

# The SAGE Handbook of Frankfurt School Critical Theory

3 Volume Set

Edited by  
Beverley Best,  
Werner Bonefeld,  
and Chris O'Kane

### **About the pagination of this eBook**

This eBook contains a multi-volume set.

To navigate the front matter of this eBook by page number, you will need to use the volume number and the page number, separated by a hyphen.

For example, to go to page v of volume 1, type "1-v" in the Go box at the bottom of the screen and click "Go."

To go to page v of volume 2, type "2-v"... and so forth.

The SAGE Handbook of  
Frankfurt School  
Critical Theory

**SAGE** was founded in 1965 by Sara Miller McCune to support the dissemination of usable knowledge by publishing innovative and high-quality research and teaching content. Today, we publish over 900 journals, including those of more than 400 learned societies, more than 800 new books per year, and a growing range of library products including archives, data, case studies, reports, and video. SAGE remains majority-owned by our founder, and after Sara's lifetime will become owned by a charitable trust that secures our continued independence.

*In memoriam*

Moishe Postone

Moishe Postone died on 19 March 2018. Words fail to express the sadness felt and the loss encountered. Amidst the misery of a time made abstract, a time of value for valorisation's sake, Moishe showed us what it means to think against the grain. He was *ein guter Mensch*.

# Notes on the Editors and Contributors

## THE EDITORS

**Beverley Best** is an Associate Professor in the Department of Sociology and Anthropology, Concordia University, Montreal. She is the author of *Marx and The Dynamic of the Capital Formation: An Aesthetics of Political Economy* (Palgrave Macmillan, 2010). She has published articles on ideology and the value-form, value and the fetish character of finance, Marx and the aesthetic, the dialectic of affect, and dialectical method in the work of Fredric Jameson and Raymond Williams. Her current research project is a study of the perceptual economy of capital as elaborated by Marx in volume three of *Capital*. She is Vice President of the Marxist Literary Group, [www.marxistliterary.org](http://www.marxistliterary.org).

**Werner Bonefeld** is a Professor in the Department of Politics, University of York (UK). Recent book publications have included *The Strong State and the Free Economy* (Rowman & Littlefield, 2017), *Notes from Tomorrow: On Reason, Negation and Certainty* (Aakar Books, 2015), *Critical Theory and the Critique of Political Economy* (Bloomsbury, 2014) and with Chris O'Kane he co-edits the book series *Critical Theory and the Critique of Society* (Bloomsbury). Recent journal articles have included work on Adorno and the critique of economic objectivity, abstract labor, authoritarian liberalism, German ordoliberalism, and on the political theology of European monetary union. His work contributed to the development of Open Marxism. He is a co-founder of the CSE Trans-Pennine Working Group.

**Chris O'Kane** teaches Philosophy, Politics and Economics at CUNY John Jay. His recent and forthcoming articles and chapters in *Viewpoint*, *Black Box*, *Historical Materialism*, *Perspectives on Henri Lefebvre*, *Logos*, *Capital and Class*, *Review of Radical Political Economy*, *Constellations*, and *The Sage Handbook of Marxism* focus on Marxian and post-Habermasian critical theory, political economy, and the critical theory of contemporary society. He is currently revising his thesis – on social constitution and social domination in Marx, Hegelian-Marxism, and Value-Form Theory – for publication with Brill, and he is editing the selected works of Alfred Sohn Rethel for the Historical Materialism Book Series and with Werner Bonefeld he co-edits the book series *Critical Theory and the Critique of Society* (Bloomsbury).

## THE CONTRIBUTORS

**John Abromeit** is an Associate Professor of History at the State University of New York, Buffalo State, where he teaches courses on modern German and French history and modern European intellectual history and historiography. He is the co-editor of *Herbert Marcuse: A Critical Reader* (Routledge, 2004), *Herbert Marcuse: Heideggerian Marxism* (University of

Nebraska Press, 2005), and *Transformations of Populism in Europe and the Americas: History and Recent Tendencies* (Bloomsbury, 2016). He is the author of *Max Horkheimer and the Foundations of Frankfurt School* (Cambridge University Press, 2011). His articles and reviews have appeared in *Constellations*; *Theory and Society*; *Theory, Culture and Society*; *Radical Philosophy*; *The Journal of Modern History*; and *The American Historical Review*.

**Felix Baum** lives in Berlin and is active in a very marginal political milieu influenced by both the Frankfurt School and Council Communism, amongst others. He occasionally writes for *Brooklyn Rail* and tiny German publications.

**Riccardo Bellofiore** is Professor of Political Economy at the University of Bergamo. He teaches History of Economic Thought and Monetary Economics (in Italian) and Macroeconomics and International Monetary Economics (in English). He is a member of the International Symposium on Marxian Theory and of the editorial committee of the Marx–Engels Complete Works (MEOC), in Italian. He is the editor (with Tommaso Redolfi Riva) of *Ricerche sulla critica marxiana dell'economia*, an Italian collection of the most important articles by Hans-Georg Backhaus.

**Aaron Benanav** is a Collegiate Assistant Professor and Affiliate Faculty in the History Department at the University of Chicago. His book, forthcoming with Verso, is titled *A Global History of Unemployment since 1949*. He also edits the journal *Endnotes*, along with several others in Europe and the United States.

**Jasper Bernes** is author of a scholarly book, *The Work of Art in the Age of Deindustrialization* (Stanford University Press, 2017), and two volumes of poetry, *Starsdown* and *We Are Nothing and So Can You*. Together with Juliana Spahr and Joshua Clover, he edits *Commune Editions*. He teaches at the San Francisco Art Institute and lives in Berkeley with his family.

**Nico Bobka** lives in Frankfurt. He is currently pursuing a dissertation project on Theodor W. Adorno's dialectical critique of ontology and the so-called ontological need at the Free University of Berlin.

**Dirk Braunstein** is Scientific Assistant at the Institute for Social Research in Frankfurt, where he is researching the work and the teachings of Adorno.

**Shannon Brincat** is a Senior Lecturer at the University of the Sunshine Coast, Australia. His research focuses on international relations theory; recognition and cosmopolitanism; dialectics; tyrannicide; climate change justice; and Critical Theory. He has been the editor of a number of collections, most recently *From International Relations to World Civilizations: The contributions of Robert W. Cox* (Routledge, 2017), *Dialectics and World Politics* (Routledge, 2015), and the three-volume series *Communism in the Twenty-First Century* (Praeger, 2013). He is also the co-founder and co-editor of the journal *Global Discourse*.

**Andrew Brower Latz** is the Head of Religion and Philosophy at The Manchester Grammar School and the author of *The Social Philosophy of Gillian Rose* (Wipf & Stock, 2018). He co-edited, with Marcus Pound, the *Telos* Special Issue on Gillian Rose (173, Winter, 2015), and, with Arseny Ermakov, the book *Purity* (Wipf & Stock, 2014). His other publications include 'Ideology Critique Via Jurisprudence: Against Rose's Critique of Roman Law in Kant'

(*Thesis Eleven* 133.1, April 2016); ‘Gillian Rose and Social Theory’ (*Telos* 173, Winter 2015); ‘Towards a Rosean Political Theology of Recognition’ in *Misrecognitions: Gillian Rose and the Task of Political Theology* ed. by Joshua Davis; ‘Andrew Shanks’ Civil Theology’, *Political Theology* 13.1 (2012), 14–36; ‘Creation in the Fiction of Marilynne Robinson’, *Journal of Literature and Theology* 25.3 (2011), 283–296.

**Nicholas Brown** teaches in the departments of English and African American Studies at the University of Illinois at Chicago.

**Hubertus Buchstein** is Professor for Political Theory and the History of Political Ideas at Greifswald University, Germany. His research interests primarily center around democratic theory, the history of political science as a discipline, and critical theory. He is the author of books about public and secret voting, about modern democratic theory, about the use of lotteries in political decision making, about right-wing extremism in Germany and about German academic emigres in the US during the period of Nazi-dictatorship. From 2009–12 he was president of the German Political Science Association. In the academic year 2018/19 he will be Theodor-Heuss-Professor at the New School for Social Research in New York. He is currently working on a 6 Volume edition of the *Gesammelte Schriften* of Otto Kirchheimer.

**Tom Bunyard** teaches in the Humanities Department at the University of Brighton. He has recently completed a book on Guy Debord’s relation to Marx and Hegel, and is currently working on issues related to the philosophy of history.

**Vincent Chanson** is a PhD student of Philosophy at Nanterre University. His research interests focus on critical theory, critical Marxism, and aesthetics. With Frédéric Monferrand and Alexis Cukier he co-edited ‘La réification. Histoire et actualité d’un concept critique’ (La Dispute, 2014).

**Matthew Charles** is a Senior Lecturer in Cultural and Critical Theory at the University of Westminster in London. He is a member of the Institute for Modern and Contemporary Culture and was part of the editorial collective of the journal *Radical Philosophy* from 2009 to 2017. His research focuses on critical theories of modern and contemporary culture and education. He is the author of *Modernism Between Benjamin and Goethe* (forthcoming with Bloomsbury), co-author with Peter Osborne of the Stanford Encyclopedia of Philosophy entry on Benjamin, and has contributed to special issues on Benjamin and education in *boundary 2* and *Pedagogy, Culture and Society*.

**Greig Charnock** is Senior Lecturer in International Politics at the University of Manchester, where he teaches international political economy, the politics of globalization, and critical social theory. His most recent research has engaged the ‘open Marxism’ approach with critical theories of the production of space and in analyses of crisis formation and management in Spain. He is co-author of *The Limits to Capital in Spain* (Palgrave, 2014), co-editor of *The New International Division of Labour* (Palgrave, 2016), and has published articles in such journals as *Antipode*, *Society and Space*, the *International Journal of Urban and Regional Research*, *Historical Materialism*, *New Political Economy*, and *South Atlantic Quarterly*. He is a member of the editorial board of the journal of the Conference of Socialist Economists, *Capital & Class*.

**Christopher Chen** is an Assistant Professor of Literature at the University of California at Santa Cruz. Chen has published poetry, essays, interviews, and reviews in *boundary 2*, *The South Atlantic Quarterly*, *The Routledge Companion to Literature and Economics*, *The New Inquiry*, *Crayon, 1913: A Journal of Forms*, and the *Los Angeles Review of Books*. He is completing a book-length comparative study of contemporary black and Asian American experimental writing.

**John Clegg** is a PhD Candidate at NYU Sociology and is an editor of the journal *Endnotes*, along with several others in Europe and the United States.

**Joshua Clover** is a Professor of English Literature and Comparative Literature at University of California Davis. He is the author of six books, including *Riot.Strike.Riot: The New Era of Uprisings* (Verso, 2016). He has collaborated with Juliana Spahr, Jasper Bernes, Tim Kreiner, Christopher Chen, Wendy Trevino, Abigail Lang, Els Moors, Chris Nealon, Michael Szalay, Sarah Posman, Annie McClanahan, and others. He is a founding editor of *Commune Editions*.

**Amy De'Ath** is Lecturer in Contemporary Literature and Culture at King's College London. Her criticism has appeared in *Women: A Cultural Review*, *Anguish Language*, *Metamute*, and elsewhere. With Fred Wah, she is the editor of a poetics anthology, *Toward. Some. Air.* (Banff Centre Press, 2015), and her most recent poetry publication is *ON MY LOVE FOR gender abolition* (Capricious, 2016). She is currently at work on an academic book, *Unsociable Poetry: Antagonism and Abstraction in Contemporary Feminized Poetics*.

**Murray Dineen** has been a member of the School of Music at the University of Ottawa since 1991, where he currently teaches music theory, history, and aesthetics. His research interests address both disciplinary music topics (such as the history of music theory and the study of counterpoint) as well as interdisciplinary matters involving music – primarily criticism and literary theory, but also human kinetics and musical expertise. In 2011, he published a book on Adorno and music, *Friendly Remainders: Essays in Music Criticism after Adorno* (McGill-Queens University Press). His most recent publications include a translation of a Marxist treatise on music published in Vienna in 1935, in *Polygraph: An International Journal of Culture and Politics* 25 (2016). He has received research funds from the Social Sciences and Research Council of Canada. An honorary lifetime member of the Canadian University Music Society, he has edited Canadian and international journals devoted to music studies.

**Ana Cecilia Dinerstein** is Associate Professor of Sociology in the department of Social and Policy Sciences, University of Bath. She has written extensively for academic and non-academic audiences on issues of labour subjectivity; urban, rural and indigenous movements; autonomous organizing; Argentine and Latin American politics; Open Marxism, decolonial theory, social reproduction and the current uses of utopia and Ernst Bloch's philosophy of hope. She was editor of *Capital & Class* (2000–5) and is a member of the editorial board of *Work, Employment and Society*, and the scientific advisory board of *Revista Sociología del Trabajo* (Madrid). She is Research Partner of the Transnational Institute's 'New Politics Project' (2016–20, Amsterdam), and Creator and Convenor of the international research networks 'Labour in Transition' (LATII-Net) and 'Women on the Verge'. Her main publications include *The Labour Debate* (ed., Routledge, 2002), which has been translated into Turkish (2006) and Spanish (2009), *The Politics of Autonomy in Latin America: The Art of Organising Hope*

(Palgrave Macmillan, 2015), and *Social Sciences for An-Other Politics: Women Theorising without Parachutes* (ed.)(Palgrave Macmillan, 2016).

**Kieran Durkin** is a Marie Skłodowska Curie Global Fellow at the University of York, UK and the University of California, Santa Barbara, undertaking the first comprehensive study of the Marxist humanist tradition. His wider research interests centre around the exploration of the possibility of resurrecting a robust radical humanism for contemporary social theory and practice. The first manifestation of this research programme was his monograph *The Radical Humanism of Erich Fromm* (Palgrave Macmillan, 2014), which was shortlisted for the British Sociological Association's Philip Abrams Memorial Prize in 2015. He has also written the first dedicated study of the intellectual relationship between Erich Fromm and Theodor W. Adorno (*New German Critique*, forthcoming).

**Nick Dyer-Witthford**, an Associate Professor in the Faculty of Information and Media Studies at the University of Western Ontario, is the author of *Cyber-Marx: Cycles and Circuits of Struggle in High Technology Capitalism* (University of Illinois, 1999) and *Cyber-Proletariat: Global Labour in the Digital Vortex* (Pluto Press, 2015), and he also writes on the video and computer game industry, the uses of the internet by social movements, and theories of technology.

**Ingo Elbe** studied philosophy, history and social psychology at the Ruhr-Universität Bochum and obtained his doctorate in 2008 at the Free University of Berlin for a thesis on the reception of the work of Karl Marx in the Federal Republic. From 2007 to 2012 he was a lecturer at the Institute of Social Sciences of the Technical University of Braunschweig and from 2011 to 2014 at the University of Applied Sciences Düsseldorf. In 2015, he completed his habilitation at the Institute of Philosophy of the Carl von Ossietzky University Oldenburg with a thesis on paradigms of anonymous rule. Elbe was a visiting professor at the Department of Political Science of Gießen University in the winter semester 2017/18. He is a lecturer and research assistant at the Institute of Philosophy of the Carl von Ossietzky University Oldenburg and Chairman of the Bochum non-profit association Institute of Social Theory. Book publication include *Marx im Westen. Die neue Marx-Lektüre in der Bundesrepublik* (Berlin: Akademie Verlag, 2008) and *Paradigmen anonymer Herrschaft. Politische Philosophie von Hobbes bis Arendt* (Würzburg: Königshausen & Neumann, 2015).

**Frank Engster** wrote his PhD thesis on the subject of time, money, and measure. His areas of interest lie in the different readings of Marx's critique of political economy, the logic and history of money, and the connection between money, measurement, time, and (natural) science.

**Lars Fischer** is an Honorary Research Associate in the UCL Department of Hebrew & Jewish Studies. He has taught at King's College London, UCL and Cambridge. He served as Councillor of the Royal Historical Society from 2012–15 and as Secretary of the British Association for Jewish Studies from 2010–12. His publications include a monograph on *The Socialist Response to Antisemitism in Imperial Germany* (Cambridge University Press, 2007) and a short study on the nexus between antisemitism and racism, "A difference in the texture of prejudice". *Historisch-konzeptionelle Überlegungen zum Verhältnis von Antisemitismus, Rassismus und Gemeinschaft* (Grazer Universitätsverlag, 2016). He edits the website of the critical theories of antisemitism network and is founding editor of the *H-Commons network H-Music* (<https://networks.h-net.org/h-music>). He lives in Berlin.

**Benjamin Y. Fong** is an Honors Faculty Fellow at Barrett, the Honors College of Arizona State University, a director of the Society for Psychoanalytic Inquiry, and author of *Death and Mastery: Psychoanalytic Drive Theory and the Subject of Late Capitalism* (Columbia University Press, 2016).

**Samir Gandesha** is an Associate Professor in the Department of the Humanities and the Director of the Institute for the Humanities at Simon Fraser University. He specializes in modern European thought and culture, with a particular emphasis on the nineteenth and twentieth centuries. His work has appeared in *Political Theory*, *New German Critique*, *Constellations*, *Logos*, *Kant Studien*, *Philosophy and Social Criticism*, *Topia*, the *European Legacy*, the *European Journal of Social Theory*, *Art Papers*, the *Cambridge Companion to Adorno* and *Herbert Marcuse: A Critical Reader*, as well as in several other edited books. He is co-editor with Lars Rensmann of *Arendt and Adorno: Political and Philosophical Investigations* (Stanford University Press, 2012). He is co-editor with Johan Hartle of the 2017 books *Spell of Capital: Reification and Spectacle* (Amsterdam University Press) and *Aesthetic Marx* (Bloomsbury Press).

**Stefan Gandler** received his DPhil from Goethe Universität, Frankfurt in 1997. He is Professor of Social Theory and Philosophy at Universidad Nacional Autónoma de México, Universidad Autónoma de Querétaro. He has been an invited professor at Goethe Universität (2001–2), University of California Santa Cruz (2009–10), and Tulane University, New Orleans (2015–16). He is also a member of *Sistema Nacional de Investigadores*, Mexico (highest category 3). He is the author of *Peripherer Marxismus* (Argument 1999), *Frankfurter Fragmente* (Peter Lang 2013), *El discreto encanto de la modernidad* (Siglo XXI Editores 2013), *Fragmentos de Frankfurt* (Siglo XXI Editores 2009/2011/2014), *Materialismus und Messianismus* (Aisthesis 2008), *Marxismo crítico en México* (Fondo de Cultura Económica 2007/2009/2015), and *Critical Marxism in Mexico* (Brill/Haymarket 2015/2016), of academic articles in 7 languages and 15 countries, and the editor of *Modernidad y diferencia* (M.A. Porrúa 2010) and *Teoría crítica: imposible resignarse* (M.A. Porrúa 2016). Gandler works on the possibility of overcoming the Eurocentric limitations of the Frankfurt School, confronting its critical theory of society with contemporary socio-theoretical debates in Latin America, constructing a critical theory from the Americas.

**Stephan Grigat** is a Lecturer at the Institute for Political Science, the Institute for Philosophy, and the Institute for Jewish Studies at the University of Vienna. He is the 2017–18 Research and Teaching Fellow at the Centre for German Studies at the Hebrew University of Jerusalem, and was the 2016–17 Visiting Professor for Israel Studies at the Moses Mendelssohn Centre for European-Jewish Studies at the University of Potsdam, the 2015–16 Visiting Professor for Critical Theory at the Justus-Liebig University of Gießen, and the 2007–2017 Academic and Executive Director for the NGO ‘STOP THE BOMB – Coalition for a Nuclear-free and Democratic Iran’. He received his PhD in 2006 from the Free University of Berlin. He is the author of *Die Einsamkeit Israels. Zionismus, die israelische Linke und die iranische Bedrohung* (Konkret, 2014) and *Fetisch & Freiheit. Über die Rezeption der Marxschen Fetischkritik, die Emanzipation von Staat und Kapital und die Kritik des Antisemitismus* (ça ira, 2007). He is the editor of *AfD & FPÖ. Antisemitismus, völkischer Nationalismus und Geschlechterbilder* (Nomos 2017) and *Iran – Israel – Deutschland. Antisemitismus, Außenhandel und Atomprogramm* (Hentrich & Hentrich 2017).

**Richard Gunn** lectured on political theory at the University of Edinburgh from 1975 to 2011. He currently writes and researches on an independent basis. His personal website (<http://richard-gunn.com>) contains papers dating from the 1980s to the present.

**Andreas Harms** works as a lawyer in Berlin and has dealt intensively with legal theory and Marxist legal criticism.

**Johan Hartle** teaches Political Aesthetics at the University of Arts and Design, Karlsruhe, and Art Theory at the China Academy of Arts, Hangzhou. He has held research fellowships at the University of Amsterdam, the Hebrew University, Jerusalem, and the Università Roma Tre, and he has taught at the Rietveld Academy, Amsterdam, the Academy of Fine Arts, Münster/Westphalia, and several other art schools. His publications include *Der geöffnete Raum. Zur Politik der ästhetischen Form* (Wilhelm Fink, 2006) and *DADALENIN* (Edition Taube, 2013, edited with Rainer Ganahl), as well as *The Spell of Capital. Reification and Spectacle* (Amsterdam University Press, 2017) and *Aesthetic Marx* (Bloomsbury 2017), both edited with Samir Gandesha. Hartle's fields of research are Marxist aesthetics and cultural theory, the history of Red Vienna (Otto Neurath), Frankfurt School critical theory (Adorno/Benjamin; Negt/Kluge), the aesthetico-political (Rancière), and questions of contemporary political ontology (Spinoza).

**Lars Heitmann** studied Politics and Sociology at the University of Bremen. His publications include *Absoluter Wert und allgemeiner Wille. Zur Selbstbegründung dialektischer Gesellschaftstheorie* (transcript, 2005) and, as editor (along with Hanno Pahl), *Kognitiver Kapitalismus. Soziologische Beiträge zur Theorie der Wissensökonomie* (Metropolis, 2007) and *Gesellschaftstheorie der Geldwirtschaft. Soziologische Beiträge* (Metropolis, 2010). He was a scientific collaborator on the interdisciplinary study on the meaning of security at the Leibniz University of Hanover and associate lecturer at the Universities of Bremen, Hannover and Bielefeld. He currently contributes to the interdisciplinary research project Society after Money, University of Bonn.

**Christoph Henning** is a Junior Fellow at the Max Weber Centre for Advanced Cultural and Social Studies, University of Erfurt. His latest books include *Philosophy after Marx: 100 Years of Misreadings and the Normative Turn in Political* (Brill, 2014), *Theories of Alienation* (Junius, 2015, in German), *The Political Philosophy of Perfectionism* (Campus, 2015, in German) and *Marx und die Folgen* (Metzler, 2017). He has edited several volumes on political philosophy and related topics, the most recent (with Hartmut Rosa) being *The Good Life beyond Growth* (Routledge, 2017).

**Christoph Hesse**, Research Assistant in Media and Communication Studies at the Free University of Berlin, formerly lecturer in Film Studies at the University of Mainz and visiting scholar at the School of Visual Arts in New York, is currently working on an edition of the correspondence between George Grosz and Hermann Borchardt. He is the author of a comprehensive study of German exile cinema in the Soviet Union in the 1930s and 40s (*Filmexil Sowjetunion*, edition text+kritik, 2017), co-author of a textbook on the history of film styles (*Filmstile*, Springer VS, 2016, with Oliver Keutzer, Roman Mauer, and Gregory Mohr), and co-editor of a three-volume anthology of letters to Brecht in exile (*Briefe an Bertolt Brecht im Exil*, De Gruyter, 2014, with Hermann Haarmann). Since 2014, he is also a member of the editorial board of the Journal for Critical Social Theory and Philosophy (*Zeitschrift für kritische Sozialtheorie und Philosophie*, De Gruyter).

**Jan Hoff** is a historian and political scientist from Germany. He received his PhD at the Free University Berlin in 2009 and his Habilitation at the University of Kassel in 2016. His books include *Marx global* (Akademie Verlag, 2009) about the international reception of Marx's critique of political economy and *Befreiung heute* (VSA Verlag, 2016) about the history and present of theories of emancipation inspired by Marx. He has taught at the Universities of Innsbruck (Austria), Kassel (Germany) and Munich.

**Philip Hogh** studied Philosophy, Modern History and Political Sciences in Freiburg, Basle, and Durham. He wrote his doctoral thesis on Adorno's philosophy of language at Goethe University, Frankfurt. Since 2011 he has been a research assistant (since 2013 as a PostDoc) at Carl von Ossietzky University Oldenburg, where he is a member of the Adorno Research Center.

**Tom Houseman** is Senior Lecturer in Political Economy at the School of Social Sciences, Leeds Beckett University, UK. He completed his PhD, on Adorno and the concept of poverty, in 2011 at the University of Manchester, and teaches critical theory, political economy, development and decolonization. His research interests focus on Adorno and epistemology, especially concerning positivism and the politics of measurement in international development.

**Owen Hulatt** is a Lecturer at the University of York's Department of Philosophy. His research interests include Adorno, Spinoza, Aesthetics, and Social Theory. He is the author of *Adorno's Theory of Philosophical and Aesthetic Truth* (Columbia University Press, 2016).

**Anselm Jappe** is the author of *La Société autophage: capitalisme, démesure et autodestruction* (La Découverte, 2017), *Guy Debord* (University of California Press 1999; PM Press 2018), *Les Aventures de la marchandise. Pour une nouvelle critique de la valeur* (Denoël, 2003, La Découverte, 2017), *L'Avant-garde inacceptable. Réflexions sur Guy Debord* (Lignes, 2004), *Crédit à mort* (Lignes, 2011, translated as *The Writing on the Wall*, Zero Books, 2017), and *Contro il denaro* (Mimesis, 2013). He has contributed to the German reviews *Krisis* and *Exit!*, founded by Robert Kurz, which developed the 'critique of value'. He teaches in the Fine Art Schools of Sassari and has been Visiting Professor in various European and Latin American universities. He also lectured at the Collège international de philosophie (Paris).

**Scott Jenkins** is a director of the Society for Psychoanalytic Inquiry. He holds a BA from Reed College and lives in Philadelphia, Pennsylvania.

**Dennis Johannßen** is Visiting Assistant Professor of German Studies at Brown University. He studied Cultural Studies, German Literature, and Philosophy at Leuphana University Lüneburg and at the University of California, Berkeley, and he completed his Ph.D. in German Studies at Brown in 2017. He published articles on the Frankfurt School, Heidegger, Leibniz, and philosophical anthropology, and he is currently working on a book about rhetoric and transgenerational trauma in twentieth-century German literature and film.

**Julia Jopp** lives in Berlin. Her research focuses on materialist epistemology, especially the concept of validity in Hegel, Marx, Critical Theory, and the so-called New Reading of Marx.

**David Kaufmann**, a graduate of Princeton and Yale Universities, is Professor of English at George Mason University. He is the author of *The Business of Common Life* (1995), *Telling Stories: The Later Works of Philip Guston* (2010) and *Reading Uncreative Writing* (2017). He has published a number of articles on the Frankfurt School, literary theory and contemporary poetry, as well as a full century of reviews and features on everything from Bugs Bunny and Allen Sherman to contemporary utopianism and books about dogs. He lives with his family in the suburbs of Washington D.C.

**Sami Khatib** taught at Freie Universität Berlin, Jan van Eyck Academie Maastricht, American University of Beirut and Akademie der bildenden Künste Vienna. He is a founding member of the Beirut Institute for Critical Analysis and Research (BICAR). Currently, he is a postdoctoral researcher at Leuphana Universität Lüneburg. He is author of the book *‘Teleologie ohne Endzweck’: Walter Benjamins Ent-stellung des Messianischen* (Tectum, 2013).

**Amy Chun Kim** is a Postdoctoral Fellow in the Society of Humanities and History of Art at Cornell University. She holds a J.D. from Yale Law School and Ph.D. in the History of Art from the University of California, Berkeley. She has published essays on abstract art in the interwar period and on the problem of constitutional democracy in critical theory. Her book, *Ideologies of Pure Abstraction: Modernism between Paris and Moscow*, is forthcoming from Verso. She is also working on a new book project, *The Nomos of Urban Space*.

**Isabelle Klasen** lives in Mülheim an der Ruhr. She studied philosophy, German philology and sociology at the Ruhr-Universität in Bochum and works in the fields of aesthetics and critical theory. She also is an artist and co-founder of the art society ZeitgenossenSchafft. Currently, she works as a teacher and as a lecturer at the Ruhr-Universität and the Hochschule für bildende Künste in Essen.

**Lisa Klingsporn** works as a researcher at the chair for Political Theory and History of Ideas at Greifswald University, Germany. Her field of interest centers around critical theory and the relation of politics and law, as well as feminist theory, especially the work of Judith Butler. Her dissertation is concerned with the reception of Otto Kischheimer’s work in the US and Germany. In this regard she is currently studying the method of reception theory as an instrument to analyse political thought.

**Gudrun-Axeli Knapp** was Professor of Sociology and Social Psychology at the Institute of Sociology and Social Psychology, Leibniz University of Hannover. From 1999 until 2009, she was the Director of the Interdisciplinary Programme in Gender Studies at the Faculty of Philosophy. She has published articles on feminist issues in various journals and books and has edited and co-authored several books on developments in international feminist theory, recently with a focus on social theory and interlocking structures of inequality and dominance.

**Hermann Kocyba** is senior researcher at the Institute of Social Research and lecturer at the department of social sciences of Goethe University in Frankfurt. His dissertation on the problem of contradiction in Marx’ critique of political economy (“Widerspruch und Theoriestruktur. Zur Darstellungsmethode im Marxschen ‘Kapital’”) was supervised by Alfred Schmidt. It was Schmidt, too, who encouraged him to engage in the debate about Althusser, Lévi-

Strauss, Lacan, Foucault and Deleuze. As a result, however, Kocyba – unlike Schmidt – felt fascinated by the possibility to read them not as antagonists of critical theory, but as sources of a renewal of critical thinking. – His actual theoretical work is focused on the conflict between economy and democracy, his empirical research is focused on labor relations, working conditions and democracy deficits within European Institutions, especially within the European Central Bank.

**Elena Louisa Lange** has studied Philosophy and Japanese Studies in Hamburg and Zurich, where she received her PhD in 2011. She now works as Senior Research Associate and Senior Lecturer at the Institute for Asian and Oriental Studies, University of Zurich. Since 2009, she has taught classes on intellectual history, Japanese philosophy, Marxism, and modernity. She has co-edited books on modern Japanese philosophy (*Begriff und Bild der modernen japanischen Philosophie*, Frommann-Holzboog, 2014) and *Concepts of Philosophy in Asia and The Islamic World, Vol. 1: China and Japan* (Brill, 2018), published articles on recent debates in Marxian value theory, and is currently working on a critical study of the Japanese Marxist Uno Kōzō. She regularly gives lectures and conducts workshops on Marx's *Capital*.

**Richard Langston** is an associate professor of German literature at the University of North Carolina at Chapel Hill and the author of *Visions of Violence: German Avant-Gardes after Fascism* (Northwestern University Press, 2007), a co-editor of the *Alexander Kluge-Jahrbuch* (Vandenhoeck & Ruprecht, 2014–), the lead translator of Kluge and Negt's *History and Obstinacy* (Zone Books, 2014), the editor of *Difference and Orientation: An Alexander Kluge Reader* (Cornell University Press, 2018), and the author of a forthcoming monograph on Negt and Kluge entitled *Dark Matter, in Defiance of Catastrophic Modernity* (Verso).

**Claudia Leeb** is an Assistant Professor in political theory at Washington State University. She is the author of *The Politics of Repressed Guilt: The Tragedy of Austrian Silence* (Edinburgh University Press, 2018), *Power and Feminist Agency in Capitalism: Toward a New Theory of the Political Subject* (Oxford University Press, 2017), *Working-Class Women in Elite Academia: A Philosophical Inquiry* (Peter Lang Publisher, 2004), and *Die Zerstörung des Mythos von der Friedfertigen Frau* (Peter Lang Publisher, 1998). She has articles published in Political Theory, Contemporary Political Theory, Theory & Event, Perspectives on Politics, Constellations, Social Philosophy Today, The Good Society, Philosophy & Social Criticism, and Radical Philosophy Review. She has also contributed several book chapters to anthologies on early Frankfurt school critical theory.

**Carolyn Lesjak** is Associate Professor of English at Simon Fraser University and is the author of *Working Fictions: A Genealogy of the Victorian Novel* (Duke University Press, 2006). Currently she is completing a book on the material basis of character in Victorian literature and culture and its relationship to notions of the common(s).

**Klaus Lichtblau** Since 2004 Klaus Lichtblau has been a full Professor in the Department of Sociology, Goethe University in Frankfurt. He is author of *Theorie der bürgerlichen Gesellschaft* (Focus, 1978), *Kulturkrise und Soziologie um die Jahrhundertwende* (Suhrkamp, 1996), *Georg Simmel* (Campus, 1997), *Das Zeitalter der Entzweiung* (Philo, 1999), *Die Eigenart der kultur- und sozialwissenschaftlichen Begriffsbildung* (VS Verlag für Sozialwissenschaften, 2011), and *Zwischen Klassik und Moderne* (Springer VS, 2017). At present he is working on a book about the different versions of Max Weber's sociology.

**Christian Lotz** is Professor of Philosophy at Michigan State University. His main research area is Post-Kantian European philosophy. His book publications include *The Art of Gerhard Richter. Hermeneutics, Images, Meaning* (Bloomsbury Press, 2015/17), *The Capitalist Schema. Time, Money, and the Culture of Abstraction* (Lexington Books, 2014/16), *Christian Lotz zu Marx, Das Maschinenfragment* (Laika Verlag, 2014), *Ding und Verdinglichung. Technik- und Sozialphilosophie nach Heidegger und der Kritischen Theorie*, edited with H. Friesen, J. Meier, and M. Wolf (Fink Verlag, 2012), *From Affectivity to Subjectivity. Husserl's Phenomenology Revisited* (Palgrave, 2008), and *Vom Leib zum Selbst. Kritische Analysen zu Husserl und Heidegger* (Alber Verlag, 2005). His current research interests are in classical German phenomenology, critical theory, Marx, Marxism, aesthetics, and contemporary European political philosophy. His website is: <http://christianlotz.com>.

**Jordi Maiso** teaches philosophy at the Complutense University of Madrid. He studied at the University of Salamanca, where he received his doctorate with a thesis on Adorno. He has been research grant holder at the University of Salamanca, the Free University of Berlin, and the Center for the Research of Anti-Semitism at the Technical University of Berlin, and he has worked for several years at the Institute of Philosophy of the Spanish National Research Council (CSIC). His main interests are critical theory, critique of political economy, and analysis and critique of modern capitalist society, mainly focusing on issues such as the culture industry today, antisemitism and the politics of resentment, and the social constitution of subjectivity. He is member of the editorial board of the review *Constelaciones. Revista de Teoría Crítica* and a founding member of the Sociedad de Estudios de Teoría Crítica.

**Inara Luisa Marin** received her PhD in philosophy and psychology at the University of Paris Diderot (Paris VII), with a dissertation on psychoanalysis in Critical Theory—from Erich Fromm to Axel Honneth. She has clinical experience both in private practice and in public institutions, including the clinics at La Maison de Santé d'Épinay and the Association En-temps. In her postdoctoral research at the Brazilian Center for Analysis and Planning (CEBRAP), she addressed the possibility of actualizing the relation between psychoanalysis and critical theory through the concepts of anxiety and autonomy. She currently works as a psychoanalytic clinician, as a researcher – developing intersections among critical theory, psychoanalysis and feminist theories – and also as an associate professor the Philosophy Department of the State University of Campinas.

**Ansgar Martins** is a graduate student working on the philosophy of Siegfried Kracauer at Frankfurt University. His research focuses on Critical Theory, philosophy of religion, twentieth-century Jewish intellectual history, and Western esotericism. Among his publications is a monograph on Adorno's Jewish sources (*Adorno und die Kabbalah*, 2016). He is also a co-editor of *Der Schein des Lichts, der ins Gefängnis selber fällt. Religion, Metaphysik, Kritische Theorie* (Neofelis Verlag, 2018).

**Paul Mattick** is the author of *Social Knowledge* (Hutchinson, 1985), *Art in Its Time* (Routledge, 2003), and *Theory as Critique: Essays on Capital* (Brill, 2018), among other writings.

**Christos Memos** is a Lecturer in Sociology in the Department of Sociology Abertay University, Dundee. His research interests include critical social and political theory, political sociology, and economic sociology/critical political economy. He is the author of *Castoriadis and Critical Theory: Crisis, Critique and Radical Alternatives* (Palgrave, 2014).

**Cat Moir** is a Lecturer in Germanic Studies at the University of Sydney. She is an intellectual historian specializing in the history of ideas in the German-speaking world in the nineteenth and twentieth centuries. Her research is particularly concerned with how ideas shape and are shaped by political histories and ideologies. She is currently completing her first book, *Ernst Bloch's Speculative Materialism: Ontology, Epistemology, Politics, 1934–1939*, which explores the intersection between politics and metaphysics in Bloch's philosophy.

**Johannes von Moltke** is Professor of German Studies and Screen Arts and Cultures at the University of Michigan, where he teaches film, cultural studies, and critical theory. He is the author of *No Place Like Home: Locations of Heimat in German Cinema* (2005) and *The Curious Humanist: Siegfried Kracauer in America* (2015). Other publications include *Siegfried Kracauer's American Writings* (edited with Kristy Rawson, 2012), *Culture in the Anteroom: The Legacies of Siegfried Kracauer* (edited with Gerd Gemünden, 2012), and *Siegfried Kracauer's Grenzgänge: Zur Rettung des Realen* (edited with Sabine Biebl and Helmut Lethen, 2018).

**Frédéric Monferrand** holds a PhD in Philosophy from Nanterre University. His research interests focus on critical theory, critical Marxism, and social ontology. With Vincent Chanson and Alexis Cukier he co-edited 'La réification. Histoire et actualité d'un concept critique' (La Dispute, 2014).

**James Murphy** is currently writing his dissertation in the Philosophy Department at DePaul University and teaching as a Clinical Instructor of Business Ethics for the Department of Management at Loyola University. His research focuses on German Idealism, Marxism, early modern political theory, psychoanalysis, and fascism, and his other published work takes up the problem of violence in Frantz Fanon and the libidinal underpinnings of self-identity in Locke's social-contract theory.

**Patrick Murray** is Professor of Philosophy at Creighton University in Omaha, Nebraska. He is the author of *The Mismeasure of Wealth: Essays on Marx and Social Form* (Brill, 2016) and *Marx's Theory of Scientific Knowledge* (Humanities, 1988) and the editor of *Reflections on Commercial Life: An Anthology of Classic Text from Plato to the Present* (Routledge, 1997). He is working on *Capital's Reach: How Capital Shapes and Subsumes*, and with Jeanne Schuler he is co-authoring *False Moves: Basic Problems with Factoring Philosophy*. He is a member of the International Symposium on Marxian Theory (ISMT). His research interests centre on the relationship between capitalism and modern philosophy and include the British empiricists, Kant, Hegel, Marx, and the Frankfurt School.

**Mark Neocleous** is Professor of the Critique of Political Economy, Brunel University, and the author of numerous books, the most recent of which is *The Universal Adversary: Security, Capital and the 'Enemies of All Mankind'* (Routledge, 2016). His work revolves around the mechanisms for managing capitalist modernity through the logic of 'police', 'security', and 'war', and the relationship between this logic and reactionary shifts in political order. This also involves the nature of the political imaginary: how the state has been imagined through categories associated with human subjectivity, how enemies have been imagined as monstrous, and how we imagine our political relationship with the dead. He is currently working on the idea of security as an autoimmune disease.

**Alexander Neupert-Doppler** studied Philosophy, Political Science and History at the University of Osnabrück, where he received his doctorate in 2013 for his work on the concept of ‘state-fetishism’ in (neo-)Marxist theories of the state. He is the author of the books *Staatsfetischismus* (LIT 2013) and *Utopie* (Schmetterlingsverlag 2015). Together with Lisa Doppler he translated Herbert Marcuses Paris lectures into German language and edited them with Peter-Erwin Jansen under the title *Kapitalismus und Opposition* (2017). He is also the editor of *Konkrete Utopien* (2018). Neupert-Doppler works as an education officer for the Socialist Youth of Germany/Falcons in Hannover.

**Mathias Nilges** is Associate Professor of English at St. Francis Xavier University. His essays have appeared in collected editions and journals such as *American Literary History*, *Callaloo*, *Textual Practice*, and *Postmodern Culture*. He co-edited the books *Literary Materialisms* (Palgrave, 2013), *Marxism and the Critique of Value* (MCM, 2014), *The Contemporaneity of Modernism* (Routledge, 2015), and *Literature and the Global Contemporary* (Palgrave, 2017). He has completed a monograph titled *Still Life with Zeitroman: The Time of the Contemporary American Novel*.

**Pedro Rocha de Oliveira** holds a PhD in Philosophy from the Pontifical Catholic University of Rio de Janeiro. He is Associate Professor at the Philosophy Department of the Federal University of the State of Rio de Janeiro. His research interests include the critique of political economy, critical theory, the dialectics of capitalist development, early modernity and critical criminology.

**Karsten Olson** is a doctoral candidate at the University of Minnesota in the department of German, Scandinavian, and Dutch. He is the author of ‘Historical-Sociology vs. Ontology: The Role of Economy in Otto Kirchheimer and Carl Schmitt’s Essays Legality and Legitimacy’, published in the *History of the Human Sciences*, and his research interests include, critical theory, eighteenth-century moral and economic philosophy, democratic constitutional law, and surveillance and social control. His work-in-progress dissertation is a comparative study of figures of the crowd as they appear in philosophical and theatrical works of the eighteenth and twentieth centuries.

**Charles Prusik** received his PhD in Philosophy from Villanova University in 2017. His dissertation focuses on the critical theory of Theodor Adorno and the political economy of neoliberalism. His research specializes in the Frankfurt School, as well as the history of economics and sociology. He has publications in the areas of political economy and aesthetic theory, and is an instructor of philosophy and ethics.

**Anders Ramsay** was born in 1954 in Malmö, Anders Ramsay studied sociology, philosophy and economic history at the University of Lund, where he completed his Dr Phil (‘Upplysningens självreflexion. Aspekter av Thodor W. Adornos kritiska teori’); and in 1987–8 he was a DAAD scholar at the J.W. Goethe University, Frankfurt. He has undertaken various teaching assignments in sociology since 1995, including at the University of Örebro and the University of Gothenburg, and he has been a Senior Lecturer in Sociology at Mid Sweden University since 2017.

**Charles Reitz**, Professor of Social Science and Philosophy at Kansas City Kansas Community College (retired), has published *Philosophy & Critical Pedagogy: Insurrection &*

*Commonwealth* (Peter Lang, 2016), *Crisis and Commonwealth: Marcuse, Marx, McLaren* (Lexington Books, 2013), and *Art, Alienation and the Humanities: A Critical Engagement with Herbert Marcuse* (SUNY Press, 2000). With Peter-Erwin Jansen Reitz he co-edited and published *Herbert Marcuse's Paris Lectures 1974 at Vincennes University* (CreateSpace Independent Publishing Platform, 2015). Reitz studied at Canisius College (Buffalo, New York), the University of Freiburg, and the State University of New York at Buffalo (PhD, 1983). He served for five years as president of his faculty association (Kansas-NEA) and for five years as campus Director of Intercultural Education. He is a charter member of the International Herbert Marcuse Society and served for six years on its Board of Directors.

**Tommaso Redolfi Riva** is an independent researcher. He graduated in Philosophy at the University of Pisa and has a PhD in History of Economic Thought from the University of Florence. He won a grant from the University of Bergamo for a research on the Italian debate (1968–83) between philosophy and (critique of) political economy. He has published several articles on Marx, Marxisms, and the *Neue Marx-Lektüre*. He is the editor (with Riccardo Bellofiore) of *Ricerche sulla critica marxiana dell'economia* (Mimesis Edizioni, 2016), an Italian collection of the most important articles by Hans-Georg Backhaus.

**Josh Robinson** teaches Modern and Contemporary Poetry and Literary and Critical Theory in the Cardiff University School of English, Communication and Philosophy and is an affiliated professor of the University of Haifa. Ze co-edited *Marxism and the Critique of Value* (MCM, 2014) and *Contemporary Marxist Theory* (Bloomsbury, 2014). Hir recent publications include 'Speculation upon Speculation; or, a Contribution to the Critique of Philosophical Economy', in *Credo, Credit, Crisis: Speculations on Faith and Money* (Rowman and Littlefield, 2017), and *Adorno's Poetics of Form* in the SUNY Series in Contemporary Continental Philosophy (State University of New York Press, 2018).

**Matthias Rothe** is Associate Professor of German at the University of Minnesota. He works on critical theory, Brechtian and contemporary theatre, and expanded aesthetics. His publications include 'The Temporality of Critique. Bertolt Brecht's Fragment "Jae Fleischhacker in Chikago"', *Brecht Yearbook* 40 (2016); 'Sohn-Rethel, das Theoriekunstwerk', *Merkur* 70 (801) (2016), and *The Frankfurt School: Philosophy and (political) Economy* (co-edited with Bastian Ronge), *History of the Human Sciences* 29 (2) (2016).

**Eric-John Russell** is a doctoral candidate at the Centre for Research in Modern Europe Philosophy in London. His dissertation examines the ways in which Hegel's *Wesenslogik* and *Begriffslogik* together with Marx's critique of political economy appear within Guy Debord's *The Society of the Spectacle*. He is a founding editorial member of *Cured Quail*.

**Frank Schale** is Scientific Assistant at the institute for political science at Chemnitz University of Technology, Germany. He earned his doctorate with a thesis on Otto Kirchheimer. His research interests lie in the fields of intellectual history and history of science in the 20th century, especially in social and legal theory. He is currently working on a comparative study of changing political theory from German Empire to post-war Germany.

**Gerhard Scheit** is an independent scholar who lives in Vienna. He has published widely on Marxism, critical theory, and antisemitism, with a special interest in theatre studies and

musicology. Inter alia, he edited three volumes of the collected works of Jean Améry, published by Klett-Cotta. He co-edits the journal *sans phrase. Zeitschrift für Ideologiekritik*.

**Hans-Ernst Schiller** studied philosophy, history, sociology and German literature in Erlangen and Frankfurt (Magister in 1978 with a thesis about Marx; Dr Phil in 1981 with ‘Metaphysik und Gesellschaftskritik’ about Ernst Bloch, published in 1982). He has been Professor for Social Philosophy and Ethics at the University for Applied Studies in Düsseldorf since 1996. He published numerous articles and essays and the books *Bloch-Konstellationen. Utopien der Philosophie* (zu Klampen, 1991), *An unsichtbarer Kette. Stationen kritischer Theorie* (zu Klampen, 1993), *Die Sprache der realen Freiheit. Sprache und Sozialphilosophie bei Wilhelm von Humboldt* (Königshausen&Neumann, 1998), *Das Individuum im Widerspruch. Zur Theoriegeschichte des modernen Individualismus* (Frank&Timme, 2005), *Ethik in der Welt des Kapitals. Zu den Grundbegriffen der Moral* (zu Klampen, 2011), and *Freud-Kritik von links. Bloch, Fromm, Horkheimer, Adorno, Marcuse* (zu Klampen, 2017). Schiller is the co-editor of *Staat und Politik bei Horkheimer und Adorno* (Nomos, 2014) and the editor of *Staat und Politik bei Ernst Bloch* (Nomos, 2016). Recently edited with Rüdiger Dannemann and Henry Pickford: *Der aufrechte Gang im windschiefen Kapitalismus. Modelle kritischen Denkens* (Springer, 2018).

**Oliver Schlaudt** is Associate Professor at the Philosophy Department, University of Heidelberg. His main research interests centre upon the philosophy of the natural and the social sciences, with a special focus on measurement and quantification.

**Roswitha Scholz** is a Graduate of Social Pedagogy (FH). At university, she studied at the Faculty of Philosophy, focusing above all on sociology, pedagogy, and philosophy. She has published in numerous Left magazines and anthologies. Her book publications include *The Gender of Capitalism: Feminist Theory and the Postmodern Metamorphosis of Patriarchy* (Horlemann 2000/11), *Differences of the Crisis – Crisis of Differences: New Social Criticism in the Global Age in the Context of ‘Race’, Class, Sex, and Postmodern Individualization* (Horlemann 2005). Her areas of work include feminist theory and radical social critique of form, intersectionality theories of knowledge, and the ‘Zeitgeist’.

**Andrés Saenz de Sicilia** is a Visiting Lecturer in Philosophy at the University of Roehampton and Central Saint Martins as well as tutor at University College London (UCL). He received his PhD from the Centre for Research in Modern European Philosophy (CRMEP), Kingston University, London in 2016, for a thesis on the concept of subsumption in Kant, Hegel and Marx. He has written for *Radical Philosophy* and *Language Sciences*, and has a monograph on the topic of subsumption forthcoming with Brill in 2019. He has translated several essays by Bolívar Echeverría and is currently preparing the first English-language collection of Echeverría’s writings.

**Marcel Stoetzler** is Senior Lecturer in Sociology at Bangor University. He works on social and political theory, intellectual history, and historical sociology. His publications include *Beginning Classical Social Theory* (Manchester University Press, 2017), the edited volume *Antisemitism and the Constitution of Sociology* (University of Nebraska Press, 2014) and *The State, the Nation and the Jews. Liberalism and the Antisemitism Dispute in Bismarck’s Germany* (University of Nebraska Press, 2008). His work has been published in the journals *Sociological Inquiry*, *European Journal of Social Theory*, *Nations and Nationalism*, *Patterns*

of *Prejudice, Sociology, Journal of Classical Sociology, European Review of History, Philosophy and Social Criticism, Historical Materialism, Feminist Theory, The European Journal of Women's Studies, fast capitalism* and the blogs *OpenDemocracy* and *History & Policy*. He is an editorial board member of *Patterns of Prejudice* and a fellow at the Centre for Jewish Studies at the University of Manchester.

**Amy Swiffen** a faculty member in the Department of Sociology and Anthropology at Concordia University, Montreal.

**Michael J. Thompson** is Associate Professor of Political Theory, William Paterson University. He was educated at Rutgers College, Humboldt Universität, and The Graduate Center, City University of New York. His recent books include *The Domestication of Critical Theory* (Rowman & Littlefield International, 2016), *The Palgrave Handbook of Critical Theory* (Palgrave Macmillan, 2017, as editor), *Hegel's Metaphysics and the Philosophy of Politics* (Routledge, 2018) and *The Perversion of Subjectivity: The Eclipse of Autonomy in Modern Society* (Stanford University Press, 2018).

**Sebastian Truskolaski** is Assistant Professor in the Department of Germanic Studies at Trinity College Dublin. His articles on Adorno, Benjamin, Kafka and related themes have appeared in journals such as *German Life and Letters, Radical Philosophy*, and *Studies in Social & Political Thought*. Together with Jan Sieber he edited *Discontinuous Infinities*, a special issue of the journal *Anthropology & Materialism* on the philosophy of Walter Benjamin (2017). Together with Sam Dolbear and Esther Leslie he edited and translated *The Storyteller*, a collection of Benjamin's experimental prose (2016). Together with Paula Schwebel he is currently working on a translation of Adorno's correspondence with Gershom Scholem (forthcoming).

**Asha Varadharajan** is Associate Professor of English at Queen's University, Canada. She is the author of *Exotic Parodies: Subjectivity in Adorno, Said, and Spivak* (University of Minnesota Press, 1995). Her writing and public speaking engage the broad sweep of postcolonial, cosmopolitan, global, secular, rights, migration, and development debates. Her most recent essays have appeared in *Cultural Studies, College Literature, Kunapipi, University of Toronto Quarterly, TOPIA, CSSAAME*, and *Modern Language Quarterly*. She has contributed chapters to books on human rights, biopolitics, and intercultural discourse. The most fun she has had lately was writing her essay on Eric Idle for the *Dictionary of Literary Biography*.

**Alfonso Galileo García Vela** has a PhD in Sociology and he is a research professor at the Department of Postgraduate Studies on Sociology of the Instituto de Ciencias Sociales y Humanidades 'Alfonso Vélaz Pliego' of the Benemérita Universidad Autónoma de Puebla. In 2017 he was a Visiting Scholar at The Department of History in The University of Chicago. With Massimo Modonesi and María Vignau Loría, he co-edited *El concepto de clase social en la teoría marxista contemporánea* [The Concept of Social Class in Contemporary Marxist Theory] (UNAM-BUAP-La Biblioteca, 2017), and with Fernando Matamoros, Manuel Garza, and Eduardo Bautista Martínez, he co-edited *A Diez Años de la Lucha de la Asamblea Popular De Los Pueblos De Oaxaca (APPO)* [Ten Years after the Struggle of the Popular Assembly of the People of Oaxaca (APPO)] (UABJO-MAPorrúa, 2016). His fields of research and teaching are sociology, theories of the state, the critical theory of the Frankfurt School, modernity theories and Western Marxism.

**Marina Vishmidt** is a writer. She is a Lecturer in Culture Industry at Goldsmiths, University of London and runs a Theory seminar at the Dutch Art Institute. Her work has appeared in *South Atlantic Quarterly*, *Ephemera*, *Afterall*, *Journal of Cultural Economy*, *Australian Feminist Studies*, and *Radical Philosophy*, among others, as well as a number of edited volumes. She is the co-author of *Reproducing Autonomy* (Mute, 2016, with Kerstin Stakemeier) and is currently completing the monograph *Speculation as a Mode of Production* (Brill, 2018).

**Sergio Tischler Visquerra** is Research Professor at the Department of Postgraduate Studies on Sociology of the Instituto de Ciencias Sociales y Humanidades ‘Alfonso Vélaz Pliego’ of the Benemérita Universidad Autónoma de Puebla. He coordinates the research group ‘Subjectivity and Critical Theory’ with John Holloway. His books include *Memoria, tiempo y sujeto* (F&G, 2005), *Tiempo y emancipación. Mijail Bajtín y Walter Benjamin en la Selva Lacandona* (F&G, 2008), *Imagen y dialéctica. Mario Payeras y los interiores de una constelación revolucionaria* (F&G, 2009), and *Revolución y destotalización* (Editorial Grietas, 2013). He co-edited the books *What Is to Be Done? Leninism, Anti-Leninist Marxism and the Question of Revolution Today* (Ashgate, 2002, with Werner Bonefeld), *Marxismo Abierto. Una visión europea y latinoamericana. Vol. I, II* (Universidad Autónoma de Puebla/Herramienta, 2007, with John Holloway, Werner Bonefeld and Alberto Bonnet), *Negativity & Revolution. Adorno and Political Activism* (Pluto Press, 2009, with John Holloway and Fernando Matamoros) and *Zapatismo. Reflexión teórica y subjetividades emergentes* (Universidad Autónoma de Puebla/Herramienta, 2008/2015, with John Holloway and Fernando Matamoros).

**Frieder Vogelmann** is Postdoctoral Researcher at the Institute for Intercultural and Interdisciplinary Studies (InIIS) at Bremen University. He studied philosophy, mathematics, and cognitive science at the University of Freiburg before doing his PhD in philosophy at the University of Frankfurt. He is the author of *The Spell of Responsibility* (Rowman & Littlefield International, 2017) and co-editor of *The Birth of Austerity. German Ordoliberalism and Contemporary Neoliberalism* (Rowman & Littlefield International, 2017). He has worked on the history of the concept of responsibility, on Michel Foucault, and on the concept of critique in critical theory. Recent publications have appeared in the journals *Constellations*, *Distinktion* and *Deutsche Zeitschrift für Philosophie*. His current work is focused on the effectiveness of knowledge and a praxeological understanding of philosophy.

**Christian Voller** studied Cultural Studies, History and Literature in Frankfurt/Oder, Berlin, and Bochum. Currently he is working on his PhD on figures of the autonomy of technology (working title: ‘Die Selbstherrlichkeit der Technik. Ein Topos der Moderne’). His research focuses on Marxist philosophy, the Frankfurt School, critical theory, and reactionary modernism. Since 2014 he has been a Research Associate at the Institute of Culture and Aesthetics of Digital Media at Leuphana University of Lüneburg.

**Adrian Wilding** is a Fellow of the Großbritannien-Zentrum, Humboldt-Universität zu Berlin. He has written and translated widely in the field of critical theory.

**Michelle Yates** is Assistant Professor of Cultural Studies and Humanities in the Department of Humanities, History, and Social Sciences at Columbia College Chicago. She received her PhD in Cultural Studies from the University of California at Davis. Her work is situated in the environmental humanities at the intersection of critical theory, film and media, and gender

and sexuality. She has published in peer review journals such as *Antipode* and *ISLE: Interdisciplinary Studies in Literature and Environment*. She is also the Co-Director of the Chicago Feminist Film Festival.

**José A. Zamora** is a tenured Researcher at the Institute of Philosophy of the Spanish National Research Council (Madrid). He has directed numerous research projects, including the current Social Suffering and Victim Status, for which he is a principal researcher. He is president of the Iberoamerican Society of Critical Theory Studies and is co-editor of *Constelaciones. Revista de Teoría Crítica*. His publications include, among others: *Krise – Kritik – Erinnerung. Ein politisch-theologischer Versuch über das Denken Adornos im Horizont der Krise der Moderne* (Lit-Verlag, 1995) and *Theodor W. Adorno: pensar contra la Barbarie* (Trotta, 2004; Portuguese trans. Nova Harmonia, 2008), and he is editor of *Justicia y memoria: hacia una teoría de la justicia anamnética* (Anthropos, 2011) and *Las víctimas como precio necesario* (Trotta, 2016), among others. His areas of research are Critical Theory, philosophy after Auschwitz, social suffering, political theologies of modernity and political philosophy of migrations.

# Acknowledgement

We are indebted to Neil Larsen for involvement in the early stages of shaping the handbook and for his guidance and advice on the tradition of critical theory in Latin America and Wertkritik.

# Introduction: Key Texts and Contributions to a Critical Theory of Society

Beverley Best, Werner Bonefeld and Chris O’Kane

The designation of the Frankfurt School as a ‘critical theory’ originated in the United States. It goes back to two articles, one written by Max Horkheimer and the other by Herbert Marcuse, that were both published in *Zeitschrift für Sozialforschung* (later *Studies in Philosophy and Social Science*) in 1937.<sup>1</sup> The *Zeitschrift*, published from 1932 to 1941, was the publishing organ of the Institute for Social Research. It gave coherence to what in fact was an internally diverse and often disagreeing group of heterodox Marxists that hailed from a wide disciplinary spectrum, including social psychology (Fromm, Marcuse, Horkheimer), political economy and state formation (Pollock and Neumann), law and constitutional theory (Kirchheimer, Neumann), political science (Gurland, Neumann), philosophy and sociology (Adorno, Horkheimer, Marcuse), culture (Löwenthal, Adorno), musicology (Adorno), aesthetics (Adorno, Löwenthal, Marcuse) and social technology (Gurland, Marcuse). In the Weimar Republic, the Institute was

known by sympathisers as ‘Café Marx’. It was the first Marxist research institute attached to a German University.

Since the 1950s, ‘Frankfurt School’ critical theory has become an established, internationally recognised ‘brand name’ in the social and human sciences, which derives from its institutional association in the 1920s and again since 1951 with the Institute for Social Research in Frankfurt, (West) Germany. From this institutional perspective, it is the association with the Institute that provides the basis for what is considered critical theory and who is considered to be a critical theorist. This *Handbook* works with and against its branded identification, concretising as well as refuting it.

We retain the moniker ‘Frankfurt School’ in the title to distinguish the character of its critical theory from other seemingly non-traditional approaches to society, including the positivist traditions of Marxist thought, constructivist idealism, French philosophies of structure, events and rhizomes,

post-colonialism, the abstract negativity of subjectivism, including the existentialist traditions and contemporary Anthropocene, and justice-orientated abstract normativism.

## CRITICAL THEORY: AN OUTLINE<sup>2</sup>

In its original formulation, critical theory is characterised by thinking against the flow of the (reified) world. It is an attempt to brush against its grain to reveal its foundation in historically specific social relations. It was the first serious Marxist attempt to confront the historical materialism of the orthodox Marxist tradition. According to the orthodoxy, labour is a transhistorical objective necessity and the various modes of production present historically specific forms of labour economy. In this view, history is objectively unfolding towards a 'higher' mode of production: socialism. For the orthodoxy, therefore, there can be no such thing as the critique of labour. There can only be a critique of the capitalist irrationality of labour organisation, leading to the endorsement of socialism as a rational form of labour organisation.<sup>3</sup> Orthodox Marxism thus conceived of capitalism as transition to socialism either through reformist struggle for recognition of labour rights or revolutionary struggle as midwife for a centrally planned labour economy.<sup>4</sup> In the 1920s, Frankfurt School critical theory emerged from within the constraints of these positions as well as the deadly hostility that existed amongst their respective supporters and between the latter and their nationalist foes.

Following Max Horkheimer, the opposite of a critical theory of society is not an uncritical theory: it is 'traditional theory'. For Horkheimer, traditional theory is uncritical of its own social and historical preconditions. Instead of seeking to establish the social and historical constitution of its object, it identifies society as given – mere data. Against idealism, it holds that positivism is an element

of critical thought. Critical theory is about the conceptuality of a historical reality. It is both a method of thought and a process of thinking in and through the social object. It is not a method of organising concepts and of thinking about society. Rather than applying thought to the social object, it argues that conceptuality holds sway within it. This insight formulates the task of critical theory as an immanent critique of society, one that sets out to uncover what is active in objects. Thus, against positivism, it holds that in its immediate and direct appearance the whole of society is untrue.

Horkheimer's 'Traditional and Critical Theory' argues that in its posited appearance, society presents itself in the form of petrified relations, which perpetuate themselves as if by some independent dynamic that is regulated by invisible forces. This appearance is real as necessary illusion, which is ideology; the ideology of the social object is its appearance as natural. According to Horkheimer, Marx was the first critical theorist who conceived of capitalist society as an objective illusion.<sup>5</sup> That is, the fetishism of commodities is real as the objective inversion of the social relations that vanish in their appearance as a relationship between economic quantities, which are regulated by an invisible hand that, as Adorno put it, takes care of 'both the beggar and the king'.<sup>6</sup> What has vanished cannot be identified nor conceptualised; what remains is the social subject as a non-conceptuality.<sup>7</sup> Abstract things neither posit themselves nor do they impose and reproduce themselves according to some innate objectively unfolding logic. Rather, it is the social relations, individuals in and through their social praxis, that render social objectivity valid by bestowing it with a consciousness and a will. The veracity of this insight is no way challenged by the equally valid insight that the subjects act under the compulsion of social objectivity, on the pain of ruin and disaster. In this context, critical theory is best seen as an attempt at conceptualising capitalist social objectivity

as a definite form of human social practice. Critical theory thus becomes a negative dialectic of the conceptualised praxis (*begriffene Praxis*) of capitalist social relations.<sup>8</sup>

As argued by Horkheimer in 'Traditional and Critical Theory', Marx's critique of political economy amounts to a devastating judgment on existence, not just of the economic sphere but of society as a whole, as a totality. Totality is a negative concept of the wrong state of things. For Horkheimer, Marx's critique of political economy is social critique. It is critique of the economic categories as the valid categories of a 'false' society. For Adorno, Marx's critical theory is characterised by its resistance to substituting the truth content of thought for its 'social function and its conditioning by interests'. Traditional theory, says Adorno, 'refrains from a critique' of social contents, and '[remains] indifferent to it'.<sup>9</sup> It classifies and defines social phenomena but does not look into them. The purpose of critical theory as a critique of ideology is to uncover what is active in things to reveal the socially constituted principle of compulsion, that power of society as a whole, in which the social subject, Man in her social relations, appears as a mere character-mask (Adorno) or personification (Marx) of reified relations between seemingly natural social things. It is of course true, as traditional theory recognises, that the 'life of all men hangs' by the profitable extraction of surplus value.<sup>10</sup> Time really is money and money is money only as more money. Yet it does not ask why that might be so and does not inquire into its conceptuality – that is, it does not attempt to comprehend the social laws that are innate to this mode of human social reproduction as definite laws of human social practice.

Furthermore, critical theory holds that social reality and theoretical praxis are the same and not the same. There is neither an untheoretical reality nor can reality be reduced to thought. Reality, the real, entails theory as the condition of its comprehension, meaning and practical intelligibility. Whether something is rational is a matter of thought

and interpretation. The comprehension of reality is a theoretical effort and the critique of reality is therefore a critique of its theorising. Reality neither speaks for itself nor by itself. Its critique is fundamentally a theoretical critique, which is also a critique of epistemology and science, that includes philosophy and political economy. As a critical theory, therefore, materialism is 'a dissolution of things understood as dogmatic'.<sup>11</sup> In this context, Lukács' notion of 'false consciousness', which he developed most clearly in his *History and Consciousness*, is unhelpful. In the 'enchanted, perverted, topsy-turvy world' of capitalist social relations, thought too is enchanted, perverted and topsy-turvy. Critical theory is here characterised as an effort of critique, making thought work, which entails confrontation of the cogitative account of society with its experience. Critical theory holds that the theoretical concept of society is fundamentally an experienced concept and vice versa.<sup>12</sup> Traditional theory might want to analyse society on the basis of algorithmic data. It can do this because it has no experience of society. What counts are numbers; whether numbers inflate or deflate is, however, of no concern to the numbers themselves. It is a concern for the social subject, and the validity of inflation or deflation is therefore a social validity. For traditional theory, experience is not a scientific category. It therefore excludes what is vital from its analytical gaze. Nevertheless, the development, say, of economic theory into social statistics is not 'false', as opposed to the 'right' theory of so-called Marxian economics. Economics, as the science of economic matter, meets definite social needs, takes the direct appearance of society as immediate proof of its veracity, analyses the economic phenomena and articulates the economic quantities in the form of mathematical equations. In this manner, it rationalises society by scientific-mathematical method. It does all this in the name of scientific method and accuracy without once asking itself what the economic categories are, what the economic quantities

are quantities of and, indeed, why the effort of human social reproduction appears in the form of economic quantities that present themselves devoid of innate human contents. For the science of economic matter, the consideration of such contents, and questions about their human-social validity, amounts to a metaphysical distraction. It inserts into economics a non-economic subject, disrupting the economic idea of purely economic matter.<sup>13</sup>

The critique of economics as a social science without social content does not entail its rejection as a science of 'false' consciousness. It rather entails social critique – that is, critique of a society that expresses itself in the form of economic categories and economic matter, which economic science seeks to render intelligible by rationalising the economic appearance of society, without distraction. Traditional social theory does not see that economic forces are forces of definite social relations. Why, indeed, does this content, human social reproduction, the satisfaction of human needs, take the form of independent economic categories, upon whose power 'the life of all man hangs by'?<sup>14</sup> The theory of society becomes no less traditional when it demythologises the social object into a secular 'logic of things' that, akin to an abstract system of logic, structures the actual behaviour, consciousness and mentality of the actual individuals and their libidos, too.<sup>15</sup>

In Adorno's memorable formulations in *Negative Dialectics*, reality requires thought for its comprehension, and historical materialism is critique of society understood dogmatically.<sup>16</sup> It is critique of society through theoretical critique. Critical theory is characterised by its attempt to dissolve the dogmatic posture of social objectivity by revealing its vanished social genesis. It holds that in order to grasp the world one has to be within it. Critical theory is critical on the condition that it thinks through society. What is vital about economic quantities is not their quantitative expansion. What is vital is the sheer unrest of life for access to the means of subsistence,

which for its success depends on economic growth for its own sake, on the accumulation of abstract wealth for accumulation's sake. As a critical theory the critique of political economy entails the recognition of suffering as the hidden truth of the relations of economic objectivity. Critical theory, therefore, is a critique of a world that is 'hostile to the subject', no matter that it is the social individual herself who endows the reified world with a consciousness and a will, not just in the economic sphere but in society at large, body and soul.<sup>17</sup> In fact, Alfred Sohn-Rethel, who never established a close working relationship with the Institute but who stayed in close contact with some of its members, and whose theoretical concerns were also close, focused the programme of research most clearly: it amounts to an anamnesis of the social origin, or genesis, of real abstractions.<sup>18</sup>

## HISTORY AND THOUGHT

The Institute was founded in Frankfurt am Main in 1923, where it was affiliated with the University of Frankfurt am Main. It was the creation of Felix Weil. Weil was born in Buenos Aires, Argentina. He was the son of a wealthy grain merchant and was able to use money from his father's business to finance the Institute. Weil graduated with a doctoral degree in political science from Frankfurt University. His doctoral thesis was about the practical problems of implanting socialism through central economic planning. It was published by Karl Korsch.

The immediate background to his initiative was the First Marxist Work Week, which Weil also financed. It was a week-long symposium in 1922 attended amongst others by György Lukács, Karl Korsch, Karl August Wittfogel and Friedrich Pollock, a close friend of Horkheimer's and co-founder of the Institute. Wittfogel was a historian noted for his studies of ancient China and is best known for developing the notion of an Asiatic mode

of production. Karl Korsch's *Marxism and Philosophy* (1923), which broke the ground for the development of heterodox Marxism, was discussed at the symposium. Korsch worked at the Institute in exile but never joined it formally.

Lukács' *History and Class Consciousness*, also published in 1923, was a major inspiration for the development of the Frankfurt School, particularly because of its argument about reification and identification of the importance of Hegel's philosophy for Marx's critique of political economy. The relationship between Lukács and critical theory is perhaps best described with reference to Wiggershaus' account of a meeting between Lukács and Adorno in 1925.<sup>19</sup> Adorno, who began his association with the Institute in 1928 and became a formal member in New York in 1938, is said to have been shocked to find that, in an attempt to restore his reputation as a reliable supporter of the Bolsheviks, Lukács was retracting precisely what had attracted Adorno to his work in the first place – namely, the critique of capitalist society as a (reified) totality. If, indeed, Lukács was Adorno's intellectual mentor, the mentoring proved short-lived and unreliable. Similarly, Neumann and Kirchheimer had started out as (socialist) students of Carl Schmitt's, and Marcuse had started his second doctorate, his *Habilitationsschrift*, under Martin Heidegger. Schmitt and Heidegger promptly supported the Nazi regime and joined its ranks as intellectual flagbearers.

Marcuse joined the Institute in 1932, having been recruited by Leo Löwenthal. Löwenthal had joined the newly founded Institute in 1926 and established himself as its leading expert on the sociology of literature and mass culture. He was the founding managing editor of the *Zeitschrift*, which was published from the United States for most of its existence. In the face of the Nazis' growing influence, including at Frankfurt University, the Institute's founders decided in September 1930 to prepare to move abroad. They established a branch in Geneva and moved the

Institute's funds to The Netherlands. In 1932, shortly after Löwenthal had recruited him, Marcuse was sent to Geneva in preparation for possible exile. The Gestapo closed down the Institute in early 1933 for 'activities hostile to the state'.<sup>20</sup>

The initial research at the Institute was close to Weil's interests in the social history of the workers' movement. Its first publishing venture was the first critical edition of the collected works of Marx and Engels, with the Institute acting as a mediator between the Moscow-based Marx–Engels Institute and the German Social-Democratic Party. It was this venture that reinforced existing, strongly held suspicions about the Institute as subversive and led to a police investigation into the backgrounds of its members. The police concluded that Felix Weil and Friedrich Pollock were undoubtedly communists. Pollock came in for special treatment on the grounds of his activities during the Munich Soviet in 1919.

During the 1920s, Löwenthal's sociological approach was the exception in the Institute. Its designated first director was Kurt Albert Gerlach, who died before the Institute's inauguration. He sympathised with anarcho-syndicalism and published on industrial relations and the conditions of female factory workers in England. Gerlach's successor and founding director was Karl Gruenberg, a Marxist historian seen as the 'Father of Austrian Socialism'. He counted Otto Bauer, Rudolf Hilferding and Karl Renner amongst his students. Gruenberg took his journal *Archive for the History of Socialism and the Labour Movement*, which he had started in Vienna in 1910, with him to Frankfurt. It became the house journal of the Institute until 1930, when it ceased publication. The two most important publications of the Institute during this time were Henryk Grossmann's *The Law of Accumulation and Breakdown of the Capitalist System* and Friedrich Pollock's *Attempts at Planned Economy in the Soviet Union 1917–1927*, both published in 1929. After Gruenberg suffered from a stroke, he retired, in 1929, and

Pollock stepped in as acting director. He was succeeded in 1930 by Max Horkheimer, who was not the obvious candidate, but who was chosen despite his leanings towards council communism. In the same year, Erich Fromm, who became one of the founders of 'socialist humanism', joined the Institute. Under Horkheimer's directorship, the Institute's research profile started to change from one focused on mainly economic developments and labour-movement studies towards empirical social research, social theory, cultural study, philosophy and social psychology, firming up the interdisciplinary research associated with critical theory.

Frankfurt School critical theory was shaped by profound experiences. It originated in the aftermath of the failed Soviet revolution, after Lenin's death and at the beginning of the new economic policy that was accompanied by the resolutely dictatorial direction of the Soviet state under Stalin. It originated, too, in the aftermath of the failed German revolution of 1918 that led to the short-lived Weimar Republic, which despised the revolutionaries and was rejected by the *ancien régime* and its willing foot-soldiers. Horkheimer took on the directorship of the Institute against the background of the crash of 1929 and the worldwide socio-economic and political consequences that followed: on the one hand, hyperinflation, depression, austerity (the German chancellor from 30 March 1930 to 30 May 1932, Heinrich Brüning, was called the *Hungerkanzler* – the famine chancellor), mass unemployment, political violence and assassinations, emergency government, politicised labour relations and a strong but bitterly divided labour movement and, on the other, Nazi storm-troopers. Against the background of German Nazism and Italian Fascism, Herbert Marcuse wrote about the coming to power of a new form of liberalism, which he conceived of as an authoritarian liberalism.<sup>21</sup> It entailed, he argued in 1934, the 'existentialization and totalization of the political sphere'.<sup>22</sup> The decisive experiences for the formation of critical theory were the

failure of revolutions, the total collapse of the German labour movement in 1933, the conditions of 'bare life', the Nazi dictatorship, Stalinist show trials and concentration camps, world war, exile and disorientation, antisemitism as political program and industrialised slaughter.

With the exception of Adorno, the small band of critical theorists left Germany in 1933, finally settling in either New York or Los Angeles. Walter Benjamin, the great literary critic and condemner of positivist Marxism, eventually settled in Paris. During the 1930s, the Institute provided him with publishing opportunities and, most importantly, financial support. Adorno who had been introduced to Benjamin in the early 1920s by a mutual friend, Siegfried Kracauer, was instrumental in securing this support. When Paris fell to the Nazis in 1940, he fled south with the intention of escaping to the United States via Spain. Informed by the chief of police at the France–Spain border that he would be turned over to the Gestapo, Benjamin committed suicide. Adorno had hoped to remain in Germany after 1933 and until 1934 hoped that the German army would take over. He enrolled for advanced studies at Oxford in June 1934 and during the next four years made trips to Germany to see his parents and, in 1937, to New York to visit the Institute. He left Europe for the United States in 1938.

Initially the focus of study in exile was authoritarianism, starting with the collected volume *Studies on Authority and Family* (1936), to which, amongst others, Fromm, Marcuse and Horkheimer contributed, then Horkheimer's 'The Authoritarian State' (1942) as well as particular analyses of the character of the Nazi state (Neumann, Pollock and also Kirchheimer and Gurland). Kristallnacht in 1938 was the immediate precursor of Horkheimer's 'The Jews of Europe' (1939). The extermination of European Jewry changed the Institute's research outlook decisively. Its two bases in the United States, in New York and Los

Angeles, developed overlapping and yet distinct research programmes on antisemitism and unreason. One was led by Pollock from the east coast, leading to the publication of a four-volume work entitled *Studies in Anti-Semitism*; and the other was led by Horkheimer and Adorno from California on the dialectic of Enlightenment (un)reason, leading to their *Dialectic of Enlightenment* and to Horkheimer's *Eclipse of Reason*, both published in 1947. *The Authoritarian Personality* was published in 1950 and Adorno's *Minima Moralia: Reflections from Damaged Life* in 1951. Erich Fromm's *The Fear of Freedom* (1941) explored damaged life in social-psychological terms.

The Institute returned to Frankfurt in 1951. However, of its core members, only Pollock, Adorno and Horkheimer returned; Leo Löwenthal, Erich Fromm, Herbert Marcuse, Franz Neumann and Otto Kirchheimer did not, nor did the majority of the Institute's members. The designation 'Frankfurt School', which came to the fore only in the 1950s, need not, then, be fixed on the Institute's post-war location; it is much more fruitful, rather, to see the Institute's decidedly heterodox Marxist social critique as originating in a specific formative experience in Weimar Germany and developing through the experience of exile, loss and disorientation. It continued to mature, against itself, in the context of Auschwitz, and later established itself as a dissenting voice in the Cold War silences. Later still, it became a theoretical expression of the new left that emerged in the movements associated with 1968.

Of the critical theorists who returned to Germany in the 1950s, Adorno is the one whose publishing took off, leading especially to *Negative Dialectics* (1966) and *Aesthetic Theory* (1970), which was published posthumously. The experience of exile and loss, authoritarianism and barbarism, tragedy and dashed hope, re-emerge in *Negative Dialectics* as a form of thought that turns thinking inside out by revealing its affective origin in 'suffering'. The experienced

catastrophe was not an aberration of an otherwise civilised world; it showed what the civilised world is capable of. What lies within its concept is not the idea of a future humanity that, reconciled with itself, organises its social affairs in freedom from coercion and according to its needs – this great idea of an equality of individual human needs that constitutes the association of the free and equal, as Marx put it in the *Communist Manifesto*. Rather, what lies within its concept is the promise of barbaric violence. The catastrophe asserted the hidden veracity of bourgeois reason, revealing its conceptuality in domination. Adorno's negative dialectic claimed that 'Hitler had imposed a new categorical imperative upon humanity in the state of their unfreedom: to arrange their thinking and conduct, so that Auschwitz never repeats itself, so that nothing similar will happen again'.<sup>23</sup> In the context of post-war Germany, and beyond, Adorno's stance was singular and unique. It enthused the emerging new left, with frustrating consequences. Adorno rejected the student revolt of 1968 as quasi-action.

In 1962, Adorno had called for a 'praxis that fights barbarism'<sup>24</sup> and in his lectures endorsed Marx as the thinker who directed his critique 'at the substance' of society – that is, the 'social production and reproduction of the life of society as a whole'.<sup>25</sup> He upheld the insight that 'society remains class struggle'.<sup>26</sup> However, and distinct from a whole tradition of Marxist theory, class struggle was not something positive or indeed desirable. On the contrary, class struggle is the objective necessity of the false society. It belongs to its concept. *Negative Dialectics* thus argues that bourgeois society is 'antagonistic from the outset' and that it 'maintains itself only through antagonism'.<sup>27</sup> Class struggle does not posit an alternative to capitalist society and does not go beyond it. That is to say, class struggle is not a positive category of history in the making. It is an entirely negative category, and the struggle to make ends meet is no longer an ontological privilege. Rather, it is a

great misfortune. 'Proletarian language is dictated by hunger. The poor chew words to fill their bellies.'<sup>28</sup> Like Benjamin, in his 'Theses on the Philosophy of History', Adorno holds that 'there is a tenderness only in the coarsest demand: that no-one should go hungry any more'.<sup>29</sup> The orthodox Marxist dictum of capitalism as transition to socialism had long been shown up, since Lenin, as mere leadership propaganda, which lived on in academic circles and as official state ideology in the countries of the then Eastern bloc.

Herbert Marcuse too demanded a praxis that fights barbarism. His writings snatched Marx from the orthodox embrace, establishing a new Hegelian Marxism in *Reason and Revolution* (1941) and Freudian Marxism in *Eros and Civilisation* (1955) and denouncing eastern Marxism in *Soviet Marxism* (1958), where he developed the notion of the communist individual as the subject of emancipated society. He established the contours of a new revolutionary subject amidst the closed society of an administered world in *One-Dimensional Man* (1964), posing the conundrum of revolution: slaves, he argued, 'have to be *free* for their liberation before they can become free'.<sup>30</sup> At the height of the 1968 movement, he explored liberation in 'An Essay on Liberation' (1969); he later assessed the balances of the forces of history in *Counterrevolution and Revolt*, advocating a council-communist approach to revolution (1972); and in his final work, *The Aesthetic Dimension* (1978), he examined the political character of works of art. Contrary to Adorno's characterisation of the movement of 1968 as quasi-action, Marcuse – and also Ernst Bloch, who, though not amongst the central figures of the Frankfurt School was a figurative intellectual influence on it – participated in the revolt and influenced a great number of its student activists, from Hans-Jürgen Krahl and Rudi Dutschke to Angela Davis. Unlike Adorno's post-war publications, which critiqued the commodified world of social relations, Marcuse's focus on the power and

probability of the rebellious subject, charting the emergence and assertion of the new left in theoretical terms and calling for liberation, endorsing the movements associated with 1968 in a direct manner.

Critical theory's call for a praxis that fights barbarism entails a shift from a critical theory of the object towards one of the subject. It articulates the need for the subject either to prevent the barbarism inherent in unfreedom from asserting itself (Adorno) or to resist the totally administered world and reified forms of experience, consciousness and rationality (Marcuse), including gender relations, racism, sexual repression, body and soul (Fromm), to achieve liberation of the subject from oppression and repressive personality in whatever form. The movements associated with 1968 fractured the post-war consensus irretrievably. For some, it was the soon to be disappointed beginning of radical and indeed revolutionary change. Others saw it as an opportunity for greater tolerance and progressive democratic renewal. Conservative critics recognised 1968 as the beginning of the end of their world. They held the Frankfurt School responsible for the turmoil and denounced it as one of the causes of terrorism.<sup>31</sup>

It was against this background that the Habermasian revision of critical theory found its voice. The new direction of critical theory under Habermas might best be exemplified by his retort to Adorno's insight into the 'radical effect [of the capitalist form of labour] on the concept of practice'.<sup>32</sup> For Adorno, in capitalism, 'the needs of human beings, the satisfaction of human beings, is never more than a sideshow';<sup>33</sup> he proclaimed that 'the abolition of hunger [requires] a change in the relations of production'.<sup>34</sup> In distinction, Habermas argued that '*liberation from hunger and misery* does not necessarily converge with *liberation from servitude and degradation*, for there is no automatic developmental relation between labor and interaction'.<sup>35</sup> His path-breaking work is *The Theory of Communicative Action* (1984), which concerns the process of formation

of public opinion and rational discussion. It is an attempt to rescue the ideas of the Enlightenment from the critique to which Horkheimer and Adorno subjected them in *Dialectic of Enlightenment*. Habermas moved critical theory away from Marx and back to the principles of idealist reason and classical conceptions of political morality. Habermas reconfigured critical theory as an extension of the Enlightenment project, seeking to free reason from instrumental rationality in support of a perfectly civil society, constitutionalism and cosmopolitan democratic forms of government. Habermas' democratic conception of reason involved what he termed 'discourse ethics', which posits communication as reason's form of social action. His revision of critical theory as a philosophy of reason unbound by the unsocial irrationality of the relations of domination and exploitation positions the democratic constitutional state as the pinnacle of social morality. His communicative action derived from many sources and was consciously eclectic, from Gadamer's conservatism via Luhmann's system theory to pragmatic philosophy, which in the case of Dewey the critical theory of Adorno and Horkheimer had regarded with great suspicion.

Axel Honneth's theory of recognition builds on Habermas' pragmatist turn. His contribution came to the fore during the 1990s, after the collapse of the Eastern bloc and at the emergence of a so-called new economy that was variously called neoliberalism, financialisation or globalisation. His account focuses on normative forms of social interaction in the purportedly differentiated economic, political and private spheres that are held to be independent of the dominating economic logic of the social reproduction of capitalist society.<sup>36</sup> This also means, however, that he regards such a conception of the economic logic of social reproduction as one that critical theory does not touch. Whereas Habermas returns to Kant to establish the reason of communicative action on rational and moral bases, Honneth goes back

to Hegel to establish his theory of recognition with philosophical argument. As he sees it, modernity is characterised by a welcome expansion of rights claims by actors who, as a consequence of their struggle for recognition, 'have to be taken into consideration'.<sup>37</sup> He therefore argues that because of the dynamic of recognition, which establishes an 'expansive participation in rational will-formation',<sup>38</sup> contemporary society contains within itself the 'promise of freedom'.<sup>39</sup> The poverty of conditions, which critical theory originally recognised as belonging to the conceptuality of the capitalist social relations, now appears contingent upon the capacity and power of the forces of recognition to impose participatory demands upon economic processes, moralising the global economy through cosmopolitan schemes. In fact, his proposals for socialism are not dissimilar to the reformist ideas at the start of the last century, which proposed to create institutions of social freedom and solidarity that realise the Enlightenment's normative project for society as a whole, establishing a just and fair labour economy beyond social-class divisions and struggles. Honneth links critical theory with concrete practices and institutions, which entail the promises of freedom through what Hirsch termed a politics of 'radical reformism'.<sup>40</sup>

The distinction between the old and the new is sharp. Whereas the founding critical theorists conceived of bourgeois society as one of unfreedom, and barbarism as a potential means of sustaining it, 'contemporary critical theory' goes back to the philosophers of reason, Kant and Hegel, to ascertain the promise of freedom in contemporary society. Instead of stopping its further progress, as Benjamin had demanded for the sake of avoiding catastrophe, the critical theory associated with Habermas and Honneth now demands its further development to achieve the progress of reason beyond the pathologies of the present. Whereas the founding thinkers understood social pathologies as innate to the existing relations of social objectivity,

it now seems that social pathology is contingent upon the power of the social forces that act upon social situations. The judgment on existence that Horkheimer brought to attention in his 1937 critique of traditional theory appears no longer as a judgment about the character of definite social relations. Instead, it appears as a contingent social situation that can be rectified depending upon the power of those left behind to demand recognition of their needs through democratic assembly.

Therefore, the idea of a linear trajectory, however fractured, from the founding critical theorists – Horkheimer, Adorno and Marcuse in particular – to the contemporary critical theory of Habermas and Honneth is more apparent than real. It is pure ideology to claim that a first generation was replaced by a second generation, and now by a third generation, etc., which shaped critical theory in its own specific ways according to the demands of its day. Discontinuities and drastic shifts notwithstanding, it is also the case that, mostly under the radar of academic officialdom and on the margins of academic respectability, an Adorno-inspired critical social theory of the object and also of the subject continues both within and outside the university and both within Europe and outside Europe, including the Americas. On the one hand, there is the social critique of the object that led to a reconstruction of Marx's critique of political economy as a critical social theory, including *Wertkritik*, Open Marxism and the *Neue Marx Lektüre*, associated with Hans-Georg Backhaus and Helmut Reichelt, both students of Adorno's. In the United States, the development of critical theory as a critique of the economic object belongs to Moishe Postone, as well as Patrick Murray, Christian Lotz and Tony Smith. On the other hand, a critical theory of the subject – experience, history and praxis – was developed by Negt, Kluge, Schmidt and Krahll, all students of Adorno's, and Adolfo Sánchez Vázquez, Roberto Schwarz and Paulo Arantes, as well as Jameson, in his critique of postmodernism and aesthetics. Feminist critical theory was

developed amongst others by Nancy Fraser in the United States and Regina Becker-Schmidt, Axeli-Gudrun Knapp and Roswitha Scholz in Germany. Furthermore, John Holloway emerged as the voice of the subject in resistance, negating power. Since the 1970s, the early critical theory of the state, from Horkheimer's authoritarian state to Pollock's and Neumann's analyses of the character of the Nazi state, has provided the background to the emergence of a heterodox Marxist state theory that developed in the context of the political challenge of 1968, the crisis of the welfare state and so-called globalisation. In the German case, Johannes Agnoli pioneered a critique of political form and also legal form, which developed further as the German state-derivation debate and as the Conference of Socialist Economists state debate in the UK.<sup>41</sup>

Considered as a concept, critical theory has its own conceptuality. The persistence of critical theory, its continued resistance against traditional theory and its own 'traditionalisation', and its expansion into new areas, including urbanity and space and post-colonialism, show first of all that its original concerns with social praxis and the critique of social totality remain unbroken. Furthermore, they also show that the development of critical theory is not linear. Critical theory is not some abstract metatheory. Rather, it belongs to and develops in and through the social constellations that it seeks to render intelligible, with practical political intent. Lastly, critical theory is not bound by disciplinary borders and never was. On the contrary, it is characterised by its refusal to comply with academic discipline and disciplinary requirements. It thinks against the order of the world to understand it better. Interdisciplinarity does not mean lumping disciplines together; rather, it entails thinking in and through social relations, becoming aware of totality through the particular traits of the manifold manifestations that constitute society as a definite praxis of human social reproduction. The conceptuality of critical theory defies definition. It is critique of society for the sake of society.

At its best, and with reference to Marx, it makes the petrified relations dance by uncovering the sheer unrest of life that endows society as a real abstraction with a dynamic, a consciousness and a will, however perverted, in the form of the social object and the social actions that it entails.

## SCOPE AND PURPOSE

The *Handbook* expounds the development of critical theory from its founding thinkers to its contemporary formulations in an interdisciplinary and global setting. The *Handbook* showcases the scholarly rigor, intellectual acuteness and negative force of critical social theory in all its theoretical manifestations, past and present, and sketches its potential future trajectories in a world that remains fundamentally hostile to the needs of human beings and to the survival, as opposed to the disintegration, of human society itself.

Our contributors are not academic gatekeepers and disciplinarians, nor do they understand critical theory in institutional terms. We asked them to think freely and to disregard the security of academic borders. The *Handbook* maps the terrain of a critical social theory expounding its distinctive character vis-à-vis alternative theoretical perspectives, exploring its theoretical foundations and developments, conceptualising its subject matters both past and present and signalling its possible future in a time of war and terror, climate change, mass migration, economic hardship, nativism, nationalism and populism.

Critical theory, at least in its founding tradition, did not look on the bright side. Especially in a time of great uncertainty and social mischief it is important to look into the eye of the storm and ascertain what is active in things. With Adorno, the *Handbook* holds that the time of human emancipation from social compulsion by real abstractions is the time of human purposes. ‘Freely

disposable time’ (Adorno) – ‘time for enjoyment’ (Marx) – is the very content of an emancipated humanity.<sup>42</sup> It posits a form of human wealth that is entirely at odds with the existing form of wealth, in which time is money and in which money is more money. *Negative Dialectics* brushes the categories of social objectivity against their grain with practical intent so that the reason of human emancipation does not become ‘a piece of the politics it was supposed to lead out of’.<sup>43</sup>

## VOLUMES AND STRUCTURE

The *Handbook* is published in three volumes. Volume 1 is entitled *Key Texts and Contributions to a Critical Theory of Society*. It maps the terrain of critical social theory in terms of key contributors and key contributions, subject matters and critical theoretical developments. Volume 2, *Key Themes in the Context of the Twentieth Century*, introduces the key themes of a critical theory of society and explores critical theory as a critique of the social object and the social subject. Volume 3, *Contexts*, expounds the development of critical theory in the context of alternative theoretical approaches and in a contemporary context of social crises, movements and theories.

Volume 1 contains chapters on key contributors to the development of a critical theory of society beyond the confines of the Frankfurt School. With the exception of Chapter 9, which explores *Dialectic of Enlightenment*, the chapters provide biographical introductions to key thinkers and develop a critical textual and contextual analysis of key notions and texts.<sup>44</sup>

Volume 1 comprises three parts. Part I, ‘The Frankfurt School and Critical Theory’, contains chapters that introduce the key founding figures of a critical theory of society, including John Abromeit on Horkheimer, Christoph Hesse on Löwenthal, Kieran Durkin on Fromm, Paul Mattick Jr on Grossmann,

Karsten Olson on Neumann, Frank Schale, Lisa Klingsporn and Hubertus Buchstein on Kirchheimer, David Kaufmann on Benjamin, Charles Reitz on Marcuse, Nico Bobka and Dirk Braunstein on Adorno, plus Marcel Stoetzler on *Dialectic of Enlightenment* as a single publication. *Dialectic of Enlightenment* was co-authored by Horkheimer and Adorno and includes an important contribution from Löwenthal. It is a core text of critical theory, in which they scrutinised the demise of the age of reason into barbarism. Distinct from traditional Marxism, it argued that the capitalist relations do not contain a developmental logic towards human emancipation. Instead, they manifest and continue to manifest barbarism as prospective destiny. Jürgen Habermas held that *Dialectic of Enlightenment* conceived of bourgeois society as a mode of irrational rationality beyond reconciliation – that is, it left ‘nothing in reserve to which it might appeal’ for it lacked ‘any dynamism upon which critique could base its hope’.<sup>45</sup> This led to Habermas’ revision of critical theory as a discourse ethics intended to assure the further progress of enlightenment reason in contemporary society.

Part II, ‘Theoretical Elaborations of a Critical Social Theory’, contains chapters that introduce the development of critical social theory by figures that were closely associated with the founding thinkers either as colleagues, friends or students. Its chapters include Cat Moir on Ernst Bloch and his philosophy of hope and Eric-John Russell on Georg Lukács, whose work was not only of immense importance for the development of critical theory but also subject to robust critique by Adorno in particular.<sup>46</sup> Ansgar Martins focuses on Siegfried Kracauer, also a close friend and critic of Adorno’s. He was an early critic of mass culture, who, like Habermas some decades later, challenged Adorno’s critical theory for its negativity – nothing remains on which to fall back and build something new. Two further chapters, by Christian Voller and Hubertus Buchstein, introduce Alfred Seidel and A.L.R. Gurland.

Gurland is a largely forgotten member of the Institute. In exile he worked closely with Neumann and Kirchheimer on the political character of bourgeois society and Nazism. Compared with Gurland, Alfred Seidel is entirely unknown. He was, however, a decisive figure in the heterodox theoretical milieu of Frankfurt in the early 1920s, and the emergent critical theorists were familiar with him as a thinker of unconditional negativity.

Frank Engster and Oliver Schlaudt’s chapter about Alfred Sohn-Rethel introduces a thinker who appears on the margins of the official history of critical theory. In the 1920s, he was in close contact with Bloch, Benjamin, Kracauer and Adorno. Especially for Adorno’s exposition of critical theory as negative dialectic, Sohn-Rethel’s understanding of historical materialist critique as anamnesis of the genesis of social objectivity and of bourgeois society as real abstraction were of decisive importance. With one exception – Johannes Agnoli, whom Stephan Grigat discusses – the remaining chapters in this part introduce theoretical elaborations and challenges by students of Horkheimer and Adorno, including Hermann Kocyba on Alfred Schmidt, Richard Langston on Alexander Kluge and Oskar Negt, Jodi Maiso on Hans-Jürgen Krahl, Ingo Elbe on Helmut Reichelt, Riccardo Bellofiore and Tommaso Redolfi Riva on Hans-Georg Backhaus and Christoph Henning on Jürgen Habermas. Schmidt’s work focused on praxis as a category of critical social theory. He conceived of it with nature as a category of the human metabolism, explored the capitalist conceptuality of nature and human praxis and rejected the structuralist view of history and society, Althusser’s in particular, as an exemplar of traditional theory. For Schmidt, the economic critique of Marx is a critique of the entire system of social reproduction. With the exception of Habermas, this understanding of Marx’s critique of political economy as a critical social theory is key also to the theoretical exploration of the subsequent contributors to the theoretical elaborations of

critical theory. Alexander Kluge and Oskar Negt introduced the notion of obstinacy as a category of the critique of history as universal, linear and unfolding. Experienced history is cognisant of violence as the midwife of the constituted forms of civility. Social objectivity hides suffering. Turning to the chapter on Hans-Jürgen Krahl, who was at the forefront of 1968 in Germany, we see his exposition of critical theory as critique of political economy as practical. Given the conditions of (economic) objectivity and, as Marcuse had argued, integration of the working class into the capitalist system, Krahl asked about the agent and the means of human emancipation. He developed the idea of a praxis of social struggle as revolutionary process – an idea that, partly in critique of Habermas, Negt and Kluge later explored with greater depth when writing about proletarian experience and the proletarian public sphere. Krahl's work on economic objectivity opened the door of critical theory to autonomist Marxism (see Volume 3), Holloway's account (see below) and to the so-called *Neue Marx Lektüre*, associated in particular with the work of Reichelt and Backhaus. One of its 'beginnings' is a paper on the value form, prepared by Backhaus for a seminar led by Adorno, but which never materialised due to Adorno's untimely death. Backhaus' value-form analysis emphasised the social character of capitalist wealth that in the form of money presents itself in the form of seemingly independent economic categories. He explored these categories as inverted social categories. The *Neue Marx Lektüre* put Adorno's critical theory to work on Marx's *Capital*. For Reichelt in particular, the new reading entailed a negative dialectic which he unfolded in the form of a dialectical presentation of economic categories, uncovering a process of economic inversion of definite social relations. In their specific ways, the contributions by Backhaus, Reichelt and Krahl, as well as those of Schmidt, Negt and Kluge, developed critical theory as a critique of society, of social praxis in the form of inverted economic categories,

uncovering a dynamic of social compulsion through the movement of fundamentally economic things. The two exceptions to these elaborations of critical theory are Johannes Agnoli and Jürgen Habermas. Agnoli's critical theory focused on the state as the political form of bourgeois society. His critique of politics examined the political character of the critique of political economy against the background of earlier critical theory about the authoritarian state and its enduring significance in the post-war liberal democracies. In context of these further elaborations of critical theory, Jürgen Habermas' critical theory is distinct. It offers neither a critique of the economic object and its political character nor a critique of the socially specific forms of human praxis and its relationship to nature. His critical theory is characterised by its ethical commitments towards reason. He established a critical theory of social civility and ethical conduct through moral government. Habermas is the outstanding German public intellectual of the last century, and his critical theory provides philosophical underpinning to his commitments.

Part III, 'Critical Reception and Further Developments', contains chapters that introduce the further development of a critical theory of society by figures that were influenced by, took up and elaborated key themes of Frankfurt School critical theory. In particular, it contains a chapter by Andrew Brower Latz on Gillian Rose, her critique of neo-Kantianism and her notion of 'the broken middle' in post-fascist modernity. The scheme of the *Neue Marx Lektüre* is developed further with a chapter by Elena Louisa Lange on Moishe Postone and his exploration of the critique of political economy as a critique of labour. Postone's work rejects the tradition of labourism and Marxian economics in a direct manner, arguing that Marx's critique of political economy amounts to a critique of labour. This theme is further developed in Ana Cecilia Dinerstein's chapter on John Holloway's critique of the state and political reading of Adorno. The expansion of critical

theory as the dialectical critique of reification and utopia in postmodernity is taken up in Carolyn Lesjak's chapter on the work of Fredric Jameson. Claudia Leeb and Michael J. Thompson's chapters on Nancy Fraser and Axel Honneth's notions of redistribution and recognition critically expound the principal development of post-Habermasian thought in critical theory. The part also contains chapters by Andrés Sáenz De Sicilia, Stefan Gandler, Nicholas Brown and Pedro Rocha de Oliveira on Latin American thinkers who developed the tradition of critical theory from within their own historical contexts, socio-economic conditions and cultural settings. These thinkers – Bolívar Echeverría, Adolfo Sánchez Vásquez, Roberto Schwarz and Paulo Arantes – developed their own reading of Marx's critique of political economy as a critical social theory. The chapter on Bolívar Echeverría explores his critique of capitalist social reproduction through the notion of 'ethe', by which he understood historically specific cultural configurations of modes of life. The chapter on Adolfo Sánchez Vásquez introduces his philosophy of praxis as critique of everyday consciousness. This topic is further developed in the chapter on Roberto Schwarz, whose critique of modern Brazilian culture developed the critical-theory notion of 'social form' as critique of realism as social process in the then periphery of capitalist society. Finally, the chapter on Paulo Arantes introduces a thinker of the dialectics of Brazilian modernity and its historical temporality. Arantes reads the 'North' by the 'South', and in this manner he joins Schwarz, Vásquez and Echeverría in making an unrivalled contribution to a critical theory of the so-called periphery and its relationship to global capitalism.

## ACKNOWLEDGEMENTS

We are indebted to Neil Larsen for his guidance and advice on the tradition of critical theory in Latin America and *Wertkritik*.

Marcel Stoetzler was instrumental in conceiving of the *Handbook* project in its initial phase. In addition, we are indebted to our advisory board for its most welcome support through all phases of the *Handbook*. Special thanks are due to Nadia Rakowitz, Lars Fischer, Christian Lotz, Patrick Murray, Frank Engster and Elena Louisa Lange for helping us with timely advice and encouragement. 'Thank you' also to Amy Allen for her help in pointing us in the right direction when all seemed lost. Finally, we are grateful to the SAGE production team and its always helpful and unstinting support. Particular thanks are due to Matt Oldfield, Serena Ugolini, Colette Wilson and especially to Robert Rojek, who got the ball rolling.

A final and most heartfelt 'thank you' is due to our Volume 1 translators: to Cat Moir for Nico Bobka and Dirk Braunstein's chapter on Theodor Adorno; Lars Fischer for Ansgar Martins' chapter on Siegfried Kracauer; Adrian Wilding for Stephan Grigat's chapter on Johannes Agnoli; and Jacob Blumenfeld for Christian Voller's chapter on Alfred Seidel, Hermann Kocyba's on Alfred Schmidt, Frank Engster and Oliver Schlaudt's chapter on Sohn-Rethel; Ingo Elbe's on Helmut Reichelt; and to Max Henninger for Christoph Henning's chapter on Jürgen Habermas.

## Notes

- 1 Max Horkheimer, 'Traditional and Critical Theory' [1937], in *Critical Theory* (New York: Continuum, 1972), 188–243. Herbert Marcuse, 'Philosophy and Critical Theory' [1937], in *Negations. Essays in Critical Theory* (London: Free Association Books, 1968), 134–58.
- 2 The outline emphasises critical theory as a critique of economic objectivity, which according to Martin Jay and Jürgen Habermas was not something that Adorno especially concerned himself with. Habermas, *Philosophisch-politische Profile* (Frankfurt: Suhrkamp, 1987). Jay, *The Dialectical Imagination, A History of the Frankfurt School and the Institute of Social Research, 1923–1950* (Berkeley: University of California Press, 1973). According to this view critical theory is fundamentally a critique of instrumental reason and of

- culture, not of political economy. This is a widely held view. See, for example, Moishe Postone and Barbara Brick, who argue that Friedrich Pollock's work on political economy spoke for the whole Frankfurt School, which allowed Adorno and others to develop more philosophical and cultural critiques. Postone and Brick, 'Critical Pessimism and the Limits of Traditional Marxism', *Theory and Society* 11(5): 617–58, 1982.
- 3 On this see the ground-breaking account of Moishe Postone, *Time, Labour, and Social Domination* (Cambridge: Cambridge University Press, 1994).
  - 4 Most decisive are Walter Benjamin's 'Theses on the Philosophy of History', which he wrote in 1940 and were first published in 1942. According to Benjamin in a letter to Gretel Adorno, the *Theses* focused 'some thoughts about which I may say that I have kept them about myself for some twenty years', and they were to establish a break between what he calls 'our' way of thinking and the 'survival of positivism', especially in the Marxism of his time. Yet, they were not meant for publication, which, he said, 'would throw wide open the doors to enthusiastic incomprehension' (Benjamin, *Gesammelte Schriften*, vol. 1.3 (Frankfurt: Suhrkamp, 1991), 1226–7). According to Benjamin, history is not on the side of the oppressed. He therefore argued for its progress to be stopped – here and now. Benjamin, 'Theses on the Philosophy of History', *Illuminations*, edited with an introduction by Hannah Arendt (London: Pimlico, 1999), 245–55.
  - 5 For further argument about this term and its standing in critical theory, see Hans-Georg Backhaus, 'Between Philosophy and Science: Marxian Social Economy as Critical Theory', in *Open Marxism: Dialectics and History*, edited by W. Bonefeld, R. Gunn and K. Psychopedis (London: Pluto, 1992), 54–92. Helmut Reichelt, 'Marx's Critique of Economic Categories: Reflections on the Problem of Validity in the Dialectical Method of Presentation in *Capital*', *Historical Materialism* 15(4): 3–52, 2007. # Max Horkheimer and the Early Model of Critical Theory

John Abromeit

## OVERVIEW OF HORKHEIMER'S LIFE AND THOUGHT<sup>1</sup>

Max Horkheimer was born in 1895 near Stuttgart, Germany. His parents were members of the local Jewish community, which had grown steadily during the course of the nineteenth century and had succeeded in becoming an integral part of the city's economic, political and cultural life. During the economic boom in Wilhelmine Germany, Horkheimer's father established himself as a successful textile manufacturer. He tried to prepare his only son to take over his factory one day, but Horkheimer was determined from an early age to follow his own path. In 1911, Horkheimer met Friedrich Pollock, whose father was also a wealthy manufacturer, and the two of them quickly became inseparable friends. As Friedrich Engels' parents had done some 70 years earlier, Horkheimer and Pollock's parents sent them abroad to learn French and English and to study the most advanced techniques in textile

production. While living in Belgium, France and England, Horkheimer and Pollock pursued their burgeoning interests in literature and philosophy and cultivated a bohemian lifestyle. With the outbreak of World War I, they were forced to return to Germany, and Horkheimer begrudgingly took a position working in his father's factory. Having already lived abroad and realizing that other Europeans were no better or worse than the Germans, Horkheimer rejected the nationalist hysteria that accompanied the outbreak of the war. As the war and his labors in his father's factory dragged on, Horkheimer's already significant disaffection with the bourgeois world of his parents and the career path his father had chosen for him grew to fever pitch. Horkheimer passionately expressed his disdain for the war and the society that had produced it in a series of novellas, short plays and diary entries.<sup>2</sup> After being drafted into the military and serving briefly as a non-combatant, Horkheimer was sent to a sanatorium near Munich to recover

from a debilitating illness. While there, Horkheimer became acquainted with Germaine Krull, an avant-garde photographer and a leading figure in the radical leftist, bohemian circles that would spearhead the Munich Council Republic in 1919.<sup>3</sup> Horkheimer became close friends with Krull and presented his novellas and plays at social gatherings in her atelier, which were attended by prominent members of Munich's literati, such as Ernst Toller, Stefan Zweig and Rainer Maria Rilke. After the brutal suppression of the Council Republic by the *Freikorps* in May 1919, Horkheimer decided that the possibility for a mass-based social revolution was foreclosed for the time being. Horkheimer's explorations of bohemia and his self-understanding as an artist were brought to an end by his decision to move to Frankfurt with Pollock in order to get a rigorous theoretical education, which he now viewed as the prerequisite for any serious social critique.

Horkheimer's first genuine philosophical interest was Schopenhauer, but he also became interested in Marxist theory toward the end of the war. Although he chose psychology and philosophy as his major fields of study at the recently founded J.W. Goethe University in Frankfurt, he continued to study Marx on the side with Pollock, who would complete a dissertation on Marx's theory of money in 1923. In the fall of 1919, Horkheimer and Pollock met Felix Weil, with whom they shared the unlikely combination of a bourgeois family background and a serious interest in socialist theory and politics. The sustained discussions between the three of them, along with the generous financial support of Weil's father, Hermann, led to the formation of the Institute for Social Research in 1923. Although Horkheimer – unlike Pollock – was not directly involved with the Institute during its early years, he did play an important role in conceiving the idea of the Institute. Horkheimer's critical theory developed independently in the mid and late 1920s and would not become the guiding

force of the Institute until 1931, when he became its director. In the early 1920s, Horkheimer became acquainted with several of the other figures who would play an important role in the Institute's later endeavors, such as Leo Lowenthal and Theodor W. Adorno, but neither played an important role in the development of Horkheimer's Critical Theory at this time. The most important figure in Horkheimer's academic studies at the University of Frankfurt in the early 1920s was Hans Cornelius, an idiosyncratic and polymathic professor of philosophy, whose primary interest was neo-Kantian epistemology. Horkheimer wrote both his dissertation and *Habilitationsschrift*<sup>4</sup> under Cornelius' guidance. Both works addressed Kant's *Critique of Judgment* and both criticized Kant – and implicitly German academic neo-Kantianism as well – from a standpoint that reflected Cornelius' philosophical arguments.<sup>5</sup> Although Horkheimer learned some important lessons from these academic writings, they remained within the horizon of Cornelius' philosophy of consciousness. As we shall see, Horkheimer's Critical Theory took shape in the period between 1925 and 1930 as an explicit critique, not only of Cornelius but of consciousness philosophy as a whole.

In the late 1920s, Horkheimer offered a series of lectures and seminars as a *Privatdozent* in the philosophy department at the Goethe University in Frankfurt. In addition to his official academic duties, he continued to develop a radical theory of contemporary society in a series of aphorisms, *Dämmerung*, which he would not publish until 1934 and then under the pseudonym of Heinrich Regius.<sup>6</sup> When the first director of the Institute for Social Research, Carl Grünberg, suffered a stroke in January of 1928, Horkheimer emerged as the best candidate to replace him. In order to qualify for the directorship and the new chair in social philosophy that had been established for him, Horkheimer published in 1929 a lengthy essay on 'The Beginnings of the Bourgeois

Philosophy of History', which explored the role of psychology, natural law, utopia and myth in various early modern conceptions of history, including Machiavelli, Hobbes and Vico. During this time, Horkheimer was undergoing psychoanalysis – with his friend and former student of Freud's, Karl Landauer – and establishing a working relationship with Erich Fromm. With the support of Landauer, Fromm and his wife, Frieda Fromm-Reichmann, Horkheimer founded the Frankfurt Psychoanalytic Institute in February 1929 – the first psychoanalytic Institute officially affiliated with a German university.<sup>7</sup> Because Fromm had been trained not only as a psychoanalyst but had also earned a PhD in sociology – from the University of Heidelberg – and was sympathetic to historical materialism, Horkheimer was eager to harness his expertise for his own plans to shift the focus of the Institute from the history of the European workers' movement to a critical theory of contemporary society, which would draw on Marx, Freud and empirical social research. Even before Horkheimer was inaugurated as the new director of the Institute for Social Research in January of 1931, he and Fromm had begun work on what would be its first large-scale empirical project – a study of the conscious and unconscious attitudes of blue- and white-collar workers in Weimar Germany.

In 1931, Horkheimer also established a new journal for the Institute, the *Zeitschrift für Sozialforschung*, which he would edit until its discontinuation in 1941. The *Zeitschrift* became a primary locus of Horkheimer's attempts to realize his vision of interdisciplinary materialism, which would draw upon the most advanced research in traditional academic disciplines, while at the same time integrating this research into a more comprehensive and radical Critical Theory of history and contemporary capitalist society. Many of the essays by Horkheimer, Fromm, Adorno, Löwenthal, Herbert Marcuse, Walter Benjamin, Franz Neumann and others that have come to define Frankfurt School Critical

Theory were published in the *Zeitschrift* in the 1930s.<sup>8</sup> When the National Socialists came to power in Germany in January 1933, Horkheimer and the Institute – most of whose affiliates were Jewish and/or socialists – were forced to flee. Fortunately for them, Robert Lynd and the Sociology Department of Columbia University in New York were willing to welcome them as associates and to provide them with the facilities they needed to continue their work in exile.<sup>9</sup> During the mid 1930s, the Institute completed its second major empirical research project – the *Studies in Authority and Family* – and Horkheimer continued to publish substantial theoretical essays in the *Zeitschrift*. In the late 1930s and early 1940s, both the institutional and the theoretical development of the Institute underwent significant changes. When Horkheimer's theoretical collaboration with Erich Fromm began to sour, Horkheimer forged a closer working relationship with Adorno, whom he invited in 1938 to join the Institute in New York (Adorno had been living in exile in Oxford, England for several years). During this time, the Institute was undergoing a financial crisis, which precipitated a final break with Fromm and led to a dramatic reduction of its operations in New York and of his own administrative responsibilities. Horkheimer was now free to focus his attention on a major work on 'dialectical logic', which he hoped to carry out in collaboration with Adorno in the following years. Seeking a climate more conducive to Horkheimer's frail health and a location with fewer distractions, Horkheimer and Adorno moved from New York to Los Angeles in 1941, where they began work on the major theoretical project that would eventually become *Dialectic of Enlightenment*. During their time in Los Angeles, Horkheimer and the Institute continued to apply for funding for major empirical research projects, although they were unsuccessful at first. It was not until 1943 that they received funding from the Jewish Labor Committee and the American Jewish Committee to carry

out a major study of anti-Semitism among American workers.<sup>10</sup> Although this study was never published, it did lead to the more ambitious *Studies in Prejudice*, in which members of the Institute collaborated with American sociologists and social-psychologists to examine the conditions that gave rise to prejudice and authoritarian social movements in modern capitalist societies. The *Studies in Prejudice* were published in five separate volumes in 1949 and 1950.<sup>11</sup>

Horkheimer's respect for American democracy increased during his years of exile, and he was deeply ambivalent about returning to Germany after the war. But several factors ultimately convinced him to move back to Frankfurt in 1950. These included the prospect of re-establishing the Institute in Frankfurt, with the financial support of the American occupying authorities and the city of Frankfurt; restoring the traditions of critical philosophy and the social sciences, which had been interrupted by the Nazis; and contributing to the reconstruction of democracy in West Germany, particularly by influencing the education of a new generation of students. That same year, Horkheimer was elected chair of the Philosophy department and the Institute was reopened under his renewed directorship. The following year, the Institute moved into a newly constructed building on the campus, and Horkheimer was elected rector of the university. He served as rector – the first unconverted Jew ever to hold this position at a German university – until 1953. In his capacity as rector, and director of the Institute, Horkheimer established and maintained contacts with some of the leading figures of both the American High Commission – such as John J. McCloy – and of the new West German government – such as Theodor Heuss and Konrad Adenauer. In 1953, the city of Frankfurt bestowed upon him its highest honor, the Goethe Award. In 1954, he was offered a part-time guest professorship at the University of Chicago; he taught there two or three months per year until 1959. In 1955, the first substantial fruits of the collective labors

of the refounded Institute appeared, including *Group Experiment* – an innovative large-scale empirical study of the attitudes of West Germans toward the contemporary political situation and their own recent catastrophic past.<sup>12</sup> In 1956, Horkheimer organized – along with the Frankfurt-based psychoanalyst and author Alexander Mitscherlich – a series of lectures by foreign and émigré scholars on Sigmund Freud, on the occasion of his one-hundredth birthday. These influential lectures and Horkheimer's key role in the following years in the founding of a new Sigmund Freud Institute in Frankfurt – with Mitscherlich as its first director – were crucial in re-establishing the tradition of psychoanalysis in Frankfurt and Germany more generally.

In the post-war period – after Auschwitz – Horkheimer paid closer attention than he had prior to his exile to specifically Jewish concerns in his own life, in Germany and in the world as a whole. In 1951, Horkheimer became an official member of the Jewish Congregation in Frankfurt. In the mid 1950s, he organized a series of lectures at the university by international scholars on the history and culture of Judaism, which he viewed as part of his larger task of helping the next generation work through the recent past and learn more about the history of Jews in Germany and Europe. As Horkheimer's notes from this period reveal, he was also a relatively close and not uncritical observer of Israel during this time. He believed that Zionist nationalism did not have the right to speak for all Jews, but also that it was a justified response to anti-Semitism in Europe and elsewhere. He viewed the existence of Israel as legitimate insofar as it offered an asylum for persecuted persons, but not as the realization of a homeland for all Jews.<sup>13</sup> Horkheimer also criticized Israel's handling of the trial of Adolf Eichmann.<sup>14</sup> As the Institute's empirical study *Group Experiment* had revealed, anti-Semitism remained widespread in post-war Germany and was particularly virulent in German universities.<sup>15</sup> After becoming the target himself of anti-Semitic comments

from one of his faculty colleagues in 1956, Horkheimer put in a request for early retirement, which resulted in a substantial reduction of his teaching responsibilities. In 1957, he, his wife Rosa Riekher and Friedrich Pollock moved to Switzerland. Until his full retirement in 1961, Horkheimer divided his time between Switzerland and Germany. In 1958, Adorno replaced him as director of the Institute.

Horkheimer's sharp critique of Soviet communism and his commitment to the Allies' aim of reconstructing liberal democracy in West Germany caused him to become more conservative politically in the 1950s and 1960s. The discrepancy between his public statements and academic persona, on the one hand, and his private reflections on the current state of Germany and the world, on the other – a continuation of the discrepancy between the 'interior' and 'exterior' that had characterized his work from the very beginning – became even more pronounced in the post-war decades. Publically, Horkheimer frequently offered interviews, gave well-attended lectures and spoke on the radio on a wide range of philosophical and sociological topics. For the most part, however, Horkheimer's public pronouncements moved increasingly within the rigid tracks of Cold War liberalism. Horkheimer's response to some of Jürgen Habermas' early writings provides a good example of his increasingly conservative political attitudes during this time. One year after Habermas had become an assistant at the Institute in 1956, he published what he thought was a scholarly review essay on the secondary literature on Marx and Marxism. Horkheimer reacted allergically, accusing him of defending an anachronistic theory of revolution, and ultimately forced Habermas to complete his *Habilitation* at a different university. In the 1960s, Horkheimer continued to articulate surprisingly conservative positions, such as criticizing the Algerian struggle for independence, viewing the US war in Vietnam as a defense of 'human rights' against barbarism, and raising concern about

the effects of birth-control pills on love and marriage. Horkheimer long resisted pleas to republish his writings from the 1930s and 1940s, and when he finally acceded, in 1968, he stressed in a new introduction that they were no longer directly relevant to the changed historical conditions of the present. Not surprisingly, Horkheimer demonstrated little sympathy for radical students in the 1960s who were circulating pirate editions of *Dämmerung* and his other earlier writings in order to justify their criticisms of the authoritarian structure of German universities, the fascist tendencies they believed existed in West German society, the US war in Vietnam and 'capitalist imperialism' more generally. By this time, however, Horkheimer's appearances in Frankfurt were rather infrequent, and it was left to Adorno and Habermas – who had in the meantime returned to Frankfurt, with the support of Adorno – to represent the Institute in its contentious dealings with the students.<sup>16</sup>

At the same time as Horkheimer's public pronouncements became increasingly indistinguishable from the Cold War liberalism that guided the reconstruction of West Germany, he continued to preserve a private, interior intellectual sphere in which he could express his more authentically critical, pessimistic and skeptical thoughts. Throughout the 1950s and 1960s, Horkheimer wrote thousands of short notes, a sampling of which he collected and prepared for publication shortly before his death in 1973. Stylistically, they represent a continuation of his early novels, the aphorisms in *Dämmerung* and the 'notes and sketches' at the end of *Dialectic of Enlightenment* in their unsystematic and frequently passionately polemical nature. The notes cannot be seen as a final philosophical work, because they were composed over a long period of time and were so fragmentary; nonetheless, when read systematically, a number of themes reappear regularly. These include sharp criticisms of the repression of the recent past in Germany and of the unbroken preservation after 1945 of German

nationalism;<sup>17</sup> dark reflections on the ongoing collapse of classical bourgeois-liberal ideals, and the ideals of Western civilization itself;<sup>18</sup> a critique of the affluent society, mass democracy, technology, the totally administered society and the disappearance of individual autonomy;<sup>19</sup> strong reservations about the transformation of traditional gender roles, the increased entry of women into the workforce and the dissolution of the bourgeois family, marriage and – allegedly – love itself;<sup>20</sup> a sharp critique of the subordination of science to the interests of dominant social groups and the reduction of philosophy to an esoteric and meaningless academic specialty;<sup>21</sup> a lament about the current powerlessness of intellectual activity in general;<sup>22</sup> and scattered positive reflections on religion and theology which, at their best, preserve a ‘longing for a completely different state of things’ even in the face of the catastrophes of the twentieth century.<sup>23</sup>

Considering the pessimistic tone of Horkheimer’s later, private reflections, it should not come as a surprise that he also returned during this time to his first philosophical love, Arthur Schopenhauer. Horkheimer emphasized the contemporary relevance of his thought on several different occasions.<sup>24</sup> At the same, Marx – who played a much more important role than Schopenhauer during the most productive and interesting phases of Horkheimer’s thought – remained a central presence in Horkheimer’s writings until the very end of his life. Not unlike the European New Left, of which he was frequently critical, Horkheimer combined a sharp criticism of the Soviet Union with an stubborn insistence on the ongoing relevance of many aspects of Marx’s Critical Theory – not only his critique of political economy but also his critique of ideology.<sup>25</sup> Where the late Horkheimer was perhaps most interesting – and went beyond both Soviet Marxism and the New Left – was his interpretation of Marx’s theory as a continuation of the Enlightenment tradition and his insistence that efforts to revive critical Marxism today need to reintegrate the

best aspects of that tradition.<sup>26</sup> Horkheimer passed away in 1973 and was buried in the Jewish cemetery in Bern, Switzerland, next to his wife, Rosa Riekher, and his lifelong friend Friedrich Pollock, who had preceded him in death in 1969 and 1970 respectively.

## THE EMERGENCE AND KEY CONCEPTS OF HORKHEIMER’S EARLY MODEL OF CRITICAL THEORY

In the following section, I present a more detailed account of the emergence and development of what I call the ‘Early Model of Critical Theory’ in Max Horkheimer’s writings from approximately 1925 until 1940. Erich Fromm, in particular, but also Herbert Marcuse and Leo Lowenthal contributed to the formation and elaboration of this model of Critical Theory, although there can be no doubt that Horkheimer was its principal architect.<sup>27</sup> As we have already seen, when Fromm left the Institute, at the end of the 1930s, and Horkheimer began working more closely with Adorno and, at the same time, adopted significant aspects of Friedrich Pollock’s ‘state capitalism’ thesis, the stage was set for a substantial shift in the content and aims of Critical Theory. The shifts would be on full display in *Dialectic of Enlightenment*, which was finished and first published in a limited edition in 1944. In what follows, I will not address *Dialectic of Enlightenment*, or any of Horkheimer’s other writings after 1940, and not only because this volume already contains an essay on *Dialectic of Enlightenment*. I have chosen to focus on Horkheimer’s early writings, first, because they were – in my own view and that of several other prominent commentators<sup>28</sup> – his best. Second, I am convinced that the early model of Critical Theory is still, or has become once again, relevant to contemporary concerns, in a way that *Dialectic of Enlightenment* and Horkheimer’s other writings from 1940 to 1970 are not. Whereas the

latter reflected many of the assumptions of the state-centric, Fordist capitalism that existed in the mid twentieth century, his earlier writings were still directly concerned with the threat of capitalist crisis and its links to the emergence of right-wing populist and authoritarian social movements – conditions that have re-emerged with a vengeance in the post-Fordist, neoliberal period of global capitalism in which we have been living since the 1970s. I have made the case elsewhere for revisiting the early model of Critical Theory in light of contemporary concerns, so I will not elaborate upon these brief remarks here.<sup>29</sup> I will say, however, that the currently widespread view of *Dialectic of Enlightenment* as the magnum opus of the ‘first generation’ of the Frankfurt School is misleading, because it obscures the differences not only between Horkheimer and Adorno’s independent trajectories before 1940 but also between *Dialectic of Enlightenment* and the early model of Critical Theory from the 1930s. The following remarks are part of an ongoing effort on my part to restore the memory of the latter, as it flashes up in the current moment of danger.

In contrast to Jürgen Habermas, who has argued that the model of early Critical Theory ‘failed not as a result of this or that coincidence, but because of the exhaustion of the paradigm of consciousness philosophy’,<sup>30</sup> I would like to argue here that Horkheimer’s Critical Theory took shape in the period between 1925 and 1930 as an explicit critique not only of his academic mentor, the neo-Kantian Hans Cornelius, but of consciousness philosophy as a whole. Horkheimer’s move beyond consciousness philosophy proceeded along two interrelated yet distinct axes: a diachronic-historical and a synchronic-social axis.<sup>31</sup>

The best example of Horkheimer’s move beyond consciousness philosophy and into history can be found in a remarkable series of lectures and unpublished essays from the late 1920s, in which he developed a sophisticated materialist interpretation of the history

of modern philosophy, from Bacon and Descartes all the way up to contemporary schools such as neo-Kantianism, phenomenology and vitalism. Implicitly following Marx, Horkheimer demonstrated how modern European philosophy represented a mediated expression of the uneven development of bourgeois society. He argued, for example, that the Enlightenment achieved its paradigmatic form in France rather than Britain or German-speaking central Europe, due to the particular constellation of social, economic and political forces there. Whereas Britain had already carried out a bourgeois political revolution in 1688, and was well on the way to establishing a modern market society during the eighteenth century, the development of bourgeois economic and – to an even greater extent – political institutions lagged behind in continental Europe. Horkheimer interpreted the affirmative character of British political economy and the resigned skepticism of David Hume as expressions of a triumphant bourgeois society. He viewed the remaining elements of theology and metaphysics in the German Enlightenment (which he sees, for example, in Kant’s efforts to rescue a metaphysics of morality) as an expression of the relatively weak state of bourgeois society. The spread of market relations in eighteenth-century France testified to the growing strength of a bourgeois class eager to emancipate itself from the remaining constraints of the *ancien régime* and gave Enlightenment ideals a self-consciously political form. Horkheimer believed that the critical and tendentially materialist principles of the *philosophes* – the right of all men and women to freedom, equality and happiness in this life – were universal ideals: they were not only an expression of ascendant bourgeois society but also pointed beyond it. Horkheimer’s lectures demonstrated that a critical, historically specific concept of Enlightenment – very different from the transhistorical concept of Enlightenment that he and Adorno would develop later<sup>32</sup> – was central to his thought from early on. Horkheimer

placed the Enlightenment, along with the rest of modern European philosophy, within the larger context of the uneven development and subsequent transformation of bourgeois society. In so doing, he insisted that ideas could not be understood purely from the standpoint of consciousness, but were always *historically* mediated.

If Horkheimer's lectures represented a decisive step beyond consciousness philosophy along an historical-diachronic axis, then the theory of contemporary society, which he developed during the same period, represented its synchronic counterpart. Horkheimer's critical theory of contemporary society consisted of three main components: Marx's critique of political economy and ideology, empirical social research and psychoanalysis. Horkheimer explored the continuing relevance of Marx's ideas in *Dämmerung: Notizen in Deutschland*.<sup>33</sup> Stylistically and thematically, *Dämmerung* represents a continuation of his early novellas, a form of 'interior' writing in which he could freely express his most radical, passionate and experimental ideas. In his 'exterior' academic lectures and writings in the late 1920s, one finds relatively few or significantly mediated expressions of his interest in historical materialism. But this collection of aphorisms, which was written between 1926 and 1931, makes clear that Horkheimer's interest in Marx – and in social revolution – remained lively during this time.<sup>34</sup> The collection was not published until 1934, after Horkheimer had already fled Germany, and even then only under the pseudonym of Heinrich Regius.<sup>35</sup> The aphorisms rely on micrological observations of the inequities of everyday life to demonstrate the concrete ways in which people experienced and unconsciously reproduced abstract social domination. Many of them address the social situation in the final years of the Weimar Republic. For example, in 'The Impotence of the German Working Class',<sup>36</sup> Horkheimer analyzes how the composition of the German working class has been altered by technological developments in production. He focuses,

in particular, on the political and ideological divide that had emerged between workers with stable jobs, who tended to support the Social Democratic Party, and the mass of unemployed, who tended toward the German Communist Party. Although his unflinching diagnosis of the deep divisions among German workers seemed to cast doubt on Marx's predictions about the increasing pauperization, homogenization and unification of the proletariat, Horkheimer did not abandon Marx's theory. Instead he recalled Marx's argument that 'there is a tendency in the capitalist economic process for the number of workers to decrease as more machinery is introduced'<sup>37</sup> in order to explain the rise of a large unemployed underclass and the resulting schism in workers' social conditions and consciousness. He also objected to the widespread belief that Marx had advocated a progressive, or even deterministic, philosophy of history. His early study of Schopenhauer and the traumatic experience of World War I had immunized Horkheimer to the idea that progress toward a more free and just society was inscribed in the logic of modern capitalism itself, as many revisionists and Social Democrats had interpreted Marx. Horkheimer recognized that the rational tendencies introduced by capitalism had long since been eclipsed by the irrational tendencies identified by Marx, such as imperialist wars, periodic crises and commodity fetishism. Progressive historical change could be brought about only through conscious intervention, not passive reliance on the 'logic' of history or capital. As he would put it later, 'as long as world history follows its logical course, it fails to fulfill its human purpose'.<sup>38</sup> Horkheimer's rejection of progressive philosophies of history was one example of his efforts to revitalize Marx's ideology critique. Another can be found in his sharp critique in 1930 of Karl Mannheim's efforts to relativize Marx's concept of ideology by interpreting it from the standpoint of the sociology of knowledge.<sup>39</sup> But his penetrating observations of the discordant state of the German

working class made clear that Critical Theorists should test and, if necessary, reformulate Marx's concepts in light of changed historical conditions.

This insistence upon a rigorous understanding of present social conditions explains Horkheimer's interest in empirical social research, which had been sparked during his university studies in the early 1920s. This interest also grew out of Horkheimer's interpretation in the late 1920s of the history of philosophy, which clearly displayed more sympathy for the empiricist than the rationalist tradition. Furthermore, he believed that an empirical deficit existed in the young discipline of sociology in Germany, which prompted him to turn to the work of US sociologists, such as Robert and Helen Lynd's *Middletown*, as models for the integration of empirical social research into his own incipient Critical Theory.<sup>40</sup> In 1929–30, Horkheimer was able to put his ideas about empirical social research to the test for the first time when he and Erich Fromm organized an empirical study for the Institute of the conscious and unconscious political attitudes of German blue- and white-collar workers. Horkheimer and Fromm's interest in psychoanalysis informed their conceptualization of the study. Horkheimer wondered why substantial sections of the German working class had initially supported World War I and had proven to be reluctant revolutionaries in 1918–19. With the rising threat of National Socialism, Horkheimer also wondered how the German working class would respond if the National Socialists attempted to seize power. With these concerns in mind, Horkheimer and Fromm used psychoanalytic techniques in their design of the questionnaires and their interpretation of the responses. They distributed over 3,000 questionnaires in 1929, and by 1931 over 1,000 had been returned. Based on the preliminary results of the study, Horkheimer and Fromm were able to identify a divergence between blue- and white-collar workers' professed political views and their unconscious

attitudes, which were, in many cases, deeply authoritarian. The preliminary conclusion of the study, that the German lower-middle and working class would not offer substantial resistance if the National Socialists attempted to seize power, was soon borne out by historical events.

The third component of Horkheimer's theory of contemporary society was psychoanalysis. Horkheimer's abiding interest in psychology emerged in the early 1920s, when he was exposed to Gestalt psychology at the J.W. Goethe University of Frankfurt, which was more open than any other German university to innovative research in this field. After abandoning a plan to write a dissertation on a topic relating to Gestalt psychology, Horkheimer's interest shifted to psychoanalysis. In 1927, he underwent analysis with Karl Landauer, a Frankfurt-based psychoanalyst who had studied with Freud and become a member of the Vienna Psychoanalytic Society in 1913. Horkheimer's analysis was motivated primarily by intellectual rather than therapeutic reasons. At about the same time, Horkheimer established a working relationship with Erich Fromm, which would prove decisive for the further development of Critical Theory. After undergoing analysis in 1924 with his future wife, Frieda Reichmann, Fromm decided to become a psychoanalyst. He completed his training in Frankfurt with Karl Landauer. Soon afterwards he became an active participant in the Berlin Psychoanalytic Association, which was conducting path-breaking discussions of the social and political implications of psychoanalysis.<sup>41</sup> As we have already seen, Horkheimer was drawn to Fromm not only because of his knowledge of psychoanalysis, but also because he had completed a PhD in sociology and was thus in a position to help Horkheimer integrate psychoanalysis into his critical theory of society. Fromm's later split with the Institute and his subsequent acrimonious debates with Adorno and Marcuse have obscured Fromm's crucial role in the early formation of Critical Theory. Horkheimer's

enthusiasm for Fromm was apparent in his decision to appoint him as director of the empirical study on the attitudes of German workers and his offer to make him a permanent member of the Institute.

By the time Horkheimer had been installed as the new director of the Institute in January 1931, the basic components of his Critical Theory were already in place: a materialist interpretation of the history of modern philosophy as the mediated expression of the uneven development and transformation of bourgeois society, and a theory of contemporary society based on a critical synthesis of Marx, empirical social research and psychoanalysis. The further development of Horkheimer's Critical Theory in the 1930s should be seen as the attempt to carry out, test and refine these ideas. In his inaugural address as the new director of the Institute, Horkheimer outlined 'The Current Situation of Social Philosophy and the Tasks of an Institute for Social Research' in precisely these terms.<sup>42</sup> He began by showing how Hegel laid the groundwork for modern social philosophy by moving beyond Kant's consciousness philosophy. Nevertheless, Hegel remained beholden to a metaphysical philosophy of history, which justified the newly emergent bourgeois society as part of a pre-ordained process of the historical realization of reason. Since the emancipatory ideals of the bourgeoisie had given way to the reality of class conflict, economic crisis, imperialism and social catastrophes – such as World War I – Hegel's faith in the inherent rationality of history was no longer tenable. But Horkheimer also objected to the two principal contemporary philosophical responses to this situation: a rejection of social philosophy in the name of 'rigorous' positivist social research or a rejection of science in the name of metaphysics. As an alternative, Horkheimer argued that social philosophy should grasp bourgeois society as a totality but not assume that this totality was already rational. To this end, Horkheimer proposed an interdisciplinary research program based

on the 'continuous, dialectical penetration and development of philosophical theory and specialized scientific praxis'.<sup>43</sup> Of particular interest for the Institute's future work would be 'the question of the connection between the economic life of society, the psychological development of individuals and the changes in the realm of culture'.<sup>44</sup> By this time the study of the attitudes of German workers was already well underway; Horkheimer would soon initiate a second major empirical research project on the relationship between authority and family structure in Europe and the United States, which would be published in 1936.<sup>45</sup>

In addition to directing these collective projects of the Institute, Horkheimer continued to develop the philosophical and historical foundations of Critical Theory in a series of remarkable essays he published over the course of the 1930s. The main themes of Horkheimer's essays from this time were *materialism*, the *anthropology of the bourgeois epoch* and *dialectical logic*.<sup>46</sup> In the essays 'Materialism and Metaphysics' and 'Materialism and Morality', which were both published in the second volume of the *Zeitschrift für Sozialforschung* in 1933, Horkheimer developed a thoroughly historical concept of materialism, in order to elucidate the philosophical foundations of Critical Theory.<sup>47</sup> Horkheimer recognized that materialism has usually been a pariah in the history of philosophy, a seemingly easily refuted metaphysical dogma that higher mental processes can be derived from 'matter'. Horkheimer argues that this definition contradicts the basic anti-metaphysical tendency of materialism to locate reason within history and society and to see it as a means of improving the quality of human life and not as an end in itself. Philosophical materialism is less concerned with absolute truths – such as the primacy of 'matter' over 'mind' – than with the possibilities of augmenting human freedom and happiness at a particular time and place. Materialism has practical, political implications and has often been associated with concrete freedom movements. Its aims

and content are derived from the barriers to human freedom and happiness that exist at any given time and its efforts to comprehend and overcome them.

Horkheimer's 1936 essay 'Egoism and Freedom Movements: On the Anthropology of the Bourgeois Epoch' contained the first comprehensive formulation of the theoretical results of his collaboration with Fromm in the early 1930s.<sup>48</sup> Although Horkheimer had already applied psychoanalysis to empirical studies of contemporary society, by this time he had integrated psychoanalysis into his theory of history as well. He had moved from the 'history of bourgeois society' – which served as the foundation for his lectures on modern philosophy in the late 1920s – to the 'anthropology of the bourgeois epoch'. Horkheimer's use of the concept of anthropology must be distinguished from the tradition of philosophical anthropology, which maintains the possibility of determining fundamental characteristics of human beings outside of history. Horkheimer, in contrast, analyzes the origins and function of the characteristics of man which have become dominant during the bourgeois epoch. Drawing upon Fromm's efforts in the late 1920s and early 1930s to synthesize psychoanalysis and historical materialism,<sup>49</sup> Horkheimer demonstrates how common historical experiences can create similar psychic structures among members of the same social group. Since these psychic structures have relative autonomy from the dynamic economic base of society, they can play a crucial role in either advancing or – as is more frequently the case – retarding historical progress. Insofar as Marx's theory of history presupposed a relatively straightforward interest psychology, it needed to be supplemented by the more sophisticated insights of psychoanalysis, which could account for the relative autonomy of psychic structures and the frequent willingness of the lower classes to act in ways that ran contrary to their own best interests.

Through a close historical examination of several typical 'bourgeois freedom

movements' in the early modern period – ranging from Cola de Rienzo and Savonarola to the Reformation and French Revolution – Horkheimer demonstrates how bourgeois leaders mobilized the masses as allies in their struggle against feudal, aristocratic and/or absolutist institutions, while at the same time never allowing their demands to progress to a point that would call into question bourgeois hegemony. Horkheimer views these exceptional instances of open political struggle and mobilization as providing insights into the more fundamental and longer-term process of the emergence and consolidation of a historically unprecedented form of society – modern bourgeois, capitalist society. The dominant character structures of both the bourgeoisie and the lower classes were formed in this historical process. Following Marx, Weber, Nietzsche and others, Horkheimer recognized that both the bourgeoisie and the lower classes were subjected to exceptionally high levels of socially mediated repression. But the function of this repression differed for the two groups, insofar as the self-repression of the bourgeoisie was at the same time its self-assertion, whereas the repression of the lower classes was tantamount to sacrifice. Horkheimer points to the various ways in which the lower classes were compensated for their sacrifices, from the reward of membership in the imagined community of virtuous citizens to the tacitly sanctioned permission to persecute internal or external 'enemies' who refuse – or are simply accused of refusing – to make the sacrifices demanded of them. The latter point, in particular, reflected Horkheimer's effort to move beyond Freud's naturalization of aggression in a 'death drive' by grasping the historically specific forms of cruelty in the bourgeois epoch. But Horkheimer's critique of Freud also drew heavily upon his pioneering analysis of the mutability of libidinal drives. Again following Fromm, Horkheimer showed how the partial and compensatory satisfaction of repressed drives could be used to reinforce existing relations

of social domination. Finally, it is important to note that Horkheimer's social and social-psychological analysis of the historically specific forms of demagoguery in 'Egoism and Freedom Movements' provided the theoretical foundations for much of the Institute's later work on prejudice and authoritarianism;<sup>50</sup> the essay can still shed much light on the mechanisms involved in right-wing populist and authoritarian movements today.<sup>51</sup>

The third key concept in Horkheimer's Critical Theory at this time was dialectical logic. It represented a much richer reformulation of his reflections on materialism from the early 1930s and a continuing effort to flesh out the philosophical foundations of a Critical Theory adequate to twentieth-century societies. In letters from the 1930s, Horkheimer speaks repeatedly of his 'long-planned work on dialectics'<sup>52</sup> and makes it clear that he viewed the essays he was writing at this time as 'in truth merely preliminary studies for a larger work on a critical theory of the social sciences'.<sup>53</sup> Horkheimer's seminal conceptualization of Critical Theory in his most familiar and influential essay from this period, 'Traditional and Critical Theory' (1937),<sup>54</sup> should be seen as the culmination of the first stage of this larger project, which would eventually become – in a much different form – *Dialectic of Enlightenment*. This larger project can only be understood by examining the other substantial essays Horkheimer wrote during this period, including 'The Rationalism Debate in Contemporary Philosophy' (1934), 'Bergson's Metaphysics of Time' (1934), 'On the Problem of Truth' (1935), 'The Latest Attack on Metaphysics' (1937) and 'Montaigne and the Function of Skepticism' (1938).<sup>55</sup> When one reexamines these essays together, the contours of Horkheimer's larger project on dialectical logic emerge. Horkheimer developed further his criticism of consciousness philosophy, with its reified notion of the ego, which exists outside of history and society, and its static and dualistic concept of knowledge, which is unable to conceptualize qualitative change

or the relationship of knowledge to society. Horkheimer also put forth the argument that the philosophy of the bourgeois epoch as a whole is characterized by a recurring dichotomy between science and metaphysics. Horkheimer showed how this antinomy attains its most consequential formulation in Kant's philosophy; for example, in his efforts to limit the natural sciences' claims to absolute knowledge while at the same time preserving certain key metaphysical principles in the sphere of practical reason. According to Horkheimer, this antinomy appears in different forms throughout the history of modern philosophy: from Montaigne all the way up to vitalism and logical positivism. Although Hegel's philosophy moved decisively beyond the static and dualistic character of traditional logic, he too ultimately reproduced the antimony of science and metaphysics, with his notion of history as the preordained self-realization of Absolute Spirit. Only with Marx's determinate negation of Hegel was the groundwork laid for a genuinely dialectical and materialist critical theory of modern capitalist society. Horkheimer stressed, in particular, how Marx integrated the findings of the most advanced bourgeois theories of society (Hegel and classical political economy), while at the same time developing a critical conceptual apparatus which pointed beyond the existing social totality. Horkheimer drew upon Hegel's distinction between understanding (*Verstand*) and Reason (*Vernunft*), and Marx's distinction between research (*Forschung*) and presentation (*Darstellung*) to conceptualize the division of labor in a dialectical Critical Theory of society. In the 1930s, in other words, Horkheimer still believed that Critical Theory should keep abreast of and – when beneficial – integrate the most advanced findings of traditional theory into its own larger, *critical* theory of history and society. For Horkheimer, critical still meant – as it had already for Kant – self-reflexive theory; but Horkheimer went beyond Kant in his insistence that the guiding concepts of critical theory be dialectical

in a specific historical sense. In contrast to traditional concepts, which presuppose the existing form of society as a given, dialectical concepts grasp the given form of society as historical and subject to transformation in the future. Dialectical concepts – such as Marx’s concept of capital or surplus value – not only grasp the essential mechanisms at work in the current society and historical epoch, but they also link these mechanisms to exploitation and social domination, and they call for the practical, historical realization of a different society in which these mechanisms – and thus also the concepts that grasp them – would no longer exist. The concepts of Critical Theory are dialectical, in other words, because they grasp a historically given state of affairs, while at the same aiming for its abolition – that is, a qualitatively new society in which the concepts would no longer have an object. In short, Horkheimer’s dialectical logic project was an attempt to flesh out the philosophical foundations of Marx’s critical theory and, where necessary, to reformulate it in light of changed historical conditions.

The contours of Horkheimer’s concept of dialectical logic can be seen clearly in ‘Traditional and Critical Theory’, which can be interpreted as an attempt to update and elaborate upon Marx’s ‘Theses on Feuerbach’, in order to provide a critical theory of knowledge and its relation to emancipatory social praxis. According to Horkheimer, the two main ways in which critical theory differs from traditional theory are its historical self-reflexivity and its recognition of the *active* role it plays in reproducing and – potentially – transforming society. Just as Marx had criticized Feuerbach’s static and passive concept of materialism and had drawn on German idealism to reconceptualize the relationship between theory and praxis, so Horkheimer characterized traditional theory as lacking any awareness of its historical specificity or the active role it plays in reproducing existing social relations. Traditional theory accepts uncritically the existing division of labor in

the sciences and accepts passively its own role within it. It posits the given methods – of subsuming particulars under general principles and thereby contributing to the gradual expansion of knowledge – as trans-historical. Critical theory, in contrast, reflects consciously upon the form and function scientific knowledge has assumed within a particular historical epoch. It also recognizes the active role it plays in reproducing this historically specific form of human social relations. Horkheimer described critical theory as a ‘human activity [*menschliches Verhalten*] which has society itself as its object’.<sup>56</sup> By this, Horkheimer meant that critical theory is aware that it forms one active element within a larger social totality that has come into being historically and that could be transformed into a qualitatively different society at some point in the future.

One of the principal tasks of critical theory, then, is to identify the essential, defining characteristics of society in the current historical epoch, which Horkheimer referred to as the ‘bourgeois epoch’. Horkheimer distinguished further between the modern epoch as a whole – which begins with the gradual ascendancy of bourgeois society in early modern Europe and its concomitant expansion throughout the globe<sup>57</sup> – and specific historical periods within the modern epoch. Following Marx, Horkheimer identifies the private ownership of the means of production and the division of society into antagonistic classes as a defining characteristic of the bourgeois epoch as a whole. But Horkheimer was also attentive to the transformations bourgeois society has undergone over its long history and continues to undergo in the present. The following macrohistorical description of transformation of bourgeois society illustrates some of the key assumptions guiding Horkheimer’s early Critical Theory.

To put it in broad terms, the theory says that the basic form of the historically given commodity economy on which modern history rests contains in itself the internal and external contradictions of the modern era; it generates these contradictions

over and over again in an increasingly heightened form; and after a period of progress, development of human powers, and emancipation of the individual, after an enormous extension of human control over nature, it finally hinders further development and drives humanity into a new barbarism.<sup>58</sup>

One sees here a historically specific notion of the *dialectic of bourgeois society*, which differs quite markedly from the tendentially transhistorical notion of a dialectic of Enlightenment that would soon come to dominate Horkheimer's thought.<sup>59</sup> In the essay, though, Horkheimer also moved beyond such macrohistorical descriptions of the bourgeois epoch as a whole, in order to determine more recent and specific transitions within it. He described the transition from liberal to monopoly capitalism that occurred in the late nineteenth and early twentieth century, which brought with it – among other things – the concentration of capital, the emergence of a powerful new group of economic leaders distinct from the owners of the means of production and the possibility of new, more directly and consciously produced forms of ideology.<sup>60</sup> We shall see below how Horkheimer would also soon adopt the concept of state capitalism, to signal the emergence in the 1930s of new forms of global political economy and ideology. In short, Horkheimer's early Critical Theory is a form of *critical historicism*,<sup>61</sup> insofar as it emphasizes periodization; but it differs from traditional, bourgeois historicism – sharply criticized by Benjamin<sup>62</sup> – in its emphasis on self-reflexivity and its ambition to guide concrete historical praxis that will usher in a new historical epoch.

Although 'Traditional and Critical Theory' makes clear that Horkheimer still accepted many key aspects of Marx's critical theory of modern capitalist society, it also displays his willingness to question reigning Marxist orthodoxies. For example, Horkheimer criticized the tendency among many Marxists – articulated most clearly by Georg Lukács in *History and Class Consciousness* – to

view the 'standpoint of the proletariat' as the ultimate source of truth in theoretical questions.<sup>63</sup> Critical Theory must be willing to oppose the immediate aims or unreflective consciousness of the working class if such aims and/or consciousness undermine the larger, long-term aims of emancipatory praxis. Accordingly, Horkheimer did not hesitate to criticize the 'bureaucratic' socialism of the Soviet Union in the 1930s.<sup>64</sup> But Horkheimer's arguments here do raise the questions of how he justified the truth claims of Critical Theory and what he viewed as its long-term aims. The first question is what led Horkheimer to elaborate at length his theory of dialectical concepts, or dialectical logic, which we discussed above. To reiterate, dialectical concepts differ from their traditional counterparts insofar as they not only grasp the forms of social domination specific to current historic epoch but also seek to guide a historical praxis that would abolish these forms through the creation of a qualitatively new society. The question of the justification or verification of the truth claims of Critical Theory cannot be resolved in the same manner as traditional theory because those claims presuppose a transformation of the existing, 'factual' conditions which would be used to judge them.<sup>65</sup> As Marx put it in his second thesis on Feuerbach, 'The question of whether objective truth can be attributed to human thinking is not a question of theory but is a *practical* question. Man must prove the truth [...] of his thinking in practice'.<sup>66</sup> In this regard, Critical Theory reveals its affinity with the imagination and its opposition to positivism, pragmatism and reified 'common sense', which are unable to transcend the given state of affairs.<sup>67</sup> Regarding the closely related second question, Horkheimer did offer a number of different formulations of the long-term aims of Critical Theory. He spoke, for example, of a 'new organization of labor',<sup>68</sup> a transformation of the blind necessity of capitalism into conscious planning<sup>69</sup> and a future society as a 'community of free men'.<sup>70</sup> Yet, in the end, Horkheimer remained

true to Marx's critique of utopian socialism, insofar as he refused to provide any concrete blueprints for a future, emancipated society. Only through identifying and striving practically to eliminate the essential features of the existing capitalist society, can a different society be brought about. Horkheimer wrote, 'critical theory cannot appeal to any specific authority, other than its inherent interest in the abolition [*Aufhebung*] of social injustice. This negative formulation [...] is the materialist content of the idealist concept of Reason'.<sup>71</sup>

Whereas the concepts of the anthropology of the bourgeois epoch and dialectical logic marked the culmination of the model of early Critical Theory in Horkheimer's thought, the period 1938–41 witnessed a significant shift in some of his basic positions and set the stage for a new phase in the development of Critical Theory. This important theoretical shift cannot be fully understood without first examining certain crucial changes in Horkheimer's life during this time. Foremost among these changes was Horkheimer's split with Erich Fromm and his increasingly intimate working relationship with Adorno. Fromm had been Horkheimer's most important theoretical interlocutor from their collaboration on the empirical study of German workers in 1929 through the publication of the *Studies on Authority and Family* in 1936. During this time, Horkheimer remained distant from Adorno and, to a surprising extent, critical of his work.<sup>72</sup> But when Fromm began to move away from his earlier, more or less orthodox psychoanalytic position in the mid 1930s, serious tensions began to develop between him and Horkheimer. Fromm had become increasingly critical of Freudian drive theory and he began increasingly to privilege social over sexual factors in the formation of character and the etiology of neuroses. Adorno, who was living in exile in Oxford at the time, attacked Fromm's revisions of Freud in a letter to Horkheimer in March 1936, claiming that they represented a 'genuine threat to the line of the *Zeitschrift*'.<sup>73</sup> The final break

between Horkheimer and Fromm was precipitated by a financial crisis at the Institute in the late 1930s. In the meantime, Horkheimer had patched up his relationship with Adorno, who left Oxford in February 1938 and finally became an official member of the Institute upon his arrival in New York. Horkheimer's theoretical collaboration with Adorno in the following years would lead to a reconfiguration of his own thought of the tradition of Critical Theory as a whole, which found its first full expression in 1944 with the publication of *Dialectic of Enlightenment*.<sup>74</sup>

Horkheimer's theoretical shift in the late 1930s and early 1940s has been variously described as a 'pessimistic turn',<sup>75</sup> a 'rephilosophization of Critical Theory',<sup>76</sup> and a shift from 'the critique of political economy to the critique of instrumental reason'.<sup>77</sup> The most important overall factor in this shift was Horkheimer's adoption of a modified version of the state-capitalism thesis, which had been worked out over the course of the previous decade by his long-time friend and Institute colleague Friedrich Pollock.<sup>78</sup> Pollock and Horkheimer viewed state capitalism as the logical conclusion of a process that had begun with the rise of liberal capitalism in the eighteenth and nineteenth centuries and continued with the transition to monopoly capitalism around the turn of the century. Whereas liberal capitalism had been defined by a large number of small- and medium-sized privately owned firms, which competed with each other in both domestic and international markets and whose relations were regulated by formal law, under monopoly capitalism increasingly large corporations and cartels came to dominate domestic markets and compete with each other at the international level, beyond the restraints of formal law. State capitalism reinforced and completed these tendencies by bringing the large corporations and cartels under state control, for the purposes of more efficient, planned domestic production and distribution and more effective international competition. Horkheimer identified the 'integral statism' of the Soviet

Union as the purest form of state capitalism, but he viewed fascism and the new state-interventionist economies of Western Europe and the United States as different versions of the same basic form. What characterized state capitalism everywhere, according to Horkheimer, was the tendential elimination of the economic, social and cultural forms of mediation peculiar to bourgeois society in its liberal phase. These included not only the market, the rule of law and replacement of individual owners by shareholders or the state, but also relatively autonomous spheres of bourgeois cultural life, such as art, the family and even the individual him or herself. Social domination had, in other words, become much more direct under state capitalism. The independent economic dynamism of capitalism had been replaced by the primacy of politics. The operations of politics came increasingly to resemble a common 'racket': survival and protection were secured through obedience to the most powerful groups.<sup>79</sup> Capital and large labor unions collaborated in the planning of the economy and divided up the spoils between them. Insofar as surplus value continued to be produced and appropriated by a dominant social class, capitalism still existed, but the political and ideological integration of the working class eliminated the possibility of any serious opposition emerging in the future.

Horkheimer's acceptance of the state-capitalism thesis reflected the changed historical realities of state-interventionist economic models which arose in the mid twentieth century. From our contemporary perspective, it is clear that state capitalism was not 'the end of history' – as Horkheimer and Adorno feared at the time – but rather a new phase in global capitalist development which would give way to the current post-Fordist, neoliberal phase of global capitalism in the 1970s and 1980s. But Horkheimer's adoption of the state-capitalist thesis brought with it a fundamental rethinking of many of the basic assumptions that had informed his Critical Theory in the 1930s. First, the focus of Critical Theory shifted

from a historically specific critique of social domination within modern capitalism to a transhistorical critique of instrumental reason and the domination of nature.<sup>80</sup> Second, this shift was reflected in the increasing prominence of a negative philosophy of history, which Adorno had adopted from Benjamin in the late 1920s.<sup>81</sup> Third, Horkheimer became increasingly skeptical about the emancipatory character of the Enlightenment ideals that had guided his earlier work. During the early phases of his project on dialectical logic, Horkheimer still believed in the possibility of a materialist reinterpretation and realization of basic Enlightenment principles. *Dialectic of Enlightenment* demonstrated clearly his new conviction that only a radical critique of these principles could create a new, self-reflexive concept of Enlightenment that could transcend its inherent limitations. Fourth, Horkheimer's new-found pessimism about the Enlightenment also translated into a radical critique of science in its traditional forms. Whereas Horkheimer's model of Critical Theory in the 1930s rested heavily upon a critical integration of research from a wide variety of scientific and scholarly disciplines, in *Dialectic of Enlightenment* Horkheimer and Adorno stated unambiguously that they had to abandon their trust in the traditional disciplines.<sup>82</sup>

In conclusion, many of the basic assumptions of the model of early Critical Theory, which had guided Horkheimer and the Institute's work in 1930s, had been called into question by the early 1940s. A new phase in the history of Critical Theory had begun. Beyond what was mentioned in the overview above, I will not seek to describe that new phase in Horkheimer's work here. I would like to reiterate, however, that the model of early Critical Theory may well be more relevant to contemporary concerns, insofar as it reflected the particular dynamics of liberal and monopoly but not yet state capitalism. More than any other single historical experience, the emergence of fascism during a period of capitalist crisis and,

in particular, a failed attempt to re-establish liberal capitalism in Europe in the 1920s and 1930s, shaped the formation of early Critical Theory. Horkheimer and Fromm paid particularly close attention to the social and social-psychological dynamics of authoritarianism and right-wing populism that made the triumph of fascism possible. At a time when the prosperity and security of the 'Affluent Society' and the 'Golden Age' of post-World War II capitalism have become a distant memory, and nearly four decades of the hegemony of global neoliberal capitalism have recreated the social and social-psychological conditions for the emergence of authoritarian and right-wing populist movements on a scale unprecedented since the 1930s, the analyses of early Critical Theory have become *unheimlich aktuell* once again.<sup>83</sup> Of course, the social and historical conditions are qualitatively different today from the 1930s, and substantial analysis of new forms of capitalist crisis and its relationship to new authoritarian and right-wing populist movements in Europe, the United States and elsewhere would need to be based on extensive empirical studies of those movements. But the uncanny persistence of such phenomena makes it all too clear that we are still living in the bourgeois epoch and that Horkheimer and the Institute's analyses of the social forms characteristic of that epoch are still a valuable theoretical resource and one eminently worthy of reconsideration.

## Notes

- 1 This essay draws in places upon an earlier essay of mine: John Abromeit, 'The Origins and Development of the Model of Critical Theory in the Work of Max Horkheimer, Erich Fromm and Herbert Marcuse', *The History of Continental Philosophy*, vol. 5, *Critical Theory to Structuralism: Philosophy, Politics and the Human Sciences*, ed. David Ingram (Durham: Acumen, 2010), 47–80. Any of the content reproduced in this essay is done so with the permission of Sage Publications.
- 2 Max Horkheimer, *Gesammelte Schriften*, vol. 1, ed. Alfred Schmidt (Frankfurt: Fischer, 1988).

Hereafter, I will refer to the *Gesammelte Schriften* edition of Horkheimer's writings as *MHGS*. Horkheimer's earliest writings have not been translated. For an overview of them and their relation to Horkheimer's biographical and intellectual development at the time, see John Abromeit, *Max Horkheimer and the Foundations of the Frankfurt School* (Cambridge: Cambridge University Press, 2011), 27–41. Hereafter, I will refer to this book as *MHFFS*.

- 80 For an illuminating examination of this important shift of emphasis, see Gerd-Walters Küsters, *Der Kritikbegriff in der Kritischen Theorie Max Horkheimers* (Frankfurt: Campus, 1980). See also my own essay, mentioned in note 29.
- 81 See, for example, Martin Jay, *The Dialectical Imagination*, 253–80.
- 82 *Dialectic of Enlightenment*, 14. The fact that Horkheimer and Adorno continued to carry out empirical research projects in the 1940s (most notably, the five-volume *Studies in Prejudice*) and that empirical research remained a crucial aspect of the Institute's work after its re-establishment in Frankfurt after the war, demonstrated that Horkheimer never completely abandoned his early model of 'interdisciplinary materialism'. Nonetheless, *Dialectic of Enlightenment* does represent a substantial break from Horkheimer's position in the 1930s and a model of Critical Theory which is more consonant with Adorno's overall philosophical trajectory.
- 83 Uncannily relevant.

# Leo Löwenthal: Last Man Standing

Christoph Hesse

His most unlikely name is probably his most enduring legacy. Skimming through the legendary history of the Frankfurt Institute for Social Research, especially the years in American exile, one will quickly come across him. Leo Löwenthal – or Lowenthal, as he used to spell his name in English-language publications – was then Max Horkheimer's closest associate (next to, of course, Friedrich Pollock, an intimate friend of yore with whom Horkheimer shared virtually all his thoughts and decisions). He officiated as the managing editor of the Institute's journal *Zeitschrift für Sozialforschung*, and later, as it were, rather unwillingly, as the housekeeper of its remaining branch in New York when his colleagues moved to California in the early 1940s. Löwenthal's contribution to the maintenance of the Institute in its hardest times, when he, along with Horkheimer, sought to keep up the material conditions for the persistence of what has since been termed 'critical theory', may scarcely be overestimated.<sup>1</sup> His own scholarly works,

however, in large part went widely unnoticed, at least by comparison with those of his celebrated colleagues. His pioneering inquiries into the sociology of literature, his formerly renowned studies on the historical formation of popular culture as well as on authoritarianism and anti-Semitism, have all withered on the vine for decades now. Neatly canonized, but seldom read anymore. Even among those familiar with – and still genuinely interested in – critical theory, the writings of Löwenthal are rather unknown.

Compared to his friends, most notably Theodor W. Adorno and Herbert Marcuse, Löwenthal never rose to intellectual stardom, nor did he win overwhelming public acclaim on the part of the protest movements that emerged across Western Europe and North America in the 1960s. Lacking both Adorno's aesthetic aura and Marcuse's radical – or, as some say, even erotic – appeal, his unpretentious and rather cautious, almost gentle style of writing was not supposed to attract an audience craving idols to look up to,

albeit he is said to have been the most approachable and amiable of them all. While Adorno delivered hundreds (!) of lectures on West German radio stations throughout the 1950s and 60s, and Marcuse, beyond belief today, was a best-selling author who spoke to enthusiastic crowds of politicized students at meetings and sit-ins in both West Germany and the United States, Löwenthal kept to the sidelines. As early as 1931, Adorno teasingly called him the 'king of the desert roaming his territory'.<sup>2</sup> Yet he stood his ground when it was most desperately needed. For instance, when the Nazis assumed power in Germany, he remained in the country a while longer than his colleagues, taking measures to ensure the Institute's survival in exile.<sup>3</sup> Later, when Horkheimer, now intellectually associated mostly with Adorno, returned to Frankfurt in 1949 on an invitation to reestablish the Institute for Social Research, Löwenthal was left behind. Yet this time it was meant to be forever. While the Frankfurt School, as it came to be nicknamed by the 1960s, soon earned some measure of fame in West Germany and abroad, he remained almost invisible, at least in Europe. Involuntarily distanced from his old friends, whom he only seldom met – except for Marcuse, who deliberately decided not to relocate to post-Nazi Germany – Löwenthal pursued his own course as a solitary 'Frankfurter' in American academia.

It was only in the 1980s that Löwenthal, by then the last member of Horkheimer's former circle still alive, came to the fore in Germany. Helmut Dubiel edited a five-volume collection of his writings, comprising early academic works and contributions to the *Zeitschrift für Sozialforschung* as well as subsequent American publications, many of which had not been easily available in Europe before.<sup>4</sup> Maybe even more important for his public perception, Dubiel published a series of interviews in which Löwenthal recollected his intellectual and political biography, thereby revealing as much about his own unexpectedly turbulent life as of the history

of the Institute that had decisively shaped his way of thinking.<sup>5</sup>

Quite recently, a new book about Löwenthal was published, one of the very few monographs on him. The title reads, in English translation, 'No Critical Theory without Leo Löwenthal'.<sup>6</sup> Yet as true as this may be, with particular regard to his managerial functions, the well-meaning and also somewhat boastful title unwittingly reflects the oblivion into which Löwenthal's oeuvre has fallen, most obviously in the United States, where he had once established himself as a sociologist and as an outstandingly erudite scholar of European literature and philosophy. As distinct from Adorno and even more so from Horkheimer, who very reluctantly revealed any details about the shrouded history of the Institute, Löwenthal held no reservations about his outright Marxist past which he had never really moved away from.<sup>7</sup> All the same, the critical theory that he passionately advocated throughout his life has been largely supplanted by a variety of self-professed critical studies, most of which, curiously enough, sprang from the post- or sometimes blatantly anti-modernist line of thought he had warned against.

Almost tragically, it was Löwenthal's unstinting commitment to the Institute, a commitment verging on self-abandonment at times, that hampered his own theoretical production. On October 3, 1947, Horkheimer wrote to him (in English): 'The fact that for a number of years you have not written an article or a book which is an adequate expression of the stage of our theoretical insight is due to the practical situation and to the set-up into which we were forced for the sake of our survival'.<sup>8</sup> The circumstances of those decades were adverse in the extreme. While Marx, back in his anything but happy days, could realistically bank on an increasing working-class movement, the likes of Horkheimer and Löwenthal had no social forces to rely on, not even virtually. In the face of Nazism and Fascism on the one hand, and the dreadfully miscarried trajectory of the Bolshevik

Revolution on the other, which had developed into a rule of sheer terror, an unflinchingly critical theory of society found itself redirected to what the young Marx called the 'ruthless criticism of all that exists'.<sup>9</sup> With hindsight, Löwenthal said, 'we had not abandoned praxis; rather, praxis had abandoned us'.<sup>10</sup> Therefore, if there was no revolutionary subject to hope for, it was up to those otherwise powerless intellectuals not only to produce and maintain theoretical insights but to anticipate, also practically, at least a few elements of a humanity that might never really come into being. 'Moreover', Horkheimer added, 'it has always been our conviction that the development of our conceptions does not exclusively express itself in theoretical writings, but in the conduct of our lives. There must be an interaction between existence and theory as it is exemplified in our own history [...]'.<sup>11</sup> This rule of etiquette, if that is what it can be called, was probably best exemplified by Löwenthal. At the end of his conversations with Helmut Dubiel he revealed, 'Of course, my heart beats faster when the utopian seems to throw off sparks, if only for a moment; but disappointment follows all too quickly. Just take a look at the world today. Tell me, just where should one plant one's political sympathies and hopes?'<sup>12</sup> What he knew for certain, though, was that any admission of regression – for example, a romanticizing of pre-modern or supposedly more authentic cultures – would offer no way out. 'You can't turn back history'.<sup>13</sup> In his early years, he had already described the life of Freud as a constant struggle to gain both insights and people sharing these insights.<sup>14</sup> The same might be said of Löwenthal himself.

His most significant insights will be discussed here. First, his contributions to the perception of art and culture, particularly his sociological – meaning, historical materialist – approach to literature. Second, his notion of mass communication and popular culture, which might offer a deeper historical understanding of what Adorno and Horkheimer notoriously termed the culture industry.

Third, his empirically based theoretical studies on authoritarianism and anti-Semitism. Finally, his critical remarks on the emerging post-modernism in the humanities and social sciences.

Before that, a quick biographical sketch, to supplement what has been said above. Born into a middle-class family in Frankfurt in 1900, Löwenthal was shaken by the horrors of the First World War, leading to his engagement in both socialism and Zionism. During his university studies, he taught classes at a Jewish center for adult education along with Erich Fromm. He was also involved in a relief agency for eastern Jewish refugees. He earned his PhD with a thesis on the social philosophy of Franz von Baader,<sup>15</sup> a widely unknown early-nineteenth-century Catholic philosopher. Through his friend Siegfried Kracauer, Löwenthal then joined the newly founded Frankfurt Institute for Social Research, initially as an unsalaried associate. His attempt to qualify as a professor (with a treatise on Helvétius and the French Enlightenment) failed, so Löwenthal taught German literature at high-school level until he became a full member of the Institute in 1930, with Horkheimer as its new director. The social history of literature was the field of study Löwenthal had been entrusted with upon his entry into the Institute in 1926. He went on to explore it throughout the years of exile and beyond. In the early 1940s, alongside Marcuse, he worked for the Office of War Information, not only to make a living but also to support the United States' defeat of Nazi Germany. By the end of the war, he had taken a growing interest in the development of popular culture. In 1949, when Horkheimer and Adorno relocated to Frankfurt, Löwenthal was appointed as research director of Voice of America. Unlike Marcuse, he would have appreciated an opportunity to go back, but Horkheimer was not able to ensure another academic position in Germany. In 1956, after a period of depression,<sup>16</sup> when he had probably given up the idea of returning, he became a

professor of sociology at the University of California, Berkeley, where he lived until his death in 1993. But this particular disciplinary denomination never meant much to him. At the most general level, he considered himself a philosopher.<sup>17</sup> 'You know my cynical remark', he told Helmut Dubiel, 'that the division of the social sciences into different academic departments is just a means of limiting structural unemployment among intellectuals'.<sup>18</sup>

## LITERATURE, ART, AND POPULAR CULTURE

Löwenthal initially outlined the task of a historical materialist theory of literature in 1932. A heated debate on this issue was already in full swing, particularly among the ranks of the Union of Proletarian Revolutionary Writers, which was closely affiliated with the German Communist Party. Regardless of the shortcomings of its opposition between proletarian culture and bourgeois tradition, such an eminently political debate was not admitted into legitimate academic discourse in those days. Moreover, Löwenthal did not quarrel with the Communists' strategically motivated understanding of literature as a weapon, an understanding alien to art which he never shared. Instead, he sought to counter academic discourse from within. Challenging both time-honored idealist and more recent positivist conceptions of literature, he insisted that a

concern with the historical and sociological dimensions of literature requires a theory of history and society. This is not to say that one is limited to vague theorizing about the relationships between literature and society in general, nor that it is necessary to speak in generalities about social conditions which are required for the emergence of literature. Rather, the historical explanation of literature has to address the extent to which particular social structures find expression in individual literary works and what function these works perform in society.<sup>19</sup>

In other words, rather than providing general considerations on the relationship between literature and society, or the social conditions that determine literature, the social dimensions of literature can only be demonstrated in detail by reference to a particular author and his or her work.

Unsurprisingly, Löwenthal's approach to literature was met with some resistance by his associates at the Institute. Adorno was particularly suspicious of this 'historical-sociological kind of work', leading him to confide to Benjamin that the Institute was unlikely to accept the *Arcades Project* as long as Löwenthal made decisions on questions of literary history.<sup>20</sup> Moreover, even if it was based on notions of historical materialism, Adorno suspected that a sociology of literature would tend to focus on the author as a social subject at the expense of his or her artistry, or at least underestimate the transcendent capacities of art. This informed a bizarre idea Adorno harbored: sending Löwenthal to Paris to apprentice with Benjamin.<sup>21</sup> This simmering conflict came to a head in March 1941 when Adorno seized the occasion of an Institute meeting to rebut Löwenthal's emphasis on the writer, his position in the process of production, and in society more generally. In contrast, Adorno argued in favor of the work of art itself, a product exempt from the constraints of production, which transcends its creator's intentions and maybe even his cognitive capacities.<sup>22</sup>

It remains questionable to what extent Löwenthal's supposedly inadequate or insufficient methodological approach really impaired his numerous studies on the history of literature. Obviously, he was a little less interested in the form and the inner logic of a work of art than in its social meaning and reception. Löwenthal saw literary works as the most revealing documents of their epoch, including their missed historical opportunities. This was the case not only because of their manifest subject matter but also because of their specific form, which he too, albeit in a manner less pronounced than Adorno,

regarded as an expression, or an unconscious inscription, of social conditions. 'Literature teaches us to understand the success or failure of the socialization of individuals in concrete historical moments and situations'.<sup>23</sup> Despite their purported status as fiction, literary works thus provide insight into the experience of particular historical realities. This is because, unlike contemporary conditions, historical realities in the full sense of the word cannot be studied immediately. Thus, as Löwenthal stated, 'great literature is the only reliable source, in my opinion'.<sup>24</sup> This perhaps slightly exaggerated assessment resonates with Engels's remark about his understanding of French history on the basis of Balzac's *Comédie humaine*.<sup>25</sup>

Roughly speaking, Löwenthal traced the development of two different paths of the literary depiction of society, a true and a false one, which occasionally overlapped and could be found in the same text. According to this simplified distinction, true refers to a genuine experience of social reality, whereas any kind of delusion that escapes reality, or society, is false. Both are incumbent upon the depiction of the individual's struggle with the emergence of bourgeois society, which brought forth the individual as a social category and at the same time denies its demands for fulfillment.

Regardless of whether Shakespeare and Goethe, Löwenthal's favorite classic authors, are realists of form and style, he considers them true witnesses of their times. Their works convey a vivid portrayal of exactly that struggle, or, in other words, of the process of bourgeois civilization, its *promesse du bonheur* as well as its immanent failure.<sup>26</sup> For instance, in Caliban, the antagonist of Prospero in Shakespeare's play *The Tempest*, Löwenthal discerned a prototype of the authoritarian personality characteristic to modern mass communications and manipulations. Thus a historically true work of art also transcends its time.

German Romanticism, by contrast, offers an outstanding example of the false in its

spiriting away from the emerging bourgeois society. Löwenthal called it a repressed revolution,<sup>27</sup> or, more precisely, 'a revolution in a type of reality that exists only on the other side of social life'.<sup>28</sup> Like an adult imagining themselves in a fairy-tale world, seeking their way back either to nature or to a long-bygone past, the Romantics succumbed to regression (as Löwenthal put it in psychoanalytic terms). Social alienation was thereby transformed into a virtue and the socially imposed isolation of the individual into a desired 'solitude in the woods', what Ludwig Tieck famously termed *Waldeinsamkeit*.

