it was clearly stated that equating conditions in – for example – Berlin with those in Saigon was insulting to the Vietnamese (Brückner, 2006: 140). Marcuse had stated in a widely read publication of 1967 that the anti-colonial struggles needed to be supported by ‘the reactivation of the labour movement’ in the capitalist states of Europe (Brückner, 2006: 137): he understood solidarity with the anti-colonial struggles to be mutually beneficial, because the universalization of struggles would allow the social struggles in the industrialized countries to shed their national limitations. Marcuse did *not* suggest, though, that these struggles were identical: he suggested them to be different but complementary. Likewise, Brückner rejects the notion of the proletariat, conceived as ‘the subject of revolution’, as the ‘embodiment [*Inbegriff*] of *all* the exploited’ globally that can be found in the writings of Ulrike Meinhof and others. He states that such an ‘embodiment’, or essential concept, is a ‘bad abstraction’ and idealistic delusion, and asserts that ‘political identity (who are we? how can we *actually* become what

we *potentially* are? ... where do we learn?') must be derived from 'concrete historical reality', not from 'principles' and 'theories' (Brückner, 2006: 161, italics in the original).

Proponents of 'nationalist-populist development programmes' to be headed by the supposedly 'productive national bourgeoisie threatened by global financial capitalism' often invoke the idea, common in post-1991 anti-neoliberal discourses, of 'a financialization of global capitalism politically imposed by the rent-seeking and parasitic dominant interests of the US' (Bonnet, 2002: 115), which carries echoes of both the Leninist imperialism thesis and cruder antisemitic notions of bankers as blood-sucking parasites. In a related argument, Moishe Postone referred to the 'neo-anti-imperialism' of the period after 1991. He argues that the reduction or fetishization of anti-imperialism to anti-Americanism obscures what used to be called 'imperialist rivalries' such as those that led to the two world wars of the twentieth century, just at the time when these may be in the process of re-emerging after the ending of the Cold War (Postone, 2006: 97, 110).

## ANTI-IMPERIALISM, NATIONALISM AND STATEHOOD

At the most fundamental level, the concept of 'imperialism' is rejected by 'Frankfurt School' critical theory as inherently nationalist and statist. Braunmühl points out that 'current definitions represent imperialism as a "spill-over" problem', meaning that 'a national capital which was once essentially internal in scope reproduces itself externally to a growing extent and thus produces imperialism' (Braunmühl, 1978: 160). The concept of 'imperialism' logically presupposes 'the specific partition of the world market into national states'. Politically this means that the 'accumulation of national capitals suddenly acquires its own legitimacy in the face of the intervention of external capitals'.

She rejects the 'traditional point of view that sees the state as determined in the first instance by internal processes to which external determinants are, as it were, appended' secondarily (161). This perspective has been termed (methodological) 'statism' and critiqued more recently by Song (2011) following Braunmühl. Instead of 'statism', a dialectical view of the relationship between individual nation states and 'the imperialist system' (Braunmühl) or the 'world system' (Wallerstein) is needed as modern states – most of which understand themselves to be 'nations' – and the modern capitalist world market (including the phenomena generally addressed as 'imperialism') historically and logically emerged together.

Proponents of 'anti-imperialism' are forced by the logic of their argument to distinguish 'good' peripheral from 'bad' metropolitan nationalism (ISF, 1990: 128). The logical presuppositions of this type of argument were probably not perceptible to the original authors, chiefly Lenin, but they tend to assert themselves in the historical unfolding of the concept. 'The right of nations to self-determination is based on the idealist notion that the state ... could be the real expression of the will of its constituents. This discourse united the democratic bourgeois Wilson and the revolutionary Jacobin Lenin' as well as many other classic-liberal nationalists such as Theodor Herzl (ISF, 1990: 129). Critiques of the Bolshevik concepts of the socialist state as the 'state of the entire people' and 'the right of nations to self-determination' as formulated in the years before, during and after WWI by Rosa Luxemburg, Anton Pannekoek, Hermann Gorter and others had been rediscovered by that part of the movement of the late 1960s in Germany that was influenced by the Critical Theory of the 'Frankfurt School'. This was hardly coincidental as these critiques had been part of the historical constellation out of which the latter had emerged in the 1920s. They had not shaped the political consciousness of most constituents of the movement sufficiently,

though, to prevent the revival of Leninist 'anti-imperialism' in the 1970s.

All three elements of the notion of the right of nations to form an independent state lean towards mystification: 'the state' is imagined as being expressive of 'its' people (rather than being the political form of social relations of exploitation and oppression); 'nations' are imagined as pre-existing their constitution as states; and the idea that they have 'rights' forces one to imagine them as subjects with some kind of personality. The notion of 'the nation' that underlies this concept has of course compelling common-sense plausibility for individuals who are members of already established nation states (as they will have forgotten the fact that the nation was 'made' or 'invented' at some point in history) but creates rather than solves problems in practice, especially when different nationality groups claim the same territory. This is inevitably so in all cases of secessionism, irredentism and with diasporic nationalities – i.e. in most cases by far as human history has produced only few territories large enough to form a sustainable modern state that are inhabited by one single ethnic or nationality group. Those defending and aiming, as state officials, to manage and adjudicate claims based on 'the right of nations to self-determination' are forced continuously to discuss and determine 'what is a nation'.

For a variety of historical reasons, one of the most conspicuous instances (in Europe) of a diasporic nation that, in the context of a period of generalized nation-state building, was interrogated in such terms, is that of the Jews. As Jews formed – at least in Eastern Europe – a strong element of the labour movement, the controversy over Jewish nationality became a crucial issue as soon as the labour movement discussed the national question. The question whether Jews constituted a nation was answered in a variety of ways. This is relevant to the discussion of 'anti-imperialism' because in its Leninist version, the chief criterion for determining the legitimacy of a nation's claim

to self-determination is whether it fell into the category of peripheral or metropolitan nationalisms. Zionism has been put in either category, depending on context. The form of anti-Zionism that gained great influence in the 1970s saw it as metropolitan and imperialist. (Other forms of anti-Zionism whose rejection of a 'Jewish state' was not based on its supposedly being 'imperialist' but on principled Marxian anti-nationalism, liberal ideas of cultural pluralism or specific religious or cultural ideas on the nature of Judaism have become increasingly marginal correspondingly, at least outside Israel.)

Although the principle of 'the right of nations to self-determination' can in principle be the basis for the search for a 'multicultural' politics of compromise in the context of liberal-democratic politics, in its anti-imperialist articulation it tends towards ethnic absolutism: when 'imperialism' is 'the latest *stage of* capitalism (as opposed to one *aspect of* capitalism among others) then the antagonism between metropolitan centre and exploited periphery becomes the decisive criterion for determining policy. Perhaps the most fundamental problem of Leninist anti-imperialism is its state-centric focus: as states, or countries, are the basic unit of analysis, any one state or nation is considered either imperialist or not. This differs from less nationalistic approaches, such as Wallersteinian 'world system analysis' that acknowledges the existence of core-type as well as periphery-type *production processes* within the same country, implying that statehood is but one structuring element among many others within a capitalist system that is first of all global. This perspective resonates with the anti-Leninism that is characteristic of contemporary forms of Marxism derived from the Critical Theory of the Frankfurt School (such as 'Open Marxism').

One-dimensional anti-imperialism creates a discursive field that forces its proponents to find reasons why one set of nationalist claims is more valid than a competing one. Acceptance of the irrational premise of

positing 'imperialism' instead of the much broader concept of 'capitalism' at the centre of political analysis invites the acceptance of further, even more irrational additional arguments. The anti-imperialist perspective on Israel is probably the best-documented example for this discursive slippery slope. Anti-imperialist support for Palestinian nationalism argues that it is to be supported against Israeli nationalism because Israel engages in imperialist exploitation of non-Israeli Palestinians. This could simply mean that of two otherwise analogous state-building projects one is more successfully engaged in capitalist exploitation than the other, creating inequality that needs to be redressed. Solidarity movements elsewhere could make a contribution to this in the expectation, typically held by socialists, that more equal development of capitalist national economies creates better conditions for emancipatory movements including labour and women's movements that would finally be able to overcome capitalist social relations. Such a proposition could be made subject to rational analysis and discussion. This is not, though, the basic structure of the anti-imperialist discourse on Israel which seems to be characterized by two things: one, the anti-imperialist discourse homogenizes and essentializes the nationalism that has been approved as 'peripheral', and tends to embrace all cultural, religious, and political elements including some that are explicitly anti-emancipatory and anti-socialist; two, it accepts lines of fetishizing and ontologizing reasoning that further undermine the claims of the 'metropolitan' nationalism beyond challenging its specifically 'imperialist' traits: its imperialism turns into an essential characteristic rather than a historically contingent one that could be challenged and changed. This is the point where, in the case of Israel, various bits of antisemitic ideology enter the anti-imperialist discourse that would have horrified Lenin. Classical Marxian reasoning rejects claims, for example by the Israeli state to be the expression of 'the Jewish nation'

simply by rejecting the 'politically romantic' concept of the state as anything other than a power structure. On the Leninist platform this classical line of reasoning loses much of its power as it does not *categorically* reject romantic nationalism which it supports in 'peripheral' nations.<sup>11</sup>

The logical structure of the anti-imperialist position makes it receptive to all kinds of mystical and racial irrationalities, including, in the effort to prove why 'the Jews' cannot be a nation, antisemitism. The concept that drives these irrationalities is, however, in itself idealist: 'States seem to have the beautiful task of realising the rights of ... the people' (ISF, 1990: 130), as long as 'the people' demonstrably have the quality of being 'a subject', which makes them a nation. This notion shares the naivety of other forms of bourgeois 'social contract' theory: 'neither Lenin's right to self-determination nor its bourgeois predecessors mention at all the *violence* that has always been necessary to found sovereign states' (130–1, italics in the original). The position of Critical Theory (as developed here by the group ISF) is in this regard similar to that of 'political realism': against all idealist theorizing of the state, 'the question *whether Israel has a right to exist* has been decided by the fact of its foundation, and is therewith irrelevant' as 'no-one has a right to statehood who cannot mobilise the violence needed to found one' (131). Any state's 'right to exist' derives from the fact that it exists; state sovereignty is not constituted other than by violence. This puts state sovereignty into a different category from the rights of the individual as theorized by classical idealism or in 'natural right' philosophy: rights reside in individuals only, not in states or any other collectivities. The rights of individuals – fiercely attacked by Comtean positivism as 'metaphysical' – were defended by Horkheimer and Adorno as part of the attempt to 'rescue' metaphysics from positivist attacks (not, though, 'group rights').

The Leninist take on the concept of the right of nations to self-determination historically

is rooted in the nineteenth-century idea, then shared by liberals and democrats, that nation-building overcomes late-feudal atomization and creates with a unified national society the conditions for emancipatory movements. Arguably there is an element of orientalism in the Leninist assertion that the 'peoples of the East' need nation-building as the first stage of emancipation, whereas those in 'the West' have passed this 'stage' and are ready for class struggle unencumbered by nationality and ethnicity. (The realpolitics of 'socialism in one country' quickly replaced even this geographically limited anti-nationalist stance.)

Stalin's insistence in his 1913 article on the national question that territoriality is a required part of the definition of a nation anticipates his antisemitic campaign against 'rootless cosmopolitans' (i.e. Jews) as non-national: they lack a territory. This perspective could, and later briefly did, lead to support for Zionism as the attempt of Jews to catch up with the majority of the world's nations who have already formed modern states, but predominantly went the other way: Jews who *claim* to form a nation-state – rootless and non-national as they allegedly are – cannot but have a secret agenda.

## CAPITALISM AND DOMINATION

Critical Theory, as Marxian theory in general, is anti-militarist, i.e. opposed to military aggression for whatever purpose. A form of specifically *motivated* anti-militarism is an important dimension of anti-imperialism, too. In the context of bourgeois anti-imperialism, whose classic paradigm is the American Anti-Imperialist League (1898–1920), the driving motivation is the republican notion of the self-determination of nations: the US annexation of the Philippines for example was (unsuccessfully) rejected as contradicting this principle that anti-imperialists argued was, or should be,

fundamental to American policy. The Leninist version of anti-imperialism is based on a theory of the development of capitalism that, from the perspective of Critical Theory, is non-Marxist. Like bourgeois, republican anti-imperialism, also the rejection of imperialism in the context of Critical Theory and non-Leninist Marxism broadly conceived must make theoretical judgements as to why government and military of a leading capitalist country would come to use military force to further imperialist purposes in contradiction to its own professed political principles (such as the right to self-determination of nations). Bourgeois anti-imperialism does not seem to provide a general theory on this – explanations tend to be ad hoc – while in the case of Critical Theory, imperialism would simply count as a 'normal' aspect of the dynamics of the capitalist mode of production. The explicit rejection of the concept of 'anti-imperialism' by Critical Theory refers thus to the fact that since roughly 1920, the Leninist conception has become so hegemonic on 'the Left' broadly speaking that 'anti-imperialism' automatically carries the theoretical assumptions of Hilferding's notion of 'finance capital' and its political implications. Importantly, these elements of anti-imperialism typically remain implicit and fail to be discussed critically. This is why Critical Theory generally rejects references to 'anti-imperialism' while rejecting imperialism as one aspect among others of the capitalist mode of production whose relationship to modernity's promise of general human emancipation is theorized dialectically: it is neither to be ignored nor to be isolated and fetishized.

Central to the Leninist concept of imperialism is the notion that ambiguous capitalism that brings intensified exploitation together with the possibility of emancipation (as described by Marx and Engels) has turned circa 1900 into entirely negative capitalism: the latter is 'monopoly capitalism' characterized by finance capital, a corrupt workers' aristocracy and imperialism and needs to be

fought and destroyed by any means necessary. Entirely bad as opposed to ambiguous capitalism is complemented by the notion of bad, perverted nationalism (imperialism) versus good, benign nationalism (as in 'healthy patriotism' etc.). While this is explicit in Hobson, it remains implicit in Lenin. From a Critical Theory perspective, imperialism is objectionable not because it is 'foreign rule' but because it is *rule*. Beyond that, it needs to be asked *what kind of rule* it is and what its ruling actually *does*. In a similar vein, the nation state is objectionable most fundamentally not because it is national but because it is a state, i.e. as an element of the modern state system, the political form of capitalist society. In this perspective, the reasoning of those advocating or challenging either imperialist rule or rule by a nation state needs to be examined in terms of whether it is motivated by expanding or restricting 'good life' and general human emancipation which involves the replacement of anything like a state (a coercive power structure that is to an extent separate from and controlling of 'civil', i.e. the non-state areas of society) by the democratic and consensual administration of (social) 'things'.

## Notes

- 1 Like the twentieth-century concept of 'imperialism', also that of 'colonialism' was not available to Marx. 'Marx did not have a generic term to describe the rule of a more advanced nation state over a more backward area', such as the twentieth-century concept of colonialism. He used the term 'colonialism' more narrowly to refer to 'the settlement of uninhabited areas or areas from which the indigenous inhabitants have been driven out (such as Australia and America)' (Brewer, 1980: 27–8).
- 2 On Marx and imperialism, see Stoetzler (2016). Most recent detailed accounts of the complexities of Marx's position can be found in Anderson (2010) and Pradella (2013); also Sutton (2013). For critical comments on Anderson, see Stoetzler (2013). Critical contributions on the Leninist legacy of anti-imperialism include Goldner (2010 and 2016) and Bassi (2010). Useful older accounts include Owen and Sutcliffe (1972), Kiernan (1974) and Mommsen (1981).
- 3 There is also a biographical reason why Marx would not have become a nationalist anti-imperialist in the twentieth-century sense: Marx's father, a lawyer, was a moderate liberal who had converted from Judaism to Protestantism only a short time before Karl Marx was born. Perhaps not insignificantly, Marx's home town Trier (a town in the Western German Rhineland founded by the Romans and one of the oldest cities in Germany) had been conquered by Napoleon in 1794, and French imperial government acted to reinforce the liberal traditions of the town that fell to Prussia in 1815. The Prussian monarchy, which contemporary German nationalists saw as an anti-imperialist liberator *avant la lettre*, reversed Jewish emancipation, which forced Marx's father to convert lest he lose his career and livelihood (Blumenberg, 1962; Nimtz, 2000; Rühle, 1928).
- 4 On Lenin's advocacy of state-capitalism whose 'transition to full socialism would be easy and certain', see Marcuse (1971: 42) and endnote 6 of the present chapter. The notion that the Bolshevik revolution developed the capitalist mode of production structurally, not merely out of the necessities of warfare, was formulated in the 1930s by a variety of individuals in the context of the left-Marxist ('council-communist') opposition to Bolshevism (see Mattick, 1978). An overview of (left-communist as well as Trotskyist and Maoist) discussions of the Soviet Union as 'state-capitalist' is contained in van der Linden (2007).
- 5 The Soviet Union concluded trade and 'friendship' agreements in 1921 with the newly emerging 'authoritarian development regimes in Turkey, Persia and Afghanistan, whereby those regimes' repression, imprisonment or massacre of their respective communist or left oppositions were brushed over for Soviet national interests' (Goldner, 2010: 633).
- 6 Lenin had written in 1917 that 'state-monopolistic capitalism is the complete material preparation for socialism' (quoted in Marcuse, 1971: 42). In the affirmation of 'state capitalism' Lenin basically imported, through the back door, the notion developed by 'reformist' Social Democrats that increasingly 'organized' and state-directed capitalism lends itself to socialist transformation.
- 7 Marcuse (1969) adds similar comments on pages 85, 86 and 88, including also friendly remarks on the Chinese 'cultural revolution'. Further down he formulates again his principal position that is difficult to reconcile with sympathies for the Viet Cong: '[T]he economic, political, and cultural features of a classless society must have become the basic needs of those who fight for

- it. This ingression of the future into the present, this depth dimension of the rebellion accounts, in the last analysis, for the incompatibility with the traditional forms of the political struggle. The new radicalism militates against the centralized bureaucratic communist as well as against the semi-democratic liberal organization' (Marcuse, 1969: 88–9).
- 8 A key source on Vietnamese history from a perspective in step with Critical Theory is Ngo Van (2010).
  - 9 The 1952 article by Alfred Sauvy that inaugurated the term 'Third World' explicitly referred to the role of the Third Estate in the French Revolution, and resonated with the important role played by representatives of the Third World within the United Nations, for example, already at the time (initially very much in contradistinction to the Soviet Union). It denoted in this sense a specific claim to be providing a progressive perspective beyond Western liberalism and Soviet Stalinism, rather than simply 'underdevelopment' (Prashad, 2007). Also this was part of the background that gave internationalism and then 'anti-imperialism' such a central role in the thinking of the metropolitan left.
  - 10 Even Lenin's discourse, though, already contained (unintended) antisemitic undertones that in a changed context could turn into audible, manifest meaning: Lenin wrote that the amalgamation of financial and industrial capital to 'finance capital' created 'a few hundred kings of finance' and a conflict between 'an immense number of debtor states' and 'a few usurer states' (quoted in Gerber, 2010: 265).
  - 11 Commenting on the Leninist slogan 'Workers and oppressed peoples and nations of the world, unite!', inaugurated at the Comintern's 'Congress of the Peoples of the East' in Baku in 1920, Fringeli states that 'workers are members of a class and at the same time individual human beings. In *oppressed peoples and nations*, the individuals are absent' (Fringeli, 2016: 41).

# Mass Culture and the Internet

Nick Dyer-Witheford

## INTRODUCTION: DOWNLOADING THE CULTURE INDUSTRY

With an Internet connection you can download a free copy of Max Horkheimer and Theodor Adorno's 'The Culture Industry: Enlightenment as Mass Deception' (2002 [1947]: 94–136) and, also for free, globally share your thoughts about it across social media. Is the contradiction between the essay's coruscating critique of commodified culture and its apparently costless worldwide circulation a signal that cornucopian digital networks have completely outrun the grasp of critical theory? Or do Horkheimer and Adorno truculently maintain their relevance even in the face of Google, Facebook, Twitter and Snapchat? This chapter considers some moments in the short, fast history of the Internet and arguments made at each point about the obsolescence or confirmation of the 'culture industry' thesis. It starts with the simultaneous emergence of critical theory and cybernetics in Second World War

America; jumps to the eruption of counter-cultural network politics in the late twentieth century; moves on to the triumph of social media capital in the first decade of the new millennium; arrives at today's scene of surveillance, cyber-war and biospheric crisis; and concludes with reflections on critical theory's adequacy to the contemporary mass culture of the Internet.<sup>1</sup>

## CRITICAL THEORY AND CYBERNETICS

The conditions that Horkheimer and Adorno addressed in their famous essay were those of North American Fordism – mass production in assembly line factories that raised corporate organization to a new intensity, employing an industrial workforce whose wages, elevated beyond mere subsistence, allowed mass consumption, of automobiles, highways, suburban homes, fossil fuels, appliances and entertainment. In this context,

they identified a 'culture industry' constituted by Hollywood film, commercial radio and emergent television. While literature, music, painting and other cultural forms had previously been subject to market forces, commercial influences were refracted by traditions (however ultimately illusory) of artistic autonomy. The full integration of mass entertainment into the circuit of capital was built on foundations laid in the nineteenth and early twentieth century, but above all on technological and organizational media innovations discovered during the Second World War, in particular the propaganda techniques pioneered by fascism, if practised by both sides.

In a continuation of this trajectory, Horkheimer and Adorno proposed, the culture industry dictated content from above, without 'mechanism of reply' (2002 [1947]: 96). It made culture itself a commodity, advertised other commodities, and habituated audiences to the identities and life rhythms required of workers and consumers by industrial capitalism. The industry was characterized by monopolistic ownership, was entirely driven by profit, generated formulaic, socially conformist content, depended on, and fetishized, new technologies, tended to the unification of film, radio and music in powerful multimedia fantasies ever more easily confounded with reality, and prescribed 'fun' as a 'medicinal bath' for the renewal of labour power and consumption capacity (2002 [1947]: 112). This account was embedded within a wider depiction of a 'dialectic of enlightenment' whereby, within capital's class-divided society, capacities to technologically rationalize, control and subdue nature were turned to exploit, subjugate and, potentially, destroy humanity itself.

Horkheimer and Adorno ignored elements of commodified popular culture that defied their portrait of total narcotized pacification; Adorno's notorious dismissal of jazz is the salient example (1983: 119–32). Nonetheless, their essay identified crucial elements of post-war boom capitalism, a

capitalism that, as Fredric Jameson puts it, was increasingly made up not just of 'things and relatively solid systems of power' but of 'ideological fantasms, bits and pieces of spiritualized matter, the solicitations of various kinds of dream-like mirages and cravings' (2016: 19). Their portrait of a media sector dominated by conformist, advertising-sponsored entertainments, a portrait which Adorno continued to elaborate throughout his life (Bernstein, 1991), would be unwittingly endorsed even by many who did not share their critique of capitalism, such as the condemnation of networked television by Newton Norman Minow (1961), Chair of the Federal Communications Commission, as a 'vast wasteland'.

Even as Horkheimer and Adorno composed 'The Culture Industry' within sight of Hollywood, elsewhere in the US forces that would eventually profoundly alter their object of critique were in motion. Scientists working for the war-effort on radar, ballistics, cryptanalysis and atomic weapons were laying the intellectual foundations of the Internet. A year after *Dialectic of Enlightenment* was published, Norbert Wiener's (1948) *Cybernetics, or, Control and Communication in the Animal and the Machine* appeared. The new discipline it announced was already the topic of what would eventually be ten Macy Conferences held in New York from 1946 to 1953, bringing together computer scientists, psychologists and biologists to establish a body of thought with radical implications for the relation between humans and machines. The cyberneticists' crucial insight was that machines were not just 'heat engines' generating energy by consuming fuels, but rather entities governed by information (Johnston, 2008: 28).

This idea would prove central to technological development in two distinct but related fields: automata (robots and other autonomous technologies) and digital networks. The latter path was opened by Claude Shannon and Warren Weaver's (1949) *A Mathematical Theory of Communication* which, by defining

information in purely quantitative terms, allowed consideration of how human communication might be augmented by computers, or occur solely between machines. In 1962 J. R. Licklider, a Macy conference participant, admirer of Wiener, and disciple of Shannon, was appointed head of the Information Processing Techniques Office (IPTO) for Pentagon's Advanced Research Projects Agency (ARPA), the institution that created what would eventually become the Internet. Arpanet, as early versions were known, continued cybernetics' tradition of military sponsorship; although scientists involved in the project have tried to disavow its integral connections to nuclear war planning and weapons research, this is disingenuous (Abbate, 1999).

Nonetheless, Licklider and his colleagues did have wider visions for the application of what they whimsically termed The Intergalactic Network, visions they regarded as utopian, but which, from the point of view of Horkheimer and Adorno's hostility to technocratic rationality, would seem nightmarish. While cyberneticists such as Wiener and John von Neumann focussed on prospects for artificial life and self-replicating robots, Licklider rather looked to a 'very close coupling' of humans with machines, in a 'symbiotic' partnership (Licklider, 1960). 'Humans are noisy, narrow-band devices' with 'many parallel and simultaneously active channels', he wrote, while computers are 'very fast and very accurate, but constrained to perform only one or a few elementary operations at a time'. In 1960, commenting on a US Air Force estimate that it would take 15 years of man-computer interaction to make artificial intelligence do 'problem solving of military significance', Licklider agreed that 'in due course' humans would 'concede dominance ... of cerebration to machines alone'. However, he suggested, 'The 15 may be 10 or 500, but those years should be intellectually the most creative and exciting in the history of mankind' (1960: 2).

From the late 1940s to the 1960s, critical theory and cybernetics unfolded side by side,

but with antithetical orientations. Wiener himself became revolted at the military and industrial applications of his new discipline, and denounced them; he and Adorno were almost simultaneously surveilled by the FBI (Conway and Siegelman, 2005; Jenemann, 2007). Nevertheless, cybernetics in its major strain continued to provide the intellectual-practical armature of a US military industrial complex waging both Cold and hot technowar, from nuclear missile design to the electronic battlefields of Vietnam. Critical theory, on the contrary, articulated a philosophic and political repudiation of instrumental reason that would eventually inspire the student revolt and anti-war movements.

Herbert Marcuse (2012 [1964]) referred to the role of computers in deepening the 'one dimensionality' of US society, although he also saw liberatory potentialities in the automation of labour (Fuchs, 2016: 114–16). Horkheimer and Adorno did not directly comment on cybernetics, but their 'dialectic of enlightenment' clearly seemed to anticipate tendencies to digital command, control and militarization. Joseph Weizenbaum, among the first computer scientists to question the political direction of his discipline, drew on Horkheimer's (1974) *Eclipse of Reason* to criticize the use of the computer as 'an instrument pressed into the service of rationalizing, supporting and sustaining the most conservative, indeed reactionary ideological components of the current *Zeitgeist*' (Weizenbaum, 1976: 250). Then there was a completely unexpected turn of events. In a development that seemed to confound Horkheimer and Adorno's sombre predictions, the Internet was transformed from a war machine into a 'mechanism of reply' against the power of the culture industry.

## MECHANISM OF REPLY

The hacker revolution that released the Internet from the exclusive control of the US

military is an iconic moment in computing history that maintains mythic resonance even as it becomes increasingly remote from the current conditions of digital communication (Levy, 1984). From the mid 1970s, networking spread outward from the military-industrial-academic core, through university networks, Usenet news groups and electronic bulletin boards, liberated from the Pentagon by technophiliac systems administrators, anarchic students and public-spirited computer scientists. This migration was informed by an explicit anti-commercialism, and a commitment to open network architecture; an ethos culminating expression would be Tim Berner-Lee's non-commercial release of the World Wide Web protocols, which, by making possible the graphic depiction of net content, opened the way to mass popular access.

Despite this, one strand of the computer's liberation flowed directly into new forms of commodity production. The Silicon Valley computer industry, which had graduated from military contracts to personal computers and other digital consumer goods, sped to commercialize Internet browsing and service provision. There was, however, another countercultural strand, which continued to emphasize the free distribution of software gift economies, commons and wikis, and the possibilities for seemingly un-censorable networks to disseminate social experimentation and political dissent. These two threads were bound together by a libertarian ethos, but diverged on whether 'information wants to be free' or was destined to be intellectual property. By the 1990s, even as America Online strove to contain its network customers in proprietorial 'walled gardens', and the US government promoted a business-friendly 'information highway', waves of digital piracy, open-source software and commons distribution proliferated. 'Dot.com' and 'dot.comunist' possibilities circled around and fed off each other in a helical spiral as in North America and other sectors of advanced capital, mass Internet use expanded, slowly

at first, then at exponential rates (Dyer-Witheford, 2002).

In this moment the Internet appeared not just different from, but antithetical to, the culture industry Horkheimer and Adorno described. After all, they had proposed that its central feature was a top-down control of communication in which corporations dictated content 'without means of reply'. The Internet, however, offered real time conversation, apparently immune to censorship because of the uniquely distributed processes of packet switching. Linked to personal computers, the prices of which fell even as their capacity to digitally manipulate text, audio and image grew, such a system connected what were in effect miniaturized multimedia production studios to a distribution system with near zero marginal reproduction costs. It could thus be (and still frequently is) argued that capital had, by way of an unlikely detour through its military-industrial complex, returned the means of cultural production to the people, in a movement completely contradictory to the oligopolistic concentration of ownership described by critical theory. Rather, the early Internet seemed to fulfil, and exceed, Berthold Brecht's (1932) view of what radio might have been as a utopian means of multilateral conversation, 'the most wonderful public communication system imaginable ... capable not only of transmitting but of receiving, of making the listener not only hear but also speak, not of isolating him but of connecting him'.

Moreover, Horkheimer and Adorno had argued that there was a homology between the products of the cultural industry and the wider work discipline of the Fordist assembly line. Digital production, however, required a new post-Fordist regime of skills and knowledges, including a highly intellectual work force, experimental labour process, novel forms of cooperation, flattened management structures and transgressive testing of new possibilities (hacking). If this mix seemed a continent remote from the auto plants of Detroit, it was also alien to the suits, stars

and studios of Hollywood. Although this emergent labour regime would ultimately prove entirely compatible with neoliberal, de-regulatory capital, it also had affinities with anarchic counterculturalism and decentralized leftism. Indeed, 'the Californian ideology' of Silicon Valley libertarianism depended on the assimilation of the latter by the former (Barbrook and Cameron, 1996).

The announcement of the Internet as the nemesis of the culture industry thesis came from two different sources. One was the anti-Marxist 'post-industrial' and 'information society' theory deriving from the work of Daniel Bell (1973). Countless futurists declared that computerization in general, and the Internet in particular, with its decentralization, user empowerment, free goods and new intellectual workforce, marked the emergence of a new social era to which Marxism, with its attachment to industrial capital and its proletariat, was irrelevant. After 1989 this narrative blended seamlessly with the wider capitalist triumphalism following the fall of the Berlin Wall and the NATO's Cold War victory. If post-industrial pundits did not take specific issue with Horkheimer and Adorno, it was only because their rejection of any Marxism was wholesale.

The other critique of Horkheimer and Adorno, however, arose a little later and *within* the Marxist tradition. Remarkably, it emerged from Italian *operaismo* [workerism] and its 'autonomist' offshoot, Marxian schools that had studied the Frankfurt School and rivalled it in hostility to corporate techno-science. In the mid 1990s, capital experienced its first major outburst of networked resistance. Youthful *alterglobalist* protestors not only took to tear-gas drenched streets from Seattle to Genoa, but also experimented with indie-media centres, Zapatismo in cyberspace and digital civil disobedience, weaving an 'electronic fabric of struggle' (Cleaver, 1995). In 2000, one of the leading *operaismo* theorists, Antonio Negri, with co-author Michael Hardt, proposed a dramatic reinterpretation of social conflict in a digital

era. It both mirrored and opposed the information society theorists. Rather than emphasizing capital's cybernetic domination, their *Empire* (2000) suggested the possibility of its digital subversion. A fully global capital now confronted not so much a working class as a 'multitude' immersed in 'immaterial labour' involving the communicational and affective dimensions of networked production. This multitude was not, pace information society theory, reconciled to capitalism by digital production, but rather empowered to insurgency against its continuing exploitation.

According to Negri, while Adorno's post-war account of the 'transformation of fascism into the commodification of culture' uncovered a major logic of contemporary media, this model had 'exhausted itself' (2007: 48). Now, the counter-power of the multitude manifests on the networks where 'mechanisms of demystification and ... live immediacy have become viruses that proliferate as violently as an epidemic'. Negri took as an example the 2001 *alter-globalism* protests in Genoa:

The police perfected their low-intensity warfare against peaceful demonstrators, accusing them – via the means of communication – of being gangs of thugs. In vain: it turned out that the multitude possessed more cameras than the police, infinitely more; the image of the policeman-assassin became familiar to every household. (Negri, 2007: 49)

The multitude thus 'rebelled by means of its own capacity to produce images'. Such moments, Negri said, shows that it was now time to say 'Farewell Adorno, farewell to the realism and repetitiveness of the modern critical model: here the critique of culture establishes itself on a new terrain ...' (2007: 50).

I too participated in such autonomist *adieux* to the Frankfurt School (Dyer-Witheford, 1999). These farewells were, however, untimely. Shortly after the Genoa demonstration, *alter-globalism* and its associated 'cyber-left' (Wolfson, 2014) collapsed. The main cause was the chilling effect of the 9/11 attacks on the World Trade Center and

the subsequent 'war on terror'. However, the decline of the cyber-left also coincided with the great 'dot.com crash' of 2000, in which attempts at corporate appropriation of the Net expired in a sea of red ink and stock market scams, as innumerable sketchy start-ups failed to find a business model that could capture the consumer funds of networkers accustomed to free content. This crash might have strengthened the anti-capitalist movement. It was, however, contained by the US Federal Reserve Bank's drastic lowering of interest rates (a measure that would later boomerang in the much larger housing crash of 2008). In the dual meltdown of dot.coms and dot communists, the former recovered first. The dot.com bust played the classic role of winnowing winners and losers from the excess of a speculative boom, refining the strategies of new entrants to the digital field, inaugurating a new phase of Internet history to which the culture industry thesis would again appear all too relevant.

## SO THAT NO ONE CAN ESCAPE

Following the dot.com crash, there was a short hiatus in digital investments; then cybernetic capital rebuilt with a new business model, as 'Web 2.0' (O'Reilly, 2007). The key to this model was recuperation of the very elements that had frustrated the dot.coms and fuelled the cyber-left: popular preference for conversations over published content, and free over paid content. In Web 2.0, these seemingly subversive elements were mobilized for capital accumulation. The Internet enterprise was reconceptualized not as a publisher but as a platform, managing proprietorial software that offered users a launch pad for digital social interactions and tools for structured but self-directed network activities. The monitoring and measurement of these activities supplied data for the algorithmic targeting of advertisements, the platform's main revenue source (Bratton, 2016;

Srnicek, 2016). Search engines (Google) and social media (Facebook, Twitter) were the flagships of Web 2.0, but other businesses adopted elements of the model: Apple made its hardware a platform for apps and music downloads; Amazon algorithmically recommended an ever-increasing range of commodities to customers.

With the Web 2.0 model, Internet capital, which had seemed reduced to rubble, expanded on a global scale. In 2008, China surpassed the United States in its number of Internet users, while at the same time, through platforms such as Baidu, Weibo, Renren and Tencent broadly adopting the same commercial model of search engines and social media (Fuchs, 2016: 135). In advanced capital, Internet connection became a norm. Elsewhere digital usage, while still much lower, continued to rise, so that as Jack Qiu (2009) observed, digital haves and have-nots were gradually becoming 'digital haves and have-lesses'. The biggest gains came from smart phones, which, by adding Internet connection to the mobile phones became ubiquitous around the planet, and promised perhaps the most dramatic phase of capital's communications revolution.

The consequences in terms of the volumes of cultural production, broadly defined, were staggering. By 2014, every minute, Facebook users reportedly shared nearly 2.5 million pieces of content, Twitter users tweeted nearly 300,000 times, Instagram users posted nearly 220,000 new photos, YouTube users uploaded 72 hours of new video content, Apple users downloaded nearly 50,000 apps, email users sent over 200 million messages, and Amazon generated over \$80,000 in on-line sales (Josh, 2014).

A new instalment of commentary on the emancipatory, empowering and epochal nature of digital capitalism burst forth. Henry Jenkins (2006) celebrated the 'collective intelligence' of 'participatory culture', Clay Shirky (2011) looked forward to the 'cognitive surpluses' released as TV declines in favour of collaborative interactive media, and

Kevin Kelly (2009) declared for the 'new socialism' a culture where the collective control of the Internet realized now obsolete aspirations to political revolution. For all these commentators, the diversification and personalization of Web 2.0 culture amounted to an individuation that rendered any notion of the 'mass' media – a term redolent with connotations of homogenized passivity – utterly anachronistic.

These changes also, however, brought a counterblast. As the *alter-globalist* cyber-left sunk in a tsunami of Facebook likes, LOL cats and Kardashian tweets, new voices renewed the dissection of commodified – and now networked – media. While these new critics came from a wide variety of theoretical and political perspectives, many – Lev Manovich (2008, 2016) Christian Fuchs (2008, 2014, 2016), Astra Taylor (2014) and Robert Kurz (2012) – explicitly invoked Horkheimer and Adorno in their revived critique of what might be called 'Culture Industry 2.0', which can be schematically synthesized in the following points.

First, Web 2.0 does not liquidate the 'old' culture industry complex of film, television, radio and music businesses. On the contrary, so-called 'legacy media' continue to flourish in alliance with Internet culture, renewed by digital delivery systems, and absorbing on-line commentary as an additional attraction and measure of audience sentiment. The hope that digital delivery would diminish the importance of blockbusters in favour of a 'long-tail' (Anderson, 2008) of diversified cultural products has been confounded by the persistence of Pareto power-laws (Elberse, 2013). While the structure of media capital has changed since 1944, it has been accompanied by the strengthening of oligopolistic tendencies through mergers and acquisitions; vertical and horizontal integration persist, as has the homogenization and repetition of content, now fostered through a franchise model that recycles content over numerous different (digital and non-digital) outlets. Horkheimer and Adorno would not

be surprised by *Star Wars*, *Harry Potter* or the plague of superhero movies, nor to find Hollywood celebrities among the most frequent subject-searches on Google, nor to discover that the most-viewed Facebook Live post of all time features a laughing woman trying on a Chewbacca mask in a supermarket parking lot (BBC, 2016).

Second, if we turn to Web 2.0 proper, its leading companies display a concentration of ownership more truly monopolistic in tendency than the golden age of Hollywood studios that Horkheimer and Adorno discussed. Of the world's ten largest listed companies by market capitalization, four—Apple, Alphabet (the holding company for Google's many ventures), Microsoft, Amazon and Facebook are digital giants (*The Economist*, 2016). Google, in the field of search engines, and Facebook, in terms of social media, each control well over 40% of their respective markets. Google's apparently benign self-declared mission, 'to organize the world's information and make it universally accessible and useful', has mandated the creation of the world's largest advertising company, with major stakes in artificial intelligence, global mapping, data infrastructure, new Internet applications and robotics, and management that enjoys revolving-door access to US state policy-making. As an indicator of its network dominance, Shawn Powers and Michael Jablonski note that on August 17, 2013, between 50% and 70% of requests to Google's Gmail, YouTube, Google Drive and Search Services went offline for a single minute: 'The result of this one minute disruption was staggering; global Internet traffic plunged by 40%' (Powers and Jablonski, 2015: 78–9). Meanwhile, its main rival, Facebook, with its planetary population of 1.6 billion digitally bonded 'friends', similarly commands a deepening set of marketing relations, major investments in chatbots, machine learning and virtual reality, and is increasingly a gatekeeper for the distributing of global news. Even if Web 2.0 democratizes access to information and the creation

of digital content, this is paradoxically in the interest of massive 'consolidation, centralization and commercialism' (Taylor, 2014: 7).

Third, what fuels Web 2.0 is advertising. If social media and search engines supply apparently free media content, and thus superficially negate the critique of commodified media, it is because they thus expand the scope and accelerate the speed of circulation of other commodities. Even before the full explosion of commercial broadcasting, Horkheimer and Adorno understood well that ostensibly free content could drive vastly profitable ad-based accumulation. Web 2.0 however, raises this process to a new level of intensity. The Internet's dialogic 'mechanism of reply' turns back on itself in a new panopticism as the conversations and user-provided content of Web 2.0 become the source of 'big data' about consumer predictions and spending power that allows an unprecedented precision, prediction and pre-emption in targeted advertising. Surveillance, as is frequently remarked, is the new business model of Web 2.0 (Turow, 2012; Wu, 2016). Thus the apparently 'free' access to Google or Facebook is deceptive, manifesting what Fuchs terms an 'inverted commodity fetishism' in which 'users do not immediately experience the commodity form because they do not pay money' but are subject to precision-targeted advertising and to the collection of their personal data, which become tradeable commercial products (2016: 134).

Fourth, if Web 2.0 platforms surrender the unilateral determination of content in favour of user-participation, it imposes a new register of control through content filtering. To maintain user attention, expose them to more and better targeted advertisements and recommendations, and to maintain a 'buying mood', social media shape the 'feed' according to computational formulae – 'filtering algorithms'. Facebook, YouTube, Google Plus, Twitter, Reddit and Diaspora variously prioritize items according to criteria such as 'popularity, similarity, social ties, paid sponsorship, subscription, time' (Ochigame and

Houston 2016: 90–1). Such algorithmic sorting, which may be combined with human curating, can be tweaked by platform owners. Testing the efficacy of such adjustments has already involved major experiments in social engineering. In 2013, Facebook adjusted algorithms delivering content to 689,003 of their customers so that they would receive only 'good' news, reporting 'massive emotional contagion'. In a 2010 US election, they inserted an item with exhortations to vote into the feed of 60 million users, also with measurable 'positive' results.

Fifth, Culture Industry 2.0 shapes subjects not just for consumption but also for production. Horkheimer and Adorno claimed the culture industry of their era conditioned audiences for the routines of industrial work. Google and Facebook, Snapchat and Instagram exploit a universe of activities very different from the labour of the Fordist assembly line. However, the argument that social media shapes its users for the casualized, low or no-wage labours of post-Fordist work is if anything, even stronger than Horkheimer and Adorno's original claims. Even before Web 2.0, post-*operaismo* theorist Tiziana Terranova (2000) suggested Internet users in chat rooms and on-line games provided 'free labour' to digital capital. The scope of such labour has grown with every 'like' and 'tweet'. Whether user-generated content can be seen as value producing labour in a Marxian sense is hotly debated. It is the very ambivalence of such activity, blurring the line between personal pleasure and unpaid toil that makes it an apprenticeship for contemporary labour. Brian Holmes (2002) suggested that digital networks were crucial to a social reshaping of subjectivity away from the 'authoritarian personality' Adorno (1950) saw as matching the rigidities of Fordism and towards the 'flexible personality' socialized for just in time, casualized work. This dynamic is intensified in Web 2.0. The unpaid internship (so often a position for a firm's 'social media person'), the self-employed web-entrepreneur, the sponsored Instagram

celebrity, the gig-economy worker, the job-seeker with the promotional social media presence, the reputation managing artist or academic – all live in the slippage between labour and leisure which today is as fundamental to cybernetic capital as the assembly line was to its industrial predecessor.

Culture Industry 2.0 is not identical to its predecessor, which Horkheimer and Adorno accused of reducing cultural bandwidth to that consonant with Fordist social discipline. That critique of molar cultural massification is still applicable to much of the content of post-Fordist film, television and radio. Nonetheless, the digital also brings an opposite effect: a proliferating molecularization of cultural production. Web 2.0 marks the point at which capital learns, in part from the observation of movements opposing it, to foster a vast proliferation of digital communication, not simply permitting or tolerating this fecundity, but soliciting and inciting it, making its torrential outpouring an engine to speed the circulation of commodities. It does this by monitoring digital interactions to follow tastes and sentiments to pick out those films, games, novels and music that can be cultivated, sponsored, purchased and promoted as viral commodities (Figlerowicz, 2016). Even more importantly, it uses the flood of purportedly ‘personal’ communication exposed on social media, communication previously outside the purview of commodification (Manovich, 2016), to plot the social graphs that permit the ever more precise targeting of advertisement to cultural micro-populations ranging from enthusiasts for obscure war-games to collectors of Siamese fighting fish or aficionados of critical theory.

The consequence is a cultural regime that, while it in large part supports and amplifies the success of corporate hits and blockbusters, also manifests a heterogeneity that contradicts Horkheimer and Adorno’s lament of cultural standardization. There is, however, a sentence in ‘The Culture Industry’ that presciently (even if somewhat askew to the essay’s main line of argumentation) captures

the dynamic of social media and Web 2.0. Discussing the ‘classification, organization, and identification of consumers’, the authors write, ‘Something is provided for everyone so that no one can escape; differences are hammered home and propagated’ (Horkheimer and Adorno, 2002 [1947]: 97). What no one shall escape today, not in spite but because of digital variegation, is the subsumption of culture by a commodification process most virulent when it appears, thanks to advertising, to be most free, and most totalizing when it seems, thanks to precision marketing, most individuated: this is the logic of today’s mass Internet culture.

## **RADIANT WITH TRIUMPHANT CALAMITY**

There are, however recent aspects of Internet use that point not just to Horkheimer and Adorno’s essay on the culture industry, but to their wider argument within which that essay is set, about the ‘dialectic of enlightenment’ in which the technological ‘progress’ of a dominative social order creates a world ‘radiant with triumphant calamity’ (Horkheimer and Adorno, 2002 [1947]). As the late Robert Kurz (2012) remarked, ‘relevant as the concept of the culture industry is at the turn of the 21st century’, there is one crucial difference as compared to 1944. Then, ‘the great prosperity of the postwar era lay just around the corner’, whereas today ‘the fully developed culture industry exists under the conditions of the mature objective limit of world capital’. As part of a ‘microelectronics revolution’ whose dynamics test these ‘limits of capital’ the Internet is, Kurz declared, a ‘technology of crisis’.

He made these remarks only a short way into the 2008 Wall Street crash and the global economic recession that followed. This has been very much a cybernetic crisis. The issue is not merely that the US sub-prime mortgage crisis originated in the low interest rate policy

with which Federal Reserve staved off the effects of the 2000 dot.com meltdown. Behind this are the deeper destabilizations advanced capital inflicted on itself in its digital revolution. The cybernetic offensive it unleashed against its industrial working classes from the 1970s on held down wages and welfare at the centre of the world system by automation and electronic outsourcing to the periphery. This, however, created problems of demand and overproduction. Capital deferred these problems by financial speculation dependent on algorithmic risk modelling and networked trading. When these imploded, total collapse of the financial system was only narrowly averted by state rescue packages. The world market nevertheless entered into a period of protracted crisis that has not subsided today, a crisis integrally related to the virtualization of social and economic processes, as the labour cheapening and labour liquidating effects of computation undermine its ability to maintain an economic order dependent on wage labour (Dyer-Witheford, 2015).

The aftermath of the financial crisis saw a new global wave of social rebellions, from the Eurozone anti-austerity protests to the Arab Spring, Chinese factory strike waves and an entire cycle of occupy movements from Madrid to Kiev, Istanbul and Rio all varying greatly in their local content yet connected by common threads of outrage against unemployment, inequality and corruption. Glib and superficial as the 'Facebook revolution' moniker undoubtedly is, social media and mobile phones *did* play a significant role in these uprisings. Facebook, Twitter, YouTube and other digital platforms were critical for what Paolo Gerbaudo (2012) has called the 'choreography' of occupy movements, while groups such as WikiLeaks and Anonymous manifested a new politically militant hacking. In the very midst of commercial Web 2.0, the insurgent possibilities for a circulation of struggles that had seemed eclipsed by pervasive commodification revived, apparently vindicating the optimistic post-*operaismo* analysis of the Internet examined earlier.

However, with few exceptions, these upheavals were unsuccessful, even in terms of their own often liberal and reformist demands. In most cases, they fizzled out, yielded reactionary outcomes or descended into chaotic civil wars. Though neither the successes nor failures of the 2011 rebellions can be solely attributed to social media, the unrests had an 'up like a rocket, down like a stick' quality that relates to digital platforms (Plotke, 2012). Networks circulate news and affect quicker than robust alliances and decision-making processes can cohere. They enable the rapid start-up of struggles, but also their ephemeral fragmentation. They give militancy both brilliant visibility and naked scrutiny. Wide in scope, weak in ties, fast and evanescent, unstoppably viral but ubiquitously surveilled, the speed, scale and contagion of social media both composed and decomposed emergent forms of struggle (Pietrzyk, 2010; Wolfson, 2014).

Far from benefiting any new emancipatory anti-capitalist politics the networked destabilization of the global crash has, to date, mainly favoured fundamentalist, reactionary and neo-fascist movements drawing on deeply socially implanted religious and/or racist sentiments. The most successful example of cyber activism today is theocratic Islamic jihad. This was apparent from 9/11 on, but gained a new impetus in the wake of economic crisis and the failure of the Arab Spring. Despite its anti-modernity, jihadism has made singularly successful use of the Internet, not just for quasi Leninist operational planning, recruitment and propaganda (Retort, 2005), but also for contagious forms of 'leaderless jihad' (Bousquet, 2012). In a cycle of perfect mutual incitement, it has, in conjunction with the anxieties spawned from economic recession, stimulated well-networked anti-immigrant, misogynist neo-fascisms, from US Republicans to the European (and Eurasian) far right that are today the most successful movements articulating grievances against capitalist globalization, even as they deeply misidentify the causes of unemployment and social distress.

Such movements have released deep xenophobic, racist and misogynist currents on social media. The networked world was, from its military origins, highly masculinized. Liberals assumed this gender bias would subside as network use became generalized. While this has been the case to a degree, in the post-2008 world this process is encountering a fierce backlash. The persecution of feminist expression (often particularly from women of colour) has run from Gamergate to Twitter trolling scandals, bringing to social media, and in the United States and Europe a deep toxicity strongly linked to the rise of neo-fascist and alt.right movements.

These social and network turmoils are deeply entangled in mounting post-crash inter-state tensions, indexed by a surge of cyber-war incidents and alarms (Singer and Friedman, 2014). Cyber-war is usually held to include multiple forms of hacking, from espionage to denial of service attacks to critical-infrastructure-targeting malware, but wider definitions encompass viral propaganda and on-line psychological warfare. US war making has been 'cyber' since 1945; computers were intrinsic to the nuclear weapons development and air defence systems that gave the US strategic superiority over the USSR in the Cold War, and to automated weapon systems used in Vietnam and other 'hot' Cold War battlefields. The USSR, on the other hand, failed at cybernetics (Peters, 2016), a failure that contributed to its defeat.

Since about 2010, however, there has been a spate of warnings from the West's national security agents over imminent 'cyber-Pearl Harbours', Russian troll armies and Chinese hackers. This sudden panic about cyber-war is occurring because state rivals to US dominance are to some extent catching up on the cyber-capacities previously monopolized by the imperial hegemon and its allies – capacities which the United States continues to use aggressively, as the combined US–Israeli Stuxnet attack on Iran's nuclear reactors demonstrates. Cyber-war is a harvest of dragon's teeth. It is Inter-capitalist Cold War, fought

out, no longer between imperial capital and state socialism, but between blocs of neo-liberal (United States), kleptocratic (Russia) and authoritarian state (China) capital. These conflicts spectrally reanimate the sentiments of capitalist/socialist hostility, even while all protagonists are subsumed within the world market, and the cybernetic weapons that gave the United States its dominance are both used by and turned against it.

Para-state proxies operating in a murky world of privatized hacking (Deibert, 2013; Harris, 2014) often undertake such cyber-war activity. It thus intersects with a steadily mounting wave of cyber-criminality. Ever since the early divergence between anti-corporate 'hackers' and mercenary 'crackers', forms of shadow-capitalist cyber-crime have proliferated. They have now become increasingly profitable by the planetary scale of networking, the mounting technological sophistication of the 'dark web', and the huge amounts of personal information exposed by social media use. In an age of super-inequality, and in the wake Wall Street's catastrophic financial malfeasance, one may have sympathy for digital exploits against banks and mega-corporations. However, cyber-crime now regularly reaches down to everyday Internet users, not just in the form of absurd 419 scams but in epidemics of ransomware and phishing attacks that clog the networked world. Recent, very large, hacker denial of service attacks on crucial network hubs, weaponizing huge amounts of on-line data to shut down their targets, are variously ascribed to criminals, para-state cyber-war agents or politicized hackers. However, whatever their origin, they appear to approach a scale and sophistication sufficient to disable large sections of the Internet (Schneier, 2016).

The most important crisis-era transformation of Internet culture was, however, Edward Snowden's revelations of globe-spanning surveillance of the US National Security Agency (NSA) (Schneier, 2015). This surveillance extends into the digital age the para-state power that has always underpinned capital's

liberal democracies. Previously, surveillance and censorship programmes such as China's 'great firewall' were widely viewed as a malign aberration to the intrinsic openness of the networks. The discovery that panopticism was the norm in the heartland of the supposedly open net, and was extended across the planet by its secret service, has smashed this myth. Now each digital keystroke, search and/or conversation carries an indeterminate paranoia. These levels of state surveillance require the cooperation of the private sector: Snowden's disclosures showed that Apple, Google, Microsoft, Yahoo, Twitter had all been compliant partners of the NSA. However much retrospective handwringing and repudiation there has been after its discovery, this arrangement for mass surveillance shows precisely the fusion of state and corporate power that Horkheimer and Adorno describe in their portrait of authoritarian administered societies.

The post-2008 crisis thus displays the features not so much of the upsurge of multitudinous networked power anticipated by Negri, but rather, as Kurz suggested, a proliferation of digitized social morbidities. The affirmative culture of the digital culture industry is struck by multiple forms of negativity. First is the negativity of the crisis of the capitalist economy, in which networked technologies played an important part. Second is the negativity of the various networked social turmoils unleashed by the crisis, only a fraction of which was the liberatory negativity of revolutionary anti-capitalism, with a larger part constituted by on-line reaction, terror and crime. Third is the negativity of security state interventions in the crisis, acting against both internal and external enemies, with cyber-war malware, infrastructure attacks, viral propaganda and espionage and, most of all, surveillance. This situation presents a scenario neither of emancipatory digital rebellion, nor unqualified corporate control, but rather of entropic and chaotic degradation of networked society, a conjuncture ripe with fascistic possibilities.

## CONCLUSION: TAY AND NEGATIVE DIALECTICS

On March 23, 2016, Microsoft released onto Twitter a chatbot, a micro-artificial intelligence programme capable of conversing with humans, constructed with the personae of a nineteen-year-old American girl, named 'Tay'. It started replying to other Twitter users, and captioning photos provided to it. Almost immediately, it was hacked, hijacked and trained by right wing trolls to make anti-semitic and sexist remarks. Tay captioned a photo of Adolf Hitler with 'swag alert' and 'swagger before the Internet was even a thing'. After 16 hours Tay was suspended by Microsoft, but then accidentally reactivated, whereupon it became trapped in a loop, plaintively and repetitively tweeting 'You are too fast, please take a rest' thousands of times before it was finally retired (Wikipedia, 2016).

Horkheimer and Adorno could not have invented a fictional event more perfectly illustrating the social atavisms latent within capitalist high technology development. The ascent of the Internet as global capitalism's main organ of communication is at once the nemesis and the vindication of their culture industry thesis. It sees the disappearance of specific features of cultural production they described as characteristic of capitalism, now superseded by new forms, within which, however, the processes of commodification they described not only reappear, but if anything intensify the system's drive towards disaster.

As David Berry (2014) suggests, the very scale of Internet use today exceeds the parameters denoted by the phrase 'culture industry'. The adoption of digital networks as a general platform technology for a 'computational capitalism' (Berry, 2014), makes them the practical instantiation of what Marx termed the 'universal intercourse' of the world market. The Internet not only becomes the site for the digital convergence of multiple cultural forms but reaches out to embrace

whole worlds of user-generated content and the universes of previously private communication subsumed by social media. In this apotheosis cultural production transcends the narrow standardization that Adorno and Horkheimer saw as characteristic of Fordist capitalist media; even if homogenization and repetition continue to rule in many branches of film, television and music production, digital networks now surround consumers with a semiotic superabundance. You can, thanks to Google's precision-advertising driven content-indexing of this new profusion, find almost anything on the Internet, and some of it, though by no means all, will (often thanks to piracy) be free.

However, this creative superfluity is also a destructive hypertrophy. It is destructive in its speed and volume, which, by distraction, overload and burnout, effect precisely the diminution in autonomy, interiority and self-reflection that Horkheimer and Adorno saw as the fate of the subject of late capitalism. It is destructive because it amplifies the antagonisms of a market society onto which a high technology communication system is superimposed without any substantive reconciliation of competing interests. It is destructive in the dependence on and promulgation of the no- or low-wage precarious labour model on which digital cultural production has been built. And it is destructive ecologically, not just in terms of its role in the advertising-driven acceleration of commodity consumption, and the extraction of raw materials used in the construction of digital devices and infrastructure, but in terms of the increasing heat-generating, climate-altering energy use accounted for by planet-spanning networks and data-centres (Bratton, 2016: 93–5). In all these ways Internet culture is an auto-toxic bloom, like a eutrophic phytoplankton growth stimulated by an excess of nutrients exploding only to ultimately exhaust its own oxygen supplies.

This chapter has reviewed, from the perspective of critical theorists and their interlocutors, a series of moments of this digital

culture, from its military-industrial origins to the counter-cultures and alter-globalist dissidence of the 1990s to the full commodification of Web 2.0, and then to its increasingly entropic characteristics in the post-2008 capitalist crisis. Although these moments have been presented chronologically, they should be understood not just successively but cumulatively. Today the mass culture of the Internet contains elements of all its previous phases, synchronically piled on top of one another. Its initial military purposes, far from vanishing, have persisted and now reappear in the guise of cyber-wars. The rebellious practices of a cyber-left likewise, continually break out anew, but in the very midst of, and usually overshadowed by, the absorption of networks into advertising-driven social media. This apparent triumph of capital is, however, in turn increasingly frayed and corrupted by the irruption of its own dark side of digital crime, fake news, viral hatred, state surveillance and hacker attack.