While the reactionary elements of German Romanticism remain ambivalent, to say the least, the apparently romantic depictions of rural life in the novels of Knut Hamsun reflect the development of political consciousness from liberalism to the authoritarian state.<sup>29</sup> From this point of view, Hamsun is depicted as a revenant of German Romanticism in late modern times, a reactionary in the most precise sense of the word. In their humble praise of down-to-earth life, with everyone rooted to his or her native soil, Hamsun's novels do not even portray living human beings, Löwenthal argued, but merely resentful attitudes toward urban civilization. Apart from the moods and landscapes they display so enticingly, the novels thus convey a false account of historical reality. Accordingly, Löwenthal was the first critic to frankly disclose Hamsun's sympathies for the Nazis, which eventually cast a shadow on his fame. Given his popularity in post-Wilhelmine years, his novels won the readers they deserved. Yet even a greater oeuvre than Hamsun's may, at least temporarily, fall prey to the dark desires of an unhoped-for audience, as Löwenthal demonstrated in his analysis of the German reception of Dostoyevsky.<sup>30</sup>

It was on the question of public reception that Löwenthal, in the mid 1930s, gradually stepped away from the realm of *Weltliteratur* (world literature) to take a closer look at more popular readings. Parallel to Adorno's examination of jazz and radio listening,

he began to explore the reception of popular biographies.<sup>31</sup> The latter, according to Löwenthal, personalize otherwise unfathomable, manifold, mediated social relations and thereby turn their protagonists into idols.<sup>32</sup> They offer their readers what Löwenthal would subsequently call a 'vicarious experience', to him one of the most salient features of popular culture. A biography of a celebrity's life, stylized like that of a hero in the movies, invites readers to put themselves in his or her place, namely to experience virtually the significance of personal existence in an age of impersonality, in which individual thoughts or actions are largely absorbed by overpowering social forces and institutions.<sup>33</sup>

Perhaps due to his comparatively circumspect diction, Löwenthal has sometimes been considered more receptive to – that is, less critical of – the promises and possibilities of popular culture than his friend Adorno, an estimate that Löwenthal himself forthrightly rejected. 'It is indeed in this area of popular culture – or, as Adorno called it, "the culture industry" – that our interests frequently converged'.<sup>34</sup> Löwenthal was probably less suspicious of the culture industry's technology, which he thought could be easily used for better purposes. But what certainly does distinguish his approach to popular culture (not only from that of Adorno) is his inquiry into the history of this seemingly ultra-modern phenomenon, which according to Löwenthal emerged in eighteenth-century England, with its blossoming journals and newspapers.<sup>35</sup>

Löwenthal, moreover, did not just look into the institutional development of media and culture but also traced the evolving debate on it back to early modern times. To the surprise of many of his contemporaries, he found out 'that quite a few basic concepts which we have been accustomed to regard as very modern emerge as early as the sixteenth century: distraction, entertainment, and, last but not least, vicarious living'.<sup>36</sup> These concepts, which are used to describe the functions of modern popular culture, had been developed long before anything like

it. Furthermore, Löwenthal did not discover them in England but in France. The first to attest to these new experiences was the solitary writer Montaigne, the renowned pioneer of modern skepticism, who, by the way, also introduced a new literary genre: the essay. And it was Montaigne, Löwenthal wrote, who first

took stock of the situation of the individual after the breakdown of medieval culture. He was particularly struck by the phenomenon of loneliness in a world without faith, in which tremendous pressures were being exerted on everyone under the conditions of a postfeudal society. To escape destruction by these pressures, to avoid becoming lost in the horrors of isolation, Montaigne suggested distraction as a way out.<sup>37</sup>

About a century later, when bourgeois commercial culture had already developed to a considerable extent and when 'the waning influence of religion, pre- or post-Reformation, had made itself felt much more strongly in the average way of life', those moods and feelings described by Montaigne had spread further, as was evident in the work of Blaise Pascal, a mathematician and above all else a firm religious believer. 'Restlessness, the search for relief everywhere and anywhere, had become a major social phenomenon. It was then that Pascal spoke up against the complete surrender of man to self-destroying restlessness'. As strictly opposed to Montaigne, Pascal 'warned against what he called "diversion" as a way of life which could lead only to permanent unhappiness'.<sup>38</sup>

'Thus', Löwenthal concludes, 'the attitude toward leisure which, for Montaigne, guarantees survival means self-destruction to Pascal. And the controversy is still going on'. Today, he suggests, we could easily imagine a 'benevolent analyst of a mass medium who seems to say that, while everything is not yet wonderful, it is getting better every day', and on the other hand a 'nonconformist social critic who connects the loneliness of modern man with his interest in mass media as a setup of utter frustration'.<sup>39</sup> However, the concepts introduced by Montaigne and

Pascal noticeably changed with the ongoing development of art and popular culture. Montaigne, back in his century, made 'no clear-cut distinction between the psychological motives of artist and audience', whereas Goethe, for example, more than 200 years later, saw 'the artist as the spokesman for the high standards of his "trade" and the public in the passive role of consumers'. Löwenthal refers particularly to the 'Prelude on the Stage' in Goethe's *Faust*, which presents a dispute between the Manager and the Poet. Here, 'when the Poet resists the Manager's exhortations, he does not do so in the name of religious or spiritual values, but in terms of the artist's mission'. And this, Löwenthal points out, was only 'the beginning of the period which witnessed both the spread of popular newspapers and magazines and the unprecedented flowering of high literature'.<sup>40</sup>

It was in this period, the early nineteenth century, that the antagonism between art and popular culture fully developed. Löwenthal points out two issues that have been discussed ever since. First, the problem of artistic standards, which is closely related to the question of the influence of public taste on the character of artistic or cultural products. Second, the problem of mediocre art. Goethe's friend Schiller early on 'recognized that as society became more mechanized it made harsher demands on the life of the individual. These demands exhaust both mind and body, and man therefore requires rest and relaxation in his leisure-time'. Beauty, according to Schiller, 'addresses all the faculties of man and can only be appreciated if a man employs fully all his strength. He must bring to it an open sense, a broad heart, a spirit full of freshness',<sup>41</sup> whereas mediocre art would make no such demands but rather suspend thought. Thereby Schiller, who, unlike Goethe, already possessed an idea of social classes, anticipated 'the tired businessman's conception of art, and foreshadows those more recent critics who are concerned about the extent to which mediocre artistic products lull the reader, listener or viewer

into passivity'.<sup>42</sup> However, the elevation of art at the expense of popular culture was by no means a uniquely German idea (although it is quite telling that those time-honored German classics, in Löwenthal's reading, knew well that their time was all but over). The English poet William Wordsworth, in considering the spread of popular literature in the early nineteenth century, arrived at the quite similar conclusion that the modern world brought forth a need for 'gross and violent stimulants' which 'tends "to blunt the discriminating powers of the mind"', whereas the function of true art is to stimulate these powers. Popular literature reduces people to an attitude of passivity or, in the words of Wordsworth, to "a state of almost savage torpor".<sup>43</sup> Finally, Alexis de Tocqueville was even more pessimistic about this. He believed that in modern societies, only mass communications would ever be successful, 'and that they can only be products of popular culture, unrelated to valid intellectual, artistic or moral criteria'. Thus, the writer of poetry, plays, and novels would in his way become 'just as much a manufacturer of commodities as any other businessman'.<sup>44</sup>

Löwenthal, for his part, did not disavow the merits of popular culture straightaway. Toward the end of his historical survey, he discusses the artistic possibilities of mass media.<sup>45</sup> Unlike conservative critics of modern culture, he certainly was not afraid of the 'masses'. He knew quite well that they were no indisputable *fait social* but a product of advanced capitalist societies. Yet why should the vast majority of people be fobbed off with lowbrow substitutes of art for all eternity? Löwenthal never condescendingly justified the badly established division of cultures, a reflection of the social division of labor. 'I don't sympathize with the proletariat', he quipped. 'Marx didn't sympathize with the proletariat either: the proletariat was to be abolished! Proletarian life-styles are hardly a model worth imitating, nor are petty-bourgeois life-styles that attempt to emulate the life-styles of the upper classes'.<sup>46</sup> On the

other hand, more strikingly, Löwenthal was not even sure about the blessings of art. With hindsight, when he turned almost 80, he said, 'How much, indeed, the art, the great literary art of the seventeenth, eighteenth, and nineteenth centuries, really accomplished; whether it changed people – that is very much yet to be decided. For, ultimately, those are our ancestors and forefathers, and what, after all, has become of our society?'.<sup>47</sup> Whatever true art might be able to achieve in terms of social history, Löwenthal clearly saw that this entire tradition was about to be absorbed by the culture industry. In response to being asked if the broad access to art was to be considered progressive, he replied that this perhaps partly sincere democratic distribution of art would not include the capability of experiencing art. For the latter was being suppressed not only by the institutions of popular culture but also by social relations more generally.<sup>48</sup>

As to both popular culture and art's transformation into the culture industry, Löwenthal was most concerned about the growing loss of individual experience and thus of individual expression. He characterized this as a process of dehumanization within a society purportedly promoting the autonomy of the individual (also contravened by the persistence of repressive collectives, communities, or clans). Communication, the main function of media, had long since assumed a reality independent from the human beings technically involved in it. This decline of language in the age of ubiquitous communication is perhaps the most striking manifestation of what Löwenthal described as a life-style of vicarious experience.<sup>49</sup> Ironically, the so-called linguistic turn in the humanities and social sciences, boasting a soberly instrumental and decidedly 'anti-human' conception of language, has supported this tendency.

Moreover, in Löwenthal's view, the aforementioned problem of artistic standards, or rather criteria, in addition to the obvious commercial interests on the part of the producers, has likewise been affected: broiled

down to the dichotomy I like it / I don't like it.<sup>50</sup> While such an attitude had already been applied to the products of popular culture, it was now applied to supposedly serious works of art as well. Even well-trained readers, listeners, and viewers of popular texts, music, or any other media product could hardly be expected to believe in utopian promises anymore. The perpetual consumption of all those more or less overtly illusionary displays of happiness had left them with no illusions, except for the enchanted world of everyday life, a reality that had become its own ideology. This most deceptive kind of realism inevitably affects the possibilities of art. Nevertheless, Löwenthal insisted that the difference between the prospering industry of cultural commodity production and works of arts must not be relinquished.<sup>51</sup> Not because art, as Goethe would have it, ought to be defended for the sake of its high standards; rather, because the experience of art, however negatively, anticipates a state of things 'that are no longer distorted by exchange, profit, and the false needs of a degraded humanity'.<sup>52</sup>

Löwenthal, more so than Adorno, was concerned with the reception of both art and popular culture. But, unlike cultural studies, he never sought to diminish the importance of the work of art as such in favor of its supposedly very significant appropriation by manifold audiences. Much like Adorno, he associated art – in a remotely messianic, though quite secular sense of the word – with redemption, or reconciliation.<sup>53</sup> Or, in Adorno's words:

Art is not only the plenipotentiary of a better praxis than that which has to date predominated, but is equally the critique of praxis as the rule of brutal self-preservation at the heart of the status quo and in its service. It gives the lie to production for production's sake and opts for a form of praxis beyond the spell of labor. Art's *promesse du bonheur* means not only that hitherto praxis has blocked happiness but that happiness is beyond praxis. The measure of the chasm separating praxis from happiness is taken by the force of negativity in the artwork.<sup>54</sup>

## AUTHORITARIANISM AND ANTI-SEMITISM

Empirical research had been part of the Institute's agenda since its inception, although it was only in American exile that Horkheimer and his associates, not always entirely by their own choice, acquainted themselves with state-of-the-art methods. Their most important empirical study, however, had already been undertaken in pre-Nazi Germany, conducted by Löwenthal's old friend Erich Fromm. This study of the mindset of German workers and employees was intended to find out why they were interested in anything but a proletarian revolution. But Fromm found out something else, namely that there was a subliminal inclination toward authoritarian rule even among otherwise progressive and liberal-minded people. The results of the *Arbeiter- und Angestelltenerhebung*, which was not fully published until the 1980s,<sup>55</sup> instantly alarmed the Institute's members and led Horkheimer to take precautions for emigration. This study saved their lives, recalled Löwenthal. It was 'one of the few examples, although not the only one in world history, in which social research helped the social researchers themselves'.<sup>56</sup>

Henceforth, the question of authority continued to solicit the Institute's attention in various ways. Löwenthal's first study, undertaken in exile, was a series of theoretical reflections on the vicissitudes of authority in modern societies, which in contrast to the medieval understanding of authority and tradition claim to be based on reason.<sup>57</sup> Even within constitutional democracies' different cultural institutions – most notably the bourgeois family – social life is governed by unquestioned, purportedly rational, authorities rather than individual desires. Owing to their broad scope, though, these essays were not included in the Institute's voluminous *Studies on Authority and the Family* published in Paris in 1936. When Löwenthal got back to this issue in the 1940s, it was on unfamiliar empirical grounds.

Research into the social and psychological foundations of authoritarianism and anti-Semitism, in particular, kept several of the Institute's members busy during this time. Horkheimer was appointed research director of the American Jewish Committee, while Adorno, along with American colleagues, proceeded with the studies on the *Authoritarian Personality*, certainly the most famous piece of empirical work associated with the Institute. Yet another groundbreaking study was also under way: Leo Löwenthal, in collaboration with Norbert Guterman – an émigré from France, where he had formerly been closely affiliated with Henri Lefebvre – conducted empirical research on fascist agitation in the United States. The resulting *Prophets of Deceit*, published in 1949, was soon to be widely regarded as a landmark study in political psychology.

The core question is why demagogic agitators are able to attract large audiences in democratic societies and how otherwise quite reasonable people can be won over to a fascist cause. Löwenthal and Guterman's answer is that the agitator deliberately rejects the rules of democratic debate, revealing that they are a giant deception staged by sinister and alien (foreigners, communists, Jews, non-believers, bureaucrats) enemies of the honest, hard-working people. While his own revelations and insinuations rely on resentments rather than arguments, they quite often match the mood of many of his listeners, who therefore tend to embrace such an impositor as their savior. In psychoanalytic terms, this is regression (if only metaphorically); people suspend their political judgment and ultimately their own ability to think while they eagerly submit to an imaginary father who promises to care for them. An illusion of happiness, or paradoxically even strength, is bought for the abandonment of reasoning.

Just one topic will be focused on here by way of example. The agitator's constant warning of imminent catastrophes will lead his followers to vaguely hope that 'when the deluge comes they, too, may be allowed

to perform the acts that are attributed to the enemy'.<sup>58</sup> This is what Löwenthal, using Freudian terms, called pathic projection, a central element of his critical theory of anti-Semitism, of which more later. Additionally,

The explanation of everyday mischances in terms of uncanny world catastrophes revitalizes and reinforces the heritage of infantile anxieties. The unconscious finds in the agitator's interpretations a replica of its own primitive reactions to the outside world; the listener plays the role of the little child responding to the warning that bogeys may come for him.<sup>59</sup>

Considering the numerous conspiracy theories cropping up nowadays, promoted by not only fascist and religious zealots or pseudo-religious agitators but various political activists, bloggers, and the like, the techniques illuminated by Löwenthal and Guterman may still prove revealing.

Moreover, as Adorno asserted back then, this kind of social-psychological research on both empirical and theoretical grounds could offer an efficient antidote to the blossoming nonsense of the strictly quantitative methods usually applied to this field of study.<sup>60</sup> Remarkably, Löwenthal analyzed fascist agitation in relation to the culture industry; both could be regarded 'as "psychoanalysis in reverse", that is, as more or less constantly manipulated devices to keep people in permanent psychic bondage, to increase and reinforce neurotic and even psychotic behaviour culminating in perpetual dependency on a "leader" or on institutions or products'.<sup>61</sup>

Löwenthal was involved in another empirical research project launched by the Institute in the 1940s. Although less renowned than the *Prophets of Deceit*, his study on anti-Semitism among American workers might be considered even more important today. Its results are certainly more disillusioning.<sup>62</sup> Löwenthal had already experienced the attitude of young German proletarians toward an allegedly privileged Jewish intellectual first-hand, when he was drafted at the age of 18 during the First World War.<sup>63</sup>

Now, by means of methodologically approved social research, he had his own personal experience empirically confirmed. The hatred for the Jew, he found out, is the hatred for the individual. Or, as he later put it, 'a perverted and suppressed form of utopia. The Jews represent something that others want to be'.<sup>64</sup> That is why at times the most relentless enemies of the Jews can at the same time be among their most fervent admirers. Anti-Semitism is longing for redemption by means of destruction, as if the imagined sinister powers of those to be killed might thus be bestowed on their assassins. Indeed, it was only in those years that the Institute, and Löwenthal in particular, gained an understanding of the specificity of anti-Semitic resentment.<sup>65</sup>

Parallel to his empirical studies, Löwenthal co-authored the first three theses on 'Elements of Anti-Semitism', a chapter in *Dialectic of Enlightenment*. At least, this is what Horkheimer and Adorno declare in the foreword to their book. However, the letters at the time, particularly the correspondence between Horkheimer and Löwenthal, suggest that the contribution of the latter went much further.

The outset of 'Elements of Anti-Semitism' states that 'For the fascists the Jews are not a minority but the antirace, the negative principle as such; on their extermination the world's happiness depends'.<sup>66</sup> Therefore, anti-Semitism ought to be clearly distinguished from racism, a lesson yet to be learnt by many today. True, the Jew can easily be portrayed as a scapegoat, though a scapegoat 'not only for individual maneuvers and machinations but in the wider sense that the economic injustice of the whole class is attributed to him'.<sup>67</sup> Whatever shortcomings the 'Elements' may have otherwise, the theoretical insights formulated in theses I and III have proven indispensable to any critical notion of anti-Semitism ever since. And there is yet another substantial one to be found in thesis IV, where Horkheimer and Adorno suggest that:

Anti-Semitism is based on false projection. It is the reverse of genuine mimesis and has deep affinities to the repressed; in fact, it may itself be the pathic character trait in which the latter is precipitated. If mimesis makes itself resemble its surroundings, false projection makes its surroundings resemble itself.<sup>68</sup>

But this notion of pathic projection had probably been brought up by Löwenthal in preceding discussions with Horkheimer and Adorno. 'I think we should add a paragraph on projection to the "Thesen"', Horkheimer wrote to him (in English). 'After all, the projection of aggression or destruction is the most obvious psychological fact of Antisemitism. [...] Would I be asking too much if I begged you to jot down the notes on projection which you made on the Sunday afternoon before I left?'<sup>69</sup>

One more thing seems worth mentioning here. In 1946, a couple of years before Hannah Arendt came up with her voluminous study *The Origins of Totalitarianism*, Löwenthal published an article on the devastating functions and dehumanizing effects of terror, covering both National Socialism and Stalinism.<sup>70</sup> Apart from many crucial insights into the very specific rationality of terror as a means of social domination, this little treatise points out an aspect that may be of interest on a more general level. Löwenthal observes the collapse of continuous experience, which terrorist rule purposefully precipitates but which, inadvertently, and to a much lesser effect, of course, is about to strike people's lives under the rather comfortable conditions provided by orderly democratic countries. Biographies are quite literally falling apart, perhaps one of the reasons why the biographic genre had become so popular in books and films.

## POST-MODERN TIMES

In his old age, Löwenthal received several honors and awards from his native country.

Belated recognition perhaps, yet certainly a welcome opportunity for him to address a familiar foreign audience in his mother tongue. From a distant point of view, however, it seems as if those honors, irrespective of the good intentions of those in charge, were also intended to say that Germany had irrevocably overcome its sinister past and that critical theory could therefore come to a close. Indeed, this kind of theory by then looked somewhat 'traditional' in its own fashion. In the 1980s, after a decade of steady decline, social criticism originating from the works of Hegel, Marx, and Freud was virtually over and done with. The Frankfurt School's 'second generation', as it came to be called, basically formed and most famously represented by Jürgen Habermas, had not only diminished the significance of both Freudian psychoanalysis and the Marxian critique of political economy but likewise stripped away their founding fathers' ill-reputed negativity. Most notoriously, Adorno's intransigent attitude toward a 'wrong' society was to be replaced by a rather conciliatory theory of communication and thus an inevitably quixotic ethics of discourse placed well beyond the relations of production.<sup>71</sup> According to Habermas, history, instead of keeping us under its spell, was finally loosening its grip on societies and individuals alike.<sup>72</sup> Of course, the legacy of Horkheimer's critical theory had not – and still has not – been fully eclipsed. One might think of, for instance, disparate authors such as Rolf Tiedemann, Detlev Claussen, and Wolfgang Pohrt in Germany, or Moishe Postone and Martin Jay in the United States. Nevertheless, an even greater challenge than Habermas's attempted rescue of modern rationality was being posed by the post-modern farewell to reason, history, and reality. Löwenthal, unperturbed by colorful intellectual trends and at the same time acutely alert to the complacent talk of *post-histoire*, in his last years seized several occasions to breast this wave that was about to wash away the conceptual

foundations of critical theory and Enlightenment altogether.<sup>73</sup>

Perhaps the most appropriate, and personally rewarding, occasion was the reception of the Theodor W. Adorno Award in his native city of Frankfurt in 1989. The speech he delivered then might be regarded as his legacy, on his behalf as well as his deceased friends'. Löwenthal said he was there to bear witness to the intellectual and moral motives of critical theory. The award, therefore, ought to belong to the entire group. Incidentally, this was shortly before the fall of the Berlin Wall inaugurated the collapse of state-socialist rule in Central and Eastern Europe. Thus the remains of the revolution, which, in Löwenthal's words, had long since abandoned him and his associates, were to be removed from history once and for all. But, by then, the idea of history he had been keeping up against all odds, particularly of a history yet to come, had already been called into question by others, most prominently by former Western Marxists, or renegade Leninists and Maoists, who, from an almost religious level of dogmatic belief in history taking its course for the good of humanity, had meanwhile arrived at quite the opposite point of view. History, for all its catastrophic failures and its obvious senselessness, now appeared to them as a mere conglomeration of contingent events, if not as an illusion, just as society or reality.<sup>74</sup> Jean Baudrillard's theory of simulacra and the simulation of reality probably reached the very peak of this overall intellectual tendency. The Marxian critique of the apparition of reality – that is, a socially produced and socially (not solely technically) mediated reality – was thereby turned into a cynical denial of reality as such, allegedly indistinguishable from its own simulation. Consequently, any possible change of social reality was to be considered equally illusory, and social criticism was exposed to ridicule, 'a travesty of what Adorno meant by his notion of a damaged life'.<sup>75</sup>

But beyond this perhaps most flamboyant display of post-modernism, which soon

disappeared, there were arguably some more serious contenders. Under the influence of French post-structuralism, many notions pertinent to critical theory were now being reviewed from a different point of view and to different ends – for example, the category of the subject. Starting with Roland Barthes's 'Death of the Author' and Michel Foucault's famous saying 'that man would be erased, like a face drawn in sand at the edge of the sea', it had become fashionable, if not obligatory, at least in many departments of the so-called humanities, to disclose the human subject as a discursive construction. In contrast, Goethe, Löwenthal recalled, had already turned against a false subjectivity, but of course he never intended to abolish the subject but to elevate it in a dialectical sense. This, too, is what critical theory always had in mind. 'We did not have to attend a post-modern salon to learn about the problematic notion and ideology of the individual'.<sup>76</sup> The much noticed fragility of the subject, Löwenthal remarked, was intended to indicate its expendability in present societies. Yet at the same time, while dismissing the subject as fiction, the post-modernist discourse itself indulges in an 'orgy of subjectivism'.<sup>77</sup> If, literally, anything goes as well as anything else, no one can tell the difference between a Manhattan phone directory and a tragedy of Shakespeare.<sup>78</sup> It goes without saying that, from this declaredly pluralistic, actually downright relativistic position, art cannot be reasonably distinguished from the products of the culture industry, nor even from any other phenomenon. What initiated as a kind of reissue of Montaignian skepticism, though more meddlesome and less smartly written, amounted to a 'triumph of instrumental relativism'.<sup>79</sup> Even worse, Löwenthal suspected, the 'monstrosity of post-histoire',<sup>80</sup> if it does mean anything at all, would entail a refusal of the Jewish-messianic heritage and of any utopian hope, however difficult these notions might have become.

Although hardly ever read, Löwenthal's distant early warnings are echoing even

louder today, since ‘deconstructionism’, as he called it, probably the most influential ‘spawn of post-modernism’,<sup>81</sup> now provides the major source of theory even for those devoted to social criticism. If they are not just grappling with cultures and identities, then notions such as class or the exchange of commodities are remodeled in terms of discourse. ‘Universalism’, for example, has become a term of abuse, whereas any kind of autochthonous barbarism might be glorified as an act of resistance to a modernity summarily equated to Western capitalism. Apparently, the dismissal of Enlightenment categories, traditionally a raging passion of reactionary critics of Western civilization, has in only slightly different terms been embraced by those who, according to that same tradition, would be considered liberals or left-wingers. But maybe this tradition has come to an end. It is quite telling that nowadays, with critical theory widely being treated as a dead dog, as Marx would have it, the works of Walter Benjamin have gained an almost obtrusive popularity, though mostly owing to ‘readings’ informed by post-structuralist philology. This is why Benjamin can now as easily be linked to Martin Heidegger and Carl Schmitt as to Marx or the Messiah. In this respect, at least, Löwenthal could consider himself lucky, since virtually no one is reading his writings anymore. Indeed, ‘the overshadowing vogue of deconstruction’, says Robert Hullot-Kentor, ‘has done inestimable damage to critical thought’,<sup>82</sup> although the real degree of this damage remains to be seen. As for the United States, where Löwenthal spent most of his life after being exiled from Germany, Hullot-Kentor notes that

academia’s contribution to a nation always wanting to get things done as with hammer and saw, rather than by invoking intellect, was to provide reading to dislodge interpretation, rewriting to take the place of conceptualization, and the handy toughness profiled in any announced *deconstruction* to easily trump weak-willed *critique* and the fragile mentalism of *insight*.<sup>83</sup>

In his very first essay, written in 1920, entitled ‘The Demonic: Draft of a Negative Philosophy of Religion’,<sup>84</sup> Löwenthal went through various demonologies worrying mankind in this disastrously enchanted world. Only the bright messianic light would ultimately doom them all. The questions they kept asking would then be answered. For the time being, however, it would be helpful to ask the right questions.

## Notes

- 1 See, for example, Horkheimer’s most grateful letter to Löwenthal from June 18, 1941, in Max Horkheimer, *Gesammelte Schriften*, Vol. 17, ed. Gunzelin Schmid Noerr (Frankfurt am Main: Fischer, 1996: 67).
- 2 Letter to Kracauer, June 8, 1931, in Theodor W. Adorno and Siegfried Kracauer, *Briefwechsel 1923–1966*, ed. Wolfgang Schopf (Frankfurt am Main: Suhrkamp, 2008: 284). ‘Well, I never had a crown’, Löwenthal laconically replied decades later in his ‘Intellectual Memoir’ of Adorno, in Leo Löwenthal, *An Unmastered Past*, ed. Martin Jay (Berkeley, Los Angeles and London: University of California Press, 1987: 184).
- 3 Provisions for this imminent case had been made since 1931. The first destination was Switzerland, yet Horkheimer and his associates were not given the opportunity to settle down. While still pondering the prospects of going to Paris or London, they received a generous offer from Columbia University in New York, which they eventually accepted.
- 4 Leo Löwenthal, *Schriften*, ed. Helmut Dubiel (Frankfurt am Main: Suhrkamp). Vol. 1: *Literatur und Massenkultur* (1980); Vol. 2: *Das bürgerliche Bewußtsein in der Literatur* (1981); Vol. 3: *Falsche Propheten. Studien zum Autoritarismus* (1982); Vol. 4: *Judaica, Vorträge, Briefe* (1984); Vol. 5: *Philosophische Frühschriften* (1987). An English version of this edition, except for volume 5, containing Löwenthal’s early writings, was subsequently published under the title *Communications in Society* (New Brunswick, NJ: Transaction Books). Vol. 1: *Literature and Mass Culture* (1984); Vol. 2: *Literature and the Image of Man* (1986); Vol. 3: *False Prophets: Studies on Authoritarianism* (1987); Vol. 4: *Critical Theory and Frankfurt Theorists: Lectures, Correspondence, Conversations* (1989).

# Erich Fromm: Psychoanalysis and the Fear of Freedom

Kieran Durkin

## INTRODUCTION

Erich Fromm's role in Frankfurt School critical theory history has historically been under-acknowledged and under-analysed. Works such as Schroyer (1973) and Tar (1977) make scant reference to Fromm, and even those works from the same period that accord Fromm a greater degree of recognition – such as Jay (1996), Held (1980), and Wiggershaus (1994) – fail to really see Fromm in his true significance. It was not until more recently that Fromm's proper place in this history has come to be more fully restored (see Abromeit, 2011; Braune, 2014; Bronner, 1994; Burston, 1991; Durkin, 2014, 2015; Funk, 2000; McLaughlin, 1999, 2008; Wheatland, 2004, 2009; Wilde, 2004). It is now clear that Fromm was very much a central figure in the early period of Max Horkheimer's directorship of the Frankfurt Institut für Sozialforschung (hereafter generally either 'Institute for Social Research' or 'Institute'), second only to

Horkheimer in terms of the derivation of the Institute's early research programme and methodology. From the theoretical and empirical merging of psychoanalysis and historical materialism, to the focus on personality/character and authoritarianism, Fromm helped shape much of the formation of the Frankfurt School's critical theory of society, but he left the Institute in acrimonious circumstances in the late 1930s, at a time when the Institute itself was realigning around the theoretical and interpersonal union of Horkheimer and Adorno. As it was, Fromm went on to have a career as a 'public intellectual' in the United States and beyond, achieving fame and recognition decades prior to his Institute ex-colleagues with books such as *Escape from Freedom* (1941), *The Sane Society* (1955), and *The Art of Loving* (1956). During this post-Institute period, Fromm developed some of the central themes of critical theory in a particular direction that he would come to describe as 'radical humanist' – developments that have

generally been thought by many to be beyond the boundaries of, and even antithetical to, critical theory, as it is canonically understood. Whilst the strong normative thrust of Fromm's writings during this period has drawn the ire of colleagues and critics alike, a more capacious understanding of critical theory and its sphere of relevance can help us see the potential that these works have for avenues of retrieval and progression in relation to the original liberatory aims of critical theory.

### **EARLY LIFE: JUDAISM, SOCIALISM, AND PSYCHOANALYSIS**

Deeply influenced by the Judaic milieu he inhabited as a child, Fromm's first wish on graduating from Frankfurt's Wöhler Gymnasium was to train to become a rabbi. This wish was thwarted, however, due to parental pressure to remain close to the family home, and Fromm eventually embarked upon an academic career, deciding to study jurisprudence at Frankfurt University. Fromm's study at Frankfurt lasted only a few months before he transferred to Heidelberg's Ruprecht-Karls University to study what was then known as 'national economics'. During his time at Ruprecht-Karls, where he attended lectures by Alfred Weber, Karl Jaspers, Heinrich Rickert, and Hans Driesch, Fromm remained devout, studying the Talmud daily with his teacher, Salman Rabinkow, as well as engaging in Jewish public life in Frankfurt as part of the circle around Rabbi Nehemia Nobel. Fromm was also instrumental in setting up a Jewish teaching institute in Frankfurt – the *Freies Jüdisches Lehrhaus* – where he taught alongside Rabbi Nobel, Franz Rozenweig, Martin Buber, Gershom Scholem, Leo Baeck, and Siegfried Kracauer, amongst others (Funk, 2000: 41; Funk, 1988). Fromm would later claim that this period in his life – particularly the time he spent with Rabinkow – was the most

influential in terms of forming his intellectual view of the world.

That this period was an important one in Fromm's development can be seen by virtue of the fact that it also contains the nucleus of what would become his characteristic contribution to critical theory. Fromm's study with Rabinkow and Nobel brought him into extensive contact with the Hasidic tradition and with Habad Hasidism in particular. Through this connection, Fromm learnt the importance of psychological analysis and self-knowledge – the psychological being stressed in Habad to the extent that Kabbalism, the ground from which Hasidism in general flows, acts as an instrument of psychological analysis and self-knowledge (Scholem, 1971: 341). Although psychological analysis and self-knowledge here are interpreted in and through a mystical-theological vernacular, it is nevertheless in this encounter that Fromm begins to develop his appreciation of depth psychology – an appreciation that anticipates his subsequent move into psychoanalytical practice and analysis (Funk, 1982: 203–4, 1988; Durkin, 2014: 48–50).

The all-pervading influence of Judaism on Fromm's life in this period is also evident in his choice of dissertation at Ruprecht-Karls. Still very much influenced by Rabinkow and Nobel, Fromm's dissertation was concerned with analysing the social and psychological functions of Jewish law in the diaspora community – the Karaite, Reform, and Hasidic sects in particular – attempting to explain how it was that they survived as Jews despite the absence of national religious institutions to help sustain their way of life (Funk, 2000: 56–8). The study, which was supervised by Alfred Weber, whom Fromm regarded as the only 'master' amongst his university teachers, was specifically concerned with how it is that ethical forms are internalised by members of groups and turned into ways of life that become definitive for those groups – a nucleic form of his later preoccupation with character and its socio-economic derivation. Notably, the study concluded

with a positive appraisal of Hasidism's ability to maintain its integrity in face of the ever increasing encroachment of liberal-bourgeois and capitalistic values (Funk, 1988).

Fromm also attributed his Judaic upbringing, and his time with Rabinkow, as the main factor in his proclivity for socialism (Fromm, 1986 [1983]: 98–9). Brought up in a world which, by his own admission, was more medieval than modern, bourgeois life always possessed something of an alien character for Fromm, its dominant values contrasting with the values instilled in him through his extensive engagement with the Judaic tradition. Such a situation is, of course, insufficient grounds for identification with socialism and with Marx, – and it is clear that Fromm played no role in activist politics during this period of his life. Fromm did, however, take courses on Marx whilst at Ruprecht-Karls, and, in his later testimony, he is quite clear that his early love for the messianic vision of the prophets did lead to an affinity for Marx's writings. Although there are subsequent encounters that were crucial in Fromm's move to Marxism (encounters which will be discussed in due course), the elective affinity, as Fromm saw it, between Marx's idea of communism and the messianic visions of the prophets is a significant factor in the constitution of his own contribution to critical theory. Fromm's heterodox, humanist reading of Marx argues that messianic thinking finds 'its latest and most complete expression' (2004 [1961]: 54) in Marx's concept of communism, representing as it does not only 'the *genuine* resolution of the antagonism between man and nature, and between man and man' (Marx, 1977: 90) but also 'the true realm of human freedom, the development of human powers as an end in itself' (Marx, 1991: 959). In order to fully grasp the nature of this correlation, and its role in the constitution of his critical theory, it is necessary to explore Fromm's relationship to the Jewish tradition in greater depth (see Durkin, 2014: 54–63 for a discussion of Fromm's account of Marx as a secular prophet).

Fromm's engagement with Judaism continued post-university and was directly implicated in his move to psychoanalysis. Fromm was formally introduced to psychoanalysis by Frieda Reichmann, an established psychoanalyst he had met through orthodox Jewish circles and whom he would marry in 1926. After being analysed by Reichmann in 1923, Fromm went on to work at the sanatorium Reichmann had established in Heidelberg – an institution specifically set up for the cure of Jewish patients. Fromm's involvement in this venture illustrates the degree to which he was still committed to Judaism during this period. As part of the sanatorium venture, Fromm spent a year in Munich, undertaking psychoanalytic training with Wilhelm Wittenberg and attending lectures given by Emile Kraepelin, amongst others. After this, Fromm spent a period of analysis with Karl Landauer in Frankfurt before moving to Berlin, where he was taught by Hans Sachs and Theodor Reik at the Berlin Psychoanalytic Institute and where he was to open his first psychoanalytic practice in 1928. The period with Reichmann, however, was also the beginning of Fromm's split from the Jewish faith.<sup>1</sup> Fromm marked this significant personal milestone through the symbolic eating of leavened bread on Passover alongside Reichmann in 1926 (Funk, 2000: 61). Despite suggestions that it was Fromm's deepening experience of psychoanalysis that provided the key motivating factor in his eventual renunciation of Judaism as a theological position, Reichmann herself suggested that the move was motivated more by Fromm's growing 'leftist interests' than any particularly exclusive function that psychoanalysis could offer (Jacobs, 2014: 34). In fact, as we will see, it is clear that Fromm came to see even psychoanalysis in terms of the service it could offer 'leftist interests'. So although Fromm officially renounced Judaism as a theological position, it is clear that his interests as derived in and through his Judaic upbringing (his interest in social psychology, in 'right living', in love, reason, and

justice) led him, in large part, to a position where Marx and Freud meet, and therefore to the position where his central contribution to critical theory took shape.

### **THE MARX–FREUD SYNTHESIS: BERNFELD, *THE DOGMA OF CHRIST*, AND PSYCHOANALYTIC SOCIAL PSYCHOLOGY**

The Berlin Psychoanalytic Institute, where Fromm studied from 1928 to 1929, played a crucial role in his development. Differing from its Viennese counterpart by virtue of its marked concern with the social and political implications of psychoanalysis, the Berlin Institute amplified Fromm's own interest in understanding the psychic milieu of groups and societies that was evident in his sociological dissertation at Ruprecht-Karls. During his time in Berlin, Fromm attended Otto Fenichel's famous *Kinderseminar*, a grouping consisting largely of dissident young analysts interested in exploring the connections between psychoanalysis and socialism. Fromm was personally acquainted with Paul Federn, Ernst Simmel, Siegfried Bernfeld, and Wilhelm Reich, all established psychoanalysts and socialists with whom he shared ideas on these connections. Bernfeld, in particular, influenced Fromm during this period, his teachings at the Berlin Psychoanalytic Institute directly moulding Fromm's nascent approach to the fusion of the thought systems of Marx and Freud. In his 'Psychoanalysis and Socialism', which appeared in 1925, we can see Bernfeld concerned with preparing the grounds for the meeting of psychoanalysis and Marxism and for what he hoped would be the eventual development of a 'materialist' and 'dialectical' psychology. In words that prefigure Fromm's own working-through of this synthesis, Bernfeld notes that:

Marx...never dealt with that problem which Freud tackles, admittedly in an elementary form – how

those psychic mechanisms operate, by means of which particular relations of production bring about corresponding ideologies in the minds of the living individuals constituting the economy. (1972: 65)

Bernfeld's pamphlet needs to be seen in relation to the critique of mechanical materialism inaugurated by Karl Korsch and Georg Lukács in the late 1910s and early 1920s, in the aftermath of the First World War and the failure of the German proletariat to unite in furtherance of social revolution. Korsch (1974) had seen that this failure could be attributed to the social-psychological ill preparedness of the workers for revolution, and Lukács (1971) had seen the general need for Marxism to deepen its appreciation of the subjective consciousness of the working class.<sup>2</sup> The synthesis of Marx and Freud, as mooted by Bernfeld, was an extension of this reasoning, even if Korsch and Lukács ultimately disavowed any recourse to psychoanalysis in their own writings. Fromm, then, was working within an environment circumscribed by Korsch and Lukács and on the path staked out by Bernfeld. Bernfeld's short piece provided an opening, paving the way and highlighting substantive connections, but it was not a detailed piece by any stretch of the imagination. It was not until Fromm's contribution, alongside the contributions of Wilhelm Reich (Reich 1929, 1931, 1933), that more detailed and substantive developments in the attempt to synthesise Marx and Freud took place.<sup>3</sup>

Fromm's earliest public pronouncements on the matter of the Marx–Freud synthesis took place in 1929, the same year as Wilhelm Reich's influential 'Dialectical Materialism and Psychoanalysis'. By this time, Fromm was partly based in Frankfurt, where he helped set up the Frankfurt Psychoanalytical Institute, alongside Gustav Landauer, Heinrich Meng, and Frieda Reichmann. At the inauguration of the Frankfurt Psychoanalytical Institute, Fromm gave a short paper on the relationship of psychoanalysis and sociology (Fromm, 1989 [1929]) in which he outlined

the potential psychoanalysis has to advance Marxian sociology. Here, we can see Fromm clearly developing Bernfeld's earlier piece, stressing in particular the contribution psychoanalysis can make to investigating the role played by the psychic apparatus in the overall functioning of society. Although this paper was an important intervention in itself, and although it definitely advanced the basis of the Marx–Freud synthesis, showing much less reticence than Bernfeld in mapping the grounds of what would turn out to be, for Fromm, a deep and lasting synthesis (Bernfeld himself abandoned the synthesis, along with Marxism, in the following years), the piece really amounts, in Fromm's own words, to little more than 'a few fundamental remarks' (1989 [1929]: 37). In it, Fromm stressed the need to avoid the reduction of analysis from the sociological to the psychological, or vice versa, but also, and in contrast to Bernfeld, to be alive to situations where the issues at hand are *simultaneously* sociological and psychological, and where, therefore, analysis needs to be social-psychological in its entirety. It was not until the following year, with the publication of his first monograph, *Die Entwicklung des Christudogmas, Eine Psychoanalytische Studie zur Sozialpsychologischen* (published in English as *The Dogma of Christ* in 1963), that Fromm made his first real standout contribution.

Substantively, *The Dogma of Christ* is concerned with the development of Christian dogma in the first centuries of Christianity. According to Fromm, Christianity arose as 'a significant historical messianic-revolutionary movement' (1992 [1930]: 35), its original doctrine, the adoptionist idea of man becoming God, addressing not primarily the educated and property-owning class but, rather, the poor, oppressed, and suffering, who had a ready attraction to the idea that the Kingdom of Heaven was at hand. As the economic and political relations in society began to change, however, and as a feudal class state arose in which nationalities

were levelled and in which infinite dependencies were set up under the hierarchy of the emperor, the Christian dogma itself changes, Fromm argued, coming to align with the psychic attitude most compatible with the altered social situation. In particular, Fromm argued that the dogma changed from the original adoptionist messianic-revolutionary position to a position that was its direct inverse: a doctrine of passive harmony, where love and grace were bestowed upon God the father, a God who had undergone an anthropological conversion and literally *become* a man. Crucially for the subsequent development of the 'psychic surfaces' of the population, Fromm argued that the aggressive impulses did not disappear but were turned away from the earlier object and back on to the self, the identification with the suffering Jesus essentially becoming an identification with his self-annihilation. The rulers were no longer to blame for wretchedness and suffering; rather, the sufferers themselves were guilty and were to reproach themselves for their unhappiness.

Fromm's account here, whilst carrying some clear limitations, is nevertheless a psychologically sophisticated historical materialist analysis which, in contradistinction to the account of his erstwhile teacher, Theodor Reik, seeks 'to understand dogma on the basis of a study of people, not people on the basis of a study of dogma' (1992 [1930]: 21). He works through an attempt to comprehend the change of consciousness as expressed in the theological ideas of the early Christian communities by the change in the unconscious processes related to individual and social character, this change in turn brought about by and corresponding to an altered socio-economic situation. In as much as this is the case, the study aligns with the basic Marxist thesis pertaining to the social determination of ideas whilst serving to extend the Marx–Freud synthesis, as inaugurated by Bernfeld. In so doing, it clearly foregrounds Fromm's work with Horkheimer as part of the Institute for Social Research.

In the opening chapter of *The Dogma of Christ*, Fromm praises as one of the central accomplishments of psychoanalysis the fact that it has 'done away with the false distinction between social psychology and individual's psychology' (1992 [1930]: 3). Fromm is clear that from its inception psychoanalysis has functioned on the premise that the individual psyche is formed and functions within the wider social environment of which it is a part. Following Freud in rejecting the notion of a 'group mind', Fromm then expounds upon the relationship between individual and social psychology, united in method of analysis, i.e. the investigation of the influence of life-situation on the pattern of emotional development, but separated with regards to specific aim. Whereas individual psychology aims at revealing the dynamism of the psychic structure of the individual under study, social psychology aims specifically at discerning the 'character matrix' common to most members of a particular group, class, or society, and it seeks to do so with primary reference to the dynamic connection between such a matrix and the economic base of the society in question. Although Fromm speaks only loosely here of the concept 'character structure' that would form the basis of his later theory and central contribution to critical theory, what he means by 'character matrix' is to all intents and purposes identical, referring to the 'average characteristic common to all members of the group, which does not necessarily play a central role in the character structure of each individual' (1992 [1930]: 6).

As Franz Borkenau described it in a review in the *Zeitschrift für Sozialforschung*, *The Dogma of Christ* was 'the first attempt by way of a concrete example of the method of a synthesis of Marxism with Freudian psychoanalysis' (quoted in Jay, 1996: 91). As Abromeit (2011: 252–3) points out, it is highly likely that it played a significant role in influencing Horkheimer's early formulation of critical theory and in the development of his concept of 'the Anthropology of the Bourgeois Epoch' in particular. Horkheimer's 1932

*Zeitschrift* article 'History and Psychology', an often overlooked essay that is nevertheless pivotal in advancing the methodological basis of his critical theory, shows clear commonalities with Fromm's outlining of an historical materialist psychoanalytical social psychology in *The Dogma of Christ* and in his earlier paper on psychoanalysis and sociology.<sup>4</sup> This raises the issue of the relative recognition accorded to Fromm in the development of critical theory. A strong case can be made for the existence of a far more reciprocal relationship between Horkheimer and Fromm at this stage than has generally been thought to be the case (Jay, 1996; Schroyer, 1973; Tar, 1977; Held, 1980; Knapp, 1993), even though Horkheimer may still be thought of as the more senior of the two. Not only does *The Dogma of Christ* prefigure Horkheimer's 'History and Psychology' and his whole concept of the anthropology of the bourgeois epoch, Fromm's 1929 paper prefigures Horkheimer's inaugural lecture as director of the Institute in 1931.<sup>5</sup> According to Abromeit (2011: 194), we can see Fromm's introduction to Horkheimer as taking place no later than 1928, and perhaps as early as 1926. It seems likely that Horkheimer also played a facilitative role in the establishment of the Frankfurt Psychoanalytic Institute in 1928, which was housed in the same building as the Institute for Social Research; and certainly, by 1931, Horkheimer and Fromm had developed a tight personal and theoretical relationship. As such, it is perhaps best to follow McLaughlin (2008: 15) in conceiving of Horkheimer and Fromm during this period as the central 'collaborative pair' in the circle that centred around Horkheimer – this circle, and particularly the Horkheimer–Fromm pairing in turn influenced by the wider formation and development of a psychoanalytically sophisticated historical materialism, as seen initially in Bernfeld but also Fenichel, Reich, and other Berlin leftist psychoanalysts.

Fromm's development of the Marx–Freud synthesis continued apace, with two articles

on the issue appearing in the *Zeitschrift* in 1932. The first of these, *Über Methode und Aufgabe einer Analytischen Sozialpsychologie. Bemerkungen über Psychoanalyse und historischen Materialismus* (translated later as 'The Method and Function of an Analytic Social Psychology'), stands as Fromm's definitive statement on the synthesis. Following on from *The Dogma of Christ*, Fromm elaborated here upon the methodological and theoretical prerequisites of a psychoanalytical social psychology that can work with historical materialist theory. 'Psychoanalysis', he proclaimed, 'is a materialistic psychology, which should be classed amongst the natural sciences. It points to instinctual drives and needs as the motive force behind human behaviour, these drives being produced by physiologically based *instincts* that are not directly observable in themselves' (Fromm, 1970 [1932a]: 110). The use of psychoanalysis in historical materialist research will, therefore, lead to 'a refinement of method, a broader knowledge of the forces at work in the social process, and greater certainty in understanding the course of history and in predicting future historical events' (1970 [1932a]: 129). In particular, psychoanalytical social psychology enables insight into and interrogation of the 'subjective factor' in the social process. Through this, it can also help ground the concept of 'ideology', showing, in a way that Marx and Engels could not, precisely *how* the economic situation is transformed into ideology via human passions and drives, i.e. through demonstrating how the content of ideologies are the products of wishes, instinctual drives, interests, and needs which come to be expressed in the form of rationalisations.<sup>6</sup>

The 'Method and Function' article is also important for its codification of the particular approach of psychoanalytical social psychology that Fromm recommends, namely: the attempt 'to explain the shared, socially relevant psychic attitudes and ideologies – and their unconscious roots in particular – in terms of the influence of the economic conditions on libido strivings' (Fromm, 1970 [1932a]:

121).<sup>7</sup> As befits a Marxist account of social life, the economic conditions are considered by Fromm to be the primary formative factor here; but, whilst this is so, the libido strivings are seen to play a crucial role alongside the economic conditions, and alongside the other factors that determine social development. What psychoanalysis can contribute to historical materialism, then, is an account of the psychological *basis* of the social structure – the active foundation upon which that structure rests and a primary reason for its stability. Indeed, Fromm straightforwardly discounts the notion that the external power apparatus is sufficient to ensure structural stability. We need, he stresses, to factor in libidinal strivings, alongside and underneath the more rational and egoist interests, and to see these libidinal strivings as the social cement that keeps the system together. Emphasis is thus placed on the 'active and passive adaptation of the instinctual apparatus to the socio-economic situation' (1970 [1932a]: 121).

In the second of his 1932 *Zeitschrift* articles, *Die psychoanalytische Charakterologie und ihre Bedeutung für die Sozialpsychologie* (translated later as 'Psychoanalytic Characterology and its Relevance for Social Psychology'), we can see Fromm developing his programmatic account of psychoanalytical social psychology. The piece is particularly important for its raising of the hitherto relatively unspoken factor of 'character' to a central analytical position. In the 'Method and Function' article, Fromm had spoken of 'libidinal strivings' and of 'psychic traits', which, as in *The Dogma of Christ*, were to be explained in terms of the socio-economic structure and the shared life experiences of their group. He also spoke of the focus of social psychology as being on the distinctive libidinal structure of a particular society. But it is in 'Psychoanalytic Characterology' that we begin to see a more consistent and explicit stress on 'character traits' as the central focus. What Fromm is primarily concerned with here is to 'show how the character traits

common to most members of a society are conditioned by the distinctive nature of that society' (1970 [1932b]: 148). In line with psychoanalytic theory, Fromm traces the social influence of society on character primarily to the family, which he describes as 'the chief medium through which the child's psychic formation is oriented toward the surrounding society' (1970 [1932b]: 148). It is through the family and the wider educational process that the child's strivings are either suppressed or intensified, this suppression and intensification taking place generally in line with the wider economic, social, or class structure to which the family is related. In addition to this, and in anticipation of his later work, Fromm stresses how the specific character of a society is conceived of as a productive force which shapes the development of that society. The piece finishes with a brief application of his approach to the issue of the 'bourgeois-capitalist spirit', including examples taken from Sombart's analysis of the Alberti family, and passages taken from Benjamin Franklin and Daniel Defoe.

The Marx–Freud synthesis as outlined in 'Method and Function' and in 'Psychoanalytic Characterology', both developing *The Dogma of Christ*, is built upon the recognition of Marx's demonstration of our being enmeshed in socio-economic conditions and Freud's demonstration of our being enmeshed in a network of psychological needs (and the enmeshing of the one with the other). By such an account, Fromm is able to add an extra dimension to Marxist analysis in the form of a sophisticated understanding of the human psyche as a determinant of social development alongside external factors, whilst at the same time grounding the claims of psychoanalysis on a more accurate sociological footing. This is the central contribution that Fromm brings to early critical theory, a contribution which, as will be shown, was instrumental in the development of the Institute under the leadership of Max Horkheimer.

### **GERMAN-WORKERS STUDY, STUDIES ON AUTHORITY AND THE FAMILY, AND THE BREAK WITH HORKHEIMER**

The first concrete manifestation of Fromm's relationship with Horkheimer at the Institute, however, was a landmark study of the attitude and psyche of German manual and white-collar workers. The study, of which Fromm assumed complete directorial control upon joining the Institute in 1929,<sup>8</sup> was a direct example of the kind of empirical research that Horkheimer spoke of in his inaugural address some two years later (Horkheimer, 1989), i.e. empirical socio-psychological research that would serve to deepen social theory's account of the connections between economic life and individual (and group) psychology. Although it followed on from previous surveys of German workers, particularly Levenstein's (1912), it was the first set up to probe the 'subjective factor' highlighted by the earlier work of Korsch and Lukács. Making use of a comprehensive questionnaire, comprised of a total of 271 questions distributed to some 3,300 workers, the study explicitly sought to gain insight into the character of the recipients. As such, the questions were concerned with general political opinions, emotional attitudes to authority, and attitudes towards collective or individualistic approaches to life, which it was hoped would elicit unconscious responses that Fromm and his team could interpret in line with standard psychoanalytical criteria. In an environment characterised by marked social upheaval and the rise of the National Socialist Party, it was hoped, too, that it would be possible to determine the relationship between outwardly socialist or communist sympathies and the unconscious authoritarian attitudes that may underlie them (in particular, they hoped to reveal something of the relationship between character traits and political commitment). In terms of results, the study concluded unsettlingly that the supporters of left-wing parties

amongst the respondents frequently exhibited a psychic attitude which in no way corresponded with the ideal-typical attitude expressed through left-wing doctrine. Indeed, as the data demonstrated – through attitudinal scepticism towards individual freedom, through the belief in the subordination of the human individual to higher powers, and through identification with the powerful over the weak, etc. – there was a marked tendency towards an authoritarian attitude amongst these very individuals. The tendency for emotional attachment to authoritarian positions, rooted at a characterological level, served, as Fromm noted, to directly undermine the avowed radicalism of a significant proportion of socialist and communist supporters – a conclusion which not only helped to explain the failed revolution of 1918–19 but also suggested the general acquiescence and even active support that would be shown to Hitler in the ensuing years.

Despite the apparent success in finding some clear empirical evidence of the social-psychological mechanisms Fromm had posited in previous writings, the study remained unpublished for close to 50 years, appearing in 1980 as *Arbiter und Angestellte am Vorabend des Dritten Reiches. Eine sozialpsychologische Untersuchung* (it was subsequently published in English as *The Working Class in Weimar Germany: A Psychological and Sociological Study* (1984)). Controversy surrounds what was essentially Horkheimer's decision not to publish the study. Officially, Horkheimer argued that the high number of non-replies to certain questions, as well as the relatively low response rate of 33 per cent, rendered the study unfit for publication (Horkheimer also cited a lack of funds as a further reason why the study could not be published). Fromm, who had been writing up the study throughout the mid 1930s, disputed that any interview was lost and suggested, in fact, that Horkheimer was disinclined to publish the study for fear of its 'leftist' pretensions (letter to Bottomore, 26 March, 1974, in McLaughlin,

1999: 116n) – a far from groundless suggestion, given the extent to which the Institute went to avoid explicit reference to socialism or Marxism in its published work at this time. Either way, it cannot be denied that the study was genuinely pioneering, paving the way for the Institute's later authoritarian-personality study led by Adorno some ten years later (Adorno et al., 1950). The fact that *The Authoritarian Personality* makes almost no mention of Fromm in its pages is remarkable, and is surely at least partly reflective of the direct attempt by Horkheimer and Adorno to obfuscate Fromm's role in the early stage of the Institute (McLaughlin, 1999).

The high watermark of Fromm's contribution to Frankfurt School critical theory, however, is surely his contribution to the Institute's *Studien über Autorität und Familie* (*Studies on Authority and the Family*) (Horkheimer, 1936). Following the research programme set out by Horkheimer in his inaugural address, *Studies on Authority and the Family* was primarily concerned with the transformation of the bourgeois character taking place in twentieth-century European capitalist societies. Fromm's contribution, 'Sozialpsychologischer Teil' ('Social-Psychological Aspects') (1936), appears in the theoretical first section of the volume, and is concerned with mapping out the social-psychological rise of authoritarianism in precisely these European capitalist societies. Fromm's account begins with a discussion of the decline of ego strength brought about by changes in the patriarchal family and in wider society. The family had, as the primary agent of socialisation, long been an important theoretical focal point for psychoanalysis, and Fromm here draws out this significance, expounding upon the role the patriarchal family has traditionally played in instilling obedience and susceptibility to authority in the population at large. Fromm then moves on to claim that the routine suppression of emotional drives that is traditionally found in the patriarchal family milieu had actually intensified in the face of monopoly capitalism.

Especially amongst the lower classes and the petty bourgeoisie, there had, Fromm argues, arisen a generalised feeling of powerlessness and inconsequentiality which, in turn, prompted ego disorganisation and depletion. As a result of this disorganisation and depletion, Fromm claims, there arose a distinct tendency to identify with and submit to the dictates of a 'superior power' - an exaggerated substitute for the reduced authority of the family. From here, a culturally patterned masochism is said to come to the fore, the self increasingly turned over to external social and internal psychic authorities in an attempt to quell the increasing isolation and estrangement experienced in society at large.

By the time *Studies on Authority and the Family* was published, the Institute had relocated to New York, partly on the basis of connections established and pursued by Fromm (Wheatland, 2009). Throughout the period covering the move to New York and the preparatory work for *Studies on Authority and the Family*, however, Fromm was recuperating from recurring bouts of tuberculosis, which severely restricted his ability for any sort of work beyond that of reading (Funk, 2000: 81–2). The physical separation from the other members of the Institute that the illness brought about – Fromm had been based at a sanatorium in Davos from 1932–4 and was thereafter frequently forced to seek sea and mountain air to aid his recuperation – meant that he was removed from regular contact with Horkheimer and therefore cut off from the kind of direct participation in the development of the Institute's research programme that had previously been the case. During this time of relative disconnection, Horkheimer's attitude towards Fromm and towards the interdisciplinary project itself had begun to shift. Such a shift was to become evident in Horkheimer's rejection of a prospective article Fromm wrote for the *Zeitschrift* in 1937 (the article has since been published, along with other previously unpublished works, by Rainer Funk (Fromm, 2010)). In a powerful piece of critical exposition, Fromm

demonstrated the central tensions and contradictions that afflict Freud's account of psychological functioning and which, thereby, undermine the very adequacy of its explanatory power. Taking issue with what he sees as the untenable sexual reductionism and bourgeois mechanicism that frame Freud's libido theory, Fromm called for a far-reaching revision that would restore 'the historical, that is to say, the social principle of explanation' (2010: 23) that he felt was ultimately missing in Freud. As part of his revision, Fromm worked through a critical exposition of Freud's account – of the Oedipus complex, of the psychology of women, of the role of the family, of the theory of the drives, and of the anal character as a stage in the predetermined process of psychosocial development – before offering an alternative interpretation based on a more thoroughly sociological and historical materialist basis. The nature of Fromm's revision is aptly summed up in a letter to Robert Lynd in the same year the unpublished essay was submitted. In the letter, Fromm outlined what he now saw as the task of psychoanalytic theory, namely: the attempt 'to understand the structures of character and instincts as a result of adaptation to the given social conditions and not as a product of the erogenous zones' (quoted in Funk, 2000: 93).

Horkheimer's rejection of the article is initially somewhat surprising, given his previous support for the interdisciplinary fusion of Marxist sociology and psychoanalysis that was the very basis of Fromm's position (see McLaughlin, 1999: 118–31; Abromeit, 2011: 34–8; and Durkin, 2014: 93–102 for discussions of the different facets of this situation). Despite seeming to follow the logic of historical materialist analysis – based as it was on sociological and anthropological considerations that challenged the patently ethnocentric and biologically reductive aspects of Freudian orthodoxy – Fromm's modification of Freud drew accusations of 'revisionism' from Horkheimer on the grounds that he was sliding into culturalism and dispensing with

the critical foundations of Freud's system. Horkheimer insisted, contrary to Fromm, on the retention of the libidinous drives as a somatic realm relatively out of reach of society – one which offers the critical function of opposing, reacting against, and therefore providing a perennial source of resistance to adverse social pressures.<sup>9</sup> More and more intent on carrying out his long projected social-philosophical 'dialectics' work, Horkheimer was in the process of striking up an increasingly tight theoretical and personal relationship with Theodor Adorno, seeing in him an aggressiveness and a 'maliciously sharp eye for existing conditions' that he felt was lacking in Fromm (Horkheimer to Adorno, 8 December, 1936, in Wiggershaus 1994: 162). As a result of these factors, alongside Horkheimer's refusal to publish the German-workers study and some personal issues relating to Fromm's request for financial assistance to secure his mother's passage to New York, Fromm finally left the Institute at the end of 1939.

### **ESCAPE FROM FREEDOM, 'PUBLIC INTELLECTUALISM', AND NORMATIVE HUMANIST CRITICAL THEORY**

One of the immediate consequences of Fromm's departure from the Institute was his exclusion from the type of financial and personal support that would have enabled him to further develop the social-psychological research programme to which he was so integral at the Institute (it would not be until 1970, with the publication of *Social Character in a Mexican Village* (Fromm and Maccoby, 1996 [1970]: 6), that Fromm would return to and expand upon his empirical work in the German-workers study<sup>10</sup>). Yet Fromm's first publication post-Institute – *Escape from Freedom*, which, for the first time, was written in English – was a clear thematic extension of the Institute's work on authority as found in

*Studies on Authority and the Family*. Appearing some two years after his leaving the Institute, the book can be seen in certain definite respects as the realisation of the proposed psychological study of 'Man in the Authoritarian State', which had been listed as part of the Institute's research programme in the prospectus of 1938 (Wiggershaus, 1994: 272). In its pages, Fromm developed his account of the basis of the contemporary authoritarian character, tracing its genesis back to the transition from the Middle Ages to the Renaissance and Reformation periods and to the diminution of priestly and monarchical power over the individual that characterises this transition. Fromm saw the development of increased individual freedom in fifteenth- and sixteenth-century Europe as simultaneously leading to heightened doubt, insecurity, and isolation, as taken-for-granted certainties and ways of interpreting the world became increasingly unfixed. His discussion here focused on the social changes and economic pressures unleashed upon the working and lower-middle classes during these periods and devotes extensive space to an exposition of the religious doctrines of Luther and Calvin considered in relation to these classes. The conclusion Fromm arrives at in this part of the book stresses the striking psychological correspondence between the unconscious authoritarian message of these doctrines – their stress on the 'wickedness of human nature' and, as he saw it, the insignificance and powerless of the individual – and the sadomasochistic need of the classes to which they primarily appealed. In as much as this is the case, the work is a direct extension of *The Dogma of Christ* – demonstrating Fromm's further development of the Marx–Freud synthesis.

After this historical preamble, Fromm moved the discussion forward to the present day and to what is the underlying concern of the work, namely: 'the meaning of freedom for modern man' (1969 [1941]: xiv). In this part of the discussion, Fromm recapitulated his earlier work on the growth of authoritarianism in Germany – the rise of

monopoly capitalism and the decline of the authority of the family, and the feelings of powerlessness and insignificance engendered by this – before moving on to look in some depth at the psychology of Nazism. His stress here was mostly on the appeal of Nazism to the lower-middle classes: that certain socio-economic and political changes – particularly the decline of the traditional middle class in the face of monopoly capitalism and hyperinflation, but also the defeat Germany suffered in the First World War and ensuing Treaty of Versailles – had a deep effect, removing traditional psychological bulwarks and mechanisms of self-esteem. As with the previous case of the adherents to Reformist Protestantism, these psychological changes led, Fromm contended, to deep feelings of anxiety and powerlessness, which Hitler was able to capitalise upon, his sado-masochistic messages of love for the strong and hate for the weak providing the means of escape from intolerable psychological burdens experienced on a mass basis. Just as in *The Dogma of Christ*, in *Escape from Freedom* we see the psychological identification of a particular class with the objective and subjective needs of their situation. In both cases, the ideological material that most clearly speaks to these objective and subjective needs is seen as deeply reflective of and, in fact, bolstering the original psychological proclivity. The point that Fromm was trying to communicate in both cases is that the influence any particular doctrine or idea will have in social life is dependent upon the extent to which it can appeal to the psychic needs of the character structure of the people to whom it is addressed. Only if the doctrine or idea answers powerful psychological needs common to certain social groups will it become a potent force in history – something that Fromm makes clear in his respective accounts of Hitler and of Luther and Calvin.

Importantly, Fromm's account of authoritarianism in *Escape from Freedom* extends beyond the authoritarianism so evident in the German situation to look at what he contends

is its presence in the American context. His analysis proceeds once more by expounding upon what he identifies as the socially patterned feelings of insignificance and loneliness that characterise American life. Consciously contradicting the much heralded individualism of the age, Fromm painted the individual American as fundamentally in thrall to gigantic forces that bear down upon and threaten it: from the alienating effects of the 1929 stock-market crash and contemporary forms of mechanised factory work to the prevalence of political propaganda and hypnoid forms of advertising, he saw the American individual as suffering from a 'loss of self' similar to that found amongst contemporary German citizens. But whereas the German citizen proceeds to 'escape' from this loss of self by flight into overt authoritarianism, the mechanism of escape predominant in American society is what Fromm termed 'automaton conformity', i.e. the tendency to conform and merge with the dominant cultural patterns and to follow the anonymous, internalised authority that encourages it. This form of compulsive conforming, in which the individual needs to continuously gain approval to avoid deeper insecurity and doubt at this loss of self, is, Fromm contended, the central affliction of the modern age. In an early example of the 'alternativism' that would come to characterise his later writings, Fromm was clear that the individual is increasingly faced with two choices: 'to escape from the burden of his freedom into new dependencies and submission, or to advance to the full realisation of positive freedom which is based on the uniqueness and individuality of man' (1969 [1941]: x).

*Escape from Freedom* was an immediate critical and popular success. Fromm quickly became a well-known name in his adopted homeland at a time when the other members of the Institute, who were much less confident writing in English, remained relatively unknown. *Escape from Freedom* was followed by *Man for Himself* (1947),

an ambitious attempt at a philosophically grounded psychology of ethics. This was followed by *The Sane Society* (1955) and by *The Art of Loving* (1956), the latter in particular becoming an international best-seller. Fromm's development of the notion of the 'marketing character' (which had first appeared in *Man for Himself*) and his critique of the affluent alienation of American society in these latter two works struck a chord with the cultural mood, during a period of rising self-and cultural-awareness. But despite Fromm's contribution to this reflective shift – a shift that would grow into the tumultuous 1960s – his popular appeal and other apparent lapses into supposedly 'existentialist' and 'psychologistic' phraseology drew the ire of his Institute ex-colleagues, who effectively accused him of regressing to a form of conformist idealism. This opposition took its most public and devastating form in a highly personal attack launched by Marcuse in *Dissent* magazine in 1955 and repeated again in *Eros and Civilization* later that year. Echoing earlier criticisms by Horkheimer and Adorno, Marcuse accused Fromm of 'mutilating' Freud's theory and of being little more than a 'sermonistic social worker' (Marcuse, 1966: 6). Marcuse's critique here came to be echoed by later critical-theory scholars such as Russell Jacoby (1977, 1983), and Fromm's reputation as a critical theorist was heavily compromised.

If, however, we look at critical theory as a pluralistic whole, with and against its branded identification, as this *Handbook* seeks to do, then it is clear that the criticisms mounted against Fromm by Horkheimer, Adorno, Marcuse, etc. are shot through with anomalies – these anomalies, in fact, pointing at areas of weakness in critical theory as canonically understood. Although the particular points of debate merit a fuller discussion than space allows here, it is clear that the characterisation of Fromm as 'conformist' or as a 'sermonistic social worker' is grossly unfair. The fact that Fromm wrote to a large audience in the form of a didactic practical

philosophy, and the fact that he devoted significant time to suggesting bridging solutions between the present and the future, in one sense surely compares favourably with Horkheimer's and Adorno's relative reticence on these matters. Books such as *The Revolution of Hope* (1968) and *To Have or To Be?* (2009 [1976]), which markedly stress ethical motivation and active transcendence of the structural forms of contemporary capitalism – on 'awakening' from the grip of alienated consumer capitalism – are in fact tied to Fromm's earlier critical theory, showing ways of uniting social psychological depth with prophetic criticism that can mobilise and engage individuals in a realm beyond that of the academy. Indeed, if what is meant by 'critical theory' at its most fundamental is the striving for greater self-awareness that can contribute to the task of emancipation, then Fromm cannot be seen as anything *but* a critical theorist. If anything, Fromm's writings after his break with the Institute take critical reflexivity in the service of emancipation to an even higher level. Certainly, it cannot be denied that his concerns in *Escape from Freedom*, *Man for Himself*, *The Sane Society*, etc. deal precisely with this issue – anticipating and chiming with Horkheimer's and Adorno's criticism of the 'culture industry' in *Dialectic of Enlightenment* (1944) and Marcuse's criticism of 'one-dimensionality' in *One-Dimensional Man* (1964).

The fact that Fromm conjoins philosophical – and, crucially, empirical – anthropology with social analysis in these works is not terminal to the materialist status of his account; it may, in the end, point at the greater progressive potential of Fromm's thinking and the avenues to which critical theory may wish to return in its future configurations. Indeed, part of what is important about Fromm's writing post-Institute is its clear and unequivocal normative nature. In these writings, Fromm seeks to ground critique on an explicit (and extensive) account of what it is that makes us human; he is positive and substantial where Horkheimer and Adorno, for instance, tend towards the

negative and elusive. Fromm's more fulsome account, which refers to *homo sapiens* in their relative stability as a recognised species of beings and which seeks to facilitate a more robust understanding of what it means to articulate an emancipatory interest, does not mar the dialectical nature of his account (Fromm too sees the future society as the result of a dialectic that will qualitatively change our nature as manifest); rather, it provides it with a didactic clarity that can be more easily employed at a time in which it has become increasingly difficult to advance the case that some particular social, economic, or political situation is *good* and that another is *bad* for human flourishing. This strong normative-ontological basis is something that tends to be occluded in the more canonical critical-theory texts, such as *Dialectic of Enlightenment*, and in later-generation theorists such as Habermas and Honneth. The practical consequences of this can be seen when we consider the more abstract formulations of Adorno's 'messages in bottles' approach or of Habermas' equally abstract regulative notion of the 'ideal speech situation'. In contrast to these accounts, which naturally have their merits and logic of application, Fromm proffers a more explicitly normative form of humanism based on a deep underlying commitment to a prophetic form of messianism that neither seeks for apocalyptic rupture nor consoles itself with the belief that the time for action has been missed (Braune, 2014; Durkin, 2014). The difference, then, is not one that resides purely at the level of theory, but one of praxis and dialectics – and, importantly, one which is increasingly being returned to and raked over in the always renewed struggle for the emancipated future that stands at the beginning of the critical-theoretical enterprise.

## CONCLUSION

One of the co-architects of the early programme of the Institute for Social Research,

Erich Fromm was central to the development of the interdisciplinary materialism which characterised critical theory in its germinal phase during the late 1920s and early to mid 1930s. Works such as *The Dogma of Christ* and 'Method and Function' were landmark contributions to the Marx–Freud synthesis that the Institute promoted during this period. His contribution to the 'Studies on Authority and the Family' and his work on the little-known study of German workers with which the Institute was engaged during the early 1930s helped to decisively set the agenda for later Institute work and the whole critical-theory preoccupation with authoritarianism. In addition to this, his *Escape from Freedom* was the first critical-theory-related work to reach widespread recognition, developing the early Institute concern with authoritarianism and popularising many of the themes that would later feature as leitmotifs in the critical-theory canon. *Escape from Freedom* was followed by works such as *Man for Himself*, *The Sane Society*, *The Art of Loving*, and *The Revolution of Hope*, as Fromm took a divergent path to the dominant 'negative dialectical' approach that was becoming emblematic of critical theory. The didactic practical philosophy that came to characterise Fromm's later works, and their appeal to a wide popular audience may, as the twenty-first century progresses, prove to be a more enduring ground upon which to base the critical theory of the future.

## Notes

- 1 Despite the fact that Fromm eventually came to lose this attachment, his work largely follows through, in a secularised form, the Judaic concern for right living, justice, and peace. His concern with 'idolatry' is central and integrated from a Judaic position through a psychoanalytic position to a Marxist position (Durkin, 2014: 51–2). Rainer Funk has also suggested more extensive commonalities between the Judaic tradition and Fromm's thinking (Funk, 1982: 183–204).
- 2 In his account of 'reified consciousness', outlined in the essay 'Reification and the Consciousness of

- the Proletariat' in *History and Class Consciousness* (Lukács, 1971), and particularly in his confrontation of the objective and subjective configuration of capitalist ideology as pertaining to the commodity form, we see Lukács challenging the shallow mechanism of the then orthodox Marxism.
- 3 There are extensive commonalities between Reich's early approach and that of Fromm, which, due to space, cannot be pursued here.
  - 4 Horkheimer's combination of psychological categories with detailed historical research so as to analyse and explain concrete historical developments was precisely the form of analysis that Fromm had pioneered in *The Dogma of Christ*, showing how the psychic structure of groups is constantly renewed in connection with their role in the economic process.
  - 5 In this address, Horkheimer stressed the need for the dialectical integration of philosophical questions with empirical social-scientific methodology. He called, in particular, for a multidisciplinary programme of research concerned with 'the question of the connection between the economic life of society, the psychological development of its individuals and the changes within specific areas of culture to which belong not only the intellectual legacy of the sciences, art and religion, but also law, customs, fashion, public opinion, sports, entertainments, lifestyles, and so on' (Horkheimer, 1989: 33).
  - 6 In Fromm's own words: 'Marx and Engels postulated the dependence of all ideological processes on the economic substructure. They saw intellectual and psychic creations as "the material basis reflected in man's head." In many instances, to be sure, historical materialism could provide the right answers without any psychological presuppositions. But only where ideology was the *immediate* expression of economic interests; or where one was trying to establish the correlation between economic substructure and ideological superstructure. Lacking a satisfactory psychology, Marx and Engels could not explain *how* the material basis was reflected in man's head and heart' (Fromm, 1970 [1932a]: 127).
  - 7 Fromm, at this time, was still a relatively orthodox Freudian for whom the libido occupied a central position in his explanation of the psyche. It is possible, however, to replace 'libido' for 'passionate forces of various kinds' which are rooted in character, as Fromm himself suggests in a footnote to the English translation of the piece (Fromm, 1970 [1932a]: 111n).
  - 8 Whilst Fromm was given directorial control of the study, he received significant assistance from Hilde Weiss – someone who had a more extensive practical and theoretical knowledge of social-scientific methodology – such that it cannot be ascertained precisely which parts of the research design stem from Fromm and which from Hilde Weiss (Bonss, 1984: 24).
  - 9 Although Fromm is generally taken to have erred in his revision relative to Horkheimer (Marcuse, 1955; Jacoby, 1977; Abromeit, 2011), it can be argued that this is not the case. Certainly, the critical view that Fromm took on the issue of the libidinal drives has come to be accepted as accurate in contemporary psychoanalysis (McLaughlin, 2000; Durkin, 2014). What is more, Fromm makes explicit reference to neuroscience and evolutionary psychology in many of his writings, something we do not see in Horkheimer, Adorno, nor Marcuse.
  - 10 The study itself commenced in 1958.

# Henryk Grossmann: Theory of Accumulation and Breakdown

Paul Mattick

## LIFE

Like most of the central figures of the Frankfurt Institute, Henryk Grossman came from a wealthy Jewish family: his father was 'a small industrialist and a mine owner'.<sup>1</sup> He was born in 1881 in Kraków, in the Austrian-Hungarian province of Galicia (transformed after the First World War into part of Poland). As a university student (enrolled in the law and philosophy faculties) he became involved in revolutionary politics, becoming active in the Polish Social Democratic Party and helping to found the Jewish Social Democratic Party of Galicia (unusually for someone of his class background, 'Grossman learned Yiddish, so he could agitate among Jewish workers'<sup>2</sup>). In 1908, however, Grossmann abandoned the life of a militant to study economics in Vienna under the academic Marxist Carl Grünberg. When in 1924 Grünberg moved to Frankfurt as first director of the Institute for Social Research established at the university there, Grossmann

became his assistant. His great book, *Das Akkumulations- und Zusammenbruchsgesetz des kapitalistischen Systems*, was published as the first volume of the *Schriften des Instituts für Sozialforschung*, under Grünberg's editorship, in 1929. Grossmann remained a paid associate of the Institute, following it to New York during the Second World War, until he became a professor of economics in Leipzig, (East) Germany in 1948.

## MARXISM

Without false modesty, Henryk Grossmann dedicated the last section of his survey of Marxism since Marx, written in the early 1930s for the *Wörterbuch der Volkswirtschaft*, to an exposition of his own ideas. It was also the longest treatment of an individual theorist, apart from his discussion of Marx's thought. This seemed appropriate as in the

period after the First World War it was Grossmann who, in his own words, 'undertook... to obtain new respect for the much-disputed fundamental idea of Marx's system', the breakdown of capitalism.<sup>3</sup>

This idea is fundamental because, as Grossmann explained in his *Wörterbuch* article on Marxism, Marx's theory of capitalism 'starts from the view that human history exists in incessant and always renewed change' (274), so that capitalism, which came into existence through the transformation of an earlier, quite different, form of society, would in turn lead to the creation of a new form of social life. 'This progressive process of transformation is however a matter not of chance, but of specific laws'; accordingly, the end of capitalism 'can only arise out of the development [of that system] itself' (274, 279).

As Grossmann's history of theory showed, a satisfactory understanding of this fundamental idea of Marx's was largely absent from socialist discussion. One reason for this was that, until the end of the nineteenth century, Marx's *Capital* existed 'only as a torso, as only one of several volumes' (281): Volume III of Marx's great work, containing the discussion of breakdown and crisis, was only published in 1894, and the *Theories of Surplus Value*, with its detailed discussion of the relation of Marx's theory to those of his bourgeois predecessors, in 1910. But even the parts of the first volume in which Marx theorized 'the historical tendencies of capital accumulation and the tendency for capitalism to break down to which they lead' (282) could hardly be understood in a period when 'capitalism had not yet reached that mature stage at which its breakdown and the realization of socialism could have had immediate reality'. (283) Instead Marxist theory, like socialist practice, was dominated by reformism, the shaping of radical ideas to the conditions of an expanding capitalism, in which it came to seem that this expansion would lead to socialism not because of the system's difficulties in functioning but

precisely because of its success, in the fruits of which the growth of socialist parties and trade unions would allow the working class to participate.

Reformist theory was proved an illusion, according to Grossmann, by the rise of imperialism, which brought with it 'a sharpening of domestic class conflicts' in the capitalist countries (306). The First World War led not only to a renewal of violent class struggle but even to the world's first successful communist revolution. With the October revolution, according to Grossmann, capitalism lost 'the aura of eternity and unshakeability, proving to be an historical, i.e. a transitory category' (323). The question of the end of capitalism had become concrete. At the heart of this question was 'the evaluation of the developmental tendencies of world capitalism' (327). Was the Soviet revolution peculiar to the backward condition of Russia as a 'weak link' in the capitalist system? Did the failure of revolution elsewhere signify that, as Karl Kautsky and others argued in 1928, capitalism was on the brink of a great upswing? Or was it, as others believed, that capitalism 'found itself in a period of downturn, which might be interrupted by short periods of transient stabilization, but as a whole pointed to a lasting sharpening of class antagonisms, which must in the end lead to a decisive struggle for power' (327)? Even if the foundation of the USSR could be understood as 'a symptom of and as the beginning of the breakdown of world capitalism' (328), an answer to this question required an analysis of the tendency to breakdown in the developed capitalist countries. This would be an examination, for the first time, of the validity of Marx's theory in *Capital*.

Grossmann thus explained his fitness to undertake this task, in a Marxian manner, by his historical position: on the one hand, as a committed Bolshevik, he recognized the historical obsolescence of capitalism; on the other, as a careful student of Marx's now published writings, he was in a position finally to grasp the contribution of the

theory in *Capital* to understanding the limits of the existing system. It was the latter aspect in particular – his comprehension of Marx’s method of analysis as worked out in the critique of political economy – that allowed him to make his particular, important contribution to the Marxist theory of crisis.

### **CAPITAL: CRISIS AND BREAKDOWN**

At the time when Grossmann entered it, the discussion of crisis by the Marxist left had been affected, after a delay, by the 1885 publication of Volume II of *Capital*. The revisionist insistence on the incorrectness of Marx’s dire predictions about the future of capitalism had acquired a solid theoretical foundation in the writings of those Grossmann called the ‘neo-harmonists’, like Rudolph Hilferding and Otto Bauer, who claimed that economic crises, caused by disproportionalities among the different branches of production, could be minimized – for example (in the former’s view), by the control over production made possible by the growth of industrial and financial monopolies. Such views built on Michael von Tugan-Baranowsky’s *Studien zur Theorie und Geschichte der Handelskrisen in England* (1901) and *Theoretische Grundlagen des Marxismus* (1905), which interpreted the reproduction schemas in Marx’s second volume as demonstrating the possibility of a proportionate, and so crisis-free, development of the capitalist system. Dividing the total capital of society into a department (I) producing consumers’ goods and another (II) producing producers’ goods, Marx showed algebraically that a condition for continuous accumulation was the exchange of products between the two departments at a particular ratio, in terms of the values of the products, given an initial distribution of investment in means of production and labor-power within and between the two departments. This seemed to disprove underconsumptionist

arguments for the inevitability of crisis, by showing that the expansion of Department II provided a market for the expansion of production beyond the consumption requirements of the working population.

Against such views, Rosa Luxemburg (and, afterwards, Nikolai Bukharin<sup>4</sup>) insisted – and in this Grossmann saw her great historical importance – that ‘the basic idea of *Capital*’ is the existence of ‘an absolute economic limit to the further development of the capitalist mode of production’.<sup>5</sup> For Luxemburg, as for Grossmann, only this could give the idea of socialism scientific meaning, making it not just an ethical ideal on the part of theorists or activists but a discernible trend in the history of modern society. Accordingly, Luxemburg argued that Marx’s reproduction schemas were ‘full of hot air’.<sup>6</sup> If equilibrated growth depends on sales within Department II – that is, on trade between capitalists – how are the latter to transform the surplus-value contained in their products into the money needed for this operation? Though it looks easy on paper, Luxemburg objected, in the real world capitalists require a non-capitalist market to realize (transform into money) the surplus produced by their employees if accumulation is to proceed. But trade with the non-capitalist environment of an expanding capitalism can only lead to further expansion and so to the eventual closing off of this essential market. Hence Marx was correct to insist in the first volume of his *magnum opus* that capitalism was doomed to collapse; the contradictory argument derivable from the second volume is actually an error.

While Luxemburg was right to insist on the historical limits of capitalism’s existence, Grossmann argued, the argument she gave was faulty. The problem was the focus she shared with her theoretical and political antagonists on the reproduction schemas. Marx’s schemas are formulated in terms of labor-time values, but exchanges in the real world are made in terms of prices, which – Marx himself argued in Volume III

of *Capital* – must differ systematically from values. Therefore, Grossmann asserted, ‘Whether one argues for the necessity and inevitability of crises under capitalism, or, as the neo-harmonists do, for the possibility of crisis-free progress, it is clear that any deductions drawn from a value schema must be premature and inconclusive’.<sup>7</sup> Such deductions misunderstand the basic nature of Marx’s theorizing, in particular the use made in *Capital* of the labor theory of value.

Curiously, it was in the very same reproduction schemas that Grossmann believed he had discovered the key to understanding Marx’s theory of crisis. In an essay published in 1929 Grossmann argued that Marx had altered his plan for the writing of *Capital* as a result of his discovery of the reproduction schema in 1863. Since capitalism’s vitality depends on the growth of capital, the dominant form of social wealth, Marx’s goal was an analysis of the ‘law’ regulating the accumulation of capital, the process by which surplus product, transformed into money, serves to increase the capital invested in means of production and labor-power. Understanding the dynamic of accumulation requires understanding what determines the growth of surplus-value and the conditions for its utilization as additional capital. Marx’s original plan of study began with the empirically given forms of capital – industrial, commercial, financial – but this approach proved unusable because of the extreme complexity of the capitalist economy, in which surplus-value produced by the employees of industrial capitalists has to be shared with commercial and financial capitalists, as well as with landlords and the state, in forms (mercantile profit, interest, rent, taxes) that seem to alter the value of a product or to be costs of its production. The solution which came to Marx in the course of trying to represent the relation between the two departments of production in the reproduction of the system as a whole was to reformulate his analysis of ‘the capitalist process of surplus-value production’ in terms of ‘the common, general category of capital as

such’,<sup>8</sup> abstracting from the particular forms of capital and their interactions and reducing the picture of modern society to the relation between industrial capitalists and productive workers, as though these exhausted the totality of economic relations.

The resulting, highly unrealistic model also solved the methodological problems raised by the divergence of prices from values caused by competition between capitalist firms, their efforts to achieve equal rates of profit measured against their total capital investments. According to the labor theory of value, surplus-value, the substance of profit, is generated only by labor, when workers work for a longer time than that necessary to reproduce their means of existence. Firms with larger shares of investment devoted to means of production – in Marx’s terminology, with higher compositions of capital – would therefore earn profit at lower rates than those with larger shares of investment in labor-power, if goods were sold at their values. By abstracting from the effects of differences in composition, thus pretending that goods exchange at their values, as well as by excluding the consideration of the multiple forms of capital investment from his initial analysis, Marx could formulate a theory of the determination of surplus-value in relation to the total capital investment of society.

The greatest significance of this procedure was that it allowed Marx to explain what he called ‘the most important law of capitalist economy’, the law of the tendency of the rate of profit to fall.<sup>9</sup> If the stability of capitalist society – its apparent naturalness and inevitability in the eyes of its members – depends on the success of capital accumulation (bringing an expansion of employment and improvement of standard of living along with greater labor productivity) this in turn depends on the sufficiency of profits to make accumulation possible – that is, on the adequacy of the surplus-value generated relative to the capital already invested. Although the tendency of profitability to decline had been sensed by the classical economists, they had been unable

to provide an adequate formulation of it. This is because

[t]he movements of the empirically visible parts of income without labour temporarily and for specific parts of surplus value run counter to the *general tendency of the movement* (or, as it is put today, the 'secular trend line') of surplus value and by the mediating movement of circulation. All those who see only the *partial* movements of surplus value, e.g. the large profits of *individual* branches of production and not the relations of society as a whole... therefore dispute the fact of the fall in the rate of profit.<sup>10</sup>

Since the law 'is a self-evident consequence of the labour theory of value if accumulation takes place on the basis of a progressively higher organic composition of capital'<sup>11</sup> it requires for a convincing statement a representation of the capitalist economy in value terms – that is, with the degree of departure from the complications of reality to which Marx adhered in *Capital*.

We know now, as Grossmann could not have, that his theory of the alteration of the plan followed in the writing of *Capital* was incorrect. The 1939 publication of the *Grundrisse*, the rough draft Marx wrote in 1857–8, contains both a first sketch of the reproduction schemas and Marx's determination of his object of study as 'capital in general', rather than the 'many capitals' of empirical reality.<sup>12</sup> But while his philology was mistaken, Grossmann's insight into Marx's methodology was both correct and fundamental. Marx himself stressed in the preface to *Capital* that because 'in the analysis of economic forms neither microscopes nor chemical reagents are of any use', the 'power of abstraction must replace both'.<sup>13</sup> As Grossmann explained, Marx began his study with a radically idealized model of the capitalist production of surplus-value, reducing the population to capitalists and industrial workers in a closed economy without foreign trade, merchants, bankers, or the state, with prices calculated in terms of quantities of gold (rather than the credit and fiat money that Marx knew to be basic to capitalist reality).<sup>14</sup>

Marx had made this clear for himself in the draft of *Capital* written in 1861–3: his analysis, he noted,

need only consider the forms which capital passes through in the various stages of its development. The real conditions within which the actual process of production takes place are therefore not analyzed. It is assumed throughout, that the commodity is sold at its value. We do not examine the competition of capitals, nor the credit system, nor the actual composition of society, which by no means consists of only two classes... and where therefore consumers and producers are not identical categories. ... Nevertheless... the examination of the general nature of capital... reveals [the possibility of crisis]... clearly.<sup>15</sup>

Grossmann was the first to understand this key feature of Marx's methodology and to make it central to the explanation of capitalism's crisis tendency. As he put it in the introduction to his *Akkumulations- und Zusammenbruchsgesetz* of 1929, 'People forget the basic rule of all scientific investigation, that every result that still seems interesting is worthless if we don't know the path by which it was won'. This is especially important, he observed, in a case like Marx's, as it provides the only way in which differences of interpretation can be decided.<sup>16</sup>

The goal of Marx's investigation, Grossmann emphasized, was 'the exploration and understanding of the concretely given totality of' the phenomena of capitalist society<sup>17</sup> – that is, not just the possibility of crisis but the particular forms taken by particular crises. The 'law of motion' identified in the value analysis is significant only in so far as it has causal effects in observable reality. Its having such significance is, of course, dependent on the possibility of making the representation of the economy more realistic while preserving the basic relations exhibited in the idealized model. In Grossmann's words, 'The decisively important "task of science" is thus to find the "mediations", the "intermediary stages", which lead from the essence [i.e., the basic structures of the model] to the concrete phenomenon'.<sup>18</sup>

This is why Marx spoke of his depictions of 'the configurations of capital' in the third volume as approaching 'step by step the form in which they appear on the surface of society... in competition, and in the everyday consciousness of the agents of production themselves'.<sup>19</sup>

Grossman described Marx's procedure as one of 'approximation': first, 'applying numerous simplifying assumptions' to create an abstract representation that is then made more phenomenally descriptive by the addition of more specific features, such as the difference between mercantile and industrial capital.<sup>20</sup> The theory of the tendency of the profit rate to fall therefore needed to be concretized, to give it purchase on the unfolding history of the social system. In particular, as we will see, this was accomplished by its transformation into a theory of the crisis cycle. In Grossmann's eyes, it was the exploration of the 'mediations' between the idealized theory and economic experience that explains the striking dualism of Marx's theory, which both proposes an explanation of the business cycle, with its recurrent episodes of crisis, as a normal feature of capitalism and predicts an inherent limit to this social system's development – a breakdown.

The breakdown, Grossmann claimed to demonstrate, followed inevitably from the mechanism of accumulation in Marx's idealized model. The chief force driving this process, the tendency of the rate of profit to fall, is a consequence of the requirement to expand imposed upon every capital entity by the need to appropriate as much as possible of the surplus-value produced by the system as a whole. Expansion – capital accumulation – would involve, Marx predicted, a tendential increase in capital invested in means of production relative to that invested in labor-power. From the point of view of the individual firm, this is a means to lower costs; with regard to the system as a whole, it (directly or indirectly) decreases the value of labor-power and so raises the rate of exploitation, increasing the quantity of value appropriable

by capital entities as profit. The long-term effect must, however, Marx argued, be a decline in the surplus-value produced per unit of capital invested (the rate of profit), since value is produced only by labor and 'the compensation for the reduced number of workers provided by a rise in the level of exploitation of labour has certain limits that cannot be overstepped'.<sup>21</sup> Thus 'the rise in the rate of surplus-value and the fall in the rate of profit are simply particular forms that express the growing productivity of labour in capitalist terms'.<sup>22</sup> In Marx's view, this process is self-reinforcing: even apart from the competitiveness inherent in a system of independent firms, each of which is striving to maximize profitability, the tendential decline, relative to total capital investment, of the total surplus-value available for division between those firms exerts pressure on each of them to increase profitability by cost-cutting.

Grossmann illustrated this process in a polemical fashion, by starting with the dynamic reproduction schema devised by Otto Bauer precisely to show, in opposition to Rosa Luxemburg's theory, that capitalism was capable of crisis-free development.<sup>23</sup> Bauer believed that the growth of the working population limited capital accumulation, and that in fact conflicts between investment decisions and population growth were the source of the cycle of prosperity and depression characteristic of capitalist history. Neither this cycle nor the tendential fall of the profit rate, however, held for Bauer any threat of an eventual collapse of capitalism. The profit rate falls as Bauer's schema progresses through time, but capital continues to accumulate, in fact at an increasing rate. This is, as Grossmann notes, 'because the extent of accumulation develops not in relation to the height of the profit rate but in relation to the weight of the previously accumulated capital'.<sup>24</sup> The existing scale of investment, for both technical and value-related reasons, determines the minimum practical further investment. It is the mass of profit available, whatever the rate at which it

is produced, that determines the accumulation possibilities.

But as the rate falls, eventually the mass will grow at a rate too small for continued accumulation. For the total capital to expand, surplus-value must be invested in additional means of production and the hiring of additional labor-power, at scales commensurate with the existing investment and the changing productivity of labor; in addition, some must go to capitalists' consumption, if the capitalist class is to continue to exist. Bauer had demonstrated to his satisfaction capitalism's capacity to meet these objectives by working out the numbers for his reproduction schema for four successive years. Grossmann demonstrated that he had simply not gone far enough: by the 34th year of Bauer's schema capitalist consumption declines, only to vanish the following year; the 36th year finds uninvestable (because insufficient) surplus-value, on the one hand, and an unemployable 'reserve army of labor', on the other. This is the situation Marx calls the over-accumulation of capital: an

undermining of the capitalist mechanism, with its economic finish. Accumulation would be, for the class of entrepreneurs, not only pointless, it would be *objectively impossible*, because the over-accumulated capital would lie fallow, could not be made functional and would yield no valorization, no profit.<sup>25</sup>

At this point, the fall in rate of profit would be accompanied not by an increasing mass of profit, as earlier, but by a declining quantity of profit. From expanding, the capitalist system would contract: break down. As it approached this point, the declining mass of profit would produce struggles over its allocation between wages and capitalists' consumption, along with struggles among capitalists for cheaper raw materials and markets for their productions. The path to breakdown would be the scene of class struggle and imperialist war.

Of course, Grossmann could not rest his argument on Bauer's schema, with its

particular assumptions; it provided only an illustration of the general case, presented for mathematicians in an algebraic argument, 'free from the contingencies of a concrete arithmetical schematic example'.<sup>26</sup> Further, the schema borrowed from Bauer, made in value terms and ignoring the use-value constraints on systemic reproduction, 'is not able to represent the *real* accumulation process'.<sup>27</sup> This is equally true of Marx's idealized model of capitalist accumulation, which is intended to show that an equilibrium growth path would lead to systemic breakdown.

Applying the theory to the understanding of historical experience requires concretization, the introduction into the theoretical description of aspects of the system from which abstraction was originally made. What Grossmann was the first to grasp was that Marx's concretization of his model of accumulation transformed it into a theory of the business cycle.

In his discussion of declining profitability in *Capital*, Marx mentions, without much elaboration, a list of factors counteracting his law: the temporary effects of productivity increases, the reduction of the value of labor-power, the cheapening of constant capital, foreign trade, and even the unproductive use of capital in speculation. Marx's treatment of the 'counteracting factors' shows little sign of careful reworking; indeed it seems to have been largely taken over from J.S. Mill's discussion of bars to declining profitability.<sup>28</sup> Thus under the heading of 'foreign trade', we find both the cheapening of constant capital and an increase in the rate of surplus-value, already discussed under those headings. On the other hand, the discussion here clarifies the concretization of the idealized model required to bring its representation of social development closer to historical actuality. Thus, to the idealized model capitalism that generates the law of declining profitability corresponds in reality to a world economy in the form of diverse nations, at different levels of capitalist development. The pressure on profitability operating in a relatively

developed area may be eased by sales to and purchases from relatively undeveloped areas, in which 'the labour of the more advanced country is valorized ... as labour of a higher specific weight' – that is, 'labour that is not paid as qualitatively higher is nevertheless sold as such'.<sup>29</sup> This increases the average profitability (while concentrating the higher profits in the more developed area). To take another example, Marx notes that paying wages below the value of labor-power, which 'has nothing to do with the general analysis of capital, but has its place in an analysis of competition', is 'one of the most important factors in stemming the tendency for the rate of profit to fall'.<sup>30</sup> When we add such factors to 'the general analysis of capital', we see why the 'law of motion' that Marx thought explained the experienced pattern of capitalist development 'operates ... as a tendency, whose effect is decisive only under certain circumstances and over long periods'.<sup>31</sup>

In speaking of 'long periods' Marx means that the counteracting factors cause the developmental path of capitalism to fluctuate around the trend defined by the tendential fall of the profit rate. That trend should still lead, therefore, to what Marx called 'an absolute overproduction of capital', which would be reached at the moment when the mass of surplus-value produced at the new low rate of profit would be insufficient for further accumulation given the existing scale of investment. At this point, therefore, 'no further capital could be employed for the purposes of capitalist production', i.e., of producing accumulable surplus-value. This moment would mark the end of capitalism as a social system governed by the drive to accumulate.

But this picture of the future of capitalism still requires a high degree of idealization. Marx de-idealizes further by depicting this trend as inflected not only by Mill's counteracting factors but by systemic crises. Mill too, despite his Ricardianism, saw recurrent crisis as a feature of the capitalist economy. For him also, 'the waste of capital in periods

of over-trading and rash speculation, and in the commercial revulsions by which such times are always followed' is both 'a consequence of the... tendency of profits' to fall and chief among the circumstances counteracting that tendency.<sup>32</sup> Mill derives the fatal tendency from a Ricardian argument that the growth of capital leads inevitably to an increase in wages, which, by the supposed laws of distribution, drives down profits.<sup>33</sup> Accordingly, he explains the return of prosperity as aided by speculative losses or foreign investment 'sweeping away from time to time a part of the accumulated mass by which they are forced down'.<sup>34</sup> These factors, however, would be insufficient to restore adequate profitability without increasing productivity, which will bring higher profits so long as it does not 'raise, to a proportionate extent, the habits and requirements of the labourer'.<sup>35</sup>

For Marx, in contrast, there is no inherent conflict between profitability and stable or even increasing real wages. This, in fact, is why he presented his law on the assumption of a constant rate of surplus-value: to derive the decrease in profitability endogenously from the process of accumulation itself. The rate of profit falls because the portion of social capital invested in labor-power falls relative to total capital. It requires the restructuring of this relationship in order for accumulation to proceed. Looked at in abstraction from the complexity of the economic system, this process leads to the long-term 'historical tendency' discussed above. Within this long term, 'certain circumstances' under which the process takes place produce near-term manifestations of the tendency.

These 'circumstances', which will be different at different historical moments, have in common, in Marx's analysis, that they are manifestations of a conflict between the development of labor productivity, to which capital is driven in the struggle for surplus-value, and the need to maintain the capital value already invested, even while it is being devalued as a result of the continuing progress of productivity. The ongoing devaluation

of capital ‘disturbs the given conditions in which the circulation and reproduction process of capital takes place, and is therefore accompanied by sudden stoppages and crises in the production process’.<sup>36</sup> Some firms continue to make sufficient profits under these circumstances, while others, unable to meet demands from creditors or to see produced goods at sufficiently high prices to continue operations, go under. ‘The portion of capital that exists simply in the form of future claims on surplus-value and profit... is devalued simultaneously with the fall in revenues on which it is reckoned’. Money ‘lies idle and does not function as capital’. The sale of commodities at prices below their original sales prices likewise represents a destruction of the capital value that produced them, since it cannot be reconstituted. And in the same way ‘the elements of fixed capital are devalued’.<sup>37</sup> All this, by lowering the composition of capitals, makes possible an increase in profitability and a resumption of capitalist growth. (At the same time, typically, rising unemployment leads to a fall in the value of labor-power and so to a rise in the rate of exploitation, which also increases profitability.) A crisis, although experienced by capitalists and workers alike as a calamity, is thus a solution (however temporary) to the underlying problem of insufficient profitability, at least for those firms that survive.

The latter point is particularly significant, as can be seen if we consider the same subject in terms of the concept of ‘organic composition’ of capital. Marx defines the ‘technical composition’ as the relation between quantities of use-values – specific types of means of production, on the one hand, and particular types of labor, on the other – involved in the production process, and the ‘value composition’ as the relation between the quantities of money invested in production goods and labor-power. To capture the close historical relationship between the two, he calls ‘the value-composition of capital, in so far as it is determined by its technical composition and mirrors the changes in the latter, the organic

composition of capital’.<sup>38</sup> To the extent that a period of depression, through such phenomena as bankruptcy sales, lowers the cost of means of production (along with that of produced goods) it decreases the value composition of capital independently of the technical composition. This can occur because value is a socially constructed, not a natural, property of commodities: the labor expended in producing them *as represented by the price system*. Just as commodities for which there is no effective demand have zero value – contain no socially necessary labor time – even in good times, so commodities for which the advent of bad times has brought decreased demand lose value, so that, *ceteris paribus*, their prices decrease.

This, so to speak, resets the value relations of capital, so that the tendential increase in the organic composition (which continues to occur in depression periods, normally characterized by technologically induced – and fear-induced – increases in the productivity of labor) starts again from a lower level. In this way, as Grossman puts it, ‘the breakdown as the natural “basic tendency” of the capitalist system decomposes into a series of cycles apparently independent of each other, in which the breakdown tendency sets in anew only *periodically*, like the natural growth process of wool, which is broken by every shearing only to begin again’.<sup>39</sup>

Grossman’s metaphor is not in accord with the diagram of the crisis cycle included in his book, in which the starting point of each upturn from a level of capital investment lowered by crisis-induced devaluation is nevertheless higher than the one before. This is a question of importance, for the diagram, unlike the metaphor, suggests a trend working its way through a cyclical process. But must things be in accord with the diagram? A negative answer to this question is proposed, for example, by Andrew Kliman:

The destruction of capital value through crises is a recurrent phenomenon. The restoration of profitability that this destruction brings about is therefore a recurrent phenomenon as well. Because of

this, the rate of profit does not have a determinate secular trend throughout the entire history of capitalism, and efforts to deduce or predict such a trend are futile.

Specifically, if 'capital value has been destroyed on a massive scale, the peak rate of profit in the boom that follows is likely to be *higher* than the previous peak'.<sup>40</sup> From this point of view, the cyclical process can disrupt – and Kliman believes, has disrupted – the secular trend.

Since Kliman offers no evidence to support his opinion, it seems to be pure speculation on his part. One might just as well guess that the continual rise in the technical composition of capital since the inception of the industrial revolution has been so gigantic, in all major industries, that periodic devaluations, even on the large scale of recent depressions, could hardly return the total capital investment, against which the rate of profit must be measured, to the levels holding at the start of the previous upswing. Kliman suggests that 'if major slumps become increasingly frequent, the tendency for the rate of profit to fall between slumps has less and less time in which to operate, so it is as likely that trough rates of profit rise over time'.<sup>41</sup> But, apart from the fact that no argument is offered relating depth of devaluation to length of slump, an increasing frequency of slumps may also suggest an insufficiency of slump-induced devaluation – in fact, I believe something like this is likely to have been true in the years since the mid 1970s – and so a failure of the profit rate to recover significantly.

The growth of the composition of capital over the first three quarters of the nineteenth century seemed to Marx so obvious that, as he put it, what has to be explained is not a fall in the profit rate but 'why this fall is not greater or faster'.<sup>42</sup> Grossman also noted, in an unpublished manuscript, that 'the experience of more than one hundred years... teaches that the *value* of constant capital... in relation to variable capital grows *more quickly* than variable'.<sup>43</sup> It is perhaps more

significant that the numerous non-Marxist researchers who have attempted to trace changes in what economists call the capital–labor ratio, despite the inherent limitations of economic statistics and the particular problem of defining a standard of price measurement holding over long periods and across different national currencies, have come to an analogous conclusion, although in terms of prices rather than values. One authoritative example can be seen in Table 2.2 of Angus Maddison's *Monitoring the World Economy, 1820–1992*: 'Stock of Machinery and Equipment and Non-Residential Structures per Person Employed, Six Countries, 1820–1992'. Maddison concludes from his data that there 'seems no doubt that high rates of capital accumulation, and high and increasing levels of capital per worker were a necessary condition for the productivity increases achieved in the capitalist epoch'.<sup>44</sup> The empirical data, such as they are, are clearly at least compatible with Marx's prediction of a tendential increase in the value composition of capital.

Of course, if capitalism's history had not taken the course prescribed for it by Marx's 'law of motion' – if the increasing productivity of labor due to mechanization had not been accompanied by crisis phenomena, the concentration and centralization of capital, and the generation of a reserve army of labor – we would have had good reason to believe that the available data for the capital–labor ratio did not echo, at whatever distance, the changes Marx expected in the organic composition of capital. But so far, at least, history seems in accord with Marx.<sup>45</sup>

While declining profits, market gluts, and bankruptcies are the real-life forms in which capitalists experience Marx's value-theoretic breakdown tendency most sharply, that tendency affects the working class directly in the form of what Marx calls 'the progressive production of a relative surplus population'. Both sets of effects are aspects of the continuing accumulation of capital, which involves 'a progressive qualitative change

in composition, i.e.... a continuing increase of its constant component at the expense of its variable component'.<sup>46</sup> Despite the continuous increase in the employed population, its numbers fall relative to total capital investment. This process is most visible at moments of crisis, as 'the path characteristically described by modern industry... [with] periods of average productivity, production at high pressure, crisis, and stagnation, depends on the constant formation, the greater or less absorption, and the re-formation of the industrial reserve army or surplus population'.<sup>47</sup> But this cycle of employment and unemployment itself is the manifestation of a trend, towards the increase of the 'industrial reserve army' of unemployed:

The same causes which develop the expansive power of capital also develop the labour-power at its disposal. The relative mass of the industrial reserve army thus increases with the potential energy of wealth. But the greater this reserve army in proportion to the active labour army, the greater is the mass of a consolidated surplus population, whose misery is in inverse ratio to the amount of torture it has to undergo in the form of labour. The more extensive, finally, the pauperized sections of the working class and the industrial reserve army, the greater is official pauperism. *This is the absolute general law of capitalist accumulation.*<sup>48</sup>

It was Grossman's opinion that the falling rate of profit, a phenomenon of the global capitalist system, manifested itself serially in different countries, with its effects visible in the eighteenth century in Holland, in the 1820s in England, and in the 1860s in France.<sup>49</sup> The United States was, in his view, similarly affected after the First World War, and surely Grossman saw the Great Depression, which broke out in the United States in the same year as his magnum opus was published, as a confirmation of this judgment. This is an interesting speculation, which merits further examination.<sup>50</sup> At the same time, given the ever closer integration of the world's nations into what gradually emerged as a world market for commodities and capital investment, the international

character of crises became stronger. In addition, the breakdown tendency manifested itself in the strengthening of imperialism in the early twentieth century, as states – nationally organized capitals – competitively strove to overcome the effects of declining profitability by extracting surplus-value from other nations.<sup>51</sup>

While a crisis is 'a *healing process* from the standpoint of capitalist production',<sup>52</sup> it is only a momentary break in the movement towards breakdown. If at some time the counter-tendencies should be weakened or cease to operate, 'the breakdown tendency would win the upper hand and achieve *absolute* recognition as the "final crisis"'.<sup>53</sup> In this situation, the only way out for capitalism would be the absolute immiseration of the working class, a lowering of wages so far below the historically achieved value of labor-power that the reproduction of the working population would be called into question. The development of capitalism would have led to 'the unfolding and sharpening of the inner contradictions between capital and labour, which can only be overcome by the *struggle* between the two'. The capitalist offensive against the working class is 'a symptom that capitalism has overstayed its time'.<sup>54</sup>

## A NEGLECTED THEORY THAT EXPLAINS OUR TIMES

Grossmann was mistaken in thinking that the 1930s had ripened the time for the reception of Marx's breakdown-and-crisis theory. He was mistaken about the nature of the Soviet regime: the inauguration of the first five-year plan marked not the construction of socialism but the stabilization of a new form of exploitative class society inaugurated by the Bolshevik revolution. Marxism in Russia became nothing but an ideology serving the needs of the regime. In Western Europe, Japan, and America, the Great Depression of which Grossmann's book was a sort of

announcement produced not revolutionary movements but state management of the economy in the interest of imperialist war. The thirty years of prosperity that followed the depression and the Second World War provided inhospitable soil for speculation into the breakdown of capitalism, at least until the weakening of the post-war prosperity in the late 1960s.

Thus it happened that Grossmann had only one important theoretical follower. Rejected not only by the official Marxist economists subservient to the USSR but also by his colleagues in the Frankfurt Institute for Social Research, as they moved away from Marxism to the Critical Theory evolved in their US exile,<sup>55</sup> his work came as a revelation to Paul Mattick, an émigré German tool and die maker in Chicago.<sup>56</sup> For Mattick, Grossmann's work provided both the key to the understanding of Marxian theory and an analysis of the world crisis of the 1930s, which seemed to be the 'final crisis' of capitalism,<sup>57</sup> leading inevitably to the choice between 'an insoluble, irrational crisis, or a new world-scale butchery'.<sup>58</sup> After the butchery that turned out to be the world's choice laid the groundwork for the post-war Golden Years of capitalism, Mattick took Grossmann's interpretation of Marx as a starting point for an analysis of the 'mixed economy', in which Keynesian methods had apparently overcome the breakdown tendency. His chief foray into Marxian theory, *Marx and Keynes*,<sup>59</sup> which predicted the limits of the mixed economy, can be seen as an elaboration of a passage in *Das Akkumulations- und Zusammenbruchsgesetz*, where Grossmann acknowledges that military spending by governments can increase the profits of individual concerns but represents only unproductive, non-profit-producing, consumption from the standpoint of the total social capital, in which value is 'destroyed instead of "saved," that is, invested as return-yielding capital'.<sup>60</sup>

Although since the 1970s there has been a revival of interest in Marxist circles about the tendency of the rate of profit to fall,

Mattick has been almost alone in insisting on Grossmann's distinction between the highly idealized model which predicts the tendency and the realities of capitalist development in which its effects can be identified.<sup>61</sup> He was also unusual among contemporary Marxists in refusing to substitute alternative formulations for Marx's in examining such questions as the value-price transformation or the analysis of the social surplus. The near uniqueness of Mattick's position suggests the idea that Grossmann's very orthodoxy in Marxian theory has paradoxically given his work a heterodox character in relation to the norm of contemporary academic Marxist economics and socialist thinking.

Meanwhile, the prosperity made possible by the economic and physical destruction effected by the Great Depression and the Second World War was, even at its highest point, the late 1950s, insufficient to obviate the need for government stimulus to maintain something approaching full employment. Government spending, on the other hand, was not able to eliminate 'official pauperism', as the failure of the American 'War on Poverty' demonstrated. Exactly as Marx's value-theoretic model suggests, the increased productivity of labor making possible the post-war growth of private capital continued to involve a displacement of labor from employment. This feature of capitalist development was accentuated when the post-war prosperity came to a definitive end in the mid 1970s, leading to a durable increase in unemployment in Europe and a tendential weakening in the American labor market. As a specialist on the topic observed more than a decade ago, the 'perceptible rise in [European] unemployment in the mid-1970s marked the beginning of a new phase' in which 'elevated unemployment rates are the reflection... of the definite decline of the [post-war] epoch of full employment'.<sup>62</sup> The current downturn has brought these conditions to the United States as well as raising levels of unemployment throughout the world.

If we attend specifically to the workers involved in Marx's theoretical model, which focuses on those whose labor is given social definition as value and surplus-value, 'the last 30 years have witnessed a global stagnation in the relative number of industrial workers'. It is only 'a low-wage service sector' that 'has made up the difference in the high GDP countries alongside an unparalleled explosion of slum-dwellers and informal workers in the low GDP countries'.<sup>63</sup> As the authors of the insightful text just cited also observe, this so-called deindustrialization – which has involved not so much a decline in industrial production as in the numbers of workers, relative to capital investment, needed to perform it – has been an international tendency, operating in the underdeveloped as well as the developed countries.

At the same time, the economic growth made possible by the increase in the rate of exploitation achieved by the combination of lowered global wage levels and technologically enhanced labor productivity has clearly not involved a growth in profits sufficient to employ increasing numbers of the masses of people being thrown onto the mercies of the labor market or to satisfy their needs unproductively. In the words of a recent survey,

Between 1973 and the present, economic performance in the U.S., Western Europe, and Japan has, by every standard macroeconomic indicator, deteriorated, business cycle by business cycle, decade by decade (with the exception of the second half of the 1990s). Equally telling, over the same period, capital investment on a world scale, and in every nation except China, even including the East Asian [Newly Industrialized Countries] since the middle 1990s, has been growing steadily weaker.<sup>64</sup>

As a result, according to the United Nations' *Human Development Report 2004*, 'an unprecedented number of countries saw development slide backwards in the 1990s' – before the current downturn. 'In 46 countries people are poorer today than in 1990. In 25 countries more people are hungry today than a decade ago'.<sup>65</sup> To take only one example of this trend, the mass pauperization of

the population in the formerly 'socialist' countries after 1989 led, by one estimate, to an increase of those living in extreme poverty from 14 to 168 million.<sup>66</sup>

Alongside these surplus people we find surplus capital – that is, capital that cannot be profitably invested in the production of new surplus-value. Here again, Grossman's development of Marxian theory, formulated on the basis of economic history up to the early twentieth century, has been strikingly vindicated by developments of the most recent period. Speaking of 'unemployed capital', unable to find investment opportunities, he observed that 'because it cannot be utilized within the sphere of production, capital is exported or – from the viewpoint of production – directed towards "internal export", the streaming of unemployed money into speculation'.<sup>67</sup> This function of financial speculation – to create 'a profitable "investment" for over-accumulated capital'<sup>68</sup> – is accompanied by speculation in real estate,<sup>69</sup> to which we can now add all the other asset classes on the basis of which bubbles can be developed, from commodity futures and more arcane derivatives to fine art. And just as capital flowed into speculation instead of into productive investment, producing the effect of temporary prosperity by means of a series of bubbles, working-class living standards were maintained only by the massive growth of consumer debt, culminating in workers' participation in the mortgage bubble of the early twenty-first century.

Like the growth of state debt and the welfare state, the difficulty we see today in doing away with them registers the decline of the private enterprise economy. Despite its dynamism and the gigantic increases in the productivity of human labor that it has achieved since the early nineteenth century, and despite the disappearance of political and social barriers to its spread in the course of the twentieth, capitalism has not been able to generate the quantities of profit required to incorporate much of the world's population into its modern industrial form. The failure

of the non-financial parts of the economy to expand sufficiently showed itself in 2008 in the near collapse of the whole Rube Goldberg device of cantilevered finance. For the same reason, the massive increase in government spending that avoided a return to depression conditions after the mid 1960s led not to a steady flow of profits from a now primed pump but to today's increasingly problematic state deficits.

Is this to say that the current crisis cycle has moved capitalism to the point of breakdown, in the sense of self-destruction? No, because today, as at all earlier moments, capitalism's fate ultimately depends (as Grossman himself insisted<sup>70</sup>) on the willingness of human beings to engage in the difficult struggles needed to overthrow existing relations of social power and create new forms of production and consumption. In the absence of revolutionary action on a scale sufficient to wrest control of the means of production from their current owners – and in the absence of the destruction of the material conditions for its existence by ecological catastrophe – capital can in principle gain yet another lease on life through the radical restructuring of capital ownership, and in its relationship to the owners of labor-power – a process likely to involve suffering and death for millions on the gigantic scale initiated in the previous century by two world wars.

On the other hand, in its current condition capitalism promises economic difficulties for decades to come, with increased assaults on the earnings and working conditions of those who are still lucky enough to be wage earners around the world, waves of bankruptcies and business consolidations for capitalist firms, and increasingly serious conflicts among economic entities and even nations over just who is going to pay for the system's survival.<sup>71</sup> The mass unemployment and material deprivation that Marx predicted as the long-term outcome of capitalist development have become features of the world economy that if not permanent will clearly be with us for an extended time. Perhaps this situation

is part of the reason for the current revival of interest in the work of Henryk Grossmann.

- 14 That such methodological ideas were not entirely foreign to Marxist circles at the time can be seen in Anton Pannekoek's article 'Das Wesen des Naturgesetzes', in the logical empiricists' journal *Erkenntnis* 3 (1932–3): 389–400. Discussing natural laws, Pannekoek – who was both an important Marxist theorist and a notable astronomer – observed: 'The abstract character of natural law must in the first place be considered with respect to the relationship between it and concrete appearances. The "a body" or "the body" of which the law [of gravity] speaks is no real, existing body, but an abstract concept' (392). For a discussion of idealization in Marxian theory, see my *Theory as Critique* (Dordrecht: Brill, forthcoming), chapter 2; for introductions to idealization in science generally, see M. Weisberg, *Simulation and Similarity: Using Models to Understand the World* (New York: Oxford University Press, 2013) and N. Cartwright, *How the Laws of Physics Lie* (Oxford: Oxford University Press, 1983). One of the earliest explorations of scientific idealization, Leszek Nowak's *The Structure of Idealization* (Dordrecht: Reidel, 1980), strikingly took *Capital* as its chief case in point, unfortunately without a mention of Grossmann's work.

- 20 H. Grossman, 'The Value–Price Transformation': 107. It would be better to translate Grossman's 'Annäherung' as 'approach' rather than 'approximation', because the latter word, without a clear definition in this context, misleadingly suggests that for Marx the value calculations employed in *Capital* are numerical approximations of the price calculations that structure real-life economic affairs. This problem arises particularly for L. Nowak, because he attempts, in chapter 10 of *The Structure of Idealization*, an exact definition of approximation relevant to Marxian theory, in order to argue that values approximate prices. But, apart from the unknowability of values, values cannot be approximations of prices, because the 'transformation' relating the two is not a direct relation between individual values and prices. Nowak may have believed that value theory would have to be understood in terms of approximation to guarantee its significance for the description of economic reality. But the inapplicability of these terms is far from peculiar to Marxian theory.

- 27 *Ibid.*: 105n.
- 28 To my knowledge, Grossmann was the first to identify Mill as the (unacknowledged) source of the list of counteracting factors in Volume III of *Capital*. See J.S. Mill, *Principles of Political Economy* [1848], Book IV, Part IV, secs. 5–8 (Oxford: Oxford University Press, 1994: 110–16). In this connection it is of interest that Mill argued, in a discussion of the method of political economy, that what 'is true in the abstract, is always true in the concrete, with proper allowances. When a certain cause really exists, and if left to itself would infallibly produce a certain effect, that same effect, modified by all the concurrent causes, will correctly correspond to the result really produced' (J.S. Mill, 'On the Definition of Political Economy and on the Method of Investigation proper to It', in J.M. Robson [ed.], *The Collected Works of John Stuart Mill*, Vol. IV [Toronto: University of Toronto Press, 1967]: 326–7). Mill did not think that the social sciences differed from the natural sciences in this regard, though he argued that, given the impossibility of experimentation, the social sciences have 'no other method than the *a priori* one, or that of "abstract speculation"' (327). In his *Logic* he argued that *all* 'laws of causation are liable to be... counteracted, and seemingly frustrated, by coming into conflict with other laws' (*Collected Works*, Vol. VII: 443). For this reason he held that causal laws 'require to be stated in words affirmative of tendencies only, and not of actual results' (445). In political economy, too, Mill held, a theorist will err in predicating 'an actual result, when he should only have predicated a *tendency* to that result – a power acting with a certain intensity in that direction' ('On the Definition': 337). That Marx had, for good reasons, a low opinion of Mill's work in political economy makes the shared elements in their methodological pronouncements all the more striking.

- 42 K. Marx, *Capital* III: 339. As Marx expressed this conviction in the 1861–3 manuscript, 'It is an incontrovertible fact that, as capitalist production develops, the portion of capital invested in machinery and raw materials grows, and the portion laid out in wages declines. ... For us... the main thing is: does this fact explain the decline in the rate of profit? (A decline, incidentally, which is far smaller than it is said to be)' (in *MECW* 33: 288).
- 43 H. Grossman ms. starting 'Die Entwertung sollen die Zusammenbruchstendenz aufheben', cit. R. Kuhn, *Henryk Grossman and the Recovery of Marxism*: 141; Grossman had earlier presented statistics bearing on this question in *Das Akkumulations- und Zusammenbruchsgesetz*.
- 44 Paris: OECD, 1995: 36.
- 45 It would be too great a digression to explore the controversy over whether the tendency of the rate of profit to fall cannot be overcome by the tendential increase in the rate of surplus-value produced by the increased productivity of labor brought by accumulation. The many restatements of this argument tend both to misunderstand Marx's conception of the rate of surplus-value and ignore his ideas about the limits within which it can be increased. And, of course, the whole history of capitalism so far seems to confirm Marx's treatment of the question, as just noted. For a detailed discussion see my *Theory as Critique*, chapter 10.

- 71 This seems to have penetrated even the practitioners of what Marx called vulgar economics: see, for a journalist's exposition, N. Irwin, 'We're in a Low-Growth World. How Did We get Here?' (*New York Times*, August 6, 2016), in which the advent of global stagnation is explained as the effect of 'supply and demand'.

# Franz L. Neumann's *Behemoth*: A Materialist Voice in the *Gesamtgestalt* of Fascist Studies

Karsten Olson

## THE PROTOTYPICAL 'POLITICAL SCIENTIST': A BIOGRAPHICAL SKETCH

As Alfons Söllner notes in 'Neumann als Archetypus – die Formierung des *political scholar* im 20. Jahrhundert' [Neumann as Archetype – The Formation of the Political Scholar in the 20th Century], there has been no true biography of Franz Neumann to date, and due to the lack of a Neumann archive, it is unlikely that one will be created (Söllner, 2002: 42). What is known of Neumann draws primarily from his work, correspondence and anecdotal interviews with his sister and former students. As a result, there is an unfortunate degree of uncertainty in many basic details of his life which is reflected in the following sketch.

Franz Leopold Neumann was born to German-Jewish parents in 1900 in the small town of Kattowitz, located in what was then Silesia. His father was a successful tanner and a figure of some prominence within the

local Jewish community – nonetheless, this tradesman heritage differed sharply from the bourgeois upbringing of later colleagues such as Adorno and Horkheimer. This distinction is worth emphasizing, as it most likely influenced the course of his education and chosen profession (Söllner, 2002: 46). Franz was remembered by his sister as the gifted child of the family, the only child of five to attend Gymnasium in neighboring Krakow. During his first two years of study in 1918–19, Neumann attended three different universities in as many semesters: Breslau, Leipzig and Rostock. In Leipzig, he took part in the barricade combat of the November Revolution, which Duncan Kelly characterizes as the beginning and end of his revolutionary ambitions (Kelly, 2002: 460). In 1919 Neumann moved again to Frankfurt am Main, where he completed several degrees. In 1923 he completed his dissertation *Rechtsphilosophische Einleitung zu einer Abhandlung über das Verhältnis von Staat und Strafe* [A Legal-Philosophical Introduction to a Treatise on the

Relation between State and Punishment] in 1923 under the tutelage of Hugo Sinzheimer, a man described by Rolf Wiggershaus as 'the founder of German employment law and one of the fathers of the Weimar constitution' (Wiggershaus, 1995: 223). In Frankfurt, Neumann met both Ernst Fraenkel, his future law partner, and Leo Löwenthal, his first connection with a future member of the Frankfurt School. After completing his degree, Neumann published essays on the topics of law and labor practices, worked as an instructor at the Labor Academy and lectured to unions. Neumann's early works are notable for connecting a theoretical interest in the nature of society and economy inspired by the Austrian Marxists with labor law and democratic reformism (Wiggershaus, 1995: 223).

In 1928 Neumann moved to Berlin in order to establish a law practice with Ernst Fraenkel. While in Berlin he met Otto Kirchheimer and lectured alongside Carl Schmitt and Hermann Heller at the College of Politics. From 1928 to 1933 Neumann fought ceaselessly against right-wing encroachments on the constitution, becoming one of the most prominent lawyers of the SPD. In 1933 the SA occupied Fraenkel and Neumann's law office in an attempt to arrest Neumann, who, as a result of his political activity and Jewish heritage, had the dubious distinction to be among the first stripped of German citizenship. To avoid arrest Neumann fled to London, where he studied under the patronage of Harold Laski, whom he had met previously when Laski traveled to Berlin to strengthen ties between the Labour Party and the SPD (Söllner, 2002: 48). Like Kirchheimer, Neumann initially continued writing articles under pseudonyms that were to be imported into Germany in order to foment resistance, but eventually gave up once he determined this course to be ineffective. Unable to practice law due to differences in the legal system, Neumann used his experience teaching at the Deutsche Hochschule für Politik as a bridge to re-education at the London School of Economics, where

in 1936 he completed his second dissertation, *The Governance of the Rule of Law: An Investigation into the Relationship between the Political Theories, the Legal System and the Social Background in the Competitive Society*, a work which 'owed much for its methodology to Karl Mannheim, Max Weber and Marx, and for its content to Harold Laski' (Wiggershaus, 1995: 225).

Neumann moved to New York that same year in order to join the Institute for Social Research, a position Laski helped him to obtain (Jay, 1973: 144). Neumann's official connection with the Institute would be brief, lasting only from 1936 to 1940. Wiggershaus characterizes Horkheimer's attitude towards Neumann, Kirchheimer and others excluded from the Institute's inner circle as uncharitable bordering on exploitative. Neumann's role within the Institute was largely administrative, ranging from organizational duties to legal counsel and defense, including a trip to Buenos Aires to defend the family interests of Felix Weil. When Neumann discovered in 1939 that he was to be included in cuts to peripheral figures of the Institute, he complained in a letter to Horkheimer that he had been assured a permanent position, and furthermore that his administrative and legal functions had kept him from publishing frequently, a fact which would make finding a position at a university difficult. Nevertheless, it was during his time at the Institute that he was able to establish a lasting connection with Columbia University through lectures on the totalitarian state in 1936–7 and again in 1941, a connection which would eventually lead to a full professorship. More importantly, it was during this time that Neumann wrote his magnum opus, *Behemoth: The Structure and Practice of National Socialism, 1933–1944*. The work owed its existence to a debate within the Frankfurt School, and was in part written against Friedrich Pollock's conception of state capitalism. *Behemoth* was important not only for Neumann but for the Institute as a whole, with which it was associated despite a lack of official

recognition (Jay, 1973: 162). It was not only the Institute's first major work written in English, but also remained its most popular work for years, a popularity which William Jones ascribes to Neumann's more empirical approach, an empiricism which found wider reception in the Anglo-American audience (Jones, 1999: 149).

*Behemoth's* success opened a number of doors for Neumann and is often credited with securing him a job advising in the US State Department in 1942 and later in the Office of Strategic Services (OSS), a forerunner of the CIA. As Matthias Stoffregen notes, *Behemoth* is permeated with a practical concern for how the Nazis were to be defeated, and also the manner in which Germany was to be rebuilt in the wake of Nazi rule (Stoffregen, 2002). Neumann was eventually joined at the OSS by other ex-Frankfurt School members such as Marcuse, Kirchheimer and Gurland. Working as a team, they coauthored a series of reports advising US foreign policy. Just how influential this group of Institute expatriots was a matter of debate: Joachim Perels notes that there was a sizeable cultural gap between the more theoretically minded Marxist Jewish Germans and their conservative and practically oriented American colleagues (Perels, 2002: 86). Nevertheless, their shared concept of technical rationality coupled with *Behemoth's* depiction of Nazi Germany as a non-state ruled by four competing powers did have an impact on policy. Most notably, the initial structuring of the Nuremberg Trials followed *Behemoth's* four-powers conception of complicity in an attempt to broaden the scope and effectiveness of denazification (Hilberg, 2001: 81). Furthermore, Neumann's conviction that Germany under the Nazis had been a lawless state initially invalidated the *nulla poena sine lege* defense of war criminals (Perels, 2002: 85, 92). Ultimately, however, few prosecutions against complicit members of industry were successful, and the retroactive invalidation of Nazi law was also lifted from 1955 until 1998, allowing many to avoid prosecution.

While the ex-Frankfurt School group argued for the expansion of guilt in Nazi leadership, they simultaneously argued against actions such as the Morgenthau Plan, which sought to deindustrialize Germany, arguing that not all Germans were Nazis and that in particular the lower and working classes had remained uncorrupted by Nazi propaganda, again expressing convictions central to *Behemoth*. They were similarly concerned with the manner in which democracy was to be established within the new nation, advocating optimistically for the Allied forces to allow for a democratic movement to form naturally within the shattered nation, instead of attempting the seemingly impossible task of instilling a democratic spirit by force (Stoffregen, 2002: 61).

Neumann worked for various state agencies from the dissolution of the OSS, in 1945, until 1947, when, in part due to the changing atmosphere within the United States, as the anti-fascism of the Second World War transformed into the anti-communism of the Cold War (Stoffregen, 2002: 63), he left. In 1948 Neumann was granted first a visiting and then full professorship at Columbia University, where he had continued to give lectures throughout his work for the state. Raul Hilberg, Holocaust scholar and former doctoral student of Neumann, described Neumann as extremely popular and influential, boasting more advisees than any of his colleagues (Hilberg and Söllner, 1988: 177). Hilberg also credits *Behemoth* as a major source of inspiration for his own work, *The Destruction of the European Jews*, for which he adopted Neumann's conception of the non-state, the four power structures and the emphasis on continuity between the Weimar Republic and National Socialism. During his tenure at Columbia, Neumann began traveling to Berlin, where he helped establish the Institute for Political Science at the Freie Universität, in addition to founding what would later become the Otto Suhr Institute for Political Science. Mattias Iser and David Strecker (2002: 7) position Neumann as one of the founding figures

of political science as a discipline within Germany, cross-pollinating the more legal and social-theory-oriented German form with the empiricism of the Anglo-American model. Neumann died in a car accident in Germany in 1954 at the age of 54, an early death which is typically listed as one of the primary causes for his diminished presence in modern literature.

## BEHEMOTH: A MATERIAL ECONOMIC RETELLING

*Behemoth: The Structure and Practice of National Socialism, 1933–1944*, first published in 1942, is comprised of five sections: an introduction, three main sections and an appendix added in 1944. The introduction provides a brief history of the German Empire and the Weimar Republic, establishing certain trends which led to the production of the National Socialist regime. Section one examines the primary political structures within National Socialism, introducing the idea of the non-state, the Nazi party as a movement, a Weberian concept of the charismatic leader and the idea of a racial people. Section two is an extensive study of the function of economics within National Socialist Germany, much of which is written explicitly against Pollock's assertion of the primacy of the political. Section three is broken into thirds, one dedicated to the organization of the ruling elite, one to the atomized and dominated ruled class and one to summarizing the theory of the Behemoth, as well as including predictions for the future and a plea for the manner in which Germany should be rebuilt. The 1944 appendix makes primarily factual changes regarding the structure and personnel of administrative bodies, although it also expands significantly on Neumann's theory of anti-Semitism and hints at an ascendancy of the party relative to the other three powers. The following analysis seeks to create a single narrative of argumentation highlighting the material economic

core of *Behemoth*. Any attempt to summarize a work as rich and complex as *Behemoth* is bound to make major sacrifices. What has been primarily lost in my condensation is, on the one hand, the work's staggering empirical rigor and, on the other, specific references to its theoretical heritage. This has been done in order to render more clearly those aspects unique to *Behemoth*, both in order to better situate it in larger discourses and to underscore what it can still tell us about the formation and functioning of fascism.

The fundamental claim of *Behemoth* is that the Weimar Republic collapsed due to an increasing disparity between the forces and relations of production. Already during the German Empire, agriculture and industry had begun consolidating; in a now familiar process, technological innovation allowed for ever more efficient means of large-scale production, which in turn led to the concentration of the means of production into a rapidly shrinking number of cartels, monopolies and industrial combines. As efficiency and productive capacity increased, so too did the demand for resources and markets, creating an explosively expansionary dynamic within the German Empire which played no small part in precipitating the First World War. While the war provided an enormous, if temporary, release for the productive capacity of German industry, the discrepancy between the forces and relations of production increased drastically in its aftermath. The problem was that while the productive capacity remained unchanged, and even continued to expand, the societal support surrounding it had been severely damaged. German trade was restricted, limiting access to both potential markets and raw materials, as was labor capital, by the huge losses of life incurred during the war; along with heavy war reparations they contributed to prevent production from operating anywhere near peak efficiency and thereby profitability. This discrepancy created tremendous political pressure within the fledgling Republic, a pressure which it was unable to resolve,

either through further socialization of the means of production or in gaining sufficient concessions from its international trade partners to allow for peaceful expansion. The National Socialists, on the other hand, were able to resolve the discrepancy and to provide a framework for nearly limitless growth through militarization, public works projects and, inescapably, violent expansion (Neumann, 1944: 3–34).

The central axiom of Neumann's theory is that every mode of production has a corresponding and complementary political system. During the era of competitive capitalism, prior to the rise of monopoly capitalism, the liberal constructs of the rule of law and property rights had best matched the needs of the economic system. Competitive capitalism requires many small, relatively equal entrepreneurs, who, through mutual competition, drive the economic 'law' of supply and demand, creating a price mechanism which regulates the market. Liberal democracy and the rule of law achieves this by placing all individuals as well as all organs of state under a universal set of norms, creating basic legal equality and freedom on the basis of the inviolability of the individual's right to person and property. Legal equality is necessary because it produces the calculability and predictability required by the 'economic laws' of the free market; for the price mechanism of supply and demand to function, individuals must be free to create contracts between one another to sell their property and labor with the assurance that the state will honor and enforce these contracts. The creation of this predictable system is raised to moral imperative by the fact that classical liberalism declares that it is through the progressive motion of competitive capitalism that humanity as a whole is guided towards ever greater prosperity and happiness (Neumann, 1944: 255–61).

Because Neumann's understanding of the political realm claims that it exists to satisfy the needs of the economic, he therefore contends that the common understanding of

'laissez faire' as the total absence of governmental interference is incorrect: instead, within liberalism and the rule of law, the state must constantly interfere in order to uphold those conditions necessary for competition. Again, because the movement of the economy and society as a whole was believed to be responsible for humankind's eventual emancipation, the 'natural lawyers' of the seventeenth century and the 'classical economists' of the eighteenth recognized that it is not enough for competition to be theoretically and legally preserved: it must be actualized. If, despite the continued *legal* ability to buy and sell goods, *actual* competition becomes impossible due to the establishment of monopolies, it is the responsibility of the state to intervene and re-establish a competitive market. If the state does not intervene and monopolies are allowed to persist, their size allows them to subvert the price mechanism through price fixing, flooding the market and buying out competitors. This was increasingly the case in both the Weimar Republic and in the German Empire before it. Neumann attributes this shift to several factors: first, to a complicity between the governmental and economic elite. Throughout *Behemoth*, Neumann is at pains to demonstrate the huge and troubling degree of continuity in judicial and bureaucratic branches of government, both between the Empire and the Republic as well as between the Republic and the Third Reich, a conservative core allied to large industry and the military and arrayed against the progressive, redistributive aspects of liberal ideology. Second, Neumann faults the left, and in particular his own party, the SPD, for a crippling degree of indecision – the SPD was famously unsure if they were to act as the doctors or poisoners of the ailing competitive economy. Following traditional Marxist theory, many saw the consolidation of businesses into increasingly large conglomerates and corporations to be an inevitable function of the economic process and welcomed it as heralding the end of capitalism (Neumann, 1944: 13–16).

Finally, and most importantly, Neumann notes that monopolization of the economy was hastened by technological changes within the manufacturing process itself. Neumann, building on the work of A.R.L. Gurland, argued that in the late 1920s and early 1930s Germany experienced a second industrial revolution. The salient example of this transformation was the creation of polymers through new chemical processes. Polymers represented a fundamental shift in the demands of manufacturing; the final reaction necessary for their creation required heat and pressure of a scale previously unimaginable, which necessitated the creation of factories on a new scale and with a greater degree of centralization, requiring unheard-of levels of economic risk on the part of investors. This risk was heightened by the highly experimental nature of the end product; millions had to be spent creating wholly new materials that would possibly have no commercial viability. Polymerization, however, is only the final step in a much larger economic process; it requires huge amounts of raw materials to be completed, especially coal, which in turn requires massive infrastructure for its mining, shipping and supply. Polymerization and other similar emerging manufacturing processes exceeded the limits of competitive capitalism: the property rights and universally valid contracts that are its cornerstone worked instead to restrict the growth of monopoly concerns. The vertical integration necessary for polymerization demanded individual measures designed to suit the immediate material and labor needs of the monopoly, not universal norms. These monopolies needed the state as an ally and not as an impartial arbiter, an ally which would cover the staggering losses associated with plant experimentation, an ally which could provide markets of sufficient scale to make the manufacturing process economically viable (Neumann, 1944: 277–92).

Neumann contends that the conditions required by vertically integrated manufacturing processes of scale specifically, and

monopoly capitalism in general, were best met in the German context by National Socialism. Crucially, the National Socialist party did not establish a state at all. Neumann gives two possible understandings of the term 'state': first, the more commonly understood liberal interpretation, one which is 'characterized by the rule of law' – that is, the establishment of a universal precedent which must be obeyed even by the governing body that created it (Neumann, 1944: 467). Through law, the monopoly of violence possessed by the state is in all instances a mediated and predictable violence, a distinction which differentiates it from the 'natural law' of sheer force. The second, more limited, understanding of the state is simply the monopoly of violence in a sovereign body. Unlike the rule of law, citizens in this limited sense of state remain vulnerable to excesses of the sovereign body but are nevertheless protected from the chaotic violence of natural law. Life under National Socialism afforded none of these guarantees or protections. While the Nazi party left the laws and the constitution of the Weimar Republic largely unchanged, the laws themselves lost all operative force, and even new legislation created by the National Socialist government itself was largely ignored. This is because the essence of law, delimitation, is antithetical to the 'movement' which the National Socialists sought to establish (Neumann, 1944: 422). The Nazis worked constantly to destroy the universality upon which laws depend, instead acting in accordance with the individual discretion of the judge or, as was more frequently the case, the administrator of the law. It was not the letter but the 'spirit' of the law which was championed, a shift which destroyed the calculable, rational foundation of the law: 'If general law is the basic form of right, if law is not only *voluntas* but also *ratio*, then we must deny the existence of law in the fascist state' (Neumann, 1944: 450). Stripped of the egalitarian properties granted by universal applicability, law which has ceased to be law functions as an instrument of obfuscation

and terror, cloaking real relations of power between employer/employee and ruler/ruled in a mystical language of shared racial destiny. Neumann writes, 'The average lawyer will be repelled by the idea that there can be a legal system that is nothing more than a means of terrorizing people' (Neumann, 1944: 440). The specificity and partiality of the individual measure, coupled with its ability to hide power relations behind vague ideological statements, provided precisely the direct support which monopolies had been denied under universal law.

Beyond lacking the protective and stabilizing framework of the rule of law, Neumann argues that National Socialist Germany failed to meet even the most primitive definition of the state as monopoly of violence in a sovereign body. Instead of one sovereign body, four discrete sources of power existed in an uneasy state of equilibrium within Germany: the army, the bureaucracy, the National Socialist party and the captains of industry. Each power bloc 'is equipped with legislative, administrative and judicial power of its own' (Neumann, 1944: 398). In place of calculable norms, the population of Germany found itself the object of four competing and overlapping jurisdictions. These competing jurisdictions had the combined effect of reducing the individual from a citizen of a state to an object of multiple dominations, a situation which lacked even the most basic guarantee of the state: safety against the strong. The temporary alliance which bound these separate fiefdoms together was an alliance of mutual dependency and loosely shared goals and *not* the result of either a single unifying ideology or the total bureaucratic centralization of the state. The distinction between an ideology and 'a series of ever shifting goals' is important. Neumann defines an ideology as a rational political theory, one which exists among others and attempts to persuade that it possesses the best explanatory force (Neumann, 1944: 38, 464). Nazi ideology, by contrast, was 'a mere *arcadium dominationis*, a technique outside of

right and wrong, a sum of devices for maintaining power' (Neumann, 1944: 465). As a result, it was an 'infinitely elastic' ideology which could position the party as simultaneously 'for agrarian reform and against it, for private property and against it, for idealism and against it' (Neumann, 1944: 438). Neumann argued that even 'magical beliefs', such as 'leadership adoration, the supremacy of the master race', were not so much central organizing principles as they were a convenient cover for the one goal shared by all factions: limitless expansion (Neumann, 1944: 439).

That the National Socialist party had not established a state, let alone a totalitarian one, was by design. This was again partly due to the fact that they correctly recognized that any state, even in its most limited sense, tends to restrict arbitrary power. Another factor was the recognition that the 'fundamental goal' of National Socialism, 'the resolution by imperialistic war of the discrepancy between the potentialities of Germany's industrial apparatus and the actuality', was best served by allowing the four major power bodies to operate independently of one another (Neumann, 1944: 38). In other words, it was a tacit acknowledgment by the Nazi party that it lacked the expertise and manpower to successfully regulate all aspects of German society, in particular the economy. It was for this reason that the 'material foundations of society' were left untouched (Neumann, 1944: 467). Neumann's use of 'material' here seems to imply material only in the limited sense of 'economic', but it is important to remember that the economic for Neumann also has a concretely material aspect; by granting industry the freedom to operate with a large degree of autonomy, the National Socialist party was pragmatically deferring not only to the superior knowledge of management but also to the material dynamics of the process of production itself.

In order to assert the relative autonomy of all four factions, it is necessary for Neumann to reject the apparent and openly stated

structure of Nazi rule. After all, the rise of National Socialism was accompanied by a staggering escalation in bureaucratic apparatus, which at least appeared to dominate all aspects of life, including the economy. Neumann concedes that for the everyday experience of the population, this totalizing bureaucratic penetration and domination was very real. In attempting to free itself and the other power blocs of all normative restrictions, the Nazi party had begun an exhaustive process of destroying all mediating institutions within society, such as families, unions, political parties, etc. and replacing them with bureaucracies of scale (Neumann, 1944: 367). In this manner, the party which claimed to honor the family actively sought its destruction through organizations such as the Hitler Jugend and pro-birth-rate policies and institutions. Similarly, instead of trade-based unions, the monolithic German Labor Front replaced specific interests with a representation so diffuse and ineffectual that it served none of its members. This indicates the other side of Nazi bureaucratization: while the number and size of bureaucracies skyrocketed, their efficacy dwindled to non-existence. Like Nazi law, bureaucracies more often than not functioned as an empty 'shell', something which served no operative function beyond obscuring underlying power struggles (Neumann, 1944: 525). Real power was not achieved through bureaucratic positions but by situating oneself at the intersections of the four power blocs. The 'regulation' of industry was for this reason a farce: in most instances, the party bureaucracies tasked with regimenting industry were occupied by the members of the industrial elite, just as the executive boards of industry were home to many high-ranking party officers. As Neumann grimly notes, under fascism, 'The practitioners of violence tend to become businessmen, and the businessmen become practitioners of violence' (Neumann, 1944: 632).

To state it more sharply than Neumann's own formulation, underneath the ideological

claims of the Nazi party, the expansionist impulse of Nazi Germany was fueled not only by the profit-driven desires of the heads of industry but also by the will of the polymer molecule itself. By intimately linking the form of government with the mode of production, it becomes possible to suggest that the rise of Hitler was preceded and accelerated by material relations descending to the atomic level. The Behemoth is an anti-state designed to unleash the productive and destructive potential of monopoly capitalism through the eradication of all mediating institutions and restrictive norms.

### **TOTALITARIAN MONOPOLY CAPITALISM VS STATE CAPITALISM**

The debate over State Capitalism is often depicted in rather lurid terms, describing the opposing sides as 'fronts' and emphasizing the vehemence with which the two groups opposed one another. The two sides are typically drawn with the 'inner circle' of Horkheimer, Adorno and Pollock comprising one 'camp', and Neumann, Kirchheimer, Gurland and Marcuse making up the other, although sometimes Marcuse is indicated as a mediating agent (Dubiel and Söllner, 1981: 23). Though no one goes so far as to suggest a causal link, this narrative is strengthened by the fact that shortly after this debate, the entire outer circle had to leave the Institute due to budgetary constraints. Each side had a clear protagonist, with Friedrich Pollock standing as the main proponent of State Capitalism and Neumann representing Totalitarian Monopoly Capitalism. Despite the seriousness of the debate within the Frankfurt School, the two theories share many core assumptions. Both blame the disparity between the forces and the relations of production within monopoly capitalism for the rise of National Socialism. Both agree, at least historically, that modes of government had been dictated by the modes

of production, and that specifically liberal democracy was the government of competitive capitalism before it was replaced with mass parties and fascism in monopoly capitalism (see Pollock, 1933). These similarities have led some scholars to claim the fascism debates were much ado about nothing, with Wiggershaus proclaiming that they 'were basically quibbles about words' (Wiggershaus, 1995: 288). This position becomes untenable when the debate is viewed through the material economic lens developed in the previous section; at stake are claims about the functioning of capitalist economies at the most fundamental level. The following section will sharpen this distinction before suggesting that, by reading Pollock and Neumann's competing theories as part of a *Gesamtgestalt*, it is possible to turn these differences into an analytical strength of a general Frankfurt School theory of fascism.

The disagreement between State Capitalism and Totalitarian Monopoly Capitalism concerned the relationship between politics and economics within Nazi Germany – that is, in what way (and to whose benefit) the tension between productive forces and relations had been resolved. Neumann holds that the solution came from within monopoly capitalism itself, that the limitless expansionary potential of production had helped foster and continued to drive an opportunist government which shared its ambition of total domination and was willing and able to destroy all institutions which prevented expansion. He argues in *Behemoth* that the 'planned' economy is bureaucratic smoke and mirrors designed to obscure the true seats of power, four distinct but overlapping ruling interests which existed inside National Socialist Germany. Neumann argues that the Nazis never intended to dominate industry, because they realized that they lacked both the manpower and the technical ability to control monopoly capitalism.

Pollock, by contrast, argues that not only was the total management of industry by the

state possible, but that this degree of management was the only solution to the disparity which had been created. While Pollock agrees that National Socialism owed its rise to monopoly capitalism during the Weimar Republic, he argues that this monopoly capitalism was in the process of being completely transformed into an entirely new form of capitalism: State Capitalism. State Capitalism is defined by the existence of a general plan, a 'conscious decision on ends and means' which dictates all aspects of the economy (Pollock, 1941: 204). This general plan replaces the 'laws' of traditional capitalism with the Tayloristic principles of scientific management. In other words, the natural, fate-like quality of capitalism posited since Smith had been stripped away, leaving a fully rationalized machine. Administrative techniques learned during monopoly capitalism replace the 'occult' arts of predicting consumer buying patterns and market fluctuations, making 'total production control technically possible' (Pollock, 1941: 208). This change 'signifies the transition from a predominantly economic to an essentially political era', with the state assuming the primary functions of the economy (Pollock, 1941: 203, 207). One of the fundamental assertions of State Capitalism is that competitive capitalism is an inherently inefficient and wasteful system, one which squanders resources on overproduction and bad investments. These shortcomings are mitigated through the implementation of a fully rationalized economy operating under the guidance of a central planning committee. Inefficiencies still occur, but when they do, they are a burden shouldered by society as a whole as opposed to a crushing blow delivered to a single entrepreneurial endeavor. Pollock sees State Capitalism as a purely technical apparatus, neutral machinery which was theoretically applicable to any industrialized economy and compatible with any form of government. State Capitalism could just as easily assist a democracy to emancipate humankind from the inequities of traditional capitalism

as enable National Socialism to perfect its imperial war machine and the domination of the masses (Pollock, 1941: 201). Because State Capitalism contained none of the inherent internal instabilities of competitive capitalism, Pollock argues that, in the theoretical absence of external interference, it could last indefinitely. State Capitalism was an economic system still in the process of forming, but worryingly, if achieved by the National Socialists, it could provide an economic engine which could make the 'Thousand Year Reich' a reality.

It is useful at this juncture to turn to a mode of analysis inspired by Dubiel and Söllner's concept of the *Gesamtgestalt* as developed in 'Die Nationalsozialismusforschung des Instituts für Sozialforschung – ihre wissenschaftsgeschichtliche Stellung und ihre gegenwärtige Bedeutung' [The National Socialism Research of the Institute for Social Research – Its Historical Status and Its Current Significance] (Dubiel and Söllner, 1981). In this essay, working against the centrifugal pressures of 'great names' scholarship and the publishing practice of collected works, they suggest that the various studies of fascism created by members of the Frankfurt School are best understood in the interdisciplinary context in which they emerged. Dubiel and Söllner argue that as a 'discursive Gesamtgestalt', collectively the Frankfurt School achieved 'an as of yet unsurpassed level of fascism research' (Dubiel and Söllner, 1981: 7). When read in this context, the State Capitalism debate is significant as a defining moment for the Institute's theory as a whole, pushing the group collectively towards the outer limits of their shared theoretical base. Neumann was so horrified by the prospect of an eternal fascist economy that he dove ever deeper into the minutiae of Nazi bureaucracy and economics, searching for proof that the laws of the economy were still in effect and with them internal contradictions inherent to the capitalist system. The second section of *Behemoth*, dedicated exclusively to economic analysis, is formulated explicitly

as a refutation of State Capitalism. It was through confrontation with the imagined perfection of State Capitalism that Neumann was forced to examine the materiality of the mode of production, to tighten the connection between the mode of production and the form of government by granting agency not only to the monopolists but also to the matter which they produced. Neumann's analysis of the imperialist force of the polymer borrows from Gurland's essay 'Technological Trends and Economic Structure under National Socialism' (Gurland, 1941). This essay links competitive capitalism with steam energy, 'non-competitive' capitalism with electric power, and totalitarian capitalism with 'the preponderance of chemical processes', also in an attempt to disprove the assertion that 'economic dynamism has come to an end in our time' (Gurland, 1941: 226). By highlighting the material agency of the mode of production, Gurland and Neumann hope to demonstrate both the continued influence of the economic on the political and the impossibility of a 'neutral' bureaucracy repurposing the monopolistic manufacturing process for different political ends.

The claim that the differences between State Capitalism and Totalitarian Monopoly Capitalism can be reduced to an argument over semantics must be discarded in light of very real differences in the conception of the relationship between the political realm and the mode of production. Similarly, the existence of two distinct 'fronts' within the Institute also loses credibility under scrutiny. Horkheimer helped define and establish the concept of State Capitalism within the Institute but completely disagreed with Pollock that it represented 'neutral' machinery equally suited to totalitarian and democratic ends, or, relatedly, that the inevitability of State Capitalism meant that it was the theorist's task to discover its best implementation. Horkheimer categorized this approach as a form of progressive fatalism, one which inadvertently advanced natural forces of domination (Horkheimer, 1981: 66–7). For the same reason,

Horkheimer rejected Neumann's optimism that continued class antagonisms within Nazi Germany would inevitably produce resistance and systemic failure, arguing that emancipation could never be the result of a mechanistic process and must instead be a conscious choice to step outside natural laws (Horkheimer, 1981: 69–70). Similarly, although both Kirchheimer and Gurland opposed the idea of State Capitalism, they developed a concept of 'technical rationality' which similarly asserted that National Socialism represented the application of the scientific techniques of Taylorism to the body politic, with the important difference that they interpreted this phenomenon as the subjugation of the political will to economic domination (see Kirchheimer, 1972; Gurland, 1941). Finally, Marcuse does not represent a middle ground between camps but, rather, the fluid, ambivalent and nuanced quality characteristic of all participants. On the one hand, he denies the narrative of reduced governmental interference during the liberal period advocated by Pollock and to a lesser extent Horkheimer, but, on the other, he suggests that the 'technics' of control developed during monopoly capitalism are neutral and can be utilized towards the enslavement or the liberation of humankind (Marcuse, 1941: 414). The *Gesamtgestalt* of a Frankfurt School theory of fascism can only take shape when these important subtleties are resolved into a mutually extending constellation, one which can accommodate both Horkheimer's critique of mechanistic progress as well as Neumann's material economic analysis. The many theoretical features shared within the Institute suggest that such a constellation is possible, but as yet a comprehensive scholarly attempt has not been made.

## BEHEMOTH AND TOTALITARISM

The term 'totalitarianism' emerged in the 1920s, but totalitarianism as a distinct field

of study would only develop post-Second World War, reaching its zenith during the Cold War. Experts on the Frankfurt School often accuse totalitarianism studies of either ignoring the wealth of research afforded by the Frankfurt School into the authoritarian personality and fascism or of taking many of its central claims without citing or acknowledging their source. While totalitarian studies do owe a debt to the work of Franz Neumann and others, it is not sheer ingratitude or a lack of scholarly rigor which prevents them from linking totalitarianism studies with earlier works on fascism. Rather, the Frankfurt School theories on fascism operate within an entirely different set of assumptions, one which is often antinomical to those of totalitarianism. This fundamental difference is already inscribed in the fact that, generally speaking, the Institute avoided the use of the term 'totalitarianism', and when it was used, such usage was 'tentative, experimental and ambivalent' (Jones, 1999: 17). The reason for this discomfort becomes clear when the field is viewed as a whole. In his essay 'Totalitarismus Theorie' [Totalitarianism Theory], Söllner enumerates three key points which all totalitarianism theories seem to share: (1) the equation of National Socialism with Stalinism; (2) a concentration on the political system and the specific methods of domination; and (3) the normative comparison between totalitarianism and an idealized Western democratic state (Söllner, 2007: 230). Often the Marxist background of the theorists is indicated as a major stumbling block for adopting totalitarianism theory, with scholars such as Peter Hayes condemning as leftist bias their unwillingness to recognize Soviet Russia as coequal with Nazi Germany. An alternative explanation would seem to be that they limited their studies to National Socialism because of personal experience and superior knowledge of German political systems. This explanation gains credibility when one considers that, unlike other Marxist thinkers, the Frankfurt School conspicuously avoided

supporting the Soviet Union, a critique in the negative which was then positively restated after the war. Furthermore, Marxism did play a role in the rejection of totalitarianism, not as a source of undue loyalty to Stalin but, rather, as a source of critique for the normative ideal of liberal democracy. What all of the Frankfurt School theories shared was the conviction that fascism had emerged not as an external threat to liberal capitalist society but as an immanent product thereof. It is impossible to sustain the binary us-vs-them mentality which totalitarianism demands when one recognizes that the same forces that produced repressive political domination are active in one's own society.

To give a concrete example of this theoretical incompatibility, of Friedrich and Brzezinski's canonical six elements of a totalitarian state, *Behemoth* contradicts half of the elements and is ambiguous towards the remainder (Brzezinski and Friedrich, 1956: 9–10). Neumann disallows any unifying ideology, arguing instead that the National Socialists were opportunists with a series of rotating mastheads used to rally support. Neumann further denies not only the existence of a central planned economy but even of a total state as such, instead developing the model of overlapping and competing jurisdictions for which *Behemoth* is named. Despite these fundamental differences with totalitarian studies as it would later develop, Neumann does use the term 'totalitarian' for *Behemoth's* most important concept: Totalitarian Monopoly Capitalism. By pairing 'totalitarian' with 'monopoly capital', Neumann fundamentally contradicts its accepted meaning; again, this is *not* a totalitarianism of the state but, rather, of lived experience. Property, labor and life no longer belonged to the individual but to the employer, the party, the bureaucracy or the military by turns. Processes of massification dislodge the individual from the protective situatedness of family, class and religion. All mediating institutions are liquidated in order to destroy spontaneity and increase atomization to the extent that the masses became

another infinitely malleable resource, ready to be formed into soldier, worker or corpse as necessary, completely 'amenable to control from above' (Neumann, 1944: 436).

Neumann's use of 'totalitarian' is fundamentally incompatible with the classical understanding of the term because it denies the existence of a centralized state as well as the domination of the economy by political forces. Furthermore, by emphasizing continuity from the German Empire through the Weimar Republic to National Socialism, Neumann, like his Frankfurt School colleagues, rejects the unreflective opposition of totalitarian with liberal states, since the monopolistic system of production which created fascism was active within both. This basic incompatibility, however, does not preclude the possibility of *Behemoth* having served as an often unaccredited source of inspiration for later studies of totalitarianism, and several works of scholarship have been dedicated to tracing this kind of influence. Hannah Arendt's *The Origins of Totalitarianism* (Arendt, 1966) in particular has often been singled out for scrutiny, most likely because it remains one of the most brilliant and influential interpretations of National Socialism ever written. Essays such as Söllner's 'Hannah Arendt's *The Origin of Totalitarianism* in its Original Context' (Söllner, 2004) and Vicky Iakovou's 'Totalitarianism as a Non-state' (Iakovou, 2009) attempt to demonstrate the debt Arendt owes to Neumann based on the significant similarities between Arendt's depiction of the totalitarian state and *Behemoth*. Despite Arendt only directly citing the work twice, Iakovou describes *Behemoth* as a 'permanent, privileged, if implicit, source' within *Origins*. Many central features of Arendt's analysis, such as the shapelessness of the non-state, the replacement of the restrictive concept of the nation state with the expansionist idea of the racial people, and the focus on the party as a movement, are either adapted from or parallel with remarkable consistency Neumann's arguments. While such attempts

to uncover hidden or buried connections with *Behemoth* are useful in restoring an intellectual history, the danger of 'contextualizing' *Origins* in this manner is that it tends to suppress or trivialize those aspects which made it the paradigm-shattering success that it was and is. Despite Söllner's professed interest in preserving the work's 'originality' and 'dynamism', over the course of his essay this 'originality' is reduced to sales tactics, literary embellishment and philosophical exaggeration married to personal experience. His critique culminates with the troubling accusation that *Origins* failed to generate 'consequential' further research in the same manner as Neumann's *Behemoth*, and that *Origins* has possibly even impeded the production of 'disinterested... historical or social-scientific... research on totalitarian societies' (Söllner, 2004: 234, 235). Rather than 'contextualizing' *Origins*, I would argue for expanding Söllner's own concept of the *Gesamtgestalt* to include Arendt, since this is a model which highlights shared theoretical assumptions while accentuating those features unique to the individual theories.

### NAZI GERMANY: REALM OF PROFIT OR IDEOLOGY?

Despite the aforementioned shared features of *Origins* and *Behemoth*, there is a major obstacle to any kind of collaborative project such as the one proposed. Hannah Arendt's Nazi Germany is an ideologically dominated world, one organized around an entirely new rationality which is beyond capitalist interests. By contrast, Neumann's *Behemoth* argues that the ideology of the Nazi party is an internally inconsistent and opportunistic sham concocted with the sole purpose of hiding its true motivating forces and power structure, which remain those of monopoly capital. Putting the question of ideology momentarily to one side, the theoretical divide over the role of capitalism alone

seems insurmountable. However, this difference is more apparent than real, as Arendt and Neumann do not disagree over capitalism as such but over the role of profit and self-interest. Despite declaring Nazi Germany to be a post-capitalist society, Arendt grants capitalism a privileged position in establishing the dynamics of totalitarian rule not unlike that granted by Neumann. When discussing imperialism, one of the origins of totalitarianism, she notes that the concept of expansion defining imperialism is 'not really political at all, but has its origin in the realm of business speculation, where expansion meant the permanent broadening of industrial production' (Arendt, 1966: 125). Imperialist expansion only occurs once the process of production slows as the result of encountering national borders, i.e. political resistance. It is at this moment that the expansion demanded by capitalist production is transferred into the political realm, 'for the accumulating process must sooner or later force open all existing territorial limits' (Arendt, 1966: 146). Arendt is then able to claim that the expansionary drive in National Socialism has ceased to be capitalist because she creates the rather fine division between the accumulation of power vs the accumulation of profit, but the internal dynamics remain identical with those of capital accumulation. Arendt sees this expansion as an endless process which can know no peace and recognizes no political or social boundaries, one which is in perpetual need of 'more material to devour' (Arendt, 1966: 146).

Arendt and Neumann's theories of anti-Semitism are likewise similar in their reliance on metaphors of limitless expansion derived from economic models, while remaining divided on the role of economics limited to the pursuit of profit. Neumann argues that the Jews represented 'a testing ground for universal terrorist methods', a subject on which methods of absolute domination and atomization could be tried before being applied to other, ever expanding enemies

(Neumann, 1944: 551). The anti-Semitism of the Nazis was merely the 'Spearhead of Terror'; while this may seem to underestimate the specificity and the intensity of the Jew hatred of the Nazis, it is important to remember that Arendt was also at pains to indicate that the eradication of the Jews represented a first step in a process of human destruction that would have no end. The concentration camps for her were laboratories of domination, the true expression of Nazi rationality in which a new humankind was being forged and whose reach was constantly growing, as demonstrated by the inclusion of Germans with heart conditions in the lists for extermination by the end of the war (Arendt, 1966: 451). Similar to Arendt, Neumann saw anti-Semitism as both an integrative tool for domestic policy through the production of collective guilt, while also serving as an export product designed to undermine the foundational values of liberal democratic enemies. Neumann substantiates this with a quote from Nazi ideologue Werner Best: "A country that surrenders to anti-Semitism has thereby already surrendered its liberal tradition. It has abandoned its bulwark against totalitarianism" (Neumann, 1944: 521). This is a current of anti-Semitism very similar to the phenomenon described by Arendt in which anti-Semitism is exported through the expulsion of the 'penniless Jew', thereby seemingly lending credence to Nazi discrimination against a 'useless' people (Arendt, 1966: 415). The purpose here is not merely to demonstrate similarity but to show that the language and dynamics of capital expansion expressed elsewhere continue to inform and structure even those moments either unmarked or coded specifically as beyond capitalism, simply because they defy the logic of profit accumulation.

Part of what makes Neumann's analysis of anti-Semitism interesting, however, is that he does connect his theory to explicitly economic motivations. Neumann argues that, in part, anti-Semitism served as a financial diversion, a means of realizing some of the

anti-capitalist promises of Nazi ideology while leaving the fundamental economic order intact (Neumann, 1944: 120–9). Beyond serving as a distraction, by expropriating Jewish owners of small businesses the Nazis were simultaneously able to severely weaken the middle class and strengthen the monopolistic elite in a process of 'combing out'; the stolen businesses and goods typically proved too expensive for the Jewish businessmen's direct competitors and were instead snatched up by major conglomerates. Neumann is always careful to avoid reducing anti-Semitism to an exclusively economic tool, but his conviction that the dynamics of capitalism worked unabated in Nazi Germany allows him to see economic consequences that are far too convenient to be incidental to the process. This approach, however, has its limits. At several junctures, he is forced to bracket off a 'magical', 'totalitarian' rationality, something which he claims defies all reason and logic. The kind of anti-Semitism he discusses is exclusively the 'non-totalitarian' form, 'for the totalitarian Anti-Semite, the Jew has long ceased to be a human being. He has become the incarnation of evil in Germany, nay, in the entire world. In other words, totalitarian Anti-Semitism is magic and beyond discussion' (Neumann, 1944: 121–2). By contrast, Arendt's insistence on the novelty of totalitarian government enables her to create a corresponding totalitarian rationality, one which is designed to explain precisely those moments where 'common sense' fails, when people and institutions begin to work against the traditional rationality of self-interest. *Origins* is littered with examples in which confounded Nazi generals and businessmen complained that a particular initiative would be detrimental to military victory or productive efficiency, unaware that the operational logic of the party surrounding them saw such concerns as petty in comparison with the grandeur of a millennial destiny.

To recognize that moments existed in which self-interest and profit were

suspended is not the same as to assert that the forces of capitalism had been rendered wholly inoperative. Arendt is so preoccupied with asserting the novelty of totalitarianism that she often slides towards essentializing the 'outside' world of liberal democracy, thereby creating the unreflective binary which plagues much of totalitarianism studies. This blindness seems to be the result of conflating capitalism with profit motives and self-interest, seemingly forgetting that she has elsewhere shown capitalism to be the transnational force responsible for exploding political and social boundaries, the motor of limitless expansion and destruction which served as the model for totalitarian domestic and international policy. It is at these junctures that *Behemoth* is illuminating, constructing a bridge of continuity between liberalism and totalitarianism, highlighting capitalism's infinite elasticity and ability to shape the political world. Neumann, however, also lapses into reductive definitions of capitalism. He frequently pins hope for the future of Germany on a potential revolution of the working class, catalyzed by their exposure through labor to the 'rational' process of production. In so doing, he neglects the revolutionary discoveries of his own research: first, by underestimating the disintegrative effects monopoly capitalism has had on all mediating institutions, including class, and, second, by forgetting the nature of the 'rationality' produced by monopoly capitalism. The mode of production is not neutrally rational and does not lend itself to the goal of emancipation but is rather imperial and socially corrosive at the molecular level. Both Arendt and Neumann's analyses suffer from overly narrow characterizations of the capitalist process; but when read with and against each other in a mutually extending *Gesamtgestalt*, the novel features of both interpretations become apparent, creating a plastic conception of Nazi Germany capable of demonstrating both the operation of a new kind of capitalism and a political model capable of exceeding it.

# Otto Kirchheimer: Capitalist State, Political Parties and Political Justice

Frank Schale, Lisa Klingsporn  
and Hubertus Buchstein

## BIOGRAPHICAL SKETCH

Otto Kirchheimer worked at the exiled Frankfurt Institute of Social Research in Paris and New York between 1934 and 1943. This was a crucial period of time for Kirchheimer, as well as for the Frankfurt School in general.<sup>1</sup> John H. Herz and Erich Hula have rightly stated that Otto Kirchheimer ‘was no systematic thinker’ (Herz and Hula, 1969: ix). The wide intellectual range of his work does not rest on an overarching theoretical basis. Kirchheimer’s focus was rather on current political problems. Nevertheless, the originality of his Weimar writings, his contributions to the work of the Institute, his analyses of changes in party systems and his reflections on political justice have stimulated a persistent interest in his work and an ever growing body of secondary literature on both sides of the Atlantic.

As is the case for many émigrés, knowledge of Otto Kirchheimer’s biography is fragmentary.<sup>2</sup> This is particularly true for his

childhood and the first years after the Nazis came to power in 1933. Otto Kirchheimer was born on November 11, 1905 into a German-Jewish family in Heilbronn, a small city in the south-western German state of Württemberg. He was the youngest of six children born to his parents, Julius and Frederike Kirchheimer. Both his mother and his father died during his childhood and teenage years. Thanks to the family money he inherited, he could be sent to excellent private boarding schools. Although he was not religious as a teenager, Kirchheimer enthusiastically joined the socialist German-Jewish youth movement *Die Kameraden* in 1919. The experiences and friends he made there awakened his interest in philosophical questions, as well as in socialism and communism. As for many left-leaning, politically organized youth at the time, renowned Marxist authors such as Rosa Luxemburg and Max Adler proved formative to his political outlook.

Supported by his parents’ inheritance, Kirchheimer studied philosophy, history,

sociology and law from 1924 to 1928. He began his studies with the Neo-Kantian philosopher Karl Vorländer in Münster. During this time he joined the German Social Democratic Party (SPD) and became active in its youth movement (*Jungsozialisten*). In 1925 he moved to Cologne to take classes with the sociologist Max Scheler and then to Berlin to study law and constitutional theory with Rudolf Smend and Hermann Heller. Smend encouraged him to move to Bonn in order to study with Carl Schmitt. Despite their diametrically opposed views, the polemically minded Schmitt relished the discussions with the young Kirchheimer, who quickly became a sort of leftist Wunderkind in Schmitt's Bonn circle (Mehring, 2011; Breuer, 2012: 111–41). Under Schmitt's supervision, Kirchheimer completed his doctoral thesis on constitutional theories in socialist and Bolshevik political thought at the beginning of 1928.

In 1930 Kirchheimer moved to Berlin, where he got a job at the law office of Franz L. Neumann and Ernst Fraenkel. The office worked for the labor unions and the SPD. Kirchheimer was skeptical of Fraenkel and Neumann's defense of social-democratic reformism but built a close personal relationship with Neumann during this time. In Berlin he also reestablished contact with Schmitt, who had also moved there. Schmitt's diaries indicate the intellectual exchange between the two of them as well as the harsh anti-semitic reservations Schmitt personally had about Kirchheimer (Schmitt, 2010: 231).

Shortly after the election in March 1933 that secured Hitler's power, the Gestapo took Kirchheimer into custody. He was rescued by the fortunate coincidence of being in a prison cell with Paul Kecskemeti, a United Press correspondent for the *New York Times*. They had never met, but when Kecskemeti was supposed to be released, due to international protest, he insisted that Kirchheimer also be released. Kirchheimer quickly managed to escape to France. In Paris, he rejoined his wife. Having lost all his inheritance, he

desperately tried to find work as a journalist and translator. He joined a group of young academics including Walter Benjamin and Arkadij Gurland who were supported for various lengths of time through small research contracts from the Société Internationale de Recherches Sociales. In 1934 he was taken on to the payroll of the exiled Institute on a part-time basis to research criminal law and criminology. Given the political situation in Europe, Kirchheimer prepared to emigrate to the United States. Due to his ties to the Institute, his papers were accepted by the US immigration agency and he arrived at Ellis Island in 1937. In New York, he found a home with Kurt Rosenfeld and his group, and Franz Neumann offered him a part-time contract at the Institute, which was now loosely affiliated with Columbia University.

With Neumann's support, he was employed two years later in the Research and Analysis Branch of the newly established Office of Strategic Services (OSS) in Washington, D.C. In collaboration with John H. Herz and Herbert Marcuse, he prepared documents on the legal grounds for bringing the political elite of Nazi Germany to trial after the war.

After the war, the intelligence branch of OSS moved to the Department of State. Whereas Neumann, Marcuse and many others left the administration and found employment at US universities and colleges, Kirchheimer had to stay on for ten more years at the Department of State, hating his job and feeling mistreated by the FBI, who interviewed him a couple of times under the suspicion of being a communist.<sup>3</sup> Kirchheimer found his intellectual succor as an adjunct teacher at colleges in nearby Washington and as the author of academic papers and numerous book reviews for the *Washington Post*.

Kirchheimer achieved a temporary professorship in Political Science at the New School for Social Research in New York in 1955 and a full professorship in Political Science at Columbia University in 1960. Professionally, he remained an outsider from academic and

intellectual émigré circles in the United States. His exchanges with Hannah Arendt were among the few exceptions, due to a shared interest in the prosecution of Nazi criminals.

After Kirchheimer's release from the State Department, he became a very productive academic writer. He finished his magnum opus, *Political Justice*, in 1961, wrote numerous reviews for newspapers and journals and published a number of articles about European political systems in general and about structural changes in party systems in particular. His next plan was to write a comprehensive book on the role of political parties in late capitalist societies. Otto Kirchheimer died of a fatal heart attack on November 22, 1965.

### **THE WEIMAR YEARS: CLASS STRUGGLE AND THE DECLINE OF THE CONSTITUTIONAL STATE**

Kirchheimer's political views during the Weimar period ranged from a reformist social democracy to a more militant class-conscious socialism. The theorists of reformist social democracy, like Rudolf Hilferding, Hermann Heller, Franz L. Neumann or Ernst Fraenkel, considered the Weimar Constitution as an opportunity to pave the way to democratic socialism. In contrast, in his early Weimar writings, Kirchheimer was one of the most outspoken young voices critical of the Weimar Republic among the non-communist left. However, he changed his position and defended the Weimar Constitution after 1930 when the democratic system of the Weimar Republic was under attack by the political right and authoritarian politicians.

In *Weimar—and What Then?* (Kirchheimer, 1930b), published in the first months of 1930, and one of his most famous texts, Kirchheimer presented his critical analysis of the Weimar Constitution in systematic form. Following more radical theorists like Max

Adler or Arthur Rosenberg, he viewed the existing Weimar Constitution as the final step in the history of bourgeois rule. According to Kirchheimer's early outlook, democracy is only one political form by which to organize a capitalist society; dictatorship is another (Kirchheimer, 1928). Following Marx's analysis of the 18th Brumaire, Kirchheimer describes the social basis of the Weimar Republic as a compromise between different social groups: the revolution of 1918 forced the old imperial and bourgeois military, industrial, bureaucratic and legal elites to agree to a compromise with the leaders of the working class. However, the political parties that founded the new German republic did not replace the old elites because they feared a revolution like the one in Russia. Right from the start the Weimar Constitution was created with 'birth defects'. This critique was aimed in particular at the second section of the Weimar Constitution ('On Basic Rights and Duties') and its unsystematic list of liberal, Christian, socialist and nationalistic statements.

Kirchheimer refused to agree with the leading social democrats who tolerated a conservative non-parliamentary government and its extensive use of the emergency rule of the constitution in the German Reichstag. Whereas Carl Schmitt was supportive of this authoritarian turn to the right, Kirchheimer criticized it and its toleration by the SPD from the very beginning in 1930. He viewed the employment of the emergency measures as not only destroying the achievements of the working class over the last decade but also of parliamentary democracy in general. Owing to the fact that the crucial administrative fields of the state had never been democratized, he stated:

Herein lies the basic and irreparable error of this constitution: it did not come to a decision; it fell prey to the misconception that the principles of democracy alone constitute the principles of a specific social or ideational order; it forgot that democracy cannot do more than articulate already existing conditions. What a democracy can do is

to give external expression to an existing social order and to represent it meaningfully. Because of the confusion between the form of democracy and its content no one undertook to endow this constitution with a political program. (Kirchheimer, 1930b: 72)

This quotation reveals two central tenets of Kirchheimer's critique of the Weimar democracy in the first months of 1930. First, picking up on Carl Schmitt's famous formula of 'a constitution without a decision' (Schmitt, 1928: 32), Kirchheimer interpreted the legal and political system of the Weimar Republic as an unstable compromise between diverse and often antagonistic social groups and classes. Both Schmitt and Kirchheimer shared the conviction that legal norms depend on power and decisions. Yet there is a discrepancy between their understandings of the term 'decision'. For the young socialist, a decision never emanated from nothing but was rather to be founded in class relations. Neither did Kirchheimer adopt Schmitt's cynical concept of the political as an uncompromising distinction between friend and enemy. In Kirchheimer's understanding, the struggle of the classes is not a blind combat in history but rather a competition of principles. Every attempt to improve the situation of the working class was thwarted by the conservative executive or judiciary. The consequence was a crisis of bourgeois rule: first, with respect to its democratic quality, as non-elected forces heavily restricted the power of legislature; and, second, with respect to the rule of law, since the current rules were not applied administratively and judicially in accordance with the rules given by the constitution or the legislature. In such a system, the belief in the rational-legal authority is shaken.

This leads us to the second tenet of Kirchheimer's critique of the Weimar parliamentary system. In order to establish a functioning democracy, society has to decide on a common social order. The implementation of political equality at the beginning of the Weimar Republic was interpreted

as a revolutionary breakthrough by many social democrats. But to Kirchheimer this 'political democracy' did not say anything about economic power relations. Although Kirchheimer's argument was often described as 'left-Schmittian' anti-parliamentarism, he did not argue for an identitarian ideal of democracy as Schmitt did. If we follow Max Adler's distinction between 'political' and 'social democracy', Kirchheimer saw only the latter as a democracy; 'social homogeneity' is the basic premise of any democratic state. Here, homogeneity does not refer to the idea of some transcendent national unity. Rather, homogeneity is a social category and, as such, a necessary condition preventing the establishment of permanent minorities, which would be marginalized and even repressed through majority rule. This argument is also expressed in his dissertation. At the end of *The Socialist and Bolshevik Theory of the State* (1928), Kirchheimer mentioned two alternatives: the policy of social democrats, which he pictured as a weak 'antipolitical refusal to make a decision' (Scheuerman, 1997: 36), and the strong Bolshevik claim for state sovereignty and power politics, which overturned any ethos of constitutionalism. Kirchheimer rejected both options and demanded a more active and militant realization of socialist aims, which had become part of the second section of the Weimar Constitution.

It is, therefore, hardly surprising that Kirchheimer focused on how the Weimar Constitution dealt with private property. According to its wording, the expropriation of private property without full financial compensation was possible as long as it was done for the public welfare and proceeded via parliamentary laws. In a democracy, the legislature is supposed to be omnipotent, and the historical trend points toward growing state intervention: 'The principle of the liberal *Rechtsstaat* is abandoned, insofar as the state, acting on its own conventions, interferes with that which was previously an unquestionable sphere of private domination'

(Kirchheimer, 1930a: 103). However, in the political reality of the Weimar Republic, Kirchheimer's interpretation of the constitution on the issue of property rights had no chance of being implemented. On the contrary, the prevailing legal opinions of the conservative courts expanded the security for private property rights and made it impossible for the state to realize certain infrastructure programs. The political hope of mainstream social democrats that the state would be able to transfer economic enterprises into common property turned out to be illusory.

Kirchheimer diagnosed a deadly crisis of the Weimar parliamentary system and suggested a more militant politics of socialist transformation. Although he had criticized the Weimar Constitution fundamentally and radically, he could draw only a limited practical conclusion from this. Kirchheimer did not change the general picture of his analysis of the Weimar Republic, but the conclusions he drew from it in 1928 were very different from those he drew from the summer of 1930.

The year 1930 ended the era of parliamentary governments in Germany. From that point on, the executive governed without the support of a majority in the Reichstag, based on presidential emergency decrees. This regime change influenced Kirchheimer's position with respect to constitutional politics.<sup>4</sup> In July 1930 he stated that the Weimar Constitution was 'at least a bit of a democracy' (Kirchheimer, 1930c: 93), which was worth being defended, because up until 1930 it led to substantial compromises between the parties of the bourgeoisie and the social democrats. Schmitt, relying on his antagonistic concept of politics, celebrated the use of emergency rules as a resurrection of the state's sovereignty and the presidential system as a true incarnation of democratic identification. Kirchheimer condemned this process as a decay of democracy and as the first phase of a dictatorship. For Kirchheimer, ruling by emergency decrees could not prove a stepping stone toward the restoration of

public order of a *pouvoir neutre* but rather a partisan tool to regulate economic, labor or social policy in a partisan way. However, instead of calling for mass demonstrations, civil disobedience or even revolutionary acts, he now insisted on compliance with the legal regulations of the constitutional state in order to defend the republican order: 'democracy is the only political system that provides an institutional guarantee that even the most decisive transitions of power need not threaten the continuity of the legal order' (Kirchheimer and Leites, 1933: 82). In his critique of the Prussian coup (*Preußenschlag*) of July 1932 as 'one of the rudest and most evident cases of abuse of form' (Kirchheimer, 1932: 49), Kirchheimer again defended the parliamentary system. In January 1933, a few days before Hitler came to power, he wrote:

The big difference between an autocratic order and a democratic constitutional order is the fact that only the latter secures legal development, though to a limited degree and at the cost of an unavoidable tension between the legal order and the order of power. Therefore, in a democratic state system it can very easily happen that [...] the ideological superstructure of the legal order 'limps ahead of' the actual power relations. (Kirchheimer, 1933b: 183)

Whereas in 1930 Kirchheimer characterized the legal superstructure of the Weimar Republic in a rather orthodox Marxist manner as inferior to power relations (Kirchheimer, 1930b), in 1933 his view turned around.

In the last two years of the Weimar Republic, Kirchheimer defined democracy not merely as a political form for social benefits and emancipation of the working class, but also as the political form that guarantees the interrelation of freedom and equality. He stated: 'the demand for equality is integrated into a demand for the realization of freedom, defined here as an agreement between an unhindered process of will-formation among citizens with the will of the government' (Kirchheimer and Leites, 1933: 65). He no longer defined democracy on the basis of a homogeneous society like Adler and Schmitt did.

Kirchheimer emphasized that democracy neither works by itself nor by the unpolitical power of the state administration; instead it has to be achieved through controversies, conflicts and, sometimes, even civil wars. Ideally, besides leading to maximal political participation, the mutual dependency of freedom and equality in democracy would result in a growing satisfaction of social needs. According to Kirchheimer, the telos of democracy is social democracy. This defense of parliamentarism distinguishes Kirchheimer from communist attitudes as well as his former teacher Carl Schmitt. After 1930, Kirchheimer rejected not only Schmitt's negative view on party politics and his anti-parliamentarianism but also Schmitt's negation of the civilizing function of law.

Kirchheimer seems to make a turnaround: despite all its weaknesses, the Weimar Constitution is no longer to be seen as a misconstruction. However, the practical political question is still unanswered: what is to be done when the legal, administrative and military elites turn their backs on democracy? The answer Kirchheimer gave in January 1933 was the following:

A socialist appreciation of democracy does not primarily concentrate on the legal norms of a democratic constitution but has to make its evaluation of democracy dependent on the question of whether it can count on the overall legal behaviour of the other political agencies of power; whether the other parties and social power groups are prepared to accept the basic democratic institutions, even if they are intent upon limiting their aspirations of power and conceding free play to their political enemies. (Kirchheimer and Leites, 1933: 180-2)

If this is not the case, even violence becomes a legitimate tool for the restoration of democracy. The social democrats should not be afraid, he repeated in an article published in March 1933, 'that the working class can conquer executive political power'. Such a 'civil war has only been forced upon it' (Kirchheimer, 1933a: 27). German history, however, took a different turn.

## THE LEGAL ORDER OF NATIONAL SOCIALISM

The biographical details of Kirchheimer's early time in Paris are still not known. Only four articles written by Kirchheimer during his first two years in exile have been discovered so far: *Remarks on Carl Schmitt's 'Legality and Legitimacy'* (Kirchheimer and Leites, 1933), *The Growth and the Decay of the Weimar Constitution* (1933c), *Zur Geschichte des Obersten Gerichtshofes der Vereinigten Staaten von Amerika* (1934) and *State Structure and Law in the Third Reich* (1935), which was published as an indictment against the Nazi regime under the pseudonym Dr Hermann Seitz. It was smuggled into Germany and published in disguise as part of the series *Der deutsche Staat der Gegenwart* edited by Carl Schmitt (Schmitt, 1933). The article was printed in Amsterdam and illegally distributed in Germany by the anti-Nazi resistance. The series *Der deutsche Staat der Gegenwart* was a main source of legal justification for the Nazi state. Important writings from Schmitt were published in this series as well as writings by leading Nazi jurists like Ernst Rudolf Huber, Reinhard Hoehn, Theodor Maunz, Paul Ritterbusch and Werner Weber. In *State Structure and Law in the Third Reich* Kirchheimer attacked the very heart of their justifications for the Nazi system by claiming that the dissolution of constitutional guarantees by National Socialism destroyed the bases for any legal order.

In retrospect, Kirchheimer described the fall of the democratic Weimar Republic as not just due to the successful agitation of the National Socialist party but on a more fundamental level as a consequence of the shift from competitive capitalism toward monopoly capitalism in modern society, a general trend he identified in other Western capitalist societies. Similar to his conclusion in *Weimar – and What Then?*, he blamed the lack of a distinct decision about the social order in the Weimar Constitution for the fall of the republic.

The idea of the 'social state' had not been compatible with the parliamentary and bureaucratic interests of the middle classes. Those groups had no interest in regulating conditions of ownership in big industrial and agricultural enterprises (Kirchheimer, 1933c: 562–4). Monopolization was not solely a product of the Nazi regime but had already developed during the Weimar Republic. He wrote in 1941:

This process of absorption of individual rights by monopolistic groups, although noticeable throughout the whole world, was especially apparent under the Weimar Constitution, where the mixture of traditional liberties and status quo guarantees under the misleading title of fundamental rights offered an excellent legal starting point for such developments. Property rights became a protective screen for the process of monopolization, freedom of religion was used to strengthen the existing religious corporations, and freedom of speech and association had to be supplemented by strong protecting organizations in order to obtain recognition. (Kirchheimer, 1941a: 142)

In his first paid work in the United States at the Institute, from winter 1937 to summer 1938, he was to revise, edit and finish a book manuscript by Georg Rusche on the labor market and penal system. The book was published in 1939 with the title *Punishment and Social Structure* and became the Institute's very first publication in English (Kirchheimer and Rusche, 1939). Kirchheimer wrote the final chapters of the book, in which he argued that punishment policies had no direct influence on the crime rate. Neither a mild policy with the goal of character reform nor a severe policy with the goal of deterrence determine the crime rate. Instead he identified the economic condition of society as the main determinant.

After completing this book, Kirchheimer was offered new contracts as a part-time assistant for the Institute. Since the beginning of the Second World War, the general research agenda of the Institute had focused on conferences and research projects on Nazi Germany. In this context Kirchheimer published his best-known work on the economic

and legal order of National Socialism during 1939 and 1943: *Criminal Law in National Socialist Germany* (1939/40), *Changes in the Structure of Political Compromise* (1941a), *The Legal Order of National Socialism* (1941b) and a book he wrote together with Arkadij Gurland and Neumann, *The Fate of Small Business in Nazi Germany* (Kirchheimer et al., 1943). Together with Gurland, he also provided the economic statistics for Neumann's book *Behemoth* (Neumann, 1942).<sup>5</sup>

Kirchheimer's position at the Institute was difficult. The historian Thomas Wheatland describes the atmosphere and Kirchheimer's status under Max Horkheimer's hierarchical regime during the years in New York in the following words:

Horkheimer, as paternal authority figure, occupied the table's center seat and never smiled. To his left sat Theodor W. Adorno, who – unable to contain his intellect or excitement – flitted about the room like a hummingbird constantly conversing with people. On Horkheimer's right sat Friedrich Pollock in a state of perpetual solemnity. Herbert Marcuse and Franz L. Neumann, two of the wittiest and most personable members of the group, were assigned the next pair of seats beside Adorno and Pollock. Leo Löwenthal and Henryk Grossmann occupied the last two interior spaces at the table, and Otto Kirchheimer and Arkadij Gurland sat at the ends of the table, occupying the most hazardous position at the seminars. After each paper, Institute members would address it in turn. Horkheimer would speak first, followed by Pollock, then Adorno, and so it would proceed until the floor was turned over to Kirchheimer and Gurland. Because both were always the last to speak, their comments often seemed unoriginal or wildly speculative, formulated in a desperate attempt to say something new. As [Daniel] Bell recalls, both received the frequent derision of their colleagues. (Wheatland, 2009: 80)

Anne Kirchheimer-Rosenthal, Kirchheimer's second wife, remembered his years at the Institute with little sympathy for its leading figures: 'They gave him a pittance and they did treat him like dirt. Only after he got a job and a position [in the American academia] they treated him like a human being' (Schale, 2006: 96). Nevertheless, Kirchheimer closely

collaborated at the Institute with Neumann, Gurland and Marcuse, and intellectually the years with the Institute were a very productive period of his life.

As Max Horkheimer explained to Neumann in a letter on February 1, 1942, profound theoretical and political differences concerning the nature and structure of National Socialism led to harsh disputes between the members of the Institute (quoted in Laudani, 2013: 3–4). Horkheimer and Adorno's theory on National Socialism was grounded on Friedrich Pollock's concept of 'state capitalism', which understood the Nazi regime as one among other cases of an emerging new economic and social order, which had transformed monopoly capitalism into a 'command economy' (Pollock, 1941: 454). They were inclined to the view that the Nazi regime was like the Soviet regime. In contrast to these members of the inner core of the Frankfurt School, Kirchheimer agreed with Franz L. Neumann, Arkadij Gurland and partly with Herbert Marcuse (Jay, 1973: 143–72; Wiggershaus, 1995: 223–36, 280–91) that National Socialism was a monopoly capitalistic system built on the social order of private ownership. The economic imperatives of monopoly capitalism were intact and the compromises among the elites of economy, party, military and administration were based on an economic system of private capitalism. This turned out to be the last intensive and truly interdisciplinary debate at the Institute.

Already in 1935, Kirchheimer had argued that in order to secure full state integration and monopolization the Nazis prevented free movements of goods by suppressing freedom of contract while maintaining the social order of private capital. This was also achieved by toughening criminal law and changing the meaning of basic legal terms, like 'substantive justice', or legal compliance (Kirchheimer, 1935: 145–6). Those terms were no longer based on legal rationality – referring to the independence of courts in reaching a sentence – but were used as an instrument to

ascertain political reliability to secure the *deutsche Volksgemeinschaft* (ethnic German community). In 1941 Kirchheimer called this form of rationality 'technical rationality' to exemplify how the administration of justice functioned (Kirchheimer, 1941b: 99). Whereas Marcuse applied the concept of technical rationality to the ideologically instrumentalized mass culture (Marcuse, 1941) and Pollock to the economic structure, and thus concluded that National Socialism is based on a 'command economy' (Pollock, 1941: 447–8),<sup>6</sup> Kirchheimer applied the concept exclusively to the legal order of National Socialism. Courts were transformed into executive organs to secure political reliability and economic monopolization enhanced by a plurality of organizations having their own jurisdiction over their members (Kirchheimer, 1941b: 108). Not only the army but also industrial and agricultural enterprises were judging working and production conditions autonomously. There was no possibility for workers to call the courts on their own. In this way the Nazis were able to secure the support of all interest groups in power. Thus, criminal law was primarily a source of instructions for political suppression, which ignored possible social circumstances as the origin of criminal behavior (Kirchheimer, 1935: 148).

Since Kirchheimer did not apply the concept of technical rationality to the economy (like Pollock did), he could interpret German National Socialism as a political compromise between certain social groups. The political compromise of National Socialism was constituted by the NSDAP and members of the SA and SS, big industrial companies, agriculture, the *Reichswehr* (the German army) and the state bureaucracy. Hitler's role as Führer was to integrate these different groups with their different social interests. Similarly to Neumann, Kirchheimer argued that the Nazi government was not in full control of the capitalist economy. The Nazi compromise was achieved by new economic and political guarantees for certain interest groups: first, the assurance of institutional

security by enforcing a 'strong government' and abolishing democratic fluctuations in the instructional structure to lower investment risks for big industries; second, opening new investment markets to benefit the few economic power holders; and, third, enhancing monopolization and cartelization by, for example, granting self-jurisdiction to the big industries (Kirchheimer, 1941a: 143–7). Therefore, the Nazi regime was by no means anti-capitalistic or post-capitalistic; it concentrated the possibility of ownership and economic power among a few people holding power over large trusts, while the middle class and small businesses were destroyed (Kirchheimer, 1941a: 155–9).

Kirchheimer insisted on the view that the self-preservation strategy of National Socialism was not sustainable. The reason for the instability of Nazi Germany was that it relied on a state that had to be able to secure simultaneously successful external expansion by war and by internal suppression of any opposition. Such a constellation was problematic for the stability of the system because in the case of external shocks 'it is rather doubtful whether suppression can be maintained when the system that insured it has been substantially shaken' (Kirchheimer, 1944: 193).

In a way similar to Neumann and Gurland, Kirchheimer occupies a distinct place within the group of the first generation of the Frankfurt School in exile. He did not follow the negative philosophy of history in Adorno's and Horkheimer's *Dialectic of Enlightenment* (1944), nor did he share the revolutionary optimism of his close personal friend Herbert Marcuse. In the debates within the Institute about the best way to describe German Nazism, he insisted, against Horkheimer, Pollock and Adorno, on the priority of structural changes in modern capitalism for any analysis of Nazi Germany. In retrospect, this constellation was paradoxical. Horkheimer and his followers created a theory of 'state capitalism', a system of society in which politics dominate the economic

sphere; but they did not carry out any analysis in political science to get a closer look at the political processes of this new system. Kirchheimer on the other hand was hired to fill the gap in Horkheimer's ambitious 'interdisciplinary materialism' in the fields of politics and law. However, his empirical research led him to conclude that any serious analysis of politics and law in Nazi Germany has to have as its analytical starting point the capitalist character of the economy.

But it is not only detailed empirical knowledge that makes Kirchheimer's analysis of fascism, in retrospect, more convincing than the state-capitalism theory of Horkheimer and his inner circle at the Institute. Axel Honneth is correct when he attributes the superiority of the interpretation by Kirchheimer, Gurland and Neumann to a 'social-theoretical approach, which is more implicitly than explicitly' (Honneth, 1995: 79) to be found in their work. Whereas for Horkheimer and his inner circle, social integration represented a process which comes about by means of the unconscious compliance with the functional imperatives of society, Kirchheimer and his two co-authors understood social integration 'also by way of communication between social groups' (Honneth, 1995: 78). Such an approach sets up a barrier against a Marxist functionalism that finally led Horkheimer and his close associates to draw a monolithic picture of a totally administered society. Against such a functionalism, Kirchheimer's analyses of both the Weimar Republic and of Nazi Germany started from an analysis of the interests and orientations that the main social groups themselves had brought into the political games.

## **WESTERN POSTWAR SOCIETIES: THE VANISHING OPPOSITION**

Kirchheimer's view on the prospects for democracy after the war changed over the years. But whereas his writings in the Weimar

period and, to a lesser degree, in the early years of his exile, were underpinned by an optimistic vision of a better and just social and political order, in his very late work he changed his fundamental perspective: instead of hoping for a better political world he hoped to avert the worst. In his last essay in the *Festschrift* for Herbert Marcuse, Kirchheimer concluded his reflections with the following diagnosis of the times:

It may well be, however, that the historian of the twentieth century will be less impressed by diverse propagandistic claims of various regimes as to the reign of law under their dominion than with the close cohabitation between wide stretches of certainty for mass man's daily living conditions with unheard-of areas of oppression, lawlessness, and rewards for maximum aggressiveness. A generation that has lived through Auschwitz and Hiroshima and was indifferent or powerless to prevent them, and which is prepared to see bigger Hiroshimas, has no cause for complacency about its preservation or even enlargement of some orderly forms of living. It may have forgotten the essential: there must be life for life to be worth living. (Kirchheimer, 1967: 261)

Kirchheimer's first studies on Germany at the OSS were guided by his fear of a forthcoming Nazi resurgence. However, such a scenario soon played a minor role in his evaluations of German society. According to Kirchheimer, the majority of Germans and the key political parties seemed to focus on industrial and economic reconstruction; political conflicts, ideological controversies and accounting for the past mattered next to nothing. West Germany was more than another bastion of the postwar affluent society, with its orientation on non-political pragmatism. The so-called economic miracle, the position in foreign policy and even the taboo of its Nazi past fostered its defining feature: the welfare state with its all-embracing universe of claims. The once feared revanchism and nationalism were replaced by the satisfaction of private consumer dreams, an increasing national income and the maintenance of social normality. West Germany was, in Kirchheimer's eyes, a stable political system but not a democratic

community with a culture of civic discussion. His criticism was now directed toward the political parties – not exclusively toward the government – and no longer toward the judicial system. Kirchheimer praised the Federal Constitutional Court for its decision in the 1950s on civil service law after Nazism and its cautious activity in the communist party-ban proceedings. His critique of political power, however, revolved around the replacement of the normative ideal of a 'good life' with the satisfaction of consumer needs. 'Part of the stupendous absorptive capacity of the West German regime [...] rests on its collective lack of memory; there is little demand for self-criticism in a successful going concern' (Kirchheimer, 1961a: 254–66).

Kirchheimer stated that anyone who disturbed this universe of claims by questioning the German emphasis on economic developments and consumerism, suggesting an alternative foreign policy toward the Soviet bloc or remembering the Nazi past was regarded as a troublemaker. His prime example became the so-called 'Spiegel case'. In October 1962, leading journalists of the German weekly news magazine *Der Spiegel* were taken into custody and prosecuted for treason by the Federal government. Kirchheimer drew a parallel between some of the government activities and the methods of the Gestapo. He called the government activities against the journalists 'cheese cover' (Kirchheimer, 1964: 85) and criticized the rise of a 'surveillance state' (Kirchheimer, 1966a: 282–6) in West Germany. Although Kirchheimer perceived the widespread public protest in the Spiegel case as an indicator for positive political change, he remained skeptical with respect to the political culture in West Germany.

Kirchheimer's research on the change of party structures can be best understood as part of his broader analysis of modern mass society (Schale and Buchstein, 2014). Due to their non-ideological behavior, the rising catch-all parties are the key political actors in modern society. They are exclusively focused

on electoral success, which leads to a minimization of ideological conflicts. Moreover, the orientation toward voters instead of party members strengthens the managerial dimension of political leadership and weakens deliberation within the party. These managerial trends strengthen the cooperation of business, administration, media and parties to a large extent and lead to a loss of critical supervision of the administration and other institutions of government. Political opposition becomes even more difficult. Kirchheimer discusses two ideal types: an opposition loyal to the government and an 'opposition by principle'. Both types of opposition lack programmatic ideas within the constitutional framework. Repeatedly, Kirchheimer wrote about the postwar setup in terms of absurdity: 'Activity becoming another form of passivity' (Kirchheimer, 1959: 499). Kirchheimer replicates such disillusioning results in many analyses, e.g., of the labor unions or the decline of intra-state federalism. However, as long as the economic miracle and the welfare state are able to maintain a 'universe of claims' (Kirchheimer, 1954: 312), this type of political integration by marketing works perfectly well.

Kirchheimer's last and more explicit sociological studies illustrate the extent to which his analyses are connected to Herbert Marcuse's writings of the early 1960s. Modern society is described as 'one-dimensional'. Kirchheimer tries to demonstrate how non-ideological political attitudes arise from social changes in modern mass production, bureaucratization and consumerism. Conspicuous private consumption substitutes the attainment of socio-political aims. Sometimes the labor unions sense the limits of such a view on society but 'an awareness of another and better order and a need to dissociate their claims from those of other groups by way of an elaborate theory [...] simply does not exist' (Kirchheimer, 1956: 508). Alienation without any proper political form entails false consciousness, the distinguishing characteristics of which are irrational

escapism, growing self-understanding as a pariah and confining oneself to pure instrumental reason. As in Marx's early writings, individualism does not mean liberation but isolation. Such an interpretation follows Marcuse's terms 'surplus repression' and 'repressive desublimation' as features of modern society, but Kirchheimer does not see any demand for non-repressive sublimation. The only remaining insight is that all the agencies organizing the universe of claims 'are insufficiently related to the major problem of his [man's] existence: his purpose in life' (Kirchheimer, 1966b: 24). Based on such a view, an analysis of Kirchheimer's magnum opus, *Political Justice* (1961b), sheds light on the extent to which his early normative ideal of a just humane society was transformed into hopeful skepticism for the reduction of injustices.

## POLITICAL JUSTICE AND LIBERAL DEMOCRACY

The first edition of Kirchheimer's book *Political Justice. The Use of Legal Procedures for Political Ends* came out in 1961. The much extended German edition appeared in 1965. Kirchheimer had worked on this book right after he had left the OSS in 1955. However, as John Herz and Eric Hula rightly emphasize, *Political Justice* is more a product of his lifelong experiences with the administration of law and politics in liberal democracies since the Weimar Republic than of his observations during the years of the Nazi regime (Herz and Hula, 1969: xxxii). While it is common to assume that the phenomenon of political justice is mainly a practice used by authoritarian regimes for purposes of propaganda, Kirchheimer focused his interest on liberal constitutional states. He was inspired by his former teacher Rudolf Smend and his 'theory of integration', which states that the courts in liberal democracies should not

only integrate the legal community but also support the general political goals of the regime and thus enhance state integration (Kirchheimer, 1965: 23).<sup>7</sup> This is where Kirchheimer's reflections on political justice begin.

The title of the book is ambiguous to English readers, as Kirchheimer explains in the preface:

The term Political Justice is usually taken to reflect the search for an ideal order in which all members will communicate and interact with the body politic to assure its highest perfection. Is it, then, gross linguistic abuse and utter cynicism to apply this term, as European writers have traditionally done, to the most dubious segment of the administration of justice, that segment which uses the devices of justice to bolster or create new power positions? (Kirchheimer, 1961b: vii)

It was to avoid confusion that Kirchheimer added the subtitle 'The Use of Legal Procedures for Political Ends' (Hackler and Herrmann, 2015: 183). Most American scholars when referring to *Political Justice* use the term 'political trials' instead.

Political justice in Kirchheimer's sense is a necessary but paradoxical component of the judicial process in any democratic state. Courts are supposed to be neutral institutions that decide on the limits of political thought and action (Kirchheimer, 1961b: 6–7). Kirchheimer claims that political trials have been a useful tool throughout history to legitimize persecution in states based on liberal principles. He illustrates this claim by presenting numerous examples up to the Nuremberg trials and those against suspected communists in the United States and West Germany. In one chapter he takes a closer and critical look at the administration of justice in the GDR; this investigation had a personal component as well, because his first wife – remarried as Hilde Neumann – took a leading position in the East German judicial apparatus until her early death in 1959. The final chapters of the book deal with the adjustments of political justice, asylum and clemency.

For Kirchheimer, 'authentication' had been one of the two major functions of political trials in liberal constitutional systems since the French Revolution. By referring to *a priori* rules, judicial authentication simultaneously legitimizes and constrains government actions. Therefore, political justice has a positive aspect: in order to gain legitimacy, a judicial process has to follow procedural law. This is the reason for Kirchheimer's exclusion of regimes like Nazi Germany from his analysis. In such systems, law is always politically controlled and implemented like an order or a directive. As Ulrich Scheuner put it in a letter: 'The counterpart [of political trials] is even worse: It is the administrative annihilation of foes, from concentration camps through to administrative forced exile'.<sup>8</sup>

The mobilization of public opinion is the second function of political justice. The courtroom becomes a stage not only for the regime but also for the accused. It gives the accused a chance to promote his or her political beliefs and goals:

The aim of political justice is to enlarge the area of political action by enlisting the services of courts on behalf of political goals. It is characterized by the submission to court scrutiny of group and individual action. Those instrumental in such submission seek to strengthen their own position and weaken that of their political foes. (Kirchheimer, 1961b: 419)

For Kirchheimer political justice is not bound to political criminal law but characterized by the intention of the actors to use courts for political purposes. It is important to emphasize that for Kirchheimer political justice does not necessarily result in the misuse of law. The functions of authentication and producing public images are also the reasons why political justice in some cases seems more attractive to power holders than administrative action (Kirchheimer, 1961b: 95–7).

Kirchheimer's definition of political justice reveals his complex intellectual relationship with Carl Schmitt and his terminology

of friend and foe. Even though Kirchheimer manages to mention Schmitt's name not once, close readers of the book realize that he defines politics as a battlefield for power in ways similar to Schmitt. But even though he uses the term 'politics' as Schmitt does, the meaning for Kirchheimer is different. According to Schmitt, politics and law are antagonistic entities and therefore any constitutional jurisdiction is self-contradictory; whenever the medium of law is used to settle political disputes, the logic of friend and foe automatically transfers law into politics. Kirchheimer, in contrast, assumes that political justice is a suitable and essential instrument to settle fights over political power. Thus, political justice should be understood in a positive way as a cultural achievement of the modern *Rechtsstaat* to constrain political arbitrariness. This insight leads Kirchheimer to agree with legal positivists like Hans Kelsen and Max Weber and their formula of 'the juridification of politics' (van Ooyen, 2011). In order to give readers of the German edition of the book who were familiar with Carl Schmitt's vocabulary no reason for possible misunderstanding, Kirchheimer instructed Gurland to avoid the term 'Feind' (enemy) and to use 'Gegner' (opponent) in the translation instead.<sup>9</sup>

## KIRCHHEIMER'S LEGACY

Kirchheimer's early articles on the Weimar years were widely recognized in Germany from the mid 1960s on, when predominantly left scholars rediscovered the *Weimar Staatsrechtslehre*. Since then, Kirchheimer's early work has stood out as a foresighted critique of the Weimar Republic. In addition, some of his concepts and categories in his Weimar writings have been picked up independently by authors of a later generation of the Frankfurt School – for example, his use of the term 'juridification' by Jürgen Habermas (Habermas, 1995: 356–73), his

analytical distinction between a 'directive' and a 'distributive' sphere in modern capitalism by Claus Offe (Offe, 1984: 89) or his discussion about the relationship between legality and legitimacy by Ulrich K. Preuss (Preuss, 1984). The Anglo-American reception of Kirchheimer's Weimar writings came more slowly and by different paths. Frank Burin and Kurt Shell had already called attention to Kirchheimer's work in 1969 with their edition *Politics, Law and Social Change. Selected Essays of Otto Kirchheimer* (Burin and Shell, 1969), but it was only in the 1980s that Anglo-American scholars took greater interest in Kirchheimer's Weimar writings. Keith Tribe's edition of essays by Kirchheimer and Neumann, *Social Democracy and the Rule of Law*, introduced Kirchheimer and Neumann in 1987 as witnesses of the fall of Weimar and advocates from the left of the 'rule of law' (Tribe, 1987). Tribe correctly contrasted Kirchheimer's and Carl Schmitt's positions. William Scheuerman picked up on this interpretation in his book *Rule and Law under Siege. Selected Essays of Franz L. Neumann and Otto Kirchheimer* (Scheuerman, 1996), in which he referred to Kirchheimer in order to argue against the emerging reception of Schmitt in Critical Legal Studies.

However, in the Anglo-American academy, Kirchheimer was for a long time mainly associated with his contributions to the body of literature by the Frankfurt School on Nazi Germany (Held, 1980; Arato and Gebhardt, 1982) and in particular with Franz Neumann's book *Behemoth*, to which he had contributed intellectually (Jay, 1973: 160–7). Only later did Thorsten Sellin and Edwin H. Sutherland discover *Punishment and Social Structure* as an important starting point for critical criminology (Taylor et al., 1975; Platt and Takagi, 1981; Melossi and Pavarini, 1981; Garland, 1990; Michalowski and Carlson, 1999: 217–49). An enthusiastic reference by Michel Foucault to *Punishment and Social Structure* in the first chapter of his *Discipline and Punish: The Birth of the*

*Prison* (Foucault, 1976: 35) helped to raise a broader interest in Kirchheimer's work on criminology.

The next wave of interest began with a crucial misunderstanding: the work of Kirchheimer, Marcuse and Benjamin was interpreted by some Anglo-American academics to be deeply influenced by right-wing conservative thinkers like Carl Schmitt, Martin Heidegger and Ernst Jünger. Kirchheimer was declared by some authors in this debate (Kennedy, 1987a, 1987b; Scheuerman, 1997) to be a 'left-Schmittian'. The critics accused Kirchheimer of following Schmitt in his concept of the political, in his anti-parliamentarism and in his critique of liberalism. It took a closer look at Kirchheimer's intellectual roots and the ways he made creative and critical use of Schmittian categories to correct this simplistic impression (Jay, 1987; Söllner, 1987; Preuss, 1987; Bavaj, 2007; Schale, 2011).

Among the wide range of topics in his late work, two issues stand out: his reflections on political justice and his analysis of the rise of catch-all parties. The English-speaking reception of *Political Justice* was sometimes characterized by misunderstandings, when his analysis was understood by some readers to contribute to the discussion of 'What makes a trial political?'. Judith Shklar's book *Legalism, Law, Morals, and Political Trials* (1964) in which she applied Kirchheimer's concept of political trials in a creative way to the Nuremberg and Tokyo trials (Shklar, 1964: 237), was the most productive reception of Kirchheimer's thoughts on this issue. She reaches, however, a different conclusion from Kirchheimer with respect to the function of political trials. Whereas he saw the Nuremberg Trials (again contra Schmitt) as a crucial contribution to the development of international law (Kirchheimer, 1961b: 341), Shklar evaluated political trials as an illegitimate or indecent practice. According to her, the Nuremberg Trials were legitimate only in a political sense, not in a legal one. The recent attempt to define political

trials in the tradition of Kirchheimer by Jens Meierhenrich and Devin Pendas leads to an even more critical conclusion: Kirchheimer's use of the Schmittian term 'politics' narrows his concept to politically intended battles in the courtroom and leaves out possible non-political trials, which may still have a major political impact (Meierhenrich and Pendas, 2016: 27).

Kirchheimer's writings about the structural changes of party systems draw wide attention from political scientists until today. Kirchheimer has become *the* classic author on the emergence of the catch-all party. Within the tradition of the Frankfurt School, Jürgen Habermas in his early work on the transformation of the public sphere, and Claus Offe in his writings about the legitimacy crisis in late capitalism, relied on Kirchheimer's reflections about the changing party systems and the vanishing of opposition in modern democracies (Habermas, 1992: 196–222; Offe, 1985). Meanwhile, there exists a rich body of literature about the empirical validity of his thesis (Wolinetz, 1979; Dittrich, 1983; Krouwel, 2003; Williams, 2009). In addition, it serves as a conceptual tool to model recent developments in party systems facing the rise of right-wing popular parties. Peter Mair and Richard S. Katz and their concept of the 'cartel party' could be read as an update of Kirchheimer's theory which corresponds to recent publications by Colin Crouch and others on 'post-democracy' (Mair and Katz, 1992, 1994, 2002; Mair, 2013).

Kirchheimer's late articles and papers are characterized by a sense of critical distance from, and even grim coolness toward, industrial societies and modern Western democracies. He sympathized with the American student protest movement, which started in Berkeley in 1964, while not sharing Marcuse's enthusiasm for it. Like Horkheimer, Adorno or Löwenthal, he did not trust that the institutions of modern democracy and the public sphere would have a powerful curing effect on the power elites in the long run. Nevertheless, Alfons Söllner

has made an important point when he identifies Kirchheimer's intellectual development as a process of internationalization, acculturation and normative Westernization in the context of his political experiences as an émigré (Söllner, 2003). Kirchheimer's personal experience during the Weimar Republic and its collapse, his precarious existence in Paris and New York and the willingness of the United States to accept him at the OSS, the State Department and in the university system turned him into an intellectually open political scientist who had learned to value and to insist on the minimal normative standards of a liberal democracy. Kirchheimer in his late work did not hope for a better political world but simply wanted to avert the worst.

## Notes

- 1 The authors would like to thank Eno Trimcev, Kerstin Pohl, Werner Bonefeld and Beverley Best for their helpful comments.
- 2 The following biographical sketch is based on John H. Herz and Erich Hula (1969) and Frank Schale (2006). Additional biographical information is based on Otto Kirchheimer's Papers (at the University at Albany, M.E. Grenander Department of Special Collections & Archives) and on conversations and interviews (Frank Schale with Anne Rosenthal-Kirchheimer on October 6, 2006; Hubertus Buchstein with John H. Herz on November 15, 1985, with Leo Löwenthal on October 10, 1990, with Wilhelm Hennis on September 26, 2009, with Peter Kirchheimer on March 12, 2015 and with Hanna Kirchheimer-Grossman on March 11, 2016).
- 3 First investigations by the FBI are documented in 1940. During his time at the OSS Kirchheimer had been the subject of loyalty reports several times. While working at the State Department in 1952 he was classified as an employee who is 'eligible on loyalty' (see FBI Headquarters file 121-HQ-13351, Section 1, Report from Hiram Bringham to Honorable J. Edgar Hoover, May 21, 1952).
- 4 *Artikel 48 und die Wandlungen des Verfassungssystems. Auch ein Beitrag zum Verfassungstag* (1930c) was the first article that showed Kirchheimer's radically changed position toward the Weimar parliamentary system after the recently announced *Reichskanzler* Heinrich Brüning passed laws in July 1930 to implement a new fiscal policy by using the emergency rule. Before-

hand, the Social Democratic party had blocked Brüning's policy. *Weimar – and What Then?* was published only a few months earlier.

- 5 On Kirchheimer's close collaboration with Gurland see Buchstein (2010).
- 6 Pollock explicitly refers to Otto Kirchheimer's essay 'The Legal Order of National Socialism' (Pollock, 1941: 447–8).
- 7 Kirchheimer only mentions his former professor Rudolf Smend in the German translation. The enlarged German edition of the book from 1965 is around 250 pages longer and was translated by his old friend from the Young Socialists Arkadij Gurland.

# The Image of Benjamin<sup>1</sup>

David Kaufmann

Benjamin's writings are an attempt in ever new ways to make philosophically fruitful what has not yet been foreclosed by great intentions. The task he bequeathed was not to abandon such an attempt to the estranging enigmas of thought alone, but to bring the intention less within the realm of concepts: *the obligation to think at the same time dialectically and undialectically*.

T.W. Adorno (Adorno, 2006a: 151–2;  
emphasis added)

## THE FIGURE OF CONTRADICTION

Walter Benjamin (1892–1940) has always cut a difficult figure. Mystical Marxist, materialist Jew, he was the self-conscious embodiment of contradiction. He performed contradiction in his work and in his life. He triangulated friendships with any number of the most important and opposed intellectual figures of late Wilhelmine and Weimar Germany from the anarchist and Marxist Left all the way to the proto-Fascist Right.

His closest correspondents held each other in the deepest suspicion.

Benjamin's writing – not quite philosophy (he abhorred deduction), not quite literary history and always more than mere journalism – is just as hard to pin down. It is inseparable from the pathos of failure and from the even greater pathos of his suicide. (He killed himself while trying to flee to America in 1940.) Benjamin's professional disappointments were many. In the mid 1920s, he found himself unable (or unwilling) to secure a university position with his brilliant and intractable study of the Baroque, *The Origin of the German Tragic Drama* [*Trauerspiel*]. As a result, he spent the last 13 years of his life moving from city to city, apartment to apartment, living from small grants, little gifts and whatever he could scrape together from reviewing. All the while, Benjamin was working on his often promised and ultimately incomplete magnum opus, a study of Baudelaire and of the Paris of the nineteenth century. We only have a torso of

this project: hundreds of pages of notes, a few preliminary drafts of essays and a string of brilliantly elusive aphorisms which have been bundled together by his editors in a book known in English as the *Arcades Project*. This volume, baffling and provocative as it is, is clearly not anything that Benjamin would have published.<sup>2</sup> It comes to us under the sign of disappointed hope. It is not a ruin. It is a monument to that which was never built.

Apart from his doctoral dissertation, Benjamin only wrote one scholarly book – the study of the *Trauerspiel* – and a very slim autobiographical volume about the socio-geography of his youth, *A Berlin Childhood around 1900*. The rest of his considerable output comes in the form of essays and reviews. The essay and the feuilleton suited Benjamin's talents, and in no small part Benjamin's considerable influence lies with the fact that he was a formidable stylist. His sentences are notable for their paradoxical force, their arresting mixture of clarity and enigma. They are just as remarkable for the brilliance of their indirection. Two examples will have to do. His great theological meditation on Goethe's *Elective Affinities* ends this way: 'Only for the sake of the hopeless have we been hope' (Benjamin, 1996: 356). At the other end of his career, in his last essay, 'On the Concept of History', he writes: 'There is no document of culture which is not at the same time a document of barbarism' (Benjamin, 2003: 392). In neither instance does Benjamin unfold an argument that would support these literally stunning statements. To go on to say, as he does in 'On the Concept of History', that the materialist historian reacts to the barbarism of culture by 'brush[ing] history against the grain' (Benjamin, 2003: 392) is not to explain the matter but to give it a slogan. In other words – and the words here are Benjamin's – Benjamin is most interested in the lightning flash of insight, not the thunder of explication that follows (Benjamin, 1999b: 456).

Benjamin is not a social theorist as such. While he assumes that Lukács's analysis of

classes and class consciousness is generally valid, his own Marxism shows surprisingly little interest in the working classes. (Like his hero Baudelaire, his compassion goes not to those whom capitalism exploits but to those whom capitalism discards.) His investment in the notion of freedom has little to do with the dictatorship of the proletariat and everything to do with his rejection of the Law. So, even though Benjamin came under the sway of Marx's thought in the late 1920s, his politics early and late always lean heavily on a distinctly German-Jewish kind of theological anarchism, one that we also find in the work of his friend, the great historian of Jewish mysticism, Gershom Scholem (Kaufmann, 2001). Indeed, Benjamin's work is less about freedom than it is about happiness (the theme of his last essay, 'On the Concept of History'). His utopianism is based on the assumption that fulfillment is within human reach yet rendered impossible by the present organization of society. Benjamin devotes his career to showing how the artifacts of culture both display and betray the promise of happiness.

In the Anglophone world, Benjamin's influence does not rest, as it does in Germany, on the essay on Goethe or the *Berlin Childhood* or on the aphorisms on history. While the *Arcades Project* has attracted a fair amount of local attention since it was translated nearly two decades ago, it has not gained traction and, considering its fragmentary and often under-theorized materials, it is not likely that it ever will. Even if it does, it will never cast the shadow that the third version of 'The Work of Art in the Age of Its Mechanical Reproducibility' has cast since its first appearance in English in the late 1960s. Although Miriam Hansen's brilliant and painstaking exegesis of the different versions of the essay have shown how its arguments and their development were riven by tension and conflict, the essay has been commonly taken to be a relatively straightforward celebration of film. It has been read as a call for what Benjamin in 'Experience and Poverty'

(1933) terms ‘a new barbarism’. It seems to advocate the liquidation of the outmoded privilege that is granted to traditional works of visual art and thus to demand the elimination of traditional aesthetic categories.

The rousing ending of the final version of the essay – the claim that the Fascists have aestheticized politics and it is for the Communists to politicize aesthetics (Benjamin, 2003: 270) – obscures its ambivalences. So does the force with which it comes down on one side of each of its constituent dichotomies. It plumps for the nearness that the contemporary ‘masses’ demand against the distance that inheres in the aura of traditional art; for exhibition value against cult value; for tactility against vision; and for bodily habit against disembodied contemplation. To get to the liquidationist position that he appears to advocate, Benjamin has to ignore contemporary film practices; he has to fudge his terms somewhat (‘tactility’ in the essay is a predicate of the *visual*, not of touch); and he has to present categories that need further elaboration (what *exactly* is ‘exhibition value’?). While Robert Hullot-Kentor’s dismissal of the essay as ‘a condensed weave of non-sequitur and untruth’ (Hullot-Kentor, 2006: 137) is unduly harsh, he is correct in his assessment that the essay assiduously ignores a good deal of Benjamin’s work on the aura during the 1930s. It thus seems to avoid his thought’s greatest insights (Hullot-Kentor, 2006: 140). One does not have to share Hullot-Kentor’s marked distaste for Benjamin to see that the ‘new barbarism’ that underscores both the second and the third versions of the ‘Work of Art’ essay goes against the line of argument that leads from ‘The Image of Proust’ (1929) through ‘A Short History of Photography’ (1931) and ‘The Storyteller’ to the all important ‘On Some Motifs in Baudelaire’ (1940). This argument, whose exploration is more or less coterminous with the *Arcades Project* itself, is a defense of the aura in its passing and of the form of knowledge-experience (*Erfahrung*) that underlies the aura in its decay. In other

words, for a good part of the 1930s, Benjamin takes up a line of inquiry that runs directly contrary to the ‘Work of Art’ essays.

My interest in pointing this out is not to choose sides but to note that Benjamin discusses the aura in two markedly different affective registers. In some places, he discusses it in a tone of liquidationist triumphalism, which seems to affirm the course of contemporary history. In others, he mourns it with a nostalgia that regrets that course. The important thing is that Benjamin strikes each of these notes in essays that are contemporaneous. He therefore appears to contradict himself. To see him as self-defeating or self-contradictory is tempting, but it misses the point of Benjamin’s triangulations. Benjamin wanted to redeem the truth-potential of *all* positions, no matter how vitiated those positions might have been. What is more, Benjamin courted misunderstanding. As Adorno reminds us in a discussion of Benjamin: ‘misunderstandings are the medium in which the noncommunicable is communicated’ (Adorno, 1983: 131).

Benjamin is a utopian – or, to put it theologically, a redemptive – thinker. In order to outline the utopian thrust of Benjamin’s thought and to see how one of its most important and elusive categories – the aura – is to be construed, I will begin by looking at Benjamin’s method and in particular at his notions of the constellation and the dialectical image. I shall go on to argue that by the end of his life, Benjamin had come to see that the utopian kernel of the aura had fled from art and had come to rest in messianic historiography.

## AGAINST DIALECTICS

Let me begin by taking to heart Adorno’s repeated complaint in his correspondence that Benjamin’s writings of the mid 1930s were not properly dialectical. We can see

Adorno's point in the 'Work of Art' essay itself, whose polarities are nothing more than mere dichotomies, categorical oppositions that do not engage each other. Unlike the other thinkers associated with the Institute for Social Research, Benjamin refuses Hegelian dialectics. He avoids overt mediation through the totality. Adorno, Horkheimer and Marcuse follow Lukács's account of reification and take the totality to mean social labor, the fact that under capitalism, commodity production organizes the whole of society. This organization ranges from the design of the industrial infrastructure to the very constitution of individual consciousness. As a result, all particulars take their shape and their meaning from commodity production. To ignore the mediation of the social whole is to fall into ideological illusion. Hence Adorno's complaint in a letter of 1938 to Benjamin about the apparently unmediated recital of historical facts in 'The Paris of the Second Empire in Baudelaire': 'It does not do justice to Marxism, because mediation by means of the total social process is missing and you almost superstitiously ascribe to the enumeration of materials a power of illumination' (Benjamin, 1994: 583). Adorno objects to Benjamin's tendency to present facts – details of a wine tax, say, or of the use of iron in construction – as if they were self-explanatory, as if they were not defined and determined by the gravitational pull of nineteenth-century industrial capitalism.

If Adorno is right and Benjamin's work does not *look* dialectical, how do we explain what Benjamin was up to? Benjamin was by philosophical education and bent a Neo-Kantian. He studied with Rickert, and his correspondence of the 1910s is punctuated by his sometimes dyspeptic comments about the great Neo-Kantian, Hermann Cohen (Caygill, 1998; Friedlander, 2012). One of Benjamin's most polemical works of the war years is the unpublished 'On the Program for the Coming Philosophy' (1918), a post-Kantian critique of Kant's strictures on experience. Now,

Benjamin's Kantianism was in good part dispositional. Hegel was not to his *taste*. As he wrote to Scholem in 1918, 'The Hegel I have read... has so far totally repelled me... an intellectual brute, a mystic of brute force, the worst there is; but a mystic, nonetheless' (Benjamin, 1994: 112).

## THEOLOGICAL SCRUPLES AND THE CONSTELLATION

That said, Benjamin's disdain for Hegel is more than a question of disposition, because it betrays a theological scruple. Even at his most materialist, Benjamin could write that the detailed interpretation of reality requires a *theological* method (Benjamin, 1999b: 460), and he is aware that his thought is 'saturated' with theology (Benjamin, 1999b: 471). Though Benjamin was not at all religious, Jewish theology served an important function in his work. With its insistence on G-d's absolute transcendence, Jewish theology provided a way of thinking past the imminence of the bourgeois world that Benjamin so detested. (His emphasis on Judaism was itself in part a protest against the increasingly anti-Semitic bent of late Wilhelmine culture.) Benjamin argues at the beginning of 'On the Concept of History' that even Marxism needs the help of theological transcendence if it is to fulfill its ultimately utopian emancipatory promise. In short, from the beginning to the end, Jewish theology was central to his project.

Pantheism is the great Jewish heresy, and the monism that many readers find in Hegel is just part of that heresy. In this light, nothing could be farther from normative Jewish thought than the vision at the end of the *Phenomenology* of the Absolute Spirit internalizing through memory (*Er-innern*) its self-othering in and through history. What is more, the Hegelian insistence on mediation also leads straight to the Incarnation, where the divine and the natural meet and are

sublated in the figure of Jesus. Judaism, on the other hand, only admits a *linguistic* mediation between God and humankind, Creator and Creation. That is why so many Jews have found so amenable the Kantian distinction between the noumenal and the phenomenal. Even when Benjamin kicked against this distinction in 'On the Program of the Coming Philosophy' and sought out that Kantian impossibility – a *metaphysical* experience – he did it by Kantian, not Hegelian, means.

It is against this background that we can understand the importance of the *constellation* for Benjamin and how it replaces the dialectic in his work. The constellation allows him to represent the social totality without requiring that his representation fall into the dialectical trap of incarnation – of filling in the outline as if it were indeed a substantial figure. The constellation, as Benjamin outlines it in the *Trauerspiel* study, derives from Hermann Cohen's notion of the 'correlation' and from Goethe's notion of primal phenomena,<sup>3</sup> even though he presents it in Platonic terms, as a new version of the doctrine of Ideas. In the preface to the *Trauerspiel* book, Benjamin claims that Ideas are *objective interpretations* of phenomena. They provide the meaning of things (Benjamin, 2009: 34). Benjamin's concern lies with the *representation* of Truth, because his definition of Truth as 'the death of intention' (Benjamin, 2009: 36) eliminates all deduction. As Truth is opposed to scientific knowledge, philosophy cannot rely on the modes of representation that science uses. Rather, philosophy will present the Idea as 'the arrangement [*Gestaltung*] of the context [*Zusammenhang*]' (Benjamin, 2009: 35) of phenomena. It is this arrangement that allows the Idea to be represented, and it is this representation that reveals the outlines of phenomena as they truly are. So *constellations* of things are their arrangement into figures that make the truth of those things self-evident. As with constellations in the heavens, written constellations require readers, an audience that will connect the dots and see the figures that they describe.

Benjamin abandoned the doctrine of Ideas as soon as he introduced it in 1926. The Ideas are the means by which he smuggled in his properly theological interests. Benjamin never jettisoned the constellation, however. It would be the cornerstone of his work for the rest of his life, though he would come to revise it in the face of his encounter with Surrealism and his 'conversion' to Marxism in the late 1920s.

## INTRODUCING THE DIALECTICAL IMAGE

The chief revision to the constellation as a figure in Benjamin's later thought comes with the introduction of the *dialectical image* in the Baudelaire studies and the *Arcades Project*. Benjamin clearly thought that the dialectical image was pivotal. In fact, it serves as the focus for the notes on epistemology and method in the file known as Konvolut 'N' of the *Arcades Project*. Even so, there is no consensus about what the dialectical image means and how it works. It is a notion that Susan Buck-Morss has called 'overdetermined' (Buck-Morss, 1989: 67; see also Pensky, 2002: 178) and which, on the other hand, Benjamin's editor, Rolf Tiedemann, has called 'undivulged'. Tiedemann's charge that the dialectical image 'never achieved any terminological consistency' (Tiedemann, 1999: 943) can be leveled at most of the terms in Benjamin's critical lexicon. Benjamin does not define his terms but allows meaning to accrete to them in ever new contexts. In other words, each term is part of a number of different constellations. In fact, each term becomes a constellation in itself.

This meaty formulation of the dialectical image from Konvolut 'N' ties the *image* to the *constellation*:

It's not that what is past casts its light on what is present [*das Gegenwärtige*], or what is present

[*das Gegenwärtige*] its light on what is past [*das Vergangene*]; rather, image is that wherein what has been [*das Gewesene*] comes together in a flash with the now [*das Jetzt*] to form a constellation. In other words, image is dialectics at a standstill. For while the relation of the present [*die Gegenwart*] to the past [*die Vergangenheit*] is a purely temporal, continuous one, the relation of what-has-been [*das Gewesene*] to the Now [*das Jetzt*] is dialectical: is not progression but image, suddenly emergent. Only dialectical images are genuine images.... And the place one encounters them is language'. (Benjamin, 1999b: 462)

Some preliminary things are worth noting here. The first is that one of the results of Benjamin's encounter with Surrealism was his fascination with images and his conviction that the image was the key to action. He wrote in *One-Way Street* (1926) that '[o]nly images in the mind vitalize the will' and that '[t]here is no intact will without exact pictorial imagination' (Benjamin, 1996: 466). So the will, the driver of conscious revolutionary change, depends on the image. The second thing to note is that the constellation here no longer consists, as it did in the *Trauerspiel* study, of mortified phenomena reorganized into a figure of the Truth. Rather, the constellated dialectical image has a temporal core. It draws the past and the present into a relation with each other. Where the constellation is ontological, the dialectical image is historical. Most importantly, the figure that the dialectical image describes is meant to have an explosive effect: it transforms the present [*die Gegenwart*] into the Now [*das Jetzt*].

## AGAINST PROGRESS

What is the Now? Benjamin makes it clear at the beginning of 'On the Concept of History' that Marxist historiography requires theological categories. The theological category that most interests him is redemption, the task of making good the losses and the promises of the past. Benjamin wants to use redemption as a way of exploding the notion

of progress, that version of history which insists that things are always getting better. In the Hegelian formulation, it is unavoidably apologetic. Even though Hegel recognizes that history is a 'slaughter bench', this blood-letting is necessary for the Spirit's full self-consciousness and thus, for the final instantiation of freedom. So the problem with the intellectual commitment to progress – and, as Kierkegaard argued, its full brutality becomes clear in Hegel – is that it sacrifices all the intervening stages to the supervening goal, the bloody middle to the glorious end. The concept of progress does *nothing* for the people who suffered so that freedom could finally find its fitting end in the Prussian state. For Benjamin, writing in the shadow of the stunning success of Fascism and the imminence of war, progress had become an impossible notion to swallow.

How to redeem the utopian promise of the notion of progress while jettisoning its plodding narrative structure? How to transform 'past' and 'present' (which are merely markers of temporal succession) into 'the what-has-been' and 'the Now' (which are the cardinal points of Benjamin's vision of conscious and consciously human history)? Benjamin claims that Marxist thought must employ a properly theological (and specifically Jewish) version of the messianic in order to break progress's delusory spell. A story from the Talmud will demonstrate the alternative to the slow crawl of progress that Benjamin has in mind. The Tractate *Sanhedrin* relates that a third-century rabbi was directed by the prophet Elijah to find the Messiah sitting among the beggars at the gates of Rome. (One of the messianic promises was precisely that the Jews would be able to throw off foreign rule, so this story has strong political overtones.) Rabbi Joshua duly went to Rome and asked the Messiah when he would come. Rabbi Joshua received the enigmatic and ultimately disappointing answer, 'Today'. So the rabbi returned to Elijah and complained that the Messiah had lied. The Redeemer would surely not come today.

To this Elijah replied, 'Today, *if you will but hear his voice*'. In other words, messianic fulfillment is possible at any time and its potential charges every moment. This is how Benjamin reworks the Talmudic motif in his notes for 'On the Concept of History': 'In reality, there is not a moment that would not carry with it its revolutionary chance – provided only that it is defined in a specific way' (Benjamin, 2003: 402). So, against an either indefinite (if you are a Hegelian-Marxist of the Third International) or infinite (if you are a Kantian) deferral, Benjamin proposes the messianic promise that even today we could see the redemption of the world. The present can give way to the Now – the moment when the divine and the human touch – if we only heed the images that lead us to revolutionary action. In other words, Benjamin thinks that dialectical images are charged with messianic energy.

## THE DIALECTICAL IMAGE AND THE NOW

Benjamin does not give many concrete examples of how the leap into redemption might work, but he does provide a telling one in 'On the Concept of History':

History is the subject of a construction whose site is not homogeneous, empty time, but time filled full by now-time [*Jetztzeit*]. Thus, to Robespierre ancient Rome was a past charged with now-time, a past which he blasted out of the continuum of history. The French Revolution viewed itself as Rome reincarnate. (Benjamin, 2003: 395)

The arc of redeemed history does not describe a temporal succession through empty time, the apparently natural flow of one damned thing after another. It is a construction, a constellation or, more properly put, a dialectical image. The French Revolution (the present) looked at Rome (the past) and in so doing, tried to fulfill the Roman Republic's untapped promise of virtue and freedom.

It remained untapped, because Brutus and his fellow conspirators lost in the end. The Republic was lost to the Empire. What is more, the Empire's own utopian promises (universal citizenship, the institution of a universal rule of law) fell in turn to the Gothic invasions, and so on. The utopian kernel of each stage was sacrificed to the thumping, catastrophic reality of the next.

For Robespierre, however, Republican Rome was a living possibility and he was able to realize the potential of its 'what-is-past' in the fulfillment of an actualized Now. Even though more than a millennium separated the end of the Republic from the French Revolution, the two moments were separated by less than a breath for Robespierre and Saint-Just. The *novum* of the Revolutionary dream of Republican Rome marked both a rupture within the existing order and the eruption of a possible *novo ordo seclorum*. In an interesting aside in the *Arcades Project*, Benjamin defines 'catastrophe' as missing an opportunity (Benjamin, 1999b: 492). 'History', in its redeemed sense, then, means nothing less than grasping the opportunity and keeping the promises of the past.

Robespierre and Saint-Just form a dialectical image with the Roman past, and *their* past as it swims into *our* ken provides us with our own revolutionary possibility. All this happens in language, not pictures. Benjamin's montage of time is linguistic. It's also worth noting that this montage, the dialectical image, is not a *narrative*. If it did tell a story, it would mimic the ongoing catastrophe of 'progress'. The dialectical image is thus the moment that *stops* that narrative and it therefore has a structural affinity with the revolutionary moment that pulls the brake on the chuffing engine of progress (this image too is Benjamin's).

Benjamin wants to change our sense of history. That is why, in the definition of the dialectical image above, Benjamin calls it 'dialectics at a standstill'. It marks an interruption of business as usual. The dialectical image is a way of writing or thinking that

shocks thought out of the dogmatic slumber that we call ideology and helps us see what has not been seen or what cannot be seen, an intimation of the truly new. He describes it this way in 'On the Concept of History':

Materialist historiography... is based on a *constructive* principle. Thinking involves not only the movement of thoughts, but their arrest as well. *Where thinking suddenly comes to a stop in a constellation saturated with tensions, it gives that constellation a shock, by which thinking is crystallized...* In this structure he recognizes the sign of... a revolutionary chance in the fight for the oppressed past. (Benjamin, 2003: 396; emphasis added)

Like Kierkegaard's notion of paradox, the dialectical image stops thought dead in its tracks and shows its limits. In Kierkegaard's *Philosophical Fragments*, this arrest comes in the form of a chiasmus: the paradox of thought – that it wants to find its limits – leads to the thought of paradox. The absolute paradox is the paradox of the absolute. (Kierkegaard, 1985: 37–48). Benjamin too is fond of this kind of chiasmic turn, most famously at the end of the essay on the *Elective Affinities*: 'Only for the sake of the hopeless are we given hope'. Paradox forces thought to think about itself even as thought fails.

## CONSTRUCTION OR ILLUMINATION?

The term 'dialectical image' is itself paradoxical. As Ansgar Hillach points out, 'image' [*Bild*] describes a figure and a *Gestalt*, whereas 'dialectic' describes the unfolding and overcoming of a contradiction in time. A dialectical image *contains* the contradictions which give it its shape. The structure that results is not dialectic at a permanent standstill. If it is dialectics, the figure can only constitute a *moment* in a further development (Hillach, 2000: 186–7).

This paradox – how can an image stop dialectics altogether and yet still be

dialectical? – brings us to the *effect* of the dialectical image. It also brings us back to the objection that Adorno raised against the portions of the *Arcades Project* that he read in the 1930s. Adorno complained that they 'superstitiously ascribe to the enumeration of materials a power of illumination'. Max Pensky has shown how Benjamin's discussions of the dialectical image cut in two opposed directions at once. On the one hand, the dialectical image hews to Benjamin's Surrealist side. It is an intentionless constellation that provides an apparently instantaneous 'profane illumination'. On the other hand, it is much more Brechtian. It describes a self-conscious construction that arrests unreflective 'common sense'. It makes the audience think. The technique of montage can serve either version of the dialectical image (Pensky, 2002: 192–5).<sup>4</sup>

So how are we supposed to read the dialectical image? Is it a figure that stops the course of thought or is it meant to be the spur to further thought, the *beginning*, not the end, of dialectics? The answer, of course, is both. Even though the notes in Konvolut 'N' in the *Arcades Project* and the evidence of 'On the Concept of History' indicate that while Benjamin never jettisoned the hope that the dialectical image would provide the immediate illumination of an intentionless truth, he takes a position in his correspondence with Adorno that is more recognizably Brechtian and less mystical.

Benjamin countered Adorno's charge that sections of 'The Paris of the Second Empire in Baudelaire' 'superstitiously ascribe to the enumeration of materials a power of illumination' by claiming that

[the] author's philological interpretation must be sublated in Hegelian fashion by dialectical materialists. Philology is the examination of a text, which, proceeding on the basis of details, magically fixates the reader on the text... They share the magical element, which is for philosophy to exorcise, reserved here for the concluding part. (Benjamin, 1994: 587–8)

Benjamin's defense would have been familiar to Adorno, because in his essay on Goethe's

*Elective Affinities*, Benjamin had been careful to distinguish between commentary – or what he here calls ‘philology’ – and critique. Benjamin is happy to concede that the philological sections of his Baudelaire study cast the very spell of the commodity fetishism that they record. He then promises that he will break this spell in the dialectical materialist final section of the book. This section will step out of the magic circle and provide the theoretical underpinning that Adorno requires. Of course, that concluding section was never written.

In his letter, Benjamin then turns the tables on Adorno. He cites a moment in Adorno’s study of Kierkegaard, where Adorno seems to say that the *effect* of the mythical image in Kierkegaard – amazement or astonishment [*Verwunderung*] – provides Kierkegaard’s deepest insight into the relation of dialectics and myth.<sup>5</sup> At that moment in his book, Adorno is quoting Benjamin, as he does throughout, by providing what is essentially a Benjaminian account of the dialectical image. (Scholem, disgusted by the ‘chutzhutzhut’ of Adorno’s book, felt it was outright plagiarism.) Adorno argues that our amazement that the mythical coexists with the rational in the image is an affective index of the truth that we do not want to admit. Our rationality is tinged with the mythical. Our pride in our ‘enlightenment’ stumbles over this reality and we feel amazed.

Benjamin is careful not to appeal to Adorno’s authority here (Adorno’s authority rests on his unacknowledged citation of Benjamin in the first place). Rather, Benjamin corrects Adorno and therefore himself:

I could be tempted to invoke this passage. Instead I want to propose that it be amended (by the way, just as I plan at another opportunity to amend the subsequent definition of the dialectical image). I believe it should read: astonishment is an excellent *object* [*Objekt*] of such an insight. (Benjamin, 1994: 588)

The affective moment is itself not the insight but the *object* of the insight. Amazement

serves as a catalyst for thought. In other words, there are two moments in the dialectical image. The image makes thought stumble, but thought then thinks about that stumble. To use the motif that Benjamin repeats throughout the *Arcades*, the dialectical image represents both dream and awakening, both astonishment and subsequent insight.

Benjamin thus switches places with Adorno. He attributes to Adorno the position that Adorno attributes to him. He criticizes Adorno for doing precisely what Adorno criticizes in him. However fair or merely tactical this moment is, it is important because it cedes to Adorno the undeniable fact that the *effect* of Benjamin’s constellations – in the more concentrated images of the *Berlin Childhood* or the more diffuse ones in ‘The Paris of the Second Empire’ – is less an immediate illumination than an amazement that needs to be thought through.

## PSAMMENITUS

In this light, enigma and illumination are intimately related. Thus – as Adorno suggested – misunderstanding might well be the medium of the as-yet-unthought. Consider Benjamin’s reflections on the story of Psammenitus in ‘The Storyteller’ (1936). Herodotus tells us that this Egyptian king did not cry when he saw his family marched as slaves in the triumph of his Persian vanquisher, but broke into tears when he saw his own servant being led away:

Herodotus offers no explanations. His report is utterly dry. That is why, after thousands of years, this story from ancient Egypt is still capable of provoking astonishment [*Staunen*] and reflection. It is like those seeds of grain that have lain for centuries in the airtight chambers of the pyramids and have retained their germinative power to this day. (Benjamin, 2002: 148)

Herodotus’s tale is an example of a dying genre, *the story*. The story (which Benjamin

opposes to the short story, the novel and journalism) was born of an era of guilds and handicrafts, of manual labor and manual expertise. It is about wisdom, not information. It transmits the content of a collective knowledge-experience (*Erfahrung*) that gets woven into the fabric of the individual life at a not-quite-conscious level.<sup>6</sup> The story does not present news you can use. It represents a tradition you can draw on. What is the aesthetic effect of the story? In this case, it is a form of astonishment [*Staunen*] that resembles in its way the kind of amazement [*Verwunderung*] that Adorno and Benjamin attribute to the dialectical image. And this effect is similar because its cause is similar. The image astonishes us because it confronts us with an unresolved piece of our archaic past. The sublimity of Psammenitus, his greatness of soul, has nothing to do with our present historical conditions. He is a defeated king whose tears speak – on the most superficial level – to ancient forms of paternalism, to kinds of warfare and social organization that no longer exist. Yet they remain compelling. They interest and perplex us. As Benjamin goes to some pains to point out, we do not have a ready *psychological* explanation for Psammenitus's tears. Something else is going on and it seems clear to Benjamin that the tears make sense and no sense at the same time. They beg for the explication that Herodotus refuses to provide. The story thus stops thought and provokes it all at once. This is its 'germinative' power. Like the Roman Republic, it demands a Robespierre to fulfill it. Until that Robespierre comes, it will tantalize – even taunt – us.

If there is any accuracy to my reading of the structural analogy between the story and the dialectical image – an analogy that rests on our aesthetic reaction to both the story and the image – then the dialectical image has everything to do with the problematics surrounding the story and with the account of modernity that Benjamin develops in 'The Storyteller' and in other major essays of his last decade: 'The Image of Proust',

'A Short History of Photography', 'Work of Art' in all its iterations and 'On Some Motifs in Baudelaire'. It has to do with the depletion of collective knowledge-experience [*Erfahrung*] and its supersession by individual lived-experience [*Erlebnis*]. It has to do with the way that traditional wisdom – the very stuff of *Erfahrung* – has been eroded by the shocks to the human sensorium that the conditions of industrial labor, commodity consumption and urbanization have dealt. It has to do with the reasons that art is no longer transmissible and no longer has little, if any, critical, utopian core. In other words, it has everything to do with the *aura*.

### AURA: OVERDETERMINED AND UNDERDIVULGED

Like the dialectical image, the notion of *aura* is overdetermined. Benjamin derived it from a number of different and conflicting sources (Fürnkäs, 2000; Hansen, 2008). It is also 'undivulged', to the extent that Benjamin barely defined it. Instead, he deployed it.

For Benjamin, the *aura* swims into view at the moment of its loss. The decay of the *aura* and the concomitant end of auratic art are historical facts. As I have already noted, his discussions of them are governed by mood. Either Benjamin mourns the fall of the *aura* (this is the case in the essays I mention above) or he views it with the 'gaiety' that he ascribes to the 'destructive character' and 'the new barbarism'. But the end of auratic art that Benjamin celebrates most famously in 'Work of Art' in all its versions is the end of a historical process that is not about art itself. In other words, the decay of auratic art is collateral damage in a larger war.

Benjamin is a follower of eighteenth-century philosophy in the following respect. As aesthetics is primarily about our sensory apparatus, it is not about art but about our sensorium, the order of our perception. Benjamin's particular contribution to that

discussion is that he historicizes aesthetics. He assumes that perception is tied to – even dependent on – particular forms of experience and that these forms of experience are historically determined.<sup>7</sup>

As noted, Benjamin opposes two different modes of perception, two different kinds of experience *Erfahrung* and *Erlebnis*. It is important to see that each has its own particular time-sense as well. *Erfahrung* experiences time as duration, while *Erlebnis* is conscious of time as the empty succession of single moments. *Erfahrung* is tied to religious and communal ritual, agriculture and craft manufacture. *Erlebnis* is the creature of modern shocks: Taylorized line work, city traffic and modern technologies (including photography and film). Aura belongs to the historical sensory regime of *Erfahrung*.

*Erfahrung* and *Erlebnis* seem to be mutually exclusive. They fall into an orderly historical succession: first we have one, then the other. As Benjamin presents them in ‘On Some Motifs in Baudelaire’, *Erfahrung* and the aura are depleted – and eventually extinguished – by the victory of industrial capital and its new perceptual-experiential regime, *Erlebnis*. This is an important point. The ‘Work of Art’ essays notwithstanding, the aura has not been done to death by the specific technologies of reproduction any more than *Erfahrung* was done in by the assembly line. If Benjamin believes that culture is the *expression* of the economy, then experience must also serve as its expression. *Erlebnis* is thus born of commodity fetishism, not of technological change as such.

## ‘WHAT IS AURA, ACTUALLY?’

We would therefore do well to pose the question that Benjamin first asks in ‘A Little History of Photography’ and then repeats in the second version of ‘Work of Art’: ‘What is aura, actually?’ This is how he defines it:

A strange weave of space and time: the unique appearance or semblance of distance, no matter

how close it may be. While at rest on a summer’s noon, to trace a range of mountains on the horizon, or a branch that throws its shadow on the observer, until the moment or the hour become part of their appearance – this is what it means to breathe the aura of those mountains, that branch. (Benjamin, 1999a: 518–9)

Benjamin indicates that he lifts his emphasis on distance from the art historian Alois Riegl and from Riegl’s notion of *Stimmung*. *Stimmung* can be translated as ‘mood’ or, in a more Heideggerian way, as ‘attunement.’ But distance in Riegl’s famous article ‘Mood as the Content of Modern Art’ (1899) serves a very particular function. It allows art to body forth the totality of nature and thus compensate for the limitations of modernity’s understanding of the universe (Riegl, 1996). For Benjamin, though, auratic attunement performs a different function. The aura does not entail the fuzzy elision of particularity celebrated by Riegl. It marks the experience of the very kind of spatial and temporal particularity that *Stimmung* eliminates. Aura, then, reveals how a thing actually *is* a specific moment. Its ‘distance’ is precisely the appearance of a thing’s particularity.

The branch that throws its shadow on the observer in Benjamin’s definition of the aura makes more sense if we note Benjamin’s emphasis on the relation of the gaze to the aura in ‘On Some Motifs in Baudelaire’:

Experience of the aura thus arises from the fact that a response characteristic of human relationships is transposed to the relationship between humans and inanimate or natural objects. The person we look at, or who feels he is being looked at, looks at us in turn. To experience the aura of an object we look at means to invest it with the ability to look back at us. (Benjamin, 2003: 338)

Our sense of the aura would thus seem to rest on a categorical error. With the aura, we experience objects as if they were people. The relationship is one of reciprocity – hence the shadow of the object falls *on us*, and the object *returns* our gaze. It would be tempting to call such a relationship *intersubjective*, but Benjamin’s whole project is dedicated to

leapfrogging over the subject. Benjamin seems to see the subject as a historical mistake, not a dialectical moment. Given Benjamin's allergy to the subject, then, we might want to say that the auratic experience of an object lends objects *dignity*. It grants them the respect that is due, according to Kantian ethics, to subjects. It treats them as subjects should be treated, not as subjects themselves.

The auratic object does not decenter us, as Miriam Hansen has suggested in her magnificent account of the aura (Hansen, 2008: 351). Nor is the aura, as Carolin Duttlinger has argued, a forerunner of Barthes's account of the *punctum*. She claims that aura involves 'a play of *identification* between viewer and image' (Duttlinger, 2008: 97; emphasis added). But the aura is not about specular identification. It establishes the proper attunement between humanity and nature.

## AURA AS FORETASTE OF RECONCILIATION

I am arguing therefore that the moment of the aura contains a utopian dimension and that this dimension is precisely its temporal index. *The aura points forward to our potential reconciliation with nature*. Benjamin makes this clear in his footnote to the passage I have quoted immediately above:

Whenever a human being, an animal, or an inanimate object thus endowed by the poet lifts up its eyes, it draws him into the distance. The gaze of nature, when thus awakened, dreams and pulls the poet after its dream. (Benjamin, 2003: 354)

This dream of nature brings together the utopian thrust of both the auratic and the beautiful:

But even there, [the Romantic definition of beauty] had some derivative qualities. Its famous tenet that beauty is semblance – the sensuous appearance [*Erscheinung*] of an idea or the sensuous appearance of the true – not only coarsened the original

teaching of antiquity but forfeited its basis in experience. This resides in the aura. 'The beautiful is neither the veil nor the veiled object but rather the object in its veil' – this is the quintessence of the ancient aesthetic. Through its veil, which is nothing other than the aura, the beautiful appears [*scheint*]. (Benjamin, 2002: 137)

In this fragment from 1935, Benjamin makes it clear that the aura is not only that peculiar weave of time and space that shows us the object in its concrete particularity. It also shows us its utopian fulfillment, its ideal future. Squaring the circle between Goethe and Schiller, Benjamin sets up a polar tension between *Schein* and *Spiel*, appearance and play. The beautiful – and art, then – contains within it a kernel of time. It shows what nature, the world, should be, which, for the sake of shorthand I have called its *potential*:

Art (the definition might run) is a suggested improvement on nature: an imitation that conceals within it a demonstration [of what the original should be]. In other words, art is a perfecting mimesis. (Benjamin, 2002: 137)

The aura, then, speaks to the utopian function of art. It is an intimation, through play and mimesis, of a reconciled world.

## THE DECAY OF THE AURA

The aura is thus a slippery concept. On the one hand, it appears to be a quality that inheres in the object. (That is why we can talk about auratic and post-auratic art.) On the other, it seems to refer to a relationship between the branch or the mountain and us, between the object and the subject. Thus the depletion of the aura either refers to a change in the structure of our relationship to objects or in the objects themselves. A mountain cannot be post-auratic, though an artwork can be. This also raises the all-important question of the auratic work in a post-auratic age. Benjamin's attempt to historicize aesthetics while tracing them back to our

experience of nature thus leads to interesting problems that he does not address. Perhaps they are problems that cannot be answered. In any event, he shows that the depletion of *Erfahrung* and the decay of the aura signal the flight of the utopian from both our experience and our art. As Benjamin writes in one of the notes for 'Work of Art', the problem for contemporary aesthetics is 'to determine the effect of the work of art once its power of consecration has been eliminated' (Benjamin, 2002: 141). Thus is it that 'Work of Art' asks what art can do now that its utopian core has been hollowed out. This goes some way towards explaining the essay's liquidationist animus towards the aura, but it does not explain its claim – a false one, if my argument holds – that the aura now serves distinctly anti-utopian ends.

Of course, the 'aura' as it appears in 'Work of Art' is a 'pseudo-aura', an after-image created for an age of commodity aesthetics. The nimbus that surrounds the film star is not a real aura but a simulation that is essentially affirmative, not utopian. At best it apes the aura, invoking an 'outmoded mode of perception' for regressive ends (Fürnkäs, 2000: 141–2). At worst, it lends its halo to the Führer at Nuremberg.

Benjamin provides an account of the transformation of the aura into this pseudo-aura in 'A Little History of Photography'. This discussion serves as a valuable corrective to the common impression that the technologies of mechanical reproduction are in themselves necessary and sufficient to destroy the aura. While mechanical reproduction helps undermine the aura of the visual arts – and 'Work of Art' is limited to the visual arts – Benjamin makes it clear that photography did not undo the aura. In fact, the question that lies at the center of 'Little History' is one that Benjamin outlines in his notes: 'If the aura exists in early photographs, why is it not in film?' (Benjamin, 1991: 1048).

In 'Little History', Benjamin notes that early photography is 'a medium that lent fullness and security' to the gaze of its subjects

(Benjamin, 2002: 515–7). That fullness and that security are a feature of a somewhat primitive technology. The aura of early photographic portraits rests on 'the way light struggles out of darkness'. The long exposure time of these early photographs leads to what Benjamin calls their 'comprehensive illumination', and it would seem – at first glance – that the lighting 'gives these early photographs their greatness' (Benjamin, 2002: 517).

But the weight of these photographs depends on more than just this 'comprehensive illumination'. In fact, Benjamin notes that the technical limitations of early photography proved easy to reproduce as the technology developed. So the aura of early portrait photography is not merely a question of technology alone. Rather, the aura of these photographs is the result of the social situation that they capture. It rests with their 'animated conviviality':

These pictures were made in rooms where every client was confronted, in the person of the photographer, with a technician of the latest school; whereas the photographer was confronted, in the person of every client, with a member of a rising class equipped with an aura that had seeped into the very folds of the man's frock coat or floppy cravat. For this aura was by no means the mere product of a primitive camera. *Rather, in this early period subject and technique were as exactly congruent as they become incongruent in the period of decline that immediately followed.* (Benjamin, 2002: 517; emphasis added)

The subjects of these early portraits were members of the rising bourgeoisie, and their ascendancy lent them a personal presence that made their very clothes an expression of their being.<sup>8</sup> The photographer too represented the latest technology, and that technology itself was *congruent* with both the technician behind the camera and the rising class in front of it.

In other words, the aura of these early photographic portraits has everything to do with the attunement of all aspects of the photographic situation: the class of the sitter, the

technical knowledge of the photographer and the development of the technology itself. In this way, the circumstances surrounding these auratic photographic portraits resemble the circumstances surrounding the 'story' that Benjamin outlines in 'The Storyteller'. There, too, the transmissibility of the story depends on an alignment between the stage of technology (craft), the class of the storytellers (who Benjamin imagines as craftsmen) and the class of the audience (also craftsmen).

This attunement between artist, subject and technology disappears in later photographs and as a result the aura vanishes. Why? Benjamin notes that improvements in the technology led to the abolition of that 'comprehensive illumination'. The vignetting and the high levels of contrast which had granted 'fullness and security' to the earlier works were subsequently eliminated by improved lenses and lighting. As a result, photographers had to find ways of simulating the lost aura. Even an easily faked duskiness, though, could not hide the fact that the bourgeoisie had become brittle:

Notwithstanding this fashionable twilight, however, a pose was more and more clearly in evidence, whose rigidity betrayed the impotence of that generation in the face of technical progress. (Benjamin, 2002: 515)

Benjamin describes the impotence of the following generations as 'the degeneration of the imperialist bourgeoisie'. Notice, though, that in the passage I have just quoted, Benjamin is not talking about decadence, but about the bourgeoisie's impotence 'in the face of technical progress'. The aura of early photographic portraiture was tied to the congruence between the relations and the means of production, a momentary equilibrium between technology and economic organization. But that equilibrium was tenuous at best. The tension between the means and the relations of production meant that the organization of society served as a brake against the revolutionary potential that the technology

presented. So, as technology outstripped the forces that controlled it, those forces became enfeebled. They were reduced to fighting a rearguard action against the new rising class (the proletariat) and the insurgent potentials that lay embedded in the technologies of the new mass industries.

The decline of auratic photography was also due to the fact that 'businessmen invaded professional photography from every side' (Benjamin, 2002: 515). Photography was no longer a craft. It had become a modern business and the photograph itself had been transformed into a commodity. So photography no longer presented an attunement between the class being photographed, the technician and the technology. We can see, then, that the aura of early photographic portraiture was *not* destroyed by technology but by the changing social relations that surrounded it. Once it becomes a commodity for an atrophied class, the auratic portrait photograph is a thing of the past. The temporal dimension of the aura – its yoking of the archaic to the present to intimate a perfected future – is flattened and its utopian potential hollowed out. All that is left in this transformation is the pseudo-aura, and it is that pseudo-aura that the new barbarism (and 'Work of Art') must liquidate.

## AURA AND TRANSMISSIBILITY

The aura is a difficult concept in Benjamin's work because it both inheres in the object and is the medium of its reception. As we have seen in my brief account of early photographic portraiture in 'Little History', it designates a relationship that includes subject and object, viewer and viewed. This is why Howard Caygill has said of the aura that it is not 'the predicate of a work of art, but a condition, now surpassed, of its transmission' (Caygill, 1998: 101). In view, though, of the drift of Benjamin's discussion in the essays on Proust and Leskov and 'On Some Motifs in Baudelaire', I wonder if it would

not be more correct to say that *Erfahrung* is actually the condition of art's transmissibility. It is the collective knowledge-experience that allows art to be written and understood. On the other hand, art's utopian charge lies with its aura.

Benjamin shows that the transmissibility of poetry, as Baudelaire discovered, becomes difficult, if not impossible, once the collective knowledge-experience on which the cultural heritage rests has given way to the individualized lived-experience he calls *Erlebnis*. Once poetry's aura becomes untransmissible, then its aura cannot help but decay, because it has no medium in which it can persist. If the aura is indeed the aesthetic-perceptual prefiguration of a utopian reconciliation, an intimation of the kingdom of ends, then the decline of knowledge-experience can only lead to the decline of the aura. In short, *Erfahrung* is the condition of the aura's transmissibility.

The new barbarism that Benjamin calls for, then, does not need to liquidate the aura. History is taking care of that quite well on its own. 'The Work of Art' essay is about shattering the privilege of the *pseudo-aura*, about destroying that nimbus of *false* consecration that surrounds art when it has become a commodity and a tool for regressive politics. This much has been clear to most commentators.

## THE AURA IN A POST-AURATIC AGE

It is worth remembering, though, that the 'Work of Art' essay discusses the visual arts, not literature. The essay thus serves as something of an anomaly in Benjamin's work. Literature complicates its argument, because literature has not been as susceptible to the technological changes of the last two centuries, at least not directly. So, the argument of the 'Work of Art' essay does not quite transfer, and this is clear in Benjamin's discussions of Baudelaire. The decline of collective knowledge-experience and of the transmissibility of the cultural heritage has been a

feature of the commodification of literature, for sure – that is the argument that gets outlined in the aphorisms that make up 'Central Park' and in 'On Some Motifs in Baudelaire' – but this has nothing to do with the printing press. It is indirectly tied to the technologies of communication but not to the technologies of mechanical reproduction as such. This is why Baudelaire is so important for Benjamin, why he serves as a model. The poet was able to turn the loss of the aura into a theme for auratic poetry. *Les Fleurs du Mal* might mourn the not-so-slow death of both the cultural heritage and *Erfahrung*, but it has become part of the cultural heritage itself. Through a brilliant legerdemain, Baudelaire made the individualization of lived-experience recognizable and thus general. In other words, Benjamin demonstrates that Baudelaire was able to secure a handhold – tenuous, of course – for both the collective knowledge-experience that he calls *Erfahrung* and the aura by thematizing their decay. Similarly, Benjamin's essay on Proust shows that the novelist was ultimately successful in his attempt to reconstitute the web of the *memoire involontaire* that makes *Erfahrung* possible (Benjamin, 2002: 315–6).

I am suggesting therefore that Benjamin's meditations on literature leave open a space for the aura in our post-auratic time. The essays on Proust and Kafka and Leskov indicate – again with qualification – that something resembling auratic art might still be possible in an age of *Erlebnis*. But Benjamin is not Adorno and is not willing to argue that the aura has come to rest in authentic art. Because he sets up *Erfahrung* and *Erlebnis* in historical succession rather than dialectical opposition, Benjamin cannot without contradiction be emphatic about finding a home for auratic experience in contemporary high art.<sup>9</sup>

Where does this leave the aura in the end?

In our relationship with nature and with art, the term 'aura' designates an experience that offers an intimation of transcendence and a

foretaste of reconciliation. But hasn't history foreclosed the aura and therefore redemption? Although Benjamin seems to come to this rather grim conclusion in the 'Work of Art' essay, the evidence of his other writing indicates that Benjamin was unwilling to let pessimism fall into despair.

It is worth considering 'On the Concept of History' for a moment. That essay – really a set of interlocking aphorisms and images – comes to us as Benjamin's final testament. Its hero is not the artist or even the Angel of History (which appears in its most famous image), but the materialist historian, who seems to stand in for the revolutionary class. After all, the Angel sees in history nothing but ruin. It would like to raise the dead, make whole what has been broken. But the Angel cannot do this. The materialist historian, however, knows that he cannot resurrect the dead. He can only hope to bring their wishes to fulfillment through the revolutionary deployment of dialectical images that will in turn lead to revolutionary action. In other words, the materialist historian wants to raise any number of latter-day Robespierres through his writing.

## MY PERORATION

At one of the darkest moments in European history, Benjamin looked around for comfort and he found it in a rather odd place – in Jewish messianism and in the writing of history. I have suggested that the temporal structure of the dialectical image is utopian. It reveals that every second is 'the small gateway in time through which the Messiah might enter' (Benjamin, 2003: 397). The dialectical image is pitched to redeem the dreams of history. In this way, it is very much like the auratic moment, which offers a foretaste of a world in which nature's dreams are redeemed. This is why it is a mistake to take the 'Work of Art' essay as conclusive. Rather, it makes sense to accept Miriam Hansen's

argument that in all its versions it was always something of a long shot (Hansen, 2004).

While Benjamin was willing to admit that the visual arts had lost their utopian core and to concede that literature was on the brink of losing it – Proust and Kafka would stand as notable exceptions – he was not willing to give up completely. Literature might have been on the brink of completely losing its redemptive function, but *writing* was not. Benjamin's final gamble – and this gamble was a mark of both the urgency of the times and of his staunch refusal to give in to defeat – was to locate the aura in materialist historiography and to settle it squarely in the dialectical image. As a result, he left us with a body of work that is as suggestive and as enigmatic as literature. From beginning to end, it is, as Adorno claims in my epigraph, dialectical and undialectical. This is of course a contradiction. But contradiction is not a fatal condition for thinking. Contradiction is the very stuff of paradox, and paradox, like misunderstanding, is a way of communicating the incommunicable or thinking the unthinkable. So, like paradox and like the dialectical image itself, Benjamin's *oeuvre* continues to serve as a source of astonishment – a spur to think what has not yet been thought.<sup>10</sup>

## Notes

- 1 This essay is dedicated to Jacob Bard-Rosenberg and to his future: *Wo aber Gefahr ist, wächst/Das Rettende auch*.
- 2 It is important to remember that the *Arcades Project* is not a book that Benjamin would ever have published. Giorgio Agamben makes the case very clearly in the Italian version of the work:

There is no doubt [...] that the *Aufzeichnungen und Materialien* [the notes and materials, which constitute the bulk of the *Passagenwerk*] do not represent in any way a draft, however temporary, of the book on the Arcades, but only the documentary and theoretical research materials. Benjamin had a very clear sense in his work of the Marxist distinction between *Forschungsweise* [mode of research] and *Darstellungsweise* [mode of representation],

which he expressly refers to in Section N: 'Research must appropriate the subject matter in its details, must analyze its various forms of developments, and trace their inner connections. Only after this work has been completed, can the real movement be presented [*dargestellt*] in an adequate matter.'

In other words, the *Arcades Project* is an important tool for Benjamin scholarship but should not be treated as a finished work, any more than the notes for the 'Work of Art' can be substituted for that essay itself. (Agamben, 1986: xviii–xix)

- 3 Here is Benjamin's testimony of his theoretical debt to Goethe:

In studying Simmel's presentation of Goethe's concept of truth, I came to see very clearly that my concept of origin in the *Trauerspiel* book is a rigorous and decisive transposition of this basic Goethean concept from the domain of nature to that of history. Origin—it is, in effect, the concept of Ur-phenomenon extracted from the pagan context of nature and brought into the Jewish contexts of history. (Benjamin, 1999b: 462)

For a more detailed account of Benjamin's debt to Cohen, see Kaufmann (2000).

- 4 Benjamin would answer Pensky's incisive analysis by citing Simmel's claim that for Goethe,

all the difficulties in knowledge end when the power of thought [*Denkkraft*] and perception [*Anschauung*] coincide in the representations of art. There the receptive part of perception catches the Truth without mediation, and the 'Idea' becomes visible in the figure [*Gestalt*] without any further mediation. (Simmel, 1913: 57)

The dialectical image, like the constellation, then becomes something like Goethe's Ur-phenomenon – a true, ideal form that actually exists. But the Goethean solution to the problem of the difference between the subject and the object, the particular and the universal, between sensuous intuition and the Truth, only works if you presume that perception gives us immediate access to the Truth of forms because of a pre-existing adequation of the senses to the universe:

The unity of the world lives in an unmediated way in phenomena and all the faculties of cognition of a particular subject are so fitted and adjusted [to the world] that the subject cannot find any content for itself beyond the

appearances that are given to him. (Simmel, 1913: 58)

And the fact of the matter is that very few people – least of all Adorno – make that presumption and accept the Goethean solution. There are therefore certain limits to Benjamin's intellectual eclecticism. It is very hard to cross Goethe, Kant and Hegel and maintain strict coherence.

- 5 Kierkegaard writes:

One may arrive at a similar consideration of the mythical beginning with the image. When in an age of reflection one sees the image protrude ever so slightly and unobserved into a reflective representation, and, like an antediluvian fossil, suggest another species of existence washed away by doubt, one will perhaps be amazed that the image could ever have played such an important role.

Kierkegaard wards off the 'amazement' [*Verwunderung*] with what follows. And yet this amazement announces the deepest insight into the relation of dialectic, myth and image. For it is not as the continuously living and present that nature prevails in the dialectic. Dialectic comes to a stop in the image and cites the mythical in the historically most recent as the distant past... They [images in Kierkegaard] are dialectical images, to use Benjamin's expression... (Adorno, 1989: 54)

- 6 In every case the storyteller is a man who has counsel for his readers. But if today 'having counsel' is beginning to have an old-fashioned ring, this is because the communicability of experience is decreasing. In consequence, we have no counsel either for ourselves or for others. After all, counsel is less an answer to a question than a proposal concerning the continuation of a story which is in the process of unfolding. To seek this counsel, one would first have to be able to tell the story. (Quite apart from the fact that a man is receptive to counsel only to the extent that he allows his situation to speak.) Counsel woven into the fabric of real life [*gelebten Lebens*] is wisdom. The art of storytelling is nearing its end because the epic side of truth – wisdom – is dying out. (Benjamin, 2002: 145–6)
- 7 Just as the entire mode of existence of human collectives changes over long historical periods, so too does their mode of perception. The way in which human perception is organized – the medium in which it occurs – is conditioned not only by nature, but by history. (Benjamin, 2003: 254)
- 8 Compare this with later generations who appear to be expressions of the fashions that they sport. One of the tricks of commodity fetishism, as Marx

points out, is that it turns human subjects into objects and grants commodified objects a kind of spectral life and subjectivity. So it is hardly surprising that subsequent generations, however substantial and prosperous they might have wanted to appear, should be transformed into mannequins in the photographer's studio.

- 9 Benjamin's concept of the 'auratic' artwork largely coincides with that of the 'closed' artwork. The aura is the uninterrupted contact of the parts with the whole that constitutes the closed artwork. Benjamin's theory emphasizes the phenomenon's historico-philosophical appearance, while the concept of the closed artwork emphasizes its aesthetics.... What results from the disintegration of the auratic or closed artwork depends on the relation of its own disintegration to knowledge. If this disintegration remains blind and unconscious, it falls to the mass art of technical reproduction. It is not a fate external to it that such art is everywhere haunted by the remnants of aura but rather the expression of the blind obduracy of the works that results from their being enmeshed in the actual relations of domination. It is in their stance as knowing what artworks become... fragmentary.... The closed artwork is bourgeois, the mechanical artwork belongs to Fascism, the fragmentary artwork – in its complete negativity – intends utopia. (Adorno, 2006b: 183n)
- 10 I realize, coming to this end, that I have done little more than reiterate Habermas's repeated critique of Benjamin, although in a different register. But here register and tone do count. Mood is indeed disclosive, and while redemptive critical theory relies strongly on the rationality of the arts and on aesthetic categories, the insights that it yields – and the astonishment that is their object – might not be available in any other way.

# Dialectic of Enlightenment. Philosophical Fragments

Marcel Stoetzler

The secondary literature on *Dialectic of Enlightenment* is vast but most contributions focus on one isolated aspect or chapter of the book. Much of it is meta-theoretical and often sidesteps detailed textual analysis. There is a general tendency to overstate the extent to which *Dialectic of Enlightenment* constitutes a turning point in Critical Theory. Schmid Noerr, one of the most authoritative commentators in the German-language literature, asserts that in his writings from the 1930s Horkheimer had seemed more optimistic about the possibility that Critical Theory could be articulated with critical empirical scholarship as well as radical political action than *Dialectic of Enlightenment* suggests (Schmid Noerr, 1987: 437). He also points out, though, that several projects that involved empirical research, and which were begun in parallel with and completed after *Dialectic of Enlightenment*, closely followed the programme of Critical Theory as formulated by Horkheimer in the 1930s, including proposals for reform of the education system

meant to prevent the emergence of the ‘authoritarian character’ prone to fascist mobilization (Schmid Noerr, 1987: 448). Observations like these suggest that there are multiple shifts in emphasis between the many different texts that comprise the canon of Critical Theory but no definitive and central shift of perspective. This chapter is based on a close reading and examination of key passages of the text and concludes that the idea that there was a ‘negative turn’ of which *Dialectic of Enlightenment* was the avatar is simplistic and unconvincing.

## ON DIALECTIC OF ENLIGHTENMENT

*Dialectic of Enlightenment. Philosophical Fragments* was written between 1941 and 1944 in Los Angeles by Theodor W. Adorno and Max Horkheimer in close cooperation, also involving Gretel Karplus-Adorno, who typed both men’s dictations, and Leo

Löwenthal, who contributed to the first three sections of the chapter 'Elements of Antisemitism'. Five-hundred mimeographed copies of a first version were informally distributed in 1944 under the title *Philosophical Fragments*. In this version, the first chapter, which in 1947 was renamed 'The Concept of Enlightenment', was titled 'Dialectic of Enlightenment'. The Amsterdam publisher Querido Verlag, a leading publisher of German-language exile literature, published the book under its final title, *Dialectic of Enlightenment. Philosophical Fragments*, in 1947. The word 'enlightenment' means both the specific eighteenth-century movement of that name and a general notion of incrementally, albeit not linearly, progressing self-consciousness observable throughout human history. The title clearly references its principal proposition: 'enlightenment' contains both the seeds of its own destruction and the potential of an escape route from that destruction. As stated in the preface, the critique of the enlightenment 'is intended to prepare a positive concept of enlightenment which liberates it from its entanglement in blind domination' (Adorno and Horkheimer, 1997: xvi; Horkheimer and Adorno, 1987/2002: 21/xviii).<sup>1</sup>

The body of the work consists of five chapters of roughly equal length and a final section of twenty-four short pieces ('Notes and Sketches') that pick up various aspects of the argument. The first chapter of the book is (since the 1947 version) 'The Concept of Enlightenment'. It is followed by two chapters that are designated as 'excursus', or digressions, related to the first chapter. The fourth chapter, 'Culture Industry: Enlightenment as Mass Deception', was also initially intended to be an excursus. The last chapter, bar 'Notes and Sketches', is 'Elements of Antisemitism: Limits of Enlightenment', which is divided into seven theses, the last of which was added in 1947. The writing generally refuses the linear logic expected of regular academic philosophy. Instead, each section starts with a fragmentary perspective,

explores its contradictions, suddenly comes to a halt and moves on to another fragment. This style of writing may appear repetitive and circular, as similar arguments are made from only slightly differing angles using different fragments of empirical or historical material. No argument is ever exhausted or concluded – arguments are rather brought into a constellation in what resembles the montage technique used by some avant-garde novels and films of the first half of the twentieth century. This unusually open style puzzled even close collaborators at the time who were familiar with the substantive arguments, and has since contributed to the book's reputation as being hermetic and esoteric. For Horkheimer, the concept of 'dialectic' meant first of all the refusal to treat any phenomena in a reductionist manner: this conception of 'dialectic', thinking about history and society as a dynamic and contradictory totality, was developed by Horkheimer in a series of essays in the 1930s and must be kept in mind when reading *Dialectic of Enlightenment*. The actual phrase 'dialectic of enlightenment' was first used by Adorno in a letter to Horkheimer in November 1941 in the context of his reflections on a book on the Marquis de Sade (Gorer, 1932; de Sade is discussed in the second excursus of *Dialectic of Enlightenment*). Adorno wrote that this book (not in fact referenced in *Dialectic of Enlightenment*) provided him with 'a lot of ideas' (Wiggershaus, 1995: 310).

Several publications by Horkheimer and Adorno from the years preceding *Dialectic of Enlightenment* anticipate aspects of the latter's argument and can usefully be studied to make it more accessible. The most obvious preparatory text is Horkheimer's 1936 essay 'Egoism and the Freedom Movement: On the Anthropology of the Bourgeois Era' (Horkheimer, 1982). This essay takes its inspiration from the contrast between the pessimistic and optimistic strands of bourgeois anthropology (such as between Hobbes and Rousseau). Horkheimer develops a dialectic of the constitution of bourgeois

subjectivity – ‘anthropology’ – in a historical framework reaching from ‘early modernity’ to the (then) present. The aim of the essay is to derive the character structure and political practice of contemporary fascist demagogues from the contradictory character of bourgeois society, rather than seeing them as forces that somehow struck from outside that society. In other writings in the 1930s, too, Horkheimer used readings of what he called ‘the dark writers of the bourgeois epoch’ – those who explored and systematically exposed its most violent and illiberal aspects – as a method to get under the skin of contemporary society. This method resonates with a sentence from Karl Marx’s ‘Introduction to a Contribution to the Critique of Hegel’s *Philosophy of Right*’: ‘these petrified conditions must be made to dance by having their own tune sung to them’, which Adorno pointed to as a key methodological inspiration (quoted in Wiggershaus, 1995: 189).

Another key influence on *Dialectic of Enlightenment* was Benjamin’s text ‘On the Concept of History’, which Adorno received (via Hannah Arendt) in June 1941 (Wiggershaus, 1995: 311). Benjamin, who had committed suicide in September 1940, identified liberals’ and socialists’ belief that they were sailing with the wind of progress as one of the chief causes of their failure to defeat fascism.

While they were writing, news about the Holocaust continued to build up, and the analysis of antisemitism became another focus of the book. The fifth chapter, ‘Elements of Antisemitism: Limits of Enlightenment’, is therefore best seen as the actualization (in both senses of the word) of the conceptual work done primarily in the first chapter, informed also by the large-scale empirical research on the causes of antisemitism that Horkheimer, Adorno and other members of the Institute undertook from March 1943 (Ziege, 2009).

Horkheimer and Adorno state in the book’s preface that its aim is ‘to explain why humanity, instead of entering a truly human state, is sinking into a new kind of barbarism’ (Adorno and Horkheimer, 1997: xi;

Horkheimer and Adorno, 1987/2002: 1/xiv), and they relate the fragmentary nature of the book to the collapse of their initial plan to structure the book along the disciplinary boundaries of sociology, psychology and epistemology. Scholarly disciplines, though, became meaningless in the context of ‘the present collapse of bourgeois civilization’. Fascist demagogues and liberal scholars feed off the same zeitgeist, marked by the ‘self-destruction of the enlightenment’. Science and scholarship are therefore no longer potent weapons against fascism, and this even affects ‘tendencies opposed to official science’ (Adorno and Horkheimer, 1997: xii; Horkheimer and Adorno, 1987/2002: 17/xv). It is for these reasons that ‘in reflecting on its own guilt’, thought finds that it lacks a language. Self-censorship has made censorship superfluous, which seems to be ‘the ambition of the educational system’ (Adorno and Horkheimer, 1997: xiii; Horkheimer and Adorno, 1987/2002: 18/xv). The cult of facts and probabilities has flushed out conceptual thinking, a crucial means of resistance: ‘the blocking of the theoretical imagination has paved the way for political delusion’, i.e. fascism (Adorno and Horkheimer, 1997: xiii; Horkheimer and Adorno, 1987/2002: 18/xvi). The ‘self-destruction of enlightenment’ inhibited the writing of the book but also provided its primary subject matter – it became thereby an exercise in self-reflection. Thinking that aims at enlightenment is inseparably linked to freedom in society, but also in its very concept (as in the societal institutions with which it is intermeshed) ‘already contains the germ of the regression which is taking place everywhere today’. Enlightenment must reflect on this ‘regressive moment’ in order to survive. Thinking must salvage its ‘sublating [*aufhebenden*] character’, i.e. its ability to drive the actuality of historical progress beyond its limitations, preserving but negating it in the making of a truly humane world. Only critical, conceptual thinking is able to contribute to this: thought that has been deprived of concepts easily falls

‘under the spell of any despotism’. Only critical, conceptual, self-reflective thinking can guard against paranoia.

Horkheimer and Adorno assert the classic Marxian point that ‘the increase in economic productivity... creates the conditions for a more just world’, which spells progress but at the same time tremendously increases the social power of those who control production. Individuals are better provided for than ever before, but they ‘vanish before the apparatus they serve’. This state of things is completed by ‘the flashy and noisy propagation of spirit [*der gleißnerischen Verbreitung des Geistes*]’: while spirit’s true concern is the ‘negation of reification’ (Adorno and Horkheimer, 1997: xv; Horkheimer and Adorno, 1987/2002: 20/xvii), the spread of *reified* spirit – i.e. culture in the form of things and commodities: *Kulturgut* – kills off spirit and with it the hope for the better state of things. ‘The flood of precise information and brand-new amusements makes people smarter and more stupid at once’ (Horkheimer and Adorno, 1987/ 1997/2002: 20/xv/xvii). Horkheimer and Adorno emphasize that their concern is not the same as that of the conservative ‘critics of civilization’ who promote ‘culture as a value’: ‘What is at stake is not conservation of the past but the fulfilment of past hopes’. The ‘selling out of culture’ would not *in itself* be particularly deplorable: the point is that it helps in ‘converting the economic achievements into their opposite’ (Adorno and Horkheimer, 1997: xv; Horkheimer and Adorno, 1987/2002: 21/xviii). Capitalist civilization has not only destroyed metaphysics, i.e. the transcendental element in thinking that pushes beyond the reality of ‘that which is’, but has itself become metaphysics: the ‘hygienic factory’ and the commodities that are produced there are imbued with the power to transcend what they actually are. The critique of the reification and destruction of spirit is meant to help reaping ‘the economic achievements’ of the capitalist economy, and *thereby* to defeat fascism and other delusions.

## ‘THE CONCEPT OF ENLIGHTENMENT’

As the first chapter contains the principal argument of the book on which the other chapters build, it will be presented here in greater detail.

‘The Concept of Enlightenment’ consists of three sections of roughly equal length, divided into nine, six and seven rather long paragraphs respectively. Most paragraphs contain several trains of thought that often dialectically negate each other. This complex style of presentation means that any kind of summary treatment of the whole would be liable to distort the argument: the essential points tend to be suspended in the tension between blocks of text that destabilize each other’s meanings. The argument of ‘The Concept of Enlightenment’, like that of *Dialectic of Enlightenment* in general, is therefore best presented through close readings of selected substantive sections. I will concentrate on reconstructing the third section (Adorno and Horkheimer, 1997: 29–42; Horkheimer and Adorno, 1987/2002: 52–66/22–34) as it is the most comprehensive part of the chapter. The main motives of the first two sections are, very briefly, as follows:

- In the first two paragraphs of the first section, a quotation from Francis Bacon (1561–1626) is used to introduce the concept of enlightenment: enlightenment lets itself be guided by nature in order to be able to command it in practice; knowledge is for the increase of power, not of happiness.
- The enlightenment translated myths into concepts, but then (in the form of positivism) went on to dismiss concepts for being merely myths in disguise, including its own core ideas, such as that of ‘human right’: enlightenment critique destroys its own concepts and becomes destructive of enlightenment, a process that is summed up in the formula ‘Enlightenment is totalitarian’ (Adorno and Horkheimer, 1997: 6; Horkheimer and Adorno, 1987/2002: 28/4); ‘totalitarian’ means here that nothing is left out – it is complete and without gaps (not ‘totalitarian’ as in ‘totalitarianism’, although that might have been intended as an connotation).

- The fourth paragraph argues that enlightenment denounces myth as the projection of human subjectivity on to nature; both rationalism and empiricism aim to abstract from particularity and quality through emphasis on systems, logic, numbers, equivalence.
- The following three paragraphs discuss myth as an early form of enlightenment that gradually turns into the enlightenment that destroys myth while preserving aspects of the mythical. Myth was always part of the attempt to dominate nature; through patterns of replaceability, representation, fungibility, abstraction and signification, logic gradually emerges from magic and myth.
- The last two paragraphs present the enlightenment, beginning with myth, as a response to fear whose expression it turns into explanation. Anything outside the systems of naming and explaining is taboo. This is still the case with positivist science, which, like myth in the beginning, is concerned with banning the fearsome, dangerous and unknown. As long as it does this, however, it remains unfree.
- The second section begins with reflections on the separation of art from science, their differing relationships to truth, and the role played by the distinction between language as a system of signs and language as a system of symbols. Art remains akin to magic that tries to influence nature by mimicking it, whereas science tries to dominate nature through work. Bourgeois revolutions have typically preferred faith over art and science; Horkheimer and Adorno refer to militant religiosity as a characteristic of modernity. In the (fascist) present, 'the utterly enlightened' turn the irrationality of faith into rationally organized fraud (Adorno and Horkheimer, 1997: 20; Horkheimer and Adorno, 1987/2002: 43/15).
- The third paragraph of the second section turns back to the discussion of the germs of enlightenment in prehistoric times. Social domination emerges together with a division of labour that makes magic a concern of a specialist: the magician. Magic rituals, then ideas, then concepts, then science are in the service of domination until domination is secure enough to do away with them altogether. On the way, human history has produced a number of ways in which enlightenment negated but also preserved magic (fourth paragraph).
- The fifth and sixth paragraphs discuss the mathematization of science as 'totalitarian', as

mathematical equations turn even unknowns into already knowns (again, 'totalitarian' means it is so complete that it knows even the unknowns). Horkheimer and Adorno argue, *pace* Husserl, that thinking becomes an automatized process and a tool. Positivism rejects atheism as metaphysical and happily tolerates religion as well as art as long as they do not claim to contribute to cognition. Everything that exists is subsumed to logical formalism, while reason (including its potential for transcendence of the existing towards a humane world) is subsumed to the world as it exists (Adorno and Horkheimer, 1997: 26; Horkheimer and Adorno, 1987/2002: 49/20). This circularity means the defeat of reason by myth. Existing social injustice becomes sacrosanct, immune to critique by reason.

- In the final paragraph of section two, Horkheimer and Adorno return to the more specific critique of the capitalist present: rather than being subjects, individuals are reduced to being functions and carriers of conditioned reactions in a web determined by 'the agencies of mass production and its culture' (Adorno and Horkheimer, 1997: 28; Horkheimer and Adorno, 1987/2002: 51/21).

The third section of 'The Concept of Enlightenment' is in three parts: the first paragraph develops the theme of 'self-preservation' as central to both myth and enlightenment; the following three paragraphs explore the Sirens episode from the *Odyssey*; and the last three paragraphs return to a more modern context and discuss aspects of agency of the exploited, culminating in a critique of modern socialism and the labour movement.

At the beginning of the third section, Horkheimer and Adorno single out as central to enlightenment philosophy, and indeed as 'the true maxim of all Western civilization', Spinoza's formulation, 'conatus sese conservandi primum et unicum virtutis est fundamentum': 'the endeavour of preserving oneself is the first and only basis of virtue' (Adorno and Horkheimer, 1997: 29; Horkheimer and Adorno, 1987/2002: 52/22; this is from Spinoza's *Ethica*, pars IV, propos XXII, Coroll.). This is, they argue, the one point in which all the differing religious and philosophical tendencies of bourgeois thought coincide.

Enlightenment detects myth 'in any human utterance that has no place in the functional context of self-preservation'. The concept of the self was gradually stripped of all 'natural traces' – denounced as 'mythological': body, blood, soul, 'even the natural ego' – so that it was sublimated to the transcendental or logical subject, 'the reference point of reason, the legislating authority for action' (Adorno and Horkheimer, 1997: 29; Horkheimer and Adorno, 1987/2002: 52/22). Enlightenment judges that 'those who abandon themselves directly to life, without any rational reference to self-preservation, regress to the prehistoric'. Instinct itself is as mythical as are superstition, thoughtlessness and lust. The process of self-preservation (the economy) is 'based on the bourgeois division of labour' and forces the individuals 'to mould themselves body and soul on the technical apparatus' (Adorno and Horkheimer, 1997: 29–30; Horkheimer and Adorno, 1987/2002: 52/23). Once enlightenment, virtue and rationality are grounded in self-preservation, the stripping down of the increasingly abstract notion of the self continues to its dismal extreme point in (logical rather than Comtean) positivism that abolished even the (fairly abstract) Kantian 'transcendental subject of cognition'. Cognition is now considered a matter of logical processes that are not dependent on subjectivity. Logical positivism has eliminated with thought 'the last intervening [literally: interrupting] agency between individual action and social norm'. After subjectivity has eliminated itself from its own consciousness, it has become *sachlich* (objective/thingly/value-free) and 'free from the polyvalence of mythical thinking and of signification in general'. Reason has become 'a universal tool for the fabrication of all other tools'. Like manual work, it is instrumental and subject to goals it would not dare to challenge (Adorno and Horkheimer, 1997: 30; Horkheimer and Adorno, 1987/2002: 53/23). From the critique of reason's reduction to a tool for tool making, Horkheimer and Adorno move (within the same paragraph) to their critique of the centrality of formal logic in the context of contemporary logical positivism. Typically for

*Dialectic of Enlightenment*, they argue here on two levels at once, a specific historical and a generic or genetic one: 'The exclusiveness of the laws of logic' (in the specific context of contemporary logical positivism) stems from the single-minded functionality of reason that has limited itself to being a mere instrument, whereas, more generally speaking, it stems 'from the compulsory character of self-preservation'. The latter 'ever again comes down to the choice between survival and death which still reverberates in the principle that from two contradicting propositions only one can be true and only one false' (Adorno and Horkheimer, 1997: 30; Horkheimer and Adorno, 1987/2002: 53/23). The proposition here is that the most modern philosophical fashion reflects a mental reaction that used to be adequate for prehistoric humans who needed to decide whether to run away or to throw the spear in a split second, without any ambiguity or the luxury of pondering on shades of grey: in prehistory there was no time for dialectics. This begs the question, of course, why such caveman philosophy, geared towards excluding the middle, seems cutting-edge in the twentieth century (and now the twenty-first)? This question is addressed by the following sentence, which contains a different, but complementary argument:

The formalism of this principle... is caused by the opacity and the entanglement of interests in a society in which the maintenance of forms and the preservation of individuals only accidentally coincide. The expulsion of thought from logic ratifies in the lecture hall the reification [*Versachlichung*] of human beings in factory and office. (Adorno and Horkheimer, 1997: 30; Horkheimer and Adorno, 1987/2002: 53/23)

Logical positivism's concern with form is caused by the fact that society subordinates the preservation of individuals to the preservation of social forms (i.e. the mode of production). Excessively formal thinking follows from the preponderance of social forms over social individuals and their concrete needs. Enlightenment subsumes any hesitancy and ambivalence under the category of 'mythological thinking' and therewith under a taboo. This taboo 'encroaches on the power that

imposed it': enlightenment encroaches 'on spirit which is what enlightenment itself is'. Once spirit as enlightenment has finally reduced itself to the formal poverty of (logical) positivism – imposing binary caveman thinking: yes/no, kill/run – it goes into reverse and destroys the unfolding of spirit, i.e. itself. The process that had started out as the promise to exorcize nature ends up unleashing nature, namely the single-minded, ultimately self-destructive pursuit of self-preservation pure and simple, culminating in capitalist crisis and modern warfare. Tragically, the self-destruction and regression of the spirit (i.e. of enlightenment) is fuelled by its own fear of regression: the process in which the self has alienated [*entfremdet*] itself from 'mere nature' was so painful that the self is horrified by the notion of falling back into nature (Adorno and Horkheimer, 1997: 31; Horkheimer and Adorno, 1987/2002: 54/24). This horror causes the regression: the fear that humans could regress to that heart of prehistoric darkness made them do the most horrible things – right in the heart of *historical* darkness: 'The living memory of prehistory, of its nomadic and even more of the truly pre-patriarchal periods, has in all millennia been expunged from people's consciousness with the most terrible sanctions'. In the modern period, torture by 'fire and the wheel' has been replaced by 'stigma with which it branded any irrationality as leading to perdition'.

The acknowledgement that evolving civilization has softened itself to the extent that torture has been replaced by stigma is followed – in the same paragraph – by sarcastic remarks on the bourgeois love for 'lesser evils' and moderation. Even enlightened hedonism is well tempered: lust that has learned to hate itself 'through millennia of work pressure' remains 'mean and mutilated'. It 'remains under the spell of the self-preservation to which reason, that has been deposed meanwhile, has once trained it' (Adorno and Horkheimer, 1997: 31; Horkheimer and Adorno, 1987/2002: 54–55/24).

Enlightenment slandered the fear of unsubdued, threatening nature as superstition, while it made domination of internal and external nature the absolute purpose of life. In developed industrial society, 'when self-preservation has finally been automated, reason is dismissed by those who, as controllers of production, have taken over its inheritance and fear it in the disinherited' (Adorno and Horkheimer, 1997: 32; Horkheimer and Adorno, 1987/2002: 55/24–5): the dialectic of enlightenment, or of reason, takes on a new form, as the triumph of increasingly rationalized self-preservation leads the ruling class (those who control production) to turn against reason because they fear that reason has now jumped ship and gone over to the exploited. In this particular perspective, the dialectic of enlightenment – at least in the paranoia of the ruling class who sense the irrationality of their domination – coincides with the class struggle in developed capitalism. This train of thought is not further developed here, though, and Horkheimer and Adorno continue with the primary motive of this section: 'The essence of enlightenment is the binomial [*die Alternative*] whose inevitability is that of domination'. This formulation needs careful reading: 'the binomial' is as inevitable as domination is, which is not to say that it is in fact inevitable – nothing in the text suggests that domination *is* inevitable. The point here is that *as long as* enlightenment takes place under the conditions of domination, it remains restricted to thinking in alternatives of either/or – kill or run (i.e. binomials) – that are the signature of nature. Horkheimer and Adorno sum up:

Human beings were always forced to choose between their subjugation under nature or that of nature under the self. With the spread of bourgeois commodity economy the dark horizon of myth is illuminated by the sun of calculating reason beneath whose icy rays the seeds of the new barbarism are germinating. Under the compulsion of domination, human labour has always led away from myth but under conditions of domination it has always fallen back under its spell. (Adorno and Horkheimer, 1997: 32; Horkheimer and Adorno, 1987/2002: 55/25)

The conclusion at the end of the first paragraph of section three is unequivocal: enlightenment is self-defeating *because and as long as it comes in the form of domination*.

### DISCIPLINE AND DEAFNESS IN ODYSSEUS' FLOATING FACTORY

The following three paragraphs of section three (Adorno and Horkheimer, 1997: 32-7; Horkheimer and Adorno, 1987/2002: 55-60/25-9) discuss the Sirens episode from the twelfth book of the *Odyssey*, the Homeric epic from the eighth century BCE. Sirens are seductively singing demons, often connected with death (they are sometimes depicted as half bird, half woman, like harpies); whoever listens to their singing will die. The aspect of Homer's text picked up on by Horkheimer and Adorno is how Odysseus deals with the danger. As Odysseus' ship is taken as a metaphor for a workplace – a kind of factory under conditions of quasi-slavery – this section is in fact a reflection on the concept of labour. The discussion of the Sirens episode in chapter one has therewith a different focus from the excursus on the *Odyssey* in chapter two, which is chiefly a refutation of contemporary romanticizing readings of Homer. They are connected, though, through the interpretation of the character of Odysseus as a prototype of bourgeois subjectivity due to his use of cunning rationality in the service of the struggle for self-preservation. The bourgeois subject is required to be totally in the present moment. To survive, one must not dwell in the past. This is, however, just what the Sirens offer: they sing about the past. Getting lost in their song promises enjoyment: their song is proto-art, art not yet 'neutralized to being merely art'. Their naughty promise of enjoyment threatens the patriarchal order represented by nautical discipline. Horkheimer and Adorno are scathing about the disciplining process: 'Humanity had to inflict terrible injuries on itself before the self – the identical,

purpose-directed, masculine character of human beings – was created, and something of this process is repeated in every childhood' (Adorno and Horkheimer, 1997: 33; Horkheimer and Adorno, 1987/2002: 56/26). To lose oneself – which means to lose one's *self* or one's ego – is tempting but as it was such hard work to produce the self, the bourgeois subject must be determined to keep it up. The process of producing the self is that of civilization, whose path 'was that of obedience and labour, over which fulfilment shines always only as semblance, as beauty deprived of power': art is the beauty of a hard-working, beauty-less world.

Odysseus' men must row like crazy and have their ears plugged: 'those who work are forced to look ahead, full of energy and keenly focussed, ignoring anything that lies to one side' (Adorno and Horkheimer, 1997: 34; Horkheimer and Adorno, 1987/2002: 57/26). 'Odysseus, the landowner, who has others working for him', by contrast, keeps his ears unplugged: he chooses to be exposed to the temptation but has himself bound to the mast, while his men can hear neither the Sirens nor their boss asking to be unbound. In the name of self-preservation, Odysseus arranges a fettering constellation to the effect that neither he nor his workers are able to abandon work discipline, but he affords himself the torturous luxury of being exposed to the temptation that he knows he will want but cannot allow himself to give in to. He denies happiness to himself as much as his men, but he at least wants to know what he is missing. The Sirens' tempting promise of happiness is 'kept out of the way of praxis' (Adorno and Horkheimer, 1997: 34; Horkheimer and Adorno, 1987/2002: 57/27), reduced to art: something to be contemplated at a distance. Homer depicts here the separation of art and labour.

Horkheimer and Adorno discuss in the following paragraph the relationship between Odysseus and his men, focusing on the image of Odysseus in bondage. The image demonstrates his remarkable power: the workers work while the boss is chained to the mast; his power is so

secure that it can be deputized. This implies, however, regression as well as increased power (Adorno and Horkheimer, 1997: 34–5; Horkheimer and Adorno, 1987/2002: 58/27): exemption from labour means mutilation. As in Hegel's *Phenomenology*, the lord becomes dependent, while the bondsman who works on the thing from which the lord is separated enjoys the element of independence that the involvement in direct production grants (Adorno and Horkheimer, 1997: 35; Horkheimer and Adorno, 1987/2002: 58/27). For Horkheimer and Adorno, Odysseus' bondage points to both, the differentiation and development of skills and knowledge that civilization comprises and the increasing 'fixation of instincts through greater repression' through which 'imagination withers'. 'The curse of unstoppable progress is unstoppable regression', which implies that those who have been left behind by progress 'represent not only untruth': those at the cutting edge are fettered by their own civilization, while some dimension of truth may be accessible to those less 'developed'.

In the following paragraph, Horkheimer and Adorno explore the other side of the relationship, that of the rowers. Here the focus is on their enforced deafness, which mirrors the self-induced immobility of their commander. 'The autocratic intellect... detaches itself from sensuous experience in order to subjugate it' and is likewise affected by regression. The intellect's 'domination over the senses' (such as when it plugs the ears in order to facilitate the labour process) takes place through the 'unification of the intellectual functions' (all energies are concentrated on one task, such as, in the Homeric image, rowing), whereby thought resigns itself to producing unanimity (the unanimity of the hard-working team of rowers). Both thought and experience are impoverished in the process of their separation: the deafness of 'the compliant proletarians' is the equivalent of 'the immobility of those in command' (Adorno and Horkheimer, 1997: 36; Horkheimer and Adorno, 1987/2002: 59/28). The Sirens episode is summed up as follows:

The more complicated and refined the social, economic and scientific apparatus, to the operation of which the system of production has long since attuned the body, the more impoverished are the experiences of which it is capable.

In other words, the system of production has attuned the body to the societal apparatus destroying its ability to make experiences. Science-based rationalization of production turns qualities into functions and humans back into amphibians:

The elimination of qualities, their conversion into functions, spreads from science via rationalized modes of work to the life world that is shared by all modern human societies and approximates it once more to that of the amphibians. The regression of the masses today lies in their inability to hear with their own ears what has not been heard before, to touch with their hands what has not previously been grasped; it is the new form that delusion assumed after all its mythical forms were defeated. Through the mediation of the total society that subsumes all relationships and impulses, human beings are being turned back into precisely what the developmental law of society, the principle of the self, had struggled to overcome: mere species beings, identical to one another through isolation within forcibly directed collectivity. (Adorno and Horkheimer, 1997: 36; Horkheimer and Adorno, 1987/2002: 59–60/28–9)

'Delusion' [*Verblendung*] has merely changed form: mythical delusion has become enlightened delusion. The history of society has returned humans to their prehistoric starting point. Horkheimer and Adorno interpret the image of the rowers as representing 'modern workers' in three different contexts that are unified by the societal totality, production (factories), culture (cinemas) and politics (collectives): 'The rowers, unable to speak to one another, are all harnessed to the same rhythms, like modern workers in factories, cinemas and collectives'. It is important to note that, in spite of the overall emphasis on civilization as the history of 'spirit' and 'the self', Horkheimer and Adorno assert here a materialist perspective: while 'conscious manipulation... additionally render[s] the oppressed stupid and deflect[s] them from the truth', conformism is enforced

*first of all* by ‘the concrete conditions of work in society’ (Adorno and Horkheimer, 1997: 36-7; Horkheimer and Adorno, 1987/2002: 60/28-9;

## REIFIED REASON CAN BECOME EMANCIPATORY

The fifth paragraph begins – like many in *Dialectic of Enlightenment* – with the counterargument: ‘This logical necessity’, i.e. the necessity of the powerlessness of the workers, ‘is not final, though’: the element that would empower the workers to end domination seems to be, in sturdy idealist fashion, their ability to think. Thinking is ‘the servant whom the master cannot control at will’. The human capacity to think is not *necessarily* subservient to power: the master’s tools can, after all, undo the master’s house, or rather are needed for doing so. Horkheimer and Adorno in particular celebrate here the positive upshots of reification and alienation. Domination has ‘reified’ [*verdinglicht*] itself by taking on the forms of law and organization, and in the process had to limit itself. These instruments of domination have gained some independence in the process, as the mediating instance of *Geist* (spirit) moderates the immediacy of exploitation: ‘The moment of rationality in domination also asserts itself as something different from [domination]’. The object-like quality of the means of domination – language, weapons, machines, thought – makes these means universally available, including for those pursuing ends other than domination, and therewith implies the critique of domination. It seems that Horkheimer and Adorno argue here not only that the instruments (guns, etc.) *can* be turned around but that their object-like, thing-like character *asks for it*. It is in this sense that progress, *by way of* being the progress of domination, is *also* the progress of the *negation* of domination – which is, of course, just what the phrase ‘dialectic of enlightenment’ means. It is here a surprisingly optimistic

concept. In the capitalist present, thought may have lost its self-reflexivity and today’s machines may mutilate their operators, but ‘in the form of machines... alienated reason moves towards a society which reconciles thought [in its reified forms, namely material and intellectual apparatuses]... with the liberated living beings’ (Adorno and Horkheimer, 1997: 37; Horkheimer and Adorno, 1987/2002: 60–1/29–30).

Of course, Horkheimer and Adorno instantly pour cold water on the hints of optimism in this account of reification by pointing out how ‘the rulers’ react to the objective openness of the historical situation: smelling the rat, ‘the rulers’ denounce reason itself as ideology, which brings the discussion back to one of the book’s leitmotifs, the attack on (Comtean as well as ‘logical’) positivism. The ruling ‘cliques’ (fascist and proto-fascist) have abandoned rationalist justifications of their ‘misdeeds’ and use instead the rhetoric of intuitions, mission and destiny, posturing ‘as the engineers of world history’ (Adorno and Horkheimer, 1997: 38; Horkheimer and Adorno, 1987/2002: 61/30). Horkheimer and Adorno conclude this paragraph with a reflection on productivity, power and class in contemporary capitalism:

Now that the livelihood of those still needed to operate the machines can be produced with a minimal part of the labour time which the masters of society have at their disposal, the superfluous... mass of the population...are drilled as additional guards of the system, so that they can be used today and tomorrow as material for its grand designs...Misery that consists of the contrast between power and impotence is growing immeasurably, in tandem with the capacity permanently to abolish any misery. Adorno and Horkheimer, 1997: 38; Horkheimer and Adorno, 1987/2002: 61–2/30)

The following paragraph explores the contradictory state of thinking under these conditions. Thinking about thinking is central to Critical Theory that constitutes an exercise in self-reflection: enlightenment’s enlightenment. It begins by stating that ‘the reason of

the reasonable society' is not in fact reasonable (it is so only in the sense in which the father orders his children 'to be reasonable, or else'). The good news is that this system's inevitability is only an illusion; the bad news is that thinking that is societally constituted 'as an instrument of domination' cannot dissolve this illusion (Adorno and Horkheimer, 1997: 39; Horkheimer and Adorno, 1987/2002: 62/31). Unfortunately, a type of *in itself* emancipatory thinking does not exist, but the crux of Horkheimer and Adorno's argument is that the nature of thinking *as such* points beyond its own social-historical constitution. Thinking cannot escape the entanglement that keeps it 'ensnared in prehistory' (the struggle for self-preservation), but at least it can recognize 'the logic of either-or... with which it radically emancipated itself from nature, as this nature itself': *we are able to understand that we escaped nature only by means of being very much like nature*. We have not yet transcended nature, and in this sense we are not human – humane – yet, and we know it somehow, due to the relentlessness of thinking itself: unstopably consistent thinking, relentless in this respect like nature, cannot stop short of recognizing, and then challenging, its own nature-like character. Thinking produces a kind of overflow that enables it to reflect on itself. Its steady trickle is the basis of humanity's hope for emancipation.

Horkheimer and Adorno's concept of dialectics precludes any attempt to separate the good bits of enlightenment from the bad bits. Enlightenment is emancipatory and liberating only *through* its instrumental and dominating aspects: this is the dialectic of enlightenment. The remainder of this paragraph elaborates this notion. Horkheimer and Adorno state bluntly that people cannot but represent nature to themselves 'in such a way that it can be mastered' (Adorno and Horkheimer, 1997: 39; Horkheimer and Adorno, 1987/2002: 63/31). They relate the notion of thinking as an instrument to that of identity: an instrument or a tool is a thing that is *the same thing* in a variety of different situations. In this sense it stands out

as something 'known, unitary and identical' from a world of 'chaotic, manifold and disparate' objects: I have one (identical) hammer but I use it to hit many different (non-identical) nails. Likewise, the concept is 'the mental tool that fits into just that point in many things where one can clutch them'. Horkheimer and Adorno caution against any form of thinking that tries to deny its own instrumental character, such as mysticism and some forms of utopian thinking: the assumption there could be a mystic union of concept and thing, or subject and object, is delusional. They applaud enlightenment, by contrast, for coldly declaring and asserting domination as a process of separation. When enlightened thinking separates subject and object, it reflects reality and is, in this sense, true; at the same time it is false when it believes things ought to be the way they ('positively') are. Domination is at the root of both superstition and enlightenment. When enlightenment denounces superstition, it actually denounces *itself* (albeit in its own earlier guise, and not consciously). Although enlightenment means domination, it also makes the dominated 'audible in its alienation'. The rate of increase of domination of nature by enlightenment seems to correspond to the increase of the counter-tendency, the greater hearing that the same enlightenment grants to alienated nature. As it did through myth, exploited nature continues to speak through enlightenment, but it speaks differently. When spirit recognizes itself as 'nature split from itself', spirit *is* in fact nature that invokes itself as blind and mutilated, whereas in prehistory nature used to invoke itself, using humans as its medium, as *mana*, as omnipotent. 'When spirit modestly confesses that it is domination and as such *not something other than nature* [*in Natur sich zurücknimmt*], it dissolves its claim to domination that subjects it to nature' (*italics added*). Domination of nature is not to end, but it ought to recognize itself honestly for what it is, and thereby – as *self-reflexive* domination of nature – transform itself into a softer, more enlightened, maybe humane form of domination of nature: it would thereby

begin to *transcend* nature. Human history (as humane history) would finally begin (Adorno and Horkheimer, 1997: 40; Horkheimer and Adorno, 1987/2002: 63/31–2). The weapons with which humans have subjugated nature always have undermined human freedom as much as they rendered it possible, and they need to be radically transformed. ‘Through recognition of nature within the subject, which constitutes the unrecognized truth of all culture, enlightenment is antithetical to domination as such’ (Adorno and Horkheimer, 1997: 40; Horkheimer and Adorno, 1987/2002: 64/32). This is one of the clearest statements of the benign side of the dialectic: Horkheimer and Adorno describe transformed, self-reflective, emancipatory enlightenment as ‘the unrecognized truth of all culture’. The enlightenment that tends to ‘confus[e] freedom with the business of self-preservation’ is denoted ‘bourgeois’. The positivistic hostility to conceptual, transcendental, truly philosophical thinking ‘left the field wide open for the lie’. Lies cannot be distinguished from truth anymore where truth has been ‘neutralized to being *Kulturgut*’, i.e. accumulated ‘cultural goods’ that are summed up in the chauvinistic notion of cultural heritage.

### THE INSUFFICIENT RADICALISM OF THE LABOUR MOVEMENT’S SOCIALISM

The last paragraph of ‘The Concept of Enlightenment’ begins with a critique of the insufficient radicalism of the labour movement: ‘socialism, in a concession to reactionary common sense, prematurely confirmed as eternal that necessity’, namely the necessity of the societal domination that results from the struggle for self-preservation against overwhelming, hostile nature. The domination of nature, though, reflects and extends nature itself, whose essence is nothing other than necessity and the struggle for self-preservation, thereby trapping humanity in prehistory:

the progress towards history proper, the history of humane society reconciled with nature, is arrested. When humanity fights and dominates nature, it *is* nature; when humanity reconciles nature on the basis of acknowledging its own being part of it, it *transcends* nature. Horkheimer and Adorno argue that socialism ‘elevated necessity to being the basis [of society] for all time to come and degraded spirit – in keeping with time-honoured idealist tradition – to the pinnacle [of the superstructure], clutching therewith too frantically the heritage of bourgeois philosophy’ (Adorno and Horkheimer, 1997: 41; Horkheimer and Adorno, 1987/2002: 64/32). In other words, the nominally Marxist notion that the economy was the ‘basis’ and that anything to do with thinking was housed upstairs in the ‘superstructure’ is a continuation of bourgeois thought that ‘degrades’ spirit by elevating it out of the realm where it would make a difference: the relationship with nature. In this traditional perspective, nature would continue to be ‘posited as entirely alien’ as it had been in mythology. Nature that remained alien and unreconciled, however, was bound to stage a backlash against its domination by human civilization and ‘become totalitarian and absorb freedom, socialism included’ (Adorno and Horkheimer, 1997: 41; Horkheimer and Adorno, 1987/2002: 64–5/33).

This (Benjamin-inspired) comment on the socialism of the labour movement is followed by a general round-up of the argument of ‘The Concept of Enlightenment’. Enlightenment ‘subjected everything particular to its discipline’ but in the process ‘allowed the uncomprehended totality as the domination of things to rebound on being and consciousness of humans’ (Adorno and Horkheimer, 1997: 41; Horkheimer and Adorno, 1987/2002: 65/33). The situation is not entirely without hope, though: ‘But true praxis capable of overturning the state of things depends on theory’s intransigence against the comatose state in which society allows thought to ossify’. It seems that those scattered bits of thought that escaped

reification – such as Critical Theory, perhaps – can, by being intransigent, inform ‘true praxis’ that will shake society out of the coma that makes thought ossify. Here Horkheimer and Adorno add an attack on the (then as now) influential conservative ‘critique of civilization’: ‘Fulfilment is not jeopardized by the material preconditions of fulfilment, unfettered technology as such’. The question of technology is not the ‘supreme’ but the wrong question as ‘the fault lies with a social context that induces delusional blindness [*gesellschaftlicher Verblendungszusammenhang*]’. The ‘mythic-scientific respect that people all over the world pay to what the given facts are’ has become ‘a fortress before which even the revolutionary imagination despises itself as utopianism and degenerates to the compliant trust in the objective tendency of history’. Horkheimer and Adorno encourage here ‘the revolutionary imagination’ not to capitulate before the positivistic fetishization of facts: ‘The spirit of a theory that is intransigently formulated in this perspective might be able to turn around that of merciless progress when it has run its course’ (Adorno and Horkheimer, 1997: 42; Horkheimer and Adorno, 1987/2002: 65/33).

The notion of the achievements of progress brings the argument back to Bacon’s dream of the unimaginable wealth of the future, referred to in the first paragraph. Horkheimer and Adorno note that Bacon’s dream has surpassed itself:

In multiplying *Gewalt* [i.e. violence, power, force, domination] through the mediation of the market, the bourgeois economy has multiplied also its things and forces [*Kräfte*] to such an extent that their administration no longer requires kings, nor even the bourgeois themselves: it only needs all. They learn from the power [*Macht*] of things finally to forgo domination [*Macht*]. (Adorno and Horkheimer, 1997: 42; Horkheimer and Adorno, 1987/2002: 66/33)

‘It only needs all’ must be the understatement of the century. On close reading, and considering the historical context, *Dialectic of Enlightenment* is much more Mountain Hut

Halfway House than ‘Grand Hotel Abyss’, where Georg Lukács famously housed Adorno in the 1962 preface to his *Theory of the Novel* (Lukács, 1971: 22). Bacon’s utopia that ‘we should command nature in action’ has revealed itself as the dream (read: nightmare) of perfecting human domination *in society*. In the process, though, human knowledge has increased so much that it can finally begin to dissolve domination for good. Unsurprisingly, the optimism of this account of what humanity can achieve is dampened in the last sentence of the text that points forward to the discussion of the ‘culture industry’: ‘But in face of this possibility enlightenment, in the service of the present, is turning itself into total deception of the masses’ (Adorno and Horkheimer, 1997: 42; Horkheimer and Adorno, 1987/2002: 66/34).

### ‘EXCURSUS 1: ODYSSEUS OR MYTH AND ENLIGHTENMENT’

*Dialectic of Enlightenment* addresses contemporary concerns by way of working through materials that are far from contemporary. The extreme point of this method is ‘Excursus 1: Odysseus or Myth and Enlightenment’, the book’s second chapter, a reading of passages from the *Odyssey*. Horkheimer and Adorno indicate in the first pages of the chapter what directed this choice of material (Adorno and Horkheimer, 1997: 43–6; Horkheimer and Adorno, 1987/2002: 67–70/35–7), pointing to how the Homeric epics had been used to denounce liberalism and modern bourgeois individuality. Some nineteenth-century conservative German ‘humanists’ had celebrated the Homeric epics as documents of genuine, archaic humanity, whereas some proto-fascists sensed that Homer’s protagonists were already quite capable of rational thinking, cunning, mediation and even exchange relations. The fascists understood that even the earliest of the Greek classics already had one foot in (emerging) bourgeois society: Homer had not in fact

painted uncorrupted images from a myth-soaked past that both conservatives and fascists dreamed of tapping into. Horkheimer and Adorno observe that the fascist critics 'made a correct observation here' (Adorno and Horkheimer, 1997: 45; Horkheimer and Adorno, 1987/2002: 68/36). The excursus on Odysseus puts a finger on a sore point at which bourgeois humanism made itself vulnerable to fascist attack: the humanists celebrated as 'myth' something that was in fact already a document of enlightenment, clearing the ground for the fascists' *anti-humanist* celebration of myth.

Horkheimer and Adorno, by contrast, deal with the literary form of the ancient myth (the epic) as a case study of the dialectic of enlightenment. Odysseus' adventurous journey home from Troy is read as a tale of the making of the bourgeois subject by resisting and overcoming temptations, conquering the emerging subject's internal nature. The chief motive is the notion that civilization is the history of the introversion of sacrifice (Adorno and Horkheimer, 1997: 55; Horkheimer and Adorno, 1987/2002: 79/43) as renunciation of desires: throughout the epic, Odysseus, whose most prominent qualities are patience and cunning, has to conquer his own impulses. Repeatedly gifts are made that, resembling sacrifices to gods and demons, amount to exchanges of equivalents that are not in fact equivalents: sacrifices are attempts to cheat the gods by offering them things (say, an animal) that are much less valuable than that which the humans in question expect to receive in return (survival, good winds, luck in warfare, etc.). Odysseus' cunning consists in his accepting the powers of the mythical forces he finds himself confronted with while discovering gaps. The most pronounced of his tricks is the (literal) denial of his own subjectivity by claiming his name is 'nobody' (which in Greek sounds similar to his actual name). After his successful return home, Odysseus engages in the reconstitution of another civilizational form of sacrifice and denial of instinctual drives:

marriage. Horkheimer and Adorno demonstrate that Odysseus' actions are driven by a form of rationality that dovetails with that discussed in 'The Concept of Enlightenment'.

## **'EXCURSUS 2: JULIETTE, OR ENLIGHTENMENT AND MORALITY'**

While the excursus on the Odyssey provides a relatively straightforward argument based on the interpretation of one principal source, the second excursus is much more complex, based as it is on a constellation of texts that conventionally would not be discussed together. It begins with an exploration of the concepts of reason and enlightenment in Kant and other enlightenment philosophers, emphasizing that reason creates order out of itself, as opposed to submitting to order externally imposed (which it denounces as 'tutelage'). Horkheimer and Adorno point to the ambiguity in the concept of reason as denoting, on the one hand, the utopia of liberated conviviality (Adorno and Horkheimer, 1997: 83; Horkheimer and Adorno, 1987/2002: 106/65) and, on the other, calculating thought in the service of self-preservation. The central theme of the chapter is the question of how enlightened thinking attempts, and fails, to argue that moral behaviour is reasonable without recourse to doctrines that it must dismiss as so many superstitions. If it postulates the existence of an ethical instinct, it finds it impossible to argue why the latter is superior to its opposite, which is equally evident empirically. Fascism draws the most unequivocal conclusion and does away with morality.

The chapter illustrates the ambiguities of Kantian moral philosophy by reading it through the writings of the Marquis de Sade, chiefly the novel *History of Juliette* (1797), as well as Nietzsche. De Sade's novels contain both pornographic narrative, which often depicts sexual practices that take the form of complex, mechanical, almost machine-like arrangements, resembling modern team

sports, and philosophical speeches and tracts that belong to the most radically atheist and materialist texts of the Enlightenment period, anticipating elements of later nihilism. Horkheimer and Adorno emphasize the closeness of both de Sade and Kant to enlightenment rationalism and of Nietzsche to fascism respectively.

The first third of the chapter (the first seven paragraphs; Adorno and Horkheimer, 1997: 81–93; Horkheimer and Adorno, 1987/2002: 104–117/63–74) provides the general argument, culminating in the observation that the mainstream representatives of the Enlightenment movement rejected the radicalism of Kant's first critique as they understood it undermined the, as it were, reasonable amount of superstition and religion that bourgeois society required, while Kant himself limited the 'critique of pure reason' through his moral philosophy 'in order to rescue the possibility of reason' (Adorno and Horkheimer, 1997: 93; Horkheimer and Adorno, 1987/2002: 117/74). Horkheimer and Adorno add that 'unreflectingly enlightened thinking' (i.e. that of lesser thinkers than Kant) always tended towards scepticism (later, positivism and, arguably, more recently, post-modernism), i.e. the rationalist doubt of the 'transcendental' validity of reason itself, especially its utopian aspects such as the goal of universal peace. 'Dark thinkers' like de Sade and Nietzsche are contrasted to both the dialectician Kant and the various forms of (proto-liberal) bourgeois sceptics, as consistently rationalist thinkers who attack morality and civilization as so much mythology. The remainder of the chapter (Adorno and Horkheimer, 1997: 94–119; Horkheimer and Adorno, 1987/2002: 117–43/74–93) mainly explores the radicalism of the 'dark thinkers'. The discussion moves from the rationalist rejection of pity and philanthropy to the discussion of the relationship between work and enjoyment – the idea that lust is only allowed as a break, and in reasonable terms rather than excessively as festival – and finally to love, marriage, family and the domination of women.

### **'CULTURE INDUSTRY: ENLIGHTENMENT AS MASS DECEPTION'**

Culture, the sphere of activity of spirit, or enlightenment, has become 'industry' and therewith deception. The logical presupposition of this idea, the central thesis of the fourth chapter of *Dialectic of Enlightenment*, is that the concept of 'culture' is meaningful only if it is opposed to industry, the sphere of self-preservation, production, exploitation, manipulation and domination of nature. Culture that has become industry is a scam. One of the countless imprecisions of the available English translations makes even the title of this chapter problematic, as there is no article in the German text: it is 'Culture Industry', not 'The Culture Industry'. The definite article wrongly added by the translators facilitates the misinterpretation of 'the culture industry' as a determinate, particular sphere of cultural production, perhaps in the sense of 'popular culture'. This is not what the chapter is about, though. 'Culture industry' is about culture *as such* that has become what it should be a negation of, thereby negating itself. In this sense, culture as 'culture industry' is another dimension of the dialectic of enlightenment.

The chapter's starting point is the rejection of the principal complaint of modern 'cultural critique': modernity's social differentiation created 'cultural chaos' (Adorno and Horkheimer, 1997: 120; Horkheimer and Adorno, 1987/2002: 144/94), a position that was ubiquitous at the time in either its right-wing, proto-fascist version or the conservative-liberal one that animated much of classical sociology. Horkheimer and Adorno make the opposite claim: contemporary culture systematically produces sameness everywhere, even across political divides. Culture has always been business, but now it has abandoned any attempts to hide it. Although written in the United States, the text hints at the fact that the new world did not seem altogether new to these German refugees: 'In Germany the graveyard

stillness of the dictatorship already hung over the gayest films of the democratic era' (Adorno and Horkheimer, 1997: 126; Horkheimer and Adorno, 1987/2002: 150/99). The claim that there is cultural continuity between liberal and fascist regimes refers to Weimar Germany and the Third Reich first, then to the latter and 'the West'.

Standardization and centralization derive neither from technology as such, nor from consumers' demands but from the inner logic of the social totality. Within the latter, the 'cultural monopolies' are relatively weak and dependent: 'the objective societal tendency in the present era' is incarnated in the leaders of steel, oil, electricity and chemistry concerns to whom the producers of culture 'must hurry to adapt' (Adorno and Horkheimer, 1997: 122; Horkheimer and Adorno, 1987/2002: 147/96). Culture (or spirit) is an index, not the cause of the societal misery. Formulaic culture saves subjects the effort that Kantian epistemology had postulated is involved in synthesizing sense data into perceptions: culture industry 'does [their] schematizing for [the subjects]' (Adorno and Horkheimer, 1997: 124; Horkheimer and Adorno, 1987/2002: 149/98). The tension that characterizes great artworks, resulting from the artist's ever failing struggle to create identity between the logic of the material and the style of its artistic shaping, fails to come about because the cultural artefact's form and matter are already prefabricated for each other (Adorno and Horkheimer, 1997: 131; Horkheimer and Adorno, 1987/2002: 155/103).

One of the key themes of the chapter is the collapse of the separation of high and low culture which damages both ((Adorno and Horkheimer, 1997: 135–6; Horkheimer and Adorno, 1987/2002: 160–1/107–8). Horkheimer and Adorno describe 'the circus, the peep show, or the brothel' as much as Schönberg's twelve-tone music as eccentric and 'embarrassing' to society: culture industry domesticates, perfects, streamlines and mainstreams *both*, high and low culture, and in the process exorcizes whatever could be recalcitrant about them. The split between cheap and dirty amusement and high art should in fact

be defended as it is witness to the division and falseness of society itself. Horkheimer and Adorno applaud 'cartoon films' that 'were once exponents of fantasy against rationalism' and 'redeemed animals and things by having their technology electrify them'. Lesser examples, domesticated by culture industry and lacking any subversive imagination, 'merely confirm the victory of technological reason over truth' (Adorno and Horkheimer, 1997: 138; Horkheimer and Adorno, 1987/2002: 163/110). 'Traces of the better state of things persist in those features of the culture industry by which it resembles the circus' (Adorno and Horkheimer, 1997: 142–3; Horkheimer and Adorno, 1987/2002: 168–9/113–14). Culture industry is 'causing meaninglessness to disappear at the lowest level of art just as radically as meaning is disappearing at the highest'; it imposes the same schemata of meaning on everything and in the process ruins all. Under the regime of culture industry, 'to be entertained means to be in agreement' (Adorno and Horkheimer, 1997: 144; Horkheimer and Adorno, 1987/2002: 170/115). Concerning high culture, Horkheimer and Adorno emphasize that artworks have always been commodities (Adorno and Horkheimer, 1997: 157; Horkheimer and Adorno, 1987/2002: 184/127): the purposelessness of great art depended on the anonymity of the market. Beethoven was a great businessman. The artwork is classically described as being determined by (internal) purposiveness without (external) purpose, but its own purposelessness is owed to purposes dictated by the market. Horkheimer and Adorno do not in fact critique culture industry for having turned all culture into commodities (as conservative and romantic 'cultural critique' does): on the contrary, part of what they lament is the *false dissolution* of its commodity form. An extreme point of this process is radio broadcasting, which lends itself to centralized, fascist manipulation. Under conditions of culture industry, the classical concert is attended in order to gain the prestige of having been there and of knowing all kinds of things about it (its exchange-value, as it were) rather than for the enjoyment (its use-value). Artworks

are denigrated to being *Kulturgüter* (culture-goods, now often supplied or subsidized by the state as advertisements of itself) when they should be *aufgehoben* (sublated, overcome, resolved) in a liberated society (Adorno and Horkheimer, 1997: 160; Horkheimer and Adorno, 1987/2002: 188/129–30).

### **'ELEMENTS OF ANTISEMITISM: LIMITS OF ENLIGHTENMENT'**

'Elements of Antisemitism' consists of seven numbered sections. The first six have clearly demarcated themes and develop different aspects of the argument, whereas section seven, added to the edition of 1947 only, mostly restates in more pointed form some of these arguments.<sup>2</sup> Like its reprise in the seventh section, the argument of the very short first section of 'Elements of Antisemitism' (Adorno and Horkheimer, 1997: 168–70; Horkheimer and Adorno, 1987/2002: 197–9/137–9) is disturbingly acerbic in tone even by the standards of *Dialectic of Enlightenment*. Horkheimer and Adorno sarcastically explore the meaning of the concept of 'truth' in the context of 'the false social order'. They state that the fascist doctrine of race is empirically true because the fascists *made* it true: the Jews are now the 'anti-race' or 'counter-race' that attracts the 'will to destruction' which the false societal order cannot but produce. It also speaks the truth about the fascists themselves, who 'express their own essence' in the image they create of 'the Jew': it is the fascists who desire 'exclusive property, appropriation, limitless power, at any price'. Horkheimer and Adorno add that the modern hunger for limitless power paradoxically emerges 'while economically there is no need any more for domination'. The liberal response to the fascist doctrine, by contrast, is 'true as an idea' only: 'By positing the unity of mankind as in principle already given, though, the liberal thesis contributes to the ideological legitimation of the existing

order' (Adorno and Horkheimer, 1997: 169; Horkheimer and Adorno, 1987/2002: 198/138). The fact that there are still Jews who have not entirely assimilated to the (false) totality is an embarrassment to liberalism. Liberal support for Jews is therefore half-hearted. The fact that 'progress brought with itself cruelty as well as liberation' had been evident in the ways 'the great representatives of the Enlightenment as well as the democratic-popular movements' treated the Jews, and it now also showed itself in the assimilated Jews' own character. They joined 'the modern bourgeoisie' when it was already 'in the process of moving on towards regression to naked domination' in fascism. The assimilated Jews adopted the liberal belief in the integrative 'harmony of society' at a time when this harmony was already morphing into the *Volksgemeinschaft* (the nation in the state of declaring itself race) that murdered them. The opening salvo of 'Elements' thus defines the illusory commitment to liberal society as the main cause of helplessness in the face of this society's fascist metamorphosis.

While the first section presents antisemitic nationalism as a movement of the modern bourgeoisie in its post-liberal state, the second section (Adorno and Horkheimer, 1997: 170–2; Horkheimer and Adorno, 1987/2002: 199–202/139–41) looks at 'antisemitism as popular movement'. For the commoners, antisemitism is 'a luxury' without material benefits. In class society, wealth and happiness are reserved for the elites. If a group from outside the traditional elites acquires wealth and happiness, they must be trampled down. The Jews are, in the context of European society, just such a group. 'The banker and the intellectual... form an imagery of the denied longings of those crippled by domination which domination utilizes for its own perpetuation'. Horkheimer and Adorno suggest that antisemitism is a particular form of appearance (*Gestalt*) of spirit (*Geist*) entangled in domination. 'Spirit' being the desperate effort of humans to break out of domination, antisemitism helps obscure the spirit's entanglement in domination itself. The entanglement

in what it struggles to overcome is the fundamental malady intrinsic to civilization as such, and this fact explains antisemitism's impenetrability: 'straightforwardly rational' explanations and refutations of antisemitism (in terms of economics and politics), even if they are entirely accurate, are bound to fail 'because rationality as entangled with domination is itself at the root of the malady'. Only reflection on the entanglement itself would help, i.e. a form of reflective rather than 'straightforward' rational explanation. The argument of the second section culminates in the claim that antisemitism is 'a ritual of civilization' that is 'pointless' if looked at from a rationalistic perspective: 'The pogroms are the true ritual murders' (ritual murder libel thus being a case of projection). Rituals are not rational, but they reflect the rationality of society.

The third section of 'Elements' (Adorno and Horkheimer, 1997: 173-6; Horkheimer and Adorno, 1987/2002: 202-5/141-4) is in two parts. The first part deals with one of the structural preconditions of antisemitism, namely the need for capitalist producers to deflect their responsibility for exploitation on to a scapegoat. The key idea here is that capitalist production conceals its exploitative character and 'shouts: stop thief!', pointing at the Jew' as an old-fashioned representative of the sphere of circulation. The second part attempts to explain why the Jews are the obvious group to be cast in that role historically: 'The Jew was not allowed to put down roots and was hence slandered as rootless'.

Section four (Adorno and Horkheimer, 1997: 176-9; Horkheimer and Adorno, 1987/2002: 205-9/144-7) deals with religion, the chief claim being that religion was 'subsumed' when it became a cultural artefact but not 'overcome [*aufgehoben*]'. This destroyed the delicate dialectic between truth and deception that had characterized spirit (i.e. the dynamic of human civilization) in its traditional, religious form: there had been priestly deception and manipulation but also the longing for redemption. Spirit-as-religion in its modern incarnation ends up hating spirit (or rather, ends up allied

with those who do). Section five (Adorno and Horkheimer, 1997: 179-86; Horkheimer and Adorno, 1987/2002: 209-16/147-53) contains an anthropological discussion of how civilization preserves the traces of its subjection of nature, and how it becomes quasi-nature in the process. Modern civilization develops a destructive fury against the 'anachronistic' remnants of its own initial stages (including mimesis and magic as representative of the first attempts of human civilization to get a grip on nature) but in fascism ends up celebrating and fetishizing mimetic and magic behaviours (formulae, rituals, uniforms, etc.). Section six (Adorno and Horkheimer, 1997: 187-200; Horkheimer and Adorno, 1987/2002: 217-30/154-65) discusses paranoia and projection, which are, on the one hand, characteristics of fascist antisemitism but, on the other, fundamental to human perception of reality – part of dealing with nature – and thus intrinsic to civilization. Horkheimer and Adorno pick up the psychoanalytic explanation of modern antisemitism but refract it through their reading of Kantian epistemology (according to which every perception contains an element of projection by the subject and is guided by fears, desires, etc.), framed by a conception of the evolution of human civilization. This allows them to propose an argument about *what kind of* projection and paranoia is implicated in fascism and antisemitism – namely the kind that is unreflectingly spellbound by self-preservation and in the process loses contact with reality as its touchstone.

Section seven (Adorno and Horkheimer, 1997: 200-8; Horkheimer and Adorno, 1987/2002: 230-8/165-72) mostly recapitulates in condensed form the overall argument of 'Elements', articulating some aspects rather more strongly than in the previous sections: the responsibility of German liberalism for fascism; the implication of progressive-democratic leftism in the general tendency of a 'rage against difference' and thus, at least indirectly, in antisemitism; the anachronism of the liberal-bourgeois order in the face of the ability of humanity's productive forces to rebuild human society on the

basis of abundance rather than artificial scarcity. Section seven, along with the first three sections, is therewith the most immediately fruitful source for discussions of antisemitism from a perspective that is political as well as societal and economic.

## 'NOTES AND SKETCHES'

The twenty-four short pieces in 'Notes and Sketches' cover a range of subjects, including education, liberalism, fascism, the philosophy of history, crime and punishment, the body, individuality, morality and animals. The last piece is titled 'On the Genesis of Stupidity', in which Horkheimer und Adorno state that the 'emblem of intelligence is the antenna of the snail' (Adorno and Horkheimer, 1997: 256; Horkheimer and Adorno, 1987/2002: 288/213). They seem to imply here that human sense-activity – like the enlightenment in general – should be directed at the world in the hesitant manner of the snail's 'groping face [*tastendes Gesicht*]'. This image concludes the book.

## Notes

- 1 I have worked from the German text and used, and silently modified, both standard English translations, neither of which is entirely reliable.
- 2 For a detailed analysis of the seventh section see Stoetzler (2009), and of sections one to three see Stoetzler (forthcoming).

# Herbert Marcuse: Critical Theory as Radical Socialism

Charles Reitz

In Herbert Marcuse one encounters what was lacking in other members of the Frankfurt School: a critique of advanced industrial society (Wiggershaus, 1988: 676) and a vision of the most radical goals of socialism (Marcuse, 1972: 5). Marcuse is one of the most illustrious and radical thinkers of his time – the author of the highly acclaimed and influential volumes *One-Dimensional Man* (1964) and *An Essay on Liberation* (1969a). His life's work offers much more than is brilliant, and constitutes his matchless contribution to the field of Frankfurt School critical theory.

Often characterized as the 'philosopher of the student revolts', his intellectual impact has been connected most closely to the campus-based turmoil of the 1960s in the United States and Europe. At that time (at the age of 70) he was seen by many as a key academic spokesperson in solidarity with the student anti-Vietnam war movement, the insurgent movements for democratic socialism, and against racial- and gender-based inequality.

His radical political philosophical positions were grounded in his critical analysis of global capitalism's wasted abundance, its forms of alienated labor, oppression, and war, and the latent utopian possibilities of this society, arrested under current conditions, yet attainable through a socialist revolutionary struggle for a future of freedom.

## EARLY YEARS (1919–22)

Born into an upper-middle-class family of Jewish descent in Berlin in 1898, Herbert Marcuse was classically educated and of that generation of young men in Germany caught up in World War I. When the war ended in 1918, Marcuse was witness to the ensuing political tumult in Berlin. A revolutionary uprising of soldiers and striking workers, with whom he empathized, sought to establish self-governing socialist republics in Berlin and Munich. These efforts ended in

defeat, and Marcuse became politically demoralized by what he understood as the complicity of the conservatively Marxist German social democrats, whom he had supported, in the assassination of the revolutionary communist leaders Karl Liebknecht and Rosa Luxemburg.

Disillusioned with his own political activism, Marcuse turned in his twenties to university study to reflect upon the troubled condition of the world and the very limited possibilities he saw for a truly socialist revolution. The dissertation he was then preparing would not look for advice in the struggle against the alienating conditions of social life to economic analyses or party-oriented political action, but rather to works of art from the history of German literature.

### ***The German Artist Novel (1922)***

Promoted to doctor of philosophy in Freiburg in October 1922, his dissertation, *Der deutsche Künstlerroman* [*The German Artist Novel*], focused on recurrent issues in modern German fiction dealing with the artist's stress and frustration at the incompatibility of an aesthetic life and the painful exigencies of everyday existence. Marcuse's approach was consistent with that of historian Wilhelm Dilthey and the then prevailing *Geisteswissenschaftliche Bewegung* the reform movement in German higher education. This emphasized the post-war renewal of German culture through study of the humanities and social sciences (the *Geisteswissenschaften*) rather than through what in the United States today are called STEM disciplines: science, technology, engineering, and mathematics. The ostensibly neutral logical positivism and empiricism of the latter fields were thought to have left unchallenged the technocratic and dangerously imperial leadership mentality of Germany's recent militarist past. Dilthey proposed that the *Geisteswissenschaften* served as an organon of critical reflection on

historical human reality and that human existence in society could best be understood in historical works of literature. The concluding sentence of Marcuse's dissertation highlights this same conviction: 'Above and beyond the literary-historical problems, a piece of human history becomes visible: the struggle of the German people for a new community [*Gemeinschaft* rather than *Gesellschaft*]' (Marcuse, 1978c: 333, my translation). His analysis is most striking when it assesses Goethe's concept of the artist's educated ripeness, maturity, and self-controlled sublimation. To Marcuse, the testimony of literature shows that a person's self-confidence and aplomb require a certain distance from any uncritical surrender to empty convention, immersion in a subjectively Romantic aestheticism, or engagement in radical mass organizations and social movements. In contrast, Marcuse became critical of Germany's conservative and traditional liberal arts education in an essay of the mid 1930s, 'On the Affirmative Character of Culture' (Marcuse, 1968a). German high art and high culture tend to 'affirm' or replicate the repression of the established social order through a poetization and exoneration of society's problems. Marcuse remained nonetheless convinced that there is a ground of reason in great literature, and he continued to pay close attention to educational philosophical issues throughout his life's work.

### ***Hegel's Ontology and Heideggerian Marxism (1932)***

After a brief hiatus compiling a bibliography of Friedrich Schiller at a publishing house back in Berlin, Marcuse returned to Freiburg from 1929 to 1933 to do post-doctoral work with Husserl and Heidegger. To qualify for an academic career the German university system required a post-doctoral dissertation directed by an academic chair. Thus, Marcuse completed his first Hegel book, *Hegel's*

*Ontology and the Theory of Historicity*, with Heidegger (Marcuse 1978b, 1975). The influence of a fundamental ontology upon Marcuse during this period was tangible and later gave rise to the term ‘Heideggerian Marxism’ (Habermas, 2013; Piccone and Delfini, 1970) to describe Marcuse’s thought (see also Wolin and Abromeit in Marcuse, 2005a; Feenberg, 2005). With the publication of *Hegel’s Ontology* in 1932 (Marcuse, 1987b), Marcuse sought Heidegger’s sponsorship, but Heidegger had antisemitic reservations (given his explicit embrace of Nazism and his ascent from Chair of the Freiburg Department of Philosophy to the university chancellor’s office in 1933). On the affinities of Heidegger’s philosophy and fascism, Heidegger’s antisemitism, and his recently discovered ‘Black Notebooks’ see Richard Wolin’s *The Politics of Being* (2016) and Olafson’s (1977) interview with Marcuse about Heidegger (also in Jansen, 1989 and Marcuse, 2005a). Max Horkheimer offered to undertake the academic sponsorship of Marcuse at Frankfurt, home of the Institute for Social Research, but political circumstances led him to assist Marcuse with emigration instead. Horkheimer invited Marcuse to become associated with the newly established branch of the Institute at Geneva, and when the Frankfurt center moved to New York City’s Columbia University in 1934, Marcuse joined its staff there.

### THE FRANKFURT SCHOOL IN NEW YORK CITY (1934–41)

At Columbia during the 1930s and 40s, Marcuse wrote several essays, first published in the *Zeitschrift für Sozialforschung* and republished in 1968 as *Negations* (Marcuse, 1968b). Thus this academic refugee from the *Gleichschaltung* [legally enforced political conformity] during the Third Reich began to elaborate his vision of a critical theory of society.

The work of Horkheimer, Adorno, Marcuse, and their colleagues will always be rightfully known as the work of the Frankfurt School, but the very concept ‘critical theory’ is a product of the New York period of the Institute. The term was not utilized at all in Frankfurt, and was first coined in the United States in essays written by Horkheimer and Marcuse ([1937]1968b). Marcuse developed a remarkable series of books, each an English-language original, that represented to the world the Frankfurt School’s critical social theory: *Reason and Revolution* (1960), *Eros and Civilization* (1966), *One-Dimensional Man* (1964), *An Essay on Liberation* (1969a), and *Counterrevolution and Revolt* (1972). Critical theory for Marcuse was more than an Aesopian substitute for Marxism. He sought to raise the philosophy of Marx to its highest level (Jay, 1973; Kellner 2005, 1984).

### REASON AND REVOLUTION (1941)

*Reason and Revolution*, Marcuse’s second Hegel book, centers on the need for a transformed revolutionary philosophy. Much of the substance of *Hegel’s Ontology* was incorporated into its first sections. In both books, Marcuse highlights the convergence of Hegel’s early writings on the ontological concept of ‘life’ with the more mature Hegelian concept of mind (*Geist*). In the former, a turning inward of the mind (*Er-innerung*) is counterposed to a loss of mind in external phenomena of alienation (*Ent-fremdung*). In the latter, inwardness and introspection are thought to provide a key intellectual warrant for the ‘revolution’. *Hegel’s Ontology* had concluded with a section explicitly on Dilthey’s theory of the humanities and social sciences, the study of which is required to grasp the meaning of being. *Reason and Revolution* was to think in a new way about the ‘and’ in ‘reason and revolution’ and transform Marx’s primarily *economic* theory of the material human

condition into Marcuse's culturally broadened critical theory. 'An *immediate* unity of reason and reality never exists. ... As long as there is any gap between the real and the potential, the former must be acted upon and changed until it is brought into line with reason' (Marcuse, 1960: 11; see also Anderson and Rockwell, 2012).

### THE FRANKFURT SCHOOL IN WASHINGTON (1942–51)

By the time of the publication of *Reason and Revolution*, the Institute's self-funded budget was stretched, and Horkheimer encouraged Marcuse to find additional employment and reduce his reliance on Institute resources. Horkheimer lowered Marcuse's salary in 1941 as a means of pressuring him into finding other sources of income and ultimately into separating himself monetarily from the Institute and its foundation, while continuing to identify intellectually with it (Wiggershaus, 1988: 295, 331–2, 338). Thus Marcuse took a position with the research branch of the Office of Strategic Services during World War II doing assiduous intellectual work against fascism. Archived projects from this period like 'The New German Mentality', 'State and Individual Under National Socialism', and 'German Social Stratification' have been published (Laudani, 2013; Kellner, 1998; Jansen, 1998), and they are treated at length in Müller (2010). Following the war, Marcuse continued to do research with the US State Department on the new Soviet adversary.

### BRANDEIS UNIVERSITY, EROS AND CIVILIZATION (1955)

From 1954 to 1965, Marcuse taught at Brandeis University, where he published *Eros and Civilization*. This took up the

dialectical frame of mind elucidated in *Reason and Revolution* in combination with the Left Freudian pursuit of a more humane society in which the social and psychological necessities of life and their fulfillment could coincide. In this work, Marcuse explores Freud's metapsychology and the relationship between life instincts (Eros) and death instincts (Thanatos). Marcuse contends that life regulated by capitalism's *performance principle* engenders surplus or needless alienation. He contends that an alternative logic of gratification needs to supplant the logic of domination. The pleasure principle is thought to persist as a sub-conscious memory of past states of fulfillment and joy, which also belong essentially to the worlds of art and literature. Marcuse argues for the economic obsolescence of scarcity and the political obsolescence of domination, such that societal suffering could be replaced by the general societal satisfaction of human needs. Elaborating Schiller's *Letters on Aesthetic Education*, he propounds a militant aesthetic humanism to advance against alienation.

### SOVIET MARXISM (1958)

Columbia University's Russian Institute (1952) and Harvard's Russian Institute (1954–5) supported the research and subsequent publication of Marcuse's study *Soviet Marxism (SM)* in 1958 (Marcuse, 1961). This depicted Soviet philosophy and politics as expressions of an untenable bureaucratism, technological rationality, aesthetic realism, etc. In this project, Marcuse did something quite unique and unexpected, which set him apart from Cold War-fueled political writing at the time: having sharply and objectively criticized culture and politics in the Soviet Union, he fearlessly risked censure in the United States by explaining that both the Soviet and Western forms of political rationality had in common the prevalence of

technical over humanistic elements in the development of the relations and forces of production. Marcuse did not back away from profound criticisms of US culture in *SM* that in 1958 might have led him to be branded as 'anti-American'. This was a major departure from the much more cautious politics of the Horkheimer inner circle as well as from the conventional wisdom in the US academic sphere. Marcuse felt confident enough to develop a clearly dialectical perspective, and in this manner *SM* was crucial in the development of his critical theory. With the 1964 publication of *One-Dimensional Man (ODM)*, Marcuse consolidated his key and most characteristic arguments to the effect that US society and culture were, likewise like the Soviet Union's, politically and economically unfree.

## ONE-DIMENSIONAL MAN (1964)

*ODM* addressed the problems of alienation and social control and the closed universe of discourse and thought in advanced industrial societies. It continues to be his most influential work (Maley, 2017; Lamas, 2016; *Radical Philosophy Review*, 2016; Sethness, 2015).

In this way, 'one-dimensionality' updates the Marxist analysis of alienation. Marcuse believed alienation theory required revision because advanced capitalism had become a society of plenty rather than scarcity and because the condition of the working class had fundamentally altered. *ODM* is centrally concerned with the new aspects of alienation resulting from the increasingly sophisticated exercise of the social-control apparatus of corporate capitalism. According to its famous first sentence: 'A comfortable, smooth, reasonable, democratic unfreedom prevails in advanced industrial civilization, a token of technical progress' (Marcuse, 1964: 1).

Marcuse argues that alienation consists in the total absorption of the personality into the processes and systems of capitalist

commodity production. This gives rise to a new kind of totalitarianism, unlike that formerly characteristic of fascist societies.

By virtue of the way it has organized its technological base, contemporary industrial society tends to be totalitarian. For 'totalitarian' is not only a terroristic political coordination of society, but also a non-terroristic political coordination which operates through the manipulation of needs by vested interests. It thus precludes the emergence of an effective opposition against the whole. Not only a specific form of government or party rule makes for totalitarianism, but also a specific system of production and distribution which may well be compatible with a 'pluralism' of parties, newspapers, 'countervailing powers', etc. (Marcuse, 1964: 3)

Thus emerges a pattern of one-dimensional thought and behavior in which ideas, aspirations and objectives that, by their content, transcend the established universe of discourse and action are either repelled or reduced to terms of this universe. (Marcuse, 1964: 12)

Marcuse is famous for his contention that labor, narcotized and anaesthetized by consumerism and in collusion with business priorities, lacks a critical appreciation of the potential of its own politics to transform the established order. 'Under the conditions of a rising standard of living, non-conformity with the system appears to be socially useless, and the more so when it entails tangible economic and political disadvantages and threatens the smooth operation of the whole' (Marcuse, 1964: 2).

We are socialized to 'submit to the peaceful production of the means of destruction, to the perfection of waste, to being educated for a defense which deforms the defenders and that which they defend' (Marcuse, 1964: ix). Thus the lack of resistance to the new and unfree social order of the working classes and others.

In *Eros and Civilization*, Marcuse had already specifically criticized schooling in advanced industrial societies, writing that 'the overpowering machine of education and entertainment... [unites us all]... in a state of anaesthesia' (Marcuse, 1966: 104).

More troubling still is the suppression of any vision of a genuinely democratic socialist society among intellectuals. ‘The intellectual and emotional refusal “to go along” appears neurotic and impotent’ (Marcuse, 1964: 9). Theory is rejected as foreign and useless:

The intellectual is called on the carpet. What do you mean when you say..? Don’t you conceal something? You talk a language which is suspect. You don’t talk like the rest of us, like the man on the street, but rather like a foreigner who does not belong here. (Marcuse, 1964: 192)

*ODM* thus began a vital new way of understanding the ideology of advanced industrial societies, building also on insights from Marcuse’s experience with, and critical study of, fascism in Germany. Marcuse had the civic courage to break through the paralysis of critique, and he had the philosophical means due to his association with the thought of the Frankfurt School, Marxism, and classical German philosophy. ‘The fact that the vast majority of the population accepts, and is made to accept, this society does not render it less irrational and less reprehensible’ (Marcuse, 1964: xiii). The critical Marxism of *ODM* sought to break through the ‘pre-established harmony between scholarship and the national purpose’ (Marcuse, 1964: 19).

### ***Technological Rationality and Reification***

The technological achievements of advanced industrial systems are what have led to the establishment of one-dimensional social realities and social philosophies from which all contradiction has been eliminated. ‘Technology has become the great vehicle of reification – reification in its most mature and effective form’ (Marcuse, 1964: 168). This reification is *the* philosophical phenomenon characteristic of the oppressive tendencies in advanced technological cultures, wherever practice and theory have forsaken the human dimension of experience and

reason in favor of a strictly instrumentalist or functionalist logic of discourse and action. Reason alienated in this manner may assume even the most inhuman tasks in the technological rationalization of methods of domination against society and nature. Andrew Feenberg argues that Marcuse’s critical theory ‘seized on Lukács’ concept of reification, which... became the basis of [his] critique of positivism and its dialectical reformulation of Marxist theory. ... [His] aim is the establishment of a dialectical paradigm of rationality suited to the task of social self-understanding and human liberation’ (Feenberg, 1981: xii–xiii; see also Feenberg, 1991 and 2014). The negation of advanced industrial society’s technological rationality becomes the revolutionary task of reason.

### ***‘Happy Consciousness’***

Marcuse understood as single-dimensional any perspective that is oblivious to the problematic nature of prevailing social and economic relations. One-dimensionality is the triumph of a ‘happy consciousness’ grounded in the suffocation and repression of life’s internal inconsistencies and contradictions. Cultural kitsch is, in contrast, grounded in the pleasant sanitization and repression of life’s internal inconsistencies and contradictions, since this facilitates adjustment and compliance to the established social order.

Critical intelligence must be more serious and sensitive to questions of complex causality and more skeptical of simplistic visions of the good life or good society. It must confront ‘the power of positive thinking’ (which he holds to be destructive of philosophy) with ‘the power of negative thinking’, which illumines ‘the facts’ in terms of the real possibilities which the facts deny. Critical intelligence, as he sees it, is thus essentially always multi-dimensional, dialectical, realistic, and normative, i.e. philosophical and generative of fuller cultural freedom.

It was Marcuse who identified the political tendencies of advanced industrial societies to manipulate and indoctrinate the public mind, and who challenged the 'total administration' (i.e. the closing) of the established cultural and political worlds. 'At nodal points of the universe of public discourse, self-validating, analytical propositions appear which function like magic-ritual formulas. Hammered and re-hammered into the recipient's mind, they produce the effect of enclosing it within the circle of the conditions prescribed by the formula' (Marcuse, 1964: 88). Today we might think of the familiar political phraseology of 'No Child Left Behind', 'Right to Work', 'Equal Opportunity Employer', 'Job Creators', etc. Marcuse castigated earlier forms of this one-dimensional thinking: 'The meaning is fixed, doctored, loaded' (Marcuse, 1964: 94).

### ***Repressive Desublimation***

*ODM* also introduces Marcuse's notion of repressive desublimation. Following a line of thinking from *Eros and Civilization*, he theorizes that the 'mobilization and administration of libido may account for much of the voluntary compliance... with the established society. Pleasure, thus adjusted, generates submission' (Marcuse, 1964: 75). He explains that society's control mechanisms become even more powerful when they integrate sexually suggestive and explicitly erotic and violent content into advertising and the mass media, and into the content of mass entertainment and popular culture. The unrestrained use of sex and violence by large-scale commercial interests accomplishes more effective social manipulation and control in the interest of capital accumulation than had repressive *sublimation*. Repressive desublimation substitutes reactionary emotional release in place of rebellion, and counterrevolutionary illusion in place of freedom.

As a critical philosophical work, *ODM* foregrounded and combated the empiricism,

behaviorism, and British and American perspectives on linguistic analysis that framed the ascendant functionalist schools of social and political thought. In England, Ernest Gellner (like Marcuse a Jewish intellectual in exile from Nazi Germany) confronted the linguistic philosophy of Ludwig Wittgenstein and Gilbert Ryle at Cambridge University in his book *Words and Things* (1959), which Marcuse (1964: 173) acknowledged in *ODM*. Gellner's book was supported by Bertrand Russell, and a huge row developed between Ryle and his defenders on the one side and Russell and Gellner on the other. This revealed the built-in theoretical blinders, silences, repressiveness, and false concreteness of our prevailing ways of thinking and acting (Marcuse 1969b).

It should be recalled that in the 1930s and 40s Marxism found a variety of viable oppositional forms in the United States – from the black Marxists W.E.B. DuBois and Eugene C. Holmes (Harris, 1983) to Upton Sinclair, Herbert Aptheker, and Barrows Dunham. The near-Marxist 'social reconstructionist' perspective in politics and education of George Counts, Merle Curti, and Theodore Brameld also thrived at Teachers' College, Columbia. By the 1950s and the Cold War, the situation had changed with the anti-communist mobilization in labor law (the Taft–Hartley Act of 1947) and in the culture at large (the blacklisting of the Hollywood Ten, Paul Robeson, and Pete Seeger, and the House Un-American Activities Committee (HUAC)). 'As late as 1959, the FBI's New York field office had only ten agents assigned to organized crime compared to over one hundred and forty agents pursuing a dwindling population of communists' (Hortis, quoted in Gladwell, 2014: 40). A US form of *Gleichschaltung* was coordinating US politics and culture with the general commodification and commercialization of social life. Wiggershaus (1988: 432) has emphasized that Horkheimer, especially, saw himself as a guest in the country and was sensitive about being seen as promoting 'unAmerican ideas'.

Horkheimer and Adorno would also see the US and German student movements as ‘anti-American’, and they were careful to distance themselves from activist students and from Marcuse. Marcuse was the subject of several FBI background investigations. The earliest was in 1943 in connection with his work for the Office of Strategic Services (OSS). A second wave of inquiries, with regard to his loyalty to the United States during his 1950s employment by the State Department, discloses that the FBI consulted with the HUAC concerning his case. During the 1960s, he was also under surveillance in connection with his ties to the New Left and international student movements (Gennaro and Kellner, 2009).