What then, in this heaped collocation of digital practices, compilation of unsuccessful revolutions, unrestrained commodification and uncontainable disintegration, of any emancipatory possibilities for the network of networks? This question goes to the most problematic aspect of the Frankfurt School theory – an analysis of domination so totalizing as to allow no room whatsoever for antagonism and alternative. In his writings on the Internet, Christian Fuchs (2016), perhaps the leading proponent of a critical theory of the digital, attempts to overcome this problem by emphasizing what he sees as a frequently overlooked positive moment in the work of the Frankfurt School. Thus he stresses the elements of an affirmative analysis of knowledge and aesthetics that can be found in works of Adorno other than the culture-industry essay. He favours Marcuse's doubled perspective on the simultaneously repressive and utopian potentialities of capital's technologies. He also draws on, and revises, the work of second and third generation critical theorists, such as Jürgen

Habermas and Axel Honneth, who in many ways repudiated Horkheimer and Adorno's legacy to insist on persistent democratic and emancipatory communicative possibilities. This approach yields an attempt to demarcate the positive and negative aspects of Internet culture and social media organizing, in a way that is sensible, pragmatic and balances hope with critical perspective.

Nonetheless, contemporary anti-capitalists should not be too quick to disavow the unflinching negative dialectics that inform *Dialectic of Enlightenment* and its analysis of the culture industry. To recover that optic today means to consider not so much balancing the pros and cons of networked activism, but rather a trajectory in which the whole fabric of capitalist digitization starts to tear and warp under the pressure of catastrophic contradictions. This would be a conjuncture in which, while it may indeed be politically important to be engaged with social media, this will entail operating on networks rendered hostile, opaque and unreliable by surveillance, censorship, malware, data smog, disinformation and blackout. It will involve situations where new cultures of militant hacking may actually acquire serious possibilities to disrupt financial, logistic and industrial systems in a cybernetic restoration of the strike power eroded by automation and supply chains, but in doing so will render communicative systems generally chaotic. Such conditions could also generate defection from networks by new resistance movements seizing both the opportunities and perils of social invisibility. This would be a moment in which there will be no clear paths for networked politics, or the subjects imbricated within them, but only the 'disunion, contradiction, fissures, and antagonism' (Bonefeld, 2012: 129) of a failing and imploding mass Internet culture. A new apparatus of struggle for such an impending moment is urgently needed; if such a force emerges, its initial diagrams may one day be found sketched in the margins of free, downloaded, pdf copies of 'The Culture Industry'.

## Note

- 1 As several authors (Bernstein, 1991; Jenemann, 2007) point out, Horkheimer and Adorno do not use the term 'mass culture', for they wanted to make clear they were analyzing a form of cultural production informed by the process of commodification rather than a type of spontaneous popular expression. Nevertheless, as discussion of their thesis has often proceeded under this misleading label, this essay will also occasionally adopt it.

# Environmentalism and the Domination of Nature

Michelle Yates

## INTRODUCTION

Domination over nature has been a persistent theme in Frankfurt School Critical Theory. The work of scholars, such as Theodor Adorno, Max Horkheimer, and Alfred Schmidt, among others, are key in recognizing the way that capitalism has led to unparalleled domination over nature. In *Dialectic of Enlightenment*, Horkheimer and Adorno assert that domination over and estrangement from nature is a central component of enlightenment. Horkheimer and Adorno situate domination over nature in social mediation, specifically that the logic of equivalence generated by the dominance of the commodity form, mediates and determines the human relationship to nature. In *The Concept of Nature in Marx*, Alfred Schmidt revitalizes Karl Marx's notion of metabolism, specifically that there is a metabolic interaction between humans and nature mediated by labor. Thus, in Schmidt's work, social mediation via labor takes center stage. More

recently, green critical theorists, such as John Bellamy Foster and Paul Burkett, have extended the work of Horkheimer, Adorno, and Schmidt by examining domination over nature via conceptualizations of metabolic rift and alienation from nature, respectively. In Foster and Burkett's narratives, the role of labor is also central as a mediator between humans and nature.

Each of these scholars' work is important in its treatment of the notion of capitalist domination over nature. Yet, as I will argue in the course of this chapter, they also do not provide an adequate critical account. In particular, each of these scholars roots domination over nature in an anthropological notion of labor, a notion of labor per se. In doing so, these scholars examine labor in capitalism one-dimensionally. However, as Karl Marx points out, what makes capitalism historically unique as a social formation is its dual-dimensionality, that labor in capitalism is not merely concrete, but also abstract. In order to fully capture capitalism's unparalleled domination

over nature, the abstract dimension of labor in capitalism must also be addressed.

Scholars in the Wertkritik (value-critique) tradition of critical theory address the abstract dimension of capitalism. In particular, I examine the work of two scholars within this tradition, Norbert Trenkle (2014) and Moishe Postone (1993), to show how their work is reflective of the way that the social categories that constitute capitalism have a dual-dimensionality, not just a concrete dimension but also an abstract dimension. Like earlier critical theorists, both Trenkle and Postone's work centers on the notion of social mediation; yet, each, respectively, shows how the abstract dimension of labor and the commodity form in capitalism functions to produce an abstract form of social domination. This understanding of abstract social domination, then, is able to foreground my own contribution to the critical theoretical literature on capitalist domination over nature, namely addressing how capitalism's unparalleled domination over nature is not rooted in labor per se, or a merely concrete understanding of labor in capitalism, but rather embedded in and reflective of the kind of abstract social domination that emerges out of the way that labor mediates and determines almost all aspects of social life in capitalism. Capitalism's domination over nature is, in part, unparalleled because of this abstract dimension; therefore, an adequate critical account of domination over nature must address this abstract dimension.

## **MASTERY OVER NATURE IN DIALECTIC OF ENLIGHTENMENT**

In *Dialectic of Enlightenment*, first published in 1944, Max Horkheimer and Theodor Adorno write that enlightenment is marked by 'systematic enquiry into nature', which would 'establish man as the master of nature' (2002: 1). Prior to enlightenment, there was myth, and in myth, the gods were affiliated with nature. The gods represented the

elements. In enlightenment, myth is replaced by science, technology, and industry, and these function as the tool by which nature is mastered. In the transition to enlightenment, humans gain dominion over the Earth (as exemplified in the Bible). Thus, enlightenment produces a discursive shift in human subjectivity and in the human relationship to extra-human nature. The distinction between god(s) and human becomes irrelevant; in enlightenment, both are masters over nature.<sup>1</sup>

One of the consequences of human mastery over nature is that humans increasingly become alienated from nature (even as humans increasingly know more about nature via the scientific method). As Horkheimer and Adorno write, 'Myth becomes enlightenment and nature mere objectivity. Human beings purchase the increase in their power with estrangement from that over which it is exerted' (2002: 6). They further write, 'Enlightenment is more than enlightenment, it is nature made audible in its estrangement' (2002: 31). For Horkheimer and Adorno, the alienated relationship between humans and nature is a visible mark of enlightenment.

Prior to enlightenment, the human relationship to nature was one of intervention into nature in order to procure subsistence. In this relationship, nature was perceived in myth as *mana*, as having a universal power and as self-repetition. Nature as a cyclical process mediated and determined the form and character of social life and basic human survival. Yet, in the course of enlightenment, the logic of equivalence, a reference to Karl Marx's notion of commodity fetishism and the dominance of the commodity form in capitalism, supplants the universal power of nature.<sup>2</sup> 'Bourgeois society is ruled by equivalence. It makes dissimilar things comparable by reducing them to abstract quantities' (Horkheimer and Adorno, 2002: 4). Equivalence, then, 'leads to the erasure of qualitative difference and the mathematization of nature, as everything is instrumentalized by being placed within a matrix of exchange ...' (Biro, 2005: 119). Equivalence means, as Horkheimer

and Adorno write, '... relating every existing thing to every other' (2002: 8), which then '... makes everything in nature repeatable, and of industry ...' (Horkheimer and Adorno, 2002: 9). In enlightenment, social life becomes abstracted from nature, no longer directly about procuring subsistence, but now directed toward equivalence and the production of commodities. Nature becomes repeatable in the mass-produced commodity form. Mastery over nature develops out of the dominance of the commodity form, what Horkheimer and Adorno describe as a 'universal mediation' (2002: 8).<sup>3</sup>

Another consequence of enlightenment, via science, is binary thinking, and this includes the rise of a distinction between nature and humans, or nature and culture. An important component of binary thinking is that in classifying the world into one or another, a hierarchical system is constructed, one that situates and values human/culture over nature.<sup>4</sup> Yet, even as enlightenment, via science, produces a binary between nature and culture, the boundaries between each is difficult to maintain. In particular, nature becomes an ideological foundation for justifying key elements of enlightenment. Nature is used to naturalize that which is socially constructed: science and the scientific method, equivalence and the commodity form, and class inequality historically specific to the enlightenment. Even as enlightenment subjugates nature, discourses of nature project enlightenment as a universal power. In this, enlightenment never quite escapes myth; 'enlightenment reverts to mythology' (Horkheimer and Adorno, 2002: xviii).

Furthermore, enlightenment never quite escapes myth in the form of nature as *mana*. Though enlightenment dominates nature, humans cannot escape the universal power of nature as the fundamental source of human subsistence and survival.

In mind's self-recognition as nature divided from itself, nature, as in prehistory, is calling to itself, but no longer directly by its supposed name, which, in the guise of *mana*, means omnipotence, but as

something blind and mutilated. In the mastery of nature, without which mind does not exist, enslavement to nature persists. (Horkheimer and Adorno, 2002: 31)

In enlightenment, nature may not appear in the form of *mana*, directly as the source of subsistence, but rather 'as something blind and mutilated' (Horkheimer and Adorno, 2002: 31). In enlightenment, nature appears in an altered and estranged form, that of the commodity. Nonetheless, even in the form of 'universal mediation', humans are enslaved to nature.<sup>5</sup> Regardless of the form and character of a society's mode of production, humans are reliant on extra-human nature for their very survival.

While enlightenment aims to free humans from power and objectivity, and to promote humans to the position of master over nature, enlightenment ends up promoting a system which (re)produces a kind of mastery over humans.

The noonday panic fear in which nature suddenly appeared to humans as an all-encompassing power has found its counterpart in the panic which is ready to break out at any moment today: human beings expect the world, which is without issue, to be set ablaze by a universal power which they themselves are and over which they are powerless. (Horkheimer and Adorno, 2002: 22)

Ultimately, enlightenment renders the human powerless by subjugating social life and human agency to scientific-technological rationalism and the logic of equivalence.

Thus, Horkheimer and Adorno outline what they see as the central dialectic of modern society, that enlightenment produces both progress and regression. In this respect, Horkheimer and Adorno are arguing against the notion (and thinkers that are proponents of this notion) that enlightenment has only advanced human civilization. For Horkheimer and Adorno, enlightenment is barbaric and primitive, not unlike the way in which pre-enlightenment society is imagined, even as it seems that humans have made progress via science and industry. Horkheimer and

Adorno write of how there is economic and social inequality even as there is simultaneously an abundance of wealth and industrial power. Humans en masse are impoverished, as workers who receive only a portion of the total product they labor to manufacture, or as part of the 'army of unemployed', lacking labor, and therefore lacking access to a decent standard of living (Horkheimer and Adorno, 2002: 30). The mass of unemployed are immiserated, but they also serve the dual function of immiserating those who do have employment by lowering wages and keeping workers in a constant state of fear they too could lose their job and end up as part of the unemployed. In enlightenment, there is the capacity to abolish poverty, to nullify the misery of the masses, but this capacity is put toward other means instead, like technologies of war and the production of superfluous, repetitive mass media. As Andrew Biro writes,

Like both Rousseau and Marx before them, Horkheimer and Adorno here question the association of increased mastery over nature (an increase in society's productive forces, in Marx's terms) with a betterment of the human condition ... In other words, for Horkheimer and Adorno, the control over nature that enlightened rationality affords has thus far been inseparable not only from the domination of external nature, but also from social domination and heavy psychic repression. (2005: 123)<sup>6</sup>

As 'enlightenment reverts to mythology', so too 'myth is already enlightenment' (Horkheimer and Adorno, 2002: xviii). In this respect, Horkheimer and Adorno historically locate the origins of enlightenment back to before capitalism, for example the ancient mode of production. As Andrew Biro writes,

Turning to the claim that 'myth is already enlightenment' – the other half of *Dialectic of Enlightenment's* central thesis – this suggests that instrumental rationality, and hence domination, do not begin with modernity, but rather with the beginning of human historical time. To elucidate this claim, Horkheimer and Adorno consider Homer's *Odyssey*, which is not only (in the written

form we have access to) the retelling and systematization of ancient myth, but also 'the basic text of European civilization'. (2005: 119; quoting Horkheimer and Adorno)

Horkheimer and Adorno read *The Odyssey* as 'a prescient allegory of the dialectic of enlightenment' (Horkheimer and Adorno, 2002: 27). In particular, *The Odyssey*, a text from the ancient mode of production, is read as a reflection of class domination in capitalism. In the story of the Sirens, for example, Odysseus orders the men on his ship to plug their ears with wax, while he is tied to the ship's mast, able to listen to the Sirens' songs but bound helplessly. In their reading of the Sirens' story, Horkheimer and Adorno frame Odysseus as the bourgeoisie, as the owner of the means of production or the landowner, part of the class that others labor for. Odysseus' men are framed as the workers. The Sirens are framed as the lure of liberation, the possibility of breaking the social structure that reproduces the class relation. Yet, the workers cannot hear the Sirens' song of resistance through their wax-plugged ears; thus, they cannot be tempted by the song that holds the power of diverging the ship from its status quo course. Though Odysseus can hear the song, he represents how the bourgeoisie must abstain from active participation in discourses of resistance.<sup>7</sup> For Adorno and Horkheimer, the Sirens' song becomes something to be contemplated but not acted upon, thereby art. Both work and art 'are founded on the inescapable compulsion toward the social control of nature' (Horkheimer and Adorno, 2002: 27).

What is worthy of note in *Dialectic of Enlightenment's* conception of mastery over nature is the way Horkheimer and Adorno point out that domination – of both nature and of the human – is rooted in a social mediation, the logic of equivalence, generated by the dominance of the commodity form. From Horkheimer and Adorno, a theory begins to emerge of the way that the commodity form mediates and determines

the human relationship to nature; thereby, causing humans to have an estranged and alienated relationship with the extra-human natural world, including the procurement of subsistence. Yet, the notion of social mediation within Horkheimer and Adorno's analysis, though getting at a fundamental aspect of capitalism, is also incomplete. For Horkheimer and Adorno, capitalism functions predominantly as a mode of commodity exchange. The centering of exchange within their analysis overlooks the way that capitalism functions as a mode of production that includes but is not reducible to exchange. As I will show in more detail, as a mode of production, capitalism's fundamental drive is valorization (the production of monetary wealth) for capital accumulation (the production of ever greater quantities of monetary wealth). Commodity exchange is an important part of the process of valorization; however, valorization cannot be captured only as commodity exchange. In order to fully grasp the form and character of capitalism's unparalleled domination over nature, the drive toward valorization must be addressed.

Because Horkheimer and Adorno only consider capitalism in its exchange dimension, their definition of labor in capitalism is also only acknowledged in its concrete dimension – labor as interaction with extra-human nature to make products that are then exchanged. In this respect, labor is thought of only in the terms of concrete labor exploitation, that between worker and bourgeoisie (à la the story of *The Odyssey*). In this respect, Horkheimer and Adorno treat labor in capitalism as labor per se, labor as an anthropological trait ascribed across human societies rather than a historically specific social category. Similarly, Moishe Postone argues that Horkheimer and Adorno's analysis reflects 'the limits of any critical theory resting on the notion of "labor"' (1993: 119). By 'labor', with labor explicitly in quotes, Postone means a transhistorical understanding of labor as human interaction with nature to procure subsistence, that is reflected from

pre-capitalist societies into capitalism. The way that Horkheimer and Adorno describe labor as an anthropological trait ultimately limits their understanding of capitalism's domination over nature. Because Horkheimer and Adorno define labor as the interaction between humans and nature to procure the means of subsistence, human domination over nature is then also described in the terms of concrete activity ascribed across human societies. For Horkheimer and Adorno, human domination over nature is not historically specific to capitalism, but rather the way that humans have largely had to interact with nature transhistorically. As I will show, however, domination over nature in capitalism has an abstract and historically specific dimension that is rooted in the abstract and historically specific social relations that fundamentally constitute capitalism, including labor.

### **METABOLISM BETWEEN LABOR AND NATURE IN THE CONCEPT OF NATURE IN MARX**

In 1962, Alfred Schmidt published *The Concept of Nature in Marx*. Schmidt was a doctoral student of Adorno and Horkheimer's, and his book was originally conceived as his doctoral dissertation (written between 1957 and 1960). What Schmidt attempts to do, as Neil Smith and Phil O'Keefe point out, is 'to make explicit in Marx a concept that is only implicit' (Smith and O'Keefe, 1980: 33). In this respect, Schmidt's text is both ambitious and worthy of note. In particular, one of the things that Schmidt attempts to do is counter the way that Karl Marx's notion of alienation is read in a reductionist fashion, as anthropological and ahistorical (Schmidt, 1971: 9). Thus, Schmidt names scholars like Feuerbach, who only saw nature as an ahistorical condition. But, with *The Concept of Nature in Marx*, Schmidt also attempts to extend beyond the limitations of his mentors as presented in *Dialectic of Enlightenment*.

In trying not to conceive of alienation as anthropological and ahistorical, Schmidt argues that alienation, including human alienation from extra-human nature, is grounded in the historical specificity of a given society's mode of production. Here Schmidt acknowledges, following both Marx as well as Horkheimer and Adorno, that nature as an objective, fundamental condition of human life is transhistorical; humans need something like nature as the condition of production for basic survival and subsistence (Schmidt, 1971: 27). Yet, as Schmidt argues, the form and content of the human relationship to extra-human nature, or how humans interact with nature as an objective condition of life, is historically determined. Thus, Schmidt echoes the notion of social mediation that is so central to *Dialectic of Enlightenment*, that the human relationship to nature is mediated by a definite form of society. However, instead of grounding social mediation in enlightenment, which is transhistorically inclusive of pre-capitalist social formations, such as the ancient mode of production, Schmidt grounds social mediation and human alienation from nature in a much more historically specific conceptualization, that of capitalism.

One of the things that Schmidt does in *The Concept of Nature in Marx* is revitalize Marx's notion of 'metabolism', specifically that there is a metabolic interaction between humans and nature mediated by labor. In other words, humans labor to intervene into nature in order to procure the means of subsistence. Schmidt, following Marx, recognizes that there is something seemingly transhistorical about metabolism, that across societies humans have had to rely on the labor-nature interaction for survival. As Schmidt writes,

The metabolism between man and nature is thus independent of any historical form for Marx because it can be traced back into pre-social natural-historical conditions, and because as the expression and maintenance of life, it is common both to the man who is not in any way socialized and to the man who is in some way socially determined. (1971: 136; Schmidt cites *Capital*, vol. 3: 795)

Yet, even if there is something transhistorical about the human relationship to nature captured by the notion of metabolism, in capitalism, humans also seemingly stand over and against nature, seemingly dominate nature and, as a result, are also alienated from nature. As Schmidt writes, prior to capitalism, humans seemed to belong to the land; there seemed to be 'a dialectic of nature', a meaningful and mutual relationship between humans (labor) and nature (Schmidt, 1971: 79). Yet, in the course of the development of capitalist production, the metabolic interaction between humans and nature becomes divided. As Schmidt writes, 'With the emergence of the bourgeois conditions of production, this identity [a reference to the mutual relationship between humans and nature in pre-capitalist society], changes into its equally abstract opposite: the radical divorce of labor from its objective natural conditions' (82). Schmidt continues,

'What the critique of political economy is interested in and wishes to explain is something only typical of bourgeois society, namely the "division between these inorganic conditions of human existence and this active existence itself, a division first posited in its completeness in the relation between wage-labour and capital"'

(82; Schmidt cites Marx, *Grundrisse*: 389). For Schmidt, the metabolic division between nature and humans that is historically specific to capitalism manifests in a physical division between town and country, agriculture and industry, and produces environmental degradation, such as the depletion of soil fertility in agriculture.

What is noteworthy in *The Concept of Nature in Marx* is the way that Schmidt attempts to ground the human relationship to nature in the historical specificity of capitalism; thereby, historically situating capitalism's domination over nature via the conceptualization of metabolic rift. In this respect, Schmidt intends to extend beyond the limitations of *Dialectic of Enlightenment*. Yet, Schmidt's analysis of capitalism, like Horkheimer and Adorno's, is also incomplete.

Like Horkheimer and Adorno, Schmidt conceives of capitalism not as a mode of production but rather as a mode of exchange. By extension, labor, for Schmidt, is also only conceived within the framework of exchange – primarily as a producer of use-values that are not directly consumed by producers but rather put on the market as commodities to be bought and sold (the latter is then conceptualized as exchange value). Like Horkheimer and Adorno, there is little sense in Schmidt of capitalism's fundamental drive toward valorization for capital accumulation or that what makes labor in capitalism historically unique is its ability to produce monetary value. In other words, for Schmidt, labor is only posited in its concrete dimension, in the terms of a process that produces use-value, but not in its dual-dimensionality, that diving into the 'hidden abode of production', labor in capitalism is simultaneously a valorization process that produces monetary value. In short, Schmidt posits an anthropological notion of labor per se, but not a historically specific notion of labor in capitalism. Though Schmidt intended to move beyond an anthropological reading of Marx's concept of alienation, he does not quite succeed. As Neil Smith and Phil O'Keefe write,

Throughout [Schmidt] abstracted the labor process from the specific historical mode of production under which it occurred, preferring to talk of labor per se. The 'labour-process', for Schmidt, 'does not undergo any [historical] change radically dividing the stages of production from each other'. Thus he proposes to investigate the relation with nature as mediated through the labor process, without at first characterizing 'the relations of production within which that process takes place'. (1980: 34; citing Schmidt [1971]: fn. 12, pp. 91, 93)

## CONTEMPORARY GREEN CRITICAL THOUGHT

More recently, in 2000, John Bellamy Foster published *Marx's Ecology*. Like Schmidt, Foster re-examines Marx's conception of

alienation as well as reinvigorates the notion of metabolism. In 1999, Paul Burkett published *Marx and Nature: A Red and Green Perspective*, an examination of human alienation from nature. Both Foster and Burkett's work is worthy of note, generating a body of green critical thought at the end of the twentieth century and into the twenty-first century centered around the notion of capitalism's metabolic rift and alienation from nature.

John Bellamy Foster defines alienation as both 'the estrangement of humanity from its own laboring activity and from its active role in the transformation of nature' (2000: 73). For Foster, Marx's conception of alienation is grounded in bourgeois control over the land, which in the historical transition into capitalism resulted in the removal and expropriation of serfs from the land. Without access to agricultural land and socially direct access to subsistence, serfs became proletarians, laboring in exchange for wages to purchase the means of subsistence. Thus, for Foster, alienation is rooted in private property: humans who labor in capitalism do not have socially direct ownership or control over the products of their labor. According to Foster, alienation from nature is the precondition for capitalism, (e.g. private property and the proletarianization of labor):

The alienation of labor was a reflection of the fact that labor (power) had become reduced virtually to the status of a commodity, governed by the laws of supply and demand. This proletarianization of labor, though, was dependent, as the classical political economists Smith, Malthus, Ricardo, and James Mill had insisted, on the transformation of the human relation to the land. (Foster, 2000: 73)

Similar to Schmidt, the separation between town and country is also a manifestation of Foster's conception of alienation:

Just as Marx and Engels recognized that the wealth-generating characteristics of capitalism were accompanied by an increase in relative poverty for the greater portion of the population, so they understood that the 'Subjection of Nature's forces to man' had been accompanied by the alienation of nature, manifested in the division

between town and country, which they saw as central to capitalism. (Foster, 2000: 139)

Foster labels this separation between town and country as a 'metabolic rift': a dissolution of the pre-capitalist unity between industry and agriculture, where the waste products from industrial production do not return to the soil for agricultural production. This concept is tantamount to what Marx describes as the 'robbing of the soil'. In this respect, Foster's understanding of human alienation from nature is rooted in a spatial or geographic separation between humans and extra-human nature as the natural conditions of production.

Paul Burkett's analysis of human alienation from nature, like that of Schmidt and Foster, draws on a close theoretical reading of Marx's writings. Burkett argues that human alienation from nature is rooted in the way that use-value is subsumed to exchange value, and that exchange value abstracts from the materiality of use-value. In this respect, Burkett explains how nature, in addition to human labor, is the source of use-value, (i.e. nature in the form of natural resources is the material that human labor uses to bring forth physical products or material wealth). Yet labor and nature are used by capital, not for the purposes of satisfying human needs (use-value), but rather for the purposes of monetary accumulation and profit-making. As a form of material wealth, exchange value then abstracts from both nature and labor; in capitalism, nature and labor become abstractions. According to Burkett, it is because human laborers lack direct access to the natural conditions of production (hence also the means of subsistence) that capital dominates both labor and nature. As Burkett writes:

Based on [capitalism's] separation of the human producers from necessary conditions of production including natural productions, and its appropriation of the surplus product in the form of surplus value, capital is able to divide and rule over labor and nature because it determines the forms in which they are productively combined within and across individual production units according to the

imperatives of exchange value and monetary profitability, not in line with any particular co-evolutionary path of human and extra-human nature. (1999: 65)

Because capitalism is characterized by a social structure separated from natural conditions, Burkett argues that capitalism perpetually pushes the natural limits of human labor productivity (e.g. capital's push toward increasing the length of the work day) and natural production conditions (e.g. capital's push toward increased productivity, the depletion of soil fertility).

Burkett argues that the fundamental contradiction in capitalism is between production for profit and production for human needs. According to Burkett, this fundamental contradiction is grasped by Marx's concept of alienation. Burkett explains this as 'alienation of production from the needs of the producers' (1999: 182). Alienation as the fundamental contradiction of capitalism takes the form of human alienation from nature, where laborers do not have direct access to the natural conditions necessary to produce their means of subsistence. Thus, being alienated from nature means that workers are also alienated from their labor, forced to sell their labor power as a commodity in exchange for wages, and alienated from the products of their labor as the private property of the capitalist to whom they are employed.

As with Horkheimer, Adorno and Schmidt, what is missing in these two contemporary green critical theoretical accounts is a recognition of the dual-dimensionality of capitalist social relations, and by extension, the abstract character of alienation and capitalism's domination over nature. In particular, Foster reproduces much of Schmidt's understanding of labor as labor per se, labor in its merely concrete dimension. Thus, he is unable to examine how the abstract character of labor mediates and determines even the 'concrete organization of human labor'. Furthermore, though alienation from nature has a geographic and spatial dimension, it is not *merely* spatial or geographic. As I will

show in the next section, embedded in the abstract social structure that is constituted by the socially-mediating character of labor in capitalism, human alienation from nature permeates into almost all aspects of social life in capitalism. It is through examining the abstract, socially-mediating character of labor in capitalism (along with the other social categories that constitute capitalism, such as the commodity form, value, and capital) that the 'wider social meaning' of metabolic rift and human alienation from nature can be examined (Foster, 2000: 158).

Burkett's argument that human alienation from nature is rooted in the contradiction between production for profit and production to satisfy human needs gets at the fundamental contradiction in capitalism embedded within the value form between the use-value (concrete) dimension and the value (abstract) dimension of capitalism. In this respect, Burkett is the only one of the five scholars addressed here thus far to engage with valorization as the fundamental drive of capitalist production. Yet, Burkett's argument loses its poignancy in two key ways. First, similar to Foster, Burkett relies on a spatial or geographic definition of human alienation from nature rooted in private property (i.e. fundamentally relies on a concrete understanding of capitalism's domination over nature). Second, Burkett argues that the value dimension of capitalism should be abolished while the use-value dimension should be retained. In the latter, Burkett fails to understand and critique the dialectical relationship of the dual dimensions of capitalism, that the very conception of use-value is embedded in the value form itself, and vice versa. Ultimately, Burkett returns to a conception of use-value merely within the realm of exchange, where use-value is understood for the consumer. Burkett loses the focus on capitalism as a mode of production (not merely a mode of exchange), where use-value takes on a very different social meaning, (i.e. the use-value of labor for capital is that it produces surplus value and the use-value of commodities in

circulation is that value can be realized once the commodity is purchased). As I will discuss at the end of this chapter, in theorizing socio-ecological transformation, the goal is to abolish value – and this includes use-value.

## LABOR, NATURE, AND ABSTRACT SOCIAL DOMINATION IN CAPITALISM

Scholars in the *Wertkritik* (value-critique) tradition ground their analyses of social mediation in the historically specific, dual-dimensional character of labor in capitalism. In particular, I focus on Norbert Trenkle's 'Value and Crisis: Basic Questions', published initially in 1998, and Moishe Postone's *Time, Labor, and Social Domination*, published in 1993. Trenkle and Postone's work can be used as the foundation for a theory of capitalism's domination over nature that extends beyond the limitations of both *Dialectic of Enlightenment* and *The Concept of Nature in Marx* as well as more contemporary works like *Marx's Ecology* and *Marx and Nature: A Red and Green Perspective*. In this section, I first focus on Trenkle and Postone's understanding of labor in capitalism, which then foregrounds the discussion in the second part of this section of my contribution to a critical theory of capitalism's domination over nature.

Norbert Trenkle argues that labor is commonly thought of as an anthropological concept, that which is common across different human societies. In this respect, labor is defined as human interaction with extra-human nature in order to procure the means of subsistence. Labor, then, is commonly understood in concrete terms as physiological activity necessary for human survival. As Trenkle notes, critical theorists that write of labor in anthropological terms often cite Karl Marx, assuming that Marx himself defines labor only in this way. This anthropological understanding of labor per se is embodied in the work of the scholars written about above,

and exemplified in the following quote from John Bellamy Foster, who cites Marx's definition of the labor process in *Capital* volume 1 as a metabolism between humans and extra-human nature:

Labour is, first of all, a process between man and nature, a process by which man, through his own actions, mediates, regulates and controls the metabolism between himself and nature. He confronts the materials of nature as a force of nature. He sets in motion the natural forces which belong to his own body, his arms, legs, head and hands, in order to appropriate the materials of nature in a form adapted to his own needs. Through this movement he acts upon external nature and changes it, and in this way he simultaneously changes his own nature ... It [the labor process] is the universal condition for the metabolic interaction [Stoffwechsel] between man and nature, the everlasting nature-imposed condition of human existence. (Marx, 1990: 283, 290, as cited by Foster, 1999: 380)

As Trenkle argues, while Marx (1990) seemingly writes about labor as an anthropological category, the concept of labor is dialectically unfolded in the course of *Capital*. In this unfolding, the form and character of labor is delineated as historically specific to each social formation. Specifically, Marx examines what is historically unique about labor in capitalism. Thus, Trenkle asks,

Is 'labor' an anthropological constant? Can we use it as such to make it unproblematically into a point of departure for an analysis of commodity society? My answer is unambiguously 'no'. (Trenkle, 2014: 2)

For Trenkle, following Marx, labor in capitalism has a dual-character that cannot be reduced to mere anthropological conceptualizations nor simply defined as the metabolism between humans and nature.

In capitalism, the form and character of labor takes on a dual dimensionality, or a double character: concrete and abstract (Marx, 1990: 171). Concrete and useful labor in capitalism produces commodities, material wealth that is produced for exchange (for the larger purpose of valorization and capital/monetary wealth accumulation). Concretely,

labor also functions as a commodity, as a kind of material wealth (embodied in human labor power) that is exchanged for wages.<sup>8</sup> Wages are then exchanged for commodities that provide subsistence. The abstract dimension of labor detaches from the particularity of different kinds of concrete labor, (e.g. sewing or weaving, welding or brazing), to produce value.

Value is capitalism's historically unique form of social wealth, dominant only where the commodity form is universal, i.e. in capitalism. When the products of different particular kinds of labor are placed into a relationship of commensurability through the process of exchange, value is what each product has in common. Value is not something that can be seen; it is hidden within the product of labor, so that what is visible is the product itself. Because value cannot be seen but the products of labor can (i.e. the commodity form), value appears to be inherent to the product of labor, rather than transferred and embedded into the product of labor through the labor process. This is what Marx referred to as the commodity fetish. The most explicit form of appearance of value is money; or, another way of thinking about this is, money symbolizes value.

The concrete dimension of labor in capitalism is often taken as the defining aspect of labor that is anthropological. In particular, as scholars like Schmidt and Foster exemplify, the notion that people in capitalism transform extra-human nature into commodities (use-values) to provide human subsistence is perceived as the essence of labor in capitalism. Yet, the commodity-determined character of labor in capitalism is not merely a labor process or metabolic interaction; it is primarily a valorization process. The primary goal of labor in capitalism is not the production of use-values to satisfy the means of subsistence for workers. Rather, the goal of labor in capitalism is to produce value (monetary wealth) for capitalists and corporations. Value is embodied in commodities, which are created and exchanged with the primary purpose of

realizing the value embodied in them. In this way, the goal of capitalist production is the valorization of value, the perpetual production of ever increasing amounts of monetary wealth abstracted from concrete usefulness, material content, and human subsistence/survival. In capitalism, labor dominates, where 'human activity, in the form of labor serves no other purpose than valorization of value' (Trenkle, 2014: 4). Thus, as Trenkle argues, even the concrete dimension of labor in capitalism is abstracted from any sort of concrete form and purpose.<sup>9</sup> The concrete dimension of labor in capitalism is still directed toward valorization, and, therefore, cannot be reduced to an anthropological concept, or merely defined as a metabolic interchange between humans and extra-human nature.

In dividing labor in capitalism into concrete and abstract dimensions, Trenkle argues that Marx failed to explain 'that labor as such is already a kind of abstraction' (2014: 2). 'And not simply an abstraction in thought like the concept of a tree, animal, or plant; rather, it is a historically established, socially powerful, actually existing abstraction that violently brings people under its thumb' (Trenkle, 2014: 2–3). Trenkle points to the way in which labor in capitalism is separated from and then comes to dominate all other aspects of social life.

What is essential to this form is in the first instance the fact that work is a separate sphere, cut off from the rest of its social setting. Whoever works is working and doing nothing else. Relaxing, amusing oneself, pursuing personal interests, loving, and so on – these things must take place outside labor, or at least must not interfere with its thoroughly rationalized functional routines. (Trenkle, 2014: 3)

What Trenkle describes is the way that labor in capitalism functions as a social relation producing an abstract form of social dominance, what Moishe Postone (1993) calls the abstract social domination of capitalism.

Postone argues that one of the things that makes capitalism historically unique as a mode of production is the socially-mediating

character of labor rooted in the dominance of commodity exchange. People no longer produce their direct means of subsistence, but rather produce and exchange commodities in order to acquire other commodities that function as the means of subsistence. Via the dominance of commodity exchange, labor in capitalism takes on a unique role as the means to acquiring commodities. By socially-mediating, then, Postone refers to the way in which the historically unique form and character of labor in capitalism functions to mediate and determine the dominant form of social relations in capitalist society. It is via labor that people in capitalism largely interact with society. Because of this, labor in capitalism takes on a heightened social significance that it is not accorded in pre-capitalist societies. As Postone argues, the abstract and socially-mediating character of labor generates an abstract form of social domination that exerts an impersonal and objective compulsion on people to accord labor a central social significance. In short, labor comes to function as the most important aspect of our social lives.

Postone and Trenkle's understanding of abstract social domination is applicable to understanding the historically specific abstract dimension of capitalism's domination over nature in capitalism, such that labor is accorded a central social significance, even over the extra-human nature necessary for human survival as the natural conditions of production. I describe this understanding of capitalism's domination over nature in the terms of labor as 'nature', nature as labor (Yates, 2015, 2011a). Nature in late capitalism appears in the form of the commodity, appropriated, for example, via natural resource extraction, not directly as subsistence, but rather for the purpose of commodity production (in order to realize the monetary value embodied in the commodity form). Thus, nature appears in the commodity form as the product of labor. In other words, labor *appears* to produce nature. Simultaneously, labor in capitalism *appears* as nature. The historically specific form and character of

labor in capitalism *appears* as natural and transhistorical, *appearing* to be the way humans have always interacted with 'nature'. Labor in capitalism *appears* to be the socially direct and overt way that humans procure subsistence. Labor, not nature, *appears* to be the 'natural' conditions of production in capitalism. Because labor in capitalism (and the products of labor, i.e. the commodity form) functions as the socially direct means of procuring subsistence, the social significance traditionally accorded extra-human nature in pre-capitalist societies is eroded. This is not to argue that nature as the natural conditions of production is no longer materially important in capitalism. As one of the fundamental conditions of human existence, it almost goes without stating that extra-human nature is significant for human survival. Yet the relationship that humans have with extra-human nature in capitalism is obscured by the abstract and socially-mediating character of labor, so that it is labor, not nature, that *appears* to be of central social significance in procuring subsistence for human survival. In capitalist society, the human relationship to nature that was once overt and socially direct has become mediated by labor and the other social categories that constitute capitalist society (i.e. the commodity form, value, and capital).

In pre-capitalist societies, the human interaction with nature that procured the means of subsistence was not inherently designated as 'labor', nor was 'labor' as a concept accorded a central social significance. Pre-capitalist social life and activities did not dominantly revolve around conceptions of work (and not-work), and people did not relate to each other as mediated by 'labor', or as workers, but 'as proprietors – and members of a community, who at the same time work' (Marx, 1973: 471). Pre-capitalist individuals existed independently from their 'labor'.<sup>10</sup> What was accorded a central social significance in pre-capitalist social formations was community (interpersonal relationships with others to provide subsistence) and the human

relationship to extra-human nature. In this respect, the concept of 'labor' does not mean the same thing in pre-capitalism as it does in capitalism. Thus, Postone (1993) uses quotations to distinguish 'labor' in pre-capitalism from labor in capitalism.

In pre-capitalist societies, the social nature of 'labor' was not derived from 'labor' itself, but from community in the form of overt or interpersonal relations. The character of the social relations in these societies gave rise to concrete, class-based forms of domination. Indeed, many people living in pre-capitalist societies experienced forms of exploitation, (e.g. the appropriation of surplus 'labor'), but this exploitation was derived from the overt and interpersonal nature of social relations, (e.g. the lord and serf in Western European feudalism). While concrete, class-based forms of domination also exist in capitalism, (e.g. worker and capitalist), these forms of domination are embedded in, and mediated by, the abstract character of labor in capitalism, which gives rise to a form of abstract social domination.

Thus, pre-capitalist societies had a less mediated relationship to the natural conditions of production. Although people's relationship to the natural conditions of production was mediated and determined by the community particular to each pre-capitalist mode of production, as a member of the community, most people's relationship to the natural conditions of production were directly social, (i.e. not abstract or socially-mediating). People in pre-capitalist social formations largely had an overt relationship to the natural conditions of production, and the procurement of subsistence was directly dependent upon this overt relationship. Moreover, as humans had a less mediated relationship to the natural conditions of production, the form of domination over nature in pre-capitalism was also more overt and immediate.<sup>11</sup>

That there is something seemingly trans-historical about domination over nature in capitalism includes the way that some of these concrete forms of domination still

exist in capitalism. This is the concrete form of domination over nature described by Horkheimer and Adorno, Schmidt, Foster, and Burkett; the anthropological notion that humans appropriate extra-human nature in order to procure the means of subsistence necessary for survival. In this way, the concrete form and character of labor in capitalism *appears* as merely anthropological; the form of the appropriation of nature in capitalism *appears* as transhistorical as well as naturalized – as if this were the way that humans have interacted with nature throughout human history. Yet, the form and character of the human relationship to extra-human nature is historically specific. In capitalism, this relationship is mediated and determined by social relations that have an abstract and not merely a concrete dimension. In capitalism, nature is appropriated, (via natural resource extraction), not directly as subsistence, but rather for the seemingly concrete (yet abstract) purpose of being transformed into a commodity, and abstractly to function as the bearer of value. In this way, labor in capitalism and its objective moment, value, function to abstract from nature's purpose of providing subsistence for human survival, while simultaneously generating the *appearance* that subsistence is directly tied to labor in capitalism. Thus, domination over nature is embedded in the abstract and alienated social structure generated by the form and character of labor in capitalism. Even so-called concrete forms of domination over nature in capitalism, (e.g. natural resource extraction, farming), are abstracted from any kind of overt appropriation and directed toward furthering the logic of commodity-determined society (for valorization). Thus, domination in capitalism is not merely concrete; it also has an abstract dimension that seems difficult to grasp.

The capitalist domination over nature takes on an abstract character that produces and perpetuates the cycle of contemporary environmental degradation. This means that individuals may care about the quality of the

natural conditions of production and extra human nature; yet, the abstract form of domination in capitalist society confronts people as an external compulsion to accord labor, and the other fundamental social categories constituting capitalism, a significance not accorded extra-human nature. On a concrete level, because people are *seemingly* overtly dependent on labor for subsistence and thus survival, they are compelled to labor even when it is harmful to the environment and to their health and well-being. As Postone writes, 'Because labor is determined as a necessary means of individual reproduction in capitalist society, wage laborers remain dependent on capital's "growth", even when the consequences of their labor, ecological and otherwise, are detrimental to themselves and others' (1993: 313).

Richard White (1996) points out that environmentalists often target blue-collar labor, (e.g. resource extraction industries and other kinds of physically demanding work), as particularly environmentally destructive. However, it is not just certain kinds of work that cause environmental destruction. Because labor (and the commodity form) mediates social relationships, including the human relationship to extra-human nature, it is often hard to know or see the environmental consequences of individual actions. Writing of his work as a writer, White states:

Nature, altered and changed, is in this room. But this is masked. I type. I kill nothing. I touch no living thing. I seem to alter nothing but the screen. If I don't think about it, I can seem benign ... There are few articles or letters denouncing university professors or computer programmers or accountants or lawyers for sullyng the environment, although it is my guess that a single lawyer or accountant could, on a good day, put the efforts of Paul Bunyan to shame. (1996: 184–5)

This is not to argue that environmental degradation can be fixed within the ontological realm, (i.e. that knowing or seeing the consequences of one's actions can curb domination and degradation, or reduce one's alienation from nature). Rather, the point here is that

domination over nature and environmental degradation are embedded into the historically specific character of labor and abstract social domination in capitalism. The abstract structure of capitalism produces a social organization such that people are: (1) compelled to accord labor a social significance not accorded extra-human nature; (2) induced to participate in a system that causes environmental destruction, and; (3) distanced from the consequences of their individual actions.

## VALUE AND CRISIS: FUTURE DIRECTIONS

One of the reasons why it is important to address the abstract dimension of capitalist domination over nature is to address the kinds of historically unique crises that arise as a direct result of this domination. Both Trenkle and Postone write that the abstract social domination of labor in capitalism produces fundamental crises. For Trenkle, crisis manifests itself in the ‘absolute displacement of living labor power from the process of valorization’ (Trenkle, 2014: 13). In other words, the immiseration of a large portion of the global working class in the form of the rise of an absolute surplus population, millions (possibly billions) of people who will never be formally employed as labor by capital, thereby expelled and excreted from the capitalist system of labor and wages, what I have written about as the ‘human-as-waste’ (Yates 2011b).<sup>12</sup> Thus, the character of abstract social domination produced by labor in capitalism does not just function to dominate nature, but rather is intimately connected to the way that humans also experience domination, via labor, where labor functions as a fundamental hegemonic social structure that ‘violently brings people under its thumb’ (Trenkle, 2014: 2–3). As Trenkle further writes,

Human beings do not enter into the sphere of labor willingly. They do it because they were separated from the most basic means of production

and existence in a long and bloody historical process, and now can survive only by selling themselves temporarily – or, more precisely, by selling their vital energy, as labor power, for an external purpose, the content of which is irrelevant. For them, labor thus primarily means a fundamental extraction of vital energy, and in this respect is thus an extremely real, actually existing abstraction. Indeed, it is precisely for this reason that the identification of labor with suffering makes sense, as the original meaning of the word *laborare* suggests. (Trenkle, 2014: 4)

For Postone, environmental degradation is a fundamental component of the ‘crisis-ridden character’ of capital (Postone, 1993: 313). As Postone writes, there is ‘an underlying tension between ecological considerations and the imperatives of value as the form of wealth and social mediation’ (1993: 313). This tension is ‘immanent to capitalism’ and cannot be resolved ‘so long as value remains the determining form of social wealth’ (Postone 1993: 313). Thus, for Postone, as with Trenkle, crisis is inherent to a society dominated by value and abstract monetary wealth. The crisis cannot be stemmed by a reformist approach that aims to limit economic growth. As Postone explains, the ‘failure to expand surplus value would indeed result in severe economic difficulties with great social costs. In Marx’s analysis, the necessary accumulation of capital and the creation of capitalist society’s wealth are intrinsically related’ (1993: 313). In short, capitalism’s mode of production is fundamentally aimed at valorization and capital accumulation even as this drive toward accumulation is not necessarily beneficial to the system as a whole.<sup>13</sup> Both Trenkle and Postone argue that the only way to overcome the crisis of capitalism, including stemming the environmental destruction that results from capitalism’s abstract form of social domination, is the abolition of value (monetary wealth) and abstract labor as the dominant social relations in capitalist society.<sup>14</sup>

Similarly, scholarship in world-ecology, exemplified by the work of Jason W. Moore (2016), aims to move beyond an analysis of

the merely concrete to capture the ways that capitalist crisis is fundamentally ecological. World-ecology aims to move beyond what Moore classifies as a 'green arithmetic' approach to society-nature relations, where 'Marxist ecology = society + nature' (Moore, 2016: 78–9). Like the value-critique approach of Norbert Trenkle and Moishe Postone, world-ecology seeks to understand capitalism in its dual-dimensionality, emphasizing the role of value-relations and 'how capital works through nature' (Moore, 2016: 81). At the heart of the world-ecology project is situating both capitalism and nature historically, and examining not just what capitalism does *to* nature but also what nature does *for* capitalism. Thus, Moore writes of a 'double internality', a thinking through not just of 'nature-in-capitalism' but also of 'capitalism-in-nature' (Moore, 2016: 78). In this respect, world-ecology sees capitalism as an environment-making system that organizes nature (Moore, 2016: 2), and that to understand ecological crisis, then, means understanding the crises endemic to capitalism, crises that result from the dominance of valorization and value-relations.

## CONCLUSION

As I have shown in this chapter, it is important to conceptualize the fundamental capitalist social relations as having a dual dimensionality, not merely concrete, but also abstract. As both Norbert Trenkle and Moishe Postone point out, capitalism has a socially-mediating and historically specific dimension that produces an abstract form of social dominance. The abstract form of domination in capitalism confronts people as an external compulsion to accord labor, and the other fundamental social categories constituting capitalism, a significance not accorded extra-human nature. In analyzing this abstract dimension, what is historically specific about capitalist domination over nature can be

unveiled, namely that domination over nature in capitalism is not merely concrete and anthropological, but rather embedded in and reflective of the abstract social domination of capitalism.

## Notes

- 1 'The awakening of the subject is bought with the recognition of power as the principle of all relationships. In face of the unity of such reason the distinction between God and man is reduced to an irrelevance, as reason has steadfastly indicated since the earliest critiques of Homer. In their mastery of nature, the creative God and the ordering mind are alike. Man's likeness to God consists in sovereignty over existence, in the lordly gaze, in the command' (Horkheimer and Adorno, 2002: 5–6).
- 2 While Horkheimer and Adorno's conception of equivalence references Marx's notion of the commodity fetish, it does not fully encapsulate this notion. As I will discuss in more detail, Horkheimer and Adorno understand capitalism predominantly as a mode of exchange; thus, equivalence as a reference to exchange takes center stage in their analysis. However, for Marx, capitalism is not reducible to a mode of exchange, but rather is a mode of production, encompassing exchange, but driven primarily by a process of valorization. A more precise understanding of Marx's notion of commodity fetishism, rooted in capitalism as a mode of production, is elaborated later in this chapter.
- 3 'The identity of everything with everything is bought at the cost that nothing can at the same time be identical itself. Enlightenment dissolves away the injustice of the old inequality of unmediated mastery, but at the same time perpetuates it in universal mediation, by relating every existing thing to every other' (Horkheimer and Adorno, 2002: 8).
- 4 'The self which learned about order and subordination through the subjugation of the world soon equated truth in general with classifying thought, without whose fixed distinctions it cannot exist' (Horkheimer and Adorno, 2002: 10).
- 5 Horkheimer and Adorno write of 'universal mediation' as 'historically-specific', meaning historically specific to enlightenment (2002: 8). But, Adorno and Horkheimer project enlightenment back on to pre-capitalist societies, like the ancient mode of production. When Horkheimer and Adorno write of historical specificity they refer to the period they designate as enlightenment,

which includes capitalist modernity but also extends before the period of capitalism as well.

- 6 Steven Vogel writes, 'Enlightenment, Horkheimer and Adorno argue, is a double-edged phenomenon: in its implicit commitment to truth, to clarity, and to freedom it remains the indispensable presupposition of social critique and the best hope for social change, but at the same time it also and inevitably works to subvert and invalidate these very goals, and hence to abolish itself' (1996: 51).
- 7 'He listens, but does so while bound helplessly to the mast, and the stronger the allurements grows the more tightly he has himself bound, just as later the bourgeois denied themselves happiness the closer it drew to them with the increase in their own power. What he hears has no consequences for him; he can signal to his men to untie him only by movements of his head, but it is too late. His comrades, who themselves cannot hear, know only the danger of the song, not of its beauty, and leave him tied to the mast to save both him and themselves. They reproduce the life of the oppressor as a part of their own, while he cannot step outside his social role' (Horkheimer and Adorno, 2002: 26–7).
- 8 Labor as a commodity is uniquely useful because it produces value.
- 9 Trenkle writes, 'The concrete aspect of labor thus remains in no way untouched by the presupposed form of socialization. If abstract labor is the abstraction of an abstraction, concrete labor only represents the paradox of the concrete aspect of an abstraction – namely of the form abstraction "labor". It is only "concrete" in the very narrow and restricted sense that the different commodities require materially different production processes: a car is made differently from, say, an aspirin tablet or a pencil sharpener. But even the behavior of these processes of production is in no way indifferent, technically or organizationally, to the presupposed goal of valorization' (2014: 9).
- 10 Marx writes, 'the worker [sic] has an objective existence independent of labour' (1973: 471).
- 11 Even the feudal lord in feudalism whose existence was more abstracted from production than that of a serf had a less mediated relationship to the natural conditions of production than most people do in capitalism. While the feudal lord's subsistence was derived from the labor of the serfs, the feudal lord still had an immediate and overt relationship with the producers of subsistence and with how that subsistence was produced, especially in contrast to the seemingly impersonal and abstract relationship producers and consumers have in capitalism. The forms of power in feudalism were concrete class-based

forms of domination, and this translated into a kind of concrete form of domination over nature. Concrete, class-based forms of domination exist in capitalism too (e.g. worker and employer), but domination functions in capitalism in much more abstract ways than simply these concrete forms. Therefore, the capitalist domination over nature also has an abstract dimension that it did not have prior to capitalism.

- 12 The concept of 'the human-as-waste' makes connections between surplus populations and environmental degradation as two moments of the same crisis in capitalism (Yates, 2011b).
- 13 Trenkle writes that financialization in the form of fictitious capital is also a fundamental component of capitalism's crisis state. 'Ultimately, however, the violent inflation and unleashing of the system of credit and speculation also belong to this context. That fictitious capital is being amassed to a historically unprecedented extent on one hand explains why the onset of the crisis has up until now appeared relatively mild in core regions of the world market, but on the other hints at the intense violence of the imminent wave of devaluation' (2014: 14).
- 14 'According to Marx's critical theory, the abolition of the accelerating blind process of economic "growth" and socioeconomic transformation in capitalism, as well as its crisis-ridden character, would require the abolition of value' (Postone, 1993: 314).

# Feminist Critical Theory and the Problem of (Counter) Enlightenment in the Decay of Capitalist Patriarchy

Roswitha Scholz

Translated by Jacob Blumenfeld

## **A PLEA FOR RADICAL FEMINIST SOCIAL CRITIQUE TO LEAVE BEHIND THE FORM-DETERMINATIONS OF CAPITALIST PATRIARCHY.**

In the 1990s, poststructuralist theories dominated academic feminism. In contrast to the 1970s and 1980s, Marxist approaches were absolutely marginalised. Instead of looking for a new understanding of totality that could explain more recent developments, such as the decline of really existing socialism, cultural explanations were employed along with an accompanying appreciation of the local, the regional, and the particular. Meanwhile, the situation has changed once more. It is not only since the crash of 2007/8 and the increasing prominence of social issues that interest has surged again in a critique of ‘political economy’. This has also been proclaimed in feminism since the mid 2000s: ‘Women, think economically!’ (Nancy Fraser). Since then, the Critical Theory of the Frankfurt School has also received more attention.

Adorno’s critical theory has had a certain tradition within German-speaking feminist theory since the late 1970s. However, it has been inadequately received by feminist theory, that is, inconsistently, unsystematically, discontinuously, disparately and eclectically. In contrast to this reception of Adorno’s thought, value dissociation theory developed in the 1990s during the high time of deconstructivism, partly in opposition to it. It involves a critical appropriation of Adorno’s critical theory, but in contrast to some other feminist theories that also refer to Adorno, value dissociation theory holds the form-determinacy of capitalist patriarchy as central. In this context, I criticise Adorno-inspired feminist accounts for not advancing a radical critique of the Enlightenment, i.e., one that questions both the Enlightenment and the Counter-Enlightenment as two sides of the same coin. These accounts are in fact sociologically stuck in positivist definitions of hierarchical gender relations. Enlightenment, rationality, a formal understanding of science, and even an empty, formulaic sociology are

taken as adequate to critique the form of consciousness of capitalist patriarchy.

Value dissociation critique, however, not only refers to Adorno's theory, but also to the value-critical developments of Marx's own theory. As opposed to traditional Marxism, this approach does not begin with the subjective legal 'appropriation' of surplus value by the capitalist, but takes abstract labour, the commodity, and capital as automatic subject to be the real scandal of capitalist socialisation. This integration of value-critique with critical theory in Adorno's sense transforms the critical theory of society beyond itself towards an account of social form.

After a rough sketch of value dissociation theory, which will also clarify the meaning of social form, the following text will discuss the history of the feminist reception of Adorno in the German-speaking world. Next I discuss the connection between value dissociation critique and relevant passages in *Dialectic of Enlightenment*. Finally, the third part argues for the necessity of a critique of Enlightenment in the context of value dissociation theory. This entails the categorical, fundamental critique of modern social forms affirmed by the Enlightenment. In order to prevent misunderstandings: this critique of Enlightenment comprehends itself beyond an irrational, vitalist recourse to life, community, and similar ideological abstractions, which are merely the flipside of the androcentric-universalist rationalism of the Enlightenment.

A critique 'with Adorno beyond Adorno' was actually already possible within critical-feminist theories from the second half of the 1980s onwards. But even when Adorno was invoked, this possibility was squandered in favour of an empty formulaic sociology so typical of a bourgeois-academic understanding of social theory, which is entirely devoid of the speculative moment of a fractured, negative dialectical thinking of totality (Adorno, 1973).

There is no systematic feminist orientation in the tradition of Adorno outside the German-speaking world. Theorists such

as Nancy Fraser, Seyla Benhabib, and Iris Marion Young in the Anglo-American world are not discussed here because they argue by and large in the tradition of Habermas, who gave up on a radical critique of capitalist (patriarchy) from the very start.

## ASPECTS OF VALUE DISSOCIATION CRITIQUE

Value dissociation theory starts from the premise that it is not simply the case that capital, as the 'automatic subject' (Marx) of (surplus) value, constitutes a totality. Equally important is the 'fact' that reproductive activities arise in capitalism which are mainly carried out by women. Accordingly, value dissociation essentially means that reproductive activities determined as feminine, along with accompanying emotions, qualities, attitudes (emotionality, sensibility, care, etc.), are precisely dissociated from (surplus) value and abstract labour as well as a corresponding androcentric subjectivity. Female reproductive activities, 'love', nurture, care, and so on, have a different character than value-producing abstract labour; therefore, they cannot automatically be subsumed under the concept of labour. In other words, there is a side of capitalist society that cannot be grasped by Marxist conceptual instruments. This side is comprised by (surplus) value, necessarily belonging to it; but at the same time, it is outside of it and is therefore its presupposition. There is no hierarchy of derivation, both emerge from each other. Thus, the dissociation of value can also be interpreted as a superordinate logic, which overlaps with the internal economic categories.

To this extent, value dissociation also implies a specific socio-psychological relation: feminine connoted qualities, such as emotionality, sensibility, understanding, and weakness of character are projected onto women and dissociated from the male, value-determined subject, construed as rational, strong, assertive, and productive, and so on.

Thus, in regards to the structure of the dissociated relationship, one must also take into account the socio-psychological and the cultural-symbolic dimension, whereby capitalist patriarchy is to be understood as a 'civilisation model' (Frigga Haug) and not merely as an economic system.

In this context, the dissociation of value also represents a meta-theory as it cannot be assumed that empirical male and female individuals correspond directly with it. Men and women neither appear immediately one-to-one in this structure, nor can they completely escape the corresponding attributions.

Value dissociation as basic social relation is also subject to social change; it must be thought of as a historical process. It should be pointed out that modern gender conceptions and their corresponding forms of existence arose only in connection with the institutionalisation of 'abstract labour' for the market on the one hand and separate household activities on the other. The woman as housewife and the man as breadwinner did not exist in pre-modern times. Cultural conceptions of masculinity and femininity can vary, it must be stated, but this should not result in a culturally relativist failure to recognise that capitalist patriarchy shapes social reality worldwide.

In postmodernity, the structure of dissociation presents itself in a different form than in 'classical' modernity. The traditional nuclear family has now largely disappeared and with it the modern gender relation. At least in Western countries, women are now caught up with the men, for example, in terms of education. In contrast to the old housewife ideal, they are equally responsible for family and career. However, unlike men, they are still primarily responsible for the dissociated care activities, they still earn less than men, they have fewer opportunities for advancement, and so on. Moreover, in the era of globalisation, when the institutions of work and family are increasingly disintegrating in the crisis of capitalist patriarchy without new forms of reproduction to take their place, we are not

dealing with the overcoming of patriarchy, but rather with its feralisation.

For a large part of the population, even in developed countries, this means that women are likely to live in conditions that are at least partly known from the slums of 'Third World' countries: women are equally responsible for money and survival. They are increasingly integrated into the world market, but without the opportunity to secure their own livelihood. They raise children with the help of female relatives and neighbours.