### ***Challenging Euro-centrism, Antisemitism, Racist Anglo-conformity***

The Frankfurt School’s critical theory is sometimes criticized as having a narrowly Eurocentric focus (Outlaw, 2013; Gandler, 1999). *ODM* widened the cultural perspective through Marcuse’s effort to deepen intellectually certain broadly critical projects already underway in the United States: the demystification of the vaunted myths of affluence and melting-pot assimilation in American life (Gordon, 1964). Marcuse understood the reigning Anglo-conformity and WASP patriotism and militarism in the United States as well as its economic instrumentalism as single-dimensional insofar as they were oblivious to the problematic nature of prevailing social and economic relations. If abundance for all was a capacity of advanced industrial society, this was effectively canceled by the forces of capitalism, while affluence for some was the privilege of the propertied. ‘In the contemporary era, the conquest of scarcity is still confined to small areas of advanced industrial society. Their prosperity covers up the Inferno inside and outside their borders’ (Marcuse, 1964: 241;

see also 1968c). Marcuse understood the limits of liberal democracy (Farr, 2009: 119–36) and how the notion of the ‘affluent society’ actually masked a gravely unequal, patriarchal, and monocultural form of domination. Of course, the conventional wisdom within the nation itself was largely oblivious to its own racism and other forms of prejudice. In many ways, it continues to be.

From 1944 to 1950, Horkheimer and Adorno, working with the American Jewish Committee, published a five-volume series, *Studies in Prejudice*. The fifth volume, *Prophets of Deceit*, written by Leo Löwenthal and Norbert Guterman, was furnished with a foreword by Herbert Marcuse when it was reissued in paperback in 1970. Marcuse stresses that any mobilization of bias must be understood concretely within the social context of contradictory economic and political conditions (Jansen, 2013).

The year 1963, just before *ODM*’s publication, marked the culmination of the US civil rights movement with its black-led (i.e. SCLC, CORE, and SNCC) bus boycotts, lunch-counter sit-ins, freedom rides, voter-registration campaigns, and the March on Washington. These anti-racism efforts also involved the support of many radical and progressive whites, especially students. Marcuse would make an explicit contribution to the movement against racism with the 1965 publication of his critique of pure tolerance, ‘Repressive Tolerance’ (Marcuse, 1965), an essay still contributing to the ferment surrounding issues of institutional racism, especially when hate speech is seen as officially, absolutely, and ‘purely’ tolerated as free speech under the First Amendment.

In 1964, in *ODM*, given the background of recent and high-profile lynchings, bombings, and murders of blacks in the United States (Emmett Till; Medgar Evers; the four girls in Birmingham’s 16th Street Baptist church), Marcuse wrote: ‘Those whose life is the hell of the Affluent Society are kept in line by a brutality which revives medieval and early modern practices’ (Marcuse,

1964: 23). As Nina Simone was singing 'Mississippi Goddamn' and castigating the 'United Snakes of America', ODM famously concluded:

underneath the conservative popular base is the substratum of the outcasts and outsiders, the exploited and persecuted of other races and other colors. ... Their opposition hits the system from without... it is an elementary force which violates the rules of the game. When they get together and go out into the streets, without arms, without protection, in order to ask for the most primitive civil rights, they know that they face dogs, stones, and bombs, jail, concentration camps, even death. ... The critical theory of society... wants to remain loyal to those who, without hope, have given and give their life to the Great Refusal. (Marcuse, 1964: 257)

In 1987, conservative culture warrior Allan Bloom's *The Closing of the American Mind* presented a bizarre attempt to turn the political tables and attack Marcuse's critical and cosmopolitan perspective. Bloom attributed a general decline in US culture to what he considered the illegitimate popularization of German philosophy in the United States in the 1960s, especially Nietzsche, Heidegger, and Marcuse. Bloom argued that US culture, entertainment, and education have imported 'a clothing of German fabrication for [our] souls, which... cast doubt on the Americanization of the world upon which we had embarked' (Bloom, 1987: 152).

## NO 'PURE TOLERANCE' OF HATE SPEECH (1965)

During the mid 1960s, Marcuse met Brandeis student Angela Davis and began an intellectual/political relationship that lasted well beyond her student years (Davis, 2004, 2013). He also published his anti-racist essay 'Repressive Tolerance' at that time and dedicated it to Brandeis students. Its insights are extremely pertinent today as we debate how to best protect human rights in an era of acrid

backlash against the multicultural education reform movement.

Given also the heightened awareness of the regularity of police killings of unarmed black men in the United States after incidents such as Ferguson, Baltimore, Cleveland, New York City, and elsewhere, Marcuse's condemnation of the violence of repression demands renewed attention. In 1965, Marcuse condemned the violence that actually prevails in the ostensibly peaceful centers of civilization: 'it is practiced by the police, in the prisons and the mental institutions, in the fight against racial minorities. ... This violence indeed breeds violence' (Marcuse, 1965: 105).

Neither a relativist nor a pragmatist, Marcuse did not tolerate all views as equally valid or invalid. Far from it: 'This pure tolerance of sense and nonsense' (Marcuse 1965: 94) practiced under the conditions prevailing in the United States today is contemptible and repressive inasmuch as it 'cannot fulfill the civilizing function attributed to it by the liberal protagonists of democracy, namely protection of dissent' (Marcuse, 1965: 117). As Marcuse recognized:

the conditions of 'tolerance' are loaded... the active, official tolerance granted to the Right as well as to the Left, to movements of aggression as well as to movements of peace, to the party of hate as well as humanity. I call this non-partisan tolerance 'abstract' or 'pure' inasmuch as it refrains from taking sides – but in doing so it actually protects the already established machinery of discrimination. (Marcuse, 1965: 84–5)

When tolerance mainly serves the protection and preservation of a repressive society, when it serves to neutralize opposition... then tolerance has been perverted. (Marcuse, 1965: 111)

This critical refusal to tolerate abusive speech/action constitutes one of the most timely aspects of Marcuse's critique today. One key premise of the free-speech hardliners is their contention that democratic institutions must maintain deference toward, and an absolute tolerance of, abusive and even assaultive speech – as protected forms of

dissent. The New Right is now using '[t]he charge of imperiling free speech... to silence oppressed and marginalized groups and to push back against their interests' (Stanley, 2016). Marcuse's partisanship is clear:

The small and powerless minorities which struggle against the false consciousness and its beneficiaries must be helped: their continued existence is more important than the preservation of abused rights and liberties which grant constitutional powers to those who oppress these minorities. (Marcuse, 1965: 110)

Right-wing writers like Kors and Silverglate (1998) assert that Marcuse's theory of repressive tolerance is the intellectual progenitor of what they deplore as the contemporary tendency toward political correctness in higher education today. In sharp contrast to this reactionary approach, a strategy for the defense of minority civil rights and solidarity with subaltern victims of hate speech has been developed by authors like Calderón (2009), Sleeter and Bernal (2003), Delgado and Stefancic (1997), Matsuda et al. (1993), and Wilson (1995). These proponents of critical race theory argue that freedom of speech is not absolute and must be viewed in the context of its real political consequences. 'The reality of ongoing racism and exclusion is erased and bigotry is redefined. ... The powerful anti-racists have [purportedly] captured the state and will use it to oppress the powerless racists' (Matsuda et al., 1993: 135).

Conservative reform approaches to the humanities and a liberal-arts education traditionally see them as serving universal aims and goals but fail to acknowledge that a discriminatory politics of race, gender, and class has distorted not only the curriculum but also patterns of faculty hiring and student recruitment and support. As Marcuse knew, this is doubly ironic because the liberation movements which resisted each of these forms of political oppression were inspired primarily not by a politics of difference and special interests but rather an intercultural politics of solidarity and hope for human rights

*universally* (Fuchs, 2005: 107–8). In his essay 'Marxism and Feminism', for example, he writes: 'There can be discrimination against women even under socialism. ... But the very goals of this [feminist] movement require changes of such enormity in the material as well as intellectual culture that they can be attained only by a change in the entire social system' (Marcuse, 2005b: 166).

## ART IN THE ONE-DIMENSIONAL SOCIETY (1967)

Marcuse lectured at the School of Visual Arts in New York City in March of 1967 on 'Art in the One-Dimensional Society'. He held that art provided a definite negation to the social status quo in that it remained committed to an instinctually fulfilling and emotionally gratifying socioeconomic order.

If we can do everything with nature and society, if we can do everything with man and things – why can one not make them the subject-object in a pacified world, in a non-aggressive, aesthetic environment. The know-how is there. The instruments and materials are there for the construction of such an environment, social and natural. ... for the creation of the beautiful not as ornaments, not as surface of the ugly, not as museum piece, but as expression and objective of a new type of man; as biological need in a new system of life. (Marcuse, 1973: 65)

Marcuse argued for the redirection of the course of technological progress and for the subordination of scientific-technical goals to the fulfillment of the mature, material, sensual, and aesthetic needs of the human race. 'Not political art, not politics as art, but art as the architecture of a free society' (Marcuse, 1973: 65–6). Art acts against alienation and dehumanization; aesthetic activity is a starting point for the rehumanization of history. This is a strong statement of the interventionist mission of the artist to transform society. Of course, 'The rest is not up to the artist. The realization, the real change which would free men and things, remains the task of political action' (Marcuse, 1973: 67).

## DEMONSTRATION, CONFRONTATION, REBELLION (1969)

What the aesthetic dimension *does* offer is a *new sensibility* (Marcuse, 1969a: 23), an insight into an *aesthetic ethos* (Marcuse, 1969a: 24) that subverts the existing one-dimensional order. The aesthetic reality recovers a sense of the human species' essence in its universal aspects. 'The universal comprehends in one idea the possibilities which are realized, and at the same time arrested, in reality' (Marcuse, 1964: 210). The concrete and critical dimension of art discloses the inevitably conflicted condition of human culture. The aesthetic ethos restores humanity's most rational enterprise: seeking the convergence of gratification and universal human need, society and human dignity, art and politics: 'the development of the productive forces renders possible the material fulfillment of the *promesse du bonheur* expressed in art; political action – the revolution – is to translate this possibility into reality' (Marcuse, 1961: 115). This is the promise of bliss, good fortune, genuine civic satisfaction, and success in life. Yet art unites the opposites of gratification and pain, death and love, freedom and repression. Only because of this can art seriously represent what Marcuse takes to be the conflicted, tragic, and paradoxical substance of human life.

*An Essay on Liberation* (1969a) is Marcuse's most militant and hopeful work. It is a scorching attack on the culture of corporate capitalism and the destructiveness of imperialist aggression:

This society is obscene in producing and indecently exposing a stifling abundance of wares while depriving its victims abroad of the necessities of life; obscene in stuffing itself and its garbage cans while poisoning and burning the scarce food-stuffs in the fields of its aggression; obscene in the words and smiles of its politicians and entertainers; its prayers, in its ignorance, and in the wisdom of its kept intellectuals. (Marcuse, 1969a: 7–8)

Marcuse dedicated the book to the protesters who took to the streets of Paris in May and

June 1968. He emphasized the need for a 'radical change in consciousness' (Marcuse, 1969a: 53) as a prerequisite to emancipatory social activity:

Historically, it is again a period of enlightenment prior to material change – a period of education, but education which turns into praxis: demonstration, confrontation, rebellion. (Marcuse, 1969a: 53)

Economic processes today divest us of our own creative work, yet these also form the sources of our future social power. A comprehensive critical social theory must stress the centrality of labor in the economy. It must theorize the origins and outcomes of economic and cultural oppression and be engaged politically by the labor force to end these abuses. Within this context, Marcuse also theorizes the 'aesthetic ethos of socialism' (Marcuse, 1969a: 48):

Released from the bondage to exploitation, the imagination, sustained by the achievements of science, could turn its productive power to the radical reconstruction of experience... the aesthetic... would find expression in the transformation of the *Lebenswelt* – society as a work of art. (Marcuse, 1969a: 45)

Marcuse's aesthetic ethos was to function also as a '*gesellschaftliche Produktivkraft*' a social and productive force (Marcuse, 1969a: 126). Marx's 1844 *Paris Manuscripts* poignantly highlighted that human beings also produce in accordance with the laws of beauty, and Marcuse would likewise stress that: 'The socialist universe is also a moral and aesthetic universe: dialectical materialism contains idealism as an element of theory and practice' (Marcuse, 1972: 3).

## COUNTERREVOLUTION AND REVOLT (1972)

Global economic polarization and growing immiseration have brought to an end the 'comfortable, smooth, democratic unfreedom' that Marcuse theorized. Neoliberalism

replaced it with something more openly vicious.

Marcuse warned 40 years ago of the economic and cultural developments that are now much more obvious given capitalism's crescendo of economic failures since 2008. Political and philosophical tendencies that are often referred to as 'neoliberalism' and/or 'neoconservatism' today were clearly understood back then as *organized counter-revolution* (Marcuse, 1972). This political development was a pre-emptive strike undertaken by an increasingly predatory capitalism against liberal democratic change, not to mention the radical opposition (Marcuse, 1987a: 172).

The Western world has reached a new stage of development: now, the defense of the capitalist system requires the organization of counterrevolution at home and abroad. ... Torture has become a normal instrument of 'interrogation' around the world. ... even Liberals are not safe if they appear as too liberal. (Marcuse, 1972: 1)

The news media recently brought us almost daily disclosures about the US military's use of torture and prisoner abuse (Abu Ghraib, Guantánamo), civilian massacres and war crimes (Fallujah, Haditha), and the loaded intelligence that the US Defense Department desired as a pretext for the invasion and occupation of Iraq. Today, the pre-emptive counterrevolution entails the police-state USA Patriot Act, global Terror Wars, a 'money-is-speech' Supreme Court, and intensifying political-economic inequalities (Kellner, 2003, 2012).

## TRANSVALUATION OF VALUES AND THE RADICAL GOALS OF SOCIALISM (1972–4)

New Left radicals were conscious of the economy's potential to eliminate want and misery, and they had a new emphasis on quality of life, not just a secure subsistence. Marcuse prized this 'emergence in the

individual of needs and satisfactions which can no longer be fulfilled within the framework of the capitalist system, although they were generated by the capitalist system itself' (Marcuse, 2015a: 53). These included the struggle for the restoration of nature, women's equality, racial equality, and reduction in profitable waste.

[W]hat is at stake in the socialist revolution is not merely the extension of satisfaction within the existing universe of needs, nor the shift of satisfaction from one (lower) level to a higher one, but the rupture with this universe, the *qualitative leap*. The revolution involves a radical transformation of the needs and aspirations themselves, cultural as well as material; of consciousness and sensibility; of the work process as well as leisure. (Marcuse, 1972: 16–17)

This New Left was *radical* because it represented the Great Refusal and because it projected the potentialities in the objective conditions; it anticipated possibilities not yet realized:

The inner dynamic of capitalism changes, with the changes in its structure, the pattern of revolution: far from reducing, it extends the potential mass base for revolution, and it necessitates the revival of the radical rather than minimum goals of socialism. (Marcuse, 1972: 5)

Socialism is a philosophy of authentic human existence and the fulfillment of both human needs and the political promise of our human nature, where creative freedom provides the foundation for satisfaction in all of our works. For a start, human emancipation requires the decommodification of certain economic minimums: healthcare, childcare, education, food, transportation, housing, and work, through a guaranteed income. These are *transitional* goals. *Revolutionary* goals envisage a more encompassing view of liberation and human flourishing flowing from a transvaluation of values.

In a 1968 lecture on education at Brooklyn College, Marcuse (2009) taught on this transvaluation:

[It is] no longer sufficient to educate individuals to perform more or less happily the functions they are supposed to perform *in this* society or extend

'vocational' education to the 'masses.' Rather... [we must]... educate men and women who are incapable of tolerating what is going on, who have really learned what *is* going on, has always been going on, and why, and who are educated to resist and to fight for a new way of life. (Marcuse, 2009: 35)

Teachers and students in the liberal arts and sciences were admonished to be critically engaged with the materials under study, to '*become partisan*' that is, *against* oppression, moronization, brutalization' (Marcuse, 2009: 38) and *for* the better future condition of the human race, as Marcuse characterized the Enlightenment goal of Kant's educational philosophy (Marcuse, 1972: 27).

## GLOBAL CAPITALISM AND THE RADICAL OPPOSITION (1974–5)

Marcuse's recently discovered *Paris Lectures at Vincennes University* (2015a) possess an uncanny applicability today. Given the crisis of global finance capital, higher education must encourage students and faculty alike to examine the conditions that serve to perpetuate the increasingly volatile realities of political, economic, and cultural life in the United States and the militarized processes of US-led global polarization. Marcuse's analysis discerns a dialectic of *ripening and rotting*:

I suggest to analyze this problem in the classical Marxian terms, namely, that the very forces which make for the preservation and for the growth of the capitalist system are also the forces which make for its decline and eventual collapse. This is the classical dialectical conception, and I've found that it is the only one that gives, or may give us, an adequate understanding of what is going on. (Marcuse, 2015a: 37)

US society represents the 'highest stage in the development of monopoly capitalism' (Marcuse, 2015a: 21): the US is exporting *production itself* from the metropolitan countries to other capitalist and pre-capitalist countries with lower production costs. There is a fusion of *political, economic, and*

*military power* in which the representatives of particular corporate interests lead the government. The population, generally managed without overt force through advanced forms of political-economic manipulation, is controlled through *the systematic increase in the power of the police*. Enforcement keeps itself within the framework, although reduced framework, of the patterns of unfreedom that pass for American democracy. Further, 'You know too well, I suppose, the progress which by virtue of the electronic industry has been made in surveilling an entire population secretly, if desired' (Marcuse, 2015a: 23). These points are quite prescient, given, as mentioned earlier, our new awareness of the regularity of police killings of unarmed black men and of Edward Snowden's revelations.

These lectures valorize a classical Marxian view of political economy. Today this has won wide acceptance among a range of anti-globalization activists and in the more radical circles of the Occupy movement and Black Lives Matter. Marcuse's comprehensive view of the Left sees in it: 'the opposition in the labor movements, the opposition among the intelligentsia, and the opposition in the women's liberation movement. They all have one thing in common, namely... new motives for revolution, new needs for revolution, and new goals for revolution' (Marcuse, 2015a: 53–4). He argues that abundance and peace, as revolutionary goals, are attainable and realistic.

The key question he poses is whether oppositional forces are gaining power. Increasing numbers of individuals are no longer adhering to the operational values that essentially help keep the system going. Prospects for radical change and the 'possible advent of a free socialist society' are warranted expectations (Marcuse, 2015a: 69).

Marcuse warned against the theory that 'knowledge workers' were becoming a new class. While knowledge was becoming a decisive productive force, 'the application of knowledge in the process of production remains dependent on the actually ruling

class' (Marcuse, 2015a: 15). In contrast, he thought the women's liberation movement was key to the transformation of civilization's traditionally patriarchal values, and central to the 'new goals and possibilities of the revolution' (Marcuse, 2015a: 60; 2005b).

Consistent with these lectures, a 1975 type-script, 'Why Talk on Socialism?', maintains:

capitalism destroys itself as it progresses! Therefore no reforms make sense. The notion that the society, as a *whole* is sick, destructive, is hopelessly outdated, has found *popular expression*: 'loss of faith' in the system; decline in the work ethic, refusal to work, etc. (Marcuse, 2015b: 304)

The general form of the internal contradictions of capitalism has *never been more blatant*, more cruel, more costly of human lives and happiness. And – this is the *significance of the Sixties* – this blatant irrationality has not only penetrated the consciousness of a large part of the population, it has also caused, mainly among the young people, a radical *transformation of needs and values* which may prove to be *incompatible* with the capitalist system, its hierarchy, priorities, morality, symbols (the counter-culture, ecology). ... The very achievements of capitalism have brought about its obsolescence *and* the possibility of *the alternative!* (Marcuse, 2015b: 307)

In the last publication of his lifetime, 'The Reification of the Proletariat', Marcuse announced a valorization and vindication of the proletariat: 'Can there still be any mystification of who is governing and in whose interests, of what is the base of their power?' (Marcuse, 1979: 23).

## THE AESTHETIC DIMENSION (1977–8)

Near the end of his life, Marcuse reconsidered the emancipatory potential of great art. His final book, *Die Permanenz der Kunst* – originally published in 1977, and in English as *The Aesthetic Dimension* (1978a) – moves away from the radical notion of the aesthetic as *gesellschaftliche Produktivkraft*. Great art is revolutionary instead because it is 'an indictment of the established reality [and] the

appearance of the image of liberation' (Marcuse, 1978a: xi). '[T]he world formed by art is recognized as a reality which is suppressed and distorted in the given reality' (Marcuse, 1978a: 6). The *aesthetic form*, as such, invalidates an oppressive society's dominant norms, needs, and values:

The aesthetic transformation is achieved through a reshaping of language, perception, and understanding so that they reveal the essence of reality in its appearance: the repressed potentialities of man and nature. The work of art thus re-presents reality while accusing it. (Marcuse, 1978a: 8)

Great works of art disclose life's dialectical permanencies and universals and are always and permanently a manifestation of the struggle for liberation (Tauber, 2015). The aesthetic form preserves the unchanging internal conflicts of human life, spanning the contradictions between illusion and reality, falsehood and truth, joy and death. This inner aesthetic dimension involves a sensitivity to the 'inexorable entanglement of joy and sorrow, celebration and despair, Eros and Thanatos' (Marcuse, 1978a: 16). These contradictory forces constitute reality 'for every human being' (Marcuse, 1978a: 6). The sensuous power of beauty imaginatively subordinates death and destructiveness to non-aggressive life instincts and heralds a logic of gratification that is required precisely because of its societal absence.

Where art is estranging and transcendent its ambivalence may be taken as escapism, yet it retains its power of opposition (Guadalupe Silveira, 2010). Critique and protest are inherent in the separation of art from life:

If art were to promise that at the end good would triumph over evil, such a promise would be refuted by the historical truth. In reality it is evil which triumphs, and there are only islands of good where one can find refuge for a brief time. Authentic works of art are aware of this: they reject the promise made too easily; they refuse the unburdened happy end. (Marcuse, 1978a: 47)

Art's critical task is the disclosure of the tragical-beautiful paradox in life, and this is the hallmark of its truth.

## ECOLOGY AND THE CRITIQUE OF MODERN SOCIETY (1979)

It is not aestheticism but a militant defense of the earth and its people that occupied much of Marcuse's final year of life. See his essay 'Ecology and the Critique of Modern Society' (Marcuse, 2011; Kellner and Pierce, 2011):

Under the conditions of advanced industrial society, satisfaction is always tied to destruction. The domination of nature is tied to the violation of nature. The search for new sources of energy is tied to the poisoning of the life environment. (Marcuse, 2011: 209)

Marcuse had written earlier of ecological ruin in 'Ecology and Revolution' (2005b). Given the general destructiveness of modern society, Marcuse recognizes the need for a reconciliation of alienated humanity with the natural world, a pacification of the struggle for existence. This requires a change in the conditioned needs of individuals – away from that generated by the mechanism of repressive desublimation, which promises compensatory satisfactions for a totally commercialized and commodified life – toward new sensibilities. The existing structure of needs is being subverted:

[Changed] needs are present, here and now. They permeate the lives of individuals. ... First the need for drastically reducing socially necessary alienated labor and replacing it with creative work. Second, the need for autonomous free time instead of directed leisure. Third, the need for an end of role playing. Fourth, the need for receptivity, tranquility and abounding joy, instead of the constant noise of production. ... The specter which haunts advanced industrial society today is the obsolescence of full-time alienation. (Marcuse, 2011: 211)

'Marcuse rooted his philosophy in the early Marx's philosophical naturalism and humanism' – and 'the struggle for a society without violence, destruction, and pollution

was part of Marcuse's vision of liberation' (Kellner, 2011: 217, 219).

## MARCUSE'S CHALLENGE TO EDUCATION

Marcuse's social philosophy and aesthetic philosophy have become quite widely known (Miles, 2012), his work on ecology and women's liberation less so. His philosophy of education deserves much wider recognition. Recent contributions include the booklet by Kellner, Lewis, and Pierce, *On Marcuse: Critique, Liberation, and Reschooling in the Radical Pedagogy of Herbert Marcuse* (2009); the essay collection *Marcuse's Challenge to Education* (edited by Kellner, Cho, Lewis, and Pierce, 2009); works by Arnold Farr (2015) and Reitz (2016a, 2016b, 2015, 2009a, 2009b, 2000).

Marcuse's critical theory has led to a recovery of the emancipatory dimension of philosophy in key sectors of the humanities and social sciences. A 'Legacy of Herbert Marcuse' conference was held at UC Berkeley in 1998, and the contributions published (Abromeit and Cobb, 2004) offer a rich context of critical scholarship. The International Herbert Marcuse Society, founded in 2005, conducts bi-annual conferences attracting theorists and activists from the United States, Canada, Europe, Mexico, and Brazil ([marcusesociety.org](http://marcusesociety.org)). A substantial online resource – 'Herbert Marcuse Official Homepage' (<http://marcuse.org/herbert/index.html>) – is maintained by Marcuse's grandson, Harold Marcuse. *The Radical Philosophy Review* (2013, 2016) has published two double issues devoted to new Marcuse studies, of which the general editor maintains: 'The revival of interest in Marcuse's work in recent years is occurring amidst a resurgence of radical politics and radical theory testifies to its continuing relevance for conceptualizing and challenging the forces of oppression and domination' (Lamas, 2016: 2). Marcuse's critical theorizing continues to rouse political ingenuity and

action to advance materially toward humanity's non-alienated character, conscience, and culture.

# Theodor W. Adorno and Negative Dialectics

Nico Bobka and Dirk Braunstein  
Translated by Cat Moir

Theodor Ludwig Wiesengrund was born in Frankfurt am Main on September 11, 1903. He was the only child of assimilated Jewish wine merchant Oscar Alexander Wiesengrund (1870–1946) and the Catholic singer Maria, born Calvelli-Adorno (1865–1952). When later, in exile, he obtained American citizenship, Theodor took his mother's maiden name, 'Adorno', as his own last name. Adorno grew up well looked after in his educated middle-class home, and developed an almost limitless passion for music under the influence of his mother and her sister Agathe Calvelli-Adorno (1868–1935), who lived with the Wiesengrunds. In his early childhood, Adorno received piano lessons; later he would learn composition and begin to write his own music. In the 1920s, he published several pieces of music criticism under the pseudonym Hector Rottweiler in Vienna. Into the 1960s he was a guest lecturer at the 'summer courses for new international music' in Kranichstein near Darmstadt.

In 1925, Adorno left his hometown to study composition with Alban Berg in Vienna. However, he immersed himself not only in music but also in philosophy, and Berg expressed the view that Adorno would not be able to carry out the two pursuits concurrently forever. 'Because you're someone who is only interested in the whole (thank God!)', he said, 'one day you will have to decide for Kant *or* Beethoven'.<sup>1</sup> Adorno's professional path eventually led him to university, but he could not accept the alternative of philosophy and composition that Berg put forward. Although he became a philosopher and sociologist in post-Nazi Germany, categorization according to a division of labor between specialist academic disciplines never suited Adorno's approach, nor his diverse intellectual activities, which cut across traditional academic boundaries. Adorno considered the usual distinction between philosophy, sociology and aesthetics artificial. It expressed the need of a classificatory science for academic order; instead of giving itself over to objects

and pursuing the moments that indicate the unity of the object, it tears the object apart by whatever method is applied and it does so on the basis of questionable and externally imposed norms of scientific conduct. The 'question of all music', he writes in fragmentary notes about Beethoven, is 'how can a whole exist without doing violence to the individual part?'<sup>2</sup> – this question motivated not only Adorno's music theory but also his philosophy.

According to Adorno, the objective historical development of society tends towards a total system which imposes itself on people objectively, as a force that is independent of and indifferent to them and which reproduces itself through violence towards them. Adorno therefore understood the need to allow the sufferings that emerge from this repressive, formally abstract generality of objective force to speak as the condition of all truth. 'For suffering is objectivity that weighs upon the subject; its most subjective experience, its expression, is objectively conveyed'.<sup>3</sup> While music and non-conceptual language can help to express suffering, and promise the redemption of a non-violent whole more immediately, the philosophical concept must first be purged of its absolutization and self-limitation through insistent reflection and intellectual mediation. Common to true music and philosophy today, therefore, is the insight into the inaccessibility of any form of systematic thinking of the kind that reached its philosophical zenith in Hegel and its musical apogee in Beethoven. Once the harmonious unity of the real system has been exposed as an ideology, and its reproduction acknowledged as constituted by antagonism, music and philosophy are only possible as a negative system. Just as Adorno already called the Marxian system of the critique of political economy a 'negative or critical system',<sup>4</sup> truth can no longer be achieved as a self-enclosed whole but only as an 'anti-system' oriented towards openness,<sup>5</sup> which does not acquire its binding character from the

stringency of the systematic but rather from thinking in and through historically concrete constellations.

The world is systematized horror, but therefore it is to do the world too much honour to think of it entirely as a system; for its unifying principle is division, and it reconciles by asserting unimpaired the irreconcilability of the general and particular. Its essence is abomination; but its appearance, the lie by virtue of which it persists, is a stand-in for truth.<sup>6</sup>

This way of doing philosophy goes back to Adorno's youth. As a fourteen-year-old, he read Kant's *Critique of Pure Reason* together with Siegfried Kracauer (1889–1966), a highly formative experience, as he himself much later testified: 'I do not exaggerate in the least when I say that I owe to this reading more than to my academic teachers'.<sup>7</sup> Under Kracauer's guidance, Adorno learned to read the work of Kant not just in a specialized philosophical way as theory of knowledge but as 'a kind of coded writing out of which the historical conditions of the spirit could be read'.<sup>8</sup> Kracauer encouraged Adorno not to let himself be impressed by the unity and systematic univocality of the philosophical text but rather to seek 'the play of forces working together under the surface of every closed doctrine':

He enabled me to see the critique of reason not just as a system of transcendental idealism. Rather, he showed me how objective-ontological and subjective-idealistic moments battle within it; how the most eloquent passages in the work are its wounds that the conflict in the doctrine left behind. Under a certain aspect, the fractures in a philosophy are essential because of the continuity of the context of meaning, which most people emphasise on their own initiative.<sup>9</sup>

According to Adorno, philosophy is, after Hegel's definition, 'its own time captured in thought';<sup>10</sup> therefore the current state of the world can be reflected in historical consciousness. In codified philosophies, Kant's and those of the early twentieth century, both the unconscious inaccessibility of the philosophical system and the tendencies to decay

of the real are articulated; they are ultimately expressed in irredeemably ideological positions.

The idea of a logic of disintegration, Adorno recalled decades later in a note to *Negative Dialectics*, is his oldest philosophical conception and goes back to his days as a student. The experience of the First World War, the failed revolutions of the postwar years and the experience of the failure of culture are articulated in it. Suitably impressed by Walter Benjamin's (1892–1940) theses on the philosophy of history, in the early 1940s Adorno discussed them in a letter to Max Horkheimer (1895–1973). None of Benjamin's work showed him 'closer to our own intentions', and there could be no doubt about the 'great pull of the whole'.<sup>11</sup> Adorno makes Benjamin's position on culture, that 'there is no document of civilisation which is not at the same time a document of barbarism', his own.<sup>12</sup> Benjamin's idea of culture as barbarism coincides almost literally with one of the last formulations of an essay of Adorno's about the cultural pessimist Oswald Spengler, who from on high both longed for and defamed the *Decline of the West*. It is not sufficient, Adorno writes, to defame barbarism and rely on the health of culture: 'Rather, the element of barbarism in culture must itself be penetrated. Only such thoughts have a chance to survive Spengler's verdict, which challenge the idea of culture no less than the reality of barbarism'. Compared to the fatal entanglement of culture and barbarism, according to Adorno, the refuge of the better is alone the termination of any allegiance to this life, this culture, its brutality and grandeur:

The powerless, according to Spengler's command cast aside by history and destroyed, incarnate negatively in the negativity of this culture, that which promises, however weakly, to break its diktat and put an end to the horrors of history. The only hope lies in their opposition, may fate and power not have the last word. Against the decline of the West stands not culture resurrected, but the utopia that resides decisively within the image of what declines, questioning wordlessly.<sup>13</sup>

Adorno published the first of his reflections diagnosing the ills of his age while still a high-school student. In the 'Frankfurt School Newspaper', for example, which Adorno co-edited, he wrote an essay in 1919 on the psychology of the relationship between teachers and students and analyzed this in view of the 'will to renewal, which has an effect in our time in all forms, in the most extreme phenomena' and '[seeks] the basics in the need of the present, and [finds] ultimate questions behind every slogan'. Behind the contemporary, sometimes superficial talk of materialism, Adorno identifies a 'longing for ultimate liberation' and is thrilled that 'perhaps what is truly great in our time' is that

we have again learned to argue an idea, that is what our time has in common with the greatest epochs of world history. Without a doubt, a time in which people fight for the sake of their belief, without any external thoughts of power, with actions, even up to the horrific destruction of the personality of the other, represents a vast improvement over one in which cowardly and self-satisfied tolerance bypass one another intellectually and ultimately the deepest questions of our lives face indifference.<sup>14</sup>

Nevertheless, he confesses to 'eschew[ing] the dogmatic'<sup>15</sup> and regrets that the questions that generally excite our tempers and contemporary debate, as well as the ideas at work in them, 'are often identified with party political goals' and are 'degraded to points on a programme'.<sup>16</sup>

While Adorno was still at high school he began a close friendship with Leo Löwenthal (1900–93), who, along with Kracauer, introduced him to the avant-garde, intellectual milieu of Frankfurt, which gathered not least around the *Jüdische Volkshochschule*, founded in 1920 – later the *Freies Jüdisches Lehrhaus* – as well as the Institute for Social Research, founded in 1923. The three friends flirted with the slogan of the 1920s, 'transcendental homelessness', which they appropriated from Georg Lukács' (1885–1971) *Theory of the Novel*, published in 1916. This

work, Löwenthal would later recall, 'was for us all a cult book, we knew it almost by heart'.<sup>17</sup>

In 1923, Adorno was introduced to Benjamin, through whom he also met Margarete 'Gretel' Karplus (1902–93), whom Adorno married in England in 1937; Gretel would make an immeasurable contribution not only to the genesis of his works but also to the preservation of his estate. After completing his school education in 1921, Adorno began studying philosophy, music theory, sociology and psychology at the University of Frankfurt. His teachers included the sociologist Franz Oppenheimer (1864–1943) and the philosopher Hans Cornelius (1863–1947). In 1924, the latter would examine Adorno's doctoral thesis on *The Transcendence of the Reified and Noematic in Husserl's Phenomenology*; his attempt in 1927 to habilitate under Cornelius with a study of *The Concept of the Unconscious in the Transcendental Theory of the Soul* was, however, unsuccessful – his teacher found the study too light and advised Adorno to withdraw it. He would finally habilitate after just over a year of intensive work on his study *Kierkegaard. Construction of the Aesthetic* in February 1931 under the Protestant theologian and Professor of Philosophy at the University of Frankfurt Paul Tillich (1886–1965).

The young *Privatdozent* Wiesengrund's teaching activity, following his inaugural lecture on *The Actuality of Philosophy*, did not last long. After the Nazis took power in January 1933, the Institute for Social Research was first searched on March 13, 1933 by the police then, on the orders of the secret state police (Gestapo), closed from May 26, based on a Law on the Confiscation of Communist Assets. The accusation: promoting 'subversive activities'.<sup>18</sup> Adorno, who at that time was not a permanent employee of the Institute, known pejoratively as the Castle of Marx, and by sympathizers as Café Marx, and who was also not politically active, could no longer give the lectures he had planned

for the summer semester; in September, the National Socialists officially revoked his authorization to teach.

In April 1934, Adorno moved to London and, in June, with the help of the Academic Assistance Council (AAC), he enrolled as an advanced student in philosophy at Merton College, Oxford. As far as the precarious circumstances of exile, worries about friends and family in Germany and uncertainty about his own future would allow, Adorno began to study Husserl's phenomenology intensively; in view of the context in which he studied academic philosophy in England, Adorno would later say of his Husserl studies: 'Here nobody understands them'.<sup>19</sup> At the same time, he assured Horkheimer,

I'm not getting myself into any academic shenanigans, as you have apparently suspected me to do; or do you think that despair about the situation has stupefied me so much that I'm considering adding a hundred-and-first to the hundred existing epistemological standpoints? In any case, the object of work is not at the front, but at the stage, I hope, that it will contribute something to the supplies.<sup>20</sup>

The study – later entered as the third chapter in the *Against Epistemology: A Metacritique* – was at first to be titled 'The Phenomenological Antinomies. Prolegomena to Dialectical Epistemology' and would attempt to 'push the inherent contradictions of the phenomenology up to the point of self-dissolution, thus as it were to thoroughly dialecticise the least dialectical of all philosophies (and nevertheless the most advanced bourgeois epistemology)'.<sup>21</sup> For all the relevance Adorno ascribed to the Husserl studies, he saw them above all as preparatory work for a future project that he wanted to tackle with Horkheimer. Meanwhile, he hoped that the studies would 'be of benefit as a real prolegomena to our actual and common theoretical task, namely the dialectical logic'.<sup>22</sup> The idea of collaborating on a book about dialectical logic is first mentioned in a letter of Adorno to Horkheimer in November 1934. He described the Husserl studies as 'a kind of

critical-dialectic prelude to a materialistic logic' and noted that 'the work thus stands in the closest connection with your own'.<sup>23</sup> Adorno declared: 'It is a very exciting task to strike the sparks of historical concretion out of philosophy just where it is at its most abstract, and of course it is a kind of test of the applicability of the dialectical materialist method; one that seems to me so far to succeed'.<sup>24</sup> Adorno leaves no doubt that he saw the materialist dialectic neither as a mere corrective to idealism, nor as its externally opposed antithesis, but rather as something to be developed only through immanent critique. The transition to the materialist dialectic consisted for Adorno only in the critical self-reflection on idealist philosophy, so that the former is mediated by the latter.

I believe I am able to say so much in any case: that it is not enough, materialistically to establish such and such structures in idealist thinking and thus to constitute more or less the plane of a materialist history of ideas, but that the problem can be solved only by entering into the substantive discussion and *immanent* resolution of idealist theses and developing the materialist theory in a binding way out of the criticism of idealism's errors, in the strictest sense. This is anyway what I imagine for our great work, and also a little for my current one, which tries everywhere to reach precisely the points at which one tips over into materialist dialectics.<sup>25</sup>

Adorno and Horkheimer discussed the planned book about dialectical logic frequently in the following years. From early 1938, they searched for a specific problem from which the materialist dialectic could be unfolded; they considered the concept of autonomy, the relationship between dialectics and totality, between dialectics and positivism, the critique of psychology and of psychologism, art, the theory of society and the relationship between the labor movement and culture. Their own position on the proletariat was for some time the most pressing problem that the staff of the Institute for Social Research had to clarify. Thus Adorno still stressed in 1936 'what seems to me to be the most important task of the Institute with

regard to the theory of dialectical materialism, namely a theoretical analysis of the current situation of the class struggle'.<sup>26</sup> Adorno actually provided such an analysis in 1942 under the title *Reflections on Class Theory*. The nine theses are however far more than that. Adorno stated that the immense pressure of rule would so dissociate the masses that the negative unity of oppression, through which workers in the nineteenth century first constituted themselves as a class, would be torn apart and that class rule was accordingly preparing itself to survive the anonymous, objective form of the class. As necessary as Adorno thought it was to consider the concept of class in such a way that it was both maintained and transformed, he also emphasized the historical-philosophical draw of Marxian class theory over a merely economic understanding. In his inaugural lecture of 1931 on 'The Actuality of Philosophy', Adorno stressed that 'the images of our life are still guaranteed through history alone';<sup>27</sup> in a lecture of 1957 on the *Introduction to the Philosophy of History* he still speaks of his 'attempt [...] to make philosophy of history in a radical sense the center of philosophy'.<sup>28</sup> Accordingly, Adorno insists in the *Reflections on Class Theory* that even if the concept of class was bound up with the emergence of the proletariat, Marx's theory that all previous history is one of class struggle extends it into prehistory and is therefore itself directed against prehistory: 'By exposing the historical necessity that brought capitalism into being, the critique of political economy is the critique of history as a whole'.<sup>29</sup> According to Adorno, Marx's observation that all history is one of class struggle, because history until today has always been the same, namely prehistory, constituted an instruction as to how to recognize history as such: 'From the most recent form of injustice, a steady light reflects back on history as a whole'.<sup>30</sup>

With the increasing radicalization of anti-semitism in Nazi Germany, however, the subject of a critical theory that takes seriously the idea of the temporal core of truth – a theory

that Adorno takes over from Benjamin – also shifts. Adorno confessed in a letter from the summer of 1940:

Gradually, and under the influence of the latest news from Germany, I am unable to free myself at all from thoughts of the fate of the Jews. Often it seems to me as if everything we were used to seeing from the point of view of the proletariat have been passed on today in terrible concentration to the Jews. I wonder whether we should not [...] say the things that we really want to say in connection with the Jews, who now represent the counter point to the concentration of power.<sup>31</sup>

This proposal eventually found approval with Horkheimer, and in October 1941 he wrote summarily to Adorno that antisemitism signifies

today really the focus of injustice, and our kind of physiognomy must return to the world where it shows its most horrific face. Ultimately, however, the question of antisemitism is the one in which what we write can most quickly enter into a context in which it is effective, without us betraying anything in it. And I could imagine even without chimerical optimism that such a study would have such an impact that it would help us further. In any case, I would certainly dedicate years to realising it, without hesitation.<sup>32</sup>

In fact, Adorno had dedicated himself since the late 1930s to comprehensively investigating and criticizing antisemitism. Adorno left Europe in 1938, relocating to New York City as an official employee of the exiled Institute of Social Research, and simultaneously taking up a position in the radio research project directed by Viennese sociologist Paul Lazarsfeld (1901–76). The Institute, partly in cooperation with the American Jewish Committee (AJC), then began to plan various research projects related to antisemitism, with Adorno's considerable input. During this period, Adorno and Horkheimer collaborated intellectually as well as maintaining a close personal friendship. Once they had agreed on antisemitism as the concrete starting point of their book on logic, both intensified their work on the common project, the results of

which would finally be published in 1944 under the title *Philosophical Fragments* and in 1947 as *Dialectic of Enlightenment*. Already by September 1940, Adorno had sent a theoretical outline to Horkheimer, which the latter still found inadequately formulated and reckless; but despite all the required modifications, Horkheimer thought it indicated how a real theory of antisemitism must be articulated. According to Horkheimer, the depth and tenacity of hatred against the Jews left the usual explanations of antisemitism appearing rationalistic and therefore inadequate. Antisemitism dates back, he argued, 'to a period in which many of the "rational grounds" for its emergence, such as the participation of Jews in capitalism and liberalism, were not yet in effect. Antisemitism itself bears some archaic traits that point beyond the usually specified causes'. Therefore a 'sufficient theory of antisemitism that goes beyond the pluralism of individual "reasons for hatred of the Jews" depends on the success of a prehistory of antisemitism'.<sup>33</sup> Horkheimer replied approvingly to Adorno's outline that contemporary antisemitism 'is grounded in prehistory', and confessed: 'I am convinced that the Jewish question is the question of contemporary society – here we are in agreement with Marx and Hitler, but otherwise as little as with Freud'.<sup>34</sup> In March 1941, in a draft letter to Harold Laski (1893–1950), Horkheimer once again stressed the special relevance of antisemitism not only for understanding contemporary society but history as such:

It appears to me as if the old instruments would no longer suffice – not even that treatise 'On the Jewish Question'. As true as it is that one can understand Antisemitism only from our society, true as it appears to me that by now society itself can be properly understood only through Antisemitism. It demonstrates on the example of the minority which is, as a matter of fact, in store for the majority as well: that change into administrative objects. The reasons for Antisemitism itself are probably much deeper, historically, than they are supposed to be. They cannot be explained solely by money economy.<sup>35</sup>

The idea of a prehistory of antisemitism takes up the idea of a theory of society based on a philosophy of history, which Adorno and Horkheimer now considered key to understanding current conditions. Reflection on the archaic and prehistoric follows the impulse to be true to the unconscious foundations of modernity and to turn the enlightenment reflexively on itself. By comprehending what is simultaneously repressed through enlightenment, as well as what continues to exist, every historical spell chained to barbaric prehistory was to be broken with the expressed aim of exploding the continuum of immanent history – it is the attempt, by immersing oneself in contemporary phenomena, to read the history sedimented within them. As Adorno later wrote in *Negative Dialectics*, ‘Becoming aware of the constellation in which a thing stands is tantamount to deciphering the constellations which, having come to be, it bears within it’.<sup>36</sup> Prehistory does not enter into Adorno’s work as something that has elapsed but as something still present. It is not a matter of illuminating prehistory as such but its relationship to modernity: this was the task of the *Dialectic of Enlightenment*. In it, every relationship of prehistory to modernity is elevated as the relationship of myth to enlightenment, and the authors intend to recognize ‘why humankind, instead of entering into a truly human condition, is sinking into a new kind of barbarism’.<sup>37</sup> To that end, they followed the process of civilization as one of the mastery of inner and outer nature to its historic beginnings, and the book’s fragmentary considerations and digressions finally culminate in theses-like explanations of some elements of antisemitism. The theses, as is stressed in the preface, are developed in close cooperation with Löwenthal and are ‘directly related to empirical research carried out at the Institut für Sozialforschung’, applying to

the actual reversion of enlightened civilisation to barbarism. Not merely the ideal but the practical

tendency of the self-destruction has always been characteristic of rationalism, and not only in the stage in which it appears undisguised. In this sense we offer the main lines of a philosophical prehistory of anti-Semitism. Its ‘irrationalism’ is deduced from the nature of the dominant *ratio* itself, and the world which corresponds to its image.<sup>38</sup>

Shortly after his return from American exile to Frankfurt in November 1949, Adorno published *Minima Moralia*. He had completed the book when still in the United States, and dedicated it to Max Horkheimer ‘as thanks and promise’. The ‘reflections from damaged life’ – the subtitle – are expressly based on ‘the narrowest private sphere, that of the intellectual in exile’.<sup>39</sup> Adorno made no secret of what was questionable in the attempt, but he believed that critical theory remained in the sphere of the individual, and not only with a bad conscience. Specifically, critical theory referred to the social substance of the individual; social analysis could therefore take more from individual experience than the philosophical tradition recognized. According to Adorno, in relation to the totalitarian tendencies of those societies that retained some residues of bourgeois freedom even as bourgeois liberalism declined, something of the liberating social forces in the sphere of the individual had temporarily contracted:

Nevertheless, considerations which start from the subject remain false to the same extent that life has become appearance. For since the overwhelming objectivity of historical movement in its present phase consists so far only in the dissolution of the subject, without yet giving rise to a new one, individual experience necessarily bases itself on the old subject, now historically condemned, which is still for-itself, but no longer in-itself.<sup>40</sup>

Though the individual was the point of departure for *Minima Moralia*, Adorno stayed abreast of the ‘changes in the rock strata of experience’<sup>41</sup> effected through National Socialism and Auschwitz and continued the conception of a logic of decay associated with a negative philosophy of history. In reference to the drama *The Last Days*

of *Mankind*, in which the Viennese writer and critic Karl Kraus (1874–1936) pilloried the atrocities of the First World War, Adorno writes: ‘What is being enacted now ought to bear the title: “After Doomsday”’.<sup>42</sup>

The thought that after this war life will continue ‘normally’, or even that culture could be ‘rebuilt’ – as if the rebuilding of culture were not already its negation – is idiotic. Millions of Jews were murdered, and that is to be seen as an interlude and not the catastrophe itself. What is this culture waiting for? And even if countless people still have time to wait, it is inconceivable that what happened in Europe will have no consequences, that the quantity of victims will not be transformed into a new quality of society at large, barbarism? As long as blow is followed by counter-blow, catastrophe is perpetuated.<sup>43</sup>

In *Negative Dialectics*, the reflection on the logic of decay of the individual and society, as well as the experience of the failure of culture, finally culminates in the presentation of the objective dilemma of the impossibility of cultural criticism itself:

All post-Auschwitz culture, including its urgent critique, is garbage. In restoring itself after the things that happened without resistance in its own countryside, culture has turned entirely into the ideology it had been potentially – had been ever since it presumed, in opposition to material existence, to inspire that existence with the light denied it by the separation of the mind from manual labor. Whoever pleads for the maintenance of this radically culpable and shabby culture becomes its accomplice, while the one who says no to culture directly furthers the barbarism which our culture showed itself to be. Not even silence gets us out of the circle. In silence we simply use the state of objective truth to rationalize our subjective incapacity, once more degrading truth into a lie.<sup>44</sup>

Adorno began work on *Negative Dialectics*, one of the most radical writings of the last century, at the end of the 1950s, and it was completed and published in 1966. It was the realization of a plan that he and Horkheimer had pursued since the late 1940s. They planned a second volume of *Dialectic of Enlightenment*, to continue the project of a dialectical logic. ‘[O]ne had to cross the

frozen waste of abstraction’ – Adorno recalls a comment by Benjamin about his study of Husserl (1937) – ‘to arrive at concise, concrete philosophizing’.<sup>45</sup> *Negative Dialectics* would retrospectively carve such a path. With it, Adorno may not have substantiated the procedure that permeates his material works, and which can neither be called strictly scientific nor traditionally philosophical, but he did justify it; he laid his cards on the table, which, however, is not the same thing as playing. If he did not want to acknowledge the usual distinction between method and objectivity, his opposition to the intellectual division of labor had to reflect this, not ignore it. Thus he decided to exclude from his main work the polemic, originally conceived as a part of *Negative Dialectics*, against the ‘jargon of authenticity’, which was in the meantime being spoken and written in Germany and, as Adorno saw it, was by no means limited to Heidegger and Jaspers as heads of a particular philosophical school but, far beyond that, represented the latest manifestation of the German ideology in the democratized national community. According to Adorno, elements of the physiognomy of language and sociological elements of the jargon of authenticity no longer fitted properly into the plan of the book:

Certainly in intention and in theme, the Jargon is philosophical. As long as philosophy was in line with its own concept, it also had content. However in retreating to its ideal of pure concept, philosophy cancels itself out. This thought was only developed in the book which was then still unfinished, while the Jargon proceeds according to this insight without, however, grounding it fully.<sup>46</sup>

This is why Adorno excluded it from *Negative Dialectics* and published *The Jargon of Authenticity* earlier, in 1964, as a kind of propaedeutic. ‘The only thing that could be controversial’, he emphasized to Max Horkheimer when *Negative Dialectics* was published, ‘is whether one should let oneself enter the sphere of so-called professional philosophy; but that corresponds to my passion for immanent critique, which is no mere

passion, and is probably also justified itself to a certain degree in the book'.<sup>47</sup>

The work on *Negative Dialectics* can be followed in Adorno's university lectures. As well as those on *Negative Dialectics* (1965–6), the lectures on *Ontology and Dialectics* (1960–1), *On the Doctrine of History and Freedom* (1964–5) and *Metaphysics: Concept and Problems* (1965) borrowed from the notes on his philosophical magnum opus. Adorno justified this with reference to his academic commitments:

the quantity of teaching and administrative chores that I have gradually accumulated render it almost impossible to continue with my research during term time – if indeed we can speak of research in connection with philosophy – with the diligence that is not only objectively indicated but would above all reflect my own inclination and disposition. In such a situation, and given such compulsion and pressure, one tends to develop qualities that are best described by the words 'peasant's cunning'. My solution to this problem one that I have had recourse to during the last two semesters and shall do so again this semester, is to take the material for my lectures from a voluminous and somewhat burdensome book that I have been working on for six years now with the title 'Negative Dialectics', the same title I have given to this lecture course.<sup>48</sup>

According to Adorno, such a procedure corresponds to the notion of philosophy better than the objective of positivist consciousness for academics to teach their students results. A question does not exhaust itself in its result, as Hegel stressed in the preface to the *Phenomenology of Spirit*; becoming is also essential to it.<sup>49</sup> Adorno insists therefore 'that philosophical thinking is an element of the tentative, experimental and inconclusive, and this is what distinguishes it from the positive sciences'. Philosophical cognition contains a moment of play as a corrective against the total rule of method. A moment of uncertainty and therefore also of possible failure is proper to it, which imposes on it a permanent self-reflection, so that it does not tip over into ideology – admittedly without ever being fully immune to it. Therefore Adorno would

encourage his students 'to think your own way through what I have to say to you and to assemble your own ideas on the subject matter rather than for me to transmit definite knowledge for you to take home with you'.<sup>50</sup>

The term 'negative dialectics' itself gives pause for thought. If dialectics has always sought to create a positive via the medium of negative thought, then it violates the philosophical tradition that has been handed down. This is the dynamic encapsulated in the Hegelian figure of the negation of the negation. Admittedly negativity, the irreconciled character of thinking and what is thought, is recognized as the impulse of dialectical movement, and yet the contradiction is transfigured into mere 'difference', which serves the 'progressive development of truth'.<sup>51</sup> Contradictions should be overcome in the totality of the philosophical system, the epitome of all negativity, as something positive; the task of philosophy in this view is 'to grasp the affirmative'.<sup>52</sup> Need, compulsion and the unhappiness of negativity, which the particular, individual, limited subject experiences in confrontation with the general, with social objectivity, is elevated by Hegel to a virtue. Because the subject is not immediate but is mediated by relations, Hegel takes the side of the objective needs of the existing against the arbitrary interests of the subjective particular. As a result, he reinstates reconciliation within the whole. 'The history of the world is not the ground of happiness',<sup>53</sup> Hegel explains dispassionately. Rather it is considered as the enforcer of inevitable catastrophe and decline, and should be justified as reason manifesting itself. Ruthlessly adhering to this single purpose, history must as an active force 'crush some innocent flowers, smash some things in its way'.<sup>54</sup> If the history of the world may seem violent and destructive to particular people (*besondere Menschen*), is it not the general idea,

which embarks in contradiction and struggle, in danger; it remains unchallenged and undamaged in the background. This is to name the *cunning of reason*, that it allows the passions to work for it,

whereby that through which it comes into existence suffers loss and damage. For it is the appearance of which part is destructive, another affirmative. The particular is generally too small against the general, individuals are sacrificed and abandoned. The idea pays the tribute of existence and transitoriness not from itself, but from the passions of individuals.<sup>55</sup>

The spirit that represents itself in world history as the general and the active genus is considered the 'sole absolute judge',<sup>56</sup> and Hegel thus secretly admits the failure of his philosophy to solve the problem of how

on the one side, reason can liberate itself from the particularity of obdurate particular interests but, on the other side, fail to free itself from the no less obdurate particular interest of the totality. How this problem is to be resolved is a conundrum that philosophy has failed to answer hitherto. Even worse, it is a problem which the organisation of the human race has also failed to solve.<sup>57</sup>

After countless social disasters, two world wars and, in particular, Auschwitz, the repetition of which could not be excluded, Adorno saw the claim of reason in history as ideology. Such reason would have to prove, Adorno argued, '*for whom* [history] has reason. If reason, a concept based on an understanding of the self-preservation of the individual, ceases to have a human subject, it lapses into unreason'.<sup>58</sup> After Auschwitz, history is unreasonable and meaningless; to claim the contrary would be merely to protect a consciousness which is not able to look the horror in the eye and which would therefore perpetuate this horror. Adorno insists

that every thought that fails to measure itself against such experience is simply worthless, irrelevant and utterly trivial. A human being who is not mindful at every moment of the potential for extreme horror at the present time must be so bemused by the veil of ideology that he might just as well stop thinking at.<sup>59</sup>

On the contrary, according to Adorno, the look into the not-past past of Auschwitz is in no way a mere idiosyncrasy owed to a particular biography, as some academics triumphantly declared of critical theory. 'The

splinter in your eye', notes Adorno in *Minima Moralia* 'is the best magnifying-glass'.<sup>60</sup>

*Negative Dialectics* denied the affirmative transfiguration of the negative into a moment of the positive whole – the fraudulent reconciliation in theory – but Adorno argued that the hoped-for reconciliation could be achieved through social liberation. Revolutionizing the relations of production in order to satisfy material needs is its necessary but insufficient condition: 'Realized materialism is at the same time the *abolition* of materialism as the dependency on blind material interests'.<sup>61</sup> Critical theory wants to criticize, in the name of materialism, the process that society must continually fuel for the sake of its reproduction and survival. A decent society would be one that does not, and in which its members do not, fight for *survival*. The eating and being eaten that humanity has copied from nature and accepted as fate – the subordination of the weaker to the stronger – shall not have the last word. Critical theory is materialist in its diagnosis of existence so that it need not remain materialist only. In fact, a materialism that posits itself abstractly in abandonment from its connection with idealism would be what Adorno calls 'myth': that ever sameness, which produces thinking in systems, as well as the systematic reason of immanent necessity. Critical theory 'cannot be science as Marx and Engels postulated',<sup>62</sup> because, as a representative of reason, it has become one productive force among others. This possibility was always in it, because the principal, unique, identitarian capacity of reason fits in very well with a totally capitalist world: identification is domination of nature. Adorno tries to avoid every form of identity thinking, which has found its practical purpose in systematically administered capitalist exchange relations, by criticizing every 'identity philosophy' by means of a negative dialectic, which includes the blind spots of previous knowledge, that which was not included in philosophy because it resisted identification for the purpose of integration into the systematic. The impulse of historical

movement is the 'irreconcilable power of the negative', the force of 'what exploiters do to the victims',<sup>63</sup> including all that which in the historiography of the victor presents unfillable gaps and through which the historic is expressed as a 'trace of former suffering'.<sup>64</sup> 'The expression of history in things is no other than that of past torment',<sup>65</sup> Adorno writes in *Minima Moralia*, and he adds:

What transcends the ruling society is not only the potentiality it develops, but also all that which did not fit properly into the laws of historical movement. Theory must deal with cross-gained, opaque, unassimilated material, which as such admittedly has from the start anachronistic quality, but is not wholly obsolete since it has outwitted the historical dynamic.<sup>66</sup>

In 1957, Adorno formulated this same thought in a letter to Horkheimer:

in all movements, which would change the world, there is always something ancient, retarded, anachronistic. The measure of what is desired is always to some extent happiness, which is lost by the progress of history. Whoever is not quite up to the standards of the time is always quite well adapted, and would not have it any other way. But this anachronistic element is at the same time also the attempt at change itself, precisely because it is just as much behind conditions as it is in front of them, always most seriously in danger, and is always open to the charge of being reactionary from among those who need it the least.<sup>67</sup>

Thus, according to Adorno, the true interest of philosophy is in

non-conceptuality, individuality and particularity – things which ever since Plato used to be dismissed as transitory and insignificant, and which Hegel labelled 'lazy existence'. Philosophy's theme would consist of the qualities it downgrades as contingent, as a *quantité négligeable*. A matter of urgency to the concept would be what it fails to cover, what its abstractionist mechanism eliminates, what is not already a case of the concept.<sup>68</sup>

Adorno conceived of negative dialectics not as a dialectics of identity; rather, it is 'the consistent sense of nonidentity'.<sup>69</sup> That is, 'we are concerned here with a philosophical project that does not presuppose the identity

of being and thought, nor does it culminate in that identity. Instead it will attempt to articulate the very opposite, namely the divergence of concept and thing, subject and object, and their unreconciled state'.<sup>70</sup> Under the spell of the principle of identity – the law of real abstraction, which presents itself in the form of an equivalence exchange between unequal values, of value as more value, and the law of identity thinking as the thought form of the latter (commodity-form and thought-form) – non-identity appears as contradiction; it 'indicates the untruth of identity'.<sup>71</sup>

The farewell to Hegel becomes tangible in a contradiction that concerns the whole, in one that cannot be resolved according to plan, as a particular contradiction. Hegel, the critic of the Kantian separation of form and substance, wanted a philosophy without detachable form, without a method to be employed independently of the matter, and yet he proceeded methodically. In fact, dialectics is neither a pure method nor a reality in the naive sense of the word. It is not a method, for the unreconciled matter – lacking precisely the identity surrogated by the thought – is contradictory and resists any attempt at unanimous interpretation. It is the matter, not the organizing drive of thought, that brings us to dialectics. Nor is dialectics a simple reality, for contradictoriness is a category of reflection, the cogitative confrontation of concept and thing. To proceed dialectically means to think in contradictions, for the sake of contradiction one experienced in the thing, and against that contradiction. A contradiction in reality, it is a contradiction against reality.

But such dialectics is no longer reconcilable with Hegel. Its motion does not tend to the identity in the difference between each object and its concept; instead, it is suspicious of all identity.<sup>72</sup>

Non-identity is thus involuntarily constituted by the identity principle. It posits what has vanished – that is, identitarian thought cuts off from the thing what does not go into its concept, and what does not go into it is in fact that which makes the thing essential. Essence appears in the form of its constituted denial – a real abstraction. Concerning the equivalent exchange relations, they posit as commensurable incommensurable social

qualities – that is, essence (*Wesen*) appears qua its disappearance, which is the fatal mischief (*Unwesen*) of a world that degrades ‘men to means’ of real abstractions that rule over and prevail in them.<sup>73</sup> Therefore the ‘cognitive utopia’, as it says in *Negative Dialectics*, would be ‘to use concepts to unseal the non-conceptual with concepts, without making them their equal’.<sup>74</sup> Society emancipated from the impulse of identity would correspondingly

not be a unitary state, but the realization of universality in the reconciliation of differences. Politics that are still seriously concerned with such a society ought not, therefore, propound the abstract equality of men even as an idea. Instead, they should point to the bad equality today, the identity of those with interests in films and in weapons, and conceive the better state as one in which people could be different without fear.<sup>75</sup>

In the condition of unfreedom, all talk of pluralism, ubiquitous today, is, on the contrary, the ideological expression of the fact that the ‘centrifugal tendencies of a society that threatens to disintegrate into unreconciled groups under the pressure of its own principles’ are presented ‘as if it were a state of reconciliation in which people lived together in harmony while in reality society is full of power struggles’. Adorno expressed the greatest skepticism towards concepts such as pluralism, since they fit into the general ideological tendency to obscure moments of social antagonism in such a way

that the very factors that threaten to blow up our entire world are represented as the peaceful coexistence of human beings who have become reconciled and have outgrown their conflicts. This is a tendency which barely conceals the fact that mankind is beginning to despair of finding a solution to its disagreements.<sup>76</sup>

Only in a truly reconciled condition that no longer knows fear would the concept of communication come into its own. ‘The present concept is so shameful’, emphasized Adorno,

because it betrays what is best – the potential for agreement between human beings and things, to

the idea of imparting information between subjects according to the exigencies of subjective reason. In its proper place, even epistemologically, the relationship of subject and object would lie in a peace achieved between human beings as well as between them and their Other.<sup>77</sup>

Peace is accordingly the state of difference without rule, in which the differentiated participate together, without repressively equalizing one another; only in such a peace could the idea of a non-authoritarian communication be realized, which today degenerates into ideology if it does not want to know anything about the antagonistic relations of production that create the antagonistic structure within which communication, albeit one not yet free of domination, is possible. Therefore Adorno designates first and foremost the condition of reconciliation as neither the undifferentiated unity of subject and object, nor as its hostile antithesis, but as ‘communication of what is differentiated’.<sup>78</sup> The dialectic serves such reconciliation, serves remembrance of the no-longer-hostile multiplicity, the release of the non-identical and the diversity of the different over which the dialectic no longer has any power. Were the principle of identity to dissolve, non-identity would also be no more and dialectics themselves would find their end in reconciliation. Critical theory knows about the openness of dialectic, the negative design of which defies any positive closure; it knows that dialectic is no eternal value but the ‘ontology of the wrong state of things’.<sup>79</sup> As ‘the self-consciousness of the objective context’, dialectics according to Adorno has not escaped the latter: ‘Without a thesis of identity, dialectics is not the whole; but neither will it be a cardinal sin to depart from it in a dialectical step. It lies in the definition of negative dialectics that it will not come to rest in itself, as if it were total. This is its form of hope’.<sup>80</sup>

In the consciousness of the non-identity of concept and thing, subject and object, dialectics refuses the affirmative, the doubling of that identity principle that is already

predominant in the medium of the spirit (*Geist*). Rather, it behaves critically. In the strict sense of the term critique – even if this is ‘nothing other than discrimination, i.e. the confrontation of moments that differ from one another’<sup>81</sup> – Adorno insists that dialectics is the thinking confrontation of what is separate, of concept and thing together, in which both moments claim what respectively exceeds them against one another: ‘Reciprocal criticism of the universal and of the particular; identifying acts of judgement whether the concept does justice to what it covers, and whether the particular fulfills its concept – these constitute the medium of thinking about the non-identity of the particular and the concept’.<sup>82</sup> Thus Adorno stresses that the terms ‘critical theory’ and ‘negative dialectics’ mean the same thing, ‘with the sole difference that critical theory really signifies only the subjective side of thought, that is to say, *theory*, while negative dialectics signifies not only that aspect of thought but also the *reality* that is affected by it’.<sup>83</sup> Critical theory is therefore by no means, as is commonly assumed, a simple nominalist name for a moralistic attitude, a pessimistic whining or arbitrary philosophical doctrine, which under the name of the ‘Frankfurt School’ would even be integrated into the culture-industrial machinery of exploitation of the academic apparatus. It is rather a reflexive moment within the dialectic itself. Without its self-conscious involvement in the dialectic the theory would collapse through unconsciousness of itself and its subject, and it would be hopelessly incorporated in the real process of negative-dialectical socialization; it would be traditional, affirmative, finally uncritical theory. The term ‘critical theory’ is determined precisely in the confrontation of thought with experience, mediation thought with the experience of reality, which also means that no critical theory is possible which is not also negative dialectics.

Adorno emphasizes that the objectivity of dialectical cognition needs, as opposed to the

usual scientific ideal, ‘not less subjectivity, but more. Philosophical experience withers otherwise’.<sup>84</sup> The subjective moment is given an extraordinary importance, but only the subject is able to experience the negativity of the objective constitution of the world – and Hegel explicitly calls the *Phenomenology of Spirit* a science of experience, just as Adorno understood his *Negative Dialectics* as a theory of reflexive experience – and to turn the medium of critique against this world. Such importance accorded to the subject within dialectical cognition is by no means to be confused with relativism and subjective arbitrariness: dialectics is not a case of a simple method that approaches the subject matter from without. ‘For instead of dealing with the matter itself, such an act is always beyond it; instead of dwelling in it and forgetting oneself in it, such knowledge always reaches for an Other and remains rather with itself, than being with the object and giving itself to it’.<sup>85</sup> Therefore Adorno and Hegel always polemicize decisively against the lifeless triplicate scheme of thesis, antithesis and synthesis. The monochrome formalism is

the shapeless repetition of one and the same, which is applied topically only to the different material and acquires a dull glow of controversy. The for itself probably true idea remains in fact always only in its beginnings if development consists in nothing other than such a repetition of the same formula.<sup>86</sup>

The affinities of philosophical knowledge and playful mimesis with the object to be known require ‘going over to the life of the object, or, which is the same, having the inner necessity of the object before oneself and expressing it’. The philosopher must hold back, must not intervene arbitrarily or on other grounds in the process of cognition, but must recognize the ‘effort of taking on the concept’<sup>87</sup> as well as one’s own abstinence as an essential element of this attention to the concept. But despite this primacy of the object, which in Hegelian philosophy is

the same as the priority of the concept, in the process of cognition in opposition to a mere conversation of the philosopher with themselves, the subjective moment of cognition must by no means be missing: 'The life of God and divine cognition may therefore probably be pronounced as a play of love with itself; this idea sinks into mere edification, and even decreases to insipidity when the seriousness of the pain, the patience and work of the negative is missing from it'.<sup>88</sup> The work of the concept is always at the same time work of the subject: a performance of the knowing human being. Subject and object are both to be understood as moments within the dialectic. Already by 1945, Adorno had noted in this sense:

the subjective enlightenment dialectic, which derives the concept of truth from the soul and finally the life process, is only one side: the objective dialectic, which only determines the individual and the life process from the concept of truth itself, belongs to that concept as well, if it is to have a meaning at all. Perhaps we should hold that for dialectical logic.<sup>89</sup>

The primacy of the object requires reflection on the subject, which is itself also an object, and at the same time it requires subjective reflection. This subjectivity is retained as a moment in the dialectic in contrast to naive realism and dogmatic materialism. There is the 'primacy of the ob[ject] only *in* dialectics', notes Adorno; 'it is at this point that [we see] the fragile nature of truth'.<sup>90</sup> Otherwise there is a relapse into *prima philosophia*:

The turn to the subject, though from the outset intent on its primacy, does not simply disappear with its revision; this revision occurs not least of all in the subjective interest in freedom. The primacy of the object means rather that subject for its part is object in a qualitatively different, more radical sense than object, because object cannot be known except through consciousness, hence is also subject. What is known through consciousness must be something; mediation applies to something mediated. But subject, the epitome of mediation, is the 'How', and never, as contrasted to the object, the 'What' that is postulated by

every conceivable idea for a concept of the subject. Potentially, though not actually, objectivity can be conceived without a subject; but not likewise object without subjectivity. No matter how subject is defined, the existent being cannot be conjured away from it. If subject is not something, and 'something' designates an irreducibly objective element, then it is nothing at all; even as *actus purus* it needs to refer to something that acts. The primacy of the object is the *intentio obliqua* of the *intentio obliqua*, not the warmed-over *intentio recta*; the corrective of the subjective reduction, not the denial of a subjective share.<sup>91</sup>

The critical examination of the Hegelian dialectic proves tricky as not only this but also other closed systems of thought perceive the dubious advantage of sealing themselves off against any criticism:

All criticism of the details, according to Hegel, remains partial and misses the whole, which in any case takes this criticism into account. Conversely, criticizing the whole as a whole is abstract, 'unmediated,' and ignores the fundamental motif of Hegelian philosophy: that it cannot be distilled into any 'maxim' or general principle and proves its worth only as a totality, in the concrete interconnections of all its moments.

Thus according to Adorno only those who do not let themselves 'be intimidated by the virtually mythological complexity of this critical method...and instead of graciously or ungraciously listing or denying his merits, go after the whole, which is what Hegel himself was after' can do Hegel justice.<sup>92</sup> The difference between negative dialectics and dialectics that affirm the whole as a positive is manifest in the judgement and critique of this whole. According to Adorno, Hegel himself had directly attacked the idea of positivity in his early writings and referred mainly to theological positivity, 'in which the subject is not "at home" [*bei sich*] and in which theology confronts him as being something alien and reified. And since it is reified and external and particular, it cannot be the absolute that religious categories claim it to be'. Even later, Hegel 'abandoned or rejected very few of his ideas. What he mainly did was to change their emphasis, albeit sometimes in a

way that turned them into their opposites'.<sup>93</sup> The greatness of the Hegelian philosophy was expressed by Marx, who is generally considered the antipode of Hegel; even if the founder of the materialist dialectic had, according to one statement, turned the idealist philosophy on its head. Against naive realism and merely intuiting materialism, Marx emphasized the immense importance of the subjective moment of dialectics when he wrote in his *Theses on Feuerbach*:

The chief defect of all hitherto materialism – that of Feuerbach included – is that the thing, reality, sensuousness, is conceived only in the form of the *object or of contemplation*; but not as *sensuous human activity, practice*, not subjectively. Hence, in contradistinction to materialism, the *active* side was developed abstractly by idealism – which, of course, does not know real, sensuous activity as such.<sup>94</sup>

Conscious of the subjective moment in the dialectic, in the consciousness of this negative and non-identical denied, the young Marx also denied the possibility of the transfiguration of the status quo for the better and called for the '*ruthless criticism of all that exists*';<sup>95</sup> he formulated the categorical imperative to '*overthrow all relations*, in which man is a debased, enslaved, forsaken, despicable being'<sup>96</sup> and understood the importance of 'revolutionary, of practical-critical activity'. His philosophical critique culminates in the critique of philosophy itself; finally in the thesis: 'The philosophers have only interpreted the world, in various ways, the point is to change it'.<sup>97</sup> If the world proves to be unreasonable to philosophy, there is no need for interpretations and systematic structures that will eventually claim the opposite but rather for a change in the world, such that it finally corresponds to its concept of a rational and humane place. The possibility of this change was for Marx, in the Hegelian tradition, located in the immanent powers of society; he trusted hopefully – too optimistically, as Adorno would see it – in the dynamics of bourgeois socialization itself, that everything would become worse

and thereby turn towards the better. '[T]he fact that the transition to practice that has been implicit in philosophy ever since Hegel has failed, contains the further implication that philosophy itself should be subjected to the most rigorous process of self-criticism, a self-criticism that must self-evidently take its lead from the latest forms assumed by philosophy'.<sup>98</sup> Accordingly, 'philosophy, which once seemed obsolete, lives on' – these are the opening words of *Negative Dialectics* – 'because the moment to realize it was missed'. Practice is postponed into the indefinite future; it is no longer 'the forum for appeals against self-satisfied speculation' but rather the 'pretext used by executive authorities to choke, as vain, whatever critical thoughts the practical change would require'.<sup>99</sup> Because no continuum exists between theory and practice – their unity is not possible in the present society – critical theory is the fragile placeholder of the realized happiness of mankind in the universal calamity. 'The remaining theoretical inadequacies in Hegel and Marx became part of historical practice and can thus be newly reflected upon in theory':<sup>100</sup> 'Perhaps it was an inadequate interpretation, which promised that it would be put into practice. ... Having broken its pledge to be as one with reality or at the point of realization, philosophy is obliged ruthlessly to criticise itself'.<sup>101</sup>

On August 6, 1969, Adorno went 'gently to sleep' during a holiday in Visp (Switzerland), as it says in the death notice signed by Gretel Adorno. Two weeks later, Herbert Marcuse wrote: 'I think there is no one who, like Adorno, radically opposed existing society, who has known and recognized it so radically. His thinking was so uncompromising that he could even afford to succeed in this society. This success has in no way compromised his thinking'.<sup>102</sup> There was no one, according to Marcuse, 'who represented Adorno and can speak for him'; and thus he predicted 'that the discussion of his work is still yet to come, must come, that it

has not even started'.<sup>103</sup> Adorno may have been a last genius – a term that Horkheimer considered adequate in his obituary and which one of Adorno's students used as the title of a biography. His thinking, however, pursued the force that holds sway in things themselves, and his work will therefore persist for as long as those conditions he insistently criticized persist.

Theodor Wiesengrund-Adorno is deceased. His work will live as long as there are people whose thinking is committed not only to exact knowledge, but also to truth, truth in the sense of expressing knowledge in such a way that its formulation leads to the right judgement about the falsely existing. He was a philosopher, not as if philosophy had been applied to him as a discipline, a profession, a specialism; it was to him the effort to form science and art, society and politics in their relation to that Other that cannot be conclusively determined, but is present in the great intellectual and artistic works as the desire of autonomous human subjects.<sup>104</sup>

# Theoretical Elaborations of a Critical Social Theory

*This page intentionally left blank*

# Ernst Bloch: The Principle of Hope

Cat Moir

## INTRODUCTION

Ernst Bloch is an ambivalent figure in the tradition of critical theory. He was never a member of the Frankfurt School, and his fidelity to the idea of utopia (the dream of an ideal society or a perfect state of humanity), which he doggedly maintained despite the atrocities committed in its name, set him apart both politically and philosophically from many of his contemporaries.<sup>1</sup> Yet Bloch nevertheless made a bold and original contribution to critical theory in the twentieth century. No other thinker went so far in insisting on the continued importance of hope and optimism in defiance of disaster. When Adorno claimed that Bloch was ‘one of the very few philosophers who does not recoil in fear from the idea of a world without domination and hierarchy’ (Geoghegan, 1996: 162), he acknowledged the courage Bloch showed in defending utopia’s promises despite its many dangers.

Adorno was one of many critical thinkers on whom Bloch’s work made a lasting impact. In the 1970s, he claimed that Bloch’s *Spirit of Utopia* (2000) had made such a significant impression on him when he read it as a young man that he had never written anything since then that did not refer to it (Adorno, 1992: 212). Meanwhile, when Walter Benjamin read the book in 1919 he insisted that, despite its deficiencies, it was the sole work by which he could take his own measure philosophically. In a letter to Gershom Scholem, Benjamin maintained that Bloch was the only one of his contemporaries whose work was not ‘derivative and adulterated’, thus acknowledging the extraordinary force and originality that continues to make Bloch a compelling if sometimes exasperating thinker (Benjamin, 1994: 148).

This chapter begins by situating Bloch’s life and work in the context of a twentieth century dominated for good and for ill by the pursuit of utopias. It then explores Bloch’s key contribution to critical theory,

*The Principle of Hope* (1986), as an attempt to fuse the twin traditions of utopianism and Marxism more tightly than ever before. It concludes by considering some key criticisms of Bloch and reflecting on his significance today. The chapter argues that although Bloch was on the margins of the Frankfurt School, his speculative materialism remains central to critical theory's attempt to liberate human beings from the circumstances that enslave them (cf. Horkheimer, 2002).

## LIFE AND WORK

Until not long before Bloch was born on 8 July, 1885, in the industrial port town of Ludwigshafen am Rhein, the German nation itself had been a utopia: a cultural ideal that existed in the mind but was nowhere to be found on a map. In 1795, Goethe and Schiller, who wrote in high German but spoke disparate dialects and were born as citizens of independent states, were still able to ask, ironically, 'Germany? But where is it? I know not where to find such a country. Where the learned begins, the political ends'. With the foundation of the German Reich in 1871, increasing German unity at the cultural level was translated into a political reality, and German history became a space in which various attempts to realize utopia would be played out. Bloch lived through much of that history, and his life and work bear witness to the magnificent promises and catastrophic failures of the utopian dream.

The world into which Bloch was born was in the grip of rapid change. The rise of industrial capitalism in imperial Germany had brought prosperity to many and misery to many more. Nowhere was this contrast more apparent than in the glaring difference in living standards between the workers' town of Ludwigshafen and the more affluent Mannheim across the bridge. Liberal social reforms gave Jewish families like Bloch's rights and opportunities they had never

enjoyed before, but they had come at a price: thorough cultural assimilation, which, however, did nothing to offset increasing anti-Semitism among those resentful of the newly found wealth and social standing of many Jews. When the First World War broke out in 1914, Bloch was disappointed to see German nationalism on display among Jews, including his former teacher Georg Simmel, with whom Bloch broke after Simmel donned the uniform of an imperial reserve officer.

Like many of his generation, Bloch believed that an apocalyptic renewal was needed to secure humanity's salvation from what G.W.F. Hegel (2007: 21), one of Bloch's most important philosophical influences, once called the slaughter-bench of history. Yet, unlike some of his contemporaries, Bloch did not see war as the solution: while in exile in Switzerland after 1917, he moved in pacifist circles and wrote anti-nationalist opinion pieces in the émigré press. Bloch looked to Russia and the promise of socialist revolution as the foundation of a new society, though the utopian future he envisaged was not one cut off from tradition. His first major published work, *Spirit of Utopia*, combined the romantic force of German expressionism with a brand of Marxism that emphasized Christian values. It advocated a utopian fusion of art and life in order to overcome alienation, though it was an art that valorized craft and ornament over the minimalism of modernist design.

If Bloch sought to mobilize folk culture in the service of social emancipation, he nevertheless vehemently opposed the *völkisch* nationalist ideas that nourished the growth of fascism in Weimar Germany. In his 1919 pamphlet, *Vademecum für heutige Demokraten* (Bloch, 1985c: 475–531), Bloch called to the like-minded among his generation to oppose the reactionary forces that would, he was sure, unleash fresh disaster in Europe if the last vestiges of the agrarian Prussian military regime were not dismantled. He predicted that, failing a 'social revolution of the heart' (Bloch, 1985c: 404), chimerical notions

of 'blood' and 'race' would be triumphant (527), and he advocated the establishment of a 'fully realised moral world parliament' to facilitate 'reconciliation' between Germany and the rest of the world (521).

Bloch's predictions were prescient. As fascist ideas took hold during the 1920s and 30s, he watched in frustration as the German left seemed capable of talking only in numbers and figures while the fascists appealed to hearts and minds by appropriating the messianic language of *Reich* and *Führer*. In *Thomas Münzer als Theologe der Revolution* (1969b), Bloch sought an example for the modern left in the history of the radical current of the Reformation, an event he saw as representing a foundational split in Germany's pre-history between revolutionary and reactionary tendencies. *Erbschaft dieser Zeit* (1985a) developed this idea further with a critique of National Socialism that explained its rise partly in terms of a fundamental non-synchronicity [*Ungleichzeitigkeit*] between different sectors of modern society. Bloch identified the Nazis' uncanny ability to fuse the values and symbols of a traditional, pre-capitalist way of life with those of a modern, technologized industrial society as a defining factor in their appeal.

Soon after Hitler came to power, a warrant was issued for Bloch's arrest, and in 1934 he and his wife, Polish architect Karola Piotrkowska, went into exile. They fled first to Paris, then to Prague, then finally in 1938 to the United States, where they remained for 11 years. It was here that Bloch wrote *The Principle of Hope*, a phenomenological exploration of what he called our 'anticipatory consciousness': an awareness of the possibility of a different, better world, so often the subject of art and religion, but which Bloch also glimpsed in everyday life, from the utopia of romantic love to the pursuit of advances in medicine. The 'principle of hope' means seeing in things as seemingly banal as the fairground or the lottery the longing for something more, even if their utopian promise remains abstract. The 'American

Dream' – 'To each his chicken in the pot and two cars in the garage' – was thus for Bloch also a 'revolutionary dream' (Bloch, 1985c: 35), though it was far from the utopia he sought. 'In America', Bloch would later claim, 'millionaires begin washing dishes, while philosophers finish up doing it' (Zudeick, 1987: 352), his irony barely concealing a certain contempt for a society which, in his view, mistakenly valued monetary wealth above culture and ideas. Unable to speak English, Bloch led an isolated life in the United States, though his isolation was undoubtedly somewhat cultivated: he longed for the language and traditions of his homeland, or *Heimat*, a figure which was elevated in *The Principle of Hope* to the utopian symbol *par excellence*.

It was particularly fortuitous, therefore, when in 1949 Bloch was offered a Chair in Philosophy at the University of Leipzig in the newly established East German state (GDR). As he reported to the Party newspaper *Neues Deutschland* in August that year, Bloch was initially full of enthusiasm for the project of building a socialist utopia on German soil. However, the honeymoon period did not last long. Bloch's choice to teach 'bourgeois' philosophy in Leipzig was a political decision in a context in which philosophy itself had become an ideological battleground. Bloch's insistence on the importance of Marxism's Hegelian legacy made him a subversive figure. Following the publication of his book *Subjekt–Objekt. Erläuterungen zu Hegel* in 1951 (Bloch, 1969a), a debate erupted that would eventually see him forced to step down from his position. With Bloch accused of revisionism by Party Chairman Walter Ulbricht, his students were openly harassed and his publications blocked. Following his address to the 20th Party Congress of the Communist Party in Moscow, in which he called on the SED government to abandon the Soviet Union's Stalinist education policy and promote academic freedom, Bloch's position as a critic of the GDR regime was beyond doubt. In December 1957, he was summoned before a tribunal where his philosophy was

denounced as un-Marxist, and he himself was declared unfit to teach.

It is hardly surprising, then, that when the Blochs were visiting West Germany in 1961, and they heard the news that a wall had been erected overnight in Berlin, they decided to seek asylum in the Federal Republic. In his inaugural lecture as honorary Professor at the University of Tübingen, Bloch, now 76, admitted that his hope in the GDR had been 'disappointed' (Bloch, 1998: 339–45). Unfettered by the constraints of (self-) censorship, in Tübingen Bloch's critique of the East became more explicit; later he would claim that 'those who are now jumping over the wall from East to West Berlin are truly making a leap from the kingdom of necessity into the kingdom of freedom' (Traub and Wieser, 1975: 20). However, the disappointment of hope was not sufficient reason, Bloch argued, to give up on socialist ideals altogether. Until the end of his life, he continued to campaign tirelessly for social justice and freedom of speech, and against fascism and war. With long experience as one of the last remaining of the pre-1918 generation, Bloch was active during the student-led unrest of 1968 in Germany, aligned with figures like Rudi Dutschke and with something of a cult profile himself. Just two weeks before he died at home aged 92 on 4 August, 1977, he wrote a letter to the German anti-nuclear lobby which described the neutron bomb as 'one of the greatest perversions that human beings have ever created' (Zudeick, 1987: 310). Bloch never lived to see the 'end of history', but even if he had, it is unlikely it would have shaken his faith in utopia – in its critical power to shine a light on the deficiencies of the present state of things and in its ability to inspire us to fight for something better.

### **Key contribution: *The Principle of Hope***

*The Principle of Hope* is undoubtedly Bloch's best-known work, in which the fullest

expression of his utopianism can be found. Written between 1938 and 1947, and published in three volumes in 1954, 1955, and 1959, this 'encyclopaedia of hopes' (Bloch, 1986: 17) attempts to archive the many manifestations of utopian longing, from our efforts at 'making ourselves more beautiful than we are' (339) to our religious dreams of everlasting life. Yet this is more than a mere catalogue of wishes great and small. In the spirit of the *Encyclopédie* of Diderot and Voltaire, *The Principle of Hope* attempts to 'change the way people think' about utopia in three main ways: first, Bloch reconceptualizes utopia as a drive or tendency within the fabric of reality itself towards the achievement of ultimate perfection; second, he argues that human culture is both a product of this tendency and can be used to read and realize the world's latent potentials; finally, Bloch maintains that by activating the unfulfilled claims of the past in this way, we can work towards creating a future of peace, plenty, and harmony with nature.

### **HISTORICAL MATERIALISM AND UTOPIA**

The relationship between historical materialism and utopia is complex and contradictory. In many ways, historical materialism – a theory based on the idea that class conflict is the prime motor of historical change – is the ultimate utopian theory. The materialist conception of history, as its originators Karl Marx and Friedrich Engels called it, emerged at the end of a process that Bloch called the 'transformation of the [utopian] topos from space into time' (Bloch, 1988: 3). During the period from approximately 1750 to 1850, which historian Reinhart Koselleck (2005) has dubbed the *Sattelzeit* (saddle-time), a series of revolutionary changes unsettled the classical European idea that the future would always look more or less like the past. Industrialization, secularization, the French

Revolution, scientific discovery, and the emergence of a public sphere, by means of which awareness of the cultures of the 'New World' also spread, combined to produce the idea of a new time, in which history was moving towards the goal of human perfection.

Under the pressure of this historical transformation, the early modern spatial utopias of figures like Thomas More, Tommaso Campanella, and Francis Bacon gave way to temporal utopias, in which a perfect society was no longer imagined as existing on an undiscovered island but rather in the future. The first example of a futuristic utopia in literature is Louis Sebastian Mercier's *L'An 2440, rêve s'il en fut jamais*, published in 1770, the same year Cook explored the east coast of Australia, heralding the limits of European expansionism. Its nameless protagonist dreams of a future Paris that is spatially continuous with the one Mercier inhabited but in which the injustices he perceived in his own time have been eradicated. Such visions were mirrored in the progressive philosophies of history that also emerged during the *Sattelzeit*, of which historical materialism can be seen as perhaps the most encompassing and sophisticated. After all, one of its central claims is that by establishing communism through revolutionary class struggle, human beings can create a society that is equal, just, and free to a far greater extent than is the case in capitalist societies.

Yet Marx and Engels explicitly contrasted the materialist conception of history, which they also called 'scientific socialism', with the 'utopian socialism' of some of their near contemporaries, reformers such as Charles Fourier, Henri de Saint-Simon, and Robert Owen, who, they claimed, attempted to build model societies based on their own abstract, personal visions rather than the careful analysis of actual conditions and possibilities. In *The Communist Manifesto*, Marx and Engels conceded that because the utopian socialists had perceived class antagonisms and attacked the miserable status quo, many

valuable insights were to be gained from them (Marx and Engels, 2010a). However, at the time utopian socialism emerged, they argued, the proletariat was not sufficiently developed to be a credible force for social change. This meant that the utopian socialists had confined themselves to small-scale experiments, which ended up reproducing rather than revolutionizing oppressive social relations. Marx and Engels aimed to go beyond utopian socialism by providing the critical tools with which to transform society on a grand scale.

If the materialist conception of history thus originally contained both utopian and anti-utopian elements, it was above all anti-utopianism that prevailed in its reception in both the Soviet and Western Marxist traditions. Soviet Marxists typically saw themselves as the legitimate heirs to the legacy of *scientific* socialism, and they branded their opponents, Bloch included, pejoratively as utopians. Meanwhile, critical thinkers in the West also maintained that social change could only be brought about by sober critique and largely rejected utopianism as impractical at best and dangerous at worst.

Bloch's utopianism met with resistance even among his Frankfurt School contemporaries, whose concern with developing a critical theory aimed at the 'emancipation and [...] alteration of society as a whole' (Horkheimer, 2002: 208) made them largely amenable to the idea of utopia. The relationship between Bloch's and Adorno's positions is particularly interesting in this respect. For both thinkers, the ultimate or total perspective characteristic of utopian thinking is in fact implied in all critical thought. In an interview with Adorno in 1964, Bloch explained this idea as follows: 'every criticism of imperfection [...] already without a doubt presupposes the conception of, and longing for, a possible perfection' (Bloch, 1988: 16). Adorno's claim that Bloch comes close to the 'ontological proof of God' here was not a dismissal. Rather, he argues that were there 'no kind of trace of truth' in the ontological argument, 'there could not only be no utopia but

there could also not be any thinking' (Bloch, 1988: 16).

The fundamental agreement between Bloch and Adorno that utopia's key function is its capacity for critique was derived from the shared influence of Jewish messianism on their thinking. As Scholem (1976: 287) acknowledged, Bloch and Adorno were among those 'ideologists of revolutionary messianism' in whose work 'acknowledged or unacknowledged ties to their Jewish heritage' were evident. Both were what Russell Jacoby (2007: 35) has called 'iconoclastic utopians', in the sense that they were influenced by the Jewish prohibition on graven images of a divine, ultimate, or highest good.

Adorno's commitment to the ban on images of utopia remained more rigorous than Bloch's, however. For while Adorno argued that '[o]ne may not cast a picture of utopia in a positive manner', Bloch (1988: 11) insisted on the *need* to 'cast a picture' of utopia, which he saw as partly coming into being through its portrayal. Such an idea was antithetical to Adorno, whose fidelity to the image ban was motivated by his concern to avoid the kind of aberrant politics that, as he saw it, had so often followed from 'blueprint utopianism' (Jacoby, 2007; Truskolaski, 2014).

It is somewhat ironic, therefore, that the one moment in which it becomes possible, perhaps even necessary, for Adorno to cast a picture of utopia is in the context of class struggle. The tipping point is reached at a point in the discussion with Bloch when the pair discusses the possibility of proletarian revolution (Bloch, 1988: 13), and Adorno finds himself assuming 'the unexpected role of attorney for the positive'. If the prospect of revolution, Adorno concedes, cannot 'appear within one's grasp', then 'one basically does not know at all what the actual reason for the totality is, why the entire apparatus has been set in motion' (Bloch, 1988: 13). Here Adorno's commitment to social transformation comes up against the limits of his relentless negativity. Herbert Marcuse

acknowledged this problem explicitly in 1979 when he outlined what he saw as the value of Bloch's utopianism vis-à-vis Adorno's negative dialectics.<sup>2</sup> According to Marcuse, Bloch had 'noticed that mere negation in the present world can lose its critical strength' (Marcuse, 2014: 421). Marcuse saw Bloch as the 'real Marxist of the twentieth century' precisely because he 'could see in Marxism more than political orientation', and more than only ruthless critique (422).

For Bloch, utopia was essential to historical materialism as a theory that 'posits the transformation of the world from within itself' (Bloch, 1986: 267). As he writes in *The Principle of Hope*, historical materialism allows us to envisage the real, historical possibility of creating 'another world beyond hardship' (267), a 'real democracy', 'beyond expropriation and alienation', in which human beings can live in harmony with each other, and with their environment (1376). To achieve this, Bloch believed that more than analysis and critique were needed. He distinguished between what he called the 'cold stream' of Marxism, concerned with the 'unmasking of ideologies' and the 'disenchantment of metaphysical illusion', and the warm stream, which he described as the 'liberating intention and materialistically humane, humanely materialistic real tendency, towards whose goal all these disenchantments are undertaken' (209). Bloch saw both analysis and vision as necessary for social and political emancipation but argued that the warm stream of Marxism had been historically neglected. He saw utopianism as belonging to that warm stream and set himself the task of revitalizing it.

Yet Bloch's understanding of utopia also went much further than anything to be found in Marx. Indeed, Bloch saw utopian theory and revolutionary action as manifestations of a more encompassing phenomenon: a drive within the world itself towards the realization of utopia on a cosmic scale. The scope and substance of Bloch's vision prompted Jürgen Habermas (1969) to describe him in a

critical review of *The Principle of Hope* as a 'Marxist Schelling', and not entirely without cause: what Habermas dubbed Bloch's 'speculative materialism' (Habermas, 1969: 323) combines a Romantic philosophy of nature with Aristotelian categories of possibility and Hegelian dialectics in a theory whose central premise is that the 'world-process itself is a utopian function with the matter of the objectively Possible as its substance' (Bloch, 1986: 177).<sup>3</sup>

For Bloch, material reality is utopian in the sense of being literally not (yet) 'there' in a finished form. Drawing on Schelling's concept of the 'eternal urge and primal ground of all creation' (Schelling, 1988: 273), which paradoxically unites nature and freedom, Bloch (1986: 306) posits the ontological incompleteness of a reality produced by a 'Not with which everything starts up and begins, around which every Something is still built' (cf. Žižek, 2012: 905). As both a 'lack of Something and also escape from this lack', the Not initiates a 'driving towards what is missing', or what is 'not yet' in the world. 'Not-yetness' thus becomes for Bloch the motive force of a materialist process ontology in which matter is no 'mechanical lump' (Bloch, 1986: 1371) but rather a dynamic material process that tends towards the realization of possibilities latent in its capacity.

Bloch's concept of matter derives its dynamism from its dialectical construction. Like Hegel and Marx, Bloch understood dialectics as the method of development through contradiction. Yet if for Hegel dialectics described a process that takes place primarily at the logical or discursive level, and for Marx at the socio-historical level, Bloch followed Engels in conceiving of the material world itself as dialectically constructed. He drew on Aristotelian categories of possibility and entelechy to develop a concept of matter with two complementary and contradictory aspects. On the one hand, Bloch's matter is 'What-Is-in-possibility, i.e. the real substratum of possibility in the dialectical process'; this is the subjective factor in

matter, something akin to Schelling's 'subject of nature', an unconscious yet constitutive driving force that generates, produces, and creates. On the other hand, his matter is 'What-Is-according-to possibility, i.e. that which is defined in terms of conditions by what is in each case capable of appearing historically' (Bloch, 1986: 1371). This corresponds to the limits or conditions matter creates for itself in the process of its self-realization. Bloch's concept thus maps onto the Spinozist distinction between subjective and objective nature, or *natura naturans* and *natura naturata*, which Schelling would later take up in his nature philosophy (Schelling, 1988: 50).

Bloch conceptualized human subjectivity, and the historical struggle for freedom and equality, as emerging from this dialectical struggle within unstable matter towards a state of possible self-identity. He thus integrates the Marxist project to create a classless society into a much more comprehensive cosmology, in which the potential goal is what the young Marx once described as the 'naturalization of man and humanization of nature' (cf. Bloch, 1986: 313).

Bloch captures this enigmatic idea in the figure of *Heimat*, in which *The Principle of Hope* culminates (Bloch, 1986: 1376). *Heimat* is a complex concept, which also underwent radical change during the *Sattelzeit* (Bastian, 1995). Originally referring to a person's place of origin, or to an inheritable estate, under the pressure of industrialization and dislocation in the German-speaking territories during the nineteenth century, *Heimat* began to connote an idealized past of childhood innocence and rural idyll.<sup>4</sup> Romantic writers, such as Novalis and Hölderlin, projected fantasies of an unalienated pre-modernity onto the idea of *Heimat*, creating a complex that would (in convoluted ways and jettisoning the constituent irony the image enjoyed among the Romantics) be taken up via the *völkisch* movement into the blood and soil ideology of National Socialism (cf. Blickle, 2002).

What distinguishes Bloch's utopian *Heimat* from the *völkisch* myth is that he recognized that the origins we seek in nostalgic images of the past were never really there in the first place. For those who would see in Bloch an uncomplicated teleology, his use of irony here is instructive. *The Principle of Hope* begins with a series of questions – 'Who are we? Where do we come from? Where are we going? What are we waiting for? What awaits us?' – and ends with a single word: *Heimat*. If there were any doubt that the meaning of the text resides in its last word, the key sentence, which stands out because it is italicized, draws our attention to the fact: '*True genesis is not at the beginning, but at the end*' (Bloch, 1986: 1376). Yet precisely as genesis, *Heimat* connotes a search for origins that have never truly existed. The childhood of *Heimat* is one in which 'no one has yet been', since 'all and everything still stands before the creation of the world as a right world' (1376). Thus the semantic content of the word returns us to the opening questions in a manner that recalls Austrian satirist Karl Kraus' aphorism 'Origin is the goal'. Bloch's text performs both linear and cyclical movements at the formal level, puncturing any premature illusion of totality or achieved finality. Rather the 'goal' of origin is created in the process of working towards it.

The purpose of history, according to Bloch, is to create a world in which human beings are at home in the way in which they frequently, but erroneously, imagine themselves to have been in the past. He claims this utopian dream is materially possible, not only through human practice but because its very possibility resides in matter itself. Bloch's vision of utopia was thus infused with the spirit of revolutionary Romanticism (cf. Löwy and Sayre, 2001), particularly in its emphasis on a possible ultimate identity between human beings and the 'hypothetical' subject of nature (Bloch, 1986: 255). Bloch speculates that this goal can be reached because the 'human house not only stands in history

and on the foundation of human activity, it also stands above all on the foundation of a mediated natural subject [*Natursubjekt*] and on the building site of nature' (290). Unlike the Romantics, however, for whom the process of history could only ever be an 'infinite approximation' [*unendliche Annäherung*] of utopia, Bloch's Marxism encouraged him to hold open the possibility of creating a utopian *Heimat* in the finite realm of human history (cf. Hölderlin, 1946–77: 558). For 'the opposite of the infinite approximation is not in fact sheer presence', he claims, 'but rather [it is] the finiteness of the process and of the consequently at least surveyable anticipated distance from the goal' (Bloch, 1986: 188).<sup>5</sup> Nevertheless, the achievement of ultimate victory remained a 'task' for Bloch, and thus 'the happy present is simultaneously grasped as pledge for the future' (188). Revolutionary politics, and cultural production and analysis, are the main means by which Bloch sees this pledge best pursued.

## HOPE AND DESIRE IN EVERYDAY LIFE

Bloch's understanding of human history as continuous with natural history allowed him to read cultural products as the concretization of desires that exist within the material world itself (at least insofar as they exist within us as material beings). He thus maintained a certain transitivity between the structure of matter as a creative striving, organized around a central lack, and the creative subjectivity of human beings, organized around what he called the 'darkness of the lived moment'. Already in *Spirit of Utopia*, Bloch had articulated a theory of experience according to which human beings exist in this the darkness. '[W]e live [*leben*] ourselves', he writes, 'but we do not 'experience' [*erleben*] ourselves' (Bloch, 2000: 191). Only through processes of memory, anticipation, and the confrontation with products of human creativity does the 'self-encounter' take place (7).

Like Freud, Bloch believed that human culture is the result of a process through which our unconscious desires are diverted and captured (Freud, 1961). However, Bloch resisted the privileged place memory and repression enjoy in Freudian theory. He argued that another 'edge' of our unconscious becomes visible in art, which he called the not-yet-conscious in opposition to the 'no-longer-conscious' of psychoanalysis. The not-yet-conscious is 'the preconscious of what is to come, the psychological birthplace of the new' (Bloch, 2000: 116). However, since human consciousness and its products are part of the material world, Bloch claimed that the 'not-yet-conscious' desires of human beings correspond to the not-yet-realized utopian contents of the world process itself. The 'Not-Yet-Conscious in man', Bloch writes in *The Principle of Hope*, 'belongs completely to the Not-Yet-Become, Not-Yet-Brought-Out, Manifested-Out in the world. Not-Yet-Conscious interacts and reciprocates with Not-Yet-Become, more specifically with what is approaching in history and in the world' (Bloch, 1986: 13).

If art is the product of not-yet-conscious (as well as no-longer-conscious) desires, according to Bloch, it is also always produced under specific socio-historical circumstances. When it came to the relation between art and society, Bloch broadly agreed with Marx's basic insight in his preface to *A Contribution to the Critique of Political Economy* of 1859, that it is 'not the consciousness of men that determines their being, but their social being that determines their consciousness' (Marx, 2010a: 263). Insofar as art is a product of social labour, which has always been divided according to interests, Bloch saw in it, too, the manifestation of ideology. Yet he resisted the reductionist reading of culture, prevalent among Soviet Marxists, according to which art and other 'superstructural' elements simply reflect a specific form of social relations or mode of production. Instead, Bloch understood the 'being that conditions consciousness, and the consciousness that processes

being [...] ultimately only out of that and in that from which and towards which it tends' (Bloch, 1986: 18). In other words, both social reality itself and the cultural products of that reality always contain more than simply oppression, violence, exploitation, and their expression. The 'blossoms of art, science, philosophy', Bloch writes, 'always denote something more than the false consciousness which each society, bound to its own position, had of itself and used for its own embellishment' (155). Bloch calls this 'more' culture's 'utopian surplus', and he sees it as at bottom always the same: an expression of the still unfulfilled desire for utopia and the anticipatory consciousness of its possibility.

It is thus primarily through art and culture that, according to Bloch, human beings can become conscious of that which Marx once said the world has long dreamed of possessing, even if something more than art is needed to realize that dream. In this respect, Bloch's view of Schiller's political aesthetics can be seen to apply equally well to his own: 'It is utopian to wish to overcome humanity's social fragmentation, and to restore its wholeness, by no other means than aesthetic consciousness. Yet nevertheless there is utopia, even if it is somewhat high-flown, in this idealism, and not just resignation, not just ethereal unworldliness' (Bloch, 1998: 89).

Bloch's interest in Schiller reflected his broader interest in the question of why some works of art speak down the ages, allowing themselves to be reinterpreted anew. For Bloch, this was not merely a matter of culture being infused with ruling-class ideas. As his friend and contemporary Walter Benjamin (2006: 392) would later put it, 'there is no document of culture which is not at the same time a document of barbarism', and indeed, since utopia has never existed, all culture up to now must be understood as the product of exploitative social relations. In Bloch's view, however, this does not prevent us from perceiving in it a utopian trace, to a degree roughly commensurate with that to which the work in question can be seen to embody

the potential for the radical novelty that utopia represents. Thus, although the Acropolis 'belongs to slave-owning society, Strasbourg cathedral to feudal society', Bloch writes, 'as we know, they did not disappear with their social base, and they carry with them nothing deplorable, in contrast to the base, in contrast to the conditions of production at the time' (Bloch, 1998: 155).

What becomes visible in such artworks is not only a will-to-utopia executed by the labour of the oppressed; precisely by confronting the product of that labour, we can recognize the possibility of utopia's very achievement. This is what makes an artwork valuable, makes it a classic, for Bloch. As he writes in *The Principle of Hope*, '[t]he classical element in every classicism... stands before each age as revolutionary Romanticism, i.e. as a task that points the way forward and as a solution that approaches from the future, not from the past, and, itself still full of future, speaks, addresses, calls us on' (Bloch, 1986: 155). This remains the case even in works ostensibly created by a single individual 'genius', since the potential achieved by one individual under circumstances favourable to their development only gives cause to wonder what would be possible if the free development of each were truly the condition for the free development of all. As Bloch puts it in the context of a discussion of the not-yet-conscious:

Mastery in the work of genius, a mastery which is foreign to what has normally become, is also comprehensible only as a phenomenon of the Novum. Every great work of art thus still remains, except for its manifest character, impelled towards the latency of the other side, i.e. towards the contents of a future which had not yet appeared in its own time, if not towards the contents of an as yet unknown final state. For this reason alone great works have something to say to all ages, a Novum pointing onward in fact, which the previous age had not yet noticed. (Bloch, 1986: 127)

Yet Bloch was far from seeing 'high art' as the exclusive province of the utopian trace. Anticipating the work of thinkers such as

Henri Lefebvre, he also took everyday life seriously as a space worthy of consideration and critique, and, unlike Lefebvre (1991), he resisted the idea that the everyday has been entirely colonized by capitalism. Instead, by analysing everyday practices and objects, he sought to decode the utopian desire that can still be seen to reside there despite the dynamics of commodification.

The daydream is Bloch's point of departure for his analysis of the utopian everyday (Bloch, 1986: 77–113). Here again, he conceives of his insight into the character of the daydream as a complement to Freud's theory of the night-dream. Whereas Freud focused on the libido as the primary drive behind the nocturnal dream, Bloch sees the daydream as driven by hunger and the arising expectant emotions, including hope. Contrary to Freud, for whom the 'night-dream is basically nothing other than a daydream which has become serviceable through the nocturnal freedom of the impulses, and distorted by the form of mental activity', according to Bloch, daydreams 'always come from a feeling of something lacking and they want to stop it, they are all dreams of a better life' (87). He discerns five key features of the daydream that distinguish it from the Freudian night-dream: an active ego, manifested among other things in the ability to daydream by choice, are its first and second characteristics, the desire for world-improvement its third. The fourth characteristic of the daydream, according to Bloch, is the drive for completion, as opposed to the often scattered, fragmented character of the night-dream. Unlike 'the spooks of the night', Bloch claims, the daydream 'has a goal and makes progress towards it' (99). To be sure, Bloch's distinction between day and night-dreams is heuristic rather than scientific: it seeks to highlight the aspects of the unconscious overlooked in Freud's theory of dreams as expressing repressed, mostly taboo, desires.

In *The Principle of Hope*, Bloch finds the daydream assuming 'symbolic form' in everything from fashion to fairy tales

(Bloch, 1986: 333). If for Marx human beings 'begin to distinguish themselves from animals as soon as they begin to produce their means of subsistence', so Bloch would perpetually emphasize the significance of the creative dimension of human labour (Marx, 2010b: 31). 'Clothes which can be chosen distinguish men from animals', he writes, 'and jewellery is even older than these clothes, it sets them off even today by standing out' (Bloch, 1986: 341). Even the fetishized commodity is not without its utopian promise for Bloch, for it 'always still needs a label which praises it', and advertising not only makes products 'shine in the shop window' (343), it also 'transforms man into the most sacred thing next to private property, into the consumer' (344). Despite his irony, Bloch's insight reminds that even commercial products can hold out, and occasionally partly keep, a utopian promise. One might think of the way in which the mass availability of household appliances in 1950s America did in fact contribute to emancipating women from the domestic sphere, even if the tropes used to market them now appear hopelessly retrograde.

If Bloch sees a kernel of utopia almost everywhere, he nevertheless distinguishes between what he calls abstract utopia – dreams that either do not truly challenge the status quo, or are mere fantasy divorced from any sense of how to realize them – and concrete utopia – those dreams that are mediated by objective possibility. Thus for Bloch the sense of premonition encapsulated in the French Revolutionary song 'Ça ira!' articulates the desire for a concrete utopia, because the 'driving images' of revolution it contains 'were attracted and illuminated by a real future place: by the realm of freedom' (Bloch, 1986: 143). Meanwhile, 'the so-called power to foresee deaths or even winning lottery numbers is obviously of a less productive order', precisely because the 'happy end' it envisages remains abstract and purely contingent (143). Yet Bloch defends the happy-end motif even in what he sees as

its most corrupted and corruptible everyday forms, identifying in it the desire for more than the mere appearance of utopia, in whose interest it is co-opted. 'The deceivability of the happy end drive', he claims,

merely says something against the state of its reason [...]. The deception represents the good end as if it were attainable in an unchanged Today of society or even the Today itself. [...] More than once the fiction of a happy end, when it seized the will, when the will had learnt both through mistakes and in fact through hope as well, and when reality did not stand in too harsh contradiction to it, reformed a bit of the world; that is: an initial fiction was made real. (Bloch, 1986: 443)

## NOT-YET AND REVOLUTION

There can be little doubt that Bloch was committed to the significance of aesthetic practice in attempting to realize utopia, yet he also knew that something more than art is required to achieve this task. Wishful images in themselves 'do nothing', he conceded. Rather they 'depict and retain with particular fidelity what must be done' (Bloch, 1986: 47). It is in this sense that Bloch (1988: 11) saw utopia as already partly achieved when it is portrayed in a book: not that utopia is realized through its mere representation, but rather that the images of the past collectively constitute a repository of cultural surpluses that can be activated and mobilized in the pursuit of utopia. Thus Bloch understands cultural tradition as in part the archive of a revolutionary tradition concerned with attempting to realize the not-yet.

Bloch's insistence on the importance of cultural heritage for social and political struggle went against a certain tendency within the socialist movement to reject what Marx in his *18th Brumaire of Louis Bonaparte* referred to as the poetry of the past (Marx, 2010b: 106). For Marx, whereas 'former revolutions required recollections of past world history in order to smother their own content', proletarian revolution could not 'begin with

itself before it has stripped away all superstition about the past' (Marx, 2010b: 106). Of course, Marx was speaking of the 'social revolution of the nineteenth century', which had failed to materialize in its hoped-for form by the time Bloch was writing *The Principle of Hope*. Nevertheless, orthodox Marxists largely maintained that entirely new forms of art, culture, and thought were required to express the desires of the workers of the world. This was one reason why Bloch's (1986: 9) definition of 'Marxist philosophy' as 'that of the future, therefore also of the future in the past' was explicitly rejected by the GDR regime. In the tribunal held to denounce Bloch in December 1957, the Secretary of the Central Committee, Kurt Hager, stated in no uncertain terms that Bloch's philosophy was judged to be a 'non-Marxist philosophy' (Bloch, 1991: 2). Extracts from Rugar Otto Gropp's damning indictment of *The Principle of Hope* were marshalled against Bloch, with Gropp condemning his philosophy as 'a mystical-irrationalistic conglomeration of components of all possible idealist systems from Antiquity to the most recent present' (20). The 'particularly strong impact of the Romantic school' on Bloch was found to be just as damning as that of 'existentialism' (20). Most 'un-Marxist' of all, though, was deemed to be Bloch's inheritance of religious thought. Indeed, Gropp found that the 'basic themes of Bloch's philosophy are of a religious nature'.

To be sure, Bloch's fondness for religious language and his insistence on the emancipatory power of religious images may seem perplexing given that he himself was an avowed atheist. In an interview from 1974, just three years before he died, Bloch was frustrated by the suggestion that his ideas had enjoyed their most extensive reception among theologians, because, as he put it simply, he himself was not a theologian (Bloch, 1974). Yet Bloch, whom Oskar Negt once called the 'German philosopher of the October Revolution' (1975), also claimed in no uncertain terms that religious messianism is the 'red secret

of every revolutionary' (Bloch, 2009: 1). If we consider that Bloch's work, as Eduardo Mendieta (2005: 12) has noted, 'was determinant for the development of the Frankfurt School's thinking about religion', then it is all the more pressing to grasp the meaning of his complex reception of religious, and particularly messianic, thought.

Benjamin's 1930 fragment 'Capitalism as Religion' provides a useful insight into the context in which he, like Bloch and other messianic Marxists, repurposed theological concepts for political ends.<sup>6</sup> Benjamin argues that in modern societies, capitalism itself has become a religion, even as it has eroded traditional forms of faith largely by assimilating them. Capitalism is a 'purely cultic religion' Benjamin claims, 'without dogma' in which 'everything only has meaning in relation to the cult' (2002: 288). In such a context, the language of religion proper can be seen to become a kind of weapon with which to critique that totality from within. This insight was key to Benjamin's late work, which refunctioned concepts of messianic time for a philosophy of history that demands justice for the oppressed. It is also at the heart of Adorno's negative theology, which sought to adumbrate the possibility of utopia without imagining it in positive or programmatic terms. Yet it is also central to the way in which Bloch reclaimed religious ideas in the service of his own social critique. 'The best thing about religion', according to Bloch, 'is that it makes for heretics' (2009: viii). When the religion is secular capitalism, however, the heretic must become a prophet.

Insofar as religion expresses desires for universal freedom and eternal peace, Bloch saw it as perhaps the oldest and most widespread form of utopianism, albeit one which had frequently been enlisted in the service of oppression rather than of liberation. 'Religion', Bloch argues, 'is superstition wherever it is not what in terms of its valid intention-content it has increasingly come to mean in its historical manifestations: the most unconditional utopia, utopia

of the absolute' (1986: 1200). In other words, the truth of religion as Bloch sees it is the desire for another world than the one of violence, death, suffering, and exploitation that we inhabit. 'Certainly', Bloch argued in *The Principle of Hope*, 'the wishful image in all religions, and even more powerfully in those of the messianic invocation of homeland, is that of feeling at home in existence' (Bloch, 1986: 1196). Its only mistake, he claims, is to project the image of a new world into a transcendent beyond rather than recognize the need to realize it historically.

Seeing the material world as hopelessly flawed beyond normal powers of human correction, the Jewish and Christian messianic traditions posit divine intervention through a specially selected human being. According to Bloch, Marxism inherits this messianic impulse, immanentizing the eschaton to envisage a 'utopia of kingdom' that 'destroys the fiction of a creator-god and the hypostasis of a heavenly god, but not the end-space in which ens perfectissimum contains the unfathomed depth of its still unthwarted latency'. Thus it is through Marxism as a form of atheism that, paradoxically, the messianic idea can be realized: '*without atheism messianism has no place*' (Bloch, 1986: 188). 'Non-existence, non-becomeness is the real fundamental definition of the ens perfectissimum', Bloch argues, but he also posits that historical struggle and political revolution bring us closer to realizing this age-old longing (188).<sup>7</sup> 'Revolutions realize the oldest hopes of mankind', he writes, and 'for this very reason they imply, demand the ever more precise concretion of what is intended as the realm of freedom and of the unfinished journey towards it' (188).

According to Bloch, the same thing is attempted again and again in every revolution, namely the pursuit of utopia. For that reason, the 'good New is never that completely new' (Bloch, 1986: 7). The fight for freedom and equality binds each successive revolution to the last, creating not only a sense of spatial solidarity among contemporaries struggling

alongside one another but 'most especially temporal solidarity as well, extending most presently to the victims of the past, to the victors of the future' (1174). This revolutionary consciousness, Bloch argues 'means that the immortal element in the individual is the immortal element in his best intentions and contents' (1174). Revolutionary practice activates the not-yet fulfilled demands of the past not only out of a sense of debt to those who have gone before; it is also motivated by the hope that the 'men of the future for whom the hero sacrifices himself will have far easier deaths', that their lives will be 'no longer violently cut short', and that 'the fear of life itself, insofar as the ruling class caused it, not least and most comprehensively through war', will finally be 'dead and gone' (1174).

As Bloch (1988: 17) admits, 'Hope is not confidence', and 'Nothing and All are still in no way decided as utopian characters' (1986: 12) – in other words, it is difficult to say from the perspective of the present what a historically redeemed future would look like. Yet the knowledge that our present struggles for freedom, justice, and equality are part of a larger history is a powerful motivation for action. Bloch puts his case eloquently when he says that 'we need the most powerful telescope, that of polished utopian consciousness, in order to penetrate precisely the nearest nearness' of the present as the concrete moment when historical change can begin (1986: 12).

## CONCLUSION: UTOPIA NOW

The reception of Bloch's work has shifted according to the changing fortunes of utopianism and, for that matter, of Marxism. David Kaufmann's (1997: 35) criticism that there 'is perhaps too much Schelling in *The Principle of Hope*, and far too much Stalin' is rather insufficiently nuanced but nevertheless raises some important questions concerning what use Bloch's thought might be for us today. Isn't Bloch's 'speculative

materialism', drawing as it does on what Habermas (1969: 325) called the 'great breath of German Idealism', not hopelessly outdated in our 'post-metaphysical' age? Moreover, given the historical failures of communism, isn't utopianism as such, with its universalist, teleological intimations, bound to be 'totalitarian'?

Perhaps the first step in a response must stem from the observation that, despite the most confident expectations and assertions, the kinds of metaphysical question Bloch poses in *The Principle of Hope* – Who are we? Where do we come from? Where are we going? – refuse to disappear. Indeed, there is a certain paradox in the fact that the apparent triumph of 'postmetaphysical thinking' heralded by Habermas (1992) has been accompanied almost everywhere by the expansion of a post-secular order in which questions about the purpose of existence are once again, or still, or increasingly, being met with religious answers. Even in parts of the world where Marxism-Leninism appears to have done its ideological work most successfully, such as the former GDR, a spirituality that once appeared thoroughly undermined is resurfacing (Pollack and Pickel, 2000). The reasons for this are undoubtedly far too complex to be addressed adequately here. Bloch certainly believed that religious longing had to be grasped as a 'sigh of the oppressed creature', and that to transcend our present, inadequate socio-historical horizon 'without transcendence' of the religious variety was humanity's true hope (Bloch, 2009: 57).

Yet he also understood that the persistence of metaphysical questions, and therefore of the kind of utopian thinking that seeks answers to them, has to do with the limits of human knowledge. Immanuel Kant argued that metaphysical speculation would continue even if the other sciences 'were swallowed up by an all-consuming barbarism' (1999: 1) if only because we have no 'experience' of the future, and therefore cannot know it in the scientific sense of the word. That does not mean, however, that we do not have any

relation to the future at all. Indeed, there is always a weakly teleological expectation that there will be future generations of human beings to pursue emancipatory goals not yet achieved. Just because the Kantian definition of knowledge 'destroys rotten optimism', as Bloch puts it,

it does not also destroy urgent hope for a good end. For this hope is too indestructibly grounded in the human drive for happiness, and it has always been too clearly a motor of history. It has been so as expectation and incitement of a positively visible goal, for which it is important to fight and which sends a Forwards into barrenly continuing time. (Bloch, 1986: 443)

Bloch makes an implicit distinction here between the 'barrenly continuing time' of cosmic chronology and the historical time of human life from which the goal or 'forwards' is derived and in and through which it has meaning.

To be sure, Bloch speculates when he claims that the darkness of the lived moment reveals and brings us into contact with the constitutive lack at the heart of reality itself. Yet as Marx revealed, *what* we speculate has implications for questions of a social and political nature, a fact that is not to be dismissed easily if we accept that knowledge has limits beyond which speculation cannot be avoided. This is not only the case when it comes to 'world views' in the classical sense. At this level, Marx showed how Hegel's mistake as a philosophical idealist was to believe that the existence of the concept of universal freedom at the level of historical institutions meant that universal freedom had actually been achieved, when it was and still is plain to see that unfreedom is everywhere.

Yet thinkers such as Hayden White (2014) have shown how the root metaphors we use all the time to interpret and describe reality have implications in the social and political spheres. Writing about the use of root metaphors in the life sciences, Kaoru Yamamoto (2007: 92) has claimed that 'life will look very differently to a person whose root metaphor is that of a ruthless, gladiatorial combat

to the bitter end than to another who perceives an aspen grove in which each tree grows individually while sustained by a common network of roots'. Bloch's root metaphor – of matter as the 'self-bearing womb' of a historical process of alienation in which human beings are capable of realizing a dream of identity latent within their power – may be speculative, but as Bloch and Adorno, taking their lead from Hegel, recognized, all thought necessarily has a speculative element.

In light of such considerations as these, I argue Bloch's legacy is best served today by interpreting his work as a politically engaged form of scepticism. We do not know whether utopia of the scale and nature Bloch envisages is achievable, but that is not entirely the point. Rather, in a situation in which people clearly still do need theories that can help orient our questioning about who we are and how we should live, Bloch's speculative materialism is one among many, but, crucially, one that is concerned to underpin a progressive and emancipatory politics. Of course, one might argue that we ought to avoid indulging this kind of grand speculation altogether, which even Antonio Gramsci called 'the opium of the labour movement'. Then again, history shows that the attempt to suppress the human imagination is just as dangerous as the desire to follow it blindly. Ultimately, the fact that Bloch seems to have personally believed even some of his own most ambitiously speculative claims does not mean that we have to. Perhaps, for those of us who would like to imagine a world beyond the end of capitalism, the *hope* that something else is really objectively possible is enough.

## Notes

- 1 That Bloch failed to secure a position at the Institute for Social Research during his time in exile in the United States was largely due to irreconcilable political and theoretical differences with Max Horkheimer, for whom he was 'too communist', and Theodor Adorno, who objected to what

he saw as Bloch's 'irresponsible philosophical improvisation' (Geoghegan, 1996: 19; cf. Schmieder, 2012: 133).

# Georg Lukács: An Actually Existing Antinomy

Eric-John Russell

## A LIFE OF DIREMPTION

Appraising a life of discord is no easy task when suffering comes in innumerable currencies. Fichte spoke of his own time as an epoch of ‘absolute sinfulness’. Ours has been arguably better assessed as the ‘new mediocrity’. The former verdict, often cited by Georg Lukács, signified a modernity that, in a word, rewarded the renouncement of instinct with chronically poor posture. International Monetary Fund Managing Director Christine Lagarde diplomatically provided the second, more uninspired, estimate of a society whose economic prospects are barely worth its name. Indeed, everywhere the blind forces of the economy drive society towards an abyss and are incessantly given rational justification. The antinomic essence at the center of such decrees need not, however, only be surmised from the grandiose macrocosm that is global political economy. Even the tiniest individual detail is not exempt from the possibility of disclosing

a wealth of objective determinations. It might even be suggested that within the seemingly arbitrary subjective flights of consciousness, the essence of a society appears more completely than when the essential questions are posed directly.

How, then, to assess a social existence teetering between the compulsion of opposite directions? Like an Ibsen play, the structure of life is full of intrigue and yet ends in indifference; we are fuming with ambition and yet hold fast to a colorless palette. The universality of this antinomy finds an overwhelming world of things antagonistically coupled with a subjectivity scarcely able to gain a foothold and yet not without the misplaced confidence to declare its supremacy.

If the contours of this contradiction are given personification within the history of Marxism, the figure of Hungarian Marxist and Soviet theoretician Georg Lukács is exemplary, and not simply because he dreamed as a child of writing plays in the spirit of Ibsen. His life and work reveal

the irresolvable antinomy between internal freedom and external necessity. From the 'transcendental homelessness' (Lukács, 1971b: 41) of his early years to his tumultuous acquiescence to official Bolshevik mandates, Lukács was a figure that illustrated the dilemma of being both held up by the neck and yet capable of wielding an incisive theoretical mind. A life notoriously wrought with recantation, self-repudiation and self-disavowal, Lukács internalized party criticism under the realpolitik moniker of 'tactical expediency'. His habitual equivocations forestalled an official excommunication from the party, or worse.<sup>1</sup> Adjusting himself to the immediate exigencies of the day, there remains a fundamental ambiguity between the stature of his own ideas and his subordination to party directive.

Living a life of diremption, Lukács remained stuck in the throat of party officials: 'They can't swallow me and they can't spit me out' (Lukács, 1983: 10). The quintessential bitter pill of this position, bringing him into direct conflict with nascent Soviet orthodoxy, is the collection of essays written between 1919 and 1923 under the title *History and Class Consciousness* (1971a). This seminal work stood as a fundamental break with Second International Marxism by both returning to the Hegelian dimension of Marx's thought and engaging the question of alienation. Lukács placed subjectivity at the center of the book, a heretical approach differing greatly from the economic determinism of doctrinal Marxism under the influence of positivism and mechanical interpretations of history. Taking these theoretical developments to task, Lukács sought to undermine their philosophical presuppositions, derived from the impasse set by the twin pillars of nineteenth-century bourgeois philosophy: materialist ontology and empiricist epistemology. For Lukács, the epistemological framework that posits an individual knowing subject against an equally ahistorical and independent object reflects the historically specific determination social form of

the commodity. Lukács thereby pursued the way in which German Idealism contained the rational kernel for overcoming positivism, ultimately leading him to the critique of epistemology in favor of a social ontology.

## REIFICATION AS A FAILURE OF MEDIATION

Alongside Karl Korsch's *Marxism and Philosophy*, published the same year, *History and Class Consciousness* captured the Hegelian dynamism of Marx's thinking. The return to Hegel, with particular emphasis on the dialectical method and its eminent category of totality, allowed Lukács to reexamine the interaction of subject and object as an historical process that generates a mode of consciousness adequate to itself. However, when the sole criterion of thought is its agreement with an impervious reality, it fails to think its own historical present and falls under the phenomenon famously theorized by Lukács as reification [*Verdinglichung*]. At the center of *History and Class Consciousness* stands the essay 'Reification and the Consciousness of the Proletariat' (1923), wherein Lukács uncovers the forms of thought mimetic to the historically specific social form of the commodity, which carries with it a particular epistemological structure adequate to the abstraction of exchange relations. Reification refers to the prevailing index of social objectivity casting its shadow over both proletariat and bourgeoisie, the subjective register of an objective fury under the abstract domination of the capitalist mode of production.

Lukács adopts the fetish-character of the commodity structure from Volume 1 of Marx's *Capital* as the model for reification. Through the production and exchange of commodities, relations between people are subordinated to the social form of the commodity, inverting their subjective relations to the supremacy and autonomy of the object.

The commodity stands over and against its creators and instantiates their practice within its own automatic circuit. The social world of commodity exchange thereby produces what Marx calls an objective domination [*sachliche Herrschaft*]: human activity becomes subordinated to objective forms of social mediation, specifically that of abstract labor, which is constituted by determinate modes of real, concrete practices and objectified through the categories of commodity, money and capital.

Through the historical transformation of the production process with its increasing fragmentation through the division of labor, Lukács distills a process of abstract and formal rationalization, effectively synthesizing the work of Max Weber<sup>2</sup> and Georg Simmel<sup>3</sup> within the framework of Marx's analysis of the commodity form as the structuring principle of society as a whole. Lukács' fundamental question is stated as such: 'how far is commodity exchange together with its structural consequences able to influence the *total* outer and inner life of society?' (1971a: 84). As 'a multivalent term of social analysis' (Bernstein, 1984: 7), the category of reification allows Lukács to disclose the universal form of the commodity within the social spheres of, for example, bureaucracy, juridical relations, journalism and marriage. Reification is not therefore simply a problem of the economy but 'the central structural problem of capitalist society in all its aspects' (Lukács, 1971a: 83). In his generalization of Marx's critique of political economy, Lukács makes explicit what was often unarticulated in Marx – the *critique of society* in which the commodity yields determinate forms of being [*Daseinformen*] and determinations of existence [*Existenzbestimmungen*] (cf. Postone, 2009).<sup>4</sup>

As a social critique, Lukács' theory of reification fundamentally concerns an inverted relation between subject and object, in perpetual antinomy, leaving subjectivity with little recourse other than to either hold fast to objective forces regarded as immutable and

timeless or defensively project rational categories onto all that surrounds it. On one side sits the irrevocable and immediate facticity of reality, as if operating by absolute necessity, while the subject of this fatalism finds only inward impotence as the world appears as a moment within and created by its rational faculties. As will become clear, a tenet of reification is therefore the failure of adequate mediation between a knowing and acting subject dragged along by the objectivity of its world. Lukács outlines a series of particular antinomies that give both sociological and epistemological expression to this fundamental condition for which the antinomic relation between subject and object is given only a reflective or, at best, a mechanically mimetic relation. Indeed, it is with different *Reflexionskategorien* that Lukács articulates reification as a failure of mediation for which a knowing subject sees, represents, reflects, imagines or pictures the world as its external object. The failure of mediation as reflection emerges as a mirroring of reality in thought which sets subject and object interminably apart.

What follows will examine Lukács' pre-eminent essay from the perspective of the irreconcilability of the antinomies, or, more precisely, from *the failure of mediation* as a perennial condition of reified social life. I will conclude with remarks on the antinomic status of subjectivity in Lukács' theory of reification. I contend that the primacy of the antinomy as the social ontology of reification – the unmediated separation of subject and object as both an epistemological and ontological problem of modern social life – remains the central theoretical core of Lukács' work. Furthermore, placing the failure of mediation at the center of the analysis will accentuate a set of dichotomies found in Lukács' own methodology – that is, an extraneous formalism that saturates his own account of the movement between each reflective structure of subject and object. Without an account of the immanent development of the antinomies of reification, Lukács is never able to fully

reconcile his epistemological analysis as a social theory. Instead, he is left to hold the sides apart while bestowing upon a particular agent the possibility of social egress that is nevertheless methodologically structured through reflective epistemology. It is therefore in Lukács' 'labyrinth of irresolvable ontological antinomies' (Lukács, 1978: 33) that we find both the failure to immanently develop the structure of his own object and his paramount contribution to what will only after him fall under the name of critical theory through its critique of modern epistemology.

### THE HEGELIAN TURN

The merit of a blade is in the incision. However, the importance of *History and Class Consciousness* is to be firstly understood from the intellectual and political climate from whence it came. Lukács' intellectual development consists in a constellation of influences that predominantly derived from the opposition to the scientific rationalism, empirical sciences and positivist philosophy that had in fact been waning since the mid nineteenth century. Here, in the prewar aestheticism and heirs of *Bildungsbürgertum* among Central European intellectuals, Lukács found himself caught between a certain irrationalist *Lebensphilosophie* and a prevailing neo-Kantianism split between Marburg and Heidelberg. Mediating the two tendencies was the influence of Wilhelm Dilthey, who adhered to the methodological separation of philosophy and the social sciences from the natural sciences. By 1912, Lukács had settled in Heidelberg and would come under the influence of Weber and Emil Lask, through whose work he would acquire a more thorough knowledge of Kant, Fichte and Hegel.

Lukács' approach to cultural questions prior to *History and Class Consciousness*

remained largely within the framework of Dilthey's *Geisteswissenschaften*. Considering Lukács' *Soul and Form*, for example, 'its tentative and fragmentary nature captures the painful reality that Simmel characterized as the "tragedy of culture," the inability of subjective and objective meaning to coincide' (Jay, 1984: 86). The antinomies of *History and Class Consciousness* appear here in the realm of culture, in the division between system and life, ethics and soul, form and wholeness, etc. It took World War I and the Russian Revolution, however, to extinguish Lukács' existential anguish and overcome the Romantic *Weltschmerz* of his student years. As long as an unbridgeable gap remained between reason and the allegedly metaphysical questions beyond the empirical sciences, both neo-Kantianism and irrationalist vitalism could not overcome the presumptions set by the positive sciences. From this point on, Lukács was beginning to transition from Kant to Hegel and would finally arrive at a more extensive understanding of Marx by the time he joined the Communist Party in 1918.

While also the period that saw him give greater attention to the works of Lenin and Rosa Luxemburg, the fundamental Hegelian thinking that would come to saturate *History and Class Consciousness* originates from the start of the war. Although a renewed interest in Hegel had emerged as early as 1900, it either tended to ignore his unrelenting critique of Romanticism and absorb him wholly within philosophical irrationalism or place him in the service of neo-Kantianism and, as exemplified in the works of Windelband, simply collapse him into Kantian agnosticism (Lukács, 1975: xi–xxx).

Prior to the publication of *History and Class Consciousness*, the reputation of the dialectic, when it wasn't dogmatized into a positivistic philosophy of nature, drowned in a sea of Kantianism and irrationalism. It was for this reason that Lukács' return to Hegel scandalized both the dominant philosophical tendencies and their political counterparts.

Lukács understood Hegel's thought as an investigation into the reality of cognition acutely aware of 'the contradictory structure and dynamic of all objects, relations and processes' (Lukács, 1978: 22). In the Preface to the *Phenomenology of Spirit*, Lukács found a new ontology in the dialectical exposition of knowledge that, while explicit in Hegel's method, is obscured by his rational system (1978: 72). This ontology consisted in the concrete becoming of true reality, for which objectivity produces its own immanent genesis. The greatest lesson of the *Phenomenology* for him was that the objectivity of thought and reality are genetically produced through the dialectical dynamic of experiential and historical development. The truth of this movement consists in the mutual penetration of subject and object, whose identity in the transformation of substance into subject elicits 'the great demand [...] that man should live in a world understood as adequately as possible' (1978: 65). In the exposition, the subject gains 'conscious insight into the untruth of phenomenal [or appearing] knowledge' (Hegel, 1977: 50) and in so doing, ultimately comprehends both itself and the world as mutually implicated and constitutive of one another. Importantly, it is the *immanent* determinations of an object of thought that are the guidelines for its dialectical apprehension. This approach stands in glaring contrast to an *a priori* or formalist approach to an object of cognition for which the knowing subject either stands over and against its object or simply applies a standardized procedure irrespective of the content of the object.

The immanent criticism of Hegel's dialectical method inherited by Marx is how Lukács grasps the essence of Marxism, described most starkly in the opening essay of *History and Class Consciousness*, 'What is Orthodox Marxism?'. For Lukács, Marxist 'orthodoxy refers exclusively to *method*' (Lukács, 1971a: 1), whereby the categories of thought are themselves conditions of existence of the knowing subject.

Fundamental to the dialectic is the category of totality. As a category that attempts to capture a system of contradictory relations, totality is always in the process of its becoming.<sup>5</sup> Hegel's ontological supremacy of a contradictory process raised this unitary conception of reality to a qualitatively new level. Never a *fait accompli* of deterministic locus or simply an accumulated set of facts, totality is instead the categorial precondition for an individual moment to unfold its universal truth. This is precisely what Lukács does in his theory of reification as deriving from the elemental form [*Elementarform*] of the commodity structure:

For here we can see in operation the truth that in the dialectical totality the individual elements incorporate the structure of the whole. This was made clear on the level of theory by the fact that e.g. it was possible to gain an understanding of the whole of bourgeois society from its commodity structure. (1971a: 198)

Hegel's contradictory ordering of the categories through their own imminent determinations for the unfolding of a totality of thought and being is inherited by Marx's critique of political economy. Marx shares with Hegel the perspective that knowledge is by no means mere description but the expression and self-knowledge of a social process by which the world is transformed. It is a genetic exposition [*Darstellung*] of the whole in its concrete determinations, a system that is necessary from the point of view of the logical reconstruction of the whole. The *Darstellung* of *Capital* proceeds in a double manner: firstly with the movement from the *immediacies* of phenomena to their essential and *mediated* determinations, and secondly by working back and developing the forms of appearance [*Erscheinungsformen*] as necessary manifestations of those essential forms. It is the totality of capital as 'value-in-process' that gives determination to each of the immediacies. In reversing directions and moving from essential categories to their necessary forms of appearance, the *Darstellung*

grasps the forms of appearance, such as wages and profit, as transformed forms of essential categories, namely labor-power and surplus-value respectively.

The dynamic of immediacy and mediation illustrated through the categories of appearance and essence derives directly from Hegel and remains a conceptual cornerstone of *History and Class Consciousness*. For Lukács, facts as immediately given must be subject to an historical and dialectical examination that distinguishes between their real appearing existence and their inner essence. While the immediacy of the given differs from its essential determinations, appearance is the mediated mode of existence of the essence rather than an illusory veil that conceals the truth of essence; it is in and through the appearance that essence acquires objectivity. Immediacy and mediation are both aspects of a dialectical process that refer to the objects of reality (Hegel, 1991: 35–7). The objectivity created by mediations necessarily yields its own immediacies.

As a central dialectical concept, mediation [*Vermittlung*] is a category of relationality. It is in fact the relating term itself, either between two other terms or a relation of one term to itself by way of a second. Against the immediate and extrinsic relation of, for example, a juxtaposition, mediation makes explicit the *internal* relation between appearance and essence, or between a seemingly independent object and a knowing subject. It is the mode of existence of the related terms and the contradictory distance given positive form between a concept and its object. The implicit contradictions contained within immediacy disclose a further development of the given object, a self-identity propelling itself forward as a reflection into itself. For this, mediation is the truth of *becoming* over any static configuration of a separate subject and object independent of one another. The category of mediation thereby contains a knowing subject – upon entering the content of its object, implicated into the structure of

its object – not as a simple relation of identity devoid of distinction but as a processual becoming. Immediacy is only one moment of the becoming of totality grasped in its isolation, a necessary appearance from the perspective of the whole rather than merely an error to be epistemologically corrected. To go beyond the immediacies of empirical reality means to comprehend objects as aspects of a totality wherein the category of mediation exposes a structurally objective reality implicated in its cognition.

## THE ANTINOMIES OF REIFICATION

The category of reification discerns in different facets of social life ‘the entrapment in the limits of immediacy and its forms of thought’ (Lukács, 2000: 126); it conceptualizes a world of inert objectivity standing over and against a subject accommodating itself merely as a functional piece of that world. On the whole, this amounts to ‘the reified disintegration of the subject and the – likewise reified – rigidity and impenetrability of its objects’ (Lukács, 1971a: 141). It is from both the subjective and objective side of reification – the antinomy between subject and object – that all other antinomies derive. ‘Reification and the Consciousness of the Proletariat’ forms the theoretical nucleus of *History and Class Consciousness*, incorporating many of the elements found in its surrounding essays. It is divided into three parts: the first part sociologically grounds the reified separation of subject and object; the second extends this primary antinomy into the critique of epistemology; and the third part provides the historical solution in the standpoint of the proletariat. Together, these three sections inherit the insight of Hegel’s *Phenomenology* that epistemology remains false insofar as it is obstructed from developing into a social theory, an idea that would become foundational for the first generation of the Frankfurt School.

## THE ANTINOMY OF QUALITY AND QUANTITY

When the commodity becomes internal to society rather than a means of relating extra-neous communities to one another, its structure begins to penetrate 'society in all its aspects and to remould it in its own image' (Lukács, 1971a: 85). This shift marks the universalization of the commodity form in contrast to being just one social regulating principle among others and wielding arbitrary quantitative ratios between exchanged products. Both objectively and subjectively, the universality of the commodity structure is the social abstraction from all qualitative determination within both the objects produced and the activity of their production. Objectively, the commodity form facilitates the commensurable exchange of qualitatively different products through the social validation of formal equality. Subjectively, this formal equality of abstraction permeates the inner recesses of individuals. As Lukács writes, the activity of the worker 'becomes less and less active and more and more *contemplative*', conforming to the mechanically fixed laws of exchange.

The pure form of exchangeability depletes commodities of their sensuous content. For Lukács, this dynamic extends throughout society, degrading the very content of life into commensurable abstract units. The result is that the wealth of concrete use-values acquires a new objectivity and substantiality through value's forms of appearance. It is in this way that the objectivity of land, for example, assumes the form of ground-rent. Within the immediacy of the commodity, 'the relations between men that lie hidden [...], as well as the relations between men and the objects that should really gratify their needs, have faded to the point where they can be neither recognised nor even perceived'. Indeed,

the reified mind has come to regard them as the true representatives of his societal existence, sub-

sisting in opposition to the concrete world it nevertheless produces out of its abstractions. Its abstract and quantitative mode of calculability is seen by the reified consciousness 'as the form in which its own authentic immediacy becomes manifest'. (Lukács, 1971a: 93)

## THE ANTINOMY OF PART AND WHOLE

Lukács demonstrates the antinomy between part and whole through an abridged genealogy of the increasing rationalization of labor over time. The development from handicraft to manufacture and machine industry witnesses the greater rationalization of the labor process and a progressive extinguishing of the qualitative and individual attributes of the worker. Labor is gradually 'broken down into abstract, rational, specialised operations so that the worker loses contact with the finished product and his work is reduced to the mechanical repetition of a specialised set of actions' (Lukács, 1971a: 88). In sum, one finds both a greater rationalization and fragmentation of labor while its temporal measure becomes more objectively abstract and calculably independent of the qualitative dimensions of the work process itself. For Lukács, the principle of rationalization is based on predictive calculability, which requires the breakdown of any complex into a series of component parts with its own special laws of operation. This 'rational mechanisation extends right into the worker's "soul": even his psychological attributes are separated from his total personality and placed in opposition to it so as to facilitate their integration into specialised rational systems and their reduction to statistically viable concepts' (Lukács, 1971a: 88). Through this process, the objectivity of the world and its inhabitants are reduced to an aggregate of atomistic facticity, in turn affirming the schism between subject and object as a perpetual disparity connected through a relation

of causal instrumentality inherited from the methods of the natural sciences.

The antinomy of part and whole resulting from the process of fragmentation witnesses the dissolution of the unity of both the product and its creator. Extending the strife between quality and quantity, the separation of part and whole finds expression in a condition for which ‘objectively all issues are subjected to an increasingly formal and standardised treatment and in which there is an ever-increasing remoteness from the qualitative and material essence of the “things”’ (Lukács, 1971a: 99). For Lukács, increasing specialization – itself stemming from the division of labor – results in ‘the destruction of every image of the whole’ (1971a: 103). Nevertheless, he contends that, at least conceptually, the whole can never be fully extinguished. The splintering of social life stands in glaring contrast to a conception of wholeness that achingly subsists within Lukács’ analysis. For example, throughout *History and Class Consciousness* the reified subject is set in distinction to what he frequently refers to as either the ‘total’ or ‘whole personality’, a shorthand which directly invokes the antinomy between part and whole operative within both the ontology of reified life and Lukács’ own method of analysis (1971a: 88, 168, 171, 319, 320).

### THE ANTINOMY OF FORM AND CONTENT

A rational systematization regulating life in all of its possible and imaginable situations subject to predictive calculation is what, for Lukács, the structure of modern legal reality shares with the structure of the commodity. The social need for exact calculation harmonizes the structure of the exchange relationship and the system of law. Largely informed by Weber, Lukács’ passages on the structural affinity between the commodity and state mechanism concern a mode of rational

formalism capable of anticipating all content. Understanding qualitative content in terms of rational calculation – that is, understanding content through form – has as its framework the cohesion of purely formal laws. The legal system of jurisprudence serves ‘purely as a means of calculating the effects of actions and of rationally imposing modes of actions’ (Lukács, 1971a: 109). Lukács extends this tendency of formal standardization to the concept of modern bureaucracy and journalism,<sup>6</sup> for which both life and consciousness are adjusted to the same commensurable premises as the commodity economy, outlined above.

### THE ANTINOMY OF RATIONALITY AND IRRATIONALITY

The antinomy between rationality and irrationality forms the contradictory essence of the capitalist economy, specifically with regards to the problem of the realization of surplus value and economic crisis. The substantive irrationality of the economy for Lukács can be discerned in moments of economic distress, which reveal the utter contingency of a society on the brink of ruination despite the rationality of its individuated parts. For Lukács, the formalism of commodity abstraction contains its own internal contradiction, a rationalization unable to completely subdue its own concrete content.

Lukács further clarifies the antinomy between formalized rational parts and the irrational whole of its content by referring to Engels’ characterization of the ‘natural laws’ of capitalist society as ‘laws of chance’: while society may appear to be held together by ‘natural laws’, the experience of their dislocation reveals the arbitrariness that in truth governs the unified bonds of partial systems. While a systematic formal necessity seems to regulate all social life, the concrete reality to which those laws pertain frequently exceeds such rationalization. In terms of

economic phenomena, there is an accidental rather than necessary connection between, for example, the amount of social labor expended on commodities and the amount of commodities available to satisfy social need. Laws of necessity are in truth fortuitous. Methodologically, the antinomy between a partialized lawful rationality and a total irrationality is displaced onto the antinomy between chance and necessity. While individually fragmented moments are ruled by formalistic rationality, the totality itself is ruled by sheer chance (cf. Adorno and Horkheimer, 2002: 1, 69, 117, 159).

### THE ANTINOMIES OF BOURGEOIS THOUGHT

In the second section of his essay on reification – ‘The Antinomies of Bourgeois Thought’ – Lukács transposes the sociological antinomies to the critique of epistemology. Specifically, he reconstructs the tradition of modern German philosophy from the perspective of the reified structure of consciousness as a universal mode of experience between subject and object. The previous pair of antinomies, between form and content and rationality and irrationality, now coalesce into the single antinomy between a rational form and its irrational content traced through a development in German Idealism. Here, philosophy is by no means merely an epiphenomenal or ‘superstructural’ problem to the travails of social life. While the section intends to establish a more comprehensive analysis of the *subjective* dimension of reified social life, it examines this terrain through the further diremption of subject and object within the realm of thought, a division that marks the actuality of the sociological antinomy outlined in the previous section.<sup>7</sup> The antinomies of bourgeois thought are the antinomies of society itself. Their irresolution is the irresolution of a historically specific situation wherein subjectivity either

collapses the world into its own immutably rational categories or, in what amounts to the same condition, fixates itself to a world outside of its control as its mere appendage. While the impulse to overcome the reified disintegration of the subject and the correspondingly reified impenetrability of objects extends beyond the issue of possible forms of cognition, Lukács nevertheless intends to give expression to the reified nature of bourgeois life through the developmental dilemmas of German Idealist philosophy, since it is there that an effort to reconcile the chasm between the antinomies is most rigorously attempted.

Lukács begins the section by recapitulating the antinomy of rationality described above and outlining a form of modern philosophical rationalism largely informed by the positive sciences. Here, a new method of human thought prevails by affirming the continuity of all phenomena and the pre-eminence of causal connections. It is an epistemic framework for which mathematical and formally rational categories envelop all heterogeneous phenomena. The positivism of its direction held philosophy to develop in tandem with the development of the exacting natural sciences and, as a result, philosophical knowledge became synonymous with systemization. The novelty of modern rationalism is its unrelenting claim to have discovered the *principle* that connects the entirety of phenomena in both nature and society. The sense of system provided by rationalism has no meaning outside the subordination of partial systems whose connections must always be postulated as necessary and are rendered predictable and calculable.

The distortion of the world into its rational systemization is, however, no mere masquerading semblance or epistemic error. In a fragment in the *Dialectic of Enlightenment*, Adorno and Horkheimer formulate the objectivity of rationalism accordingly: ‘The essence of the world coincides with the statistical law by which its surface is classified’ (Adorno and Horkheimer, 2002: 183).

The truth of reality confirms its positivist contortion. The contemplative stance which bears witness to its own formalistic constructions is itself the actual condition of society (Lukács, 1971a: 128). In other words, these are *actually existing antinomies*. Human relations are assimilated to the level of natural laws, assuming the objective form of abstractions modeled upon the conceptual systems of the natural sciences. Subjectivity is reduced to the stance of a purely contemplative observer and the irrational forces of nature are replaced by the second nature of social objectivity.

### THE ANTINOMY OF A RATIONAL FORM AND ITS IRRATIONAL CONTENT

For the principle of systematization, all content is reduced to the immediate facticity regulated by formal structure and 'must be wholly absorbed into the rational system of the concepts of the understanding' (Lukács, 1971a: 118). Formal rationality thereby contains the implicit split between an empirical datum and a rational form. The heterogeneity of the given world therefore remained a challenge for all-encompassing rational systems in which the irrationality of matter was pushed into formal mathematical models. From the perspective of omnipotent rational categories, the material substratum of existence remains a liability on their universal claims. Lukács thereby argues that when rationalism claims to be the universal method by which to obtain knowledge of the whole of existence, the necessary correlation between the rational and the irrational dissolves. The irrationality of rational formalism finds its consummate expression in the concept of the thing-in-itself of Kant's philosophy. In the *Critique of Pure Reason* (1781), Kant erects a relation between subjective knowledge and the appearance of an objective world

that is explicable in terms of its causal laws. The world *appears* as such through the forms of human knowledge, by categories imputed to the world so that knowledge about it can be possible. The law-like objectivity of the world thereby originates within the freedom of the knowing subject. The *is* of the world is subordinated to a subjective *ought*, which is the former's transcendental ground. Kant's categories of the understanding [*Verstand*] are thereby necessary for the possibility of experiencing the world at all. The fundamental antinomy within Kant's system concerns the division of the knowing subject into a transcendental self governed by the law of freedom and an empirical self administered by the law of causality. The resulting *interiority* of human freedom corresponds to the *inaccessibility* of the world as it exists in-itself. The transcendental subject which prescribes regularity to the objectivity of the world is schematically denied access to that world.<sup>8</sup>

The Kantian antinomies hold an unbridgeable gap between the noumenal thing-in-itself [*das Ding an sich*] and our knowledge of appearing phenomena organized for the possibility of experience. The non-sensuous origin of our ideas remains unknowable, a transcendental object and 'a *priori* and valid prior to all experience' (Kant, 1998: 283). Relating sensuous content to rational forms evokes the problem of irrationality insofar as there is an impossibility of reducing content to their rational elements. The problem of irrationality is the impossibility of penetrating objects without the aid of rational categories. Kant's concept of the thing-in-itself thereby solicits the limit of rational systematicity and is central for any mode of thought seeking to bestow universal applicability on rational categories.

The tension between the rational form and its irrational content derives from the displacement of the possibility of knowledge from the external world onto the knowing subject. To know the world is to know its representation through a subject ordering

and connecting perceptual manifolds. For Lukács, the limits of this knowing subject express the determinate forms of existence of bourgeois society for which the world is wholly unrecognizable outside of its rationalist mutilation. Kant's antinomies are themselves the antinomies of social life within capitalist society, the philosophical articulation and consecration of reified consciousness (Adorno, 1998: 255).

## THE ANTINOMY OF *IS* AND *OUGHT*

The antinomy between freedom and necessity within Kant's system finds resolution in the sphere of ethical practice. Nevertheless, for Lukács, this is the contemplative subject turning *further inward*. Lukács thus pursues a potential solution to the antinomy through the principle of practice exemplified in both Kant's *Critique of Practical Reason* and in the work of Fichte. Thought grasps a world it itself has created. It then, however, confronts the problem of the thing-in-itself. Its recourse, specifically with Fichte, was to turn inward – beyond irrationality, beyond the transcendental thing-in-itself, beyond the given, beyond mere contemplation. In Fichte's systematic philosophy, the seeming solution to the antinomy is discovered in the subject of action, which posits the objectivity of the world as an internal moment of itself. In this identical subject-object, all of reality is synthesized through the activity of an absolute subject.

Lukács recognizes that with Fichte a concept of the subject emerges 'which can be thought of as the creator of the totality of content. [...] Fichte's task, therefore, is to exhibit the subject of the "action" and, assuming its identity with the object, to comprehend every dual subject-object form as derived from it, as its product' (Lukács, 1971a: 123). The duality of subject and object transcends into a unity through the activity or 'positing' [*setzen*] of the subject. As Lukács observes, however, the primacy of activity can already be seen in

Kant's *Critique of Practical Reason*. Through Kant, the active subject was provided with a capacity for grounding objectivity within its Categorical Imperative for ethical action, a law that the moral subject gives to itself as a condition for its own freedom. However, like its knowledge of the world, Kant's ethical subject remains purely formal without penetrating its material content.

In the *Critique of Pure Reason*, the dislocation between subject and world translates into the separation between *ought* and *is*, which remained unresolved as long as the thing-in-itself represented a limit to reason. The introduction of a new subjectivity on the level of ethical practice also succumbs to the problem of the thing-in-itself. Kant's formal ethics prohibits the *ought* of the individual and internally free subject to externalize itself in the world – that is to say, to challenge the necessity of the *is*. What *is* remains categorically encapsulated within a deterministic system of causal laws.

While Kant posits a free subject of activity, that subject is deprived of a world in which to act. As a result, the previous antinomy between subject and object reappears within the realm of ethics. For Lukács, the contradiction of the thing-in-itself has not been overcome but only displaced insofar as the *ought* remains cut off from the world of appearances. Moral sanction ultimately derives from a realm inaccessible to the understanding, and freedom does not belong to the world of appearances. The resulting ethic becomes purely formal and without content. When this ethic tries to make itself concrete, it must borrow its content from its own conceptual system, which absorbs all contingency. As such, 'practical norms can only have bearing on the inward forms of action' (Lukács, 1971a: 124). There remains no unity of the world, or, worse yet, the duality of the world between an inward subject and impenetrable object is sublated into the subject itself and split between an empirical and transcendental ego. The empty freedom of the subject cannot avoid the abyss of fatalism.

## THE ANTINOMY OF HISTORY AND GENESIS

Before turning to Hegel as a subsequent attempt at resolving the antinomies, Lukács takes a slight detour into the philosophical sphere of aesthetics, since, after developing the antinomic fracturing of the subject through Kant's epistemic and moral philosophy, it provides yet another domain for addressing social fragmentation. Aesthetics seems to offer a solution to the antinomy as the mediation between the contemplative attitude and ethical practice insofar as the faculty of the 'intuitive understanding' yields content that is not passively received but spontaneously created. However, for Lukács, this faculty only anticipates how it might be possible to complete a perfected system whose postulate of 'intellectual intuition becomes the cornerstone of systematic philosophy' (1971a: 138), most notably in the work of Schelling. Kant's aesthetic aims to deepen the rationalism of the knowing subject while Schiller's 'play-instinct', in an attempt to restore the wholeness of man, seeks to overcome the antinomy of social life by aestheticizing the world into an absolute identity between subject and object, effectively 'mythologis[ing] the discovery of intuitive understanding' (Lukács, 1971a: 140).

The unity of subjectivity with its world can only be conceived for Lukács through the dialectic, whereby all of the previous ossified antinomies are sublated through their own immanent determinations. In both the *Phenomenology of Spirit* and the *Science of Logic*, Hegel was the first to

set about the task of consciously recasting all problems of logic by grounding them in the qualitative material nature of their content, in matter in the logical and philosophical sense of the word. This resulted in the establishment of a completely new logic of the *concrete concept*, the logic of totality'. (Lukács, 1971a: 142)

Through the category of totality, the dialectic evokes the problems of the genesis of

the epistemic subject and the dissolution of the irrational thing-in-itself. For Hegel, the knowing subject is no longer an unchanged and contemplative observer. Instead, the dialectic is enacted between subject and object, undermining all rigid opposition. With Hegel, we find the first thorough interpenetration of the subject with the object itself – the truth of Substance and Subject. Dialectics destroys reification by calling into question the tenability of absolute separations: reification thus becomes a moment superseded within dialectics (Feenberg, 2011: 183; 1981: 243). With Hegel, the riddle of reason becomes its own solution.

Lukács does not, however, rest content with the antinomies reconciled under Hegel's philosophy. There, the unity of subject and object, of thought and existence, is fulfilled *only in the determinations of thought*. The task remains to discover the concretely historical terrain from which to grasp this unity and to elucidate the *concrete we* of the subject of history. For Lukács, the subject–object as *Weltgeist* cannot fulfill the methodological and systematic function Hegel assigned to it as a concrete subject of genesis; it allegedly remains a metaphysical power instantiating the lives of empirical individuals through its own logical supra-historical movement. Hegel's philosophy, then, is driven into mythology. Nevertheless, the progressive aspect of Hegel's new path to knowledge pushes more strongly towards objective reality than Kant's epistemology of transcendental subjectivism. In Hegel's ontological advancement towards the intrinsic relation between subject and object, the identical subject–object dynamically concretizes as a process in which substance becomes subject and subject becomes substance (Hegel, 1977: 9–10).

After having grounded the antinomy of subject and object within the structure of the commodity, Lukács confronts German Idealism's attempted solutions to the Kantian aporia. German philosophy took the antinomies of society to their furthest extreme

while leaving them insoluble insofar as it could not penetrate their social origin. For Lukács, the dialectical method as the true historical method is reserved not for a superior philosophical tendency but ‘for the class which was able to discover within itself on the basis of its life-experience [*Lebensgrund*] the identical subject–object, the subject of action; the “we” of the genesis: namely the proletariat’ (1971a: 149).

### THAT INCORRIGIBLE IDENTICAL SUBJECT–OBJECT

Reification abandons mediation and is the stunted affirmation of immediate knowledge – it is the failure of the subject to impinge upon the structure of its object. However, for Lukács, the *standpoint* of the proletariat, rather than the proletariat in its empirical existence, contains the implicit potential to make explicit the mediations of immediate existence and resolve the antinomy between subject and object. Lukács thereby unfolds a theory of praxis from the standpoint of the proletariat as the free and self-conscious subjective constitution of objective forms. The relation of consciousness to reality is what the dialectic is meant to uncover, whereby the proletariat, in coming to know itself, comprehends society as a whole and thereby overthrows it. Only in this way does the proletariat become both the subject and object of knowledge – that is to say, the proletariat comprehends reality through the very act of transforming it.<sup>9</sup>

However, it has been argued that Lukács’ understanding of the proletariat as the identical subject–object is predominantly Fichtean, likely informed by the influence of Lask (Lukács, 1918). Here, objective reality is the object of human activity – not an impenetrable given but ultimately derived from the subject. For Fichte, the absolute self is the ultimate subject–object of thought and action from which everything flows; according to

this interpretation, the proletariat appears as an historically produced transcendental ego. As an identical subject–object, it is said that Lukács’ proletariat appears as an anthropological instantiation of Fichte’s subjective idealism, a self-positing subject that contains within itself all objectivity. For Adorno in *Negative Dialectics*, Lukács’ proletariat signifies a complete constitutive subjectivity that collapses the objective world into itself. Similar criticisms can be found in the work of Postone, according to whom Lukács conceives the proletariat as a totalizing subject of Hegel’s *Geist* (Postone, 2009).

If, however, in Lukács’ concept of the identical subject–object the concept of *identity* is to have any affinity with Hegel’s concept of identity, then the manner in which identity immanently demands and maintains the category of *difference* cannot be disregarded. For Hegel, identity is not simply the cancellation of differing sides. As Lukács writes in *The Ontology of Social Being*:

Hegel demonstrates the difference in identity itself, and the implicit presence of contradiction in simple distinction; the reflection character is discovered in the apparently logical and tautological category of identity, while, and closely connected, Hegel discloses the indissoluble reality of the reference to the other. (Lukács, 1978: 84)

The determinations of reflection found at the center of the *Science of Logic* salvage the complete and absolute identification of subject and object. Here, identity does not eliminate difference and that ‘the logical form in which Hegel expresses this is that “the law of identity itself, and still more the law of contradiction, is not merely *analytic* but of *synthetic* nature”’ (1978: 85). The persistence and loss of identity, as the mediation of difference through reflection, is a real process that does not simply nullify the distinctions of a relation. The possibility of adequation between subject and object without either an abstract identification or refuge within an absolute separation comes to signify for Lukács the revolutionary meaning of the standpoint

of the proletariat in the overcoming of the antinomies.<sup>10</sup>

### THE ANTINOMY OF FATALISM AND VOLUNTARISM

While the antinomies of reification in *History and Class Consciousness* acquire a predominantly sociological and philosophical form, there is an additional political manner in which the antinomies find expression. There, reified consciousness remains trapped within the two extremes of objective facticity and subjective caprice. Lukács relates 'the dilemma created by the pure laws with their fatalism and by the ethics of pure intentions' (1971a: 39) to the ideas of Austrian and German Social Democracy. For example, in the neo-Kantianism of Eduard Bernstein facticity either reigned or was reduced 'to the status of a subjective, ethical imperative' (Lukács, 1971a: 182). For Lukács, however, the dialectic between subject and object theoretically overcame the inevitability of historical law and the rigidity of empirical facticity through which neo-Kantian Marxists inferred the need to import ideals from moral philosophy.

Particularly in the essay 'The Marxism of Rosa Luxemburg', Lukács establishes the reconciled antinomy between an economic fatalism in which capitalism possesses the capacity for limitless accumulation, irrespective of its historical determinations, and that of the Social Democratic petty-bourgeois perspective that socialism can be achieved by a series of ethical choices enacted by individual intention. This political antinomy consists firstly in the mere strategic utilization of what are viewed as eternally valid economic laws, and secondly in activity that is solely directed inward – that is, 'the attempt to change the world at its only remaining free point, namely man himself' (Lukács, 1971a: 38). This latter recourse finds apt expression in an abstract Kantian ethics in

which man remains isolated from the world, operating by means of invariant normative laws applicable in all situations and at every historical moment.

The dualism of economic fatalism and ethical utopianism or voluntarism is the political correlate of the antinomies of bourgeois thought. For Lukács, fatalism and voluntarism are complementary opposites. On the one side lies the fatalistic regard for an objective reality that has the character of an impenetrable thing-in-itself; on the other stands an overestimated moral subject that regards itself as a power able of its own volition to ascetically achieve inner mastery while presuming an empirical world of unalterable structure.

Aside from the antinomy of fatalism and voluntarism, the most arresting political antinomy of *History and Class Consciousness* is the ambiguous relation between the proletariat and its representation in the form of the party. The party and the proletariat interchangeably bear responsibility for the cultivation of class consciousness, capriciously alternating between the *effect* and *cause* or *premise* and *result* of the revolutionary process. On the one hand, the party appears as the *articulation* of the proletariat, as the objectification of its own will, or as 'the visible and organised incarnation of their class consciousness' (Lukács, 1971a: 42). The party mediates between the subjectivity of the proletariat and its objective conditions (1971a: 327). However, the party is 'sometimes forced to adopt a stance opposed to that of the masses; it must show them the way by rejecting their immediate wishes. It is forced to rely upon the fact that only *post festum*, only after many bitter experiences, will the masses understand the correctness of the party's view' (1971a: 329). The party promises the overcoming of the division of labor and yet through its autonomy from the proletariat, reproduces a division of labor (1971a: 336). While the party is the alleged intermediary between empirical and class consciousness, it often appears as the mere *substitution* of

the proletariat, which only widens the chasm between empirical 'trade-union' consciousness and the class consciousness of the proletariat. All in all, the autonomy of the party (1971a: 330) from the proletariat elicits the overarching problem of antinomy in *History and Class Consciousness*.

## THE APORETIC STANDPOINT OF SUBJECTIVITY

The preceding analysis offered an exposition of Lukács' theory of reification from the perspective of a set of antinomies whose shared structure is the failure of mediation between subject and object. This structure derives from the social form of the commodity with epistemic implications illustrated through the conceptual developments of German Idealism. This has left the standpoint of subjectivity in a somewhat uncertain position, with individuality in particular consisting of little more than an abbreviated footnote to a society outside of its control. The following conclusion will thereby briefly assess the status of subjectivity in Lukács' analysis.

For a tendency within Marxism that stretches back to Kautsky, the perspective of subjective experience falls into disrepute insofar as the objective forms of the capital-labor relation cannot be reduced to individual psychologies and intentions. Lukács indeed follows in this tradition at least partially and repudiates the immediate givenness of inner experience as unconditioned and primary. Those curious to know the truth about life in its immediacy are rightly implored to scrutinize its objectively estranged form, which vindicates individual existence in its most intimate recesses. Subjective reflection thereby falls into the realm of the sentimental, arrested in a condition of lamenting the course of the world. For Lukács, class consciousness is therefore 'neither the sum nor the average of what is thought or felt by the single individuals who make up the class'

(1971a: 51) but the 'objective possibility' (1971a: 51–2, 79, 234, 327) of overcoming immediacy and thereby 'the transformation of the objective nature of the objects of action' (1971a: 175).

However, given the serene indifference with which exchange-value liquidates that which is particular, the standpoint of individual subjective experience ostensibly offers critical theory a place to linger without bad conscience. Despite all of Lukács' criticisms of the primacy of individual thought and his rejection of any individual or psychological solutions to the fragmented condition of reified life, subjectivity remains the center of gravity of *History and Class Consciousness*, most notably in the theory of reification for which the stakes of the proletariat are set. Lukács nevertheless took seriously the peril of exaggerating the importance of individuals (1971a: 193). Under reification, the individual is both destroyed and reconstituted as an empirical ego facing an unchanging objective reality or a transcendental ego of cognition without a world to inhabit. The cleft between the two poles becomes the last damaged reminder of subjectivity and solicits a tension within its standpoint. Here, Lukács gives to the proletariat the possibility of agency whose inverted form is reified consciousness. In both cases, and even under the prescribed necessity of the Leninist vanguard party, the role of consciousness thereby acquired an unprecedented prominence within Marxist theory. Rather than conceiving class consciousness as a mechanical process written into the immediate economic position of the proletariat, immediacy is superseded through the development of subjectivity, and the real dialectical forces bringing forth that immediacy are overturned within the social totality.

## EPILOGUE

The prominence of antinomies in the work of Lukács serves not only to grasp the continuity

between the alleged rift between his 'pre-Marxist' period and the work from *History and Class Consciousness* onward. Placing the antinomies at the center also indicates the continuity of some of his most enduring criticisms of his work. For example, in *Negative Dialectics* Adorno takes issue with Lukács for romantically elevating use-value as an essential substratum externally straddled by the formalism of exchange-value (Adorno, 2014: 146–8). Further, Postone provides a related criticism by calling attention to the unmediated relation between the abstract form of the commodity and its concrete content in Lukács' concept of reification (Postone, 2003: 91). The methodological failure to carry the concept of internal mediation through to the end extends throughout *History and Class Consciousness*. All of the antinomic binaries – between quality and quantity, use-value and exchange-value, form and content, the fragmented subject and the 'total personality', individual and class consciousness, etc. – have their basis in a dualism of immediacy and mediation that lacks any demonstrative internal relation of mutual constitution through a process of *becoming*. We thereby reach the remarkably counterintuitive conclusion that Lukács was *not Hegelian enough*. The question remains of how to comprehend *objective* distinctions in their immanently developing mediation without succumbing to a simple arbitrary correlation characteristic of reflective epistemology and its mechanical mimesis, in which epistemological problems extrinsically cohere with social ontology. Nevertheless, the failure of mediation, which can be assuredly said to capture the essence of Georg Lukács, remains indicative of the same reification to which he provides the key.

## Notes

- 1 On the cusp of his death in 1971, an interview with Lukács revealed a solemn breath of clarity when he was asked about a dubious historical

analogy he made to illustrate the Stalinist purges: 'Int: Do you think that the analogy between Robespierre and Danton and Stalin and Bukharin can still be upheld? G.L.: No. But I do think that it was an excusable way for a Hungarian émigré living in Russia to have thought about it at the time' (Lukács, 1983: 107).

- 2 Lukács appropriates Weber's concepts of formal rationality, modern science and industrialization pivoting upon the mechanisms of quantification and calculability. His employment of the concept of 'objective possibility' also derives from Weber's methodological writings on 'adequate causation' (Weber, 1949: 49–112, 166–88; Arato, 1972: 62).
- 3 Since the term *Verdinglichung* is only seldom used by Marx – most notably in volume three of *Capital* – it remains the case that one of the prominent ways in which the influence of Simmel appears in *History and Class Consciousness*, aside from the residual *Lebensphilosophie* and neo-Kantian separation of form and content, is the frequency with which *The Philosophy of Money* (1900) utilizes the category in varied forms, albeit as a predominantly subjective phenomenon (Simmel, 2004: 127–8, 174–5, 186, 195, 211, 278, 472–4).
- 4 It might be said that Lukács' background in the critique of modern social life and culture assisted his interpretation of Marx as a critic of social form rather than as simply a critic of an economic system (Lukács, 1970: 4).
- 5 Further, the parts to a dialectical whole do not 'interact' in a one-way causal sequence or as a functional aggregate. Lukács provides the example of how hitting a single billiard ball changes the configuration of the entire table. However, even this example is insufficient insofar as the ball itself remains in-itself unchanged. The relation of moments determines the objective form of every object of cognition (Lukács, 1971a: 13).
- 6 For Lukács, journalism is almost always the most vulgar and 'grotesque' expression of reification (1971a: 100, 172). Its recurrent debasement interestingly anticipates Debord's comments in *The Society of the Spectacle* – a book that in many ways is the theoretical heir to Lukács' theory of reification – wherein the reification of the spectacle has only its most superficial expression in the forms of mass media (Debord, 1970: §24).
- 7 Lukács briefly describes bourgeois attempts to comprehend the phenomena of reification as simply 'ideological'. This consists in divorcing the manifestations from their capitalist foundation and making them into timeless problems of human relations that offer detailed descriptions without identifying the social foundation (1971a: 95). While Lukács here makes explicit

reference to Simmel, a similar concern, beyond the scope of the present essay, could be reproached on Axel Honneth's interpretation of the concept of reification whereby the category is adapted to a theory of normative intersubjective recognition without an analysis of the sociological structure of the social form of the commodity (Honneth, 2008).

- 8 It is in this regard that Lukács at one point fittingly describes reified consciousness as the 'schematic' or 'stereotyped' consciousness [*Schematisierung des Bewußtseins*] (1971a: 334).
- 9 It is worth emphasizing that the distinction between the standpoint of the proletariat and its empirical instantiation is hardly a negligible difference in Lukács' analysis. The former refers to a potential in the structure of society bereft of the necessity for its actualization. In this way, the standpoint of the proletariat is the revolutionary capacity yet to be realized or even experienced, since such a fulfillment would weigh overwhelmingly upon the empirical world while abolishing reified facticity. It is in this way that it can be said, following Adorno, that a 'standpoint' of experience is no experience at all: 'Any standpoint it were asked to have would be that of the diner regarding the roast. Experience lives by consuming the standpoint' (Adorno, 2014: 30).
- 10 More difficult to contest than the objections to the Fichtean interpretation of Lukács' concept of the proletariat (Bernstein, 1984: 25; Feenberg, 1981: 124, 202–12, 242–4) is the influence of Lask's understanding of Fichte under which irrationality remains as an internal tension that expresses a form of thought inadequate to its object. The intrinsic irrational limit to human knowledge has it that objects can never be fully known, and it is this restriction which, for example, Rockmore cites as demonstrative of Lukács' neo-Kantian methodology insofar as German Idealism is immanently obstructed from grasping the inner social and concrete truth of its object as the proletariat and is thereby incapable of truly knowing, never mind solving, the problem of its antinomies (Rockmore, 1992).

# Siegfried Kracauer: Documentary Realist and Critic of Ideological 'Homelessness'

Ansgar Martins  
Translated by Lars Fischer

Siegfried Kracauer (1889–1966) was born into a Jewish family in Frankfurt.<sup>1</sup> Following his parents' wishes, he studied architecture, yet even then his true interests lay elsewhere, as his early engagement with Georg Simmel and phenomenology indicates. Already as a student, Kracauer wrote substantial philosophical texts, yet these would be published only in 2004. Viewed as a maverick by most established academics throughout his professional life, Kracauer enjoyed broad acclaim in the 1920s as a journalist working for Germany's then foremost (liberal) daily, the *Frankfurter Zeitung*. In this prestigious capacity, he developed meaningful intellectual relationships with Benjamin, Bloch, and Adorno, and it is principally as their associate that he is still cited.<sup>2</sup> His relationship with Adorno, whom he had mentored in his early years, though often conflicted, would remain particularly fond. Having encountered the turmoil of the disintegrating Weimar Republic in the early 1930s in Berlin, he and his wife Elisabeth left Germany immediately

after the Reichstag fire. The *Frankfurter Zeitung* dropped him soon after. It was during his years of extreme disillusionment and poverty in Paris that Kracauer, hoping for a position in the United States, developed the broad outline of the film theory that he would later publish to considerable acclaim. Only in 1941, at the eleventh hour, were Kracauer and his wife able to leave Europe via Marseille and Lisbon for New York. Though their financial situation remained precarious for another decade, Kracauer soon felt at home in the United States. He decided henceforth to publish only in English and devoted all his energy to enemy reconnaissance. Keeping himself afloat with precarious fellowships, he was initially affiliated with the MoMA Film Library. Later, he regularly served as a consultant for empirical social-science research projects and evaluated research proposals for various foundations. Kracauer gradually found new interlocutors in the likes of Erwin Panofsky, Paul Lazarsfeld, Hans Blumenberg, and the 'Poetics and Hermeneutics' circle.<sup>3</sup>

His more substantive works include a discussion of the transcendental foundations of sociology (1922); metaphysical reflections on the 'trivial' genre of the detective novel (1922–5); a sociological and literary study of the salaried employees in Weimar Germany under the spell of the early culture industry (1929–30); two autobiographical novels, of which only the first, *Ginster* (1928), was published during his lifetime; a generally under-rated 'social biography' of the composer Jacques Offenbach and the Second Empire (1938), in which he paid precious little attention to Offenbach's compositions; studies on the functioning of 'totalitarian propaganda' in Germany and Italy (around 1940); group-psychological accounts of the German character, drawing on Weimar cinema as a case study (1947), and people's 'satellite mentality' in countries in the Soviet sphere of influence (1956); a work of film theory focusing on the possibilities of representing 'physical reality' from the 'perspective of the camera' (1960); and an unfinished epistemology of history.

The biographical caesura of his emigration is imprinted on the evolution of his theory. Kracauer scholarship tends to distinguish between his earlier, more political works published in Germany and his later, more strongly empirical and aesthetic works that came out in the United States.<sup>4</sup> His politics, however, do not lend themselves to any straightforward characterization. One might say that he began as a cultural critic influenced by vitalism, subsequently became a Marxist, and then a liberal humanist – and yet none of these labels truly seem to fit. Not least, one can identify numerous continuities that cut across these outward distinctions. Overall, his texts from the later Weimar years, written between 1926 and 1933, are the ones that connect him most intimately with the development of critical theory. Kracauer was, for many years, categorized unquestioningly as a proponent of critical theory.<sup>5</sup> In the 1960s, it was his association with Adorno and Benjamin (as well as Bloch) that secured him

a readership. Especially in the eyes of the 'younger critics', Kracauer noted in 1964, the four of them formed 'a group that stands out. I would have thought that we can only welcome this state of affairs'.<sup>6</sup> Yet this all too neat association with critical theory has detracted from a fuller understanding of his entirely idiosyncratic approach and its transformations over the years.

### **'THE FIGURE OF THE COLLECTOR': CONTINUITY AND DISCONTINUITY IN KRACAUER'S WORK**

Throughout all his texts, Kracauer insisted on the need to argue in a concrete phenomenological manner and maintain a strict focus on the object at hand. His 'empathic method'<sup>7</sup> fundamentally challenged the validity of systematic conceptual dispositions and instead focused on the heterogeneity of empirical experience and the world of objects ('According to his theory, Columbus had to land in India').<sup>8</sup> His critical contribution, then, lies in his micrological insistence on the logic of the slightest object or phenomenon. As an empathic observer, he directed his gaze towards the usually overlooked pathologies, promises of happiness, and demands of everyday life and the 'lifeworld' [*Lebenswelt*],<sup>9</sup> which for him formed the blind spot of the grand theories. 'How is everyday life supposed to change if even those qualified to put the cat among the pigeons ignore it?'<sup>10</sup>

It is a reflection of Kracauer's *realism* and *pluralism* that he deployed a range of media and modes of expression in approaching the motley assortment of coexisting objects. Their philosophical sophistication notwithstanding, his acclaimed texts from the 1920s were recognizably journalistic in character; indeed, they decisively helped shape the genre of the political feuilleton.<sup>11</sup> Kracauer's writings also reflect the gaze of the trained architect. He frequently presented systematic

problems in the form of geometrical allegories and 'topographical' images, not to mention those texts which dealt explicitly with street maps, streets, buildings, and interiors.<sup>12</sup> Writing articles from the vantage point of a monocle or the apparently doomed umbrella, or offering an account of his all too human and crisis-ridden relationship with his typewriter,<sup>13</sup> he transcended the conventional realms of journalism, literature, and theory. With enormous plasticity he demonstrated what, on his reading, the period after the First World War had itself confirmed with enormous plasticity – namely, that the objects humans had created were turning into independent beings with a life of their own that interacted with one another and with the humans. In the meantime, Kracauer also wrote two autobiographical novels in which he developed the same critical diagnosis of his time and portrayed the abandonment and insecurity of the contingent subject in the 'Age of the Masses'. The principal protagonists, Ginster and Georg, frequently seem to be only passive participants who merely respond to an environment that cajoles them into taking on certain roles.<sup>14</sup> This speculative literary social philosophy stands in marked contrast to Kracauer's focus on empirical social research following his emigration. In his late film theory, the cinema screen eventually emerged as a far more reliable means of conveying the experience of physical-sensory reality.

What united these differing methodological and stylistic approaches was their phenomenological focus on the objects at hand. Against this backdrop, Kracauer was consistently concerned with the *indirect* juxtaposition of phenomena: 'To focus directly upon ideas is at any rate a sure means never to grasp them... Ideas manifest themselves rather in by-ways, in unobtrusive facts'.<sup>15</sup> Consequently, general problems too could be approached only circuitously, by sounding out contingent phenomena and their *surface appearance*. Like the notion of the anteroom, the term 'surface appearance'

was among Kracauer's central theoretical concepts. It points to the transitory and relative nature of human knowledge and insight. Yet Kracauer went further and argued that the most profound and substantial problems actually revealed themselves in the surface appearance *of the object at hand*. To give one example, Kracauer rejected the notion that National Socialism was a masked bourgeois-capitalist counter-revolution. If fascism masked anything it was the goals and interests of the concrete gang of rulers. Yet this should not detract from the need to take its ideology seriously on its own terms. Instead of tearing off the 'mask', 'as though one obviously knows already who has deigned to hide behind it',<sup>16</sup> one needed to dissect the mask itself. 'Only the character of the mask may, at best, reveal the nature of the monster wearing it, provided, that it is actually possible to tear off its mask'.<sup>17</sup>

One of the results of Kracauer's vigilance in this regard was his immediate insistence, in 1933 – when many on the left still considered it a propagandistic red herring – on the centrality to National Socialism of anti-semitism and the 'force of the annihilatory intent' it reflected.<sup>18</sup> Yet Kracauer's approach pertained not only to major ideologies such as National Socialism. For him, the symptoms allowing for a valid diagnosis articulated themselves, as a matter of principle, in 'inconspicuous surface appearances'. It was 'precisely because of their nescience' that they offered 'direct access to the basic content of social reality'.<sup>19</sup> The streamlining character of the capitalist mode of production, for instance, was, to his mind, revealed paradigmatically by the Tiller Girls. This dance troupe presented not individual human beings but 'indivisible clusters of girls' as 'ornaments'.<sup>20</sup> Similarly, the displacement of umbrellas by light waterproof raincoats with hoods bore testimony to the dwindling of the bourgeois generosity of spirit.<sup>21</sup>

In his unfinished and posthumously published study on the writing of history, Kracauer took stock of the continuity of his

work, which he saw precisely in the recording of *discontinuities*. The book, he wrote, was

another attempt of mine to bring out the significance of areas whose claim to be acknowledged in their own right has not yet been recognized. ... So at long last all my main efforts, so incoherent on the surface, fall into line – they all have served, and continue to serve, a single purpose: the rehabilitation of objectives and modes of being which still lack a name and hence are overlooked or misjudged.<sup>22</sup>

He owed this focus on symptomatic details and novel phenomena to his first teacher, Georg Simmel. In the course of the 1920s, against the backdrop of his exchange with Bloch, Benjamin, and Adorno, Kracauer developed his mode of essayistic narration into an entirely new and stringent method of socio-philosophical critique.<sup>23</sup> In 1930, Benjamin famously praised his friend Kracauer as

a rag collector... recovering rags of speech and linguistic snippets with his stick. Mumbling cantankerously and a little boozily, he tosses them into his cart, not without, on occasion, derisively letting one of these faded calico rags... flutter in the morning breeze. A rag collector out at the crack of dawn on the day of revolution.<sup>24</sup>

Yet the revolutionary political perspective Kracauer still shared with Benjamin in 1930 gradually receded after 1933 and no longer featured in his later work (although he did continue to acknowledge Marx's qualities as a historian). In the late monographs on film and historiography, he is 'merely' concerned with adequate ways of approaching concrete individual phenomena in their diversity, without any revolutionary backdrop. As he noted in 1966 in a letter to Rolf Tiedemann, he still valued Benjamin's messianic plea 'that nothing should ever be lost'.<sup>25</sup> In *History*, he drew on this demand to ground his insistence on the viability of forms of historiography that stay close to the sources, but he now viewed this not as a political but as a 'theological argument': '[T]he "complete assemblage of the smallest facts" is required for the reason

that nothing should go lost. It is as if the fact-oriented accounts breathed pity with the dead. This vindicates the figure of the *collector*'.<sup>26</sup> How far removed this sorrowful collector was from the Marxist Kracauer of the 1920s is illustrated by a letter to Bloch. Back in 1926, when he first conceived of the plan to write a philosophy of history, Kracauer had complemented the notion 'that nothing should ever be forgotten' with the claim that 'nothing that is unforgotten will remain untransformed'.<sup>27</sup> This 'motif of transformation',<sup>28</sup> located in the utopian abyss between theology and revolution, was not lost without trace, though. His experience as a refugee and his encounter with US democracy formed the counterpoint to its disappearance from Kracauer's horizon.

## DIALECTICS AND THE PARTICULAR: KRACAUER'S CONTROVERSY WITH CRITICAL THEORY

Philosophers have frequently found Kracauer's realism, pluralism, and documentary approach too imprecise.<sup>29</sup> In his reckoning with his former mentor, Adorno noted in 1964 that Kracauer felt no 'desire for the rigorous mediation within the object itself, no urge to evince the essential at the heart of individuation processes'.<sup>30</sup> Yet paradoxically, Adorno added, this was precisely the source of Kracauer's strength: 'The greater the blindness and abandon with which he devoted himself to the subject matter... the more fecund was the result'.<sup>31</sup> Since Kracauer did in fact draw out the 'essential' – by which Adorno meant the social relations refracted in the slightest detail – in his texts well into the 1930s, this was a tendentious claim on Adorno's part. The phenomena he sought out with abandon were characterized precisely by the fact that they revealed the state of society at large.

There can be no doubt that Kracauer's Weimar-era texts directly prefigured Adorno's

mode of philosophizing, be it in terms of the critique of language,<sup>32</sup> the predilection for the essayistic form,<sup>33</sup> or – as an (anti-) methodology – the ‘construction’ of systematic problems in the form of a ‘mosaic’<sup>34</sup> of characteristic individual features in which the logic of the whole shines through. Both methodologically and in terms of its content, Adorno’s own *Habilitation* (postdoctoral thesis), *Kierkegaard*, which he dedicated to his mentor Kracauer, still reflected this micrological montage technique and the ‘motif of transformation’. Yet the impulse that for Kracauer was a way out of conceptual philosophy Adorno directed back into philosophy, albeit a philosophy intensely critical of concepts. This move resulted not least from his engagement with Hegel, which Horkheimer initiated in the context of their dialectics project. For Adorno, it was the further differentiation of his dialectics that led him away from the bifurcated dialectical and social perspective of the 1920s; for Kracauer, it was his continued questioning of dialectics on behalf of dispersed and overlooked phenomena. The counterpart to Adorno’s critique of Kracauer’s neglect of ‘mediation’, then, was Kracauer’s critique of Adorno’s universalization of dialectics. The latter, on Kracauer’s reading, was no longer connected to individual sensate objects, yet they alone could provide the point of departure for critical judgements. Adorno’s ‘rejection of any ontological stipulation in favour of an infinite dialectics which penetrates all concrete things and entities’, Kracauer wrote, ‘seems inseparable from a certain arbitrariness, an absence of content and direction’.<sup>35</sup> Kracauer reproached the sort of universally mediating dialectics he attributed to Adorno for creating precisely the night in which, as Hegel had warned, all cows were black.

For Kracauer, then, respect for the boundary set by real objects was indispensable if one was to avoid being trapped by the tautological immanence of dialectical logic and stand a chance of explaining why sensory experience exceeds abstract generalizing

judgements. Adorno’s critique of the identity principle came up against the same boundary, but he responded to it negatively. Rather than resorting to ontology, he developed the relational category of the ‘non-identical’.<sup>36</sup> Adorno acknowledged the problematic nature of an all-encompassing form of dialectics yet recognized in it a real problem of capital (as a social relation), a problem that genuinely pervaded ‘all concrete things and entities’ or produced them in the first place. In his historiographical monograph, *Kracauer*, by contrast, in order to establish a connection to the object and the viability of the writing of history, resorted to material and thus to ‘positive’ solutions. It is in this dispute between Kracauer and Adorno over the unbounded character of dialectics, the significance of the damaged individual phenomenon, and the claims of immediate experience that Kracauer’s role in the context of critical theory ultimately lies. Do the individual phenomena reveal the non-material and yet pernicious nature [(Un-)Wesen] of society that reproduces itself within them, or does the crucial task lie in defending that which is irredeemably atomized against the reductionist social ascription of meaning? In fact, if one understands the essence of society as a pernicious, non-sensuous essence that disregards concrete objects and individuals, Kracauer’s and Adorno’s perspectives converge.<sup>37</sup> Both sought to defend the concrete objects against this being. Their disagreement concerned the extent to which the latter pervaded the former. For all that Kracauer subjected the Horkheimer circle to polemical criticism, especially in the 1930s, and they, in turn, viewed him with derision, their approaches continued to intersect in terms of their micrological focus. The enthusiasm Kracauer showed in 1964 for Karl Heinz Haag’s essay ‘Das Unwiederholbare’ [The Non-repeatable] is a case in point.<sup>38</sup> Nor did Kracauer ever lose sight in his late works of the fact that he was dealing with ‘constructions’ of reality. Both the camera and the work of the historian obviously represent

mediated forms of access to physical and historical reality. What truly set his German and US writings apart was the more pronounced social criticism in his earlier accounts of reality.

Kracauer's stance regarding the relative significance of dialectics and the individual case found its paradigmatic expression in the works he wrote during the Second World War. In *From Caligari to Hitler* (1947),<sup>39</sup> like Horkheimer and Adorno in *Dialectic of Enlightenment*, he developed a historiosophical scheme that culminated in National Socialism. Its frame of reference, however, was not the history of civilization; instead, he sought to portray the authoritarian disposition of the specifically German unconscious, an undertaking for which he has drawn considerable flak. Ultimately, then, he was a theoretician not of the dialectic of enlightenment but of the German *Sonderweg*. The pessimism of his focus on Germany stood in marked contrast to his much more positive assessment of Hollywood, indicating considerable optimism regarding the course of the enlightenment in the democratic West.

Already in his essay 'Das Ornament der Masse' [The Mass Ornament], of 1927, long before his orientation shifted from the critique of capitalism to democratic concerns, he categorized capitalist rationalization as a form of 'turbid' reason, implying that the latter could be distinguished from a positive, enlightened impulse, no matter how precarious. '[A]nd as history proceeds, nature, subject to ever more disenchantment, may become increasingly permeable to reason', he suggested.<sup>40</sup> For Kracauer, then, it was an increase in rationality that would effect the disintegration of the 'turbid nature' of society. Almost 20 years later, Horkheimer and Adorno's take on this demythologization process was much more skeptical and the domination of nature one of the main butts of their critique. From this perspective, it would be misleading to suggest that Kracauer was a proponent of the Frankfurt School's critical theory. Yet the controversies concerning

dialectics and micrology and the mediation and immediacy of experience were of fundamental significance to the Frankfurt School, and Kracauer was party to them, both directly and indirectly. From the vantage point of critical theory, Kracauer's gaze – like Benjamin's – stood for the 'obligation to think dialectically and undialectically at the same time'.<sup>41</sup>

While much can be gained from drawing out the controversy concerning dialectics and micrology so sharply, the concrete historical process was altogether less heroic. The dispute between Kracauer and the protagonists of critical theory sprang primarily from personal disagreements during his exile in Paris. He was commissioned to write a study on propaganda, which Adorno rejected and then rewrote, effectively creating an entirely new text (though this was actually an indication of professional rather than personal disdain). The Institute provided him neither with a living nor with an opportunity to flee Europe, and Kracauer eventually viewed it with bitter disappointment. Although 'this Institute is the only one... that... might have seemed an obvious choice all this time', he wrote to Richard Krautheimer in 1936, it was also 'the only institution in the whole world with which we neither can nor want to be involved'.<sup>42</sup>

## SENSUOUS AND SOCIAL REALITY AS KRACAUER'S PRINCIPAL THEME

Kracauer's sustained attention to individual sensuous data, to surface phenomena, and to objectification took on distinct guises during his respective ideological phases. In his first published monograph, *Soziologie als Wissenschaft* [*Sociology as a Science*], he illustrated his critique of scientific conceptual abstraction with the image of a cone that represented the ideal scientific order.<sup>43</sup> The contingent empirical world formed its base and pure consciousness its tip. In between lay the various levels of conceptual

abstraction in hierarchical order. Ideally, one should be able to move from any given individual phenomenon to the general laws and vice versa. At the very end of the book, Kracauer rejected this construction. Such a correspondence between thought and empirical reality had existed only in a lost 'era of sense' in which thought and world, subject and object had not yet been separated.<sup>44</sup> The harmony and order on which a 'scientific' – which in the spirit of the nineteenth century meant 'objectivistic' – form of sociology was predicated in fact no longer existed. All one could do was describe the fluid physical and social reality while maintaining a critical awareness of how things 'really' ought to be.

Together with Adorno, Kracauer intensified his focus on the contingent world of appearances by engaging Kierkegaard's apology of the 'individual'. In Kracauer's posthumously published monograph, *Der Detektiv-Roman* [*The Detective Novel*], the cone was replaced by a recasting of Kierkegaard's theory of stages as a theory of spheres. The ethical and religious spheres had become inaccessible and the theoretician – indeed, humanity in general – had been banished to the shady sphere of aesthetics. In the highest sphere, the religious sphere, the 'names' were still accessible in the form of metaphysical entities. Down below, this divine substance remained 'inexorably in force', but here it was scattered: 'all names are distorted to the point where they are unrecognizable'. Given its contemporary popularity, the genre of the detective novel permitted a precarious analysis of this distorted truth.<sup>45</sup> The extent and character of the distortion corresponded to the rules of the 'thoroughly rationalized society'.<sup>46</sup> Here, too, as he had done in the sociology monograph, Kracauer constructed a collapsed metaphysical-philosophical order with a hierarchy of planes, only to conclude that the sphere of individual sensuous and social phenomena was the only one still epistemically accessible.

As far as Marx was concerned, Kracauer argued in the mid 1920s that one needed to

dig a tunnel beneath the 'mountain massif Hegel' towards the naturalistic and sensualist materialism of the French Enlightenment.<sup>47</sup> While he had admired Georg Lukács's *Theorie des Romans* [*The Theory of the Novel*], Kracauer felt that *Geschichte und Klassenbewusstsein* [*History and Class Consciousness*], in which Lukács had brought Hegel back into Marxism, remained unduly caught up in idealistic concepts.<sup>48</sup> For Kracauer, the experience of physical, sensuous reality was a crucial corrective to the 'abstract' character of the capitalist world of commodities. In his essay 'Die Photographie' ['Photography'], of 1927, he explained his approach. He contrasted two photographs, one of a world-famous diva whom one could see everywhere in magazines and on billboards, the other of somebody's grandmother, portrayed when she was the same age as the diva was now. The second photograph was totally inaccessible to her grandchildren and, from their vantage point, could just as well show any other person in traditional costume. They had to take their parents' word for it that the photograph really showed their grandmother as a young woman. It was the 'memory image' of the grandmother, bequeathed to them by their parents or other contemporaries, that lent meaning to the photo. Yet, inevitably, what the camera had caught was in various respects at odds with this 'memory image', much more (noticeably) so than was the case with photos whose meaning seemed instantly self-evident. In the discrepancy between the 'mere surface cohesion' of the photograph and the 'memory image' (or its ostensibly self-evident meaning), seemingly meaningless 'remnants of nature' – in other words, sensuous physical reality – became visible, rendering this discrepancy the (potential) locus of emancipation. Reality only became visible in the photographs once the status of the diva and the 'memory image' of the grandmother were forgotten. The emancipatory potential of photography lay precisely in this ability to expose the

'mere surface cohesion', because, in contrast to the hermetic ideological meanings produced by society, reason could reassemble the uncovered remnants of nature and give them a new order.<sup>49</sup>

In his monograph on salaried employees, *Die Angestellten*, Kracauer collated tableaux, as the book's subtitle indicated, 'from contemporary Germany'. Here, physical reality featured predominantly as the locus of floundering sociation, as the surface appearance of the corporeal *lifeworld* of the Weimar-era cult of sport, the body, and youth. To his mind, this idealization of the corporeal represented a form of false concretism, a fetishization of 'mere vitality'.<sup>50</sup> Here, too, the implication would seem to be that reason had to destroy this fetishization. The praise of the youthful body and debasement of age (not least on the job market) demonstrated 'indirectly that under the current economic and social conditions humans are not living life'.<sup>51</sup>

For Kracauer, the conformist 'cult of diversion' that he saw at work in Berlin's Weimar-era cinemas diverted attention away from social reality and colonized sensuous reality.<sup>52</sup> In his relevant studies from the late 1930s onwards, he argued that National Socialist propaganda went one step further: 'The Nazis utilized totalitarian propaganda as a tool to destroy the disturbing independence of reality'.<sup>53</sup> The power of the fascist images emerges as the diametrical opposite of the emancipatory capacity for sensuous experience in which Kracauer placed his trust. In 'totalitarian propaganda', decontextualized elements of reality were instrumentalized, and reality was 'put to work faking itself'.<sup>54</sup> Real bodies of knowledge and traditions were transformed into malleable narratives that could be randomly deployed. Goebbels's understanding of propaganda as a 'creative art' had to be taken literally in the sense 'that a world shaped by the art of propaganda becomes as modelling clay – amorphous material lacking any initiative of its own'.<sup>55</sup> This form of propaganda was creative in the worst possible sense and lent a new meaning

to existing orders, a form of meaning that was capable of violently asserting itself against the previous reality.

Kracauer addressed the manipulation and deletion of reality in Nazi films with his own *Theory of Film*, which, as the subtitle indicated, promised *The Redemption of Physical Reality*. This redemption was facilitated by the perspective of the camera that records physical life in motion. The camera's documentary capacity, he argued, reached beyond the human apparatus of perception and abstract thought. Successful films therefore provided people with 'a chance of finding something we did not look for, something tremendously important in its own right – the world that is ours'.<sup>56</sup> At its best, film could effect in the viewer – who was half in a dream-like state, half awakening to actual reality – an awareness of the logic and language inherent in the objects that surrounded him, of 'the murmur of existence'.<sup>57</sup>

On Kracauer's account, the epistemology underlying the writing of history was like the redeeming eye of the camera. In *History*, it was the 'micro' and 'macro dimensions' in the 'structure of the historical universe' that corresponded to the different layers of the cone of abstraction and the collapsed Kierkegaardian spheres.<sup>58</sup> Kracauer primarily argued the case for microhistory. Only the inherent logic of the slightest objects could be recorded and represented responsibly. To be sure, to do so one also needed cautiously to extend one's scope and venture into broader contexts. Yet the emphasis always needed to lie on allowing the idiosyncrasies and specific temporality of the sources and objects to emerge. Kracauer thus clarified the meaning of his focus on the 'figure of the collector': like the camera, the historian salvages the hopeless fragments of physical reality and in so doing gains a form of contemplative access to that reality and to the conditions of his or her own human existence.

Physical reality was not yet the ultimate point of reference, though. Films, Kracauer suggested, 'penetrate ephemeral physical

reality and burn through it'. Yet where that took them, 'their destination', he hastened to add, his study could not determine.<sup>59</sup> Kracauer's relativism, then, did not precipitate a critique of all epistemic claims that detract from the heterogeneous world of objects. Rather, it led him to bracket this world of objects as the 'anteroom'.<sup>60</sup> Hence the subtitle of *History: The Last Things before the Last*. Kracauer wanted to refer to the 'last things', the objects of metaphysics and eschatology, only *ex negativo*. This negation nevertheless indicates a theological dimension in the deep structure of Kracauer's thought that runs through all his writings from the Weimar era onwards. It was both as constant and mutable as his concept of sensuous reality.

### **'TRANSCENDENTAL HOMELESSNESS': THE SHOCK OF THE FIRST WORLD WAR AND THE RELIGIOUS REVIVAL MOVEMENTS OF THE WEIMAR ERA**

In much of the secondary literature, Kracauer's religious early works (roughly up to 1926) are distinguished from his irreligious later work. Yet initially, religion was in fact of no great interest to Kracauer. It only became a substantive concern after the First World War. The form of liberal Judaism he encountered in his parental home evidently instilled no pious sentiments in him. As he noted in one of the few early diaries that have survived, in 1907 he demonstratively read a biography of Nietzsche on Yom Kippur (though he did not take to Nietzsche, either).<sup>61</sup>

The isolated modern subject and its attempts to come to some form of accommodation with its environment formed a central focus in his early writings (which, as mentioned, were not published during his lifetime). Here, too, he was already grappling with the problem posed by the 'manifoldness' of reality. However, he still saw a way from the Spirit to the world. 'The relativist',

he wrote in 1916, 'is a relativist only because he wants to be a dogmatist'.<sup>62</sup> From the fact that there is no one all-encompassing truth, the relativist concluded that there was no point in even trying to attain the manifold truths that could be determined on the basis of experience. The dogmatist, by contrast, failed to comprehend the manifoldness of reality and assumed that truth could be found only where basic human experience clustered around extant concepts. For Kracauer, the goal was a sense of rootedness in the world and of 'community' [*Gemeinschaft*] attained by the subject by arranging its experiences in the radiant light of 'concepts'. This forging of ideational links between the subject and the environment and community within which the isolated individual found itself was Kracauer's concern, *inter alia*, in 'Über das Wesen der Persönlichkeit' [On the Essence of Personality], written in 1913–14. He characterized the human personality as a cosmos of concepts gravitating around one core concept.<sup>63</sup> In the only text of this corpus of largely neglected early philosophical works published (in part) at the time, 'Vom Erleben des Krieges' [On Experiencing the War], which came out in the *Preußische Jahrbücher* in 1915, Kracauer applied this scheme to patriotism [*Vaterlandsliebe*] and argued that the latter was only genuine and durable if it formed the core of the personality.<sup>64</sup>

In the event, patriotism did not offer a successful path towards either the Spirit or the community. Instead, the First World War turned out to be a catastrophe. Consequently, *Ginster*, in stark contrast to this early text, became an anti-war novel. Against this backdrop and the sense of crisis it generated, Kracauer's categories became more reflexive. One of the thematic implications of this development was his 'departure from inwardness'.<sup>65</sup> In the early writings, he had lamented the loneliness of the modern subject, sought a sense of belonging through the attachment to grand ideas and ideals, and experienced the manifoldness of external reality as dolorous. In his subsequent works he identified

'objectless inwardness' as a form of idealistic ideological deception: 'The fact that the artistry with which the book elucidated mental states was praised', he wrote in *Georg*, 'led Georg to suspect that it obscured the external circumstances all the more intensely'.<sup>66</sup>

Kracauer focused on the question of why the extant forms of human sociation were so deficient, resorting to a new discipline and an old promise: sociology as the quest for the logic of sociation, on the one hand, and the quest for a religious community that would transcend the mundanities of earthly existence, on the other. In the early 1920s, like Erich Fromm and Leo Löwenthal, Kracauer was drawn to the charismatic Frankfurt Rabbi Nehemias Anton Nobel and subsequently, for a short while, to the *Freie Jüdische Lehrhaus* [Free Jewish Academy], established, also in Frankfurt, by Franz Rosenzweig and Martin Buber. In his features, he reported critically on other neoreligious movements and prophetic figures such as Hermann Keyserling, Eugen Diederichs, Rudolf Steiner, and their esoteric 'circles'. Kracauer's novel *Georg* also bears eloquent testimony to the Weimar smorgasbord of worldviews. Its principal protagonist jauntily moves through various religious and political sects before finally blurting out, mid-conversation, the tenets of a social critique tinged with Marxism.

In the end, Kracauer viewed all religious attempts to lend meaning to human life with skepticism. Yet in the early 1920s, he was convinced that only religion could provide a solution to the crisis of modernity. As he wrote in 1922, philosophy could only point to the chaotic and lawless present in self-critical terms and thus 'help prepare, within narrow limits, the transformation, which can already be sensed faintly on occasion and will lead an expelled humanity back into the new-old realms suffused with divinity'.<sup>67</sup> For life that still *had* meaning, this had not been a concern. Kracauer's point of reference for this idea was a neoromantic notion Lukács had developed in *Die Theorie des Romans*. It concerned periods in which the deity had melded

the world into a meaningful totality and in which subject and object, content and form were still coextensive. Lukács called these 'blissful times' [*selige Zeiten*];<sup>68</sup> Kracauer referred to them as 'meaningful eras' [*sinnerfüllte Epochen*].<sup>69</sup> Yet this holistic unity of a mythical golden antiquity had fractured. This notion implied a pessimistic theory of modernization as a process of anomic differentiation. For the implications of this development, Lukács had coined the term 'transcendental homelessness';<sup>70</sup> Kracauer's utopian notions in these years were authoritarian and reactionary to match. Given his desire for an objective and irrefutable footing and his yearning for meaning anchored in attempts at religious restoration and revival, he in fact had more in common with the modern prophets he criticized than he would have cared to admit.<sup>71</sup>

Kracauer's quest for a meaningful footing in the absolute ultimately clashed with the insight that the religious revivalist movements never delivered what they promised. He remained an agnostic who, despite wanting to, could not believe. Every spiritual proposition seemed to short-circuit the issues it claimed to address.<sup>72</sup> In Ernst Bloch's 1918 theosophical narrative of illumination, *Geist der Utopie* [*Spirit of Utopia*], for example, he saw 'God running amok',<sup>73</sup> and he soon concluded that new religious formations were 'illusory and romantic' and that 'the positive word' was therefore 'not ours'. Instead, one needed to be 'a thorn' in others' sides; it was better 'to drive them, with us, to desperation than to give them hope'.<sup>74</sup> The only contribution one could make to redemption lay in the forthright denunciation of false promises of redemption. Kracauer thus initiated the *Bilderverbot* [prohibition of the image] that would later feature prominently in critical theory. As Kracauer put it in 1926 in his critique of Buber and Rosenzweig's 'Germanization' [*Verdeutschung*], i.e., their German translation, of the Tanakh, the religious revivalist movements merely immobilized the vexing heterogeneity of the world, substituting

a false harmony for the totality of meaning that had been lost. Precisely because of their conceit that the translation should make the word of God audible in a new way, Buber and Rosenzweig resorted to neoromantic phraseology.<sup>75</sup> Kracauer directed the same critique at the *völkisch* religious publisher Eugen Diederichs, who claimed that the germanizing 'word agglomerations' with which he advertised his 'religious propaganda weeks' originated organically in the very essence of the German people [*Volk*].<sup>76</sup>

In order to uncover the original meaning of the religions, one needed to take a detour that entailed secular criticism. Kracauer's critique of Buber and Rosenzweig hinged on a theoretical assumption he shared with Adorno and Benjamin – namely, that of the 'migration' of theological 'truth' into the 'profane'. 'Economics instead of explicit theology!' he demanded in 'Zwei Arten der Mitteilung' [Two Types of Communication]. 'First the outrage in the material realm, then the contemplation which, for heaven's sake, must not detract from that realm'.<sup>77</sup> Those categories in the religions and myths in which truth had once inhered now had to be demythologized, and the content of theological categories had to change in tandem with social transformations until it could 'hold its ground... in the face of the lowliest needs... One would need to come across theology in the profane and point to the holes and fissures of the profane into which the truth has sunk'.<sup>78</sup> Only on rare occasions did Kracauer clarify that the 'indirect path' of profanity implied not only a critique but also a practical attempt to establish this-worldly truth. Thus Kracauer argued that the 'concept... of the classless society', for instance, 'represents not least a contemporary transformation of theological fixations'.<sup>79</sup> Drawing on Kafka, Kracauer described the structure of capitalist society as a 'burrow' and a self-created prison of humanity. For the time being, only its critique was indirectly preparing the way for its destruction, which would amount to the uncovering of the obscured reality.

The articulation of social criticism was thus equated with the Kafkaian 'theological' perspective: 'The true law is thrown into relief only by the untruth that surrounds it'.<sup>80</sup>

If one takes the theological discourse between Benjamin, Kracauer, Adorno, and Bloch into account, the conventional account that has Kracauer swap his religious for a political stance in the mid 1920s turns out to be imprecise. Both phases were in fact political and religious at once. The conservative-authoritarian episode, with its historico-metaphysical notion of the shattered absolute and the yearning for community, was superseded by a vision of utopia that drew on both Marxism and messianism. As he wrote to an author whose book he reviewed in 1929: 'But theology exists and, like you, I acknowledge the reality of the term eternal'.<sup>81</sup>

### **'HOMELESS SHELTER': THE MASSES OF SALARIED EMPLOYEES AND THE CULT OF DIVERSION**

Like the implicit theology, the concept of 'homelessness' he had appropriated from Lukács's *Theorie des Romans* also ran through Kracauer's subsequent work. The way in which his utilization of this concept changed over time allows us to chart the development of his philosophy overall. In the early 1920s, he still used the concept as a means of expressing the metaphysical pessimism with which he viewed his own situation. By the end of the decade, the concept had gone from being an expression of his vantage point to forming the object of his investigation. Kracauer now pointed to the authoritarian potential that lay in the desire for a definitive footing and used the concept to characterize the socially unaware and historically hopeless salaried employees of the Weimar Republic.<sup>82</sup> As Kracauer added later, it was precisely the middle-class salaried employees in their state of homelessness who formed the first and principal target audience

of 'totalitarian propaganda'. Their quest for an absolutely secure shelter was a precursor of the conformist rebellion of the Nazis.<sup>83</sup>

In the essays on the salaried employees he wrote in 1929 and 1930, Kracauer's philosophy reached its initial apex, both in terms of style and acuity. In the introduction to the book version, he juxtaposed his account both to merely descriptive reportage and to merely deductive 'idealism', and emphasized its constructed, mosaic-like structure.<sup>84</sup> He had condensed, once again indirectly, ethnographic observation of the relevant milieux, advertisements and death notices, leisure opportunities, the self-promotion of certain associations, and the content of personal conversations to arrive at a comprehensive cultural diagnosis. Kracauer portrayed a new class, which, in the eyes of both the right and the left, should never have emerged and which no longer trusted in the utopian promises of either left-wing or bourgeois-liberal politics. The number of salaried employees had grown exponentially after the First World War, and they formed a 'new middle class': the 'white-collar proletarians' and petty bourgeoisie of the Weimar Republic. They were in fact proletarianized but superficially aspired to bourgeois cultural values. It was the task of the emerging culture industry to meet these aspirations. Kracauer illustrated this by pointing to Berlin's nightlife. In the popular entertainment venue 'Haus Vaterland' he saw a 'homeless shelter'. 'Nothing is more characteristic of this life, which can only be called life to a limited extent', he wrote, 'than the way in which it perceives of higher things. In them it sees not substance but glamour. It grasps them with the means not of concentration but of diversion'.<sup>85</sup> The 'geography of the homeless shelters' was shaped by dance-hall music, enthusiasm for sport, cinemas, and the allure of fairground booths: in short, by the 'cult of diversion'.<sup>86</sup> As the erosion of traditional modes of sociation gathered pace, the salaried employees epitomized the transformation of human beings into appendages of capital. They became more and more

streamlined and atomized at the same time. Where the repressive authority of tradition had died away, images from films and magazines came to define culture.<sup>87</sup> From its analysis of the pseudo-authenticity required at job interviews ('virtuous pink complexion') to its focus on the integration of leisure activities as workplace amenities, *Die Angestellten* is Kracauer's most topical book.

For Kracauer, the concurrence of conformism and atomization was closely connected to the – at the time much discussed – sociological concept of the masses. The First World War and the rapidly rising number of salaried employees in the cities were widely seen as the dawn of an age of the masses. Unwittingly, the atomized individuals – for whom the ideologically malleable salaried employees stood paradigmatically – lined themselves up as a 'mass ornament'.<sup>88</sup> The organic solidarity of the pre-capitalist eras had been shattered by the capitalist mode of production. What remained were subjects who were like dots clustered into pseudo-geometrical structures that matched the functions of economic rationality. The Tiller Girls or the assembly-line workers laboring in perfect synchronicity were cases in point.

As Kracauer noted elsewhere, the largest mass was the proletariat. Its emancipation had to consist precisely in the shedding of its state as an amorphous agglomerate of 'mass particles'.<sup>89</sup> Fascist propaganda intentionally treated human beings as masses within which the individual was interchangeable and which, in their entirety, were easily manipulable.<sup>90</sup> From Kracauer's point of view, the transition from the capitalist 'cult of diversion' to reactionary propaganda, then, was a fluid one. The atomized individuals were diverted so they did not congregate, the masses so they did not rally. In the first part of *Erbschaft dieser Zeit* [*Heritage of Our Times*], published in 1935, Ernst Bloch discussed Kracauer's *Die Angestellten* and the 'cult of diversion' in detail. 'Cinema or race', he concluded succinctly, were apparently two homologous modes of that cult.<sup>91</sup>

Kracauer's notion of the ornament formed by the masses was underpinned by a description of the ways in which socially produced economic forms became second nature, placing human beings at the mercy of its laws and the structures it stipulated. To be sure, compared to pre-modern organic forms of association the geometry of the mass ornament amounted to a form of rationalization. Yet given that people were unaware of its functioning and it was not instituted by reason, it still belonged to the realm of nature; indeed, from the perspective of reason it represented a 'relapse into mythology so massive that a greater one seems inconceivable'.<sup>92</sup> His strong concept of reason notwithstanding, then, in *Das Ornament der Masse* Kracauer observed elements of the dialectic of enlightenment: phenomena and relations that have developed historically, specifically economic ones, gain a momentum of their own that determines human existence no less comprehensively and mercilessly than did fate in the mythical mindset.

In keeping with the theological concept of the migration of truth into the profane, which could not simply be leapfrogged but needed to be subjected to critique, Kracauer warned against a premature quest for an alternative praxis in the existing order or in the context of escapist forms of community. This would amount to 'disrespect for our historical locus'. The only viable way led 'right through the mass ornament, not backwards from it'.<sup>93</sup> Against the bourgeois critique of the thoroughly capitalized mass culture Kracauer consequently insisted that 'aesthetic enjoyment of the ornamental mass movements is *legitimate*'.<sup>94</sup> At least this form of mass entertainment was in touch with the current state of reality, which was more than could be said for the elitist enjoyment of high culture.

This also helps explain Kracauer's focus on film as a modern, mechanized art form. The screen was the paradigmatic surface on which the logic of society – from the Tiller Girls to totalitarian mass rallies – could quite

literally be watched. Traces of this ideology-critical understanding of the cinema were still present in his later film theory; for instance, when he wrote: 'The film screen is Athena's polished shield'.<sup>95</sup> By watching her reflection in this shield instead of looking at her directly, Perseus was able to approach Medusa without turning into stone. For Kracauer, this allegory implied that, even where the human apparatus of perception and conceptualization had shut itself off ideologically, say, in the face of the unimaginable horror of National Socialism, that horror could still be confronted with the gaze of cinematic realism.

### AHASVER, CHARLIE CHAPLIN, AND JACQUES OFFENBACH AND THE EPISTEMIC SUBJECT IN KRACAUER'S THEORY

Whether Adorno was right in assuming that Kracauer had derived his idiosyncratic 'gaze', which viewed even the familiar as 'an object of amazement', from the sublimation of a 'childhood trauma of dubitable belonging' is a moot point.<sup>96</sup> Certainly, it was not only his contemporaries and subsequent scholars who described him as a loner and a maverick. As his early self-identification as 'transcendentally homeless' indicates, he too saw himself in these terms. Later, he would describe his existence as 'exterritorial'. This sense of alienation was owed not least to the antisemitic animosity he encountered at school.

This outsider perspective has repeatedly been interpreted as a specifically Jewish form of subjectivity. It should be borne in mind, though, that the characterization of 'the Jew' as an alien and outsider resonates profoundly with fundamental antisemitic tropes. Kracauer grappled with this problem in an intensely reflective manner.<sup>97</sup> His references to the anti-Judaic Christian myth of the 'eternal Jew' Ahasver are a case in point. An early unpublished note bore the title 'Die ewigen

Juden' [The Eternal Jews]. Here, Kracauer described the Jews as isolated and displaced, as 'vagrant souls'. They ought to find their 'realm' [*Reich*] among their fellow human beings yet are not granted access to them.<sup>98</sup> Ahasver repeatedly turned up again at crucial junctures. In the theses on antisemitism Kracauer published anonymously in 1933, he cited the eternal Jew as the exemplary cosmopolitan who transcends humanity's natural separation into races and classes. He characterized this 'explosion of an existence beholden entirely to nature' and reorganization of nature with the means of reason (which he had also outlined in 'Die Photographie' and 'Das Ornament der Masse') as a 'Jewish trait directed towards redemption'.<sup>99</sup> In *From Caligari to Hitler*, Kracauer interpreted Paul Wegener's second *Golem* film (1920) as one of the few attempts in the history of Weimar film to leverage reason and liberate the oppressed. In the film, Ahasver is among those whom the legendary Rabbi Löw invokes in defense of Prague Jewry. For Kracauer, both the eternal Jew and the Golem symbolized reason.<sup>100</sup> In *History*, finally, Ahasver represented the dialectic of time and historical nonsimultaneity.<sup>101</sup> Condemned for all eternity and wandering through all ages, he embodies the paradoxical unity of continuity and discontinuity in history.<sup>102</sup> Ahasver was just one of the allegorical figures with which Kracauer illustrated systematic problems in his late work. Uniquely, though, he can also be interpreted in autobiographical terms. The way in which Kracauer's Ahasver changed over time perfectly encapsulates the development of his theoretical and political point of view, from his early lament about the rootlessness of modernity via the 'explosion' of social relations beholden to nature to the involuntary witness of the involute course of history that leads to no redemption.

Within the context of Kracauer's changeable theory, the empathic outsider was the epistemic subject and, in turn, inseparable from the empirical subject. As opposed to the deluded people who aligned themselves

with the mass ornament, the gaze of the outsider focused on the essential surface appearances and recognized their patterns. The principal protagonists of his two novels, Georg and Ginster, also embody this vantage point. There is one caveat, though. Elsewhere, Kracauer portrayed the objects of his investigation as clear-sighted outsiders of this kind. In 1919, Kracauer credited his first teacher, Georg Simmel, with the gaze of the rootless stranger, who, for that very reason, can observe the state of the world with the requisite distance.<sup>103</sup> In 1926, he ascribed this estranging gaze to 'the Jew Kafka', whose writings brought 'dread into a world' from which 'the countenance of truth is withdrawing'.<sup>104</sup> This is exactly the position of Adorno's later 'inverse theology', which can reveal no divine secrets but only the utter negativity of the existing order.<sup>105</sup>

For Kracauer, nobody represented this figure of the outsider more incisively than (the non-Jew) Charlie Chaplin. Kracauer's take was in some ways similar to Hannah Arendt's claim on Chaplin for her hidden tradition of the Jew as pariah.<sup>106</sup> To Kracauer's mind, Chaplin demonstrated that the experience of one's hostile environment could be processed aesthetically and reflected upon in an emancipatory manner. As the (ostensible) preacher in *The Pilgrim*, Kracauer wrote in 1929, Chaplin discredited sectarianism by outwardly imitating it.

Finally, he walks off, one foot in the USA, the other in Mexico. Religion is no more his home than any fatherland. Nor do his fellow humans offer him a genuine home... One has to fear and outwit them like the things... for him, organic and inorganic nature are one and the same thing... He simply does not know his way around life; he has no religion and no fatherland.<sup>107</sup> And yet, for all that, he does still have a home, one that seems palpable to anyone who sees him.<sup>108</sup>

Kracauer's construction of Chaplin reflected his assumption of a form of human impotence that was experienced involuntarily by Jews and that everybody could grasp on the screen.<sup>109</sup> In film, he found the

epistemological reliability he had sought in vain elsewhere. Through Chaplin's performance, a trace of rootless rootedness could be experienced in a tangible manner all over the world, or at least wherever the film was shown.

In his second-most controversial book, after *From Caligari to Hitler*, his monograph *Jacques Offenbach und das Paris seiner Zeit* [*Jacques Offenbach and the Paris of His Time*], written while in exile in Paris, Kracauer took a similar approach. His major concerns throughout his work converged in this 'social biography' [*Gesellschaftsbiographie*]. It too was a product as much of construction as of reconstruction. It comprised historiosophy, assemblages of single frames, sociology, and indirect-allegorical contemporary analysis. Given that the book focused on a Jewish immigrant in Paris and Kracauer portrayed Napoleon III as a tyrannical dictator, one can even discern an autobiographical dimension to the project.<sup>110</sup> Written when he was in great financial difficulties, it was pitched at a broad readership. This, and the fact that Offenbach's music barely featured in his account, precipitated profoundly polemical responses from both Adorno and Benjamin.<sup>111</sup>

Like Kafka, Chaplin, and Ginster, Kracauer's Offenbach achieved a satirical estrangement from the society that surrounded him, whose contours he threw all the more sharply into relief for it: 'He is a mockingbird'.<sup>112</sup> As such, he did not destroy or profane the lofty and sacred, but he did discredit that which unjustly donned the mantle of sanctity. From the perspective of the mockingbird, one saw an inversion 'of the customary image of the world. Many things that seem to be at the bottom are in fact on top; many things generally considered great turn out to be small'.<sup>113</sup> Later on in the book, Kracauer described Offenbach's qualities in terms of the confluence of two Jewish backgrounds: emancipation in the spirit of the tolerance that Offenbach's father represented, on the one hand, and an inclination Kracauer ascribed to Jewish bandmen

and occasional and wandering musicians [*Spielleute*], on the other – namely, that 'they played and engaged in tomfoolery at worldly festivities with the same dedication they displayed when performing their duties in the synagogue'.<sup>114</sup> Kracauer also invoked the problematic Jewish motif of peregrination [*Wanderschaft*]<sup>115</sup> and a form of homesickness with metaphysical connotations for which the boulevards of Paris – as a 'home for the homeless'<sup>116</sup> akin to the 'homeless shelter' – offered poor compensation. Kracauer attributed Offenbach's operettas to a society that had itself become operetta-like under the dictatorship of Napoleon III. They offered 'intoxicating illusions' to the citizens who, having been expelled from politics, were now confined to the private sphere.<sup>117</sup>

Here, then, all the characteristic tenets of Kracauer's early theory – emancipation, sensuousness, homelessness, and ideological diversion that serves authoritarian domination – were assembled. Kracauer's mockingbirds – the principal protagonists of his novels and Chaplin, Kafka, Simmel, Offenbach, and Ahasver – had (at least) three functions: the first was epistemological, the second directed towards the critique of society, and the third existential. Their status gave rise to social criticism and as excluded figures they were credited with a gaze well suited to that criticism. At the same time, their quest for a 'home for the homeless' reflected Kracauer's grappling with his own existence.

Today, Kracauer is discussed predominantly as a pioneer of film and media studies. A second line of reception takes the perspective of intellectual history and reads him as a critical social philosopher akin to Benjamin and the proponents of critical theory. In both cases, he is considered a classic. Yet this generally leads to his no longer being engaged as a thinker who has a genuine contribution to make to current debates. He continues to be discussed in university seminars and doctoral dissertations, and a first biography was published to mark the fiftieth anniversary of his death. Whether he really could be used to

initiate broader debates seems a moot point, though. On the one hand, his fundamental critique of theoretical endeavors on behalf of the individual objects has lost nothing of its topicality. The ignorance of academic and ideology-critical analyses regarding inconspicuous everyday phenomena remains a constant challenge. Taking up Kracauer's legacy means learning to engage in exacting observation rather than simply allowing explanatory patterns and concepts to click into place. On the other hand, the work of this 'collector' radiates a sense of cultural anti-quarianism. One encounters typewriters, tatty umbrellas, silent movies, forgotten micro-historical events, and missed opportunities. Where Kracauer offered thick phenomenological descriptions rather than engaging in theoretical argument, his texts appear irrecoverably historical. The question, then, is not whether they can be short-circuited with the current state of academic thinking but what current readers can learn from them about their own conditions.

# Alfred Seidel and the Nihilisation of Nihilism: A Contribution to the Prehistory of the Frankfurt School

Christian Voller

Translated by Jacob Blumenfeld

In a lecture on *Negative Dialectics* on December 7, 1965 that dealt with the relationship between Marxism and idealism, Theodor W. Adorno mentioned the name of Alfred Seidel, a ‘late friend from my youth’, who introduced the concept of the ‘metaphysics of the forces of production’ into the critique of Marxism. This concept, according to Adorno, claims that within a certain Marxist theoretical tradition, ‘a simply absolute potential is attributed to the productive forces of human beings and their extension in technology’ (Adorno, 2008: 96). The critique of this metaphysics of the forces of production, along with its accompanying absolute belief in progress, became a central theme in the formation of critical theory, at least from *Dialectic of Enlightenment*. It is all the more surprising that the name Alfred Seidel never appears in this context. The casual mention within the lecture of 1965 – which was never intended for publication – remains Adorno’s only reference to the ‘friend from youth’. And even the

commentary by the editor of the lecture, Rolf Tiedemann, contains only sparse information on ‘the now almost forgotten Seidel’ (Adorno, 2008: 240). It is worthwhile, however, to take a closer look here, because the social philosopher and cultural critic Alfred Seidel (1895–1924) has been described not without reason as a figure whose ‘character and themes’ at one time captivated the young Adorno; furthermore, ‘many of the philosophical peculiarities that Adorno later brought to the subject matter and methodology of “Critical Theory” [...] can be traced back’ to Seidel (Frese, 2001/2: 51).

Seidel is interesting not only as an unappreciated friend from Adorno’s youth but as a remarkable representative of the intellectual milieu that was, as Alfred Sohn-Rethel once wrote, the Marxist reaction to the ‘theoretical and ideological superstructure of the German revolution that never happened’ (Sohn-Rethel, 1978: xii). During the 1920s, this milieu was grouped around the southern German university town of Heidelberg, where

Seidel had studied economics and sociology since 1919. This milieu formed one of the main reservoirs from which, at the beginning of the 1930s, the Frankfurt Institute for Social Research and, in a wider sense, critical theory as it is known today was to be recruited. Following the traces that Seidel left behind in Heidelberg therefore promises insights into both the theoretical and intellectual prehistory of critical theory. When Seidel became acquainted with Adorno at the beginning of the 1920s, he had already made a name for himself as an ambitious left-wing partisan of Mannheimian sociology at Heidelberg and a determined but not at all orthodox communist. He was regarded as an eccentric, brooding person and an original social theorist, and he was in contact with numerous representatives of Western Marxism and the later Frankfurt School. He was on friendly terms with Walter Benjamin, Leo Löwenthal, and Siegfried Kracauer. He belonged to the circle of pupils of Karl Mannheim, Alfred Weber, and Emil Lederer; he knew Ernst Bloch and Georg Lukács, whose Hegelian Marxism was a guiding principle for his own thinking. Plagued by mental and physical ailments, Seidel took his own life in 1924, without leaving behind an authoritative testimony of his thinking. Although it is reported that he published some smaller works in his lifetime, as far as I can see there is only a brief outline of the 'History of the Socialist Student Movement in Germany', which provides little insight into Seidel's theoretical position (Seidel, 1919). He successfully completed a doctoral thesis on 'Productivity and Class Struggle' in 1922, supervised by Alfred Weber. Even though Adorno refers to this dissertation in his remarks on the 'metaphysics of the forces of production', it remained unpublished, and it circulated only as a typescript in the Heidelberg circle of friends. Seidel worked intensively throughout the early 1920s on a book about the disastrous aspects of rational knowledge, which in more than one sense anticipates the methodological and thematic motifs of critical theory, yet

he could not complete it. Published posthumously by the Heidelberg psychiatrist Hans Prinzhorn under the title *Consciousness as Doom* [*Bewußtsein als Verhängnis*], the book briefly acquired some fame and was evidently read by Benjamin, Adorno, Sohn-Rethel, Löwenthal, Bloch, and Kracauer, before it quickly fell into oblivion.

At the point when Adorno remembered his former friend, Seidel was, in fact, largely forgotten. Although *Consciousness as Doom* was reissued in 1979 by Impuls-Verlag (Bremen) at the suggestion of Sohn-Rethel (Seidel, 1979), and although Seidel's dissertation, which is still worth reading, was published in 2008 in the *Archiv für die Geschichte des Widerstandes und der Arbeit* (Seidel, 2008), the official historiography of critical theory has hitherto largely ignored him. In the following, I would like to present the life and theory of Alfred Seidel and, above all, to elaborate more closely the biographical and theoretical references that connect Seidel to critical theory. The biographical portrayal has to be given a relatively large amount of space for two reasons. In the first place, Seidel's tragic life journey and experience seems to have been in certain regards archetypical for the first generation of critical theory. Second, Seidel's theory is peculiarly characterized by the fact that it makes one's own experience and position within society the starting point of comprehensive historical diagnosis. Indeed, this approach forms part of the prehistory of a theoretical formation which invariably grants 'the realm of idiosyncrasy, usually conceived as the individual sphere par excellence' (Adorno, 2005: 15) a central function in the knowledge and criticism of the existing state of affairs. The questions as to whether and in what way Seidel should be included as a forgotten influence in the history of the early Frankfurt School cannot be answered conclusively within this short essay. It is merely a question of tracing the genuine links that connect Seidel with the later protagonists of critical theory, in order to at least prepare the material with which

this question can be answered. This material is widely dispersed and difficult to access, especially in the English-speaking world. A translation of Seidel's work has not yet taken place.

## WHO HE WAS

Alfred Seidel was born in 1895 into a Silesian family of merchants who had reached modest prosperity in the mid-nineteenth century. In addition to a small fortune, which later enabled him to focus exclusively on his studies, Seidel also inherited the genes of an exceptionally weak physiognomy, bone abnormalities due to rickets, and a melancholic temperament from which he suffered his entire life. In 1897, his father committed suicide, leaving the mother with four children, the youngest of whom was two-year-old Alfred. Later in his life, one of his two brothers died of tuberculosis at 16 years old; the other committed suicide at the age of 23. We know nothing about the life of the only sister. After his mother died in 1907, Seidel came into the care of an aunt in southern Germany. There, in Freiburg, he joined the youth movement and, among other things, began studying the philosophy of Heinrich Rickert. Shortly after he volunteered for military service in 1914, Seidel was dismissed because of his unsuitability. He was thus able to continue his studies in Freiburg, where, from 1916, he heard the phenomenologist Edmund Husserl, whose lectures he later appreciated as his philosophical awakening. Seidel probably met Walter Benjamin there for the first time, since he was also active in the milieu of the Freiburg youth movement.

After completing his studies, Seidel first went to Berlin, where he became involved with the Berlin *Wandervogel*<sup>1</sup> and worked on the youthful, anti-bourgeois journal *Der Anbruch* [*The Dawn*]. All the while, he was drawn into the vortex of the revolutionary events of the day. He devoted himself to the

communist idea and actively participated in the November Revolution, although his life had hardly prepared him for revolutionary street battles. Already in Freiburg, Seidel had pacifist tendencies, which were not exactly popular in that boy-scoutish milieu. His siding with the revolution finally led to an open break with the youth movement and its protagonists. Similar to Walter Benjamin a few years earlier, in 1919 Seidel turned away disappointed from the youth-movement circles in which he had been active, hanging his hopes instead on the ideal of a classless society. Even after the defeat of the Spartacus revolt, Seidel emerged as a determined communist. He did not want to accept the failure of revolution, which he considered not only possible but necessary. Thus it was no coincidence that he went from Berlin to Heidelberg, which around 1920 was one of the centres for the renewal of Marxist philosophy in the German Reich. Alongside Walter Benjamin, who spent the summer of 1921 in Heidelberg, Seidel met Karl Mannheim, Georg Lukács, and Ernst Bloch. He befriended Leo Löwenthal, Siegfried Kracauer, and Sohn-Rethel, with whom he temporarily lived. In 1922, Kracauer acquainted him with the then 19-year-old Theodor Wiesengrund, which resulted in a rather intense friendship. Seidel is mentioned repeatedly in Adorno's correspondences of the early 1920s in a manner whose casualness indicates how naturally he belonged to that Heidelberg/Frankfurt circle of friends around Kracauer, Löwenthal, and Adorno. There is also an unpublished letter to Adorno, which bears witness to a lively exchange of ideas.

Seidel became politically involved in the Heidelberg socialist student union, where he temporarily served as the head of its science division. The Catholic-baptized atheist described his position as that of a 'Renowned Goy' (Seidel, 1927: 32), which indicates the prevalence of Jewish students in the socialist student body, in stark contrast to the youth movement and, above all, the fraternities of this time. The political events of the early

1920s, however, increasingly unsettled him, and his relationship to communism was not free from doubts. In 1920, he confessed in a letter to a friend (Seidel, 1927: 30–2) that his ‘scientific socialism’ was ‘collapsing’. He described his attitude to communism in the following way:

Politics will be wild, decision; I stand on the side of the ruthless communists and respect the believing fanatics, even if I can not be one myself [...]. It will be bleak, but it must be, terrorist bolshevism or terrorist reaction will be the cruel alternative, and I am on the side of the former. (Seidel, 1927: 32)

Although he was loyal to the communist idea – yet not without some doubts – Seidel occasionally sought out the Heidelberg George Circle, a cultural-conservative grouping around the poet Stefan George, whose elite worldview was difficult to reconcile with the ideal of a classless society. Seidel was fascinated by the contemporary criticism and intellectual ideals of the group, but he could not gain a foothold there and later contemptuously expressed his opinion about the ‘pseudo-culture’ of the Georgians (Seidel, 1927: 179).

In Emil Lederer and Alfred Weber, two of the most important representatives of an economics-based, interdisciplinary approach within Heidelberg’s social sciences, Seidel found supportive supervisors for his doctoral thesis on the philosophical structure of historical materialism. This work is particularly noteworthy as it intended to ‘understand Marx’s historical materialism much more from Hegel than it has been so far’ (Seidel, 2008: 187). Here, Seidel was referring to Georg Lukács’ article ‘The Marxism of Rosa Luxemburg’, included in the 1922 collection of essays *History and Class Consciousness*, which was crucial for the philosophical development of critical theory. Seidel reacted relatively early to the failure of the German revolution with an attempt at a philosophical revision of Marxism, at the centre of which he placed, along with Lukács, the category of totality. Although his dissertation

was not published, some copies circulated in the wider circle of friends and took effect there, because the work also contains that critique of the ‘absolutisation of the productive forces’ (Seidel, 2008: 185) which left a mark on Benjamin<sup>2</sup> and Adorno and was also noted by Sohn-Rethel and Leo Löwenthal.

At the beginning of the 1920s, Seidel had settled in the (socialist-oriented) Heidelberg intellectual scene. He worked as a private tutor and gave public lectures on the literature of Dostoevsky and Goethe as well as on psychoanalytic and sociological topics. These lectures obviously required some effort from the shy Seidel, who had been plagued by self-doubt. Although he prepared for them months beforehand, he could not count them as successes. The psychiatrist Hans Prinzhorn reports stylistic clumsiness and a disjointed, soliloquizing manner of speaking; he notes, with all due sympathy, that it was often difficult to follow the argument. Seidel must have also been an exhausting conversation partner: tireless, erratic, and driven by a radical pessimism, depressing negativity, and a propensity for pedantry. Nevertheless, he seems to have made a lasting impression on people. Sohn-Rethel, for example, thought of his ‘unforgettable friend Alfred Seidel’ as one of the most lively spirits of the time (Sohn-Rethel, 1978: xii); he remembers that Seidel stood at the centre of a ‘very close working and living community’ which had developed out of the student circle of Emil Lederer. The writer Carl Zuckmayer, who had also studied in Heidelberg, wrote about this community, which included Seidel, Sohn-Rethel, and Leo Löwenthal: ‘The most intelligent personalities of the student youth belonged to this circle, I remember Alfred Seidel, who later took his life in a fit of world despair’ (Zuckmayer, 1966: 353–4). Just how well known Seidel was at the time is apparent from the fact that Thomas Mann, who neither lived in Heidelberg nor had socialist inclinations, responded in detail to Seidel in his 1932 *Address to the Youth*. Against Seidel’s ‘intellectual despair’, Mann proposed his own

notions of youth, education, and culture (Mann, 1932: 326 ff.).

Seidel thus left a lasting impression even outside his close circle of friends. Zuckmayer's talk of a fit of world despair, however, does not really ring true, because Seidel suffered his whole life from recurring states of depression, which played an increasingly significant role in his life. Prinzhorn became an important caregiver early on, outside the university. Whenever Seidel's mood turned suicidal, which was apparently regularly the case in autumn, he was admitted to Prinzhorn's clinic. Otherwise, Seidel maintained a lively, close relationship with the psychiatrist, whose records give us the most detailed description of Seidel and his time in Heidelberg (Seidel, 1927: 7–29).

After graduating in 1922, Seidel took a position at the Sociological Institute of the University of Frankfurt. Here he held propaedeutic courses for Gottfried Salomon (later Salomon-Delatur), one of Adorno's academic teachers, who was also involved in the protracted quarrels surrounding Walter Benjamin's *Habilitation* thesis as one of his supporters. At this time, Seidel was in close contact with Kracauer and Adorno. When he was invited to dinner with Adorno's family in September 1922, however, there was an incident to which the only handwritten letter passed down by Seidel bears eloquent testimony. Seidel must have given the evening dinner discussion such a depressing turn with his long monologue that, a few days later, he felt compelled to ask not only Adorno but also his mother and aunt to forgive him for the 'catastrophic condition' he was in – not without mentioning that he was right in the matter.<sup>3</sup> Such lapses were also reported by Prinzhorn and can probably be regarded as characteristic for Seidel in the 1920s. During this period, Seidel was trying to develop and clarify his thoughts in talks and lectures, demanding much, perhaps too much, from his conversation partners and listeners. These ideas were connected to a manuscript that he had been working on intensely since at least 1922.

The themes of this work had already been developed by 1920 (Seidel, 1927: 30–1) and were even in the background of his dissertation. But whereas in *Productivity and Class Struggle* Seidel still largely operated within the framework of historical materialism, he now aimed at a broader critique of the historical tendency. He now increasingly incorporated aspects of psychoanalysis, *Lebensphilosophie*, existentialism, and contemporary cultural criticism into the manuscript, which had the programmatic working title of *Consciousness as Doom*. It not only questioned the practical value of scientific knowledge of the world but ultimately denied the value of consciousness.

In 1923, while oscillating between Frankfurt and Heidelberg, Seidel was working on his manuscript, for which he had already found a publisher. He discussed the thesis of disastrous consciousness at every opportunity and was seemingly relatively capable of meeting his professional and private obligations. In the winter of 1923, he went back to Freiburg, where he wanted to finish writing *Consciousness as Doom*, but his inheritance had meanwhile fallen victim to inflation, like so many small- and medium-sized fortunes at the time, forcing Seidel to look for work, which did not go so well. Furthermore, his depression worsened. Nevertheless, Prinzhorn, with whom Seidel maintained contact by letter in his absence, noted a phase of emotional stability in Seidel's life in the autumn of 1924. He was thus surprised when, on October 20, 1924, Seidel declared *Consciousness as Doom* to be finished, and then hung himself in a mental hospital in Erlangen. In his last letter to the psychiatrist, marked by paranoid delusions and a deep world-weariness, Seidel writes: 'The book is completely finished, my purpose in life, for which I lived under great torment for many years, is fulfilled. [...] Ensure the publication of the work. I give it to you warmly. You contributed to its development. I thank you' (Seidel, 1927: 45–6).

Prinzhorn took up the task, fundamentally revising the unprintable manuscript left by Seidel in order to produce 'in complete familiarity with Seidel's intentions and his mode of expression' an 'absolutely correct version of the text, characteristic of the author and valid in a deeper sense' than Seidel 'himself had accomplished by then' (Seidel, 1927: 9). Since the original manuscript has to be considered lost, it is not possible to trace just how deeply Prinzhorn reworked the material. *Consciousness as Doom* appeared in the spring of 1927, accompanied by a detailed report on the manuscript and an extensive foreword by the editor. At any rate, it stirred quite some attention. Prinzhorn advertised the book in a press release with the announcement that it was the life testimony of a type of person 'characteristic of the face of this period and of considerable structural importance' (Seidel, 1927: 3–4). The book was also received in this sense. A number of reviews agreed that Seidel's life journey was representative of his generation. The Nietzschean Ludwig Klages, to whom Prinzhorn had sent a copy, disparagingly criticized *Consciousness as Doom* as the work of a person typical of the times – that is, weak (Klages, 1928: 629). Siegfried Kracauer stated that the obvious inadequacies of the book were not based on individual weakness but reflected the 'disappointment of a whole generation'. He valued the book of his friend as a 'document of the time' in which the 'present situation is exemplarily experienced and decidedly rejected' (Kracauer, 1927: 521–3). The poet and journalist Margarete Susman, who had met Seidel in Frankfurt, made a similar point. In the 'self-dissolution' to which Seidel had pushed a fatal encounter of objective and subjective factors, she saw the 'genuinely exemplary, representative' aspect of his work and postulated that by his suicide he had 'attempted to overcome [the analysis] not only for himself, but also for his generation' (Susman, 1927: 338). Ernst Bloch too, who recalled Seidel in hindsight from 1938, remarked that he was 'only a seemingly

absent type'; in fact, he expresses himself in his fate, 'which many suffered at the time', and like 'many people of bourgeois existence alienated from life, the truth became disgusting' (Bloch, 1938: 67–8).

Altogether, Seidel's posthumous 'main work' was interpreted as a unique coupling of theory with epochal despair and a final report on life, all of which took on representative significance. This assessment may have been influenced by Prinzhorn's announcement that the book was the testimony of 'self-sacrifice as warning to the Zeitgeist' (Seidel, 1927: 4). However, it primarily corresponds to Seidel's self-stylization, for he didn't want to allow any programmatic distinction between theory and lifestyle. He even interpreted his own suicide as a consequence of the thought of decomposition. After the nihilisation of all ideals of the epoch, the only prospect left was 'nihilising oneself' (Seidel, 1927: 46).

## HIS THEORY

Although *Consciousness as Doom* was undoubtedly the more influential book, the unpublished dissertation on *Productivity and Class Struggle* played a significant role in the context of critical theory. The apocryphal status of the work, however, refers, strictly speaking, to speculative deliberations on its reception history. Evidence of readings can be found in Adorno, Benjamin, Sohn-Rethel, and Löwenthal, as noted already, but these are limited to the mention of keywords, usually 'the metaphysics of the forces of production'. Although these hints do not necessarily signify a detailed familiarity with the work, they at least show that Seidel's text had been read. It makes sense, therefore, to consider some of the themes developed there.

First of all, the historical index of the work should be stressed, which, as Seidel clarifies, emerged 'from a [lost, CV] work on the sociology of modern revolutions' (Seidel, 2008: 187). Its composition dates from the second

half of 1922, with Georg Lukács' 1921 article 'The Marxism of Rosa Luxemburg' being its first reference. Seidel's work is thus one of the earliest reactions to Lukács' Hegelian Marxism, which began to have a wider effect only after 1924. Seidel had already finished his work before Lukács published *History and Class Consciousness* in the winter of 1922. He could not, therefore, take into consideration the ideas Lukács presented in the preface and in the essay 'Reification and the Consciousness of the Proletariat' – that is, Lukács' own confrontation with Marxist philosophy. The correspondences between *History and Class Consciousness* and Seidel's work are clear. Seidel agrees with Lukács' desire 'to understand the essence of Marx's method and to apply it *correctly*' (Lukács, 1971: xlii). As opposed to Lukács, who was forced to take care because of his position within the Communist Party, Seidel, whose communist attitude never led him to join the Communist Party, was more clearly critical of Marx and contemporary Marxism-Leninism. Overall, *Productivity and Class Struggle* can be understood as a redemptive critique of historical materialism, one that attempts to explain in particular why Marx's prognoses have not (yet) come to pass – why the proletarian revolution failed in Western Europe. In the first place, Seidel holds the metaphysics inherent in Marxism philosophically responsible for this failure. He sees this in the way that Marx and Engels' 'historical-philosophical question' calls for *one* 'primacy' and proceeds from 'one history-moving agent' (Seidel, 2008: 192). Seidel identifies this primacy in the productive forces, to whose development Marx subordinated all other historical factors from 1847 onwards (*Poverty of Philosophy*). While his philosophy of history began from two historical-structural moments, namely the development of the productive forces and the dynamics of class struggle, Marx eventually moved on to consider class struggle as simply a 'means to expand the productive forces'. As telos of history, therefore, the 'development

of the productive forces' takes the place of the 'actualization of reason'. On the one hand, Seidel criticizes this for weakening the mobilizing function of historical materialism, and, on the other hand, he analyses it as a problematic relapse to Hegel's idea of the cunning of reason. It is as though class struggles are not really concerned with their declared goal – the abolition of the class society – but rather with the hidden *telos* of developing the productive forces (Seidel, 2008: 194). Against this backdrop, he emphasized the need to read Marx – even against his self-understanding – radically from the perspective of Hegel. At the same time, he criticized the fixation on the development of the productive forces for turning the *idea* of a classless society into a *historical* necessity – something not worth fighting for, since it will happen anyway.

According to Seidel, then, 'metaphysical teleology' and one-sidedness of historical materialism in connection with the late Marx deprives said materialism of its persuasive force as a mobilizing ideology, because it no longer regards classless society as an idea to fight for but a historical necessity that will be self-realized – if need be, 'behind the backs' of the actors. At the same time, Seidel also sees the reason for the philosophical strength of Marx's conception in the one-sided fixation on the development of the productive forces: 'Though great mistakes and shortcomings may spring from this metaphysical system of Marx's philosophy of history, they enabled Marx to conceive of his philosophy of history and not to fall into the now popular eclecticism' (Seidel, 2008: 231). Seidel thus calls for an understanding of Marxism as a philosophy of history precisely in its philosophical reductionism, yet he opposes a 'causal-mechanistic view' that is 'so often interpreted into historical materialism'. This applies in particular to the relationship between base and superstructure, which, in contrast to the more traditional approaches of Marxist theory, Seidel interprets 'neither causally nor functionally' but rather draws

upon Hegel to understand it in terms of the category of 'totality, that is, of whole and part' (Seidel, 2008: 205). Here, Seidel comes very close to Lukács. While Lukács wants 'to adhere to Marx's doctrines, then, without making any attempt to diverge from them, to improve or correct them' (Lukács, 1971: xlii), Seidel tries to uncover the limits of knowledge in Marx's philosophy, which he sees in the fact 'that historical materialism is almost devoid of any psychology' (Seidel, 2008: 231). Lukács sought an answer with Hegel in Marx to the question of why the consciousness of the proletariat did not (yet) lead to the practical overcoming of capitalism, despite the fact that the objective possibility was given. Seidel, however, attempts to provide sociological and psychological elements through an *expansion* of the theory of historical materialism. In *Productivity and Class Struggle*, this expansion remains a demand not fully worked out, but it indicates in particular the attempt to synthesize Marx with Freud, which will eventually become a key strategy in critical theory.

Seidel tries to accomplish this synthesis in *Consciousness as Doom* in his own distinctive way, basing it on a Marxist analysis of the economic basis of society, an extensive reading of the Freudian theory of the unconscious, and the fundamental assumption of *Lebensphilosophie* that life is appropriately conceived of only as a blind drive. With these tools, Seidel develops a dialectically conceived critique of rationalism that denies neither the truth content nor the integrity of scientific and rational knowledge but rather analyses how culture, by means of scientific knowledge of the world, is gradually revealed as the adventitious masking of deeply libidinal and economic processes. Referencing the 'state of research' of his time, Seidel states that culture essentially means sublimation, displacement, and diversion: sublimation of the *hypertrophied sexual drive*, repression of the productive basis of capitalist socialization in the cultural *superstructure*, and diversion on the way to goals that, in the last instance,

*the will to power* determines, as Nietzsche interpreted it. Seidel tries to establish the connection between historical materialism and psychoanalysis in a structural analogy. He sees the basis of the capitalist economic order as a blind drive, which corresponds to sublimation or neurosis on the surface of cultural phenomena. They are often difficult to separate from each other. Seidel postulates that one 'could address individual cultural phenomena more as neurosis than as sublimation, it is often only a matter of circumstances, and is probably only a question of judgment' (Seidel, 1927: 96).

The problem is that in the course of analysis, though neuroses can indeed be resolved through consciousness of the underlying motives, at the same time, according to Seidel, culture itself dissolves. The clearer the consciousness of the repressed, sublimated, and deferred motives becomes, the weaker the binding force it can develop. This discovery, which Seidel relates to both the individual and the society, leads his thinking to the following alternative: 'either one affirms sublimation, that is, the repression of impulses, and thus accepts the neuroses – or, one defends the right of the drive and the cure of neuroses regardless of cultural sublimation, and thereby hands over to mankind the dynamics of its instinctual life' (Seidel, 1927: 94). The anxiety common among Seidel's contemporaries – that although certain neuroses can be healed through the psychoanalytic method, this nonetheless deprives one of potential and creativity – is thus transposed to the social field. Seidel understands Max Weber's expression about the *disenchantment of the world*, which he quotes frequently, in the sense that sciences and modern reason have not substantially changed the world but simply brought to light what the unconscious foundations of culture have always been – blind drives. This movement, however, runs systematically contrary to the cultural-social production of sublimation, according to Seidel. In fact, sublimation can only function as an unconscious operation; as a consciously

performed act, it becomes a logical self-contradiction, which manifests itself as a necessarily violent execution of (self-)deception.

Unyielding, because driven by good intentions, the modern sciences are therefore pushing towards the self-dissolution of culture by revealing blind drives as the hidden motive of cultural institutions:

The dethroning of absolute ideas by the affirmation of realities – these are now called life, power, sexuality on the one hand, or nation and class on the other – is a sign of the dissolution of culture. The tension between idea and reality is overcome [*aufgehoben*], reality itself is raised to the idea, the dynamics of the life process amplified; but in so doing, cultural fulfilment is made impossible. (Seidel, 1927: 202)

By abruptly adjusting consciousness to being, and becoming the mere doubling of what already is without any *tension*, culture dissolves itself in the process of becoming aware of its basic drives. The culture that sees through itself thus proves to be a self-dissolving culture. Therefore, as Seidel diagnosed in 1924, murder and suicide would inevitably become the epochal signature of a fully enlightened age. The driving forces are those ‘movements, which under the talk of positivity have only a de facto nihilistic effect’ (Seidel, 1927: 203) – that is, those sciences involved in different fields that seek to discover what culture fundamentally is, and in so doing, reveal nothing but blind drives.

This clearly sounds like the critique of positivism that Adorno and Horkheimer will develop in their works of the 1930s and 1940s, especially in its tone. Like the authors of *Dialectic of Enlightenment* following him, Seidel manoeuvred within an argumentative jam. What does the critique of progress really entail and what is its critical standpoint? For this critique is neither an enemy of progress nor fundamentally denies that scientific progress furnishes valid knowledge, i.e., that it actually is progress. Seidel forbids himself from retreating from what is already known and at the same time denies the vulgar Marxist illusion according to which the

development of scientific knowledge, as an expression of the further development of the productive forces, leads inevitably to social progress. Already in his dissertation, Seidel had subjected such thought to severe criticism and characterized it as *Marxist chiasm*.

The idiosyncratic severity and paradoxical structure of Seidel’s thinking results from the fact that he cuts the ground away from an irrationalist, conservative critique of culture with the argument that one simply cannot *not* know what one knows. At the same time, he abandons the perspective of a quasi-automatic self-consummating revolution in which the world once again fills up with meaning. Against the contemporary, neo-romantic tendencies of a rationally based retreat into irrationality, exemplified by Ludwig Klages or Stefan George, on the one side, and against traditional Marxism’s optimistic belief in progress, on the other, Seidel proposes a programme of immanent critique – that is, determinate negation: ‘You must dissolve the enemy by applying his own theory to himself’ (Seidel, 1927: 203). Analysis should be driven against analysis, clear consciousness set against clear consciousness, all without falling into a new faith, in order to ‘free the way for a growing positivity without being positive or wanting to be positive’. The negation of the negation alone still assures Seidel of hope in positivity, although it threatens to result in a ‘potent negativity’ at any moment (Seidel, 1927: 204).

Already in his lectures from the early 1920s – which we only know of second-hand – Seidel had repeatedly postulated the necessity of a *psychoanalysis of psychoanalysis* and a *sociology of sociology*. He continued this self-reflexive programme with his idea of a *nihilisation of nihilism*, yet he took it a decisive step further. In the pathos of a tragic delirium, simultaneously described as the delusions of an individual and typical of the era, Seidel elevates himself to the status of the self-conscious subject-object of history, following the dialectical laws of motion which have hitherto turned into

irreconcilable negatives, as reason and freedom have irrevocably diverged. In light of this, Seidel declares his own psychological disposition – which precluded every feeling of community, every positive reference to his time, and thus, ultimately, any possibility of affirmation and belonging throughout his life – the predestined starting point of critical reflection. He calls for a new, contemporary type of intellectual, one whom he alone believes can stop the nihilising tendencies of the positive sciences: ‘In his activity, based on his essential nature and from inner necessity, this type must be negative, but against negativity, nihilistic against nihilism’ (Seidel, 1927: 204). Thus only by using one’s own damaged life is it possible to drive ‘the practical nihilist type’, i.e., the positivist scientist, ‘to despair’ and, at the same time, to realize ‘redemption, if only temporary, from individual despair’ (Seidel, 1927: 204). The objectivity that comes from taking a critical distance is therefore made possible by the radical, absolutely negative subjectivism of the depressive outsider, like Seidel himself. Theory and practice thus merge into one, fuelled in equal measure by disposition and lifestyle.

In fact, Seidel’s idiosyncrasy and negativity afforded him critical insights, often ahead of his time. By rationally turning against reason – ‘in a way that actually costs something’, as Ernst Bloch wrote (Bloch, 1938: 67) – Seidel the theorist invariably fought his intellectual battles for the sake of humanity as a whole. He put his life in the service of a theory of unconditional negativity. So the obvious question – whether insanity was really the mother of thought, whether negative dialectics was ultimately nothing but the cultural transformation of an endogenous depression – is irrelevant. For Seidel, his theory can only be the self-conscious negation of depression, insofar as depression is nothing but a blind, chemical process. In this context, however, negation concretely means ‘integrating psychopathies in one’s life plan’ (Seidel, 1927: 214). The *nihilisation of nihilism* that Seidel conceived

in *Consciousness as Doom* thus functions as both a heuristic intended to provide theoretical access to contemporary cultural phenomena and an intellectual survival strategy which enables a type, as Seidel represents it, to ‘be honest and genuine, that is, [to] develop his essence and even lead a meaningful life, at least for a while’ (Seidel, 1927: 203).

In a retrospective note on the *Problem of Genius and Insanity*, Seidel writes that the constant ‘sublimation of suicide’ is the ‘only possible psychological basis for more accurate knowledge’ (Seidel, 1927: 214). The fragments left behind testify to this unbroken struggle for *more accurate* knowledge. In this way, *Consciousness as Doom* can seem like the journal of an intellectual self-experiment undertaken with the utmost commitment. Just how intricate the relationship between work and life became in Seidel need not be seen only from the perspective of the interweaving of his further work and further life, assigning a direct life-preserving function to theoretical reflection: it is already there in the way that Seidel structures his book entirely along the lines of his own experiences, which were typical of his entire generation. By way of example, he wants to walk along the path of his generation’s development and philosophically *work through it* by means of determinate negation. The beginning is marked by the youth movement, which functions, on the one hand, as an early experience and, on the other hand, as the first ‘classical example’ (Seidel, 1927: 89) of the thesis of doomed consciousness. Seidel analysed the youth movement’s self-deceptive romanticism as a long since transparent – and therefore impossible – sublimation of homoerotic impulses. ‘In today’s youth, poisoned by psychology, it has become all too common for erotic relationships with each other, or better, against each other, to be analysed, talked to death’, he writes. He laments the fact that raising awareness of this hidden motive has led to the dissolution of the ‘delicate spiritual transformations’, for which male homosexuality is precisely appropriate.

In Seidel's experience, raising awareness resulted, on the one hand, in a 'much more dangerous' repression of the second order, 'packed full of neurotic traits' and, on the other hand, in an 'open affirmation of inversion', which led to a 'weakening of the transformations on which the spiritual content' of the youth movement is based. By 'making conscious their unconscious motives', the movement forfeited the driving force of unconscious sublimation, and thus lost that 'authenticity and impact' which at one time had distinguished it (Seidel, 1927: 89).

This critique of his own experience within the German youth movement reflects the pattern according to which Seidel, in the mode of immanent critique, subsequently disputes with Freud, Marx, Oswald Spengler, and various contemporary ideologies. For instance, Seidel criticizes Freud's psychoanalysis against the backdrop of his theses on desublimation: though it may have healed some neurotics, 'this saving of individuals' ends up 'surely costing too much [in its] disintegrating effect on the totality of culture' (Seidel, 1927: 93). He reproaches the political, class-struggle Marxism of his time for making a 'resentment filled class hatred and will to power' into the driving force of action, which runs exactly counter to the 'spiritual basis of socialism'. Moreover, Seidel revisits a thought he had already developed in his dissertation. There, he accuses Engels, especially his attempt at a realistic psychological supplement to Marxism in his late writings, of depriving Marxism of its one-sidedness and thus of its historical philosophical impact. The argument in short: what a philosophical idea gains in scientific quality, it loses in mobilizing potential. In contrast to other ideologies, Marxism has the merit of using 'historical necessity [...] not in defence of the status quo'; but by implying that progress is anchored in this necessity, it also pays homage to the blind drive, not to the idea: 'In this way, it may have perpetuated the class division of every society, and thus class struggle as well, both of which it

wanted to practically overcome by theory' (Seidel, 1927: 167).

Following this pattern, Seidel goes through a series of contemporary phenomena, frequently making both the phenomenon and the (conservative) critique of it into the object of his own critique. Against the notion, for example, that modern expressionism is a web of psychopathic and schizophrenic minds, he argues that the weakness of this artistic movement is not due to its madness but, 'on the contrary', to the 'inauthenticity and health of these schizophrenic components' – in the knowledge, therefore, of its own 'mad' effect (Seidel, 1927: 182). He similarly dealt with Spengler, whose historical pessimism and cultural criticism captivated not only Seidel but his entire generation. Seidel does not take this pessimism seriously but acknowledges that 'if his philosophy would have been more open to pessimism and nihilism', then Spengler's work could have been 'bigger, bolder and more impressive'. In the allegedly 'uninvolved' affirmation of technology, monopoly capitalism, caesarism, and nationalism, however, this pessimism falls victim to an 'abuse of its creator', which it then uses as an 'ideological justification for our time' and thus lags behind possible insights (Seidel, 1927: 199). In 1955, Adorno analogously writes that Spengler wanted to do 'nothing at all, but usurped the standpoint of the uninvolved spectator, which in truth is not so uninvolved. By watching only, he helps in his own way to push what falls' (Adorno, 1955: 145).

Overall, Seidel develops the thesis of doomed consciousness consistently with the stages of intellectual influences and experiences that shaped him and his generation. The youth movement, psychoanalysis, Marxism and revolutionary socialism, reactionary cultural criticism, and various aesthetic strategies and avant-garde movements of the 1920s are analysed as lived-through stations on his own path of life and thought. Thus Seidel thoroughly makes his own experience – particularly the experience of suffering

(threatening) madness and the resulting position of the outsider – into the basis of a method to enable objective insights through radical subjectivism. Many of the unfinished, (self-)critical sketches that comprise long stretches of *Consciousness as Doom* seem nervous and erratic. They approach a lamenting, reactionary critique of culture rather than meet their own demands of carrying out a sober criticism of scientific knowledge of the world. But what prevents them from losing themselves completely in tragic speculation and what guarantees their analytical sharpness throughout all the nervousness is the proximity from which they are written. Seidel himself went through the doctrines that he so relentlessly dissected: through psychoanalysis, for example, whose potency he learned both theoretically and practically, and through the (deceptive) sense of community of the youth movement or Marxist theory, including the practice of class struggle. As the invectives against the romanticism of the youth movement were fuelled by the disappointment of those hopes which Seidel had once placed in them, so his reckoning with the resentment of applied Marxism can only be adequately understood against the backdrop of the shocked horizon of expectations of that time. '[T]he German proletarian revolution should have occurred and tragically failed', as Sohn-Rethel retrospectively concluded, in line with Seidel (Sohn-Rethel, 1978: xi).

Critique, therefore, always remains oriented to and legitimized by the unfulfilled and betrayed promises to which the criticized is committed. The youth movement and Freud, Marx and class struggle, Spengler's degenerate pessimism as 'ideological justification', and many of the other phenomena that Seidel makes into objects of critique in *Consciousness as Doom* appear as the final stages of an intellectual biography that culminates in a relentless self-analysis – a self-analysis which claims to be the analysis of an entire epoch. On behalf of his generation, Seidel wants to reflectively work through

his formative journey, and he thereby shows what underpins the 'obsessive brooding' of individuals in terms of a philosophy of history: 'Hamlet-like types' like him, perpetually inhibited and disastrously predisposed through compulsive reflection, are 'of course possible at any time, [...] but will be represented particularly strongly in certain epochs'. Only when they are no longer 'embedded' 'in the circle of the bound community of which they are borne and by which their destructive qualities are suppressed', does their liberated disposition become doom, while their speech acquires an 'exemplary' character'. Their 'truth sadism' will then become the 'symptom of a certain epoch and not only individual types' (Seidel, 1927: 100 ff.).

## WHAT REMAINS

Seidel attempted to accomplish the *nihilisation of nihilism* by identifying his own depression with the fate of an epoch increasingly drifting into objective madness; from the outset, it was aimed at the perspective of tragic failure. In the mid 1920s, the promise that the generation born around 1890 linked with the self-conscious entrance of *youth* onto the stage of history seemed to be dead. The youth movement had lost its innocence in a world war that some already referred to as the *first* one; the revolution in the German Reich had failed and fascism was on the rise all over Europe. Moreover, to the critical communist Seidel, the consolidation of Stalin's pre-eminence at the XIII Party Congress of the CPSU (May 23–31, 1924) may have appeared as bitter confirmation of his thesis that the communist movement was on the way to forcibly perpetuating class hatred and class relations instead of finally abolishing them. In the Weimar Republic, political events constantly threatened to explode into open violence, thus verifying Seidel's pessimistic predictions. The dissolution of the Reichstag on October 20, 1924, which marked a new

degree of escalation, coincided with the last manifestation of the depressive episodes that plagued Seidel every year in autumn. Subjective and objective symptoms of crisis came together in such a sinister manner that the *persistent sublimation of suicide* could no longer be maintained. Against this background, Siegfried Kracauer judged: 'If the value of a book is determined by the degree to which it has been lived, then Seidel's book would be of unimpeachable validity' (Kracauer, 1927: 521).

But what is the theoretical value of the book? This should also only be judged in its historical context. Jürgen Frese has rightly pointed out that Seidel will 'certainly not be able to be brought out of his historically marginal position with regards to philosophy and science' (Frese 2001/2: 61). The weaknesses of the book are too obvious, and it is entirely unclear what sections in the published edition are from Prinzhorn – whether we are even dealing with an 'authentic' Seidel at all. The differences between the clearly structured dissertation on questions of Marxist philosophy of history and the often confused *Lebensphilosophie*-based cultural critique of *Consciousness as Doom* are certainly substantial. Seidel's dissertation, however, is very interesting in terms of the history of ideas, for at a very early stage, it criticized instrumental views of technology, of Marxist faith in progress, and of schematic interpretations of historical materialism. Furthermore, it suggested a deeply psychological complement to Marxism. These approaches have become fundamental pillars of critical theory and are reflected in almost all the work done in and around the Institute for Social Research. Accounting for the fact that Seidel's work was never published yet circulated precisely in the milieu from which critical theory developed, it thus makes perfect sense to regard *Productivity and Class Struggle* as a document which, together with Lukács' *History and Class Consciousness*, exerted an early influence on the theoretical development of the Frankfurt School. At least the critique of Marxism presented there

seems to have been ground-breaking, and it found a clear echo, too, for example, in the critique of the social-democratic ideology of progress developed by Walter Benjamin in the 1940s.

Benjamin turns out to be a good reference point, since – although he only began to read Marx relatively late – contrary to Horkheimer and Adorno, he expressly avowed again and again 'the political practice of communism... as a binding attitude' without, however, drawing practical consequences from it (Benjamin, 1994: 248). In this sense, Seidel's plea for a terrorist Bolshevism if necessary was located at a rather abstract level; it did result, however, in a theory that made stronger reference to aspects of class struggle than to the Marxist *metaphysics of the productive forces* – a theme which also played a role in Benjamin's late works. In contrast, the theoretical development of Horkheimer and Adorno's version of critical theory was strongly marked by a disappointment of the hopes that had first been placed in communist movements. In the 1920s, Seidel faced the choice between 'terrorist bolshevism' and 'terrorist reaction'. After the experience of National Socialism and the extermination of the Jews, critical theory became more concerned with salvaging the bourgeois remnants of reason, barely noticing the real struggles of the proletariat. This circumstance has been occasionally criticized as the bourgeoisification of Marxism through critical theory. However, this relies on a development of the proletariat – especially in the German Reich – which could not have been foreseen in the 1920s.

If we concentrate on the just mentioned developmental line within critical theory – that is, the critique of enlightenment, which acquires its first comprehensive formulation in *Dialectic of Enlightenment* – then the question as to Seidel's theoretical contribution is less related to his dissertation than to *Consciousness as Doom*. In Prinzhorn's edition, the book appeared to be so obviously a theoretical reflection of a tragic individual

fate that it was received as a symptom of crisis rather than as a diagnosis of crisis. Yet theoretical positions are developed there which share a family resemblance to the critical theory of Adorno and Horkheimer. Besides the theoretical attentiveness to (its own) idiosyncrasies and outsider positions, a central theme in Adorno's *Minima Moralia*, what is noteworthy is Seidel's fundamental shift of the historical-materialist method from economic questions to ideology critique, which later became characteristic of critical theory as a whole. Seidel's revision of the theoretical position of the (negative) subject of history, a position assumed by the proletariat in classical Marxism, also belongs to the thematic spectrum of critical theory. Methodologically speaking, Seidel's contribution lies in his insistence on unconditional negativity and his critique of a thoroughly transparent enlightenment as self-critique, which met an (unnamed) afterlife within critical theory, especially in Adorno. While Lukács' Hegelian Marxism was still bound by the scheme of a positive dialectics in which the Communist Party was to carry out the final synthesis, Seidel proposed a model of critical reason that operates purely negatively and does not derive its legitimacy from either a transcendent goal or a privileged position, except that of the isolated outsider. It is therefore hardly a coincidence that Adorno mentions his 'late friend from youth' in 1965, as he himself was busy 'retrospectively' tracing his own path of thought in *Negative Dialectics* and 'justifying' his previous philosophical procedure with an abstract text, in the centre of which stands the 'concept of philosophical experience', marked by negativity (Adorno, 2003: xx).

Thus motifs of Seidel's thought continue to live on within critical theory. And they are not found only in Adorno and Benjamin but in Sohn-Rethel, whose lifelong project of philosophically relating the commodity form and the form of thought dates back to his time in Heidelberg. Nevertheless, the material presented above does not seem enough to defend the thesis that Seidel is a forgotten founding

figure of critical theory. According to Jochen Hörisch, critical theory tries to discover 'a repression-free consciousness of crises [...] not by attempting to freeze the specifically modern "mobility of thought," but rather by releasing it' (Hörisch, 2010: 83). If this is true, then Seidel's extremely radical attempt to do just that belongs indeed to the ancestral halls of the Frankfurt School, but it is difficult to say how original his thinking actually was for the time and for the Heidelberg milieu. What survives from Seidel's work should therefore not be used as material for the construction of a linear history of influence but rather as a testimony to the theoretical development and scope of an intellectual milieu, which as a whole had a considerable influence on the development of critical theory. Seidel's notes, incompletely concluded in 1924, conserve in a peculiar manner the then intact status quo of an ongoing development within the intellectual history of Germany, which would eventually differentiate and divide from the common experience of awakening in the youth movement and the shared canon of literary and scientific sources into theoretically and politically irreconcilable camps. Seidel declares that his entire work is primarily intended to synthesize the thinking of Freud and Marx, and to that end he relies on Goethe, Hegel, Dostoyevsky, Nietzsche, Stefan George, Ludwig Klages, Alfred Adler, Henry James, Georg Simmel, Max Weber, Karl Jaspers, and Oswald Spengler (Seidel, 1927: 72). He thus provides the reader with a representative list of those authors who were significant for building community and directing their generation. Yet, even more importantly, he constructs a panorama that will soon be unacceptable within the framework of a *single* theory. The theoretical, ideological, and political trenches that have opened up between these thinkers and schools of thought, and that will open up, are evidently too deep. Frese rightly sees Seidel's 'significance' primarily in the fact that his work makes possible the 'analysis of theoretical elements and motives of a theory' that came before the 'differentiation'

of sociological theories, 'whose seemingly disparate origins were still grasped as a unity', and thus makes this differentiation 'objectively, temporally, and socially identifiable' (Frese, 2001/2: 48). In Seidel's work, therefore, one can still see the whole whose differentiation then led, among other things, to what is today understood as critical theory.

In a certain sense, this could also be applied to more decidedly communist theory and to communism understood as the 'real movement which abolishes the present state of things' (Marx and Engels, 1975–2004: 5/49). Since the October Revolution did not prompt world revolution and since the social revolutions in Western Europe failed, communism and communist theory lost its unity and consequently forfeited its mobilizing effect, as Seidel would say. Seidel tried to maintain this unity through a firm commitment to the 'ruthless communists' and 'believing fanatics' – in whom he could no longer count himself – and failed. What remains is a testimony of this failure, a condensation of that 'agitated, beat down spirit [...] running through the streets at the time' that became the 'impetus' for 'the new development in Marxist thought' to which 'the Frankfurt school testifies' (Sohn-Rethel, 1972: 10).

## WORKS BY SEIDEL

*Bewußtsein als Verhängnis. Fragmente über die Beziehungen von Weltanschauung und Charakter oder über Wesen und Wandel der Ideologien.* Edited and with an afterword by Hans Prinzhorn. Bonn: Friedrich Cohen, 1927.

At the suggestion of Sohn-Rethel, *Bewußtsein als Verhängnis* was published by Bremer Impuls-Verlag in 1979 in an unlicensed reissue, edited with an extensive foreword by Helmut Höge (under the pseudonym W. Meier).

'Produktivität und Klassenkampf' (unpublished dissertation from 1922) in: *Archiv für die Geschichte des Widerstandes und der Arbeit* 18 (2008), 185–234.

'Geschichte der sozialistischen Studentebewegung Deutschlands' in: *Die neue Erziehung. Sozialistische pädagogische Zeitschrift* (Berlin) 12/13 (1919), 426–9.

## Notes

- 1 Translator's note: *Wandervogel* was the name of a German youth movement from the late nineteenth and early twentieth centuries that focused on hiking, adventure, being outdoors, and getting back to nature.
- 2 Benjamin records the dissertation as item 778 on his reading list, but under the wrong title: *Alfred Seidel: The Metaphysics of the Forces of Production* (Benjamin GS VII.1: 449). Esther Leslie (2000: 35) points out that Benjamin could have received important impulses for his own philosophy of technology from the dissertation, especially as regards his critique of the optimism of progress.
- 3 The letter is dated September 8, 1922 and is located at the Adorno Archive in Frankfurt am Main. A partial print can be found in Voller, 2014: 312.

# Arkadij Gurland: Political Science as Critical Theory

Hubertus Buchstein

## BIOGRAPHICAL SKETCH

Arkadij Gurland<sup>1</sup> worked at Max Horkheimer's Institute of Social Research (ISR) from 1940 to 1945 and had previously contributed to the review sections of its journal *Zeitschrift für Sozialforschung*. During his years at the ISR, he became an important voice in the controversy within the Frankfurt School group about state capitalism.<sup>2</sup> But Gurland's understanding of critical theory was not focused on the ISR. Before his years with the Frankfurt School in exile, as a translator and political journalist he followed his own independent ideas about Marxist political and social criticism. After he left the ISR, he developed a unique program for a critical political science in the early days of the new academic discipline in West Germany. Even though Gurland failed to be successful as the manager of a research institute in Berlin, the substance of his ambitions put him in a special position within the tradition of critical theory.

Arkadij Gurland was born in Moscow on September 1, 1904.<sup>3</sup> The families of his parents, Isaak and Debora Gurland, were of German descent and had lived in Poland and Lithuania. Gurland's father worked as an engineer in Moscow and Sebastopol. In the early days of the Russian Revolution, he was deeply impressed as a teenager by the mass assemblies following the revolutionary outbreak. As a Moscow high-school student, he participated in revolutionary mass demonstrations and he heard Lenin, Kamenev, Trotsky and other leaders of the Bolsheviks speak in person. In 1920, his father decided that the family had to leave the Soviet Union, and they moved into exile to Berlin, where he obtained his *Abitur*. Gurland and his parents never received German citizenship. Although the son of a rich and respectable family, he became a member of the *Sozialistische Proletarierjugend* [Socialist Proletarian Youth] and of the radical left USPD [Independent Social Democratic Party] during his time at the *Gymnasium*.

After completing his *Abitur*, he began to study at Berlin's Friedrich-Wilhelms-Universität in late 1922 and became a member of the German Social Democratic Party (SPD). Officially a student of mathematics and physical chemistry, Gurland used his time as a student mainly to provide an academic foundation for his socialist views, taking lectures and classes with Gustav Mayer, Arthur Rosenberg and Heinrich Cunow. He continued his studies in Leipzig in 1924 in the subjects of economics, philosophy and history. As a student, Gurland translated several books by leading Russian Mensheviks like Aron Jugow and Theodor Dan into German. His critical view of Soviet politics and economy brought him in contact with Max Horkheimer's closest personal friend at the ISR, Friedrich Pollock,<sup>4</sup> who was working on a book about the planned economy in the Soviet Union. Gurland finally graduated with a doctoral dissertation on the theory of dictatorship in 1929.

From 1924 to 1928, Gurland also taught at the Leipzig *Arbeiterbildungsinstitut* [Institute for Workers' Education], and from then until the collapse of Weimar, at the Berlin *Arbeiterbildungsschule* [School for Workers' Education]. In addition to his academic and teaching interests, Gurland started a successful career as a political journalist. From 1924 on, he contributed to practically the entire socialist press – for example, the *Außenpolitische Wochenschau*, the *Kulturwille*, the *Jungsozialistische Blätter* and Paul Levi's influential *Sozialistische Politik und Wirtschaft*; and from the beginning of 1932, he worked as editor-in-chief of the *Marxistische Tribüne*, a paper on the left wing of the SPD.

After the Reichstag fire in February 1933, Gurland first believed that the new coalition government with Chancellor Adolf Hitler would not last long. Urged by friends, he decided to leave the country in March of 1933, and he made it just in time: in early April 1933 an arrest warrant was issued for him by the Gestapo. Gurland first went to Belgium,

and in the summer of 1933 he moved to Paris, then one of the capitals of German emigrés. Gurland continued to maintain conspiratorial contacts with his comrades and friends in Germany, some of whom also supported him financially. He earned additional income as a translator, a sales director and an accountant in a newspaper distribution company, and as an employee of the French weekly *La Documentation de Statistique Sociale et Economique*. After the German invasion of France in May 1940, he was lucky enough to escape the Nazis again. He first fled to England and from there he was able to emigrate to the United States. His cousin by marriage, Henny Gurland, was with the group of Walter Benjamin who found their way – after Benjamin's suicide – through Spain finally to the United States (Brodersen, 1997: 252). It was A.R.L. Gurland from whom Horkheimer and Adorno first heard the details of Walter Benjamin's death in Port Bou (Horkheimer, 1996: 713–16, 727–30). Gurland's sister and mother also succeeded in leaving for England, but his father had already been deported to Poland in 1938 and was murdered in the Vilna ghetto in 1941.

In New York, Gurland was one of the emigrés whose political interest remained fixed on Germany. Together with the influential social-democratic journalist Max Sievers, he unsuccessfully attempted to revive the exile newspaper *Freies Deutschland* (Kaiser, 1981). In the fall of 1940, he was hired as a research assistant at the ISR by Max Horkheimer. Horkheimer and Gurland hardly knew each other beforehand. Joseph Maier, also a former doctoral student of Hans Freyer in Leipzig, who had started to work at the ISR, established contact with Horkheimer. Gurland stayed on the payroll of the ISR on a part-time basis until 1945. His two main fields of work were economic studies about Nazi Germany and antisemitism in Germany and the United States. Gurland also managed to get money for research projects under the roof of the ISR from other sources. After the ISR in New York was slowly dissolved in

1942, Gurland continued his research independently in New York for the American Jewish Congress (AJC), the Library of Congress and the Department of Labor. He also briefly worked with Neumann and Kirchheimer for the OSS (Office of Strategic Services) in 1945. Being stateless since his family had left Russia, Gurland achieved US citizenship in 1946 and changed his name to Arcadius Rudolf Lang Gurland. From time to time he still worked with members of the ISR. Alongside Adorno and Löwenthal, he collaborated with Horkheimer for his book *Eclipse of Reason*, which was published in 1947 (Wiggershaus, 1994: 344).

Two years after the war, Gurland made his first attempt to return to Germany. In the spring of 1947, he traveled throughout the British and American zones of occupation as a Visiting Expert Consultant to the US Department of Labor in order to observe the development of trade unions in Germany (Gurland, 1949). In 1950, he decided to move to Germany. His former colleague at the ISR, Franz L. Neumann, had offered him the directorship of a new political-science research institute to be founded in the Western sectors of Berlin, the *Institut für politische Wissenschaft* (IfpW, Institute of Political Science). Gurland stayed at the IfpW for four years. After personal conflicts with other members of the IfpW, he went back to New York in 1954. Although considered briefly for a sociology chair at Marburg University in 1957, he did not return to Germany until 1962, when he was appointed to the Chair for Political Science at the Technical University in Darmstadt, with the help of Adorno.<sup>5</sup> After his arrival in Darmstadt, however, Gurland did not intensify his contact with Horkheimer and Adorno in nearby Frankfurt. Politically, he was closer to Wolfgang Abendroth, the supporter of Jürgen Habermas's *Habilitation* in Marburg. In the late 1960s and 1970s, Gurland sympathized with those groups of the student protest movement who wanted to engage with the left wing of the social democratic party. A.R.L. Gurland died on March 27, 1979.

## MENSHEVISM, REVOLUTIONARY HEGELIAN-MARXISM AND SOCIAL DEMOCRACY

As a high-school student in Berlin, Gurland sympathized with the left wing of the Russian Mensheviks. He translated a number of their brochures into German. At 21, in his first book, *Der proletarische Klassenkampf in der Gegenwart* [Proletarian Class Struggle Today], he promoted Marxism as a 'method of thinking and doing research' (Gurland, 1925).<sup>6</sup> He finished his doctoral dissertation three years later, with Freyer, one of the most prominent sociologists in Germany, as his advisor in Leipzig. Freyer was an outspoken right-wing Hegelian. In his understanding of sociology as a *Wirklichkeitswissenschaft* [science about reality], Freyer tried to combine empirical social research with Hegelian dialectics and attracted a number of left-wing students in the 1920s.

The topic of Gurland's doctoral dissertation was the concept of dictatorship in the materialist approach to history. The book offers a Marxist counterargument to Carl Schmitt's book on dictatorship, which had appeared in 1921. In his predominantly philological work, Gurland sought to differentiate between a 'bourgeois' and a 'socialist' understanding of dictatorship, thus 'exposing' the Weimar parliamentary democracy as a bourgeois dictatorship (Gurland, 1930). Arguably the most exciting theoretical parts of the dissertation are the passages on the theory of science in which Gurland undertakes a kind of synthesis of Georg Lukács's theory of reification and Max Adler's empiricism as a starting point for a theory of class consciousness in late capitalist societies (Gurland, 1930: 32–46).

Due to his Russian connections, Gurland was in contact with Dawid Rjazanov, the editor of the collected works of Marx and Engels in Moscow, and was invited to collaborate on the new critical edition. This plan fell short after Rjazanov was purged by the Stalinist regime in 1931. Gurland's political positions

placed him on the left wing of the SPD, and he sought to influence the party to become part of a movement for revolutionary struggle. In the years of Social Democratic government participation in the Weimar Republic after 1928, he was one of the most vocal critics of the policy of entering into coalitions with the 'bourgeois' parties. Although he changed course in the early 1930s, he did so only for tactical reasons. Gurland considered the reformism of the German labor movement to be a result of its historic development, and believed that this stance could be overcome by means of revolutionary agitation that connected with workers' everyday experiences, as he detailed in his best-known Weimar piece, *Das Heute der Proletarischen Aktion* [The Actuality of Proletarian Action] (Gurland, 1931). Gurland was a socialist who propagated a mixture of Luxemburgism and cultural revolutionary activities within the working class. The theory of fascism he developed using the example of Italy and presented in the same piece is probably the most interesting part of the book. Gurland did not consider fascism the product of capitalism at a new level but as an expression of economic and social backwardness. Fascist ideology would seep into the working class only when crisis-driven deindustrialization on a large scale takes place. Gurland considered the ideological power of both the socialists and the fascists as being fairly high. Later, this perspective permitted him to take an unbiased approach to Marxist economic categories and to revise them.

Gurland's main contributions to the political thought of the Weimar republic are his Marxist concept of dictatorship, his theory of fascism and his emphasis on culture and education as means to mobilize the working class.

## RESEARCH ON THE NAZI SYSTEM

After his escape to France, Gurland soon made contact with the Paris branch of the

ISR, via Friedrich Pollock.<sup>7</sup> Gurland contributed reviews for the *Zeitschrift für Sozialforschung*, using different pseudonyms.<sup>8</sup> Looking back at the collapse of the Weimar Republic, Gurland castigated the Social Democratic policies of the Weimar years as 'the most abominable capitulation that the history of class struggles (...) has ever seen' (Gurland, 1935: 184). His main activity in his French exile was political journalism. From 1937, he directed the ongoing reports on Germany's economic development for Max Sievers's weekly paper, *Freies Deutschland*. He wrote more than 400 articles, mostly on questions of economic policy, until the paper was discontinued in the summer of 1939. The overarching theme of his articles and theoretical deliberations was the question of why the labor movement in Germany had been defeated without a struggle.

In his Paris exile, he started to compile material for a larger academic project in order to find an answer to the enduring question of why the German working class had been defeated by the Nazis. According to his application to the American Guild for German Cultural Freedom, he wanted to work on a 'comprehensive study of the sociology, history of ideas, and critique of ideology of the modern – primarily the German – socialist labor movement'.<sup>9</sup> The five-part analysis was to summarize socialist theory and practice in the nineteenth and twentieth centuries and elaborate on the ideological situation of socialism following the victory of fascism in Germany. The most innovative part of his project was the plan to analyze the 'new capitalism' under state-interventionist conditions and the economic order of National Socialism. In taking up the question of 'state capitalism' or 'monopoly capitalism', Gurland began to address the problems that he extensively dealt with years later in New York at Max Horkheimer's ISR. Indeed, the outline of his work displays parallels with the later analysis of fascism in Franz L. Neumann's *Behemoth*. However, Gurland's

application to the Guild was unsuccessful, and he had to continue making at least some money from his work as a journalist. In September 1939, he briefly published in the *Pariser Tageszeitung*, an emigré newspaper, together with Friedrich Torberg (Peterson, 1987). In his articles in newspapers and journals about the Nazi system, Gurland emphasized the fragility of the social compromise among the leading social groups and insisted on the continuity of the capitalist system in Germany (Gurland, 1938a, 1938b).

After Gurland was hired by the ISR in 1940, he concerned himself with two areas of work: the economic analysis of German Nazism and research on antisemitism. In his work on economics, he cooperated closely with Franz L. Neumann and Otto Kirchheimer, as the three had been hired to fill the political-economy gap of the ISR. But instead of orienting their work toward Pollock's and Horkheimer's theory of state capitalism, as had been expected of them, the three ignited a controversy about how the ISR's core members had placed National Socialism within their theory of capitalist society.<sup>10</sup>

Horkheimer and Adorno's theory on National Socialism was grounded in Friedrich Pollock's concept of 'state capitalism', which understood the Nazi regime as one among other cases of an emerging new economic and social order that had transformed monopoly capitalism into a totalitarian 'command economy' (Pollock, 1941: 454). They were inclined to the view that the Nazi regime was like the Soviet regime. In contrast to these members of the inner core of the Frankfurt School, Gurland agreed with Franz L. Neumann, Otto Kirchheimer and partly with Herbert Marcuse (Jay, 1973: 143–72; Wiggershaus, 1994: 223–36, 280–91), viewing National Socialism as a monopoly capitalistic system, which was founded on the capitalist relations of private property. The economic imperatives of monopoly capitalism were intact, and the compromises among the elites of economy, party, military

and administration that had come about were based on an economic system of private capitalism. The debate between the IRS members on this issue turned out to be the last intensive and truly interdisciplinary debate at the Institute.

In this debate, Gurland was – from the beginning and in contrast to his earlier views – a proponent of the theory of continuity, according to which fascism was the appropriate political organizational form for developed monopolistic capitalism. In his best-known work from his years in exile, an essay in the *Zeitschrift für Sozialforschung*, published by the ISR in English in 1941, he opposed Horkheimer's and Pollock's theory of state capitalism on empirical grounds (Gurland, 1941).<sup>11</sup> The manuscript was discussed within the ISR a couple of times and only after a number of revisions, which downplayed the dispute with Pollock and Horkheimer, was the article finally allowed to go to print.<sup>12</sup> Although Gurland agreed that technological rationalization had been advanced under the Nazi system, he did not turn this observation into a statement about the end of private capitalism. According to Gurland, the centralization and the bureaucratization of the economy had already started in Germany at the beginning of the twentieth century. Gurland saw these huge private companies and cartels as still being much more powerful than the Nazi state companies like the Hermann Goering Stahl Werke (steel-works). The technological progress and innovations that Pollock had emphasized in his article were more the result of the activities of these big private conglomerates than those of the government. Again, he used empirical data from the chemical industry to prove his case. According to Gurland, the German economic system was still monopoly capitalist, based, however, on a social 'compromise' (Gurland, 1941: 252) between economic managers and state leaders. In this connection, Gurland saw it as highly important to recognize that the social position of the political machine which runs the state – the

party – had undergone considerable changes. First, the party elite was no longer a gang of *déclassés* but had become the leading group of organizers within the governmental set-up. And second, the active rank and file's claim for security and prosperity had been fulfilled. The party supporters participated in the universal prosperity as capitalists, managers or corporate officers.

In this context, Gurland focused his attention on the importance of economic expansion as a means to prevent conflict within competing social groups in the Nazi system. He opposed Pollock's argument that the power of big business had been crucially reduced. The government, he asserted, represented the anti-monopolistic resentment of the petit bourgeoisie; the Nazis had made plenty of anti-capitalist propaganda. But after they had come to power they did not attack the social power of the entrenched business interests. He argued that the discontented middle classes – small-business owners, petty bureaucrats and white-collar workers – had always had more interest in security and participation in prosperity than in destroying the big capitalist companies. According to Gurland, this yearning had been fulfilled to the benefit of both the Nazi government and big business by German imperialist expansion. Opposing Pollock's statements about state capitalism, Gurland suggested that the expansion guaranteed the realization of the capitalist profit motive, and the profit motive stimulated further German expansion. Gurland also opposed the pessimistic view held by Horkheimer and Pollock that saw state capitalism as an ultra-stable social system: the monopolist capitalist system in Germany 'maintains the pluralism in the social and political set-up, and preserves the inconstancy of the balance of power' (Gurland, 1941: 263).

In a lengthy letter to Leo Löwenthal of November 29, 1941, Horkheimer expressed his concern that the ISR would rapidly decline if it continued to operate with Neumann, Kirchheimer and Gurland – that

the Institute would simply explode into different groups (Horkheimer, 1996: 223–30). Further, Horkheimer explained to Neumann in a letter of February 1, 1942 that the profound theoretical and political differences concerning the nature and structure of National Socialism had led to unbridgeable disputes between the members of the ISR (quoted in Laudani, 2014: 3–4). The social climate at the ISR became even colder than before.

In this situation, Gurland's collaboration with Neumann and Kirchheimer at the ISR became even closer. In 1943, the three authored a study on the fate of small businesses in Hitler's Germany for the Special Committee to Study Problems of American Small Businesses of the United States Senate (Gurland et al., 1943). Most of the empirical work for this book was done by Gurland, as the drafts and letters in his papers indicate.<sup>13</sup> The vast empirical evidence about the decline of small businesses in Germany and the ever growing economic and political power of big business was interpreted by them as supporting their view of the monopolist capitalist character of the Nazi system. Gurland also contributed his economic analyses to *Behemoth*, Franz L. Neumann's voluminous study of National Socialism.<sup>14</sup>

The controversy within the IRS about the alleged emergence of state capitalism could not be settled. The different implications for political action drawn from the two contrasting positions were profound. The state-capitalism theory stated that the contradictions of the capitalist system had been suspended, whereas the monopoly-capitalism theory argued that these contradictions were actually intensified. Gurland and his collaborators' empirical challenge for the state-capitalism theory was not taken up by the core group at the ISR. Neither Horkheimer nor Adorno had any real interest in empirical economic research. In 1943 and 1944, Horkheimer's circle began to close ranks. Apart from the intellectual differences over the economic basis of German National

Socialism, the financial situation of the ISR in exile had become difficult.<sup>15</sup> Horkheimer dismissed most of the ISR's staff and moved with Adorno to the west coast.

## RESEARCH ON ANTISEMITISM

Research on antisemitism became the second field of research for Gurland in New York. The American Jewish Committee (AJC) had already started to fund Gurland's research on antisemitism in 1943. Officially, it had been undertaken by the ISR. Gurland collaborated with Paul Massing on preparing the section on the economic and social origins of antisemitism. Franz Neumann had initiated some of these projects, and he and Gurland wanted to enlarge the project to include research into antisemitism among the American labor movement (Wiggershaus, 1994: 333–5). This idea, however, provoked Horkheimer's harsh opposition. In a letter to Neumann dated November 8, 1942, Horkheimer proclaimed that the labor study was pointless insofar as labor did not represent a 'hotbed' of antisemitic trouble (Worrell, 2006). This, however, was part of the reason why Neumann and Gurland were interested in the topic. Thanks to the intervention of a personal friend at the American Labor Committee (ALC), Gurland was finally able to secure financing for a separate project on antisemitism that dealt specifically with the topic 'labor and antisemitism'.<sup>16</sup>

When reading Gurland's research reports today, it is striking to discover how strongly he disagreed with the pessimistic outlook taken by Horkheimer and Adorno. Whereas the philosophical heads of the Frankfurt School presented in *Dialectic of Enlightenment* (1944/7) a diagnosis of their times which described the emergence of authoritarian capitalist societies and growing antisemitism (Horkheimer and Adorno, 1994), Gurland's empirical findings made him much more optimistic with respect to the future of Western

capitalist societies. The labor and antisemitism study examined the attitudes of 566 workers in New York, Detroit, San Francisco, Los Angeles and Philadelphia who belonged to the two main unions at that time – the American Federation of Labor (AFL) and the Congress of Industrial Organizations (CIO) – as well as unorganized workers. The study's methods were innovative because they partially referred to 'screened interviews', which meant that fellow workers on the shop floor gathered some of the material and conducted follow-up interviews.<sup>17</sup> Gurland concluded that younger workers, women and workers with higher education could be identified as being basically immune to antisemitism. In particular, American white-collar workers possessed 'amazingly liberal' attitudes, which pointed to a crucial difference from their counterparts in Europe. African-American and Hispanic workers also emerged from the study as being relatively free of antisemitism. Since those groups were growing in number among American labor, their political attitudes were to be understood as foreshadowing a more democratic (and not fascist) future in modern capitalist societies.<sup>18</sup> In the words of Mark P. Worrell: 'The labor report postulated that the future of American labor was heading, decisively, away from authoritarian ideology and that important segments of the working class were resistant or allergic to antisemitism' (Worrell, 2006: 281). The research was supposed to be published along with the outcomes of another empirical project at the ISR, which later became the famous book *The Authoritarian Personality*. However, Gurland's empirical labor project was not published by the ISR. In the internal discussions, Adorno asked for a theory which distinguished between middle-class antisemitism and working-class antisemitism. Horkheimer complained that the research emphasized the quantitative findings too much while neglecting qualitative analysis and philosophical considerations.<sup>19</sup> Segments of the study have only recently been published, under the title 'Social Power and the Fetishization of Jews:

American Labor Antisemitism During the Second World War' (Gurland, 2008).

After the dissolution of the ISR in New York, Marcuse, Kirchheimer and Neumann, members of the group in opposition to Horkheimer, soon obtained long-term positions with the Office of Strategic Services (OSS). Gurland succeeded only in working for the OSS on a short-term basis. As a result, the American Jewish Committee (AJC), the largest and oldest of the major Jewish defense agencies in the United States, became the main sponsor of his work in 1946 and 1947. He went on producing studies on antisemitism in Germany and the Soviet Union as a freelance researcher for the AJC and composed a number of research reports, which together amounted to more than 3,000 pages.<sup>20</sup>

### THE PROGRAM FOR A CRITICAL POLITICAL SCIENCE IN POSTWAR GERMANY

After the collapse of the Nazi regime, Theodor W. Adorno, Max Horkheimer and Friedrich Pollock soon returned to Frankfurt University, where they became influential academics in German philosophy and sociology. In political science, the case was different. Although a number of former emigrants took part in the founding of the new academic discipline in West Germany, the emigrés with a political-science background from the former ISR were reluctant about returning to Germany. Otto Kirchheimer and Franz L. Neumann stayed in the United States, where they became acclaimed political scientists. Gurland took a different path: he immediately looked for opportunities to participate in the new and growing discipline of political science in West Germany.

Gurland arrived in November 1950 with an ambitious research plan for the new IfpW in Berlin.<sup>21</sup> He wanted to break with the tradition of German *Geisteswissenschaften* and

create a new and critical political science in Germany.<sup>22</sup> In *Political Science in Western Germany*, he exemplifies with great flair the battles that lay ahead. In this large-scale book review for the Library of Congress, he reviewed more than 1,000 books by 384 German authors who had commented on political issues since the end of the war. His verdict was scathing. Affinities with National Socialism, pan-Germanism and a lack of analysis of the National Socialist era were only a few of his charges (Gurland, 1952a). Gurland contrasted the existing literature with the state of political science in the United States. The traditions of a 'Mohl, a Stein, a Marx and a Gneist' had emigrated there, and that was where the requisite modernization of the subject of political science had taken place. In a further publication later that year, he emphasized how the nascent German political science could employ approaches developed in the United States (Gurland, 1952b).

Gurland's own conceptual ideas of that time were published only in part during his lifetime. But the contours of these ideas can easily be reconstructed if we take an additional look at the internal papers he produced for the IfpW. Gurland intended to redefine the relationship between empirical research on the one hand and social and political theory on the other. Political science was to take on the task in terms of a critique of ideology, not in the Hegel-Marxist sense of deciphering 'necessarily false consciousness' but simply with an empiricist understanding. Political science would be in a position to hold its own as a discipline in its own right and stake its claim vis-à-vis the existing social sciences to the extent that it elaborated on procedures that would increase empirical knowledge of political structures, processes and functional relationships and permit a precise description of phenomena about which previous theory formation had made 'for the most part only ideological statements'.<sup>23</sup> German political science was lacking such empirical data to a serious degree. The goal was to capture reality by means of theory, just as in all other

social sciences. Theoretical work could not be accomplished 'in the seclusion of a retreat', but 'derives the decisive impulses from empirical research' (Gurland, 1952c: 35).

According to Gurland, 'political science [...] should first and foremost observe and classify the facts and sift the evidence; at a later stage hypotheses would be formulated, to serve as starting points for theoretical evaluation'.<sup>24</sup> In this construct, empirical research has the function of delivering data. Gurland envisioned a broad palette of methods of empirical social research, including clinical analyses and analyses rooted in depth psychology, methods for precisely measuring politically relevant means of influencing the masses (qualitative semantics), representative statistics and participant observation. Introducing these procedures, some of which were unknown in Germany, was so important to him that he taught several classes on methodological problems and encouraged his Berlin colleagues to participate in the training he offered.

In keeping with his empirically oriented program, Gurland referred to Max Weber's postulate of a 'value-free' social science time and again. To him, however, political science was not a value-free undertaking, as it almost always automatically argues in favor of freedom and democracy. The political scientist's preference for democracy was neither the consequence of external normative considerations nor the result of a dialectical historical truth. On the contrary, Gurland hypothesized that political science had an internal normative center, as scientific discourse itself is essentially bound to the existence of political freedom. Scientific progress was founded on the possibility of correcting mistakes. That is the case only where science enjoys the freedom to test itself time and time again. Political science was a kind of litmus test of political freedom because of its subject: politics. As a consequence, under the existing historical conditions, there could be no political science without freedom of speech (Gurland, 1952c: 35).

By tying it to freedom and democracy, Gurland also sketched out the critical object of political science: political power. From the perspective of freedom, it was never a science of the supposedly correct use of power in terms of a 'science of governance' but rather served to ruthlessly decipher power relationships. At the center of the discipline's epistemic interest, therefore, are 'society's power structures that determine political decisions as active factors, and the social, economic and psychological processes from which political power in modern society emerges, in which it develops to form an order and through which it is subverted' (Gurland, 1952c: 25). Gurland derived this epistemic interest not least from the National Socialist past: 'Under the impact of the last decades' cataclysmic events, the study of politics has become to a large extent an inquiry into the nature, the sources and the functions of power' (Gurland, 1952a: 2). Governance in mass democracies was hiding under the cloak of common interests. The task was to tear this cloak apart in order to reveal the actual relationships of power: 'In democracies, too, processes of forming power are increasingly characterized by the anonymity of the power of control, the lack of transparency of political decisions and the concealment of power'.<sup>25</sup> According to Gurland, political science is the restless search for the societal conditions of political power.

### **THE CRITIQUE OF POLITICAL RESTORATION IN WEST GERMANY AND BERLIN**

Political parties were at the center of Gurland's restless search for power structures during his four years at the IfpW. All of his works, even if they covered other topics, had the same theme: to criticize the tendency to restore capitalism in the Federal Republic and to express concern about the emergent character of West German democracy.

Gurland criticized three aspects in particular. First, he declared denazification a complete failure and bitterly called its factual results 'renazification'.<sup>26</sup> Second, the Western allies had neglected to override the power of the 'bureaucratic caste'. This was particularly worrying, as the German civil service had been nothing less than a bastion of anti-democratic policy since the establishment of the Reich and had paved the way for fascism (Gurland, 1947b). Third, he accused the occupying powers of having done nothing to prevent capitalist monopolies from attaining key positions anew: 'The political power of [...] big business – pro-Nazi, semi-Nazi, or profiting from the Nazis – rests on its close links to the Bizonal and Land Bureaucracies and the CDU party machine' (Gurland, 1949: 242), he complained in an article in *Commentary* in September 1949, which was widely discussed among the old Frankfurt School group. Gurland painted a dark picture of the young republic, articulating the fears and anxieties of a large part of the political left at that time. A growing unemployment rate, an intensifying economic crisis and monopoly capital rejecting full-employment policy, Gurland saw this situation as a breeding ground for National Socialist forces. Alarmed, he reported to his US readership about neo-Nazism and the resurgence of antisemitism.

During his years at the IfpW, Gurland did not retract any part of this diagnosis. He considered the IfpW's political function to be the detection of any form of restoration, down to its most subtle manifestations, thereby exposing it to public criticism. A study on the history of the founding of the Christian Democratic Union (CDU) developed into one of his most ambitious projects. Originally conceived as an essay for an edited volume on the West German political parties, his manuscript rapidly grew beyond that framework. But it was not only its unforeseen expansion that explained why the partially finished manuscript was not published in the IfpW's book series: a commission at

the IfpW rejected the publication due to the work's content and language, saying the study lacked the necessary effort to be scientifically objective, thus falling to the level of social-democratic propaganda.<sup>27</sup> Gurland gave up, leaving the IfpW in anger, and never finished the manuscript. The extensive study was finally published after his death 25 years later by Dieter Emig (Gurland, 1980) and is today seen as one of the best empirical studies about the early phase of the German party system.

The study presents the history of the founding of the CDU in seven sections. The first three chapters are compilations of the dates, background and personnel of the various CDU organizations that were established after the war; next is a description of the party programs from the *Cologne Principles* to the *Hamburg Program* of 1953; and, finally, Gurland examined the ideological bases of the founding circles, focusing on the stream of 'Christian socialism'. In the next three chapters, in which he himself took a stand most distinctly, Gurland reconstructed the debate about the formation of the first Bonn government as well as the course of the legislative process regarding socialization in Hesse and North Rhine-Westphalia. He made a detailed attempt to show how Konrad Adenauer's followers had taken over power within the CDU step by step. Gurland believed he could detect that the will of the founding circles to accomplish a new socio-political orientation was dissolved in a process encompassing five phases. Little by little, the CDU had degenerated from 'socialism carrying Christian responsibility' to a party intended on 'restoration' (Gurland, 1980: 417). The party's rejection of controlling monopolies and its dedication to the philosophy of the market were the logical end points of its development into a political force oriented toward large corporations. He expressed his concern about the CDU's future development, fearing that the 'hierarchical influencing of the masses and leadership' would return in dangerous form because of the 'charismatic authority of

the party leader' Adenauer (Gurland, 1980: 464). In other words, he anticipated so-called chancellor democracy.

But Gurland also found little to praise about the SPD, his own old party. For example, he accused it of bearing a large part of the responsibility for Adenauer's victory regarding the legislation on socialization. His accusation was as such: 'Basically, the SPD didn't know what to do with the coal industry; even if the best case of socialization had simply fallen into its lap, the party still wouldn't have known what to do: it had no stated goals in terms of production policy, technology or economic geography' (Gurland, 1980: 325). Two years before, he had taken the Berlin party association to task. The first volume of the IfpW book series, *Wahlkampf und Machtverschiebung* [Election Campaign and Power Shift] was an exhaustive empirical analysis of the election in Berlin's Western sectors in December 1950. The election study, the first in the young Federal Republic, was headed by Stephanie Münke, but Gurland, as editor-in-chief of the book series and as director of the IfpW, intervened in the preparation of the manuscript, at times rewriting entire chapters. In the foreword, he explicitly took responsibility for the content of the sections on the SPD. He explained the party's massive losses – from 64% to 45% – by asserting that the SPD had neglected to go on the offensive: it had failed as a party of a new socialist beginning.<sup>28</sup>

Gurland, not a person to shy away from disputes, knew what he was getting into in uttering such criticism. In spite of all the rhetoric that political science in Berlin was politically neutral, it had close ties to the SPD; and even though Gurland did not need to fear direct consequences because of his criticism, influential party members were no longer prepared to protect him. The atmosphere began to turn against Gurland in late 1953, and he finally had to leave the IfpW as personal conflicts and disputes about research projects became more intense.<sup>29</sup> The price of these disputes was that Gurland did not

finish his voluminous study on the CDU that had grown to 700 pages. In 1954, Gurland returned to New York.

## LATE WORK

During his time at the IfpW, Gurland reconsidered his thoughts about the economic theories of Marxism and about the rise of fascism in Europe. He defended the importance of an economic theory to explain the success of fascism in Europe but criticized the dismissal of the role of the middle classes in traditional Marxist thought (Gurland 1953a, 1953b). Before he returned to New York, Gurland contacted Horkheimer to figure out whether he would get the opportunity to work on these topics with the ISR in Frankfurt.<sup>30</sup> When this attempt failed, he sought longer-term academic employment in the United States. He continued his research as a freelancer on political parties in Germany, anti-democratic thought in Germany and on Soviet ideology for the Library of Congress, the Harvard Russian Research Center and the Rand Corporation.<sup>31</sup> At one point, when he felt desperate because he was unable to find appropriate employment in the United States, he saw, as he put it in a letter to Max Horkheimer, 'really no other alternative to becoming an academic civil servant in Germany'.<sup>32</sup> After he took up a professorship at Darmstadt University in 1962, he attracted significant attention one more time, at the 16th Congress of the German Sociological Association in Frankfurt in April 1968. Confronting Adorno, who painted a picture of an integrating cultural system in late capitalist societies (Adorno, 1969), Gurland held fast to the use of Marxist economic categories and the critique of capitalism. In contrast to Adorno, Gurland was optimistic about possible changes in the direction of a democratic and socialist society (Gurland, 1969). His arguments and political ambitions found positive resonance among the younger

generation of critical theory such as Claus Offe. Gurland invested most of his time in Darmstadt in teaching and on translations of academic books into German. He spoke and wrote fluently in seven languages. Thanks to him, Otto Kirchheimer's *Political Justice* got a superb German translation (which is still in print to this day); the same holds for *Revolution and the Civil War in Spain* by Pierre Broué and Émile Témime.

### GURLAND'S LEGACY

From the perspective of today's historiographies, it may appear as if Gurland placed himself between two distinct scientific fields in the 1950s – the returning Frankfurt School and the emerging discipline of political science in Germany – and that he nearly got lost in this position. This may be the reason why historians both of the Frankfurt School and of political science have often portrayed Gurland as a marginal figure. It was only very recently that he was rediscovered as an important author within the tradition of critical theory, aptly called a representative of 'the other Frankfurt School' (Worrell, 2006, 2008; Amidon and Worrell, 2008), and championed as an original figure among the founding fathers of German political science (Buchstein, 2010; Keßler, 2010; Detjen, 2016: 315–25). His work at this crucial time is worth a second look because it hints at the loss of an important alternative critical-theory approach within the newly founded discipline.

A closer look at Gurland's life, his intellectual development and his academic projects in the early 1950s indicates that he did indeed work at a particular crossroads between critical theory and political science which has been overlooked until today. Retrospectively, the historical significance of his work can be found in the fact that he championed an academic project which broke with the philosophical positions held by members of

the returning Frankfurt School on the one hand and by the new professors of political science in Germany on the other, both on political and methodological levels. The legacy of Gurland's work in the 1950s could be understood as an early contribution to a critical theory as a critique of political power structures in modern democracies. In order to fulfill this goal, Gurland argued for a political science based on empirical findings on the distribution of political power in modern societies that does not shy away from outspoken critique.

The three former political scientists at the ISR followed different intellectual paths after 1950. Whereas Neumann and Kirchheimer integrated the critique of reification and consumer society by the core group of the ISR into their political thought, Gurland insisted on a Marxist analysis of society which was primarily based on empirical analysis. Gurland's significance in terms of the history of the critical theory of the Frankfurt School can be found on substantial and on methodological levels. On the methodological level, Gurland integrated positivist empirical research into his approach and broke with his own and the Frankfurt School's Hegel-Marxist tradition. In addition, he presented a rigorous critique of the *geisteswissenschaftliche* and primarily normative orientations of most of his colleagues in early German political science.<sup>33</sup> On the substantial level, during the disputes at the ISR in the early 1940s with Pollock and Horkheimer, he insisted on the monopoly-capitalist character of German Nazism based on his empirical economic analysis. Gurland did not change his position on this controversy at all. Following his old line of argument after the war, he championed positions that were uncompromisingly outspoken in their critique of economic and political restoration in West Germany. Neither the members of the Frankfurt School in West Germany – at least in their statements to the public – nor his colleagues within the newly founded community of political scientists found sharper words against 'renazification'

in postwar West Germany than Gurland. Within the field of the next generation of critical theorists, the empirical research by Claus Offe in the 1980s and 1990s probably comes closest to Gurland's ambitions.

Today, after the empirical turn in mainstream political science, Gurland's criticism of the speculative and normative biases in social research has lost its sting. More interesting are his considerations of different stages of capitalist development. In his article 'Technological Trends and Economic Structure under National Socialism' (Gurland, 1941), he argued that the correlation of technology policy and political systems can be observed at three levels: liberal capitalism corresponded to the steam engine, bourgeois mass democracy to electricity, and the new chemical industry required a fascist state to develop under capitalist conditions. It might be worthwhile to consider the contemporary meaning of Gurland's idea. What would the thesis of the correlation of technology policy and political systems hold in the light of nuclear technology, alternative energies or the information technology of today?

## Notes

- 1 This article is based in parts on Buchstein, 2010. I would like to thank Eno Trimcev and Kerstin Pohl for critical comments. Gurland's papers are available at Goethe Universität Frankfurt (Universitätsarchiv, Na5, Nachlass A.R.L. Gurland). Additional biographical information can be found in 'Promotionsakte A. Gurland' in Universität Leipzig, Universitätsarchiv, Philosophische Fakultät, Promotionsakte 1701. For a bibliography of his publications see Gurland, 1991: 419–36.

# Alfred Sohn-Rethel: Real Abstraction and the Unity of Commodity-Form and Thought Form

Frank Engster and Oliver Schlaudt  
Translated by Jacob Blumenfeld

'In exchange the action is social, the mind is private'.<sup>1</sup>

## INTRODUCTION

Alfred Sohn-Rethel (January 4 1899, Neuilly sur Seine, France – April 6 1990, Bremen, Germany) was a trained economist, but he is known first and foremost as a Marxist philosopher. He lived in the UK for more than three decades and published in both English and German. He earned his PhD under the supervision of the Austromarxist economist Emil Lederer in 1928 at Heidelberg. During this time, he was also introduced to the early sociology of knowledge by Karl Mannheim. After his doctorate, he worked as a writer for a lobby group of Rhenish heavy industry in Berlin. In 1936, he emigrated via Lucerne and Paris to the UK, where he earned his living as a teacher in Birmingham. Only in 1972 did he finally get a position at the newly

founded university of Bremen (Germany), where he spent most of his time during the last 20 years of his life. During this period, he published most of his writings (written much earlier), among them his best-known book, *Intellectual and Manual Labour*. Sohn-Rethel is often regarded as close to the Frankfurt School. He was indeed friends with Adorno before World War II and exerted a certain influence on him; he also had contact with Bloch, Kracauer, Horkheimer and Benjamin. Reichelt (2002) and Bonefeld (2016) suggest that Adorno's *Negative Dialectics* in particular is indebted to Sohn-Rethel's concept of 'real abstraction'. Horkheimer, on the contrary, was hostile to him and his work, ultimately preventing him from receiving financial support from the Institut für Sozialforschung.<sup>2</sup>

Sohn-Rethel has the peculiarity of being the only philosopher close to the Frankfurt School who systematically attempted a Marxist philosophy of science. Similar to Lukács and others in the strand of Hegelian

Marxism, he understood science as a mode of bourgeois thinking, i.e., as a non-transparent, deficient mode of thought tied to bourgeois society. But contrary to Lukács and similar thinkers, he also wanted to understand the *validity* of scientific knowledge and how it derives its origins in capitalist society. He tried to do so by synthesising Kantian epistemology with Marx's critique of political economy, in particular Marx's analysis of the value-form. Sohn-Rethel's approach owes much to the influential tendency around 1900 (say, from the 1870s to the 1930s) to 'naturalise' or 'de-transcendentalise' Kantian epistemology by naturalistically reinterpreting the categories which, according to Kant, shape the way the world and empirical objects appear to the epistemic subject. Sohn-Rethel's idea was to 'derive' the categories of scientific thinking from the exchange of commodities. In a nutshell, Sohn-Rethel thought that an unconscious and unintended 'real abstraction' takes place through the exchange of commodities, reducing them to pure physicality and quantity. This abstraction takes place *in* the action, not in thought (hence 'real' abstraction as opposed to 'ideal' or purely mental). The abstraction crystallises in money and is eventually translated into definite forms of thought. Thus money in the literal sense 'coins' our thinking about nature. The deficiency of this kind of thinking resides, according to Sohn-Rethel, in its being unaware of its social origins and hence of its social boundedness.

Sohn-Rethel's approach to the philosophy of science can best be located at the intersection of three currents. (1) Neo-Kantian epistemology, i.e., a Kantian-style constructivist epistemology combined with a historical reading of Kant's categories. Cassirer, for example, with whom Sohn-Rethel occasionally studied at Berlin between 1919 and 1922, identified the categories with some basic concepts of science (like causality, energy, inertia). These basic concepts of physics act like Kantian categories because, according to Cassirer, they do not simply

serve to picture the objects of experience but rather have the function of organising our experience.<sup>3</sup> Sohn-Rethel retained this notion of scientific concepts from Cassirer and also inherited his rationalist notion of science. (2) Early sociology of knowledge, which was largely neo-Kantian and shared the historical interpretation of the categories but tried to overcome the latter's internalism by offering an external, sociological explanation of the historical development of the categories. This is true not only for the seminal contribution by Durkheim and Mauss on 'primitive classifications'<sup>4</sup> but also for Karl Mannheim, with whom Sohn-Rethel studied at Heidelberg. Sohn-Rethel retained from Mannheim in particular the idea that sociological explanations do not apply only to 'false consciousness', as it was understood in a more traditional reading of the critique of ideology, but also to valid insight.<sup>5</sup> Unsatisfied, however, by Mannheim's hesitations vis-à-vis the mathematical sciences, Sohn-Rethel explicitly aimed at pushing the sociological approach to these realms of knowledge. (3) Marx's critique of political economy, from which Sohn-Rethel adopted two basic elements. First, unlike in the positivist sociology of knowledge, the sociological approach should not only apply to valid knowledge but also explain in which sense and to what extent it is valid. Second, he adopted Marx's analysis of the value-form, which provided the basis for his 'derivation' of the categories of scientific thinking.

Sohn-Rethel emphasised that his approach cuts Marx's theory in two, retaining his analysis of the value-form but suspending his labour theory of value. It is true that Sohn-Rethel's approach presupposes that the value-form is completely determined by exchange and that labour (and capitalist production) only accounts for the *substance* of value, i.e., its nature in general and its amount in each specific commodity. Under this presupposition, the value-form (and its consequences) can be studied without taking into consideration capitalist production.

Moreover, identifying the substance of value with abstract labour runs the risk of establishing a new fetishism insofar as it does not acknowledge that there is no 'pure' substance of value outside or above the substance in its historically determined form. According to Sohn-Rethel, there is no substance of value without a particular value-form and no abstract labour without exchange. Labour transforms into abstract labour and determines value only if the labour products are to be sold on a market, i.e., only if the labour produces commodities. Hence the primacy of exchange in Sohn-Rethel.

This peculiar reading of Marx also determines Sohn-Rethel's particular position *within* Marxist philosophy of science. Albeit a minority, there were nevertheless a number of scholars who tried to understand the link between the rise of modern science and the rise of capitalism, in particular the industrial revolution. Before explaining Sohn-Rethel's approach in more detail, it might be useful to locate him not only on the general plane of intellectual history, as we just did, but also to sketch his positioning vis-à-vis other Marxists' approaches.

Marxist philosophers of science in the 1920s and 30s shared the idea that modern science was a result of the industrial revolution and the rise of capitalism. There was, however, no consensus on which characteristics of capitalism were decisive for the emergence of modern science.<sup>6</sup> A dividing line may be drawn *grosso modo* between two camps. On the one side are those who refer to factors stemming from the sphere of production (i.e., manual labour, division of labour, manufacture, and technology), and on the other are those of a more Lukácsian bent, including Sohn-Rethel, who seek the origins of science exclusively in the sphere of circulation and the form of social mediation (i.e., exchange, money and the commodity-form). As a consequence, Sohn-Rethel rejected some insights of the 'production camp' which had made their way into contemporary sociology of science, in particular

the Zilsel thesis and the Hessen–Grossmann thesis. Edgar Zilsel argued that the rise of capitalism allowed the social barrier between rational, mathematical skills and more experimental skills to break down. Previously, both types of skill were strictly associated with two socially separated groups, academics and craftsmen, and thus could not combine in one individual as would be necessary for modern science. Accordingly, the emergence of science would be due to a synthesis or merging of manual and intellectual labour in the renaissance figure of the artist–engineer.<sup>7</sup> Sohn-Rethel, however, understood science as essentially a mode of 'pure theory' and thus as a product of the complete separation of 'head and hands' in capitalist production. Boris Hessen and Henryk Grossmann, as well as Robert K. Merton, for their part argued that the focus of science was determined by contemporary technology and its urgent problems.<sup>8</sup> The Hessen–Grossmann thesis stipulates that, at least in the seventeenth and eighteenth centuries, science was the outcome of technology and not the other way around. Sohn-Rethel explicitly contested the Hessen–Grossmann thesis. To do so he draws upon the distinction between the form and content of scientific knowledge.<sup>9</sup> In a first step he insists that the sphere of production may at best affect the *contents* of science, but that its characteristic *form*, i.e., mathematisation, can only be derived from the exchange of commodities. (The distinction between form and content of scientific knowledge thus parallels that between value-form and value-substance.) At this level Sohn-Rethel could still have accepted the Hessen–Grossmann thesis at least as an approach complementary to his own. But in a second step he rejects their thesis entirely, calling the claim that science resulted from technological problems in early capitalism simply an 'absurdity'.<sup>10</sup> Sohn-Rethel thus can be seen as an adversary of any historical materialism that sees progress in science and knowledge as determined by resolving technological problems.

In the following, we will (1) develop the two 'great ideas' Sohn-Rethel claimed for himself, then (2) present the critique they provoked, before we (3) finally show how Sohn-Rethel's ideas could be further developed with help of the recent Marxist discussion around the value-form and money.

## THE VALUE-FORM AS TRANSCENDENTAL SUBJECT

Long before the reappropriation of Marxism that began in the 1960s, the analysis of the commodity-form had already undergone a significant reinterpretation in the 1920s and 30s by Sohn-Rethel. This reinterpretation contains, on the one hand, the critical-epistemological implications of commodity-exchange in the subject of exchange, and, on the other hand, it leads to a theory of 'synthetic' and 'functional socialisation' (Sohn-Rethel).<sup>11</sup> The major claim is no less than to establish the commodity-form as the constitutive social condition of pure reason and natural science.

For the reconstruction of the genesis of pure forms of validity, Sohn-Rethel relates Kant's questions about the conditions of possibility of pure knowledge, pure natural science and *a priori* synthetic judgments directly to Marx's analysis of value. As part of a materialist critique of the forms of pure knowledge, he attempts to develop the unity of commodity-form and thought form within a single context of explanation.<sup>12</sup> On the one hand, the Kantian *apriorism* of subjectivity and the purity of reason's validity are to be 'critically liquidated'. On the other hand, however, it is necessary to establish *with* Kant the determinate forms of intuition and categories of thought, together with their pure validity, from sources other than empirical experience and sensory-objective practice.<sup>13</sup>

For both Sohn-Rethel and Kant, a form of knowledge characterised precisely by the empirical purity of its objective and timeless

validity cannot be founded on sensory-empirical experience. Rather, it is always based on the *a priori* and transcendental. Nevertheless, unlike Kant, Sohn-Rethel wants to uncover the *social* and *historical* origin for this form of knowledge. Taken together, the task is to show how a form of knowledge arises from a specific socio-historical foundation, a knowledge characterised by the ahistorical and unsocial status of its universal validity; it claims truth precisely through the implicit denial of its social origin.

Sohn-Rethel believed that the solution to this paradoxical problem is to be found in 'real abstraction', the pivotal point of his entire critique of epistemology.<sup>14</sup> Real abstraction takes place *practically* in commodity exchange and at the same time realises a purely social synthesis; it is this synthesis that underlies cognition of scientific knowledge of nature. Sohn-Rethel traces the form of objective scientific knowledge back to the synthesis consummated in the exchange of commodities which underlies the socialisation of Kant's '*a priori* synthesis'.

Even though Sohn-Rethel, following the Marxist tradition, does not deny the dependencies that result from the metabolism with nature, production and the division of labour, commodity owners still only realise their sociality as 'practical solipsists' synthetically through exchange. Indeed, the abstraction that constitutes social as well as empirical purity is precisely the real abstraction *from* material nature, *from* work and production, *from* the use and utility of things; this abstraction gives rise to the abstraction of thought.<sup>15</sup>

According to Sohn-Rethel, the logic of appropriation and the form of exchange alone establish the unity of commodity-form and thought form and consequently the connection between the sociality of being on the one hand and the sociality of consciousness on the other. With this argument, he decisively breaks from almost the entire Marxist tradition and, with restrictions, even from early critical theory. The universality and necessity of the determinations of thought should not

be based explicitly on the natural determinacy of matter and its appropriation and mediation through labour; they should also not be based on successful, productive practice. With 'real abstraction', a concept not explicitly present in Marx's work but always there in substance, according to Sohn-Rethel,<sup>16</sup> the mind's capacity for abstraction can be explained by social practice, as required by any materialist critique. For social practice is the practice of *abstracting* from practice.

This real abstraction is intended to ground both conditions of Kantian transcendental subjectivity: first, its empirical purity,<sup>17</sup> and second, its status as an *a priori* condition of all empirical experience. According to Sohn-Rethel, the purity of forms of knowledge is based on the social practice of a real abstraction that unconsciously renders things identical through exchange. On the one hand, this occurs in the absence of all qualitative properties and in the quantitative equalisation as pure values,<sup>18</sup> and, on the other hand – which is often overlooked in the interpretation – in the absence of all *acts of use*, so that things are also qualitatively treated as objects identical in time and space. Thus the purity produced qua abstraction from everything empirical brings forth a corresponding pure mode of knowledge on the part of the exchangers but without immediate recognition of the social and historical origin of its own validity. The real abstraction of *activity* immediately assumes the *form* of thought,<sup>19</sup> taking effect with validity as it vanishes in abstract thought forms.<sup>20</sup> One must pay close attention here to the status of genesis and validity. For Sohn-Rethel, it is *not* that the forms of cognition negate and forget their genesis from material conditions and social practice, as Adorno suggests. Rather, such validity takes effect precisely *with* the negation of its social conditions and *in* the negation of its genesis.<sup>21</sup> As much as both Adorno and Sohn-Rethel take their point of departure for epistemological critique from the logic of exchange and abstraction, they go in almost opposite directions.<sup>22</sup> Both of them base the unity of social critique and

critique of epistemology on the mediation of the commodity-form, and thus both pursue a kind of socialisation of German Idealism and an enlightenment of Enlightenment. But while Sohn-Rethel stresses the objective, scientific validity of forms of thought, and explicitly attributes them to the abstraction *from* labour, *from* production and even from sociality, Adorno emphasises the reduction and harm that this abstraction *from* sociality causes *in* society. Sohn-Rethel's critique of the commodity-form seeks to elucidate the constitutive conditions of natural as well as purely social objectivity and believes that socialist society should develop this rationality in an affirmative manner; for Adorno, the objectification of society (de)generates into the domination of a second nature, directed against society itself, with enlightenment and rationality fatally turning into their immediate opposites, irrationality and delusion.<sup>23</sup> The socially accomplished real abstraction does not return in a cognitive synthesis or in an empirically pure form of scientific rationality, as in the case of Sohn-Rethel; rather, it turns into coercion of a second nature which asserts itself against the individual as objective coercion and higher necessity.

For Sohn-Rethel, contrary to Adorno's critical theory, society does not undergo a violent adjustment and hermetic closure in a false immanence through its commodity-form mediation. Rather, society experiences its own mediation through a form that produces an objective experience of nature with the practical mediation of things. Thus Sohn-Rethel's historical-materialist reconstruction is 'only' supposed to explain why the forms of validity, which have disappeared without a trace in the social synthesis as well as in the individual mind and in its effects, truncate their own genesis as much as enforce their validity.

Through this disappearance of genesis in validity, according to Sohn-Rethel, the second characteristic of Kant's transcendental subject, after its empirical purity, can be socialised: *apriorism*. Kant not only interpreted

the purity of forms of knowledge in a one-sided subjective sense; he also posited them as 'originally acquired' *already* in this subjectivity and imputed them to the mind as a spontaneous achievement. This semblance of an *a priori* capacity for reason results from the fact that blindness to its social origin is inscribed in the developmental process of thought forms from real abstraction; the origin of thought is a blind spot for it.<sup>24</sup> While the real abstraction of the act of exchange provides a *practical* synthesis of society, the mind carries out a *theoretical*, purely mental, intellectual synthesis which functions like Kant's transcendental subject.<sup>25</sup> The real abstraction of the act of exchange is the condition of possibility for *subjective* knowledge yet with *objective* validity; the abstraction, however, has disappeared into a separate mind, reflected in itself, just as it reappears in a seemingly given, *a priori* faculty, attaining validity as the individual mind literally thinks *for* society: 'For this mind acts intellectually for society'.<sup>26</sup>

Yet this 'translation' of the real abstraction of activity into thought remains unclear. Sohn-Rethel sometimes implies that practical activity 'imposes' itself on consciousness and translates into a thought form in an immediately spontaneous yet causal manner. He does not unambiguously clarify whether the mind reflects the unconscious yet real abstraction, and consciously adopts this abstraction, or whether this adoption is not conscious but immediately shapes the form of consciousness itself.<sup>27</sup> Whatever the case may be, what needs to be grasped is a causal yet spontaneous-immediate translation, sustained in the thought form by the generalisation of commodity exchange and the practical 'solipsism'<sup>28</sup> of the commodity owner. The 'usual flow of commodities' is 'thus very much entrenched in the routine of its institutional tracks', and it is 'so little the place for philosophising, that on the spot consciousness of the underlying structures remains impossible'.<sup>29</sup>

Real abstraction for Sohn-Rethel is individually, subjectively put into effect in a way

that is functional not only for the practical synthesis of society and the intellectual-theoretical synthesis of the mind but also for the scientific knowledge of *nature*. The real abstraction of social acts of exchange treats things like the exact natural sciences do, namely as objects identical in space and time; the determination of things through their relations as mere magnitudes of value corresponds to how objects are treated in natural science, which also quantifies qualities and determines natural properties through value relations. Thus, by ignoring all subjectivity and sensuality, and as much through social practice as in the translation to thought forms, the exchange abstraction constitutes an identical space of validity, in which objects, according to the scientific view, must appear desubjectivised and de-sensualised with the strict necessity and universality of *a priori* forms. The empirical purity of natural science is thus possible, according to Sohn-Rethel, for one and the same reason that the purely functional and synthetic socialisation is possible; or, rather, the mode of exchange and logic of appropriation in acts of exchange accomplishes the same pure 'physicality' (Sohn-Rethel) in which objects stand in compliance with the scientific view.<sup>30</sup>

This social mode of knowledge, broken by its form, makes nature appear as the other of society and turns it into an object. Sohn-Rethel develops this into its own independent thought: the domination of the logic of appropriation over the logic of production.

### **DOMINATION OF THE LOGIC OF APPROPRIATION OVER THE LOGIC OF PRODUCTION: THE ORIGIN, CRISIS AND OVERCOMING OF 'FUNCTIONAL SOCIALISATION'**

By his own estimate, Sohn-Rethel had a 'second great idea' alongside his 'semi-intuitive insight' to identify Kant's transcendental subject with the value-form: the

domination that the logic of appropriation exerts over the logic of production. He explicitly examines this idea in his first major exposé, written in Lucerne in 1936, published only in 1985 under the title *Sociological Theory of Knowledge*,<sup>31</sup> although it runs throughout his other writings, too. The 'logic of appropriation' refers to the whole of social relations of exchange and its laws, while the 'logic of production' corresponds to the whole of production. According to his 'second idea', even the historically earlier class divisions within communities occurred together with those forms that, in turn, functionally mediate these divisions for the sake of domination. The fundamental division of society running throughout history is the separation into producers and appropriators, with the domination of the form of appropriation over production and consequently the appropriators over the producers.

If, however, socialisation follows a definite logic of appropriation and takes place according to its laws, then this logic must be decisive for the *historical* development of society. In his writings on the relation between the logic of appropriation and the logic of production, Sohn-Rethel has in fact developed a philosophy of history that operates teleologically with a beginning, a contradiction throughout and an end. This philosophy begins (1) with the division of primitive communities as the origin of a functional socialisation in the service of economic exploitation and political domination, which, however, (2) ultimately produces and develops the possibility and even necessity of another socialist socialisation, yet remains (3) contradictory and crisis-ridden, as Sohn-Rethel shows in his writings on National Socialism.

### THE HISTORICAL ORIGIN OF THE COMMODITY-FORM AND LOGIC OF APPROPRIATION

With regard to the determination of the historical origin of the value-form, Sohn-Rethel's

fixation on the exchange process and the primacy of the logic of appropriation over the logic of production breaks not only with the Marxist tradition but with Marx himself. Marx traced his critique of the commodity-form to the form of capitalist commodity production and began it both historically and logically with 'primitive accumulation' – that is, with the liberation of the two components of valorisation and its commodification: on the one hand, labour time and labour-power itself, and, on the other hand, the means of production and the conditions of production (land, tools and machinery, work materials). Sohn-Rethel traces it historically further back, to the 'original sin'<sup>32</sup> of the first relation of exploitation, simple commodity-exchange.<sup>33</sup> He assumes that the transformation into a 'functional socialisation' begins with the first forms of commodity exchange and that this emerged with the 'original division of primitive communities' through the 'relation of exploitation'.<sup>34</sup> The appropriation of products of labour as commodities by means of money is a social form of the division of society into classes, of domination and exploitation through appropriation.

For Marx, unlike Sohn-Rethel, commodities and their values are not the result of an exchange. Rather, this is a semblance on the surface of society, which Marx makes transparent through the development of the capital-form of money on the one side and the valorisation of labour and capital on the other. Through this development, commodities and their exchange-values are posited as products of the valorisation of labour and capital, purely logically; conversely, Sohn-Rethel derives the capitalist determination of labour and production from the logic of the commodity-form, both logically and historically. The logic of exchange and appropriation is the timelessly valid *a priori* of the socialisation of labour and production; both take place under this form and thereby obtain their determinacy, entirely in line with Sohn-Rethel's idea of socialising Kant's transcendental subject.<sup>35</sup>

## **CAPITALIST COMMODITY PRODUCTION AND THE TRANSITION TO SOCIALISM**

The historical implementation and social generalisation of the functional mediation of this logic of exchange and appropriation ultimately leads to the specifically capitalist production of commodities. However, only in the capitalist phase of commodity production does the logic of appropriation begin to take effect in the modern sciences. From there, it in turn dominates labour and production, bringing a productive application of science to commodity production, especially through the Taylorist and Fordist disassembly of production and the composition of its elements according to abstract, quantifiable time.<sup>36</sup> This scientification of labour and production should ultimately overcome the commodity-based mode of appropriation and sphere of circulation through a 'full socialisation of labour',<sup>37</sup> leading to a totally social, socialist synthesis. In the course of the scientification of production according to real abstraction, an equality of the scientific form of thought and the process of labour should be advanced, culminating in this 'full socialisation of labour'. The social synthesis could thereby become the formal law of the entire society as well as of classless production; in fact it *must* become it, but without the detour through an appropriating logic, which is neither necessary nor capable of reproducing the society anyway.<sup>38</sup> It is the final consequence of Sohn-Rethel's idea that the purely social forms of validity in the natural sciences, despite and yet due to the mistaking of their socially constitutive conditions, provide for a kind of self-reflection of nature. The 'main achievement of intellectual labour in bourgeois society' is the 'encounter of nature with itself'.<sup>39</sup> Moreover, the scientification of labour and production ensures that the separation of the socialisation and science of nature ceases to be necessary; the social process of reproduction can be organised as a natural process. Since the labour and

production processes are organised as natural processes, the individual producer can activate the synthetic unity of society, accomplishing it naturally *a priori*, so to speak, always with the consciousness of the social totality of labour.<sup>40</sup>

## **CRISIS OF THE LOGIC OF APPROPRIATION AND THE RISE OF NATIONAL SOCIALISM**

Sohn-Rethel ties the great economic crisis at the end of the 1920s and the rise of National Socialism to the contradiction between the logic of appropriation and the logic of production. His critique of the economics of National Socialism is the third strand of his theory, although he only worked on it intermittently; he wrote it between 1932 and 1948.<sup>41</sup> Here again, the separation of the logic of production and the logic of appropriation is central. On the eve of fascism, the capitalist mode of production was ripe for a socialist takeover due to its Taylorist labour organisation and Fordist assembly-line production. Fascism was a reaction to the already quasi-socialist flow of socialised production, pushing the bourgeois logic of appropriation into a crisis without any corresponding socialist planning. If the capitalist logic of appropriation was to remain the basis of production, then it could only be maintained by the concerted centralised power of a state-corporatist mode of exploitation and appropriation. According to Sohn-Rethel, in this hopeless situation National Socialism implemented a state-corporatist military Keynesianism to replace the failing market and the lack of purchasing and consumption power (especially on the part of the workforce and the population) that accompanied the vastly increased productive capacity (especially on the part of the rationalised heavy industry). Disastrously, and not just because of its use-value, defence production, with its non-reproductive war goods, was directed to destruction and war instead

of productive consumption. The actual exchange-value was also oriented towards war, because the goods were not produced for the market and the (expanded) reproduction of capital, but were first of all valued by the state, ultimately through war – and that meant direct predatory appropriation. The deficient circulation between the armaments industry and the state could either implode or turn its inner-crisis dynamics outwards imperialistically into direct appropriation through plunder.

In National Socialism, Sohn-Rethel saw a ‘twofold social syntheses’ break down, no longer converging in the direction of socialism, as is the case with the reproductive capacity of capitalism. The military Keynesianism of National Socialism was a reaction to the crisis and breakdown of business and production economics as well as to the crisis and breakdown of appropriation and market logics; to Sohn-Rethel, it was also closely tied to the development of monopoly capitalism and imperialism in general.

## CRITIQUE AND ASSESSMENT

To critique Sohn-Rethel it makes sense to begin with his deliberate deviations from Marx. Following this critique, and in conjunction with the insights of the Marx discussion since the 1960s, it will be shown how the idea of a unity of social critique and epistemological critique, which Sohn-Rethel links to the relation between the commodity-form and thought form, can be developed further.

## SOHN-RETHEL’S HISTORICAL-MATERIALIST ‘GROUNDING’ OF VALUE-FORM ANALYSIS

Sohn-Rethel’s grounding of the social constitution of pure knowledge and modern natural

science in the logic of appropriation and exchange goes together with some crucial departures from traditional Marxism and from Marx himself.

As far as traditional Marxism is concerned, Sohn-Rethel explicitly breaks with the substantialism and essentialism of the concept of labour that appeared in the form of a left-Ricardian, objective labour theory of value and was also essential to politics ‘in the name of labour’. This departure was crucial for critical theory as well as the various new readings of Marx and need not be considered in greater detail here.<sup>42</sup> It is important, however, that Sohn-Rethel also makes a conscious departure from Marx himself, particularly in regards to his concept of ‘abstract labour’.<sup>43</sup> Sohn-Rethel not only saw this difference but also proceeded to differentiate himself from Marx in a deliberate, albeit cautious way. He talks of finding ‘certain ambiguities’ in Marx, especially in the ‘relation of the form of value and substance of value’. Marx tried to ‘short-circuit the value-form with abstract labour’, and thus ‘the epistemological implications of abstraction remained closed off’.<sup>44</sup> Moreover, the problem of the value of labour in Marx ‘occurs doubly, in the form of an essence logic and in a functional logic’.<sup>45</sup> Sohn-Rethel makes a far-reaching distinction: he separates the substance and magnitude of value from the form of value.<sup>46</sup> He does this for two reasons: first, in order to develop the critical epistemological implications – in the sense of the aforementioned functional logic – from commodity exchange alone, independently of labour, even granting logical priority to exchange; second, he does so in order to maintain labour as *chronologically* first in the sense of a necessary mediation with nature (especially against the subjective theory of value).<sup>47</sup>

Value, the magnitude of value and the value-form stem from different sources. Labour gives them value, but only in consequence of the real abstraction of exchange by taking on, the purely social quality of ‘abstract human labour’ in its value-creating capacity. The value-form is reduced to the

real abstraction of exchange, which alone confers on commodity exchange its social-synthetic efficacy, thus enabling the 'private exchange of individual products of labour' to 'assert the relation of social labour.' The exchange process thus produces the value of the commodity; labour, on the other hand, determines its *magnitude of value* according to the socially necessary average labour time expended on commodities. This separate derivation of the value-form from exchange, or rather, real abstraction is fundamental; it is absolutely necessary to adhere to it.<sup>48</sup>

Sohn-Rethel here acknowledges the existence of the form of value independently of the substance and magnitude of value. According to Sohn-Rethel's separation of substance and form, the substance of value emerges from the practical relation of human beings to nature and things. The exchange abstraction, however, cannot arise from the material nature of commodities, neither from their 'nature as use-values nor their nature as products of labour'.<sup>49</sup> It is a *pure relation* between human beings as well as between things as commodities; thus the *form* of value, in contrast to its *substance*, is the purely social synthesis between human beings and their context of appropriation and exploitation. Since the form results from the equalisation of things qua abstraction, it is purified of all material qualities and use-value determinations, and it puts owners via things into a social relationship that is empirically 'pure' in the Kantian sense.

While Sohn-Rethel admits that Marx orients the nexus of socialisation around labour, he insists that labour does not spontaneously exist in the abstract-general form that underlies the social synthesis. Society is not a relation of labour but of exchange and appropriation.

Here, Sohn-Rethel's interpretation directly reverses the determination, common in traditional Marxism, of the relation between substance and form of value. The value-form imposes its form-determining logic *a priori* on production as well as on its results, and *that is why* labour first of all receives the

character of an abstract-universal substance of value.<sup>50</sup>

Therefore the real abstraction of the exchange act and the appropriation logic of commodity exchange are constitutive only for the *semblance* of abstract labour as the substance of value; against this semblance, processes of exchange and circulation are held up as an autonomous sphere with logical priority and historical force.<sup>51</sup> An 'abstractified' labour and substance of value are thus a kind of misrepresentation, created by the effective equalisation of commodities in exchange, and only have reality in the imagination of the subject.<sup>52</sup> Hence the concept of abstract labour has no further, substantial meaning for Sohn-Rethel. It is consequently dismissed as a 'fetish concept owed to Hegel's legacy'.<sup>53</sup>

However, this status of abstract labour and the coming apart of substance and form of value point to a real problem in Sohn-Rethel: the substance and form of value can only be adequately related and Sohn-Rethel's dualism can only be overcome by an adequate determination of *money*. But, as will be explained in more detail below, money is underdetermined for Sohn-Rethel because it ultimately derives from an immediate exchange of commodities and is nothing more than a mere reification of the commodity-form. The abstract form of exchange can be disclosed not only separately in the mind but also in money. But, like the mind, 'money' for Sohn-Rethel remains 'a diversion, or more precisely, a materialisation of the commodity-form with respect to its intrinsically reciprocal appropriation of exchange'.<sup>54</sup> The mediating function of money is necessary for social synthesis; in money, the commodity-form even becomes 'independent'. But ultimately for Sohn-Rethel money remains external to the actual social mediation, similar to bourgeois economic theory; as he declares in his later writings, money is the 'bare coin of the *a priori*'.<sup>55</sup> Therefore what 'thinks for society' without knowing it – as much unconsciously as functionally, whether understood as an individual form of thought and necessary

concept or as a quasi-independent, supra-individual and blind-automatic subject – is precisely *not* money; rather, it is the synthesis of the individual abstract mind, which originates from real abstraction but remains ‘conceptually independent’.<sup>56</sup>

These so-called divergences from Marx are already the consequence of an even more fundamental break: Sohn-Rethel develops the commodity, value, labour and money through a completely different *method* from Marx. Sohn-Rethel’s divergences follow from the fact that he takes up Marx’s *systematic-categorical* analysis of the value-form of the commodity as an *empirical* process; he wants to *derive* the categories of the economy and the intellect, together with their objective and timeless validity, from this empirically conceived process.<sup>57</sup>

Therefore, the determinations Marx gains in the analysis of the value-form through conceptual-logical *critique* are quickly transformed by Sohn-Rethel into the empirical, action-theoretical groundwork for a materialist *theory* of knowledge. Marx’s analysis of the simple value-form ‘x commodity A = y commodity B’<sup>58</sup> is interpreted as a practical, empirical activity. Sohn-Rethel (mis)interprets the logical equation of Marx’s analysis as exactly that practical act of exchange whose unconscious equalisation of things as values must nevertheless become conscious, namely in a cognitive faculty that cannot recognise its own validity nor its functionality for social synthesis.

### **THE ACTUALITY OF SOHN-RETHEL’S QUESTION CONCERNING THE ORIGIN OF PURE KNOWLEDGE, AND THE LOGICAL-CATEGORICAL INTERPRETATION OF VALUE-FORM ANALYSIS AS A CRITIQUE OF PRE-MONETARY THEORIES OF VALUE**

Sohn-Rethel has been criticised from at least two different sides. Traditional Marxism, as expected, insisted that the identical quality of

commodities is ultimately constituted by labour and its capitalist valorisation, and that Sohn-Rethel could only grasp the substantial essence of labour from the deficient idealist standpoint of exchange and circulation. Knowledge too should have its basis in the material process of labour and production and arise from empirical, practical experience.<sup>59</sup> Sohn-Rethel has also been criticised in the Marx discussion which, like him, departed from a theory of knowledge or reflection based on labour and practice and sought the constitution of determinate forms of consciousness, thought and conceptual necessities in the form of social mediation.<sup>60</sup> This shift in the foundation of a critique of knowledge away from labour and production and towards the social forms of mediation had already taken place in the first generation of critical theory and Western Marxism, albeit mostly in the sense of a critique of consciousness and ideology instead of a materialist theory of epistemology.

But the decisive objection to Sohn-Rethel was first formulated with the help of the key findings of the Marx discussion of the 1960s and 70s. In contrast to Sohn-Rethel’s interpretation – and here Sohn-Rethel stands for a widespread interpretation – Marx’s value-form analysis should not be interpreted as a direct exchange of commodities, neither in a purely systematic-logical sense nor even in a historical-logical sense, but should be read as a critique of all pre-monetary theories of values – as a critique of a pre-monetary and pre-value commodity. Accordingly, value-form analysis obtains the necessity of money in a logical-categorical way. This reading of value-form analysis was first achieved in the course of the new Marx appropriations which began in the mid 1960s almost simultaneously in several industrialised nations of the West and a few of the East, prepared as it was by ‘Western Marxism’ (the young Georg Lukács, Karl Korsch, Henry Lefèbvre, Merleau-Ponty, Galvano Della Volpe, Lucio Colletti and others, as well as the authors of critical theory).<sup>61</sup>

From the perspective of this reading, Sohn-Rethel even missed the fact that with Marx such ideas of direct commodity exchange – which are ironically characteristic of bourgeois economic theory – can be criticised in at least two respects.

On the one hand, Marx wants to reveal the exchange of commodities as a necessary semblance: what seems to be a mere money-mediated exchange of commodities is in fact the realisation of their *production*. On the other hand, Marx traces this production of commodities back to the valorisation of labour and capital. Marx thereby wants to show the capitalist determination of both commodity *and* money: ‘The whole difficulty arises from the fact that commodities are not exchanged simply as *commodities*, but as *products of capitals*’.<sup>62</sup> Hence the values of commodities and their magnitudes are due to the capital-determined movement of money on the one hand and the valorisation of labour and capital on the other, rather than any abstraction in exchange.

Money realises on the part of the commodity a relation of valorisation, not exchange, but it creates precisely this *semblance*, as if a direct exchange of commodity for commodity was carried out. Marx wants to critique this semblance, which fools both bourgeois economic theory and Sohn-Rethel. Although in his later writings, Sohn-Rethel opens up his interpretation of the commodity-form more towards money, and even calls money ‘the bare coin of the *a priori*’, his concept of money remains problematic in the same two respects that the concepts of value and the commodity-form are problematic. On the one hand, he logically and historically derives money from a direct exchange of commodities, which in fact should be criticised as the false semblance of money; on the other hand, Sohn-Rethel simply has no capital-determined concept of money and consequently no capital-determined concept of value, abstract labour or the commodity.

If one wishes to develop further Sohn-Rethel’s approach along the lines of the

sketched-out results of the more recent Marx discussions,<sup>63</sup> then, instead of real abstraction, what should determine money is the social relation between labour and commodity, the substance and form of value; money is necessary in order to posit labour and the commodity as the substance and form of a *value*-relation. On the one hand, money would be traced back to its capital form, and, on the other, the values of commodities along with the substance of value and the concept of abstract labour would be attributed to the valorisation of labour and capital. In the course of the development of the capital form of money and the valorisation of labour and capital, Marx recovers the capitalist determination of the categories with which he entered into the development. He thus shows that money, value, commodity and labour receive their determinations through capitalist valorisation. When Marx develops the relations of money and value, commodity and labour towards the capital form on the one hand and valorisation on the other, he is thus attributing them less to a real exchange-abstraction or the *a priori* of a transcendental social synthesis. Rather, he resolves them in a common process in which money realises the results of the capitalist valorisation of labour in commodities and their values – that is, a valorisation in which money itself was advanced and entered anew. Marx understands the ‘automatic subject’<sup>64</sup> developed in this capital-determined movement of money more as an immanent critique of Hegel’s spirit than as the socialisation of Kant’s transcendental subject.

Sohn-Rethel received greater attention only in the 1970s, mostly in West Germany. In the critique of him, the view prevailed that he resolved the relationship of substance and form one-sidedly towards form, and, according to his own claim to have socialised Kant’s transcendental subject, that he ends up in nominalism with a circulationist theory of value. According to this critique, Sohn-Rethel is characterised by a dualism as thorough as it is consistent. In Kant, the

dualism was the result of critical distinctions. In Sohn-Rethel's attempt to socialise the Kantian critique of reason, the dualism reappears in the separation of the value-substance from the value-form; it continues in the relation between the logic of production and the logic of appropriation as well as in the unresolved transition from the real abstraction of activity to the purity of thought form; and, finally, it can be found in a philosophy of history and critique of economics in which the political and ideological-critical implications remain almost entirely external.