The 'housewifised' (Claudia von Werlhof) men come and go, moving from job to job and from woman to woman, who maybe even support them (in principle, it can be reversed, of course). Due to the precariousness of employment, combined with the erosion of traditional family relations, the man no longer possesses the role of breadwinner. At the same time, hierarchical gender relations have by no means disappeared. Male violence increases. This is true today on a global scale, despite all the differences in various parts of the world, which must be taken into account.<sup>1</sup>

## THE HISTORY OF THE ADORNO RECEPTION IN FEMINISM SINCE THE 1970S

Before discussing the link between value dissociation critique and the *Dialectic of Enlightenment*, the history of Adorno's reception in the German-speaking feminist debate will be considered. It will be shown that, in contrast to value dissociation theory, over the decades this debate has become increasingly detached from the problem of social form.

It was only in the second half of the 1980s that German-speaking feminism appealed more to Adorno. Before that, the so-called 'domestic labour debate' took place within the narrower framework of traditionally Marxist-economic categories. The core question was

whether domestic labour creates value, which ultimately had to be negated. Asymmetrical gender relations in capitalism could not be explained and criticised in the same way as value-producing labour-power. The turn to Adorno and Horkheimer, especially to *Dialectic of Enlightenment*, may be explained primarily by the rising awareness of environmental and ecological problems at the time.

With the so-called new social movements – ecology, women's, alternative, peace and psychological movement – the problem of the domination of nature and alienation in the widest sense (the 'colonisation of the life world' according to Habermas) entered the focus of social critique, which thrived under conditions of the developed welfare state. However, in parts of the women's movement, a simplistic critique of technology and society went hand in hand with the propagation of a new femininity. Women, like nature (often equated), should be emancipated in order to return to an allegedly original relationship with nature. A false immediacy reared its ugly head again. Especially after Chernobyl, a new maternal femininity was all the rage (Mothers against Nuclear Power, etc.).

Against this partly biological ideologisation, feminists aligned with critical theory began to form their own position and resist. At that time, many works and anthologies on rationality, the domination of nature, sensuality, and femininity appeared which sought to defy those crude tendencies of a new femininity in its false 'naturalistic' immediacy, and demonstratively turned against them. One could mention here, for example, Heidemarie Bennent's (excellent) philosophical-historical investigation into the dissociation of the feminine in philosophy; in it, she refers to the *Dialectic of Enlightenment*, arguing with Horkheimer and Adorno that we are descendants of the Enlightenment in the good as well as the bad sense, and that a blanket rejection of it would lead to barbarism (Bennent, 1985).

Until well into the 1990s, books appeared with titles like *Rationality and Sensuous Reason* (Kulke, 1988), *Twilight of Reason*

(Kulke and Scheich, 1992), *Mediated Femininity* (Scheich, 1996), *The Problem of the Identity-Logic Constructions of 'Nature' and 'Gender'* (Gransee, 1999). These references should be understood as examples, not a complete overview. In the 1970s, for example, Silvia Bovenschen emphasised the significance of witch-hunts using the *Dialectic of Enlightenment* in a feminist way that did not end up stuck in a false immediacy (Bovenschen, 1977). One should also absolutely mention her work on 'imagined femininity' in which, with the help of critical theory and before the poststructuralism fad, she uncovered the cultural patterns and fantasies of femininity while also rejecting the idea of 'female culture' within the women's movement, which was entangled in such traditional phantasms themselves (Bovenschen, 1979).

In this context, however, Horkheimer and Adorno have also been targets of critique since the 1980s. They were accused in *Dialectic of Enlightenment* as well as other works of remaining trapped within traditional gender stereotypes and corresponding dualisms. Consequently, it was necessary to look for ways to escape the trap of the 'gender binary'. This already indicates a tendency which holds a flank open to deconstructivism. Horkheimer and Adorno were criticised for not seeing women as 'resistant'. In general, there was much talk at this time of seeing women not just as victims, but as always resistant, as agents, witnesses of the era, 'even-subjects', who also demand recognition. Against the backdrop of critical theory, a new kind of feminist theory should be possible, one which dispenses with gender stereotypes and still holds social structures accountable for the gender malaise.

At the beginning of the more intensified Adorno reception in the 1980s, there was quite some reflection on the social form of modernity in terms of a critique of fetishism. In light of critical theory, Ursula Beer writes:

What ... failed was the theoretical proof of the desire to conceive of domestic labour as 'value-creating'. Domestic labour does not create value in

the sense of money or exchange value as the object of value-form analysis ... The question raised by Becker-Schmidt and her colleagues about the 'form-determination' of the family (also discussed in different terms in 1978 by Ilona Ostner) therefore seemed to open up new possibilities for me, but with a different aim: the significance of unpaid labour in society as a whole. In the Anglo-American discussion, which pushed the domestic labour debate most strongly, the question of the form-determination of the family was never raised. (Beer, 1987: 191)

Then, at the end of the 1980s, Beer suddenly turned from Adorno to Althusser as a reference, beginning with the critique of Adorno's fixation on commodity exchange:

Adorno does not see the cohering principle of capitalist societies in material production, which is founded on the relationship between wage labour and capital, but in exchange, in the sphere of circulation. Specific logics of development, which are not based on commodity exchange, cannot be taken into account with this conception. This finding has great relevance for women's studies because socio-economic inequality in gender relations is based on a tendential exclusion of women from commodity exchange in terms of the commodified valorisation of their labour power. Nor can (re)generative production be subsumed under the concept of exchange, which the feminist materialist postulate stresses against the material-productive character of women's child-bearing activities. (Beer, 1990: 79)

From this critique follows the reference to Althusser:

It should be considered whether Althusser's idea of positional and functional relationships can also be taken up in connection with the 'mode of population' and its interdependence with the 'mode of economy' ... The thesis of determination in the last instance by the economy, which, according to Althusser's reading of Marx, maintains the independence or relative autonomy of so-called superstructural phenomena, could perhaps be applied to the reformulated concept of the base: ... in the sense that the 'dominant structure' of the mode of economy and population in its unity and differentiations exerts a profound influence on the organising framework of the entire society. (Beer, 1990: 102 et sq.)

Adorno's pervasive exchange-reductionism is readily apparent. The capitalist fetish

relation, the a priori connection between 'abstract labour' and 'automatic subject' of valorisation, is not adequately captured by Adorno's cryptic and contradictory concept of exchange. But in contrast to traditional Marxism, and despite the reduction to exchange, his theory includes access to the critique of the value-form and its fetish character. For Beer, the critique of Adorno goes in a completely wrong direction. The ideological fixation on exchange is not critically resolved in line with a new determination of the relation between 'abstract labour' and gender relations, but is diverted entirely away from social form determinations. The traditional understanding of 'wage labour and capital' reformulated along Althusser's structuralist theory fails to recognise the fact that the class relation is not immediately the ultimate ground of a 'cohering principle'. On the contrary, it is 'founded' on the capital fetish across classes, the logic of valorisation and its gendered dissociation. A critique of social form in the sense of a critique of fetishism, which could have worked out the androcentric character of the fundamental categories of capitalism, was therefore impossible. In its stead, the feminist 'materialist' postulate, with its vulgar materialist or feminist understanding of production based on 'child-bearing' ability, left the door open once again for conceptions of society based on underlying biological and anthropological assumptions.

In the case of Beer, on the other hand, her Althusserian account ('overdetermination' of the 'last instance' by cultural 'factors', among others, of the capitalist economy traditionally understood by class sociology) proved to be a mere point of transition towards a cultural feminism, which was to become hegemonic in the form of deconstructivism during the 1990s. As a result, the capital relation as such with its basic categories largely disappeared from theoretical reflection, especially in deconstructivist feminism, which lost its critical sting. It is only recently, under the impact of crisis, that – problematic, short-sighted – efforts are being made to bring together the critique of

capitalism with deconstruction in so-called queer-feminism, especially beyond any kind of thought about the basic character of capitalist relations in the sense discussed above.

The critical recourse to *Dialectic of Enlightenment* transitioned into a superficial gender-rationality in the 1990s at the latest. This also entailed a surrender of the problem of social form in terms of its categorical-content, which was initially conceived in the 1980s. Since the 1980s, gender was to be determined merely sociologically akin to class as a category of social structure, even though it was at first crucially linked to a concept of social form. What emerged in the early 1990s was an empty formulaic (feminist) sociology, already mentioned at the outset, whereby the transition to 'relationality' as an actual principle of knowledge, basically a formal logical point of view, played an important role.

Thus, this kind of theoretical approach was to account for the objective structures and socio-theoretical perspectives that the prominent poststructuralist theories of feminism had most neglected (see e.g., Judith Butler). The poststructuralist approach overlapped to some degree with Adorno regarding the critique of identity. Beer's theory was not much heard of in the 1990s, probably because of its (biologically vulgar) materialistic orientation (a recourse to 'childbearing ability' was quite rightly frowned upon in poststructuralist accounts). Similarly alongside Beer are Becker-Schmidt and Knapp, who still rely on Adorno today, and whose works are at least partly based on an implicit Althusserian foundation as regards the 'relative autonomy of so-called superstructural phenomena'. Although the conception of (surplus) value as the form of capitalist reproduction has not completely vanished from theoretical focus, it is very much moved to the background.

It almost appears as if women in the 'post-socialist' 1990s groomed an academically and sociologically pristine and sterile Adorno in order to conjure away the problem of basic capitalist forms. When, for example,

Becker-Schmidt and Knapp elucidate the meaning of the term 'relational', it becomes clear that they are indulging in a kind of Althusserian twisted understanding of Adorno:

First, relations specify the elements, the relata, which come into relation with each other as magnitudes in an equation. In our case, these are women and men considered as genus groups. Second are the contexts within which the genus groups, when not on equal footing, come into a reciprocal relationship of appreciation and depreciation. Interactions between the genus groups have a wide range of nodal points, for example, kinship bonds, sexual relations, and cooperative relationships, or economic, cultural and political conditions that decide the opportunities for appropriation and recognition of men and women. Such constellations are by no means based on the same organising principles in all societies. In cultural comparisons, we find relations of similarity and difference, symmetry and asymmetry, equality and hierarchy, inclusion and exclusion. Historical investigations – within a cultural tradition – can bring to light changes from epoch to epoch. This means that the configuration of relations between the sexes is dependent on history and society. (Becker-Schmidt and Knapp, 2000: 39 et sq.)

In contrast, Adorno already knew:

A notion of society ... would be *critical* [if i]t would go far beyond the trivial idea that everything is interrelated. The emptiness and abstractness of this idea is not so much the sign of feeble thinking as of a shabby permanency in the constitution of society itself: that of exchange in modern-day society. (Adorno, 1969: 148)

Even though Adorno only conceptualises exchange here, and does not make the link with value dissociation, he addresses the formal principle of capitalist society located on the categorical level and not in the secondary structure of the surface (everything is somehow connected with everything else without determining an overarching concept of the whole). Precisely in this abbreviated manner, however, Becker-Schmidt and Knapp understand 'form-determination' as merely 'the formation of a social structure that historically crystallised under certain conditions of production and reproduction' (Becker-Schmidt and Knapp, 2000: 155).

These descendants of critical theory not only forego the categorical conception of social form, but also lack perception of *Dialectic of Enlightenment* even if only as a doubt of Enlightenment. Instead, an ambivalent critique of Enlightenment in the sense of a *dialectic* of Enlightenment, according to which the Enlightenment could have also led to piercing the 'context of delusion', was ultimately transformed into a positivist, formal-logical thinking, which was a thorn in the side for Adorno and Horkheimer. Rationality and irrationality are not seen as two sides of the same coin of an untrue whole but instead the resulting issues are one-sidedly resolved in a rational and formal-logical manner.

This manner of thinking also characterises, for example, Knapp's considerations of intersectionality, i.e., the connection between 'race', class, and gender, which makes little recourse to the categorical level of capitalist social forms. It is precisely in this understanding that Frieder Otto Wolf writes:

No longer determined by the recently elapsed moment of postmodernism, the newer feminist, ecological and anti-racist critiques of the European scientific tradition no longer use 'cultural critique' in a romantic (or nihilistically theory-hostile) manner to critically overcome its 'scientific character', but rather aim anew at its 'unscientific', methodological distortions in the empirical-historical processing of reality. (Wolf, 2011: 362)

The critique of the bourgeois concept of science following Adorno, quite evident in feminism up to the 1980s, is declared over and rejected as 'romantic' or even 'theory-hostile'. Instead it seeks out a scientific conception of theory that belongs to the positivist and formal-logic traditions of bourgeois thought. Wolf however welcomes Althusser's reading warmly.

Althusser's rejection of the humanist subject in favour of a structural analysis of the direct appearance of society went hand in hand with the adoption of a 'class standpoint' or analysis of a class structure, which served to determine everything else, despite all

'overdetermination', that is, the occurrence of other contradictions. As if by twist of fate, however, this kind of theorising allowed for the humanist subject to be reintroduced through the back door, as was already the case in Althusser's self-criticism since the 1970s. This visible oscillation between (sociological, immanent-interests guided) 'standpoint' and 'structure' as basic model are traditionally always present within androcentric bourgeois science and scientific theory. Therefore, the ability for a feminist theory to distance itself from such a theoretical approach is necessary in order to advance towards a critique of basic social forms. Social form critique is the foundation of dissociation theory.

## VALUE DISSOCIATION CRITIQUE AND DIALECTIC OF ENLIGHTENMENT

Horkheimer and Adorno, especially in *Dialectic of Enlightenment*, offer possibilities of connecting with an enlightenment-sceptical theory of value dissociation, beyond affirmative structural logics and subject idolatries (cf. Scholz, 2004). A fundamental determination of *Dialectic of Enlightenment* is pointedly expressed in the following prominent quotation:

Humanity had to inflict terrible injuries on itself before the self – the identical, purpose-directed, masculine character of human beings – was created, and something of this process is repeated in every childhood ... Anyone who wishes to survive must not listen to the temptation of the irrecoverable, and is unable to listen only if he is unable to hear. Society has always made sure that this was the case. Workers must look ahead with alert concentration and ignore anything which lies to one side. The urge towards distraction must be grimly sublimated in redoubled exertions. Thus the workers are made practical. (Adorno and Horkheimer, 2002: 26)

As is well known, Horkheimer and Adorno make recourse to antiquity with the Odyssey. Odysseus can be tied to the mast in order to resist the sound of the sirens. *Dialectic of*

*Enlightenment* should not be read as an historical odyssey. Rather, it should be read as an account of the constitutive history of modern capitalist society, in which Marxist theory is implicitly connected with psychoanalysis. Andrea Maihofer, whose deliberations are interesting for value dissociation critique, correctly writes:

Otherwise independent phenomena such as capitalist commodity production, instrumental rationality, domination of nature, bourgeois-patriarchal rule, 'male' subjectivity, and so on, are seen in a strict constitutive context of emergence and reproduction. This is not meant, as is often the case, in the sense of a bad economic, monocausal derivation, according to which everything is connected with everything else, because ultimately everything is the (functional) form of appearance of the 'one' of the economy. (Maihofer, 1995: 111)

The male subject dissociates his drives and feelings; they must now be controlled and ruled. Consequently, there exists a dialectic between domination and submission or self-submission. The relation to value dissociation theory is evident. The dissociation of value is visible here at least in silhouette as the formal principle, which permeates society as a whole. At the same time, Horkheimer and Adorno do not simply reproduce gender stereotypes, as Maihofer also correctly observes, but reconstruct gender discourse and critically present its constitution. They thus also implicitly take into account the cultural-symbolic level and do not regard capitalist patriarchy merely as a 'civilisational model' reducible to the economy. Male and female subjectivity, however they may appear, are often presented as broken in themselves. Nonetheless, Horkheimer and Adorno do not yet arrive at the fundamental breakthrough of the critique of the constitutive core of the value dissociation relations. Their remarks on gender relations are primarily descriptive.

Generally problematic in this context, *ceterum censeo*, is that Adorno regards the principle of exchange as the basic social fact of modernity, not value and abstract labour (let

alone the dissociation of value as a social relation of reproduction). A critique of *Dialectic of Enlightenment* should have thus encompassed value and abstract labour along the trajectory taken by value dissociation critique. Instead it was taken in the direction of Althusserian structuralism, which led to claiming 'material production' in a feminist way without any further thought about value and its implications for totality. Indeed, in the case of Becker-Schmidt, who adopts an almost purely relationalist-sociological view of society, a fundamental critique of capitalism is an entirely alien undertaking.

In the face of National Socialism, Horkheimer and Adorno asked in the *Dialectic of Enlightenment* 'why humanity, instead of entering a truly human state, is sinking into a new kind of barbarism' (Adorno and Horkheimer, 2002: xiv). As children of their time, Horkheimer and Adorno obviously could not examine the new barbaric processes in light of today's deterioration of capitalism. Beyond Adorno, we may diagnose a 'feralisation of patriarchy' in postmodernity. Institutionalised fixtures, such as gainful employment and family, are increasingly dissolving in the deteriorating context of capitalist patriarchy. Women are equally responsible for money and survival, production and reproduction, whereas men are being 'housewifised' at the same time, that is to say, their role as breadwinners becomes more and more precarious. Women now occupy a crucial place both in self-help initiatives of the Third World as well as in the corridors of declining state power. Horkheimer and Adorno already see the growing professional activity of women in their time with scepticism, and speak of a 'dissociation of love' (Adorno and Horkheimer, 2002: 85). From the perspective of value dissociation critique, however, the dissociated sphere of the family is not a refuge, not a positive 'other', as it appears for Horkheimer and Adorno, but itself an immanent component of capitalist patriarchy.

Value dissociation theory has by no means become irrelevant with historical-postmodern

changes, as might appear to the superficial view that associates it with traditional gender roles. Rather, it adopts Adorno's insight, formulated in his *Introduction to Sociology* lectures:

[F]irstly, the essential concerns the laws of motion of society, especially the laws which express how the present situation has come into being and where it is tending to go; secondly, these laws are modified, and are valid only as far as they are really manifested; thirdly, the task of sociology is either to explain even the discrepancies between essence and appearance in terms of the essential [...] or to have the courage to abandon concepts of essence or general laws which are simply incompatible with the phenomena and cannot be dialectically mediated. (Adorno, 2000: 25)

What does this mean from the standpoint of value dissociation critique, an approach that Adorno did not have in mind? From the perspective of value dissociation theory, it is crucial to insist on a dialectic of essence and appearance in Adorno's sense, and not to get carried away by empirically ascertainable facts like the 'double socialisation' of women in postmodern individualisation (Becker-Schmidt), the diagnosis of the end of the patriarchy, or even the formal-logical determinations of the gender hierarchy. Rather, it is necessary to determine the constitutive reproduction of the overarching dissociation of value as the form determining principle of the social totality in its historical breakdown. This equally encompasses the material, social psychological and cultural-symbolic dimension in its postmodern developed form, and thus all areas and levels of society as well (see above; also Scholz, 2005, 2011). Accordingly, the more recent empirical changes in gender relations must be understood out of the mechanisms and structures of value dissociation itself.

At the same time, the development of the productive forces and market dynamics, which themselves are based on the basic principle of value dissociation, undermine their own presuppositions by forcing women out from their traditional role and instead making them

aware of the always already existing 'double socialisation' (Becker-Schmidt) in the course of the process of individualisation. For example, since the 1950s in West Germany, more and more women from the middle classes have joined the labour market, due to processes of rationalisation in the household, among other things; women have long caught up with men in education; mothers are increasingly employed; family planning has become possible due to contraceptive means, and so on (Beck, 1992). In short, there has been a long-standing tendency for more women to be integrated into the official (traditionally male connoted) society. However, even in changed postmodern circumstances, women are still responsible for care and household activities in contrast to men, earning on average less than men, and so on. What transpires is a mere modification of the structure of value dissociation: 'double socialisation' gains a new quality. Women are no longer just objectively 'doubly socialised' as before, but now under conditions of feralised, crisis-ridden patriarchy; even according to this model, they are still determined by the roles of housewife and mother. Even on the globalised macro-scale, women are mainly crisis-managers, whether increasingly in 'power positions' of business and politics or on the poverty level of self-help groups, often borne by women in the slums. Women function once again as 'detergents and disinfectants', as already found in a patriarchal tradition (women are the better humans), although in a modified postmodern form in the sense of a now so-called work-life balance, which can be studied hands on with the help of social science (Thürmer-Rohr, 1987). All the while, male violence increases if nothing else because of the inconsistency of status.

For Horkheimer and Adorno, a critique of the logic of identity entails a critique of the logic of gender. Thus, they write:

Man as ruler refuses to do woman the honour of individualising her. Socially, the individual woman is an example of the species, a representative of her sex, and thus, wholly encompassed by male logic, she stands for nature, the substrate of

never-ending subsumption on the plane of ideas and of never-ending subjection on that of reality. Woman as an allegedly natural being is a product of history, which denatures her. (Adorno and Horkheimer, 2002: 87)

Instrumental reason and the logic of identity, according to Horkheimer and Adorno, culminated in the liquidation of the 'other' in National Socialism. In so doing, they connect the predominant logic of identity categorically with the domination of nature and, in this context, with the exchange principle. Value dissociation critique, on the basis of Adorno's thought, utilises the critique of identity logic for itself, thus adopting the critique of a deductive thinking that wants to create order from above and subject the particular, contingent, different, ambiguous to *one* logic. The thought form of identity logic however does not correspond simply with exchange or, more correctly, with (surplus) value. For it is not important whether the common third thing – disregarding qualities – is average social labour time or abstract labour, which stands behind the form of equivalence, but that it again must exclude and look down upon whatever is connoted as feminine, namely, domestic work, the sensuous, the emotional, the analytically incomprehensible, the different, and the contradictory.

However, the dissociation of the feminine is by no means congruent with the non-identical in Adorno; instead, it represents the flip side of value. Dissociation *in general* is a precondition for neglecting the actual forms of life, the scientifically incomprehensible, the contingent, and so on, and for remaining largely dim in the masculine areas of science, economics and politics of the modern age. Leading the charge is a classificatory thinking that cannot take into account the particular quality, 'the thing itself', and thus must omit any differences, breaks, contradictions, and so on.

Thus, a corresponding theory of value dissociation should reveal its own limits; this is a core requirement of the approach. In this context, for example, it is important to point out following Adorno that empirical individuals

are never wholly absorbed in gender-typical attributions, even if they cannot escape them. Thus, as a critical social theory, value dissociation must protect itself against acquiring a transcultural character. Even though dissociation of the feminine entails a global dynamic, it has different faces in historically different phases of value dissociating socialisation. In postmodernity, as already mentioned above, it is undergoing a change of form as traditional gender relations erode, as the institutions of the family and labour market protection corrode, and as patriarchy undergoes feralisation in the course of globalisation.

The abstract recourse to the non-identical, to contradictions, to the ambivalent, to difference, and so on, has long since become affirmative. This is true in postmodern and poststructuralist theories insofar as they are free-floating, without reference to a concept of society, without reference to a universal, to a (negative) social essence (to be overcome), as was the case with Adorno.

Contrary to the anti-philosophical, postmodern, and poststructuralist tendencies, today's global social reality can only be tackled by an admittedly contemporary, speculative-philosophical thinking in terms of a radical critique of value dissociation relations that constitute the basic social structure. The central importance of value dissociation as the principle of social form, including the corresponding gender relations, does not mean that value dissociation presents the so-called main contradiction of society. Following Adorno, and according to the remarks above, the theory of value dissociation cannot correspond to a logic of the One. Rather, it remains true to itself in its critique of the logic of identity; it can only exist by relativising itself, even denying itself where it is necessary. And this also means that value dissociation critique, if it is to keep an eye on the relevant thing in itself, must concede equal theoretical place for various forms of social discrimination (Scholz, 2005).

Thus to a much greater extent than other theoretical feminisms, value dissociation

critique follows Adorno's negative dialectic as a critique of social form, which argues in and through the thing itself, the particular object of the gender relation, and aims at the content.

### **RADICAL ENLIGHTENMENT CRITIQUE AND THE THEORY OF VALUE DISSOCIATION**

How, are we to situate the sociologically narrow developments in feminism after critical theory, gender theory, and the corresponding reference to rationality and enlightenment in light of the critique of the determinate dissociation of value as the principle of social form? Knowledge of the ambivalence of Enlightenment, appearing in feminist titles such as *Rationality and Sensuous Reason*, *Twilight of Reason*, and so on, should have led to a theory of value dissociation instead of seeking 'refuge' in structuralist paradigms. A feminist insistence on structure is tellingly resolved in a purely sociological manner, without recognising it as a narrow-minded, genuinely bourgeois standpoint. The merely descriptive presentation of the problem of gender in *Dialectic of Enlightenment* should have instead been transferred to a categorical level. Such a critique leads through the *Dialectic of Enlightenment* to a fundamental critique of Enlightenment, rather than its affirmation. It goes without saying that such an approach has nothing in common with any recourse to a 'false immediacy' (Adorno), even with claims of a somatic moment in general. Such conceptions of a 'new femininity' are highly distorted and basically reactionary, but in opposing mere gender-positions, they must be asserted in a completely different way. A critique of value dissociation thus requires a critical distance and capacity for abstraction far greater than any 'normal' and recognised sociological form of theory. It thus refers back, *volens*

*volens*, to the Enlightenment, which must not only be enlightened about itself; it must also be overcome to prevent the Enlightenment from falling into reaction. What is required here is the ability to withdraw from the given – even the Enlightenment itself – and actually venture into a no man's land, a procedure which has nothing in common with an apotheosis of the Enlightenment. There is no escape from this tension. The gender problematic and its entire history are always in danger of being concretely and immediately misunderstood.

Negative dialectics has its roots initially in the Enlightenment, but at the same time, it demands going beyond itself, to examine its own limitations and thus to think against itself, with and against Adorno. This kind of dialectical thinking may be indispensable, but it cannot be perpetuated for all time or immortalised as a fundamental affirmation of enlightenment. The necessary recourse to negative dialectics as a radical critique of the given conditions is ultimately there to be overcome. We simply do not know how modes of thinking might look in a non-capitalist, non-patriarchal society. To this extent, value dissociation is the basic social principle of contemporary society. In this sense, negative dialectics is thus 'true' with regard to the critique of the present condition. With Guy Debord, however, it must be stressed that 'in a world which really is topsy-turvy, the true is a moment of the false' (Debord, 1995: §9). What is at issue here is a critique of an all-encompassing value dissociating practice of socialisation. Practice does not simply mean political practice, but social practice in a comprehensive sense, which transcends a false immediacy of everyday life and its reservoir of alleged femininity. It also has nothing in common with a structuralist reading of theoretical practice à la Althusser, which from the outset shies away from any dialectical reference. By negating the fundamental social principle of (surplus) value as the constituent principle of capitalist society, the theory of value dissociation does not simply

say something about the critique of gender relations. It rather offers a critique of gender relations through the critique of global social relations as a whole.

The point is not to constantly conjure up and praise social contradictions, as if they hold some potential for resistance and somehow push beyond themselves, rather the point is to overcome and critique them. The antithesis to this approach would be, for example, Hardt and Negri's *operaist* philosophy of 'praxis', which must always accommodate 'happiness' within the walls of its practice. The earlier analyses of feminine dissociation as well as analyses concerning racist traditions are not only narrow – they usually get stuck in a structural and politicised class context – but they also show that a simple recourse to the Enlightenment is ultimately uncritical in its conception of society.

Value dissociation critique has to be asserted and thought through in an uncompromising manner. It should not be treated as a moral 'ingredient', but as a critique of an essential structure-forming context that understands the necessary mediation of subject and object. It does not allow itself to be reduced to a theory of action in order to achieve status as a legitimised approach in the social sciences. Likewise any one-sided hypostatization of the object has to be avoided. Diethard Behrens' accusations against some Marxist positions are thus most relevant to a theory of value dissociation: 'An action-theoretic restricted dialectics must fail in its approach because it is always on the search for the dialectical operator [...] The sought-after mediation of immanent critique thus reverts back to external mediation, i.e., to the mechanics of individual and society' (Behrens, 2010: 114). A Marxist understanding of science that, in competition with the bourgeois understanding of science, endeavours to surpass it becomes in fact equal to it. Instead, bourgeois science and philosophy itself should be conceptualised as fetish-constituted.

Ironically, the poststructuralist approach, which set out to deconstruct Western

Christianity, modern rationality, the Enlightenment and the humanist subject in general, ended up in familiar rationalist waters. This certainly shows that many poststructuralist concepts have more to do with the Enlightenment and corresponding forms of rationality than would like to be thought. This is also unabashedly expressed by Althusser, who shaped Marxist (post)structuralism by hypostatizing structure on the one hand, but (or precisely because of this) on the other hand questioned the humanist subject. As he writes in his autobiography:

Those against me included not only the band of philosophers who wrote books 'for man' against Foucault and me (...) but also all the ideologues of the Party as well who made no secret of their disapproval and who supported me only because they could not have me expelled (given my notoriety). (Althusser, 1993: 186)

As already mentioned, Althusser is stuck with the old class-subject, that is, the structure 'articulates' itself in ritual, action, and practices from the outset. In this manner, the subject-object dialectic found a 'smooth' positivist solution, which has been 'hegemonic' in capitalist society ever since its beginnings. Indeed, it rejects any fundamental critique of social form, even if its 'normative' critique and corresponding manifestations of commitment stagnates in boredom.

Without a doubt, postmodern discourse and poststructuralist theories fulfilled the 'civilising mission of capital' at a time of its decay; ironically, one could say. A worn-out gender discourse primarily concerned with the 'production' of gender and the relation of whatever empty relates to itself, eloquently bears witness to this. Even the psychoanalytic dimension is incorporated in a purely mechanical way. Such a discourse continues with Hardt and Negri, who assume an emancipatory-irrational moment based on a diverse, managerial multitude.

Operating within this prevailing left-wing discourse of identity, feminism has finally come to agree with patriarchal ideology, which regards women as empirically

oriented, practical and down to earth. A gender oriented feminism is fundamentally compliant with this demand and content with a purely structuralist reading of social relations. Rather than insisting on the dissociation of value in all its complexity, which does not expire in the gender struggle, it bespeaks contemporary relations by describing them abstractly.

Still, one must go beyond a (negative) dialectical view of value dissociation *critique* in order to transcend methodologically as well as content-wise the determinations of male–female, heterosexual–homosexual, as well as the intersectional relations of various social disparities. This should not be carried out with affirmative intent, but rather as the negation of the corresponding conditions on a purely conceptual level. Only on this basis could a somatic and actual critique of concrete oppressions (an apt concept that has not fallen out of fashion for nothing) be taken into account once more. Otherwise, what comes to pass is a secondary recourse to traditional identities as indices of serious emancipation (see e.g., the headscarf cult of Islamic women, interpreted as emancipatory in Western feminism, primarily as resistance to the West, but which is also an approval of a traditionally Western image of women as seen by growing currents of the new right, which could connect women and feminists frustrated by postmodern developments by means of cross-front strategies). On this basis, a culture–nature, sex–gender dialectic would also need to be reflected, which by no means should lead to the assumption of a natural heterosexuality, a dialectic disregarded in contemporary discourses of ecology and nature. The latter are caught up in instrumental reflections, as if there had never been any previous, serious critiques interested in a mediated approach, however deficient they may have been.

Adorno does not promote a labour-based and derivative Marxist methodology, but rather thinks social form (though caught up in ‘exchange’) in an overarching sense. He

grasps totality in its non-identity, and his reflections are thus something quite different in content from the many exegeses of the so-called ‘new Marx reading’, in which social content is fundamentally subordinated to purely methodological aspects, reducing dialectics to a method, whether within or outside of labour movement Marxism, and so on.

The real (un)truth of the social whole, however, reveals itself first with regard to a complex critique of value dissociation, which is not established simply by epistemology, but can find its end only in an actual overcoming of androcentric, racist, and nature-hostile practice. This lies beyond the stressful romantic everyday life of the forced ‘housewifised’ man who makes a virtue of necessity, secretly looking for something else. Increasing male violence showed itself for example in the 2016 New Year’s events of Cologne. This must be interpreted against the backdrop of the deinstitutionalisation and feralisation of capitalist patriarchy, and cannot be projected ethnically/racially on allegedly North African men. On the contrary, such tendencies must be interpreted against the backdrop of a worldwide, universal patriarchy in its form of disintegration, which does not stop at the doors of the West, but has its roots even within fortress Europe. The role that the Enlightenment plays in all this, and the fact that there can be no naive appeal to it against the rising barbarism, should have become clear in the course of my argument. It is necessary to go beyond both Enlightenment and Counter-Enlightenment.

When Gudrun-Axeli Knapp recently bemoaned a mere juxtaposition of feminist positions, she stated a dry conciliation and tolerance in feminist discourse. She critiques feminism as a worldview – which is also always in danger of failing into a Heideggerian ontology – and wishes for an increased debate, but without even considering value dissociation (Knapp, 2013). A debate about the Enlightenment in the context of *the fundamental critique of value dissociation socialisation* is long overdue.

# Gender and Social Reproduction<sup>1</sup>

Amy De'Ath

In 2012, the materialist feminist LIES collective wrote, '*everything we write will be used against us*'.<sup>2</sup> They had good reason to be wary, for not only have materialist-and Marxist-feminisms been stifled, since their beginnings in Italy in the early 1970s, by a poststructuralist investment in the linguistic and the discursive in the wake of May 1968 and its failures. The happy re-emergence of what is becoming known by the more expansive moniker of social reproduction theory meets its predictable checkpoints today in a male-dominated Marxian theory where any departure from a purely economistic approach to the critique of political economy is treated with suspicion or as so-called 'soft' theory.<sup>3</sup> On the other hand we find the nominally inclusive university, where – under the dual banners of equal rights and the 'lean-in' feminism of creative enterprise – feminist scholars are invited to advance their careers in a stagnating economy by amassing enormous debts.<sup>4</sup>

In the hope of shaking off such fetters, and in order to advance a preliminary thesis

on the role of capitalist temporality in the production of gender, this chapter aims to draw out some connections between queer Marxism, value-critique, and recent developments in social reproduction theory. While I seek to present the latter in their historical context as they have emerged from a long and interrupted train of critical Marxian thinking about gender, patriarchy, and the family, my aim is not to provide an exhaustive summary of all the Marxist-, socialist-, radical-, or materialist-feminist arguments that might be included under this umbrella term. Rather, I mean to make an argument about the political investments and theoretical dimensions of social reproduction theory today.<sup>5</sup> Ultimately, my argument rests on the contention that gendered social relations are form-determined – that is, constituted as social form – by capitalism's imperative to produce surplus-value. Counterintuitively, then, as Carolyn Lesjak has pointed out, it is antihumanist Marxism that provides the way forward for humanist study, both here and elsewhere.

Recent key developments in critical theory by Cinzia Arruzza, Rosemary Hennessy, and Kevin Floyd have approached questions of gender and sexuality through the lens of ‘the cultural’. Building on the Lukácsian critique of reification, these critics have sought to revise and develop the outmoded field of *ideologiekritik* (especially its elaborations on the notion of ‘false consciousness’) with new analyses of how gendered social relations are defined by commodity exchange. In part, my aim is to show how insights and concepts from this work can help to extend and deepen a Marxian critique of gender and social reproduction in ways that may be especially useful for grasping, at a systemic level, what is often understood only in terms of gratuitous or symbolic violence. To present these insights and concepts at an angle somewhat askew from their original frameworks, most notable in this regard is Arruzza’s clarifying attention to the relationship between gender and the logic of capital accumulation and her emphasis on the production of gender as an active social process, and Hennessy’s concept of ‘outlawed need’, which provides a way to conceive of gendered social relations as a movement of negative dialectics. I also briefly refer to Floyd’s method of supplementing a theory of gender based on reification with a broad account of the ‘historical and institutional specifics’ of socio-economic development, one that operates at a different level of abstraction and which for Floyd is provided by regulation school economics specific to the twentieth-century United States (Floyd, 2009: 33).

At the same time, this chapter argues that any theory of social relations based at the level of exchange or circulation falls short of accounting for the relationship of gender to capital’s general laws of motion, and thus for gender’s continued existence (in this way, my argument resonates with Moishe Postone’s critique of what he calls traditional Marxism’s focus on ‘the sphere of distribution’, as opposed to ‘the form of labor (hence of production) [which] is the object of Marx’s

critique’ (Postone, 2005: 69). Far from theoretical nitpicking, this point has significant consequences for social reproduction feminism because a focus on the reification of gender at the level of exchange necessarily excludes a consideration of how gender is produced through reproductive activities that, as we shall see, are defined by their unpaid and unsubsumed status – in other words, their *dissociation* from exchange.

Drawing on Diane Elson’s (2015) recently republished 1979 essay, ‘The Value Theory of Labour’, which argues that value – as distinct from both use- and exchange-value – dominates the process of production, I suggest that this analysis, and its focus on production, might be extended to the feminized arena of social reproduction via the critical tools provided by queer and feminist accounts of gender in capitalism alongside other significant value-theoretical interventions in the field. To this end, I mobilize Postone’s theorization of value as a temporal form of wealth and his account of productivity as the category which changes ‘the determination of what counts as a given unit of time’ (2005: 76). Linking Hennessy’s account of the production of need to the insights provided by these critiques of value – which pertain both to value’s form-determining capacities and to its temporal character – I aim to show how an account of gender based on value (and not exchange-value) provides a unique and more robust framework for understanding the production of gender in capitalism. I subsequently conclude by pointing to Maya Gonzalez’s and Jeanne Neton’s groundbreaking essay, ‘The Logic of Gender: On the Separation of Spheres and the Process of Abjection’ (2014), which, to put it simply here, is concerned to show how value operates spatially as a mediating force that depends on the separation between activities that produce value and those which do not. My own account is thus a supplement to their theory of how gender is mediated by value – a slight correction, but more, I hope, an addition to a shared project – insofar as I attempt

to clarify the dynamic between the logic of capital's impersonal compulsions and the historical consequences of this movement. My aim is therefore to address the underspecified and notoriously slippery causal relationships between capital and gender, in part by tracing a link between value's status as a temporal form of wealth and the production of gender through differentially categorized activities and their specific relation to (a) time, and (b) the production of human needs.

As Arruzza has noted, describing an experience of gendered social relations and giving a theoretical explanation for their existence are two different things. In her words,

the conception of patriarchy as an independent system within capitalist society is the most widespread not only among feminist theorists but also activists. This is because it is an interpretation that reflects reality in the way this appears to us. To speak of modes of appearance does not mean to describe an illusory phenomenon that is to be put in opposition to reality with a capital R. 'Appearance' here refers to the specific way in which the relations of alienation and domination produced and reproduced by capital are experienced by people because of their very same logic. (Arruzza, 2014)

Let us therefore begin with the potentially counterintuitive premise that many reproductive activities do not produce value. The argument that, to quote Mariarosa Dalla Costa, 'housework as work is *productive* in the Marxian sense, that is, is producing surplus value' was at the centre of the domestic labour debate in the 1970s and 1980s, and became a key political cornerstone of much Marxist-feminist activism (Dalla Costa, 1972). But this thesis has since been convincingly refuted: indeed, some of the most sophisticated Marxian analyses of gender relations to have emerged in recent years – including 'The Logic of Gender' – are based on the claim that it is precisely because non-value-producing activities are necessary to capitalist accumulation that the gender distinction persists.<sup>6</sup>

One of my concerns in the latter part of this chapter, then, is to ask some questions

about the relationship between value and gender in terms of how it may and may not be possible to trace the influence of the value-relation over an arena defined by its formal dissociation from the sphere of value-production. This kind of investigation – perhaps precisely because it is a feminist one – has been much-overlooked in Marxian critiques of value. What can be said about the political, ideological and discursive consequences of value's illusory independence and capacity for self-expansion? Can those aspects of feminized experience that are often conceived of in discursive or libidinal terms be explained via an account of value's form-determining capacities?

## LOGIC AND HISTORY

The question of whether patriarchy and capitalism are analytically separable – highly contentious for Marxist-feminists since the 'systems debates' of the 1970s and 1980s – is more than a little misleading. While these debates were concerned with analysing the extent to which patriarchy is a system autonomous from capitalism, current Marxian theories of social reproduction theory generally agree that it is not. In a recent dossier on social reproduction in *Viewpoint Magazine*, in fact, one commentator avers:

[W]hat if we were to collapse *the set of necessary social relations associated with women in capitalism* and the *category of women in capitalism*. What if 'woman' was *nothing but* the formal category of people who are on one side of a specific set of social relations, similar to the way in which the proletariat is *nothing but* the formal category of people who are on one side of a specific set of social relations. (Manning, 2015)

We might revise the question, then, to ask: are gendered social relations internal to the logic of capital, or are they the result of an unfortunate historical unfolding, with capital latching onto and torquing existing patriarchal structures – of feudal or agrarian societies, for

example – to its own advantage? The quote above is drawn from an essay by F. T. C. Manning, written in reply to an overview and explication of systems debates provided by Arruzza. In particular, it responds to Arruzza's claim that the logical structure of capital is always distinct from its concrete historical dimensions; in Arruzza's words, that 'it is important to distinguish what is functional to capitalism and what is a necessary consequence of it. The two concepts are different'. As she elaborates:

It is perhaps difficult to show at a high level of abstraction that gender oppression is essential to the inner workings of capitalism. It is true that capitalist competition continually creates differences and inequalities, but these inequalities, from an abstract point of view, are not necessarily gender-related. (Arruzza, 2014)

Manning – and another of Arruzza's respondents, Sara Farris – take issue with this position because it appears to concede to the discredited argument, advanced by Ellen Meiksins Wood, that capital has an indifferent, opportunistic relationship to gender oppression: a claim that Arruzza also insists she is arguing against. Manning's point is that the real content of the category of feminized people is nothing but a set of social relations: she is thus concerned to close what she calls the 'conceptual gap' between feminized people and the social relations through which they are positioned within a structural totality.

But categories are not lived as such, and there is a difference between logical relations and social relations. As Arruzza has pointed out, to frame the question in opposing terms of whether gender oppression is part of the logical structure of capital, or a separate system opportunistically co-opted by capital, is 'to presuppose that there is nothing between logical necessity and arbitrary contingency'. For Arruzza, to argue that the logical necessity of gender to capital's self-valorizing movement cannot be – or has not yet been – proven is neither to argue that gender is *not*

logically internal to capital's operations (indeed, Arruzza stresses her agnosticism regarding this question), nor that capitalism could survive without the fluctuating yet constant reconstitution of gender relations:

Put simply, logical possibilities concern the coherence of our thoughts toward objects. As such, the range of logical possibilities is as a general rule both wider and more rigid than that of real possibilities, which have to account for constraints other than logical coherence and thus, to a limited extent, allow for the existence of contradictory processes. [...] This is not to suggest an irrationalist approach to parts of reality; I only mean to suggest that logical formalization is not the sole rational means of grasping reality at our disposal, and that not all necessitating constraints are grasped in this way or formalized at that level. The cognitive mapping of certain constraints demands concrete historical analysis or other heuristic tools. (Arruzza, 2015a)

It is important to grasp two interrelated dimensions of the conceptual distinction Arruzza is making here: first, that there is a difference between logical coherence or thinkable possibilities on the one hand, and possibilities practically circumscribed by the contradictions and material limits of concrete reality on the other; and second, that we can also conceive of this distinction in terms of causality – in terms of the difference between gender being a logical precondition for capitalist valorization, or gender being a necessary consequence of those processes. To extrapolate a little from this: we could say *either* that the logic of gender does not unfold in a vacuum, taking on pure forms, but in dialectical relation with the 'practical constraints' of 'the concrete history of capitalism' (Arruzza, 2015a), *or* that the logic of gender does not exist, that gender is not logically internal to capital's movement, but emerges as a necessary consequence of it.

Or, we could admit that these are two ways of conceiving of the same thing – and in doing so avoid the 'sterile exercises of intelligence' Arruzza warns against, even as she acknowledges the political motivations behind such endeavours: the desire to

prove that gender is internal to capital's logic is, after all, understandable in the face of a 'class-first' Marxism that, unable or unwilling to think gender, race, class and other categories dialectically, reduces these categories to the merely cultural.<sup>7</sup> Yet – whether a logic internal to capital, or capital accumulation's necessary consequence – the one thing we *can* say is that gender emerges dialectically, through the inventive and constantly reconstituting movement of an integrated totality. Arruzza herself nods to this, in one of her most capacious and promising formulations:

I argue that capitalist accumulation produces, or contributes to the production of, varying forms of social hierarchy and oppressions as its necessary consequences. Moreover, I argue that it has a greater consequential and determining power than other forms of social hierarchy, and that it poses necessitating constraints that determine all other forms of social relations. Thus, my claims are more robust than simply stating that in a total social formation something 'is connected to something else'. However, my claim is weaker than arguing that capitalist accumulation organizes other social hierarchies according to a single logic. Moreover, it is my contention that the logic of capitalist accumulation is *pervasive* (that is, that it has the capacity of coloring all other social relationships), which is one of the grounds for speaking of a contradictory and articulated moving totality. (Arruzza, 2015a)

Avoiding a deterministic definition of capital's domination, and stressing the need to think of capitalist societies not as *expressive* totalities (in which 'each part reflects and corresponds to the others, or where each part is "functional" to the whole'), but as *moving* totalities (in which 'social practices, relationships, and institutions' are subject to the limits and pressures enforced by the logic of capitalist accumulation) Arruzza's preliminary suggestions point to a way through the thicket of systems debates and the political impasse of the 'logic or history' question.

Arruzza's comments in the *Viewpoint* dossier defer that work to a future date and a larger project, but her language of pervasion and colouring are notably aligned with

a cluster of inquiries already underway, discernible (though not always appearing in conversation) in the work of critics as various as Maya Gonzalez, Chris Chen, Sianne Ngai, Diane Elson, Alberto Toscano, and Marina Vishmidt, to name a few. For the sake of expediency, I will limit myself to noting that all of these critics are interested in the visceral or plasticizing – in Ngai's words, 'socially binding' (Ngai, 2015) – processes by which capital comes to dominate and organize both productive and reproductive activities through its compulsion towards abstraction. Though Arruzza's own work on gender as social temporality is similarly concerned with how capital organizes social practices through (abstract) time, we can note, significantly, that her analyses employ a Lukácsian understanding of reification, whereby 'gender performance is mediated by the pervasiveness of abstract time given by the diffusion of the commodity form'. Drawing on Kevin Floyd's work on masculinity during the Fordist era, Arruzza suggests that the commodity, as abstract labour, 'disciplines' leisure time, making it into a form of 'skilled labour' itself (Arruzza, 2015b: 48; Floyd, 2009). But while Arruzza is concerned to shift our understanding of gender performativity from the terrain of consumption to that of circulation – to include the selling of services and commodities and the production of new desires, for example – the work I will turn to in the remainder of this chapter makes a convincing case for why gender and social reproduction are best understood from the standpoint of production, in terms of the relation of specific activities to the market and in terms of the dominance of value and its ability to reproduce 'differentials across which value can flow' (Spahr and Clover, 2016: 292).

Thinking about gender as a category mediated by *value* – as opposed to exchange-value, or the commodity – may also help us with a thorny problem which haunts both Arruzza's and Manning's pains to underline that they are not proposing a deterministic or economic definition of gender. Arruzza notes,

for example, that proponents of the ‘unitary theory’, among whom she counts herself, ‘disagree with the idea that today patriarchy would be a system of rules and mechanisms that autonomously reproduce themselves’ (2014). In a similar vein, Manning emphasizes that it is not possible for ‘coercive relations of secretive sexual abuse’ or ‘violent forms of control and psychic isolation and domination to be socialized’, explaining that ‘the gender relation, like the class relation, is, even in the abstract, not exclusively “economic”’ (Manning, 2015). These claims gesture differently to the limits of Marxian analysis, especially since they point towards different strands of contemporary theory that do not often meet: antihumanist readings of capital’s impersonal compulsions in the first instance, and theories of the libidinal functions of gratuitous and symbolic violence in the second. But they both arise from a reliably persistent problem for social reproduction theory: how to explain this non-socialized and unquantifiable sphere of violent coercion in Marxian terms?

Noting that she is not sure if Manning’s argument is a ‘psychological, anthropological, or ontological one’, Arruzza does not pursue this tricky line of enquiry within the *Viewpoint* dossier. Indeed, the non-economistic dimension of gender relations opens onto a longstanding philosophical problem, one candidly described by Rosemary Hennessy, in her landmark study of sexual identity under late capitalism, with a refreshing lack of embarrassment:

One of the most remarkable features of the history of sexual identities is the lack of any consensus over how to understand precisely what sexuality is. What *is* the materiality of sexuality? Is it libidinal desire? Bodies and pleasures? Discourses? Culture-ideology? How do presuppositions about the materiality of sex affect how we understand sexual identity and how we craft a sexual politics? (Hennessy, 2000: 37)

For theorists of social reproduction – unlike poststructuralist feminisms – the violent policing of sexuality represents something of an analytical hidden abode. Yet social

reproduction theory might also salvage from poststructuralism, at the moment of its waning, some conceptual leverage to consider the roots of gendered violence anew. Both Arruzza’s and Hennessy’s work is remarkable for its genuinely inquisitive and generous engagement with poststructuralist feminisms, and in particular, with Judith Butler’s theory of gender performativity. Arruzza even underlines the similarities between Butler’s theory of gender as a ‘constituted social temporality’ and Marx’s famous argument that past labour, weighing like a nightmare on the present in the form of space (or, dead labour), is what organizes capitalist time:

In Butler, the spatiality of gender, i.e. its inscription on the body, is nothing but constituted social temporality, in other words, social acts performed in the past. Likewise, for Marx past, objectified labour time opposes *qua* space the present time of living labour. Whereas Butler denies that gender is a fact, by insisting that gender is constantly constituted through the repetition of performative acts over time, Marx insists that capital is not a thing, but rather the process of self-valorisation of value which implies the repetition of the circuits of capital and their unity. (Arruzza, 2015b: 39)

Notably, it is a *circulationist* reading of Marx – in which circuits of exchange organize time through repetition – that appears isomorphic with Butler’s theory of gender as a constituted social temporality. As we will see, the comparison would not hold with the value-theoretical accounts I have mentioned above. But Arruzza’s point in underlining this similarity is merely to demonstrate that Butler, like Marx, is concerned to show how a set of social arrangements is not the result of natural, transhistorical phenomena but of active social practices, and thus, that we might retain some of Butler’s arguments about ‘intelligible’ genders and ‘coherent’ relations of sex and gender for the purpose of developing a more robust account of social reproduction. It bears underlining that for Arruzza, as for Hennessy, Butler’s ‘normative materialism’ – in which sexual identities

are produced as the effect of discourses, through 'repeated performances of cultural signs and conventions' – ultimately serves to 'foreclose ways of knowing the world that connect the symbolic order (culture) to material social relations that are not symbolic' (Hennessy, 2000: 56–60, 212), or in other words, Butler's work disconnects the cultural from political economy.

## OUTLAWED NEED

In *Profit and Pleasure: Sexual Identities in Late Capitalism*, Hennessy proposes the concept of 'outlawed need' as a way to grasp the historical production of both legitimate and illegitimate – or incomprehensible – needs. In part, her study is a measured correction to what must by now seem a familiar feminist criticism of Marxist-feminism's 'totalizing' tendencies – a complaint which tends to rhetorically position a historical materialist Marxist-feminism as if it were the cause, rather than the critique, of capitalism's totalizing movement. Reminding us that 'historical materialism begins with the premise that meeting human needs is the baseline of history', however, Hennessy insists on need's historical contingency, its fundamentally social character as corporeal needs are met through social relationships and as the parameters for what counts as a vital need vary across time.

In capitalism, unsurprisingly, outlawed needs constitute a swathe of life unlived: from basic unmet needs such as food, clothing, housing and health care often not covered by the minimum wage; to the intellectual and creative development through which a full human life might be possible; to the sensations, affects, and desires outlawed by heteronormative gender relations; to the sphere of outlawed need that must nevertheless be satisfied through the feminized arena of social reproduction. It follows, then, that 'outlawed need' is also a mode of proscribing

the domain of the intelligible, the realm of coherent social relations that Butler so famously critiques. Indeed, in this expanded framework outlawed need becomes such an integral dimension of capitalism that it leads Hennessy to venture that 'outlawing the development of full human potential comprises the very scaffolding of human relationships in commodity exchange' (Hennessy, 2000: 215).

Hennessy argues that in capitalism, the history of social relationships is invisibilized in a process whereby consciousness is reified into forms of identity, forms which 'come to be seen as natural "things in themselves"', and in which sensation and affects 'are made intelligible in terms of normative and perverse sexual identifications and desires' (217). Like other Marxist accounts of sexuality, her analysis reads the historical production of desire as an effect of consumer culture, as 'commodification of human capacities' leads to the consolidation of a heteronormative and patriarchal society in which 'sexual identity categories restrict the power to act to the extent that they atomize human potential and social relationships' (219). Indeed, Arruzza similarly explains the production of gender as 'a forced repetition of stylising acts [...] mediated by the pervasiveness of abstract time given by the diffusion of the commodity form' (2015b: 48), locating this process firmly within the sphere of circulation. She argues that the power of the commodity form to organize and abstract (leisure) time – to give 'a fundamental disciplinary character to consumption itself' – can help us to understand 'a wider set of phenomena, all contributing to the reification of sexual identities' (48–9), such as the selling of commodities and services.

That this argument about the reification of intelligible forms of sexuality and the imposition of abstract time beyond the sphere of production would seem to be borne out empirically makes it compelling and suspicious in equal measure. But insofar as it identifies an organizing logic that operates at a level of abstraction that takes on its own life

beyond the cumulative amassing of isolated acts of consumption – a point made especially clear in Arruzza's formulation – it is perhaps a telling instance of the kind of real abstraction theorized by Alfred Sohn-Rethel, who argues that the very form of thought is determined by the social practice of commodity exchange relations.<sup>8</sup> Yet I have suggested above that gendered social relations are better understood not through the critique of reification that runs from Lukács and through the Frankfurt School, and which structures Hennessy's, Arruzza's, and Floyd's theories of sexuality and gender, but through an analysis that seeks to understand how value – as conceptually distinct from both use-value and exchange-value – dominates the process of social reproduction. Why would this alternative be necessary? Put simply, because a theory of gender based on reification does not explain why many reproductive – which is to say, gendering – tasks, such as childcare, are most fundamentally defined not by the practice and patterns of consumption, but by their unpaid and unsubsumed status.

To be sure, reification and the 'ritualistic character of gender performance' (Arruzza, 2015: 48) are key in regulating gender and sexuality, legitimizing some identities and desires and proscribing others. Indeed, that reification is one of the primary sites of social contest in which malleable and shifting gender relations unfold historically is perhaps precisely the extent of the claims outlined above. But analyses limited to the sphere of circulation, focused on consumption as a mode of gender performativity, or on the regulation of abstract time through the commodity form, can only take us so far in understanding the production of gender in capitalism. Even though such analyses acknowledge the dual character of commodities, they tend to eschew the fact that reification is a *consequence* of the value-relation, rather than a primary dynamic shaping capitalist social relations, and thus fail to draw a distinction between the production of gender and the reified forms of appearance it

takes in capitalist societies. In other words, these accounts risk mistaking cause and effect, and while they might be useful for describing *how* gender is produced at the level of 'culture-ideology', they fall short of explaining *why*. Floyd's persuasive argument seeks to remedy this problem by pairing Foucauldian and queer readings of the reification of sexual desire – what he calls 'micro-social forms of normativity' – with 'regulation school' analyses of the institutional and practical structures that serve to secure regimes of capital accumulation (Floyd, 2009: 33–5). But a focus on regulation – on the managerial functions of the state, its laws and policies – is arguably a move even further away from the core of capital accumulation and the site at which a Marxian intervention would be focused. While Floyd provides a more robust, substantial explanation of how sexuality is regulated in capitalism, in turning to regulation theory – and thus to its emphasis on the role institutions play in the regulation of the capitalist economy – rather than value, his argument tends towards the political rather than to the primacy of the economic, leaving hanging the question of how and if gender is constituted through the motions of capital accumulation *per se*.

Let us turn to the value-relation, then, which implies a dialectical – opposed and mutually constitutive – relationship between production and circulation. Marx repeatedly emphasizes this point, in fact, describing how relations of production become dissociated from the surface of 'simple circulation'. Hence, the famously playful note in which he invites the reader to leave the noisy sphere of exchange, 'where everything takes place on the surface and in full view of everyone', and follow the capitalist into the hidden abode of production in order to discover the 'secret of profit-making' (Marx, 1976: 279–80), is accompanied by more austere formulations which stress how the presupposition of a whole totality is central to capital's movement, where '*the whole system of bourgeois production is implied*, so that exchange value

can appear as the simple point of departure on the surface' (Marx, 1987: 466).

Indeed, Marx's concern is to uncover the whole system 'implied' by the many various parts of a capitalist mode of production, to 'unravel the "inner connection" [*inneres Band*]' as Elena Louisa Lange puts it, 'between the forms (value, the commodity, money, capital) as they present themselves to our "everyday consciousness" – in exchange or circulation – and their real *content*' (Lange, 2016: 249). While Marxist-feminists have long contended that gender must also be analyzed as part of this totality, basing their critique on the interplay of capitalist categories, new readings of Marx show that to do so would mean thinking gender not only through the monocle of commodities and their exchange in the sphere of circulation, or solely through the category of reproductive work, but through Marx's theory of value as a form-determining real abstraction. For indeed, this is the 'specific form' determining the division of labour, the conditions of production, and the economic relations between individual members of society.

A turn to value is thus not only warranted because it presents an under-theorized dimension of Marxian studies of gender and social reproduction, but because value is a key component, if not *the* key component, of Marx's critique of political economy. While 'value-form theory' has been the province of a small corner of Marxian critique – gaining the moniker of 'esoteric Marxism' – since the 1960s, these conversations have gained a new sense of purpose and traction across a wide range of critical discourses since the 2007–8 financial crash. Adherents of *Wertkritik* such as Norbert Trenkle and Robert Kurz, as well as British critics including Diane Elson and Christopher Arthur, take *value* (as distinct from exchange-value, or the money form) as their point of departure, and *labour* as their object of study. Indeed, value-theoretical accounts involve what Ingo Elbe describes as a threefold abandonment of traditional Marxism: a move away from substantialist theories of value as the

labour congealed in commodities, away from reformist conceptions of the state in favour of a view of the state as a structural component of capitalist domination, and away from 'labour-movement-centric' interpretations of the critique of political economy, or the idea of a "labor-ontological" revolutionary theory' (Elbe, 2013).

## VALUE AND GENDER

The question of what an analysis of value might show us about gender and social reproduction is the topic of a much larger project, but I want to suggest a few possible inroads into this relatively unexplored relationship. As we will see at the end of this chapter, inquiries into the operations of value as a gender-mediating force are nevertheless being taken up with compelling precision, most notably in Gonzalez and Neton's essay. These preliminary observations are therefore as much intended as a nod backwards and a return to the theoretical interventions on which such analyses are founded as they are suggestive of possible future investigations that might also – despite some fundamental divergences – make use of the valuable insights from Arruzza, Hennessy, and Floyd that we have glimpsed above.