But even if Sohn-Rethel could not fulfil his powerful claim to have grounded the forms of scientific knowledge through the form of social mediation in a historical-materialist manner, the task remains open. Social critique has not only disregarded a materialist theory of knowledge and a critique of (natural) science; it does not even realise that this is its task.<sup>65</sup>

## Notes

- 1 Sohn-Rethel, 1978a: 43.
- 2 Hörisch, 1996: 241; Sohn-Rethel, 1990: 9 ff.; for Sohn-Rethel's relation to critical theory in general, see Breuer, 1992.
- 3 Cassirer, 1923.
- 4 Durkheim and Mauss, 2009; cf. Bloor 1982.
- 5 Cf. Bailey, 1994, chapter 4.
- 6 Cf. Freudenthal and Schlaudt, 2012.
- 7 On the Zilsel thesis, cf. Zilsel, 2003.
- 8 On the Hessen-Grossmann-thesis, cf. Merton, 1939, and for Hessen and Grossmann, Freudenthal and McLaughlin, 2009.
- 9 Sohn-Rethel, 1976: 45.
- 10 Sohn-Rethel, 1972: 85, fn. 20 (not in the English version).
- 11 Sohn-Rethel makes a distinction between 'social synthesis' [*gesellschaftliche Synthesis*] that concerns socialisation in general, and 'socially synthetic' [*synthetische Gesellschaft*], which specifically applies only to commodity societies. See Sohn-Rethel, 1972: 61; Sohn-Rethel, 1978a: 37; on social synthesis in general, cf. Sohn-Rethel, 1978a: 4–8. In the early writings, the term 'functional socialization' was still central; cf. Sohn-Rethel, 1985: 39–44.
- 12 Sohn-Rethel, 1989b: 158–63.
- 13 Sohn-Rethel, 1978a: 7, 33–9.
- 14 The terms 'value abstraction', 'commodity abstraction' and 'exchange abstraction' are occasionally used synonymously with 'real abstraction'. The term 'real abstraction' [*Realabstraction*] is preferred here, because it was strongly emphasised by Sohn-Rethel and also shaped by him. 'Real abstraction' [*Reale Abstraction*] was, however, first used by Simmel; cf. Simmel, 2004: 80. Where Marx himself speaks of 'real' [*reeler*] and 'actual' [*tatsächlicher*] abstraction, he usually refers to labour and, unlike Sohn-Rethel, not to the abstraction from the material and use-value characteristics of commodities in exchange. Sohn-Rethel first saw this and emphasised it in distinction from Marx; cf. Sohn-Rethel, 1971a: 22. Nevertheless, he also refers to points in *Capital* where Marx argues along his own lines – for example, 51 ff.
- 15 Sohn-Rethel, 1978a: 18–34; Sohn-Rethel, 1990: 16–17.
- 16 Sohn-Rethel, 1978a: 19.
- 17 'I call all representations *pure* (in the transcendental sense), in which nothing is to be encountered which belongs to sensation'. Kant, 1998: A20.
- 18 Sohn-Rethel, 1978a: 30 ff.
- 19 'The act of exchange is not thought, but it has the *form* of thought'. Sohn-Rethel, 1972: 99; similar to Sohn-Rethel, 1971b: 47.
- 20 Sohn-Rethel could not decide on a definitive and unequivocal determination of his method. In *Intellectual and Manual Labour*, his method amounts to a 'genetic reconstruction' of the abstraction of thought from real abstraction in the sense of a historical-materialist grounding of the pure validity of forms of knowledge (Sohn-Rethel, 1972: 33 ff.; Sohn-Rethel, 1978a: 195 ff.). In this period, he even considered 'form-genetic explanation' as an 'acceptable synonym for dialectics' (Sohn-Rethel, 1971a: 6). He consistently maintained the claim that he did not want to make a mere analogy with the unity of commodity-form and thought form but to develop a single explanatory framework.
- 21 Concerning Adorno's statement from a conversation with Sohn-Rethel that historical materialism is the 'anamnesis of Genesis' (Gödde, 1991), see the revealing notes in the afterword of Sohn-Rethel, 1985: 265 (also Sohn-Rethel, 1989c; Sohn-Rethel, 1978b: 137–41).
- 22 It is undeniable that Sohn-Rethel had an inspiring effect on the young Adorno. It is controversial how far the influence went, and whether Adorno even makes the link between the commodity-form on the one side and subjectivity, consciousness and thought on the other, since the opposite interpretation has also been defended. For a critique of the influence of Sohn-Rethel on Adorno,

- see Müller, 1988: 177. Jürgen Habermas makes the general conclusion that Adorno (and Horkheimer) did not derive the thought form from the commodity-form, in the sense of Lukács and Sohn-Rethel; cf. Habermas, 1981: 506. In contrast, see Fetscher and Schmidt, 2002. Adorno explicitly refers to Sohn-Rethel only once in his writings; cf. Adorno, 1973: 177. Sohn-Rethel, however, who was always proud of his contact with Adorno, did not fail to cautiously but decisively contradict his interpretation; cf. Sohn-Rethel, 1972: 90 ff. (not in the English version). On Adorno's relationship to Sohn-Rethel, cf. Freytag, 2006.
- 23 Cf. Adorno, 1973; Horkheimer and Adorno 2002.
  - 24 Sohn-Rethel, 1972: 22, 89 ff., 99; Sohn-Rethel, 1978a: 7, 19–22, 30–79.
  - 25 Real abstraction and its manner of functioning is developed in almost all of Sohn-Rethel's writings, but the most prominent is Sohn-Rethel, 1978b; cf. also Toscano, 2014: 1226–9; Tsogas, 2012: 380–3.
  - 26 Sohn-Rethel, 1978a: 77. German version: 'The synthetic society itself is the one which, in short, thinks in the form of the separate intellect'. Sohn-Rethel, 1972: 115.
  - 27 For discussion and critique of this ambiguity, see Bahr, 1973: 65, who calls Sohn-Rethel's theory an 'implicit reflection theory'. Sohn-Rethel also *explicitly* states at one point in his main work that the possibility of a theoretical knowledge of nature 'arises from the conceptual reflection of the exchange abstraction' (Sohn-Rethel, 1972: 104). In one of his last texts, he opts for the variant, that real abstraction is 'imposed' on consciousness by means of money. Here, too, Sohn-Rethel also states that he considers the term 'identification to be more appropriate than the familiar expression "conceptual abstraction", which is reminiscent of the indeterminacy of "reflection" in my book [*Intellectual and Manual Labour*] and already presupposes the conceptual faculty, whose very emergence is at stake' (Sohn-Rethel, 1974: 192).
  - 28 Sohn-Rethel, 1972: 64 ff.; Sohn-Rethel, 1978a: 39 ff.
  - 29 Sohn-Rethel, 1972: 68 (not in English version; cf. Sohn-Rethel, 1978a: 44 ff.).
  - 30 More explicitly on the physicality of real abstraction and its connection with modern science, see Sohn-Rethel, 1978a: 35–57; Sohn-Rethel, 1990: 28 ff. On the history of the emergence of modern science, see Sohn-Rethel, 1987.
  - 31 It is his most thematic early writing; cf. Krüger, 1990: 114–232. On the logic of appropriation, see Franz, 2006.
  - 32 Sohn-Rethel, 1972: 34 (not in English version).
  - 33 Correspondingly, he assumes simple commodity production before capitalist commodity production, in Engels' sense (see Sohn-Rethel, 1989b: 161; Sohn-Rethel, 1990: 17; Sohn-Rethel, 1971a: 28 ff.). It is to be noted, however, that Sohn-Rethel does not proceed from an immediate, 'primary' or 'primitive' (natural) exchange in either the historical or logical determination of the commodity-form; that is, he does not accept the kind of exchange that economic theory and the subjective theory of value today still use to underlie their model-theoretical assumptions and the 'robinsonades' of their homo oeconomicus (see Sohn-Rethel, 1978a: 98). Rather, he starts from a 'secondary' exchange that already refers to values (Sohn-Rethel, 1985). Yet, concerning the historical origin and genesis of money, Sohn-Rethel remains thoroughly captured by the idea of a direct exchange, from whose logic certain ideas of rationality, identity, etc. should arise, as was the political economy and Marxism of his time (and, for the most part, the authors of critical theory).
  - 34 For Sohn-Rethel, the beginning of coinage in Greek antiquity is decisive for the separation of intellectual and manual labour, for the formation of the intellect as well as for the concepts of being and mathematics; European capitalism then has only a 'specific significance' (Sohn-Rethel); cf. Sohn-Rethel, 1972: 228–40, especially 230 (not in the English edition; cf. here Sohn-Rethel, 1978a: 47, 58–60, 65–7). This has led Sohn-Rethel, among other things, to almost equate the money of antiquity (or rather the coin) with the money of capitalist society – although coins in antiquity and money in capitalist society, as the latest anthropological and ethnological research has shown, perform completely different functions and thus mediate completely different social relationships.
  - 35 Sohn-Rethel, 1972: 123–73 (part II); Sohn-Rethel, 1978a: 80–135 (part II); Sohn-Rethel, 1987.
  - 36 On the relation between the logic of appropriation and the logic of production, see Sohn-Rethel, 1972: 174–227 (part III), especially, 186 ff., 212 ff., 255 ff. (appendix B); in the English version, see Sohn-Rethel, 1978a: 139–85 (part III).
  - 37 In the English edition: 're-socialised labour'; cf. Sohn-Rethel, 1978a: 139–85.
  - 38 For more details, see Sohn-Rethel, 1971; Sohn-Rethel, 1972a.
  - 39 Sohn-Rethel, 1972: 169.
  - 40 On the idea of a social labour that has an 'immediately social-synthetic function' (Sohn-Rethel, 1972a: 47) and takes place according to the measure of an immediately given total labour,

- instead of disintegrating into disparate private labours and becoming synthesised only in exchange according to real abstraction, see Sohn-Rethel, 1972: 206; Sohn-Rethel, 1971b: 55 ff.
- 41 Sohn-Rethel, 2015, first published 1973; English excerpts: Sohn-Rethel, 1978c.
  - 42 Cf. Breuer, 1977; Postone, 1993; Gorz, 1980.
  - 43 The discussion of abstract labour can be positioned against Sohn-Rethel's understanding of the relation between the form and substance of value, if they are based on Hegel's dialectic; cf. Elson, 1979; Arthur, 2011.
  - 44 Sohn-Rethel, 1990: 31.
  - 45 Sohn-Rethel, 1971c: 69.
  - 46 Various parties have criticised Sohn-Rethel for this separation, maintaining that one can mediate the substance and form of value; this leads to a similar dualism which Hegel criticised in Kant and which he claimed to have overcome by a dialectical mediation of form and content.
  - 47 Sohn-Rethel presented an independent, historical-materialist motivated critique of the theory of marginal utility in his own dissertation in 1928.
  - 48 Sohn-Rethel, 1990: 30 ff. This is also made clear in Sohn-Rethel, 1978b: 122, 113–116; Sohn-Rethel, 1971a: 37 ff. Sohn-Rethel presented 'the deepest of discrepancies' with Marx most clearly in three appendices: Sohn-Rethel, 1971c: 65–74; Sohn-Rethel, 1970: 183–93; Sohn-Rethel, 1972: 228–40. (Here, Sohn-Rethel explicitly corrects his critique of Marx from the two previous appendices, which may be the reason why they are not included in the English edition. In any case, his critique of Marx here is already modified and much more restrained. See, for example, Sohn-Rethel, 1978a: 22 ff.)
  - 49 Sohn-Rethel, 1978b: 114.
  - 50 'The abstraction does not spring from labour but from exchange [...] and it is through exchange that the abstraction imparts itself to labour, making it abstract human labour'. Sohn-Rethel, 1978a: 6.
  - 51 Sohn-Rethel, 1978a: 60–79.
  - 52 According to Helmut Brentel, Sohn-Rethel developed a 'unique compromise formula between Marxian and subjective value theory'; Brentel, 1997: 131. Sohn-Rethel explicitly criticised the subjective theory of value, even devoting his dissertation topic to it. He argued that the subjective theory of value does not conceive of exchange as a practical *activity* but rather reduces it entirely to the economic rationality of a single economic subject, ignoring its critical epistemological implication; cf. Sohn-Rethel, 1972: 79; Sohn-Rethel, 1978a: 69; and, for more detail, Sohn-Rethel, 1989a and Sohn-Rethel, 2012.
  - 53 Sohn-Rethel 1971c: 70. For Sohn-Rethel, abstract labour also appears as labour under Taylorist-Fordist conditions. This simply means that concrete labour is disassembled into its individual processes and reduced to simple, repetitive work and formalised accordingly.
  - 54 Sohn-Rethel, 1972: 23.
  - 55 Sohn-Rethel, 1990.
  - 56 Sohn-Rethel, 1978a: 77; Sohn-Rethel, 1972: 21; similarly, Sohn-Rethel 1971b: 48.
  - 57 In all of Sohn-Rethel's writings, the value-form analysis is regarded as an empirical process of exchange, and real abstraction as an activity, especially in Sohn-Rethel, 1978a: 19–45; Sohn-Rethel, 1978b: 116–122; Sohn-Rethel, 1989: 210 ff. Sohn-Rethel even explicitly calls for the double character of the commodity and commodity-form to be conceived as a practical-sensuous activity according to Marx's theses on Feuerbach, contrary to the conceptual-logical development of *Capital*; cf. Sohn-Rethel, 1971c: 69.
  - 58 Marx, 1976: 138.
  - 59 For the Marxist-Leninist perspective, see Sandkühler, 1973; Brand et al., 1976.
  - 60 Dombrowski et al., 1978; Wassmann, 1979; Heinz and Hörisch, 2006; Engster, 2014: 517–81.
  - 61 Elbe, 2008: 12–87; Hoff, 2009. In the German-speaking world today, Michael Heinrich's call for a 'monetary theory of value' is pertinent; Heinrich, 1999. For France, see de Brunhoff, 1967; for the Anglophone world, see Elson, 1979; Moseley, 2015; for Italy, see Bellofiore, 1989.
  - 62 Marx, 1991: 275.
  - 63 Cf. Chapter 80 on critical theory and economic theory. See also Engster, 2016.
  - 64 Marx, 1976: 255.
  - 65 Even more rare are attempts to develop modern science from the logic of money rather than exchange as part of a unified critique of society and knowledge; see Thomson, 1955; Müller, 1977; Pietilä, 1981; Seaford, 2004; Engster and Schröder, 2014; Engster, 2014.

# Alfred Schmidt: On the Critique of Social Nature

Hermann Kocyba

Translated by Jacob Blumenfeld

From the early 1960s onwards, Alfred Schmidt (May 19, 1931, Berlin – August 28, 2012, Frankfurt am Main) provided a decisive impulse for the critical reappropriation of Marx's theory and the further development of critical theory in West Germany and beyond. His work on the philosophical-historical presuppositions of the critical theory of Horkheimer, Adorno and Marcuse, and his confrontation with French structuralism, especially the Althusser school, attracted attention even beyond academic philosophical debates. In addition, Schmidt focused on the history of philosophical materialism, the philosophy of Schopenhauer, Goethe's philosophy of nature, Sigmund Freud's philosophy and – in light of his interest in the intellectual history of Freemasonry – the modern Deism of the Enlightenment. Furthermore, from the 1960s he translated or published numerous works by Herbert Marcuse, Max Horkheimer, Maurice Merleau-Ponty, Henri Lefebvre and Anton Pannekoek. As the editor of Max Horkheimer's collected

works (together with Gunzelin Schmid Noerr) and the editor of the republished *Zeitschrift für Sozialforschung*, he laid the decisive foundations for the reception of original critical theory.

In contrast to his teachers Max Horkheimer and Theodor W. Adorno, Schmidt did not come from an upper-class or educated middle-class home. Born in Berlin as the son of a mechanic, he spent his youth in the North Hesse province of Rotenburg an der Fulda, where the family ended up as a result of the war. There, in the spring of 1952, he passed the school-leaving examination. In the summer semester of that year, he began his studies at the Faculty of Philosophy in the University of Frankfurt, initially studying History, English and Latin. Attending the lectures of Max Horkheimer sparked his academic interest in philosophy. He chose philosophy as his main subject, sociology as his second and English philology as his third; he also studied classical philology. From 1957 to 1961, Schmidt was a graduate assistant

and from 1961 onwards a research assistant for Max Horkheimer and Theodor W. Adorno at the University of Frankfurt (Jeske, 2015).

On July 13, 1960, Schmidt graduated with a doctorate in philosophy with the topic 'The Concept of Nature in Marx's Conception of Society'. His thesis, supervised by Horkheimer and Adorno, was published for the first time in 1962 under the title *The Concept of Nature in Marx* as the eleventh volume of the 'Frankfurt Contributions to Sociology' series, edited by Adorno and Walter Dirks. The work attracted international attention. It was translated into 12 languages and went through a total of four editions in Germany during Schmidt's lifetime, as well as a series of pirated prints. In the summer semester of 1965, Schmidt received a university teaching position in the Philosophical Seminar at the University of Frankfurt on Lessons in the History of Philosophy, in particular the Enlightenment and its Tradition. In the following semesters, he dealt with the themes of Left-Hegelianism, the sociology of Auguste Comte, Karl Marx's critique of political economy and the philosophies of Friedrich Nietzsche and Jean Paul Sartre. In 1972, after the departure of Jürgen Habermas to Starnberg as co-director (alongside physicist and philosopher Carl-Friedrich von Weizsäcker) of the Max Planck Institute for the Study of the Living Conditions of the Scientific and Technical World, Schmidt was appointed to Horkheimer's former chair as Habermas' successor. Schmidt held this chair until his retirement in 1999 (when Habermas returned to Frankfurt in 1983, a new chair had to be established for him in Social Philosophy and the Philosophy of History).

According to the official dedication of this Professorship for Philosophy and Sociology, Schmidt lectured in both subjects during the first years but then limited himself to courses in the field of philosophy. He remained faithful to his listeners as an emeritus professor, giving lectures on Herbert Marcuse, Ludwig Feuerbach, Heine, Spinoza, Lessing, Nietzsche and Richard Wagner. In addition,

he wrote studies on Goethe, in whom he was primarily interested as a natural scientist and natural philosopher; he was also especially fascinated with the philosophy of Schopenhauer. Schmidt continued lecturing and reading about the history of materialism, the sociology of worldviews in the nineteenth century, the German Enlightenment and the philosophy of German Romanticism. Furthermore, Schmidt was active in the university's interdisciplinary Institute for Research in the Philosophy of Religion, which he co-founded; he worked as a lecturer in adult education in Frankfurt, in trade union education at the Academy of Labour and in the context of the Masonic movement (Jeske, 2015; Schmidt, 2014a). In November 2012, the Archive Center of the Johann Christian Senckenberg University Library of the Goethe University Frankfurt am Main received his entire estate, including correspondence, manuscripts, electronic documents from three computers and his extensive private library.

The manner in which the Frankfurt School is usually presented, which divides the representatives of critical theory into a first, second, third and now even fourth generation, makes it difficult to elucidate Schmidt's specific contribution. In the 1960s at the Philosophical Seminar at the University of Frankfurt, Schmidt was teaching together with his teachers, like Karl-Heinz Haag (1924–2011) and Hermann Schweppenhäuser (1928–2015). As a student of Horkheimer and Adorno, he saw himself primarily committed to the continuation of their thought. He did not partake in Habermas' critique of the 'philosophy of consciousness' and its rejection of the critical potential of Marx's concept of labour. Nor did he take part in the communicative turn in critical theory. The primary goal of his philosophical work was to explicate the theoretical motives and philosophical-historical presuppositions of the critical theory of Horkheimer, Adorno and Marcuse. In this way, he embodied a counterbalance to the linguistic-analytic, action-theoretical or

system-theoretical ‘reconstructions’ of critical theory, which, in his opinion, ran the risk of missing the specific impetus of critical theory. In contrast, his aspiration was to preserve and convey the original content and authentic form of critical theory.

## ON THE CONCEPT OF NATURE

Schmidt’s 1962 thesis on the concept of nature in the teaching of Karl Marx had an unusually strong resonance. On the one hand, it was directed against a dogmatic dialectics of nature taught as state doctrine at that time in the Soviet Union, the GDR and the countries of Eastern Europe; on the other hand, it went against a pure philosophy-of-praxis perspective, which tends to dissolve history into a dynamic of interaction detached from the metabolic process between humans and nature, thereby ignoring the natural constraints of human existence.

In their preliminary remark, Horkheimer and Adorno summarise Schmidt’s work within the ‘Frankfurt Contributions to Sociology’ as follows:

Even where nature is not a topic [in Marx; H.K.], conceptions of nature are implied in the theories of labour, value and commodity. Thus the responsible presentation of the concept of nature also illuminates other parts of the theory. For example, Schmidt corrects the conception of a radical opposition between idealist and materialist dialectics, and thus also straightens out the often cited phrase of Marx that his method merely flirts with dialectics. (Adorno and Horkheimer, 2003: 9)

Schmidt drew upon the entire corpus of Marx available at that time, including documents from different phases of his theoretical development, particularly the *Grundrisse*, whose philosophical significance Schmidt recognised early on.

In contrast to the philosophical discussion of Marx in the West at that time, Schmidt’s thesis studied Marx’s early writings intensively in order to establish the connection

with certain themes of the middle and mature Marx. He did not, therefore, reduce the *philosophical* thought of Marx to the anthropology of the Paris manuscripts. On the contrary, Schmidt stressed that Marx is by no means at his most philosophical when he employs the traditional academic language of philosophy, and so Schmidt thoroughly incorporates the political and economic writings of the middle and mature Marx into the discussion. He thus clarifies the philosophical significance of Marx’s critique of economics, which is crucial for a critical concept of materialism; at the same time, he notes that Marx’s critique of political economy is not exhausted by a technical-economic analysis. Indeed, Marx’s critique is fundamentally a critique of economic categories. To illustrate Marx’s position, Schmidt repeatedly draws upon individual writings by Engels – for example, with reference to the concept of the dialectics of nature – and does not shy away from bringing out the differences between the authors.

According to Schmidt, the problem of nature and the dogmatic conception of the dialectics of nature could not be solved by elegantly avoiding the entire subject and sticking to a half-baked Marx concerned only with the philosophy of praxis. This tendency could be read in Georg Lukács, Karl Korsch, Antonio Gramsci, and the philosophers grouped around the journal *Praxis*. Although arising from legitimate opposition to the dogmatic ‘diamat’ worldview prevailing in Eastern Europe, but also among many communist intellectuals in the West, these philosophers risked throwing out the baby with the bathwater by eliminating the theme of nature, thus reducing Marxism to a philosophy of history. For Schmidt, the task was to critically incorporate nature into reflection as a historical category mediated by human practice. From the *Holy Family*, Marx and Engels’ first joint text, published in Frankfurt in 1845, to Friedrich Engels’ *Anti-Dühring* in 1878, nature is regarded as mediated by social practice: nature is developed and constituted by human practice, but it cannot be

dissolved in this way without a remainder. It is the object of human appropriation and yet does not arise through it. The nature-mediating social-labour process, as a metabolic process between humans and nature, is itself a part of nature. Society is not a mere communication system; rather, it is a specific mode of human social reproduction.

In addition to the simultaneous emphasis on the social mediation of nature and the irreducibility of nature, which is not completely absorbed in this mediation through social practice, we find in Marx the notion borrowed from Hegel of a second nature of incomprehensible coercive social forces. Even though, in knowledge as well as in practical appropriation, we nowhere encounter nature in itself, but always only nature already mediated by human practice, it would be ill-conceived to absolutise this aspect of mediation. Such an absolutised mediation, which makes the irreducible particularity of nature and individuals into practically subordinate moments of a universal system of mediation, represents for Marx the capital relation, which asserts itself as the 'automatic subject' of the processes of social reproduction. The objection against such an absolutised mediation formed a crucial motive for critique, which saw in this totalisation of mediation new natural constraints at work, precisely the constraints of a socially produced second nature.

Against a mere standpoint philosophy, which believes it can reach truth through the unwavering absolutisation of isolated ideological certainties, Schmidt always claimed that knowledge can only be attained in the critical passage through conflicting positions – that is to say, neither as a middle position between extremes nor through the simple affirmation of one side. This is best exemplified in his portrayal of the relation between Hegel and Feuerbach:

It was not Marx's intention simply to replace Hegel's 'World Spirit' with a material 'World Substance' which would be an equally metaphysical principle. He did not reject Hegelian idealism abstractly like Feuerbach, but rather saw in it truth

expressed in an untrue form. Marx accepted the idealist view that the world is mediated through the Subject. He considered however that he could bring home the full significance of this idea by showing what was the true pathos of 'creation' as presented by philosophers from Kant to Hegel: the creator of the objective world is the socio-historical life-process of human beings. In modern times extra-human natural existence has been reduced more and more to a function of human social organization. The philosophical reflection of this is that the determinations of objectivity have entered in greater and greater measure into the Subject, until at the culminating point of post-Kantian speculation they become completely absorbed in it. (Schmidt, 2014b: 27)

The aim of critical materialism is to help human beings escape the self-made prison of economic determinations in which they let themselves be degraded into objects of a blind and mechanical economic dynamic. The laws of economics for Marx do not form a universal metaphysical principle of explanation:

The 'materialist' character of Marxist theory does not amount to a confession of the incurable primacy of the economy, that anti-human abstraction achieved by the real situation. It is rather an attempt to direct men's attention towards the ghostly internal logic of their own conditions, towards this pseudophysics that makes them commodities and at the same time provides the ideology according to which they are already in control of their own destinies. (Schmidt, 2014b: 41)

At this point, Schmidt refers to Horkheimer's diagnosis: 'The process is accomplished not under the control of a conscious will but as a natural occurrence. Everyday life results blindly, accidentally, and badly from the chaotic activity of individuals, industries and states' (Horkheimer, 1986, cited in Schmidt, 2014b: 41).

In Marx, materialism does not entail the identification of the prevailing conditions, and similarly the concept of nature does not aim at romantic transfiguration.

Hegel described the first nature, a world of things existing outside men, as a blind conceptless occurrence. The world of men as it takes shape in the

state, law, society, and the economy, is for him 'second nature', manifested reason, objective Spirit. Marxist analysis opposes to this the view that Hegel's 'second nature' should rather be described in the terms he applied to the first: namely, as the area of conceptlessness, where blind necessity and blind chance coincide. The 'second nature' is still the 'first'. Mankind has still not stepped beyond natural history. This fact explains the closeness of the method of Marxist sociology to that of natural science [*Naturwissenschaft*]. Many critics of Marx regard this method as inappropriate, but in fact the 'nature-like' constitution of its object of investigation ensures that it is not a human science [*Geisteswissenschaft*]. When Marx treated the history of previous human society as a 'process of natural history', this had first of all the critical meaning that 'the laws of economics confront men in all... planless and incoherent production as objective laws over which they have no power, therefore in the *form of laws of nature*'. (Schmidt, 2014b: 42)

With regard to the natural basis of human life, Schmidt acknowledges the ineliminable requirement of a metabolism between humans and nature: even if hunger, poverty and exploitation are overcome, and the human being confronts the material world in a qualitatively new way as 'overseer and regulator' (Schmidt, 2014b: 147), as Marx put it in the *Grundrisse*, this does not overcome the relationship with the natural foundation of human life (Marx, 1986). Even after the economic compulsions of commodified labour are abolished, freedom remains dependent on the interaction with nature.

The philosophical themes of his dissertation also characterise Schmidt's further works. In his essay 'On the Relation between History and Nature in Dialectical Materialism', originally written for the book *Existentialism and Marxism* (1965) and from 1971 onwards attached to the new editions of the thesis as an appendix, he again takes up the question of a dialectics of nature. He develops his argument into a critique of the complementary yet one-sided thesis of Lukács and Western Marxism, according to which dialectics is strictly bound to human practice. This thesis, according to Schmidt,

threatens to conceive of nature only as a social category and thus lose sight of the natural basis of human existence, the metabolism with nature.

In a postscript from 1971, Schmidt emphasises again that Marx's 'critique of political economy' should not be understood simply as a positive theory of economic development and some law-governed transition to socialism, as is often the case in the official Marxism of the labour movement. In the new edition of 1993, he adds the preface from the French version, which appeared in the same year, and carries the subtitle 'For an ecological materialism'. Schmidt points out that Marx is not a consistent apologist for the development of the productive forces but rather in the early writing criticises the 'degradation of nature'. Also in *Capital*, Marx refers to the 'natural limits of the exploitability of nature' and emphasises that the productivity of labour itself is bound to natural conditions. Nevertheless, Schmidt critically finds an anthropocentrism in Marx's conception of nature. What Marx and Engels criticised in their time as a defect of 'contemplative materialism' has today to be rediscovered for the sake of regaining an unobstructed understanding of nature (Schmidt, 1993: xi; see also 1973a). If we want to experience nature not only as an object of science or as raw material, then this 'requires a *philosophical approach* that goes beyond the separation between humans and nature established by the subject-object-schema of the process of labour and knowledge' (1993: xii). The perspective oriented to human practice and history is not invalidated, but it is certainly relativised. The question of an 'ecological materialism' thus arises from within the context of contemporary experience.

## CRITIQUE OF POLITICAL ECONOMY

While Schmidt's thesis was published in the official 'Frankfurt Contribution to Sociology'

series of the Institute for Social Research, and while other important works from the 1960s appeared in *edition suhrkamp*, which was important for the intellectual development of West Germany, the *Critique of Political Economy Today: 100 Years of Capital*, which Schmidt co-edited with Walter Euchner, was somewhat removed from public attention. This book, which was published in 1968 by the *Europäische Verlagsanstalt*, recorded the presentations and discussion remarks of a colloquium organised by the Institute for Political Science in Frankfurt in September 1967. The director of the institute, Iring Fetscher, succeeded in gathering experts on Marxist theory from West and East Germany, the United States, France, Belgium, Austria, Yugoslavia and Poland. The speakers ranged from Wolfgang Abendroth to Oswald von Nell-Breuning, from Ernest Mandel to Nicos Poulantzas, from Roman Rosdolsky to Elmar Altvater. While the hundredth birthday of Marx's *Capital* provided the occasion for the colloquium, remarkably the subtitle of *Capital* was chosen as the title for the event: *critique of political economy*. The underlying vision can be found in Schmidt's paper 'On the Concept of Knowledge in the Critique of Political Economy' and also in many of his published discussion remarks. Its implied reading of Marx was soon to become significant for what was later called the 'new reading of Marx' (Elbe, 2008) in West Germany and beyond (especially in the works of Hans-Georg Backhaus, Hans-Jürgen Krahl and Helmut Reichelt). Indeed, Schmidt's discussion with Nicos Poulantzas already anticipates the confrontation of a Frankfurt School-inspired reading of Marx and the Marx interpretation of the Althusser school, as formulated in the extensive critical essays 'The Structuralist Attack on History' (Schmidt, 1969) and 'History and Structure: An Essay on Hegelian-Marxist and Structuralist Theories of History'. In fact, the discussions at the colloquium can be regarded as the starting point for the development of

critical theory outside the academic and institutional framework exemplified by the intellectual histories of the Frankfurt School by Martin Jay, Helmut Dubiel, Hauke Brunkhorst and Rolf Wiggershaus.

After the presentation of Roman Rosdolsky, who was unable to deliver in person his 'Comments on the Method of Marx's *Capital* and Its Importance for Contemporary Marxist Scholarship', and following Nicos Poulantzas, Schmidt took a pointed stand on the question of Hegel's role in the method of Marx's critique of political economy. For Schmidt, there is something like an 'ironic' repetition of certain passages of Hegel's logic in Marx's *Grundrisse* and *Capital*. For Schmidt, this does not mean, however, that Marx is simply a Hegelian. On the contrary, it is a question of thinking with Marx

the extent to which the specific character of bourgeois society, which in reality ultimately underlies Hegel's philosophy, does not compel ideas of an 'existing abstraction,' and the extent to which the value-form [...] does not represent an abstraction carried out by the empirical world itself. The social world contains a conceptual element insofar as it reduces the concrete labour of individuals and their products to quantifiable expressions of general human labour. Although this 'conceptual' character of tangible empirical processes brings to the fore certain theoretical parallels to Hegel's thought, one should not be tempted to consider Hegelian and Marxist dialectics as homologous. (Euchner and Schmidt, 1968: 26)

What initially looks like the adoption of the speculative premises of Hegel's logic thus does not entail endorsement of absolute idealism, according to Schmidt, but rather the conceptual doubling of a real process occurring in social practice:

When Marx says that human beings would be portrayed by him as personifications of economic categories, this obviously sounds 'idealist', but it is an idealism that the world itself forces on people every day. For the 'materialist' aspect of Marx's economy, if we are to speak in these terms, is precisely the domination of individuals by incomprehensible abstractions, which determines empirical reality as capitalist. One could say that Hegel's

philosophy – which Marx famously accused of making the second into the first and the first into the second – is bourgeois society conceived as ontology. Hegel posits what is already present in the bourgeois mode of production, namely, the demotion of the genetically first, use-value creating concrete labour, to an appendage of what derives from it, abstract labour. (Euchner and Schmidt, 1968: 27)

How can one comprehend this rule by abstractions without falling into a circle, such that reality can only be described with the aid of Hegel's categories, which, in turn, are legitimised through their congruence with the very reality that they posited in thought? Hegel's logic does not reconstruct the thoughts of God before the creation of the world, as Hegel himself wanted, but rather unintentionally expresses the secret of bourgeois society, albeit as ontology. In this manner, and despite its transformation into ontology, Hegel's philosophy already provides the conceptual means for grasping the objective structures of social reality. Schmidt formulates the critical point of Marxist theory with reference to the theme of his thesis:

The methodologically most important thought of materialist dialectics seems to me to consist in the distinction between nature as first nature – in the sense of the metabolism which grounds human existence – from second nature. This forms the specifically capitalist problem of materialism, while the metabolism between humans and nature is a material fact that can indeed change, yet traverses mankind's history in general. I believe that we should keep this double foundation of Marx's argument in mind, and think about whether we are discussing second or first nature. Therefore, whether we are discussing the problematic of alienation, that is, commodity fetishism, or materialism in a much more elementary sense, as is also found in Marx. (Euchner and Schmidt, 1968: 29)

In his own paper, 'Zum Erkenntnisbegriff der Kritik der politischen Ökonomie' (On the Concept of Cognition in the Critique of Political Economy), Schmidt defends Marx against the accusation of economism: 'As the investigations of *Capital* show, the one-sided, idealistically deplored "economism" is

an abstraction which is accomplished not by the theorist but by social reality on a daily basis' (Euchner and Schmidt, 1968: 33). With the characterisation of his theory as a 'critique of political economy', Marx makes his specific intention clear:

He understands it in a double sense, first as a critique of the real, political-economic relations which necessarily arise from the capitalist mode of production, and second as a critique of political economy as the comprehensive science of the whole life-process – *le monde moral* as it was called in the 18th century – in which the theoretical self-understanding of bourgeois society expressed itself most adequately. The empirically given relations of production form the immediate object of Marx's investigation. But – and Marx emphatically pointed this out against *Lassalle* – it is not possible to conceptualise this given object in its immediacy. The actual 'system of bourgeois economy' is apprehended by means of a 'critique of economic categories' as they appeared in the history of economic thinking. In this respect Marx's critique of capitalism is largely a critique of the theories of political economy, from *William Petty* to *David Ricardo*. By keeping the intellectual premises of bourgeois economy in tight focus, he exposes the contradictions between these premises and their social reality, and through them the objective contradictions of social reality itself. Dialectics, therefore, is by no means 'ontologically' asserted by Marx. Dialectics is not simply a matter of the process of thought, but of reality, too. However, this reality is not independent of the concepts through which it is grasped. But – different from Hegel – reality is not reducible to its very concept. One should neither suppress the mediation of Marx's object of 'critique' through theory and its historical interest nor deny the fact that the object is mediated *in itself*, which makes the theory into an objective one. (Euchner and Schmidt, 1968: 34)

While in Hegel's logic, 'the method is the form of movement of the absolute itself and the total sequence of categories coincides with the eternal object' (Euchner and Schmidt, 1968: 34), for Marx, the method and object are not identical. Modes of inquiry and modes of presentation must therefore be 'formally' distinguished for Marx. Indeed, in his *Philosophy of Nature* and in certain parts of the *Lectures on the History of Philosophy*,

Hegel too distinguishes between inquiry, the ‘path of emergence of science’ and presentation, the ‘path in itself when it is complete’, as Schmidt vividly points out. This distinction arises where the material analysed with the aid of ‘concepts of the understanding’ must be converted into ‘concepts of reason’. In summary, Schmidt states ‘that the correct understanding of Marx’s method in *Capital* stands and falls with the concept of “presentation”’ (Euchner and Schmidt, 1968: 35). It is at this point that he refers to *Lire le Capital* [Reading Capital], published in 1965, highlighting the contribution of Jacques Rancière’s ‘The Concept of “Critique” and the “Critique of Political Economy”’: From the 1844 *Manuscript* to *Capital*’ (Althusser et al., 2016). With reference to Horkheimer’s 1934 article in the *Zeitschrift für Sozialforschung*, ‘The Rationalism Debate in Contemporary Philosophy’ (Horkheimer, 1993), Schmidt points out that the distinction between inquiry and presentation, between isolated analytical dissection and the integrating presentation of the dissected material, which brings the living whole – grasped by the individual sciences only one-sidedly – to ‘concrete’ unity, corresponds with the methodological self-understanding of the Institute for Social Research at that time (Euchner and Schmidt, 1968: 36).

Logically, the presentation does not simply follow the course of history. On the contrary, it pursues ‘a path opposite to the real development’. It begins with the finished product of the process of development (Euchner and Schmidt, 1968: 37). Here, Schmidt provides an important correction to a long-held view that assumes, with Engels, that in the opening chapters of *Capital*, Marx wanted to depict by means of historical summary a phase of pre-capitalist ‘simple commodity production’. Marx’s presentation does not follow the course of history; it often takes the opposite path: chronological sequence and logical order of presentation do not coincide.

For the Marxist understanding of science as well as for the self-understanding of the

founding generation of the Frankfurt School, the distinction between inquiry and presentation as well as the distinction between essence and appearance is constitutive: ‘all science would be superfluous if the form of appearance of things directly coincided with their essence’ (Marx, 1991: 956; see also Marx, 1998: 804). The distinction between essence and appearance, between the ‘apparent and real movement’, has direct consequences for both the methodological self-understanding of the theory and its substantive content. This becomes clear in contrasting classical political economy and so-called ‘vulgar economics’. Schmidt argues that Marx presents a twofold opposition against classical economics on the one hand and ‘vulgar economics’ on the other hand, starting with Say. This contrast is based on the distinction between society in its immediate appearance and law, appearance and essence, which Marx identifies with the scientific approach:

He acknowledges that the classical economists, and especially *Ricardo*, despite their class standpoint which regarded the capitalist mode of production as natural and constant, all sought to systematically investigate its ‘inner connection,’ while vulgar economics (that is, all economics since the dissolution of the Ricardo school) moved only within the context of appearance, falling into the crude empiricism of ideological consciousness. (Euchner and Schmidt, 1968: 40)

However, Schmidt does not declare the difference between essence and appearance formulated here as a methodologically universal principle, but ties it back to a historically specific form of social relations. The non-identity of appearance and essence, constitutive for Marx, does not reside in society as such but rather in capitalist social relations. Pre-capitalist forms of domination are thus more transparent because they ‘are not abstract, but based on personal relations of dependency’ (Euchner and Schmidt, 1968: 42).

Against the claims to objectivity of economic analysis, particularly by scientists from the Soviet Bloc at the aforementioned meeting, Schmidt asserts alongside the early Engels

that the natural laws of capitalist development ultimately depend on the unconsciousness of the participants. According to Marx, the

purpose of economics is precisely for human beings to consciously shape their conditions and not be bound by any second nature, which is much more violent than the first, inasmuch as the subject has objectified itself in it. The more subjectivity is embodied in objectivity, the more 'consciousness-independent' it is – thus requiring its critique and abolition. (Euchner and Schmidt, 1968: 57)

Here, it is easy to see that the Frankfurt School reading of Marx took its starting point from very different themes from those of the Parisian Althusser group, which conceived of Marx's theory as a breakthrough to a scientific analysis of social processes. Schmidt follows a philosophical interpretation, characteristic of critical theory in general, according to which Marx's theory is to be seen as an attempt to overcome philosophy by its practical realisation (Schmidt, 1973b). The aim of overcoming philosophy is emancipation and liberation, not scientification. From this understanding of Marx's critique, Schmidt's argument establishes connections to a philosophy of praxis and, in particular, to the existentialist interpretation of Marx by the early Marcuse (Marcuse and Schmidt, 1973). In contrast to Habermas, Schmidt was not primarily concerned with making certain elements of Marx's theory scientifically 'compatible' through an attempt at reconstruction or through their translation into another theoretical language. His aim was, in essence, to liberate Marx's theory from the ideological ballast of traditional party Marxism in order to lay bare the critical character of Marx's theory.

## **HISTORICAL MATERIALISM AS CRITICAL THEORY**

Leaving aside the debate with Nicos Poulantzas at the Frankfurt Colloquium and

the mentioning of Althusser and Rancière in a footnote to his own paper at the seminar, Schmidt's first reference to French structuralism comes in an essay from 1967, titled 'On History and Historiography in Materialist Dialectics', published as a contribution to the book *Consequences of a Theory: Essays on Karl Marx's Capital* (Schmidt, 1967). Following Lucien Goldmann, Henri Lefebvre and Jean-Paul Sartre, Schmidt understands structuralism, and in particular Lévi-Strauss' contribution, as proof that the empirical methods of social sciences were gradually displacing the critical role of philosophy for public discourse in France, too. Structuralism was not yet perceived as a rival interpretation of Marx's theory but as a 'new eleatism', an unhistorical form of sociological thinking. In Schmidt's argument, the new eleatism corresponds to a historical period of state intervention for the sake of preventing the eruption of major conflicts and crises. The structuralist method proceeds from the most general mental structures – supposedly common to all cultures, peoples and societies – and then prescribes them to acting subjects; this runs the risk, in a ciphered idealist form, of turning what Marx critiqued – that is, the rule by abstractions, reified society – into an affirmative normative stance. With Sartre, Schmidt arrives at the conclusion that structuralism would ultimately serve the ideological defence against historical materialism (Schmidt, 1967: 106). Already in 1923, in *History and Class Consciousness*, Lukács had formulated the crucial objections against the unhistorical or anti-historical essence of bourgeois thinking (Schmidt, 1967: 107). At this point in Schmidt's intellectual development, he treated structuralism as an object for ideology critique rather than an intellectual challenge.

This changes in 'The Structuralist Attack on History', in the volume edited by Schmidt himself, *Contributions to Materialist Epistemology*. In particular, Althusser's theoretical rejection of philosophical humanism, his definition of humanism as an ideology, and the

dichotomising division of Marx's work into an ideological phase and a scientific phase are not acceptable to Schmidt. Althusser's doctrine of ideology (which Schmidt criticised even before Althusser formulated his theory of ideological state apparatuses and the concept of 'interpellation') appears to Schmidt as a hardly original recapitulation of Mannheimean ideas. It is at any rate incompatible with the idea of liberating human beings from domination by incomprehensible economic abstractions. Althusser, in fact, discards everything that embodies the emancipatory message of Marxism for Schmidt, and Schmidt places Althusser close to the functionalist systems theory of Talcott Parsons (Schmidt, 1969: 209). Schmidt's essay, however, focuses mostly on the work of Lévi-Strauss, although he identifies Althusser with Lévi-Strauss' stance through the collective singular term 'structuralism'. The key points of his critique originate primarily from Sartre, Lefebvre and Goldmann.

In his 1971 book *History and Structure*, Schmidt considers Althusser's reading of Marx as a positive challenge, even though he notes that 'the "constructive" aspect of the method of *Capital* can be more adequately grounded in a materialist interpretation of Hegel' (Schmidt, 1981: 6). At the centre of the debate with the 'Althusser school' is the relationship between the logical and the historical. Schmidt emphasises – with Althusser and against traditional Marxist orthodoxy – that the process of cognition is characterised by relative autonomy in the face of its object and does not simply reproduce its historical process (Schmidt, 1981: 32). He combines this with the thesis of the cognitive primacy of the logical rather than the historical. In this context, Schmidt returns to his earlier argument about the difference between the mode of inquiry and the mode of presentation, referring to analogous distinctions between analysis and dialectics in Hegel's philosophy of nature. In Marx, as in Hegel, the 'material' gathered in the individual sciences is to

be presented in a rational, i.e., philosophical, form (Schmidt, 1981: 37 ff.).

On the whole, Schmidt agrees with the Althusserians on one of their fundamental concerns: the critique of historicist interpretations of Marx's work. In *Capital*, Marx advocates anything but an unreflective historicism that makes knowledge run directly parallel with the chronological sequence of events. Schmidt concurs with structuralist interpreters like Althusser and Poulantzas up to this point. The consensus ends when they deny the *constitutive* role of Hegel's *Logic* for Marx's economic work (Schmidt, 1981: 61). Indeed, in spite of itself, concerning value-form analysis, Althusser's pointed formula, according to which the 'simple only ever exists within a complex structure', can easily be reformulated into Hegelian terms (Schmidt, 1981: 63).

In the final part of his book, Schmidt discusses the role of Gaston Bachelard and the historical-epistemological work of Cavaillès, Canguilhem and Foucault for Althusser's understanding of science and the history of science. He highlights the primacy of the logical in the reconstruction of historical processes. Against chronological sequence, Marx himself considers the anatomy of man as a key to the anatomy of the ape (Marx, 1986: 42). Schmidt, however, points to the danger that this methodological principle tends to solidify underhandedly into ontological certainties: 'What is theoretically secondary for the present becomes null and void' (Schmidt, 1981: 106). As Marx writes in 1858, 'The dialectical form of presentation is right only when it knows its own limits' (Marx, 1987: 505).

Schmidt never published the second volume of *History and Structure*, to which he repeatedly refers. In *Critical Theory as a Philosophy of History* (1976), which dates back to a lecture he gave in June 1974 on the 50th anniversary of the opening of the Institute for Social Research, he revisits the decisive themes of his debate with Althusser and structuralism. Starting from Horkheimer's

confrontation with Dilthey, Heidegger and the Baden school of Neo-Kantianism, including Karl Mannheim's sociology of knowledge, he explains the thesis of the 'natural law' character of history hitherto and the consequences that result for its (action-theoretical) 'intelligibility'. Finally, his account turns to the historical-materialist notion of supersession [*Aufhebbarkeit*], which he develops against structuralism as the central historical-philosophical category of critical theory. For a critical theory of society, it is necessary to subordinate the hitherto blind natural power of the process of social production to human consciousness (Schmidt, 1976: 104). With Adorno's *Negative Dialectics*, Schmidt stressed that 'those laws can be abolished' and that the coming realm of freedom would be released from them (Adorno, 1973: 346). Schmidt's argument is not unique as such. For Rosa Luxemburg, too, political economy comes to a close once the anarchic economy of capitalism makes way for consciously organised relations of social reproduction. That is why, according to Luxemburg, Marx conceived of his economic doctrine as a critique of political economy (Luxemburg, 1955: 491). Similarly, as Bukharin explained in 1920, 'Theoretical political economy is the study of a social economy based upon the production of commodities, i.e., the study of an unorganized social economy' (Bukharin, 1979: 57). Only where production is anarchic does social life manifest itself in the form of 'elementary laws of nature' independent of the will of individuals or communities, and thus function with the same 'blind' necessity as the law of gravity. Schmidt thus recalls that both the older critical theory and even the more reflective authors of orthodox Marxism at the beginning of the century by no means advocated a consistent historical determinism. The laws of capitalist development, as analysed by Marx, do not imply that social analysis should ultimately be pursued with the methods of natural science; rather, they point to a problem. According to Schmidt, critical theory conceptualises the

socially constituted lawfulness of historical development that characterises the inverted [*verkehrte*] and perverted [*verrückte*] world of capitalist social relations.

In Schmidt's philosophical works, undogmatic materialism, sensuality, corporeality and the social mediation of nature remain key, as does his insistence on the irreducibility of naturalness to social mediation. He places Marx in a tradition of materialism that does not reduce nature to the dimension of instrumental control but, with recourse to Feuerbach and Goethe, traces another approach to nature. As Horkheimer and Adorno emphasise in their preliminary remark to his thesis:

The dissolution of all reality into mere nature, into atomic particles, or whatever counts as the last component according to the state of science, is by no means unconditional... The quantifying conception of nature as it must prevail in laboratories today cannot immediately be the same as the concept of nature in a humanity no longer divided in itself, no longer entrapped in nature. (Adorno and Horkheimer, 2003: 7)

Schmidt's return to the subject of materialism was not primarily concerned with the reconstruction of Marx's critique of political economy as a critical analysis of domination by incomprehensible abstractions. Rather, it was concerned with the very idea of materialism as the underlying premise of the critique of political economy. In his later dialogue with Feuerbach, Goethe, Schopenhauer and Freud, Schmidt continued his argument for a non-reductive materialism. He thus remained faithful to the topic of his thesis, where he turned his back on the then dominant debates about Marx. Similarly, his engagement with Werner Post in 1975, titled *What Is Materialism?*, furthered this trend (Post and Schmidt, 1975). For Schmidt, the touchstone of materialism is not its accordance with the latest state of research in the natural sciences but its capacity for insight into human suffering. When Schmidt deals with nature beyond human control, he is not concerned with a romantic idolatry of

nature – this remains ultimately bound to its counter-image in the form of unbridled natural domination – but the insight that nature, in the here and now, must not be hypostatized into a norm.

## ON DIALECTICS

Schmidt's philosophising is characterised by an unpretentious proclivity for dialectical formulations. He does not discuss dialectics from the outside – from the perspective of traditional logic, for instance. Rather, he *thinks* dialectically, formulating his thoughts in dialectical terms, thereby expounding the social nature of capitalist society from within. He was sceptical of attempting an analytical reconstruction of dialectics without dialectical means. Dialectics for Schmidt is a medium of thought, not an object for rational reconstruction separate from the human condition.

What comes into play with Schmidt against Althusser and structuralism as a science of society (which cannot seriously deny the presence of Hegelian motifs and their genetic significance in Marx, but, rather, to put it pointedly, follows motifs of linguistic structuralism for the sake of appropriating Hegel's objective spirit without Hegel's metaphysics) is also implicitly directed against certain tendencies within contemporary critical theory. Axel Honneth and Ulrich Oevermann also defend a theory of objective spirit, which they developed by different conceptual means. In their argument, social objectivity does not stand for social domination by incomprehensible economic abstractions. Rather, they treat it as an institutional order or objective structure of meaning. Schmidt, in contrast, keeps the occasionally uncomfortable memory of the negativism of critical theory alive. A theory of social objectivity, spelled out by means of speech-act theory, structuralism or variants of neo-pragmatism, risks resulting in a reified ontology that lacks

critical consciousness and emancipatory insight. The step from the negative ontology of social nature to an apologetic ontology of social objectivity would in this manner be misunderstood as a theoretical advance. Against this, and beyond the critique of social objectivity as second nature, Schmidt develops a concept of nature unconstrained by the narrow confines of positivism, even if this means incorporating the metaphysical tradition of Spinoza and its reception by Goethe (Schmidt, 1984) or Schopenhauer's 'cryptomaterialism' (Schmidt, 2004) into the argument.

## CONCLUSION

Schmidt's critical materialism of second nature opposes both traditional Marxism and the structuralist reading of Marx. The objectivity of the social is not an indication of its rationality but of its socially coercive character. In the concept of a second nature, however, conflicting contemporary interpretations of Hegel's conception of objective spirit collide, and their tension-ridden character cannot simply be removed by decree. The objectivity of the social – which renders society an object of causal analysis – can be understood in terms of institutions, rules and conventions that acquire their own existence in opposition to the subjective ideas and intentions of individuals, yet without being completely separable from their actions. This raises the question of the extent to which the critical concept of social objectivity and social laws of nature can be extended into a generalised critique of linguistic rules, social conventions and institutional orders, without ultimately reproducing the methodological individualism of liberal theory as a utopian perspective of critique. Schmidt strictly binds the theory of social laws of nature developed by Marx to the structural features of a society characterised by capitalist commodity production. He thus rejects all attempts to

understand this critical theory of the social nature of capitalist social relations as an ahistorical doctrine of invariants.

Another question arises in connection with the concept of second nature in light of John McDowell's discussion of 'naturalised Platonism' (McDowell, 1996): how must nature be constructed so that it can be conceived not only as a space of causal relations of determination but also of socially embodied freedom and reason? This is not primarily a question about the conditions under which meaningful action, symbolic structures and normative orders can be causally effective (and how constraints of social nature can be overcome through rational practice). Rather, if we want to follow the conviction that, at least in principle, not only blind natural laws but also insights, reasons and arguments can be effective, then the question at issue is how to conceive nature in a way that makes this possible.

The critical theorist does not conclude that wherever human practice follows rules, these must be forms of alienation and socially produced unconsciousness. However, it is distinctive of this theory that it does not let itself be taken in by the socially objective character of institutions, rules and norms. On the contrary, it uncovers their coercive character and exposes them to critique. Social orders do not constitute an unquestionable primacy; they are philosophically on trial. When Marx describes capital as an 'automatic subject', this also implies a fundamental critique. This is true even if the depersonalised social relations of capitalist exchange and exploitation, when compared with pre-modern relations of bondage, are considered as 'progress in the consciousness of freedom' (Hegel) or 'normative progress' in Honneth's sense (Deranty, 2009). A critical materialism of second nature is no ahistorical universalised negativism, which from the very start conceives every form of social objectivity only as an expression of reification. It implies, however, an important corrective against the social-theoretical gullibility currently

shaping the debate on second nature, as can be seen, for example, from the call for abstracts for the 2017 International Hegel Congress on 'Second Nature' (Internationale Hegelvereinigung, 2017).

In his philosophical-historical studies, Schmidt did not strive for superficial topicality. He did not shy away from pursuing allegedly esoteric detours through the history of materialism, working through now almost forgotten debates and reintroducing medieval heretics, ostracised precursors and lost strands of the Enlightenment. His works on the intellectual history of critical theory and its political-historical realm of experience are particularly important today, especially if we want to see Horkheimer, Adorno and Marcuse not just as precursors and instigators of contemporary varieties of critical theory (from communicative reason to recognition theory) but take them seriously in their own – nowadays seemingly old-fashioned – philosophical profiles, even though neither the philosophical materialism of the French Enlightenment nor the philosophy of Schopenhauer are currently en vogue. Schmidt's engagement with Marx makes it clear that philosophical insights can often be won from intensive examination of the texts themselves and their material content rather than by superficial attempts at bringing them up to date, a task primarily concerned with the adaptation of relevant themes to the guiding ideas of the academic zeitgeist. Schmidt has supplied important impulses for the international discussion of Marx and for a critical concept of materialism. Even though these have not been mentioned in the official track record of critical theory until now, or figure only in the margins, their importance can be found in works outside the narrow specialist community of philosophy. In contrast to both the Althusser school and representatives of the 'new reading of Marx' (Elbe, 2008), Schmidt is not simply concerned with the internal reconstruction of the original programme of a critique of political economy. His reference to Marx is not blinded by the systematic character of Marx's

analysis: the grandiose systematic architecture of his theory is the expression of the tragedy of individuals.

# Oskar Negt and Alexander Kluge: From the Underestimated Subject to the Political Constitution of Commonwealth

Richard Langston

## **HISTORICAL CONTEXT, OVERVIEW AND BIOGRAPHIES**

Already a celebrated filmmaker on account of his internationally acclaimed feature film *Yesterday Girl* (1966), writer, filmmaker and jurist Alexander Kluge first encountered Jürgen Habermas's gifted assistant Oskar Negt from afar when in late May 1968 Negt, whose tutorial on Marx's Parisian manuscripts later that year would draw between 700 and 800 activists, contributed to the Extra-Parliamentary Opposition's transformation of Frankfurt's Johann Wolfgang Goethe-University into the short-lived Karl Marx-University (Kluge, 2001: 12). As Negt tells it, a year later Kluge stood out among the many students (many of whom were Theodor W. Adorno's or Habermas's pupils), unionists and community members sitting in his philosophy of law seminar in Frankfurt's newly opened Juridicum (Negt, 1991: 89). 'I noticed him in several class meetings', Negt recalled decades later, 'especially

since he took notes so diligently' (Negt, 2012b: 299). Only momentarily taken aback by Kluge's fame, Negt was quickly entranced by Kluge's unanticipated introduction one day and the sudden intensity of their discussion about the protest movement and the public forms it assumed and exploited. After several 'theory marathons' between the two, Negt invited Kluge to coauthor a book that would become the first of three interlocking treatises spanning three decades (Kluge, 2001: 15). *Public Sphere and Experience: Toward an Analysis of the Bourgeois and Proletarian Public Sphere* (1972) and everything published and broadcast in its wake bears the mark of this tumultuous transition in West German society and politics that originally brought these unlikely bedfellows together. In the preface to their third and final volume, from 1992, the essay collection *Maßverhältnisse des Politischen* [Measured Relations of the Political], Negt and Kluge appraised their 30 years of thinking and writing together as a 'joint effort [...] to analyze what [they] call the *political*' – a category distinct

from professional politics – by interrogating not only the metamorphic ‘elements and components’ of but also the necessary conditions for emancipation, subjective autonomy and commonwealth [*Gemeinwesen*] building (Negt and Kluge, 1992: 9–10). Echoing their mentor Adorno’s posthumous exhortation that ‘theory is a form of praxis’, this political dimension subtending all of Negt and Kluge’s ‘joint philosophy’ [*gemeinsame Philosophie*] is best grasped in terms of what they elsewhere call ‘theory labor’, the production of radical critiques of the existing social order that not only engender missing historical contexts and therefore measurable forms of orientation but also anticipate objective possibilities for confronting the ‘unbearable relations’ of what Sigmund Freud originally called the ‘reality principle’ (Adorno, 2005: 261; Negt and Kluge, 2001b: 480–5; Kluge and Negt, 2014: 139). However, Negt and Kluge parse reality much more with an eye to Marx. Whereas the permanence of primitive accumulation has long defined what counts as reality, the misery engendered by this historical process intent on leaving out ‘essential portions of history’ – the unfulfilled, genuine needs and interests of history’s losers – also harbors antagonistic feelings that form the phantasmagorical basis of a ‘practical critique of [this] alienation’ (Kluge and Negt, 2014: 86, 139; Negt and Kluge, 2016: 33). The task of theory – anti-realist critique – is thus rooted in and driven by misery. At the core of all of their work, then, lies an exacting attention to the conditions of possibility for imagining individual freedom and genuine social happiness. But of all the attendant keywords commonly associated with their sustained collaboration – one need only recall the concepts populating the titles that constitute their trilogy – Negt is quick to remind their readers that ‘only the impetus for independent thought and the expansion of the political power of judgment are meaningful contributions for the peaceful configuration of society. Therein lie the basic themes of [their] joint thinking’ (Negt, 2012b: 305).

‘Critique’, Adorno exclaimed at roughly the same time Negt and Kluge first met, ‘cannot be restricted to a narrow political field’ (Adorno, 2005: 281). Insistent themselves that ‘Critical Theory is and always was a political theory’, Negt and Kluge conceive of the political in their three formal contributions to the Frankfurt School (along with their some 60 television interviews recorded since 1988) broadly (Kluge, 2001: 16n2). Yet each installment is tethered to the very same questions that compelled them to write *Public Sphere and Experience* in the first place: ‘where do people get their self-consciousness? What brings people to trust their experiences? How is autonomy engendered in the individual?’ (Kluge, 2001: 15). Far from pursuing a linear trajectory of thought, Negt and Kluge double back with each ensuing collaboration to ever more fundamental questions. Whereas *Public Sphere and Experience* interrogates the ‘dialectic of the bourgeois and proletarian public spheres’ and, more specifically, the historical production of alienated experience, their follow-up, the monumental *History and Obstinacy*, addresses a lingering question, namely the individual’s persistent ‘need’ to articulate its otherwise repressed, disorganized experiences (Negt and Kluge, 1993: xliii; Negt and Kluge, 2001b: 88). In their words the compliment to Karl Marx’s political economy of capital, this second book burrows downward from societal matters of class experience into ‘the nature of cells, the skin, bodies, the brain, the five senses, and the social organs constructed on top of them’ in its pursuit of a political economy of labor power, a microscopic account of the political potential for protest inherent in the human species that Marx himself never wrote (Kluge and Negt, 2014: 98, 121; Knödler-Bunte, 2014: 60–1). Given all the many intricacies to their account of this obstinate need within every human being, Negt and Kluge bring the political back into view with *Maßverhältnisse des Politischen* by zooming out and delineating the conditions of possibility for honing the political faculty of judgment, especially

in times of epochal upheaval, such as at the dawn of the millennium, when human powers of differentiation were overwhelmed like never before.<sup>1</sup> This red thread coursing through all three collaborations notwithstanding, commentators Hansen and Fore are right to point out that Negt and Kluge's first two works are very much products of their respective decades. The same can be said for their third volume. In the shadow of the student movement's collapse, *Public Sphere and Experience* not only revised Marxian orthodoxy's notion of organization for emergent new social movements but also liberated the concept of experience from the confines of the autonomous aesthetic as Adorno defined it posthumously (Hansen, 1993: xv–xxvi). Written amid a pall of domestic terrorism, counterinsurgency measures and leftist disillusionment in the second half of the West German 1970s, *History and Obstinacy* ekes out its political economy of labor power in the face of what Negt later describes as an era of unprecedented 'socio-association [Vergesellschaftung] from above' that expropriated individual life contexts, or, framed in the language of Habermas, governmental-corporate regimes that thoroughly colonized the life-world of the Federal Republic under Chancellor Helmut Schmidt's rule (Fore, 2014: 19–22; Negt, 2010: 292–3). Written in the wake of major political upheavals marking the dawn of a new post-Cold War era – the Chernobyl nuclear meltdown in 1986; German reunification in 1989; the thoroughly televised, seven-month Gulf War that ended in early 1991; the failure of German intellectuals in the Gulf War; and Francis Fukuyama's case for neoliberalism – *Maßverhältnisse des Politischen* sets out to reclaim for everyday social life a communal notion of the 'political' neither subsumed by professional politics nor complicit in the obliteration of a commonwealth as advocated by proponents of postmodern agonistic pluralism.<sup>2</sup>

Like no other collaborative team within the Frankfurt School, or outside it for that

matter, Negt and Kluge's work together is unique precisely because of what makes each of them so different. Born to prominent middle-class parents in the town of Halberstadt in 1932 and raised by his divorced mother in Berlin from 1946, Kluge trained as a lawyer in Marburg in 1949 and slogged through several internships before moving to Frankfurt, where that university's trustees employed him on account of his 1956 dissertation on self-governance in higher education (Combrink, 2009: 294–300). With Adorno's help, whose acquaintance Kluge made by coincidence in 1955, Kluge apprenticed under film director Fritz Lang in 1958 and then, disillusioned by both law and the studio system, turned to writing prose, to Adorno's dismay. By 1962, he had published his first collection of stories (*Attendance List for a Funeral*, 1966); co-authored a study on financing cultural politics with his legal mentor Hellmut Becker; co-directed two documentary shorts; co-signed the Oberhausen Manifesto that paved the way for German auteur cinema (Rentschler, 1988: 2, 10–13); spoke before the influential West German literary salon Gruppe 47; and laid the foundation for and taught at West Germany's first film school, based at the Ulm School of Design (Hörmann and Eder, 1995).<sup>3</sup> By the end of the 1960s, Kluge's notoriety as author, filmmaker, legal counsel to Adorno, film theoretician, media lobbyist and public intellectual was irrefutable. In the ensuing decades, he maintained his influence within all these parallel fields while shifting, adapting and expanding his praxis to account for transformations in technology, culture and politics. Kluge wrestled, for example, with the problem of television as early as *Public Sphere and Experience*, but it was the advent of West German cable television in the 1980s that brought him to bid farewell to film after making 14 features and invest in private broadcasting instead. In the late 80s and 90s, Kluge and his production company DCTP hunkered down to furnish his three separate television programs (*News & Stories* on Sat.1 and *10 to 11* and *Primetime/Late Edition*

on RTL) with original material every week. Since 2000, he has made an unprecedented literary comeback, beginning with *Chronik der Gefühle* [Chronicle of Feelings] (Kluge, 2000); released swaths of his long out-of-print work in print and on film (Kluge, 2007, 2009); returned to filmmaking; expanded into online streaming video; and most recently collaborated with renowned visual artists on books and museum exhibitions.<sup>4</sup>

While Kluge fondly regards himself as critical theory's gardener, committed to curating its ideas in poetic and aesthetic form – the gardener is but one of two types, says Kluge, characteristic of writers and artists – Negt arguably is that other type, namely the lion tamer at work in the center ring of social politics and theory (Kluge, 2012: 26). Two years Kluge's junior, Negt was the youngest of seven children born to working-class parents who farmed on an East Prussian estate (Negt, 1997: 298; Negt, 2016: 107–25). Evacuated via Denmark to Oldenburg due to Soviet military advances in early 1945, Negt briefly studied law in Göttingen at his father's request before transferring in 1956 to Frankfurt to study philosophy with Max Horkheimer (Negt, 1991: 76). Already a member of West Germany's Social Democratic Party by 1954, Negt assumed leading roles in the party's Socialist German Student Union in 1958 and taught at a trade-union school outside Frankfurt in 1960; the outcome of these early pedagogical experiences was Negt's first, best-selling publication, *Soziologische Phantasie und exemplarisches Lernen: Zur Theorie der Arbeiterbildung* (1968) [Sociological Fantasy and Exemplary Learning: Toward a Theory of Labor Education]. After completing his dissertation on Auguste Comte and G.W.F. Hegel under Adorno's direction in 1962, Negt followed Habermas to Heidelberg as his assistant in philosophy and then returned to Frankfurt, where in 1970 he was briefly considered for the deceased Adorno's chair before he accepted an appointment in sociology at the Leibniz University of Hanover.

There he and colleagues like the social psychologist Regina Becker-Schmidt, sociologist Detlev Claussen and interdisciplinary psychoanalyst Alfred Lorenzer established a Hanoverian School of Critical Theory (Açıkgöz, 2014: 195, 211–15). His academic calling and concomitant publishing certainly did not preclude the continuation of his previous political commitments. An early member of the Socialist Bureau committed to organizing the frayed New Left (Negt, 1973), Negt advocated in the early 1970s for alternative schools like the Glocksee-Schule of Hanover (Negt, 1997, 2014); battled in the 1980s for the 35-hour working week (Negt, 1984) and for unions (Negt, 1989); and championed the SPD and its coalition with the Green Party, as well as European integration (Negt 1983b, 1998, 2012a, 2008). He even advised Chancellor Gerhard Schröder (Negt, 2002).

Negt's and Kluge's familial backgrounds, theoretical training, vocations, experiences and temperaments could not be more different. In fact, Kluge once fondly labeled himself and Negt 'incompatible opposites' (Kluge, 2001: 7). This contrast applies equally to their respective relationships to philosophy and theory; whereas Negt is far more apt to ground his thinking in ancient Greek and modern German philosophical traditions (not to mention works from the Frankfurt School's first generation), Kluge, certainly no stranger to Negt's influences, has long demonstrated a curiosity, if not appreciation, for contemporary French and Anglo-American thought, developments that Negt himself has regarded over the years as misled 'theoretical fads' (Knödler-Bunte et al., 2014: 36; Negt, 2014: 71; Negt, 1983a). Yet even the most superficial of differences, like Kluge's penchant for associative montage, best exemplified by his films, and Negt's drive for concentrated logic, typical of his finely honed academic speeches, never express themselves in any predictable division of labor (Kluge, 2001: 8). 'It was typical in *History and Obstinacy*', Negt once explained, 'that I introduced the literary examples while Kluge was much more

oriented toward Marxist orthodoxy. [...] An inversion took place that made for a very satisfying cooperation' (Negt, 1991: 90–1). Of central importance for every installment in their entire theoretical project, cooperation for Negt and Kluge involved forging every sentence together while nevertheless allowing room for both individual differences and mutual trust to thrive (Kluge, 2001: 9).<sup>5</sup> The resultant trilogy stands out, with respect to their respective outputs. While Negt occasionally references his collaborations with Kluge in his own major publications – e.g., his own trilogy *Kindheit und Schule in einer Welt der Umbrüche* (1997) [Childhood and Schools in a World of Upheavals], *Arbeit und menschliche Würde* (2001) [Labor and Human Dignity] and *Der politische Mensch* (2010) [Political Man] – these works address more his own immediate political interests than they do ideas developed with Kluge. And while Kluge's literature, films and videos resonate with ideas developed with Negt and even occasionally riff on Negt's own independent publications, they are more likely to mediate this 'theory labor' on the aesthetic plane than to engage in it directly (Streckhardt, 2016). All in all, appreciation of Negt and Kluge's joint contributions to critical theory must recognize not only the thematic thread coursing through each of their three publications but also the decade-long pauses in between that have afforded each thinker opportunities to pursue his own interests in works which themselves must be regarded as just as much a part of the Frankfurt School canon as their principal collaborations.

In spite of their direct involvement in the Institute of Social Research and close acquaintance with its major players since the 1950s – above all but certainly not limited to Adorno, Horkheimer and Habermas – Negt and Kluge's theoretical relationship to their elders of the first generation and their peers from the second generation of the Frankfurt School is not as self-evident as it might appear. Although the authors frame

the outset of their debut, *Public Sphere and Experience*, as a corrective to Habermas's *habilitation* thesis, the actual impetus for their first and subsequent collaborations was certainly not any formal, sustained tangle with Habermas or, for that matter, his subsequent reconstruction of critical theory, a shift Negt and Kluge certainly keep at arm's length (Negt and Kluge, 2016: 1; Negt, 1991: 91). While they have occasionally awarded others from their own generation, like Karl-Otto Apel, Claus Offe, Alfred Schmidt and Albrecht Wellmer, cursory attention, thinkers associated with the School's third generation, like Axel Honneth, Christoph Menke and Martin Seel, appear nowhere in their more recent work. (In fact, these 'grandchildren' have little if anything to say about Negt and Kluge; Honneth's 1980 essay on work, for example, is entirely oblivious to Negt and Kluge's longstanding attention to matters of production (Honneth, 1982).) When Negt and Kluge do engage the Frankfurt School directly, they are, more often than not, in dialogue with their aforementioned mentors, as well as Walter Benjamin. Nevertheless, neither their repeated reliance on Horkheimer's landmark study of the authoritarian family (Negt and Kluge, 2016: 75–7; Kluge and Negt, 2014: 345–7) nor their stated adherence to Adorno's new categorical imperative after Auschwitz (Kluge and Negt, 2014: 198); neither their adoption of Benjamin's constellative method and reliance on his philosophical theses of history (Kluge and Negt, 2014: 93; Negt and Kluge, 2001a: 909; Negt and Kluge, 2001b, 282–3); nor even the centrality awarded to *Dialectic of Enlightenment* as a foil for the whole of their interventions (Kluge and Negt, 2014: 267–94) encapsulates the definitive point of continuity between them and their mentors. Although a wide net cast for a broad theme like that of experience, its loss and sought-after redemption – one of the oldest motifs in all of critical theory – could certainly establish a conceptual lineage passing between Benjamin's and Adorno's opposing views,

Negt has repeatedly insisted that his collaborations with Kluge were never motivated by any doctrinal sense of loyalty to already established subject matter, let alone any need to remedy their mentors' oversights and omissions (Jay, 2005: 313, 357; Negt, 2007: CD 3, lecture 19, track 16). Contrary to the strictures typical of academic philosophy, Negt has contended that it was always the Frankfurt School's unparalleled toolkit for thinking philosophically about 'the weal and woe of a commonwealth' that fueled their collaborations, even if it meant parting ways with Adorno, Horkheimer and Habermas (Negt, 1991: 92). A 'central epistemological entry point' into the problems facing contemporary societies, critical theory was an inherently political project insofar as 'theory labor' always 'strives to provide praxis with a measurable amount of orientation' for steering clear of imminent danger and suffering (Negt, 2007: CD 3, lecture 19, track 17; Negt and Kluge, 2001b: 483).

## PUBLIC SPHERE AND EXPERIENCE

*Public Sphere and Experience* emerged less as a theoretical corrective to Habermas's 1962 *habilitation*, *The Structural Transformation of the Public Sphere*, than as a response to, if not intervention into, the vicious circle of violence that began plaguing West Germany in the late 1960s. 'Life that reacts with violence', they implored in the final chapter of *Public Sphere and Experience*, 'is not able to organize itself as life' (Negt and Kluge, 2016: 186). This menace first emerged with the shooting of student protesters incited, in part, by inflammatory language in the yellow press, and soon begat counter-violence in the form of vandalism and arson (Negt, 1995: 78–97). Domestic terrorism ensued and democracy in the Federal Republic suddenly seemed in jeopardy. Originally a book contracted to address public spheres excluded by both

media cartels and Habermas's account of the dominant bourgeois one, *Public Sphere and Experience* did nonetheless take exception to Habermas's insistence that what he calls the 'plebeian public sphere' is a mere 'variant' of the classical bourgeois sphere, one presumably oriented toward the latter's intentions (Negt, 2012b: 299; Habermas, 1989: xviii). Departing from Benjamin's conviction that history is always written by the victors, Negt and Kluge maintained that Habermas's concept fails to account for two key constituents of real human life – labor (i.e., the production process) and the family (i.e., the realm of socialization) – and therefore inadvertently occludes all non-bourgeois experience, a 'block of real life' they subsumed under the intentionally anachronistic category of the 'proletarian context of living' (Negt and Kluge, 1993: 57, xlvi). Making Habermas's account even more problematic for Negt was its omission of National Socialism's "'strong" public sphere', a historical caesurae when the reign of the classical bourgeois public sphere waned and the collusion of capital and ideology steamrolled proletarian experience entirely by valorizing and mobilizing the aforementioned precluded realms of work and familial life altogether (Negt and Kluge, 2016: 12n22, 166–9; Negt, 1991: 91). What distinguishes pre-fascist and fascist imperialisms from the imperialism characteristic of the contemporary 'capitalist global public sphere' in which Negt and Kluge found themselves is the latter's inward turn (Negt and Kluge, 2016: 166). In this new 'public sphere of production', where public and private are blurred, human beings have become the 'raw material' with which capital, operating on the plane of multinational consciousness industries, ensures its future growth (2016: 18). 'The libidinal fantasies of human beings, their hopes, wishes, needs, are no longer set free', Negt and Kluge summarize, 'are no longer capable of developing themselves in accordance with random interests, but are concretely occupied with use-values, with

commodities' (2016: 172). This alienating homogenization and the attendant synchronization of family life, education and work block full class consciousness, extirpate proletarian experience and foreclose critique. Yet even the most advanced forms of capital allow for contradictions like the student insurrections of 1968 and therefore draw attention to the structural limits of its desired subsumption of the mind: 'The overall organization of the human being resists being reduced to *one* interest that presents itself as the whole. In this respect there is a difference between [...] the technical enlistment of the human brain, and its real mode of functioning, which has its foundation in the libidinal economy' (2016: 185). This limit, they insist, reveals the proverbial silver lining where a 'most progressive solution' could be found, where the utopian quotient of Negt and Kluge's social theory emerges (2016: 171; Negt and Kluge, 1993: xliii; Jameson, 1988: 157). The Herculean task for emancipation would entail nothing short of reclaiming fantasy itself, such that dispossessed classes are capable of reorganizing themselves according to their own interests and needs. To this end, an effective counter-public sphere would necessarily have to pit its own ideas, products and production sectors against those of private capital and its co-conspirator, the 'illusory public sphere' (Negt and Kluge, 2016: 79–80). Against Habermas's distributive model of the classical bourgeois public sphere, Negt and Kluge imagine a model rooted in production capable of articulating otherwise repressed experiences that, when collectively organized, could constitute resistance in the form of a proletarian public sphere (Knödler-Bunte, 1975: 65–7). This program has been the theoretical structure upon which Kluge has erected his entire aesthetic project.

That *Public Sphere and Experience* struck a chord with sympathizers of West Germany's New Left caught in the throes of its deterioration had less to do with any reunification of their bygone cause or

identity than with the potential of the concept of experience, which Negt and Kluge's book had shot through with 'openness, inclusiveness, multiplicity, heterogeneity, unpredictability, conflict, contradiction, [and] difference' (Hansen, 1993: xviii). In other words, Negt and Kluge delivered a sorely needed remedy for the 'hunger of experience' plaguing myriad constituencies (feminist, environmentalist, pacifist, LGBT) associated with West Germany's 'new social movements' (Hansen, 1993: xix). Shortly before the English-language translation appeared in 1993 Anglo-American scholars interested in matters of the public sphere chided Negt and Kluge for their perceived 'romantic' emphasis on production – for cultural studies scholars, consumption was then the locus of subversive agency – as well as their blindness to gender (Polan, 1990: 39). Others underscored just how prescient the book's authors were with respect to the coming of 'electronically mediated' 'postliberal, postliterary public formations' comprised of 'unstable mixtures of different types of publicity' that 'cut across [...] the traditional opposition of public and private' (Hansen, 1993: xxviii–xxx). The relevance of *Public Sphere and Experience* was reinvigorated yet again when Negt, writing in the shadow of appalling right-wing violence against asylum seekers in newly reunified Germany, conjectured that in spite of recent structural shifts in electronic media their account of the debilitating effects of 'public spheres of production' on experience and democracy still holds (Negt, 1995: 94–103). Addressing whether their argument conceived in the era of print journalism and television still applies to the digital age, Negt and Kluge contended in 2014 that the media oligopolies of yesterday, so central to their original account of the consciousness industry, now struggle against innovations emerging out of Silicon Valley; and yet the questions and concepts underpinning their first book are not so much invalidated as 'merely *radicalized*' by recent technological advances

(Negt and Kluge, 2016: xliii–xliv). The validity of their original claims applies equally to the possibility of counterpublic spheres in the twenty-first century: ‘The fact remains that people, on account of their very nature, cannot adapt completely’, Kluge recently insisted. ‘On the contrary, their very nature makes them insubordinate’ (Kluge, 2015: 123).<sup>6</sup> However, for every claim to its continued relevance – some North American sociologists have even identified Negt and Kluge as models for ‘public sociology’ (Krause, 2006: 119–20) – there are other related discourses for which *Public Sphere and Experience* remains a negligible footnote to Habermas, if at all. Fraser’s important challenges, for example, to the nationalist framework subtending public-sphere theory in the name of illuminating ‘emancipatory possibilities of the present “postnational constellation”’ overlook Negt and Kluge’s prescient account of global public spheres of production, their case for multiple publics and their emphasis on human sensuality as the basis for collective social production (Fraser, 2005: 45–7).<sup>7</sup>

## HISTORY AND OBSTINACY

Assaying the outcomes of their first collaboration almost a decade later, Negt and Kluge emphasized that their first was, in fact, ‘not a book written about the proletarian public sphere, but rather one about the bourgeois public sphere’ (Negt and Kluge, 2001b: 88). (In fact, they say as much at the close of *Public Sphere and Experience*, too, when they write that it can only be ‘defined *negatively*, as a context of blockage wherein experience, needs, wishes, and hopes do concretely come into being but cannot develop in an autonomous fashion’ (Negt and Kluge, 2016: 296).) Originally intended just to ‘illuminate a few obscure points’ from their first book – like the brain’s aforementioned ‘real mode of functioning’ – *History*

and *Obstinacy* evolved to seek out ‘what constitutes the opposite pole to capital’ (Knödler-Bunte et al., 2014: 37). Work on the book mushroomed into a massive 1,245-page tome divided into three four-chapter books comprised of a dizzying array of illustrations, footnotes, excursuses, addenda and commentaries (Negt and Kluge: 2001b: 5).<sup>8</sup> The authors regarded the final product as an exhausting, incomplete fragment full of gaps that readers would need to decipher themselves (Negt and Kluge, 2001b: 1245). Formally the culmination of Kluge’s experimentation with collage in his storybooks *Neue Geschichten: Hefte 1–18* ‘Unheimlichkeit der Zeit’ [New Stories: Notebooks 1–18 ‘The Uncanniness of Time’] (1977) and the revised 1978 edition of *The Battle* (*Schlachtbeschreibung*) (Kluge, 1967, 1978), the content of Negt and Kluge’s follow-up swelled into a rigorous critique of the historical character of labor at a moment in time when the interest in labor both within and without the Frankfurt School was at an all time low.<sup>9</sup> Right when Habermas zeroed in on communicative action (in lieu of purposive-rational action, i.e., work) and not long after Michel Foucault and others left of the Rhine renounced Marxism altogether, Negt and Kluge committed themselves to answering politically pressing questions first raised during the student movement, using, in large part, Marxian tools increasingly out of favor on the increasing post-Marxist Left (Langston, 2013: 52–8; Knödler-Bunte, et al., 2014: 35). Book one, the theoretical linchpin of the entire volume, begins with the historical process of primitive accumulation itself. In accordance with Marx’s critique of political economy, the defining feature of capitalism’s imprint on human history is first established as humankind’s separation from its original property and the imposition of unnatural mandates on its labor capacities. This is the moment when historical labor characteristics (like the sense of having) are imposed on top of the human body’s natural, self-regulating ones. Yet for Negt and Kluge,

the 'exploitative potency' of capital also gives rise to a 'generative potency', a capacity residing within humankind's 'essential powers' for finding 'ways out of the historical structures' of work (Kluge and Negt, 2014: 83). The counterpoint to the preceding account of history as the catastrophic permanence of primitive accumulation, the second chapter establishes self-regulating processes in a wide range of phenomena, from human cells to social history, as the elemental action subtending all obstinacy. In chapter three, Negt and Kluge interrogate references in the mature Marx to a political economy of labor (or the working class) in order to work open the first of several long-ignored contradictions. Whereas the mature Marx only sees the laborer 'like someone who has brought his hide to market', Negt and Kluge identify two simultaneous, contradictory processes quite different from Marx's account of labor as both exchange-value and use-value (Marx, 1990: 280; Martin, 2015: 28). On the one hand, laborers toil outwardly according to the dictates of capital that require self-exploitation, obedience and instrumental reason. On the other, their cells, organs and bodies toil according to an inner law – that of the self-regulating metabolism – effective both in and outside of the workplace such that they either comply or resist the demands of *Kapitallogik* (Kluge and Negt, 2014: 124–5). A fourth chapter struck from the English-language edition details the actual reciprocal give and take – Negt and Kluge advance here a concept of the dialectic as the 'actual shape of cohesive material processes' – between 'historical faculties for laboring' and the obstinate 'capacity for maintaining organic relationality [*Zusammenhang*]' (Negt and Kluge, 2001b: 226, 241).

As much as it resurrects the young Marx's humanist anthropology as a corrective for the mature Marx's de-emphasis on the human factor in his critique of the political economy of capital, *History and Obstinacy* is neither a work of philosophical anthropology nor a philosophy of life, nor is it a contribution

to the sociology of work (Martin, 2015: 26, 32–3, 36n5; Knödler-Bunte et al., 2014: 68). Speaking in 1983, Negt aptly summed up their objective as an inquiry into the contemporary subject in a late capitalist world, a time and place when more and more nature is de-objectified and humans are self-estranged like never before:

The agenda of the analysis of capital has certainly been completed; incomplete is the agenda concerning the constitution of the Subject. Everything that Marx said is correct, but he did not say everything that we need in order to comprehend the modern world [...] How could [Marx] speak scientifically about the constitution of the Subject when in his lifetime there was no psychology of internal development or of compulsive drives? (Negt, 1988: 220; cf. Knödler-Bunte et al., 2014: 58–62)

Far from simply championing the modern subject that Horkheimer and Adorno disparaged in *Dialectic of Enlightenment* for its self-sacrificing tendencies, Negt and Kluge set out to remedy this agenda from the standpoint of Marx's appropriation of Hegel's account of subject–object relations.<sup>10</sup> In order to substantiate this constellation in which modern, chameleon-like subjects find themselves and therewith throw into relief the conditions of possibility for resistance to capital, Negt and Kluge weave a rich tapestry in book one ('The Historical Organization of Labor Capacities') that also calls upon a wide array of thinkers and disciplines, such as Hegel's Logic; Lenin's and Adorno's concepts of the dialectic; Benjamin's aforementioned theses on history; Freud's theory of the drives and culture and the developmental psychology of Piaget; postwar and contemporary French thought (Levi-Strauss, Foucault, Derrida, and Deleuze and Guattari); as well as sundry references to the natural, biological and social sciences.

With the second formal section of *History and Obstinacy*, originally entitled 'Germany as a Public Sphere of Production', the authors put their theory of a political economy of labor to the test by framing German history as a two-centuries-old industrial production center

of dead labor that eventually led to the killing factories of Auschwitz (Kluge and Negt, 2014: 83). Why is it, they ask, 'that throughout the entirety of German history the inorganic whole [of historically produced labor capacities] has something deadly about it'? (Negt and Kluge, 2001b: 363.) In pursuit of just some of the characteristics involved in the making of this long tragic history, Negt and Kluge delineate the geographical boundaries of German experience – landlocked Central Europe in contradistinction to the Mediterranean coast prominent in Horkheimer and Adorno's reading of Odysseus – and reach back to the 'ur-trauma of German history', the Peasants' War (1524–5), when capital violently overturned the unique habitus of peasant life (Jameson, 1988: 168). Explicated in part using the tenth-century experiences preserved in the Grimms' fairy tales, this defeat resulted in a recurring set of individual and collective losses (of consciousness, the capacity for differentiation, reality, identity, nation, etc.) that resurface with every major caesura in modern German history: World War I, the rise of National Socialism, Auschwitz, Stalingrad and the terrorism of the Red Army Faction. The fact 'that the actual energies of labor power in Germany never found their own adequate object', they sum up, 'but instead always an object that retracted itself' resulted in an intensification of energies such that the total destruction of both the perceived enemy and part of the self always ensued (Negt and Kluge, 2001b: 368). (Although not entirely denuded of its German focus, the second third of the English-language translation refrains from illuminating in full the unique historical trajectory of Germany's labor capacities and instead underscores just some of the key concepts and characteristics (individual life spans, primitive property, reliability, obstinacy) both valid for a German history of labor power and serviceable for other unwritten local, regional and national histories that lurk beneath the transnational flows of twenty-first-century globalization (Kluge and Negt, 2014: 218; Miller, 2015: 84–5). In the final

third, entitled 'The Violence of Relationality', the authors hark back to the beginning of *History and Obstinacy*, originally a prelude subtitled 'Violence as a Labor Characteristic', and examine those forms of violence – direct, indirect, precise, powerful, physical, structural – characteristic of the work involved in the three primary sites where social exchange transpires: everyday experience from below (versus capital from above), the political economy (of war labor) and intimate personal relationships (i.e., 'love politics'). A final chapter on the centrality of orientation once again takes exception to the geohistorical applicability of Horkheimer and Adorno's diagnosis of modernity. Unlike the sailor Odysseus who navigated the seas according to the starry heavens, we moderns find ourselves in a 'fogbank' and must therefore rely on indirect alternatives ('introversion, discourse, curiosity' (Negt and Kluge, 2001b: 1004, 1012)). When the authors then underscore that they are 'primarily interested in the juxtaposition [of such alternatives] especially since no single form of orientational labor can achieve relationality', they conclude *History and Obstinacy* not with any nostalgic appeal to Lenin's or Lukács's organizational party politics; rather, this practical orientation – 'when every [available alternative] cooperates together' – must arise from the free expression of interests and needs and for that a counterpublic sphere is once again essential (Negt and Kluge, 2001b: 1010; Negt, 1973: 48).

For all its grandiose ambitions, *History and Obstinacy* has long struggled to find a lasting audience, let alone a substantive resonance within academic discourses. Considered an essential 'cult book' in its own day, critical reception among its most obvious addressees – historians and philosophers, economists and sociologists – did not materialize even after the three substantial editions of 1981, 1993 and 2001 (Siebers, 2005: 214; Stollmann, 2005: 235). (Steidl Verlag has planned yet another edition for late 2016 as part of Negt's 20-volume collected works.) The reasons for this lapse are myriad and

can be partially traced back to the book's unwieldy form as well as the untimeliness of its interdisciplinary content. Whereas historians, for example, rejected the book's speculative nature at precisely that moment in the early 1980s when their discipline underwent an empirical paradigm shift (Stollmann and Schulte, 2014: 71), some philosophers engaged with *History and Obstinacy* charitably early on but took issue with the book's bagatelles (like its occasional tautologies, pleonasm and inaccurate synopses of concepts borrowed from the natural sciences), its flirtation with (and disavowal of) questionable discourses (Engels's *Dialectics of Nature*, cybernetics) and its unresolved contradictions and omissions (Burger, 1982: 118–24). Although many within their ranks had begun to question the viability of the subject around the time Negt and Kluge made their case for the subjective factor of obstinacy, German and Anglo-American literary and film studies have from the start been a cornerstone of those speculative disciplines with the greatest investment in *History and Obstinacy*. Still a tendency within Kluge scholarship to this day (Schulte, 2012a, 2012b), early German-language analyses of Kluge's prose and feature films (e.g., Carp, 1987; Bosse, 1989) sought out correspondences between Kluge's poetics and his second collaboration with Negt. Anglo-American scholars later expanded upon this by applying tools developed in *History and Obstinacy* to a wider range of modern and contemporary texts (Adelson, 1993; Langston, 2007; Pavsek, 2013; Schiesser, 2008). Another dominant line of inquiry among Anglo-American critics has sought to identify *History and Obstinacy* as an innovative intervention in contemporary theoretical currents. Bowie contended early on, for example, that Negt and Kluge's appeal lay in their rebuke of Horkheimer and Adorno's negative dialectic as well as Lacan's negative ontology (Bowie, 1985/6: 190), while Jameson drew attention to their 'original and complex' case for multidimensional

forms of resistance that transcend even the dualisms subtending what was then still considered Deleuze and Guattari's cutting-edge schizoanalysis (Jameson, 1988: 173). Others like Pavsek have asserted that Negt and Kluge provide an important corrective to post-Marxist projects (e.g., Laclau and Mouffe and Žižek) intent on reinvigorating socialist strategy under the star of postmodernity (Pavsek, 1996: 152–63). Writing on the occasion of the 2014 English-language translation, some reviewers dug up bygone reservations about Negt and Kluge's conceptual expansion of labor and struggled to size the work up against the *Neue Marx-Lektüre* (allegedly a glaring omission on Negt and Kluge's part) (Wilding, 2015; Langston, 2015: 56–9), while others championed the authors' historiography of human characteristics as the crux of their innovative break with Marx (Martin, 2015: 30–1). Thirty years after his original review of *Geschichte und Eigensinn* Andrew Bowie echoed others in arguing that *History and Obstinacy* is more relevant today than ever before, especially in light of financial capital's global ascendancy, the Great Recession and, most importantly, the metamorphosis of labor into new postindustrial forms of work (Bowie, 2015: 77–8; Langston, 2013; Fore, 2014: 65).

## MEASURED RELATIONS OF THE POLITICAL

A collection of thematically related essays, many of which Negt penned himself, *Maßverhältnisse des Politischen*, sets out to make a claim for the concept of the 'political' at exactly the moment – the aftermath of the fall of the Iron Curtain – when its currency, as Carl Schmitt had defined it in 1927, was on the rise among post-Marxist Leftists (e.g., Hirst, Mouffe, Derrida, Hardt and Negri) (Wolin, 2006: 246–7). In contradistinction to the antagonism between nation states characteristic of Schmitt's treatise, Negt and Kluge

forge in the shadow of German unification a concept of the political relevant for fostering solidarity *within* what they, borrowing from Ferdinand Tönnies, call a commonwealth [*Gemeinwesen*], an inclusive, durable social unit comprised of mutual understanding, organized life interests and collective agency (Negt and Kluge, 2001a: 695, 757–8; Tönnies, 2001: 227–9). In lieu of Schmitt's keywords 'foe' and 'war', Negt and Kluge advance their account of the political with an emphasis on 'friend' and 'peace'. What Negt and Kluge do share with Schmitt is the conviction that politics as Max Weber defined it – a vocation synonymous with the state and its functionaries, professional politicians and their parties – is inherently separate from the affairs of the political. In fact, the pragmatism of institutional realpolitik, Negt and Kluge insist, is rarely if ever organized according to the vital interests of members of the community it purports to represent. In this respect, realpolitik is devoid of any reality and therefore leaves no space for the political to unfold. Like Schmitt, Negt and Kluge frame the political as a function of intensities. But whereas Schmitt sites this affective dimension in the space between friends and foes, they situate it in an 'intensity of feelings' (Negt and Kluge, 2001a: 757).<sup>11</sup> Harking back to their account of labor capacities in the third chapter of *History and Obstinacy*, Negt and Kluge regard feelings rooted in either bodily sensations or 'the social organs constructed on top of them' – in other words, lived unalienated experiences – as the front-line where prevailing conditions in the political economy of labor are either tolerated or protested (Kluge and Negt, 2014: 98, 139). These feelings comprise the raw materials of the political. Far from promoting the manufacture or governance of actual feelings – feelings can only emerge and form associations with one another of their own accord – Negt and Kluge turn instead to Hegel's concept of measured relations [*Maßverhältnisse*] in order to underscore the quantitative and qualitative conditions and

forms through which these raw materials find expression. When the forms and measured relations that feelings assume fail to express their sense of protest adequately, then 'violent explosions regularly occur' (Negt and Kluge, 2001a: 721). And when they do take shape, what differentiates an outcome like National Socialism from the French Revolution is not its intensity but rather the forms and measured relations it assumes. 'Political energies and qualities require', the authors underscore in the foreword to the first edition of *Maßverhältnisse des Politischen*, 'time, recognizable places, [and] the subject's capacity for autonomy' (Negt and Kluge, 1992: 10–11). Without sufficient spare time, for example, the affective capacity for differentiation never matures; the political faculty of judgment fails to materialize; feelings cannot integrate themselves into the organic fabric of a commonwealth; and, as a consequence, any political response is all but certain to fail. Central to the conditions of possibility for any collective praxis is making enough time for raw materials to transform into collective learning processes. For this, the temporal relations under late capital typified by stretches of boredom, on the one hand, and imperceptible high speeds, on the other, must be arrested or at the very least challenged. 'Incubation periods are necessary', they had already declared in *History and Obstinacy*: 'These pauses are time sluices [and] make it possible that [...] velocities adapt to one another, that subjective and objective relations unify into one subjective-objective relationship' (Negt and Kluge, 2001b: 212). Kluge scholars have long held that his montage is an exemplary aesthetic praxis intent on fashioning such sluices.

### **NEGT AND KLUGE'S 'STRUCTURE OF THOUGHT'**

Ten years after the publication of *Maßverhältnisse des Politischen*, Negt and

Kluge published transcriptions of what must be considered their fourth and most recent collaboration.<sup>12</sup> Entitled *Suchbegriffe* [Search Terms], the first third of volume one of their ‘joint philosophy’ contains 26 televised interviews reaching back to 1988 that address a multitude of topics ranging from globalization to the ideology of flexibility, from the Enlightenment’s interest in encyclopedic knowledge to the West German student movement, from Kant’s categorical imperative to Verdi’s operas.<sup>13</sup> Neither garden-variety television interviews nor an underlying concession to Habermas’s case for communicative rationality, Negt and Kluge’s dialogues demonstrate their very ‘structure of thought’, not for passive consumption but with the open invitation to spectators to actively think alongside them and join in the production of thought itself (Langston, 2010). Negt and Kluge’s dialogues are, Negt once explained, ‘not about reiterating philosophical treatises and certainly not about mulling over texts by members of the Frankfurt School’. ‘Our thinking’, he added, ‘rebels against that, against limitations arising from disciplines, academic training, unconsidered traditions, or imitation’ (Stollmann and Schulte, 2014: 72). So while Negt and Kluge have indeed resorted to thinkers like Kant and Marx in order to move beyond both Adorno’s underestimation of fantasy and his patently bourgeois notion of individual emancipation (Negt, 1991: 92), it is also indisputable that they have ‘radicalize[d] Adorno’s [...] insights into the non-identity presupposed by capitalist identity’ by shining light on the historical emergence of labor power’s obstinacy (Martin, 2015: 27). And while Negt and Kluge are both quick to admit their gratitude to Habermas’s thought – their recurrent attention to the concept of interests culled from his *Knowledge and Human Interests* is just one example of such indebtedness – they purposefully refrain from following him down his path toward communicative action; in matters dear to Negt and Kluge, like labor power, the psychic constitution of subjects

and the actuality of utopian thinking in the new millennium, Habermas has been a negligible influence (Langston, 2010: 273–5; Langston, 2015: 66–7). Negt and Kluge were never ‘orthodox devotees’ of any one Frankfurt School figurehead or line of inquiry (Stollmann and Schulte, 2014: 72). ‘I actually made a point of not writing about the Frankfurt School’, Negt once confessed (Negt, 1991: 80). Instead, he and Kluge have sought to apply the Frankfurt School’s original mode of thinking – Negt invokes the image of ‘*bohrendes Denken* [thought that bores holes] – to topics untouched by their mentors and peers (Stollmann and Schulte, 2014: 72). Critical thought for Negt and Kluge entails ‘assimilating the “humane implications” [of the Frankfurt School] and putting them to the test on historically different objects’ (Negt, 1991: 82). Underlying all their intertwined topics – counterpublic spheres, human obstinacy, the political potential of everyday feelings – lies the conviction that in spite of the history of misery engendered by capital, human subjects are still capable of producing their own happiness.

## Notes

Unless otherwise noted, all translations into the English are those of the author.

- 1 A concept that first gains momentum in their political economy of labor, the faculty of differentiation [*Unterscheidungsvermögen*] advances, especially in Kluge’s own essay on the privatization of mass media from the 1980s, as an answer to what Habermas called in an essay from 1985 the postmodern predicament of ‘obscurity’ (cf. Kluge, 1985: 88). The loss of this faculty in the German history of social experience is expounded best in the English-language translation in the twelfth commentary to chapter 5 (Kluge and Negt, 2014: 268–96). See also Negt’s enumeration of the five most pressing flash points (globalization, labor crises, education, the ethical dimension of technological progress, depoliticization) facing Europe in the twenty-first century (Negt, 2010: 161–77).
- 2 In the preface to his storybook *The Devil’s Blind Spot* (2004), Kluge encapsulates the sense of

- despair that quickly clouded over the initial euphoria associated with German reunification: 'After 1991, following the disintegration of the Russian imperium, as we looked forward to the year 2000, I had the feeling that the new century would take the bitter experience of the 20th century and turn it around into something hopeful. But are we now seeing instead a relapse into the era of the Thirty Years' War?' (vii).
- 3 For the most thorough English-language biography of Kluge published to date, see Lutze, 1998: 33–61. Select biographical details about Negt in English can be gleaned from Stollmann and Schulte, 2014.
  - 4 For an overview of the historical context, development and inner workings of Kluge's television programs, see Uecker, 2000. See also the essays in Schulte and Siebers, 2002 and Lämmle, 2013. On Kluge's post-televisual foray into the digital, see Ekardt, 2011. Kluge's online portal for streaming video can be found at [www.dctp.tv](http://www.dctp.tv).
  - 5 See Philipp's engrossing interview with Negt and Kluge (Philipp, 2007) for further details on their remarkable working method.
  - 6 The technological grounds for this radicalization, says Kluge, not only put the remaining representatives of the classical public sphere on the defensive but also foreclose 'individually produced modes of experience'. See Kluge's account of the internet's 'bewildering expansion of public spheres' in Kluge, 2015: 121–3.
  - 7 Morris's recent critical account of the Occupy Wall Street movement throughout the United States and its reliance on cellphone technology is a notable exception to this tendency to disregard Negt and Kluge (Morris, 2013).
  - 8 Pared down to roughly a third of its original size, the 2014 English-language translation retains the theoretical essentials while either updating or jettisoning material on German history deemed irrelevant for non-German readers. The ensuing discussion pays particular attention to the translation but nevertheless includes salient references to the original from 1981. Both the 1993 and 2001 editions of *Geschichte und Eigensinn* include revisions, some slight and others substantial.
  - 9 On the relationship between form and content in *History and Obstinacy*, Negt concurred that the book's fragmentary collage is, on the one hand, 'a critique of systematic thinking'. On the other, their reverence for systematic thinking as exemplified by Kant, Hegel and Marx leaves its traces throughout the book (Stollmann and Schulte, 2014: 84). For an account of the photograph's role within the network of illustrations in *History and Obstinacy*, see also Harris, 2014.
  - 10 In one of many scattered methodological commentaries transplanted from an original chapter on the subjective–objective elements of Germany's public sphere of production, mostly excised for the English-language translation, Negt and Kluge underscore the importance of subjective–objective relations as theorized by Hegel and Marx and insist that such relations in societies must be grasped not in terms of any given appearance but rather how subjects and objects 'always depend upon a constellation' (Kluge and Negt, 2014: 243). See also Langston, 2015: 51.
  - 11 The tenth commentary from the 1981 German edition of *History and Obstinacy* entitled 'The Political as Intensity of Everyday Feeling' was originally the title of Kluge's 1979 acceptance speech on receiving the Fontane Prize for Literature; it counts as a cornerstone of Kluge poetics. See Negt and Kluge, 1981: 1175–84 and Kluge, 1986. An entirely different text, the tenth commentary (as well as the sixteenth) is republished verbatim as chapter three in *Maßverhältnisse des Politischen*.
  - 12 Only occasionally cited in German-language scholarship, and in cursory fashion, *Maßverhältnisse des Politischen* boasts no substantial reception compared to its two predecessors. Ganahl suggests that this may be due to incongruities between Negt and Kluge's humanism, rooted in nineteenth-century philosophy and tethered to a 'structural Eurocentrism', and a growing number of contemporary theorists like Edward Said, Homi Bhabha, Gayatri Chakravorty Spivak and others interested in a subaltern politics 'trans-continental, trans-ethnic, and trans-cultural' in outlook (Ganahl, 1992: 176).
  - 13 A selection of 30 of Negt and Kluge's interviews are available to the general public through the Cornell University online portal 'Alexander Kluge: Cultural History in Dialogue': <https://kluge.library.cornell.edu/conversations/negt>. [Accessed 1 May 2018].

# Hans-Jürgen Krahls: Social Constitution and Class Struggle

Jordi Maiso

Hans-Jürgen Krahls (1943–70) has fallen into oblivion. If he is ever mentioned, it is usually as the rebellious student of Theodor W. Adorno who turned against his teacher during the student demonstrations of the late 1960s, and in so doing, revealed a supposed rupture between critical theory and emancipatory praxis. The tipping point of the conflict was the occupation of the Institut für Sozialforschung in January 1969, led by Krahls, which eventually caused Adorno to call the police.<sup>1</sup> It is said that Adorno asked for a can of spray paint during the occupation, as he also wanted to write graffiti that read: ‘This Krahls is inhabited by wolves’. This story fits the clichés that have become established since then about the ‘protest movement’ labelled as ‘1968’, as well as those related to Adorno’s alleged contradictions. However, strictly speaking, these commonplaces do not provide an accurate understanding of what was at stake in the frictions and affinities between some politicised students and the various generations of

lecturers in Frankfurt, who were, above all, their mentors.<sup>2</sup> These platitudes are even less helpful in understanding the figure of Krahls himself, who was undoubtedly the most prominent head of the student movement in Germany. His premature death in a car accident on the night of 13–14 February, 1970, at the age of 27, abruptly curtailed an intellectual career that had barely begun. ‘He is irreplaceable, and I am convinced that he would have been a remarkable person’, Max Horkheimer wrote to his parents after hearing the news of his death (Horkheimer, 1970). ‘He was the cleverest of us all’, Rudi Dutschke said at some point (quoted by Reinicke, 2013: 282).

Krahls was, along with Dutschke, the main figure of the anti-authoritarian movement in the Federal Republic of Germany. Both of them were decisive at the height of the protests between 1967 and 1969. But Krahls essentially stood out as the movement’s theoretician, constantly standing guard for theory against the anti-intellectualism and hostility

within his own ranks, while Dutschke emphasised political agitation (Claussen, 1985: 427; Reinicke, 2010). The brief life of the movement was marked by the tragic fate of both figures. Dutschke was shot on the Berlin Kurfürstendamm in April 1968, and he would die 11 years later as a consequence of his injuries. Krahls sudden demise in February 1970 was a real blow. The protest movement was undergoing a seemingly unstoppable breakdown process into small sectarian groups. In fact, the main student association during the protest movement, the SDS (*Sozialistischer Deutscher Studentenbund* [Socialist German Student Federation]), would informally dissolve immediately after Krahls burial and officially a few weeks later. But it could be said that his demise sealed not only the breakdown of the student movement in West Germany but also the phase in which Frankfurt was the epicentre of critical social theory. Adorno had died of a sudden heart attack barely six months before, and his theoretical positions were not pursued further at the University of Frankfurt; Horkheimer had been retired in Montagnola for some time. Among the youngest, only Schmidt would stay in Frankfurt. Oskar Negt would soon move to Hanover in order to establish a new focus of critical social theory there; Jürgen Habermas, for his part, would leave for Starnberg to develop his theory of communicative action at the Max Planck Institute. His return to the University of Frankfurt in 1983 was the beginning of a different phase.

But who was Hans-Jürgen Krahls? Although he did not receive as much media attention as Dutschke, his intellectual and political potential was extraordinary. If Günter Grass came to refer to the student revolt as the 'well-read revolution' (Wesel, 2002: 39), given that its main members had a solid theoretical background, this was especially true for Krahls. There is no shortage of evidence of his extensive scholarship, which was not limited to the Marxian tradition, since he has also been shown to be familiar with the philosophical work of Kant, Hegel, Nietzsche,

Plato and Aristotle, with literary Classicism and German Romanticism (Hölderlin, Jean Paul) and with authors such as G. Büchner, S. George and G. Benn.<sup>3</sup> Adorno described him as one of his most brilliant students, and he was perhaps the only one capable of holding his own not only with Habermas, Negt and Schmidt but also with Ralf Dahrendorf and Alexander Mitscherlich. However, Krahls barely published during his lifetime. The period of heightened politicisation and protests between 1967 and 1969 left no time for a conventional academic career. His doctoral thesis on the 'natural laws of capitalist development', supervised by Adorno, had been put on hold with the emergence of the protest movement. What has come to us from his work is irrevocably fragmented and bears witness to the fact that his thought was abruptly interrupted: he left mainly unfinished papers, texts and transcriptions of seminar presentations, teach-ins and other speeches, as well as some notes and reflections.

His main book, *Konstitution und Klassenkampf. Zur historischen Dialektik von bürgerlichen Emanzipation und proletarischer Revolution* [Social Constitution and Class Struggle. On the Historical Dialectic of Bourgeois Emancipation and Proletarian Revolution] (Krahls, 1971), edited by some of his comrades a year after his death, consists of 400 tightly written pages containing writings and presentations from 1966 to February 1970. As Detlev Claussen has pointed out (Maiso, 2009: 121), this volume brought together texts that were produced at a time when theoretical work was conceived as being part of a process of political intervention – a conception which arose in the midst of the student movement – and it cannot be evaluated according to the conventional criteria for a theoretical work. It was down to Krahls friends and comrades that his mainly spoken or scrawled words would take the form of a printed book.<sup>4</sup> This should be borne in mind when reading these writings, as most of them were not intended to be fixed and exposed, or to be made available to readers

who today can barely guess what was at stake in each utterance. Hence, the book has remained largely an 'historical document' of a theoretical-political path that was inextricably linked to the anti-authoritarian movement and would disappear with it.

However, these writings may also offer something more. For they reveal Krahls search for a theoretical and political position capable of living up to the demands of his time; he was aware that the tradition that had emerged from the labour movement was no longer useful, and that the priority of critical theory was to articulate the potential for social transformation available within advanced capitalism. Undoubtedly, Krahls language and interests were marked by the anti-authoritarian movement from which they emerged, but his search remained and remains central to any living critical theory. The aim was to grasp social reality from the point of view of its transformation (Krahl, 1971: 248). Theory was to be once again a 'material force' in history. Krahls therefore embodied an understanding of critical theory that was completely alien to the academic drifts that have prevailed since his death, starting mainly in the 1970s. What constituted this understanding was mainly its partisanship, its rejection of 'pure' knowledge, as well as an eminently political drive. 'Krahls death in 1970 symbolised the death of this political orientation in West Germany, something that could only be suspected at the time: the 1970s were marked by spontaneous, vertically structured parties and the RAF' (Claussen, 1985: 426). The historical understanding of the anti-authoritarian phase of the protest movement has been overshadowed by what followed: the dissolution of the movement into small sectarian groups of Maoist or Marxist-Leninist bent and into factions that opted for armed struggle. In German public discussion, the protest movement, sometimes including Krahls himself (Kalitz, 2007: 127 ff.), has been reduced to a mere 'antecedent' of the armed actions of the Red Army Faction or the 2 June Movement in the 1970s.

Together with Krahls untimely death and his scattered and fragmented oeuvre, this is perhaps the greatest difficulty in understanding the relevance of his contributions and his political and intellectual physiognomy.

## THE FORGING OF 'ROBESPIERRE FROM BOCKENHEIM'

Krahls himself provided significant testimonies about his political and intellectual path. The main document in this regard is his famous 'Angaben zur Person' [Personal information], an improvised speech delivered at the trial of the demonstrators against the granting of the Peace Prize of the German Book Trade to the Senegalese president, Léopold Senghor. In this speech Krahls showed off his abilities as an orator, and recounted how his 'odyssey through the forms of organisation of the ruling class' (Krahl, 1971: 20) had led him to the anti-authoritarian movement. When Krahls gave this speech, in October, 1969, he was barely 26 years old, and was already a public personality. This pale and fragile young man with a glass eye (he lost his right eye in a bombing when he was barely one year old) exhibited here a rhetorical style that was self-assured, precise and scathing. Barely two years earlier, in June 1967, the complicated Adornian-Hegelian jargon used in the speech he delivered in a protest over the murder of the student Benno Ohnesorg in Berlin emptied the campus (Claussen, 1985: 427). He had now become a brilliant orator and a figurehead for the movement, and had managed to gain the respect even of those who did not share his political positions (Schütte, 1970: 711). Given his talent as an agitator, the media would refer to him as the 'Robespierre from Bockenheim', alluding to the Frankfurt district where the university was based. For Krahls was not only the major figurehead of the movement: like Dutschke, he was right at the forefront, both in the teach-ins and

assemblies and in the confrontations with the police.

A sort of personal legend began to emerge around Krahls, which he himself would help to create.<sup>5</sup> Although he did not care much about his appearance and did not at first stand out among the stylised and subversive looks that prevailed in the movement, Krahls embodied an existential radicalism. The attempt to give birth to new forms of individuality after the historical decline of the bourgeois subject became a way of life for him. He had no fixed address and often no money either. He slept in friends' houses, shared flats or student lodgings, always accompanied by his bag filled with books and notes. He had no library, but he had read a lot and had a prodigious memory. He did not hide his homosexuality, and his stamina with alcohol was legendary (he drank quadruple shots of *Korn*). Despite coming from a humble family from Lower Saxony, which had allowed him to have a good education, he often alluded to a presumed aristocratic origin, and even mentioned the dynasty of the von Hardenbergs, which would make him nothing less than a descendant of Novalis (zur Lippe, 1989: 122; Rabehl, 1997: 42). These attempts to devise a character, however, were probably above all a kind of armour, an attempt to protect himself. He was an intelligent and sensitive young man who had quickly become a public figure and who, despite his many admirers and adepts, was rather lonely (Wesel, 2002: 130).

But Krahls knew that his personal path was also symptomatic, as it gave a voice to the politicising process of a young generation in post-Nazi Germany. In his 'Angaben zur Person', he shed light on the hidden side of the Adenauer restoration and the economic miracle in West Germany, which led this generation to grow in an atmosphere of tacit continuity with the national-socialist past:

In Lower Saxony, at least in the places where I come from, what can be called the ideology of the soil still dominates to a large extent, so in my political education process I could only move within a spectrum that ranged from the German Party to

the Guelph Party. I could not even access the ideologies of liberalism and parliamentarism. It must be borne in mind that in the villages where I grew up, meetings still retained that non-public sphere reminiscent of the rituals of witchcraft trials in the Middle Ages. (Krahls, 1971: 19)

His journey would lead him to pass through mystical and ultranationalist groups such as the Luddendorffbund, close to the ideology of blood and soil, until in 1961, when he was only 18 years old, he founded the youth section of the Christian Democrat Union (CDU) in his native town. It was through the church that he heard, for the first time, news of the resistance against Nazism. But even in his earliest years at university, in Göttingen, he frequented elitist student associations that practised fencing. Intellectually, he would first come into contact with Heidegger's philosophy ('a philosophy that was given to imperialist adventures': Krahls, 1971: 21), then with logical positivism, before finally discovering Marxist dialectics. What Krahls described here was an education process understood as a process of individual emancipation, a gradual break with the oppressive and authoritarian environment that prevailed in the German society where he grew up.

It is not surprising, therefore, that a young man on such a path might be attracted to the figure of Adorno, as he raised a solitary, non-conformist voice in the 'castrated' political environment of German restoration (Adorno, 2003: 18). Books such as *The Jargon of Authenticity* had been crucial in warning of the dangers of a new German ideology in which the echoes of the *Volksgemeinschaft* still reverberated (Krahls, 1971: 22). It was precisely Adorno's critical theory that led Krahls to move to the University of Frankfurt, a decision that he himself described as 'eminently political'. It would not take him long to become Adorno's doctoral student and to gather around him a group of politicised students with a strong interest in theoretical work. For this young generation of students, the need to understand the reality they

lived in was linked to the search for social transformations, and certainly what could be learned in the environment of the Institute of Social Research responded to these longings. Adorno and Horkheimer also represented a living connection with the critical tradition of the 1920s and 1930s, which had been buried by National Socialism and exile. But Frankfurt was not only the city for critical theory: it was also the seat of the federal leadership of the SDS, the association of socialist students that was to become the centre of the anti-authoritarian movement. The city of Frankfurt am Main was to be their main focus in West Germany, behind only West Berlin. Students who were considered to be disciples of Adorno and Horkheimer set the tone there, and Krahel was undoubtedly one of the most prominent among them if not the most prominent of them all.

Krahel had joined the association in 1965: 'In the SDS, I learned for the first time what solidarity meant, namely: building ways of relating to each other that allowed a detachment from the oppression and subjugation of the ruling class' (Krahel, 1971: 22). In this student association Krahel would find the culmination of the process of individual emancipation that he would narrate in his 'Angaben zur Person'. The collaborative work in discussion and reading groups, as well as the political activities at the university and outside it, enabled many young people to overcome their feelings of isolation and understand the political dimension of their individual life stories. It was a generation that grew up in the tacit concealment of the National Socialist past, was marked by the suffocating atmosphere of the Cold War and which in the 1960s would become aware of the terrible burden of unbroken German continuities and awake to world politics through national and decolonial struggles (Cuba, Algeria) as well as the horror of the Vietnam War. These experiences would lead Krahel's generation to confront the Cold War climate and institutions, which seemed outdated in their eyes.

The history of the SDS was to some extent an illustration of such conflicts. Until 1961 it had been the student organisation of the Social Democrat Party (SPD). But its support for campaigns against atomic weapons and insistence on recognising the existence of the GDR resulted in the SPD cutting off the SDS's funding and expelling its members. However, against all expectations, the SDS did not disappear. The political conjuncture of the 1960s allowed it to survive, and by the middle of the decade it had members who were not aligned with social democracy or communism and who considered 'actually existing socialism' to be an undesirable alternative. This was the origin of the new left and the anti-authoritarian movement, which, from June 1967, would become hugely significant in the Federal Republic. Its figureheads would be Dutschke and Krahel, who – from essentially minority positions – would manage to steer the course of the association away from the currents of orthodox Marxism closely related to the Communist Party.

The 'anti-authoritarian' label did not only refer to the movement's refusal to submit to the state, teachers or public opinion. It also involved a critique of traditional politics and authoritarian socialism, of the traditional system of education and of German continuity, and it was a symptom of an uneasiness about the traditional family and forms of intimacy (Claussen, 1988: 52). It was driven by subverting social norms and oppressive institutions which no longer seemed legitimate. In this way, the movement pointed to a new way of life, the kernel of which was to be anticipated in the very forms of political organisation: 'The *pathos* was to develop a concept of emancipation that would not appeal to pre-established norms in order to guide action' (Demirovic, 1989: 73). But the designation of the movement as 'anti-authoritarian' was also a nod to the influence of critical theorists who had carried out studies on 'authority and the family' and the 'authoritarian personality'. Some of their writings from

the 1930s and 1940s – chiefly *Dialectic of Enlightenment, Dawn and Decline* and ‘The Authoritarian State’ – circulated among students as pirated copies. They had discovered an implacable critique of both National Socialism and Soviet Communism that was directly linked to the political drives of the movement (Claussen, 2000: 155 ff.).

Krahl’s theoretical understanding was undoubtedly based on Adorno’s critical theory, although his texts also show the strong influence of Marcuse and the young Horkheimer. For Krahl, these theorists had provided critical categories that enabled an understanding of the logics of domination in advanced capitalism, which could no longer be interpreted from within the framework of pauperisation and material misery provided by traditional Marxism (Krahl, 1971: 292). Critical theory emphasised the indissoluble link between advanced capitalism’s forms of socialisation and the configuration of living subjects, who internalised the relations of domination at the expense of seeing their potential stunted and having their social relations reified in impoverished life. Individuals were reduced to being mere character-masks, incapable of acting autonomously or articulating the critical instances of the self, which the bourgeois family nurtured within its bosom. The capitalist system could develop a high degree of sophistication in its means to satisfy needs, but it reduced social life to the mere struggle for physical subsistence and ultimately brutalised human relations (Krahl, 1971: 25). What critical theory had recorded was precisely the historical significance of the collapse of bourgeois individuality, which was also to mark the rise of the protest movement:

In fact, its anti-authoritarian origin was a mourning for the death of the bourgeois individual, for the definitive loss of the ideology of the bourgeois public sphere and the domination-free communication, which arose from the solidarity which the bourgeois class had promised to humanity in its heroic period, for instance, in the French Revolution, and which it never successfully fulfilled, and which now has finally collapsed. (Krahl, 1971: 25)

Krahl shared with Horkheimer and Adorno the awareness that the end of bourgeois society had not only involved an emptying of democracy but also the end of a revolutionary horizon. His divergence from his mentors was that they had offered a clear diagnosis of the breakdown of the bourgeois subject but to a certain extent had been remained imprisoned in its ruins (Krahl, 1971: 291). Leaving these ruins behind required the articulation not only of forms of theoretical reflection but also of emancipatory praxis. The diagnosis of the defeat of the labour movement at the hands of Nazism and its integration into post-war capitalism seemed certain. However, the question then posed was ‘how is a transformation of social relations possible, ultimately under more difficult circumstances’ (Krahl, 1971: 242). When nothing in the logic of capitalism seemed to point beyond systemic immanence, Krahl asked how was it possible to move towards the realm of freedom. His position has been interpreted as a sort of immanent critique of the Frankfurt tradition (Spaulding and Boyle, 2014; Reinicke, 1973). But, strictly speaking, this transformative drive of critical theory was in perfect harmony with the tone that Horkheimer had set when he proposed the collective project. In his prologue to the long-awaited reprint of his writings from the 1930s, published in 1968, Horkheimer had written: ‘To extract from critical theory consequences for political action is something that those who take it seriously yearn for’ (Horkheimer, 1968: 14). The theoretical differences with his mentors would come from Krahl’s voluntarist approach, which emphasised the roles of spontaneity, consciousness and will in social transformation.<sup>6</sup> The conflict, however, resulted from the strategies to unify the movement in its decline, which would turn the ‘critical authorities’ into symbols to be capitalised on in the political struggle, as was also understood by Adorno (Adorno, 2000: 95). But to understand Krahl’s relationship to ‘classical’ critical theory requires

an analysis of the focus he attempted to give to the anti-authoritarian movement and how he sought to articulate in it the relationships between critical theory and transformative praxis.

## POLITICISING CONSCIOUSNESS IN ADVANCED CAPITALISM

The great coalition which united the CDU and the SPD at the end of 1966 under Chancellor Kiesinger and left the German government virtually unopposed in parliament gave rise to the growing student mobilisation for an 'extra-parliamentary opposition'. But the movement would not gain major impetus until June 1967. During a large demonstration against the visit of the Shah of Persia to West Berlin, the police brutally repressed the demonstration and allowed the Shah's guard to beat the students. A policeman shot an unarmed and peaceful student in the back and killed him. The Berlin government and the mainstream media closed ranks and defended the police action. The police officer who carried out the shooting would even be acquitted a few months later. This provoked general outrage and reinforced support for the extra-parliamentary opposition among intellectuals, students and the liberal press. Many students joined the SDS in the following weeks, to the extent that its organisational infrastructure could barely cope with the influx of new members. This new situation of political effervescence would be the framework within which Dutschke and Krahls, from the autumn of 1967, would turn the SDS into the centre of the anti-authoritarian revolt.

However, Krahls was aware that post-war capitalism posed a historically new situation for an opposition movement. The population was fully integrated into the system of labour and consumption, and after Nazism and the war, there was no politicised labour movement. Within capitalist societies, the economic struggle to gain access to livelihood

assets (wage claims and labour rights) had ended up being separated from the political struggle. This involved renouncing any transformation of social relationships in which survival is at stake:

The purely economic struggle integrates the masses into the relationships of economic domination and condemns them to apathy in the face of extra-economic violence. The suppression of categories of political perception, ignorance in the face of brutalisation in all spheres of social life, is something that this reformism has helped to produce. (Krahls, 1971: 161)

In this context, the organisational forms of traditional politics were no longer useful. However, the population continued to have expectations of peace, freedom and a full life that were incompatible with their integration into the system (Krahls, 1971: 248). This showed a potential for social politicisation the movement could try to connect with, which would become its aim. But this also required an understanding of the existing balances of power and their evolutionary tendencies.

The first step to elaborate the movement's positions was the celebrated *Organisationsreferat* [Paper on the organisation], which Dutschke and Krahls jointly authored for the SDS federal assembly in September 1967. The starting assumption was that the period of the economic miracle (with its high growth rates and a level of employment close to full employment) was over. The historical moment was interpreted as entering an economic crisis. In this context the alternative between emancipation and barbarism took an unprecedented shape. Krahls had already noted that the 'natural laws' of capitalist development did not lead by themselves to socialism but rather to 'relations of domination which may be adequate for the development of production forces, but of pure barbarism: an industrial fascism' (Krahls, 1971: 88). This seemed to be confirmed now under the form of a 'system of integral statism' (Dutschke and Krahls, 1980: 288). Under this system, capitalist

relations could be stabilised but only thanks to state intervention that reduced the role of the sphere of circulation and exchange and imposed a command economy. The influence of Horkheimer's 'authoritarian state' on this diagnosis was very clear: Horkheimer pointed to the establishment of an increasingly tight and centralised control of production, which would eliminate free competition and the model of the liberal market economy. What maintained the social order and made the accumulation of capital possible was an increase in state coercion, unfiltered by market mechanisms (Dutschke and Krah, 1980: 288 ff.). The authoritarian state, rather than being a mere state form, referred to a phase of advanced capitalism that was a 'historically new constitution of the system of social totality' (Krah, 1971: 222).

The appeal to Horkheimer's text to signal the risk of an authoritarian takeover was not gratuitous: the great coalition between the CDU and the SPD had left the Federal Republic unopposed in parliament, and in May 1968 the government was to issue Emergency Acts that would restrict democratic rights significantly. As the 1929 crisis had favoured the brutal fascist power structure, the thesis here was that this coercion had not disappeared from the economic-miracle society, but that it had been internalised by individuals. The direct violence of the fascist phase had been replaced by the guarantees of the social state and by new forms of manipulation, in the style of the cultural industry, which attached the consciousness of wage-earners to the conditions of capitalist life (Krah, 1971: 351 ff.). The influence of the Springer publishing group was symptomatic of this. Domination no longer operated as external coercion but as the production of a conformism that delegated all satisfaction of needs to the social apparatus. This is why Krah warned of an authoritarian element in the 'welfare state', since its guarantees of material security repressed the social articulation of needs that went beyond

survival within the given social framework. Improvements in living conditions were introduced at the cost of plunging the population into a system of apathy (Krah, 1971: 239). In a society where the vast majority of the population could acquire television sets and refrigerators, and where many had access to 'cultural goods', 'exploitation means the complete, radical annihilation of the development of needs in the dimension of human consciousness. [Exploitation] means that human needs, despite their capacity for material satisfaction, are attached to the most elementary forms for fear that the State and capital might take away the minimum guarantees' (Krah, 1971: 30). This also involved a transformation of the temporal horizon of existence, which undermined the continuity of life histories and evidenced a new level of impotence against concentrated social power: 'Today, instead of long-term hopes, desires, expectations and fears, we have sudden reactions, expectations of immediate gratification and sanctions, and very short-term forms of instinctive satisfaction' (Krah, 1971: 322). This transformation of the forms of social consciousness should not be considered at the level of mere cultural critique – of 'superstructure', so to speak – but should be interpreted as a constitutive element of the social system of advanced capitalism.

Clear consequences were identified: 'If the structure of integral statism, with all its institutional mediations, constitutes a huge manipulative system, this leads to the suffering of the masses acquiring a new quality' (Dutschke and Krah, 1980: 289 ff.). The population was still thrown into the struggle for material subsistence in a society whose technical capacities allowed much greater degrees of freedom. The internalisation of the forms of domination made it very difficult to self-organise interests, needs and desires, since the population perceived reality from within the schemes of the dominant society. The prevailing logic of social rationality promoted a passive life, one withdrawn

into the private sphere; and the importance of SDS laid precisely there. Its function was, above all, the politicisation of intelligence. The students' position gave them the opportunity to transcend the conformist horizon of the 'golden age of capitalism', because their task as intellectuals was the understanding of the ins and outs of society. Undoubtedly, this opportunity was based on a privileged social position. But the goal was not to abolish privileges but to try to expand them beyond the universities, giving rise to processes of political awareness that would allow new ways of intervention and collective learning in which waged labourers and students could participate together. It was emphatically about enabling new forms of political experience.

The first objective was to make visible the latent, abstract violence that pierced the forms of socialisation of advanced capitalism and shaped the very psyche of individuals, threatening to seize even their internal nature. The new forms of political action and agitation, which were conceived as a process of social awareness carried out by 'active minorities amid passive, suffering masses' (Dutschke and Krahll, 1980: 290), should be aimed at achieving this purpose. In other words, a 'guerrilla mentality' capable of revealing 'the system of repressive institutions' was demanded.<sup>7</sup> The methods for this were taken from the student struggle in Berkeley that had started in 1964; as was the case there, the university was seen as the 'social base' of the movement. The protest consisted of various forms of 'civil disobedience', from sit-ins to teach-ins, which forced the consensus of the liberal public sphere and often its rules of play. Provocation was not an end in itself but a strategy to initiate reflection processes that broke the pre-reflexive connivance with the social system. Dutschke and Krahll wanted to direct the new organisational strategy of the SDS – which for them could not be content with being a traditional political organisation but should demand a transformation of

daily life and the forms of political struggle – towards this end: 'the problem of organisation is raised today as the problem of revolutionary existence' (Dutschke and Krahll, 1980: 290).

The ultimate aim of Dutschke and Krahll was to test how a politicised *intelligentsia* could become a material force in history – how it could reach a broad stratum of the population and transform their way of understanding reality. Undoubtedly, the movement failed in his most emphatic ambitions. It was overwhelmed by its own evolution, and was too weak and precarious to deal with an increasingly branched and complex social and political situation (Claussen, 1988: 51 ff.). Its verbal radicalism also had an impact on this, as it contributed to generating its own conformism; Krahll was also a lucid and implacable critic of the movement in this sense (Krahll, 1971: 309–16). However, the student association became the epicentre of an extra-parliamentary opposition that would transform German society: 'A social democracy lives only thanks to the enlightened activity of the politically mature masses' (Krahll, 1971: 156). In this sense, with no means other than leaflet distribution, demonstrations and constant processes of collective discussion, the movement managed to raise awareness of the importance of an active defence of its own interests. The intention was to go beyond the sphere of leftist ghettos in the conditions of advanced capitalism, and they succeeded in politicising a broad section of society without falling into the mechanisms and patterns prescribed by institutionalised politics (Claussen, 1988: 24). But Krahll's theoretical and political drive was not limited to the defence of a radical democracy. His main interest was to analyse the objective conditions for an emancipatory social transformation within advanced capitalism. His writings are permeated by the need to go beyond the spectacular logic of protest with a view to articulating forms of organisation that would enable a transition towards the realm of freedom.

## CRITICAL THEORY AND EMANCIPATORY PRAXIS

The core element that runs through Krahls reflections is the analysis of the conditions for the constitution of a political subject commensurate with the capitalism of his time (Reinicke, 1973: 6). The purpose is to test the ground in order to move from 'prehistory' to history. In this sense, the title 'Social Constitution and Class Struggle' points to the very core of his theoretical proposals. But his notion of 'class' should not be understood in the traditional sense. It is not a reference to the industrial proletariat or to a social group with a certain level of income. What Krahls means by 'proletariat' cannot be considered as a 'given' in the existing social order, but has a strong utopian dimension: it is something that is constituted from within the enlightened activity of the dispossessed and salaried, emancipating themselves from the forms of coercive organisation in the classic institutions of the labour movement (Claussen, 1985: 429). The question therefore was: how could this new subjectivity be constituted in Western European societies in the late 1960s? Krahls noted that there was no revolutionary theory that was commensurate with the conditions of advanced capitalism (Krahls, 1971: 256). He would direct much of his theoretical effort to this, starting with an analysis of the social constitution of the capitalism of his time.

A first step in this direction came from his interest in Marxian approaches. The work for his doctoral thesis, entitled 'On the Natural Laws of Capitalist Development in Marx's Theory', aspired to a current understanding of the dynamics of capitalism based on a new re-appropriation of the critique of political economy. His famous text 'On the Logic of the Essence of the Marxian Analysis of the Commodity' (Krahls, 1971: 31–83), based on a presentation at an Adorno seminar in 1966–7, was fundamental. In it he sought to track down the role of abstraction in Marx's

critique of political economy in relation to Hegel's *Wesenslogik*. It is an analysis focused on the social forms of capitalism, essentially concerning value, abstract labour, commodities and money.<sup>8</sup> These abstract economic categories were understood as the 'forms of being' and 'determinations of existence' of bourgeois society (Krahls, 1971: 32). They also revealed the objective forms of social domination. Without doubt, the central category is value, which constitutes 'the automatic and pseudo-natural [*naturwüchsig*] engine of capitalist development' (Krahls, 1971: 84). Value is therefore revealed to be the true subject of the social process. Its abstraction becomes a tangible force, since the material and concrete being of commodities increasingly conforms to the pure form of value. In this way, it appropriates the materiality of the world and converts use values and human needs into a mere allegory: 'it lets them die' (Krahls, 1971: 58). Faced with the totalitarian and destructive predominance of the abstraction of value, the emancipatory interest consisted in re-appropriating human capacities to give rise to history as a conscious process. But Krahls stressed: 'Understanding the fatal necessity of the law of value... is not yet freedom in act, but it provides a theoretical basis for its conditions of possibility' (Krahls, 1971: 56).

But the conditions for this possibility to materialise also need to be understood. The 'natural laws' of capitalist development, laid out in the critique of political economy, necessarily lead to recurring crises, but not to emancipation. Emancipation cannot be the result of a predetermined historical process, resulting from objective mechanisms or needs. Rather, it requires a conscious political intervention, capable of breaking with this 'natural necessity', because only in this way can it open access to the 'realm of freedom'. In this sense, in his later texts Krahls focuses on Marx's insufficient links between the objective forms of capitalist domination and a theory of emancipation (Krahls, 1971: 392–415). For emancipation, in order to put an

end to 'prehistory', must come from the conscious will of organised human beings, not from processes imposed on agents from outside. This was also applicable to the Marxian notion of 'class consciousness', which could not be understood as being purely objective (Krahl, 1971: 398 ff.). Ultimately, it was a question of purging the Marxian tradition of its mechanistic elements, of all objective determination that might constrain the spontaneity of a transformational political subjectivity. But merely affirming this subjectivity was not enough: its historical and social conditions of possibility also needed to be investigated.

Grasping capitalism from the perspective of its transformability [*Veränderlichkeit*] required going beyond the very immanence of the system to probe the conditions of possibility of a transformative subjectivity. Hence his defence of the concept of a 'concrete utopia' (Krahl, 1971: 350). His proposals are tentative, sketches left in a fragmentary state due to his early death. One of their key aspects is in the category of production, which is clearly fundamental in capitalist socialisation. Production encompasses both labour and its social organisation. But a purely economic interpretation would overlook its political potential, for labour is not only a 'misfortune that valorises capital' but also – at least potentially – 'a productive force of emancipation that denies capital' (Krahl, 1971: 396). In this sense, Krahl's approach can be read as a rejection of the Habermasian separation of labour and interaction, which ontologises social metabolism with nature and confines it to the realm of necessity. Labour, as an 'objective activity' [*gegenständliche Tätigkeit*], cannot be reduced to mere 'instrumental action' (Krahl, 1971: 401 ff.). The development of human abilities, and even the capacity for enjoyment, is also part of the productive forces. In this sense Krahl developed a concept of production with a strong emancipatory potential. Production is understood by him as the 'beginning of history'

and therefore as the end of 'natural history': 'Production is what enables human beings to develop an active relationship with nature and means that they are able to emancipate themselves from it' (Krahl, 1971: 393). It is linked to the development and emancipation of human needs, even beyond self-preservation, is what enables 'an autonomous life activity' and, as such, 'is inextricably linked to political spontaneity' (Krahl, 1971: 344).

But how does this potential materialise in advanced capitalism? When labour becomes subsumed under capital, production is socialised. In capitalism, the productive process itself, the social metabolism with nature, is socialised – albeit not consciously. But this makes the contradiction between socialisation and private appropriation increasingly apparent. In this sense Krahl detected a key process by which, with the growth of productivity, scientific and technical knowledge becomes a production factor. Intellectual labour, increasingly necessary in a productive process based on automation and on the growth of fixed capital, is subsumed under the demands of capital. This transforms the very character of social antagonisms (Krahl, 1971: 340). On the one hand, intellectual and scientific labour loses its special character and is subject to the same criteria that govern productive labour, becoming subordinate to the demands of capital profitability. On the other hand, this makes possible an alliance between manual and intellectual labourers.<sup>9</sup> This alliance would be inscribed within the relations of production of advanced capitalism, and it opened up new possibilities for Krahl. First, it meant that the 'class' to be politically articulated could no longer be identified with the industrial proletariat. Without including scientific intelligence, it was no longer possible to construct a class consciousness commensurate with the conditions of advanced capitalism (Krahl, 1971: 341). In his opinion, this meant that the 'movement of scientific intelligence' could now be expected to become a 'collective theorist of proletarian praxis' (Krahl, 1971: 351).

These formulations, and especially the text 'Thesis on the General Relationship between Scientific Intelligence and Proletarian Class Consciousness' (Krahl, 1971, 336–53), have had a considerable influence on the approaches of Italian post-operatism (Berardi, 2016; Negri, 1976). But perhaps it would be excessive to consider Krahl as a pioneer of the post-worker condition. It has already been highlighted that some of these formulations, closely linked to the crumbling phase of the student movement, were somewhat problematic (Cavazzini, 2010; Reinicke, 1973: 54). To a large extent these theses are marked by Krahl's opposition to the 'proletarian turn' within the movement, which after some defeats and disappointments had led to the predominance of pseudo-working-class positions among students (Kocyba, 2010). Moreover, the later course of capitalism revealed that the emancipatory possibilities that Krahl had predicted were not realised: the incorporation of co-operation and human relationships into the productive process has not broken the realm of necessity, nor has the division between labour and thought really been overcome. However, this does not detract from his search for ways to disrupt the objective logic of socialisation and articulate new forms of political subjectivity. In this regard, the core aspect that runs through his proposals seems to be the question of organisation. His purpose was not so much to develop a strategy for taking political power as to constitute forms of life and struggle that anticipated a way towards emancipation within actual existing reality. Krahl's merit lies in having noticed the centrality of this issue for all emancipatory theory, pointing to the need to go beyond the positions of 'classic' critical theory in this regard (Krahl, 1971: 292, 300).

For Krahl, the constitution of a transforming subjectivity amounts fundamentally to a question of organisation. In his view the objectivist character of Marx's notions of class and class consciousness prevented him from adequately addressing this question (Krahl, 1971: 400). Leninism, for its

part, with its confidence in the vertical structure of the party, took for granted what had to be built: class and the organisation itself. Krahl believed that only through the praxis of struggle could a political subjectivity with transforming consciousness be articulated. His approach would therefore be linked to Walter Benjamin's observation that organisation is the medium in which the reification of social relations is reflected, but also the only medium in which this could be overcome (Benjamin, 1930: 221). This is where the centrality of self-determination comes to the forefront, as opposed to the imperatives of the constituted logic of socialisation. The aim was to anticipate the realm of freedom in the struggles carried out in the midst of a world marked by coercion. This was undoubtedly the point at which the dissolution of bourgeois individuality was bound up with the utopian dimension of the movement. But the new subjectivity, which required spontaneity and solidarity, could not be considered as a given in capitalist conditions, as atomisation, strategic relationships and a conformist attitude prevailed in them. Giving rise to new ways of living also required discipline. It was a 'concerted effort to overcome the de-individualised status of individuals' (Berndt, 1988: 182). In Krahl's words: 'For us in the SDS the question arises as to how to build a form of organisation which, under conditions of coercion and violence, could generate individuals who were both autonomous and able to submit to struggle demands under conditions of coercion. This problem is completely unresolved' (Krahl, 1971: 262).

Certainly, Krahl did not succeed in solving this problem, but he unequivocally noted its centrality. The question of organisation also had to do with attempts to go beyond the individual experience of impotence in advanced capitalism. It was a reality that had to be faced, because 'everyone tries to escape this experience of impotence and the pressure of the social relations because it is something painful' (Claussen, 1985: 429). This became apparent in the breakdown of the movement,

in its degeneration into sectarian and self-referential groups, whose radicalism was purely verbal and did not allow for the articulation of a significant social force. In his later writings, Krah1 repeatedly pointed to the need to reflect on the contradictions of a movement of young intellectuals increasingly turned to actionism, acting from within an 'action-based, sectarian and blindly selfish' consciousness (Krah1, 1971: 311). But an emancipatory movement required the establishment of long-term solidarities and an understanding of the coercive framework involved in social logic. If Adorno had confronted students with the critique of pseudo-activity, Krah1's later texts revealed that he was aware that the movement's emancipatory reason had become self-destructive. For Maoist or neo-Stalinist groups, indoctrination in their respective worldviews became a substitute for praxis and ultimately prevented them from understanding the capitalist reality they lived in:

The closed canon of systematic theorems and a disciplined organisation are symptomatic of a substitute for strategy and for the need of security and bonding that blocks the development of revolutionary praxis and emancipatory needs of freedom; of revolutionary needs in a political struggle that demands results and is fraught with risks. (Krah1, 1971: 318)

In his later writings, Krah1 repeatedly pointed out that the movement suffered from the lack of a political reality principle. This principle should take into account both power relations and the social forms of consciousness (Krah1, 1971: 284–90). Only on the basis of the reality principle could strategies and organisational imperatives be developed for survival in late capitalism. Undoubtedly, 'the anti-authoritarian revolt was dashed by this lack, not by external repression' (Claussen, 1985: 429). For Krah1, therefore, the priority was to connect with diffuse social needs in which an emancipatory impulse could be seeded. The integration of the working class into capitalism meant that the impulse for politicisation was no longer hunger and material misery.

This broke the certainties of the traditional revolutionary movements, but it opened up new possibilities: articulation of emancipatory interests that aimed beyond the mere sphere of survival, of the struggle for 'rough and material things' (Benjamin, 1997: 694); awareness of the mutilation of human opportunities at the centre of the socialising logic of advanced capitalism, as well as the administered reduction of opportunity and the mutilation of experience; evidence that the technical sophistication of society, its progress in the mastery of nature, had not been accompanied by a development of individual and social potential but rather by their brutal atrophy. Hence Krah1's insistence on formulating widespread emancipatory needs at the social level, even using precarious and insufficient categories. Otherwise, critical theory would succumb 'to the technification process of the sciences' (Krah1, 1971: 323).

The sudden death of Krah1 cut short the potential for a model of critical theory that had barely emerged. 'The life of Krah1, who physically and psychically walked a steep and deadly path, bears witness to the existential seriousness with which an emancipatory reality principle was developed as a collective possibility of living hope for the individual' (Claussen, 1985: 429). What followed was a process of breakdown into sectarian fractions, armed struggle and the repressive brutality of the German state. It would be naive to think that Krah1 could have stopped this historical drift, but he would certainly have been able to theoretically articulate the *movens* of defeat and seek new perspectives of emancipatory struggle in them. What remains of him are only a few writings, some transcripts of talks and annotations rescued from oblivion.<sup>10</sup> These are little more than fragments, and they contain the imprint of a life in turmoil, marked by the intensity of a movement that left little respite for theoretical work. Nevertheless, they make possible the recognition of an enormous theoretical and political potential that continues to offer stimuli that deserve to be pursued.

## Notes

- 1 For background on the occupation, cf. Negt, 1995: 177 ff. For an elaboration of the events by a participant who was close to Krah! see Claussen, 1985: 230.
- 2 First and foremost were Max Horkheimer and Theodor W. Adorno, intellectual authorities with whom they were constantly in contact. At a greater geographical distance but closer to the politicised students was Herbert Marcuse. An intermediate generation was composed of Jürgen Habermas, Oskar Negt and Alfred Schmidt (and to a lesser extent Karl-Heinz Haag), who were at that time young lecturers and assistants at the University of Frankfurt. An interesting testimony of Adorno's relationships with his students can be found in Claussen, 1988: 267–71.
- 3 In 1965, Heinz Ludwig Arnold commissioned him to co-ordinate an issue for the *text + kritik* journal about Jean Paul. The volume would be published in 1970 and would contain many of the authors and articles proposed by Krah! (Sassmanshausen, 2008: 432). Rolf Tiedemann, editor of the works of Benjamin and Adorno, told how, in 1968, during the controversies of the Congress of the German Sociological Society on 'Late Capitalism or Industrial Society?', in which Krah! took the lead, the young SDS leader introduced himself in one of the breaks and sat down with him to discuss Benjamin's concept of allegory (Tiedemann, 2011: 56).
- 4 This is also true of the rest of Krah!'s edited texts. The book published as *Erfahrung des Bewusstseins* [Experience of Conscience] (Krah!, 1979) is the transcript of a recording of Krah! in a 1968 workgroup on the introduction to Hegel's *Phenomenology of the Spirit*. *Vom Ende der abstrakten Arbeit* [On the End of Abstract Labour] (Krah!, 1984) contained different fragments of his work on Marx and the state of advanced capitalism. Other texts mainly contain transcripts of collective discussions about Lukács' *History and Class Consciousness* (Cerutti et al., 1971) and about the relationship between sensitivity and abstraction for a materialist epistemology (Brinkmann et al., 1978).
- 5 Among the biographical profiles of Krah!, those by Detlev Claussen (1985) and Uwe Wesel (2002: 127–34) are especially valuable. The notes of Sassmanshausen (2008) are also very useful but contain some inaccuracies. In contrast, Gerd Koenen's (2008) attempt to re-evaluate his trajectory from an unpublished private notebook that Krah! wrote at the age of 17, suggesting affinities with a kind of ultra-conservative mysticism, is unconvincing and highly suspicious.
- 6 In fact, the most pronounced theoretical differences would not be with Adorno or Horkheimer but with Habermas (Krah!, 1971: 248–260, 401 ff.).
- 7 The language used in the text has often led to misunderstandings: 'The "propaganda of shots" (Che) in the "Third World" should be supplemented with the "propaganda of action" in the metropolis, which historically makes urban guerrillas possible. An urban guerrilla fighter is the organiser of an irregularity understood as the destruction of the system of repressive institutions (Dutschke and Krah!, 1980: 290). But it would be wrong to see in this 'guerrilla mentality' an intellectual anticipation of the RAF: 'Not only because it is false in a strictly historical sense, but also because between this call in the autumn of 1967 and the praxis of the RAF in the 1970s, there was a clear qualitative difference. Dutschke and Krah! defined the urban guerrilla as an element of an awareness strategy. The importance of militancy came from its propaganda function, not the other way around. The meaning of irregular action would therefore not lie in the materially destructive force of violence, but in the specificity of abstract violence, in order to turn it into a sensitive certainty, something that, through action, can become an object of experience' (Kraushaar, 1987: 23).
- 8 Krah!'s relationship with the 'new reading of Marx' undertaken by Hans-Georg Backhaus and Helmut Reichelt has often been pointed out (Spaulding and Boyle, 2014; Kocyba, 2010). Undoubtedly there are points of convergence, and Backhaus himself has underlined his influence on Krah!'s approach (Backhaus, 1997: 31, 216 ff.), but the priorities diverge. Krah!'s interest does not focus on a thorough understanding of capitalism at a high level of abstraction but on an attempt to conceive it from the perspective of its transformability.
- 9 'By this I mean that, on the one hand, the adaptation of intellectual labour to the norms of capitalist labouring time hinders mediating thinking, which understands society as a whole. But, on the other hand, as scientific labour is subsumed under capital, the bourgeois cultural consciousness in the classical sense (to which the scientific intelligence of the bourgeois class subscribed, precisely in the realm of natural sciences and technical intelligence) becomes annihilated. This opens up the possibility, not the necessity, that scientific intelligence conceives and experiences the products of its scientific labour as the alien and non-mystified power of capital' (Krah!, 1971: 325).
- 10 Since 2005 several initiatives have been launched to rescue the memory of Krah!, ranging from a

file and an institute in his name to several web-pages. A number of unpublished documents were also published in issues 3 and 4 of the *Digger Journal* (<http://www.digger-journal.net/>).

# Johannes Agnoli: Subversive Thought, the Critique of the State and (Post-)Fascism

Stephan Grigat

Translated by Adrian Wilding

## **BY WAY OF A BIOGRAPHY: 'NEGATION AS *DESTRUCTIO*'**

Vladimir Ilyich Lenin recommended that revolutionaries practice 'patience and theory' during periods of counter-revolution (Lehmann, 2013). The left-wing communist/anti-authoritarian critic Johannes Agnoli, by contrast, counted upon patience and irony. To the objection that in so doing he was making himself comfortable within the false whole, Agnoli, who taught political science as a professor at the Otto Suhr Institute of the Free University of Berlin from 1972 to 1990, responded shortly before his death: 'one does not have to be a Jesuit, Jacobin, or Bolshevik just because one intends to destroy the state. The true revolutionary must always preserve a vestige of irony and self-irony. Communism is important, but so is *osso bucco*' (Agnoli and Bruhn, 2003). With this ironic distance, Agnoli attempted as much as possible to

keep the stupefying impositions of capitalist social constitution at bay until his death.

As both a mentor to and activist in the protest movement at the end of the 1960s, Agnoli rejected Theodor W. Adorno and Max Horkheimer's sympathetic skepticism toward the '68 movement. This was reflected in a text published in 1969 that aimed a pointed critique at the supposed rejection of revolutionary praxis by critical theory (Agnoli, 1998: 51 ff.). In the last years of his life, however, Agnoli expressed a far more nuanced view of the exiles who had returned from America to Frankfurt after fleeing Nazi persecution. 'In the larger historical context' (Agnoli and Bruhn, 2003), he regarded the works of Adorno and Horkheimer as exceptionally important and vehemently opposed the 'uncritical theory' (Bolte, 1989) of Jürgen Habermas, whom he accused of 'betraying' Adorno and Horkheimer's radical social critique. He found it 'outrageous' that Habermas 'is still regarded as a representative of critical theory' (Agnoli and Bruhn, 2003).

What united Agnoli with critical theory was his insistence that social theory could only exist as social critique, that the presentation of social categories and ideologies, their conceptual reconstruction, always implies their condemnation. In stark contrast to a traditional understanding of theory, Agnoli's reflections are committed to Horkheimer's dictum that a critical theory of society must be 'the unfolding of a single existential judgment' (Horkheimer, 1937: 227). As in the case of Adorno and Horkheimer, Agnoli's preoccupation with society does not result from purely academic interest but rather from dissatisfaction with existing conditions and an interest in the universal emancipation which arises therefrom, from a 'longing for the completely other' (Horkheimer, 1970). For critical theory, as well as for Agnoli, materialism is not a transhistorical method but a socially and historically determined form of critique. A materialist concept of materialism thus implies the necessity that it pursue its own abolition (Adorno, 1992: 277; Demirović, 1999: 460 ff.) in that it realizes an 'association of the free and equal' (Agnoli and Bruhn, 2003).

Johannes Agnoli died in 2003 at the age of 78 in the Italian city of Lucca, where he had retreated after his retirement from the Free University of Berlin in 1990. Born in 1925 in Valle di Cadore in Northern Italy, in his youth, as a 17-year-old, Agnoli was engaged in the *Gioventù Italiana del Littoria*, the fascist youth organization, which earned him a place on the list of those to be shot by the Italian Partisans. Later, as a left-wing communist and anti-fascist, he repeatedly argued with the different currents in Benito Mussolini's movement and with philosophical pioneers of fascism such as Ugo Spirito and Giovanni Gentile. Immediately after completing his Matura, Agnoli reported to the Waffen-SS, which in Italy was responsible for the recruitment of foreign volunteers, and ended up in the mountain infantry of the Wehrmacht. He fought against partisans in Yugoslavia and ended up as a British prisoner of war in

Egypt. Later in life Agnoli spoke very openly and publicly about his membership of the fascist youth (Burgmer, 2002: 18); he was less public about his time in the Wehrmacht, however, something which earned him sharp reproaches (Kraushaar, 2007; Aly, 2009).

In 1948, Agnoli was released to Germany from British military imprisonment and worked as an unskilled laborer in a wood factory in south-west Germany, where he maintained close contact with an old member of the Communist Party. He studied in Tübingen, where an intensive reading of Marx opened up a new world to him. In 1957, he joined the Social Democratic Party of Germany (SPD), from which he was expelled in 1961 for cooperating with the Socialist German Student League (SDS), the movement which later played a decisive role in the revolt of 1968. Earlier, in 1959, Agnoli, together with Ernst Bloch's assistant, had formulated a radical alternative manifesto for the SPD party congress in Bad Godesberg. Despite dissenting voices such as Agnoli's, the congress ultimately adopted the Bad Godesberger Program that would remain doctrinal until 1989 and saw the SPD bid farewell to its tradition as a Marxist-inspired class party and become a 'party of the people' [*Volkspartei*]. Here, one also sees a parallel between Agnoli and critical theory: after the Second World War, Adorno and Horkheimer took up a discussion they had begun on the need for a new *Communist Manifesto* (Horkheimer and Adorno, 1956; Quadfasel, 2013), and in the early 1960s, Adorno voiced a plan to write a critique of the Godesberger Program in the spirit of Marx's *Critique of the Gotha Program*, which would identify the social democratic reconciliation with the false society (Braunstein, 2011).

After finishing his PhD in 1956, Agnoli taught at the University of Tübingen and from 1958 at the Stuttgart University of Applied Sciences, proceeding to take up an assistantship in Cologne in 1960, which he quickly lost due to his engagement with a campaign to recognize the GDR. At this time,

he became an assistant at the Free University of Berlin, where he gained his *Habilitation* in 1972. In 1966, along with other prominent thinkers of the extra-parliamentary opposition (APO), he helped to found the November Society, which became the Republican Club in 1967 and where decisive discussions took place concerning the orientation of the APO and SDS. In West Berlin he disconcerted his employer, the judicial system, and his academic colleagues when, while under investigation for 'denigrating the state', he regularly transformed courtrooms into lecture halls, tormenting the audience with texts such as the 'Attempt to Enlighten the Criminal Court and Public Prosecutor about the Fascistic and the State Form', his defense statement from the Mescalero trial, in which several professors had been put on trial for publishing a commentary on the Red Army Faction's murder of the Attorney General Siegfried Buback (Agnoli, 1998: 165 ff.).

Agnoli was repeatedly concerned with criticizing the 'objectively coercive character of social reproduction' guaranteed by the state (Agnoli and Mandel, 1980: 19). He viewed social reproduction's coercive character as emerging historically and socially and therefore as capable of being overcome with a view to emancipation. At the same time, in contrast to many of the protagonists of the revolts of the 1960s and 1970s, he had no illusions about the immediate chances for such radical change. Agnoli factored in the failure of revolutionary awakening from the outset and counted on the patient work of critique and negation, the 'laborious work of the mole' (Agnoli, 2000), on subversive thought and the enactment of collective self-reflection. He would promote such work in practical ways – for example, regular talks for an audience of Italian immigrant laborers in the car factories of Wolfsburg or discussions with Fiat workers in Turin. In theoretical terms he took inspiration from Baruch de Spinoza, Immanuel Kant, the young Georg Wilhelm Friedrich Hegel and Karl Marx, turning these thinkers against the grain of

academic political science: 'the abolition of the objectively and one-sidedly (that is to say, expedient to certain interests) coercive character of society: this is the aim which political science should pursue' (Agnoli, 1990: 20). Political science does not refer 'to the dysfunctional relationship between politics and the constitution. Rather, it demonstrates that the constitution is the regulation of a dysfunctional social relation' (Agnoli, 1990: 17).

Agnoli saw Marx not as a positivist economist but as the thinker of revolution, and he shared Horkheimer's view that the point is 'not to see Marx with the eyes of the professional economist, but rather with those of a person who knows he is living in an inverted society and who desires the right society' (Horkheimer, 1988: 325). When Agnoli dealt with the classics of political thought, he was concerned not with philology but rather with the extent to which they could help 'promote thinking about another form of social synthesis' (Agnoli and Bruhn, 2003). Just as critical theory never allowed itself to go with the flow of the world or 'constructive critique' (Löwenthal, 1980), Agnoli felt wholly obligated to destructiveness. On the one hand, he did not participate in the search for alternative political forms to better administer capitalism. On the other hand, he also declined to offer concrete alternatives for a potential post-capitalist society. The 'actually existing' socialist and party-communist notion of a society emancipated from capital, and the organizations designed to achieve such a society, along with alternative radical leftist forms of organization, each appeared to him as deserving of critique – even if his sympathies for the latter were beyond question. Against the 'actually existing socialism' of the Eastern Bloc and the 'super state' of the Soviet Union (Burgmer, 2002: 68), he constantly invoked Marx's postulate that in a liberated society, 'the freedom of each individual' must be 'the precondition for the freedom of all' (Burgmer, 2002: 28).

It was precisely the negative orientation of his critique which was an abomination to

those on the traditional left and which make his objections to the ruling order so fruitful. Just as in the critique of political economy, where the sense, necessity and possibility of abolishing the commodity-form of the products of human labor (and thus money and capital) result from an analysis of the historical emergence, function and analytic-logical derivation of value, money and capital, so in Agnoli's critique of politics the sense, necessity and possibility for abolishing the state results from an analysis of politics, the state and its contemporary constitution and not from some utopia painted in fine detail. Agnoli made precisely this analysis his task. In a conversation with the newspaper *Arbeiterkampf* in 1988, he asserted that he was 'incapable of constructive thought' (Agnoli, 1998: 237); he later described himself as 'impossible to organize' (Agnoli and Bruhn, 2003). In rejecting the painting of utopias he was in agreement with Adorno's dictum that 'the false, once determinately known and precisely expressed, is already an index of what is right and better' (Adorno, 1997: 793).

Protagonists of postmodernist and post-structuralist theories, who triumphed within universities at the end of the 1980s, must have felt provoked by Agnoli's materialism, with its straightforward yet crucial insights into the practice of exploitation and rule in societies based on the valorization of capital and organization by the state. Adorno already had an inkling of the need to avoid being tricked of the fundamental insights of a Marxist inspiration by fashionable theoretical approaches: 'In all its versions, materialism has always had (in contrast to chic or subtle philosophies) an aspect of backwardness, of the rustic' (Adorno, 1992: 175). In an article first published in 1968, and wholly in line with Adorno, Agnoli had said of fashionable theories of language: 'Certainly, it is only the rulers who are able to impose themselves linguistically; but not because they use language, but because they rule' (Agnoli, 1997: 62). He regarded 'PC language rules'

as a 'hypocritical attempt to semantically whitewash deplorable social conditions' (Agnoli, 1998: 10). Conservatives consistently regarded Agnoli as an anarchist-communist troublemaker disrupting the academic establishment. During an examination, a professorial colleague allegedly admonished him: 'When you come to power, you'll probably put me up against the wall!', to which Agnoli impishly and dryly responded: 'What an imagination, Herr Professor. When we come to power you'll be on our side. You're always on the side of power' (Markl, 2003).

For somebody who was active for many decades as a public scholar, Agnoli left behind a comparatively small oeuvre. His 'personal right to be lazy' was important to him, and he regarded himself as a 'friend of the small format' (Agnoli and Bruhn, 2003). He concentrated on writing essays, which were often published in non-academic publications (frequently journals of the Italian left), instead of writing thick doorstops fated to remain unread or collect dust in libraries. He preferred to read rather than turn himself into a professorial word-processing machine as had many of his university colleagues. The latter once led him to state: 'reading takes time, time during which Habermas writes' (Agnoli and Bruhn, 2003).

An impression of Agnoli's activity as a teacher is provided by *Subversive Theory*, a transcript of his penultimate lecture at the Free University of Berlin, published as the third volume of his *Collected Writings*. Reading these expositions, it becomes clear that the academic boredom that almost all of today's students endure need not dominate the lecture halls and places of learning. Agnoli stood in stark contrast to the academic administrators of theory and the university functionaries who have robbed even Marx of his political and polemical sting. Agnoli remained a thinker capable of empathy, who was always concerned with engaged critique, even self-critique. He was not concerned with theoretical coherence for its own sake but rather with reflective experience,

conceptually grasped, with the aim of intervening in social reality.

In *Subversive Theory*, Agnoli attempts to trace the history of subversion, both intellectual and practical, from the days of ancient and Christian myths through the Middle Ages up to the modern era. His approach and examples provide a very different model to the traditional history of political ideas, and show how certain recalcitrant, subversive or even just uncomfortable thinkers (particularly women) were (and still are) disregarded, falsely interpreted or labeled as pathological by the academic mainstream. He defines the concept of subversion as a form of human emancipation undertaken in gloomy (that is, repressive and counter-revolutionary) periods. This has implications for academic work, too, for which Agnoli recommends *Destruction as the Determination of the Scholar in Miserable Times*, to use the title of a piece first published in 1990 in the leftist monthly magazine *konkret* (Agnoli, 1995: 10 ff.; Agnoli, 2003a). Though subversion does not amount to revolution itself, it prepares revolution's way. It involves 'negation *sans phrase*, negation as *destructio*, as obstinate reason' (Agnoli, 1999: 16). Subversion is both a theoretical and practical activity which attacks the existing order without demanding a 'more orderly order' (Agnoli, 1999: 14) as do fascists and other protagonists of conformist revolt.

## THE CRITIQUE OF THE STATE AND DEMOCRACY

In Agnoli's forays into the history of philosophy, one sees again and again the key elements of his critique of the state and politics as developed in his more well-known texts such as *Die Transformation der Demokratie* [*The Transformation of Democracy*] (Agnoli, 1990). First published in 1967 and originally co-written with the social psychologist Peter Brückner, it is regarded as 'the Bible of the

extra-parliamentary opposition' (Kraushaar, 2008: 143) and as having had an enormous influence upon the students in revolt at the end of the 1960s. Until the early 1990s, *The Transformation of Democracy* enjoyed a reception in German-speaking countries far beyond leftist academic circles. Since then it has been a focus of diverse left-wing debate: in 'ideology-critical' and 'anti-German' circles, for instance, and among autonomists, libertarian socialists and anarchists, whereas Agnoli's reflections receive hardly any discussion in mainstream German-language political science. If they are engaged with, they are at best described as 'products of their time' and at worst disqualified as 'left-fascist', imputing an affinity between a leftist critique of the state that aims at an association of free human beings and fascist contempt for democracy. Agnoli reacted to such accusations by making clear that he did not criticize 'the bourgeois constitutional state because the bourgeois constitution is what Carl Schmitt thinks of it, namely an institutionalized talking shop' but rather as 'the state of capital' (Agnoli and Bruhn, 2003). To criticize the state thus is not to disdain the bourgeois civil liberties that the constitutional state usually guarantees.

The fact that the majority of former '68 activists choose not to heed Agnoli's words is all too understandable: if they had taken his critiques of democracy, state and institutions seriously they could not have embarked upon their beloved 'long march through the institutions' nor participated in such great numbers and with such enthusiasm in the project of the Green Party and, later, the Left Party [*Die Linke*]. Agnoli attributes to them a 'drive to institutional power', toward reconciliation with capitalist society and affirmation of its state (Agnoli, 2000).

If it is part of the essence of subversion that human beings always resist becoming a pure object, then subversion must also be directed against politics, since human beings, as Agnoli puts it, 'are never at the center of politics (as the parties proclaim), but only a

means used by politics – so that, for example, voting at elections becomes a mere means of distributing power among the parties’ (Agnoli, 1999: 29). Arguing against the institutionalization of subversion, Agnoli set out a critique of parliamentarism and the state, by pointing out a tendency toward ‘involution’ in modern democracies. This involves the originally revolutionary-emancipatory institutions which developed out of the French Revolution being transformed into institutions of domination and administration in the modern authoritarian-constitutional state of the second half of the twentieth century. According to Agnoli, these institutions became useless for the general human emancipation at which society’s ‘negative potential’ aims (Burgmer, 2002). For Agnoli, parliament is a special form of the representation of domination, which, via the ballot box, maintains the illusion of self-determination on the part of the dominated. In order to carry out this function, it requires the presence of actual social power in parliament but not necessarily the actual power of parliament. Parliament plays a decisive role in transforming ‘conflicts of domination’ into ‘conflicts of leadership’. A conflict of domination occurs between two antagonistic groups who follow mutually exclusive aims. Here, Agnoli primarily has in mind the conflict between labor and capital, which he regarded – following a very traditional Marxist understanding of Marx (Grigat, 2007) – as embodying a contradiction that points beyond the existing system. A leadership conflict, by contrast, is the competition between leading elites conducted in a system-immanent way. An essential element in the transformation of democracy into an authoritarian-constitutional state, according to Agnoli, is the transformation of the conflict of rule emanating from the contradiction between labor and capital into a conflict of leadership, the content of which is mere competition over the best way to supervise the contradiction between capital and labor.

Using the example of the ‘anti-institution’ of the Roman tribune of the plebs, Agnoli

explains that power can never be effectively checked, and certainly not sabotaged, when subversion gets involved with the institutions of power, but only ‘when reason is permanently on the streets’ (Agnoli, 1999: 79). For this reason Agnoli remained a strict opponent of that march through the institutions by which many of the ‘68 activists whom he had earlier inspired later justified their adaptation to the existing state of affairs. He knew that, as a rule, institutions are stronger than the people who enter into them: ‘The state is a palace one can enter but which has no rear exit’ (Burgmer, 2002: 21). As a consequence of this critique and against the background of a narrow concept of politics, Agnoli was not concerned (as are many today who discuss globalization and the loss of the regulatory capacity of the state that it has supposedly caused) with rescuing politics or defending the political sphere against the economic sphere but instead simply with abolishing politics and thus a society necessarily constituted and reproduced by the state. Agnoli conceived politics as statist *per se*. Against the mainstream of the left in the 1970s and 1980s, he did not call for a ‘general politicization’ but demanded the liberation of the private from the political in the sense of pushing back against the statification of society (Nachtmann, 2003a) to achieve the liberation of society from political domination. Against the bourgeois equation of politics with the public sphere, he held onto Marx’s conception of communism: ‘a public sphere without political character, that is to say a public sphere without structures of domination’ (Agnoli, 1999: 73), which means a ‘society of the free and equal’ (Agnoli, 1995: 115).

In contrast to the Marxist critic of the state and law, Eugen Pashukanis, Agnoli was not primarily concerned with the various forms of the state and their institutions but rather with the ‘state form’ (Neupert, 2013: 191), which in the various epochs of the capitalist mode of production has always been necessary to bestow an organizing authority (admittedly diverse in appearance, mediation

and organization) on contradictory economic and social relations. This authority is not identical with the business that it ultimately seeks to protect. Agnoli saw the various disputes about good and bad governance, about corruption and the misbehavior of individual politicians, as mere forms of appearance of the political. By contrast, he saw the essence of politics as consisting in the fact that it is 'a system of conquering, maintaining, and exercising power', an 'institutional, partially constitutional form of statehood into which social and economic rule is translated' (Agnoli, 2000).

The political means of power – above all the state's monopoly on the use of force – were interpreted by the traditional left as the ruling class's instruments of oppression. The maintenance of the political, economic, social and cultural power of the bourgeoisie was seen as the essence of bourgeois politics but not as the essence of politics as such. As a rule, it was assumed that politics was something neutral that had to be filled up with content and which was merely instrumentalized by the ruling class for its own aims. The traditional left provided only a critique of bourgeois politics, not a critique of politics as such. Agnoli, by contrast, wanted to formulate a fundamental and radical 'critique of politics' – a phrase that is already found in the work of the young Marx (Marx, 1843/44: 379) but which had not received much consideration in traditional Marxism.

No materialist critique of the state and politics can exist without reference to Marx's critique of political economy, and Agnoli also repeatedly described his program of a critique of politics as 'a continuation of the critique of political economy' (Agnoli, 1998: 220). Agnoli analyzes the act of voting and state rule in *The Transformation of Democracy* with direct reference to the categories of Marx's *Capital*. Voters see themselves as conscious consumers of political goods offered on the market, 'which the consumers themselves regard as use-values, whereas in reality these goods absolutely

constitute real exchange values. They are realized as exchange values on the market of power, in order to make the political power invested in elections profitable' (Agnoli, 1990: 45). The election of a parliament is a central moment of the legitimation of domination. By consummating the act of voting, voters accept domination over themselves, because they adhere to the illusion that they could also abolish that domination in the same manner if necessary.

In his critique of the state, Agnoli distances himself from notions that see the state in modern capitalism as an all-encompassing organizer which itself directly takes over the function of capital, as well as from theories that do not admit of any autonomous activity on the part of the state. He breaks with the dogmatically posited base–superstructure schema and resists a view of the state as a mere superstructural phenomenon. Instead, the state is 'firmly rooted [...] in the social base' (Agnoli and Mandel, 1980: 26).

The state is more than just a vicarious agent of the economy. Agnoli emphatically pointed out that the state in capitalism is not just the state of the capitalists but rather the state of capital, whereby capital needs to be understood as a social relationship and not as a monolithic power bloc. According to Agnoli, in light of the crisis-prone nature of capitalist societies, the state must not only put itself in the position of the ideal 'total capitalist' in the sense Marx and Engels used the term, but also in the role of the ideal total proletarian (Nachtmann, 2003b). The political sovereign in the form of the state mediates the contradictions of an antagonistic society based upon the valorization of capital, and to secure the 'fundamental, objective conditions of capital accumulation' it must 'take hold organizationally of the social existence of the worker and partially support it economically' (Agnoli, 1995: 35). The state molds the bourgeois class into a unity, which it does not have in the spheres of circulation and production. On the one hand, it implements specific class interests of capital

and balances out opposing interests between individual fractions of capital. On the other hand, it takes into consideration general interests, transcends class-specific demands, condenses social contradictions and acts like the guarantor of the commonweal. According to Agnoli, the state

cannot be an 'agent of capital', since total capital is not a real magnitude, but is however a real mediation [...] it only directs itself selectively according to individual pressure; essentially it organizes total social reproduction according to the general lines of the common interest of all individual capitals in accumulation. (Agnoli, 1995: 48)

In the 'immanent anarchy of the movement of capital' with its 'double conflict' between individual capitals on the one hand and the classes on the other, it is solely the state that is able to act as the 'real total organizer' (Agnoli, 1995: 46).

Agnoli points to a close connection between theoretical assessments of the state and political orientation. Viewing the state as a purely superstructural phenomenon already involves, as he elaborates, using the example of the Italian Communist Party, the danger of a reformist orientation, which aims at mere participation in domination rather than its overcoming. In the concept of a transitional society organized by the state, which is still propagated today by many party-oriented Marxists, Agnoli recognizes a problem 'that [...] precisely the state which is supposed to ensure the transition begins to wither away from the very start' (Agnoli and Mandel, 1980: 19).

Here he makes a distinction between a 'fundamental opposition' and an 'integrated opposition'. The integrated opposition, which would like to participate constructively in shaping the existing system, evolves in almost every case out of the fundamental opposition. However, not only the integrated opposition but also the fundamental opposition tends to accept the given rules of society. It hopes that by accepting these rules it will have a chance to make its own radical

critique more widely known and more convincing. For Agnoli, however, this overlooks the fact that the critique of political rules was originally an integral component of the substantive critique formulated by every emancipatory fundamental opposition. Each time an oppositional force makes a merely formal adaptation to the rules, a substantive adaption also occurs.

Agnoli emphasizes that a radical opposition also fulfills a central control function within the false whole, in the sense of a democratic-critical public sphere, since a moderate left tends to voice some but by no means all social grievances. He emphasizes that 'only a fundamental opposition is interested in relentlessly uncovering all political and social grievances. The constitutional opposition will always remain within a tight framework: grievances are only uncovered if they are advantageous to a change in government, or influence the periodic distribution of mandates' (Agnoli, 1990: 89).

Against reformist conceptions of politics, Agnoli points out the structural impossibility of system-transformational reform: the material foundation of politics is the success of capital producing under the aegis of a particular state. The economic condition of a state's existence is its maintenance of the production of surplus value. The state must guarantee and improve as much as possible the conditions of successful accumulation of capital. By taxing both the surplus value produced and wages, the state secures its own material foundation and thus maintains the possibility of politics. The structural problem for emancipatory politics consists in the fact that the state, as soon as its political measures attain a quantity and quality that allow them to be understood as a contribution to general emancipation and not just as a different distribution of misery, tends to deprive itself of its own material basis. Emancipatory politics limits the possibilities for capital accumulation. The amount of surplus value shrinks and conservative politicians and business leaders are correct, despite all their ideological

and strategic rigmarole, when they state that where there is nothing, nothing can be redistributed. If the state intervenes so energetically in production that the production of surplus value is reduced, it already scrapes away at its own ability to intervene further, since it begins to threaten the conditions of its own existence (Agnoli, 1995: 43 ff.). Agnoli thus points out the 'logical dilemma of all "progressive regulation" of capitalism: no politics without valorization – and vice versa' (Schlemmermeyer, 2010).

The question regarding the extent to which politics can be understood exclusively as conscious behavior to secure domination had already appeared in debates in the 1970s. Agnoli was accused of overestimating the role of self-consciously acting subjects at the pinnacle of bourgeois society. The transformation of conflicts of domination into conflicts of distribution was not, according to this criticism, the result of conscious strategies but rather

the result of the inversion of the class relation in the production of value and surplus value through relations of competition. Class relations only appear in this inverted form and are structurally or unconsciously reproduced through it. It is the relations of competition that constitute the foundation for the conflicting and compromise-laden coexistence of social interests in politics. (Blanke, 1976: 210 ff.)

This criticism, which calls to mind Marx's critique of the fetishism and mysticism of capitalist society from the three volumes of *Capital*, nevertheless provoked only incomprehension on Agnoli's part. Asked by the Trotskyist Ernest Mandel, who was not unversed in Marxist terminology, 'What does that mean?', Agnoli replied: 'I don't know either'. Despite this, Agnoli himself raised the issue of the contradiction between conscious political action aimed at implementing the interests of capital and the state on the one hand, and the blind operation of the law of value through activity rooted in fetishistic consciousness on the other. He was concerned with the connection between the

apparent naturalness of capitalist society, the permanent possibility of crises and the state's efforts at planning which necessarily arise from this, which he summarized as 'the political synthesis of social coercion' (Agnoli and Mandel, 1980: 19). The laws of value Marx had in mind 'are nowhere transformed into a mystical demiurge with total power' and it is therefore possible that it is suspended quite consciously by, for example, monopoly power. Because of this, the state is compelled to act as the concentrated power of the law of value to secure its legitimacy (Agnoli, 1995: 68).

The apparent contradiction between conscious action and the blind action of the law of value dissolves once the economic character of society, its commodity-form and the subjective will to political power are conceived as mutually dependent but distinct spheres. Shifts in political power as well as the control and regulation of social relationships are by no means blind processes. They result from conscious strategies on the part of individual power groups. Nevertheless, one can also speak here of 'subject-less domination': the existence of fetishized consciousness is 'total' in the sense that it is not consciously placed in the world by any class or social grouping. Rather, it tends to confine all subjects who live in developed commodity-producing and exchanging societies in a false reflection of social reality, which at the same time is a correct reflection, since it accords with those subjects' everyday necessities. Unawareness of the internal laws of movement of capitalist society – 'they do this without being aware of it' (Marx, 1990: 166–7) – and conscious political action for the maintenance of capital accumulation and its political framework exist simultaneously: 'In this way it is possible to speak of a link between the blind law of value and the deliberate political choices and decision-making of ruling groups' (Agnoli, 1995: 69).

Nevertheless, the charge cannot be denied that despite all his anti-authoritarian anti-dogmatism and his critique, formulated early

on, of Marxism-Leninism as the legitimating ideology of Stalinism, Agnoli has carried some traditional Marxist baggage along with him. Peter Klein has pointed out shortcomings in Agnoli's theory, and though Klein's tone is sometimes ungenerous, even acrimonious, his criticisms are in some respects quite justified. Klein accuses Agnoli of viewing democracy as nothing but a fraud. Agnoli's approach in *The Transformation of Democracy*, he argues, reduces democracy to a 'strategic maneuver of the executive "ruling class"' (Klein, 1991: 143). Leaving aside the brusque nature of Klein's critique, it is useful to see it as an expression of the ambiguities in Agnoli's critique of democracy and the state, because Agnoli also refers again and again to the subject-less character of domination in capitalist society: he talks of the 'derivative, instrumental character of the "rulers" of production' (Agnoli, 1998: 109), and capital is for him not simply a monolithic power bloc standing over and against the dominated but a phenomenon which manifests itself as 'a social given, whose highest goal is its own valorization' (Agnoli, 1998: 110). Even if Agnoli never excluded from his critique the respective 'masters' who are the concrete appearance of social 'character masks', he never understood domination as personal rule but rather as a 'reified and juridified encapsulation of the objectively compulsive character of capitalist production and reproduction in the form of the state' (Nachtmann, 2003b).

## FASCISM, POST-FASCISM AND POST-NAZISM

Agnoli's works explore the reversal of liberalism – the 'classical form of a class-state of the liberal-police type' (Agnoli, 1995: 43) which appears in economic terms as 'night watchman' but in domestic-policy terms as 'day policeman' against the rebellious proletariat (Agnoli, 1995: 44) – into fascism, a development whose beginnings he dates to

the age of classical imperialism at the end of the nineteenth century. Referring to Alfred Sohn-Rethel's analyses of class structure under German National Socialism, Agnoli conceives fascism as a political rearguard action that resorts to absolute (as opposed to relative) surplus-value production in the face of manifest difficulties of capital valorization and the collapse of the world market. The fascist 'war of plunder and conquest' is a 'necessary element of solving the crisis' (Agnoli, 1997: 102). Whereas in a bourgeois constitutional state political violence is directed against the revolutionary workers' movement, in a fascist state it is directed even against the reformist workers' movement, which Agnoli describes as the '*differentia specifica* of the fascist form of bourgeois domination' and which simultaneously recalls the 'common denominator of all bourgeois forms of rule' (Agnoli, 1997: 111).

According to Agnoli, Italian fascism was much more significant for the development of post-war bourgeois-capitalist societies than was German National Socialism, whose mania for annihilation he saw falling outside of capitalist logic: the 'destruction of labour power is not part of this logic, even if German capital has been its beneficiary' (Agnoli, 2003b: 19). In contrast to National Socialism, Italian fascism did not have an ideology of *Volksgemeinschaft*; it was instead characterized by

an ideology of the neutralization of class relations. Class conditions were recognized as real, but they were to be institutionalized – which was not the case in Germany, because there the class structure was simply denied and subsumed by the *Volksgemeinschaft*. It was not by chance that trade unions were banned in Germany. In Italy, on the other hand, they existed, albeit in fascist disguise. Corporatism...meant an attempt to neutralize the class structure by incorporating the exponents of these classes into joint institutions under the aegis of the state. (Agnoli, 2003b: 19)

Fascism was 'not a dictatorship in the usual sense of the word' in that it 'tried to establish a general consensus beyond social conflicts' (Agnoli, 2003b: 19).