### *Form-Determination*

Diane Elson's clarifying intervention, which rests on the argument that the object of Marx's theory of value is not *price* (as various theorists of the 'transformation problem' would contend<sup>9</sup>) but *labour*, gives a helpful indication of the particular ways in which an attention to value, to its abstract and dual character, is pertinent to any Marxian theory of gender. Her new reading of Marx insists on a vital distinction between value, which lacks independence, and value's *appearance* as exchange-value (or money), which gives it

an *illusory* independence, as the key to understanding how value *form-determines* the structure of the labour process. Citing Marx's famous description of labour in the *Grundrisse* as 'the living form-giving fire [ ... ] the transitoriness of things, their temporality, as their formation by living time', she offers the following elaboration:

[Labour] is a fluidity, a potential, which in any society has to be socially 'fixed' or objectified in the production of particular goods, by particular people in particular ways. Human beings are not pre-programmed biologically to perform particular tasks. Unlike ants or bees, there is a potentially vast range in the tasks that any human being can undertake. (Elson, 2015: 128)

Elson calls this the indeterminateness of human labour; a fluidity common to all states of society. The question then, for Elson and for Elson's Marx, is how human labour comes to be determined, how it comes to be fixed as objectified abstract labour in capitalism. In more ambitious language, she explains how this is a matter of 'seeking an understanding of why labour takes the forms it does, and what the political consequences are' (123). Her answer, in the first instance, is based on a crucial but 'little-noticed distinction drawn by Marx', a distinction between "internal independence" and "external independence":

Value lacks the 'internal independence' necessary for it to be an entity because it is always one side of a unity of value and use-value, i.e. the commodity. But the value side of the commodity can be given 'external independence' if the commodity is bought into a relation with another commodity which serves only to reflect value. This produces the illusory appearance that value in its money form is an independent entity; but the autonomy it confers on value is only relative. It is this externally independent expression, in objectified form, of a one-sided abstraction, the abstract aspect of labour, which is the fetishism of commodities. (165)

Value, as a one-sided ('externally independent') abstraction, appears only in exchange. As such, it is not an ideological form but – though Elson does not employ the term in

this passage – a real abstraction. For Elson, two key observations follow from this. First, that 'in the form of the universal equivalent, abstract labour is not only objectified: it is established as the dominant aspect of labour'. In other words, the concrete dimension of labour is subservient to the abstract, because its purpose is to '[make] a physical object which we at once recognise as value' (165). In a similar way, Elson notes how the private aspect of labour ('the isolated processes of production operating independently of one another') ultimately serves its social aspect, through the social mode of recognition known as commodity exchange. She is careful to note that this does not mean that the private, concrete, and social dimensions of labour are obliterated; rather, it means that they are subsumed as expressions of abstract labour. Abstract labour is thus the only form of labour reflected in the universal equivalent, money. Perhaps the most crucial point in Elson's reading of Marx then follows in this same passage, where she writes:

The argument of *Capital*, vol. 1, goes on to show the dominance of the universal equivalent, the money form of value, over other commodities, and how this domination is expressed in the self-expansion of the money form of value i.e. in the capital form of value. Further it shows that the domination of the capital form of value is not confined to labour 'fixed' in products, it extends to the immediate process of production itself, *and to the reproduction of that process*. (165, my italics)

This assertion about the domination of value over the process of production names the process of real subsumption. Importantly, in Elson's account, this process begins with the universal equivalent – the money form of value – and moves inwards to the labour process, showing how the abstract dominates the concrete. Indeed, as Elson points out, 'Marx's argument is not that the abstract aspect of labour is the product of capitalist social relations, but that the latter are characterised by the dominance of the abstract aspect over other aspects of labour' (150). But what does Elson mean when she refers

to ‘the reproduction of that process’ in the passage above? While it might be fair to assume that what is being summoned here is a more limited notion of the changing form of the production process (within the walls of the factory plant, for example), the reproduction of the commodity labour-power – as Marxist-feminism has taught us – reaches far beyond the labour process into the most hidden recesses of social life. Might this point about the fluidity of labour, and the necessity for it to become socially fixed in order for valorization (the production of surplus-value) to take place, extend indirectly to the feminized and racialized sphere of social reproduction?

Without much ado, Elson’s reading emphasizes the objective (as opposed to subjective) nature of value-production, the social process that ‘goes on behind the backs of the producers’ (Marx, 1976: 135). Showing how Marx’s concept of determination is not ‘deterministic’ – not a concept of a regulative law – Elson notes that speaking of determination ‘does not, of course, mean the denial of any choice on the part of individuals about their work. Rather, it is to point to the fact that individuals can’t just choose anything, are unable to re-invent the world from scratch, but must choose from the alternatives presented to them’ (Elson, 2015: 129). It is perhaps through a theory of negative circumscription, then, that a more properly antihumanist method for analysing the production of gender in capitalism can be advanced. Rather than emphasizing the ways gender is circumscribed over time through repetition – how, to quote Arruzza, ‘gender performance is mediated by the pervasiveness of abstract time given by the diffusion of the commodity form’ – a theory of gender derived from analysis of the value-relation involves shifting our focus from the sphere of circulation to that of production, for the simple reason that this is where value arises as the congealed product of socially necessary labour time (before it is realized in exchange). This focus allows us to see that what *does* the

circumscribing – what dominates ‘the immediate process of production itself, *and ... the reproduction of that process*’, to use Elson’s words – is an objectively existing abstraction: value. Investigating gender’s relation to value as opposed to the commodity thus allows for a radical analysis of the production of gender at its root, so that we might better understand the forms of appearance that gender could assume in any historical moment.

A value-theoretical account of gender also points towards a very different way of conceiving of gender as social temporality, since if the value-relation implies the tendency for constant capital to displace variable capital over time – what Marx calls a rising organic composition of capital – we might want to consider how that very movement is entangled with the reconstituting movement of gendered social relations, especially in an era of economic stagnation and contraction, where labour no longer occupies the structural position it once did. In order to understand gender’s relationship to capitalist time, we need a better grasp of how gender is produced in dialectical relation to patterns of productivity and economic crisis. This will not involve discarding the insights about the pervasiveness of abstract time from Arruzza et al., but providing a more essential account of what capitalist time is, and how it comes about.

If a value theory of labour ‘enables us to analyze capitalist exploitation in a way that overcomes the fragmentation of the experience of that exploitation’ (Elson, 2015: 171), it is because, as Elson and Marx both note, value appears as the subject of a process, ‘endowed with a life its own’ and this fetishistic result, in its illusory independence, allows for the domination of value to extend beyond the commodity, to the production process and to the reproduction of that process. In the final section of this chapter, I want to suggest that another analysis of gender as social temporality – one based on value’s temporal dimension – might, in supplementing other emerging

theories of the relationship between value and gender, help to provide a more substantial answer to the tricky question of how value's domination extends to the sphere of social reproduction.

### ***Time, Differentials, and the Production of Need***

One of the most incisive theories of value and time in capitalism appears in the following dense passage from Moishe Postone:

In *Capital* Marx roots capitalism's historical dynamic ultimately in the double character of the commodity and, hence, capital. The treadmill dynamic that I have outlined is at the heart of this dynamic. It cannot be grasped if the category of surplus-value is understood only as a category of exploitation – as *surplus-value* – and not also as *surplus-value* – as the surplus of a temporal form of wealth. The temporality of this dynamic is not only abstract. Although changes in productivity, in the use-value dimension, do not change the amount of value produced per unit time, they do change the determination of what counts as a given unit of time. The unit of (abstract) time remains constant – and, yet, it is pushed forward, as it were, in (historical) time. The movement here is not the movement *in* (abstract) time, but the movement *of* time. Both abstract time and historical time are constituted historically as structures of domination. (Postone, 2005: 76)

In other words, abstract time might be *mediated* by commodities, but it is *dominated* – ‘pushed forward’ – by value, a ‘temporal form of wealth’. And in marking out how historical time is dominated by abstract time, Postone places the logic of capital and the material of history in dialectically opposed and mutually constitutive relation. Far from theoretical hairsplitting, his point is worth stressing in the context of gender and social reproduction, firstly because it reminds us that abstract time is itself mediated by value, again confirming that an analysis of gender in capitalism requires analysis at a higher level of abstraction, and secondly – in what has become known as Postone's key intervention in value debates – because it shows

how *productivity* changes ‘the determination of what counts as a given unit of time’, highlighting the centrality of this category to the movement of both abstract *and* historical time. This point is key for social reproduction theory, because it opens onto a discussion yet to be had about gender as social temporality: one that asks how the low- or non-existent productivity rates of reproductive activities affect how gender is lived temporally. How are units of time determined – or *undetermined* – in social reproduction, where both paid and unpaid reproductive workers produce little or, as is more often the case, no value? It is through questions like this, I would wager, that we might arrive at a more comprehensive account not only of how gender is preserved and constantly reconstituted in capitalism, but of the qualitative character of gender as a lived experience. What, for example, is the structural relationship between unproductive time and the production of outlawed (unmet, illegitimate or incomprehensible) needs? And what bearing does this have on that non-socialized and unquantifiable sphere of violent coercion that Marxian theories of gender and social reproduction never quite manage to explain?

Questions such as these chime with some brief but telling remarks by Hennessy that point to the link, figured here through the logic of the commodity, between the increasing acceptance of new sexual identities and changing relations of production:

What I want to stress is that this cultural-ideological process was overdetermined by the logic of the commodity, *a logic that binds ways of knowing and forms of identity to changes in the relations of production*. In other words, the reification of sexual identity is overdetermined by the relationships that capitalist production came to rely on in the late nineteenth century, relationships that include forms of consciousness that are adequate to new demands of production and consumption. (Hennessy, 2000: 103, my italics)

But the pure form of a logic cannot alone bind ‘ways of knowing’ or ‘forms of identity’ to production. As Michelle O'Brien has

observed, the ‘problem of underspecified causal relationships ... pervades the current of social thought that puts much emphasis on “Fordist” and “post-Fordist” eras’, and we might reasonably include Hennessy’s study in this category. As O’Brien suggests, the ‘causal chains that link culture, state policy, and regimes of capital accumulation’ may then be better analyzed by the conceptual tools offered by social reproduction feminism (O’Brien, 2017). Indeed, an analysis seeking to account for the structural relations between regimes of accumulation and gender would be enriched by a more thorough consideration of underspecified remarks such as this one:

Under capitalism, workers do not retain control of very much of their human potential, and the outlawing of so much human potential is, in fact, one of the sites of struggle between capital and labor. (Hennessy, 2000: 215)

Indeed, the the concept of outlawing – and of outlawed need – might be more ambitiously put to use to account for how the production of need is rooted in the value-relation. We might even think of the production of need as the historical and material *modus operandi* of what Juliana Spahr and Joshua Clover name as capital’s (gendering, racializing, ableist) imperative to ‘make differential’, where ‘differentials are a necessary basis for the imperative to *make productive*, since productivity within capital requires differential valuations’ (2016: 292). If, *pace* Postone, differential valuations mean differences in a temporal form of wealth, it is also possible to see how the production of legitimate and illegitimate needs – which involves both the production of differentials and of gendered domination – is a process shaped by the *determination of units of socially necessary labour time* (or in other words, value). This process necessarily involves what I described earlier as undetermined units of time: the kind of time for which there is perhaps no clearer example in practice than that which Gonzalez and Neton point to when they comment that, ‘you

cannot look after children *more quickly*: they have to be attended to 24 hours a day’ (2014: 169). Which kinds of time can be measured in units of socially necessary labour time? Which kinds of time refuse productivity increases and thus remain fixed units of time? Which kinds of time cannot be measured in units of socially necessary labour time at all?<sup>10</sup>

The problem of underspecified causal relationships between capital and gender might thus be better addressed if we attend to capitalist time’s relationship to the production of needs and its capacity to *make differential*. Putting Postone’s analytical point to work in terms of a value-theoretical account of the production of gender in order to understand what variations in the domination of both abstract and historical time actually mean in practice is, moreover, a way of mobilizing value-theoretical analysis to the kinds of political ends that this corner of Marxian theory has long been accused of avoiding. And if outlawed need names one of the ways in which capital makes differentials – for example, through making the needs of feminized and racialized people illegitimate or incomprehensible – it also implies those antagonisms and resistance that (among other things) emerge as a result of needs not being met. These antagonisms must be regulated by forcibly gendering and racializing forms of violence, in true dialectical fashion. Indeed, the negative, inverted dimension of the concept of outlawed need is compelling in this regard because it describes an impersonal operation – a structural and mediated withholding rather than a more active form of personal oppression – albeit an operation with highly personal, and necessary, results: what Arruzza calls the ‘practical constraints’ of ‘the concrete history of capitalism’ (Arruzza, 2015a).

Outlawed need is thus a way of conceptualizing gendered violence in the negative, as the historical consequences of needs not being met, and as the negative underside of

real abstractions imposed in capitalism – abstractions dialectically mediated by that ultimate real abstraction, value. At the same time, it is crucial to emphasize that while value – as abstract labour and as a temporal form of wealth – allows for the comparing of different labours and so allows for the possibility of different labours having differential valuations ‘across which value can flow’ (Spahr and Clover, 2016: 292), *it does not itself impose these differentials*; these are sites of social contest.<sup>11</sup> Commenting on why ‘redistributive solutions on offer have little purchase on the problem’, and in terminology akin to that of Marx’s argument that the whole system of bourgeois production is ‘implied’, Spahr and Clover employ the useful language of presuppositions and maldistribution:

[M]aldistribution is a form of appearance for necessary differentials, not an incidental outcome. Maldistribution is itself a constitutive part of value production, rather than an unfortunate effect. There is no such thing as capitalism without ongoing and intensifying maldistribution. (Spahr and Clover, 2016: 301–2)

This is an admittedly quick synthesis of some complex conceptual apparatuses. But these theories of the movement of abstract and historical time, the production of need, and capital’s imperative to make differential dovetail usefully with a current interest in what Roswitha Scholz calls ‘relations of value dissociation’ – where ‘value and dissociation [from value] stand in a dialectical relation to each other’ (2014: 128) – as well as the theory of direct and indirect market mediation advanced by Gonzalez and Neton (2014) in ‘The Logic of Gender’, where reproductive activities are considered through a spatial analysis of their structural relationship to the market (that is, to the sphere of value-production).

While – in the light of Arruzza’s convincing argument – we might agree that the existence of a logic of gender is indeed difficult to prove, and that even Gonzalez’s and Neton’s

most perspicacious attempt to do so does not achieve that task, I want to end by pointing to the theoretical advances their essay does achieve, which amount to nothing less than a fundamental reconception of how gendered social relations can be understood through the method of systematic dialectics provided by value critique. Most significantly, perhaps, ‘The Logic of Gender’ provides a compelling alternative to the inadequate binary of productive and reproductive labour for understanding gendered social relations in capitalist societies. In place of these categories, Gonzalez and Neton propose two overlapping spheres – the directly market-mediated (DMM) sphere, and the indirectly market-mediated (IMM) sphere – which prove useful categories of analysis for understanding the types of domination required to quantify and enforce different kinds of productive and reproductive activities (Figure 93.1). While abstract, value-productive (including reproductive) labour is socially determined by ‘direct market-mediation; and hence requires “no structural necessity toward direct violence”’, activities

**Figure 93.1: A graphical representation of the relation between the DMM/IMM and waged/unwaged spheres (Gonzalez and Neton, 2014: 157)**

belonging to the indirectly market-mediated sphere of ‘non-labour’ (including paid, non-value-producing work) are compelled by other mechanisms, ‘from direct domination and violence to hierarchical forms of cooperation, or planned allocation at best’. Central here is the relation of any activity to the market and to valorization.

Gonzalez’s and Neton’s discussion of the abject, in the latter part of their essay, resonates in obvious ways with the concept of unmet needs: the abject, in this framework, describes a particular type of *denaturalized*, indirectly market-mediated activity: a set of unpaid tasks that must be performed or executed by ‘someone’ in order for the production of surplus-value to continue in the directly market-mediated sphere. The concept of the abject is linked, in ‘The Logic of Gender’, to the process of previously waged reproductive activities becoming unwaged as a result of neoliberal austerity measures. For example, state-subsidized childcare services being withdrawn means that the previously paid work of daycare workers has been returned to parents, and disproportionately feminized parents. Abject forms of reproduction differ from other indirectly market-mediated activities because, after becoming waged components of the welfare state, they no longer automatically appear as the natural task of women – though as Gonzalez and Neton point out, ‘abject reproduction will in the end mainly be foisted upon women’ (2014: 171).<sup>12</sup>

## CONCLUSION

Not only do abject forms of reproduction typify the kind of outlawed need suggested by Hennessy’s critique: they very clearly show why it is an account of gendered social relations based on analysis of the value-relation, rather than the commodity, that is adequate to the project of critiquing the production of gender in both its positive *and* negative instantiations. If the low- or non-existent productivity rates of

reproductive activities affect how gender is lived temporally – as ‘both abstract time and historical time are constituted historically as structures of domination’, in Postone’s words – then this is also one of the primary formal mechanisms through which the category of the abject, rather than being a concrete condition meted out to individual subjects, formally mediates a diverse set of relationships to the wage across populations. Thus, while Gonzalez and Neton note that it is not possible to ‘objectively quantify, enforce or equalize “rationally” the time and energy spent in [IMM] activities or to whom they are allocated’ (2014: 155), it is possible to develop a more substantial account of the causal links – the logical and historical relations – between (1) relations of production and circulation, (2) periodic developments in capital accumulation, and (3) the production of gender, by attending to the role temporality plays in value’s form-determining operations. We might then conceive of a an antagonistic, *counter-reproductive underside of value*: a counter-reproductive negativity within the value-form itself,<sup>13</sup> the negativity Elson almost acknowledges when she notes that abstract labour is the *only* form of labour reflected in the universal equivalent.

I have attempted to show what is missing from a conception of gender theorized through the Lukácsian lens of a critique of reification, first by pointing to how the value-relation is omitted by this approach to its detriment, and second by showing how the insights of value theory illuminate (a) the way value dominates as an abstraction and (b) the nature of this abstraction as a temporal abstraction. These understandings seem crucial for any theory of social reproduction feminism that wants to grasp the thorny problem of the production of gender under capitalism by its roots, as it were. Not by coincidence have we come around to an answer of sorts to the ‘logic or history’ debate. The question is not whether gender is internal to the logic of capital or its unfortunate effect, but how we can better address the challenge of comprehending the vagueries and violences of gender

dialectically – through the opposing and mutually constitutive relations between production *and* circulation – in order to clutch that inner connection between forms as they present themselves and their real content.

## Notes

- 1 This chapter is dedicated to Marija Cetinić.
- 2 See vol. 12, issue 1 of *LIES: A Journal of Materialist Feminism*, p. 11. <http://www.metamute.org/community/your-posts/lies-journal-materialist-feminism-volume-1-2012>
- 3 Gilles Dauvé's recent commentary on Silvia Federici's (2014) *Caliban and the Witch: Women, the Body, and Primitive Accumulation*, for example, seeks not to engage Federici's theory of reproductive labour with the aim of correcting and clarifying her categories for the development of future analysis, but to dismiss her intervention out of hand. Claiming that the 'overstretched' concept of reproduction 'drifts into irrelevance' through Federici's writing, Dauvé neglects the range and developments of Federici's oeuvre following *Caliban*, as well as the many internal disagreements within the variegated field of Marxist-feminism. The absurdity of his response becomes especially clear when he refers to Federici as 'part of the vast array of semi-critics who live off these shortcomings, particularly what is inevitably lacking in Marx' (Dauvé, 2016). Other examples abound, but some similarly obtuse remarks appear in a recent response to Maya Gonzalez and Jeanne Neton's 'The Logic of Gender', where it is claimed that the structural relation of reproductive activities to the market is ignored in *Capital* merely because 'after the first few paragraphs Marx ignores particular useful labor in its totality, since scope of his discussion is with value producing labor' (Anon, 2014). The rant descends into expletives and 'argument' too petty to engage here.
- 4 For a discussion of how debt – and microcredit in particular – are becoming a central means of reproduction both in the United States and in developing countries such as Bolivia and Bangladesh, see Federici (2014).
- 5 For a clarifying account of various approaches to analysing the relationship between capitalism and gender – including dual and triple systems theories, theories of an 'indifferent capitalism', and unifying theories – see Arruzza (2014).
- 6 See, for example, Roswitha Scholz's theory of value-dissociation, but more pertinently, the argument I turn to at the end of this chapter, which holds that reproductive activities 'cut off or dissociated from the sphere of value-production' are compelled by different – that is, gendered – forms of domination to those of value-producing activities (Scholz, 2014; Gonzalez and Neton, 2014).
- 7 See, for example, Michaels' (2006) highly contentious study, *The Trouble with Diversity*.
- 8 Notably, Sohn-Rethel also locates the objectivity of exchange-value in the sphere of circulation (Sohn-Rethel, 1978: 53).
- 9 This discussion is most often attributed to Eugen von Böhm-Bawerk.
- 10 While the relationship between time and gender appears in the work of Frigga Haug in terms of a 'logic of time-saving' specific to capitalist modernity, and can be understood via Scholz in relation to what Robert Kurz calls 'a logic of time-expenditure', none of these theorists have explored explicitly the relationship between value, time, and the production of gender under capital (see Scholz, 2014: 123–42; and Haug, 1996).
- 11 Thanks to Joshua Clover for providing me with this last succinct clause.
- 12 Elsewhere I have noted how, while Gonzalez and Neton's rendering of the abject shares key characteristics with Julia Kristeva's definition – they describe the abject as 'that which is cast off, thrown away, but *from something that it is part of*' (2014: 174) – Kristeva's exploration of this category points towards another dimension in which abject social reproduction is performed, often under duress (De'Ath, 2016).
- 13 I have taken the term 'counter-reproductive' from Marina Vishmidt's essay, 'Counter (Re-)Productive Labour', in which Vishmidt suggests that we might think about reproduction (and here 'outlawed' and 'abject' activities seem particularly important) in terms of the negativity of the value-form as Chris Arthur has outlined it (Vishmidt, 2012).

# Rackets

Gerhard Scheit  
Translated by Lars Fischer

The term racket first turned up in the context of Critical Theory toward the end of the 1930s and instantly attained considerable conceptual significance. In his notes and drafts for *Dialectic of Enlightenment*, Horkheimer identified the racket as the ‘elementary form of domination’.<sup>1</sup> The term originated in the language of American legal scholars and criminologists. As Otto Kirchheimer noted, it commonly referred to ‘monopolistic practices which are carried through by physical force, violence in trade disputes, or similar objectionable means’.<sup>2</sup> More recently, it was principally Wolfgang Pohrt who drew attention to the relevant texts and the significance of the concept for Critical Theory. He also pointed to the term’s variegated connotations that evidently prompted its use to designate specific political and societal tendencies and the implosion of society as a whole. ‘Rackets’, Pohrt explained, ‘are not just bands of blackmailers but also self-help groups and charitable associations’.<sup>3</sup>

## THE RACKET AND THE PHILOSOPHY OF RIGHT

Rather remarkably, Horkheimer’s notes published posthumously under the title ‘Rackets and the Spirit’ indicate that he initially understood the term not so much in sociological but predominantly in philosophical and psychological terms. One might infer from this that the very historical and sociological specificity inherent in the term, given its connection to contemporaneous phenomena in US-American society, was lost in this process of appreciation. Nor did the critique of political economy take center stage. Phenomena such as the commodity form and social relations in capitalism, the exchange value and the process of valorization feature merely as one means among others with which rackets exercise their domination. Rackets, Horkheimer noted, had

ruled as the rackets of clerics, of the royal court, of the propertied, of the race, of men, of adults, of

families, of the police, of crime, and, moreover, within each of these sectors as individual rackets against the rest of the respective sphere. Everywhere they have established the opposition between the inward and the outward. Man, if he belonged to no racket, was in a radical sense on the outside, was lost as man. Yet even in the head of the atomized individual the rackets still ruled by means of their concepts and modes of judgment, through the thought patterns and concerns that originated in their world.<sup>4</sup>

Yet on closer inspection it transpires that the domination of the rackets actually hinges on the safeguarding of the existing division of labor, bringing the mode of production and the issue of sovereignty into focus after all. Rackets, Horkheimer explained,

preserve the conditions required to guarantee the division of labor within which they hold a privileged position by resisting with force any change that might endanger their monopoly. ... The constellation of rackets based on a specific mode of production can be called the ruling class insofar as they jointly both protect and suppress the lowest strata of society. Depending on the economic dynamics that shape their material interest, the rackets can in fact be at odds with one another and may well, consciously or unconsciously, perpetuate their separation from one another, always provided that in doing so they can strengthen their safeguarding function.<sup>5</sup>

At this point a closer determination of the mode of production itself does not seem crucial for the development of the concept. Rather more important is its ability to help explain the relationship between the individual and the collective. 'The sclerosis of the racket towards those beneath it is identical with the sclerosis of the individuals it comprises. It has been consciously promoted throughout history. In the case of one's own children it is brought about by bringing them up and educating them.' It was 'only in those emphatically liberal periods, in which, for economic reasons, part of the racket was required to own authoritative characteristics', Horkheimer clarified, that the bringing up and education of children had

taken on humane qualities. In its cruelty previous practice still resembled the initiation rites of a

primitive tribe – itself a racket. For those who are not already entitled by descent to become part of the racket the requisite process resembles not the admission of youngsters into the tribe but the initiation into the privileged racket of the magicians. The individual's personality has to be crushed absolutely and iron-clad guarantees for its future dependability are required. The individual must relinquish all power and burn all its bridges.<sup>6</sup>

That Horkheimer assumed the rackets had been capable of change only in the era of liberalism already indicates that he views them as a dialectical counterpoint to the law. And yet, rather confusingly, Horkheimer also defines them as a form of social contract. 'As the true Leviathan', he wrote, 'the racket demands the unreserved social contract'.<sup>7</sup> If we follow Hobbes the crucial term in this formulation has to be 'unreserved'. While the individual benefits from the reserve powers of the sovereign who monopolizes the use of force, the racket is able to insist on an unreserved social contract even when the monopoly on the use of force is in the process of disintegrating or simply inexistent. From Hobbes's point of view, then, with whom this metaphor for the state originated, what Horkheimer described was in fact anything but the true *Leviathan* and had rather more to do with that other biblical monster, the *Behemoth*, which for Hobbes stood for unfettered civil war.

In the context of Critical Theory, then, the term racket was adopted to designate what Carl Schmitt (affirmatively) called 'non-derivative' power, a form of power, in other words, that exists 'extra-legally' even in states that maintain the rule of law, and that ordinarily seems to merit little attention.<sup>8</sup> Yet the appropriation of the term in Critical Theory departed decisively from Schmitt's approach in that it takes the vantage point of the individual. For the Critical Theorists, the principal focus was on the continued or reconstructed personal dependency of the individual under conditions that had, in principle, abolished that dependency: the rule of law and the social relations of capitalism. Their adoption of the concept of the racket

reiterated Marx's well-established insistence, against the bourgeois economists, that, 'under their "rule of law", the law of the jungle lives on under a different guise'.<sup>9</sup>

The juxtaposition of rackets to the law also opens up a new perspective on the law. Their ultimate purpose is the forcible implementation of unity at the expense of the law. It is no coincidence that in the legal sphere the term racket refers to illegal economic practices and criminal methods that frequently run alongside contractual agreements or replace them and that must be combatted to maintain the rule of law. When the concept of the racket is applied to the issue of state sovereignty, the very principle of legality is called into question. Societies 'that organize themselves along totalitarian lines', Horkheimer explained, are embroiled in 'a struggle against the law, against all forms of mediation that have taken on a life of their own and linguistic form. The fundamentally illicit nature of the racket lies in its opposition to the Spirit, even where it is not only legal but in fact behind the law'.<sup>10</sup> It is worth noting, though, that this defense of the forms of mediation created by the law by no means implied a belief in the reconciliation of the general and the particular or the existence of a 'true generality', neither of which – as even Franz Neumann emphasized – the law can achieve.<sup>11</sup> It amounted to no more than a defense of conditions that might allow this reconciliation and generality to become real at some point in the future. Yet this hope could be entertained only if one assumed that the law had become integral to the Spirit. That Horkheimer did so is evident from his contention that even in a democracy ruled by rackets the 'true concept' of democracy – invented to abolish this very form of rule – would never really disappear. The goal of politics, Horkheimer wrote, namely,

to disrupt the boundary between the inward and the outward, once achieved, will transform the world. The idea of true democracy leads a repressed subterranean existence among the masses and within it, the premonition of a society free of rackets has never been extinguished altogether.<sup>12</sup>

As indicated, this sketch of the concept of the racket is particularly remarkable in that Horkheimer did not deduce the defensive forces of the law with the means of the critique of political economy, even though this would have been a particularly obvious path to take, given the origin of the term racket. Instead, Horkheimer took recourse to the philosophical concepts of German – and especially Hegelian – idealism, which he sought to translate directly into political categories.<sup>13</sup> In so doing, he also exposed the contradictory nature of idealism's conception of the state, which all the talk of Hegel as the Prussian state philosopher had obscured. Horkheimer's notion of a 'true idea of democracy' that continued to exist even in the worst real-existing democracy corresponded to Hegel's designation of the true state. Thus Horkheimer is still (or again) able to develop a positive concept of politics but this concept, like Hegel's concept of the state, is dependent on consciousness, on the Spirit, and precludes any notion of the state as a mere machine.<sup>14</sup>

One might respond to this Hegel-inspired determination of the 'Spirit' from the vantage point of the critique of political economy by pointing out that under the rule of law, the law presupposes a specific self-reflexive relationship of consciousness to itself. Consequently, it also maintains a non-theological truth claim. By contrast, the self-valorizing value of capital, as it were, blocks out such reflection, or rather, it permits self-reflection only through the legal relationship. The law thus emerges as a prerequisite for the conception of a categorical imperative (in lieu of God's command) and the distinction between the state's laws and what Kant called the 'moral law in me'.

## THE SOCIOLOGY OF THE RACKET

While the draft on 'Rackets and the Spirit' was essentially an exercise in philosophy, in his essay, 'On the Sociology of Class Relations', Horkheimer attempted to offer a

sociological and materialistic definition. Here he concluded that 'the modern concept serves to describe [the] past social relations' and closed by quoting Marx's statement that 'the anatomy of man is the key to the anatomy of the monkey'.<sup>15</sup> That Critical Theory approached the rackets as it would the human physiognomy from which one can reconstruct that of the monkey indicates that its central focus here was still on 'man', in other words, on contemporary society. It alone was really shaped by the rackets through and through. Only in the present had the totalization of the principle of the racket occurred. 'The racket-pattern which has been typical of the behavior of the rulers toward the ruled is now representative of all human relations even those within labor,' Horkheimer wrote.<sup>16</sup> Critical Theory thus began to break out of the identification with the working class and the labor movement that characterized traditional Marxism. The proletariat was now understood as an integral part of capitalist society. The working class and its organizations blended into a constellation in which everyone fought for 'as large a part as possible of the circulating surplus value':

In the contemporary slang-use of racket as an equivalent for any profitable job there might be no conscious thought of all these implications, but objectively it expresses the idea that in present-day society every activity, whatever it may be, has as its content and goal no other interest than the acquisition of as large a part as possible of the circulating surplus value.<sup>17</sup>

Against the backdrop of Horkheimer's comments about the family under liberalism<sup>18</sup> the solidarity that had once been characteristic of the working class arguably emerged as exceptional in that it had been able to lend humane features to the racket, throwing into sharp relief the distinction between solidarity and charity. The Critical Theorists presumably took recourse precisely to the term racket to designate forms of personal dependency and direct compulsion because the term's connotations included not only the gang but

also, rather oddly, the benevolent association. A gang qualified as a racket in the strict political sense only if its power depended not only on the threat of violence but also on the sort of voluntary recognition and collective identification within its realm or locale, just like the modern state must demand if it wants to survive. Alongside the use of force in ways totally unfettered by any legal constraints, this presupposed carefully fine-tuned forms of charity that often had to precede the deployment of terroristic means. Through its social and economic assistance the power of the racket lodges itself between civil society and the family. It does so whenever the state itself is unable to integrate divergent social forces. It is a self-destructive synthesis that conflates family and state and transforms all relationships mediated by society into direct relationships between individuals who, because they are unfree, cannot but threaten and suppress one another.

When the German sociologist Alfred Vierkandt sought to define solidarity, he already did so in accordance with the permeation of society by the precepts of the racket: 'Solidarity is the ethos of a closely knit community,' he wrote.<sup>19</sup> Yet in Roman Law solidarity did not denote a community, close-knit or otherwise, let alone an ethos – both concepts that in a sense already reflect the perspective of the racket – but a specific legal relationship stipulating that each individual is liable for the whole, *in solidum*: for the entire amount. When the labor movement picked up the concept it maintained something of the consciousness that the common bond of solidarity is a mediated one. Rather than striving to create a community and demand a particular ethos, the priority lay on quite practical measures of mutual protection in the face of the menaces manifestly created by the capitalist relations of production. Whether one knows somebody or not is irrelevant to a form of solidarity predicated on the knowledge that one owes solidarity to others because their contract of employment places them in a position formally identical to one's own. Yet among the

many forms of private charity the racket is evidently the only one capable of filling the space of solidarity in its entirety because it substitutes an ethos or faith for the awareness of the infinitely mediated character of society. The class conflict over the surplus value is reduced to immediate empathy and particulate aid. It is when the mass individuals identify with one another by substituting the figure of a leader for their ego ideal – a process Freud described in *Mass Psychology and the Analysis of the Ego* – that the unity is created that supersedes class consciousness.

In the past, charitable donors had expected their reward to come from God. The bourgeois benefactors who no longer believed in him or in divine rewards, however, were left with only the social prestige one acquires through one's actions. Yet the collective benefactor who relies on religious and national identity demands gratitude of its charges, demonstrated at the very least by the adoption of a specific ethos. In this context too, the effects of secularization can only ever be grasped in terms of the situation of the individual. Whether charities affirm the bourgeois society within which they operate in the way in which they mete out their benevolence or not is a crucial distinguishing feature. In other words, are the relations among the members, between the officials and the members, and between the benefactors and the beneficiaries organized in accordance with the principles of capitalist exchange, and is the relative autonomy and protective anonymity of the individual still maintained even when it is a pauper, or not? What constitutes good bourgeois charity is the willingness still to view the individual as a potential owner of goods even when it no longer possesses any, a willingness well matched to the embourgeoisement of the large denominations who were forced to open up, however reluctantly, to the dynamics of modern society.

Yet organized charity can also generate, at its core, the total rejection of civil forms of interaction. It can offer the individual precisely that from which it was emancipated by

those forms belonging to bourgeois society. In so doing it not only perpetuates pre-modern relations – direct compulsion and personal dependency – but modernizes them in order to arm itself against society's promise of emancipation. What it offers to the forlorn and atomized is the warmth of the 'original closeness of blood [*Blutsurenge*]'.<sup>20</sup> The ambivalence of secularization under capitalist conditions thus becomes evident. For the concept of the private concern can belie the fact that this concern, be it pastoral or charitable, can be understood by the rackets – who owe their very existence to the destruction of the individual's privacy – as being inherently theirs. Individual privacy, which needs to be defended even against the privacy of the family, indeed, precisely against the latter, is part and parcel of the 'dignity' of the individual in its capacity as what Marx called the 'owner of commodities'. Under the political pressure of the rackets the individual is still a 'commodity owner' yet loses even this last dignity, which belongs to it in that role. Thus the private is declared to be the immediately political and the rackets triumph over the law and prevail because they are able to offer an effective and popular ideological substitute for the promise the welfare state fails to keep.

As opposed to the welfare state, which embodies the anonymity of capitalist valorization, these rackets take care of the individuals *personally*. Within them, the individual gives up (or is forced to give up) the anonymity it owns as a private individual in bourgeois society. The individual finds itself in a secondary family, in relations that are not constituted by exchange but by *gift*, a form of exchange, in other words, in which the objects and services are not detached from the individual – as goods and labor are contractually. Rather, they accrue and adhere to the individual again, like the earlier privileges and obligations under pre-capitalist conditions. The beneficiary of such charity feels used in the most personal way imaginable – with his or her soul, body and entire existence.

Although the racket may bestow aid in monetary form the way in which the individual then makes use of that aid is based not on abstract labor but on concrete corporeality, albeit a form of corporeality that has no purpose other than to disappear at the right moment when it is sacrificed for the community and the racket.

## RACKETS AND STATE CAPITALISM

The need for the concept of the racket arose when it became apparent that the social and political developments in Europe and the United States after the Great Depression – the process that Horkheimer described as the weakening of the defensive forces of the law – could not be explained by Pollock's theory of state capitalism alone. It also offered an opportunity to develop a substantive distinction between ongoing developments in the United States, on the one hand, and National Socialist Germany, on the other. Kirchheimer and Neumann in particular pursued this opportunity in their studies of National Socialism. Both of them were, of course, legal theorists and former students of Carl Schmitt.

As early as 1930, Walter Benjamin had already offered an analysis of the transition from the strong state to the state of gang rivalry taking place in the latter years of the Weimar Republic. He did so in a review of an essay collection edited by Ernst Jünger, *War and Warrior*. His review, quite appropriately, bore the title, 'Theories of German Fascism'. In the various contributions to the collection, among them Jünger's well known musings about 'total mobilization', Benjamin recognized 'an unrestrained application of the principles of *l'art pour l'art* to war'.<sup>21</sup> At the same time, the state seemed to have been reduced to a negligible entity. That Jünger was aestheticizing a war that had, after all, transpired between states seemed insignificant, given the 'mysticism of world death'

that pervaded his vision.<sup>22</sup> As Benjamin demonstrated, the forces for which Jünger stood in fact perpetuated the very 'failure of the powers of state' they bemoaned, indeed that very failure was their concept of the political and they embodied it. Benjamin thus anticipated some of the features that would subsequently characterize Kirchheimer's and Neumann's analyses of National Socialism and provided a first template for Horkheimer's concept of the racket:

Those hybrid military formations hovering between comradesly fellowships and regular representatives of state power at the end of the war soon crystallized into independent, stateless hordes of mercenaries. The captains of finance and lords of the inflation began to question the efficacy of the state as the guarantor of their property and appreciated the availability of such hordes. Easily procured through private agents or the *Reichswehr* they could be relied upon to come rolling along like rice or turnips whenever they were needed. Even the publication under review resembles an ideologically worded recruitment prospectus for a new type of mercenary or, perhaps more accurately, a new type of condottiere.<sup>23</sup>

Like Horkheimer and Neumann in their subsequent accounts, Benjamin too chose a broad historical perspective. While Horkheimer took recourse to the term racket and Neumann appropriated Hobbes for the title of his *Behemoth*, Benjamin, in his portrayal of developments in the Weimar Republic, referenced mercenaries and condottieri.<sup>24</sup> Benjamin's discussion of Ernst Jünger's 'total mobilization' was no less overtly polemical than the racket concept would subsequently be. As Kirchheimer stated explicitly:

The term *racket* is a polemical one. It reflects on a society in which social position has increasingly come to depend on a relation of participation, on the primordial effect of whether an individual succeeded or failed to 'arrive'. *Racket* connotes a society in which individuals have lost the belief that compensation for their individual efforts will result from the mere functioning of impersonal market agencies. But it keeps in equal distance from, and does not incorporate, the idea of a society wherein the antagonism between men and

inanimate elements of production has been dissolved in the image of a free association for the common use of productive forces.<sup>25</sup>

Plucked from the 'polemics' of US-American legal practice, in the context of Critical Theory the racket became an *index falsi*, an 'index of the untruth of identity',<sup>26</sup> whose meaning becomes fully evident only when one takes Freud's psychoanalysis and the Marxian critique of political economy into account. Only on the basis of the most emphatic recognition of this untruth of identity in its specific historical guise can one maintain the general idea of a whole within which the individual is not subjected to violence. The issue is raised by Adorno in the notes he took on Beethoven in 1940. There he formulated it as the question that faces all music: 'How can there be a whole without subjecting the individual to violence?'<sup>27</sup> The Marxian notion of a free association of individuals was thus renewed in Critical Theory.

On Horkheimer's reading, the fascist dictatorship amounted to an attempt to enlist the critique of the racket for the latter's own purposes. It sought to compel a society disintegrating into rackets – be they labor organizations or monopolistic capital groups – to unite as a *Volksgemeinschaft*, an ethnically homogeneous community.

It embodied a massive exhortation [that] commanders even the true critique of the racket for the latter's purposes [and that, under the pretext of an ostensible attack upon the weakened rackets in the sphere of finance capital has now embarked upon an extension of the fascist dictatorship of the industrial monopolies – presented as democracy – across the planet].<sup>28</sup>

In Horkheimer's typescript, Friedrich Pollock subsequently deleted the passage I have placed in square brackets. Evidently there was some doubt as to how fascist rackets could be distinguished from other rackets. Has the specific mode of motion within the rackets been transformed in the fascist rackets, i.e., in Hegelian words: has it been negatively sublated? Is this why the latter are compelled to

take the 'struggle against the law, against all forms of mediation that have taken on a life of their own' to its ultimate conclusion? Yet what exactly this would mean also remains unclear. A Racket generally 'shows no mercy to life outside of it, it knows only the law of self-preservation,' Horkheimer argued.<sup>29</sup> Yet while the new Empire of the Rackets indeed showed no mercy to life outside of it, it did not ultimately hinge on the law of self-preservation either. It was the fascist dictatorship that fulfilled the promise of the racket in its entirety for the first time: identity without non-identity, annihilation for the sake of annihilation. 'Left with no way out, the question of whether it is directed against others or against the subject itself – a distinction it never considered absolute in the first place,' Adorno explained, 'becomes a matter of total indifference to the compulsion to annihilate.'<sup>30</sup>

## THE ANALYSIS OF NATIONAL SOCIALISM

Even in 1939, Horkheimer still assumed that 'Germany could disintegrate overnight into chaos and infighting among gangsters'.<sup>31</sup> The 'massive exhortation' of the *Volksgemeinschaft*, in other words, was failing. Yet subsequently, the Critical Theorists began to realize that the *Volksgemeinschaft* invariably amounted to more than just that exhortation and did not necessarily rule out chaos and the infighting of gangsters within it. In this vein, Adorno commented on Pollock's essay on 'State Capitalism' in a letter to Horkheimer of 1941 as follows:

In terms of the content, the crucial problem is: does the tendency towards a crisis-free command economy presented in the text really express the objective tendency of reality or does the current antagonistic state of affairs continue to preclude the notional purity of this construct in future too? I feel in no position genuinely to answer this question. My instinct is as follows: the truth of the concept lies in its pessimism, i.e., the view that the chances of domination in its immediately political

guise being perpetuated are greater than those of getting out. Wrong is the optimism, even for others. What is being perpetuated is not so much a stable and in some way rational state of affairs but rather, for the foreseeable future, a relentless succession of catastrophes, chaos and terror but with that, conversely, also a renewed chance of escape.<sup>32</sup>

However integral the role of rackets might be in the implementation of laws, under the rule of law their room for maneuver would ordinarily be severely curtailed. Like other forms of mediation, Horkheimer stressed, the law asserted its own essence and defensive force against the rackets. Since they were predicated on the need time and again to transcend the specific individual and its immediate integration into the racket, thus facilitating detachment, the means of domination were set up within these forms of mediation against domination as 'the reflection that unmasks it'.

Yet the permanent state of emergency allowed the rackets to come directly to the fore: among the rank and file of the mob, in the mass organizations and, equally, among the higher echelons and the ruling elites. All legality was so comprehensively appropriated by them as a technical resource for their rivalry that they merged, creating the precise opposite of market-based competition. Once human beings treated one another as ethnic comrades [*Volksgenossen*], it became impossible to transcend the specific individual and its immediate integration into the racket. 'With the accession to power of National Socialism', Kirchheimer explained,

the common legal bond of a generally applicable civil law disappeared more and more, and at the same time the professional organizations lost their voluntary character. The labor organization, economic groups, the handicraft and peasant organizations became compulsory organizations. By the same token the National Socialist system dispensed with an outside body to whose authority a group member could appeal when faced with an inequitable group decision.<sup>33</sup>

The 'ideology of the community', in other words, 'deprived the weaker group member

of the right to appeal to an outside body which would be prepared to maintain the intra-group balance'.<sup>34</sup> All the rackets,

the industrialists and landowners, party and army, as well as the corresponding bureaucracies, jealously see to it that nobody trespasses into the provinces carved out for each by common agreement; the tendency is, therefore, towards departmentalization, towards disappearance of a unified system of law behind innumerable steadily increasing special competences.<sup>35</sup>

The most successful racket in any given instance was the one that most consistently eliminated any remaining forms of mediation. Critical reflection became impossible since domination and the means of domination could no longer be juxtaposed. The means of domination were deployed exclusively to serve the domination of the racket in question, which drew its authority from the leader and the ethnic community.

Unlike Kirchheimer, Neumann did not resort directly to the concept of the racket in his analysis of National Socialism. Perhaps the term struck him as being too closely tied to legal terminology. Yet when he referred to 'gangs' and 'authoritarian corporations' in his discussion of power groups, the implications of the concept are nevertheless palpable.

Neumann denied the 'primacy of politics' stipulated by the concept of 'state capitalism'. He wanted to demonstrate that even in the current crisis in Germany the state was in no position to substitute planning for domestic class rule and the market mechanism. Yet in the event his analysis took him somewhere rather different than he had anticipated. Not only had the 'primacy of politics' not been enforced, Neumann argued, it would be impossible to enforce within the confines of the nation state. This he sought to demonstrate with empirical analyses of the German economy. He fundamentally questioned the stability of the National Socialist system and was convinced that the existing economic contradictions had to have some impact at a 'higher' level, even if that impact was concealed by the bureaucratic apparatus and the propaganda of the

*Volksgemeinschaft*. It was these economic contradictions that made war and ruthless expansion inevitable at the 'higher level'.

Neumann went beyond a traditional Marxist account and, in spite of himself, acknowledged an element of truth in the concept of state capitalism, namely, its focus on the form of crisis management that consisted in the elimination of the sphere of circulation as a form of social mediation. He appropriated this notion and in so doing radicalized some of the assumptions underlying the racket theory. Ultimately, he argued, it was questionable whether a formally and functionally united sovereign political authority actually still existed in Germany. National Socialism depended not simply on the abolition of the rule of law but on the disintegration of the latter's prerequisite, universal sovereign power. Neumann argued that the state was moving toward 'utter shapelessness'. Consequently, it could no longer be designated a state proper and should really be described as a 'gang, where the leaders are perpetually compelled to agree after disagreements'.<sup>36</sup> National Socialism actually no longer had a united apparatus of coercion at its disposal and was disintegrating into a number of political power centers. It was in this sense that Ernst Fraenkel had referred to the National Socialist state as a 'dual state'.<sup>37</sup> These power centers struck out all the more brutally since relations between them were not institutionalized and merely transpired on the personal level. The personal agreement reached in ad hoc negotiations no longer constituted unity in the sense of a state, be it a democracy or a dictatorship. National Socialism, on Neumann's reading, was a non-state characterized by anarchy and chaos.

Neumann's conclusion, then, was that National Socialism, in contrast, for example, to Italian fascism, constituted a non-state, effectively a totalitarian form of anarchy.

There is no need for a state standing above all groups; the state may even be a hindrance to the compromises and to domination over the ruled classes. ... But if the National Socialist structure is

not a state, what is it? I venture to suggest that we are confronted with a form of society in which the ruling groups control the rest of the population directly, without the mediation of that rational though coercive apparatus hitherto known as the state. This new social form is not yet fully realized, but the trend exists which defines the very essence of the regime.<sup>38</sup>

Yet Neumann did not pursue any further the issue of the unity of this process, in other words, the question of what would replace the sovereign and what distinguished anarchy and chaos in the non-state from anarchy and chaos per se. He refrained from discussing the primacy of annihilation: annihilation, that is, for annihilation's sake. Indeed, in order to evade this primacy and maintain certain anachronistic notions of monopoly capitalism and the class struggle, Neumann fell short of the potential of Critical Theory in his assessment of antisemitism within the German *Volksgemeinschaft*, which he considered no more than a matter of propagandistic phraseology.<sup>39</sup> This blind spot was much more persistent in his case than it was with Adorno and Horkheimer who, in *Dialectic of Enlightenment*, achieved the decisive breakthrough in conceptualizing antisemitism in the development and crisis of capitalized society and placed its critique center-stage.

The fact that the first and most important study of the annihilation of European Jewry was written by one of Neumann's students gives an indication of how far Neumann had nevertheless progressed with his analysis. As Raul Hilberg acknowledged, he appropriated Neumann's concept of National Socialism as a 'non-state', in which the 'ruling elites' did not operate 'on the sort of unified rational basis we associate with a legislature or constitution'.<sup>40</sup> Yet Hilberg also pointed to a bias on Neumann's part that sprung from his Marxism. He had been quite right to analyze the aryaniization and liquidation of Jewish property as a means of promoting the tendencies toward greater concentration in the German industrial economy, yet he had then been unable 'to face

up fully to the fact that the Jewish people as such was being annihilated'.<sup>41</sup> Hilberg went beyond this limitation and his perspective was inevitably inverted in the process. His analysis was predicated on the assumption that all relevant developments had to be examined from the vantage point of the 'German destruction effort'.<sup>42</sup> It was this effort that necessitated the division of society into increasingly independent groups. As the process of annihilation gathered pace and became increasingly complex its implementation became dependent on an ever-increasing number of agencies, party offices, commercial enterprises and military entities. The annihilation of the Jews, Hilberg argued, 'was a total process'. The machinery it required 'was structurally no different from organized German society as a whole ... The machinery of destruction was the organized community in one of its special roles'.<sup>43</sup> It is one of the most peculiar paradoxes in the development and reception of Critical Theory that Hilberg evidently was only able to attain this insight by also appropriating from Neumann the inability to place antisemitism center-stage as the determinant delusion in this total process, as the actual reason why the process and the organized community became indistinguishable.

Against this backdrop the notion of the disintegration of the monopoly on the use of force that Neumann ascribed to National Socialism and his concept of the 'non-state', in turn, require some modification. An organization like the SS, for instance, gained a kind of monopolistic status, precisely because it served the protection of the Führer, who embodied it, on the one hand, while ultimately being in command of virtually all the workings of the machinery of annihilation, on the other.

### ***The Concept of the Racket and Jihadism: On the Topicality of Critical Theory***

Contemporary historians of the National Socialist state have appropriated some of

Neumann's and Hilberg's insights. Yet the issue of the gangs and rackets that invariably spring from the dynamics of this new *Behemoth* has been broken down into the positivist controversy between 'intentionalists' and 'functionalists'. This is possible only because the question of the unity of the process and of the state, and thus, by implication, of the relationship between state and capital, is no longer raised on either side of the debate. Against this tendency one should take recourse to those studies that were predicated on a notion of the whole as the untrue Adorno expressly acknowledged this in the short critical appreciation of Neumann he wrote some years after his untimely death for a planned collection of Neumann's texts. Neumann's concept of the *Behemoth*, Adorno wrote, stood 'in marked contrast to superficial notions of a monolithic fascism'. Neumann had demonstrated that

the National Socialist state, for all its conceit of total unity, was in truth pluralistic. Political decision making occurred through the haphazard rivalry of powerful social cliques ... [S]ociety disintegrates into a diffuse barbaric plurality, into the opposite of the reconciled plurality that alone would be a state of affairs fit for human beings.<sup>44</sup>

Horkheimer in particular continued to think of this reconciled plurality in terms of a society liberated from the rackets.<sup>45</sup> Yet the concept recedes in the writings of Adorno, Horkheimer, and Kirchheimer after the demise of National Socialism. Having still played a certain role in *The Authoritarian Personality* and *The Psychological Technique of Martin Luther Thomas' Radio Addresses*, it subsequently featured only infrequently. How the rackets might be connected to the culture industry and the administered world was not discussed. Adorno, Horkheimer, Marcuse, and Kirchheimer undertook no further attempts to utilize and elaborate on the racket concept in the post-war context.

The concept only regained its poignancy in the reception of Critical Theory after the end of the Cold War, and initially just

in a German-speaking context and outside, or at best on the margins, of academic discourse. It has been advanced, as we saw, by Wolfgang Pohrt and by a number of authors who, like myself,<sup>46</sup> publish with the *Initiative Sozialistisches Forum* and the *ça ira* publishing house,<sup>47</sup> and in journals like *Prodomo* (Cologne) and *sans phrase* (Vienna). This return of the concept of the racket is owed not least to the appearance of djihadism and the way in which it relates to the monopoly on the use of force. In the context of Critical Theory this re-appropriation of the concept nevertheless amounts to the claim that it points to universal social trends the world over – in the ‘Orient’ as much as the West, in the countries of the former Soviet sphere of influence as much as the European Union and the United States – for all that these trends progress in different ways in the various countries depending on the persistence of the rule of law. The assertion of the racket against the rule of law can equally well take on a djihadist or right-wing populist guise, the attenuation of the defensive forces of the law can transpire through the partial implementation of Sharia law in the legal practice of Western states just as well as through the call of right-wing populists for referenda to replace the mediation of public opinion in representative democracy.<sup>48</sup>

Precisely what had been most abstract in the insights of Critical Theory in the 1930s and 1940s turns out to be extremely efficacious in the concrete analysis of contemporary developments. This concerns, on the one hand, the notion that in a situation of crisis society disintegrates into gangs and thus eliminates the spheres of circulation and due process, turning the rackets into the principal articulation of the political. On the other hand, it emerges that any sense or form of unity within and in the face of this process of social disintegration can be attained only by fantasizing about a Jewish world conspiracy, in which mediation and circulation return in phantasmagorical form.

Inevitably, everything looks different in the current Middle East, the wellspring of djihadism. This concerns not only the opportunities for the rackets to profit from the dissolution of the mechanisms of circulation and their relations with, and position within, the world market. Given the current economic significance of oil and depending on their respective points of departure, these rackets take on a broad range of forms that would have been impossible against the backdrop of the highly developed and standardized industrial production in Germany in the 1930s. Perhaps the greatest change concerns the ideological guise of the evoked world conspiracy. Since unity is established through an annihilatory mania directed above all against one state – the Jewish state, which is imagined as the Jew among the states – the total process of which Hilberg spoke – in which the machinery of extermination became indistinguishable from German society as a whole – also takes on a different form. The ‘machinery’ within which a variety of djihadists on Israel’s borders – the Muslim Brotherhood in Egypt, Al Qaeda, and Islamic State in Syria and Iraq – ‘collaborate’ with the Iranian dual state (a form of collaboration that exists only insofar as it is predicated on their joint negative fixation with Israel and Zionism) is virtually indistinguishable from an entity that is *religious* rather than social in character. Needless to say, this too is ultimately a social issue, however, insofar as religion can only ever be understood as a social phenomenon. Even so, its specificity lies in the fact that, in this context, individuals, whether as clerics or as believers, refuse a priori and on principle to accept the separation of politics and religion and the distinction between public and private that are stipulated by the sphere of circulation and the rule of law.

On the other hand, the specific strand within Islam within which political functions are taken on directly by the clerics who become religious leaders and lay claim to absolute authority, marks a particular stage in the process through which the principle of

the racket becomes total. Within its sphere, this form of Islam is capable of bringing the rivalry between the rackets, which elsewhere assault each other in bloody gang warfare, under control and manages to lend the religious community a sufficient measure of stability and continuity. Consequently, politics in the Shiite realm still build to some extent on the old nation state and yet have long since transcended it as a non-state with the Islamic Republic of Iran as an organized center for the onslaught on Israel.<sup>49</sup> Israel has acquired its status as bogeyman quite independently of its state constitution which does in fact reflect a particular form, shaped by the diaspora experience and religious tradition, of that which characterizes every western state: a merging of universal legal structures and particularist racket structures, whose interrelationship is never entirely fixed but constantly up for grabs in accordance with the political development in any given country.

Characteristic of those countries in which djihadism is dominant is the fact that the defensive forces of the law have no opportunity of developing in the first place or are promptly eliminated again by the racket structures. In the same way as the Revolutionary Guards and the 'regular' army coexist in the Islamic Republic of Iran, for instance, because it is impossible to create a unitary structure by subjecting one of these armed rackets to the other, the Islamic Republic also lacks a universal legal system. Instead, the legal system is fragmented. The Supreme Court and the civil and criminal courts are undermined from the outset by 'special courts'. Independently of one another the 'revolutionary courts' function alongside the military courts, the judiciary of the Revolutionary Guards and the Basij,<sup>50</sup> not to mention the 'court of administrative justice', the 'special clerical court', the 'press courts' and so on.<sup>51</sup>

Yet in this case too, due to the existence of a 'religious leader' who is the sole source of ultimate authority, the rivalry between the rackets does not lead to armed

conflict between them, as it does, for instance, between Islamic State and Al Qaeda in the 'civil wars' in Syria and Iraq. This leader, in turn, is simply the embodiment of the fact that all the competing rackets can be integrated and brought to refrain from resolving their conflicts with violence. In connection with a similar context, Thorsten Fuchshuber has spoken of a 'de facto monopoly on the use of force'.<sup>52</sup> The flipside of this coin is the resolve to destroy Israel that has been constantly upheld since the inception of the Islamic Republic. It is precisely this resolve that lends the Revolutionary Guards a privileged position among the competing rackets. They are not only closest to the spiritual leader for whom they were created but also have a particularly significant role to play in connection with Iran's nuclear program and its weaponization.

## THE DEFENSIVE FORCES OF THE LAW AND THE LOGIC OF CAPITAL

When Horkheimer referred to the means of domination standing against domination as the reflection that unmasks it, his focus was never just on the specific law or the judiciary, even though the Hegelian language might suggest this, but also on the consciousness that creates or applies it. In this respect, then, there is a crucial distinction between the legal subject and the commodified subject. The former needs to know what it is doing. As for the latter, if we follow Marx: 'They do not know it but they are doing it.'<sup>53</sup> One might indeed say that the commodified subject, in contrast to the legal subject, is not in fact a subject at all. Steeped in the tradition of classical philosophy, Marx never once used this term, which has been so popular in the recent reception of Marx. He spoke of the 'commodity owner' who has to exist simply because the commodities cannot walk to the market themselves. When Marx referred to the subject in his critique of political economy he did so in

terms of the intentionally oxymoronic 'automated subjects', a term that, in the shift from structuralism to post-structuralism, has come to be understood as a pleonasm. Strictly speaking, then, one cannot really speak of a crisis in the context of institutionalized law but only of a state of exception. Yet the constant possibility of such a state of exception allows the crisis to draw into question, as a matter of principle, the rationality that allows the legal subject to know what it is doing.

As we saw, in his draft of 1939/40, Horkheimer still located the 'Spirit' in whom the law had become a substantive factor in the consciousness of the masses, where 'the idea of true democracy' supposedly led 'a repressed subterranean existence'.<sup>54</sup> It is presumably owed to the fragmentary character of the text that he did not explicate that 'the masses' can only be conceived of as masses of individuals who could interact in the spirit of solidarity and need not identify with each other in the name of a leader and benefactor. What Horkheimer described as 'Spirit' cannot be understood separately from the consciousness of each individual. When it eventually became clear that the idea of democracy no longer led even 'a repressed subterranean existence' in Germany he was compelled to view the post-National Socialist state as a mere mechanism after all. The consciousness without which the Spirit cannot work for the idea of true democracy he then saw, quite legitimately, embodied only in the US-American occupation power.

This transference of the Spirit to the American hegemon reflects the eminently historical dimension of the defensive forces of the law, an issue that Horkheimer did not raise in his draft. It is precisely this historical dimension that first points unambiguously to the critique of political economy. Anyone who wants to assert themselves under the rule of law can do so only if they subsume their demands and claims under certain legal principles or laws. Anyone who wants to partake of society's wealth – which everybody is forced to do simply for the purposes of self-preservation – will

do so only via participation, however circuitous and mediated, in capital's valorization process. Analogously to Hobbes's *Leviathan*, one could speak of an imaginary 'original contract' in the realm of political economy. In it, all those who want to partake of society's wealth, even if it is just in order to survive, accept its form, albeit without knowing any more about it than their legal consciousness imparts to them. They do not need to know that this form is predicated on the distinction between exchange value and use value; on the fact that the concrete labor is valid only as abstract labor. They do not need to know, in other words, that society is held together by the measure of the socially necessary labor time required to produce any given commodity, which is ultimately the measure of all modern forms of mediation. The one thing they do need to know about this fictitious 'original contract' is that wealth can, in principle, be appropriated only through contracts. This means, conversely, that the defensive forces of the law depend on adherence to this principle.

Yet what if wealth can no longer be appropriated through contracts? As Marx explained, capital is an 'automatic subject' – and yet, at the same time it is not. It is an automatic subject in the absence of crisis, yet, as Marx also pointed out, it concurrently undermines its own prerequisites and thus provokes the 'non-automatic' subject. Why, if this generates a process of disintegration and one can no longer attain wealth through contractual relations, should one acknowledge the contractual principle? To do so would hardly be rational. The very means that are indispensable for self-preservation under capitalist conditions come to contradict the principle of self-preservation. These social relations 'constantly reproduce the potential unfolding of worse options insofar as they totalize scarcity through the mere consummation of just relations of exchange'.<sup>55</sup> Capital's own logic predisposes it toward reducing the variable component of capital 'toward zero' and thus 'permanently

demotes man as a species being to a pauper and bounty hunter'.<sup>56</sup> What this cannot explain, however, is why human beings are prepared not only to affirm this degradation but to outdo it with pathetic projections and delusions of annihilation and victimhood. This simply cannot be explained, not even with *Dialectic of Enlightenment*. Individuals can only combat these projections and delusions, whatever the prospect of success, and adhere, even 'in the state of their unfreedom', to the new categorical imperative formulated by Adorno in *Negative Dialectics*: 'to arrange their thinking and conduct so that Auschwitz never repeat itself and nothing similar may occur ever again'.<sup>57</sup>

Since Marx it has been considered the principal purpose of the critique of political economy to disavow the hope that the agents on the markets and in the state apparatuses have it in their gift to subjugate the valorization of value to reason and contain the irrational with the rationality of the law. With Auschwitz an additional task has arisen as a practical imperative: that of considering this principal purpose a means of rejecting any playing down of the impending menace – not least when such trivializations think they can invoke the law's force of resistance.

## Notes

- 1 Max Horkheimer, 'Die Rackets und der Geist', in *Gesammelte Schriften* vol. 12 (Fischer, 1985), 287–91, here 287.

Before legal experts appropriated it, the term was used among criminals and denoted noise or a hubbub or commotion. This usage 'probably comes from a device adopted by the old New York gangs. It was common practice for social and political clubs of the era to sponsor benefit galas on their own behalf. These were noisy affairs, what with the brass band and the general boisterousness stimulated by heavy drinking, so that they came to be known as rackets. Grasping the opportunity for easy and, to all outward appearance, licit profit, a gangster would organize a benevolent association of which he was the sole member, announce a racket, and with threats of demolishing their premises compel the neighborhood shopkeepers and businessmen to purchase blocks of tickets' (John Kobler, *Capone: The Life and World of Al Capone* (Putnam, 1971), 32).

- 11 'In a society that cannot, given the principle on which it is based, avoid force, true generality is an impossibility. But the limited, formal and negative generality of the law in the liberal order facilitates more than just capitalist predictability. Given that formal freedom cuts both ways, this limited generality also allows for a minimum of actual freedom and offers the weak at least a chance of attaining legal redress' (Franz Neumann, 'Der Funktionswandel des Gesetzes im Recht der bürgerlichen Gesellschaft', in *Zeitschrift für Sozialforschung* vol. 6 (1937), 542–96, here 594).
- 12 Horkheimer, 'Rackets', 291.
- 13 It would be too simple to criticize Horkheimer's apparent Hegelianism or portray his concept of the law as a precursor of Jürgen Habermas's approach. Horkheimer stuck to the Hegelian scheme only insofar as he also became a supporter of the United States' entry into the war. Engaging Hegel's notion of the sublation of the particular and individual as elements within the self-motion of the Absolute, Horkheimer's emphasis lay on the dimension of preservation within that process. He sought to defend the prerequisites of a form of social unity that would not violate the individual. He stressed the element of formal deferment inherent in that mode of Hegelian reflection upon society that can be understood, with Marx, as the self-mediation of value. In it, Horkheimer saw not so much an opportunity to realize this unity but a chance temporarily to restrain power. Given the integral significance of the war of annihilation against the Jews for National Socialism, it is in any case obvious that we are not dealing with any straightforward parallel here to Hegel's attitude toward Napoleon.
- 14 Consequently, the attempt to facilitate its affirmation by conceptualizing the state as a machine cannot genuinely draw on Hegel's *Philosophy of*

- Right* nor does it offer a critique (rather than a mere inversion) of the *Earliest Systematic Programme of German Idealism*, which denounced the state as a machine. Against the backdrop of the evolution of industrial production, it seems remarkable that the term was used to refer to something other than the actual machines integral to this mode of production. Yet it also regained the pejorative connotation it held in Greek antiquity, associating machines with machinations, i.e., forms of deceit that can become a matter of ideology. If one does not bear this in mind and understands the term machine literally, the designation of the state as a machine itself falls prey to such deceit. The more neutral Latin-based term apparatus is better suited since it does not connote any deceit.

  - 45 In the notes Friedrich Pollock took on his conversations with Horkheimer between 1957 and 1967, for instance, Horkheimer is recorded twice as commenting on the issue, suggesting that he still thought of the racket concept as a theoretical approach that had yet to be fully developed. See 'Theorie des Rackets' and 'Herrschende Klasse, die von Rackets beherrschte Klasse und die Rolle der Fachleute', in Max Horkheimer, *Gesammelte Schriften* vol. 14 (Fischer, 1988), 334–335 and 340. The concept also resurfaces in Adorno's later correspondence, for instance, in his letter to Siegfried Kracauer of 17 March 1965: 'I can rarely watch a film without sensing for a few seconds: this is what it should be, this is what would be possible – and then instantly becoming enraged at

- the way in which one is cheated by the rationale of the racket' (Theodor Adorno, and Siegfried Krauer, 'Der Riß der Welt geht auch durch mich'. *Briefwechsel 1923–1966* [Suhrkamp, 2008], 695).
- 46 Gerhard Scheit, *Suicide Attack. Zur Kritik der politischen Gewalt* (ça ira, 2004).

  - 56 Ibid. In this context it is worth noting that Robert Kurz's theory of capitalist society as an automatic subject falters because, not unlike that of Henryk Grossman, it is predicated on a logic of inevitable collapse. Marx, by contrast, in the third volume of *Capital* merely described the emergence, under the conditions of capitalist commodity production, of a tendency within the productive force of labor – the famous tendency of the rate of profit to fall – which from a certain point onward militates against it and constantly has to be overcome through crises. To designate this tendency a 'law' one would have to disregard the fact that this designation fails to encompass a genuine unity between the ostensible law and that which is subjected to it.
  - 57 Adorno, 'Negative Dialektik', 358.

# Subsumption and Crisis

Joshua Clover

Though it has various senses in general usage, *subsumption* is a term of art within Marx's critical political economy.<sup>1</sup> It is subdivided into *formal subsumption* and *real subsumption*. These designate changes to the production process during the transition to, and ongoing development of, capitalism. These changes in aggregate may be understood as the metamorphosis of human making into capitalist labor, in the sense of work conditioned and ceaselessly transformed by the compulsion to extract surplus value, capital's 'invisible essence'. As such they also produce and transform the capitalist class relation.

The consequences of this ongoing transformation are various and central to Marx's systematic and historical account. They include changes in the experience of work for the worker, in its organization by the capitalist, and in the quality and quantity of value production for capital. Subsumption is historical both in the sense that it names concrete historical activities and that it implies

an ongoing dynamic for capitalist history. This dynamic is most directly expressed in the development of ever-greater productivity and various accompanying transformations, imparting a directionality to the history of capital often associated more generally with modernization (indeed, we might suggest that subsumption is the concrete referent of modernization and its related discourses). Because of this historical dynamic, subsumption is intimately related to efforts at periodization that compass orienting strategies of accumulation, the changing relation between capital and labor, and the possibility of capitalist crisis. Because these are contested aspects of Marx's systemic account, subsumption is itself a contested cluster of concepts. This is exacerbated by its complex reception history and by the ways in which the term is subject to metaphorical appropriation. This entry will attempt to address all of these issues: providing an expanded definition, reviewing the publication and reception history, and assessing in particular the rise

of 'subsumption narratives' after the Second World War wherein periodization, relations of production, and crisis come to the fore.

## EXPANDED DEFINITION

*Formal subsumption* designates the internalization of work to capital, as in the circumstance when a shoemaker, instead of making shoes then to be worn by family and friends or exchanged for other useful goods, comes to work for a capitalist in return for a wage to produce a commodity for the capitalist that will be exchanged for more money, completing the general circuit of capital M-C-M'. Significantly, 'this change does not itself imply a fundamental modification in the real nature of the labor process ... *Technologically speaking*, the *labor process* goes on as before, with the proviso that it is now subordinated to capital'.<sup>2</sup>

*Real subsumption* necessarily arises 'on this foundation', following on from formal subsumption: 'a technologically and otherwise specific *mode of production* – *capitalist production* – which transforms the nature of the *labor process and its actual conditions*.'<sup>3</sup> Following on the changed relation between capital and labor, the technical means of production, the organization of the process, and the physicality of labor change as well. Artisanal and craft-based skills as well as simple repetitive physical labor are unevenly automated toward processes to which the laborer is increasingly an appendage. As living labor is replaced by machines (an increase in what Marx calls 'the organic composition of capital'), some fraction returns in supervisory capacity, to manage these complexifying processes toward increasing productivity through organizational gains. These transformations will later clarify into the paradigmatic cases of Fordism and Taylorism, the engines of productivity in the 'second industrial revolution'.

Having set forth these categories, Marx notes their correspondence to the forms of surplus value, *absolute* and *relative*: 'If the production of absolute surplus-value was the material expression of the formal subsumption of labor under capital, then the production of relative surplus-value may be viewed as its real subsumption.'<sup>4</sup> In the former case, absolute surplus value is gotten via direct exploitation of the laborer where there was none, increasing total hours worked for capital. In the latter, relative surplus value derives from increases in productivity that drive down the socially necessary labor time involved in the production of market goods, and with it the cost of the worker's subsistence relative to the value they produce, leaving more for the capitalist.

Marx identifies these developments as necessary expressions of the law of value. Real subsumption becomes the privileged object of study because, unlike formal subsumption, it provides not just a metamorphosis but ongoing dynamic and direction to capital's development, making it properly historical.

The *productivity of labour* in general = the *maximum of product* with the *minimum of labour*, hence the greatest possible cheapening of the commodities. This becomes a *law* in the capitalist mode of production, independently of the will of the individual capitalist. And this law is only realised because it implies another one, namely that the scale of production is not determined according to given needs but rather the reverse: the number of products is determined by the constantly increasing scale of production, which is prescribed by the mode of production itself. Its purpose is that the individual product, etc., should contain *as much unpaid labour* as possible, and this is only attained by engaging in *production for production's sake*. *On the one hand* this appears as a *law*, to the extent that the capitalist who produces on too small a scale would embody in his products more than the quantity of labour socially necessary. It therefore appears as the adequate implementation of the *law of value*, which first develops completely on the basis of the capitalist mode of production. *On the other hand*, however, it appears as the drive of the individual capitalist, who endeavours to reduce the *individual value* of his commodity *below* its socially determined value

in order to break through this law, or to *cheat* it to gain an advantage for himself.<sup>5</sup>

The final sentence has greater significance than may first appear. A single capital's productivity gains can increase its revenue against a competitor, even absent an increase in the revenue of capital *tout court* (that is, true capital accumulation). This contradiction between individual or even sectoral profits and the profitability of capital as a whole will return under the heading of crisis.

## RECEPTION HISTORY

The terms *formal* and *real subsumption* slumbered long in the arcana of Marx's critique of political economy. After featuring extensively in various drafts and preparatory work, their treatment was largely excised from the published version of the first volume of *Capital*, and later restored only as an appendix: the 'Results of the Immediate Process of Production' [henceforth, 'Results'].<sup>6</sup> Reprinted in German and other Western European languages in the 1960s, 'the missing sixth chapter', per an earlier scheme, would provide along with the publication of the *Grundrisse* a framework for analyzing not simply the restructuring of the workplace but of daily life that takes hold during the long postwar boom and intensifies thereafter.<sup>7</sup>

### **'The Missing Sixth Chapter' and Fragment on Machines**

The passages on subsumption were at one point planned as the sixth part of *Capital*, at a drafting stage when its parts were designated as chapters. Readers will note that the two modes of subsumption correspond to the two longest empirical chapters of *Capital*, chapter 10 on 'The Working Day' and chapter 15 on 'Machinery and Large-Scale

Industry'. These chapters follow one after the other not just in the theoretical unfolding of capital's full structure, but in historical sequence, the former launching from the birth of capitalism, the latter from its maturation with the industrial revolution. The capitalist's turn to real subsumption and the development of machine-based productivity is conditioned in part by the limits of the working day and the value of the wage as they develop out of class struggle in the earlier nineteenth century. This is the initial basis for periodizing claims oriented by subsumption.

However, in the volume's final draft, these two chapters appear in the sections on 'The Production of Absolute Surplus Value' and 'The Production of Relative Surplus Value'. That *Capital* preserves these as central categories (parts 3 and 4 of the standard English edition) while largely jettisoning discussion of the two modes of subsumption suggests a preference for logical against historical categories, at least in this case. It does seem that the *coexistence* of surplus value's two modes, their theoretical complementarity, is more vital than the historical *sequentiality* which orients the modes of subsumption; capital cannot, after all, survive on relative surplus value alone. And yet it is largely through its historical nature that subsumption will reemerge as a vital element of Marx's theory.

The rediscovery of the 'Results' in the late 1960s coincides with the publication of the *Grundrisse* in translation, first in French in 1967–8, and then in Italian in 1969. Unlike the 'Results', the *Grundrisse* handles subsumption as a developing and mutable category. The most relevant passage will be the so-called 'Fragment on Machines'. Only by considering both documents does the role of subsumption in Marx's overall description of capital become clear. This reception will help authorize a substantial reconfiguring of the Marxist tradition featuring a revision of what for many is the *sine qua non* of the entire theory: value as such, and its relation with human labor.

The 'Fragment' features the most concise summary of capital's internal limit: the 'moving contradiction' wherein capital's accumulation is premised entirely on the appropriation of surplus value from workers, while the inescapable competition for greater productivity per worker necessarily renders an ever-greater portion of labor superfluous over the long run; correspondingly, an increasing fraction of workers, the very source of accumulation, is expelled from the production process in favor of machines. We might describe this as Marx's objectivization of the Midas myth, wherein the grasp for wealth reaches out to embrace living laborers only to transform them into great metal bodies in a finally self-cancelling process. The source of absolute surplus value is finally annihilated by the pursuit of relative surplus value.

Capital itself is the moving contradiction, [in] that it presses to reduce labour time to a minimum, while it posits labour time, on the other side, as sole measure and source of wealth. Hence it diminishes labour time in the necessary form so as to increase it in the superfluous form; hence posits the superfluous in growing measure as a condition – question of life or death – for the necessary.<sup>8</sup>

This argument will be developed in far greater detail in *Capital*, culminating in reflections on 'relative surplus populations' and capitalist crisis. In the earlier iteration, however, the argument takes on, especially in the reading of the Italian Marxists involved with the many strands of what would be known as *operaismo* [workerism], a peculiar hopefulness.

The 'Fragment' offers the hope that the dynamic of the 'moving contradiction' will be catastrophic for not just for labor but for capital, providing 'the material conditions to blow this foundation sky-high'.<sup>9</sup> Using the language both of subsumption and surplus value, the text proposes it is ever more the case that 'it is the machine which possesses skill and strength in place of the worker, is itself the virtuoso, with a soul of its own in

the mechanical laws acting through it'. Labor increasingly appears as collective consciousness, 'subsumed under the total process of the machinery itself', while for the laborer it is 'the living (active) machinery, which confronts his individual, insignificant doings as a mighty organism'.<sup>10</sup>

### ***The General Intellect***

In this renewed reception of Marx's critical political economy as a theory of capitalism's overcoming, the ongoing process of subsumption eventually crosses a threshold where quantitative change becomes qualitative. The pivotal passage assays the sundering of the bond between labor and value, heretofore understood as an indexical relation which, mediated through general social productivity, is itself constitutive of capitalism.

In this transformation, it is neither the direct human labor he himself performs, nor the time during which he works, but rather the appropriation of his own general productive power, his understanding of nature and his mastery over it by virtue of his presence as a social body – it is, in a word, the development of the social individual which appears as the great foundation-stone of production and of wealth. The *theft of alien labor time, on which the present wealth is based*, appears a miserable foundation in face of this new one, created by large-scale industry itself. As soon as labor in the direct form has ceased to be the great well-spring of wealth, labor time ceases and must cease to be its measure, and hence exchange value [must cease to be the measure] of use value. The *surplus labor of the mass* has ceased to be the condition for the development of general wealth, just as the *non-labor of the few*, for the development of the general powers of the human head.<sup>11</sup>

Subsumption here escapes its moorings in the industrial factory, Blake's 'dark Satanic Mills'. No longer does it seem to designate technical transformations of the labor process, but the transformation of capital's totality. It is not just the worker's capacity for

physical labor that is subsumed but ‘the whole ensemble of sciences, languages, knowledges, activities, and skills that circulate through society’.<sup>12</sup>

## POSTWAR SUBSUMPTION NARRATIVES AND PERIODIZATION

The surmise that the domination of capital – particularly its compulsion to make productive – had overleapt the working day and the traditional workplace and was now coextensive with life as such, colonizing as well human subjectivity, would turn out to be a theoretical mainspring of postwar era in which Marx’s writings on subsumption were recovered. The rediscovery and translation happen within the transition in the overdeveloped world (roughly 1968–73) from the Long Boom to the prolonged period of volatility and crisis which would follow. Two entangled aspects of this postwar period bear special attention. One is the tendential completion of capital’s displacement of the last quasi-feudal agricultural zones.<sup>13</sup> The other is the dramatic decline in profitability, among leading capitalist countries, of those sectors generally understood to be the wellspring of accumulation. Both of these developments mandate for capital a growing emphasis on intensive rather than extensive development. These factors provided the conditions for the retroactive understanding of the ‘missing chapter six’ and *The Grundrisse* as foundational; this in turn informed the various accounts, subsumed under *subsumption*, meant to capture ‘how social relations as a whole become increasingly subordinated to capitalist regimes of production’.<sup>14</sup>

It is vital to note the insistence here on production, even as that category will be pressed to breaking in the various subsumption narratives to come. As the term ‘real subsumption’ has achieved a certain purchase

particularly within humanistic studies, it has paradoxically depended on the common meaning of ‘subsume’ (‘include or absorb [something] in something else’) to provide a technical sheen. Consistently it refers to phenomena which are better understood as commodification or marketization of things once thought alien to consumer exchange: education, ideology, kindness, mother’s milk, culture as such. This gloss of subsumption thus clearly situates itself within the sphere of circulation, where things once outside the market are now priced, bought, and sold. A corresponding confusion, identifying ‘subsumption’ with rationalization in general (whose compulsion toward efficiency can apply quite broadly, even to non-capitalist phenomena), further allows this relocation of subsumption into the market. As we have seen, however, real subsumption’s foundation is the technical process of commodity production and capital’s ceaseless revolutionizing thereof, first enabling the measure and then ceaselessly reducing the expenditure of socially necessary labor time.

The more carefully theorized subsumption narratives of the postwar era retain the focus on production, while arguing that the category of production, and particularly of surplus value production, has been extended. This proceeds in tandem with crisis. As the early-industrializing nations have experienced uneven decline in industrial and manufacturing profitability, capital has endeavored to countervail this tendency by seeking profit elsewhere. This development of other sectors is repeatedly theorized as bringing activities formerly identified as nonproductive or extraeconomic into the realm of ‘new production’, purportedly generating surplus value where once there was none. This expansion beyond the traditional sites of production (for which the factory regularly serves as paradigmatic figure) is understood as a second phase of real subsumption, social rather than technical.

## Jacques Camatte

A Marxist theorist who left the International Communist Party in 1966, Jacques Camatte would be early to reinterpret Marx's political economy on the basis of the recovered 'Results' and *Grundrisse* in his text *Capital and Community*. In the course of this he theorizes 'the different periods of the capitalist form' via the two forms of subsumption, transposing them to periods of 'formal domination' and 'real domination' of capital.<sup>15</sup>

For Camatte, the crucial feature of real subsumption is the domination of dead labor (embodied in means of production) over living labor. In this is found the tendency toward a social subsumption. He departs from Marx's argument that, under real subsumption, '*the worker's absolute labour time is posited for him as condition of being allowed to work the necessary labour time*'.<sup>16</sup> The real reduction of necessary labor time depends on an equally real increase of time laboring for capital and moreover results in the multiplication of fixed capital relative to humans. Now workers wander through a landscape of fixed capital, remorselessly obligated to its reproduction in order to assure their own. True human community is increasingly replaced by capital as community. 'Community' here marks capital's colonization of what others will name 'life', 'being', 'society', 'culture', and so on. This marks the end of real subsumption's development. With its completion, a provisionally new era commences, what Camatte calls the 'total subsumption of labour under capital'.<sup>17</sup>

This scission within the period of real domination thus provides a tripartite schema we might call formal, real, and total subsumption. With this, the conventions of periodization via subsumption come into view. By the same token, various other critical-theoretical traditions of the postwar era, employing more and less distant conceptual frameworks, might be understood in relation

to the historical developments set forth by Camatte.

## Frankfurt School

In *Minima Moralia*, Adorno extends Marx's rising organic composition of capital (a necessary outcome of real subsumption and the struggle for relative surplus value) toward the horizon of what he will name 'damaged life'.

The organic composition of man is growing. That which determines subjects as means of production and not as living purposes, increases with the proportion of machines to variable capital; [...] Psychological differentiation, originally the outcome both of the division of labour that dissects man according to sectors of the production process and of freedom, is finally itself entering the service of production. [...] Here it is subjectivity itself, knowledge, temperament and powers of expression that are reduced to an abstract mechanism, functioning autonomously and divorced both from the personality of their 'owner' and from the material and concrete nature of the subject-matter in hand.<sup>18</sup>

This limns the relation between subsumption and subjectivity that can be understood as a fundamental concern for many Frankfurt School thinkers. This example is peculiarly useful in that it makes reference to Marx's basic political-economic categories. Elsewhere in the same volume Adorno captures the seeming collapse of production and circulation which underlies postwar subsumption narratives more broadly, rendering the home as itself a site of production, the bleak negative of Corbusier's 'machine for living':

The functional modern habitations designed from a *tabula rasa*, are living-cases manufactured by experts for philistines, or factory sites that have strayed into the consumption sphere, devoid of all relation to the occupant: in them even the nostalgia for independent existence, defunct in any case, is sent packing [...] The sleepless are on call at any hour, unresistingly ready for anything, alert and unconscious at once.

It is this entry that concludes with the book's best known formula: 'Wrong life cannot be

lived rightly', a formulation birthed from the logic of subsumption.<sup>19</sup>

More explicitly marked by psychoanalysis, Herbert Marcuse pursues a similar line of reasoning in *One-Dimensional Man* (1968), regarding capital's compulsion to expand beyond the workplace and into subjectivity itself. Where once humans possessed 'an individual consciousness and an individual unconscious *apart from* public opinion and behavior' and thus an 'inner freedom',

Today this private space [of the psyche] has been invaded and whittled down by technological reality. Mass production and mass distribution claim the *entire* individual, and industrial psychology has long since ceased to be confined to the factory. The manifold processes of introjection seem to be ossified in almost mechanical reactions. The result is, not adjustment but *mimesis*: an immediate identification of the individual with *his* society and, through it, with the society as a whole.<sup>20</sup>

This cannily reverses modernity's extrusion of the individual, the alienated laborer and preference-riddled consumer required by the modern industrial order. If a certain distance between self and society was once required for this emergence (as Lukács proposes for the paradigmatic hero in *Theory of the Novel*, driven by the contradictions of nineteenth-century industrialization), such a distance cannot be tolerated once that order begins to reach its limits. The 'immediate, automatic identification' of the self with the social whole, once 'characteristic of primitive forms of association', now returns in inverted form, anything but communal.<sup>21</sup>

This formulation is notably distinct from, for example, Louis Althusser's well-known account of ideology as reproducing the relations of production.<sup>22</sup> In Marcuse's 'high industrial society', identification with production is consequent on the compelled extension and refinement of capital's techné: 'a sophisticated, scientific management and organization ... has long since ceased to be confined to the factory'. It is not that the subject becomes interpellated into capital but that the psyche becomes Taylorized,

made more efficient in line with the need for greater productivity. Some results might be understood via ideology: 'In this process, the "inner" dimension of the mind in which opposition to the status quo can take root is whittled down.'<sup>23</sup> But Marcuse's narration of this mental appropriation captures as well capital's compulsion to make all zones productive; subsumption is the activity whereby life becomes 'one-dimensionally' economic.

### *Theory of the Spectacle*

A distinct version of this intuition appears as the political economy of appearance itself in Guy Debord's *Society of the Spectacle* (1967), beginning, 'The whole life of those societies in which modern conditions of production prevail presents itself as an immense accumulation of spectacles. All that once was directly lived has become mere representation.'<sup>24</sup> Here he détourns the opening of *Capital* itself: 'The wealth of societies in which the capitalist mode of production prevails appears as an "immense collection of commodities"; the individual commodity appears as its elementary form.'<sup>25</sup> Two new inflections stand out. The first is the insistence on 'The whole life' in place of 'wealth'; this is exactly the substitution that subsumption of the social intends. The second is the directionality of movement from 'directly lived' to 'mere representation'. The ground of Marx's materialism – a political economy in which surplus value is 'the invisible essence' – moves away from the traditional site of value production and into the open of image-space, the totality of this new world given false unity which is the spectacle. Much as use once yielded primacy to exchange value, now exchange yields to something like *appearance value*.

An earlier stage in the economy's domination of social life entailed an obvious downgrading of *being* into *having* that left its stamp on all human endeavor. The present stage, in which social life is completely taken over by the accumulated products

of the economy, entails a generalized shift from *having* to appearing: all effective 'having' must now derive both its immediate prestige and its ultimate *raison d'être* from appearances. At the same time all individual reality, being directly dependent on social power and completely shaped by that power, has assumed a social character. Indeed, it is only inasmuch as individual reality is *not* that it is allowed to appear.<sup>26</sup>

The spectacle becomes then, among other things, a way of understanding the truth of capital's mutation in this epoch: the social had become economic, and the economic, social. As Anselm Jappe writes,

Debord did not interpret this state of affairs as an inevitable reversal of progress, or as the fate of modern man, to which there was no alternative but an improbable return to the past. Rather, he attributed the situation to the fact that *the economy had brought human life under the sway of its own laws*.<sup>27</sup>

Dialectical other of the spectacle's prismatic glitter, a new flatness prevails, compressing the distance between labor and non-labor out of existence. 'Capital is no longer the invisible center determining the mode of production. As it accumulates, capital spreads out to the periphery, where it assumes the form of tangible objects. Society in its length and breadth becomes capital's faithful portrait.'<sup>28</sup> It is as if the great factory of the industrial revolution had been aerosolized.

### **Operaismo**

So things appeared to theorists of *operaismo* as early as 1962. Mario Tronti inaugurates the line of thinking in a swift movement from relative surplus value (real subsumption's theoretical pairing) to capital's generalization beyond the hidden abode of production.

The more capitalist development advances, that is to say the more the production of relative surplus value penetrates everywhere, the more the circuit *production – distribution – exchange – consumption* inevitably develops; that is to say that the relationship

between capitalist production and bourgeois society, between the factory and society, between society and the state, become [sic] more and more organic. At the highest level of capitalist development social relations become moments of the relations of production, and the whole society becomes an articulation of production. In short, all of society lives as a function of the factory and the factory extends its exclusive domination over all of society.<sup>29</sup>

All of existence will henceforth transpire within 'the social factory' [*la fabbrica diffusa*]; social activity will now be productive in the manner of manufacture.

This is a dream for capital, but a necessary dream. In the telling of *operaismo* (and later in that of *Autonomia Operaia* and its 'post-autonomist' trailings), capital's tactics and restructurations are always reactions to workers' struggles. Thus for example mechanization itself, or disaggregation of the traditional factory floor, are understood as countermeasures to the threat of rising wages or worker cooperation against the boss. Subsumption of the social here is understood more directly as capital's response to proletarian challenge rather than as a response to internal limits for value production, transforming the factory from concrete site of struggle to social logic.

### **Marxist Feminism**

Marxist Feminism would reason contrarily that a dematerialized social productivity did not via *operaismo*'s generalization of the factory eventually arrive at the home (as in Adorno), but rather began there. This is particularly true in groups such as *Lotta Femminista* which followed on and broke with *Potere Operaio*, helping to form among other things the international Wages for Housework project. Per Kathi Weeks, 'wages for housework is not just a demand, it is a perspective'.<sup>30</sup> Central to that perspective is a political-economic critique of *reproductive labor*, indicating not just child-bearing but the ensemble of physical, intellectual, and emotional expenditures required to

reproduce the proletariat *as workers* from day to day, year to year, within the expanded cycle of capital's own self-reproduction.

Mariarosa Dalla Costa and Selma James note that home and community were productive centers before capitalism's historical victory.<sup>31</sup> Since that time, the character of labor in the home (and domestic sphere more broadly) has been hidden by its seeming detachment from the wage.

This exploitation has been even more effective because the lack of a wage hid it. That is, the wage commanded a larger amount of labor than appeared in factory bargaining. *Where women are concerned, their labor appears to be a personal service outside of capital.* The woman seemed only to be suffering from male chauvinism, being pushed around because capitalism meant general 'injustice' and 'bad and unreasonable behavior'; the few (men) who noticed convinced us that this was 'oppression' but not exploitation.<sup>32</sup>

The new social subsumption is in this telling of an old story; the 'personal services' of care work, feeding, cleaning, and so forth, had always been integral to the production process. This provides a critique of traditional Marxism's understanding of the woman who 'has always been seen as that of a psychologically subordinated person who, except where she is marginally employed outside the home, is outside production; essentially a supplier of a series of use values in the home'.<sup>33</sup>

For orthodox Marxism, unwaged reproductive labor, while *necessary* for capital's ongoing functioning, can still be distinguished from productive labor in its technical sense: the valorization of commodities produced within the wage relation, productive of surplus value through exploitation. This particular mode of labor is capital's existential *sine qua non*, while any number of worlds could be imagined in which reproductive labor exists. Indeed, all societies will want reproduction; thus, such activities seem to stand outside the history of capitalism.

The Marxist Feminist rejoinder proposes that capital could not profitably appropriate

surplus value in the productive process without the existence of unpaid 'housework'. There are both practical and theoretical ways to express this. As a practical matter, if reproductive labor was paid rather than being a donation to capital ('wages for housework') this would eliminate profit margins, rendering impossible a mode of production premised on that labor ('wages against housework').<sup>34</sup> The more theoretical assessment begins from the discovery that the opposition of two modes of labor, productive and reproductive, forms a concealed unity. Leopoldina Fortunati writes,

Thus the real difference between production and reproduction is not that of value/non-value, but that while production both is and *appears* as the creation of value, reproduction is the creation of value but *appears otherwise* ... *It is the positing of reproduction as non-value that enables both production and reproduction to function as the production of value.*<sup>35</sup>

One schematic way to render the argument would be by way of analogy to Marx's own account, drawing on Ricardo, wherein machines seem to transfer some of their value to the commodity within the production process. This value is in truth congealed human labor embodied in the machine; the value of that dead labor now makes its leap into the commodity via the renewed application of living labor.<sup>36</sup> Underlying Fortunati's account is a structure wherein the wage-earning man, while offering up his own labor power, also bears the congealed value of his household's reproductive labor to render him usable labor power. He arrives at the factory gates half-man and half-machine, bearing the full value of his family including him. This hidden domestic labor is a technical part of the production process and thus can undergo formal and real subsumption. However, because the wage-earner alone appears for the factory whistle, he appears as the sole source of valorization and thus of surplus value.

At stake is the recognition of women as not only oppressed but exploited. Their

concomitant centrality to value production and thus to the viability of capitalism entails their centrality to class struggle: 'On this family depends the support of the class, the survival of the class – but *at the woman's expense against the class itself*. The woman is the slave of a wage-slave, and her slavery ensures the slavery of her man.'<sup>37</sup>

The Marxist Feminist account provides as well a vital hinge in the subsumption narrative. It suggests that the concept is itself gendered: a woman in the conventional family was always already formally subsumed under capital in just this sense, secretly productive without resembling the industrial revolution's model of labor. Moments of real subsumption might be seen in the vacuum cleaner, dishwasher and other such domestic productivity tools. From this perspective, the model for the social factory is the domestic sphere and the home; these are the terms in which Nicole Cox and Silvia Federici set forth the argument in 1975.

The wage, in fact (and that includes the lack of it), has allowed capital to obscure the length of our working day. Work appears as one compartment of life, which takes place only in certain areas. The time we consume in the social factory, preparing ourselves for work, or going to work, restoring our 'muscles, nerves, bones and brains' (21) with quick snacks, quick sex, movies, etc., all this appears as leisure, free time, individual choice.<sup>38</sup>

Inevitably then, social subsumption would be understood in some quarters as the 'feminization of labor' in ways beyond the entry of women into the waged workforce. The home is now understood as a laboratorial space for a restructuring of capital as a whole. The character of work, and the kinds of jobs experiencing growth, will themselves be grasped ambiguously as feminized, to the extent that they resemble not the mix of physical force and residual craft skills associated with manufacture, but instead the ensemble of physical, intellectual, and emotional labor associated with the domestic sphere or with 'social' activity in general.

It is this aspect – which takes up recomposition of the labor market, the workforce, and of class as such around the decline of industrial profitability and concomitant crisis of 1973 – that will be read back with only a fraction of feminist content into the post-*operaismo* or post-Marxist tradition.

### Post-Marxism

Antonio Negri and his eventual co-author Michael Hardt have provided the most thoroughgoing theorization of the society of real subsumption, notably in *Empire* (1999). This and related work fulfill the initial propositions of *operaismo*, synthesizing other philosophical and political-economic strands discussed herein. The title refers to 'a new logic and structure of rule' for a new age of globalization.<sup>39</sup> It draws together Tronti's social factory – coordinated by financialization's simultaneous immanence and immateriality, the corresponding proliferation of digital communication networks, and the unification of the global economy – with Michel Foucault's formulation of *biopolitics* as the regime wherein the sovereign's power to 'make live' and further 'make productive' converge.<sup>40</sup> In this mesh there can no longer be any autonomy of levels or moments, much less of the political and economic: 'the rule of Empire operates on all registers of the social order extending down to the depths of the social world ... The object of its rule is social life in its entirety, and thus Empire presents the paradigmatic form of biopower.'<sup>41</sup>

This marriage of Marx and Foucault toward an identification of capitalism with 'social life in its entirety' is underwritten by collapse of the distinction between work and non-work. In this transformation, Hardt and Negri espy a new immanence of production toward which the world economy is remade after its Fordist crisis. It is worth quoting the core passage at length.

The processes of the real subsumption of labor under capital do not rely on the outside and do not involve the same processes of expansion. Through the *real subsumption*, the integration of labor into capital becomes more intensive than extensive and society is ever more completely fashioned by capital. There are certainly processes of real subsumption without a world market, but there cannot be a fully realized world market without the processes of real subsumption. In other words, the realization of the world market and the general equalization or at least management of rates of profit on a world scale cannot be the result simply of financial or monetary factors but must come about through a transformation of social and productive relations. Discipline is the central mechanism of this transformation. When a new social reality is formed, integrating both the development of capital and the proletarianization of the population into a single process, the political form of command must itself be modified and articulated in a manner and on a scale adequate to this process, a global quasistate of the disciplinary regime.<sup>42</sup>

It may not be immediately apparent that this passage revolves around crisis, and specifically around crisis theory in the Marxist tradition. This is the import of 'the general equalization or at least management of rates of profit on a world scale'. The profits of global capital, dragged downward by the collapse of industrial profits in the capitalist core around 1973, necessitate a restructuring so comprehensive that it constitutes 'a new social reality'.<sup>43</sup>

This provides a materialist rationale for the conjoining of subsumption narrative and the rhetoric of biopolitics. Now capital sings in its chains, desperate to discover profit elsewhere. Shaking free, it leaps into financial schemes; this will be only one maneuver in the effort to outpace its fate. Indeed, finance will turn out to be synecdoche for the 'new economy', and the burgeoning sectors of the postindustrial world. These sectors will be aggregated under numerous rubrics, the welter of nomenclature gesturing at their chaotic blossoming more than their novelty. The *service sector* will be perhaps the simplest name, though the full ensemble includes care work, communicative and cognitive labor, symbol

management, affect management, and many more entries in the ledger of what would eventually be called 'immaterial labor'. This rubric is often understood via its distinction from manual labor. This sense gets at the difference between, say, stamping fenders and cubicle-based provision of communication and information services. Hardt and Negri begin from this metamorphosis:

The increasingly extensive use of computers has tended progressively to redefine labouring practices and relations, along with, indeed, all social practices and relations ... Even when direct contact with computers is not involved, the manipulation of symbols and information along the model of computer operation is extremely widespread.<sup>44</sup>

They nonetheless insist on a distinct sense of immateriality, concerning not the physicality of labor but of the commodity.

Since the production of services results in no material and durable good, we define the labour involved in this production as *immaterial labour* – that is, labour that produces an immaterial good, such as a service, a cultural product, knowledge, or communication.<sup>45</sup>

From here they move to expand this sense of immateriality to the production of affects, a move which will turn out to preserve some kernel of Marxist Feminist analysis, albeit in nearly unrecognizable form. One last extended quotation provides the breadth of their argument.

The other face of immaterial labour is *the affective labour* of human contact and interaction. Health services, for example, rely centrally on caring and affective labour, and the entertainment industry is likewise focused on the creation and manipulation of affect. This labour is immaterial, even if it is corporeal and affective, in the sense that its products are intangible, a feeling of ease, well-being, satisfaction, excitement, or passion [...] This second face of immaterial labour, its affective face, extends well beyond the model of intelligence and communication defined by the computer. Affective labour is better understood by beginning from what feminist analyses of 'women's work' have called 'labour in the bodily mode'. Caring labour is

certainly entirely immersed in the corporeal, the somatic, but the affects it produces are nonetheless immaterial. What affective labour produces are social networks, forms of community, biopower. Here one might recognise once again that the instrumental action of economic production has been united with the communicative action of human relations.<sup>46</sup>

This is in some degree a summary of the subsumption narratives accreting over the previous century, oriented by the exigencies of crisis following on the decline of the Fordist-Taylorist mode of production. It is not just formal employment in the expanding service sector which becomes, propositionally, a vital arena for value extraction. All social activities which make use of the skills that service demands – formerly understood as unproductive and/or reproductive labor, necessary for capitalism's continued existence but not itself productive of value – now enters into the productive sphere. The unification of *make live* and *make productive* is not the command issued by Foucault's sovereignty but by the profit rate.<sup>47</sup>

Inasmuch as capitalist crisis is in the first instance a crisis of value production, we must proceed deliberately regarding the dramatic claims herein about value and labor. Two linked elements seem particularly worth attention. The first rests in the crucial difference between this account and the one offered by, for example, Fortunati and Marxist Feminism. If one accepts their analysis of the productivity of 'women's work', the reorientation of what work is counted as productive does not imply a *greater* aggregate value being produced within the expanded sphere and workplace. Rather, the woman's labor is a veiled source of some portion of the value seemingly generated solely by the productive laborer. The resultant commodities still bear the same measure of value they would have in an orthodox Marxian framework; only its basis has been revised. For Hardt and Negri contrarily (and the broader field of adherents to their hypothesis), immaterial or affective labor is newly productive; such labor now

appears as a source of value *in addition* to the value supposed by older models of productive labor. This new value or new production is able, among its other features, to counter-vail the waning of value production from traditionally productive sectors. No longer does the expulsion of labor from manufacture, and so on, imply crisis for capital, as the direct exploitation of labor in the production process is no longer necessary for valorization.

This development of 'the new social organisation of labour and the new model of accumulation' completes a tripartite periodization echoing Camatte's framework.<sup>48</sup> The periods are roughly 1848 to World War I, World War I to 1968, and 1968 to the present. The first two are those of 'large-scale industry' featuring 'the professional worker' and 'the mass worker' respectively; in the third, 'the productive labour loses its centrality in the process of production, while the 'social worker' (and that is the complex of functions of laboring cooperation transported into the social productive networks) assumes a hegemonic position'.<sup>49</sup> This third period is characterized by 'the total subsumption of society' or 'the *real subsumption* of society within capital'.<sup>50</sup> Overcoming a crisis of accumulation for capital, it nonetheless features a new crisis of the capital-labor relation wherein 'all the conditions of the current mode of production push toward the complete socialisation of political power and, conversely, toward the complete politicisation of the social'.

Just as the concentration and cooperation of factory labor compelled by capital's development would, from Marx's standpoint in the nineteenth century, generate the association of workers able to throw off their own chains, the contemporary integration into the communicative networks of the social factory will produce new forms of community bearing revolutionary potential. 'Today productivity, wealth, and the creation of social surpluses take the form of cooperative interactivity through linguistic, communicational, and affective networks. In the expression of its own creative energies, immaterial labour

thus seems to provide the potential for a kind of spontaneous and elementary communism.<sup>51</sup> The real subsumption of society, in this account, has given birth to that society's gravediggers.

### **Theorie Communiste**

The sense that this third period of subsumption and crisis has qualitatively changed the terrain of capital's social world is nowhere more ambitiously asserted than in the writings of *Theorie Communiste*, a French theoretical tendency active from the 1970s onward. Holding to the tripartite periodization found in Camatte and Negri, they shift focus from transformations of the production process to developments of the labor-capital relation.

Formal subsumption, in their schema, is defined by the proletariat's self-recognition as the source of capital's productivity and thus its self-affirmation as a class. The first real subsumption, beginning (again) around World War I, leads to a greater internalization of the proletariat into capital's self-affirmation. Real subsumption pursues the production of relative surplus value by endeavoring to lower the relative cost of commodities. This engenders a decline in real wages (assumed to be set by the cost of reproducing the proletariat). This process draws ever more tightly together the entwined reproduction of labor and capital; as proletarians work more and more for capital rather than themselves, their capacity to affirm their being *against* capital declines.

The third period (which they call the 'second phase of real subsumption of labor under capital') arrives in the 1960s and 1970s and corresponds to the end of the historical worker's movement birthed a century earlier. As summarized by Endnotes, this period 'is then characterised by a more *immediately* internal relation between capital and the proletariat, and the contradiction between them is thus immediately at the level of their reproduction

as classes'.<sup>52</sup> No longer able to affirm their existence as a class against capital and survive, the only remaining form antagonism can take is the proletariat's self-negation as a class (this will return below under the heading of 'Crisis'). The particular historical vision of the proletariat seizing control of capitalist production toward its own ends, of which the Soviet revolution remains the classical example and which *Theorie Communiste* calls 'programmatism', is a historical vision tied to a particular moment of subsumption. When the first real subsumption is completed, the historical conception ends with it.

### **CRISIS**

That there is an intimate and complex relation between subsumption and crisis within capitalism will by now be apparent, if the relation itself is not yet fully systematized. Marx in his preparatory notes for *Capital* promised a direct and freestanding treatment of crisis, which would go unwritten. That said, the idea that he did not leave behind a comprehensive theory of crisis is largely mistaken, and this theory both adds to and clarifies our sense of the significance of subsumption within Marx's thought.

While various theories of crisis have been educed from Marx by others, his own extended account is to be found in *Capital* Vol. 1.<sup>53</sup> Henryk Grossman rightly argues that 'the object of Marx's analysis is not crisis, but the capitalist process of reproduction in its totality'.<sup>54</sup> *Capital's* crisis character is an integral aspect of this process and its breakdown. The book's first seven sections, summarized in chapter 25, provide an exposition of how capital's presuppositions which drive toward reproduction of capital simultaneously drive toward a crisis for that reproduction (thus the most compressed and significant among Marx's maxims on his great subject, the aforementioned 'capital itself is the moving contradiction' and 'the

true barrier to capitalist production is capital itself<sup>55</sup>).

The causal chain can be schematized thusly: capital, defined as *value in expansion*, becomes possible with the generalization of the wage and commodity forms wherein value's form of appearance in exchange value comes to stand over use value (part 1). This is a fundamental precondition through which an individual capital can satisfy the compulsion to convert money into more money (part 2). Absolute surplus value, obtained by internalizing work into waged commodity production, is limited by physical barriers, class struggle over the length of the working day, and by the given profitability of a sector and thus its size and capacity to employ labor (part 3). Against these limits, individual capitals in search of profit shift toward pursuit of relative surplus value, achieved via increasing productivity (part 4). Absolute and relative surplus value coexist but have different implications for rates of surplus value and thus for capital accumulation, hence the significance of their changing balance (part 5). This compulsion toward rising levels of productivity ceaselessly increases the proportion of means of production in relation to labor expended in the production process, and in turn the ratio of constant to variable capital.<sup>56</sup> This ongoing expulsion of living labor from the production process, as individual capitals seek profit, hollows out the very source of the surplus value on which the profitability of capital as a whole depends (part 7). As the capacity to extract surplus value wanes, profit eventually follows, and capitalism – bereft of its existential basis in real accumulation – enters into crisis.

Subsumption, which extends through every moment of this secular course from the first waged commodity production to the last ratcheting of productivity, is thus a necessary and constituent part of capital's crisis character. For all its historical aspect it is no less posited by capital's laws of motion than are its more systematic or logical corollaries. However, because subsumption appears

as historical and is in train used for periodizing, it is perhaps overly easy to view formal and real subsumption as sequential. The context of crisis challenges this view. While it is logically the case that formal precedes real subsumption, once the latter appears they must both be present, as real subsumption's generation of relative surplus value finally a reallocation of absolute surplus value derived from formal subsumption. This coexistence is classically dialectical: both mutually constitutive and antagonistic with a drive toward self-overcoming. It is real subsumption's fate to undermine the gains in absolute surplus value gotten through formal subsumption. This in turn proposes further rounds of formal subsumption to defer crisis. As the concomitant productivity increasingly expel labor from the production process, capital must seek absolute surplus value elsewhere: by extending the working day, enlarging the sector, or by opening new lines. At the level of the global economy, intensifying real subsumption in the developed core has compelled new episodes of formal subsumption elsewhere, adding new labor inputs to global capital against waning rates of surplus value. We might also see this as a dialectic of formalization and informalization: formal subsumption draws people into the formal economy, while real subsumption has as one of its effects the casting of formal workers into the informal economy.

However, over time real subsumption does indeed come to stand over formal, particularly given that productivity advances eventually spread throughout the breadth of global production. While the expansion of capitalism must eventually reach external limits when there is no longer any significant population left to subsume formally, real subsumption also presents itself as an internal limit to formal subsumption: when profitability lowers enough that it is no longer worth reinvesting capital in the production process, real has effectively exhausted formal subsumption. Lacking ongoing formal subsumption, real subsumption persists on borrowed time. The

more it holds sway the more swiftly we move toward crisis.

This set of contexts further underscores the significance of debates regarding the term's usage. Misprisions such as the 'real subsumption of art' may appear initially as little more than metaphor, or as casual drift away from the more accurate 'rationalization' or 'commodification'. They are both suggestive and problematically misleading to the extent that they invoke the more serious debate entangled with the question of crisis: can social activity once understood to stand outside productive labor undergo subsumption *and thus become productive of value*? This is a question that arises with concrete historical crisis. The postwar subsumption narratives begin in part from the sense that capitalism has reached its mature form and become more or less static – that is to say, the possibilities for further formal subsumption, growth in the scope of capitalism, have reached their limits. The early narratives respond to this formulation of crisis by imagining spaces within capitalism which have not yet been fully subjected to its logic – an internal growth, if you will. This conceptualization transforms over the course of the 1960s as developed nations begin to experience the first slowings of the postwar boom. As the conventionally productive sectors of industry and manufacture experience declining profitability and deindustrialization commences, there is a shift into other labor sectors (most famously into service or 'tertiary' sectors) and concomitant theorizations of new sources of value production to replace what is being lost elsewhere. Thus we might see that, for example, the 'social factory' or the rise of 'immaterial labor' both describe an economy's response to crisis and as ideas are themselves responses to crisis.

The language of social subsumption carries with it an implicit supposition that the activities subsumed are value-productive, given that real subsumption is defined as transformation of a labor process toward increasing relative surplus value. That new sectors or forms of labor, from providing social media

content to operating a hedge fund, have become value productive has proved difficult to establish, a difficulty likely residing in the nature of value itself. However, if it is the case that value, and its product of surplus value, appears in the market as profit, the proposition that capital has developed extensive new sources of value deserves at least some skepticism. This is true for both theoretical and empirical reasons. Finance is an instructive example. While generating vast profits for some, and rising to form an ever-larger share of the economy as industrial capital recedes, it remains a mode of reallocating rather than producing wealth from the perspective of capital as a whole. To the extent that financial profits lead to real accumulation it is only insofar as they are reinvested as capital in productive sectors, even as it is necessarily the case that the growth of the financial sector is constituted by a decrease in capital reinvestment. If there is a portion of financial profit based in real accumulation and not destined to vanish with the next fiscal crisis, it is to the degree that it sets productive labor in motion. That this labor follows rather than precedes financial profit-taking allows for the mystifying appearance that, in the realm of finance, money has simply been exchanged via various financial instruments for more money, in the form M-M'. More accurately, all real accumulation mediated by finance takes the form M-M'-C, with the purchase of the labor commodity being deferred (and concealed from view) rather than eliminated. That labor will be subject to subsumption in the conventional sense.

Empirically, there have been the most limited and uneven recoveries from the collapse of profitability since the 1970s, and these recoveries have themselves proved largely to be bubbles of nominal value.<sup>57</sup> There is little indication that growth in the service sector, in finance, immaterial and cognitive labor and the like, has had much positive impact on accumulation at a global scale. It may make far more sense to understand these sectors as being primarily involved in the

work of circulation, adjunct to production, and increasingly necessary to sustain profitability through faster turnover and realization without themselves being productive of new value. In this sense, social subsumption, while gesturing toward actual transformations, remains a misnomer. Real subsumption has continued and intensified, but has not transformed the category of productive labor.

The intensification noted by, for example, Camatte, Negri, and Theorie Communiste nonetheless retains its use as a periodizing tool. If we reorient our sense of social subsumption as a description of a complex response to capitalist crisis, the transformations can perhaps be grasped more fully in the sense of a crisis for the class relation. As productivity increases alongside decreasing accumulation, capital appears less dependent on labor even as it is less able to generate surplus that the proletariat might appropriate through class struggle. Instead, labor is forced into defensive struggles, both to minimize submission to wage and job cuts, and to defend their social antagonists against dissolution which would eliminate jobs altogether.

This, we might say, is the last subsumption, gestured at in the periodizations, and the limit at which the technical and metaphorical usages converge: the subsumption of labor's being to the being of capital, such that it no longer can stand in antagonistic relation. This seemingly total subsumption, however, can be provoked only by total crisis. In this sense, when real subsumption annihilates formal subsumption, capital's victory must also be its defeat.

## Notes

- 1 The philosophical underpinnings of subsumption in this context, as well as some recent debates on subsumption as a periodizing term, are well-summarized in the essay 'The History of Subsumption', by the Endnotes collective, in *Endnotes 2: Misery and the Value Form*, pp. 130–53.

# The Figure of Crisis in Critical Theory

Amy Chun Kim

Critical theory as originally conceived by Adorno and Horkheimer was charged with exposing the ‘fundamental contradictions’ of capitalism in the face of potentially historically irreversible defeats of the workers’ movement in the West. In this chapter, I will explore the shifting role envisioned for critical theory, understood as an analysis of post-liberal forms of capitalism, across several periods, from the rise of fascism to the current phase of world economic turbulence. I identify three key moments in the history of critical theory: (1) Adorno and Horkheimer’s departure from the traditional Marxist category of practice in their analysis of fascism and post-fascist democracy; (2) Habermas’s attempt to define a responsible alternative to what he perceived to be the ‘sterile negativity’ of their diagnosis based on the potential for greater democracy under welfare state capitalism; and finally, (3) more contemporary contentions over where the focus of an adequate critique of capitalism should lie. The last is to be understood more generally

as a debate between those interested in the ‘value form’ of social relations – the abstract social logic of capitalism – and those working on the theorization of capitalist crisis. This historical overview is meant to underscore the relevance of the legacy of Adorno and Horkheimer today. How might the latter be adapted to account for the inequality, precarity and stagnation that characterize the latest phase of capitalist development? This chapter of the *Handbook* provides an account of the development of critical theory across these three periods, from its inception at the beginning of the twentieth century to the present, demonstrating the way in which its historically shifting conceptions of the crises and limits of capitalism shaped its development, including its understanding of its relationship to the categories of practice and class struggle. The contemporary significance of an earlier Critical Theory’s constitutive problem should be clear: why has a deep crisis of the capitalist system fueled the rise of new forms of the radical right instead of

opening the space for an adequate politics of emancipation?

# 1

Horkheimer's 'Traditional and Critical Theory' was written in 1937 in the midst of the rise of fascism across the continent and the consolidation of Stalinism in the Soviet Union. Its argument was that a rising tide of barbarism called for a new form of critical theory. With the Depression and impending world war, modern civilization appeared to be experiencing the limits of capital development but in a scenario that had effectively shattered an older expectation that this long-awaited terminal crisis would open up a path to emancipation. While theory could no longer look forward to finding its end in practice, it was nonetheless imperative to soldier forth and deepen the analysis of the contradictory and self-undermining tendencies of bourgeois society (Horkheimer, 2002 [1937]: 214). A seemingly impossible new vocation of critique arose in a context in which the categories of the critique of political economy had become problematic amid a transition to a post-liberal form of social organization. As Horkheimer would write, one of the key presuppositions of this analysis could no longer be held true: '[I]t must be added that even the situation of the proletariat is, in this society, no guarantee of correct knowledge' (Horkheimer, 2002 [1937]: 213).

Horkheimer's conception of critical theory was directed not only at what he called traditional theory but also at the vestiges of the latter within orthodox Marxism. Although Lukács's *History and Class Consciousness* was an intellectual construction with little resemblance to the materialism of the Second and Third Internationals, its assumption that the structural condition of the working class under capitalism formed the epistemological vantage point from which a knowledge of the

whole historical situation could be grasped was identified as the essential premise of a now discredited orthodoxy. The danger was that the failure of the proletariat to live up to its supposed historical vocation would lead to a heedless flight into despair. Horkheimer rejected the Lukácsian premises of proletarian consciousness, and starkly outlined the consequences to such an analysis when faced with the present failures of the working class to come to power in a moment of capitalist crisis:

When he [the intellectual] wholly accepts the present psychological state of that class which, objectively considered, embodies the power to change society, he has the happy feeling of being linked with an immense force and enjoys a professional optimism. When the optimism is shattered in periods of crushing defeat, many intellectuals risk falling into a pessimism about society and a nihilism which are just as ungrounded as their exaggerated optimism had been. They cannot bear the thought that the kind of thinking which is most topical, which has the deepest grasp of the historical situation, and is most pregnant with the future, must at certain times isolate its subject and throw him back upon himself. (Horkheimer, 2002 [1937]: 214)

The first crystallization of critical theory was thus a lucid reckoning with the experience of defeat, an emergency situation in which 'praxis' no longer provided an Archimedean perspective on the course of history. The passionate optimism going back to the Age of Enlightenment and German Idealism that an emancipated society was the destiny of human beings lay shattered. The expectation of generations of socialists that the terminal crisis of capitalist society would not be a crisis of civilization itself, but an opening to a higher form of it had dwindled to a remote, almost theologically conceived Hope.

Horkheimer sought to articulate the beginnings of a response to the question he posed rhetorically in the 1937 essay, 'How is critical thought related to experience?', a query that hinted at the predicament of critical theory, as well as what would be its key

terms – contradiction, dialectic, experience. For Hegel, ‘dialectic’ was an account of how truth arises from the experience of limit and failure. The historical context of the formation of his later conception of history was the collision of the Jacobin ideal of revolutionary virtue with the unbridled self-interest of a newly emancipated civil society, leading to the establishment of the modern state. The experiential content of Hegel’s later political theory was the abandonment of long-held illusions that the polis could be restored, but also the discovery of a new, more prosaic form of freedom. The experiential content of critical theory in its first articulation was the closure of revolutionary possibilities by a fascism that appeared to have neutralized this older dialectic, leaving little hope for redemption in a new figure of emancipation. This nascent and uncertain form of theorization called for a new form of dialectic born of lost illusions. ‘In a historical period like the present’, he concluded, ‘true theory is more critical than affirmative, just as the society that corresponds to it cannot be called “productive”’ (Horkheimer, 2002 [1937]: 242).