Here, however, Agnoli seems to give too much emphasis to an apparent manipulation of the so-called ruled by the apparently self-conscious rulers. While his writings on the theory of fascism never make unqualified reference to a merely 'incited' working class, people or masses (as is typical on the nationalist left), Agnoli nevertheless talks primarily (even when discussing antisemitism) of 'techniques of domination'. This bears similarities to certain problematic formulations in Adorno and Horkheimer's *Dialectic of Enlightenment*: they allege that the Antisemitism's 'high commissioners' who knew what was really at stake did not hate Jews. Similarly to Agnoli, Adorno and Horkheimer argue that antisemitism serves domination by means of distraction and corruption of character. While the ruling elite talked about antisemitism, the ruled would put it into practice (Horkheimer and Adorno, 1947: 179).

Agnoli admits, however, that he is unable to comprehend the Shoah 'by means of any categories, rational, Marxist or otherwise' (Agnoli, 1997: 10), and he maintains that the correct characterization of mass extermination is as an expression of the 'total irrationality of domination' (Agnoli, 1997: 52). Antisemitism itself, *before* the National Socialists' creation of a bureaucratically organized system of industrialized mass murder, is construed as a means to other ends. He does not conceive of the notion of a 'Jewish-Bolshevik worldwide conspiracy' as a lie that its proponents themselves believed, as some extreme pathological projection of the madness of capitalist commodity production and state domination. Instead he understands it as one of the 'main instruments of integration and manipulation at the level of the masses' (Agnoli, 1997: 127). It is not hard to see here a risk of downplaying the gravity of antisemitism: it becomes merely a particularly insidious means of domination that is (given the right circumstances) available to rulers to ensure they (apparently consciously) stay in power. The ruling class's real antisemitism

and the actions which result from it risk being overlooked and underestimated, as does the widespread antisemitism of the dependent classes, which exists without significant persuasion or manipulation 'from above'.

Agnoli has repeatedly emphasized the fact that in the European post-war states we are by no means dealing with societies that have emerged *ex nihilo* but with post-fascist societies, which have taken up numerous components of fascism (for instance, corporatism) in modified form. Fascism should not be reduced to 'the formalized barbarism of "totalitarian rule"' and in particular not to the National Socialist practice of extermination, otherwise it would no longer be possible to analyze the extent to which the fascist corporatist model of state integration of labor and capital was partially taken up in the corporatist models of post-war societies under the aegis of social planning. Agnoli did not simply equate the socio-partnership models of post-war Europe with the fascist social pact but attempted to show what, 'for example, in the West German program of social symmetry or the policy of French *planification* displays technocratic and especially fascist-corporatist characteristics' (Agnoli, 1997: 28 ff.).

The specific manifestations of the post-fascist social pact, the institutional organization of the contradiction between capital and labor in most European post-war societies that followed the experience of fascism, did not 'emerge naturally from the laws of the market' but rather involved 'the attempt to put those market laws back on the right tracks: conscious intervention in the relationship between labour and capital in order to restore its "natural character" (capitalistically understood) and to regulate the labour market in a way conducive to renewed accumulation' (Agnoli, 1990: 198). In post-fascist societies, it is not only that the capital relation is present in the state but that the state – in contrast to the liberal state of the early bourgeois epoch, which largely trusted in the compulsion of economic laws – enters the capital relation

and acts as a social planner and preventive crisis manager (Nachtmann, 2003b).

The late capitalist state in the second half of the twentieth century is founded on the experience of the ruling personnel of fascist times, who were not simply expunged by the military defeat. Fascism, with its economic and socio-political forms of organization and its institutional strategies for the prevention of radical upheavals, had developed components that were then preserved in the bourgeois state and made irreversible: 'If an epoch ceases to be fascist, this does not mean that fascism ceases to exist and to have effects' (Agnoli, 1997: 27 ff.). Rather, according to Agnoli, 'it becomes an irreversible component of capitalist society' (Agnoli, 1997: 74). The West German state of the post-war period thus appears as a political expression of 'permanent crisis prevention' (Nachtmann, 1995: 87). In an attempt 'to circumvent the need for open terror in times of crisis' it had resolved 'the ambivalence of representative bodies and the representatives' parties', which in his view was characteristic of early liberalism and pre-fascist bourgeois society (Agnoli, 1990: 41).

By emphasizing the persistence of fascism, while rejecting any equivalence between state repression in the democratic constitutional state and the practices of Italian fascism or German National Socialism (Agnoli, 1997: 28), Agnoli formulated a warning similar to that given by Adorno when he maintained that the afterlife of fascist tendencies within democracy is potentially more menacing than the afterlife of fascist tendencies against democracy (Adorno, 1997): 'The insight that Fascism is not a sort of "alternative superstructure", but that, once established as a form of domination, it changes qualitatively and irreversibly the conditions which it encounters, links Agnoli's analyzes with those of Adorno and Horkheimer's Critical Theory' (Nachtmann, 1995: 87).

Unlike Adorno and Horkheimer, however, Agnoli set little store by the fact that the Federal Republic of Germany is not only a

post-fascist state but above all a post-Nazi state. Even though Agnoli pointed out (earlier and more forcefully than other theorists) the differences between Italian fascism and German National Socialism, he lacks an incisive critique of post-Nazi German society, which would need to focus on the modified continuation of the nation-socialist *Volksgemeinschaft* within the constitutional consensus of the Federal Republic of Germany. This continuation, which is strikingly different from Italian post-fascist society, involves the *Volksgemeinschaft* as both persecuting and persecuted.

If we consider the many critiques of a revolutionary automatism, which identifies the goals of emancipation in each and every action of the working class, then Agnoli's texts from the 1960s and 70s must, from a contemporary perspective, be viewed as workerist or as romanticizing the masses. True, Agnoli rightly points out that the worker is neither 'per se a reformist' nor 'per se a revolutionary' (Agnoli, 1998: 130 ff.), yet he seems to express mere wishful thinking (and confuses the wishes of a relatively small part of the proletariat with the general will) when he argues that 'the proletariat wants communism as emancipation and not as state power' (Agnoli, 1998: 93).

Against the backdrop of such 'lingering legacies of traditional labour-movement Marxism' (Vogt and Benl, 1998: 113), the question arises as to the actuality of Agnoli's critique, especially that contained in his *Transformation der Demokratie*. Agnoli himself has taken several positions on this question. On the one hand, he has pointed out that his critique is to be understood as a *fundamental* critique such that its enduring validity would have to be measured against the basic structure of society and the state. In Western societies the mode of production, social structure and political form, which Agnoli called the 'three basic elements... grounding the critical analysis in *Transformation der Demokratie*' (Agnoli, 1990: 182), remain essentially unchanged, even 20 years after

the appearance of his magnum opus. For this reason, he surmised that his critique has lost none of its validity. On the other hand, Agnoli refers to political developments, such as the integration and de-radicalization of the German Green Party during the 1980s, which 'despite all accusations and counter-arguments verifies the theory of involution' (Agnoli, 1990: 183).

Similarly, it could be argued that the integration of the German Left Party [*die Linke*] that has occurred since 1990, and the transformation of Western democratic societies into 'tougher forms' of political constitution (Agnoli, 1997: 7) remain highly topical, especially in the light of a twenty-first-century crisis of accumulation that is not only economic but structural. According to Agnoli, fascism and the liberal rule of law aim at the same goal: maintaining the conditions for accumulation in capitalist society. The method in each case is repressive but the means are terrorist in the former and constitutional in the latter; only 'special circumstances' force civil society 'on the road to terror' (Agnoli, 1997: 24). Both roads always remain open for bourgeois society. 'Capitalism doesn't want fascism, it only wants to secure profit' (Agnoli, 1997: 43). The question 'Which political form does capital need?' (Agnoli, 2003b: 23) must always be answered anew. At the beginning of the twenty-first century Agnoli assumed that a 'much tougher political form' would be necessary to 'reproduce global capital', not least to maintain the 'privileges of the metropolises... against the rest of the world, [...] which indeed belongs to the world market, but lies completely outside of prosperity and of every capitalist blessing' (Agnoli, 2003b: 25).

Alongside this 'hardening of the objectively compulsive character of society' (Burgmer, 2002: 19) by which the wealthy defend their privilege against the impoverished masses, Agnoli toward the end of his life also saw Islamic jihadists as important protagonists of social regression, speaking of them as a similar threat to general human

emancipation as the fascists had been: 'They too [...] don't want freedom. On the contrary, their dream is to Islamize the entire world. That this goes under the banner of "liberation" is down to an ideological use of concepts' (Burgmer, 2002: 19).

The debates over nation and nationalism, antisemitism and *ressentiment*-fueled capitalism critique, which have been conducted especially on the left in the German-speaking world since the early 1990s, and which should play a decisive role in a discussion of future 'tougher forms' of socialization, have nonetheless received barely any impetus from Agnoli's texts. This is primarily due to the fact that the average nationalistic and commodified monadic individual who feels permanently deceived and outsmarted has a diffuse hatred of those 'at the top' and, at worst, fantasizes about secret powers in the background who are to blame for their misery. These are not the object of Agnoli's critique but, on the contrary, serve as proof of the fundamental capacity of the dependent masses for resistance.

With regard to Agnoli's critique of representative democracy and its mediating institutions, and his positing of a popular emancipatory impulse which seeks to become directly sovereign, it seems appropriate, in light of the experience of National Socialism and the renewed agitation of right-wing and far-right parties, to be highly skeptical of the procedure of direct democracy. Though Agnoli's critique is diametrically opposed to anti-emancipatory versions of the attack on representation and instead has recourse to a diffuse 'healthy popular feeling' on the part of mature, rational individuals, it seems that in late-capitalist post-fascist or post-Nazi societies these qualities no longer exist in any collective agent and seem ever more hard to find in the individual.

Agnoli's critique is based on the Marxian categorical imperative of abolishing all relationships 'in which man is an abased, abandoned, enslaved and contemptible being' (Marx, 1843/44: 385; Agnoli, 1990: 20). By

contrast, Adorno's categorical imperative, which adapted Marx in the wake of National Socialism and maintains that 'in the state of unfreedom' it is a matter of 'thinking and acting in such a way that Auschwitz does not repeat itself, that nothing similar ever happens again' (Adorno, 1966: 358), plays only a subordinate role for Agnoli's theory and political judgments. Agnoli's distance from Adorno's and Horkheimer's critical theory is exemplified in his significantly less skeptical assessment of the revolts of 1968, a point which Joachim Bruhn made clear in an interview with him:

Adorno and Horkheimer always reflected out of the experience of national socialism, out of the reversal of bourgeois society into barbarism, whereas you understand Nazism in terms of Italian fascism. The consequence of this is that the role of antisemitism is ignored or misunderstood. As I see it, the difference between you and Horkheimer and Adorno in the matter of the student movement arises from this. (Agnoli and Bruhn, 2003)

### 'BASSO CONTINUO OF IRONY'

Johannes Agnoli, 'Marxist, anarchist and communist in one' (Narr, 2003), never submitted to any dogma, preferring to take on 'the power of doubt' (Agnoli and Bruhn, 2003). He led a 'non-ascetic life', a life that 'fell between the cracks' (Dahlmann, 2003). With his heretical form of critique, he espoused (always with a wink in his eye) a 'Marxist Agnolism', aiming to reverse the historical divide between communist and anarchist ideas and to show Marx was a 'better anarchist' than he himself knew. At the same time, he declared that 'if Marxism-Agnolism ever became the political program of any group', he would promptly 'quit his own theory' (Agnoli and Bruhn, 2003).

Agnoli's critique of the authoritarianism of the constitutional state; his reflections on the need for fundamental opposition despite the integrating power of the existing order;

on the continuing hold of fascist ideology and fascist techniques of domination and on the state as a social planner, as discussed in the volume *Der Staat des Kapitals* and in his writings on the theory of fascism; and his characterization of the post-Nazi party political landscape of West Germany as a 'pluralist version of a one-party State', along with his predictions of a future hardening of the political form, have lost none of their topicality. After all the criticism of his romanticizing of 'the dominated', of his sometimes traditionally Marxist interpretation of the critique of political economy, of the functionalist concept of antisemitism in his theory of fascism and of his praxis-fetishizing objections to the work of Adorno and Max Horkheimer, one cannot deny the simultaneously serious and charming critical theory of this 'partisan professor' (Bruhn, 2003) who refused to bow to false authorities, even in the face of the state-idealizing conformism of large parts of today's left, and who, finally, offered a welcome antidote to their humorlessness: 'the melody which should make petrified social relations dance requires the *basso continuo* of irony' (Agnoli, 1995: 20).

# Helmut Reichelt and the New Reading of Marx<sup>1</sup>

Ingo Elbe

Translated by Jacob Blumenfeld

## BIOGRAPHY AND POSITION IN THE FRANKFURT SCHOOL TRADITION

Helmut Reichelt, born in 1939, studied political science in Freiburg from 1959 to 1961 and subsequently in Frankfurt under Theodor W. Adorno and Max Horkheimer, graduating in 1966. He completed his political science dissertation in 1968, supervised by Iring Fetscher among others, and published it in 1970 as *On the Logical Structure of the Concept of Capital in Karl Marx*. In 1972 he became a Professor in Frankfurt, and in 1974, he received a position at the University of Bremen as Chair of ‘Scientific and Social Theory with specific focus on Dialectics in the Critique of Political Economy’.<sup>2</sup> The University of Bremen, founded in 1971, can be regarded as one of the academic centres for the development of Marxist theory in West Germany in the 1970s and 1980s (e.g., Alfred Sohn-Rethel, Freerk Huiskens, Margaret Wirth, Heide Gerstenberger, Hans Jörg Sandkühler, Hansgeorg Conert,

Lothar Peter). Reichelt taught in Bremen until his retirement in 2005.

Alongside Hans-Georg Backhaus, Helmut Reichelt represents the new reading of Marx [*neue Marx-Lektüre*] that developed in West Germany from the mid 1960s onwards.<sup>3</sup> This new reading opposed both the Marxist-Leninist and Social-Democratic orthodoxy of Marx, and undertook a comprehensive reconstruction of the object and method of the critique of political economy, at least from the Frankfurt Colloquium on *Capital* (1967).<sup>4</sup> The basic thesis concerns the utterly inadequate interpretation of Marx’s work, first established by Friedrich Engels and then adopted by party officials, and reflected in an empiricist methodology<sup>5</sup> and a value theory indistinguishable from classical economics.<sup>6</sup> Nevertheless, it was not until the mid 1970s that this critique of traditional Marxism was worked out clearly. Also beginning in the 1970s, Marx’s scattered and sometimes contradictory positions on the state and history were subjected to the same effort of critical reconstruction

beyond the confines of traditional Marxism.<sup>7</sup> Helmut Reichelt took part in all these debates, in a more or less decisive manner.

Both Reichelt and Backhaus were students of Adorno, but they explicitly distanced themselves from what they considered to be his largely superficial reading of Marx and his idea of critical social theory, which slipped into civilizational critique. As Peter Ruben notes, the Frankfurt School of the new Marx-reading begins 'as a self-negation of the culture-critical orientation' of classical critical theory.<sup>8</sup> Instead, the new Marx-reading addresses problems about the method and object of the critique of political economy, a task already identified by Horkheimer in his 1937 essay *Traditional and Critical Theory* as a prime example of critical social analysis,<sup>9</sup> although it was not systematically followed through by him or his colleagues. Reichelt thus states in his dissertation 'that critical theory to date has contributed nothing essential to elucidating the dialectic in *Capital*' and it is 'characteristic' of critical theory that 'it is only able to formulate dialectical theory as a program, and, at the same time, assumes a standpoint in the material investigation of capitalist society (and also in the reception of Marx's late work) which Marx criticized as a positivism unclear to itself' (Reichelt, 1973: 17 ff.).

At the same time, however, Reichelt and Backhaus draw on a whole range of ideas from Adorno as guiding principles for their reconstruction of Marx's understanding of the object of economy. *First*, there is Adorno's identification of economic objectivity as 'conceptuality holding sway in reality itself', of 'exchange value' as 'merely thought',<sup>10</sup> and his associated diagnosis of the 'domination of the universal over the particular'.<sup>11</sup> Also in this context stands the theory of real abstraction by Alfred Sohn-Rethel,<sup>12</sup> with whom Reichelt collaborated in Bremen, according to his own account (Reichelt, 2009: 3). These themes carry on for Reichelt into his later theory of validity, which seeks to decipher value as a 'thing of

thought' [*Gedankending*]. *Second*, Adorno's idea of an 'inverted form of the primacy of objectivity'<sup>13</sup> returns in Reichelt's theory of the predominance of objectivity (Reichelt, 1973: 37; 1982: 168) and signifies the real independence of capitalist society in relation to the intentions and needs of the actors. *Third* is the critique of methodological individualism and objectivism in social theory. According to Adorno, the real independence of the capitalist economy cannot be made transparent to the intentions of the actors in a 'social nominalist' way, but neither is it an in-itself which exists independently of the actions of the individual.<sup>14</sup> *Fourth*, there is the critique of 'positivism' as a naïve empiricist methodology, which ignores the historical-social mediation of 'facts' and inverts 'the mediated into something immediate'.<sup>15</sup>

This lineage from Adorno through Alfred Schmidt to Reichelt and Backhaus is not mentioned at all in the classic overviews of the Frankfurt School, such as those by Martin Jay, Rolf Wiggershaus, or even the more recent works on the development of the Frankfurt School, like that of Alex Demirović.<sup>16</sup> On the other hand, however, there is a tendency, among Backhaus and Reichelt themselves<sup>17</sup> as well as both their pupils<sup>18</sup> and critics<sup>19</sup> to equate the new Marx-reading in West Germany with the contributions of the late Frankfurt School.<sup>20</sup>

### **ON THE LOGICAL STRUCTURE OF THE CONCEPT OF CAPITAL – BEGINNINGS OF THE WEST GERMAN NEW MARX-READING (1970)**

Helmut Reichelt describes in retrospect his investigation into the logical structure of the concept of capital in Marx as the 'first attempt at a reconstruction of the [...] dialectical method in *Capital*' (Reichelt, 2001: 7). In the following, I present the fundamental theses of his work alongside criticisms of it within the West German debate.

### ***On the continuity of the critical-genetic method***

Reichelt identifies substantial evidence in Marx's early work of the methodological concept of the critique of economy, whose social-theoretical complements content can be 'deciphered only against the background of the late work' (Reichelt, 1973: 24). Reichelt's main thesis is that Marx's analysis of value should be understood as the 'fulfilment of the program of the fourth thesis on Feuerbach at the level of political economy' (Reichelt, 1973: 151).<sup>21</sup>

What Feuerbach practised in his critique of religion – the dissolution of the (apparent) independence and substantiality of God through his analytic reduction to the unified but unhistorically understood essence of man – is found in the political economy of Smith and Ricardo as the reduction of the independent forms of wealth to the uniform but unhistorically understood principle of human labour.<sup>22</sup> Marx's project was to carry out a *genetic reconstruction* of the necessity of these independent forms and their objective appearance from *historically specific* social conditions of labour. Reichelt thus makes an implicit parallel of the theoretical difference between Marx and Feuerbach with that between Marx and Ricardo.<sup>23</sup> The characteristic doubling in capitalism – of the product into use-value and value, of the commodity into commodity and money, of bourgeois society into society and the state, and so on – should be understood from 'the intrinsic contradictoriness' of the 'secular basis'.<sup>24</sup> Already in the *Economic and Philosophical Manuscripts* of 1844, Marx's first attempt at a systematic explanation of the fundamental forms of alienation in bourgeois society, he criticizes the central failure of political economy in that it does not derive the genesis of the forms of wealth and coercion from the structural contradictions of this society. Instead, it starts 'with the fact of private property'<sup>25</sup> without explaining it, thus assuming what it first has to develop. In this 'standpoint of the finished phenomena',<sup>26</sup>

which Marx later accused of 'economistic one-sidedness', the alienated mechanisms of reproduction in bourgeois society are therefore uncritically accepted as 'final, no longer derivable' and thus no longer conceived as historical-social forms (Reichelt, 1973: 43).

According to Reichelt, Marx criticized the 'positivism' (empiricism) of political economy at the programmatic level in his early writings. In the value theory of the later period, Marx overcomes this 'external grasping procedure of the bourgeois subject' insofar as 'no category is introduced which is not completely legitimized' (Reichelt, 1973: 142). For Reichelt, Marx's 'positive science', understood as 'the first unadulterated knowledge – not preformed through what can be known – of social reality', presents itself as a critique of positivism in a double sense (Reichelt, 1973: 65). The 'positivism' of the bourgeois condition consists not only in the apparent naturalness of economic objectivity but also in the real independence of social relations in the form of the domination of economic objects over the human beings who have, under specific conditions, produced them (Reichelt, 1973: 62, 266). However, Marx's theory can only reconstruct the process of constitution of this 'predominance of social objectivity' (Reichelt, 1973: 37; 1982: 168) from the historically generated perspective of unalienated socialization (Reichelt, 1973: 38 ff., 58). Only modern productive forces therefore create the conditions for overcoming the inversion of subject and object and form the historical-philosophical anchor of Marx's science (Reichelt, 1974a: 39; Reichelt, 1995: 56 ff.).

In 1971, Project Class Analysis (PKA) criticized this position. The outlines of a definition for an emancipated society become recognizable only at the *end* of Marx's process of inquiry. Before Reichelt's presupposed anticipation of this condition can acquire any determinate content, the social causes, structures, and conditions of the possible abolition of 'alienation' must be clarified.<sup>27</sup>

The anticipation of communism therefore 'does not enter "into the theoretical penetration" [...], but only into the presentation' of the capitalist mode of production. Ulrich Müller introduced the opposite approach in 1974. In a way typical of the times, Müller accuses Reichelt of not 'referring to any class standpoint' but rather to an anticipated human subject and thus indulging in a 'phil-anthropic alienation lament', which is due to the placement of his work within the 'transitional phase of the student movement from the positions of the Frankfurt School and Marcuse to Marxism'.<sup>28</sup>

Whereas Reichelt claims a strong continuity between the *Theses on Feuerbach* and Marx's later work, Michael Heinrich radically calls this into question. In 1845–6, accordingly, Marx and Engels replace the abstractions of Feuerbach's 'human essence' and Stirner's 'unique one' with 'real individuals' and their historical-economic relations as 'empirically confirmable' presuppositions of a materialist theory of society. This materialism, however, is empiricist; the 'practice' from which all independent and mystified entities are derived, according to *Theses on Feuerbach*, is 'nothing more than an empty formula'.<sup>29</sup> It was only in the course of the so-called epistemological break of 1857 that the understanding of the method and object relevant to the critique of political economy really emerged. 'Practice' moved from the explanans to the explanandum in a strategy of presentation divided into structure, action, and function. The actions of the commodity owners were now understood on the basis of the gradually unfolding structure of the mode of production and were 'no longer the transparent reason for explanation'.<sup>30</sup> In departure from empiricist methodology, cognition is grasped as the conceptual reproduction of the object rising from the abstract to the concrete.<sup>31</sup> With this, Marx first explicitly recognizes the necessity of a 'non-empirical level of theory'<sup>32</sup> due to the existence of real abstractions as the object of theory. Heinrich's remarks are surely correct as a warning against

the empiricist- 'praxeological' shortcomings of the *Theses on Feuerbach* and value-form analysis. However, he ignores every reference to historical structural categories in the *German Ideology*, such as the concept of the 'mode of production', which encourages Reichelt to see 'no naive empiricism' at work here (Reichelt, 1973: 46).<sup>33</sup> It is also significant that Heinrich does not consider the *fourth* thesis on Feuerbach, upon which Reichelt essentially bases his claim of the continuity of the critical-genetic method. At the least, he would have been attentive to the salient parallels with *Capital*,<sup>34</sup> which can hardly be dismissed.

From the standpoint of an analytical theory of science, Christof Helberger in 1974 criticized Reichelt's elaboration of Marx's critique of economic empiricism. Reichelt's objection to a merely empirical approach, instead of as a complete legitimation or explanation of economic categories, is initially understood as a reproach against bourgeois science, insofar as it is unable to supply 'historical-genetic explanations'.<sup>35</sup> The object of the 'logical analysis' unnoticed by Helberger and first postulated by Reichelt is the systematic re/production of determinate forms of wealth under given but at the same time historically specific social conditions of labour. Reichelt's accusation therefore consists neither in the assumption of a supposed 'bourgeois' inability to make *historical* explanations nor in assuming the inability to make causal analyses of social facts in general. Marx's anti-empiricism is, according to him, a critique of political economy (not a statement in the philosophy of science about 'bourgeois' thought per se) for failing to take into account the difference between theoretical and empirical concepts, and ultimately for succumbing to the object-induced semblance of the naturalness of historically specific relations. The structural-analytic explanation of political economy is therefore not pushed far enough (incomplete abstractions), the empirical and the theoretical are confounded (false abstraction or lack of an intermediary between the theoretical level and the empirical level) (Reichelt, 1973: 115, 117)<sup>36</sup> and

finally the historicity of the object is missing (economic one-sidedness). This breakdown in explanation, or the fact that these explanatory approaches remain within the framework of *specific* uncritically presupposed categories, is not a problem of the arbitrary 'selection of questions'<sup>37</sup> from which Helberger derives the differences between 'bourgeois' and Marxist approaches, but is materially grounded: the object leads the scientific observer to certain evidential assumptions about the nonhistory of the capitalist mode of production. This epistemological dimension of the material analysis in *Capital*, however, does not occur to Helberger. His positivistic conception of ideology stems from the deviation of 'subjective ideas [...] from actual reality' and the blurring of descriptive statements with normative expectations.<sup>38</sup> Helberger sees another possible interpretation of Reichelt's critique of the empirical assumption of categories in the idea of a 'complete explanation',<sup>39</sup> i.e., the demand for an explanation of *everything* that can be explained. But neither Marx nor Reichelt pursue this goal, even though Reichelt may sound like this sometimes. In contrast to Hegel, Marx does not investigate an absolute system but a finite system based on presuppositions which it itself did not create, and which therefore cannot and must not be explained within the framework of the system. This is precisely what Marx calls the limits of dialectical presentation, which Reichelt repeatedly points out (Reichelt, 1973: 132, 252; 2000b: 119).

### ***Critique of the rule of abstractions***

According to Reichelt, it is the *Grundrisse*, with its inner 'relations of economics and dialectics', that first opens up 'access to the real contents of Marx's economic critique and thus also the logical structure of *Capital*'. Even in his rather unphilosophical, 'extremely sober language' (Reichelt, 1973: 75), there are traces of a second Hegel reception here, something already emphasized by Alfred

Schmidt.<sup>40</sup> This suggests that Marx's recourse to a dialectical sequence of categories as the expression of a 'compulsion' from the object itself indicates a 'structural identity' (Reichelt, 1973: 76) between Hegel's notion of spirit and Marx's concept of capital. The rule of an abstractum (i.e., value) adopting various forms (i.e., the value-forms) and reproducing itself therein (i.e., as the accumulation process of capital)<sup>41</sup> is considered by Reichelt to be the objective foundation for the workability of dialectical presentation: 'It has validity only where a universal is asserted at the expense of the individual'. In its idealist variant, it is the mystifying doubling of this real subject-object inversion; as materialist, it reflects upon itself as a historically limited 'method of recall' (Reichelt, 1973: 81).

As PKA pointed out in 1971, Reichelt reaches just as little beyond 'merely abstract references to parallels'<sup>42</sup> between Hegel and Marx as Roman Rosdolsky did before him. Ulrich Müller argues that Reichelt's Adorno-influenced critique of abstraction has a tendency to absolutize the critique of science, which is suggested through equivocations of the formula of the 'domination of the universal', and whose final consequence would be manifest irrationalism.<sup>43</sup> Thus, in the manner of a romantic critique of the abstract also found in Adorno, Reichelt claims: 'When individuals first come into their own, and are no longer subsumed under one abstract-universal produced by themselves in this form, then general statements become impossible. With the abolition of social objectivity, the abstract negation of real individuality, the object of all theory disappears' (Reichelt, 1973: 40).

### ***Dialectic of value-form***

It is above all the reconstruction of the dialectical structure of value-form analysis that distinguishes Reichelt's work from similar works of his time. He specifically draws attention to the program of value-form analysis, still clearly formulated in the first edition of *Capital*. There, Marx's point is 'to prove

that the value *form* arises out of the value-*concept*.<sup>44</sup> What was regarded with suspicion by previous commentators as a 'merely' conceptual dialectic, to which a historical proof should be attached,<sup>45</sup> is thus recognized as the real problem posed by Marx: the transition from value to value-form, from the simple to the general form of value and finally the money-form presented as the conceptual unfolding of the existing necessary connection between commodity and money (Reichelt, 1973: 139). The motor of presentation is the 'contradiction [...] between the universality of value and the inadequate form of its appearance' (Reichelt, 1973: 159). In the universal equivalent, according to Reichelt, not only does each commodity by itself distinguish its value from its use-value, but all commodities do together. The value which is common to commodities – socially universal form – is actually expressed first here, namely 'simply (in a single commodity-body) and homogenously (in the same commodity-body of another)' (Reichelt, 1973: 158). 'The commodities are all qualitatively equated, all are expressed as the material of the same labour and can now be compared quantitatively. Thus, if labour-time in general should operate as the regulating law of production, then abstract-human labour itself must exist alongside and outside all particular commodities in natural form' (Reichelt, 1973: 159). It is thus clear that – contrary to Engels – the 'law of value' and 'commodity exchange' cannot be spoken of before the existence of money; the pre-monetary concept of the commodity has no empirical correlate. Reichelt also explains Marx's distinction between the 'analytical' and 'real' relationship of commodities to each other. He shows that within value-form analysis, the commodity in the shape of the value-form gains 'only a double existence in the head'. The independent existence of abstract labour in the shape of a specific concretum here is only the result of an 'ideal doubling' on the part of the scientific observer. The 'real doubling' of the commodity (into commodity

and money) is tracked in the chapter on the exchange process. Here the contradiction between use-value and exchange-value (value) drives the conceptual analysis (Reichelt, 1973: 159 ff.).

This division is put into question by Dieter Wolf, who argues that Reichelt artificially separates the commodity-immanent contradiction (W1) between use-value and value from the contradiction between the value of the commodity in the relative value-form and use-value of the commodity in the equivalent-form (W2), and then assigns them incorrectly to the levels of presentation in chapters 1 and 2 of *Capital*. Reichelt finds the former contradiction only in the second chapter, and the latter one only in the first chapter, and he thinks that the second contradiction (W2) drives the independent expression of value. This assertion, however, presents a logical contradiction, for the commodity-immanent (W1) contradiction is the basis for the distinction between the poles of value-expression (W2), and this is already the first form of solution for that;<sup>46</sup> but it is only *after* this solution that Reichelt encounters a 'contradiction [...] at all' at the level of the still insufficient, objective expression of value.<sup>47</sup> According to Wolf, the immanent contradiction (W1) as the basis of the simple form of value remains the foundation of the further expressions of value, since these are only the developed forms of the simple ones; nevertheless they differ from that which drives the development of the value-form (W2). The contradiction of the simple value-form no longer exists between the value and use-value of the first commodity (which has just found its form of movement here), but rather, as Reichelt describes, it exists between the social-universal character of the value of the first commodity and the unsocial-particular character of the use-value of the second commodity.<sup>48</sup> But only after contradiction 1 has been 'solved' immanently does contradiction 2 arise externally, which Reichelt disregards.

### ***Simple circulation or simple commodity production?***

In *On the Logical Structure*, Reichelt distances himself from Engels' claim that Marx, in the first three chapters of *Capital*, traces the historically independent phase of 'simple commodity production'. Reichelt, like Rosdolsky before him, draws attention to Marx's definition of simple circulation (C–M–C) as an 'abstract sphere' of the overall capitalist reproduction process. Only in capitalism, then, is commodity production the universal form of social metabolism: simple circulation *presupposes* capitalist production relations (Reichelt, 1973: 130). Therefore, the logical-conceptual mode of presentation exhibits simple circulation as a moment of the production relations and destroys the harmonic semblance 'of the encounter between free and equal individuals in the sphere of circulation' (Reichelt, 1973: 165). The dialectical entanglement of both levels furthermore implies a critique of the projection of the laws of appropriation for commodity exchange, and the semblance of appropriation through labour produced by them, onto pre-capitalist social formations (Reichelt, 1973: 129 ff., 166).<sup>49</sup> Starting from this understanding of simple circulation as a level of abstraction in Marx's development of the concept, Reichelt argues that the transition from money to capital is 'carried out more smoothly' (Reichelt, 1973: 244) in the *Grundrisse* than in *Capital*,<sup>50</sup> based on the deficiencies of the money-form. Marx's critique of the economy thus turns out to be a theory of the constitution of the forms of alienated socialization and its characteristic doubling in the shape of a logical-conceptual explanation of material reproduction's independence from its real systematic context: capital as 'self-perpetuating' value in process (Reichelt, 1973: 244–9).

Nevertheless, *On the Logical Structure* remains captive to Engels' historicist methodological orthodoxy, thereby obscuring the above-mentioned insights. Reichelt speaks

diffusely of a 'peculiar intertwining of the historically-descriptive and immanent-genetic method' (Reichelt, 1973: 166), assigning a historical-empirical correlate to the logical transition from the undeveloped to the general form of value (Reichelt, 1973: 167), thus conceding the correctness of Engels' historicizing methodological reflection, if only 'approximately' (Reichelt, 1973: 133). As Bader et al. criticized in 1975, this confuses Marx's talk of the 'real movement through which capital comes into being' with a historical process (Reichelt, 1973: 136).<sup>51</sup> As the PKA noted in 1971,<sup>52</sup> Reichelt ultimately falls back into a logical-historical parallelism, in which the unfolding of the categories in the critique of economy is to be understood as the 'abstract form of presentation of that process which historically leads to capitalism' (Reichelt, 1973: 136).<sup>53</sup> Characteristic of Reichelt's ambiguity with respect to the mode of presentation is his 'peculiar', contradictory, mixing of logical and historical elements. He points to a passage in *Capital* where Marx emphasizes that one must assume a phase of 'primitive accumulation' preceding capitalism – in which the conditions of the capitalist form of the material reproduction process were first created – if one does not want to run into the vicious circle of saying that capital originally brought itself into the world.<sup>54</sup> Alongside this reflection on the *limits* of the dialectical presentation of the movement of capital, however, Reichelt suddenly adds the claim that Marx in the *Grundrisse*<sup>55</sup> describes the presupposition of capitalist production, the separation of direct producers from the means of production, 'as also a result of the movement of capital' (Reichelt, 1973: 260). It is unclear which capital he is talking about here. Peter Römer has therefore rightly pointed out that Reichelt's thesis, taken literally, entails the belief in a 'mystical self-generation' of capital.<sup>56</sup>

The only explicit critique of Engels in his book comes in the following context. Engels interprets Marx's remarks on the transformation of the laws of appropriation

as a historical presentation of the emergence of the capitalist mode of production from the laws of simple commodity production *without any direct violence* (Reichelt, 1973: 257 ff.). Reichelt rightly criticizes this as a 'grotesque distortion' of Marx's ideas. But what he blames on Engels is not the historicist interpretation of the transformation – on the contrary, he reiterates his commitment to precisely this interpretation – but only his 'abstract opposition between violence and economic dynamics'. Here, Reichelt once again confuses the fundamental difference between the constitutive violence of class relations as external historicity (which in the chapter on so-called primitive accumulation Marx clearly separates from the analysis of the movement of capitalism on its own basis) and the reproduction of the founding violence of separation (of direct producers from the means of production) through structural coercion as a 'contemporary' dynamic of the capitalist mode of production. This confusion happens because his only argument is that even in capitalism, labour-power is compelled 'if necessary, with brutal violence' to produce surplus value (Reichelt, 1973: 259).

### **ON THE CRITIQUE OF THE PHILOSOPHY OF HISTORY: PRODUCTIVE FORCES AND PRODUCTION RELATIONS (1975/83)**

Marx and Engels' conception of history was also the subject of the reconstruction debate in West Germany. Helmut Reichelt provided important contributions with his annotated *Texts on the Materialist Conception of History* (1975) and especially his essay *On the Dialectic of Productive Forces and Production Relations: Attempt at a Reconstruction* (1983). In these writings, he observes an ambivalent conceptualization of the relationship between productive forces and production relations in Marx. Accordingly, a *causa sui* concept of productive forces<sup>57</sup> stands

immediately opposed to the analysis of the development of productive forces as a result of the capital relation (Reichelt, 1975: 80 ff.; 1983: 41).

Marx developed the first concept primarily in his early writings.<sup>58</sup> Here, *first*, the productive forces (labour-power and means of production) are regarded as an automatic universal-historical motor of progress, which presupposes production relations (above all, property ownership) as the merely reactive variable of social development. Marx, according to Reichelt, 'postulates [...] the determining function of the productive forces' (Reichelt, 1983: 42) as 'the basis of the [...] entire history'<sup>59</sup> of mankind. According to Marx (and Engels), the character of the means of production itself suggests specific property relations or determines them directly (Reichelt, 1983: 41):<sup>60</sup> 'The hand-mill gives you society with the feudal lord; the steam-mill society with the industrial capitalist', writes Marx in *The Poverty of Philosophy* (1847).<sup>61</sup>

*Second*, according to Reichelt, Marx, before he even begins any historical research, expands his diagnosis of a present contradiction between productive forces and production relations<sup>62</sup> to the developmental logic of universal history. The productive forces now bestow the unity of history, and their contradiction of the property relations determines the social progress of the mode of production: 'With the acquisition of new productive faculties', Reichelt quotes Marx, 'man changes his mode of production and with the mode of production he changes all the economic relations which were but the necessary relations of that particular mode of production'.<sup>63</sup>

*Third*, the thesis, formulated in the context of overcoming capitalist structures, that revolutionary change 'supposes the existence of all the productive forces which could be engendered in the bosom of the old society',<sup>64</sup> eventually becomes hypostasized by Marx into a universal-historical truth in the preface to *A Contribution to the Critique of Political Economy* (1859).<sup>65</sup>

Reichelt understands this approach as heir to the bourgeois-fetishistic evolutionary theories in which 'technology' and 'knowledge' are taken as autonomous factors of modernization. Ever since the *Grundrisse*, Marx had conceived of this 'inability to analytically separate the material side and the formal side and to reconstruct it in its complex unity' (Reichelt, 1983: 53) as the 'crude materialism of economists' who 'regard people's social relations of production, and the determinations acquired by things [...] as *natural properties* of the things'. They thus fall into a 'crude idealism, indeed a fetishism which ascribes to things social relations as determinations immanent to them, and thus mystifies them'.<sup>66</sup>

Against the fetishizing of historical processes through a technicist idea of a 'basis of the base',<sup>67</sup> Marx's mature economic critique shows, according to Reichelt, that the industrial mode of production is the *result* of capitalist production relations and does not precede it. The tendency to develop productive forces results 'from the competitive structures of capital reproduction [...] since individual capitals can only maintain themselves in a competitive situation if they secure advantages'.<sup>68</sup> With insight into the dynamics of relative surplus-value production and its accompanying real subsumption of the labour process under capital, Reichelt sees a reversal of the correlation between productive forces and production relations (Reichelt, 1983: 49 ff.). Since the *Grundrisse*, Marx had understood the industrial process of modernization as 'the self-induced movement of capital' (Reichelt, 1983: 44). Production relations now bring about corresponding productive forces and thus form the material side of the production process. 'In machinery', Reichelt cites Marx's *Grundrisse*, 'objectified labour confronts living labour in the labour process itself as the power which dominates it, a power which, in terms of its form, as the appropriation of living labour, is capital'.<sup>69</sup> The formal and material dimension, to Marx, should not be confused.<sup>70</sup> But it remains an

open question if Reichelt means something more than an external conceptualization of the difference between machinery in itself and its capitalist application.<sup>71</sup> It is unclear whether the productive forces, despite their pre-formation, must be conceived as 'form-specific and form-transcending at the same time'.<sup>72</sup> In any case, it is certain that in the *Grundrisse*, 'a theory of history is presented which cannot easily be reconciled with that of the Preface to *A Contribution to the Critique of Political Economy*' (Reichelt, 1983: 50). Reichelt finds this diagnosed ambivalence again in *Capital*,<sup>73</sup> even if the idea of the primacy of production relations – the conclusion that the 'explosive development of the productive forces' is due 'to the bad infinity of capital in process' (Reichelt, 1983: 52) – clearly prevails there. Thus, Tobias Reichardt notes that in *Capital*, Marx recognizes that only the 'technical basis' of capitalism is 'revolutionary, while all earlier modes of production were essentially conservative',<sup>74</sup> and so no dynamic predominated then, let alone a self-dynamic of the productive forces. But if one maintains a *causa sui* model of the productive forces, this leads to an 'aporia'. Marx 'argues that pre-capitalist societies differed from capitalism in that they were *not* based on the development of the productive forces, and that just such a development of the productive forces *necessarily* led to the dissolution of all previous forms of society'.<sup>75</sup>

Reichelt's Bremen colleague Heide Gerstenberger asks what conception of the unity of history remains after the universal-historical hypothesis of early historical materialism turns out to be a residue from the philosophy of history? What happens when the 'question as to the historical causes for the inauguration of a new historical formation' is no longer 'solved once and for all'?<sup>76</sup> Since Marx's more mature theory, as Andreas Arndt observes, could no longer be 'a theory of history',<sup>77</sup> historical continuity would only be 'produced through the development of labour, its means, and its organization in the simple continuity of the generations.

Labour, however, can neither be abstractly generalized nor considered the subject of history'.<sup>78</sup> Beyond the assumption of supra-historical laws of motion, as can be seen in the *causa sui* model of the productive forces, but also beyond the dissolution of history into a 'smorgasbord of arbitrarily arranged data', there remains 'a concept of social formations as the units in which history structures itself, i.e., transpires within a determinate context'.<sup>79</sup>

### THE VALIDITY THEORY OF VALUE (2007)

In his later work, *The New Marx-Reading* and related essays, Reichelt declares that the reconstruction efforts of the 1970s failed. No longer must one contrast Marx with Marxism and reconstruct an authentic Marxian theory. Rather, Marx's critique of political economy itself demonstrates irreparable 'discrepancies and flaws already in the core theoretical arguments' (Reichelt, 2008: 42). Reichelt's project thus shifted towards a 'new new' Marx-reading, so to speak. To this end, he draws upon Adorno's intuition of a dialectical theory of society that renders discernible the emergence *and* independence, subjectivity *and* objectivity of the social (Reichelt, 2008: 24, 26).<sup>80</sup> 'Bourgeois' social theory, on the other hand, does not develop an adequate concept of its object but merely interprets different levels of experience found within capitalism. On the one hand, Reichelt diagnoses in methodological individualism the hypostatization of subjects' private dissociation into the primary, irreducible fact of the semblance of autonomy; on the other hand, he diagnoses in objectivism the hypostatization of experience with the independent dynamic of capital into a collective, transcendently presupposed entity (Reichelt, 2008: 17 ff., 38, 178 ff.). To avoid the classical dualism between theoretically constitutive individualism and collectivism, Reichelt now refers to another idea in Adorno: the interpretation of

a specifically economic-social objectivity as 'conceptuality holding sway in reality itself'. To work through these unfulfilled aims of Adorno, Reichelt, like Backhaus in 1978, turned to Jürgen Habermas' concept of reconstruction: the theoretical material at hand, above all the Marxist critique of economics, should be taken apart and reassembled in a new form in order to better achieve the goal it set itself (Reichelt, 2008: 42).<sup>81</sup>

Habermas, maintains Reichelt, abandoned the debate on economic-theoretical problems with his project to reconstruct historical materialism. He criticizes Habermas for replacing a genetic analysis of money as a form of wealth from certain production relations with a neoclassical and functionalist approach that conceptualizes money solely as a symbolic medium of generalized communication. Thereby, money is grasped linguistically and endowed by Habermas (without any justification) with a capacity for symbolizing *utility*-quantities (Reichelt, 2008: 375). Moreover, Habermas artificially separates the idea of the money-mediated economy from its class-specific implications and thus turns out to be an ideologist of simple circulation.<sup>82</sup> When the money medium is seen as a supposedly harmless means to facilitate the coordination of material reproduction and relieve the risk of disagreement in linguistic negotiation, it can no longer be conceived as the independent, crisis-prone end of the capitalist economy, which entails exploitation. In so doing, Habermas also misses the systemic character of the capitalist economy.<sup>83</sup> 'Habermas' favoured conceptual framework for the economy', Reichelt concludes, 'implies the romantic image of an exchange society of free and independent equals' (Reichelt, 2000a: 124, 144). The business of critical theory for Habermas thus lies merely in criticizing the 'colonialization' of the sphere of norm-regulated socialization through the medium of money, and to relegate it to 'its rightful' systematic domain.

Reichelt, on the other hand, tries to solve the aporias of social science and economics

simultaneously with the central problems of Marx's theory by linking economic phenomena with norm-regulated socialization in a completely different way. Reichelt assumes the task of clarifying the question of the ontological status of value and money within the framework of a new theory of validity, which he considers to be implicit in the first edition of *Capital* (Reichelt, 2007: 11 ff.). In order to theorize value as an independent, 'incomprehensible' social relationship (i.e., irreducible to the rational motives of individuals or groups), but also to de-naturalize it at the same time, Reichelt uses Adorno's terminology of value as objective 'conceptuality holding sway in reality itself'.<sup>84</sup> Value is thus considered the result of a real abstraction generated in exchange but not reducible to conscious acts of abstraction by subjects. Reichelt now regards it as his task to explicate and concretize this concept of real abstraction, since it is only in this way that the specific social objectivities of value, money, and capital are scientifically knowable (Reichelt, 2007: 8). Proceeding from this specific interpretation of the exchange abstraction<sup>85</sup> as a theory of the 'objective concept', Reichelt begins constructing his premises by 'taking apart' and 'reassembling' Marx's theory. However, in decontextualizing and reframing Marx's quotations, which he does, Reichelt does not mean to reinterpret Marx's central theses. Rather, Reichelt presents this as the explication of Marx's own systematic intentions and concepts, albeit not yet formulated precisely enough (Reichelt, 2007: 10 ff.).

Three hermeneutical operations on Marx's text lead Reichelt to his conception of value as the product of an abstraction existing unconsciously in the head of the commodity owner.<sup>86</sup>

First of all, Reichelt quotes from Marx's appendix on 'The Value-Form' in the first German edition of *Capital*: 'Equivalent means here only *something equal in magnitude*, both things having been silently reduced in our heads to the abstraction *value*'.<sup>87</sup>

The context of this statement in the presentation of *Capital* shows that Marx is speaking here about the *analytical apprehension* of value by scientific consciousness. The point is that the value-magnitude of a commodity existing in the equivalent form is 'measurable' within the value-relation 'only indirectly'<sup>88</sup> by reversing the relation of polarity. That is to say, the polarity relation 'x commodity A is the value of y commodity B' is also an equivalence relation ('x commodity A = y commodity B'), but the value of the relative value-form and the equivalent-form cannot be expressed ('measured') in it at the same time. Understood *merely* as a relation of equivalence (as in the later first and second subsections of the first chapter of *Capital*),<sup>89</sup> the equality in magnitude of the two commodities holds only theoretically 'for us' in the head. This assertion is only about the theoretical *presentability* of the value of both commodities beyond the value-form, and therefore, in contrast to Reichelt's interpretation, it does not contain a thesis about the supposed mental construction of value. A similar meaning also lies behind the formulation that value (in the later first and second subsection) is still merely a 'thing of thought'.<sup>90</sup> Since the real abstraction of value does not take place outside the exchange process, the specific social character of the 'individual' commodity (from the beginning of the presentation in *Capital*) can only be conceived of as a mental category.<sup>91</sup> Value *as such* is only conceivable, not observable. Reichelt now takes such statements as descriptions of the ontological status of value per se. He can thereby invoke Adorno when he writes that exchange-value, compared to use-value, is 'a mere thought' which 'dominates humans needs and replaces them'.<sup>92</sup>

Second, Reichelt draws a distinction between economic forms and the categories in which these forms are described. Marx's statement that 'the categories of bourgeois economy' consist in the objectively induced semblance of the material characteristic of direct exchangeability as 'objective forms of

thought<sup>93</sup> is removed by Reichelt from the reference to the fetishistic *semblance* [*Schein*] that the forms produce in the expression of value, as well as to its treatment in the discourse of political economy. No longer are the 'perverted forms'<sup>94</sup> described as *mystified and fetishized* real forms, but rather these forms are now considered to be objective forms of thought (Reichelt, 2007: 25; 2001: 17). Thus, Reichelt describes the *objects* of economy as 'categories', distancing himself from Marx's materialism in which neither value nor money as economic forms are 'objective forms of thought'; only the *mental reproduction* of these forms in their finished, material shape, which no longer exhibits the social processes of mediation of their production, are designated as such forms of thought.

The revocation of the difference between object-theoretical ('value is...') and metatheoretical reflections ('value is here only conceptually intelligible...') as well as between form and fetish leads Reichelt to his validity theory, which, *third*, also leaves behind Marx's distinction between the levels of presentation of value-form analysis and exchange analysis. Reichelt presents the constitution of economic objectivity as follows: under social conditions of private, specialized labour ('due to the initially structured situation'), commodity owners are 'compelled' to carry out an 'act of equating unaware to themselves' (Reichelt, 2007: 24) to produce value through a 'logically unconscious' (Reichelt, 2007: 16) movement of thought that occurs in the minds of all individuals independently of each other, thus presenting itself as a socially necessary nominal abstraction.<sup>95</sup> Thus, in Marx's talk of the 'objective equalisation of unequal quantities of labour forcibly brought about by the social process',<sup>96</sup> Reichelt reads the fact that products of labour, in their capacity as indiscriminate products of labour, obtain the social function of being the ground of exchangeability – the socialization of products under conditions of private-specialized labour – as cognitive performances of the actors. At first, this 'subjective' equalization

of commodities (described in Form II of the value-form analysis)<sup>97</sup> is explained through an 'inversion' – which also takes place in the minds of the actors before their social contact – of the developed form of value to the general value-form and into the 'objective' (equal) positing of commodities. Value-form analysis thus shows the 'change from subjective to objective "form of thought"' (Reichelt, 2007: 27). The genesis of money occurs through the combination of this unconscious production of the general equivalent with the conscious selection of the commodity fulfilling the equivalent-function. Marx's concept of money should be distinguished from the technologically neutral theories of money as a 'cunningly devised means of information'<sup>98</sup> by the fact that the 'universal acceptance' (of money) – which 'universalises and standardises' subjects' movements of thought (Reichelt, 2007: 25) – is tied back to the unconscious 'universal validity'. For Reichelt, the explanation of the 'change' (Reichelt, 2007: 27) from subjective to objective cognitive activity separates this from subjectivist theories.

Dieter Wolf subjected this conception to a detailed critique, which Reichelt ignored in his later works. Although Reichelt ostensibly makes a distinction between the theoretical and actual relationships of commodities with each other (Reichelt, 2007: 24), he puts into practice a mixture of both levels of abstraction. In so doing, the findings of the scientific consciousness are ascribed to the unconscious of the commodity owners. In the specifically social relation of things (in which they are placed involuntarily by people under certain social conditions of their labour), what happens in an extra-mental process – the equalization and presentation as values – is projected into the minds of the commodity owners. This transforms the genesis of economic objectivity from a materially mediated relation between human beings into a direct relation between them with respect to a thing. Even more: according to Reichelt, the production of a specifically

*social* objectivity (value and general equivalent) *precedes* every social contact in the minds of each individual commodity owner, since, as he himself emphasizes, the actual relation of commodity owners first becomes the topic in the chapter on exchange. In this way, the *socially valid* form of value, the universal equivalent, emerges in *presocial* acts of thought,<sup>99</sup> and the actual relationship of commodity owners to each other is reduced to the conscious choice of a special money-commodity. In systematically abstracting from commodity owners, value-form analysis shows that value is the formal nexus of social matter as products of labour, determining the agents' logic of action.<sup>100</sup> Yet even there Reichelt operates with the psychological acts of commodity owners. When the actual genesis of the universal equivalent *and* money should be explained by an unconscious social act, in the second chapter,<sup>101</sup> Reichelt limits the act to a conventional determination of the natural form of the *already assumed as real* equivalence function. Thus, Reichelt not only picks up all the constitutive problems of social-contract theories, he also remains in the dualism of matter and spirit and can only imagine objectively mediated social relations as pure ideas or norms.

## CONCLUSION

In this paper, I presented three main strands of Helmut Reichelt's work as well as their critical reception in West Germany. Looking back over more than 40 years of theoretical work, it must be stressed that Reichelt carried through a move away from the economic abstinence of the classical representatives of critical theory. He retained, however, the young Hegelian social ontology of Adorno – which ultimately understood all social phenomena as things of thought and nurtured a sceptical relation to emergent social qualities<sup>102</sup> – and systematized them in his contributions from the year 2000 onwards.

Historically, his contributions to the individual strands of the West German reconstruction debate were crucial.<sup>103</sup> With all their criticisms of Reichelt, especially with regards to his reconstruction of the mode of presentation in Marx's critique of economy and its object-theoretical implications, researchers like Dieter Wolf, Helmut Brentel, and Michael Heinrich<sup>104</sup> have been able to build up the new Marx-reading. Reichelt's ideas have been carried forward in contemporary sociological theory mainly by his students Christian Girschner, Lars Meyer, and Hanno Pahl.<sup>105</sup>

- 20 Reichelt suggests that the new Marx-reading is a pure 'Frankfurt product', due to Hans-Georg Backhaus' accidental discovery of the first edition of *Capital* in a Frankfurt student centre in 1963 (Reichelt, 2008: 11; 2009: 1). Backhaus, trained in Adorno's social theory, recognized at first glance the crucial differences between the first and second editions and laid the foundations for the efforts of critical reconstruction. However, in my view this is an unacceptable reduction of the sources of the new Marx-reading; see Elbe, 2010, chapter 1.1.
- 21 Backhaus (1997d: 405 ff.) draws attention to the fact that Marx, as early as 1843, in the course of his *Critique of Hegel's Philosophy of Right*, stressed the critical-genetic method: 'So the truly philosophical criticism of the present state constitution not only shows up contradictions as existing; it explains them, it comprehends their genesis, their necessity' (Marx, 1843: 91).
- 22 Later, Reichelt also emphasized some parallels between Feuerbach and Marx himself. The latter conceived of money in an analogous way to Feuerbach's concept of God – as a sensual individualization of a universal and as an alienated form of social interaction through an independent third (Reichelt, 1975: 15 ff.).
- 23 Backhaus also pointed out these parallels and even modified the fourth thesis on Feuerbach in a manner critical of Ricardo: 'Ricardo starts from the fact of economic self-alienation, of the doubling of the product into a value-thing, an imagined and an actual thing. His theory consists in dissolving value into labour. He overlooks that the main thing still remains to be done. Namely, the fact that the product contrasts itself with itself and fixes itself as an autonomous realm of economic categories beyond consciousness is only to be explained precisely from the self-distortion (*Selbstzerissenheit*), and the self-contradiction of social labour. This must first be understood in its contradiction and then be practically revolutionised by the abolition of the contradiction' (Backhaus, 1980: 108).

- 32 Heinrich, 1999: 157.
- 33 See also Arndt, 1985: 61, which emphasizes that in the *German Ideology*, reality is regarded as a 'context of mediation', as a 'structure of relations which escape the immediacy of an intuitive understanding'; see also Kittsteiner, 1977: 10, 15.
- 34 See also Marx, 1867/72: 375 n2: 'It is, in reality, much easier to discover by analysis the earthly core of the misty creations of religion, than, conversely, it is, to develop from the actual relations of life the corresponding celestialised forms of those relations. The latter method is the only materialistic, and therefore the only scientific one'.
- 35 Helberger, 1974: 177.
- 36 See also Marx, 1861–3: vol. 31, 338, 401; Marx, 1861–3: vol. 32, 500.

- 38 Helberger, 1974: 163.
- 39 Helberger, 1974: 177.
- 40 For more detailed information on this thesis of a second Hegel reception, see Kittsteiner, 1980: 65–9.
- 41 See also Reichelt, 2001: 14.
- 42 PKA, 1971: 102 n. See also the critique by Müller, 1974: 281.
- 43 Müller, 1974: 283.
- 44 Marx, 1867a (cited in Reichelt, 1973: 156).
- 45 Rosdolsky, 1989: 113 ff.; Zelený, 1980: 35 ff.
- 46 Even Projektgruppe Entwicklung des Marxschen Systems (PEM), 1973: 201 recognizes this: 'What Reichelt [...] misses is that [...] the value-form is already based on the opposition between use-value and value', so the latter cannot be first introduced after it.
- 47 Wolf, 1985: 181.
- 48 Wolf, 1985: 178.
- 49 With this critique, Marx not only challenges Locke and Smith but also implicitly Engels' model of 'simple commodity production'. This model also assumes the political-economic construction of an 'undistorted' effect of the law of value in pre-capitalist epoch, regards abstract labour as an empirical measure of value and conceives money merely as a technical instrument to facilitate exchange.
- 50 In fact, there is nothing else in *Capital* about the transition. See Heinrich, 1999: 253 ff.
- 51 Bader et al., 1975: 78 n; Marx, 1857/8: vol. 28, 236.
- 52 PKA, 1971: 96.
- 53 W. F. Haug thanks him later with a positive mention: Haug, 2004: 360.
- 54 Marx, 1867/72: 704.

- 55 Marx, 1857/8: vol. 28, 183 (cited partially in Reichelt, 1973: 135).
- 56 Römer, 1978: 146 n. Ulrich Müller (1974: 281; 1977: 138 n) also sees an idealistic tendency in Reichelt's work, which takes 'the automatic subject qualities [of capital] at face value'.
- 57 The notion of the *causa sui* concept of the productive forces stems from Ritsert, 1988: 69 ff.
- 58 See Marx, 1847: 175; 1846: 96 ff.; 1849: 212. However, there are also statements to the contrary: 'Till now the productive forces have been developed by virtue of this system of class antagonisms' (Marx, 1847: 132).
- 59 Marx, 1846: 96 (cited in Reichelt, 1983: 42).
- 60 Reichelt points to Marx, 1845/6: 85 ff.
- 61 Marx, 1847: 166 (cited in Reichelt, 1983: 42).
- 62 Marx, 1845/6: 85 ff.
- 63 Marx, 1846: 97 (cited in Reichelt, 1983: 42).
- 64 Marx, 1847: 211 (cited in Reichelt, 1983: 43).
- 65 Marx, 1859: 263: 'No social formation is ever destroyed before all the productive forces for which it is sufficient have been developed, and new superior relations of production never replace older ones before the material conditions for their existence have matured within the framework of the old society' (cited in Reichelt, 1983: 43 ff.).
- 66 Marx, 1859: 77 (cited in Reichelt, 1983: 53).
- 67 On this concept, see Weber, 1995: 34. It posits the productive forces as the basis of the economic base. It was a fundamental ideologeme of Marxism-Leninism, e.g., Walter Tuchscheerer, who says that according to Marx, 'the productive forces of society form the basis of production relations' (Tuchscheerer, 1968: 254).
- 68 As Reichelt's Bremen colleague Heide Gerstenberger (2007: 9) notes.
- 69 Marx, 1857/8: vol. 2, 83 (cited in Reichelt, 1983: 49).
- 70 Marx, 1857/8: vol. 2, 84.
- 71 Marx, 1867/72: 444 ff.
- 72 Zech, 1983: 63.
- 73 See Marx, 1867/72: Vol. 35, 190: 'It is not the articles made, but how they are made, and by what instruments, that enables us to distinguish different economic epochs'. And in a footnote, Marx praises the division of 'prehistory' into 'the stone, the bronze, and iron ages'. This is strongly reminiscent of some 'crude materialist' passages from the early period. On the other hand, there are such statements as: 'The essential difference between the various economic forms of society, between, for instance, a society based on slave labour, and one based on wage labour, lies only in the mode in which this surplus labour is in each case extracted from the actual producer, the labourer' (226–7).
- 74 Marx, 1867/72: 489 (cited partially in Reichardt, 2006: 209).
- 75 Reichardt, 2006: 209.
- 76 Gerstenberger, 2007: 8.
- 77 Arndt, 1985: 65.
- 78 Arndt, 1985: 63.
- 79 Arndt, 1985: 65.
- 80 See the comments by Reichelt's student Lars Meyer on Adorno's sociology in Meyer, 2005.
- 81 Habermas, 1990: 9.
- 82 See in connection with Reichelt: Rakowitz, 2000: 174, 335.
- 83 See in connection with Reichelt: Pahl, 2004: 202–7.
- 84 Adorno, 1976: 80.
- 85 The concept of real abstraction comes from Alfred Sohn-Rethel (1978: 20 ff.), but Marx also speaks of real abstraction (Marx, 1859: 272). What is meant is that commodities in the act of exchange are reduced to what is common to them – to be products of social labour.
- 86 See, first of all, Backhaus and Reichelt, 1995: 89: 'Since value concerns a process of abstraction, in which commodity owners and their heads participate, value can only be formed only in consciousness'. Incidentally, in 1987 Robert Kurz similarly presented the thesis of value as a thing of thought [*Gedankending*] (Kurz, 1987: 85–99). Reichelt's theory of validity is largely a reformulation of Kurz's approach.
- 87 Marx, 1867b, cited by Reichelt, 2007: 8.
- 88 Marx, 1867b.
- 89 Marx, 1867/72: 45–56.
- 90 *Gedankending*; see Marx, 1867a.
- 91 See also Wolf, 1985: 108, 132, 175 ff.
- 92 Adorno, 1976: 80, tr. amended.
- 93 Marx, 1867/72: 87, tr. amended.
- 94 *Verrückten*: Marx, 1867/72: 87, tr. amended.
- 95 'Nominal abstraction' means a 'generic concept nominalistically formed' through subjects' cognitive acts of abstraction; see Heinrich, 1999: 210 n.
- 96 Marx, 1859: 299.
- 97 'z commodity A = u commodity B or = v commodity C or = w commodity D', etc.: Marx, 1867a.
- 98 Marx, 1859: 291, tr. Amended.
- 99 A social universal, however, is not justifiable from individuals' subjective cognitive performances before their social contact. In addition, Marx can show that the various interests within the pre-monetary starting condition of exchange could generate as many universal equivalents as commodities (owners), which would thus rule out the existence of an actually universal equivalent. See Wolf, 2004: 85 ff.
- 100 Wolf, 2004: 51.

- 101 According to Wolf, the unconsciousness is 'a non-knowledge about what is happening in the social relation of things' (Wolf, 2004: 33). So it is not an internal psychological process, but the act of human beings relating to each other through the inclusion of their products of labour.
- 102 On Marx and Engels' critique of Young Hegelian social ontology, which conceptualizes all supra-individual entities only according to the model of religion as a 'thing of thought', see Marx, 1845/6: 29 and 91 n: 'For the philosophers relationship = idea'.
- 103 Reichelt also contributed two essays to the reconstruction of Marx's theory of the state: Reichelt, 1974b, 1974c.
- 104 Wolf, 1985; Brentel, 1989; Heinrich, 1999.

# Hans-Georg Backhaus: The Critique of Premonetary Theories of Value and the Perverted Forms of Economic Reality

Riccardo Bellofiore and Tommaso Redolfi Riva

Hans-Georg Backhaus was born in Remda, Germany (later the German Democratic Republic) in 1929. In the 1950s he emigrated from East to West Germany where he studied philosophy, sociology, and political economy in Heidelberg and then in Frankfurt. In 1965 he presented the fundamentals of his own interpretation of Marx's theory of value in Adorno's advanced seminar [*Oberseminar*] at the University of Frankfurt. In 1969 he wrote his best known and widely translated article *Zur Dialektik der Wertform* [*On the Dialectics of the Value-Form*] (Backhaus, 1969), which can be considered the founding document of what is now known as the *Neue Marx-Lektüre* [*New Reading of Marx*].<sup>1</sup> From then on, in an enduring process of self-criticism and self-correction, carried out over the course of many articles (now partially collected in the volume *Dialektik der Wertform: Untersuchungen zur Marxschen Ökonomiekritik* (Backhaus, 1997b), he developed his interpretation of Marx's critique of political economy.

## THE NEW READING OF MARX AS CRITICAL THEORY OF SOCIETY

As Backhaus himself acknowledges, his reading of the critique of political economy is profoundly indebted to Adorno's critical theory of society. Adorno conceived of society on the basis of the concept of socialization [*Vergesellschaftung*]: 'when we speak of society in the strong sense [...] we are referring essentially to the element of "socialisation", which does not apply in the same manner to the [pre-bourgeois] societies' (Adorno, 1969b: 29). What marks the difference between the different forms of society is the form in which 'we, born as separate biological entities [...] are able to become *zoon politikon*' (Adorno, 1969b: 114). From this perspective, Marx's critique of political economy is interpreted by Adorno as the unfolding of a definite form of socialization that is specific to capitalist society.

## EXCHANGE, SOCIALIZATION, AND TOTALITY

For Adorno, the specific form of socialization in bourgeois society is entailed in the exchange relationship. It establishes an objective, total connectedness among the social subjects. In this form, society presents itself as autonomous from the subjects that comprise it. Adorno describes the relationship between object and subject as 'the domination of the universal over the particular' (Adorno, 1969a: 14). In the analysis of exchange, Adorno underlines the contradiction between individuals and society: while individuals act according to intentional and free actions, they create an objective [*gegenständlich*] process that imposes itself as if by nature on them. Society is a human construction that imposes itself on individuals that have created it. As Adorno says, 'society – what has been made autonomous [*Verselbständigung*] – is, in turn, no longer intelligible [*verstehbar*]; it is only the law of becoming autonomous' (Adorno, 1969a: 15, trans. mod.).

For Adorno society is thus a totality, and the totality character is an objective property of society itself:

This latter use of the term implies that there exists between people a functional connection, which varies considerably, of course, according to the historical level of development of the society, and which leaves no-one out, a connectedness in which all the members of the society are entwined and which takes on a certain kind of autonomy in relation to them. (Adorno 1969b: 29–30)

## REAL ABSTRACTION, CRITICAL THEORY, AND THE CRITIQUE OF POLITICAL ECONOMY

This totality character of society has to be understood in connection with exchange as the specific form of capitalist socialization. In this context Adorno turns to the idea of real abstraction, an idea he borrows from

Alfred Sohn-Rethel. Exchange is where real abstraction takes place, in the abstraction from the concreteness of the objects which are reduced to a common and abstract value dimension. Such an abstraction is not a subjective process carried out by social individuals in the act of exchange. It is a real abstraction, independent of their consciousness. The process of the socialization – exchange – entails social individuals as character-masks of their own social world: it is here that society becomes autonomous. The real and objective reduction of commodities to their common dimension, to their essence, shows exactly what Adorno means when he talks about 'the conceptuality of social reality', 'not merely the constitutive conceptuality of the knowing subject but the conceptuality which holds sway in the thing itself [*Sache selbst*]' (Adorno, 1957: 80).

Consequently, for Adorno, the critical theory of society has the task of understanding the process of autonomization: how relationships among men have become autonomous from human beings themselves. More specifically, the task is to understand how these social relationships have become autonomous from the individuals that comprise society.

In a dialogue with Sohn-Rethel, Adorno expresses the necessity of a 'systematic-encyclopaedic analysis of the abstraction of the exchange' (Adorno, 1965: 226), a task Adorno accomplished only in a fragmentary way. It is possible to find openings in his sociological writings and in his lectures that suggest the manner in which he might have developed the critique of the capitalist exchange relations further. Backhaus' transcription of a seminar held by Adorno in 1962 is most decisive in this context (Adorno, 1962).

Here Adorno's analysis of exchange is developed in two connected directions. On the one hand, according to the idea of an immanent critique of society, he wants to show 'the semblance' and superficial character of the equality in the exchange between

two equal values; on the other hand he wants to describe the fetish character assumed by social relations of production in the exchange of commodities – that is, to understand their social nature. When Adorno describes the process of reduction of commodities to their common dimension, i.e. the process of real abstraction embedded in every exchange of commodities, he explicitly refers to Marx's theory of value. For Adorno, Marx's notion that 'it is not the consciousness of men that determines their existence, but their social existence that determines their consciousness' (Marx, 1859: 263) finds its explanation in comprehending the commodity form as the *Urform*, the original form of bourgeois ideology; in fact, the commodity 'is not the simple false consciousness but results from the structure of political economy' (Adorno, 1962: 508). In other words, the ideological forms, by means of which social agents understand the process of production and reproduction of capitalist society, are not simply misleading categories: they are objective forms in which the relations of production manifest themselves. Fetishism is real. That is, 'the theory of ideology [*Ideologielehre*] has its gravity only in the fact that false consciousness manifests itself as a necessary figure [*Gestalt*] of the objective process which holds together society' (Adorno, 1962: 508).

Adorno explains the objective form of capitalist social relations by turning to the concept of abstract labor. 'The unity of socially necessary labor-time' [*die Einheit der gesellschaftlich notwendigen abstrakten Arbeitszeit*] is what makes the commodities exchangeable. This real and objective abstraction is an abstraction from 'the conditions [*Bedingungen*] under which a commodity comes into being [*zustande bekommen ist*]' . The social conditions, under which a product of human labor acquires the form of a commodity, manifest themselves as qualities of the objects exchanged: 'the concept of commodity fetishism is nothing but this necessary process of abstraction. By performing the operation of abstraction, the commodity

no longer manifests itself as a social relation, but it seems as if value was a thing in itself' (Adorno, 1962: 507). In the form of the commodity, social relations manifest themselves as natural qualities belonging to exchange relations between economic things of ostensibly equal value. Exchange entails a process of the realization of profit. In this context Adorno asks himself how to understand profit on the basis of an exchange between equal values. For Adorno, 'the semblance [*der Schein*] is not exchange, because exchange really takes place. The semblance in the process of exchange lies in the concept of surplus-value' (Adorno, 1962: 508) – that is exactly where the process of production assumes the form of the process of valorization.

Adorno conceives of Marx's critique of political economy as an explication of the process of autonomization of society. The critique of commodity fetishism is the theoretical tool to understanding the social nature of capitalist social relations. It amounts to an 'anamnesis of the genesis' (Adorno, 1965: 223) of autonomized social forms, its task is to understand their social origin. According to Adorno, the anamnesis of the genesis lies in the process of exchange as a real abstraction – the objective reduction of the concrete quality of human labor to social abstract labor – that conceals the specific social character of capitalist economic relations.

## SHORTCOMINGS

However, in Adorno's critical theory of society the relation between abstract social labor and the fetish character of the commodity remains undetermined. What has to be explained – that is, why the reduction of commodities to their unity in abstract social labor assumes an objective form – is assumed from the beginning as a character of exchange. The fetish character of the commodity seems to be the result of exchange.

Even if Adorno's analysis often refers to the concept of surplus value and to the process of exploitation, the link between the private expenditure of labor and the process of socialization in exchange remains unspecified. The questions that have to be asked, if the task of the theory is to understand the 'anamnesis of the genesis', are why the processes of socialization assume the form of a system of the private monetary exchange of commodities, and why labor privately expended has to assume the form of money in order to count as social abstract labor.

This is exactly where Backhaus' reading of Marx begins. From Adorno, Backhaus gained a clear insight into the importance of social form in Marx's thinking. This insight was fundamental to his elaboration of value as a social form. For Backhaus, the autonomization of capitalist social relationships, that Adorno linked to the process of exchange, has to be brought back to Marx's theory of the form of value and to the contradiction between the private expenditure of labor and the process of socialization by means of exchange in the form of monetary circulation. Backhaus thus argues that money is the objective social form of privately expended labor. Adorno's idea of historical materialism as the 'anamnesis of the genesis' is thus actualized by Backhaus through the analysis of the form of value – as the central moment of Marx's critique of political economy – by means of which he grounds the constitution of money in the social relation of production.

In Adorno's critical theory, the money form – the 'media [...] accepted by naïve consciousness as the self-evident form of equivalence and thus as the self-evident medium of exchange' – is understood only insofar as the real abstraction of exchange 'relieve[s] people of the need for such a reflection' (Adorno, 1969b: 32); but according to Backhaus, what remains unexamined is the analysis of the form of labor that has to assume the form of money in order to count as socially abstract labor. If money is the social medium that relieves people of the need for

subjective abstraction in the act of exchange, what needs to be understood is why money assumes that social role, and the answer lies, Backhaus argues, in Marx's analysis of the form of value. The real abstraction achieved in exchange is only a consequence of the specific capitalist form of labor. Private labor expended in production is valid as social abstract labor only by assuming the form of money. The process of exchange confirms the social character of privately expended labor by means of a particular and at the same time universal form: money. Money manifests that social dimension which Marx calls value.

## RECONSTRUCTION AND INTERPRETATION OF THE CRITIQUE OF POLITICAL ECONOMY

Backhaus' elaboration of Adorno's insightful interpretation of social form begins with a close analysis of value as a social form. This leads to a critical evaluation of the readings of Marx that neglected the problem of form as well as to his own reconstruction and then interpretation<sup>2</sup> of the critique of political economy as a critique of the social constitution of perverted social forms.

In his first essays Backhaus proposes a reconstruction of Marx's theory of value on the basis of a logical reading of Marx's method of presentation [*Darstellungsweise*]. He also identifies a misunderstanding that has plagued the reception of Marxian value theory. Both inside and outside Marxism, Marx's theory of value has been read in continuity with the Ricardian labor theory of value. This misses the problem of form and Marx's subsequent critique of Ricardo and classical political economy.

As Marx himself pointed out:

It is one of the chief failings of classical economy that it has never succeeded, by means of its analysis of commodities, and in particular of their value, in discovering the of value which in facts turns value into exchange-value. Even its best

representatives, Adam Smith and Ricardo, treat the form of value as something of indifference, something external to the nature of commodity itself. The explanation for this is not simply that their attention is entirely absorbed by the analysis of the magnitude of value. It lies deeper. The value-form of the product of labour is the most abstract, but also the most universal form of the bourgeois mode of production; by that fact it stamps the bourgeois mode of production as a particular kind of social production of a historical and transitory character. If then we make the mistake of treating it as the eternal natural form of social production, we necessarily overlook the specificity of the value-form, and consequently of the commodity-form together with its further developments, the money-form, the capital-form etc. (Marx, 1872: 174)

The misunderstanding in the reception of Marx's theory of value is linked to the lack of insight in regard to the problem of *Capital's* method of presentation and to its dialectical nature, which is often reduced to a simple logical mirroring of an historical process or to a mere rhetorical ornament. Backhaus' program endeavors to understand the specific differences between the critique of political economy and classical political economy through a deep examination of the method of presentation. To accomplish it, Backhaus critically examines the changes in Marx's method of presentation from *Grundrisse* and *Contribution to the Critique of Political Economy* to the last edition of *Capital*.<sup>3</sup> These different drafts of the theory of the form of value are used as a tool to underline the defects of Marx's presentation. Moreover, Backhaus utilizes them to argue for the presence of an esoteric and an exoteric theory of value. The latter is traced back to Engels and traditional Marxism; the former requires a dialectical interpretation of the method used by Marx in his presentation.

Backhaus maintains an *intentio operis* of the critique of political economy that exceeds the *intentio auctoris*, as Althusser and his school had already expressed from a different perspective some years before. In his first essays Backhaus is convinced that a textual comparison between Marx and his erroneous interpretations can reconstruct 'the real Marx's' method of presentation.

In 1978, in the third part of the essay *Materialen zur Rekonstruktion der Marxschen Werttheorie* (Backhaus, 1978a), Backhaus' perspective changes. He now identifies the logical readings of Marx which intend to develop a 'fair' interpretation of the texts as a new form of orthodoxy. He also states that it is impossible to ground a logical reading of the theory of value solely on a textual basis. The idea of the reconstruction he developed in his first essays is thus defined 'an unbearable simplification of the problem of the presentation [*Darstellung*]' (Backhaus, 1978a: 133). Instead, it is necessary to recognize the multilayered obscurity of Marx's text as an actual problem that cannot be set aside by a logical interpretation. The problem of the 'logical' and of the 'historical' is then not only a problem of the interpretations of Marx's works: it is a problem Marx himself did not solve univocally. While the logical interpretation is prevalent in *Grundrisse* and the first edition of *Capital*, the logical-historical interpretation is prominent in the second edition of *Capital* and in the *Appendix* of the first edition. Focusing attention on the different layers of Marx's work can thus produce opposing interpretations.

However, Backhaus does not abandon the logical reading of Marx: he only discards the idea that it can be reclaimed through a univocal textual reconstruction. Instead, he focuses on substantiating a logical reading in regard to the core theoretical questions Marx's critical theory was focusing on. Along the lines of this new perspective Backhaus develops his reading of Marx in a continuous confrontation with the different economic traditions (classical, neoclassical, neo-Ricardian, etc.) and with the essential epistemological and methodological problems that lie at the core of economic theory. His interpretation of Marx's critique of political economy, and especially of his theory of the form of value, addresses on the one hand the unreflected assumptions of economic theory, and on the other it addresses the perspective opened by Adorno: the comprehension of the social

constitution and autonomization of the economic realm as the terrain in which the unreflected assumptions of economic theory have their root.

### **SIMPLE COMMODITY PRODUCTION AND THE HISTORICIZATION OF MARX'S METHOD**

The first step of Backhaus' reading of Marx is the critique of the historicization of Marx's method of presentation. According to Backhaus, Engels' review of *Contribution to the Critique of Political Economy* and his 1895 'Supplement' to the third volume of *Capital* represent the key writings for understanding the reception of Marx's theory of value and the historicization of the method of the presentation (Engels, 1859, 1895). The idea of the theory of value as a premonetary and pre-capitalist theory of exchange, and the idea of the method of presentation as a logical mirroring of an historical process, have their roots in these two writings. According to Engels, the first three chapters of Marx's *Capital* are devoted to the explanation of 'simple commodity production' in which workers are not separated from the means of productions and are the owners of commodities, which are exchanged on the basis of the quantity of labor expended in their production. Engels' historicist interpretation of the theory of value is based on the interpretation of Marx's method that he sketches in his review of *Contribution to the Critique of Political Economy*. He maintains that critique of political economy amounts to a critical science of bourgeois society that could be developed in two ways: historically and logically. Marx decided on the logical method only accidentally, because of the lack of preliminary works on the history of economics. Nonetheless, according to Engels, the logical method of presentation is 'nothing but the historical method, only stripped of the historical form and of interfering contingencies'

(Engels, 1859: 475): logical presentation is interpreted as a conceptual mirroring of the historical development of capitalism.

The critique of the notion of 'simple commodity production' and of the related interpretation of the theory of value is the point of departure for Backhaus' reading of Marx. For Backhaus, two complementary interpretative tendencies originate from Engels' interpretation: logical-historical and mythodological. The logical-historical interpretation explicitly assumes Engels' reading of Marx's theory and recognizes the development of the form of value as the logical unfolding of an historical content: the theory of value is the logical concretion of 'simple commodity production' and the analysis of the form of value is the logical reflection of the historical process of the birth of money. Backhaus criticizes not only the philological pertinence of the interpretation but also the *historical* applicability of the argument. If Engels had no ethno-logical data on the forms of production and reproduction of ancient communities, actual existing logical-historical interpreters should confront historical investigations and realize that the results of their method are 'neither logically free from contradictions, nor historically *plausible*' (Backhaus, 1978a: 165). Mythodological interpretation understands 'simple commodity production' and the law of value as an ideal representation from which Marx's analysis has to begin in order to reach the mode of capitalist production where commodities are sold at their prices of production. According to this interpretation, the theory of the form of value is only an historical *excursus* on the evolution of the exchange from barter to the advent of money as a means of circulation.

### **THE CRITIQUE OF PREMONETARY THEORIES OF VALUE**

Backhaus says that at the basis of both interpretations there is an implicit assumption of

generalized commodity exchange. Without a proper understanding of money as the universal equivalent, these premonetary theories of value analyze the substance and the magnitude of value without considering the form of value. According to these theories, it is necessary to 'abstract' from money in order to examine exchange and grasp its essence in isolation from money. He charges that this approach overlaps with the neoclassical subjective theories of value, which try to explain exchange according to subjective utility, abstracting from monetary mediations. According to Backhaus, what neoclassical economics names the 'monetary veil' and the Marxist tradition the 'phenomenon' that conceals the structure of exchange, for Marx's theory of the form of value is the process of the manifestation of the essence of what lies behind the veil.

For Backhaus therefore it is not possible to separate the theory of value from the theory of money: Marx's theory of value is a monetary theory of value, and the fact that this has not been taken into account is the origin of that odd situation according to which many Marxists agree upon the theory of value and struggle over the theory of money.

According to Backhaus, Marx's development of the form of value, from the 'simple' through 'expanded' to 'universal' form, has to be explained as a critique of premonetary theories of value: what Marx wanted to show is that the concept of a premonetary market economy or the concept of a premonetary commodity is quite impossible. The notion of a generalized commodity exchange without money amounts to an untenable hypothetical model since in this model commodities present each other as products and use-values, not as commodities that, in distinction to their concrete quality as use-values, have a common social substance that becomes visible in the money form. From this perspective, Backhaus proposes an original reading of Marx's concept of exchange: it is a universal and transhistorical concept, like labor or product, yet from the beginning of

Marx's presentation it has to be understood as monetary circulation – a specific form of exchange, different from barter, in which the products of labor figure as commodities that assume the form of money and the form of price. This is the reason why it is neither possible to see non-monetary exchange in the first section of *Capital* Volume I, nor to read it, like Engels, as an historical stage in which exchange relations are regulated by the labor-time contained in the commodities exchanged.

As a critique of premonetary theories of value, Marx's theory has to understand the immanent link between the private expenditure of social labor and its appearance in exchange in the form of money. Backhaus takes Marx's use of the Hegelian categories of the logic of essence into serious consideration, expressing that 'dialectical method cannot be restricted to leading the form of manifestation back to the essence' (Backhaus, 1969: 102) – that is, discovering social labor behind exchange-value. Hegel's sentence that 'essence must manifest itself' becomes for Marx the necessity of showing 'why the essence assumes precisely this or that form of manifestation' (Backhaus, 1969: 102), 'why this content has assumed that particular form, that is to say, why labor is expressed in value, and why the measurement of labor by its duration is expressed in the magnitude of the value of the product' (Marx, 1872: 174). According to Backhaus:

Marx obtains [*gewinnt*] the concept of 'social labour' and discovers a contradiction between this form of labour and the 'actual' [*wirklichen*] form of labour which has a private character. This contradiction is considered by Marx the reason of the presentation of labour in value, i.e. the reason of the existence of money. (Backhaus, 1979: 265)

For Backhaus, an interpretation of Marx's theory of value that does not understand the link between value and money – that is, how capitalist wealth (value) manifests itself in money as the form of value – can be reduced to a theory in which labor is interpreted as

subjective disutility, as in neoclassical economics. Interpreting the first section of *Capital* according to the model of simple commodity production leads necessarily to assuming a subjective measurement of labor-time expended in the production and to understanding commodity exchange as a conscious comparison of the subjective sacrifices of producers. It is the way classical political economy created its 'Robinsonades', starting the analysis of exchange from the primordial fisher and hunter exchanging their products according to labor expended in the production. Such a reading of the theory of value eludes the contradictory character of capitalist production in which 'a priori, no conscious social regulation of production takes place' and the social character of labor 'asserts itself only as a blindly operating average' (Marx, 1868: 69). For Backhaus, the law of value is a supraindividual [*überindividuell*] process that manifests itself objectively [*gegenständlich*] behind the backs of social individuals. Every productive unit expends a certain quantity of labor in the production of its own commodities, but it is not possible to know before the metamorphosis with money the amount of private labor which will be confirmed as social. Marx's theory is the unfolding of the law of value, its actualization behind the backs of the social agents. According to Marx's critique, the pre-monetary labor theory of value either posits as a subject a social organization of labor different from the one characterizing the capitalist mode of production or it does not understand the basic contradiction of the mode of capitalist production.

## THE PROBLEM OF THE SOCIAL CONSTITUTION OF ECONOMIC OBJECTS

The critique of the historicization of Marx's method together with the critique of the pre-monetary interpretations of the theory of

value lead Backhaus to understand value as a supraindividual process and to connect Adorno's idea of the autonomization of society with money as the specific, autonomized form labor has to assume to count as social.

In the light of this, Backhaus relates Marx's theory of value as a supraindividual process with the method of critique of political economy as the critique of the categories of political economy. Backhaus often repeats the idea Marx expressed in 1858 in a letter to Lassalle, according to which the critique of political economy represents a '*critique of economic categories* [...] a critical exposé of the system of bourgeois economy. It is at once an exposé and, by the same token, a critique of the system' (Marx, 1858: 270). Since the theory of value is a supraindividual process in which social individuals appear as personifications of seemingly independent economic categories, Marx develops his method as a critique of *the categories* of political economy. For Backhaus, the latter express the reality of the capitalist mode of production. The task of the method of the critique of political economy is to show the process of the constitution of the forms, i.e. of the categories of political economy. Marx's critique of political economy is an analysis of the social constitution of the categories of political economy and at the same time an analysis of the genesis of the objects to which political economy refers scientifically.

Marx's critique develops the economic categories as 'forms of being, the characteristics of existence' [*Daseinsformen, Existenzbestimmungen*] or 'socially valid and therefore objective thought forms' [*gesellschaftlich gültige, also objektive Gedankenformen*]. In this his account is entirely at odds with the construction of models of behavior in economic theory. It is not the behavior of agents that determines the law of value; inversely, it is the law of value that imposes itself through economic agents. As Backhaus states, in Marx's theory we deal neither with 'ideally typically modelled economic subjects nor economic subjects actually exchanging with

one another in pre-capitalist society; rather, we deal with the analysis of the *structure* and of the *form* of commodity-money relation' (Backhaus, 1979: 277). The point of departure of Marx's theory lies in the categories of political economy as 'non-conceptual representations' [*begriffslose Vorstellungen*] of a reality, which, through the dialectical presentation, show their own connections and allow conceptual access to their contents:

it is not possible to assert that at the beginning of the conceptual development there are axioms and fundamental presuppositions from which it is possible to deduce other propositions. At the beginning there are the categories [Marx] found in bourgeois political economy handbooks, categories which are themselves an element [*ein Stück*] of the social reality. (Backhaus, 1975: 101)<sup>4</sup>

Marx's distinction between classical and vulgar political economy – the first determining value starting from labor expended in the production of the commodities, the second solely interested in the superficial connections of the sphere of exchange – can be sublated starting from the contradiction characterizing the connection between commodity and money. While classical political economy absolutizes the moment of the process of production of commodities, immediately reducing value to labor, vulgar political economy absolutizes the moment of the exchange between commodity and money, reducing value to utility in exchange. Both classical and vulgar political economy are unable to understand the connection between production and circulation in the capitalist mode of production: if the commodity is the product of private labor that is validated as social (according to socially necessary labor-time) only in the metamorphosis with money, it is necessary to understand that the specific form of labor arrives in money as a social connection in the form of things. This logical development from the substance of value to its own form of value characterizes Marx's presentation of the value form and the fetish character of the commodity. According to Backhaus,

this account of social constitution is the *differentia specifica* of the critique of political economy. It represents the analyses of the constitutive conditions of a peculiar objective [*gegenständlich*] dimension of a society in which the objects have supernatural attributes. All the commodities have a price and the aim of the critique of political economy lies in understanding the genesis of this objectively [*gegenständlich*] valid dimension. In distinction, political economy does not concern itself with the social constitution of the economic categories. The question of genesis is outside the horizon of political economy.

## THE PERVERTED FORMS OF POLITICAL ECONOMY

To further explore Backhaus' account, let us turn to the extremely important discussion Backhaus undertakes with the Austrian economist Gottl-Ottlilienfeld and his notion of the 'economic dimension'. Gottl-Ottlilienfeld is a strong opponent of every theory of value. In his methodological works he shows the aporetic condition of political economy which is implicitly obliged to presuppose the existence of an ontological dimension that allows the economic object to acquire an objective magnitude. As Backhaus says: 'when we speak of the commodity [...] we are also obliged to think about the absurd condition according to which a supersensible quality inheres in sensuous things, so that, it is reasonable to talk about an economic dimension like the natural dimensions of distance, weight, temperature etc.' (Backhaus, 1978b: 495).<sup>5</sup> According to Backhaus, Marx's theory of the form gives us the tools to think about the autonomization of that peculiar dimension of mediated sociality – value – that asserts itself as if by nature over the individuals who comprise sociality itself. This is what is achieved through Marx's theory of value, which is able to understand the genesis of a supraindividual structure constituted

through the actions of individuals themselves. As Gottl-Ottlilienfeld states, without clarifying the question, we are obliged to think an inversion in which ‘something personal becomes something impersonal’ (Backhaus, 1978b: 495).

With regard to Joan Robinson’s appeal to translate Marx’s terminology into ordinary economic language, so that Marx’s contributions would be included in scientific academic discourse, Backhaus develops the problem of commensurability between Marx’s concepts and economic science. It is a problem that the Frankfurt School faced from the 1930s on:<sup>6</sup> Marx introduces philosophical categories into economic discourse not because he coquetted Hegel’s mode of expression but because of the very nature of the economic object. According to Backhaus, the objects of political economy are ‘more than just economic’, and this is the reason why Marx developed ‘a critique of economic concepts in the narrow sense’ (Backhaus, 1992: 55). Thus, in contrast to Robinson, Backhaus expresses the impossibility of fully translating Marx’s theory into the language of economic science. This is due to the double nature of the economic categories – that is, their sensuous-supersensible character, which is always presupposed by economic analysis.

In this context Adorno’s conceptualization of society both as subject and as object plays a pivotal role in Backhaus’ argument. The idea of supraindividual social objectivity [*Gegenständlichkeit*] as something that asserts itself behind the backs (and through the actions) of the economic agents is the means Backhaus exploits in order to understand the sensuous-supersensible character of the economic realm. He expounds on Adorno’s critique of traditional Marxism and the trivialization of the architectonic analogy of base and superstructure as the key to understanding the role of ideology:

The difference between the object of traditional theory, that of the natural sciences in particular, and the objectivity of critical theory can be made clear in the following manner. Society is not merely

object, but at the same time subject. Its autonomy [*Eigengesetzlichkeit*] is thus paradoxical. Society is only ‘objective’ insofar as and ‘because’ its ‘own subjectivity is not transparent’ to it. (Backhaus, 1992: 57)

Thus, what in Simmel’s reflection on money assumes the feature of ‘an originary phenomenon and hence an *a priori* factor’ (Backhaus, 1992: 60–1), what Schumpeter assumes as ‘ultimate ground’ and as a ‘given’ and what Gottl-Ottlilienfeld named the ‘economic dimension’ as a presupposition of every economic analysis has its origin in the specific character of economic objects: it is the ‘economic objectivity or the “objectivity of value” [*Wertgegenständlichkeit*] which has a “*sui generis*” objectivity that can be pictured as a “second nature” [...] concealed behind what is in itself’ (Backhaus, 1992: 61). The supersensible character of economic objects is presupposed and not recognized by these approaches to economic theory. The presupposition of economic objects is an aspect of economic reality itself, which hides supersensible character under the appearance of the concrete materiality of objects. This is what Backhaus terms the ‘objective semblance’ [*gegenständliche Schein*] of economic objects. They possess this social character because economic forms are perverted. Marx here intentionally makes use of the ambiguity of this word, an ambiguity which is innate to the German language alone. Thus on the one hand money is a ‘deranged [*verrückte*] form’ in the sense it is the ‘most nonsensical, most unintelligible form’ – that is, it is ‘pure madness’ [*reine Verrücktheit*]. On the other hand money is a deranged form in the other, spatial sense of ‘derangement’ [*Verrücktheit*], as an object which is de-ranged [*verrücktes*], displaced out of its natural locus. It is not merely a ‘sensuous’ but also a ‘supersensible thing’, and as such it is a thing which has been transferred and dis-placed into the external world which is independent from consciousness (Backhaus, 1992: 61–2).

Hence the task of Marx’s theory of the form of value is to show the genesis of the

supersensible character of economic objects and at the same time the genesis of the perverted form of political economy: on the one hand it is the understanding of the social constitution of value; on the other it is a critique of the lack of methodological reflection of political economy. According to Backhaus, Marx explains the social dimension in which objects have a value objectivity [*Wertgegenständlichkeit*] only because he recognizes the contradiction between the private expenditure of labor and the process of socialization established by means of separate (in time and space) private exchanges of commodities and money. While the private expenditure of labor is something individual – something that can be recognized in the conscious consideration of the producer – the process of the socialization of this labor is something accomplished in the sphere of circulation, a supraindividual process that imposes itself behind the backs of economic agents.

## THE ECONOMIC DIMENSION

In the dialogues Backhaus undertakes with economists and sociologists who have acknowledged the peculiarity of the economic realm, it is possible to distinguish a particular topic. Simmel, Amonn, and Gottl-Ottlilienfeld are praised for having shown the duality that characterizes the objects of political economy. In their analysis it is possible to find the problem every subjective theory of value is obliged to face: the separation between individual esteem, as the basis of the utility theory of value, and the validity of the supraindividual unities of account, the passage from the individual to the supraindividual dimension in which objects already *have* an *objective* [*gegenständlich*] value and a price. Hegel is applauded as the first thinker to develop the dual nature of the economic realm, but at the same time since he ‘blends [*kontaminiert*] continuously subjective and objective [*objective*] determinations of value,

he was not able to accomplish, in a consistent manner, his doctrine of the double, dialectic, character of the commodity’ (Backhaus, 1984: 302).

According to Backhaus, these thinkers were not able to systematize their intuitions of the duality of the economic realm, because it is impossible ‘to develop the objective structures [*objektiven Strukturen*] of the commodity and money from the elements of a subjective theory of value’ (Backhaus, 1984: 303): ‘there is no step that can lead from the concept of value of the subjective school to the concept of money. Subjective economics is obliged to treat the theory of value and the theory of money as two heterogeneous doctrines that cannot be referred to one another except extrinsically’ (Backhaus, 1975: 96).

In this context Backhaus emphasizes the meaning of Marx’s critique of Samuel Bailey. Bailey developed a criticism of Ricardian value theory. According to Bailey, value is the mere relation commodities have in exchange. Value is ‘power of purchasing’ and it is a relational category: it is impossible to talk about a substance of value just as it is impossible to establish the value of a commodity outside of its relation with another commodity. The concept of value is only a fiction created by Ricardo and Ricardian economists who substantialize the relation of exchange between commodity and money: ‘it is not the determination of the product as value which leads to the establishment of money and which expresses itself in *money*, but it is the existence of money which leads to the fiction of the concept of value’ (Marx, 1859: 332). Since Bailey’s concept of the ‘power of purchasing’ indicates the lack of mediation between value and exchange-value in Ricardo and his followers, he is obliged to introduce the concept of subjective value in order to explain that power, but he is not able to deduce the objective power of purchasing from the subjective esteem of the exchangers. The problem for Bailey’s theory is the unbridgeable gap between the individual and

the supraindividual – that is, between individual exchange determined through subjective evaluation and the objective determination of price which a commodity has before every subjective esteem. Backhaus explains that the subjective theory of value, with the use of the concept of ‘objective exchange-value’, is obliged to recur unconsciously as a ‘transcending’<sup>7</sup> relationship that represents a logical structure extraneous to its systematic principles: the subjective theory of value can explain a single act of exchange having place *hic et nunc*, but it cannot analyze a supraindividually valid category (Backhaus, 1978b: 524).

Bailey is right when he criticizes Ricardo and the gap between the two measures of value: labor as the theoretical measure and money as the actual and objective measure. But his subjective theory of value cannot determine money as supraindividual unity. According to Backhaus, it is only possible to deduce this concept of money from a labor theory of value; Marx’s theory of the form of value is the process of money as supraindividual unity of the private labor expended in production. It is here that the theory of the fetish character of the commodity shows its explicative power, not only as a critique of classical and vulgar political economy and of the naturalization of the forms of the capitalist relations of production, but as the actual exposition of the process in which social relationships assume the form of a relationship between things. Money is the means through which the social connection of private labor is achieved; it constitutes society independently of the consciousness of social agents. Private labor achieves social validity in exchange with money and money is the form of manifestation of that social dimension that Marx calls value. While the subjective theory of value can explain the relationship between men and things, what is absolutely outside its perspective is the idea of a social relationship among things as the specific form of socialization of the capitalist mode of production.

## ANTHROPOLOGICAL CRITIQUE

Backhaus’ reading is not limited to the interpretation of the critique of political economy as developed by Marx from 1857 onwards. He also outlines an original reading of the young Marx, especially of the *Economic and Philosophical Manuscripts*, developing a ‘backward reading’ of Marx as proposed by Helmut Reichelt and Alfred Schmidt.<sup>8</sup> He individuates the primitive forms of the critique of the economic categories from the perspective of his mature work. What economic readings of Marx set aside as a philosophical residue and Althusserians consider as the pre-scientific humanistic approach, Backhaus considers the initial effort to put forth a critical method that acknowledges ‘the isomorphic structures of the onto-theological, social-metaphysical objects or the isomorphic structures of the political and economic objects’ (Backhaus, 1989: 18). The isomorphic structure of theological and economic objects is what induces Backhaus to praise the Feuerbachian anthropological standpoint of the early Marx. The anthropological critique of religion brings back theological disputes to their human-social foundation: a critique of theology is not possible on a theological basis. The same argument is used by Backhaus to understand Marx’s first attempts to criticize political economy. The critique of political economy cannot be developed on an economic basis, because the economic standpoint presupposes as valid those same categories that need to be comprehended. It presupposes value and exchange-value; and it presupposes the economic object without analyzing its social genesis. It is necessary to bring the objects of political economy back to their human-social basis and to establish ‘the social relationship of “Man to Man” the basic principle of the theory’ (Marx, 1844: 328). Backhaus (1992) thus stresses the limits of the economic perspective and maintains that Marx’s critique lies ‘between philosophy and science’. It carries the philosophical categories into the domain of political economy and

transforms the economic categories into philosophical concepts.

The young Marx is still far from the wholly developed and conscious critic of the mature works. He is still influenced by the criticism of economic science proposed by Fourier and Proudhon, according to which economics is unconscious of both itself as a discipline and its object: 'the crux of economics, that is, its inability to determine its economic object, is [...] a central topic of the early socialist critique of economics, and was later reiterated by Auguste Blanqui' (Backhaus, 1989: 16). Differently from socialist criticism of economics, Marx can develop a 'determinate negation' of political economy thanks to anthropological critique, as stated explicitly by Marx in 1844: 'Besides being indebted to these authors who have given critical attention to political economy, positive critique as a whole – and therefore also German positive critique of political economy – owes its true foundation to the discoveries of Feuerbach' (Marx, 1844: 232). The 'determinate negation' and not 'the abstract negation of economics' is the standpoint of Marx's approach based on Feuerbach's anthropological critique of theology. According to Backhaus, at its core the critique of political economy is an *ad hominem* critique: it is the understanding of the human basis of the autonomization of the economic realm, the comprehension [*Begreifen*] of the constitution of the economic dimension and the presentation of the genesis of the object of economic science. The anthropological critique Marx develops in the early writings on the basis of Feuerbach's approach is linked by Backhaus to the concepts of 'critique', 'comprehension', 'inner genesis', and 'presentation', which characterize the mature works.<sup>9</sup> Even if Backhaus is never wholly explicit, Marx's *reductio ad hominem* should not be confused with Feuerbachian essentialism. The reduction of the social economic world to the human being itself and the genesis of the process of autonomization that distinguishes the economic realm is achieved by starting from

the specific social relations of the mode of capitalist production, not from a presupposed human essence: the 'return' [*zurückführung*] of the second nature to Man [*Mensch*], not as an abstract individual, but as a member of a 'definite form of society', this *reduction ad hominem* is the most important principle of his [Marx] mature critique or analysis of economic categories. Marx demands the 'return' of 'a *relation of objects to one another*' – that is, of economic categories to 'relation between Men [*Menschen*]'. This is the anthropological core of economic analysis (Backhaus, 1989: 20).<sup>10</sup>

## CONCLUSION

Backhaus' reading of Marx represents an extraordinary effort to develop the critique of political economy along the lines opened by Adorno's critical theory of society. It is at once an attempt to elaborate and to deepen the critical theory of society and an original interpretation of the critique of political economy. The in-depth analysis of Marx's theory of value and the critique of historicist and economic interpretations go side by side with the presentation of the categories of economic theory as socially constituted forms arising from the definite social relations of production that impose themselves on social individuals (and social scientists) as a social nature, as if it were an objective external economic realm.

Marx's critique of political economy represents for Backhaus the comprehension of the genesis of that objective economic realm in which social relations take on the form of a relationship between the products of labor as commodities. If for Adorno the 'anamnesis of the genesis' of the autonomization of society had its root in exchange as the real and objective abstraction imposed on social agents, for Backhaus exchange has to be determined through the analysis of the form of value and hence the 'anamnesis of the genesis' has

to be brought back to that specific form of exchange in which privately expended labor becomes social only by assuming the form of money. Once the genesis of the social relations of production is accomplished, and at the same time concealed in the system of exchanges between commodities and money, that socially constituted reality becomes the objective domain of economic science. The critique of political economy has the task of taking back the social form to a specific human practice, and to reveal the perversion of a form of society in which human 'relations of production [...] assume a material shape [*sachliche Gestalt*] which is independent of their control and their conscious individual action' (Marx, 1872: 187).

## Notes

- 1 On the New Reading of Marx see Backhaus, 1997a; Reichelt, 2008; Elbe, 2008; Fineschi, 2009; Heinrich, 2012; Bellofiore and Redolfi Riva, 2015.
- 2 For Backhaus, the 'reconstruction' is the removal of the supposition of 'interpretations' in order to unfold the specific proper textual meaning of Marx's work.
- 3 The first was published in *Contribution to the Critique of Political Economy*, the second in the first edition of *Capital*, the third as an *Appendix* to the first edition of *Capital*, the fourth as the third paragraph of the second edition of *Capital*, Volume I. Backhaus himself says that he could only develop this perspective thanks to reading the first chapters of the first edition of *Capital*: the different presentations of the theory of the form of value allowed him to focus his attention on dialectical structures of the argument that in the second edition were only sketched.
- 4 Backhaus was inspired by an insight of Alfred Schmidt's into Marx's concept of knowledge: 'The immediate object of Marx's investigations, it is true, is empirically given conditions of production. But [...] it is impossible to master this immediate object in a direct way. On the contrary, the factual "system of bourgeois economy" is grasped by means of criticism of bourgeois categories' (Schmidt, 1968: 95).
- 5 The quotation comes from the essay 'Zur Problematik des Verhältnisses von "Logischem" und "Historischem" in der Marxschen Kritik der Politischen Ökonomie' (Backhaus, 1978b). It is an unpublished German manuscript that has been published in Spanish (*nueva política*, 1978) Danish (*Kurasje*, 1980) and Italian (*Marx 101*, 1984) translations. We quote from the Italian translation, by Emilio Agazzi, collected in Backhaus, 2016.
- 6 Both Horkheimer and Marcuse showed the peculiarity of the critique of political economy in comparison with philosophy on the one hand and political economy on the other. Backhaus quotes the essays *Traditional and Critical Theory* by Max Horkheimer and *Philosophy and Critical Theory* by Marcuse, both published in 1937: 'It was Horkheimer who first attempted to clarify the unique methodological status of the Marxian critique of political economy in terms of its position "between" philosophy and science. For this very reason he drew the distinction between traditional and critical theory as the "difference between two modes of cognition; the first was grounded in the *Discours de la Méthode*, the second in the Marxian critique of political economy" [Horkheimer]. The paradoxical intermediary position of the latter is articulated in the fact that, on the one hand, Marx's critique of economy opposes philosophy by insisting that it "is an economic, not a philosophical system" and moreover that "philosophy appears in the concepts of economy" [Marcuse]. On the other hand, however, the critique of economy is adamantly opposed to "economism", stipulating that the "critical theory of society, as critique of economy, remains philosophical" [Horkheimer]. Precisely because "philosophy appears in the concepts of economy", "every single one of these" is "more than an economic concept" [Marcuse]' (Backhaus, 1992: 55).
- 7 Marx employed *übergreifen* with a double emphasis. Following the translators of Hegel's *Encyclopaedia Logic*, the first emphasis may be rendered as 'to overgrasp': the reference is to the *Aufhebung*, the speculative comprehension, which 'reaches back and embraces within its scope' the opposition of the moments in its dialectical stage. In the same way that universality 'overgrasps' particulars and singulars, thought 'overgrasps' what is other than thought, so the *Subjekt* developing into *Geist* includes objectivity and subjectivity within its grasp. The second emphasis is 'overreaching' and 'overriding', bordering on 'dominant'.
- 8 Reichelt expresses the need to read Marx's work employing the same methodology used by Marx in his study of 'previous social formations (i.e. the fact that Human anatomy contains a key to the anatomy of the ape. The intimations of higher

development among the subordinate animal species, however, can be understood only after the higher development is already known. The bourgeois economy thus supplies the key to the ancient, etc.) and to interpret earlier formulations from the point of view of later works' (Reichelt, 1970: 24). It is the same perspective proposed by Alfred Schmidt: 'the early writings of Marx and Engels, which for a long time were considered to contain the Marxist philosophico-humanist content proper, can only be fully understood by a historico-economic analysis of *Das Kapital*' (Schmidt, 1968: 94). The idea of reading Marx backwards is also proposed by Bellofiore, 2013.

- 9 The expression *ad hominem* with this meaning can be found in Marx himself: 'The weapon of criticism cannot, of course, replace criticism by weapons, material force must be overthrown by material force; but theory also becomes a material force as soon as it has gripped the masses. Theory is capable of gripping the masses as soon as it demonstrates *ad hominem*, and it demonstrates *ad hominem* as soon as it becomes radical' (Marx, 1843: 182). It has been used by Adorno: 'The *reductio ad hominem* which inspires all critical enlightenment is substantiated in the human being who would first have to be produced in a society which was master of itself. In contemporary society, however, its sole indicator is the socially untrue' (Adorno, 1961: 122).
- 10 This lack of distinction between Marxian and Feuerbachian anthropological standpoints led Werner Bonefeld to criticize Backhaus' critical perspective: 'According to Backhaus, the critique of fetishism deciphers economic categories on a human basis. It reveals the human content of seemingly extramundane economic things. This argument, however suggestive in its critical intension, comes at a price. The anthropological standpoint is not the critical standpoint. "Man" in general does not do anything. Does not work, does not eat, does not truck and barter and has no natural tendency, needs, consciousness, etc. Man in general does also not alienate herself in the form of value. In distinction to Backhaus, Man has needs only as concrete Man and the "determinate character of this social man is to be brought forward as the starting point, i.e. the determinate character of the existing community in which he lives". Neither economic nature nor anthropology but the "definite social relations" that manifest themselves in mysterious economy forms are "the point of departure". That is to say, the reified world of economic necessity is innately practical – it entails the actual relations of life in their inverted economic form' (Bonefeld, 2014: 8).

# Jürgen Habermas: Against Obstacles to Public Debates

Christoph Henning  
Translated by Max Henninger

Jürgen Habermas (born 1929) is a leading figure associated with the Frankfurt School of critical theory and is best known for advancing the linguistic or communicative turn in critical theory in the 1970s and 1980s. Before the turn to communication, Habermas developed epistemological and social-evolutionary approaches to critical theory in an effort to find an empirical approach that was equivalent to the role that political economy had played in earlier, more radical versions of critical theory. In later years, Habermas turned towards legal studies and democratic theory, while, today, his work is discussed in disciplines as diverse as bioethics and theology. Across the twentieth and twenty-first centuries, Habermas's sophistication of thought and his wide influence on other thinkers has earned him a reputation that is presently unmatched by any other left-leaning German intellectual. He is consistently open to many schools of thought, some of which he has integrated into his own approach, beginning with Heidegger and Adorno and

later the evolutionary theories of Jean Piaget and Michael Tomasello. Habermas has engaged with theories from the sociology of work, psychoanalysis, hermeneutics, political economy, linguistics, pragmatism, systems theory and, more recently, jurisprudence. His most recent work, on human cloning and on the relevance of religious arguments for a democratic debate, has been widely discussed (Habermas, 2002, 2012). This range of analysis distinguishes Habermas from his predecessors in critical theory, who were sometimes negligent of, or at least single-minded towards, other theories and scholars (Dahms, 1994). Yet this openness can also make it a challenge to locate, precisely, the critical edge in Habermas's theories. While his books often focus on the reconstructions of theories of other thinkers (Karl Marx and Max Weber, Niklas Luhmann, G.H. Mead and Talcott Parsons, John Austin, Ronald Dworkin and many others), in this chapter, I will focus on those contributions that established Habermas's critical acumen.<sup>1</sup>

## BIOGRAPHICAL SKETCH

Habermas's intellectual development was influenced by Erich Rothacker, a cultural anthropologist with whom he studied philosophy in Bonn, and by Arnold Gehlen and Martin Heidegger (all of whom were involved in National Socialism; for more biographical information see Müller-Doohm, 2008, 2016). After a short period as a journalist, he became an assistant to Theodor W. Adorno. Habermas had already written a dissertation on Schelling and published some papers (which he described as being 'with Heidegger against Heidegger' (Habermas, 1953)) when he entered a professional relationship with Adorno, in 1956. The cornerstone of Habermas's engagement with critical theory was its apparent political hopelessness, which Habermas perceived as leading to an intellectual dead end. Later on in his career, Habermas became a severe critic of what he called the Frankfurt School's 'foundational deficit' (1981: I, 366 ff.; 1985a: 106 ff.). The problem with critical theory was that it often formulated value judgements but was seldom able to provide criteria by which to assess its verdicts (Dahms, 1994: 138 ff., 318, 392). According to Habermas, this position was aporetic due to the fact that it involved, at one and the same time, a radical critique of reason and the invocation of reason in support of this critique. Also, the Frankfurt School consistently called for consideration of the totality (the 'view of the whole') even as they described such consideration as impossible ('The whole is untrue', according to Adorno). These positions were contradictory, and Habermas would struggle with this for decades to come.

In spite of Adorno's close relationship with Habermas, Horkheimer had some reservations about the young Habermas – he considered him to be too politically active in the peace movement of the time. For this reason, Habermas finished his *Habilitation* thesis in Marburg, in 1961, with Wolfgang Abendroth, a Marxist scholar of law, and from 1961 to

1964, he was an associate professor of philosophy in Heidelberg (with the help of Hans-Georg Gadamer, a scholar of Heidegger). In 1964, he returned to Frankfurt to take over Horkheimer's chair in philosophy and sociology. Here, Habermas came to Adorno's defense in the so-called 'positivism' of the 1960s, where Adorno tried to defend his own dialectical thinking against an empirical approach in social theory that Adorno perceived as reductionist. Habermas soon developed his own approach in this debate, attacking not empirical research per se (in fact, the Institute for Social Research aimed to do empirical research itself, but there was always a disjuncture between this research and its theory) but rather the naturalist theory of science that was erected around it by scholars like Karl Popper and Hans Albert (referred to as critical rationalism). The dispute can be condensed down to the question of whether social theory should follow empirical research (a bottom-up approach), or whether empirical research should be guided by theory (as in the program Horkheimer defined as 'critical theory' in the 1930s). The problem for critical theory was how to remain critical, especially in regard to the facts that empirical research uncovers, without becoming dogmatic.

During these debates, Habermas developed a conceptual hierarchy: he elevated 'interaction' above the 'reduction of the self-generative act of the human species to labor' (Habermas, 1968a: 42) that he associated with Marxism as well as with positivism (1963: 142 ff.; 1968b: 91 f.). Thus, a reductionist conception of a purely technical 'labor' is superimposed by higher human forms of behavior. Both levels have their corresponding activities, social spheres, perspectives and sciences. This dualistic and hierarchical constellation can still be found in the controversy with Niklas Luhmann: Luhmann's arguments are not criticized by Habermas on their own ground but rather supplemented by a higher-level theory of 'communicative action' (Habermas, 1968a:

53; Habermas, 1971). This unmediated juxtaposition of various forms of action consolidates the problematic features of each of them. The content of 'labor' remains undetermined since it is taken to be a closed technical system in the manner of Friedrich Pollock or Arnold Gehlen. Moreover, the hermetic interpretation is perpetuated by closing it off to criticism: in a Diltheyan dualism, where mind is addressed only by mind, labor is left to the 'specialised sciences',<sup>2</sup> leaving philosophy free to engage with loftier intellectual matters.

This dualism was widely criticized. The East German sociologist Erich Hahn (1970) faulted Habermas for abstracting from the 'social character of production'. According to Hahn, this move forced Habermas to develop an anthropologized 'historical dualism' within which domination and ideology are explained 'only' (Habermas, 1968a: 42; 1981: II, 333) on the basis of 'interaction' – that is, idealistically (Willms, 1973: 33 ff., 70 ff., 138 ff., 162, 178; Rüdtenklau, 1982). A little later, Habermas transformed his anthropological model into a terminologically modernized 'rationality theory'. This transformation of anthropological dualism into an epistemological trinity took place in *Knowledge and Human Interests* (Habermas, 1968a). The distinction between the interests guiding cognition is not derived from personality types, as in Dilthey, nor is it based on the assumption of self-contained cultures, as in Rothacker; it rests on an 'attempt to reconstruct' various sciences (Habermas, 1968a: vii), following a Neo-Kantian thread. With this formulation, Habermas sought to lay the groundwork for a 'theory of society', insisting at the time that such a theory did not yet exist.

In the view that Habermas developed, truth claims can be upheld not only in the natural (nomothetic) and empirical (fact-stating) sciences but also in practical disciplines like ethics and hermeneutics, or in critical theory. In order to defend this view, Habermas developed, in addition to his epistemological

(Habermas, 1967, 1968a) and social-evolutionary work (Habermas, 1973, 1976), a Kantian (quasi-transcendental) 'ethics of discourse' (beginning in the 1970s and published as a book in 1991) and a corresponding social theory about types of action that, similar to Talcott Parsons's approach of 1937, claims to be a theory of society at the same time. In the book that developed this approach, the *Theory of Communicative Action* (Habermas, 1981), he reflected on critical theory in the narrow sense of Horkheimer or Georg Lukács. Here, he presented his own ideas as *the* contemporary approach in critical theory. Hence, the two dualisms of communicative vs. instrumental or strategic action and 'systems' vs. 'lifeworld' take the place of other distinctions such as freedom vs. domination, equality vs. inequality, fulfillment vs. alienation and capital vs. labor.

The personal context for this renewed interest in critical theory was that Habermas, who had been away from Frankfurt from 1971 to 1981 co-directing an institute in Bavaria for research on the conditions of life in a technical world (Max-Planck-Institut zur Erforschung der Lebensbedingungen der wissenschaftlich-technischen Welt, Starnberg), was returning to Frankfurt, where he was a professor of philosophy from 1983 to 1994. During this time, he defended modernity from a philosophical position against authors like Michel Foucault and Jacques Derrida, whom he read as irrationalistic (Habermas, 1985a, 1990), as well as against historians like Ernst Nolte who had attempted to relativize Germany's fascist past as a more or less justifiable evil against the greater evil of Stalin's brutal state communism. Habermas defied this latter claim immediately and harshly in the press (Habermas, 1986), engaging in exactly that type of public debate on which his theory placed such great importance.

It also illustrates the way in which Habermas engages in more than strictly scholarly work. He has been a participant in public debate ever since his criticism of Martin Heidegger's refusal to deal with his

fascist phase (Habermas, 1953),<sup>3</sup> and he continues to write in international newspapers (his political essays since 2005 can be found at [www.habermasforum.dk](http://www.habermasforum.dk); also see Habermas, 2014). Even though he would like to differentiate between his roles as a public intellectual (in fact, he might be one of the last of this genre) and as a scholar and teacher, in his case the line is particularly hard to draw. As much as his public comments draw from his theories, the latter are often inspired by, and responses to, contemporary political events. Maybe the most important of these topics for Habermas was the failure to come to terms with the catastrophic political past that was burdening (West) Germany after 1945 (see his preface to Habermas, 2009: V, 9 ff.). Additional issues included Germany's nuclear armament in the 1950s, the student revolts of the 1960s, the ecological and financial crises as well as leftist terrorism in the 1970s, the historians' dispute and, later, Germany's reunification in the 1980s, the Gulf wars in the 1990s and 2000s and the religious renaissance of recent years (for an illuminating discussion of the conjunction of Habermas's works and political debates, see Müller-Doohm, 2016).

In addition to this dual course of theoretical work and involvement in public debate, one central, recurring theme of his theoretical work is public debate itself. What he calls 'communicative action' or 'deliberative democracy' in his theory generally refers to the activity he is engaged in himself: the free and public discussion of issues that are relevant to 'the public' and to civil society (which is similar to Hegel's understanding of society, only without the economy: Habermas, 1992: 100). Habermas's theory is, therefore, somewhat self-implicating. As we will see, on the upside this can lead to a high level of reflexivity; on the downside it can lead to certain blind spots in that the theory itself is primarily *about* public debate and not about the arguments that *animate* such debate. Hence, the recurring criticism of Habermas's work is that it is too formal, or (which amounts to the

same thing) too 'Kantian'. In what follows, the guiding theme of public debate will be traced through different stages of his theories.

## EARLY WORKS AND KEY IDEAS

When an author writes for seven decades, rereading his early works can illuminate some core ideas. In Habermas's large body of work, some topics emerge and then disappear (e.g., ideology, research-guiding interests and developmental moral psychology), while others remain more or less stable throughout his development, some of them appearing quite early in his work. One such topic is the opposition between technology (including *social* technology, such as bureaucracy and public administration) and 'real' politics (defined as speech acts advancing the common good, as opposed to egoistic, 'instrumental' or strategic uses of language: Habermas, 1968a: 76; 1981: II, 445 ff.; 1991). This can be seen in Habermas's early distinction between work and interaction (Habermas, 1968b: 9 ff.), running through the dualism of 'system' and lifeworld (1981), and remains visible in Habermas's campaigning for a EU-wide public sphere against a mere economic-administrative or 'technocratic' Europeanization (1998, 2014).

Unlikely as it is for a critical theorist, the young Habermas's view on technology was less influenced by Karl Marx or John Dewey than by Martin Heidegger. Marx interpreted technology as a tool used to increase productivity and output, tighten control over workers, lower costs and thus maximize profits. For Heideggerians, however, this interpretation appeared too superficial (Habermas, 1954: 8). For them, technology is more than a mere means of production within capitalism; rather, it defines our culture as a whole. In this formulation, we live in a 'machine-culture' (Habermas, 1954: 9). So, rather than subsuming technology under the capitalist economy, as did Marx and Lukács, the young Habermas

subsumes economy under the more abstract 'logic' of technology. This move had a huge impact on Habermas's later work. Early on, authors that were cited in support of this technocentric worldview, in addition to Heidegger, were Hans Freyer, Ernst Forsthoff, Friedrich Georg Jünger, Max Weber and, most importantly, Arnold Gehlen. Later, Luhmann and Foucault were perceived in a similar way.

As we often find in Habermas's work, this reversal of economy and technology takes place on different levels. One argument works on a *conceptual* level: it understands basic economic categories like work or consumption as parts of a 'technology' (Habermas, 1968a: 46) or 'machinery' (1954: 23; note the similarity to Deleuze and Erich Fromm). As a consequence, it interprets the 'technocratic' tendencies of explanatory, so-called 'positivistic' sciences such as economics and the great bulk of empirical social research (financed, in part, by big business) as driven by imperatives of technical disposal, or 'work' (Habermas, 1976: 184; Müller-Doohm, 2008: 70). Comparatively, the world of interaction seems free from economics, technology and power. A second, *socio-historical* line of argument reads the history of capitalist societies, along the lines of Pollock (1941) and Horkheimer (1942), as one of growing bureaucratization, mechanization and concentration, echoing the Leninist idea of state monopoly capitalism. This view implies that the driving capitalistic mechanisms (free exchange, the law of value, exploitation of labor power and, ultimately, class struggle) no longer function and have been superseded by political control and administrative planning.<sup>4</sup> For decades, Habermas was convinced that the welfare state was indeed successful in *overcoming* class divisions and inequality:

The welfare states of Europe and other OECD countries have in fact largely compensated for the socially undesired effects of a highly productive economic system. Capitalism has, for the first time, not obstructed but made possible the fulfilment of the republican promise of the equitable inclusion of all citizens. (Habermas, 2014: 425; written in 1999)<sup>5</sup>

This double perspective – conceptual as well as historical – indicates that Habermasian dualisms have no explanatory center but are rather free-floating: the subsumption of the economy under technology appears in the theory of science as well as in the theory of action and the theory of society. It is not quite clear whether the *explanans* for these simultaneous shifts is historical, theoretical or conceptual. Since they occur all at once, the non-falsifiability that was alleged during the positivism dispute is not completely mistaken. Because Habermas is embedded in public discourse, he sometimes takes the assumptions of this discourse (such as the 'end of class') at face value and treats them as theoretical arguments, which in some cases they are clearly not.

The work in which Habermas first developed these technocentric dualisms is surprisingly relevant for the twenty-first century, as several of Habermas's early arguments continue to be discussed – less by Habermas himself and more by other scholars. For example, in an article from 1954, Habermas (echoing Adorno and Erich Fromm) discusses a 'complete' and 'universal alienation' (1954: 26 ff.) that results from the mechanization of both production and consumption. This phenomenon, which also includes social services ('kollektive Daseinsvorsorge': Habermas et al., 1961: 262), he later called depoliticization or 'colonisation' of the lifeworld (1981: II, 522). People's decisions in different spheres, in their work life as well as their private life, are more or less prefigured by institutions. An effect of this total outreach of the system is the reshaping of post-political citizens ('Es werden unpolitische Bürger in an sich politischer Gesellschaft hervorgebracht': Habermas et al., 1961: 270). This perspective connects to Habermas's narrative of the 'end of the philosophy of the subject' and his own intersubjective turn (see 1985a and 1991; for the classic theme of the 'disappearing of the individual' as formulated by both Horkheimer and Adorno as well as by conservatives like Gehlen and Schelsky, see Habermas, 1973: 162 ff.).

Theoretically this biopolitical hypothesis is consistent: inspired by the young Marx and Helmuth Plessner, Habermas's anthropology had stressed the plasticity of human nature. Human lifestyles and interests are 'mediated through labour, as Hegel and Marx already knew' (Habermas, 1958: 28), and 'embedded in a certain "system" of social labour, in relations of production' (1958: 31). In short, "'the' human being as such does not exist, just like "the" language does not' (1958: 31). Hence, it would seem impossible to resist capitalism with forces that are modified by capitalism itself. (This already introduces another of Habermas's running themes, the dialectic of immanence and transcendence.) However, unlike Arnold Gehlen or Adorno, Habermas is not a fatalist when it comes to human nature. During 1968, for example, he followed Marcuse in stressing the new moral 'sensitivity' that had evolved among students (Habermas, 1969: 146, 182, 193; Marcuse 1969). Likewise, in *Knowledge and Human Interests*, he does not shy away from postulating a particular 'human' interest in emancipation (Habermas, 1968a, 244), which he distinguishes from both technical-instrumental and practical-communicative interests (1968a: 222), indicating that communicative action and critical activity are not the same. (Comments on the book are gathered in Dallmayr, 1974 and Müller-Dooch, 2000.)

Habermas's anthropological considerations duplicate Adorno's hermeticism in their own way, but they also provide options for escaping this hermeticism. Not unlike Erich Fromm, whose anthropological optimism led to his conflict with Horkheimer, Habermas could resort to *anthropological* counter-hypotheses. This strong anthropological undercurrent in Habermas's thought resurfaced three decades later, when he discussed and rejected genetic programming with anthropological arguments (Habermas, 2002). These later papers are continuous with Habermas's very early ideas; they continue to criticize the practice and attitude of 'control' ([*Verfügung*]: Keulartz, 1995: 35

ff.; Habermas, 1968a: 47, 61; 1992: 393), which drives instrumental action and rationality. Human nature as such never was – and, hence, should not be – at our disposal. In a dialectical move, Habermas interprets this very unavailability of our own nature as a natural foundation of our ideas of freedom and equality (Habermas, 2002: 101 ff., 110 ff.; this idea resonates with Schelling but also with French postfoundationalist political theory). If we instrumentalize 'the species', genetically modified persons could no longer be free and equal authors of their own life (2002: 115) since others have manipulated their DNA. This runs against the 'species-ethics' (2002: 121; the term 'species' carries a lot of weight in 1968a: 77, 341 but was hardly visible after Habermas's linguistic turn in the 1970s).

The running theme of a 'universal alienation' due to a dominance of technology connects Habermas not only to Foucauldian readings of biopolitics and posthumanism but also to claims of a 'post-democracy' as put forward by Jacques Rancière, Colin Crouch or Chantal Mouffe. Crouch's (2015) claims that big profit-maximizing corporations have privatized large parts of public life is exactly what Habermas had already claimed in the early 1960s (in his *Habilitation* thesis from 1962: 217 ff.; he also cites Altmann's term 'communification' for commodified communication: Habermas et al., 1961: 278; Habermas, 1962: 239; Altmann, 1954: 72). Even the Schmittian influence that drives Chantal Mouffe's version of post-democracy is already visible in Habermas's earlier version (Altmann, for example, an assistant of Wolfgang Abendroth, had studied with Carl Schmitt). Part of the problem for Habermas is that politics is no longer pure; it is 'infected' (Habermas, 1954: 25) by social and economic reasoning and, hence, 'decisions' (Habermas et al., 1961: 279; Habermas, 1962: 250) are rare. The welfare state leads to an expansion of state and administrative activities that were not foreseen in the classical political approach. On the one hand,

the state itself has become an economic actor, regulating the market and providing for citizens' welfare. *Daseinsvorsorge* is a term Habermas (Habermas et al., 1961: 267; Habermas, 1962: 179) took from Ernst Forsthoff, a Schmittian state lawyer (for self-criticism, see Habermas, 1992: 521 n.). On the other hand, subsidiary powers (unions, parties, administrative law courts) take over state functions (Habermas et al., 1961: 267 ff.), though they are not legitimized by parliament or through public debate. Again, this is a criticism Habermas repeats later against the EU – he criticizes it not for being 'post-national' but rather for not being fully legitimized by common debate (Habermas, 2014).

The commercialization, or economic privatization, of the public is only part of the problem, then; the other serious issue for Habermas is the expansion of the political sphere per se. The culmination of Habermas's argument only becomes visible if both arguments are taken together (the reification from Lukács and the political neutralization from Schmitt). It is not uncommon for actors in the public sphere (publishers, editors, newspapers) to be private businesses; in fact, their private status can guarantee a free (not state-dominated) press. Paradoxical as it may seem, the public is something private (Habermas, 1962: 42 ff.). However, once the state transgresses its core competencies, or large corporations and sub-state actors take over state functions, they gain a political power that is not democratically legitimized. They use political power in order to protect their private interests. Therefore, the real problem arises once concentrated media corporations (Habermas, 1962: 223) or political institutions try to *legitimize* the non-democratic decisions of non-state actors by using their influence on public opinion to *simulate* a public. The tools they use (e.g., advertisement and PR technologies) may be private, even if they are applied on a large scale; yet now they are used to 'manufacture' a public consent *ex post* rather than stir debate *ex ante* (Habermas et al., 1961: 298; Habermas,

1992: 250 ff.; Chomsky and Herman, 1988). Habermas's term for this is the 'depoliticization of the masses' (Habermas et al., 1961: 280; Habermas, 1968b: 71; 1969: 189), or of 'the public'; he also refers to it as neutralization and reification (these are, of course, Marxian terms used in a modified way; see Habermas, 1981: II, 514 ff.). This substitution of public debate by non-political means is the main target of his theories. One may wonder to what extent his experiences of National Socialism were a key motivation here.

The ideal behind this criticism is communicative action, later referred to as public deliberation. As powerful as it is as a political slogan (see the section below), it is questionable whether it is a good foundation for a *theory of society*. Yet for Habermas, this ideal serves both functions. Communicative action, as a specific subset of the action of individuals, relates to the actions of other individuals, and it is thereby guided by certain moral ideas that are 'generated' intersubjectively. These norms are of interest only insofar as they provide the 'frame' for an action that is conceptualized from the point of view of individual actors. Thus, norms make 'social sense' only on the premise that society is conceptualized as the aggregate of individual, norm-guided actions. Consequently, Habermas declares real structures to be the epiphenomena of more basic, normative structures based on the intentions of speaking subjects; norms and organizations 'issue from' law (Habermas, 1992: 153; cf. 25), much as 'institutions' were conceived as the product of communication (Habermas, 1968a: 283). It is hard to comprehend how this is not idealistic.

## POLITICAL AMBIVALENCES

Once we take these recurring themes as Habermas's main 'problématique', one quickly detects certain ambivalences. Early on, Habermas talks about an 'obscurity': 'Everything becomes blurred into an authoritarian and abstract "political apparatus"'

(Habermas et al., 1961: 295; cf. Habermas, 1985b). If we ask about the political model that motivates this criticism, there are at least two possibilities, just as the diagnosed problem itself has two poles. The term he uses in 1981, 'colonisation' of the lifeworld, includes *both* economic and political encroachments (with 'power' and 'money' as the two leading 'media' of control: Habermas, 1981: II, 273, 581) on a better world of mutual understanding and good intentions. One side of the problem is the commercialization of more and more fields of society, including the media. But we have seen that Habermas no longer assumes the capitalism of the nineteenth century as analyzed by Marx. Free exchange, the law of value and class struggle are no longer relevant in Habermas's writings, at least from the 1950s to the early 1990s, because for him the state and the bureaucracy have taken control of many economic functions ('the state apparatus executes many imperatives of the economic system': 1973: 52; for a change of mind on this, see the first essay in Habermas, 2014).

Politically this means that *more state* can hardly be the answer because we already have too much of it. This leads to the other side of the problem: the expansion of the political apparatus by the welfare state and the growing political influence of large non-state actors (a problem he later calls 'juridification': Habermas, 1981: II, 522 ff.).<sup>6</sup> This poses another problem: the compromising of democratic procedures and the depoliticizing of citizens. How should critical theory tackle this bivalent situation? Simple solutions (like the liberal credo 'less state and more market', or the social-democratic credo 'more state and less market') are no longer possible here, for whichever side of the problem is addressed, the other side will grow. Is the solution merely the right balance, or is there something more to it? As we will see, balancing between positions (between liberalism and republicanism: Habermas, 1992: 359; between human rights and popular sovereignty: Habermas, 1992: 131; between Kant

and Hegel, etc.) soon became Habermas's favorite position. This is no surprise, once we consider that the function of communicative action is to find a consensus.

The ambivalence of Habermas's political stance was visible in his role in the students' unrest of 1967–8. Like Habermas (1969: 83 ff.), the students were quite willing to discuss issues that had until then been concealed. This is the inevitable way to proceed in practice if 'public debate' is at the core of one's theory. But deliberation can also mean that some people discuss, while others *decide* (Habermas, 1992: 437; see the watered-down republicanism in Kant by 1795). To what extent decisions are driven by discussion cannot be determined by discussion alone. The students of 1967 were no longer willing to adhere to mere discussion as they witnessed the scant effects this had on the political situation. At this point, Habermas parted ways with the more radical students, claiming that any political act beyond debating would not only provoke massive counter-violence from the state: it would also turn the student movement into an irrational and voluntarist form of activism – a 'fascism from the left', as he warned Rudi Dutschke, the students' intellectual leader until his assassination in 1968 (Habermas, 1969: 148). Left fascism here did not mean a left wing of the fascist movement, as in Agnoli (1973), but rather the use of fascist methods by the left.

The dividing line between Habermas and the activists was not only the question of violence, however: it was one of political goals. Habermas understood the students' interests to be his own, namely the interest in communication for its own sake ('Der Kampf richtet sich gegen die entpolitisierte Öffentlichkeit': Habermas, 1969: 190). He assumed, and also expected others to believe, that under given circumstances more cannot be asked. Habermas held this position in the 1950s, continued to defend it in the 1980s and continues to believe it to this day. It appears to be Habermas's *idée fixe*. He once called those who asked for more political engagement

‘infantile’ and ‘deluded’ (1969: 197). Public debate, therefore, appears as something self-referential: in the debate, the debate itself (and its conditions) remains the only topic. It thus appears as the heir to the absolute subject: it posits itself and recreates itself permanently. The major step beyond Fichte is that now the subject is conceived as a *col-lective*. Habermas’s main topic, however, is not society; it is rather, as it was in Hegel, reason. Public debate and discourse are the form in which Habermas believes that reason realizes itself or, rather, into which it retreats (Habermas, 1992: 228, 360). This neo-Hegelianism is subsequently taken up and modified by Axel Honneth (1992).

More radical students, scholars and politicians, however, soon responded that more can and *should* be asked of political intervention (Abendroth et al., 1968; Willms, 1973; Bolte, 1989), and that alternative political goals that went beyond the conditions for debate should also be discussed. Students, especially, tried to politicize workers and larger parts of the public. Astonishingly, this led Habermas to doubt the very possibility of a politics that could seriously change civil society into something more socialist or emancipatory. Among other things, he based this political appeasement on a defensive rereading of Karl Marx (Henning, 2015: 406 ff.). That he transformed the debate with radical students about the limits and goals of politics into a discussion and reconstruction of ‘historical materialism’ (Habermas, 1976; cf. Rapic, 2014) indicates, again, the collapsing of his political and intellectual roles.

Surprisingly, even in his most original period – the middle years of the 1970s and 1980s – the political implications of Habermas’s theories are difficult to track. The ‘lifeworld’, the normatively laden remainder after deducting the political and economic ‘systems’ from social life, is quite meager in content if we observe the actors and structures within that sphere. The unequal bargaining power of actors in the field is not clearly addressed: ‘Habermas screens power

out of the lifeworld’ (Allen, 2008: 121). For Habermas, the lifeworld is composed of *knowledge* (1981: II, 189 ff., 521; 1992: 429), thus it is defined not in social but in *epistemic* terms; it is the cognitive, yet non-thematic background of people’s experiences (for a later elaboration Habermas, 2009: V, 203 ff.). This ‘supply’ of knowledge is differentiated between knowledge referring to ‘culture’, ‘society’, and to the ‘personality’ (1981, II, 209f.). Defending the lifeworld against ‘the system’ primarily means to fight a *cognitive* fight (as it was initially intended by Edmund Husserl) – against abstraction, neutralization, formalization and differentiation, in order to return the ‘freed territories’ to the other, communicative rationality (Habermas, 1981: II, 582). Communicative *actions* – acts of coordination – are only possible if the world is accessible by a communicative *rationality* in the first place (for the logical succession of rationality, action and society see Iser and Strecker, 2010: chapter 2). Habermas’s difficulty is in demonstrating the ways in which this abstract activity of reinterpreting the world, in order to deformalize the knowledge about it, is *not* backwards-looking. Most social movements he observed in 1981 were defensive; only feminism seemed to conquer new ground instead of defending older territories (Habermas, 1981: II, 578). So the question is, what is Habermas’s own political objective?

The ideal Habermas holds up against the diagnosed economic-political double-invasion (‘like colonialists invade a tribal society’: Habermas, 1981: II, 522) is ‘democracy’ – in early writings with the prefix ‘social’, in later writings with the prefix ‘radical’ (Habermas, 1992: 13). But what does that mean in practical terms? On the one hand, Habermas could be taken to endorse traditional social democracy, which implies extending the power of political institutions to redistribute income and life changes (an ‘economic democracy’ as advocated by Wolfgang Abendroth, for example). At least that is how some passages – never the central ones – in his work may be

read (Habermas et al., 1961: 290 ff.; Iser and Strecker, 2010: 144 ff.). This, however, is at odds with the Schmittian and Arendtian purism that also runs through Habermas's writings, which asks us not to 'mix' political and economic issues (because the resulting welfare-mentality transforms citizens into consumers or clients and thus compromises democracy: Habermas et al., 1961: 295f.; Habermas, 1992: 490 ff., 520). On the other hand, he could also be taken to endorse the neoliberal counterrevolution that calls for more 'freedom' and less regulation (for this unintended effect of leftist-liberal demands, see Fraser, 2013).

In fact, the neoliberal counterrevolution was pushed through by *social democrats* like Tony Blair (so-called 'New Labour') and Gerhard Schroeder in the 1990s. Like their intellectual godfathers, Anthony Giddens in the UK and Habermas in Germany, they talked about 'reflexive' politics – especially in relation to welfare (Habermas, 1985b: 141 ff.; 1992: 494; Iser and Strecker, 2010: 164). In practice, 'reflexive welfare' often means that citizens no longer receive benefits and instead have to endure a civic 'activation' towards an economically functionalized virtue ethics. When Habermas begins to talk about the welfare state, he often ends up with the idea of participation (Habermas et al., 1961: 297; Habermas, 1985b: 161; 1992: 495 ff.). So, even for him, political participation appears to be the alternative to crisis-ridden social democracy. In what way a repoliticized public could redesign a welfare state (and the character of that state) remains open in Habermas's writings.

Both politically and theoretically Habermas's focus on extending public debate is sandwiched between two camps. One camp denies the very possibility of communicative action (conservatives and technocrats, represented in theory by Gehlen and Schelsky or, later, by Luhmann or the bureaucracy of the European Union). It relies on systemic functionality, for which public debates are not only useless but an impediment. A similar avoidance of discussion could be found in

real socialism, which is why there emerged an alliance with socialist dissidents that resulted in a cooperation in Korcula known as the Yugoslav summer school. The second camp is very much in favor of communicative action, not for its own sake but in order to use it for other, more substantial goals (the student movement and socialists, for example). It is difficult to locate Habermas's position between these two camps because he is constantly arguing against *both* of them. On the one hand, he wants to enhance public debates. This is a running topic in most of his writings. On the other hand, he struggles with more radical politics that go beyond this position. When, early on, students' socialist ideas were attacked for overstressing their 'operational framework', Habermas echoed John Rawls's political liberalism that material 'conceptions of the good' should be avoided in political debate. The only topics that can be raised in public are those that could be held by everybody. This principle of universality sounds radically democratic, but, in fact, it leads to a formalism that restricts topics to procedural ones: it is only procedures that everybody can agree on, since everybody has different opinions on material topics. So Habermas's political program seems to be to always find a middle ground – a position neither very critical, nor particularly 'radical'.<sup>7</sup>

The change in critical theory's political orientation is also visible in Claus Offe's statement: 'There is no practical alternative to the constitutional program of liberal and welfare state democracy' (Offe, 1972: 53). When Habermas, building upon Offe, addressed late capitalism's legitimation issues (Habermas, 1973), he changed his position vis-à-vis his earlier position as a cultural critic. He no longer acted as an advocate *against* the state and its bureaucracies, conceived of as excessively powerful and as depriving people of their liberties; he was now concerned with the legitimacy of the state (governed by the Social Democratic Party at the time); he consolidated this apologetic position in *Between Facts and Norms*.

## ANOTHER TURN: LEGAL NORMATIVISM

The ideal of communicative action, of finding a consensus for contested issues in an ideal discourse, free of domination and restraints, has always been a counterfactual model. Neo-Aristotelians and Marxists alike criticized it by pointing out that nothing of the kind has existed in reality. The focus on law that Habermas developed in *Between Facts and Norms* (1992) responds to this critique. On the one hand, the provision of freedom of speech, association, assembly and the press *by means of* law is the institutional precondition for the occurrence of unfettered discussion. On the other hand, legal arguments presuppose the freedom and equality of legal subjects. Habermas now argues that this is no vicious circle but rather cuts the Gordian knot. The focus on law is thus a lifeline that ties the theory of communicative action to social reality, even though the 'reality' of law is itself partly normative (that is the 'norm' dimension of law, while the 'fact' dimension refers to its political existence). Thus, law is not so much examined for its own sake as used in an attempt to close the gap, deeply rooted in Habermas's approach, between sense-free technology and immaterial interaction, system and lifeworld.

Critical theory, which, according to Habermas had been aporetic for decades, now achieves a 'systemic closure', but it is a closure that once again replicates the dualism between technology and moral practice inherent in Habermas's basic approach. Habermas effects a rapprochement between discourse theory and law, integrating law between system and lifeworld as a 'transmission belt' (Habermas, 1992: 76, 81, 448). He examines law both from a normative perspective (which Habermas believes to be a participant's view) and from a systems-theoretically reductive observer's perspective. From this 'double perspective' of his own theory (Habermas, 1992: 66), he draws conclusions about the

nature of the object of inquiry. Within law, he claims, the two worlds, *facts and norms*, achieve the sought-after synthesis. In this way, law can be a 'plausible solution to the puzzle' since it thrives on communication even if it is coercive in nature:

A morality that depends on the accommodating substrate of propitious personality structures would have a limited effectiveness if it could not engage the actor's motives in *another* way besides internalization, that is, precisely by way of an institutionalized legal system that *supplements* post-conventional morality in a manner effective for action. (Habermas, 1992, 114)

In *Between Facts and Norms*, law serves as a 'safety net' providing the social integration other 'systems' fail to bring about: '*unfettered* communicative action can neither unload nor seriously bear the burden of social integration falling to it' (Habermas, 1992: 73). Yet even though law may be *one* medium of 'social integration' among others, this does not make it a sufficient mechanism of social integration. This assumption would overestimate the power of law.

Habermas alleges that normative implications are evident throughout law (and faults Luhmann for not seeing this: Habermas, 1992: 50) and assumes that law, driven by normativity, has detached itself from the economy and politics (1992: 75). For this reason, he is not interested in 'negative liberties and social entitlements' (1992: 78) but in the de-economized and depoliticized liberties of 'civil society', the 'rights enjoyed by citizens' (1992: 83, 75 ff., 79), i.e., the ones that rest on communicative action (this corresponds to Hannah Arendt's 'pure politics'). Thus, Habermas does not so much address the actual development of a specific legal system via social struggles but rather contents himself with discussion of an abstract 'generation' of 'validity' – a transcendental history ('logical genesis': 1992: 121).

Consequently, terms such as 'radical democracy' or 'political culture' have no definite referent. The question of what exactly

these terms refer to remains unanswered. Habermas analyzes the implications of normative concepts derived from the *self-understanding* of the democratic constitutional state in what amounts to a hermeneutics of democracy. Habermas's result looks like a transcendental deduction of the German Federal Republic. Consequently, what begins as a pamphlet on radical democracy in the end boils down to a politics of imagination: citizens are autonomous not because they themselves author the law, but because they 'may ... understand themselves' as authoring it (Habermas, 1992: 33). A law is just when all those affected by it can be thought of as approving it. They need do no more than imagine that they might be in a position to do so. Ultimately, it is enough for the 'authors' of such theories to imagine that the subjects can imagine this too: 'Just those action norms are valid to which all possibly affected persons could agree as participants in rational discourses' (Habermas, 1992: 107).

Habermas defends himself against the accusation of idealism (1996: 335 ff.), but the 'substantive reasons' (1996: 342) he invokes years later somewhat contradict his earlier assumptions ('There is still much work to be done in this area' (1996: 354)). In retrospect, the 'ideal communicative community' and 'discourse without domination' reveal themselves to be the somewhat exalted precursors of the later 'democratic procedure' (Habermas, 1992: 301 ff.), except that the latter does not leave much to be realized. As accurate as some of the descriptions provided in this model are, it is debatable whether it constitutes a critical theory of society (Shabani, 2003; maybe it never was; see Müller-Doohm, 2015) or, rather, a defense of liberal democracies in times of political crisis. Maybe this is the secret of Habermas's tremendous success (he has earned numerous prizes and distinctions): he is always well informed and vigilant about potential problems, but he does not ask the reader to expect more than there essentially already is.

## Notes

- 1 In this chapter, I expound on arguments from Henning, 2015. I want to thank Max Henninger for his translation and also Bev Best for her help.
- 2 While Arendt's (1958) assumption that capitalism is capable of 'smooth functioning' was neoclassical, Habermas (1963: 195 ff.) accepted hypotheses on 'organized capitalism', the supplanting of exploitation by 'alienation' and the disappearance of the proletariat.
- 3 The break with Heidegger was prompted by the renewed publication of texts written during the Nazi period: 'Until the publication of Heidegger's *Introduction to Metaphysics* in 1953, my political and my philosophical allegiances were... two utterly different things – two universes that hardly touched' (Habermas, 1979: 515).
- 4 Instead of private capitalism, 'today' we have the primacy of politics (Habermas, 1973: 5), a new complex of the economy and the state that 'no longer' involves problems such as the systematic discrimination of entire sections of the population (statements like these can be found in Habermas et al., 1961: 295; Habermas, 1968a: 74 ff.; 1968b: 100 ff.; 1973: 33 ff., 49 ff.; 1976: 182; 1981: II, 273, 343 ff., 505 ff.; 1992: 520).
- 5 'Only in an egalitarian public of citizens that has emerged from the confines of class... can the potential of an unleashed cultural pluralism fully develop' (Habermas, 1992: 308). Class barriers seem to be abolished by 'equal rights of citizenship' (1992: 308). This misreads a juridical expression as a description of reality.
- 6 Following Gehlen, Habermas originally calls for 'asceticism' (1954; see Keulartz, 1995: 60). In 1992, he still refers to the 'undesirable effects of welfare-state provisions' (Habermas, 1992: 391; cf. 1981: II, 361 ff.). The 'paternalistically bestowed' 'social entitlements' promote a 'privatistic retreat from the citizen's role' (1992: 78). Habermas even uses the Schelskyan term 'leveling' (1992: 79). Opposition to the welfare state is seldom motivated by a democratic ethos (authors such as Forsthooff, Huber, Gehlen and Schmitt enjoyed successful careers under National Socialism); more frequently, such opposition is motivated by a fear of losing one's social status or of more far-reaching political demands.
- 7 Later on, he had second thoughts, claiming that in a postsecular age it would be too harsh to exclude believers from public debate (Habermas, 2005: 119 ff.; 2012: 127 ff.). But even if religiously motivated arguments may be articulated in a public debate, they have to be sorted out from decision-making and its legitimation – they need filters and floodgates (Habermas, 1992: 387, 398, 431 ff., 449).

# Gillian Rose: The Melancholy Science

Andrew Brower Latz

## INTRODUCTION

Gillian Rose was born Gillian Rosemary Stone in London on 20 September 1947 to a secular Jewish family originally from Poland. She studied philosophy, politics and economics at Oxford, then continental social philosophy, sociology and the Frankfurt School at New York's Columbia University and the Freie Universität of Berlin. She also attended the New School for Social Research whilst in America. Her introduction to German philosophy began at Oxford, in a seminar set up by Hermínio Martins; continued in America and Germany (she studied Hegel with Dieter Henrich in Germany); and resumed in Oxford when she returned to complete a PhD on Adorno under the supervision of Leszek Kołakowski and Steven Lukes (Bernstein, 1995: 12; Caygill, 1996: 56; Martins, 1996: 112–14; Milbank, 1995; Rose, 1995a).

She was Reader in Sociology at Sussex University from the mid seventies to 1989 and Professor of Social and Political Thought

at Warwick University from 1989 to 1995, a chair created especially for her. All ten of her PhD students moved with her from Sussex to Warwick. Rose published eight books, two articles and four book reviews (for a full bibliography see Brower Latz, 2016b). She wrote on German Idealism, the Frankfurt School, Marxism, postmodernism and poststructuralism, sociology, Christian theology, Jewish theology and philosophy, Holocaust studies, architecture and jurisprudence, and offered original readings of many figures including Hegel, Kierkegaard, Nietzsche, Heidegger, Arendt, Luxemburg, Varnhagen, Girard, Thomas Mann and Kafka. She read German, French, Latin, Hebrew and Danish. Rose was 'one of a number of Jewish "intellectuals" chosen to advise the Polish Commission on the Future of Auschwitz' (Rose, 1995a: 12).

In Coventry on 9 December 1995, Rose died at the age of forty-eight, after a two-year struggle with ovarian cancer. She was baptized into the Anglican Church moments before her death by the Bishop of Coventry, Simon

Barrington-Ward. This surprised and troubled some of her acquaintances and readers, fueling a debate about how or whether Rose's conversion to Christianity related to her work (Ellis, 2000; Jay, 1997; Kavka, 2001; Rose, 1998; Wolf, 1997). 'Conversion', however, may be the wrong term, since she wrote in her final weeks in hospital, 'I shall not lose my Judaism, but gain that more deeply, too ... I am both Jewish and Christian' (Rose, 1998: 7). Some of her close friends were important religious figures and theologians (Julius Carlebach, John Milbank, Simon Barrington-Ward) (Rose, 1995a, 1996, 1998, 1999) and Rose has had an important influence on some Christian and Jewish theologians, including Rowan Williams, former Archbishop of Canterbury.

The theological element of her thought should not be overstated, however, as it sometimes has been. Rose began her work as an atheist Marxist and only gradually began to consider political theology and liberation theology as worthy topics of research. Her own social philosophy, although evolving up until at least the early nineties, found its core coherence around Hegel (more on this later). That is, she had developed much, though admittedly not all, of the major planks of her social theory before she took up theological themes. When she did consider the theological, it was in response to reading Kierkegaard, to the theological turn in continental philosophy, an intellectual friendship with John Milbank (one of the major English language theologians of his generation), and, only later, her own burgeoning religious experiences (Rose, 1995a, 1996, 1999).

Rose located herself within the Frankfurt School tradition: 'there are now generations of Frankfurt School students who occupy posts as sociologists and philosophers throughout the world. I really consider myself to be one of them' (Rose, 1986). She was, more specifically, part of the second generation of the Frankfurt School, and took her bearings primarily from Hegel and Adorno. Rose's doctoral dissertation, submitted at

Oxford in 1976, was called *Reification as a Sociological Category: Theodor W. Adorno's Concept of Reification and the Possibility of a Critical Theory of Society*. A revised version was published as *The Melancholy Science: An Introduction to the Thought of Theodor W. Adorno* (Rose, 1978). It was the first book to provide an overall introduction to Adorno's thought in English and made a major contribution to introducing the Frankfurt School to English language scholarship. Her second book, 1981's *Hegel Contra Sociology* (republished with a new Preface as Rose, 1995b), criticized the neo-Kantian basis of classical and Frankfurt School social theory, and argued for grounding social theory instead on a full-blooded Hegelian philosophy. Let us take each in turn.

## ROSE'S HEGELIANISM

Hegel first. Rose's version of Hegel was unusual. She disagreed with most Frankfurt School theorists because she opposed their rejection of central aspects of Hegel's philosophy. As Garbis Kortian explained, in a book cited by Rose, 'The more precise coordinates which define the Frankfurt School thesis are, on the one hand, the two fundamental concepts of the *Phenomenology of Spirit*, speculative experience and the speculative proposition, and, on the other, the fact that the dissolution of German Idealism threw these concepts into question' (Kortian, 1980: 26). Rose took exactly the opposite view to the Frankfurt School's rejection of speculative experience and speculative propositions. *Hegel Contra Sociology* begins: 'This essay is an attempt to retrieve Hegelian speculative experience for social theory' (Rose, 1995b: 1) and goes on to explain speculative propositions as fundamental to the whole enterprise. Again, in Kortian's view, philosophy must understand the implications of the dissolution of Hegel's idea of absolute knowledge, and must 'denounce

one of the constitutive moments of Hegelian speculative experience: the moment of recognition and appropriation (*Anerkennung und Aneignung*) of the phenomenised totality of the absolute concept in its otherness' (Kortian, 1980: 41). This is precisely contrary to Rose's view in which the Marxist distinction between 'radical method' and 'conservative system' has obscured

the centrality of those ideas which Hegel developed in order to unify the theoretical and practical philosophy of Kant and Fichte ... These ideas, recognition and appropriation (*anerkennen* and *aneignen*), are fundamental to Hegel's notion of a system, and their importance cannot be appreciated apart from Hegel's critique of the methodologism and moralism of Kant and Fichte. (Rose, 1995b: 45)

Hegel's system and method cannot be separated because Hegel 'demonstrated the connection between the limitations of the idea of method in Kant and Fichte and the limitations of the kind of social and political theory which they produced' (Rose, 1995b: 45). The two most serious limits in said social and political theory were, in Rose's view, their formality and lack of critical edge. Hence: 'the "absolute" is not an optional extra, as it were ... Hegel's philosophy has *no* social import if the absolute is banished or suppressed, if the absolute cannot be thought' (Rose, 1995b: 45).

Rose's Hegelianism is considered unusual outside the bounds of Frankfurt thinking too. Robert Bernasconi noted how in Rose's presentation, 'the completion of philosophies and religions takes place as the revealing of their social and political foundations ... It is hard to recognise this as a description of Hegel's discussions of the history of philosophy and when Hegel accounts for the possibility of the science it is not in these terms' (Bernasconi, 1981: 42). Or, for H. S. Harris 'her interpretive gambits are certainly very one-sided' (Harris, 1984: 426), which he put down to her focus on sociological implications, as when she read the *Logic of Being* as a critique of Kant and the *Logic of Essence* as a critique of Fichte. By the standards of contemporary

Hegelian scholarship she played rather fast and loose with the detail of Hegel's work. Above all, she tended to conflate Hegel's speculative logic with his phenomenology, she never really addressed how the *Science of Logic* is to be understood, and she never set out her vision of Hegel's system even though she repeatedly insisted the system was necessary and inseparable from Hegel's method.

Despite these flaws, at the time of its publication in 1981, *Hegel Contra Sociology* played a role in advancing Hegel scholarship, being used by Robert Pippin (1989: 272 n.49) and Slavoj Žižek (2008: 99) for instance, and it enabled Rose to create some very illuminating and suggestive works in social theory. For example, in 1984 Rose made the following observation about commodity fetishism in *Dialectic of Nihilism*:

In the *Grundrisse* Marx examines how Capital posits individuals as 'persons', the bearers of rights, and as 'things', the commodity 'labour-power'. The theory of commodity fetishism subsequently developed in the first volume of *Capital* is not simply an account of how material relations between 'persons' are transformed into social relations between 'things'. It is an account of the 'personification' and 'reification' intrinsic to the juridical categories of 'commodity', 'capital', and 'money'. Emphasis on the differences between Marx's and Hegel's thinking has obscured the continuity of their preoccupation with the antinomy of law. The juridical opposition of free subjects and subjected things, which characterizes not only relations between different classes but the relation of the individual to itself in modern states, forms the speculative core of Hegel's and of Marx's thinking. (Rose, 1984: 3)

This passage highlights Rose's emphasis on speculative thinking (which underlay her belief that Hegel and Marx are more similar than was generally recognized at the time). Each point is linked through the 'antinomy of law': law's tendency within capitalism to treat both persons and things as both persons and things in a way that is not and cannot be neatly resolved. It is precisely the bifurcated nature of law – which filters through politics, ethics and economics – that both Hegel and

Marx understood as requiring speculative, dialectical handling. The main source of Rose's dissatisfaction with classical and Frankfurt School theory was her belief that both were unable to handle antinomies as well as they should, which she traced back to their neo-Kantianism. Her own social philosophy, which operated under the figure of the 'broken middle', was an attempt to move beyond these dissatisfactions.

## ROSE CONTRA NEO-KANTIANISM

From 1981 onwards, Rose opposed a Hegelian speculative form of social theory to a neo-Kantian one. She developed and explored various ways in which the two differed and she never retreated from her reading of Hegel that originally led her to the distinction. In Rose's second book, *Hegel Contra Sociology*, her 'reading of Hegel functions as a reformulation of the foundations of Critical Theory' (Osborne, 1982: 8). In her view – not always clearly expressed – good sociology works on a Hegelian speculative basis but often mistakes its own procedures because it understands itself on a neo-Kantian basis. The nub of the issue is that neo-Kantian sociology both separates and yet conflates the conditioned and its condition of possibility (or, put otherwise, the social and the transcendental), whereas speculative thought is better able to relate the two (see further Brower Latz, 2015, 2018 and in press). Let us unpack this thought.

In *Hegel Contra Sociology*, Rose traced the neo-Kantian training and intellectual background of Durkheim and Weber, which she saw as both a strength and liability. As she says on the first page: 'The neo-Kantian paradigm is the source of both the strengths and weaknesses of Durkheim's and Weber's sociology' (Rose, 1995b: 1, cf. 31). Neo-Kantian sociology does provide information about and insight into society but is incomplete. Its transcendental circularity posits a

condition of possibility (e.g., the economy) and a conditioned (e.g., moral philosophy), but does not sufficiently allow the conditioned to redound onto the condition: 'a transcendental account necessarily presupposes the actuality or existence of its object and seeks to discover the conditions of its possibility' (Rose, 1995b: 1, cf. 129–30). Again:

empirical reality or experience of it cannot be specified apart from concepts. Experience of social reality is mediated by concepts, thus there is no independently definable reality to pit against concepts in order to 'test' them ... to stipulate *a priori*, that is apart from experience, what is to count as empirical evidence for a concept, is merely to register what the methodology is equipped to register.... A circle is unavoidable. (Rose, 1978: 101)

As Adorno had it, 'an object gets investigated by a research tool which, through its own formulation, decides what the object is: a simple circle' (in *Soziologie* cited in 'Introduction' to 'A Critique of Methodology' by Eike Gebhardt in Arato and Gebhardt, 1978: 376). Hence Rose:

With instruments in general we can demonstrate their use without setting about using them ... But designing, building and examining sociological tools can only be done by the same rationality that is sociology's object. Rationality means rules, and sociology is the study of the rules and conventions of social life. So we are in a vicious circle. We are assuming the validity of the operation whose validity is to be questioned. This [neo-Kantian] approach is claiming that it is neutral and makes no assumptions but it has overlooked a major assumption: that logic, here socio-logic, is distinct from the rest of reality and that it can be used to grasp that reality, or at least part of it. The very metaphor of tool in sociology is suspect. The power of sociology, especially Marxist, is that scientific rationality and subjective consciousness are themselves part of the whole to be apprehended. Instrumental method, however, seeks to know before it starts knowing. This is absurd – this is what Hegel said about Kant .... (Rose, 1987)

Rose looked to Hegel to provide a better awareness of the interaction between reason and reality, or between the society being investigated and the reason doing the investigating, essentially transposing Hegel's

critique of Kantian epistemology into the realm of sociology, but with the crucial proviso that, just as Hegel's critique of Kant was appreciative and aimed at furthering and improving the Kantian project, so Rose's critique of sociology was aimed at assisting her own discipline of social theory and sociology (though the title and tone of *Hegel Contra Sociology* led some to regard it as a rejection of sociology).

Systematizing and reconstructing Rose's views from across her corpus we can discern other ways in which she thinks neo-Kantianism causes further problems for social theory. First, in a transcendental account, that which explains other terms does not explain itself, such that one term tends to become unknowable. Durkheim, for instance, 'transforms society into the precondition of facts and, therefore, into a primary and ultimately unanalyzable concept' (Crane, 1982: 638; cf. Rose, 1978: 82–6). Transcendental thinking within sociology

involves the postulation of various mechanisms, powers, structures, etc. at a level which is logically unexperienceable because it supposedly constitutes the very conditions of possibility of experience. These transcendental entities are then taken to be, in a sense, more 'real' than the reality which can be and is known; the former is understood to generate the latter. In critical social theory this form of reasoning issues in a conjunction of theoretical assertions which purport to explain how people do what they do, how social order is sustained, and how social change is possible. Critical social theory is respectably fallibilist about *particular* kinds of knowledge-claim, but assumes infallible authority over *generalised* transcendental knowledge-claims. (Pleasants, 1999: 178)

Second, the neo-Kantian 'transformation of Kantian transcendental epistemology into a series of *methodologies* concerned with ascertaining the basis of validity implied that epistemological problems could be transformed into problems of the sociology of knowledge' (Israel, 1990: 116). As a result, the force of practical reasons is much reduced and Rose thus doubts the quasi-transcendental form of social theory can fully account for

ethics, especially if it is used as the basis of philosophy as a whole and as the way to hold together practical and theoretical reason. And, indeed, the neo-Kantians conceded they could not explain the unity of fact and value; these had to be taken on faith (Beiser, 2009; Adorno, 1977). 'Behind [Weber's] demand for value free science lies an epistemological conception derived from the neo-Kantians, namely, that value judgements are not the result of cognitive acts. In fact Weber later saw the justification of practical judgments as meaningless' (Frisby, 1976: xxiv). Weber and Durkheim accept the fact-value distinction in a way that assumes mind and world are separate, and so fail properly to understand their mutual mediation. Weber, following Heinrich Rickert, saw the world itself as irrational, and the values and categories used to understand it imposed on it by human minds (Habermas, 1988: 4–5, 13–16). Rose's Hegelian social philosophy does not take the fact-value distinction so rigidly, and sets it within a different mind–world relationship in which the aim is to see all the multiple mediations through which subject and object, individual and society, create one another (Rose, 1995b: 194).

Third, a corollary of Rose's critique of neo-Kantianism in sociology is that one of the sources of the repeated recurrences of positivism within sociology may be the lack of appreciation by sociologists about the transcendental form of their thinking (cf. Steinmetz, 2005; Habermas, 1988: 109). Neo-Kantian sociology is problematic when the 'notion of the limitations of knowledge simply turns into positivism of a generally scientific or, more specifically, psychological or sociological kind' (Pippin, 1989: 58, discussing Rose). The epistemological roots are evident in passages from Rickert such as: '*Nur aus dem Sollen also und nicht aus dem Sein kann ich die Wahrheit des Urteils ableiten*' [Only from the ought therefore and not from being can I derive the truth of the judgement]; '*der Gegenstand der Erkenntnis ... kann nur das Sollen [sein], das im Urtheile*

*anerkannt wird* [the object of knowledge can only be the ought that is recognized in the judgement] (Rickert, 1892: 66–7).

Fourth, the neo-Kantians shared the problem of ‘the transformation of Kant’s critical method into a logic of validity (*Geltungslogik*), a general method, [which] *excluded any enquiry into empirical reality*’ (Rose, 1995b: 10, emphasis added). How can this be, when the whole purpose of sociology is to enquire into the empirical reality of society? Rose’s protest is more subtle than a simplistic reading of this sentence indicates. The problem with a ‘method’ in the human realm is its external relation to what it analyses. Hence her doctoral supervisor Kołakowski: ‘What we properly call a method should be a sequence of operations which, when applied to the same subject, will give the same or approximately the same results. In the humanities, the identification and collation of sources apart, this is far from being the case’ (Kołakowski, 1990: 244). The so-called methods in the humanities are really only general guidelines such as ‘the way people think is usually influenced by their social relations, the values accepted within their community’; thus ‘no explanatory method exists in the study of cultural history’ (Kołakowski, 1990: 245). ‘A method is simply a question ... and surely no method will yield information which it does not ask for (through its very formulation) ... Methods/questions are thus as dependent on the cultural paradigm as are “satisfactory” explanations’ (Gebhardt, 1978: 379). On these grounds Rose opposed Marxism’s claim to be ‘scientific’ (Rose, 1995b: 2).

Finally, over the course of the neo-Kantian period, methodology became detached from and began artificially to dominate substantive study (Frisby, 1976: xxviii). Validity, values and cognition of the world were separated from one another. Validity became an *a priori* matter, separable from conditions of experience; values were based only on conviction. Weber’s value neutrality, for example, whilst legitimate if methodologically constrained,

‘makes independent scientific access to empirical reality a logical impossibility and ultimately reduces science to just one more value’ (Crane, 1982: 638).

Rose’s criticism of the neo-Kantianism of classical and Frankfurt sociology is not always fair, and she did enthusiastically use and value the work produced by Weber, Durkheim and the Frankfurt School. Nevertheless, she thought their misunderstanding about the methodological basis of social theory could and did lead to substantive problems. Not the least of these was the connection between theory and practice, an issue at the heart of critical theory and one she found especially wanting in the work of Jürgen Habermas:

This jettisoning of speculative thinking by recent ‘critical theory’ of modernity has also meant the abandonment of that methodological reflexivity, which is equally substantive, and which learns by coming to know its own formation in the culture it explores. Habermas and Giddens write in the severe style, having disqualified not only Marx and Hegel, but also Weber, Horkheimer and Adorno, who are read without any attention to their difficult and facetious presentation. This lack of attention to form and style leads to the functionalism of the subject: to the critical theorist who becomes a sociologist, his own authoritative voice a neutral, unimplicated discourse of its object. (Rose, 1992: 245)

As with Rose’s critique of Kant and Fichte, her criticism of Habermas focuses on his formality and attempt to produce ethics from theory rather than from ethical life (for a detailed critique and positive alternative along Rosean lines see Bernstein, 1995, 2001, 2015).

## THE SPECULATIVE SOCIAL PHILOSOPHY OF THE BROKEN MIDDLE

In contrast to such neo-Kantianism, Rose proposed a Hegelianism that embraced Hegel’s speculative logic, recognition, appropriation and the absolute:

Hegel put a trinity of ideas in place of Kant's idea of transcendental method: the idea of phenomenology, the idea of absolute ethical life (*absolute Sittlichkeit*), and the idea of a logic. The idea of phenomenology can be seen as an alternative to Kant's theoretical *quaestio quid juris*, while the idea of absolute ethical life can be seen as an alternative to Kant's justification of moral judgements. This, however, would be to concede the Kantian dichotomy between theoretical and practical reason. The idea of all Hegel's thought is to unify theoretical and practical reason. In his *Logic*, as in all his works, the unification is achieved by a phenomenology and the idea of absolute ethical life. (Rose, 1995b: 48)

The broken middle as an 'idea' is Rose's critical theory of modernity, which she glossed as 'the political diremption of the modern state', (Rose, 1992: 199) namely, the necessary tensions between self, society and state. Modernity 'is discovered to be diremptive and is not defined, quasi-a priori, as a "project"' (Rose, 1992: 240), and this discovery occurs by investigating modernity's political history and sociology. For Rose, philosophy and politics 'arise out of ... diremption and its provisional overcoming in the culture of an era' (Rose, 1992: 286). Diremption does not mean the absence of relation, but the relation of mutual dependence and tension. Law and ethics, and state and civil society, both require one another but pull apart. Rose's 'aporetic universalism' is a form of rationality that explicitly works through these tensions. 'While arcadian and utopian universalism would reconcile and posit the unity of particular and universal, aporetic universalism explores and experiments with the disunity of singular and universal' (Rose, 1992: 164).

The historical nature of speculative thinking was important to Rose and the source of her tendency to bind closely together (read: conflate) Hegel's speculative logic with his phenomenology. She discussed Hegelian phenomenology as an 'existential drama' (Rose, 1995b: Preface) and a 'comedy' (Rose, 1996: 63–76). By this she meant philosophy involved learning from mistakes, and

that it should be not merely an intellectual exercise but fully self-involving. In phenomenology, the dialectic between experience and thought, and between natural consciousness and philosophical consciousness, is just as much an existential formation and re-formation (a culturing) of the self as it is an epistemological exercise. 'Culture here has a specific educational meaning and import within speculative philosophy. It refers to the way in which an idea or an experience, in being known, re-forms itself in this being known. Ideas without such a notion of culture or re-formation tend towards dogma because they are asserted without philosophical or educative significance' (Tubbs, 2005: 39). Coming to awareness of the social determinations of both natural and philosophical consciousnesses through the phenomenological journey, does not allow a complete escape from social determinations, but a different relation to them and thereby some measure of freedom. 'We observe that justifications are circular and self-defeating. Why should this observation, the common-sense experience of contradiction, be ruled out as a valid observation?' (Tubbs, 2005: 23). In this way the 'speculative can retrieve the non-foundational experience of thought at the same time as the authority and integrity of reason' (Tubbs, 2005: 15). That makes it neither positivist nor relativist, avoiding the pitfalls of non-critical sociology and Nietzschean-postmodern social philosophy (Rose, 1995b: Preface).

Rose's speculative thinking had an advantage over the dichotomous nature of sociological thinking, still prominent in the seventies and early eighties. In Robert Pippin's words:

the foundational issue [in *Hegel Contra Sociology* is] ... the way in which a subject can be said to determine itself (to be a subject) ... and yet how a subject can be said also to be a real, concrete, and so, in some sense, determined subject ... To think both aspects together, indeed even to be able to recognize that they must be thought together, requires, as Rose points out with great thoroughness and insight, the move to Hegel's 'speculative' position. (Pippin, 1989: 272 n.49)

A common response to the central antinomy of sociology – whether society makes people or people make society – is, ‘both’. This employs the category Hegel terms ‘reciprocity’. It prevents the chicken-and-egg situation between the two terms. ‘Reciprocity is, to be sure, the proximate truth about the relationship of cause and effect and it stands, so to speak, on the threshold of the concept’ (Hegel, 2010: 229). The problem is it leaves each side ‘as something immediately given’ rather than ‘coming to know them as moments of a third, higher [dimension], which is precisely the concept’ (Hegel, 2010: 229 [translators’ insertion]). He continues:

If we consider, for example, the customs of the Spartan people as the effect of its constitution and then, vice versa, this as the effect of its customs, this consideration may for all that be correct; but this construal, for this reason, does not provide any ultimate satisfaction, since by this means neither the constitution nor the customs of this people are in fact comprehended. That happens only by virtue of the fact that those two sides, and equally all the remaining particular sides revealed by the life and history of the Spartan people, are known to be grounded [*begründet*] in this concept. (Hegel, 2010: 229)

Sparta’s customs and constitution can in this light be seen as the unfolding of a self-moving whole, not simply the back-and-forth between two pre-defined terms. In the whole, understood conceptually, the parts are essential to the whole, not accidental properties. The picture is not of an enduring substrate with subtractable predicates; rather a conceptual whole is ‘organic’: each part is necessary to the whole and is itself only within the whole; in this sense, each part is or expresses the whole. The concept also names what it is that makes the thing the thing that it is. The concept is similar to Aristotelian form: it is what makes, say, an eye an eye; what it is we understand by ‘eye’ that is not the same as listing all its properties. If the eye is removed from the body (the whole) it dies, and is no longer properly an eye, but a piece of flesh. The difference between reciprocal and conceptual (speculative, in

Rose’s terms) thinking is the difference between understanding the relation between things in terms of ‘efficient causes all the way down’ versus their relation in terms of ‘what they are’ (Schick, 2014: 96). Hegel suggests we need to posit (retrospectively, phenomenologically) something like ‘the concept (or spirit) of Sparta’ as what develops and expresses itself in the reciprocal interaction between customs and constitution: ‘it is a specific spirit which makes itself into an actual world which now exists objectively in its religion, its ritual, its customs, constitution and political laws, and in the whole range of its institutions, events and deeds. That is its creation – that is this people’ (Houlgate, 2005: 21). Rose was willing to follow Hegel this far, though with a heavy emphasis on the imperfections and fractures in the ‘whole’ that society is. (Organic was not a term Rose used). In Frankfurt School terms, society is ‘a sort of linking structure between human beings in which everything and everyone depend on everyone and everything; the whole is only sustained by the unity of the functions fulfilled by all its members’ (Frankfurt Institute, 1972: 16). For Rose, the society must be viewed as a whole – because it was one – but never could be entirely grasped as such.

In Rose’s view, speculative philosophy is required for understanding the human social world because it dialectically and progressively relates finite and infinite; it knows what *Geist*/spirit is in and for itself, a matter of ‘practical self-consciousness’ (Pippin, 2008: 227). History, reason and *Geist* cannot properly be understood merely in finite or quantitative terms, which is why positivism does not suffice. Speculative social theory therefore takes less for granted than its transcendental or quasi-transcendental cousins, just as it does in logic. This is the basis of its powerful ability to handle contradiction and antimony. Sociology has in fact moved in this direction since Rose first made her argument, though not by relying on Hegel. As an example, consider a very different kind of sociology from Rose’s own writing,

in order to see how Rose's speculative social philosophy provides a logical grounding for empirical sociology. In 2012, Rebecca Catto and Linda Woodhead published the results of a large-scale, multi-disciplinary, team research project into secularism and religion in modern Britain (Woodhead and Catto, 2012). Their approach can be read as exemplifying various aspects of Rose's philosophy. (For the background to Rose's views on empirical sociology see Rose, 1978: esp. 77–148). They used a combination of methods, including qualitative and quantitative (cf. Rose, 1978: 95–108). They bore in mind the position of researcher and theory with respect to society, and approached theories as both *explicans* and *explicandum*: 'far from being neutral voices speaking on the post-war religious condition, these [secularization] theories are integral to it. And, as such, they offer an important route into some of its deepest presuppositions' (Woodhead and Catto, 2012: 3). They emphasize an historical perspective on the multiple levels of mediation of religion and secularism, both of one another and by other social forms such as policy, media and law. They propose a dialectical relation between 'religion' and 'secular' as mutually determining, since "secular" gains substance in relation to the kind of "religion" it rejects' (Woodhead and Catto, 2012: 4). And they offer a speculative conclusion: 'post-war Britain emerges as both religious *and* secular ... Neither makes sense without the other, and their shifting meanings must be analysed in relation to their changing linkages, configurations, commitments and mutual hostilities' (Woodhead and Catto, 2012: 3–4). Here we have an example of some of the best contemporary sociology, combining various forms of empirical data collection and analysis, affirming that sociology needs to think in terms of contradictions and determinate negation, must use increasingly comprehensive levels of explanation and historically informed analyses, and be aware of its own role within its object of study. Although the empirical and descriptive

work in this volume fits the criteria of Rose's social theory, it still leaves open the normative questions that need to be tackled. Rose's work thus offers significant advantages to social theorizing by providing a sophisticated framework for relating its methodological, logical, descriptive, metaphysical and normative moments.