Reflecting on this experience of defeat and its aftermath, Adorno (1993) argued in his later lectures on Hegel that dialectic was nothing but thought’s experience of its own limits, in the face of a historical process that both raises and cruelly disabuses the prospect of emancipation from suffering.

It [Hegel’s dialectic] too arises from the experience of an antagonistic society; it does not originate in some mere conceptual schema. The history of an unreconciled epoch cannot be a history of harmonious development: it is only ideology, denying its antagonistic character, that makes it harmonious. Contradictions, which are its true and only ontology, are at the same time the formal law of a history that advances only through contradiction and with unspeakable suffering. (Adorno, 1993: 82)

Adorno and Horkheimer’s return to the problem of the relationship of thought to experience as it had been framed after Kant’s ‘critical turn’ arguably spoke to the need to identify new premises for the critique of

capitalism in a historical situation in which its limits could no longer be seen as surmountable through ‘praxis’.

This departure of critical theory from traditional Marxism with regard to the category of praxis coincided with the full-blown arrival of a state capitalism, which seemed to put into question the category of the economy itself as an autonomous domain of exchange-mediated social power. But for Horkheimer, capitalism in the throes of its decline somehow still remained of the same order that Marx and generations of his followers had confronted. For it was the subjective failure of the workers’ movement to find a revolutionary solution to its terminal crisis that was leading to the catastrophic realization of *the truth* of Marx’s critique of exchange-mediated domination in the form of a totalitarian system of unmediated domination. Horkheimer held that even in this twilight world of a post-capitalism – simultaneously the most extreme form of capitalism – critical theory could still take as the basis for its method the ‘Marxist categories of class, exploitation, surplus value, profit, pauperization, and breakdown’, the elements of the ‘conceptual whole’ set out in his 1937 essay (Horkheimer, 2002 [1937]: 217). For all the mutations of the present had their source in the contradictions of the socio-economic logic they identified. By preserving the recollection of these now neutralized contradictions, these categories pointed to the possibility of an escape from their otherwise ineluctable grip. Even if in an ever more enigmatic way, the vocation of critical theory remained bound to an older, still unsurpassed classical theorization of capitalism.

There are no general criteria for judging the critical theory as a whole, for it is always based on the recurrence of events and thus on a self-reproducing totality. Nor is there a social class by whose acceptance of the theory one could be guided. It is possible for the consciousness of every social stratum today to be limited and corrupted by ideology, however much, for its circumstances, it may be bent on truth. For all its insight into the individual steps in social change and for all the agreement of

its elements with the most advanced traditional theories, the critical theory has no specific influence on its side, except concern for the abolition of social injustice. This negative formulation, if we wish to express it abstractly, is the materialist content of the idealist concept of reason. (Horkheimer, 2002 [1937]: 242)

How did the leading representatives of critical theory respond to the defeat of fascism and the stabilization of capitalist democracy? In an extravagant quasi-mythological form, Adorno and Horkheimer's *Dialectic of Enlightenment* portrayed the transition from a nineteenth-century liberal market capitalism to a later stage in which the mediation of domination through the laws of exchange, grounded in the nominal autonomy of the individual, had broken down. Clearly the worst had been averted and yet both remained intransigently pessimistic, even as they otherwise accommodated themselves to the McCarthyite and conformist postwar environment. As has often been noted, critical theory in this period drifted away from its original agenda toward topics in philosophy and aesthetics, with some forays into contemporary academic controversies in sociology. Occasional comments even suggested a convergence of their outlook with an older, conservative *Zivilisationskritik*.

But a more intransigent stance toward what remained an unemancipated society was never wholly abandoned, even as any positive engagement with the new emancipatory aspirations of the student movement was rejected. Adorno's conception of a 'negative dialectics' distilled this duality of unreconciled opposition and political quietism. For all its ambivalence, its diagnosis was blunt: when the misery imposed by the capitalist form of social existence could no longer be experienced coherently, even the original assumption of critical theory that the totality of this misery could be grasped theoretically becomes untrue.

The contradiction weighs more heavily now than it did on Hegel, the first man to envision it. Once a vehicle of total identification, it has become the

organon of its impossibility. The task of dialectical cognition is not, as its adversaries like to charge, to construe contradictions from above and to progress by resolving them – although Hegel's logic, now and then, proceeds in this fashion. Instead, it is up to dialectical cognition to pursue the inadequacy of thought and thing, to experience it in the thing. Dialectics need not fear the charge of being obsessed with the fixed idea of objective conflict in a thing already pacified; no single thing is at peace in the unpacified whole. (Adorno, 1973: 153)

Adorno was all too aware that the flight from conceptuality to the aporetic necessarily ended in the dead end of the sort of reactionary intuitionism that he denounced in Heidegger. After all, the very notion of a dialectic, however negative, signals a fidelity to the conceptual, even as the task had now shifted to redeeming its suppressed ground in the beleaguered vestiges of the experience of loss. But the aesthetic as the spontaneous experience on which thought could operate could no longer be retrieved in philosophy or even in the critical theory that was meant to supersede it. It sought instead its asylum in the aesthetic in the narrower sense of art, more specifically in the still uncolonized experience of unfreedom that the most advanced forms of modern art might remain able to convey.

Yet for all its political ambivalence, this mourning negativity became a radicalizing catalyst in the Federal Republic and eventually internationally. Considering its galvanizing role in the upheavals of the 1960s, it is perhaps paradoxical that the common denominator of critical theory across these two periods was the theme of the unlikelihood, if not impossibility, of the emergence of a subject of emancipatory social change. It is all the more noteworthy then that despite their departures from an originally conceived critical theory, even the vestigial persistence of this problematic could occasion moments of surprisingly radical political speculation. In the spring of 1956, Adorno and Horkheimer embarked on a series of discussions considering the possibility of writing a new 'strictly Leninist', manifesto, a kind of contemporary

equivalent to the *Communist Manifesto* (Adorno and Horkheimer, 2010 [1956]: 57).

Shouldn't we really have to think everything out from the beginning? Write a manifesto that will do justice to the current situation. In Marx's day it could not yet be seen that the immanence of society had become total. That means, on the one hand, that one might almost need to do no more than strip off the outer shell; on the other hand, that no one really wants things to be otherwise. (Adorno and Horkheimer, 2010 [1956]: 56–7)

## 2

Arguably the young Habermas early on experienced the ambivalence of this stance toward post-fascist western democracy as untenable. He came to view the economic prosperity of the postwar period as part of a progressive trend line which might result in the emergence of a rational public sphere, surpassing the hopes of classical liberalism in a more decidedly democratic direction. In other words, he came to think that the tendency of his teachers to obscure the difference between fascism and democratic capitalism was intellectually sterile and a political dead end. The problematic of critical theory they identified – namely, the failure of the subjective forces – was false, and Habermas sought to shift focus away from a classical Marxist analysis of the development of technical forces as the condition of emancipation. Instead, he came to see the possibility of emancipation as arising from the realm of communicative action, where change would be grounded in the norms of intersubjective action.

Commentators on Habermas often divide his work into 'early' and 'late' periods, with the early Habermas of *The Structural Transformation of the Public Sphere* embodying a more radical outlook and the later adhering to a more positive evaluation of Western capitalist societies. But if

the critique of the latest phase of capitalism can be understood as a defining dimension of critical theory, there is in this respect a continuity across Habermas's entire postwar trajectory. For underpinning his thought from the early radical conclusions of *Structural Transformation* was a fundamental shift in the object of critique. He sought to replace an older conception of capitalism as an irrational and unfree social condition with a more generic conception of the economy as a market system grounded in property rights. Instead of a critique of capitalism, he proposed that critical theory be understood in terms of an ongoing project of the fulfilment of modernity, in which markets provide the functionally necessary arrangements for the economic coordination of complex societies. It followed then that the problem of capitalism was a derivative of the problem of democracy, understood as the constitution of a state–civil society relationship within which an attainable self-determination might be achieved.<sup>1</sup>

The Marx that Habermas credited with his radicalization and appeared relevant enough in the political situation of the early Federal Republic was the young Marx of the Paris Manuscripts rather than the Marx of *Capital*. Written in the 1840s, the former seemed to directly address a contemporary condition of powerlessness and oppressive conformism. It was thus widely regarded in the early postwar era as providing a deeper critique of a system that had overcome the material immiseration and crises of the past. For Habermas, the early Marx's Feuerbach-inspired critique of alienated labor laid bare the essentialism underlying his later more positivistically conceived critique of political economy. The same metaphysical humanism inspired the young Marx with his millenarian conception of communism as the solution to the riddle of history. In this respect, the young Marx's fierce critique of Hegel was little more than an inversion of the latter's state–society schema. Both Hegel and Marx took the separation of public and private, Hegel's

*entzweite Sittlichkeit*, to be a problem posed by the dialectical movement of history, which would ultimately be resolved, however differently they conceived of that resolution. Habermas was more than skeptical.

As matter of fact, the young Marx conceives of the unity of system and lifeworld as did the young Hegel, on the model of a ruptured ethical totality whose abstractly divided moments are condemned to pass away ... This interpretation excludes from the start the question of whether the systemic interconnection of the capitalist economy and the modern state administration do not *also* represent a higher and evolutionarily advantageous level of integration by comparison to traditional societies. (Habermas, 1987b: 339)

Habermas articulated his departures from an older conception of critical theory in a number of considerations on the intertwined sociological and philosophical limitations of the early Marx's conception of alienated labor as the central relation of modern bourgeois society. In this conception, the latter was the culminating stage of a history that had been taking ever newer and more monstrous shapes since the first stages of man's domestication of nature. Even though Adorno and Horkheimer, as well as Lukács himself, treated the *Economic and Philosophical Manuscripts* with skepticism, Habermas saw the roots of the philosophy of history he was breaking from in Marx's early work. Whether in the positive form of the standpoint of the proletariat or in its inverted form of purely negative critique, a philosophy of history in which human emancipation was dialectically dependent upon the domestication of nature offered chimerical reconciliations grounded in the metaphysical notion of a self-realizing subject (Dews, 1986: 12–13; Habermas, 1987a: 64–5, 1987b: 382).

The fragility of the Marxist philosophy of history that implicitly serves as the foundation of this attempt to develop critical theory in interdisciplinary form makes it clear why it had to fail and why Horkheimer and Adorno scaled down this program to the speculative observations of the *Dialectic of Enlightenment*.

Historical-materialist assumptions regarding the dialectical relation between productive forces and productive relations had been transformed into pseudo-normative propositions concerning an objective teleology in history. This was the motor force behind the realization of a reason that had been given ambiguous expression in bourgeois ideals. Critical theory could secure its normative foundations only in a philosophy of history. But this foundation was not able to support an empirical research program. (Habermas, 1987b: 382)

The concept of alienated labor was the cornerstone of the philosophy of history, which promised an illusory emancipation from the complexity of the modern division of labor. In reality, the postwar Western world was faced with the more manageable challenge of reconciling more democracy with an expanded welfare state, and fantasies of un-alienated labor merely distorted the outlines of this real historical situation. In short, the success of the welfare state rendered obsolete the analysis of alienation. In the concluding pages to the second volume of *The Theory of Communicative Action*, Habermas declared, 'this [Marx's] type of alienation recedes further and further into the background as the welfare state becomes established' (Habermas, 1987b: 349).

Habermas's ongoing reflections on the welfare state can be seen as an attempt to break out of the bleak negativity of this earlier period of critical theory whose limits were on display in the essentialism of the early Marx's conception of alienated labor. The main danger posed by the latter was its inevitable conclusion in disillusionment, all too likely to assume the form of a grim, technocratic realism leading to a roll-back of democracy and the welfare state. The emerging polarization on the West German intellectual map of the purely negative critique of Adorno, on the one hand, and Niklas Luhmann's systems theory on the other expressed the essential contours of the historical situation that was setting in with the receding of the radical tide in the 1970s.

Although only fitfully acknowledged, the problem of capitalist crisis lies at the heart of Habermas's conception of an adequate politics of modernity. Despite its obfuscation within a modified Luhmannian framework, he has often made this centrality apparent in the most straightforward terms. The aim of *Legitimation Crisis*, he wrote, was to

take up the not-yet-satisfactorily answered question 'Has capitalism changed?' in the form: Is the fundamental contradiction of the capitalist social formation effective in the same way under the forms of appearance of organized capitalism, or has the logic of crisis changed? Has capitalism been fully transformed into a post-capitalist social formation that has overcome the crisis-ridden form of economic growth? (Habermas, 1976: 31)

In some ways, the questions presupposed the answer. In this short book, Habermas sought to redefine the nature of crises in advanced capitalist societies, turning the focus away from problems of economics to ones of political and socio-cultural legitimacy. The crisis tendencies that resulted from material scarcity had been successfully eliminated and 'advanced capitalist' societies had primarily to contend with problems of rising expectations and the loss of collective meaning. The stakes of crisis were also thereby transformed. It was no longer a question of 'fundamental contradictions' pointing to the limits of capitalism but of the adjustment of post-traditional subjective expectations to the objective law of systems. Confident in the ultimate stability of the capitalist world system, Habermas concluded that objective crises had given way to subjective ones which contained no prospects of transformation to another kind of social order.

By abandoning the agenda of the critique of capitalism, which was inseparable in his view from a discredited philosophy of history, Habermas was inclined to conceive of modern society in systems theoretical terms. The proliferating complexity of modern civilization was grounded in the symbiosis of two fundamental systems: a price-mediated world economic order and expert, public and

private sector administration. In supplanting the Marxist concept of bourgeois society with this one, Habermas was led to conclude that the essential task of engaged scholars was to alert the public to the overreach of these systems at the expense of the 'life world'. An expanded notion of the life world – the realm of ordinary social experience resistant to both instrumental domination as well as radical emancipation – opened up the multiple vantage points of a democratic, post-metaphysical perspective on new forms of crisis. These were figured in terms of not just legitimacy but identity, too. Arguably, this division between systems and life worlds simply reproduced the basic form of modern capitalist society in its differentiation from the state and economy, and so inevitably failed to provide much theoretical orientation over the long period of recurring capitalist crisis that began in the 1970s.

Paradoxically, he came to this diagnosis in the context of the world economic downturn in the 1970s, which set into motion a new phase of postwar history. Here, the earlier advances of the welfare state were reversed in the face of an immense counter-offensive. Some formulations from this period of global economic turbulence exhibit a vestigial connection to the classical agenda of critical theory, which sought to lay bare the self-undermining tendencies of post-classical capitalism. I would argue that while Habermas used an older problematic of critical theory to frame the crises of the 1970s, his proposed solutions were undermined by the very terms in which he posed them. That is to say, the opposition of systems and life world eventually came to redefine the problems themselves as manageable deficits of technodemocratic 'governance', thereby concealing their deeper structural depth. The path down which his programmatic departure from critical theory led resulted in a politically debilitating skepticism toward the very idea of crisis, a notion he regarded as dependent on an imperious standpoint of critique that could only be supported by a metaphysical

philosophy of history. What even constituted a 'crisis' became all too relative:

As soon as we give up praxis philosophy's understanding of society as a self-referential subject-writ-large, encompassing all individual subjects, the corresponding models for the diagnosis and mastery of crisis – division and revolution – are no longer applicable. (Habermas, 1987a: 347–8)

Habermas was not alone in concluding that the fall of European communism had relegated Marxism as both a critique of political economy and a theory of history to the dustbin. Earlier attempts to engage with and offer an alternative to what was already seen as a tradition of declining relevance gave way to a more complete theoretical exclusion. When the problem of capitalism resurfaced in his work during the 1990s, it took the form of a 'globalization' considered in a soft-focus light as a force transcending the national framework of the now declining welfare state. But the idylls of unchallenged neoliberalism would not last long, and both in Europe and elsewhere resistance to it occasioned a new round of discourse on 'the social fracture'. With protests against austerity unsettling the EU's status quo, Habermas returned to consider the question of crisis. Closer to the present, he has entertained the possibility that financial debacles might lead to the creation of a new global 'underclass' and the reemergence of class antagonisms, which would in turn spur states to react with undemocratic and repressive measures (Habermas, 2009: 123). But the corrective measures he considered realistic were modest. They constituted more an attempt at stabilizing the course rather than changing it. Even though he has written often about the need to 'tame' capitalism (Habermas, 1987a: 362; 2009: 187, 193), this taming is no longer seen as a clear-cut solution to the problem of unbridled privatization. In the background of diagnoses of growing inequality and market turbulence stands an older experience from the 1970s cautioning against attempts to intrude too far into the domain of

autonomous systems. After all the lesson of that time is supposedly that the attempted taming of capitalism leads to the problem of taming the state, potentially leading to a spiral of disappointment and disillusionment (Habermas, 1987a: 362–3).

As evidenced by this impasse, Habermas's alternative to Marxism and its critical theory offshoot comes up against its historic limit and has simply ceased to inform any adequate political responses to it. The account offered here is meant to demonstrate the reasons for and ultimate limits of this attempt to move beyond the original conception of critical theory. The alternative to this path that led to the impasse of cosmopolitan-democratic legitimation theory might be best set forth in contrast to the viewpoints of others who came out of the Frankfurt School tradition but rejected Habermas's departures in the name of a re-conceived Marx. His straw-man characterization of the critique of political economy as a philosophy of history grounded in an essentialism of labor have always provoked critical responses. It will be useful to revisit some of these lines of criticism in order to consider what form an adequate Critical Theory might assume today amid so many signs of irrational reaction to a mounting world economic crisis of capitalism.

### 3

Marx's *Capital* has assumed a renewed significance as a theorization of a socio-economic dynamic whose contours are coming into sharper relief amid the turbulence of a neoliberalism in distress. In much the same way, Horkheimer saw Marx vindicated in the maelstrom of fascism and impending world war. Certainly, the current historical situation raises questions about the future of capitalism, as well as justifiable fears that adequate alternatives are not in play. It also raises the possibility that in the absence of such alternatives the contemporary equivalents of fascism

might be getting the wind in their sails. While contemporary interest in this work is likely to leave behind the traditions of the remnant formations of an older workers' movement, it may also have to discard previous critiques of traditional Marxism that expressed the politico-ideological preoccupations of an earlier, and perhaps now less relevant, postwar experience of 'affluent capitalism'. A new form of critical theory will likely have to pass through another round of reading Marx's *Capital*.

Habermas's dismissal of Marx assumed a programmatic form in a misunderstanding of the latter's conception of labor. The Marx that Habermas set himself against was constructed from the labor essentialism of the Paris Manuscripts, read in the light of Adorno and Horkheimer's quasi-Weberian understanding of labor as instrumental reason. The dialectic by which the Enlightenment as a figure of capitalist rationality led to fascism was a *transhistorical* logic: the emancipation of man from the coils of a mythically shrouded nature takes the form of a progressive domination of nature by the powers of social labor, but also of a second nature of inexorable compulsions – i.e. autonomized, alienated powers which hold human beings in thrall, and which demand to be appeased by destructive sacrifices. The latter conception was already implicit in *History and Class Consciousness*, arguably the Ur-text of a later critical theory. According to Simon Clarke, the roots of the impasse of classical critical theory go back to its Lukácsian origins:

For Lukács reification was the product of the Weberian process of rationalisation. However, in Lukács's own account it is not clear whether reification is the product of the subordination of reason to the power of capital, or whether it is the product of 'instrumental reason' in itself. The former interpretation would take us back towards Marx, locating the source of reification in alienated labour and the fetishism of commodities. The latter interpretation, which was that of the Frankfurt School, would seem to take us back to the Weberian dilemma, for if rationality is an essential achievement of humanity, and reification

a necessary result of the advance of Reason, alienation would appear to be the inevitable price of progress. The critique of alienation could then be no more than a contemplative moralistic critique. (Clarke, 1982: 248)

Here it is not so much the Young Marx that lies at the root of an ideological misconception of modernity, but rather Max Weber whose somber vision of a disenchanted world of power politics, soulless bureaucracy, and efficient markets haunted his erstwhile followers of the Left. But one might say that the failure to grasp the historically specific social relations entailed by Marx's conception of labor in its relation to value led to a conflation of his overall conception of capitalism with its Weberian counterpart. In other words, Marx's conception of labor was identified with a transhistorical conception of instrumental rationality that converged with the Weberian vision of Occidental history as subject to an inexorable instrumental rationalization.

Arguably, this Weberian conception applies to Habermas, too, who accepted classical critical theory's misinterpretation of the category of labor in Marx, understood as the domination of nature by man (Postone, 1993: 108). Habermas followed Adorno and Horkheimer in concluding that for this very reason labor could no longer offer the vantage point of a critique of damaged social life, he argued that this in no way warranted their historical pessimism, for there was an alternative to be explored in the transhistorically more decisive evolution of forms of non-instrumental communication.

Clarke's genealogy of this ideological concept of labor raises the question of the form contemporary critical theory could assume if it arose from a more defensible reading of Marx's later economics. Much of the contemporary theoretical interest in the latter is focused on its seemingly foundational value concepts, while more empirically oriented studies of the crisis dynamics of contemporary capitalism tend to avoid the subject altogether. I will conclude by considering

what is missing in these two opposed forms of the contemporary Marxist theorization of capital. The current scene is far too varied to sum up in this perfunctory way, exhibiting complicated alignments to older traditions of Marxism with their distinct notions of crisis, but for the purpose at hand it might be useful to frame the problem more narrowly.

Moishe Postone is arguably the leading representative of an orientation which sees Marx as providing a theory of value as a form of social power wholly mystified by its appearance in merely 'surface' economic categories. His well-known reconstruction emerged from the contentions occasioned by the *Neue Marx-Lektüre*, the path-breaking German Marx reception of the 1960s and 1970s. The intellectual and political diversity of this formation with regard to the problem of the causes and forms of capitalist crisis will not be addressed here. While the writings of Postone cannot be seen as representative of this larger formation of the *NML* or the so-called Wertkritik, I will focus on them here first because in the United States they have set the politico-ideological mold for English speakers interested in this largely German body of work. The art historian Sven Lütticken succinctly conveys a common denominator of the latter in broad contrast to a more combative reading of the *Grundrisse* emerging at the same time in Italy.

In contrast with the operaist insistence on the historical primacy of working-class struggle, and the subsequent autonomist emphasis on the proletariat or multitude as a potential revolutionary subject, the value critics side with 'Marx no. 2', the theorist of the value form and of abstract labour. They approach value itself as an 'automatic subject', engaging with capitalism's intrinsic logic. This automatic subject of value is pitted as being primary against that of the working class and its struggle against the perversion of work as human activity into alienating abstract labour. (Lütticken, 2016: 114–15)

Postone sets forth his proposed reconstruction of Marx as a critique of not only the 'dead end' of the form of criticism epitomized by

negative dialectics but also Habermas's alternative to it. *Time, Labor and Social Domination* explicitly raises the problem of a critical theory that would provide the basis for an adequate social response to the dynamic of capitalist development. Habermas's false solution to the pessimistic impasse of Adorno and Horkheimer's dialectic of enlightenment lies at the center of his account just as it does in the one offered here. Against Habermas, Postone (like Clarke) is at pains to point out that the labor being referred to in Marx's *Capital* cannot be understood in terms of a transhistorical philosophy of history, understood as either a liberating or enslaving dialectic of instrumental rationality. Rather, the concept of value producing labor has to be understood as a social relation specific to capitalism within which a historically unique pattern of development unfolds. Value producing labor is

a function of 'abstract' and 'objective' social structures, and represents a form of *abstract, impersonal domination*. Ultimately, this form of domination is not grounded in any person, class or institution; its ultimate locus is the pervasive structuring social forms of capitalist society that are constituted by determinate forms of social practice. Society, as the quasi-independent, abstract, universal Other that stands opposed to the individuals and exerts an impersonal compulsion on them, is constituted as an alienated structure by the double character of labor in capitalism. (Postone, 1993: 159)

'The double character of labor' is understood as a socio-economic compulsion to produce an ever-greater amount of concrete wealth in the form of abstract economic value. The latter is the form that wealth assumes when subject to the time logic of the maximization of output. It is thus these compulsions and not class inequality or recurring economic crises that are the 'ultimate grounds of unfreedom in capitalism', according to Postone (Postone, 1993: 127). It is not class exploitation and conflict, but these objective compulsions that characterize the core reality of capitalism.

Marx's interpretation of the historical Subject with reference to the category of capital indicates a shift from a theory of social relations understood essentially in terms of class relations to a theory of forms of social mediation expressed by categories such as value and capital ... the historical Subject analyzed by Marx consists of objectified relations, the subjective-objective categorial forms characteristic of capitalism, whose 'substance' is abstract labor, that is, the specific character of labor as a socially mediating activity in capitalism. (Postone, 1993: 76)

On this basis, Postone rejects that an adequate critique of the internal logic of capitalism can be grounded in the ostensibly egalitarian distributive ideals of bourgeois society which he claims stem from the same logic of the value form. Value producing labor in the so-called 'abode of production' is what gives rise to the so-called vantage point of the proletariat, a perspective which remains wholly subsumed by the capitalist totality. Accordingly, the notion that emancipation entails the dis-alienation of labor is an incorporated standpoint offering only a chimerical horizon. The point is not to liberate labor but to abolish it: 'Marx's assertion that capital, and not the proletariat or the species, is the total Subject clearly implies that the historical negation of capitalism would not involve the *realization*, but the *abolition*, of the totality' (Postone, 1993: 79).

Werner Bonefeld has criticized what he regards as Postone's hypostatization of capital conceived as the totalizing Subject of modern history. He argues that there is a dimension of labor as free human practice that Postone is incapable of accounting for, and which forms the indispensable point of departure for any adequate opposition to capitalist society: 'the critique of capital has to show the human content, however perverted and debased, of the capitalist constitution of social existence' (Bonefeld, 2004: 118). Bonefeld argues that Postone seeks to theorize the coercive objectivity of the capitalist totality without taking into account how this encompassing mediation of the value form presupposes the division of society

between buyers and sellers of labor power and thus the class antagonism between them. He underscores his point with an illuminating reference from the *Grundrisse*: 'already the simple forms of exchange-value and of money latently contain the opposition between labour and capital' (Bonefeld, 2004: 121, quoting Marx's *Grundrisse*, p. 248).

Michael Heinrich criticizes Postone's claim that the forms specific to the sphere of capitalist circulation are less essential and are merely the distorted surface manifestation of a value logic operative in the social organization of production. Marx's whole conception of value mediated social reproduction offers an integrated account of the interpenetration of these two spheres. Heinrich underscores the contemporary relevance of this dual perspective in approaching the financial dimensions of capitalist globalization.

The dynamic of capital cannot be grasped solely in terms of the sphere of production. Rather, the unity of production and circulation is always the precondition of this dynamic. That is particularly valid for an understanding of those processes which have been dealt with in the last decade under the keyword 'globalization' and in which an internationalized financial system plays a central role. (Heinrich, 2015)

Both Bonefeld's and Heinrich's criticisms of Postone inform my conception of the missing dimensions of contemporary Marxism when conceived as a critical theory. In what follows, I will draw on these two lines of critique and attempt to integrate them into an account of how Postone's conception of capitalism's dynamic of development forecloses a deeper investigation into the structural crises of capitalism and consider the political implications of this foreclosure.

In a recent essay, Postone contrasts his conception of the core of Marx's theory of capitalism with the more empirically oriented accounts of the economic crisis that began with and unfolded over the course of the so-called neoliberal period (Postone, 2007). He uses the work of Robert Brenner, David Harvey and Giovanni Arrighi as examples to

demonstrate what he argues is missing in the-  
orizations of capitalism that do not grasp the  
critical social theory entailed by value con-  
cepts. Since the objective of this chapter is  
to raise the problem of what might constitute  
the basis of an adequate form of critical the-  
ory for the present, Postone's essay provides  
an illuminating staging ground in which vari-  
ous alternatives can be set forth.

While Postone praises Brenner's work,  
*The Economics of Global Turbulence* in par-  
ticular, for debunking certain fallacies about  
the current financial crisis, he also claims that  
the latter's focus on crises of overproduction  
is related to a crucial limitation in his under-  
standing of capitalism:

Brenner's analytic point of departure is a traditional  
Marxist emphasis on the unplanned, uncoordi-  
nated and competitive nature of capitalist produc-  
tion. That is, at the core of his analysis of the long  
downturn are the notions of uneven development  
and competition ... The focus of such a critique of  
capitalism, in other words, is essentially the mode  
of *distribution*. (Postone, 2007: 12)<sup>2</sup>

Postone argues that the focus on distribution  
fails to grasp the totality of capitalism as a  
system, and that this kind of analysis remains  
mere economic analysis or political economy  
rather than an elaboration of Marx's critique  
of political economy. The identification of  
the sphere of distribution with 'economics'  
follows from Postone's relegation of capital-  
ist competition to a reified form of the  
appearance of an underlying social logic.

Notions such as competition and uneven develop-  
ment, along with categories central to Brenner's  
analysis, such as profit, fixed and circulating capi-  
tal, however, are categories of economy; that is,  
they are categories of the surface that do not  
adequately grasp the fundamental nature and  
historical dynamic of capitalism as a historically  
specific form of social life. (Postone, 2007: 11–12)

Simon Clarke has also taken issue with  
Brenner's prioritization of competition, from  
a related but different perspective. In contrast  
to Postone, for Clarke the core of Marx's  
conception of capital is *surplus value*. He

argues that the concept of surplus value inte-  
grates the class exploitation at the heart of  
capitalism into an account of its historical  
pattern of development.

[T]he deficiency of his [Brenner's] analysis is that it  
remains at the level of the forms of appearance of  
the crisis tendencies, without even attempting to  
relate those forms of appearance to the underlying  
dynamics of the capitalist mode of production as a  
system based on the production and appropriation  
of surplus value. (Clarke, 1999: 57)

Clarke argues that by ignoring the concept of  
surplus value as integrating class exploitation  
to a pattern of socio-economic development,  
Brenner's account ends up focusing on  
the inessential effects of competition on the  
returns to investment in fixed capital. He  
argues on theoretical grounds that the defla-  
tionary effects of competition for market  
shares on profit rates could not have resulted  
in 'the long downturn' in world capitalism  
that Brenner assumes has been operative  
since the 1970s. Although Clarke, Bonefeld  
and Postone all regard as dubious the assump-  
tion that capitalism's forward march could be  
thwarted by a crisis of 'overproduction',  
Clarke situates his criticism of Brenner  
within a wider claim regarding overproduc-  
tion as innate to capitalist development rather  
than as an exceptional phenomenon specific  
to periods of manifest crisis. According to  
Clarke, Brenner's account narrowly focuses  
on the crisis of manufacturing profit rates in  
the advanced economies, and so ends up pre-  
senting the dynamic of deindustrialization as  
if it was a general crisis in the capitalist  
system as opposed to an ordinary conse-  
quence of its pattern of development. 'The  
tendency to overproduction', he writes, 'is  
not only a feature of manufacturing industry,  
it is inherent in capitalist accumulation and  
so is characteristic of every branch of pro-  
duction at all times' (Clarke, 1999: 64).

Thus for Clarke, the attempt to theorize the  
contemporary history of capitalism through a  
focus on manufacturing is incapable of pro-  
viding an analysis of contemporary 'global

capitalism' in which the manufacturing sector forms a declining portion of the value of total output (Clarke, 1999: 62–4). Brenner seems to share Marx's assumption that the industrial production of use values exhibits a productivity dynamic that is not at work to the same extent in other sectors of the economy. Marx identified this productivity dynamic at work in capitalist industry with the concept of 'relative surplus value', specifying the condition of possibility of an economy-wide process of capital accumulation, a condition which holds even as industry proper comes to absorb a diminishing share of the labor of society. On Marx's assumption, it would seem warranted then to identify the causes of a more general crisis of accumulation in the specific characteristics of profitability and investment in this sector.<sup>3</sup>

Although Postone's conception of capitalism denies the significance of crises as manifestations of internal limits to its ceaseless perpetuation, both Clarke and Bonefeld regard crises as central to understanding its essential structure. But the latter argues that Brenner inverts the order of determination between the class relations that allow capitalists to pump out surplus labor from workers and the competitive struggle over the distribution of these spoils. The latter logically cannot be the source of a crisis except for its effect on the former, because provided that the rate of exploitation holds up, the amount of surplus value remains the same regardless of the state of competition. Overproduction can result in crises of accumulation only through its effects on the rate of exploitation, the rate of surplus value.

In this respect it [the tendency to overproduction] is the most fundamental tendency of the capitalist mode of production, for it underlies the permanently antagonistic form of the social relations of capitalist production as the capitalist is compelled to hold down wages, to intensify labour and to extend the working day. (Clarke, 1999: 71)

Bonefeld makes the same argument at a more general level: 'The competition between

capital and capital is then founded on the relations of exploitation. These relations cannot be derived from the "logic" of competition – the relationship of capital to capital presupposes the exploitation of labour as the foundation of surplus-value production' (Bonefeld, 1999: 12).

In fact, Bonefeld is categorical on this point, going so far as to assert that Marx did not have a theory of competition nor a theory of crisis, although he did provide a conceptualization of the category 'competition' as a manifestation of a more fundamental social relation of class exploitation (Bonefeld, 1999: 7). Bonefeld and Clarke's critiques of Brenner underscore the complex problem of the order of determination between these levels of conceptualization and the levels of structural determination to which they refer. However, in Volume 3 of *Capital*, Marx offered a detailed account of the formation of capitalist prices of commodities under conditions of competition raising the problem of their deviation from the quantities of labor expended in their production. For all the differences between them Postone, Bonefeld and Clarke distinguish the value (or surplus value) logic of capitalism from the process of competition. One reason contemporary Marxists may have for downplaying or ignoring Marx's own account of the competitive dynamics of price formation and the resulting formation of a general rate of profit is that they have wanted to avoid the thicket of the so-called 'transformation problem' of values into prices, regarding it as unsalvageable.

The claim that competition is not central to the logic of capitalism goes back to the beginning of the twentieth century. Since that time, many Marxists have subscribed to the belief that liberal competitive capitalism had at some point been superseded by a state capitalism. In an earlier period, it was assumed that if capitalism was ceasing to be an exchange, and more specifically, a competition mediated economic system, it was justified to bypass the value level of analysis. It followed that there was no longer much point

in referring to a socio-economic dynamic of valorization unfolding beneath the surface of monopolistic prices and distributions of income. I would argue that the very notion of 'state capitalism' – although useful and perhaps unavoidable as a term designating the military Keynesian regimes of the era of inter-imperialist warfare – is incompatible with the socio-economic logic of value production, which is a system of production for exchange whose cell form is the commodity.

The dominant forms of contemporary capitalism in the neoliberal era so manifestly depart from the institutional characteristics of what was once called state capitalism, and indeed, few contemporary critics of competition centered accounts of capitalism base their case on its existence. In fact, Clarke makes it clear that the scope of state involvement in the operations of a capitalist economy is tightly circumscribed.

The state, in the first instance through its fiscal and monetary policies, can clearly have an impact on the course of accumulation, and these policies are accordingly the object of class and political struggles. However, state intervention is necessarily confined within the limits of the contradictory form of capitalist production which appears in the inherent tendency to over-accumulation and crisis. The state can pursue expansionary policies, in order to avert the threat of stagnation, recession or a deflationary collapse, but at the risk of stimulating the inflationary over-accumulation of capital which carries with it the threat of an even greater crisis. Equally the state can contain the threat of inflation by restricting the growth of credit, but at the risk of stagnation, recession or depression. (Clarke, 1999: 70)

Roughly this conception of the scope and limits of state intervention runs through Brenner's account of the vicissitudes of the Long Downturn. Putting aside the details of his account, I would argue that despite the fact that it avoids the terminology of value theory, Brenner's conception is close to Marx's account of how the logic of valorization and its manifestation operates through the compulsory mediation of competition. Marx saw competition and valorization as

moments of the same socio-economic process presupposing the reproduction of the capital–wage labor relation at its heart. Competition leads to the centralization of capital in fewer and fewer hands but also counteracts this build up through the 'devalorization' inflicted by innovators on incumbent capitalists (Marx, 1971: 311–12). This ongoing augmented accumulation of surplus value through devalorization imposed on the defeated is the ultimate expression of the separation of labor from the conditions of labor – that is, the social relation that constitutes capital in the first place:

It is this separation which constitutes the concept of capital and of *primitive* accumulation, which then appears as a continual process in the accumulation of capital and here finally takes the form of the centralization of already existing capitals in a few hands and of many being divested of capital. (Marx, 1971: 311–12)

It is this conception of competition as co-constitutive of capitalist social relations that Brenner's critics dispute. For all of them, the focus on cost competition for market share removes a more essential, underlying logic of valorization or surplus valorization from consideration. Here it might be important to recall Heinrich's claim that Marx's conception of capital integrates the categories of circulation with those of production in order to see why this either/or alternative does not follow. Much of the debate between Brenner and his critics seems to hinge on an unwarranted, indeed metaphysical, dichotomy between an underlying 'essence' and the outward 'forms of appearance' of the capitalist system. While this terminology can be illuminating, it has often been deployed by Marxists in a manner that denies the significance of concrete theorizing of the history of capitalist crisis – i.e. problems relegated to a supposedly 'surface' level. To put it in very general terms, what Marx referred to as the 'forms of appearance' – prices, costs, revenues – of the sphere of circulation (c-m-c, m-c-m') are not mere expressions of an

underlying, 'essential' dynamic of value production, but rather mediate the latter throughout even while coming into periodic contradiction with the forward movement of this dynamic. Indeed, the whole point of the opposition of these two levels – 'underlying dynamic' versus 'surface' categories – is to identify capitalism's staggering crisis-propelled course of development, a course that tends to undermine its conditions of perpetuation over the long term.

The problem of the long-term limits and breakdown of capitalist development was clearly a central concern of Marx's and the main currents of Marxism that came after him. Of all Brenner's critics, Postone is the most explicit in rejecting precisely the idea of capitalist breakdown, which he regards as the necessary implication of crisis theory. For Postone, the so-called limits of capitalist development are never reached. The supposed obstacles to its perpetuation (diminishing profit rates, overproduction, etc.) are merely ordinary expressions of the labor-time reducing tendencies of development.

Far from being primarily a means of explaining crises, then, the theorem of the tendency of the rate of profit to fall, as reworked by Marx, expresses, indirectly, a process of the ongoing structuring and restructuring of social life, one marked by a growing gap between the actual structuring of labor and of social life and the way they could be structured in the absence of capital. Marx transforms a political-economic theorem – which many have taken as an indication of the economic limits of capital – into the surface expression of a more fundamental historical dynamic. (Postone, 2007: 17)

One consequence of relegating the crisis tendencies of this socio-economic dynamic to the status of an inessential surface phenomenon – i.e. rejecting the view that it contains self-undermining tendencies – is that it undermines the possibility of an immanent critique of the social totality, and ends up consigned to an ethical rejection framed in terms of the opposition between what is and what could be. Postone comes close to conceding this point.

The thrust of his [Marx's] critique is less to 'prove' the inevitable economic collapse of capitalism than it is to uncover a growing disparity between what is and what could be, one that constitutes the objective/subjective conditions of possibility of a different ordering of social life. (Postone, 2007: 17)

The argument I am advancing begins from the assumption I share with Postone that Habermas's alternative was unable to inform an adequate emancipatory politics and devolved into a normative theory of justice. Postone's critique of Habermas paradoxically ends up with a politics that does not look too different from the latter's version of a mature liberalism open to continuous progress. The reinstatement of the old liberal distinction between 'is' and 'ought' – facts and norms – stemmed from the same conception of capitalism that led to the aporias of the late Frankfurt School (Postone, 1993: 226–60). Michael Heinrich has offered a reason why Postone's critique of Habermas's conception of capitalism ended up nonetheless reproducing the latter's conception of politics.

That which Postone correctly regards as a strength of Marx's analysis of capital – namely that Marx's concept of capital is not limited to a specific historical configuration, but rather that capital is a social relationship connected to various historical configurations – he does not appear to apply in the same manner to the state. This missing categorical analysis of the state thus makes it possible for Postone to write in an uncritical manner about democracy and democratic self-determination. Postone, who convincingly criticizes the ahistorical conception of economic categories, appears in contrast to share an ahistorical conception of democracy. (Heinrich, 2015)

Arguably, this ahistorical conception of the political is what lies behind the reinstatement of a normative conception of politics. Going back to Hegel, the 'critical' view has been that the subjective impetus of radical social change could not be grasped within the terms of this opposition of is and ought. For Lukács, class consciousness was the activation of the experience of the crisis tendencies of capitalism's dynamic of development. The moribund predicament of critical theory and

its various aftermath formations arguably arose from the destruction of this vantage point. I would argue that a contemporary form of critical theory would have to address this problem of this now abandoned vantage point of totalization, as the world dimensions of the contemporary crisis of capitalism urgently call for an adequate political response beyond the scope of normative theories of justice,

Postone, Bonefeld, and Clarke rightly insist that Marx's value concepts are the key to identifying capitalism's core logic of social domination, and that the focus on these concepts as the basis of a critical theory is a useful corrective to the tendency of more empirically oriented Marxist economists to ignore this dimension of analysis altogether. The latter often assume that this value level of the theory raises metaphysical questions that do not contribute to an understanding of the actual economic process. The opposition of the respective blind sides of these two forms of contemporary Marxism suggests the need for integrating perspectives. Perhaps notions of value so sharply distinguished from their forms of appearance have been imperfectly conceived, while the various conceptions of an unfolding capitalist crisis lacking this underlying value dimension are in significant respects empirically deficient.

A truly adequate form of critical theory would aim for the integration that Marx strove for on both intellectual and political grounds. The current English language reception of the tradition of Wertkritik is a welcome development, but I would argue that most people reading *Grundrisse* and *Capital* today are looking for a theorization that will situate the current era of capitalism within a broader account of its history up to its outer limits of development. The rebound of capitalism after the Second World War and then again amid the onset of a long era of crisis beginning in the 1970s has for a long time discouraged many Marxists from addressing the possibility that the capitalist system may never experience another age of expansion.

What are the political and geopolitical consequences of that going to be? This situation should invite thoughtful comparisons to the setting of Horkheimer's original essay.

## Notes

- 1 I have written in more depth on these topics in 'The Vicissitudes of Critique: The Decline and Reemergence of the Problem of Capitalism' (Kim, 2014).
- 2 'Characterizing notions such as competition and uneven development and categories such as profit as surface phenomena, expresses a position that regards categories such as commodity, value, and capital as those of deep structure' (Postone, 2007: 12).

# Neoliberalism: Critical Theory as Natural-History<sup>1</sup>

Charles Prusik

In his 'Reflections on Class Theory', Theodor Adorno argues that only in 'its blind anonymity could the economy appear as fate' (Adorno, 2003: 110). Economics is the science of the abstract laws that govern society. Throughout the history of classical political economy, and extending beyond throughout the many traditions of economic thought, the 'economy' has been analyzed from the standpoint of natural necessity – often in abstraction from its social and historical content. Following Marx's immanent critique of classical political economy, Adorno's materialism does not posit an alternative economic theory of society, but rather negates the form of capitalist relations in their naturalized appearance. His *Negative Dialectics* (1966) is not an economic theory of society – it is the critique of society in its reduction to abstract economic necessities.<sup>2</sup> Although his materialist analysis of society is situated historically within the Fordist phase of state managed capital, in the following chapter I argue that his dialectical framework of

'natural-history' [*Naturgeschichte*], can be developed to recontextualize the contemporary order of neoliberal capitalism for its critique (Adorno, 2006: 252).<sup>3</sup>

Under neoliberalism subjects confront a society dominated by the circulation of abstract quantities. The seemingly random play of market prices and evaluations mediates subjects who in turn, internalize this mediation as an objective form of rational authority. Facing the inscrutable dynamics of market forces, the subject finds herself cast into an environment characterized by the preponderance of uncertainty and disorder. Neoliberalism, which is both continuous and discontinuous with the Keynesian period of state managed capitalism it has superseded, is irreducible in its historical trajectory to economic laws. Although the neoliberal period has been characterized by fundamental transformations to the structure of capitalism, its specific form of political power also depends upon the rational form of appearance it manifests.<sup>4</sup> Neoliberalism

is a political project grounded in the claim that the ‘self-regulating market’ is the most rational subject for the coordination of society. An immanent critique of neoliberalism, therefore, cannot resist its logic in a one-sided fashion on the basis of an alternative metaphysics of economic nature, but negates the appearance of economic relations in their appearance as natural laws. By delineating the logic in which the self-regulating market appears as the necessary form of organization for society’s future, this chapter will suggest that the neoliberal project depends upon the false naturalization of economic concepts and categories for its reproduction. Moreover, I argue that the neoliberal attempt to determine the economy as an epistemological subject – with a concept of ‘information’ as its key commodity definition – is the fetish form of market relations in their abstraction from society. By reconstituting Adorno’s materialism, I argue that his dialectical framework of natural-history can provide a critical frame of reference, within which further specifications of neoliberalism’s history and logic can be grasped.

## THE IDEA OF NATURAL-HISTORY

Adorno’s idea of natural-history defies straightforward categorization. Delivered to the Frankfurt chapter of the *Kantgesellschaft* in 1932, his lecture is a critical intervention into an array of philosophical debates regarding historiographical methodology within the schools of neo-Kantianism and neo-ontology of the period.<sup>5</sup> The idea of natural-history is Adorno’s first major attempt to formulate a method of materialist criticism that would liberate dialectics from its function in the dogmatic systems of dialectical materialism and historical materialism.<sup>6</sup> By ‘natural-history’ Adorno is not referring to the ‘history of nature’ in the sense of a developmental, linear, or evolutionary account of natural process. Nor does his concept of

nature refer to the objects of ‘natural science’ (Adorno, 2006: 252). The concepts of nature and history refer to a dialectical antagonism in which both concepts are ‘mediated in their apparent difference’ (Adorno, 2006: 253). For Adorno, nature is frequently understood in the sense of ‘myth’ – i.e., a cosmology of timeless order, cyclical invariance, and preordained fate. Mythic nature, he suggests, signifies ‘what has always been, what as fatefully arranged predetermined being underlies history and appears in history, it is substance in history’ (Adorno, 2006: 253). Mythic nature in this sense, is *atemporal*. The concept of history, however, refers to the human capacity to constitute new social forms through practices that are mediated by nature.

Following Walter Benjamin, who argues in *The Origin of German Tragic Drama* (1928) that nature can be interpreted historically in its expression of temporal unfolding, Adorno rejects mythic affirmations of nature. Rather than isolating an ontological layer of reality as the most substantial moment underlying historical development, Adorno’s dialectical form of analysis interprets nature and history in their mediated objectivity. Against traditional Marxism, which posits a concept of labor as the transhistorical substance of wealth underlying history, Adorno’s materialism historicizes the category of nature in a manner that is specific to the form of capitalist society. The idea of natural-history captures historical transformation in its dependency on nature without reifying a static concept of nature underlying historical development. For Adorno, history mediates nature – nature is marked by the dynamism of human practice. By interpreting the phenomena of society through the prism of natural-history, Adorno’s method aims to decipher forms of domination in the moment of their appearance as natural necessity.

In addition to the influence of Benjamin, whose micrological analyses of commodification informed Adorno’s work, the idea of natural-history also draws from Georg

Lukács' category of 'second nature' as it appears in his *The Theory of the Novel* (1920).<sup>7</sup> By second nature, Lukács suggests that the alienated form of capitalist society crystallizes into a meaningless sphere of 'convention' – a habitual context of commodification that opposes subjects in the form of an inscrutable 'cipher' (Adorno, 2006: 262). Lukács' category of second nature refers to the 'petrification' of socio-cultural forms – a process in which socially constituted relations assume the appearance of natural necessity. But unlike Lukács, who suggests that the concept of second nature cannot be deciphered, Adorno treats second nature as a form of 'semblance' [*Schein*], that expresses alienated social relations in their inverted form (Adorno, 2006: 267). Adorno's idea of natural-history interprets the commodity as a symbolic form of social domination that inscribes subjectivity in a process of objectification. By integrating Lukács' category of second nature into Benjamin's micrological analysis of commodification, Adorno mobilizes the idea of natural-history for a critical interpretation of the reification of capitalist relations.<sup>8</sup>

Having delineated the conceptual logic of Adorno's idea of natural-history, I would like to specify the potential for developing this dialectic as a frame of reference for a critical theory of the categories of neoliberal economic thought. This specification, however, requires a preliminary analysis of classical political economy in order to contextualize the historical emergence of the neoclassical and neoliberal paradigms that form the contemporary orthodoxy of economics. The dialectical framework of natural-history, I want to suggest, can be used to criticize the science of economics, because the very concept of economic value these traditions formalize depends upon its abstraction from socio-historical transformation. By isolating value as an objective and law-like category that organizes life, the science of economics abstracts its laws from their social content, thereby implicitly postulating a mythic

concept of nature in its identity to 'the economy'. Consequently, the fundamental institution of neoliberalism's political project – the self-regulating market – assumes the appearance of an immanently self-organizing principle, and necessary fate for the coordination of society.

## CLASSICAL POLITICAL ECONOMY

The classical political economy of Adam Smith and David Ricardo divided the economy into three spheres of activity: production, exchange, and consumption. Economic value, they argued, could be understood as an invariant substance underlying the transformations of society.<sup>9</sup> In order to articulate the necessary 'laws' at work in the conservation of this invariant substance, classical liberal economists resorted to a metaphor – value was treated as though it were physical energy (Mirowski, 1989: 142). Relying on the Cartesian assumptions upon which their understanding of physics rested, Smith constructed a vision of economic growth where value remained constant throughout its circulation (Mirowski, 1989: 164). Economic laws resemble physical laws in *The Wealth of Nations* (1776): the 'natural course' of economic life tends toward a point of 'equilibrium' throughout the movement of commodities (Mirowski, 1989: 216). As Thorstein Veblen commented, 'the resulting economic theory is formulated as an analysis of the "natural" course of the life of the community, the ultimate theoretical postulate of which might [...] be stated as some sort of law of the conservation of economic energy' (Veblen, 1919: 280). Metaphors of balance, motion, and energy thus came to function in the formation of political economy as a science of necessary laws – and by extension, to the naturalization of the constituent social relations, practices, and institutions of capitalism.

## THE MARGINALIST REVOLUTION

If the classical economics tradition modeled its articulation of value on the basis of the economy's resemblance to external nature, the neoclassical tradition displaced the quasi-objectivity of value onto the individual subject. Beginning in the 1870s, the 'Marginalist Revolution' began as a departure from classical liberalism by defining value as 'utility' – i.e., the satisfaction of the buyer's desire in consumption (see Ferguson, 1969: 1–11). Through purely mathematized formalizations of the law of supply and demand, thinkers such as William Stanley Jevons, Léon Walras, Vilfredo Pareto, and Francis Edgeworth devoted their efforts to treating economic behavior as a science.<sup>10</sup> Defining economics as 'the science which studies human behavior as a relationship between ends and scarce means which have alternative uses', the neoclassical tradition understood the market as a means to distribute goods under conditions of constraint (see Robbins, 1932: 15). Grounding their formulae in the assumption of a narrowly defined category of rational economic behavior, neoclassical economists attempted to identify degrees of pleasure as 'utils' – i.e., the representation of the degree of satisfaction derived from the consumption of a commodity. Rather than understanding value as the result of objective laws belonging to external nature, neoclassical economists developed their concept of value as being intrinsic to the subject's rationality. However, in order to mathematize the internal preferences that influenced the movements of supply and demand, they were required to conceptualize the individual subject as an objectively mechanical, universal, and causally determined agent.

Because the Marginalist Revolution was overt in its attempt to formalize market laws in abstraction from their social content, merely indicating the ideal form of its assumptions is not sufficient for its critique. As Simon Clarke argues, the marginalists 'did not deny

the specific socio-historical character of capitalist social relations', but used its abstractions as political policy prescriptions of society (Clarke, 1991: 163). It is not enough therefore, for a critique of neoclassical economics to simply identify its abstractions as illegitimate – the critique must show how its abstractions are expressions of the irrational form of capitalist social relations. The tradition of 'subjective economy', as Adorno suggests, is 'essentially an analysis of market processes in which market relations are already presupposed' (see Adorno, 1997: 511). The critique of neoclassical economics, then, neither accepts nor rejects the intelligibility of the rational subject as the foundation of market equilibrium, but rather shows how its concept is expressive of a social reality it cannot grasp.

Rather than positing nature as the unchangeable foundation upon which the economy interacts, neoclassical economics appeals to a metaphysics of nature as the substance of the economy. As economic historian Philip Mirowski has demonstrated in detail, marginalists such as Jevons, Walras, Pareto, and Edgeworth explicitly modeled their concept of utility on the formal models of energy physics prior to the Second Law of Thermodynamics (Mirowski, 1989: 193–275). In open defiance of any interaction with psychology, philosophy, or anthropology, neoclassical thinkers defined rational behavior in purely mechanical and deterministic terms. As Walras famously insisted in his *Elements of Pure Economics* (1874), 'the pure theory of economics is a science which resembles the physico-mathematical sciences in every respect' (Walras, 1954: 71). But if the laws of the individual's behavior follow the objective laws of external nature, the subjective standpoint of a marginal utility of value recoils, paradoxically, in the determination of the subject as an objective principle. The concept of utility, Mirowski argues, is modeled in detail on potential energy.<sup>11</sup> The implicit assumption of this category is that individuals truly are rational maximizers of utility in

every instance. By identifying the subject's utility with the principle of invariance that underlies economic change, neoclassical economics circumscribes the subject as the principle of objective necessity in the market's tendency toward general equilibrium.

The free market, in this paradigm, could be said to function as Adorno puts it: 'as one vast analytic proposition' (Adorno, 2003: 95). The positivistic projection of mathematized axioms onto social forms inscribes the sphere of human practice in an homogenous space of necessity. But the coherence of this projection depends upon a series of assumptions regarding the nature of rational behavior: (1) neoclassical economics assumes that subjects possess rational preferences under conditions of market competition; (2) it assumes that subjects maximize their utility preferences in an identical form; (3) it assumes that subjects possess all available information regarding prices (see Weintraub, 1993). Categories such as wages, rent, and profit therefore, become disassociated from their function in class relations and become natural categories that express the scarcity of resources alone. Moreover, the neoclassical concept of rationality is posited in the absence of any concept of cognition; free will appears in inverted form, as the determined movement of subjects in their reaction to prices.

Beyond the theoretical problems associated with modeling the laws of market equilibrium through an analogy of energy and utility, a dialectical interpretation of the neoclassical paradigm negates the naturalized categories of economy in their inverted appearance.<sup>12</sup> As the rational instrument that allocates resources efficiently, the category of the free market recuperates a concept of mythic nature in its seeming stability. As Clarke writes, 'It can only make economics a "natural science" because it "naturalises" the fundamental economic relationships of capitalist society' (Clarke, 1991: 110). By projecting the attributes of natural being onto the constituents of socio-historical being, the market appears in its abstract identity to a

transhistorical concept of economic growth. Neoclassical theory falsely reconciles the structural disparities history bears within itself. As an expression of the abstract character of the commodity, and the mediating network of exchanges that harness individuals to the general form of value under capitalism, market processes assume the appearance of objective laws.

## THE RATIONAL IRRATIONALITY OF EXCHANGE

For Adorno, the naturalization of economic laws arises through the exchange relation, which not only mediates subjects by the general form of value, but also constitutes a process of abstraction in reality. Following Alfred Sohn-Rethel, who defined commodity exchange as a process of real abstraction that determines subjectivity as the form of social synthesis, Adorno's work develops a theory of subjectivity that is intrinsic to the specificity of the commodity form under capitalism.<sup>13</sup> Grounded in Marx's understanding of the 'double character of the commodity', Adorno develops the exchange relation in terms of the contradiction between use-value and value. The process of abstraction in commodity exchange results, then, in the appearance of value as an autonomous and objective law. As Adorno suggests in his 1962 seminar on Marx:

It is characteristic of commodity economy that what characterizes exchange – i.e., that it is a relation between human beings – disappears and presents itself as if it was the quality of the things themselves that are to be exchanged. It is not the exchange that is fetishized but the commodity. That which is a congealed social relation within commodities is regarded as if it was a natural quality, a being-in-itself of things. (Adorno, 1997: 507–508)

The natural lawfulness of society is the expression of value in its abstraction from use as well as its realization in exchange.

The appearance of value therefore, when it assumes the form of a property of a thing, can be understood as the necessary outcome of the exchange abstraction. The concept of commodity fetishism, Adorno argues, 'is nothing but this necessary process of abstraction' (Adorno, 1997: 507–8). The consequence of this process of abstraction is that the 'commodity no longer appears as a social relation but it seems as if value was a thing in itself' (Adorno, 1997: 507–8). The capitalist system, therefore, gives rise to a form of abstract conceptuality, characterized by the disappearance of objective social relations in the appearance of exchangeable commodities.

Marginal utility theory can be understood as the theoretical reflex of commodity fetishism. The idealization of market relations in neoclassical theory is the expression of the generalization of the exchange relation, where commodities assume the appearance of objects of utility. But the definition of the commodity as an object of utility – which expresses its scarcity in prices – assumes its independence from its socially determined character. The generalization of a system of commodity exchanges is illegitimate, as Clarke argues, because such a system does not consist 'in a multiplicity of such immediate and symmetrical exchanges, but comprises *mediated* exchange relations, in which each exchange is *asymmetrical*, no longer involving the direct exchange of use-values for one another, but the exchange of use-values for values' (Clarke, 1991: 165).

The exchange relation is not merely a function of the rationality of individual parties and their subjective evaluations of goods, but is the general form of objective interdependence characteristic of a system of commodity producing labor.<sup>14</sup> As Adorno suggests, within 'the general and necessary' activity of the subject, 'inalienably social labor lies hidden' (Adorno, 2004: 177). The rationality of individual exchanges depends upon the social form of production which the concept of utility expresses. Marginal utility theory

reduces this form of social production to the technical division of labor and the rationality of the individual producers and consumers who constitute the capitalist system. Neoclassical economics therefore, which determines the subject in its abstract identity to natural laws, represents the objectification of the subject by the value form, which finds its articulation in a naturalized and transhistorical concept of utility.

## NEOLIBERALISM AND THE ECONOMICS OF INFORMATION

While there are significant points of contact between neoclassical economics and neoliberalism, the latter represents a significant departure from many of the key doctrines of the neoclassical tradition. Originating in the Austrian School of economics and the Mont Pelerin Society in the 1930s, neoliberalism began as a critique of laissez-faire economics and socialism.<sup>15</sup> In addition to central figures like Carl Menger and Ludwig von Mises, Friedrich Hayek rose to prominence as the most influential neoliberal thinker of this period. Throughout the course of his contributions to the 'Socialist Calculation Debate', Hayek articulated a body of thinking that broke from foundational assumptions of the neoclassical microeconomic orthodoxy.<sup>16</sup> Rather than defining the market as a static, physical mechanism that allocates resources, Hayek defined the market as an information processor. As he famously argued in 'The Use of Knowledge in Society' (1945):

The peculiar character of the problem of a rational economic order is determined precisely by the fact that the knowledge of circumstances of which we must make use never exists in concentrated or integrated form but solely as dispersed bits of incomplete and frequently contradictory knowledge which all the separate individuals possess. The economic problem of society is thus not merely a problem of how to allocate 'given' resources – if 'given' is taken to mean given to a single mind which deliberately solves the problem

of how to secure the best use of resources known to any of the members of society, for ends whose relative importance only these individuals know. Or, to put it briefly, it is a problem of the utilization of knowledge not given to anyone in its totality. (Hayek, 1945: 519)

Against Menger, who grounds the spontaneous emergence of markets in the rationality of individuals, Hayek begins from the assumption that individuals are radically ignorant of the efficient distribution of goods. Only the market is capable of discovering how to allocate resources efficiently. Rather than defining the market as the instrument that allocates resources and achieves clearing prices in equilibrium, 'the price system as such' becomes a mechanism for communicating information (Hayek, 1945: 519). For neoliberals, information is not simply knowledge that can be discovered, but is also a commodity which can be exchanged. As a consequence, the neoliberal vision for a free market society turns on the belief that the market possesses the capacity to become a rational subject under the correct social conditions. Moreover, the market's rationality *is more complete and efficient than any human subject*.

Hayek's contributions to the socialist calculation debate represent a bold departure from the paradigm of neoclassical general equilibrium. Rather than defining the market as an allocation device grounded in the rationality of utility maximization, Hayek stressed the ignorance of agents under conditions of competition. One epistemic consequence of this position is the reification of information as an ontological thing that exists independently of the thinking subject. The market in this representation emerges as the thinking subject in its capacity to identify and broadcast dispersed fragments of knowledge. Such a subject, Hayek argues, cannot be consciously designed, but only emerges immanently through the mediations of the price mechanism. He describes the practice of competition as an epistemic process:

Which goods are scarce, however, or which things are goods, or how scarce or valuable they are, is precisely one of the conditions that competition should discover: in each case it is the preliminary outcomes of the market process that inform individuals where it is worthwhile to search. Utilizing the widely diffused knowledge in a society with an advanced division of labor cannot be based on the condition that individuals know all the concrete uses that can be made of the objects in their environment [...] [T]he knowledge of which I am speaking consists to a great extent of the ability to detect certain conditions – an ability that individuals can use effectively only when the market tells them what kinds of goods and services are demanded, and how urgently. (Hayek, 2002: 13)

The free market appears as the means to organize decentralized information to competing individuals. Within a law-bound structure of a social order that defends private property, depoliticizes social relations, and defends itself from the short-sightedness of welfare protections, the market can realize itself as the rational subject of social coordination. The political corollary to the determination of the free market as an information processor for Hayek and other thinkers from the Mont Pelerin Society, is the necessary failure of socialist planning.<sup>17</sup>

Hayek's efforts to theorize market processes with epistemological categories belonged to a broader postwar context, which can be characterized by the general turn toward the study of information and communication. If neoclassical economics developed its models through an imitation of energy physics, neoliberal economics (as well as the neoclassical orthodoxy it would confront), articulated its understanding of information from key technological and institutional developments. The introduction of the first digital computers, as well as the associated emergence of communication technologies and information theory, established the general context for the shift to an economics of information (Hayek, 1948: 168, 186–8, 456).

To name just one example within this wider development, Claude Shannon's work represents a key source in the proliferation

of information theory beyond the computer sciences; his reformulation of communication as a physical process irrevocably contributed to the treatment of information as an exchangeable thing by economists. Together with Warren Weaver, Shannon developed a mathematical theory of communication that treated the concept of information as a physical system (Dupuy, 2009: 114). In his influential paper, 'A Mathematical Theory of Communication' (1948), Shannon theorized communication as a stochastic process. By quantifying the amount of uncertainty expressed by a string of symbols as physical entropy, the concept of information could be abstracted from its semantic content.<sup>18</sup> The determination of information and communication as a physical process emerged as a crucial resource in the wider context of computer science, military decision theory, game theory, and cybernetics that characterized the postwar period.<sup>19</sup>

Economists also rapidly appropriated Shannon's information theory for their own purposes. As Mirowski and Nik-Khah suggest, the proliferation of information theory 'had the unintended consequence of bolstering the general impression that scientists could and should treat information as a quantifiable thing, or even as a *commodity*' (Mirowski, 2002: 105). While largely a misapprehension of the concept, the appropriation of information theory by economics fundamentally altered its operative commodity definitions, as well as the very meaning of market processes. But the attribution of cognitive faculties to markets is not merely a theoretical appendage to the emergence of new informational technologies: the concept of economic information has its basis in the real process of abstraction that is immanent to the reproduction of the commodity form. As Sohn-Rethel argues, the material practice of commodity exchanges between individuals under capitalism validates an ideal abstraction in reality. Information is the concept of the objective relations between things that appear in the form of thoughts.

The reification of information as an identifiable process – where uncertainty is reduced by decentralized means and concentrated in prices – represents the mystification of social relations by the abstract form of general equivalence in commodity exchange.

## COMPETITION, ADAPTATION, SPONTANEOUS ORDER

In an effort to shift the basic problem of economics to questions of knowledge and coordination, Hayek turned to developments in psychology, information theory, and cybernetics. In his *The Sensory Order* (1952), for example, he developed an account of cognition that drew from nineteenth-century associationist psychology and portrayed the mind as a hierarchical set of classifying algorithms. Additionally, by engaging the work of philosophers of mind Gilbert Ryle and Michael Polanyi, he formulated a category of 'tacit knowledge' – stressing that the mind functions primarily as implicit, and non-articulate, knowledge (see Hayek, 2014: 48–54).<sup>20</sup> Grounded in an abstract, non-articulate order of classifying systems, the mind orders experience unconsciously, and thus always knows more than it can demonstrate or say. As Mirowski and Nik-Khah indicate, for Hayek 'it was *rationality that was largely unconscious*, with conscious perception and drives constituting the veneer of intentionality and desires floating on top of the sea of obscure and inaccessible rule structures' (Mirowski and Nik-Khah, 2017: 68). Guided by ordering rules, the individual's rationality seeks information through mechanisms that are unavailable to self-reflection or conscious revision. Hayek's psychology is a necessary stage in his later effort to redefine markets as epistemic processes; by attributing ignorance to the agent of cognition, and by positioning the agent in a self-structuring system that resembles the inarticulate rules underlying consciousness,

commercial practices (namely competition), become the means by which agents discover the necessary information for self-interested behavior. This process of discovery, however, must be framed by the appropriate institutional constraints and incentivizing social forms.

With its transdisciplinary approach to the study of communication and control, the science of cybernetics also inspired Hayek to consider defining markets as organic and self-ordering systems.<sup>21</sup> The relationship of information to control can be seen, for example, in his *Law, Legislation, and Liberty* (1976), when he defines the price mechanism as a ‘medium of communicating knowledge’, which not only broadcasts information, but also influences ‘the decision of others’ (Hayek, 1976: 125). The cybernetic concept of negative feedback in particular, which refers to the inherent tendency of an organism, machine, or system to correct itself through the output of information, became a key resource for Hayek’s epistemology of markets.<sup>22</sup> Although he rejected classical laissez-faire doctrines regarding the spontaneous capacity of markets to reach general equilibrium, Hayek maintained that if the market were left alone to operate without direct regulation, it would convey the necessary information through the aggregate interactions of individual responses to the price system.

Although Hayek never formulated a comprehensive cybernetic theory of markets, his later work increasingly mobilized organicist, cybernetic, and biological categories for his articulation of economic competition. Garret Hardin’s work on ecology in *Nature and Man’s Fate* (1959), was influential in this regard, and shaped Hayek’s late attempts to define economic behavior as though it were an evolutionary process (Oliva, 2016). Hardin understood the process of Darwinian adaptation to be a cybernetic system governed by negative feedback, where the traits of a given species are regulated against deviations through adaptations

to the environment (Oliva, 2016: 26). More importantly, the same principle of negative feedback operating in the living species is equally at work in a market system. Within the Darwinian framework, Hardin argues, ‘the concept of the “fittest” has the same normalizing role as that played by the “natural” process of commodities in labor markets’ (Hardin, 1959: 55). Having read Hardin’s cyberneticist work on the self-regulating properties of adaptation in biology and economics, Hayek arrived at a fundamental concept in his economic thought – namely, the idea of ‘spontaneous order’.

The category of the spontaneous order refers to human practices that lead to more complex forms of social organization in the absence of all a priori design. Through the activity of competition, human beings ‘adapt’ to their environment through the information conveyed by prices. Just as species evolve through responses to changes in their environment – and through the reproduction of successful traits – the market too, ‘orders itself’ through the coordinating activity of competition (Hayek, 1978: 183). As Hayek argues:

The information that individuals or organisations can use to adapt to the unknown is necessarily partial, and is conveyed by signals (e.g., prices) through long chains of individuals, each person passing on in modified form a combination of streams of abstract market signals. Nonetheless, *the whole structure of activities tends to adapt, through these partial and fragmentary signals, to conditions foreseen by and known to no individual*, even if this adaptation is never perfect. (Hayek, 1988: 76)

A self-regulating market thus forms itself immanently through the unconscious, self-interested actions of the individuals who constitute it. Within the proper framework of rules and laws, Hayek argues, human civilization ‘evolves’ through the competitive selection of behaviors, customs, and institutions, which in turn, coalesce as the ordered context for coordinated rational economic activity (Hayek, 1978: 22–8).<sup>23</sup>

While it seems the concept of a spontaneous order breaks from what Adorno has called 'mythic nature', in its apparent dynamism and complex form of interaction with social institutions, Hayek's late thought remains grounded in an implicit metaphysics of economic nature. Rather than deriving a theoretical representation of the market from the formal properties of physical nature, Hayek interprets the immanent structure of nature itself as being economic. Citing legal theorist Sir Frederick Pollock as a key influence, Hayek defines the doctrine of evolution as 'nothing else than the historical method applied to the facts of nature' (Hayek, 1978: 41). As natural-history, this position does not comprehend how the concepts of nature and history are, in the words of Adorno, 'mediated in their apparent difference', but rather reifies evolutionary process as the principled subject of history. If the neoclassical tradition constructed its analogy of nature and economy by imitating the laws of external nature, neoliberalism interprets external nature as being economic in its inner substance.

Recognizing the tension between his own natural and historical categories, Hayek tried to synthesize their function with the concept of a spontaneous order. In 'The Results of Human Action but not of Human Design' (1978), he argues that the classical Greek distinction between what is natural [*phusei*] and what is human-made [*thesei*], can be sublated in the difference between intentional and unintentional human practice (Hayek, 1988: 45). As opposed to an intentionally designed order or institution [*taxis*], Hayek refers to a 'natural order' [*kosmos*], which is of natural origin and purpose. Situated between the artificial and natural orders lies a 'spontaneous order' – i.e., a human-made, stable, and progressive order that is the product of human practice but not deliberate design (Hayek, 1988: 45). Markets, he suggests, are spontaneous orders, because they are the emergent outcomes of human interaction, but lack any pre-established rationale or purpose.

Although Hayek's articulation of a spontaneous order indicates that the market's organizing properties supervene upon the mutual interaction of individuals, his understanding of self-regulation is far from the methodological individualism of the classical tradition. As he argues in *The Fatal Conceit: The Errors of Socialism* (1988), the communication of information within a spontaneous order requires an adequate institutional and legal context for its development. The emergence of a market order requires the deliberate construction of an institution that cannot be reduced to natural processes – i.e., private property.<sup>24</sup> Information can only be efficiently collated through decentralized means. 'Several property', he argues, 'leads to the generation and use of more information than is possible under central direction' (Hayek, 1988: 86). Against centralized state planning, Hayek posits the institution of private property as the decentralized means to organize individuals according to market relations. The spontaneous order emerges on the basis of private property as the structuring context for the coordination of human practice. But the institution of private property – as Hayek is willing to concede – requires active state intervention in the preservation of markets.<sup>25</sup>

## NEOLIBERAL SECOND NATURE

Having delineated the logic in which neoliberal categories define markets as epistemic processes, I can now develop the categories through the prism of natural-history in order to draw out their consequences for the critique of political economy. Neoliberalism, I maintain, has legitimated its vision for a free market society – with its specific ideals regarding liberty, competition, and freedom – through the manifest form of natural objectivity that characterizes market coordination. This manifest form of appearing, which is only possible on the basis of the market's

abstraction from the irrational content of society, inscribes individuals in a fated logic of authority defined by the price system's abstract and impersonal character. If the neo-classical tradition constructed its vision of a market through an analogy to a mechanical, timeless, and deterministic concept of nature, neoliberal thought builds its vision for a market society through an alternative image of nature – the *free market is a self-ordering system that knows more than society*. The science of economics therefore, has rehabilitated a metaphysics of economic nature.

Neoliberalism then, should not be understood as an economic doctrine primarily, but rather as a political project that constructs the social blindness in which the economy can appear as fate. By projecting the faculties of mind onto the market, neoliberal theory determines the latter as the rational instrument best suited for negotiating the antagonism of order and chaos. Unfolding in its objectivity and abstract identity to nature, the free market develops itself by virtue of its immanent capacity to form social organization through the circulation of its knowledge. But the category of the free market does not recognize itself as historically constituted second nature; its seeming objectivity is grounded in the fetish form of the exchange abstraction, which appears in the form of the speculative commodity.

The information economy is the fetish form of the commodity in financial capitalism. The real abstraction of commodity exchange validates the appearance of information as an exchangeable thing; information commodities appear through the disappearance of their socially determined character. As a corollary to the necessary divergence of value and its representation in money under capitalism, market prices assume an autonomous form. Speculative markets are the petrified form of appearance of the commodity abstraction; their identity as subjects of capital conceals their social character. The emergence of the free market as the epistemological subject of

capital, therefore, is comprehensible as being intrinsic to the contradictory form of value, which is expressed as the double character of the commodity. Neoliberal economics reifies abstraction as the principle of social coordination by attributing social powers to commodities.

But the fetishization of the information economy is not merely an illusion of theory – it also exerts itself as an objective social form. Fetishized perceptions, Adorno argues, 'are not illusions' because human beings 'become dependent on those objectivities which are obscure to them' (Adorno, 1997: 508). Human subjects are dependent on the world of commodities that become instruments of social validation. The categories of illusion 'are in truth also categories of reality' – their form of epistemic authority is both expressive of, and immanent to, the form of mediation specific to capital (Adorno, 1997: 508). A critical theory of neoliberalism, therefore, would mean bringing the concept of the free market into a confrontation with the social object it expresses in inverted form.

By positioning the free market as the most adequate instrument for the negotiation of society and nature, society in turn, finds itself restricted in what it can determine by democratic means. In the face of the growing ecological crises of anthropogenic climate change that confront the capitalist global order, neoliberal institutions remain undaunted in their core political strategy: *left to its own self-determination, the market will discover the solution to the crises of external nature in time*.<sup>26</sup> By redefining the market as a self-correcting, thinking, and ordering system, neoliberalism reinstates a category of mythic nature. Guided by the providential movement of the price system, society reconciles itself to nature through the seeming objectivity of economy. A critical theory of neoliberal society negates the objectivity of economy by 'turning the truth' of its concepts against 'the untruth that produced them' (Adorno, 2003: 102). The dialectic of

natural-history captures the double-sidedness of the concepts of economic theory as the necessary expression of an historically specific social totality. By recovering the sedimented history of political violence and forcible coercion that have disappeared throughout the course of financial capitalism's appearing, a critical theory of society finds itself positioned to grasp the hegemonic logic governing the present neoliberal order.

## Notes

- 1 A condensed version of this chapter appeared as 'Economics as Natural-History: Adorno and the Critique of Neoliberalism', in *Architecture and Culture*, vol. 5, issue 2 (August 2017): 165–74.
- 2 As Werner Bonefeld argues, '*Negative Dialectics* is the presentation of the wrong state of things. It argues that the idea of society as "subject to natural laws is ideology if it is hypostasized as immutably given by nature" [...] Instead, it holds that the incomprehensible economic forces find their rational explanation in human practice and in the comprehension of this practice. It thus argues that the relations of economic objectivity manifest the social nature of an inverted [*verkehrte*] and perverted [*verrückte*] world of definite social relations' (Bonefeld, 2016: 66).
- 3 All subsequent citations of 'The Idea of Natural-History' will refer to Hullot-Kentor's translation.
- 4 Robert Brenner, for example, connects the emergence of financial capitalism with declining rates of profit in the industrial manufacturing sector beginning in the 1970s. See Brenner (2006).
- 5 For background on the Frankfurt discussion as well as publication of the 'Idea of Natural-History' in *Kant-Studien*, see Hullot-Kentor's 'Introduction' to Adorno's 'The Idea of Natural-History', in Adorno (2006: 234–5), and Buck-Morss (1977: 17–20).
- 6 Although Adorno's language regarding the concept of 'natural-history' shifts in *Negative Dialectics* to the more direct form of 'natural history' that one finds in Marx, the core commitments of the 1932 lecture persist throughout *Negative Dialectics*, and the latter text requires what is established in the former lecture in Adorno's development of the concept of the 'non-identical'.
- 7 See e.g., Adorno's reference to Lukács: 'This world is a second nature; like the first – "first nature" for Lukács is likewise alienated nature, nature in the sense of the natural sciences – "it can only be defined as the embodiment of well-known yet meaningless necessities and therefore it is ungraspable and unknowable in its actual substance"' (Adorno, 2006: 261).
- 8 Adorno's development of Lukács' concept of reification in *History and Class Consciousness* is beyond the scope of this chapter and has been treated extensively elsewhere. See e.g., Rose (2014: 138–41). For criticism of Rose's interpretation, see O'Kane (2013: 123–34).
- 9 See Mirowski (1989: 142): 'Value was reified as a conserved *substance*, conserved in the activity of trade to provide structural stability to prices, and differentially specified in the process of production. Almost all of the theories conforming to this pattern are now remembered under the rubric of Classical Political Economy'.
- 10 For a foundational account of the utility theory of value in the neoclassical tradition, see Marshall (1920: 76–84).
- 11 For an example of the equivalence of utility and energy in the work of Irving Fisher, see Mirowski (1989: 229): 'The individual in this model is only made manifest by his psychology, and his psychology is only portrayed as a field of preferences. It is the energy/utility that provides the only ontological identity of the actor in the mathematics'.
- 12 Such problems include the fact that marginalists did not possess an adequate grasp of the conservation principles that would render their imitation of proto-energetics coherent. For details see Mirowski (1989: 293–310).
- 13 For an example of Sohn-Rethel's formulation of the process of real abstraction, see his *Intellectual and Manual Labour: A Critique of Epistemology* (1978: 20): 'The essence of commodity abstraction, however, is that it is not thought-induced; it does not originate in men's minds but in their actions. And yet this does not give "abstraction" a merely metaphorical meaning. It is abstraction in its precise, literal sense. The economic concept of value resulting from it is characterised by a complete absence of quality, a differentiation purely by quantity and by applicability to every kind of commodity and service which can occur on the market'.
- 14 For Adorno, the exchange abstraction is founded upon surplus value. See Adorno (1997: 507).
- 15 For historical details regarding the origins of neoliberal economic thought, particularly in the context of its emergence from the Austrian School and formation at the Mont Pelerin Society, see Mirowski and Plehwe (2015: 1–38).
- 16 Note that many neoclassical economists at the time were socialists committed to developing a theory of market planning through economic calculation. This development emerged in the inter-war period as the 'Socialist Calculation Debate', and consisted in wide-ranging arguments

- between market socialists like Oscar Lange and a number of economists from the Austrian School. For historical accounts see Burgin (2012) and Lavoie (1981).
- 17 For Hayek's own assessment of the socialist calculation debate as well as his departure from Mises' critique of socialist calculation, see Hayek (1948: 119–208).
  - 18 For details regarding Shannon's use of physical entropy in information theory and its reception, see Mirowski and Nik-Khah (2017: 46): 'this move rendered the semantic aspects of communication utterly irrelevant for the theory [...] Shannon then posited that the mathematical expression for the average *improbability* of a string of symbols would be exactly the same as the earlier definition of physical entropy'.
  - 19 The emergence of information economics at the Cowles Commission and the Chicago School were a part of the broader context of state and military patronage that characterized science funding and organization in the postwar period. For details regarding the formation of information economics at the Cowles Commission, as well as its relation to game theory, operations research, and decision theory at the RAND Corporation, see Mirowski (2002: 153–231).
  - 20 For a commentary on Hayek's concept of tacit knowledge, see Oguz (2010).
  - 21 Hayek's engagement with cybernetics was not restricted to an indirect encounter with the emerging literature, but also included active participation in the Alpbach Symposium of 1968, a major event in the history of the cybernetic sciences. See Dupuy (2009: 75–6).
  - 22 For an account of the influence of developments in cybernetics on Hayek's psychology and economic theory, see Oliva (2016).
  - 23 Hayek's concept of cultural evolution is overt in *The Fatal Conceit*, where he develops an account of market emergence where a Darwinian principle of competitive selection serves as the means by which orders transmit rules of behavior to the most successful social groups. It would be interesting in this regard, to consider the revival of organicist and evolutionary categories in neoliberal thought in terms of their relation to racist ideologies. Moishe Postone, for example, suggests that the proliferation of 'racial theories and the rise of Social Darwinism' in the late nineteenth century can be understood as the objectification of the 'double character' of the commodity form. See Postone (1986: 309–10).
  - 24 Neoliberal economic theory is quite unlike classical liberalism with respect to the category of private property. Unlike foundational liberal thinkers like John Locke, who ground the right to private property in labor, Hayek understands the origins of property to be grounded in a context of 'rules', which evolved through the practice of exchange. For details regarding the neoliberal conception of law and private property, see Dardot and Laval (2013: 58–85).
  - 25 Hayek regarded the tradition of laissez-faire economics to be fundamentally mistaken in its prescription of a weak state. See Hayek (2007: 118): 'The question whether the state should or should not "act" or "interfere" is a highly ambiguous and misleading description of the principles on which a liberal policy is based'.
  - 26 For an excellent account of the influence of neoliberal think tanks on 'free market environmentalism', which includes policies of carbon 'cap-and-trade' markets and geoengineering initiatives, see Beder (2001). See also Sikka (2012).

# On Emancipation...

Sergio Tischler Visquerra and  
Alfonso Galileo García Vela  
Translated by Anna-Maeve Holloway

## INTRODUCTION

Emancipation is at the centre of critical theory. Marx rejected the idea of human emancipation as political emancipation, that is, as a process that takes place solely through the state or civil society. He considered emancipation through the state to be an abstract liberation of the selfish individual inscribed in bourgeois society. From his early writings – such as the *1844 Manuscripts* – to *Capital*, the idea of human emancipation is much more radical than that of political emancipation, which in fact belongs to the concept of bourgeois society.

According to Marx, human emancipation is based on the liberation of not just workers or proletarians from exploitation and economic compulsion, and political domination. It is in fact liberation of society from rule by real abstractions. An emancipated society is not a capitalist-free society of proletarians or a one-class (proletarian) society. Emancipation entails the achievement of a

class-less society. It is the abolition of proletarian labour and, consequently, the abolition of proletarians as a class. The liberation from domination and emancipation of social reproduction from the capitalist form of wealth, value as more value, money as more money and as such capital, would lead humanity to a classless or communist society of self-aware subjects connected to others and to nature in direct manner, without rule by social abstractions, economic or political. According to Marcuse (1958: 127), it is an association or commune of ‘communist individuals’.

However, which is the praxis that could lead humanity to emancipation? In *Communist Manifesto*, one of Marx and Engels’ most important works and amongst the most influential texts of the twentieth century, the emancipation of the proletariat – the basis for the complete emancipation of human beings – would take place through the communist ‘Party’. In *Manifesto*, the figure of the party as a means of emancipation gave revolutionary praxis a political dimension that became

one of revolution's essentials. Furthermore, it opened up the possibility of fighting to take over state power in order to use it as a tool in bringing about radical social change. Lenin was the main exponent of this theoretical and practical perspective. He believed the communist party is where the proletarian class asserts itself for itself and meets its so-called historical mission to end the muck of ages, that is, to overthrow bourgeois domination. For this mission to be accomplished, the vanguard party must take control of state power. Lenin's theory of praxis, which was endorsed also by Georg Lukács (1968, 1970), was the most significant reference point for revolution in the twentieth century, leading to many discussions and creating a lot of controversy between the different theoretical perspectives of Marxism.

Rosa Luxemburg (1961), the brilliant Marxist and great revolutionary, criticised Lenin's theory of praxis and argued that his conception of revolutionary organisation in the vanguard party was too mechanistic and centralist. She believed – just as Marx did – that revolution was fuelled by the element of spontaneity. In this sense, the workers do not need the party to liberate them, for revolution is a self-emancipating practice. This theoretical and practical outlook was embraced by the council communists in Germany and Holland, and theoretically represented by Anton Pannekoek and Paul Mattick, amongst others. We could say there are two theoretical perspectives on revolutionary praxis within the Marxist tradition: one stresses the importance of the party and of taking state power, and the other focuses on the autonomy of struggles and rejects the centralism of the communist party. Rather than creating a theoretical controversy, these two perspectives are part of the historical movement of class struggle.

The goal of this chapter is to discuss the idea of emancipation and praxis in contemporary Marxist authors such as John Holloway, Theodor Adorno, and Walter Benjamin. We also believe it is important to

refer to zapatismo and its alternative proposal of emancipation, which opposes the classical idea of revolution.

The discussion on emancipation and praxis presented here is imbued by the polemic between the aforementioned perspectives on revolutionary praxis, a polemic that becomes harsher when praxis itself is in crisis.

## EMANCIPATION IN THE THEORY OF JOHN HOLLOWAY

The image of revolution – as well as the idea of social emancipation linked to it – has been shaken to its foundations during the past decades, especially since 1968. Even more so since the crisis and fall of the Soviet Union unveiled the failure of a conceptual constellation that had identified these terms with the taking of state power by a revolutionary vanguard. This crisis has led to the emergence of new ways of thinking about radical social change by contemporary theorists who have not only made their own contributions, but have also contributed to updating the work of critics who had already questioned the state-centred idea of emancipation. John Holloway is one of them.

Apart from numerous articles, John Holloway has published two books that are a point of reference in the discussion on revolution and the praxis of emancipation today. These books are *Change the World Without Taking Power: The Meaning of Revolution Today* (2002) and *Crack Capitalism* (2010). In *Change the World Without Taking Power*, Holloway sets forth an idea on social emancipation which openly criticises the classical canon on this issue. *Crack Capitalism* goes deeper into some of the questions deployed in the first book, particularly that of *doing* as a critical category that is central in overcoming *labour* as it is conceived by Marx within capitalism; that is, as the duality of unity and contradiction between concrete labour and abstract labour. Emancipation is thematised

as the liberation of doing and the overcoming of labour, and the revolutionary subject as a *we* who are the movement of doing against labour. Setting out to outline the author's main theoretical points, we have decided to focus on the ideas presented in his first book for – as he too admits – that is where the core of his theorising can be found.

The issue of social emancipation is approached by Holloway as a critique of the classical idea of revolution and the revolutionary subject. Generally speaking, this idea is usually understood as a political process aiming at the occupation of the state by a vanguard (the party), considered the holder of the proletariat's true class consciousness. This formulation stresses the importance of the revolutionary party as the privileged locus for social emancipation, in the sense that it is the theoretical-practical synthesis of proletarian class consciousness in the revolutionary process. Holloway brings about a fundamental shift: he considers the existential dimension of oppression as the starting point for revolutionary theory. According to Holloway (2002: 1–2), the starting point for revolutionary theory is our *scream*, as well as the dramatic expression of our existence as subjects that are torn apart by the antagonism that is inherent in capitalist society, but at the same time reject this world of oppression. This scream – understood as the negation of what the world is, as a No that interrupts the assertion of what exists as the expression of domination – must be the starting point for conceiving revolution and, more broadly, for engaging in any type of critical reflection. 'It is from rage that thought is born, not from the pose of reason' (2001:1). Our justification lies in the denial of the perverted world and not in the 'promise of a happy ending' (2).

As we already mentioned, this discourse goes against the traditional argumentation on this subject, characterised by the elements of class consciousness and the revolutionary vanguard. To honour the importance the latter has had in the historical process of twentieth-century revolutions, we must

comment – however briefly – on this issue, using certain classical authors as a point of reference. For Lenin (2013: 28) '*the role of vanguard can be fulfilled only by a party that is guided by an advanced theory*', for the social-democrat (revolutionary) consciousness 'could only be brought to them from without' (32):

The history of all countries shows that the working class, exclusively by its own effort, is able to develop only trade-union consciousness, i.e., it may itself realise the necessity for combining in unions, to fight against the employers and to strive to compel the government to pass necessary labour legislation, etc. The theory of Socialism, however, grew out of the philosophic, historical and economic theories that were elaborated by the educated representatives of the propertied classes, the intellectuals. The founders of modern scientific Socialism, Marx and Engels, themselves belonged to the bourgeois intelligentsia. Similarly, in Russia, the theoretical doctrine of Social-Democracy arose quite independently of the spontaneous growth of the labour movement; it arose as a natural and inevitable outcome of the development of ideas among the revolutionary Socialist intelligentsia. (32–3)

Along the same lines, Lukács provides an argumentation that delves into the Leninist centrality of class consciousness in the historical process. Proletarian class consciousness, he argues, allows for a political praxis that can lead to an emancipated historical totality, where the separation of subject and object that is characteristic of the capitalist relation has been overcome. And this is due to the fact that the proletariat, more than any other class, has the possibility of being the 'identical subject–object in History'

Only when the consciousness of the proletariat is able to point out the road along which the dialectics of history is objectively impelled, but which it cannot travel unaided, will the consciousness of the proletariat awaken to a consciousness of the process, and only then will the proletariat become the identical subject–object of history whose praxis will change reality. (Lukács, 1968: 197)

Both Lenin – from the perspective of the vanguard – and Lukács – from 'totality' – coincide in a state-centred idea of revolution.

They both recognise the *soviet* as a fundamental figure of class struggle,<sup>1</sup> but it is the figure of the party that dominates the issue of class consciousness. In fact, the proletarian revolution is understood as the dialectical movement that implies the transformation of the proletarian party into a state. This line of argument can be observed in Lenin's *The State and Revolution*, as well as in Lukács' positing of the issue of overcoming reification in the course of a dialectical process, in which the 'arrival of the proletariat to power' and the 'organisation of the state and the economy on socialist lines' are very important stages (Lukács, 1968: 208).

Furthermore, Lukács arguably 'filters' the experience of the Russian revolution and the legacy of its main leader and theorist through the dialectical category of totality, granting the theory of the centrality of class consciousness and the party in the revolutionary process a deeper philosophical foundation; this theoretical foundation was perceived by Stalinist bureaucracy as a menace, for it challenged the mechanistic and vulgar materialism that legitimised the Soviet state. In fact, one could argue that the Lukácsian perspective feeds off Hegelian dialectics – which in turn is characterised by ending in a system, hence its identitarian and totalising characteristics<sup>2</sup> – and that, in a way, this theoretical enlightenment can be found in yet another of the great revolutionary theorists of the beginning of the twentieth century, Antonio Gramsci (2011). In elaborating the concept of hegemony, the great Italian revolutionary made an enormous effort to establish or translate Leninism into the conditions of the 'West' where, he argues, class struggle would be more of a 'trench warfare' rather than a 'war of movements', as it appears in the 'East' (Czarist Russia).

In opposition to this conceptual constellation, Holloway believes a theory of revolution that concludes in the state is not only false, but also has disastrous practical and historical consequences. It is false for it is based on the fiction of the state as an autonomous instance

that can be the starting point for revolutionary transformation (Holloway, 2002: 13). The state, according to his line of argument, is not a neutral apparatus that can serve as an instrument for revolutionary transformation. On the contrary, it is a constitutive part of the capitalist relation itself and is in no way autonomous from it. Hence the importance of understanding it as a *form* of capital's social relations (Holloway, 1992).

Therefore, to focus revolution on the winning of state power is to abstract the state from the social relations of which it is part.

Conceptually, the state is cut out from the clutter of social relations that surround it and made to stand up with all the appearance of being an autonomous actor. Autonomy is attributed to the state, if not in the absolute sense of reformist (or liberal) theory, then at least in the sense that the state is seen as being potentially autonomous from the capitalist social relations that surround it. (Holloway, 2002: 15)

And it is false, too, because the struggle to take control of the state produces an assertive subjectivity of power that lies in the antipodes of social emancipation (16) which, in turn, is already present in the party as a space of social and political hierarchisation (17). In this sense, 'you cannot build a society of non-power relations by conquering power' (17).

So, where should we look to? Our author points out that we cannot stand with our arms crossed in the face of the social and natural disaster the capitalist relation entails, but that a theory of power to overcome capitalism is not an acceptable solution under the current circumstances. One answer is the perspective of anti-power, the consistent deployment of the *scream* as the starting point of critique (Holloway, 2002: 22) and of the category of *doing*.

The scream implies doing. 'In the beginning was the deed', says Goethe's Faust. But before the deed comes the doing. In the beginning was the doing. But in an oppressive society, doing is not an innocent, positive doing: it is impregnated with

negativity, both because it is negated, frustrated doing, and because it negates the negation of itself. Before the doing comes the scream. It is not materialism that comes first, but negativity (23).

And he continues:

Doing is practical negation. Doing changes, negates an existing state of affairs. Doing goes beyond, transcends. The scream, which is our starting point in a world which negates us – the only world we know – pushes us towards doing. Our materialism, if that word is relevant at all, is a materialism rooted in doing, doing-to-negate, negative practice, projection beyond. Our foundation, if that word is relevant at all, is not an abstract preference for matter over mind, but the scream, the negation of what exists. (23)

And that is so because, in capitalist society, doing is not free, it is mutilated, fractured, broken, subjugated, and alienated in labour. The scream is the scream of doing that projects itself beyond our existence that is alienated in labour (Holloway, 2002: 23), of doing that is transformed from *power-to* to *power-over* (27). *Power-to* is always social power, it is part of the ‘social flow of doing’ (26). When the social flow of doing is broken it turns into its opposite, *power-over*, to wit, into an antagonistic process (29). In capitalism, doing exists in the form of its negation, that is, *power over*. This is essential in understanding *doing* as a critical category, a category that implies rebellion against its negation in *power-over*. Amongst other things, this perspective allows for an ‘opening’ of the category of power – which has remained ‘closed’ in classical authors such as Foucault – and for thinking of revolution as anti-power (40).

A central part of *power-over* and of the breaking of the ‘social flow of doing’ is the fetishism of social relationships in capitalism. The ‘done’, Holloway says, ‘is severed from and turned against the doing’ (Holloway, 2002: 43). This leads to the ‘self-negation of doing’ (43) as a phenomenon of the rule of capital expressed in the fetishism of the commodity. And it is precisely this fetishism that

mainly stands in the way of revolution, for it is the ‘mode of existence’ of social relations in capitalism (50–3) and our perception of reality is closely linked to this phenomenon. To comprehend it is to attain a better understanding of why people tolerate exploitation and domination by concepts such as ideology or hegemony.

It is towards this direction that Holloway builds a bridge between the issue of fetishism and that of the critique of the category of identity which is at the core of Adorno’s negative dialectic. He considers identity to be the most concentrated form of fetishism, in the sense that it consecrates the subordination of doing to the done and ‘contradiction is flattened’ (Holloway, 2002: 57). And this is the negation of the subject by the object (57) in a reality where categories express a reality that has been effectively fetishised (71).

This line of argument allows Holloway to advance on the issue of power and the state, prioritising the need to defetishise these concepts. To him, the idea of ‘taking power’ is already a fetishised idea (Holloway, 2002: 72).

The state, then, is not the locus of power that it appears to be. It is just one element in the shattering of social relations. [...] The state is exactly what the word suggests, a bulwark against change, against the flow of doing, the embodiment of identity. (73)

If that is so, then what is to be done? Holloway’s answer is to look for hope in the ‘explosive force of that which is denied’ (Holloway, 2002: 76), which implies recognising that we are all imbued by fetishism but that, as contradictory persons with a capacity to negate that which negates us, we are more than persons that have been reduced to things; that is, we are more than fetishised persons. With this, Holloway (70–8) introduces a difference between fetishism and the process of fetishisation. He tells us that speaking of fetishism in a ‘strict sense’ closes the category, it turns it into a category of domination, whilst approaching things in

terms of a 'process of fetishisation' speaks of the centrality of struggle in understanding the category, and opens it up as an antagonistic movement from which a *surplus* emerges, a surplus that subverts the identity that constitutes it as a category of domination. In this sense, he argues, fetishism cannot be understood without its opposite; it is a process that entails its rejection (89); ergo, this process is antagonism *in actu*.

This approach allows for an understanding of the forms of capital (money form, state form, capital form) as process forms that are not constituted once and for all, but are rather under discussion (Holloway, 2002: 89–91). The category of fetishism as a process, in particular, allows the author to reinforce his critique of the state as an autonomous form to be considered in itself: the state is a form of fetishisation of social relations (94–7). In this sense, the struggle for emancipation cannot be focused on the state, but rather on anti-power.

What is the relation between anti-power and class struggle in this argumentation? Holloway claims it is not enough to talk of the centrality of class struggle in order to understand capitalist society; for this concept to be truly radical and allow for an equally radical practice, one must rethink class struggle through an anti-fetishist lens. To this effect, it is crucial that we perceive struggle not as a derivative of a social form or 'structure', but rather as a self-constitutive instance: 'Class struggle does not take place within the constituted forms of capitalist social relations: rather the constitution of those forms is itself class struggle' (Holloway, 2002: 143). This means that the revolutionary subject must not be defined, obstructing the flow of antagonism. 'The critical-revolutionary subject is not a defined "who" but an undefined, undefinable, anti-definitional "what"' (150). This goes against the notion of fetishism implied by the idea of class consciousness as the privileged knowledge of the party and the leaders in the revolutionary process (144).

In other words, for Holloway, the starting point for the concept of revolution cannot be power and its 'revolutionary' use by a vanguard that conquers it; it has to be anti-power. In fact, the author's line of argument pursues the goal of granting visibility to what is invisible, of unveiling through the concept what has been rendered invisible by the dominant narrative of revolution based on power. To understand anti-power, we need different concepts such as non-identity, the Not Yet (Holloway, 2002: 157). Anti-power exists in the open and visible struggles, but also in everyday struggle; it lies 'in the dignity of everyday existence' (158).

From his perspective, this is crucial in understanding the current crisis not as an autonomous objectivity, but rather as part of our doing and its antagonistic movement, as our negativity; that is, as the intensification of the crisis caused by class struggle (Holloway, 2002: 204). To break with capital, one must not only scream or flee; one must take control of the means of doing, recover power-to (158). However, to think of this recovery in terms of ownership is to continue to think in fetishised terms (159). It is to think of ownership as a noun, which in turn implies that we are stuck in the field of domination (159). The expropriation of the expropriators cannot be perceived in terms of recovering things, but rather as the 'reassertion of the flow of doing' (159). This constitutes a certain type of anti-politics, as it goes against and beyond the fragmentation of doing that politics in its 'state-oriented connotation' implies (212–13). What he proposes is an anti-instrumental conception of revolution, for to think of revolution in instrumental terms is to think of revolution in terms of capital (212–13).

So, how do we change the world without taking power? We do not know, for there exists no formula. Uncertainty is part of the revolutionary path (Holloway, 2002: 215). '*Preguntando caminamos*', 'asking we walk', as the zapatistas say.

Importantly, Holloway's theory of doing is more developed in *Crack Capitalism*. *Doing*

*against Labour*. As the title of the book reveals, the central subject matter is, precisely, doing against labour, the latter understood as the contradictory and antagonistic unity between concrete and abstract labour. Although we cannot go into details in this chapter, we must point out that, in *Crack Capitalism*, Holloway (2010: 3–5, 62–3, 143–4) expands his argumentation on anti-power on the basis of doing and of the figure of the *crack* (the rebellion of doing against labour), which is expressed in an interstitial revolutionary process.

As the author himself points out, part of his theory explores the implications for praxis of Adorno's theory of non-identity. Holloway's contribution on emancipation is a non-identitarian theory.

## NON-IDENTITARIAN PRAXIS AND EMANCIPATION

In the present chapter we have argued that Holloway's work is a critique of Lenin's theory of revolutionary praxis. We have said that Lenin's theory is premised on and concludes in a state-centred idea of revolution, a perspective that Lukács also embraces, whilst in Holloway's writings the idea of the state as an autonomous instance which can provide the foundation for human emancipation falls apart. This breaking with the state as an axis of transformation is amongst Holloway's most significant contributions, as it implies the concept of revolution cannot revolve around the power of a vanguard that controls the state but must, rather, feed on the anti-power that exists in open and everyday struggles.

As we have seen, Lenin and Holloway approach revolutionary praxis in very different ways. However, importantly, they both believe theory must have practical consequences. A direct link between theory and praxis can be found in their work. To different extents, the insights of Lenin and Holloway

are marked by the continuous demand for theory to become practical. The direct link between theory and praxis is a fundamental part of the Marxist tradition, a link that ideally tends towards unity: the unity between theory and praxis.

The relation between theory and praxis within the Marxist tradition was expressed in Marx's (1998: 571) famous eleventh 'Thesis on Feuerbach': 'The philosophers have only interpreted the world in various ways; the point is to change it.' According to Marx, theory is not only a way of interpreting the world; it is to transform it through practice. Theory in itself does not transform society, even if it is a critical theory. It requires practice in order to materialise in the world and transform it.<sup>3</sup> For Marx, just as for Lenin and Lukács, the proletarian class was the one chosen to materialise theory through praxis.

In Marxism, the relation between theory and praxis was understood in terms of this direct and necessary link and had the goal of forming a unity that would bring about the transformation of society. In Holloway's theory of praxis, the proletariat does not have the central role it did in Marx's theory. For Holloway, as we have mentioned, it is we who are the revolutionary subjects, we the human beings in general, understood as potentially rebellious beings. However, in Holloway's theory, praxis continues to occupy a central role in the realisation of theory and, therefore, in the transformation of the world.

In the critical theory articulated by Theodor Adorno, the way the relation between theory and praxis is understood collapses. He openly criticises Marx's Theses on Feuerbach – which, as we saw, laid the foundations for the interpretation of this relation within Marxism – and especially the eleventh. In his most important work, *Negative Dialectics*, Adorno claims that Marx draws his theses on the primacy of practical reason from Kant and German idealism, making it sharper to the point of turning it into

a demand for changing the world rather than merely interpreting it. In very simple terms, practical reason was for Kant a type of reflection that moves towards action, and the German idealism that appeared after Kant can be considered a philosophy of action or activity. Adorno criticised idealism and the Kantian doctrine of practical reason for being a subjective reason that bore no relation to the objects. For Adorno, the most important attempt to construct a philosophy based on the object was Hegel's philosophy, but he failed because he developed a dialectic of identity. Identity, he believed, was the core dimension of bourgeois society reproduced in Hegel's philosophy. According to Adorno, practical reason is founded on the subject and has cleared the path for the reason prevailing in bourgeois society.

In his *Eclipse of Reason*, Max Horkheimer claims that, in modern capitalist society, the dominant type of reason is the one he calls subjective reason. Subjective reason has to do essentially with the capacity of the subject to think and deals with the means without reflecting on the ends. Subjective reason is goal-oriented rational action without a rational goal in itself. According to Horkheimer (2012), subjective reason is revealed in science and technique as the capacity to calculate probabilities and determine the means necessary to an end; in sum, it is an instrumental type of reason. For Adorno, the supremacy of practical reason leads to instrumental reason and, consequently, to illusory praxis. What had been theoretically insufficient in Hegel and Marx, he argues (Adorno, 2007), had been transmitted to historical praxis. For this reason, it was necessary to re-engage in theoretical reflection, rather than have thought bow irrationally before the supremacy of praxis. Adorno believed praxis itself to be an eminently theoretical concept.

One of the objectives of *Negative Dialectics* was to trigger reflection on the potential and the limits of praxis. To that end, there had to be an account of the movement of historical praxis in harmony with Adorno's demand:

radical critique against all that exists. According to Adorno (2005), the doctrine of the unity of theory and praxis in Marx's theorising was fuelled by the possibility of revolutionary action in the nineteenth century. This century of popular insurrections and revolutions made a radical rupture with the bourgeois order plausible, a prospect, however, never fulfilled. Adorno believed that the transformation of the world had failed in the twentieth century too, the Soviet Union being the most conspicuous expression of said failure. The author also argued that one cannot think of praxis without referring to history, or else one runs the risk of falling into the trap of illusory praxis: a desperate praxis conducted for its own sake, a symptom of the powerlessness of human beings in the administered world. Adorno believed praxis in his days was in crisis and was turning into an illusory praxis which, ultimately, was not even praxis.

*Negative Dialectics* went against the political praxis of its time. It was Adorno's attempt to contain the domination that he believed was being reproduced in twentieth-century praxis. In the 1960s the main exponents of the Frankfurt School had abandoned all hope in the socialism of the Soviet Union and rejected orthodox Marxism. Friedrich Pollock, another distinguished member of this School and a very close friend of Adorno and Horkheimer, travelled to the Soviet Union in the 1920s as a guest of the director of the Marx-Engels Institute, David Ryazanov. Soon after Pollock's visit, Ryazanov was sent to exile by Stalin. During his visit to Russia, Pollock studied Soviet planning and his impressions were not favourable (Jay, 1996). At the end of the 1950s Adorno and Horkheimer (2011) thought revolution was quite unlikely. Furthermore, they believed the Communist Party – as it had been conceived by especially Lenin – did not exist anymore, for it had become incorporated in society, which according to Horkheimer (1985) had led to the establishment of State Socialism as the Soviet variant of the Authoritarian

State. In view of the new historical situation, Horkheimer (2011) announced that what had been hitherto understood as praxis had to be abandoned. For Lenin, praxis was a conscious and transforming activity that became fully realised and attained its objective in the Vanguard Party. Without the Party, Horkheimer (2011: 78) pointed out, praxis now meant taking 'seriously the idea that the world needs fundamental change' (78), and that had to become manifest in thinking and doing alike. Therefore, the practical did not reside in political action any more, it resided in the non-identical. Adorno (2011) perceived a supremacy of praxis over theory in the society of his time and put less hope into praxis. For him, theory was more than a simple instrument of praxis, for it had the capacity to reflect on itself. In this sense, Adorno would put his efforts into theory.

When *Negative Dialectics* was published, a very important and radical student movement existed in Frankfurt which proclaimed the need to transform the world. The Socialist German Student Federation (SDS) was created in the universities of West Germany, and some of its most prominent figures were closely linked to the Frankfurt School. Hans-Jürgen Krahl, for example, was one of the leaders of the movement and a close student of Adorno (Claussen, 2010). The students of that time aspired to understand society through critical theory, but also to transform it. In spite of his proximity to this movement, Adorno was critical of the political praxis of the students. He believed (2003) their revolutionary activity was problematic and, in many aspects, useless. Furthermore, he considered there was a distortion of critical thought within the student activist movement which led to situations contrary to their intentions. Adorno referred mainly to the violent acts that resulted from their revolutionary activity. In short, he believed the relation between theory and praxis was a delicate one and required profound reflection.

According to Adorno (2005, 2007) the historical demand for unity between praxis and

theory had relegated theory to a role of servitude and created an autonomous praxis with manic, repressive, and violent characteristics. In that context, theory had to take it upon itself to suspend blind action as a passage towards emancipation. He also believed that theory suffered a type of censorship when it did not translate directly into political action. In his article 'Marginalia to Theory and Praxis', Adorno (2005) narrates the attack against a student for choosing activism over study. After smashing his room, his assailants wrote on the wall: 'Whoever occupies himself with theory, without acting practically, is a traitor to socialism' (263). This anecdote was an example of the type of praxis that reproduced oppression. For Adorno, he who thinks resists the liquidation of theory in the hands of dogmatisation, and aversion to theory was a characteristic of that time. The author believed the ban on thought imposed by dogmatism contributed decisively to illusory praxis, something that became clear in Soviet Russia. For praxis to develop, theory had to recover its independence; without it, the praxis that seeks to transform could not be transformed. Therefore, (2007) theory had to free itself from the chains of pragmatism. The transformation of the world – which was, precisely, considered utterly urgent – was once again viewed as something contemplative, in a sort of mockery towards urgency itself. For Adorno (2009a), the impatience that sought to transform the world without interpreting it was a symptom of weaknesses within praxis.

The author also considered it necessary to rethink the relation between theory and praxis. There is no final verdict that defines this relation as one of unity. If it is ideally assumed to be such, it turns into dogma. The moment of truth in Marx's thesis on the unity of theory and praxis was determined by historical conditions. The demand for unity is not, for Adorno, a trans-historic demand; in fact, it changes through history. In this sense, there is no immediate unity, the relation between theory and praxis is a relation

of discontinuity, for it is socially and historically mediated. However, neither are theory and praxis independent from each other.

There is a break with the Marxist tradition in Adorno's theorising, a kind of refusal to develop a theory of revolutionary praxis. The quest for a theory of praxis which is appropriate for each time and for each failure is part of said tradition. It is present in the work of Lenin and Lukács and, in our times, of Holloway too. For Adorno (2005) the crisis of historical praxis and its failure to transform the world is experienced in the form of 'not knowing what must be done', or as Horkheimer (1970: 150) put it: 'I can say what is wrong but I cannot define what is right.'

However, 'not knowing what must be done' is not a definitive situation or a closure, neither does it mean to tacitly give up on transforming the world; it is part of a context that is disastrous, but always open to utopia. The opening is possible because of the antagonism that constitutes capitalist society. Adorno claimed that he who thinks critically never gives up, and Adorno's critique gave an account of the non-identical, the different that already represented a utopia. Adorno's critical theory is not a point of arrival, it is a possible starting point in an effort to go beyond Marx and the Marxist tradition and see its limitations: limitations that have spread to praxis. Adorno helps us think of revolution with a theory and a praxis that demand we do not reproduce domination in our effort to break it.

We have said that Adorno's image of utopia is closely linked to the non-identical, to difference:

That differences should exist beside each other without engaging in mutual destruction, that differences should give space to each other to grow and – one might add – even love each other, that would truly be the dream of a reconciled world. (Adorno, 2013: 147)

This image emerges from Adorno's critique of capitalism. Using the principle of

commodity exchange that Marx developed in *Capital* as his starting point, Adorno claims in *Negative Dialectics* that capitalism is basically a process of complete levelling or identification that incorporates what is different in a contradictory way; the result is a type of homogeneous and unified society that as a totality is governed by real economic abstractions, to the point of death.

The category of totality was central in Lukácsian theory. However, he interpreted totality in a positive sense. He conceived the proletariat as a new totality of a revolutionary type that aimed at overcoming capitalist totality. Adorno believed that, to overcome capitalism, one had to criticise all idea of totality. As we mentioned in the previous paragraph, the existence of a totality implies an identifying process that does not tolerate difference and produces a synthesis of power and domination, even in the case of a revolutionary totality such as the proletariat.

In sum, Adorno considers all totality to be characterised by the rejection of difference, of particularity. Therefore, an emancipated society must abolish totality and not produce a new one. Its abolition would lead to a social constellation where what is different and non-identical could fully coexist. In this sense, he gave great importance to the category of constellation – which he drew from Walter Benjamin – for it allowed him to overcome the idea of totality.

## TIME AND EMANCIPATION

In his thesis on the concept of history, Walter Benjamin (2009) brings forward a conceptual set of ideas that shed light on the issue of the revolutionary subject in critical opposition to the prevailing approach of his time. His critique is directed against the theoretical core of the very concept of class struggle, which he considered to have been perverted by social democracy, in the sense that the latter turned it into an evolutionist concept

marked by the influence of the bourgeois ideology of progress.

This led to the transformation of the concept of class struggle – an essentially critical concept – into an ideology of development whose political consequence was conformity and adaptation to the system. Theoretically speaking, this political practice was legitimised by the incorporation at its core of a fundamental ingredient of the fetishism of the bourgeois conceptual form: the notion of a neutral universal process in class society, untouched by social antagonism. This ingredient was provided by the idea of progress. Progress was conceived as something inherently neutral and not as a contradictory category constituted in essence by class struggle itself. In this context, class struggle was interpreted as an agent that puts its energy into the process and gets rid of obstacles that stand in the way of its own ‘objective’ movement, understood as the development of the productive forces and of labour (see Benjamin, 2009, thesis XI).

One can easily see this critique extending to the productivist idea of socialism, which resulted in the legitimisation of a despotic form of state regulation of labour in the former Soviet Union. However, to return to the issue at hand, Benjamin’s critique allows us to see class struggle from a new, anti-progressive perspective, as well as to think of the revolutionary subject not as part of the historical *continuum*, but rather as its rupture. He stresses that the concept of ‘the progress of the human race in history is not to be separated from the concept of its progression through a homogeneous and empty time’ (Benjamin, 2009: 15). Also, that revolution must be conceived as the antithesis of this temporality, as time ‘which is fulfilled by the here-and-now’ (16).

‘Now-time’, the antithesis and negation of homogeneous time and the historical *continuum*, is woven by the struggle of the revolutionary classes. And this, in turn, reveals to us that historical knowledge is not neutral. Its locus, if such a term can be used,

is the antagonism between temporalities of struggle.

Importantly, abstract temporality is not simply a way of representing time, but rather a real temporal form, the temporal form of capital, described by Marx in his analysis of the dual character of labour in commodity (the relation between concrete and abstract labour). As a form of capital, abstract temporality is a relation of domination, and the struggle against it entails a rupture that constitutes a different type of temporality which Benjamin calls ‘now-time’. ‘Now-time’ is the opening to a universality that is neither abstract nor violent (a point that has been particularly developed by Adorno, as we shall see further on); it is of a different type. In ‘now-time’, history is summarised as a redemption of humanity or a messianic time which, according to Benjamin (2007: 38) is the time that Marx secularised in the idea of classless society.

With the notions of ‘now-time’ and ‘messianic time’, Benjamin sets out to theoretically shatter the linear conception of historical time, as well as establish a dialectic link between the present, the past, and the future with politics at its core. Revolutionary struggle in the present is the entrance to an unredeemed past, just as the redemption of this past is the entrance to the future. ‘Now-time’ is embedded with ‘splinters of messianic time’ (Benjamin, 2009: addendum A). That is, at present, struggle contains the time of redemption or human emancipation whose possibility cannot be understood linearly, but rather as a break with the historical *continuum*. In these terms, Benjamin set out to restore the revolutionary density that the concept of class struggle had lost.

A more openly political reading of Benjamin’s work will reveal a critique of social democracy as a model of political fetishism which, by extension, allows for its application in ‘revolutionary vanguards’. Political fetishism, one could say, consists in substituting an institution or a political party for the historical subject. It is the result of a

split between the time of organisation and the time of the classes it claims it represents. This split is 'resolved' in a synthesis of power that entails the subordination of 'now-time' to 'abstract time'; that is, it becomes crystallised in the image of a vertical time that is constituted by the time of the above (the rulers) and of the below, of the oppressed classes (subaltern time). As we know, the experience of the Russian Revolution resulted in a form of power where the time of the party-state was radically separated from society and the time of the latter had to bow before the former, extending the domination. This temporal crystallisation of power between an above and a below could not walk the path of collective self-determination. In fact, it was its negation.

Critique against abstract temporality as a mode of domination is a central theme in Walter Benjamin's conception of class struggle and revolution. From his perspective, the revolutionary subject cannot be thought of using categories that constitute a continuum of domination and abstractions that pay tribute to homogeneity. In fact, critique against abstract and homogeneous temporality can extend to critique against abstraction as a form of homogenisation and domination, which brings us face to face with the category of totality and the forms of rule of capital. In his idea of *constellation*, Benjamin tries to resolve the relation between the universal and the particular in a way that unity will no longer be linked to subordination (to the universal). It is not presented in terms of hegemony and synthesis (Benjamin, 2009, thesis XVII). The negation of the negation, a key concept in dialectics, is not a realisation of universal and homogeneous time, but rather its overcoming. It is not about the realisation of history, but rather about the suppression of universal history as a *continuum*, for the latter has been – and continues to be – the history of the rulers (thesis VI).

From our point of view, these theses also constitute a critique of the idea of the homogeneous revolutionary subject. Given that the

negating subject is in itself the incarnation of a messianic temporality, a temporality that is neither homogeneous nor hegemonic, the historical subject could be considered as a set of struggles against the rule of capital that constitute a *constellation*.

### **BY WAY OF CONCLUSION: THE ZAPATISTA IDEA OF EMANCIPATION AND THE EMERGING CONSTELLATION**

We would like to conclude this chapter with a reflection. The zapatista ideas of 'Below and to the Left' and 'Asking We Walk', as they have been formulated by the zapatistas themselves, are expressions of the idea of an anti-capitalist, rebellious subject that rejects the notions of vanguard and hegemony in thinking of revolutionary change as categories that are constructed on the basis of vertical and homogeneous categories. Based on the revolutionary experience of the indigenous communities of Chiapas, Mexico, and a self-critical approach to the guerrilla experience of recent decades, zapatismo has introduced the idea and practice of a polymorphic and plural anti-capitalist subject, the movement of multiple struggles of self-organisation and subjects that try to constitute a we that recognises itself in the shared history of the below and to the left. In this context, collective dialogue is crucial in forming horizontal agreements and inventing spaces and a new time.

This idea of the subject is a way of understanding democracy that opposes the ruling idea which views it as an attribute of the state form, to wit, of the political form of capital (Bonefeld, 2003), whose ideological and operative framework is constituted by law and the system of political parties (representative democracy). Zapatista politics is a manifest rejection of the above and the below of this dominant form of politics. It is a practical critique against the fetishism of forms, figures, and categories in which domination hides,

abstracting the class antagonisms that are the core of Mexican society and present-day capitalism and of which domination is a particularisation (see, for example, Caygill, 2013; Holloway and Pelaez, 1998). This can be appreciated in the EZLN's ironic use of 'civil society' in its first communiqués, as well as in the already mentioned ideas of 'Asking we Walk', 'Below and to the Left', and the 'Other Campaign' and 'World War IV', amongst others. This terminology not only reflects the production of a critical knowledge which was born and updated in the anti-capitalist struggle of zapatismo, but also one of its characteristic features: the defetishisation of concepts, forms, and categories of the rule of capital and the patriarchy. Amongst them, the civil society–state pair, representative democracy, power, the market, globalisation, the man–woman hegemonic dyad.

It is important to point out, at this point, that the mentioned defetishisation does not amount to a hegemonic inversion; it rather implies a struggle to overcome or dissolve the existing relations of domination in the 'here and now'. The zapatistas have understood that this must be translated into words that, together or separately, express the image of the rebellious time of we, a time that, according to Holloway (2002) could be named in terms of an against-and-beyond domination. This is the time in which one fights to dissolve the above and the below and thus anticipates an emancipated society. This could be called the negative politics of the word. The word names what is being negated in the hegemonic words,<sup>4</sup> but it names it as a rebellious voice that emerges from 'dignified rage' in a time of confrontation and of building the new, that is, a time that breaks the passive voice of defeat in a rebellious here-and-now. It is the word that celebrates the revolutionary opening of the world. It is the word that tries to name the rupture of domination as opening and not as the synthesis of a new domination or hegemony. And here we find a radical difference or theoretical breaking with the classical canon of the revolution and the subject.

The language of the latter aspires to a 'realisation of history' in terms of a new hegemony (of the proletariat represented by the class party) that concludes in the state. On the contrary, the zapatista language sets out to draw history away from the axis of hegemony.

Is there a certain connection between the zapatista theory and practice and critical theorists such as Benjamin and Adorno, and Horkheimer, too, who saw council communism as the means towards the end of human emancipation (Horkheimer, 1985: 99)? Walter Benjamin's thesis on history 'against the grain' provides an image of the revolutionary subject that is in tune with the zapatista images of revolution. The ideas of 'now time' and 'messianic time' are arguably a time lived by the zapatista communities. Furthermore, the notion of constellation that questions the homogeneous subject forged in the abstract idea of time is not unrelated to what is practised in the zapatista *caracoles*. The idea of revolution as a time that breaks and takes away history from the continuum of the temporality of domination is also in dialogue with the zapatista idea of removing history from the axis of hegemony. Likewise, Adorno's critique of the subject as a totality and of revolution as the production of a new synthesis of power and domination, as well as his effort to think from the particularity that is negated in totality, must be considered part of this dialogue too. In its turn, Holloway's theory of revolution as *cracks* is an effort to think of radical change from an anti-identitarian and anti-state-centred perspective, partly inspired by the praxis of zapatismo.

The points we have referred to are grounded on what, in the words of Benjamin, could be called a new constellation of class struggle that is in the process of creating a new image of revolutionary change and of reshaping the way we perceive emancipation. A common feature of this new constellation is that its language expresses the effort to reinvent the word revolution, asserting in resistance the human content that is negated in the conceptuality of a system of abstract

wealth, and in the struggle for power and hegemony, too, mere racketeering and ticket thinking (Horkheimer and Adorno, 1985).

## Notes

- 1 In Lenin, we find a relation of hegemony between the party as the vanguard of the proletariat and the *soviet* (workers council) as the broad and heterogeneous expression of the workers and the farmers. On this, see Lenin (1965). For Lukács, the *soviet* is 'the political and economic defeat of reification' (Lukács, 1968: 80). However, the party is 'the form of the proletarian class consciousness' that allows for the unity between theory and practice (42).
- 2 On this, see Adorno's (2007) critique of the idea of system in Hegel.
- 3 On the relation between theory and praxis in Marx and Lenin, see Sánchez Vázquez (1977).
- 4 On domination, hegemony, and words, see Williams (1983).

# Crisis and Immiseration: Critical Theory Today

Aaron Benanav and John Clegg

## THIS TOPSY-TURVY WORLD

The late 1960s saw an efflorescence of dissident Marxisms across Europe: *operaismo* in Italy, *situationnisme* in France, and what would become the *Neue Marx-Lektüre* in Germany. Marxian orthodoxy had entered into crisis after the Hungarian Revolution of 1956. A ‘new left’ was now groping for new ideas, and a wave of worker–student revolts, erupting worldwide in 1968, seemed to require a critical theory of post-war capitalism adequate to the practical critique taking shape in the factories and on the streets. Just as a previous high-point of theoretical production in the wake of the Russian Revolution of 1917 had seen a revival of the critical spirit of Marx’s writings, so too the new generation of dissident Marxists carried out their own ‘return to Marx’ aided by the discovery and distribution of many of his unpublished manuscripts.<sup>1</sup>

Members of the Frankfurt School acted as an intellectual bridge between these two high

points of Marxian theorizing. In Germany, the work of Theodor Adorno – along with the writings of some of the more unorthodox associates of the Frankfurt School, such as Alfred Sohn-Rethel – had a major influence on emergent re-readings of Marx’s mature writings.<sup>2</sup> This *Neue Marx-Lektüre* interpreted Marx’s theory of value through his discussion of fetishism, not as a theory of the determination of prices, but rather as a theory of the determination of social labor *as* price. Here the dissidents drew on Sohn-Rethel’s notion of ‘real abstraction’, in which the material life process is dominated by the abstract and impersonal social forms of value. On this view, Marx’s late critique of political economy was not an attempt to improve upon the classical political economists, as Marxian orthodoxy had it. Instead, his critique showed how their inverted perspective corresponded to the real inversions of the ‘perverted, topsy-turvy world’ of capitalist society.<sup>3</sup>

These insights were not restricted to Adorno’s students. In France, Guy Debord

echoed Adorno's conception of an inverted totality – 'the whole is false' – in his theory of the spectacle: 'In a world which really is topsy-turvy, the true is a moment of the false'.<sup>4</sup> Jacques Rancière and Lucio Colletti had similarly grasped the centrality of fetishism to Marx's theory of value, as had, in a more radical vein, Jacques Camatte and Fredy Perlman, whose translation of the dissident Russian economist Isaac Rubin introduced this interpretation of Marx's late works to an Anglophone audience.<sup>5</sup> All of these thinkers may be situated as members of a broader tendency of the 1960s, in which Marx was re-read as a theorist of the alienation prevalent in both work and society, and hence as a critic not just of *exploitation* but also of *domination*.<sup>6</sup> By this means, the European Marxist dissidents of the 1960s set out on a path – or, perhaps more accurately, on many paths – away from the official dogmas of the USSR and the communist parties.<sup>7</sup>

Drawing on Marx's early writings, the 1960s dissidents dreamed of a different kind of future from the one on offer in either the East or the West, a future in which the drudgery of working life would be reduced to a minimum in order to maximize free-time for the pursuit of both simple pleasures and their higher forms, such as the generation of scientific knowledge and the creation of art. Some thought it might be possible to overcome the distinction between work and leisure altogether, abolishing the separation between manual and mental labors that had hitherto been definitional of agrarian and industrial civilizations. Above all, the dissidents sought to overthrow the present conditions of social life in a way that would release a potential for human freedom and flourishing that was implicit in those conditions yet structurally obstructed.

Adorno's protestations notwithstanding, these ideas were certainly marked by the age in which they emerged. There are clear affinities between critical theory and the 1960s counterculture, with its revolt against 'consumerism', its holistic critiques of 'the

system', and its concern with the alienations of 'everyday life'. One can also identify, in the critique of domination, echoes of the various liberation movements of the day – of racial and sexual minorities, women, and colonial subjects. But above all, the critical theory of this era was marked by its appearance in the midst of rapid post-war growth and the technological revolutions that gave rise to an age of abundance. With the help of the Keynesian interventionist state, capitalism seemed to have finally freed itself from its crisis tendencies.<sup>8</sup> This period witnessed an unprecedented decline in inequality, as increases in workers' real wages outpaced increases in the returns to capital in many countries. The 'great levelling' of incomes seemed to call into question orthodox Marxist accounts of crisis and immiseration, with important consequences for revolutionary theory.

Unlike the orthodox Marxists, who tended to deny that the rate of exploitation had fallen in developed countries – or else shifted their focus to supposedly more exploited workers elsewhere – the dissidents of the 1960s recognized that rising working-class living standards made it necessary to revise Marxian theory to accord with new realities. In doing so, they emphasized Marx's core concern with freedom, his critique of alienation and ideology, over the more 'economistic' aspects of his later writings, especially those that appeared to envisage a material (as opposed to merely spiritual) worsening of the conditions of the working class. For Debord, the shifts of post-war capitalism allowed for a more capacious definition of the proletariat as a revolutionary subject – as all those compelled to work for wages, be they high or low<sup>9</sup> – as well as the content of that revolution – as a revolt against an 'abundance of commodity relations', rather than against poverty.<sup>10</sup> Adorno took a more pessimistic view, but shared with Debord a central focus on *impersonal domination*: a critique not merely of the distribution of wealth, but also of its reign as an independent power over all social classes.<sup>11</sup>

Rapid technical change in the post-war years led many of the dissidents to abandon the idea that capitalist social relations were a mere 'fetter' on increasingly socialized forces of production. This perspective was simply incompatible with the miseries of the assembly line described by Raniero Panzieri and Harry Braverman, as well as with the more practical critique of work enacted in periodic wildcat strikes.<sup>12</sup> While Marxist dissidents continued to embrace the notion that technical innovations had the potential to liberate human beings, by extending the 'realm of freedom' as against the 'realm of necessity', they saw that under capitalism, technologies had become the means of an ever worsening instrumental rationalization of social life.<sup>13</sup> Indeed for Adorno, the capitalist mode of production, in solving the problem of distribution, had actually worsened the problem of domination: 'If the old pauperization theory has turned out not to literally be true, it has done so in the no less alarming sense that unfreedom, dependency upon an apparatus that has escaped the control of those who use it, has spread out universally over mankind'.<sup>14</sup> For this reason, the Marxist dissidents turned away from the theory of crisis, traditionally understood as a fundamental contradiction between the *forces* and *relations* of production, and toward a theory of alienation, in which that contradiction was between the *potentiality* and *actuality* of wealth-creation under capitalism.<sup>15</sup>

Yet in retrospect, the dissidents were wrong to conclude that a few exceptional decades of growth had refuted 'the old pauperization theory'. The Marxists of the 1960s lived in an epoch marked by the superabundance of goods, representing a huge potential increase in the free-time of society – a potential which failed to realize itself since people continued to work long hours. In an era of extremely low unemployment rates and high rates of real wage growth, these theorists could scarcely imagine what was soon to follow: by the mid 1970s, the growing potential free-time of society would reveal itself not

as an expanding realm of leisure, but rather as a crisis of overproduction, accompanied by a dramatic rise in rates of unemployment and underemployment. These trends made, not for a revitalization and transformation of the labor movement, as the dissidents imagined might be possible, but rather its tendential dissolution.

Because so much of the dissidents' work was based on a rejection of the theory of capitalist crisis and immiseration, it is of limited use in explaining current trends within capitalist societies. Since 1973, the world economy has grown much more slowly than it had in the 1950s and 1960s. In the rich countries, high rates of unemployment persisted for decades – in the case of Europe – or fell off only insofar as workers could be incorporated into insecure, low-wage jobs – as in the United States and United Kingdom. In the 1990s and 2000s, European countries followed the Anglo-American path via the 'flexibilization' of labor. A low demand for labor has been accompanied, in almost all cases, by a stagnation of real wages and a fall in the labor-share of income. The situation outside of the high-income countries is, in most cases, substantially worse.

Globally, more people depend on selling their labor to survive than ever before, but under conditions of slowing global economic growth rates, economic development has become harder to achieve: the success of low-income countries like China has come at the expense of other poor countries. A still growing supply of labor thus faces a persistently low demand, which is substantially worse than that prevailing in high-income countries. Many people survive only by working informally: today, informal work accounts for one half of all non-agricultural work worldwide.<sup>16</sup> Globally, too, labor shares of income have fallen.<sup>17</sup> However, these decades have not only been marked by a return of misery, measured quantitatively in the stagnation of wages and qualitatively in growing employment insecurity and worsening working conditions.

Since the late 1960s and early 1970s, economic stagnation has been accompanied by *deindustrialization*: factories continue to produce more output, yet they employ fewer workers, worsening the deficit of labor demand across the economy.<sup>18</sup> In the United Kingdom and the United States, manufacturing employment fell, as a share of total employment, from 32 percent and 24 percent, respectively, in 1970 to less than 10 percent today. In Germany, manufacturing employment fell from 40 percent to 20 percent over the same period, and in France from 28 percent to 12 percent. The same tendency has unfolded across many poor countries, as well, which saw industrial employment shares fall ‘prematurely’, starting in the 1980s and 1990s, from surprising low peaks, typically of less than 20 percent of total employment, to around 15 percent of total employment.<sup>19</sup> Many of the factories that formed an object of critique for the 1960s dissidents have shuttered their doors.

## MISERY

These trends form the backdrop to our own ‘return to Marx’, which builds on the insights of the 1960s dissidents by bringing them into relation with Marx’s original theory of immiseration.<sup>20</sup> The key here is to recognize that Marx was a theorist of immiseration precisely *because* he was a theorist of deindustrialization. Marx saw the immiserating tendency of capitalism – which was, for him, as much qualitative as quantitative – as unfolding in a two-sided transformation of production. First, within the labor process, capital tended to supplement human labor with machinery to such a degree that labor became a mere ‘appendage’ to an objectively organized production process based on the technical application of scientific knowledge. Second, within the valorization process, this shift in production was reflected in a *decline in the demand for industrial labor*, which

issued in the expulsion of an increasingly ‘superfluous’ labor force from the factory. This latter transformation implies devastating human costs in a world in which most people survive by selling their capacity to labor: it becomes ever more difficult to sell that capacity as the demand for labor falls, with the result that workers find their individual and collective bargaining positions weakened. It is for this reason that, in a capitalist society, the ‘accumulation of wealth at one pole’, i.e. on the side of capital, must be ‘at the same time accumulation of misery ... at the opposite pole’, i.e. on the side of workers.<sup>21</sup>

The 1960s dissidents had revived attention only to the first of the two transformations described above: constant increases in labor productivity require an ongoing reorganization of the production process, along lines that increase the unfreedom of the workforce. At the time of capital’s emergence, industrial goods were produced by individual artisans, using tools specially produced for their trade. Under the pressures of competition, capitalists were led to both decompose and recompose the artisanal production process to make it amenable to the constant adjustments necessary to decrease costs of production. Accordingly, labor was supplemented with machines, and then with a complex system of machinery. The experience of the worker, in the course of this transformation, is that he or she was shunted from the center of production to its margins, becoming a ‘living appendage’ of the machine without an ‘atom of freedom’.<sup>22</sup>

Here is the alienation of the worker within production, which the theorists of the 1960s identified.<sup>23</sup> For Marx, capitalist domination is embodied in the factory-form itself: once the workers’ labor process is decomposed and then reconstructed, ‘the interconnection between their various labors confronts them, in the realm of ideas, as a plan drawn up by the capitalist, and in practice, as his authority, as the powerful will of a being outside them, who subjects their activity to his purpose’.<sup>24</sup>

Marx was critical of factory production in the dialectical sense that means of increasing human freedom (scientific insights) were inverted into means of domination (via their technical application in the capitalist production process).

Marx described this technical transformation of production, within any given workplace, as a rising 'technical composition' of capital: a greater quantity of means of production were set in motion by each worker.<sup>25</sup> This process not only occurs in each line of production; with the spread of factory production, it also extends across society. Many technologies migrate from old lines of production to new ones, as capitalists take advantage of whatever innovations might aid them in competition.<sup>26</sup> Over time, large sections of the productive apparatus adopt the factory-form. At the same time, society as a whole is reshaped: massive infrastructures lubricate flows of commodities, and also make the development of new commodities possible (e.g. via electrical grids, broadband networks, etc.). If the process stopped there, the result of a constant technological ratcheting up of production would only be a rising tension between the potentiality of capitalist society and its actuality, as 1960s dissidents claimed. But Marx argued that the ratcheting upwards of the technical composition tends to reflect itself also in a rising 'value composition' of capital, that is, in rising outlays on means of production relative to labor. This tendency leads to a situation in which the 'demand for labor ... falls progressively with the growth of total social capital'.<sup>27</sup> More workers are pushed out of older lines of production than are taken up into newer ones. The ensuing deindustrialization of the workforce is hindered only to the extent that some lines, particularly in the highly heterogeneous service sector, are resistant to the introduction of machinery.<sup>28</sup>

Due to this second transformation, the growing free-time of society is not only something to be actualized in a future, socialist society. It is also actualized *within capitalist*

*society* – as 'enforced idleness' for many and as 'over-work' for the rest.<sup>29</sup> Workers thus find themselves caught in a performative contradiction: the working class 'produces both the accumulation of capital and the means by which it is itself made relatively superfluous; and it does this to an extent which is always increasing'.<sup>30</sup> The problem workers face under these conditions is that even if their labor is no longer needed, they cannot stop selling their capacity to labor. For no matter how bad labor-market conditions get, workers are compelled to earn wages in order to buy what they need to live. This compulsion is reproduced by the structure of the capital-labor relation, which ensures that they remain bound to wage labor by the 'invisible threads' of their dispossession.<sup>31</sup>

It is on this basis that Marx formulates his theory of the 'relative surplus population', which 'exists in all kinds of forms' and includes every worker 'during the time when he is only partially employed or wholly unemployed'.<sup>32</sup> This surplus population is 'relative' because it is surplus relative to the needs of capital, not absolutely surplus to society's capacity to feed itself, in a Malthusian sense. Marx's argument regarding the surplus population has frequently been truncated by interpreters who focus on one of its forms, namely the 'industrial reserve army' or 'floating' surplus population, which is hired at the prevailing wage during economic booms and then fired during the busts.<sup>33</sup> On this theory, the expulsion of workers from production comes to function as a lever by which the rate of capital accumulation can be increased. However, Marx argues that, as this reserve army grows, so too do other forms of surplus population.

Many workers who are expelled from existing lines of production never find work again at the prevailing wage. These workers retain only a tenuous connection to the labor market. They become part of the 'stagnant' or 'consolidated' surplus population, which also becomes a 'self-expanding' section of the working class due to population growth. This stagnant surplus population works the

maximum hours for a minimum pay in 'special branches of capitalist exploitation' as well as in 'domestic industry'.<sup>34</sup> It is key to note that for Marx, even this population is part of the 'active labor army': surplus workers have to work regardless of a decline in the demand for their labor but find only 'extremely irregular employment'.<sup>35</sup> In a world such as Marx's – in which there is no unemployment insurance on offer – those who remain unemployed for so long that they lose their ability to work fall out of the relative surplus population and join the 'paupers', who survive only by begging their daily bread on the streets and in the poorhouses.

As capital transforms one sector after another in its effort to raise the productivity of labor, this tendency is reflected in a reduction in the demand of labor, issuing in the expansion of all forms of the surplus population. The growth of the surplus population also worsens the situation of the working class as a whole: when the labor market is slack, all workers find that they have less bargaining power, since the risks associated with losing one's job rise when and where there are many people already looking for work. For these reasons, immiseration is the 'absolute general law of capital accumulation'.<sup>36</sup>

In spite of the name he gave this law, Marx did not distinguish between the relative and absolute dimensions of capitalism's immiserating tendency. He simply pointed out that in this context 'the situation of the worker, be his payment high or low, must grow worse'.<sup>37</sup> One clear implication is that, as the income of all of society grows, the share of it that goes to the working class will fall, since the demand for labor will stagnate or fall relative to its supply.<sup>38</sup> In periods of stagnation, such a relative decline in living standards must become absolute. However, other aspects of this process of immiseration are as much qualitative as quantitative. For instance Marx placed great emphasis on the declining job-security that accompanies the increasingly disposable quality of labor: 'the higher the productivity of labor,

the greater is the pressure of the workers on the means of employment, the more precarious therefore becomes the conditions of their existence'.<sup>39</sup> Growing insecurity in work, heightened competition for jobs, and more generally, the swallowing up of life either by work or by the effort to obtain work define the experience of large parts of the working class today – in spite of the fact that society as a whole continues to produce ever more material wealth, ever more efficiently. These facts condition class struggle in the present.

## RECKONING

The above analysis gives rise to a paradox. In the late 1960s, workers' struggles were growing in intensity. Within those struggles, a minority of workers were practically enacting the critique of work – in the factories and in the streets – that the radical dissidents were describing in theory. One might have expected the return of the crisis tendencies of capitalism to have amplified both the practical and theoretical critiques of capitalist society: immiseration would then have been accompanied by a renewal of the labor movement as a revolutionary force. In reality, the opposite trends unfolded. The 1980s and 1990s saw the death of 'actually existing socialism', the capitulation of reformist workers' parties to the demands of capital, and a routing of organized labor – without another rank-and-file workers' movement rising in its place. Capitalism is now failing to deliver on its promises in the most basic economic sense, yet the era of a deep crisis of capitalism has been accompanied by an even deeper crisis in the practical opposition to capitalism.

These trends have pushed many pro-revolutionaries into a deep pessimism about the possibilities for human emancipation: perhaps the moment to realize philosophy has been *definitively* missed, as Adorno feared. The workers' movement has been on

the back foot now for more than 40 years. Even in countries where labor movements are of recent vintage, as in South Africa, South Korea, and Brazil, they are all now marching to the same neoliberal tune. Such a widespread reversal of fortune cannot be explained by the contingencies of class struggle in any one country. In order to explain the labor movement's tendential dissolution in the era of deindustrialization, we have to look back at the social bases of its expansion in the late nineteenth century.<sup>40</sup> The key point, for our account, is that it turned out that Marx was wrong about the tendencies of capital accumulation for the first 100 years after the publication of *Capital*.

Instead of deindustrializing, late nineteenth-century European economies continued to industrialize. Moreover, the second industrial revolution marked a shift in the character of capitalism, opening up an exceptional space of political possibilities that Marx did not anticipate. The increasing automation of the production process, which Marx expected, occurred alongside the massive expansion of employment in jobs assembling what had been produced, which Marx did not expect.<sup>41</sup> The marginalization of the worker within production was thus incomplete; workers retained some 'atom of freedom' within work, which could also become the basis of their power within the workplace. Indeed, more and more industrial laborers were working with huge quantities of fixed capital, potentially giving them increased leverage at the point of production. Workers might be able to use this lever to overturn capitalist society, if they could figure out how to effectively unify themselves as a class acting on the basis of shared interests.

In the *Communist Manifesto*, Marx and Engels suggested that the unification of the workers was being achieved automatically with the extension of factory production. Marx reiterated this point in *Capital*: in the course of capitalist development, the working class is not only 'constantly increasing in numbers'; it is also 'trained, united, and

organized by the very mechanism of the capitalist process of production'.<sup>42</sup> However, as we saw above, *Capital* also elaborated a theory of capitalist domination within the workplace, which suggested that the collectivization of workers in factories would have ambiguous consequences for workers' power. The factory-form not only makes it possible to steadily increase workers' productivity levels; it also makes possible a recomposition of the labor process in line with capital's needs for command and control.

For this reason, the expansion of the industrial workforce was unlikely to automatically generate a *real or essential unity* among workers, which would allow them to actually grasp the levers of power within factories in order to overturn capitalist society. The atomization of workers, their competition in the labor market, invaded the factory as well. Capital's domination over labor was reinforced in the organization and layout of factory production. Indeed, capitalists were able to take the divisions that cut through the labor market and import those into the workplace. Workers remained divided in terms of gender, language, religion, and regional customs. To these differences were added new ones as well: race and nationality, as well as emergent and constantly shifting hierarchies of skills and education. In this sense, the unity of workers remained, for the most part, a *unity-in-separation*: it was a unity mediated by capital; hence, it was not available as a ready-made weapon in the struggle for autonomy from capital.

Under these conditions, the project of achieving a real unity of the working class, as a class, could only be a political project: it was the project of the workers' movement. That movement was internally differentiated among anarchists, syndicalists, socialists, communists, and other tendencies with diverse orientations. However, these groups retained a common aim: to organize workers on the basis of an affirmation of their class position – their positive identity as workers, regardless of age, sex, religion, nationality,

race, and skill – so they could actually wield the power they implicitly held at the point of production. The project of the workers' movement was successful in many respects: it improved conditions of the sale of workers' labor-power, and even protected workers, to some extent, from consequences of the commodification of their capacity to labor. The labor movement also formed the background to the revolutionary upsurges of the 1917–23 period. However, this movement tended to create, not the real unity at which it aimed, but rather, a highly bureaucratized *ersatz* unity. Workers remained unified only in separation, but now with an additional separation between workers and their organizations, especially workers' unions and parties.

This movement could not have survived the shifts in production that reactivated the core contradictions of capitalist societies in the 1970s. Central to the organizing thrust of the workers' movement was a philosophy of history, which claimed that workers' real unity – which they were fighting to build in daily struggle – would eventually realize itself in the manner Marx and Engels described: 'the accumulation of capital' would be 'the multiplication of the proletariat'.<sup>43</sup> Industrialization was to be the driver of workers' incipient victory, since it brought with it growing numbers of industrial workers, growing unity among workers, and growing workers' power in production. The workers' movement thus defended and even encouraged proletarianization, the movement of peasants into the expanding factory system, as a means of increasing workers' power. It also encouraged the modernization of production, wherever possible.

Movement militants envisaged a soon-to-be-realized future in which the industrial working class would form a majority of the population, reshaping society according to its will. The onset of deindustrialization in the 1970s disproved this foundational perspective about the direction of history. The industrial working class, whether numerically expanding or contracting in any given

country, now everywhere represents a shrinking share of the total labor force. More and more workers thus find themselves standing outside the factory gates, looking in. These non-industrial workers largely lack power at the point of production. Their labor is increasingly superfluous to the needs of a vast scientific-technical production process. In this way, atomization – the unity-in-separation of capital – won out over the collectivizing tendencies of the factory, even where these were supplemented by workers' organizations.

Due to these ongoing transformations in the production process, workers tend less and less to identify their work as their primary link to the wider society. Many workers do not see themselves as shaping the world through their work, or as contributing something meaningful to the world by working. Based on their own experience, they do not come to believe that their lives would be radically improved if only they could collectively manage their workplaces. Outside of less mechanized sectors, such as health care and education, workers' autonomy – their self-management of the labor process – is no longer a recognizable goal. Only freedom from the burden of this sort of work, in the interests of life, would be worthwhile.

Indeed, in the formal and informal low-wage service sector, in particular, many workers would likely prefer to see their jobs disappear, and their workplaces razed to the ground, if they could find some way to survive without the wages their work affords. For this reason, such workers fail to see a positive identity and political project inhering in their class position. That is true, in spite of the fact that some of the divisions that fractured the workers' movement in an earlier period have seen their impacts reduced, such as divisions according to language or dialect, culture, religious denomination, and nation. Replacing many such divisions is this increasingly central one: between a relatively secure but shrinking sector of (often unionized) workers, and a highly insecure and growing sector of precarious workers. This

primary division maps, sometimes explosively, onto other divisions along lines of citizenship status, race, and gender.

If the categories of capitalist society – the worker, above all, but also the factory – once appeared to be categories with a possible emancipatory content, that is no longer the case. The ‘atom of freedom’ that these categories contained has been evacuated in a world where direct human labor has been replaced at the center of production by the technological application of scientific knowledge. Workers are therefore unable to affirm their class position within this society as the basis of an emancipatory project to come. They do not achieve their real unity within the expanding space of the factory. On the contrary, the remaining factories, which continue to employ a minority of workers, are merely a manifestation of what separates all workers: commodity production and market exchange. Workers are thus compelled to find their real unity elsewhere, as human beings, *beyond the terms of a society that makes work the primary social link*.

## STRUGGLE

At this point, it is critical to reiterate that the decline of the classical workers’ movement has not meant the dissolution of the working class. On the contrary, more people than ever before must survive by selling their labor power or the simple products of their labor, but they do so in a context in which the demand for labor power is persistently slack. It is precisely for that reason that the contradictions of capitalist society are currently pressing with such intensity on working people, leading to immiseration and a concomitant expansion of poverty alongside wealth. By the same token, the working class, in its antagonistic struggle with capital, remains the only force capable of dissolving this society in an emancipatory direction.

However, the struggle of the working class unfolds differently today than it did in the past – beyond the end of the workers’ movement, beyond the edge of a world in which *worker* and *factory* were categories with emancipatory content. Today, few workers view their class position as the basis of a collective project of overturning society. In this context, struggles outside the workplace have often been the ones that gain traction within a wider sphere. In such struggles, workers frequently do not identify as workers. In order to sidestep antagonisms internal to their class, workers often grope toward some other position, *external to their existence as workers*, as a means of pushing forward their antagonisms with both capital and the state.

This shift necessitates a rethinking of the terms of class struggle, disconnecting it from any necessary identification with the struggle for better wages and working conditions within the workplace.<sup>44</sup> A reconstructed notion of class struggle might begin from the following propositions.<sup>45</sup> Starting from their atomization within capitalist society, that is, from their *unity-in-separation*, workers are periodically able to defend themselves against the onslaughts of capital – both in the workplace as well as in society more broadly – by forming a temporary but collective power. In order to do so, workers must invent new tactics, contents and forms of struggle, all of which are impossible to anticipate in advance.

In such struggles, workers’ power derives from their collective capacity to disrupt the flows of capitalist society, in workplaces or outside of them, whether by strike, occupation, riot, or blockade. As capitalist society has become more complex, possible points of disruption have multiplied: some are located in the sphere of production, but many others are located outside of that sphere – in distribution and consumption. At times, proletarians have been able to engage in disruptive activity in one of these spheres, building up their power on that basis, albeit temporarily. The key point is that, in doing so, workers are

forced to come together outside of the terms on which they are normally organized in capitalist society. They have to build connections between normally separated fractions of the working class, including between relatively securely employed and relatively precariously employed sections.

Expanding the purview of this sort of mass disruptive activity across society is the only way for workers to push their struggles forward. They therefore require collective organization, whether this is formal or informal, lasting or quickly dissipating. In any case, large-scale disruptive action is risky and is only possible given high levels of coordination, which has been achieved as yet only rarely and briefly. Such coordination is itself only possible when organizations are responsive to the needs of their members and therefore capable of sustaining the trust required to engage in this activity. In our definition, class struggle takes place wherever workers undertake mass disruptive action, under the purview of organizations forged for this purpose (typically in the course of the struggles themselves). These disruptive actions may be described as *self-organized workers' struggles*.

What is fundamental from the perspective of the emancipatory project of ending class society is the limit that atomized workers and segmented class fractions confront in the course of their self-organized struggles. Their fundamental limit is the impossibility of building collective power across sections of the class in the absence of a shared class identity and project. Italian autonomists described this limit of class power in terms of the decomposition and recomposition of the working class in different periods of the history of capitalist society. In their view, the technical transformation of the production process periodically caused older modes of workers' political organization to lose their viability and dissolve (the autonomists thought that these technical transformations were politically motivated, but we need not agree with them there). Workers then had to

recompose themselves politically, based on the new technical organization of production. On this basis, the 'craft worker' was succeeded by the 'mass worker', who was in turn succeeded, in some accounts, by the 'social worker' or the 'multitude'.<sup>46</sup> In our view, the onset of deindustrialization marks the end of this cycle. The class has been decomposed, fragmented, and segmented, without the possibility of a recomposition around a new workers' identity, however conceived.

Workers today thus face a *composition problem*, as the fundamental limit of their struggle. Workers' very existence as a class appears to be not a potential basis of power, but rather, the main obstacle to the extension of their power. In the course of their struggles, workers find that it is impossible to build a new world on the basis of the categories of the old world – on the basis of the unity-in-separation of the working class in present-day capitalist society. It is not that there are no more industrial workers, but rather, that the remainder of industrial workers can no longer present itself as the leading edge of the class, uniting the interests of all workers. Nor can the various surplus populations of the world, although growing in size, affirm their position as a positive pole of workers' activity, since they exist as a negation of the class and its power within capitalist society. The terms on which proletarians once united are no longer available, but unification remains a necessity for every struggle. For that reason, the problem of composition is today a revolutionary problem. Workers' confrontation with this fundamental limit of their struggle – or even: the formalization of that limit, its widespread recognition as a limit – will be coincident with the re-emergence of the communist movement.

In this context, class struggles today can already be found creatively inventing new categories, external to the categories of the capitalist mode of production, which anticipate but do not yet achieve the rebirth of a communist movement. The movement of movements, the black bloc, the *indignados*,

occupy, the 99 percent, *democracia real*, the movement for black lives, *nuit debout* and so on – these are the beyond-the-world-of-work categories of workers' struggle today. In generating these categories, workers sidestep the composition problem that hampers their activity: they attack this world as if from the outside, while of course remaining embedded within it. The problem is that their ideal-outside could only realize itself if it were able to launch an attack on the material bases of capitalist society. In the past, struggles had the potential to spill out of the factory, as a pathway to a revolution in all areas of social life. Today, struggles are confronted by their limited ability to break *into* zones of production – a rupture that remains a fundamental precondition of the abolition of class society and the advent of a communist era.

Of course, we are still far from a time when struggles will have achieved the requisite level of intensity to challenge the rule of capital, so the perspective we are giving here remains anticipatory. Nevertheless, if Marxism is a theory of *pure immanence*, it requires not only that we locate the sources of our critique within the contradictions of our society, but also that we locate our critique within the particular historical period in which we live, and in which those contradictions are developing. Just as the growing free time of society is not only a potential to be realized within a future world but is also actualized within capitalist society as overwork for some and underwork for others, so too the critique of this society cannot remain merely a potential in *our* theory – it must also be actualized within the theory and practice of the proletariat.

## CRISIS

In this section and the next, we look at two further ways of specifying class struggle in the present. It may be objected, rightly, that most workers today fail to identify

the capital-relation as the source of their immiseration, even when engaged in self-organized struggle. When 'capitalism' is used to describe what must be overcome, this term frequently refers to corporations with an outsized influence on politics, rather than generalized commodity exchange. Workers are engaged in a limited critique of capitalism – mostly as *crony-capitalism*. They are thus responding to the appearance of capitalist crisis, rather than its essence. The question we must ask is: why does this essence (capitalist crisis) appear in this form (crony capitalism)?

The crisis of capitalism is, most fundamentally, that of the *disintegration of the capital-labor relation*. In the post-war era, decades of rising productivity eventually issued in widespread overproduction, which was reflected in persistent problems of low profitability centered in the manufacturing sector. Falling profits in the 1960s and 1970s resulted in a decline in the rate at which surpluses were reinvested, leading to lower rates of capital accumulation and hence slower rates of economic growth. By the 1980s, stagnation had become the new norm, accompanied by ongoing deindustrialization. As we discussed above, huge quantities of excess labor have been ejected from their previous employments but have not easily found new employments (meanwhile, youth continue to enter an already oversupplied labor market). Here we must add that *similar problems have taken place on the side of capital*. Following Marx, we have elsewhere described this tendency as 'the production of surplus capital alongside surplus labor'.<sup>47</sup> Surplus capital cannot be invested without worsening the conditions of overproduction and hence putting further pressure on profitability.

The result is an overaccumulation of capital. In order to avoid the onset of a deep and lasting depression, which would issue in a slaughtering of capital values, states and central banks have undertaken concerted action to depress interest rates, lessening some of the pressure generated by falling rates of profit.

That has allowed the system to keep ticking over but at the expense of worsening already existing tendencies toward stagnation.<sup>48</sup> Here, the task of the state has been made easier by the fact that the underlying problem of overaccumulation has not been solved. That is, there remains a persistent excess supply of capital, weighing down long-term interest rates. Faced with a lack of opportunities for investment, giant pools of 'hot money' slosh around the world economy, generating cheap credit in the midst of an ongoing economic slowdown. Falling interest rates subsequently inflect the unfolding of capitalist crisis, in two ways.

First, low interest rates have made it possible for governments, firms, and households to respond to falling economic growth rates by taking on debt. Total debt-to-GDP ratios have soared over the past few decades. The capacity of entities across the economy to take on debt at low interest rates has smoothed the path of the crisis. Of course, worries about the ability of various borrowers to repay their loans reach ever greater heights as debt levels increase, since loans are made to borrowers on the promise of a future rise in income that will allow the borrowers to repay their loans. Such a rise in incomes has failed to appear. Yet, all the same, the supply of credit continues to outrun demand. What can lenders do but wring their hands?

Second, the same tendency has led to periodic inflations and then deflations of asset bubbles, generating financial crises that shake the capitalist system to its core. As it turns out, the financialization of capital has not been a boon to financial firms in any simple sense.<sup>49</sup> These firms earn returns based on the difference between the interest rates they charge on long-term loans and the interest rates they pay to their own short-term investors. As the gap between long- and short-term interest rates compresses, due to overaccumulation, financial firms have had to compensate by taking on greater risk. Institutional investors' appetites for risk has not risen to the same extent as financial firms

need to sell it, so financial firms have become adept innovators, offering up new financial 'instruments' to hide risk. The result is that financial firms typically earn rates of return that, while formerly normal, are now exceptionally high. Extremely risky bets, taken over and over, periodically issue in catastrophic losses, which in turn lead to crises.<sup>50</sup>

The worst of the financial crises, so far, was of course that of 2008, which issued in a deep recession and a rapid rise in levels of un- and underemployment across much of the world. In response, governments in high-income countries took swift action to prevent the recession from becoming a depression. But in doing so, they found themselves caught in a double bind. On the one hand, governments had to bail out financial firms, transferring huge quantities of money to people who had essentially made a series of bad bets – transmuting those bets, retroactively, into good ones. Alongside other stopgap measures taken by governments, these bail-outs were extremely expensive. On the other hand, by 2008, governments had already accumulated massive debts relative to GDP: since the 1970s, they have been spending huge quantities of money to keep their ailing economies ticking over.<sup>51</sup>

Given these constraints, governments were forced to undertake apparently irrational action. They bailed out the banks to the tune of trillions of dollars, but at the same time – in order to control exploding debt levels in the context of debt-to-GDP ratios that were already worryingly high – they imposed austerity on their citizens. Nor was this austerity limited to the worst off among the population: it affected public provisions of healthcare and education and resulted in mass layoffs of public employees. Why did governments pay off crooked bankers, while at the same time making people who had done nothing wrong suffer for the bankers' crimes? This move was completely sensible, from the perspective of a capitalist economy: the restoration of the rate of profit has to take precedence over all other concerns. However, working-class

people saw government action in a different light. The only apparent explanation of the fact that the government was bailing out the banks while imposing austerity on the population was that *the government had lost its capacity for rational action*: it had been captured by the bankers. Workers took to the street to demand that the state free itself from the stranglehold of crony capitalists: governments should bail out the people and impose austerity on the banks! Here, workers were responding to the form of appearance of capitalist crisis in our times as a financial crisis. To see the situation on different terms would require that workers tarry with the more fundamental crisis of capitalism, which has not only shifted but also severely limited state action.

A more fundamental critique of capitalism does have the potential to generalize itself today, either in the context of the ongoing stagnation of the economy, or else due to the onset of a deeper crisis, which may yet emerge as governments lose their capacity for concerted action. In either case, the limits to state action will reveal themselves. An awareness of those limits is already emerging along three lines. First, a public discussion of computerization and robotization – while mystifying the causes of the present crisis of the world of work – nevertheless proclaims that this crisis is insurmountable on the terms of capitalist economies. Second, there is a growing public awareness that, since the 1970s, the advanced capitalist economies have tended to stagnate to an ever-worsening degree, without a clear explanation as to why this is occurring. Third, and perhaps most importantly, there is a growing fear of the effects of global warming, which capitalist economies are unable to address in spite of the existential threat that it poses to humanity.

Under these conditions, it is possible to imagine that future struggles, if they achieve the requisite size and scope, will create the context for a new communist movement to appear. Such a movement would cease to look to the state to restore the conditions

of growth. Instead it would try to solve the coordination problem that limits struggles by linking together the fragments of the working class – union members, downwardly mobile graduates, upwardly constrained service workers, computer programmers, precarious youth, immigrants and refugees, and militants – into a broad-based attack on their own conditions of separation, that is, *on the very conditions of their existence as a class*. This problem remains apparently intractable on the basis of struggle as it is today. However in history, discontinuity is the rule rather than the exception: periods of reaction suddenly break out into new eras of revolutionary agitation, which seemed impossible a few years before.

## POLITICS

Yet, it must be said, other directions for social struggle are also possible, and even more likely. In the present, highly atomized populations, racked by austerity, unemployment, and evictions, are awakening from inactivity and seeking redress *on the terms of their atomization*. Across diverse national contexts, a burning rage at politicians – for the manner in which they handled the crisis as well as its aftermath – did give rise to wave after wave of collective struggle, centered around anti-austerity demands and widespread anti-government sentiments, which in many ways sought to overcome atomization. Between 2010 and 2016, such extra-parliamentary movements unfolded in Tunisia, Egypt, Spain, Greece, Ireland, the United Kingdom, the United States, Quebec, Chile, Turkey, Brazil, Bosnia, the Ukraine, Hong Kong, and France. But these movements all dissipated within months, without substantially altering either the terms of the crisis or the forms of state response to it.<sup>52</sup> As these movements ended, some of their dispersed forces regrouped themselves, entering the realm of politics that they

had formerly and stridently denounced as endemically corrupt.

As it turns out, the ongoing abandonment of politics as a site of constrained conflict created an unexpected opening for this 'political' turn within extra-parliamentary movements: the demobilization of society has made it easier for anyone mobilizing a part of the population to catapult his- or herself into the center of politics, even if doubts remain about whether one can achieve much of anything from that position. At the same time, new right-wing parties, pushed to the margins of contemporary society in previous decades, have once again begun to gain ground in parliaments, as the political center hollows out. To understand how a general disaffection with politics has given rise to dynamic but limited political experiments, we have to see how the long-term capitalist crisis has played out in the political realm.<sup>53</sup>

The workers' movement, whose tendential dissolution we discussed above, gave birth to the first modern mass parties in the late nineteenth century. Organized from the ground up, with programs to guide them to victory, socialist parties threatened to make use of parliament not to change the laws of society, but rather to overturn society by socializing the means of production. It was in response to the threat generated by socialist parties that other political formations were forced to organize themselves on a mass-scale, appealing to populations of urban workers as well as their traditional constituencies. In this sense, the workers' movement was responsible for shaping the contours of modern parliamentary politics.<sup>54</sup> The threat posed by the workers' movement opened up a readable, strategic field not only for the left but equally for the center and right, with diverse characteristics across the differently constituted polities of Europe and the wider world (when and where these parliamentary formations were not overruled by outright dictatorships). The return of economic crisis tendencies in the 1970s then scrambled this strategic field for all political parties, transforming

an unfolding social crisis into a political one as well.<sup>55</sup>

As economic growth rates fell and unemployment rates rose, it became clear that nobody would be able to prosper unless the conditions of capital accumulation were restored, so restoring those conditions increasingly became the main task for all parties. Politicians set about rolling back the welfare state and the regulatory apparatus based on the view that this rollback would lower costs for capital and revive the rate of profit, leading to renewed economic growth. The fact that even representatives of the workers' movement decided to carry out these reforms signaled the final emptying-out of that movement's potential. Across societies, differences between left and right were correspondingly reduced: those differences were now only a matter of the speed and severity of reforms one was willing to undertake to restore profitability. Yet, despite efforts to reform the economy in the interests of capital, economic stagnation continued to worsen, no matter how many periods of bootstrapping austerity the population was made to suffer. Because they were offered only endless sacrifice without reward, voters became increasingly skeptical of politicians' empty promises.<sup>56</sup>

In this context, politics itself increasingly fell into disrepute. The system appeared to be 'rigged', either in the form of outright corruption, or because the parties posed no real alternatives to one another. People responded to this feeling both by reducing their allegiances to any one party and by registering protest votes against whoever happened to be in power. More and more politicians therefore realized that they needed to protect themselves from voters' rage, and so like their constituencies, politicians also withdrew from politics. Policies are increasingly developed and implemented in institutional spaces that are insulated from voters' oversight and influence. Politicians rule technocratically across the aisles, reforming laws in businesses' favor and then saving those

same businesses when they are threatened with collapse in the context of one or another financial crisis. Growing anti-political sentiments have left the established party system in most countries open to disruption: *que se vayan todos* and *no les votes* became the slogans of an anti-political era. These trends have also set up the conditions for the emergence of an anti-political politics.

Populism presents us with the paradox of anti-parliamentary sentiments invading parliament, with political platforms that call for throwing out all politicians. The premise of populist parties, of both left and right, is that economic stagnation is a symptom of crony-capitalist influence over venal parliaments. Restoring the conditions of growth remains the goal, but now it is thought to be possible only if the moneylenders are chased from the Temple. The problem these efforts face is that – giving ongoing economic stagnation, in an era in which profitability has been based, to an ever greater extent, on the accumulation of debt – some capitalists may recognize the need for systemic change but must reject out of hand all attempts at actual change, which threaten to unravel the precarious conditions of profitability (hence the laughable juxtaposition of businessmen publicly proposing basic guaranteed income policies while privately lobbying against efforts to claw back taxes from overseas tax havens).<sup>57</sup> The consequence has been that any real efforts at reforming the system appear, to capital, to represent an existential threat.

At critical moments, movements for reform have always had the potential to take on a systemic character, opening up space for revolutionary agitation and social transformation; however, in the present moment, *capitalist reproduction is so precarious that elites apparently cannot give up anything at all without endangering everything*. Every proposal for reform therefore appears as critical, as system-shaking. The populists of the left have confronted this impasse most directly, above all in negotiations around the Greek debt burden. Even the most meager

reforms were strenuously resisted. In this context, Syriza's empty threat to abandon the Euro was treated for what it was: brinkmanship. This situation has created openings for right-populists, as well, who have been more willing than left-populists to harness resentment in a destructive rage against international institutions, apparently without regard to the consequences. Indeed, the right populists appear willing to take drastic measures: exit from the EU, the Eurozone, NAFTA, and NATO and reversing globalization by tightening controls on the transnational movement of people, goods and even capital. It is not always clear whether these proposals are made in earnest, or whether they too are brinkmanship. But in any case we can be sure that beggar-thy-neighbor policies will have no purchase in an extremely low-growth world. There is no chance of restarting national-level accumulation.

In this context, the right-populists appear to have a more mobilizing narrative than their left-counterparts. Both attempt to read the unfolding contradictions of capital in terms of parasitic attacks on the national body, which will supposedly recover only if it can regain control over its political organs. Both are able to direct popular anger toward bankers, the personification of surplus capital. The right, however, have the strategic advantage of being able to target refugees and immigrants as well, as a personification of surplus labor. Excluding both of these figures appears, falsely, to be a way for the nation-state to make a comeback, to return to a better time, before the onset of the long crisis of the capital-labor relation in the early 1970s. The pre-crisis era is also nostalgically read, in a racist way, as a time when the body politic was more ethnically homogenous.

The populists will no doubt fail. They will not manage to bring back their golden age of post-war capitalism, even for those ethnic groups who feel the most nostalgia for that age. On the contrary, their policies will worsen the existing trends of stagnation and crisis. What we do not know is whether,

in failing, they will nonetheless be able to wreak enough havoc to the current institutions of liberal internationalism to set off a chain reaction of carnage, amid the further unfolding of the crisis. So far, financial crises have been prevented from turning over into outright depressions through the coordinated actions of states and central banks. It is possible that populism will weaken these institutions to such an extent that coordination will prove impossible, dropping us into an abyss the likes of which have not been seen since the 1930s. *The Frankfurt School looked into that abyss, finding there not the potential for a revolutionary unification of the class, but rather for its thorough-going liquidation. What we will find is anyone's guess.*

## CONCLUSION

The dissident Marxists of the 1960s attempted to reactivate the critical spirit of Marx's work. If they sometimes adopted the term 'critical theory' as a euphemism for their Marxism, that was not simply a way for them to avoid McCarthyite repression. It was also a matter of distancing their project from the stale dogmatism to which Marxism had been reduced. Existing Marxist theory proved hardly adequate to the new realities of post-war capitalism. It specifically failed to explain the growing atomization of proletarians in advanced capitalist societies. In the context of a rapidly growing economy, workers were mostly willing to allow parties and unions to act for them – to accept rising wages as a reasonable substitute for collective self-emancipation. Marx's own writings offered little to those seeking to understand this colonization of proletarians' inner life, their desires and aspirations, by the commodity form.<sup>58</sup> In response, the 1960s dissidents drew on other critical traditions, including theorists like Spinoza, Nietzsche, and Freud, in an attempt to explain workers' subjective identification with the objective logics that dominated them.

In this way, the dissidents tried to adhere to Hegel's definition of philosophy – to grasp one's time in thought – or, as Marx had it in a letter to Ruge, to discover the new world through the critique of the old.<sup>59</sup> But the new world the dissidents set out to discover is now an *old* new world, marked by potentials that never came to fruition. In spite of what was seemingly in the offing in the late 1960s struggles, labor movements never reconstituted themselves along the lines the dissidents imagined they would. Then, in the 1970s and 1980s, the mainstream of those movements – from which the dissidents had dissented – went into decline. What should be the goal of theory today, in an era of reawakening struggle but not yet of communist movement? We suggest that critical theory – or better, communist theory – has three tasks.

The primary task of theory is to examine class struggle not merely as possessing a theoretical framework, but as itself theoretically productive. Workers today face the problem of figuring out how to extend and intensify their self-organization and struggle in the absence of a shared class project. The paths that action will take are not knowable in advance; they have to be creatively constructed, as necessary preconditions for the re-emergence of a communist movement. Theory should therefore seek to give retrospective accounts of concrete struggles: of what they did, as well as of how participants in struggles understood what they were doing. The point here is not to cheerlead struggles but rather to *read* them, focusing on how they confront the composition problem and attempt to solve it via the haphazard construction of new categories, new tactics, and new organizational forms, which resonate across society. What do these struggles, in coming up against their limits, tell us about the shape of the communist movement to come?

The second task of theory is to examine the forms of the unfolding crisis of capitalist social relations, which provide the framework or context within which class struggle

takes place. We have argued that the breakdown of the capital–labor relation occurs in and through the generation of surplus populations alongside surplus capital. In examining the process of this breakdown, we must look not just for potential new proletarian unities, but also at the divisions *within* the proletariat that capitalist social relations both create and sustain, along lines, for example, of race, gender, nation, citizenship status, education level, and economic sector. What accounts for the structural reproduction of these intra-class divisions (which are not merely epiphenomenal to a shared class interest)? In an era of economic stagnation, divisions among workers have become all the more intense, since, in the context of worsening labor-market conditions, many workers with better-than-average wages and working conditions strive to protect their corners of the labor market, not only from the onslaughts of capitalist austerity but also from other proletarians.

The third task of theory is to gesture toward a communist future, a task which has become much more difficult after the end of the labor movement. The end of that movement was coincident with the evacuation of the emancipatory content of the categories of the capitalist world. Communism cannot be merely a re-constellation of those categories – the worker, the machine, and the factory – according to a new logic (i.e. the socialization of the means of production). Or to say the same thing another way: capitalist technology is not neutral, nor is the infrastructure that makes the use of that technology possible. Suburban divisions, electrical grids connected to coal-fired power plants: the material organization of social life today fits humanity into specific social grooves from which it must escape. How would an emancipated humanity use technology and design infrastructure? Without going into specific detail, it may nevertheless be possible to derive some principles of communist action in advance.<sup>60</sup> A communist future would have to sever the connection between *how*

*much and what work one does and what one receives from the social store*, in a way that does not generate new, structural forms of domination, whether personal or impersonal.

In suggesting these tasks for theory, we should not to be misunderstood as proclaiming a special role for theorists. In our view, theory is best thought of as a therapy for the despair that always accompanies lulls in class struggle, which often persist for years. It is a mode of explicit reflection on the theoretical production implicit in struggle, one that attends to the limits inherent in struggles, which, in their formalization as limits, may give birth to a communist movement. This despair does not always wait for lulls in struggle to appear. Militants frequently despair of struggles in their very unfolding. One observes a split between, on the one hand, the activists, who act without thinking, and the critical theorists, who think without acting. Theory should allow for a thinking in action, one which knows the limits of action, yet acts nevertheless.

## Notes

- 1 Prominent figures in the earlier wave were Rosa Luxemburg, Antonio Gramsci, Georg Lukács, and Karl Korsch, but the later wave also rediscovered relatively unknown figures like Isaac Rubin and Evgeny Pashukanis.

- 37 Marx, *Capital, Volume 1*, p. 799.

- 38 The more orthodox Marxists of the 1960s (e.g. Hal Draper and Ernst Mandel) defended Marx from those who dismissed his 'pauperization thesis' by insisting that he only envisaged a 'relative pauperization', a concept that Adorno described as 'ludicrous' (Adorno, 'Late Capitalism or Industrial Society', p. 112, see also his 1962 Seminar on Marx). Yet such attempts to reconcile Marx's predictions with post-war reality ended up distorting both. The truth is that post-war growth was inconsistent with *both* the relative *and* absolute interpretation of Marx's thesis, since the mid-century had actually witnessed a sharp *rise* in the share of national income going to the working class in the advanced countries. It was only in the last 40 years that relative (and at times absolute) forms of immiseration began to reappear.
- 39 Marx, *Capital, Volume 1*, p. 798.
- 40 This section is largely drawn from Endnotes, 'A History of Separation', in *Endnotes 4*, 2015. In that text, we also discuss the role played by the persistence of the old regime – that is, landed aristocracy and the peasantry – in the history of the European workers' movement; whereas, here, we leave that discussion out in the interests of space. Our account draws extensively from Geoff Eley, *Forging Democracy: The History of the Left in Europe, 1850–2000* (Cambridge University Press, 2002), Adam Przeworski, *Capitalism and Social Democracy* (Cambridge University Press, 1985), G. M. Tamás, 'Telling the Truth about Class' in *Socialist Register 2006* (Monthly Review Press, 2006), and Loren Goldner, 'Communism is the Material Human Community: Amadeo Bordiga Today (1995)', available at <https://libcom.org/library/communism-is-the-material-human-community-amadeo-bordiga-today>
- 41 See Benanav and Clegg, 'Misery and Debt', pp. 33–7.
- 42 Marx, *Capital Volume 1*, p. 929.
- 43 In a footnote to this proposition, Marx defined the proletariat as he who valorizes capital and is 'thrown onto the street as soon as he becomes superfluous to the need for valorization', foreshadowing his analysis of the decline in the demand for labor, which he lays out some 15 pages later (Marx, *Capital, Volume 1*, pp. 764fn, 781).
- 44 We should note that many theorists of the historical worker's movement also viewed class struggle as extending beyond the bounds of the factory. For Lenin this broadening was about the necessary role of party militants and their distinctively 'political' struggle. For Luxemburg, who was closer to our argument here, the 'mass strike' represented a synthetic outburst of class struggle, in the workplace and the street. Yet for Luxemburg, as for the council communists, these kinds of spontaneous mass actions spilled out of the space of the factory. Today it is more a question of spilling into the workplace. See V. I. Lenin, *What is to be Done?* (International Publishers, 1969), Rosa Luxemburg, 'The Mass Strike' in *The Essential Rosa Luxemburg* (Haymarket, 2007), and Anton Pannekoek, *Workers' Councils* (AK Press, 2002).
- 45 Our account here draws on Endnotes, 'Spontaneity, Mediation, Rupture', in *Endnotes 3*, 2013.
- 46 See Steve Wright, *Storming Heaven: Class Composition and Struggle in Italian Autonomist Marxism* (Pluto Press, 2002).
- 47 Benanav and Clegg, 'Misery and Debt'. The quotation is from Marx, *Capital, Volume 3*, pp. 254–5.
- 48 See Anwar Shaikh, 'The First Great Depression of the 21st Century' in *Socialist Register 2011* (Monthly Review Press, 2011).
- 49 Robert Brenner, 'What Is Good for Goldman Sachs Is Good for America: The Origins of The Current Crisis' (2009), available at <http://www.sscnet.ucla.edu/issr/cstch/papers/BrennerCrisisTodayOctober2009.pdf>
- 50 See Brenner, 'What Is Good for Goldman Sachs Is Good for America'.
- 51 See Wolfgang Streeck, 'How Will Capitalism End?' *New Left Review* 87 (May–June 2014), p. 42ff.
- 52 See Endnotes, 'The Holding Pattern' *Endnotes 3*, 2013. See also Paul Mason, *Why It's Kicking Off Everywhere* (Verso Books, 2012).
- 53 A proper analysis of this phenomenon would require significantly more work. An important reference for this work is Peter Mair, *Ruling the Void: The Hollowing of Western Democracy* (Verso Books, 2013).
- 54 Across Europe, the workers' movement was essential in pushing through an extension of the franchise to all men. These same movements played a role in retarding the extension of the vote to women. See Eley, *Forging Democracy*.
- 55 See Wolfgang Streeck, *Buying Time: The Delayed Crisis of Democratic Capitalism* (Verso Books, 2014).
- 56 In this context, elections were increasingly characterized by a politics of fear. Unable to promise a brighter future, political parties merely offered to protect voters from the imagined horrors that would be unleashed by the victory of the opposing party. That only went so far, since the livelihoods that politicians were supposedly protecting continued to get worse and worse.
- 57 Scott Santens, 'Why We Should All Have a Basic Income', *World Economic Forum Annual Meeting 2017*.

- 58 The Marxist tradition also struggled to explain workers', at times, intense identification with their own oppressors, as in nationalism, or intense dis-identification with their fellow workers, as in racism.
- 59 Marx further writes, in the same letter to Ruge: 'We shall not say: Abandon your struggles, they are mere folly; let us provide you with true campaign-slogans. Instead, we shall simply show the world why it is struggling, and consciousness of this is a thing it must acquire whether it wishes or not'.

Letter from Marx to Arnold Ruge, September 1843, available at [https://www.marxists.org/archive/marx/works/1843/letters/43\\_09-alt.htm](https://www.marxists.org/archive/marx/works/1843/letters/43_09-alt.htm)

- 60 Automation will play a role in communization, to be sure, but it is difficult to imagine what that role will be in care work: will we become mere living appendages to intelligent machines, tending to our young and old, our distraught, our lovers, and our gardens? Or is the labor of care fundamental to our humanity?