Rose concentrated her social philosophy on two main areas, the relation between state and civil society and the connection between law and ethics. She regarded both as dirempted, that is, split in two in a way that cannot be resolved even though it seems very strongly as though there should be a way to unite each half. Much of jurisprudence, for example, has concerned itself with bringing law and ethics into line with one another – think of Thomistic natural law – whilst other approaches have largely bracketed out the question of ethics from the study of law – such as Hartian legal positivism. Rose's harshest criticisms are directed at attempts to theorize away these diremptions, whether by proposing a clean separation of the two terms or by positing a premature reconciliation between them. She regarded post-structuralist views of law, for instance, to be reductive in the first sense, and much political theology to be reductive in the second sense. She called the latter approach an attempt to provide 'mended middles', which not only failed to recognize the reality of the diremptions in the 'broken middle' but also exacerbated them by obscuring from view the real problems on which intellectual and political work was needed (Rose, 1992). The 'broken middle' was Rose's name for her view of society as well as for her own social philosophy. In this way she avoided any utopian, facile or nostalgic connotations that often accrue to talk of society as a 'whole'. The diremptions of the broken middle pointed towards 'absolute ethical life', a society in which law and ethics would be united by belonging wholly to a people without alienation, but this was clearly unattainable and ought to be no more than a regulative ideal.

Rose did not offer stipulative definitions, preferring to allow connotations to accrue to her main terms of interest, because a 'grand theoretical explanation ... would hypostatize the distinction ... It would probably result in glib philosophical generalizations, oversimplified sociological observations and misguided or dogmatic political recommendations' (Keane, 1988: 14 [a volume cited by Rose, 1992]). Instead the distinction should serve as an '*interpretive standpoint* which can be of utility in historical investigations, sociological inquiry, normative discussions and political action' (Keane, 1988: 14). Rose indeed views the diremption as an interpretive standpoint, and offers Marx, Arendt and Luxemburg as examples of their exploration. The broken middle is thus 'a condition and a means of investigating that condition' (Gorman, 2000: 55); it is, as any reflexive sociological concept should be, *explicandum* and *explicans*.

Rose's account takes off primarily from Marx's 'On the Jewish Question', particularly Marx's observation that state and civil society both presuppose and contradict one another, and that the shift from feudal to modern societies involved depoliticized work and property and a bifurcation within the individual. A 'permanent "mismatch" between the economic and political spheres is a defining characteristic of modern capitalist systems of production' (Keane, 1988: 7). As a result, people lead a double life: in political life they regard one another as communal beings, but in civil society they act as private individuals, treating others as means rather than ends and being so treated, and thus are not entirely free. Indeed, 'political life declares itself to be only a *means*, whose end is the life of civil society' (Marx, 1978: 44).

Insight into these inversions cannot solve them by imposition of a philosophical ought [*Sollen*]. The dynamic movement of *Geist* in Rose's Hegelianism reveals how the social undermines and inverts political meanings, yet 'without trying to overcome [by means of theory] these meanings and their inversions

... as long as they continue to be generated by their legal and political and productive preconditions' (Rose, 1993: 68). Yet people do succumb to the temptation to mend the diremptions by theory alone, whether by appeal to community, the unmediated encounter with the face of the other, and so on. Rose was particularly scornful of such attempts at solution by theory. The centrality of misrecognition in Rose's account of *Geist* avoids such premature and dangerous pseudo-reconciliation of diremptions.

Rose's broken middle does not, then, expect too much from ethical life or its carriers in contemporary society, but she is more sanguine about its achievements than Adorno was. One of the reasons civil society works is because individuals are distanced from their economic, social and political roles, and as such can move around, be substituted one for another, join and leave associations at will without undue penalty. Recognition of the brokenness of the middle prevents an unrealistic investment in the social and political order. Indeed, although civil society has now become routinized it still needs, and has, values. On the one hand, routinization and the ability to move are essential to the success of civil society and the values and freedoms it rightly contains. On the other, much of the sociological and philosophical critique of modernity from the Frankfurt School objects to that routinization and movement as constantly carried too far and producing pathologies. The broken middle names this inescapable predicament, the necessary imperfection of current social forms and any provisionally achieved equipoise.

The broken middle is phenomenologically 'locatable – in history, in polity, in institutions, in *dominium*' (Rose, 1992: 288). Rose notes that one of the meanings of *aufheben* (Hegel's key term, usually translated 'to sublate') is 'to carry an opposition back to its source' (Rose, 1984: 50 n.2). Much of the social theory put forward within continental philosophy and political theology was in Rose's view insufficiently sociological.

She wished to show that its failure properly to grapple with its own sociological preconditions (especially the two fundamental diremptions) causes theoretical problems, which in turn reinforces those diremptions.

It has become easy to describe trade unions, local government, civil service, the learned professions: the arts, law, education, the universities, architecture and medicine as 'powers'. And then renouncing knowledge as power, too, to demand total expiation for domination, without investigation into the dynamics of configuration ... Because the middle is broken – because these institutions are systematically flawed – does not mean they should be eliminated or mended. (Rose, 1992: 285)

Social theory must be able to 'acknowledge that it does not know in advance whether such institutions are violent or peaceful' but 'is able to find out – by reconstructing the changing relation between universal, particular and singular' (Rose, 1992: 264). Rose argues modern society cannot properly be understood without reference to the institutions of civil society mediating between state and individual, hence her criticism of the tendency in politics to reduce their power and in (some) theory to denigrate their legitimacy. Equally, social theory cannot understand its own preconditions, or itself, if it ignores the state–civil society diremption.

Rose called the law–ethics diremption 'modernity's ancient predicament' (Rose, 1992: xii). This facetious phrase refers to the fact that debates around law and ethics stretch back to Socrates and the Sophists yet have a specific modern form, inflected through the Kantian revision of Roman law in combination with capitalist private property (Rose, 1993: 250–1): 'With the institutionalization of private property and contractual law, a market economy comes into being whose primary organizational unit, the business firm, disposes over purposive-rational methods of accounting, management, and production in the calculated pursuit of profit' (Ingram, 1987: 46). Thus the importance of the modern form of the law–ethics diremption: the

'single most decisive event paving the way for modern society was undoubtedly the separation of ethics and law from one another and from religious custom (*Sittlichkeit*)' (Ingram, 1987: 45). Where Rose's first fundamental diremption followed Marx, the second accepts Weber's pioneering analysis. Modern subjects, unlike their ancient counterparts, now experience the:

paradox of life lived in the two apparently different realms of the social and political when both realms are juridical, equally constituted by the civil law. Unaddressable oppositions between morality and legality, autonomy and heteronomy, the good will and natural desire and inclination, force and generality, can be traced to an historically specific legal structure which establishes and protects absolute property by means of the juridical fictions of persons, things, and obligations (Rose, 1984: 2–3).

The law–ethics diremption also refers to the Weberian problem of rationalization. Rationalization is the thread uniting Rose's ideas on the law–ethics diremption, violence, and ethical politics. Society, law and economy all now reflect the loss of meaning flowing from rationalization. Ethical values and ideals seemed increasingly less rational as scientific truth and rationality replaced other forms of reason. 'Modern, secular reason is self-undermining' (Bernstein, 2001: 5). With rationalization, society began to doubt ethical values and ideals (including even reason and truth), which in turn lost their motivating force. Agents' ability to understand and guide their lives with practical reason is then undermined. This begins to threaten 'the *ethical meaningfulness* of human existence' and 'in so doing, undermine the conditions of *rational agency, of goal-directed meaningful action* as such' (Bernstein, 2001: 6, emphasis in original). In terms of law: 'Modern legal practice – thinking, writing, deciding – is presented as a sort of hermetically sealed operation, formal logic without regard to "substance", a world of its own entire of itself. And it is the elimination of all concrete determinations from this process

which is said to be central – the transformation of a dispute into simply or essentially one between abstract (disembodied, anonymous) bearers of rights, legal subjects’ (Murphy, 1997: 56). And within the economy: ‘From an ethical viewpoint, this “masterless slavery” to which capitalism subjects the worker or the mortgagee is questionable only as an institution. However, in principle, the behavior of any individual cannot be so questioned, since it is prescribed in all relevant respects by objective situations’ (Weber, 1968: 1186). The result is the legal subject and ‘the misrecognitions attendant on abstract legal personality, private property and the decay of public and political life’ (Rose, 1993: 67).

Rose thus regarded law as necessary to gain a view of the social totality, and jurisprudence as an expansive enterprise, examining the links between the metaphysical, ethical and legal (Brower Latz, 2016a). From the diremptions evident in such jurisprudence, and existing law in contemporary society, if they are exposed in a Hegelian speculative manner, a view of the social whole is negatively implied. Rose calls this ‘absolute ethical life’, the implied unity of law and ethics and of state and society. Such seamless unity will never exist but it does offer an angle for critique of contemporary society and a normative goal to weigh against the bleak picture of Weberian rationalization. Absolute ethical life includes mutual recognition as the actuality, or immanent normative *telos*, of modern society, implied by the speculative unity of its two main diremptions, state–civil society and the law–ethics. It thus acts equally as a critique of society and sociology, including the role of bourgeois property law and social contract theories reflective of it, the hollowing out of middle institutions, and rationalized forms of law and ethics that undermine mutual recognition. The normative core of mutual recognition runs through all Rose’s work and refutes any ascription to it of relativism, nihilism, or lack of substantive normativity. It is the main way she saw herself

departing from Adorno, whom she viewed as ethically paralysed.

Rose’s influence runs along two axes, historical and theoretical. In the history of the reception of the Frankfurt School in the UK and English language scholarship, she had an important place, with her first two books, her teaching and doctoral supervision, and her intellectual friendships. In terms of theory, her influence is patchier. J. M. Bernstein credits Rose as a hugely important inspiration in his books (and, in the realm of theology, John Milbank and Rowan Williams were deeply effected). Yet difficult writing, a huge range of thinkers and themes, and no attempt to guide readers with a glimpse at the coherent position underlying her various essays, all combined to limit the reception and use of her own social philosophy, though it has found enthusiasts in a range of fields.

# Bolívar Echeverría: Critical Discourse and Capitalist Modernity

Andrés Saenz De Sicilia

Born in Ecuador, formed intellectually and politically in West Germany, resident of Mexico until his death, Bolívar Echeverría (1941–2010) is a singular figure within the landscape of twentieth-century critical theory. Following his early engagement with leftist politics and the existential philosophies of Unamuno, Heidegger and Sartre in his home country, Echeverría moved to Germany in 1961, initially with the intention of studying under Heidegger in Freiburg. Later that year Echeverría relocated to Berlin, where he would eventually become involved both politically in the German student movement that saw the SDS (Sozialistische Deutsche Studentenbund) rise to prominence, and theoretically with the associated revival of critical Marxist thought. In the midst of intense cultural and social upheaval, Echeverría established himself as a revolutionary intellectual and expert in Latin American politics, forming friendships with Rudi Dutschke and Bernd Rabehl (Gandler, 2015: 61ff.). In 1968 Echeverría returned to

Latin America, settling in Mexico, where he began university teaching alongside Adolfo Sánchez Vázquez and concentrated his research on Marx and Marxism, specifically focusing on the critique of political economy. He began to publish the results of this work from the 1970s onwards, initially in a series of journal and magazine articles and eventually in a number of book-length essay collections. Echeverría's essayistic predilection (only three full-length monographs appeared under his name during his lifetime) was heavily indebted to Walter Benjamin, in style as well as form. He continued to teach at the National Autonomous University of Mexico (UNAM) in Mexico City up until his death in 2010.

Three key problematics constitute the fundamental co-ordinates of Echeverría's project: (1) the 'critical' status of theoretical discourse; (2) the dialectical relation of nature and society in the process of social reproduction; and (3) the historical, political and cultural condition of capitalist modernity.

Each of these problematics establishes a key point of affinity with concerns central to the Frankfurt School, although in Echeverría's work they are developed and reworked significantly in relation to the very different historical, geopolitical and cultural conditions under which his intellectual production took place. Broadly, Echeverría's project departs from a detailed, systematic and non-Eurocentric reading of Marx's writings, especially *Capital*, that emphasizes the centrality of their critical character as well as the concepts of 'use-value', 'natural form', 'social reproduction', 'fetishism' and 'subsumption'. At the forefront of this analysis, and taken to be the foundational aspect of Marx's entire critical project, is the contradiction between value and use-value, and more specifically the subsumption of the latter under the former that characterizes the capitalist mode of social reproduction. Based on this initial orientation, Echeverría engaged with the debates around 'culture', 'cultural form' and 'modernity' (both as a general process and in its Latin American variant) in order to propose a distinctive theorization of the 'crisis' that 'defines our epoch'. In this respect, his critical purview far exceeds typical Marxist accounts of society, and – here the influence of Braudel, Mumford and Benjamin, as well as Marx, is clear – could be called properly 'civilizational', engaging with the problem of freedom across the *longue durée*, as well as in its specific conjunctural instantiations. In his own words, his writings combine an insistence on remaining faithful to 'certain basic approaches of Marx's critical discourse with a willingness to radically recompose them in light of the practical and discursive experience of the twentieth century' (Echeverría, 1998a: foreword).

This spirit of radical recomposition, perhaps a fitting characterization of the Frankfurt School's own relation to Marxism, describes Echeverría's attitude toward Frankfurt School associated authors – primarily Adorno, Horkheimer, Benjamin and Marcuse – whose influence informs his thought as one part of

an eclectic constellation of figures: Lukács, Korsch, Sartre, Heidegger, Nietzsche, Hegel, Braudel, Mumford, Jakobson and Hjelmslev being key amongst them. Frankfurt School authors were a central reference point throughout the period Echeverría spent in Berlin. Subsequently, Echeverría went on to teach key works from the Frankfurt oeuvre as part of his seminar on 'German texts' at the UNAM in Mexico City. Whilst Echeverría's work was not produced primarily, or even expressly, in the direct lineage of Frankfurt School thought, he nonetheless maintains a generous dialogue with Frankfurt thinkers throughout his writings. In a pair of introductory lectures on the Frankfurt School delivered in Mexico City in the mid 1990s, Echeverría summarized the distinctiveness and originality of its contribution, focusing primarily on the work of Adorno and Horkheimer (Echeverría, September 2010–February 2011). But if critical theory is, and indeed must be, a response to the circumstances and struggles of its time, then it is essential to appreciate that the conditions under which Echeverría was working were very different to those which shaped the ideas of the first generation of Frankfurt thinkers. Echeverría's intellectual maturity coincided with the failure and retreat of the revolutionary cycle which reached its climax globally in 1968, and in Latin America throughout the 1970s. So whereas the discourse of the Frankfurt School arose, for Echeverría, within what Lukács in the 1920s termed the epoch of 'the actuality of revolution', lacking by the 1960s only the subject who could realize it, by the 1980s the very actuality of revolution was in question on both a practical and theoretical level (Echeverría, September 2010–February 2011: 22). Struggles had not only undergone a qualitative transformation, but the capacity to produce 'revolutionary significations on the discursive terrain' had become increasingly attenuated. Echeverría thus understood his own time to have inherited an intensified version of the problematic that Adorno, Horkheimer and Marcuse

understood as the benign totalitarianism of everyday life in the west, only without its dialectical other, the authoritarian regime of the Soviet Union. The blockage of critical possibilities implied in this context was reflected in the ascent of postmodernism and the rejection of Marxism within Latin American intellectual life after the 1970s, giving rise to a different configuration of interests and oppositions on the level of theoretical discourse. This in part explains Echeverría's transition to a focus on questions of semiotics, culture and the global during this period, although this was best understood as a polemical shift of register, given that its analyses remain grounded in a theory of social reproduction departing from terms set out by Marx. It is this highly original account of social reproduction that remains Echeverría's key contribution to a critical theory of society.

## CRITICAL THEORY AS CRITICAL DISCOURSE

The first point of convergence connecting Echeverría's thought to the Frankfurt School can be found in his emphatic assertion of the necessarily 'critical' character of revolutionary theory, and in a careful and comprehensive attempt to elaborate precisely what such criticality consists in. For Echeverría, this necessity can be traced intellectually back to a distinction between what he terms the 'romantic' and 'classical' modes of reflexive discourse. Whereas the latter, primarily francophone/anglophone in origin, purported to know its object by confronting it dispassionately, 'with distance', simply observing it 'as it is' independent of the observer, the romantic attitude, of central European provenance, is grounded upon the idea of a relation of *interiority* between the thinking subject and the thought object. Such interiority acts as the basic postulate of the romantic disposition, for which the thing is transformed in being thought, to the degree that thought

constitutes 'a moment of the existence of the thing'. The objectivity of reality (in this case *social* reality) does not therefore, following the romantic contention, subsist in an uncontested and neutral manner, as 'a sum-total of facts', in Horkheimer's words, that 'is there and must be accepted' (1972: 199) but is rather grasped via categories that are 'always already charged with signification and interpretation' (Echeverría, September 2010–February 2011). The 'critical' dimension of critical theory involves uncovering the charge of meaning undergirding all apparently immediate social phenomena, and in doing so, designating their relation to the broader social order and historical dynamic within which they are inscribed. It is on the basis of this postulate of interiority that epistemological adequacy and objective context become inextricably bound together, grounding the unity of critical theory – despite the diversity of concerns encompassed within it – in the refusal to separate theoretical and metacritical problems from historical judgement and social critique:

Social discourse is a historical discourse, and there is no possibility of realising it in any other manner, since all sociological, or anthropological approximations have sense only to the extent that they describe, establish, problematize the substance of the present, which is to say historical tension. In the consistency itself of the objectivity of things is marked, impregnated, a historical tension that gives significance to things and permits their sense to be fathomed and described. (Echeverría, September 2010–February 2011: 31)

Theorizing social reality in this manner does not aim to establish a static connection between objective entities and some set of constitutive relations that would form a closed totality, but orients every fixed social form toward a 'horizon of intelligibility' opened by a process of historical transformation bearing emancipatory possibilities. Echeverría thus affirms Horkheimer's notion of a 'dynamic unity' between critical theorist and oppressed class, which obliges the former to present social contradictions as not

merely the 'expression of the concrete historical situation but also a force within it to stimulate change' (1972: 215). This synthesis, binding the inner connection of knowledge and object to the project of realizing human emancipation, pits critical theory against a conciliatory bourgeois discourse that confounds freedom with unfreedom and happiness with suffering: 'critical discourse alone is capable of detecting the points of rupture or zones at which this conformism breaks down, appearing in the insignificant fissures or dysfunctional peripheries of the great apparatus, of rescuing the survival of feeling directed toward freedom' (Echeverría, 2006a: 7–8).

For Echeverría, such criticality also accounts for the 'programmatically difficult' mode of exposition characteristic of critical theory (especially pronounced in the case of the Frankfurt School), as a necessary reflection of the difficulty of comprehending this socio-historical tension itself, as well as the difficulty of the practical and political conditions in which such thinking occurs. Echeverría's conception of 'critical discourse' is determined in large part by the idea that such difficulty places demands on the very *mode* of theorization that can adequately respond to the historical reality of capitalism:

the originality, the specificity, or peculiarity of Marx's critical discourse is revealed even in its purely formal dimension. Marx's discourse is not only critical through its content, but also, and especially, by virtue of its form; what is more, if it were not critical in its form it would not be in its content. (Echeverría, 1998a: 62)

It is this formal dimension that endows Marx's thought with its 'properly "critical" or deconstructive scientificity' for Echeverría. Understood in this sense, critical discourse neither contributes to, corrects or appropriates the products of bourgeois ideological discourse, nor attempts to destroy them 'by means of another, more powerful, discourse' (as the official 'proletarian science' of 'real socialism' sought to) but rather works upon

them 'deconstructively', treats them as historical ciphers or symptoms from which tensions can be identified and rendered operable within a cycle of struggle. Here Echeverría works with a specific and precise focus on Marx's critique of political economy, taking *Capital* to be the *exemplary instance* of critical social theory (as it also is for Horkheimer, 1972).<sup>1</sup>

This focus on the critique of political economy is what delimits and gives content to Echeverría's critical theory. As simultaneously a revolution *in* theory (effecting a radical transformation of what is possible on the discursive level) and theory *of* the revolution (as a component of transformative struggle at the level of social practice), this critique does not simply designate an abstract method, applicable to whatever content, but derives its determinate characteristics and orientation in relation to its historical situation. It is, as a result, obliged to impugn *political economy* (primarily, although not exclusively) as the principle positive expression of social reality in the capitalist era, that around which 'the entirety of theoretical discourse revolves – openly or covertly' (Echeverría, 1976). For Echeverría, the discursive primacy of bourgeois economics is derived not simply from the greater material force through which it can saturate the channels of social communication but also, and especially, because of the manner in which it immediately reflects the necessary forms of appearance taken by capitalist social relations (Echeverría, 1976). It is this structural isomorphism, between ideal categories and social practice, that gives political economy its 'spontaneous' validity and ideological traction. Rather than denying this isomorphism as false and opposing to political economy an alternative, positive socio-economic theory ('marxist economics'), Echeverría points out that Marx's discourse works upon political economy 'parasitically'. Critical discourse dissolves the putative harmony and immediacy of economic discourse from within, in order to penetrate through the deceptive surface layer of 'freedom, equality, property and Bentham' and uncover capital

in its processual entirety as a mode of social organization that contradicts and disfigures its real foundations: nature and labour. Critique thus becomes the only adequate mode by which the relationship between dominant bourgeois discourse and revolutionary counter-theory can be resolved; it is only as critique that the latter can resist subjection to 'rules of the game' that would 'make of it, in the last instance – and unwillingly – a discourse apologetic of the capitalist order' (Echeverría, 1976). Understood in these terms, Marxist theory departs from 'the impossibility of constructing a positive discourse parallel to the established discourse of modernity, the impossibility of creating a *corpus* of knowledge alternative to the scientific knowledge elaborated by capitalist modernity' (Echeverría, 2011). Marx's work thus marks, for Echeverría, the instauration of an entirely new paradigm of theoretical practice for which, 'to realise itself as *revolutionary theory* means to realise the revolution also as a *revolution on the specific terrain of theoretical discourse*' (Echeverría, 1976).

The name given to this theoretical revolution is, quite simply, 'materialism', a position which Echeverría understands – *contra* the Althusserian notion of an 'epistemological break' – to be developed and refined coherently throughout Marx's entire oeuvre. In his 1974 essay, 'Marx's Materialism', a close textual analysis and commentary on the theses 'On Feuerbach', Echeverría attempts to establish 'from which basic affirmation of objectivity and which type of theoretical activity adequate to that objectivity communist theoretical discourse departs' (Echeverría, 1986: 20). Echeverría insists that the theses reorient the axes upon which theoretical engagement had hitherto proceeded at the most fundamental level, by dissolving the false antithesis of idealism and 'traditional' materialism which mutually constitute the horizons of bourgeois discourse:

are referred to? It is not, without doubt, the content of the definitory philosophemes of two doctrines present in the panorama of the history of thought: it is not a case of choosing between two philosophical positions or opinions, nor of synthesizing or surpassing them in another conception of the world. Marx speaks clearly of (traditional) 'materialism' and idealism as horizons or ambits of cognitive apprehension, as fields of possibility of theoretical action, in which an object may be 'captured' ('gefasst') or not. His critique is aimed not so much toward the knowledge produced explicitly in the modern scientific-philosophical discourse, but precisely toward the horizon of cognitive possibilities set out as a condition of that discourse [...] toward the specific configuration of its fundamental structure. [...] A central signification that, by its maximum simplicity and radicality, is inscribed at the level of the linguistic code and penetrates it decisively, thus outlining a totalising subcodification, capable of overwhelming every possible explicit message. (Echeverría, 1986: 24)

Emerging from the critique of this fundamental structure, Marx's new theoretical discourse transcends the limits of a unilaterally subjectivist (idealism) or objectivist (materialism) perspective. In order to do so, this 'new' materialism must simultaneously grasp the subjective dimension of praxis 'that founds the entire subject-object relation and therefore the entire presence of sense in the real' alongside the objective dimension of 'this founding process as a basically material process, as a process of practical "metabolism" between man and nature' (Echeverría, 1986: 27–8). The unity of these two aspects is given in an idea of praxis that integrates both of these subjective and objective dimensions. For Echeverría, the most developed conception of such praxis – of the metabolic realization of active, subjective being – is found in the idea of social reproduction. The critique of political economy is thus read by Echeverría as a critique of capitalist social reproduction, possible only with recourse to a conception of social reproduction as such, in its 'general form'. Critical theory therefore implies critique of economic discourse, only possible via Marx's 'new' materialism, which in the final instance must be elaborated as a critical theory of social reproduction.

What exactly is it that enters into Marx's critical view, when (traditional) 'materialism' and 'idealism'

## SOCIAL REPRODUCTION AND PRACTICAL SEMIOSIS

For Echeverría, the capacity of a critical discourse to constitute itself as revolutionary discourse is grounded in a radical rethinking of the relation between human society and its natural basis, beginning with concept of praxis and finding its most conceptually refined expression in the theory of social reproduction. It is perhaps in this latter notion above all else that Echeverría's work is most invested and attempts to work through at the deepest level, generating a unique framework through which to pursue a critical theorization of society. There is a recognizable affinity here with Adorno's work on the concept of natural-history (2006; 1973: 354–8) that would be developed significantly in his student Alfred Schmidt's *The Concept of Nature in Marx* (1971). Drawing on a similar conception of the dialectical relation between society and nature (albeit via a different constellation of theoretical resources, specifically the addition of Heidegger and Sartre's ideas), Echeverría places at the centre of Marx's critical discourse the much neglected concept of 'natural form', or what Echeverría more precisely designates 'socio-natural form'. It is, Echeverría argues, only by virtue of the complex force through which the concept of 'natural form' or 'use-value' (its synonym) designates the objective concretion of social life that Marx is able to 'shatter the horizon of intelligibility' within which bourgeois thought moves (Echeverría, 2014). 'Natural form' is a concept, however, that in *Capital* 'remains only an outline and an indication' and therefore solely 'makes itself evident in its peculiar theoretical effects' (Echeverría, 2014: 26). Echeverría therefore undertakes the task of recovering and consolidating this concept, which he considers essential to combat the complicity of Marxist discourse with the myth of revolution, especially in light of the fate of 'actually existing socialism':

Only the reconstruction of the radical critical concept of use-value can demonstrate the fundamental

defect of the identification of Marxism with western productivism, the economic progressivism of capitalism and the bourgeois political statism which K. Korsch took in 1950 [...] to raise again for the second half of this century the theme, vulgarized in the seventies, of the inadequacies of the Marxist discourse to the demands of the new historical figure of revolution. (Echeverría, 1984)

This reconstruction of use-value and social reproduction departs from a radical re-reading of the concept of praxis in Marx's early thought, in a manner that establishes a deep coherence and continuity with his mature critique of political economy. In this conception of praxis, object and subject attain a new articulation in which neither is given a privileged role as the 'organising principle' of the actual, and such that neither corresponds simply to one pole of the opposition between idealism and ('traditional') materialism. Instead, both subjectivity and objectivity are grounded in the unity of a 'practico-critical' process of active world-constitution, conceived as 'a process in motion, and as a process that affects essentially and equally both the subject and the object that appear in it' (Echeverría, 1986: 25–6). The 'natural form' appears within this practical process as its objective side, yet without it being reducible to a passive, independently existing object (as in the object of intuition), given that it is exterior to the subject (so 'natural') but endowed with 'sense' or a specific determination of being according to its functions (symbolic and 'real') within the practical totality encompassing them both. The object of practice (rather than intuition) therefore always, necessarily, has a socio-practical objectivity that transcends, and is irreducible to, its purely 'natural' – which is to say, empirically intuited – qualities. This objectivity [*gegenständlichkeit*] is the 'general form' or global context within which anything can exist in opposition to the subject as the possible object of its activity:

Whichever element of nature, be it physical, chemical, vital, psychic; whichever fact, be it material or spiritual, etc., whichever parcel of exterior or

interior reality, whichever section of material, of whichever materiality it may be, when it is integrated into a social process of production and consumption, of the reproduction of a social subject, constitutes that which we could call a practical object, or an object that has a socio-natural form. (Echeverría, 1998b: 13)

The only possible mode of being in which nature can confront the social subject is therefore as already mediated by it, so that, as Lukács puts it in *History and Class Consciousness*, ‘nature’s form, its content, its range and its objectivity are all socially conditioned’ (Lukács, 1971: 234). This conditioning and mediation is at the core of the concept of the natural or socio-natural form, as determined by the metabolic process of production and consumption in which subject and object encounter one another. Hence for Echeverría, the ‘logic’ of the ‘natural form’ is social reproduction (1998b).

The *differentia specifica* of the human reproduction process, then, is its constitutive under-determinacy in purely ‘natural’ or ‘animal’ terms and the corresponding genesis of a social subjectivity that prosthetically undertakes to determine the form of its reproduction in a multiplicity of historically and ethnically variable configurations. This idea of ‘transnaturalized’ reproduction, elaborated by Marx and presented schematically by Echeverría in his 1984 essay ‘La “Forma Natural” de la Reproducción Social’ (‘The “Natural Form” of Social Reproduction’) is the most developed ‘general’ account of the practical and social structure of the reproduction process, conceived of as a totalizing but mobile relationship between subject and object. For Echeverría, it forms the basic theoretical framework from which a materialist theorization of society departs and can then be developed via an engagement with its variable concrete forms:

The concept of ‘production in general’ that Marx employs in his critique of political economy, taken in the widest possible sense, which is to say considered as a complete process of social reproduction implies the existence of an essential structure,

transhistorical and supra-ethnic, whose presence only acquires actuality or reality to the extent in which it is actualized or given form within innumerable particular situations or specific conjunctions of historical and ethnic conditions. Each one of the forms in which this structure is actualized constitutes the concrete figure or identity of a society. (Echeverría, 2014: 25)

In his reconstructive exposition of this ‘general form’, Echeverría transposes Marx’s conception of the specificity of human labour into an account of the specificity of human reproduction, arguing that because human praxis is not bound to any pre-established instinctual image – and, indeed, is distinguished by this lack of ‘natural support’ – its concrete content must always be given form according to the particular ‘political’ organization of practical life that governs it. This is what Echeverría terms the ‘basic politicity’ inherent to the socio-natural form of reproduction, whereby the social subject must consciously subsume its natural (‘animal’) life process under a particular form of political community in order to realize it. Such a form is always inscribed within a cyclical temporality of reproduction (production/consumption) that must continually and metabolically re-establish its own validity – that is, the functional correlation of the ‘system of productive capacities’ and the ‘system of needs for consumption’. The social process of establishing and modifying the form of human existence is thus always ‘in play’ and subject to change through the practical, collective action of its individual members in these two basic phases: the first moment of the realization of the subject through production of the object, the second of the realization of the object in consumption that (re)produces the subject. Reproduction is therefore governed by a *dynamic* politicity with a disjunctive structure, distributed across the *two modalities* of the metabolic relation to nature as it is conceived in process. This contestability and dynamism is what distinguishes the ‘socio-natural’ mode of reproduction from purely natural being,

which, as Hegel notes, knows only repetition, establishing 'a difference that could be an insignificant unhinging of the universal order, but that is sufficient to unfold within it an autonomous dimension of being: that of human existence' (Echeverría, 1995: 76). The realization of the human's biological reproduction is thus necessarily and exclusively tied to the reproduction of a socio-political order and, *vice versa*, so too is that socio-political order bound to the fulfilment of the basic physiological reproduction of the social subject. Not only, consequently, are the natural and social aspects of human existence mediated through one another – in spite of their non-identity – but, as Echeverría points out, humanity, precisely in its capacity 'to take the sociality of human life as a substance to which it can give form', to 'trans-naturalize' its 'animal' existence, and thus act as a 'subject', re-establishes the general lawfulness of nature, at the same time as it transcends it (Echeverría, 1998c: 77–8).

At the centre of Echeverría's critical theory of society is this 'dialectical violence' of subjectivation, whereby the social subject's realization is dependent upon its self-restriction to a determinate (if ambiguous) political configuration. The 'subjectness' [*sujetidad*] of the human resides in its active perpetuation or modification of the relational structure through which it is constituted, 'the capacity to constitute the concretion of sociality' or 'to give form, figure, identity to the sociality of its life, that is, the ensemble of social relations of co-existence that constitute it as a communitarian subject' (Echeverría, 2014; 2006b: 39). Yet this occurs not only in the directly 'political' activity that takes this form of sociality as its object, but also in the 'basic politics' characterizing every act of material production and consumption, because:

the form that a good that has been produced has is never neutral or innocent; it always has a concrete use-value that determines, in turn, the form that the subject that will consume it should have. Labour has a *poiétic* dimension; its giving form is a

*realization*, Marx says. It is an invention and the carrying out of a project; a project that is only immediately the construction of a thing, which indirectly but ultimately is the construction of the subject itself. (Echeverría, 2014: 29)

The practical intentionality and social project objectified in any use-value is not only inherent in every act of labour, but also comes to be totalized and impressed into the objective structure of means of production through which the social subject produces, and thereby reproduces itself, stamping those means with a distinctive qualitative character – a practical 'form':

The *effectiveness* of the instrumental field is not reducible to its productivity; this is only its quantitative determination – the degree to which the global instrument enables the subject to dominate or transform nature. Effectiveness is the qualitative content of productivity; it establishes an entire defined horizon of *possibilities of form* for the global object of production and consumption. In this sense, in presenting certain possibilities of form and leaving aside others, in being 'specialized' in a determinate axiological direction, the global effectiveness itself possesses a particular form, which rests upon the technological structure of the instrumental field. (*ibid.*: 31)

When the social process is grasped as a totality, as a process of socio-natural reproduction, praxis is seen to give form not only to the objects and in turn the subjects, of practical life, but also to the very form of the process itself, revealing reproduction to be a mediating mode of 'self-activity' [*Selbstbetätigung*]. The activity of the social subject, then, is consummated in the reproductive cycle of production/consumption, as that through which it gives form to its own sociality, to its 'socio-natural form' of existence. The specificity of this process, as a special version of the reproduction of animal life, is that for Echeverría it has freedom as its foundation, a freedom that emerges from the transgression of natural lawfulness. This conception of freedom is metaphysical (in that it establishes the possibility of practically transcending that which is objectively

given to the social subject) but not transcendent (in that this practice is delimited by and responds to those given conditions).

Departing from this 'ontological' schema, Echeverría draws critically upon concepts from semiotic theory and structural linguistics in order to argue for the identity of the production/consumption of practical objects and the production/consumption of significations. For him, every practical object is at the same time a significative object, precisely because of its 'transnaturalization' – its situation within a politically and culturally determined, rather than merely 'animal', process of reproduction – a situation devoid of any guaranteed correspondence between the moment of the object's production and that of its consumption. This constitutive ambiguity equally marks the acts of production and consumption that enact this semiosis, emitting/receiving the intentional 'messages' of practical life with a necessary degree of openness, uncertainty and selectivity. Taking this practical process of symbolization in its most characteristically human – and therefore political – mode, as *language*, Echeverría finally develops the idea of its capacity to act uniquely upon the basic practicality of the production/consumption of use-values, in so far as it 'not only passively condenses and refines the semiotic realizations of practice' but rather 'penetrates and interferes in each and every one of them with its own perspective'. He thus produces a critique of the discourses of linguistics and semiotics from a Marxist perspective by grounding them in a theory of social reproduction, whilst also deepening a Marxist conception of the latter by highlighting its peculiar communicative dimensions.

This confrontation between the Marxist, ontological and semiotic discourses should not be seen simply as a synthesis of heterogeneous concepts, or a mapping of terms between distinct disciplinary fields. Echeverría does not 'apply' a Marxist analysis to linguistics, or vice versa. Instead, he offers a conceptual elaboration of their

necessary inner connection and essential identity. He both grounds the conceptual innovations of contemporary linguistics within a critical understanding of reproduction, as the general structure of social materiality, and demonstrates the necessarily communicative character of all acts of production and consumption. Communication is therefore not simply a side-effect of production/consumption, nor is production/consumption a side-effect of communication. Social reproduction, the 'natural form' of human praxis, *must* be a semiosis, and semiosis *must* in turn be grounded in the basic structure of social reproduction. The necessity of the identity between these two processes derives from the dual and reciprocal character of human reproduction, as at once 'animal' (a metabolic process of the appropriation of nature for the reproduction of the organism's living consistency) and at the same time 'political', which is to say, a social process of establishing and contesting the concrete figure within which this first process is realized. Because this 'transnaturalization' (of the purely natural by the political) occurs in the movement between production and consumption, as the two phases of the reproductive process, and this movement has an uncertain or 'open' character, human activity always involves a constant ciphering/deciphering of form-intentional 'messages' inscribed within practical objects. Every social act of production transmits such a message, whilst each act of consumption interprets one.

On the basis of this identification, Echeverría is able to specify the distinct quality of language as a 'particular class of practical object' that combines 'a minimum degree of practicality with the maximum degree of semioticity', a quality that underpins both its emancipatory (or utopian) and ideological functions. This was an idea first developed in relation to capitalist ideology and its critique in his seminal 1976 essay, 'Discourse of the Revolution, Critical Discourse', where he argues that the 'technical composition' of the practical sphere is precisely what determines,

or ‘sub-codifies’, the boundaries of the general communicative code, positing the conditions for the intelligibility and efficacy of certain practical-discursive objects (‘messages’) over others:

The possibilities of truth that exist for knowing are defined within a socio-natural horizon of objectivity or meaning, constituted practically as a negation or re-ordering of the purely natural. It is the basic tendency of historical modifications of praxis (revolutions), or the social process of reproduction (labour), that demarcates the space inside of which an intended knowing can be true or scientific. (Echeverría, 1976: ??)

And yet this demarcated space is threatened with rupture, because the reproduction process binding its horizon of objectivity together is fundamentally disjunctive in structure, so that ‘without ceasing to be the same, [it] must be always other in being altered by its inevitable subjection to the change of situations carried with it by temporal flux’ (Echeverría, 1998d: 133). It is this constitutive non-identity and structural inconsistency of the social process that grounds the ‘the perennial open-endedness characterizing the significance of historical entities’ and from which a critical discourse can be articulated (Echeverría, 2005). Echeverría thus proposes a materialist understanding of the relation between semiosis and practical life that refutes the thesis of a parallel or homologous relation between the two spheres and is instead grounded in the wider project of attempting to ‘break with the dichotomy that postulates a substantial heterogeneity between material practice and spiritual guidance in human life’ (Echeverría, 2010: 46).

## THE CHALLENGE OF MODERNITY

If critique and a materialism of social reproduction are the resources with which Echeverría’s critical theoretical engagements are sustained, every one of these engagements

(taken both discretely and in their unity as a ‘project’) can be understood to be circumscribed by the historical, cultural and political condition of modernity. ‘Modernity’ is the name given by Echeverría to that ensemble of objective conditions and behavioural dispositions [*comportamientos*] which have come to characterize civilized life and its struggles over the course of the last millennium, in opposition to and as the negation of ancestral logics of social organization. In Echeverría’s account of these conditions and the process of their instauration certain motifs resonate strongly with the historical problematics that characterize Frankfurt School critical theory, and important convergences between Echeverría’s concept of modernity and Adorno and Horkheimer’s concept of Enlightenment have been highlighted, notably by Stefan Gandler (2015: 227 n.109). However, whereas the latter is identified with the long history of ‘western society’ and instrumental reason as such (of which capitalism is but an expression), Echeverría rejects this ethnocentric definition of modernity in favour of an account grounded in the development of the technical relation governing the metabolic interaction of human society and nature.

For Echeverría, following Lewis Mumford, the origin and foundation of modernity can be located in the ‘eotechnic phase’ of civilization that began around the tenth century AD, forming the initial instance of a process grasped in its entire unfolding as the ‘neotechnical epoch’. The significance of the eotechnic moment is its initiation of a complete transformation of the logic of the instrumental apparatus through which social production was previously realized, such that:

the secret of the productivity of human labour would cease to reside, as it had done throughout the entire Neolithic era, in the fortuitous and spontaneous discovery of new instruments copied from nature, along with their usage, and would begin to reside in the capacity to deliberately undertake the invention of new instruments and corresponding new techniques of production. (Echeverría, 2010: 22)

The effect of this 'eotechnic revolution' was to inaugurate an immense, if in its incipience gradual, intensification of the productive technical powers of labour, in a manner that decisively altered the relation between civilized humanity and nature. The new material basis of this relation effected a negation of the 'absolute scarcity' of natural wealth to which archaic societies were condemned, in favour of a merely 'relative scarcity' of that wealth, enabling the historically unprecedented possibility that the humanity–nature interaction 'not be directed toward the elimination of one of the two but rather toward collaboration between both in order to invent or create precisely within the other forms until now inexistent within it' (2010: 23). What is thus carried within modernity, understood in this specifically 'technical' sense, is the promise of abolishing those traditional forms of life which have their origins in a situation of naturally imposed scarcity – the originary impetus driving the impulse to conquer and dominate both inner and outer nature, as self-repression and instrumentalization respectively – once the material constraints of that situation have been superseded:

In both the means of production and the labour force, the scale of instrumental operability has taken a 'qualitative leap'; expansion has been such that it has moved to a higher order and, thus, to a horizon of possibilities for giving and receiving forms, unknown during thousands of years of history. The productive forces are no longer beleaguered by and subjected to the universe beyond the world conquered by them (a universe called 'Nature'), but have become if not more puissant than it then more powerful in so far as their specific objectives are concerned; they appear to have eventually appointed man to the promised hierarchy of 'lord and master' of the Earth. [...] This raised the age-old suspicion again, now on the strength of much more trustworthy data: if scarcity was not, in fact, the 'curse sine qua non' of human reality. The Pólemos model, which has inspired every project of the historical existence of Man, by making it a war strategy that conditions survival in terms of the annihilation or exploitation of the Other (of the human other, of Nature), is not the only possibility; one might, without it being an illusion, imagine a different one, in which the Other is called following the model of Eros. (Echeverría, 2005)

Modernity thus constitutes a novel logic of 'civilizational totalization' whose possibilities present a 'challenge' to civilized life, a challenge to which different configurations of that life have responded in diverse manners. Treated in abstraction from those configurations modernity would be but an ideal totalization, 'artificially isolated by theoretical discourse from the configurations that have given it an empirical existence' (Echeverría, 2005). In its concrete historical figure however, the specifically 'western' response to this challenge was established in the 'zone of encounter' of modernity with commercial capitalism, as the pragmatic dynamic of neo-technical invention interlocked symbiotically with the circulatory logics of commodity exchange, mercantile accumulation and accompanying 'antediluvian forms' of capital. It is, ultimately for Echeverría, the *subsumption* of the technical revolution grounding modernity under the economic compulsion to valorize and accumulate abstract wealth that endowed European capital with 'a progress of totalitarian reach, both extensive and intensive, (as planetarization and technification respectively)' (Echeverría, 2005). Beginning in the 1980s, Echeverría attempted to disinter a comprehensive theory of capitalist subsumption from Marx's writings, emphasizing its centrality to the critique of political economy in its entirety by declaring it be 'the most advanced attempt made by Marx to show in general theoretical terms how the two contradictory processes' of capitalist accumulation and the production and consumption of material wealth 'are articulated'. (Echeverría, 1983). It is through this theoretical framework primarily that Marx is able, on Echeverría's reading, to comprehend the manner in which the 'the apparently natural development of modern technology' (and the utopian promise borne within it) is 'set loose by a *regressive social necessity*, that of perfecting the exploitation of the labour force' (ibid., emphasis in original). As capitalist social relations extend themselves virulently they establish the

injunction, ever more forcefully, that ‘nothing is produced, nothing is consumed, no use-value can be realized in the practical life of capitalist society, if it is not also found in the function of vehicle or support of the valorization of value, the accumulation of capital’ (Echeverría, 2010: 113).

In this way, the essence of modernity became actualized as a specifically *capitalist* modernity only able to integrate neotechnical innovations in a ‘unilateral and impoverished manner’, treating them as if they were products of ‘the same old neolithic technique, only quantitatively potentiated’ whilst simultaneously repressing the possibility of a new compact between humanity and nature (Echeverría, 2010: 30). This abortive metamorphosis expresses itself, at the most fundamental level, in the essential vacuity of the social forms generated under capitalist conditions. Production within capitalist modernity – that is, production first and foremost of abstract wealth – truncates the creative elicitation of new forms based on material abundance, because ‘indispensable as it is to the concrete existence of modern social wealth, capitalist mediation cannot assert itself as an essential condition for its existence, nor can it synthesize a genuinely new figure for it’ (Echeverría, 2005). Instead, capital regressively reconstitutes and selectively promotes archaic modes of concretion, those social forms that are ‘nothing other than organs or means of sublimation of a self-sacrifice, a productivist repression that in principle has lost its reason for being’ (given the potential abundance borne by new material conditions) (Echeverría, 2010: 25). This time however, these archaic modes, whose ‘physiognomy is completely changed’ (as Marx noted in another context), present themselves only as ‘simulacra’ destined to ‘artificially reproduce absolute scarcity’ of social wealth, despite the potential profusion of satisfactions unlocked by the neotechnical revolution. Capital must repress or displace this profusion, and does so, as the material basis for it is rendered increasingly self-evident,

in an ever more violent and extreme manner. The contradiction between such monumental material capacities and their deformed actualization expresses the ambiguity of modernity in its existing (capitalist) form, as well as the ambivalence it displays with respect to the search for greater satisfaction of needs and freedom of action, despite its self-proclaimed superiority to traditional modes of life. Echeverría concludes thus that ‘modernity would not be “an unfinished project”, as Jürgen Habermas sees it; instead, it would be a set of possibilities, which are explored and actualized from only one side and in only one sense, and which might be approached from another perspective and have another light cast upon it’ (Echeverría, 2005).

The possibility of realizing the essence of modernity on a non-capitalist basis depends, however, on the excision of a certain abstraction – both theoretical and practical – relating to concrete forms of life, which has occupied a central place not only within bourgeois discourse but also within Marxism. One of the most valuable contributions made, for Echeverría, by the Frankfurt School was to identify this deficiency in Marx’s thought insofar as it remains a critique of traditional social forms and use-values without at the same time criticizing that critique (Echeverría, 1998a). Capital, for Marx, carries a progressive impulse within it, in its tendency to dissolve ‘all traditional, confined, complacent, encrusted satisfactions of present needs, and reproduction of old ways of life’ (Marx, 1993: 410). In affirming this restless drive to reinvent the forms of social life as an aspect of the communist supersession of capital, Marx’s thought is contaminated by what Echeverría calls the modern or bourgeois ‘myth of revolution’. Underlying this myth is the crypto-theological principle of an omnipotent subject of creation acting unilaterally upon the world’s ‘passivity as mere useful material’. Persisting in secularized form, this notion converts itself into the metaphysical *hybris*, proper to the ‘entire dominant political culture’ of modernity,

which anthropocentrically appropriates those powers normally attributed to a 'supreme fictitious being', in assuming:

that the human being has the capacity to create and re-create ex nihilo not only forms of sociality but sociality itself, without the need of abiding by any pre-existing natural or historical determination; in accordance with this myth, 'second nature', the ensemble of norms of communitarian co-existence, is a neutral and passive material, at the disposition of the activity of the human as a subject of 'politics'. (Echeverría, 1998a: 68)

Within traditional Marxist discourse, this myth has been inscribed in the idea of revolution as

an action capable of re-founding sociality after annihilating the forms of sociality cultivated and transformed by the human being over millennia, of erasing past history and recommending to write it upon a blank page [...] a moment of absolute creation or re-creation, in which human beings cast down everything and rebuild it all; in which all forms of sociality are destroyed and new ones created from nothing. (ibid.: 68)

Here, however, the discourse which claims for itself a 'critical' status demonstrates its complicity with precisely that which it ostensibly opposes, because 'only for [capitalist] modernity is use-value, the natural form of the world, nothing and, inversely, economic value, the crystallisation of energy, of activity, of human subjectness, that which is everything' (ibid.: 69). Capitalism, as the epoch of total and unending revolution, 'an era of destruction and radical restructuring', already spontaneously assumes an antipathy toward the traditional forms that it must constitutively render obsolete (even as it seeks to exploit them and even intensify their reactionary opposition to progress where it can gain from doing so). In the face of this tendency it is insufficient and naïve for critical discourse to simply advocate the acceleration or appropriation of this creatively destructive drive, purified of its exploitative class dimension. Without positing its own conception of the axiological specificity of practical life and an accompanying consciousness of qualitative

distinctions within that life, Marxism is bound to the figure of the abstract bourgeois subject submerged in civil society, for whom 'forms of sociality are presented as mere folkloric coatings or masks of the elemental functions of human sociality', forms which this subject 'in its narcissistic self-idolatry, can remove and place at its discretion' (ibid.: 70). For Echeverría, the only manner by which Marxist discourse can transcend this abstraction is by rescuing and elaborating the concept of use-value, enabling the comprehension of those concrete forms of social life that are the substance of any revolutionary process.

Modernity thus 'throws its challenge to civilized life', presenting itself, in the torsion of its utopian essence and its catastrophic actuality, as a 'situation on the edge'. Its interpenetration with capitalism is akin to the relation 'between a whole and independent totalization and one of its dependent parts, which has thus far imposed itself on the totalizing action of the whole' (Echeverría, 2005). This establishes the stakes of the communist project: to disarticulate the possibilities of technical socialization at the core of modernity ('an "indecisive" yet polymorphous exigency, a pure potency' [Echeverría, 2005]) from their repressive subjection to the demands of accumulation, in order that a history of social being based on generalized abundance, or merely 'relative' scarcities, can commence.

## CONCLUSION

The richness of Echeverría's systematic theorization of social reproduction in both its ontological and semiotic dimensions, alongside his unique conception of the condition and challenge of modernity and his precise definition of what constitutes critical discourse, presents a significant and original contribution to critical theory. By redressing the theoretical priority given to the economic dimension of social life in much Marxist thought with his account of the 'natural-form'

of reproduction, Echeverría is able to simultaneously analyse both capital's abstract mediation of the social process and the concrete diversity of effects and struggles it gives rise to. Locating the contradiction of capitalist society at the point of form-determination (of what is produced, reproduced and ultimately of the process as a whole), as an opposition between two competing logics of reproduction (of abstract or of concrete wealth, and the life-processes which give content to each), Echeverría presents a unifying framework for social research that supersedes the opposition of 'history' and 'system'. At its most basic level this framework grounds the normative distinction between the dialectical violence of transnaturalization through which 'subjectness' emerges and realizes itself, and social domination as the *negation* of that 'subjectness'. With the historical advent of capital that negation becomes depersonalized and autonomous, concentrating the antithesis of dialectical and dominating violence into that between the 'socio-natural' and 'socio-capitalist' logics of reproduction. For Echeverría, the problem of 'natural form' only becomes legible within the 'crisis of modernity' in its widest sense, which is to say, the fundamental conflict between two contradictory tendencies or 'dispositions' giving form to social life: between the social subject proper (freedom in its enactment, humanity living 'its own drama') and its alienated, spectral inversion (freedom subordinated to the end of capitalist valorization). From this perspective, what historically distinguishes capitalist modernity from other civilizational configurations is that within it the concrete form of society is generated in a conflicted 'dual manner', such that the 'proper' social subject is sublimated and displaced by capital's abstract dynamic of accumulation, what Marx famously refers to as an 'automatic subject'. The problem of politics in modernity is therefore first and foremost a problem of (alienated) form-determination, 'the permanent "effort" of the "spectre" to maintain and affirm its domination over real being'

(Echeverría, 2010: 113). This is the point of departure for an analysis of domination based on the capitalist ethos of self-repression:

If human beings exist in the absurd manner that we can observe empirically – in the midst of oppressions, repressions, exploitations, all of which are in principle avoidable –, it is because their natural process of reproduction does not obey a *telos* capable of synthesizing itself but rather an alien – alienated – one that is the 'reified' *telos* [...] of the accumulation of capital. (Echeverría, 1998b: 10)

At the same time there is fundamental negativity to Echeverría's 'ontology' of social reproduction, in that whilst it provides the conceptual resources to distinguish *between* social forms, it lacks any qualitative content or determinacy (it stipulates no specific configuration) and thus requires an attentiveness to the concrete forms – of both objectivity and subjectivity – assumed by social life within and against its capitalist organization; the theory must be operated in relation to the historical co-ordinates against which it is elaborated. The idea of the 'natural form' that Echeverría opposes to the value-form is not, therefore, a romantic or utopian concept, and far from conceiving of the supersession of the capitalist mode of reproduction as a final act of emancipation or advocating a restoration of the 'purely' natural as an idyllic state of harmony, Echeverría emphasizes only that the 'natural form of social reproduction' is only the site in which freedom and proper human history *can be* established, not its guarantee or original image. The necessity of selecting a form for social life can only occur by way of a politically uncertain process, and in light of this ambivalence Echeverría endeavours to chart a path between the 'utopian' and 'realist' impulses that have characterized the revolutionary movements of the modern era (Echeverría, 1976). Echoing Marx, Echeverría sees this project not as a retreat from the possibilities and dangers that modernity presents, a regression to pre-capitalist forms of life, but rather as a new way of responding to them.

## Note

- 1 The consonance of this deconstructive conception with the stance concentrated in Adorno's idea of negative dialectic is evident. But if, in the principal works of the Frankfurt School, tarrying with historical tension takes the form of critique of culture, philosophy, sociology, politics, psychoanalysis, etc., there is a marked ambivalence with regard to the economic dimension of first generation critical theory (Friedrich Pollock's contributions notwithstanding). In foregrounding this economic-critical dimension Echeverría reveals an affinity with later members of the Frankfurt School such as Backhaus and Reichelt, who in a similar period endeavoured to articulate elements of classical critical theory with Marx's mature critique of political economy under the banner of a 'new Marx reading' (see Chapters 22 and 23 in this volume).

# Adolfo Sánchez Vázquez: Philosophy of Praxis as Critical Theory

Stefan Gandler

One of the outstanding, most studied, yet hard to grasp, works of Karl Marx are his *Theses on Feuerbach*. Adolfo Sánchez Vázquez's philosophy presents one of the most insightful and critical approaches to them. He not only manages to reboot the theoretical interest in the *Theses* through a critical interpretation of the concepts of *praxis* and *everydayness*, but also overcomes some of the original limitations of the text; shaping his own interpretation by drawing on his non-eurocentric political experience. Along with Alfred Schmidt, Sánchez Vázquez stands as a mandatory reference for understanding the true extent of the philosophy of praxis and its role inside critical Marxist theory.

\*\*\*

Adolfo Sánchez Vázquez was born on 17 September 1915 in Algeciras, in the Andalusian (southern Spain) province of Cádiz. After some time in the province of Madrid, in 1925 his family moved to the southern city of Málaga:<sup>1</sup> 'This "fierce city", which had given

the Republican Courts their first communist deputy, was at the time called "Malaga: the Red"'.<sup>2</sup> In 1933, he published a first poetic text in the journal *Octubre*,<sup>3</sup> and joined the Revolutionary Student Bloc within the Spanish University Federation (FUE) and the Communist Youth. In 1935, he entered the Faculty of Philosophy and Arts of the Universidad Central and studied with José Ortega y Gasset.<sup>4</sup> At the outset of the Spanish Civil War in 1936, the Executive Committee of the Unified Socialist Youth (JSU), with more than 200,000 members, put him in charge of editing *Ahora*, its central publication.<sup>5</sup>

In early July of 1937, he was invited in this capacity to the Second International Congress of Antifascist Writers in Madrid. At the International Congress for the Defense of Culture, he met, among others, Juan Marinello,<sup>6</sup> Louis Aragon, Anna Seghers, André Malraux, Ilya Ehrenberg, and Octavio Paz.<sup>7</sup> Then he renounced his position as editor and requested that the Executive Committee of the JSU transfer him to the front.<sup>8</sup>

Sánchez Vázquez participated in the Civil War and in September 1937 he joined the 11th Division under the orders of commander Líster.<sup>9</sup> He assumed responsibility for the press and propaganda commissariat,<sup>10</sup> and published the newspaper of that unit: *¡Pasaremos!*<sup>11</sup>, and in 1939 he became a member of the 5th Army Corps, where he became a battalion political commissar.<sup>12</sup> After losing the war, the democratic forces had to leave Spain toward France, and in late May 1939, Sánchez Vázquez left the Mediterranean port of Sète with the first ship sent by the Mexican president Lázaro Cárdenas, the *Sinaia*, to travel to Mexico: 'On 13 June 1939 the *Sinaia*, an old ship previously used to transport pilgrims to Mecca, entered the port of Veracruz. With it, the first few hundred Spanish refugees arrived in Mexico from the southeastern coast of France. Many thousand would arrive later'.<sup>13</sup>

In 1941, he moved to Morelia, capital of the state of Michoacán de Ocampo, situated to the west of Mexico City, 'a city of scarcely 60,000 inhabitants but with an intense university and cultural life',<sup>14</sup> to teach undergraduate philosophy. There he married Aurora Rebollo, who he had already known during his youth in Spain.<sup>16</sup> In 1955 he obtained his Master's Degree<sup>17</sup> in Philosophy with a thesis entitled *Consciousness and Reality in Artwork*.

The 1959 Cuban Revolution, and the 1968 invasion of Czechoslovakia were two historical events that changed Sánchez Vázquez's theoretical perspective.<sup>18</sup> After these moments, what most mattered to him was jettisoning his previous theoretical framework: 'After that point, I was at pains to abandon the materialist metaphysics of *Diamat*, to return to the original Marx, and to take the pulse of reality in order to thereby gain access to a Marxism which was understood above all as a philosophy of praxis'.<sup>19</sup> In 1959, he obtained the position of full-time professor at the Universidad Nacional Autónoma de México (UNAM), and in 1961 published

his first academic text: 'Aesthetic ideas in Marx's "Economic-philosophical manuscripts"'.<sup>20</sup> In 1965, his first book appeared in Mexico City: *Art and Society. Essays in Marxist Aesthetics*,<sup>21</sup> which was inspired by the experiences on the terrain of art and cultural policy release in Cuba.

In 1966, he presented his doctoral thesis in philosophy under the title *On Praxis*, from which his main book *The Philosophy of Praxis* (1967) emerged.<sup>22</sup> Sánchez Vázquez joined the student movement along with other UNAM professors. His assistant, Roberto Escudero, was imprisoned; his former colleague and friend Eli de Gortari was unjustly detained; and his son Juan Enrique experienced the 'Night of Tlatelolco':<sup>23</sup>

Although it was crushed, the movement of '68 changed the political physiognomy of the country, and from that point onward the Universidad Nacional was never the same again. Marxism with a critical and anti-dogmatic edge became one of the most vigorous currents of thought in the institutions of the UNAM and especially in the humanities.... [M]y *Ética* [Ethics] ... was inspired in its elaboration by the objectives, achievements, and sacrifices of that student movement which taught not only political but also moral lessons.<sup>24</sup>

The Nicaraguan Revolution represented an important historical event for Sánchez Vázquez. He engaged in a lively theoretical-political exchange with prominent Sandinista leaders and, in 1983, gave speeches in Managua, at the Ministry of Culture and the Universidad Nacional Autónoma de Nicaragua, on the topic of Marxist aesthetics (for example, on Brecht and Lukács)<sup>25</sup>; as well as 'Democracy, revolution, and socialism' in 1989.<sup>26</sup>

Sánchez Vázquez was invited as an advisor to the Special Forum for State Reform, called for in July 1996 by the Zapatista Army of National Liberation (EZLN). He participated by sending a contribution to the discussion of the question of human rights in Mexico, on the basis of the Zapatista rebellion and its causes. He died on 8 July 2011 in Mexico City, after having published more than 30 books and hundreds of

academic articles, translated into more than 15 languages.

\*\*\*

As has been shown so far, Sánchez Vázquez's work focused on a non-orthodox reading of Marx's work, this way, he aimed to state the critical extent of concepts as *everydayness* and *praxis*; thus his main work is the *The Philosophy of Praxis*. He develops its central idea further in the article, 'La filosofía de la praxis como nueva práctica de la filosofía [The philosophy of praxis as a new philosophical practice]'.<sup>27</sup> Core to his argument is Karl Marx's first *Thesis on Feuerbach*, which criticises Feuerbach's anthropological materialism in the following terms: 'he does not conceive human activity itself as objective [*gegenständliche*] activity ... he does not grasp the significance of "revolutionary", of "practical-critical", activity'.<sup>28</sup> Sánchez Vázquez cites this affirmatively as a definition of 'praxis' and speaks of 'human activity as objective activity' and 'critical practical ... revolutionary activity'.<sup>29</sup>

Sánchez Vázquez – in his first interpretation of Marx's concept of praxis in the *Theses on Feuerbach* – grants the two moments of praxis a special value: on the one hand, on its objective side, praxis consists of the true transformation of the world as it exists in the here and now (and which often presents itself to us as overwhelming); in this sense praxis refers just as much to palpable things, to nature, as to the relations which exist between humans and nature and also between humans; the totality of these relations constitute society. On the other hand, the subjective side of praxis constitutes the active moment, the initiative aspect of the human being as an actor in history, who focuses consciously on objectives and attempts to realise them. In this sense, Sánchez Vázquez understands praxis as 'activity ... oriented toward the end of transforming an object (nature or society), devised by the conscious and active subjectivity of men'.<sup>30</sup> The activity that he understands as praxis is, 'consequently, activity –

in indissoluble unity – objective and subjective at the same time'.<sup>31</sup> He understands the particularity of Marx's concept of praxis as that of the *unity* of those two moments. 'What is determinant in this practical process is neither objective transformation (separated from subjectivity) nor subjective activity (separated from objectivity), but rather the unity of both moments'.<sup>32</sup>

Marx formulates this unity through his double critique of two different unilateral philosophies: 'hitherto existing materialism – that of Feuerbach included' which only grasped the objective side in the form of contemplation, and idealism, which of course reflects the side of human activity neglected by 'hitherto existing materialism', but which could only arrive at a concept of praxis as ideal, intellectual, and not 'real, sensuous'.<sup>33</sup> Therefore, in Marx's concept of praxis the immense achievements on the theoretical terrain of both previous materialism and idealism find their place; following Sánchez Vázquez, we could boldly ask if this concept does not simultaneously transcend, maintain, and suspend (in the Hegelian sense of '*aufheben*') the entire dichotomy between materialism and idealism. Understood in this way, the seriousness of the second part of the eleventh *Thesis on Feuerbach* begins to take shape: 'the point is to change it [the world]', which, pronounced too quickly on more than one occasion, only serves to 'justify' our own distress in observing the philosophical giants upon whose shoulders we all stand.

Sánchez Vázquez's critical concept of praxis is based on a critique of the everyday consciousness<sup>34</sup> of praxis. He introduces his critique of the everyday consciousness of praxis through reference to the latter's philosophical conception: the philosophy that has praxis as its central concept, as its cornerstone, is Marxism. Now, the philosophical concept of praxis does not develop on its own, but rather draws support from a long history of humanity and its intellectual doctrines (theories), and so we cannot conclude that it reaches its conclusion with the philosophy of Marx.

In terms of overcoming the 'level reached by German idealism',<sup>35</sup> Marxism entails both a more developed consciousness of praxis as well as a more powerful theoretical connection to it. So we must overcome idealism, but this does not mean a return to the immediate and naïve perspective of everyday consciousness. This is not a question of returning to a pre-philosophical state or to a 'vulgar or metaphysical materialist philosophy' – to some degree stuck to run-of-the-mill conceptions of the human being – and which 'preceded the more developed expositions of Idealist philosophy (in Kant, Fichte, and Hegel)'.<sup>36</sup> A developed concept of praxis from a historical-philosophical perspective, is obligated to pass through and transcend its idealistic formulation.<sup>37</sup> In order to overcome philosophical idealism, we thus need a more broadly developed 'philosophical theory' and not 'a dose of "common sense"'.<sup>38</sup> On the contrary, such a theory would distinguish itself even more from everyday consciousness than does idealism. This is not just any philosophy, however, but precisely that which – based on its theoretical analysis of what praxis is – demonstrates the conditions that make possible the transition from theory to praxis.<sup>39</sup> The importance of idealism in world history has been underestimated, as the theoretical foundation for a Marxism which has broken radically with it, but which has been heavily enriched by this same idealism. This underestimation is one of the reasons that, in various sectors, Marxism has found itself reduced to 'the old materialism fertilised by dialectics on the one hand, or a materialist metaphysics which is little more than an inverted Idealism'.<sup>40</sup>

In internal Marxist debates, what interests Sánchez Vázquez is rescuing 'a true conception of praxis'. But this cannot occur through reference to everyday consciousness of praxis, but by destroying even the attitude that the latter determines<sup>41</sup>; this is necessary not only to achieve a developed theoretical-philosophical conceptualisation of praxis, but also to propel everyday political praxis and

elevate it to a higher level, which means, for Sánchez Vázquez: to make it creative.<sup>42</sup>

A fully *atheoretical* world does not exist, however, Sánchez Vázquez bases this point on two elements, without referring – as does Schmidt – to the history of philosophy. Against the belief that everyday consciousness is not tainted by any theoretical reflection, he criticises not only the fact that this neglects the 'prejudices, mental habits and commonplaces' that influence it, but moreover that – whether we like it or not – theories sediment within such consciousness.<sup>43</sup> Equally, the real human being, who possesses this consciousness, which is purportedly not influenced by the history of ideas, is a social being, incapable of subtracting himself from the historical framework in which he finds himself. 'The day to day character of his life, as well as the vision that he has of his own practical activity, are historically and socially determined'.<sup>44</sup>

At this point of the discussion of everyday consciousness, Sánchez Vázquez does not explain how we should understand in detail the end of the quoted phrase, for example, how the current 'historical situation' engenders a specific 'ideologically determined perspective'. Setting out from Marx, we could explain these formulations in the sense that, under given social relations, a specific ideological consciousness can be facilitated in humans insofar as, in all their contradictions, such relations slow or impede their own knowledge. Marx explains this in *Capital*, and especially in the subchapter 'The Fetishism of the Commodity and Its Secret'.<sup>45</sup> He shows the effects provoked by the double character of human labour, which simultaneously generates *use-value* (concrete and useful, created by 'private individuals')<sup>46</sup> and *value* (abstract and socially mediated). This double character of human labour prevents or makes it difficult for humans to see its second side, as a result of which *value* does not appear as a social relationship, but, instead, as something almost inherent in the commodity as a seemingly natural thing.

The false consciousness that the human being develops, here, does not result simply from a misleading theoretical development, but from the objective appearance of the commodity, which 'automatically conceals' its social character.<sup>47</sup>

On the question of everyday knowledge – which concerns us, here, principally in relation to theoretical conceptions and its dependence on them – Sánchez Vázquez concludes that everyday consciousness is influenced by ideas that 'are present in the very air [the human being] breathes'.<sup>48</sup> Consequently, everyday consciousness is not completely free of a certain 'theoretical basis' in which it carries theories, albeit in a simplified and degraded way.<sup>49</sup>

Sánchez Vázquez develops the character of the double dependency that everyday consciousness has on both social theories and material social relations, on the basis of his understanding of two specific forms of creative praxis: revolutionary and artistic. The individual activity of a revolutionary cannot be understood in general by the everyday human being in his social or class dimension, who thus considers it to be something 'fruitless, foolish or irresponsible [... that will] never lead to the transformation of the world in its present state'.<sup>50</sup> But this disdain toward practical transformative activity on the terrain of social relations fits seamlessly within a generalised pessimistic atmosphere which is characterised by the underestimation of the active, social, and transformative elements<sup>51</sup> of humans. Here, the critique of everyday consciousness begins to emerge. For Sánchez Vázquez, it is not a question of privileging philosophical consciousness as better developed and truer than everyday consciousness *per se*, but of demonstrating the intersections and connections between a widely disseminated orientation of the latter and influential tendencies among the former. Everyday consciousness should, therefore, not be transferred to a philosophical and therefore rational plane through a theoretical-pedagogical mechanism, but instead critical analysis must uncover the contradictions of

all predominant types of thinking (both everyday and theoretical). But to do so, a particular foundation is essential, another theoretical basis which understands the human being as social, historical, and active.<sup>52</sup>

This is one of the questions to which the critical Marxist theory of knowledge owes its relevance. But here we would like to return to a more precise investigation of everyday consciousness. The fact that the latter is infiltrated with theoretical ideas, which it collects unconsciously, does not in any way entail that everyday understanding assumes a theoretical attitude toward praxis. What is lacking for it to do so is the conscious relationship of consciousness to its object.<sup>53</sup> The everyday human being, who perceives himself to be a 'practical man, ... living and acting in a practical way',<sup>54</sup> has, of course, a conscious relationship with his actions – he cannot carry them out without reflecting – but at the same time 'he does not separate or stress practice as his proper object in such a way that that separation occurs first of all in consciousness as a theoretical attitude'.<sup>55</sup> It is as a result of this that, as Sánchez Vázquez explains, everyday consciousness does not develop a theory of praxis (and nor could it do so, as will need to be shown).<sup>56</sup>

Sánchez Vázquez's critique of everyday consciousness of praxis has, therefore, raised, through a contrast with revolutionary praxis, two problems: in the first place, its concrete determination, namely, its immanent *pessimism*, which fails to grasp the human being in all its importance as a subject of history, and in the second place, its general conception, which he has determined to be *atheoretical* and which, in the absence of the reflexive moment, 'can never nurture a true revolutionary praxis'.<sup>57</sup> He continues his critique on the basis of three other concrete determinations of the everyday consciousness of praxis: its inherently 'ingenuous realism', its 'objectivism', and its 'utilitarianism'.<sup>58</sup>

*Ingenuous realism*, insofar as everyday consciousness assumes that things 'are ... known in themselves, irrespective of their

relation to human activity', whereby when speaking of human intervention, Sánchez Vázquez evidently refers to the act of knowing.<sup>59</sup>

The *objectivism* characterises the everyday consciousness insofar as, through the assumption that things are known in themselves, it additionally implies that their importance, their meaning, and their significance are given to the human being almost as if by nature. That is to say, the ordinary man ignores 'the fact that because they have a practical significance practical acts and objects exist only *for* and *through* men. The characteristic of ordinary consciousness is that it regards the practical world as a world of things and meanings *in themselves*'.<sup>60</sup>

Sánchez Vázquez speaks here, above all, of that aspect of the cognisant subject, which is underestimated by everyday consciousness: the *active* subject who recognises things and gives them meaning. But it seems that, at the same time, this – the capacity of recognising things and giving them a meaning – is present in a hidden way in the other side of the subject, which also produces those things, which are already implicitly present in the 'critique of pessimism'. A formulation in the final line of the 'critique of objectivism' in the introduction to *The Philosophy of Praxis* would seem to speak to this broader interpretation: 'this objectivism which disregards the human, subjective aspect, and maintains the separation between the practical object and the subject'.<sup>61</sup>

Aside from this objectivism, which, as we have seen, constitutes part of ingenuous realism, Sánchez Vázquez also critiques the everyday consciousness of praxis for its *utilitarianism*, which it is similarly not conscious of and which implies that it 'reduces the practical to a single utilitarian dimension, whereby a practical action or object is one which has material utility or which produces profit or advantage; that which lacks that direct or immediate utility, is impractical'.<sup>62</sup>

Here, his philosophy takes an interesting turn when it relates this aspect of everyday

human consciousness to the economic reality in which it is located as well as respective economic theories. While he does not suggest that the latter represent the immediate material foundation of this consciousness, as was the case with earlier economists and their theories, such as classical political economy, for example,<sup>63</sup> he does indicate that 'ordinary consciousness and the standpoint of capitalist theories of economics and production coincide', the utilitarian understanding of the concept of praxis in everyday consciousness maintains a discrete but definite relationship with the capitalist mode of production in which the law of value dominates. What other authors would understand as a clear *dependency*, Sánchez Vázquez describes as *simultaneity*, a concept that he makes broad argumentative use of in various texts (it is true that the grammatical construction of simultaneity is, as far as we know, used more in Spanish than in German and English, languages in which the *causal* construction insatiably and jealously demands its rightful place): 'For ordinary consciousness what is productive is by definition practical; from the point of view of capitalist production the practical is defined as whatever produces new value or surplus value'.<sup>64</sup>

In sum, Sánchez Vázquez's critique of the everyday consciousness of praxis centres on a general understanding of everyday consciousness and its concrete determination: its *atheoretical* conception, as well as its concrete determination as pessimistic, ingenuous realistic, objectivist, and utilitarian.

Sánchez Vázquez analyses the relationship between praxis and knowledge in Marx primarily on the basis of the *Theses on Feuerbach*. In this text, which was written immediately after the *Paris Manuscripts* and at almost the same time as *The German Ideology*, the essential elements of a 'true "philosophy of praxis"' already appear clearly.<sup>65</sup>

But he does not consider this early text to be separate from Marx's complete works, referring at various points to *The German*

*Ideology* in order to help interpret it. Moreover, for understanding the relationship between praxis and knowledge, he refers to *Capital*, for example, the subchapter on 'The Fetishism of the Commodity and Its Secret', which is of such great significance to Western Marxism.<sup>66</sup> This manner of approaching Marx's work already allows us to glimpse the fact that Sánchez Vázquez considers it to be an indivisible whole. Now, I will move to discussing with greater precision the position that the *Theses on Feuerbach* hold in Sánchez Vázquez's general interpretation of Marx, and, in connection with this, in the structure of his chapter on *Marx's conception of praxis*,<sup>67</sup> as well as the position he takes regarding the debate about continuity and rupture in Marx's work.

Emerging from his anti-Francoist praxis, Sánchez Vázquez summarises in an introductory manner what is decisive about the *Theses on Feuerbach*: 'In the *Theses*, Marx formulated a conception of objectivity founded on praxis, and defined his philosophy as the philosophy of the transformation of the world'.<sup>68</sup>

These two aspects are inseparable. The material world can only be recognised along with the concept of its transformation. When Marx locates the practical and transformative activity of human beings at the centre of all human relations, this cannot but have serious consequences on the terrain of knowledge. The praxis/knowledge relation is represented in three ways in the *Theses*:

- Praxis as basis of knowledge (Thesis 1);
- Praxis as criterion of truth (Thesis 2); and
- Praxis as the end of knowledge.<sup>69</sup>

As has already been asserted, 'the intervention of praxis in the process of knowledge leads to the overcoming of the antithesis between idealism and materialism', which is to say, the antithesis 'between the understanding of knowledge as knowledge of objects produced or created by consciousness and the conception that sees that knowledge as the mere ideal reproduction of objects

in themselves'.<sup>70</sup> It is necessary to overcome both positions: we cannot persist in either an idealist theory of knowledge or in 'a realist theory like that of traditional materialism, which had done little more than elaborate upon the standpoint of ingenuous realism'.<sup>71</sup>

Sánchez Vázquez indicates, here, that different interpreters of Marx derive different conclusions from the introduction of the concept of praxis to the problem of knowledge, mentioning three positions in this regard:

- 1 'the fact that praxis is a factor in our knowledge does not mean that we cannot know things in themselves';
- 2 'the admission of the decisive role of praxis as an indication that we can never know things in themselves, outside their relation to man, but only things humanised through praxis and integrated thus into a human world' (Gramsci's view);
- 3 'maintain[ing] that without praxis, or the creation of socio-human reality, knowledge of reality is itself impossible'<sup>72</sup> (Kosík's position<sup>73</sup>).

The difference between the second and third positions is not immediately obvious. On the basis of the entirety of *The Philosophy of Praxis*, it is possible to sketch in broad strokes the differences between the three, as well as Sánchez Vázquez's own evaluation of them. While the first position recognises, albeit underestimating it, the epistemological relevance of human praxis, the second position moves in the opposite direction and grants human praxis such importance that, beyond its influence, no reality exists.<sup>74</sup> The third position, like the second, appreciates the irreplaceable epistemological relevance of praxis, but, diametrically opposed to the second position, criticises the idea of bearing praxis as an ontological claim, and, as a result, shares with the first position the recognition of the primacy of the object.

In what follows, I set out Sánchez Vázquez's argument in favour of the third position. He returns to Marx's original text to investigate its 'actual meaning', which, at first, becomes problematic for him since

the text lends itself to opposing or even contradictory interpretations.<sup>75</sup> But, in order to understand how Sánchez Vázquez goes into more depth regarding the three aspects of praxis in the process of knowledge – praxis as basis for knowledge, as criterion of truth, and as the end of knowledge – we will unpack his interpretation of the *Theses on Feuerbach*.

To illustrate Marx's critique of 'hitherto existing materialism', he continues with his interpretation of the German term '*Objekt*', used by Marx in the first thesis: 'This latter is opposed to the subject, for it is a given, existing *in* and *for* itself, and not a human product; thus the form of relation between subject and object in this case is one in which the subject is passive and contemplative'.<sup>76</sup>

Sánchez Vázquez's interest in aesthetics, and above all his dispute with 'socialist realism',<sup>77</sup> is visible, here, as in so many other parts of the book when he continues with his interpretation of the Marxian critique of traditional materialism: 'the subject ... restrict[s] itself [in traditional materialism] to receiving or reflecting reality. Here knowledge is simply the result of the actions of the objects in the external world and their effects upon the sense organs'.<sup>78</sup> And he takes up again the distinction between the concepts '*Gegenstand*' and '*Objekt*': 'The object is *objectively* grasped [i.e. *Objekt*, S.G.], rather than *subjectively* as the product of practical activity' [i.e. *Gegenstand*, S.G.].<sup>79</sup>

Human knowledge is not directed at things that are totally foreign to it. The world as presented to us today is produced by previous generations; it is, therefore, the product of human praxis.<sup>80</sup> When a human being looks upon the world, he does not see just any accumulation of matter, which in turn puts off just any electromagnetic waves – which is to say, light – entering his retinas through his open eyes, but, instead, confronts the product of his own activity and that of his contemporaries, as well as his forbears. The rays of light that stimulate his optical cells – continuing with this idea – are not in any way a merely natural phenomenon, but are, instead, socially and

historically conditioned. Even the light of distant stars that we see today, even though they could have been extinguished before there were even humans on this Earth, do not reach our eyes in a 'pure' or untouched fashion (and this is not to even speak of the telescope, through which such light is channelled, and which also does not come out of nowhere). The air over Frankfurt, like that of many of the world's cities, is becoming increasingly cloudy, according to the complaints of the scientists at the old Observatory at the Senckenberg Museum, and this again is a result of the overwhelming nature of human praxis.

This is what pre-Marxist materialism fails to see or 'forgets' when it does not include in its reflections praxis as the basis for knowledge. Marx does not examine in greater detail the problematic of human praxis as the basis for knowledge in this text of 'noteworthy brevity' (Bloch). In contrast to traditional materialism, idealism has focused subjective activity on the process of knowledge (the active side). 'The subject [in idealism...] did not grasp objects in themselves, but as products of his activity'.<sup>81</sup> In this sense, therefore, it is superior to 'hitherto existing materialism'. Sánchez Vázquez mentions, on this point, that Marx is thinking of Kant's idealist conception of knowledge, and that 'it was to Idealism's credit, in Marx's view, that it had underlined the active role of the subject within the subject-object relation'.<sup>82</sup>

But idealist philosophy has another weakness in its understanding of knowledge: it knows the active and creative subject only as something conscious, thinking, but in which its practical, sensuous, and real activity is excluded.<sup>83</sup> Thus, Marx sees the need for a double overcoming: of traditional materialism and of idealism, the overcoming of the theoretical negation of human praxis – with which natural forces become eternal and absolute – and the overcoming of the neglect of the material force inherent in praxis and the latter's reduction to thought.

Human praxis is the foundation, the basis for knowledge, since it has first created the objects that will be recognised (against traditional materialism), but it is not an isolated question of spirit, but tangible, since with material interventions it creates an objective, real, sensuous reality (against idealism). Regarding the first aspect of the critique of the ingenuous understanding of nature as already given, prior to human history, the author adds that with this Marx does not deny the existence of a nature beyond human praxis, but merely insists that what confronts our knowledge today is hardly this '*virgin nature*'.<sup>84</sup> 'Thus Marx accepts the ontological priority of a nature outside praxis whose ambit is progressively reduced as it becomes humanised nature'.<sup>85</sup>

Sánchez Vázquez argues that Marx takes up again here his understanding of the human–nature relationship developed in the *Paris Manuscripts*.<sup>86</sup> In his interpretation of the first *Thesis on Feuerbach*, it has become evident that Sánchez Vázquez, as previously indicated, leans toward the last of the three possible exegeses of this brief text: Marx does not here deny the existence of a reality of things which is fully independent of human beings; however, he does reject the idea that 'knowledge could be mere contemplation unrelated to practice. Knowledge exists only in practice as knowledge of objects integrated into practice and of a reality that has already lost or is in process of losing its immediate existence to become a reality mediated by man'.<sup>87</sup>

With the help of the second *Thesis on Feuerbach*, Sánchez Vázquez explains to what degree human praxis is not only, as we have said, the basis for knowledge (insofar as it creates its object), but, moreover, the criterion for the truth of knowledge. Recall Marx's thesis: 'The question whether objective truth can be attributed to human thinking is not a question of theory but is a *practical* question. Man must prove the truth, that is, the reality and power, the this-sidedness of his thinking in practice. The dispute over the

reality or non-reality of thinking which is isolated from practice is a purely *scholastic* question'.<sup>88</sup>

Sánchez Vázquez insists that, according to this thesis, 'truth does not exist in itself'.<sup>89</sup> A thought, a theory, cannot be certain in and of itself; its truth cannot be verified within the theoretical terrain. Here, as a result, the truth of a thought, a theory, is understood as its 'this-sidedness [*terrenalidad*]'. It is only when the idea applied in praxis is crowned with success that we have a basis for the verification of this idea with regard to pre-existing reality.<sup>90</sup>

This understanding of truth, we could add, reminds us of the modern natural sciences, which are oriented toward application: a law of the natural sciences is recognised as such at the moment in which it produces the desired results in experiments and in technical application.<sup>91</sup> An emphatic notion of truth – like that which Sánchez Vázquez also claims – as the coincidence of the idea with the reality existing outside of that idea,<sup>92</sup> is not (or almost never) found in the natural sciences. Nor is this logic uncomfortable with the recognition of reciprocally contradictory theories as valid – at least at a specific level of scientific development – as is the case with the undulatory and corpuscular theories of light. In each case, the theory which promises the best path to success is simply applied.

With reference to social theory – which is what most interests us here – it is thus worth asking whether Marx formulates an empiricist or a pragmatic concept of truth. Is the social or political theory which gives rise to the greatest political success therefore the most correct one? Is the one which we manage to impose more easily the right one? In the final instance, it would be possible to ask the following with regard to human praxis: is imposed praxis correct praxis? Which would imply: are stable systems of domination, by principle and thanks to the force of their imposition, the truest ones, which would therefore need to be placed outside any radical and systematic critique? Adolfo Sánchez

Vázquez rejects such a pragmatist interpretation of the *Theses on Feuerbach*: 'At the same time we must be wary of interpreting this relation between truth and success, or falsehood and disaster, in a pragmatist way, as if truth or falseness were determined by success or failure'.<sup>93</sup>

In praxis, the human being *is obliged to demonstrate* the truth of his reasoning, as Marx says in the thesis in question. He needs to demonstrate it there, but this does not mean that success constitutes truth or that praxis automatically confirms, so to say, the truth of a theory applied successfully. Sánchez Vázquez formulates this relationship between praxis and truth as follows: 'If a theory can be successfully applied, it is because it is true; the reverse, however, is not necessarily also true'.<sup>94</sup>

The success of a praxis, then, should not be compared to the truth of the theories upon which it is based. The power of this-sidedness of reasoning is not the essence of its truth, but rather merely an indication thereof. To express our understanding of Sánchez Vázquez's interpretation of Marx in the language of formal logic: the this-sidedness of thought is the necessary but not sufficient condition for its truth; since this condition must not be understood in the sense of formal logic as an *attribute*, but rather in the chemical sense as an *indicator*. Or, as Sánchez Vázquez puts it: 'Success does not constitute truth; it simply reveals the fact that thought can adequately reproduce reality'.<sup>95</sup>

This 'reveals' or 'makes visible' should be understood in relation to what has been said and quoted before, in the sense that success makes visible the truth of the theory that serves as its basis because it is also true independently of it. Success, then, is an indication of truth, but is not sufficient for its knowledge, while the absence thereof denotes that there is something that requires revising in the thought in question. After this critique of a possible erroneous interpretation of the concept of truth in the second *Thesis on Feuerbach* – an interpretation which Sánchez

Vázquez calls 'pragmatist' – our author indicates another interpretive problem which points implicitly toward an empiricist focus. This second aspect is both complementary to the first as well as offering the possibility of understanding what is necessary, alongside the 'success' of a given praxis, in order to follow the trail of the truth of the corresponding thought.

The 'making visible' of a theory's truth through praxis should not be understood to mean that it suffices to merely open one's eyes and simply read truth in praxis. If praxis is the criterion for a theory's truth, this does not mean, according to our author, that the search for truth is exempt from all theoretical feedback: 'Practice does not speak for itself; practical facts must be analyzed and interpreted, since they do not reveal their meaning to direct and immediate observation nor to intuitive apprehension'.<sup>96</sup>

In order to make praxis effective as a criterion for truth, a theoretical relationship to it is necessary. The dependent relationship between theoretical knowledge and praxis, as we again see demonstrated here, is bilateral, extremely close, and intertwined.<sup>97</sup> In order to document this understanding of the concept of praxis contained in the second *Thesis on Feuerbach* as a criterion of truth, Sánchez Vázquez refers, for assistance, to the eighth thesis, from which he cites the following: 'All mysteries which mislead theory to mysticism find their rational solution in human practice and *in the comprehension of this practice*'.<sup>98</sup>

For Sánchez Vázquez, this is how we establish the unity of theory and praxis in the second and the eighth *Theses on Feuerbach*, namely: in a 'double movement; from theory to practice (*Thesis II*) and from practice to theory (in *Thesis VIII*)'.<sup>99</sup> In so doing, Marx – in the concept of the unity of theory and praxis – turns against two conceptions of knowledge which are incapable of understanding this double movement as a result of their unilateralising optic: on the one hand, against an idealist understanding of the truth of knowledge 'whereby theory contains within itself

the criterion of its own truth', and, on the other hand, an empiricist approach 'according to which practice provides the criterion for judging the truth of theory in a direct and immediate way'.<sup>100</sup>

Sánchez Vázquez would like to make known the role of praxis as the criterion of truth of significant generality, without being restricted to the sphere of the sciences, which he discusses in greater detail, making note of the fact that this criterion for truth can assume different forms in the different sciences. But, at the same time, he indicates that this criterion for truth finds limitations in its application 'which prevent it [praxis] from becoming an absolute criterion of truth'.<sup>101</sup>

Sánchez Vázquez says that in the third thesis, unlike the first and second, praxis does not appear as a 'cognitive category', but instead here 'becomes a sociological category';<sup>102</sup> however, in discussing it he comes to speak various times about the relationship between praxis and knowledge. From the aforementioned double movement in the unity of theory and praxis, after studying up to this point principally the movement from theory toward praxis (what does praxis mean for theory as its basis and criterion of truth?), we now turn to the other movement, namely that from praxis toward theory (what does theory mean for praxis?). The problem of the role of the process of knowledge with regard to a world-changing transformative praxis is dealt with in this third *Thesis on Feuerbach*, through a discussion of the meaning of the power and limitation of knowledge or understanding acquired through education. In this thesis, Marx is thinking about Enlightenment philosophers and thinkers and about eighteenth-century materialists, whose thought Feuerbach and the nineteenth-century utopian socialists 'carried on'.<sup>103</sup> According to this understanding, the human being is essentially marked by two influences: circumstances and education. Voltaire places more emphasis on the first aspect, philosophers of the German Enlightenment the second; they understand the transformation of

humanity as a 'vast educative enterprise'.<sup>104</sup> The foundation of this view of education is the idea of the human as a rational being. According to this view, human progress can be driven by the destruction of prejudices and the dominion of reason. 'In order for man to progress, enter the age of reason and live in a world constructed according to rational principles, all that is required is that consciousness be illuminated by the light of reason'.<sup>105</sup>

This process of enlightenment occurs through the labour of the educator, who frees human beings from superstition and brings them from obscurantism to the realm of reason. And who are these noble educators? They are the Enlightenment philosophers and the 'enlightened despots' who follow their advice. But this understanding contains precisely the division of humanity that Marx mentions, into an active part and a passive part. Nothing remains for the rest of society (the non-educators) but to allow their consciousness to be shaped from without.<sup>106</sup> The human being, then, is considered 'passive matter which can be molded by the environment and by other men'.<sup>107</sup> Sánchez Vázquez reconstructs in three steps Marx's critique of this idea of the human being and its possible transformation by the 'simply pedagogical', and not the practical revolutionary, route.<sup>108</sup>

- The circumstances, which undeniably influence the human being, are treated as external and immutable instances, and the fact that they are produced by human praxis is ignored.<sup>109</sup>

Following Sánchez Vázquez, we could say that this step belongs to a critique of reified consciousness, which does not understand the degree to which the things we confront are in themselves the expression and result of a historical social situation and of relations of production which are in turn created by human hands. The circumstances studied thereby acquire the character of a thing, they appear as 'objective' [*objektiv*], which is to say, untransformable, as a thing-in-itself, which rises intact amid the swell of history.

Or as Marx puts it in *Capital*: in the world of commodities, products of human hands – like the products of the mind in the ‘misty realm of religion’ – appear as ‘autonomous figures endowed with a life of their own, which enter into relations both with each other and with human beings’.<sup>110</sup>

- The educators must also be educated. Marx here criticises the presumption typical of the revolutionary bourgeoisie of the eighteenth century, which considers itself the single driving force of the historical process and, at the same time, deems it unnecessary for this process to continue developing. To the dualism of educators and those who are to be educated, Marx counterposes the ‘idea of a continuous praxis in which both subject and object are transformed’.<sup>111</sup>

To explain the third *Thesis on Feuerbach*, Sánchez Vázquez cites the following passage from Marx’s main work (*Capital*) on the effects of human labour: ‘Through this movement he acts upon external nature and changes it, and in this way he simultaneously changes his own nature’.<sup>112</sup> He discusses a process of ‘self-transformation’ which ‘is never completed’, thereby excluding the existence of educators who, in turn, would not need to be educated.<sup>113</sup>

- The aspects mentioned in the two previous points, the circumstances which transform humans and are in turn transformed by humans, and the educator who educates other humans and must in turn be educated, can be combined in thought with the idea that only the human being is capable of transforming both his circumstances and himself. Those transformations can only be understood as a joint and simultaneous task, as revolutionary praxis.<sup>114</sup> This unity of the transformation of the human being through understanding, education, and the transformation of circumstances, as well as the manner that the author has of interpreting these, can be understood as an emphatic formulation of what is meant by the inalienable meaning and importance of the unity of theory and praxis more generally.

Sánchez Vázquez interprets that unity to which the third *Thesis on Feuerbach* refers as a double negation. Here, he again takes up

the model of the critique of two forms of unilateralising a process which is only conceivable in the unity of two moments: on the one hand, he rejects the ‘Utopian conceptions’ that consider the self-transformation of human beings through education to be sufficient, ‘irrespective of the circumstances of his life’, to accomplishing a radical transformation. At the same time, and on the other hand, he rejects a ‘rigorous determination’ which considers it sufficient to transform the conditions of life ‘without reference to the changes in his consciousness resulting from the labour of education’, in order to transform the human being.<sup>115</sup> But what both conceptions have in common is that they underestimate the importance of a unity between the subjective transformation of consciousness and the transformation of objective social relations; in other words, the relevance of revolutionary praxis.

After interpreting the first three *Theses on Feuerbach*, during the course of which he also introduced the eighth, Sánchez Vázquez moves directly to discussing the final thesis, which is by far the most famous, and not only for being the shortest. The eleventh *Thesis on Feuerbach*, one of the best-known phrases of Marx’s entire body of work, can be understood as an extremely concise summary of what Marxists like Sánchez Vázquez understand to be the German exile’s great theoretical revolution: the entrance of praxis as a fundamental category of theory, which had previously opposed it with a greater or lesser degree of scepticism. Let us once again examine the original version of the phrase that, chiselled in large letters – and in the version Engels published it for the first time – today adorns the gravestone of its author: ‘The philosophers have only *interpreted* the world in various ways, the point is to *change* it’.<sup>116</sup>

Sánchez Vázquez understands the eleventh *Thesis on Feuerbach* as a radical critique of previous philosophy, above all German idealism, which ‘culminat[ing] in Hegel and Feuerbach, was just such a philosophy of interpretation’.<sup>117</sup>

As we have just seen, we are dealing with a profound rupture with *this* philosophy, but at the same time and through this same rupture, there is an effort to save philosophy – in a new sense – as a highly developed theory of the revolutionary transformation of existing social relation. When Marx, in this famous *Thesis on Feuerbach*, criticises earlier philosophers for limiting themselves to *interpreting* the world, this is also synonymous with the affirmation that ‘they have accepted and sought to justify it, but have not contributed to its transformation’.<sup>118</sup>

The transition from interpretation to transformation implies a ‘theoretical revolution’ that Marxism must carry out and which is inseparable from the ‘revolutionary praxis of the proletariat’.<sup>119</sup> Sánchez Vázquez turns his interpretation of the final *Thesis on Feuerbach* in the direction of a manifesto for the unity of revolutionary theory and praxis, against the two attitudes which see only one side of the coin, and which bypass this unity entirely: unreflexive spontaneism and academic Marxism. Regarding the first of these attitudes (Sánchez Vázquez does not use either of the two terms mentioned), he emphasises that it is ‘an interpretation of the world that makes transformation possible’.<sup>120</sup> On the second, he insists that to reduce Marxism to mere interpretation means no less than to do exactly what Marx denounces in the eleventh *Thesis on Feuerbach*: to persist in remaining enclosed within the limits of theory.<sup>121</sup>

To conclude the interpretation of the *Theses on Feuerbach* by Sánchez Vázquez, we will permit ourselves a small political-theoretical observation. The contradiction between traditional materialism and idealism that Marx attempted to overcome, which was mentioned in the first thesis and which reappears here, seems to continue to be present in debates about leftist politics. Quite often there occurs a conflict that is occasionally quite vehemently fought out, between two distinct currents, which follow the respective steps of argumentation.

On the one hand, a naively sensuous current attempts to determine political action by

setting out directly from lived experience, individual involvement, and in part from felt desires. In so doing, this current loses its connection to the social and historical determination of that reality, which is understood as immediately given and directly graspable.

On the other hand, another current with a serenely distanced attitude which, from a more or less neutral and certain vantage-point, knows the dynamic of the process in which we are all immersed and, therefore, does not think simply that the ‘untouched sensuousness’ is a path which gives direct access to the correct analysis of the situation. But, at the same time, it hides behind this judgement; as a critical commentator its only enemy is the false concept, and it gradually loses the possibility for the materially transformative and objective conscious intervention into this reality, which is at least verbally recognised as historically and socially conditioned (and, therefore, as transformable in its very foundations).

Without a doubt, it is not possible to equate these two currents with ‘traditional materialism’ or ‘idealism’, respectively, but there seems to exist a certain parallel in their problematic and their errors, such that we can ask ourselves if present debates and actions (the emancipatory praxis) have fallen far behind Marx, or if while he recognised the problem – and despite the immense effort that he no doubt carried out – he was still not in a position to resolve it.

Finally, attending to re-establish the importance of the study of Sánchez Vázquez and remembering his contributions to the Leftist political thinking in general and, more particularly, to the critical – non-dogmatic – interpretation of Marx, the work of Sánchez Vázquez amounts to a serious attempt at overcoming some of the deficiencies that the orthodox Marxist tradition established for Marxist thought in general, causing its stagnation. For example, the commonplace idea that it is an impossibility for Marxism to theorise everyday life, or the critique that the Left depletes itself in material demands provoke a strong response in the Spanish-Mexican

thinker Philosophy of Praxis, claiming the true importance of Marxian concepts.

## Notes

- 29 Sánchez Vázquez 1983b, p. 36. Sánchez Vázquez does not note the precise citation, here, but we could assume that he is referring to the same Spanish translation of the *Theses on Feuerbach* that he cites in *Philosophy of Praxis* (namely, that of Wenceslao Roces). See Sánchez Vázquez 1980, p. 22. Omissions belong to Sánchez Vázquez. The quotation marks in the Marx's original text do not appear in Sánchez Vázquez).
- 30 Sánchez Vázquez 1983b, p. 36.
- 31 Ibid.
- 32 Ibid.
- 33 Marx 1978b, p. 143.
- 34 The concept of '*conciencia ordinaria*' that Sánchez Vázquez employs can be translated not only as '*gemeines Bewusstsein*' [ordinary consciousness] but also as '*Alltagsbewusstsein*' [everyday consciousness]. As a general rule, we use the second variant, which is slightly freer but also more common in German, and in favour of which Sánchez Vázquez also speaks with regard to the meaning of the concept of the everyday. For a similar reason, his expression 'ordinary man' [literally, '*der gemeine und gängige Mensch*'] can be translated as '*Alltagsmensch*' [everyday man].
- 35 Sánchez Vázquez 1980, p. 21. [In the English version of *The Philosophy of Praxis*, these words are simply translated as: 'Having gone beyond German Idealism' (Sánchez Vázquez 1977, p. 2.)]
- 36 Sánchez Vázquez 1977, p. 2.
- 37 Ibid.
- 38 Ibid., pp. 2f.
- 39 Ibid., p. 2.
- 40 Ibid., p. 3.
- 41 Ibid., pp. 2ff. The 'abolition' discussed here refers above all to the *attitude* of everyday man. His consciousness, as Sánchez Vázquez says later, must be 'overcome' (ibid. In this regard, see the following extensive quotation in Sánchez Vázquez).
- 42 Ibid.
- 43 Ibid., pp. 4ff.

- 50 Ibid.
- 51 '... [M]an as a social, active, and transformative being ...' (Sánchez Vázquez 1980, p. 25). This is different in the English-language edition: 'the active role of men in transforming society' (Sánchez Vázquez 1977, p. 5). Sánchez Vázquez does not let slip such anthropological determinations.
- 52 But why is everyday consciousness not oriented, as a result, according to *this* philosophical consciousness? Why is it that it does not allow itself to be infiltrated by it, rather than this being merely occasional, as stated above? Is Schopenhauer simply more astute than Marx, does he have better 'public relations'? Or is it because the man from Trier, since his burial at Highgate Cemetery on 17 March 1883, has died over and over again in recent years with increasing frequency and greater commotion? (And what, then, would Lazurus – one of the few figures who, according to tradition, died *twice* – say of this immoderate competitor?)

- 68 Ibid., p. 116.
- 69 Ibid.
- 70 Ibid.
- 71 Ibid.
- 72 Ibid., pp. 116f.
- 73 Karel Kosík (1923–2003) was a Czech philosopher whose most important contributions are in the field of Neomarxist critical epistemology. His best work is *Dialectics of the Concrete* (1963). It focuses on the problem of knowledge. Furthermore, the importance of this thinker when studying Sánchez Vázquez is increased by the fact that Sánchez Vázquez was directly involved in the translation of *Dialectics of the Concrete* to Spanish.
- 74 Elsewhere, Sánchez Vázquez characterises Gramsci's position with the latter's own words, as 'absolute immanentism', 'absolute historicism' and 'humanism' (Sánchez Vázquez 1977, p. 33. This quote was changed using the second edition of the Spanish original: Sánchez Vázquez 1980, p. 56).
- 75 Sánchez Vázquez 1977, p. 117.
- 76 Ibid., pp. 117–18.
- 77 On Sánchez Vázquez's abandonment and critique of socialist realism, see our biographical introduction.
- 78 Sánchez Vázquez 1977, p. 118.
- 79 Ibid.
- 80 Ibid., p. 119.
- 81 Ibid., p. 118.
- 82 Ibid.
- 83 Ibid.
- 84 'Marx does not deny the existence of a nature outside praxis or prior to history; the nature that actually exists for him [man], however, is given *in and through* practice' (ibid.).
- 85 Ibid.
- 86 Ibid., p. 119.
- 87 Ibid., p. 120.
- 88 Marx 1978b, p. 144. Marx's cited formulation, 'the truth, that is, the reality and power, the this-sidedness of his thinking', shows that he is not interested in an abstract concept of truth that floats in the air, as is generally associated with the German term '*Wahrheit*'. The Spanish term '*verdad*' [truth] does not generally carry that heavy significance, but can also be understood by the terms '*Richtigkeit*' [being correct] or '*Wirklichkeit*' [reality]. This question – which we here describe as specific to the Spanish language and of its German translation, as well as one pertaining to Sánchez Vázquez's texts – is also present in Marx's original text. Studies on the topic note that 'two concepts of truth coexist in the second Thesis on Feuerbach'. Alfred Schmidt distinguishes between truth as "'objective truth": pertinent knowledge' and truth as the "'reality", "power", and "this-sidedness" of human thought' (Schmidt 1973, p. 1129).
- 89 Sánchez Vázquez 1977, p. 120.
- 90 Ibid., p. 121.
- 91 See, in this respect, Sánchez Vázquez's following formulation in his interpretation of the second thesis on Feuerbach: 'If the ends pursued are achieved through action, this means that the knowledge out of which those ends can be elaborated is true knowledge.... if we base our hope for the achievement of certain ends on a given judgment about reality, and those ends are not achieved, it follows that our judgment was false' (ibid.).
- 92 Ibid.
- 93 Ibid.
- 94 Ibid.
- 95 Ibid.
- 96 Ibid.
- 97 'The criterion of truth may be found in practice, but it is only discovered within a properly theoretical relation with practice itself' (ibid.).
- 98 Marx 1978b, p. 145. Italics according to Sánchez Vázquez 1977, p. 121.
- 99 Ibid., pp. 121–2. Another note, perhaps a *pedantic* one: we are not citing here from the second edition, which we have used in other cases, but from the first edition (Sánchez Vázquez 1967, p. 130). This is due to an error in the second edition: in the phrase cited above, 'thesis II' suddenly becomes 'thesis I'. We have allowed ourselves to correct this error, one that is obvious in context. With regard to the unity of theory and praxis, Sánchez Vázquez always speaks only of theses II and VIII, but not thesis I. [The English translation also includes a mistake, corrected above, when mentioning the numbers of the theses here referred to: instead of 'thesis VIII', the translator of *The Philosophy of Praxis* put 'thesis III' (ibid.).]
- 100 Sánchez Vázquez 1977, p. 122.
- 101 Ibid. The reader who was hoping for a clear and final answer to the possibility of establishing a definitive truth will respond with disgust. Where, in the end, does this leave the advanced position of knowledge as compared with idealism and empiricism? Here, once more, we see the results of a non-dogmatic interpretation of Marx: great disgust and insecurity, but little knowledge that can be applied. For the orthodoxy this is a most disappointing outcome. How to build a state on such an uncertain basis?
- 102 Sánchez Vázquez 1977, p. 125.

- 103 Ibid., p. 122.
- 104 Ibid.
- 105 Ibid., p. 123.
- 106 Ibid.
- 107 Ibid. On this topic, what interests Sánchez Vázquez is, among other things, the various forms of violence applied in politics and art. In the latter case, this violence falls on passive material, for example, the stone to be carved, but in the first the action is exercised upon active beings, toward whose creation of consciousness it is directed and which in a given case can generate a counter-violence. Here we will quote a central passage from this chapter to allude to the force field in which Sánchez Vázquez is roaming: 'Indeed violence has been so clearly linked to all historical production or creation, that many commentators have seen violence as the very motor force of historical development – for example those who, like Dühring and Gumplowicz, have tried to find a theoretical justification for racism or fascism'. Sánchez Vázquez 1977, Part II: 'Some philosophical problems of praxis', Chapter VII: 'Praxis and violence', pp. 305–36, here: p. 308.
- 108 Sánchez Vázquez 1977, p. 123, italics by S.G.
- 109 Ibid.
- 110 Marx 1976a, p. 165.
- 111 Sánchez Vázquez 1977, p. 124.
- 112 Marx 1976a, p. 283.
- 113 Sánchez Vázquez 1977, p. 124.
- 114 '... [C]hanges in circumstances cannot be separated from changes in man, just as the changes that occur in him as circumstances and human activity, or rather of the transformation of circumstances and the self-transformation of man, can only be achieved *in and through* revolutionary practice' (ibid.).
- 115 Ibid.
- 116 Marx 1978b, p. 145. [Translation corrected, based on the German *original* text of the *Theses*, written by Marx. It seems that the translator of the English-language edition of the *Theses* used here was taking its cue from the problematic German version published by Engels. It mistakenly separates the two parts of the sentence by a semicolon and confronts them with the added word 'however', both non-existent in Marx's handwritten original. In consequence, the translator writes erroneously: 'The philosophers have only *interpreted* the world, in various ways; the point however is to *change* it'. (Ibid.)]
- 117 Sánchez Vázquez 1977, p. 126.
- 118 Ibid.
- 119 Ibid., p. 127. For his interpretation of the eleventh thesis on Feuerbach, Sánchez Vázquez refers here to the last line of Engels' text, 'Socialism, Utopian and Scientific': 'To thoroughly comprehend the historical conditions and thus the very nature of this act, to impart to the now oppressed proletarian class a full knowledge of the conditions and of the meaning of the momentous act it is called upon to accomplish, this is the task of the theoretical expression of the proletarian movement, scientific Socialism': Engels 1907, p. 87.
- 120 Sánchez Vázquez 1977, p. 126.
- 121 Ibid.

# Roberto Schwarz: Mimesis Beyond Realism

Nicholas Brown

## INTRODUCTION

Over the course of a career that has so far spanned more than a half-century, Roberto Schwarz has made several indelible contributions to critical theory. While Schwarz has written commandingly on diverse topics, his towering achievement is his work on the late nineteenth-century Brazilian literary figure Joaquim Maria Machado de Assis, particularly his last great novels. Born in 1938 in Vienna, Roberto Schwarz moved with his family to Brazil in 1939 after the annexation of Austria into Nazi Germany. Schwarz studied social sciences at the University of São Paulo (USP) before taking a Master's degree in Comparative Literature at Yale University under René Wellek. Returning to Brazil in 1963, Schwarz taught under the great Brazilian critic Antonio Candido in the Literary Theory Department at USP. With the hardening in 1964 of the dictatorship that had begun in 1964, Schwarz was forced into a decade-long exile in Paris. During that time

he completed his doctorate in Latin American Studies at the Sorbonne (University of Paris III) with a thesis that would become his first book-length study of Machado de Assis, *Ao vencedor as batatas* (*To the Victor Go the Potatoes*).<sup>1</sup> From his return to Brazil in 1978 to his retirement from teaching in 1992, Schwarz taught literature and literary theory at the University Estadual de Campinas (Unicamp).

\*\*\*

Schwarz's contributions to critical theory develop along two major axes: the elaboration of a theory of literary realism that goes far beyond the Lukácsian limit of the historical novel (while maintaining and developing many of Lukács's insights and commitments), and the development of a framework for understanding the relationship between culture on the periphery and in the dominant countries. The problem of literary mimesis is surprisingly poorly developed among Schwarz's Frankfurt School forbears;

Schwarz's jumping-off point is not even Lukács but the work of the great (and in English woefully under-translated) Brazilian critic Antonio Candido de Mello e Souza, universally known as Antonio Candido. Among Schwarz's Marxist contemporaries, only Fredric Jameson has offered a theory of interpretation of comparable ambition. In the classic Frankfurt School texts, the theorization of cultural production outside Europe and North America is so conspicuously lacking as to amount to a blind spot; Schwarz's work stands, with that of his followers and students, as the great dialectical alternative to post-colonial and Latin American studies criticism indebted to the moment of subaltern studies. Making difficult work for the commentator is the fact that neither of these projects is conceived or pursued as a separate development; indeed, for the most part they are undertaken in the course of close engagements with particular texts. The necessary attempt to disentangle them will involve a certain amount of violence to the texture of Schwarz's thought.

## INTERPRETIVE METHOD

The most explicit statement on method that Schwarz has made takes the form, characteristically, of a textual commentary. In 'Objective Form: Reflections on the Dialectic of Roguery' (1979), Schwarz pinpoints Antonio Candido's 'Dialectic of Roguery' (1970) as the breakthrough of dialectical criticism into Brazil as a project rather than as a mere slogan.<sup>2</sup> Candido's contribution – 'without predecessors' in Brazil and rare enough outside it – is to produce an account of self-legislating ('emancipated' [20]) form as itself revelatory of 'the movement of society as a whole' (24). By 'emancipated' form, Schwarz means that in a successful work the link between literary and social form is not itself a directly social process. It neither takes place through the development of

preexisting generic forms (which, in relation to self-legislating form, are merely raw material), nor through a 'political unconscious' that insists behind the back of the novelist. (Whether that Jamesonian category works the way it is commonly understood to work is another matter). As he says in an early study of Henry James, 'in a literary text ... everything is construction, intentional gesture'.<sup>3</sup> The creation of literary form is a cognitive act, even though, as we shall see, it is a cognitive act of a peculiar sort. 'Before it was intuited and made objective by the novelist, the form that the critic studies was produced by the social process, even if nobody was aware of it' (22). We will return to this dense formulation, but it is enough to note at present that social form is not an object to be reported on by the novelist, but is rather something that is made objective by the novelist – at the same time, however, as it is the effect of a real social process quite apart from the intuition or will of the novelist.

Form – 'any and every nexus that subordinates others in the text' (20) – mediates our understanding of all the particular elements in the text, all the way from inherited literary forms to narrative sequences to sociological or historical data, whether these be suspect or apparently trustworthy. Apparently paradoxically, then, the link between aesthetic and social form can only be achieved by first rigorously delinking them: since mimesis inheres in the form, no single element is to be taken as immediately mimetic. 'The unification of the novelistic sphere with that of reality takes place through their near-total separation, and the dialectic of the two passes through their precise articulation and not, as usually happens, through their confusion' (23–4). Everything depends on this articulation which, as will not have escaped notice, is nothing other than literary form itself: 'As to method, it should be noted that in the back-and-forth between fiction and reality the priority of literary form is absolute. It is form that poses the problem that

the knowledge and study of the critic help to formulate' (21–2).

Antonio Candido's breakthrough essay concerns Manuel Antônio de Almeida's 1854 novel *Memoirs of a Militia Sergeant*. We begin (rearranging Antonio Candido's argument for our own purposes) with the extraordinary observation that *Memoirs* achieves the standpoint of totality by means of a radical constriction of viewpoint. The book presents an 'impression of reality' (89) that strikes us with the 'force of conviction' (88) despite the near absence of both slaves and landholders, which is to say the near absence of both the labor force and the ruling class (87). 'In suppressing the slave, [Almeida] suppressed labor almost totally; in suppressing the ruling classes, he suppressed the controls of power' (95). Despite ignoring both labor and power – the two major candidates for forces actually shaping society – the novel 'suggests the lively presence of a society that seems to us quite coherent and existent' (86). Somehow Almeida's novel allows us 'to intuit, beyond the fragments described, certain principles constitutive of society – a hidden element that acts as a totalizer of all these partial aspects' (89). How?

The greater part of Antonio Candido's essay is devoted to drawing out formal peculiarities of Almeida's novel, whose distinctive texture derives from the figure of the *malandro* or rogue. In the novel the *malandro* is not precisely a type, though he is that too and will certainly become one over the subsequent course of Brazilian literary history. Rather he is a principle of composition, a figure that passes easily between two poles that Antonio Candido labels 'order' and 'disorder' respectively: something recognizable as bourgeois society on the one hand, with its laws, marriages, professions, and all the rest, and on the other a larger zone, difficult to qualify, that presents 'twenty situations of concubinage for every marriage and a thousand chance unions to every situation of concubinage' (95). This movement, once we are attuned to it, turns out to govern the novel as a whole, such that

even omnipresent Major Vidigal, the fearsome representative of order throughout the novel, turns out to obey the same logic. In a climactic scene the major, approached at home in *deshabille* by three women who seek to intervene on the hero's behalf, rushes inside and reemerges wearing his uniform dress coat – but not his pants. The major, complacently responsive to the blandishments of the ladies, appears 'in regimentals from the belt up, homespun from the belt down – armoring reason in the norms of the law and easing the solar plexus in amiable indiscipline' (95).

It is this organizing principle that gives the novel its coherence and, as it plays out across social strata and situations, its 'feeling of reality' (96). But so far this is a purely subjective – though, as we will explore more thoroughly below, modally universal – judgment. What is the 'reality' whose presence we feel? We recall that the action of the novel is 'circumscribed socially to the kind of free people of modest means who we would today call the *petit bourgeois*' (86). Almeida will restrict his action to this world – a marginal one, but one whose consistency is only intelligible with reference to the other two classes. Landowners are landowners, slaves are slaves, but the petty bourgeoisie is not a petty bourgeoisie but rather a superfluous but relatively privileged population; while the economy is capitalist, it does not produce a classically bourgeois society but rather one 'in which only a few free people worked and the rest whistled whichever way the wind blew, gleaning the leftovers through parasitism, venal contrivance, the kindness of patrons, good luck, or petty theft' (95). This, then, is the objective correlative of the dialectic of roguery:

What remained was the gamelike air of this unsteady organization fissured by anomie, translated into the dance of characters between licit and illicit, without our being able to say in the end which was one and which the other, because everyone ends up circulating between the two with a naturalness that recalls the mode of formation of families, power, fortunes, and reputations in urban Brazil in the first half of the nineteenth century. (95)

Two observations remain to be made. First, while social form here pertains to the real, it is not a fact. Form is rather imposed upon facts of two different orders: both the facts of lived experience and the historical record, and the fictional facts that belong only to the novel. This is what Schwarz means by the ‘near-total’ separation of the real and fictional orders: fact does not relate to fact, but both sets of facts are subjected to the same logic, ‘thanks to which the two series, real and fictitious, are rendered coherent’ (96). Second, while this is clearly a cognitive process, it is a cognitive process of a special kind. The pertinent criterion of judgment is not truth, in the sense of something that can be verified by means of other kinds of documents, but plausibility: as we have seen, Antonio Candido’s categories of judgment are always subjective: the ‘sense’ [*senso*] or ‘feeling’ [*sentimento*] or ‘impression’ of reality, which carries a greater or lesser ‘force of conviction’. Plausibility is a subjective determination, but one whose mode is nonetheless universal: if two people disagree about the ‘feeling of reality’ produced by a work of fiction, they do not simply have different opinions: each party is saying that the other is wrong, which means that each party is saying that her own impressions are not simply her own impressions, but are correct. We should not be shocked or disappointed that this modality of judgment ultimately rests on nothing more solid than argument and consensus. (So does politics.) With art, plausibility is a higher criterion than verifiable truth, which after all is not rare. Every photograph on Facebook bears an indexical relationship to the real world, some element of verifiable truth – which does not mean that what it says is plausible. A Jeff Wall photograph, on the other hand, may be so highly manipulated that no particular element can be said with certainty to bear an indexical relationship to an actual state of affairs. A successful Jeff Wall picture is successful, then, not because the state of affairs it represents is true, but because its fictional presentation is plausible.

Since Kant, aesthetic judgment has been understood as, only apparently paradoxically, both subjective and universal. Indeed, the philosophy between Kant and Hegel – Jacobi and Reinhold through Fichte – finds the justification for this mode of judgment in an inchoate set of implicit, and possibly inexpressible, convictions, without which experience would not be intelligible in the first place. Recall that for Schwarz, as we saw above, a social form can, apparently paradoxically, be recognized without having been previously known. For these reasons, as we shall see below, realism inheres in works that, like *Memoirs of a Militia Sergeant*, appear very far from the realist tradition.

## THE SPECIFICITY OF THE LITERARY

Schwarz tests these propositions in his underappreciated *Two Girls* (1997).<sup>4</sup> The book would be said to concern two characters in Brazilian literature that share similar formal features, except that one is not a character, but rather a young girl (‘Helena Morley’, nom de plume of Alice Dayrell Caldeira Brant) from the mining town of Diamantina who kept a diary between 1893 and 1895 and who published them in 1942 – with what degree of subsequent polish and rearrangement is not clear. The other character is Capitolina, or Capitu, the heroine of one Machado de Assis’s late masterpieces, *Dom Casmurro* (1899). Both Capitu and Helena are inquisitive, self-enlightening female figures inserted into a conservative, patriarchal culture that is, on one hand, not ignorant of metropolitan developments whose hegemony is acknowledged but not felt, and, on the other, tacitly complicit with other local, less formalized modes of existence. Helena’s book, while hardly innocent of literary form, nonetheless cannot be said to deploy it in the way that Machado de Assis or Manuel Antônio de Almeida does. Life in a declining mining town in late-nineteenth-century

Brazil has a texture and a form, and Helena, with astonishing perspicacity, records events that exhibit that form.

Like the girl, her little brothers sometimes do work normally done by blacks, or become poor cousins, exploited for domestic work by wealthy relatives, or take their place as members of an important family. This alternation between more or less incompatible roles, far distant from one another in the social spectrum, is lived as an everyday experience, so that the system of social differences is transformed into an interior reality marked by a surprising objectivity and irony of manner. (119)

The point of interest and difficulty is that Helena's registration of social form seems only quantitatively, not qualitatively, different from that of Machado or (here) Almeida. Helena Morley's speech is, as non-literary speech, not different qualitatively from any other speech. It may be cleverer, more insightful, more lively than others, but it requires no special status simply because it lies between two covers. The particularity of literary form, which Antonio Candido and Schwarz had been so careful to specify, threatens to evaporate before our eyes, and literary study begins to look like an elite variant of qualitative sociology, cultural anthropology, or history.

Schwarz solves the problem by performing a thought experiment. What if the book's form turned out to be literary in the strict sense? What, in other words, if the book turned out to be a hoax, written, rather than merely edited, by a cosmopolitan woman in her 60s? In that case,

the nature of our reading changes. Much of what would appear as curious, lively detail in a day-to-day registration of events becomes, in a strictly composed work, crude, pseudo-ingenuous, and artistically inadequate. In other words, we already didn't believe that we were confronted with a work of the imagination in the strict sense. Indeed, the interest and beauty of the work are tied to the feeling that it was composed according to the drift of days, 'without artistic intentions'. (96)

The problem had in fact already been solved, though we didn't realize it, because not only had we already posited the book as

non-literary, but the very felicitousness of the book's contents depended on being posited a priori as non-literary. As a register of events, the diary as a form bears with it an indexical relation to reality. The work of producing a 'feeling of reality' has been accomplished before the first word has been read. The moment we are asked to sever the indexical link, the book fails to strike us with the 'force of conviction': it becomes a novel, but a bad one.

This thought experiment has interpretive implications as well. Helena's story ends well. One can hardly take issue with this, as the story of the girl who wrote the diary indeed ends well. Capitu's story ends unhappily. This is not just a felicitous choice, but from the standpoint of the logic Machado is developing, a necessary one. 'The obstacles that are overcome [by Helena] do not go away; they remain, awaiting their next victim. From the collective standpoint, there is more reality in them than in the triumph of the occasional lucky individual' (151). Again, the point is not to criticize Helena Morley for having overcome obstacles: to do so would be, absurdly, to criticize Alice Brant for having overcome those same obstacles. The point is rather that, as something that happened, Helena's triumph is simply beyond criticism on literary grounds. If, on the other hand, Capitu had enduringly rather than provisionally overcome the obstacles that confronted her, the 'feeling of reality' – the opposite of the Barthesian 'reality effect', which is a mere literary technique rather than a principle of composition in the sense that Antonio Candido and Schwarz have elaborated it – would have been sacrificed for a singular romantic adventure.<sup>5</sup>

## CASE STUDIES

Two relatively minor essays illustrate Schwarz's productive and unconventional approach to the question of literary realism.

The first is Schwarz's brief but decisive reading of Kafka's *Worries of a Family Man*.<sup>6</sup> The story sticks with us less for the family man, who turns out to be the unnamed narrator of the piece, than it does for the figure of Odradek, a strange object that looks like a spool but isn't, since its spool-like form, covered in random pieces of string, is supplemented by two crossed bars that enable it to 'stand upright as though on two legs'.<sup>7</sup> As we soon find out, Odradek not only stands upright, but speaks. This would seem to be an odd place to look for realism. But the story's secret is hiding in plain sight: its title has nothing to do with Odradek, but rather the somewhat mysterious anxiety of the narrator, whose patriarchal status would seem to have little enough to do with the figure at the story's center.

Looking for a unifying compositional principle, Schwarz discovers that the piece is organized around a series of shifts in tonal register that reveal the family man's attitude toward Odradek: initially amused, then condescending, dismissive, anxious, and ultimately (though this is expressed indirectly) murderous. Why should little Odradek provoke any reaction at all, much less this peculiar sequence? The only thing we know about the narrator other than what he tells us is his status as paterfamilias, and the prose confirms that he sees himself as the bearer of bourgeois responsibility and propriety. Looking carefully at what the family man tells us about Odradek, Schwarz explains that Odradek is 'the precise and logical construction of the negation of bourgeois life' (23). We are told twice that Odradek has no purpose. On the other hand, he does have purposive form, so emphatically so that the family man can, to his frustration, withhold it from him for only a sentence before it reasserts itself. To say that Odradek is useless but in his own way complete is to say that Odradek's form is immanently determined. In a society like ours, no entity is permitted an exemption from the obligation to serve a heteronomous purpose. Since Odradek's being cannot

be connected to any heteronomous activity, rather appearing complete in himself, 'he is the extreme image of liberty amidst the effort required by propriety; a perfection neglected but perfectly safe, since it is made up of parts that nobody wants'; climactically, Odradek is 'a lumpenproletariat without hunger and without fear of the police' (24). But the point is not that Odradek allegorically represents the lumpenproletariat without hunger and without fear of the police: since the lumpenproletariat is hungry and does fear the police, the formulation is just as much an impossible schematic construction as Odradek himself. Since realism in fiction is not a matter of relating fictional facts to real ones, there is nothing anti-realist in Kafka's prose and Odradek doesn't 'stand for' anything at all; rather, the realism of Kafka's story inheres in the form given to the family man's prose, which schematizes the condescension, fear, and hostility exhibited by bourgeois life when confronted with what escapes its logic.

Schwarz's reading, brief though it is, goes theoretically far beyond Benjamin's and Adorno's more comprehensive approaches to Kafka, which always in the end lunge for Kafka's thematic bait. Something similar could be said for the debate between Brecht and Adorno over the question of literary 'commitment' – a question Schwarz resolves by sidelining the immediate question of commitment to ask the question of how Brecht means what he means.<sup>8</sup> As is well known, Brecht sought to turn the ancient defense of poetry – 'delight and teach' – more fundamentally into a choice of priorities: theater for pleasure or theater for learning?<sup>9</sup> Adorno raises an objection to this orientation that is in its essence very basic. If a work of art is to be judged not according to immanent criteria but according to its ends – revolutionary precepts or lessons on the functioning of capitalism – then what is in fact to be judged is those ends themselves, and the aptness of the work as a means to them.<sup>10</sup> In the early 1950s Adorno is, to say the least, suspicious of the ends to which Brecht is committed.

More devastatingly, however, Adorno points to the implausibility of the work of art as a means. In order to do what it claims to do – namely, to ‘strike in images the being of capitalism’ (Adorno: 416) – Brechtian theater has recourse to the technical means available to drama as a medium. But from the perspective of propositional truth, of the revolutionary doctrine the work of art is supposed to contain, these technical means are distortions. The very requirement that Brecht’s *Saint Joan of the Stockyards* be a play falsifies the treatise it also claims to be. The ostensible thesis of *Saint Joan*, that individual do-gooding is a compensatory substitute for collective action, is subverted by the fact that everything hinges – necessarily, since this is a play – on the success or failure of Joan’s individual do-gooding.

The brilliance of Schwarz’s intervention is to see that Adorno’s critique is devastating to Brecht’s claim to didactic effectiveness, but not to the play for which this claim is made. The loss is not as great as it might seem: after all, Schwarz reminds us, the Brechtian ‘lessons’ are ‘of modest scope’ and it is not obvious that they remain today ahead of historical developments (43). ‘Thus, against claims to the contrary, the truth of the plays would not lie in the lessons passed on, in the theorems concerning class conflict, but rather in the objective dynamic of the whole’ (44). This is not to say that Brecht’s plays have no cognitive content or that they have no political potency, but rather that their content and their politics are mediated by ‘emancipated form’, the self-legislating nature of the work. On Schwarz’s reading, the central figure is not so much Joan as the industrialist Mauler, whose need to outdo his competitors leads him to take risks that provoke successive crises. We remember, of course, that for Marx, ‘the characters who appear on the economic stage are merely personifications of economic relations’: competition is not a drive, but an effect of relationships among firms. In *Saint Joan*, subjectivity takes its revenge. If universal competitiveness is indeed a product

of capitalist economic relations, it is nonetheless, in Mauler, hypostasized into something very like a drive, which is to say something that overrides self-interest. ‘The capitalists’ extraordinary cleverness changes meaning, in turn becoming obsolete and pernicious’ (54). What appears on the stage is the ‘transformation of the cunning of capital into reflexes that are counterproductive, one would almost say antideluvian. The contrast ... recalls in fact a loss of judgment on a species-wide scale’. The plausibility of this formalization, and its relevance to contemporary history, could not be clearer, or more lamentable.

## MISPLACED IDEAS

So far we have taken Schwarz’s work in its dimension as a continuation, methodological refinement, and theoretical justification of a familiar problematic, namely the problem of literary realism in its non-literary-historical sense, the interpretation of literary form as disclosing social form. But Schwarz’s major contribution has been to produce a powerful and productive version of what Fredric Jameson has called in another context a ‘spatial dialectic’. That is, the social form disclosed by literary formalization is, particularly in Schwarz’s work on Machado de Assis, not just national in scope, but reaches out to the dynamic of what an older vocabulary called ‘combined and uneven development’, the differential development of capitalism across geographic and political space.

The major text here is *A Master on the Periphery of Capitalism*, a book-length study of Machado’s masterpiece, *The Posthumous Memoirs of Brás Cubas*.<sup>11</sup> But a chapter of an earlier study, published separately in English as ‘Misplaced Ideas’, concisely lays out the theoretical coordinates.<sup>12</sup> Schwarz begins by diving into the historical record, showing that in the debates around the abolition of slavery, the latter is argued to be not just good or bad, justifiable or unjustifiable, but is seen

against the background, implicit or explicit, of the European ideology of free labor. The economist F.H. Cardoso, who studied Marx with Schwarz and later became President of the Republic, noted that the structural effects of this mismatch are thoroughgoing (21). In Europe, the profit motive directly produces the need for efficiency, for shedding labor costs. In Brazil, the same motive required the slaveowner to 'fill and discipline the day of the slave' (21), who could be sold but not laid off. The critical point, however, is that these totally divergent forms of labor organization are not separate phenomena: they are linked by the same world economy that requires ever new efficiencies and innovations in the industrial center, but also requires stability in the production of raw materials on the periphery.

The ideological consequences of this phenomenon are complex and wide-ranging. If we conceive ideology in a broadly Althusserian vein, as an imaginary relationship to real conditions of existence, then we notice that the dominant discourses – from political economy all the way down to everyday bourgeois morality – do not, in fact, relate to Brazilian conditions of existence. As Schwarz pithily phrases it, in this situation 'ideologies do not describe reality, not even falsely' (23). Art historical developments, for example, which are intuitively understood in Europe, at least by their partisans, to be vital responses to rapidly changing social and sensory conditions, can only appear from the periphery, even to their partisans, to be a parade of fashions – a perspective that is not false. A phenomenon that relegates Brazil to a kind of cultural backwardness is not, then, without a certain lofty ambivalence: failing to (falsely) account for local conditions, liberal ideology became preposterous, but 'inasmuch as they became preposterous, these ideas ceased to mislead' (24). Adding to the ambivalence is the fact that also in Europe liberal ideas had been given the lie by the apologetic turn they had taken since 1848. Since Brazil's 'improper discourse was hollow even when used properly' (25),

there is a certain congruence between apologetic speech in Brazil and critical speech in Europe, such that a defender of slavery can call the European laborer 'a slave without a master to pity him' (19).

Complicating all this is the fact that the central class articulation worked out in the actual functioning of everyday ideology is not that between masters and slaves but between the former and the anomalous class already familiar to us from the discussion of Almeida above: free whites without property. 'Favor', the system of unequal reciprocities that maintained the privileged but dependent class, 'formed and flavored the whole of national life, excepting always the basic productive relationship which was secured by force' (22). But if slavery renders liberal ideas irrelevant, 'favor, more insidiously, uses them, for its own purposes, originating a new ideological pattern':

The element of arbitrariness, the fluid play of preferences to which favor subjects whatever it touches, cannot be fully rationalized. In Europe, when attacking such irrationalities, universalism had its aim on feudal privilege. In opposing this, bourgeois civilization had postulated the autonomy of the individual, universality of law, cultivation for its own sake, a day's pay for a day's work, the dignity of labor, etc., against the prerogatives of the Ancien Regime. Favor in turn implies the dependency of the individual, the exception to the rule, ornamental culture, arbitrary pay and the servility of labor. (22–3)

Liberal ideas, which do, after all, legitimize the organization of the independent Brazilian state and its articulation with the world system, continue to circulate, but without a connection to a social reality that they do not (falsely) describe. But since the whole point of liberalism is to account for a social reality, this displacement cannot be acknowledged even though it is generally understood: an openly ornamental liberalism no longer looks like liberalism. 'Real as it was, the antagonism vanished into thin air, and the opposing positions walked hand in hand' (23). This same structure, most easily visible in

relationships of direct patronage, can be seen to operate at manifold levels: 'The same is true of institutions, bureaucracy and justice, for example, which though ruled by patronage, proclaimed the forms and theories of modern bourgeois state' (23). In a final twist, however, we have to be reminded that while the structure underlying Brazilian culture was retrograde from the standpoint of liberalism, it was not archaic, but rather rigorously contemporaneous with and linked to developments in the central economies:

However, Brazil was not to Europe as feudalism was to capitalism. On the contrary, we were a function of European capitalism, and moreover, had never been feudal, for our colonization was the deed of commercial capital. ... In this confrontation, the two principles were not of equal strength: in the sphere of reasoning, principles the European bourgeoisie had developed against arbitrariness and slavery were eagerly adopted; while in practice, sustained by the realities of social life, favor continually reasserted itself, with all the feelings and notions that went with it. (23)

This is essentially the structure that Machado de Assis will bring to consciousness in his late masterpieces. We will return to this shortly. Meanwhile, it is important to note exactly what has taken place here. The ideological structure of slaveholding Brazil – and Schwarz makes it clear that the argument holds, *mutatis mutandis*, for other periods, as long as Brazil is in the position of periphery to a European and American center – is drawn with extraordinary sensitivity and complexity. But at the same time it is drawn into a binary structure. The texture of Brazilian life is not simply produced from the *sui generis* interaction of its various constitutive elements; rather, it is much more profoundly produced by its relation to the world economic system. However, this culture, subordinate though it is, is not merely to be condemned nor criticized for its backwardness since it is not literally backward – feudal, let's say – but rather in every way contemporary with, indeed, produced by, the same process as its

industrializing counterpart. 'In such wise, our national oddities became world-historical'. Indeed,

The tenacity of the basic social relationships and the ideological volatility of the 'elite' were both a part of the dynamics of Capitalism as an international system, the part that it was ours to live out. The latifundia [landholding elite], little changed, saw the baroque, neoclassic, romantic, naturalist, and modernist cultures pass by, cultures which in Europe reflected immense transformations in its social order. We could well suppose that here they would lose their point, which in part did occur. But this loss to which we were condemned by the working of the international system of capitalism condemned the working of that very system itself. We say this to indicate its more-than-national significance. (27–8)

Neither, then, is peripheral culture to be celebrated under the banner of difference. For while the difference has an ambivalently positive aspect – a critique of the world system is implicit in it – its source is at basis deeply negative: the profound structural inequalities built into capitalism's reproductive process. Third world or subaltern culture is of world-historical significance not for its alterity in relation to the culture of the dominant countries, but through its differential insertion into the world system. What Schwarz produces in these relatively few pages is nothing less than what Fredric Jameson has called a 'spatial dialectic', one in which the great Hegelian schema of the 'identity of identity and difference' plays out not only in time but across apparently disparate social formations. (Indeed, at a moment when capitalism's ability to absorb labor displaced by technological advances is doubted even by mainstream economists, even the core economies may be entering a Machadian universe where liberal ideas no longer describe reality, not even falsely.) It is not only an external framework for understanding peripheral culture in general but, when works of extraordinary power draw this structure into their own literary form – as for example, in the late novels of Machado de Assis – a kind of key.

## MACHADO DE ASSIS: PERIPHERAL IDEOLOGY AND LITERARY FORM

*A Master on the Periphery of Capitalism*, Schwarz's book-length study of Machado de Assis's *Posthumous Memoirs of Brás Cubas*, is a critical masterpiece whose intricacy and rigor cannot be adequately conveyed in summary. However, much of the critical apparatus we need to understand it has been sketched above. Schwarz begins with a series of textual observations that are schematized into a description of the generative structures that underlie the novel. The novel is written, appropriately for a memoir, in a strong first person; indeed, the narrator has such firm control over the flow of language that the implied addressee – and very likely the actual reader, at least on a first reading – is left at sea, at the mercy of the mercurial Brás. The effect is initially charming, if bewildering:

I hesitated for some time as to whether I should open these memoirs at the beginning or the end, that is, whether I should put my birth or my death in first place. Granted, the common usage is to start with one's birth, but two considerations led me to adopt a different method: the first is that I am not exactly a writer who has died, but a dead man who has become a writer, and for whom the grave was a second cradle; the second is that my writing would thus be more elegant and novel. Moses, who recounted his death, didn't put it in the introduction, but at the conclusion: a radical difference between this book and the Pentateuch.<sup>13</sup>

The debt to Sterne is obvious; and yet with these first lines we realize we are in the presence of something new. Summarizing Schwarz's initial approach: Brás exhibits a conscious desire to provoke. Already in the first paragraph he compares his book to the Hebrew bible – to the detriment to the latter, since the difference is that his own book is 'more elegant and novel'. On the other hand elegance and novelty are hardly Mosaic virtues, so the whole provocation is made in such a way that the narrator, at least, does not take his impertinence seriously – or at least,

he does not expect anyone else to take overt offence. Similarly with the claim to be not a writer who has died, but a dead man who writes. The proposition seems to make a fine distinction but is in fact an absurdity: in the light of what follows, the line drips with a contempt that is casual but serious. He speaks as one who does not expect to be believed, but also does not expect to be contradicted.

The key to Brás's language is his 'volubility', a period term that refers to speech but means not so much talkative as variable, mercurial, capricious.

At every turn Brás puts on the airs of a modern gentleman, only to disparage them in the next moment, then take them up again, setting up a system of inconsequentiality that in the course of the novel will become the norm. It is as if enlightened conduct were equally deserving of respectful consideration and mockery, functioning at one moment as an indispensable norm, at another as an obstacle. (9)

Once one becomes sensitive to them, the class overtones of this speech are unmistakable and give the prose its peculiar edge, even if one has no particular understanding of Brazilian social structure then or now. It is a structure that can, returning to Schwarz's earlier formulation, be recognized without being known. However, in light of what we already know from 'Misplaced Ideas', we can begin to see in Brás's speech a formalization of the peculiar ideological formation that prevailed in Brazil in Machado's time. Brás's insouciance is 'an acritical or nonspecific irreverence' (19) constantly taking contrary positions without taking any of them seriously, appropriate in a world where the ideas that circulate don't describe reality, not even falsely. His volubility 'is unimaginable without the ... groundwork of secularization and unification of human experience that the Enlightenment carried through, a struggle whose spirit Brás does not share, even though he makes use of its results, always stamping it with a note of derision' (19). Brás's volubility 'gives the objectivity of form to an

ideological ambivalence inherent to the Brazil of its time' (27).

As Merleau-Ponty says of painting, Machado's production of Brás's language as a thoroughgoing principle is almost mad – precisely because it is complete while being deliberately partial: a social totality, presented in nothing more than the way one man talks. (Schwarz goes on to show that the formal principle of volubility is also active at the level of the plot, where different figures effortlessly assume mutually incompatible social significations.) The force and ambiguity of this form is then familiar to us from 'Misplaced Ideas'; the comic effect of the novel is aimed at the mincemeat Brás is making of the various positions he adopts. We never lose sight of the fact that he is doing so as a wealthy provincial, but at the same time 'we are laughing here at nothing less than the achievements of the modern Western world' (35). However, there is in the end nothing attractive about Brás's volubility. In what is surely one of the most convincing close readings in the history of criticism, Schwarz demonstrates the class violence at work in Brás's volubility in a chapter that reveals its almost unbearable verbal and narrative cruelty when confronted with the poor girl Eugênia, who because she has nothing to stand on but her own dignity has, unlike Brás, something solid for her character to stand on – but nothing solid to live off.

With this one reaches the turn within a turn or negation of the negation in Schwarz's reading. Brás treats prestigious, liberal ideas with a contempt that is casual yet tacit. As we have seen, the peculiar ideological structure that gives Brás's speech its plausibility is a symptom of nineteenth-century Brazil's social and political formation. A side-effect of that formation is a certain critical distance from the liberal ideas it makes use of, which is nonetheless an 'acritical or nonspecific' criticism. But Brás is not a symptom but a formalization, and his final ugliness is not an external commentary on Brás but rather part and parcel of the figure's plausibility. In other words, *Brás Cubas* is, like 'Worries of

a Family Man', a profoundly realist text that uses apparently anti-realist means. But more than this, Machado is then closer to Flaubert than to Sterne in his historical significance. For while in Brás himself the critique of liberal ideas is tactical and nonspecific, this is not the case for Machado, whose earlier novels had attempted – at the cost of plausibility – to narrate the influence of those very liberal ideas on the ruling classes. But the cynical adaptability of liberal ideas to illiberal circumstances is not unique to Brazil: as we have seen, it is an open secret in Europe after 1848. Indeed, it is such a feature of daily life that it takes a truly self-parodic figure – like the tech billionaire who sleeps in his office on his own largely automated factory floor to show that he believes in a day's work for a day's pay – to remind us of it. 'Unerringly, by concentrating on the internal and external thresholds of the bourgeois order, the advanced literature of the second half of the nineteenth century dedicated itself to showing this same relativity and usurpation. This vanguard still has validity today' – one might even say that it has validity especially today – 'and Machado de Assis is part of it' (146).

### **CULTURAL CRITIQUE: POST-COUP BRAZILIAN CULTURE AND POSTMODERNISM**

Even the most accomplished works of art have blind spots, limitations imposed by the work's formal procedures, that cannot be overcome by means of those procedures themselves. Almeida's *Memoirs of a Militia Sergeant* succeeds despite its weak initial plan, which seems to have been overcome in the course of composition. Machado's earlier novels, which aimed to have 'a civilizing effect without being disrespectful' (152) fail, even when their content is a critique of the 'liberal-clientelist system' (151), to reconcile their romantic and realist aims in a satisfying way. *Memoirs* itself is powerfully mimetic

but, as a direct consequence of its formal procedures, limited in its ability to present historical movement. It is a limitation we may well see as symptomatic, as a 'sacrifice made' (128) in the name of Machadian mimesis that points to a blind spot, however historically unavoidable, that may have made the Machadian inventions necessary in the first place.

In other words there is, in Schwarz's work, room for a more traditional, Adornian culture critique, where the failures and limitations of works of art are symptomatic of historical impasses. Schwarz's relatively recent essays on Caetano Veloso and Augusto de Campos would fall into this category. But the most celebrated essay in this vein was written near the beginning of his career, when Brazil was undergoing a profound and prolonged political crisis. Despite its modest and workman-like title, 'Culture and Politics in Brazil, 1964–1969', written 1969–1970, is one of the great works of cultural criticism.<sup>14</sup> So profound is the cultural matrix it produces that work written on the period in real or apparent ignorance of it – as, for example, a great deal of North American writing on Brazilian concretism and on the musical movement known as *Tropicália* – renders itself pointless, already undermined by Schwarz's critique. Not necessarily of greater importance, but of greater interest to non-Brazilianists, is the fact that it concerns the coup of 1964, 'one of the crucial moments in the Cold War' (139), a turning point that marked as an event what was elsewhere felt as a more gradual process of the elimination of socialist alternatives – a process whose cultural equivalent is eventually known as postmodernism.

Schwarz's sweeping critique of Brazilian culture during the first years of the dictatorship reveals how profoundly the coup affected the arts. The situation of architecture is emblematic: Brazilian architects, whose formation had been centered around a collectivist, Utopian modernism that developed out of Brazil's popular-developmental period and into the developmental-socialist moment

cut short by the coup, suddenly had nothing better to do than build single-family houses. The ends being completely out of proportion to the means, the result was architecture ill-suited for living: formerly 'rational' design principles were turned either into a mere sign of good taste or a moralistic symbol of abstract revolution. This evacuation of content – the Jamesonian 'withdrawal of the signified' – is the very prototype of the transition from an avant-garde aesthetic economy to postmodern transavantgardism.

Schwarz reserves his most detailed analysis for the theater. Simplifying Schwarz's discussion, we might say that there are essentially two possibilities. The first is represented by the Augusto Boal's Teatro de Arena, whose dominant influence is Brechtian. As with the architectural instance, Brechtian techniques, developed in the context of a potential revolution, undergo a certain deformation in the context of the immediate aftermath of a failed one. Indeed, to put it in overly brutal terms, the Brazilian cultural elite, though sincere in its Left politics and opposition to the coup, was 'objectively' on the side of the coup, since it failed to take account of the way in which its own class interests coincided with the populist elision of class conflict: 'The defeated Left triumphed, without critique, in front of a full house, as though its defeat had not been a defect' (148). Revolutionary artistic technique becomes, at best, a reproduction of the problems inherent in Left populism, and at worst a consumable sign of the audience's innocence. The pleasure of this experience gives the lie to the innocence.

On the other hand we have José Celso Martinez Corrêa's Teatro Oficina. The Oficina represents an entirely different kind of theater experiment based on assault. Grounded in a more critical understanding of the role of the middle classes in the coup, Celso argued that 'any understanding between the stage and the house is an ideological and aesthetic mistake' (151). The audience, therefore, is to be insulted by the stage, its habits and choices ridiculed, its very person grabbed by the

collar, yelled at, spattered with blood, jostled by actresses fighting in the aisles over a raw ox liver (representing the heart of a TV celebrity), jeered out of the theater if they show any resistance. The surprising thing, and also the problem, is that the audience enjoys the image of its own humiliation: the show is a tremendous commercial success. But we are not dealing here with simple masochism. In fact, something rather more sinister appears to be taking place: the audience

identifies with the aggressor, at the expense of the victim. If someone, after being grabbed, leaves the theater, the satisfaction of those who stay is enormous. The disintegration of solidarity in the face of the massacre and the disloyalty created in the midst of the audience are absolute, and repeat the movement initiated on the stage. (153)

Does it need to be said that that movement initiated on the stage, in turn, repeats the movement of society at large?

Two ways of evaluating these thoroughly ambiguous experiments present themselves. The criterion of the first would be overcoming the contemplative attitude inherent in the aesthetic principle in favor of the value of political solidarity. From this standpoint, the minimal political cohesion maintained by the Arena productions is preferable to the thoroughgoing 'disintegration of solidarity' in the Oficina. The criterion of the second, which also seeks to exceed the aesthetic principle, is on the contrary finally cognitive: 'By its content, this movement is demoralizing in the extreme; but since we are, after all, in the theater, it is also an image, hence its critical force' (153). The Oficina productions, in all their brutality, in fact forecast the actual brutality of the dictatorship (the worst of which was yet to come) and general complacency in the face of it.

Any choice between the two modes – which remain 'options facing culture'<sup>15</sup> – would have to depend on how we understand our shared post-1968 political-cultural scene. However, it well may be that this era is everywhere drawing to a close, and what the

unsettling new conjunction calls for is new and unconventional realisms, 'emancipated forms' like those Roberto Schwarz draws our attention to in Machado de Assis.

## Notes

- 1 Roberto Schwarz, *Ao vencedor as batatas* (São Paulo: Duas Cidades, 1977).
- 2 Page numbers for Schwarz refer to 'Objective Form: Reflections on the Dialectic of Roguery', in *Two Girls and Other Essays* (London: Verso, 2012: 10–32); the Portuguese version is 'Pressupostos, salvo engano, de "Dialética da malandragem"', in Roberto Schwarz, *Que horas são?* (São Paulo: Companhia das Letras, 1987: 129–55). The translation may be silently amended to match the original more closely.

# Aborted and/or Completed Modernization: Introducing Paulo Arantes

Pedro Rocha de Oliveira

Brazilian philosopher Paulo Arantes was born in 1942. He belongs to a generation of Brazilians who became intellectualized and politicized in the vibrant, turbulent years preceding the 1964 military coup. Despite sometimes defining himself as a ‘vulgar materialist’, his work was mainly influenced by Roberto Schwarz. György Lukács, Theodor Adorno, Jean-Paul Sartre, Herbert Marcuse and Hannah Arendt – but also Francis Fukuyama, Jürgen Habermas, Fernand Braudel and Carl Schmitt – are all names appearing regularly in Arantes’ writings which often take the form of critical analyses of varied but simultaneously contrasting authors and works. Yet, Arantes is only superficially concerned with defending his own take on celebrated authors and works. The epigraph of his 1996 book *O Fio da Meada* (‘The Skein in the Tangle’) could be used for the whole of his work: ‘he thought inside other heads’ (Brecht, 1988: 420).

At first glance, the themes occupying his thought have varied greatly. In the

1970s and 80s, Arantes studied the transition from classical bourgeois thought to the Critique of Political Economy. In the 1990s, he reflected on the connection between the previous decades’ projects of socioeconomic modernization and socialist ideology. In the early 2000s, he wrote about the processes of economic and political polarization underlying ‘neoliberalism’ and ‘globalization’. Since then, Arantes has discussed the consequences of militarized territorial administration on a national and international level.

However, his work as a whole displays formal unity. His books are collections of often jocosely titled essays (‘Single-minded thought and the distracted Marxist’ (Arantes, 2004) enigmatically grouped in untitled, numbered parts. With few exceptions his texts are organized in puzzling arguments with doubled negatives, parentheses inside parentheses, and closing with deliberately inconclusive twists. This consistent choice of form is, however, no mere stylistic caprice

but an expression of the difficulties and aporias implied by the subterranean problem occupying Arantes: the ways in which the complex relationship between the ideology of socioeconomic development and the historical intensification of capitalist social relations, inspired a tradition of radical social transformation and yet, collapsed into a brutal reaffirmation of capitalist accumulation – or, in his characteristically aphoristic terms, how modernity came to be aborted and/or completed (Arantes, 2004: 66).

Arantes' work is also trespassed by a certain unity of approach. In his assessment of capitalist modernization, Arantes adopts a perspective with two fronts. On one, bourgeois socialization appears as an open, potentially emancipating project or process; on the other, it is taken as a short-lived deception whose clear signs of failure are displayed all over the history of mass movements and in the peripheries of capitalism. This approach, clearly inherited from Roberto Schwarz, entails that global capitalism is better understood from the cognitively *privileged* position of its downside – 'reading North by South', in Neil Larsen's expression (1995).

The chapter reconstructs Arantes' arguments in what I consider his most representative works. The aim is not to exhaust the texts I will be dealing with, but to explore their points of contact in order to give the reader a bird's-eye view of Arantes' thought. That exploration will be undertaken in the following ways. I begin with an analysis of Arantes' essays on the genesis of the thought of Hegel and Marx, attending to the sociological foundations of the dialectical consciousness of bourgeois modernity. I then proceed to address Arantes' appraisal of the relation between that dialectical consciousness and the political possibilities of modern society. From there, I go on to discuss Arantes' interpretation of Brazilian modernization, especially in light of its authoritarian modulation, determined by and/or determining the 1964 military coup and of certain paths

taken by the theoretical consciousness that developed around it. I then engage the way in which Arantes follows the implications those developments have for a diagnosis of contemporary global capitalism, particularly as pertains to the dissociation between economic development and social progress: a dissociation that connects to an increasingly violent social administration and the material transformation of the classical role of temporality in bourgeois ideology and political practice.

## **SOCIAL CONSCIOUSNESS AND MODERNIZATION**

### ***Theory, Nation Building and Political Modernity***

One of the recurring ideas in *Ressentimento da Dialética* ('The resentment of dialectic'; Arantes, 1996a) is that one of Marx's and Engels' fundamental discoveries – in *The Holy Family* and *The German Ideology* – was the connection between the genesis of bourgeois social theory and the class character of the capitalist relations. According to Arantes' account, due to the complexity of civil society – the volume and diversity of the propertied classes – national consolidation under capitalism demands a discursive effort capable of displaying, in terms of state formation, the material interests particular to each social sector. To that effect, the workings of capitalism must be represented in terms compatible with common interest, common advantage and general viability. State formation must therefore appear as a more or less conscious project, oriented by the universal language of science – sociology, economy, philosophy, etc. In the mid to late 1700s, Germany had a philosophical discourse, but a national bourgeois society was yet unformed. In that, according to Arantes, lies the root of dialectic.

### ***Intellectual Resentment in the Periphery of Classical Bourgeois Society***

The basic idea, here, is that Idealism sprang from the frustration felt by intellectuals whose work failed to penetrate a politically closed society. In the resentful tones that give Arantes' work its title, German intellectuals began to picture themselves as those not heard or read because German society was not ready to appreciate their sophistication.

Their resentment had a material basis. On the one hand, the middle class was bound to become intellectualized because of its specific socioeconomic functions. From the standpoint of public administration, however, the mixture of political fragmentation and concentration of authority that characterized Germany made middle-class ideology dispensable. The common people, in their turn, had no reason to care about the political consequences of ideas in an environment completely closed to their political participation. The intelligentsia, therefore, found itself dependent on an aristocracy whose uncontested power limited their intellectual endeavours to the purely professional or private spheres, making political ideas irrelevant.

French philosophy, with its cosmopolitan, universalized content and outlook, expressed a fundamental moment of European reality: social modernization as the rational exercise of administrative power by the modern state. Scottish and English thinkers, in turn, were deciphering the hidden laws of economic activity. The German intelligentsia, no matter how sympathetic to such projects, were socially excluded from the possibility of promoting a problematic clash between thought and reality: an interested social class was lacking, as well as the political structures capable of advancing their ideas. Thus, German philosophic discourse was forced to assume a self-centred disposition for which the practical criterion of truth was restricted to the paradoxical space between political

conservatism and intellectual modernity, carefully avoiding the 'excesses' of French Enlightenment – both the enthusiasm of its form and the radicality of its content.

### ***Idealism and Reality as a Problem***

According to Arantes, the interiorization of the objective impotence of thought, combined with its subjective empowerment, had paved the way for a German reception of scepticism. In Immanuel Kant's Philosophy, David Hume's radical empiricism was distilled as a taboo against the 'thing-in-itself' due to its incognizability. Such a taboo was also extended to the essence of the human being, which could be known as a 'transcendental subject' deprived of historical and sociological context. Kant further dissociated philosophy in its technical specificity from a philosophy sufficiently sure of its own powers and limitations as to be able to safely discuss matters of general interest. The latter was indefinitely postponed until the theory of knowledge was completed, a day Kant himself did not live to see. Therefore, philosophy had nothing to say about the social, historical world, except whatever could be deduced from the metaphysics of the transcendental subject. And all this went hand in hand with Kant's distinction between the 'public' and 'private' uses of reason, which fitted well into the politically imposed limitations on thought in Germany – even as it tried to translate those limitations in terms not of social theory, but of epistemology.

Jacobi's reading of Kant's Criticism was to the point. If existing things were forbidden to thought, and intelligence was thus limited to the world of mere appearance, then, the only object of thought was nothingness, and reason thus was left in a useless state. However, Fichte would see in the transcendental nullification of things the opposite of an impoverishment of thought. Reality was nothing, but *should* become something,

as inscribed in the teleological character of ideas which were not *yet* socially relevant.

### ***Fichte and the Neutralized Masses***

Fichte, Arantes argues, went on to root his philosophy in the social context of Europe. Specifically, the nihilism at the core of Idealism – nullified reality – corresponded to the socio-political inertia of the masses. However, in his system, that inertia was represented as an empty space for the didactic political activity of intellectuals. German backwardness, and even the dissociation between thought and political action, existed only so that the intellectual could fulfil his civilizing destiny – a project inscribed in the title of Fichte’s magnum opus, the *Doctrine of Science* [*Wissenschaftslehre*].

Characteristically, Fichte ignored the sociological basis of the dissociation between the politically neutralized masses and the highly cultured intellectual sectors. Instead, Fichte made a place for a didactic reforming ideal. The plebs, as ignorant and impoverished as they were alienated from politics, oscillated between revolt and passivity. A slow process of reformation, rooted in education, was needed to change that.

### ***Hegel, Social Theory and Class Alliances***

Fichte was not alone in that regard, Arantes argues. German Idealism was constantly concerned with the possibility of a popular uprising, giving a patronizingly reformist response to that imagined threat. But Arantes points out Hegel’s contribution to that consensus was slightly dissonant. In 1798, Hegel saw German society as riven by a loss of ‘power and dignity’ of ‘existing life’, in which ‘no satisfaction can be found’ (cited in Arantes, 1996a: 324). However, the young Hegel did not prescribe an immediate restoration of dignity through culture, but instead

lingered on that negative moment, and described it as a social experience shared by both the learned classes and the masses. He thus moved on to say that the people and the intelligentsia suffered from the same problems and *wanted the same change*. In Hegel’s words, quoted by Arantes:

The growing contradiction between the unknown that men unconsciously aspire to, and the life that is given and consented, and which is in fact their own life, and the nostalgia for the life of those who have in themselves elevated nature to the condition of the Idea, carries in itself an impulse of reciprocal attraction. The need of the former to accede to the consciousness of what imprisons them, and the unknown to which they aspire, meets the need of the latter, of introducing in life the Idea they have formulated. (1996a: 324)

Over the years, though, Hegel would express a diminishing sympathy for popular political action. In his mature writings, the only remaining aspect of his youthful tirades will be the image of coerced, powerless masses and a rigid state bureaucracy stopping the enlightened sectors from dedicating their capacities to the modernization of German society. The generalization of suffrage was not recommended; the prevailing feudal structures could be overcome only through a restricted democracy in which the enlightened few would represent the common interest in modernity.

### ***The Proletariat as the True Heir of Bourgeois Resentment***

In Arantes’ account, Hegel was thus responsible for bringing into the idealist tradition the representation of politically efficient universality as class alliance. After Hegel, theoretical truthfulness could be posed in terms of the ability of ideas to respond to and express social needs. In his most recent essays collected in *Ressentimento*, Arantes (1996a) further suggests that Marx’s work was shaped around that same demand. However, the critique of bourgeois ideology,

based on an awareness of the class character of universalism, would allow Marx to question the idea of class alliance.

Arantes interprets the sociological grounds of Hegel's contribution in the following terms. Due to the operational complexity of the state and the market, capitalist public administration needs to incorporate a technical-scientific content, which is also the basis for the growth of a social sector exclusively dedicated to thought. The intellectual productions of this sector are, therefore, impregnated with habits of thought linked to the preservation of the status quo, and manifested in the reformist impulses of the German intelligentsia. Yet the fact that social administration is, by definition, restrictive and hierarchical, imposes a frustrating limitation to the degree to which intellectuals can identify themselves with political conservatism. The emphatic moment of bourgeois universalism springs from that frustration: it expresses an alienation that the intelligentsia shares with the masses, and projects a reality entirely permeable to rationality and human agency in general.

Marx's critique of ideology stressed that this universality represented a politically valid ideal. It was society itself which, when measured against that ideal, appeared as false. In historical terms, universalism was rooted in class alliances forged in the struggle against Absolutism; but bourgeois society had appropriated the machinery of the modern state, and employed it for the expansion of capitalism. The violence required for the conservation of property reaffirmed social alienation, imposing it on the dispossessed. The proletariat was thus the heir of bourgeois resentment, but in a historical moment in which rationality could no longer be represented as a merely subjective attribute: after all, the bourgeoisie had already unleashed social modernization. The *Communist Manifesto* will thus reinterpret the alienation that Idealism saw as a gap between reality and the rational faculty in terms of the contradiction between, the modern state and

its political-juridical-administrative apparatus centred on the preservation of private property – the relations of production, and the technology, machinery and administrative knowledge inherent in them – the productive forces. The revolt of the masses was thus thought of as the negativity of bourgeois rationality – inasmuch as it resented alienation, and of its positivity – since overcoming alienation was possible through the potential expansion of the technical-scientific moment: modernization.

## LIMITS AND POSSIBILITIES OF BOURGEOIS MODERNIZATION

### *The 1848 Paradigm*

In *O Fio da Meada*, Arantes (1996b) adds a further layer to his account of the genesis of Marxian thought: his analysis of *The Eighteenth Brumaire*. For Arantes, 'the 1848 upheaval represents the true dawn and still birth of bourgeois politics' (1996b: 31). The demand for the democratic reorganization of the French political system imploded when the propertied classes turned against universal suffrage, fearing the consequences of the growing radicalism of popular political consciousness, thus laying bare the class content of the universalism of the 1789 Revolution.

Insofar as this defeated mass movement involved not only the organized proletariat but also the intellectualized petite-bourgeoisie, it was also the expression of a turning point in capitalist accumulation. The period of free enterprise was over: the victors of 1848 were the monopolistic bourgeoisie of high industry and finance. Thus, Arantes suggests, socially relevant philosophy seems to have been a fading dream tied to a phase historically doomed by the logic of capitalist modernization.

In Arantes' appropriation of Marx's argument, the historical repeal of universalism transforms the positive moment of bourgeois

thought. The modernization impulse was critically connected to the idea of an ample civil society, due to its rootedness in the critique of alienation. Expressed in universal terms, that connection imbued bourgeois ideology with a democratic moment, which was suppressed by 1848. If we read that suppression in terms of the *Communist Manifesto*'s formula, it can be said that 1848 repositioned modernization in a manner that would tend to the concentration of both economic power and political power. The sterilization of bourgeois universalism thus seems to imply the sterilization of politics in capitalist society.

### ***Philosophy without an Object and the Critique of Political Economy***

The outcome of 1848 thus caused philosophy 'to lose its object once and for all' (Arantes, 1996b: 31): its function of articulating class alliances for the transformation of social reality was historically revoked. However, it retained a sort of empty functionality despite its loss of object. After the mid 1800s it increasingly turned itself into a highly specialized academic subject.

Yet the fact that philosophy was now barred from having direct political implications did not mean that all critical thought was paralysed. The Critique of Political Economy emerged precisely in this context, shedding 'a retrospective light over the previous philosophical illusion' (1996b: 40). Philosophy is overcome by the discovery of a sort of rationality alienated from itself – Capital as a seemingly automatic subject – and by the exposure of its violent core of social domination, which expressed itself in the political limitations of class alliance in bourgeois society. This, argues Arantes, is reflected in the path taken by Marx's work after 1852 and, ultimately, in *Capital*.

At the same time, that dissociation between philosophy and social transformation was not permanent. Georg Lukács and a whole lot of Marxist philosophers will seek to re-establish

the problem of universality within the discourse of the Critique of Political Economy. Arantes finds the historical context of development of 'Western Marxism' noteworthy. In his view, *History and Class Consciousness* was an 'unrepeatable model' written in a 'moment of historical grace' (1996b: 45). The Bolshevik Revolution had reopened sudden possibilities for popular organization worldwide, so that the political perspective of the working class could be formulated in terms of a general critique of capitalist society based on the problem of commodity fetishism – thus, alienation – and expressed through a Weberian sociology of modernization. A socially relevant critical philosophy thus emerged in connection with a real political process in a brief historical opening soon closed by the catastrophic rise of National Socialism.

## **INTELLECTUALS AND MODERNIZATION IN THE PERIPHERY OF CAPITALISM**

### ***The Problem of the Brazilian Socialist Intelligentsia***

The intellectual reception of socialist ideas in Brazil began on the eve of that European collapse. The absence of an endogenous theoretical tradition critical of modernization was a constitutive problem for the Brazilian intelligentsia. Its left-leaning elements turned to socialism, and were thus faced with the task of translating into local terms a set of theories originally formulated to cope with a very different reality.

I sought to show, above, how Arantes read the genesis of Marxian thought as stemming from a philosophical discourse sensitive to the peripheral character of German society, concluding with questions regarding the relationship between the historical relevance of that thought and the political limits of capitalist socialization. Arantes will take that

peripheral character and these limits further, as the keys to reflect on the intellectual reception of socialist ideas in Brazil.

### ***Modernization and Progressivism***

Fundamental to Arantes' reading of that reception is the consideration of the context in which it takes place: the industrializing effort undertaken by president Getúlio Vargas' 1930–1945 administration. His corporatist, nationalistic, authoritarian developmentalism had some ideological affinity with the European extreme right, but it dispensed with its sort of popular mobilization, which at any rate, was then impossible in Brazil. The population was largely occupied in rural activities involving extreme economic vulnerability, on which Vargas' fundamental economic strategy relied. Heavily subsidized coffee exports combined with rigid state control of the resulting influx of foreign currency, allowing the concentration of wealth required for the intense imports of production goods and the consequent state-driven development of the steel and energy industries. A change in the Brazilian economy was thus implied, as well as a reorganization of the relationship between the productive sectors, financial capital, and a new industrial working class subjected to trade unions controlled by the Ministry of Labour.

In spite of its authoritarian overtones, Vargas' modernizing initiatives imbued the Brazilian political imagination with the enduring legacy of 'progress' as a guiding principle for public administration. This progressivism portrays 'social-economic development' as the result of overcoming the country's comparative backwardness in the face of the Northern economic powers. It first found adherents among the intellectuals of the propertied classes of the state of São Paulo, the seat of the coffee-producing elite.

Those sectors related ambiguously to Vargas' government, though. Economic modernization would eventually consolidate

a *paulista* middle class, and the University of São Paulo – where Arantes was to be a student and a teacher – was founded in response to its demand for higher education. At the same time, the authoritarian government could do without an intellectualized sector: Vargas surrounded himself with a small council of appointed technical advisors, and the propertied classes who benefited from his policies, and were to some extent partial to the discourse of economic progress, were at the same time not politically integrated into his administration. Besides, their privileged social position depended fundamentally on the agrarian export economy, and thus on the social inequality that made the export system lucrative enough to sustain state-driven industrialization, so that their commitment to modernization had to be somewhat limited.

At any rate, in the 1930s and 40s, socialist intellectuals – mostly, members of those same propertied social sectors – predominantly adopted the progress-centred discourse. The formation of a proper proletariat, the development of the productive forces – and thus of a national bourgeoisie – and the 'political front' strategy prescribed by the Third International, lay the schematic foundations for the hope that Vargas' authoritarian modernization would help to place Brazil on the path of socialist revolution.

### ***Populism and Its Dialectic***

Immediately following Vargas' initial modernization, industrialization brought an increased formalization of labour which conflicted with the political limitations of state-controlled unionism, and enduring agrarian poverty. Towards the late 1940s, as a result of this contradiction, social movements developed a semi-independent streak that combined adherence to the institutional structures of progressivism and growing popular mobilization at a local level. Usually referred to as the 'populist' period, the often-convoluted relationship between industrial and agrarian

labour organizations and traditional political institutions were characteristic of the years between the end of Vargas' first administration and the military coup of 1964.

Populist ideology represented social reform as a consequence of the mutual trust between a somewhat politically organized population and a national government committed to employing economic development to generally improve the quality of life. Agrarian reform, price control, workers' rights and minimum wage policies were constantly on (and off) the political agenda. Populism thus implied some level of collaboration between the social sectors produced by Vargas' authoritarian modernization: organized labour, the historically new national industrial bourgeoisie, and the progressivist, learned middle class that had developed around the universities and technical councils.

All this imbued populism with an inner dialectic. Popular capacity for political organization and demand-making collided with the limitations imposed on the official trade unions by their institutional subjection to the Ministry of Labour. Increasingly formalized labour also meant increased job security and thus, potentially, a disposition for more radical demands and strategies. A coherent struggle for greater economic advantages as well as political freedom – including the freedom to form independent trade unions – began to develop both in urban and rural areas.

Inside the universities, the social sciences, had already accumulated a certain level of endogenous reflection on Brazilian economic development, partly seen as problematic due to its enduring compatibility with sustained poverty in the outskirts of industrial development. A progressivist youth increasingly engaged in educational campaigns that were concerned with the development of popular political consciousness and literacy.

Leftist organizations articulated these different dimensions of political activity. The largely socialist intelligentsia that circulated in them projected a connection between economic modernization and social revolution.

When the resulting political effervescence began to clash with the politico-economic order, it had to be suffocated by a military coup, engineered with the active support of significant portions of the industrialist sector. The populist political machinery was destroyed, leftist organizations were outlawed, political leaders and intellectuals murdered or sent into exile. While some embarked on armed struggle, no such initiative outlived the first ten years of the military regime.

### ***Dictatorship and Authoritarian Modernization (again)***

In Arantes' account (1996b, 2014), the Brazilian military regime (1964–1985) is portrayed as the rupture of the system of potentially conflictive social alliances that were the basis for populist politics, and thus the obstruction of the political processes leading to radical social change, but *not an interruption in Brazilian modernization*. On the contrary, industrialization never was so intense before, or since. Brazilian history thus offers a bizarrely privileged opportunity for witnessing how the development of the productive forces can take place independently of social and political development. In the schematic terms employed above, Brazil's modernizing dictatorship illustrates the sterilization of the dialectic of capitalist socialization. A Brazilian progressive left-wing imagination, based as it was on the tensions of populism, was rendered objectless.

## **THE DIALECTIC OF MODERNIZATION IN BRAZILIAN THEORETICAL CONSCIOUSNESS**

### ***Dualism***

Arantes studies the expressions of that political-conceptual perplexity in *Sentimento da Dialética* ('The feeling for dialectic')

(1992). The book presents a critical history of a Brazilian theoretical consciousness of modernization, beginning with assessments of the country's 'backwardness' as conditioned by its colonial disadvantages, and ending with reflections on the place of underdevelopment within the global system of capitalism. The concept of 'dualism', very popular among progressivists in the 1940s and 1950s, is central to Arantes' exposition. Dualists represented the problems of Brazilian society as a civilizational deficit in the face of Northern economic powers whose path to greatness had to be emulated.

In Arantes' account, one of the fore-fathers of dualism is the famous abolitionist Joaquim Nabuco (1849–1910), who spoke of nineteenth-century Brazil as being stalled in its ascent to modernity by slave-owning elites stupidly attached to primitive labour relations and thus blind to the economic advantages of capitalist modernization. According to Nabuco, what was lacking, then, was the enlightenment of the propertied classes, which would result from the contact with modern foreign ideas. Therefore, Brazil found itself on the unfavourable side of the world market for cultural reasons.

In the early 1900s, intellectuals connected to the Brazilian Communist Party (PCB), then a member of the Third International, also reasoned in dualist terms. The export agriculture which would still dominate Brazilian economy in the 1920s and 30s was the heir of pre-modern – 'feudal'(!) – colonial archaism. The problem of socialist revolution in Brazil was thus complicated by the fact that capitalism – the modern state and civil society – had not fully developed *yet*. The PCB thus read Brazilian reality in terms of altercations between backwardness – the archaic slave-owning elites whose socioeconomic action revolved around export and subsistence agriculture – and progress – unleashed by the industrial bourgeoisie. The latter was to be found acting whenever Brazilian history gave signs of modernization: the abolition of slavery (1888), the proclamation of

the republic (1889), the republican militaristic nationalism of the early twentieth century and even in the aesthetic modernism that culminated in the Week of Modern Art in 1922. This missionary view of the national bourgeoisie would later clash bitterly with the events of 1964.

Dualist ideology also penetrated the populist environment – specifically, intellectuals connected to the Institute for Higher Brazilian Studies (ISEB), created in 1955 by president Juscelino Kubitschek. One such intellectual, Ignácio Rangel (1957) saw dualism in historic-geographical terms. Coastal cities, traditionally connected to international capital, were modern spaces, while the hinterland remained archaic. American sociological functionalism inspired variations of this version of dualism, construing what would become the persistent view of Brazil as the 'divided country' where different historical times coexisted, among which, however, a political choice had to be (urgently) made.

The 'divided country' or 'two-countries' discourse was extremely long-lived. It integrated the ideology of fiscal and monetary rearrangement undertaken in the 1990s by Fernando Henrique Cardoso's administration. Arantes finds Cardoso's intellectual trajectory particularly noteworthy. In the 1960s, Cardoso argued that, having supposedly experienced the structural incompatibility between a slave economy and late 1800s capitalism, the Brazilian elites had chosen to abolish slavery (Cardoso, 1977). However, in a full-fledged capitalist economy such as that of the mid 1900s, those same elites were to become content with their subordinate, essentially dependant role in the international division of labour (Cardoso, 1972). As president of Brazil, however, Cardoso accommodated his earlier views to the allegedly urgent need of synching the Brazilian economy with the new financialized realities of international capitalism: given the uncontested power of transnational financial capital, the local elites had to be free to use this power to their best possible advantage, even if that meant, to

some extent, turning the government's back on the needs of the common people.

### ***The Critique of Dualism***

Dualist ideology underwent an interesting transformation in the hands of the proponents of so-called Dependency Theory, a group of authors connected to the United Nations Commission for Latin America and the Caribbean (CEPAL), whose creation coincides with the apex of Brazilian progressivism. What interested these authors was not so much the opposition, but the combination between development and economic archaism. Celso Furtado (1964) formulated a concept of underdevelopment that incorporated the Trotskyite discussion of 'uneven and combined development' clarifying the socioeconomic necessity that bound together archaic and modern economic processes – specifically, formal wage labour and informal, subsistence-oriented labour; industrial technology and primitive cultivation techniques; rationalized industrial production; and the concentration of land and political power in the hinterland.

In the 1970s, dualism began to give way to a new theoretical awareness of the consequences of authoritarian modernization under military rule – as exemplified in the works of Florestan Fernandes (1976) and Francisco de Oliveira (1972). Industrialization continued, but economic inequality and other important social characteristics up to then predominantly associated with pre-modern society not only persisted, but intensified. Shanty towns spread in the urban spaces, revealing the reality of Brazilian wage labour. A brutal concentration of land continued to endow the landowning elite with power over an economically destitute and politically powerless population which remained, moreover, largely illiterate. These were not signs of archaism – some sort of historical accident peculiar to a maladjusted national economy – but

constitutive elements of capitalist modernity on the periphery. Part of the Brazilian left-leaning intelligentsia could thus distance itself from the PCB's developmentalist ideology by incorporating a more supple Marxist grasp of the seeming paradox of capitalist economic development fully linked to specificities of Brazilian reality once thought to retard that development.

In Arantes' reading, historian Fernando Novais (1986) took a particularly important step in this direction. Novais traced the paradox of Brazil's pattern of development back to Brazil's colonial past as a movement towards integration within the totality of world capitalism. In his formulations, the Brazilian slave economy had a central role to play in the development of European mercantile capitalism, thus revealing the violent core of capitalist modernization.

Here, according to Arantes, Roberto Schwarz's contribution was crucial. Schwarz (1997, 2000) demonstrated that, long before attaining a full *theoretical* formulation, the true peculiarity of Brazil's dialectic of modernization was given expression as the organizing formal principle of the fictions of Machado de Assis.

At first, schematically speaking, Machado's novels were aligned with the progressive mentality of the late 1800s. Typically, his female characters would be placed in the problematic social position of being free, but not propertied, individuals living in a slave society. This showed how women's ambitions and prospects were curtailed by the archaic economic and political structures of nineteenth-century Brazilian imperial society, while their talents went to waste in a, for them, non-existent labour market. At the same time, their social and financial dependence invariably clashed with inner moral principles forbidding any benefit from the patriarchal, hierarchical culture of 'favour' (patronage) presiding over pre-modern socioeconomic relations. Their worthy obstinacy and valiant resignation ended up forcing the propertied

men in whose sphere of power they existed to see the intrinsic indecency of their own privilege. The ensuing moral reflection and reform of the lords of slave society ultimately opened a little space for a properly civilized engagement with life on the part of the formerly subjugated women. At this stage, that is, Machado's literary output took part in a programmatic belief in the possibility of a cultural and moral transformation – the enlightenment – of the national elite. This was a mentality very similar to that guiding enlightened abolitionism.

In his second phase, inaugurated by his *Posthumous Memoirs of Brás Cubas* (1881), Machado abandoned the intellectual and moral reformation of the elite. The subjective passage from hierarchical archaism to modern civilization, reappears, but here as a prerogative of the powerful: the very fact that the elite can actually choose between acting according to civilized norms or not is a sign of their socioeconomic privilege. Cultural inner growth is, for them, a sort of luxury item. An external, arbitrary contact with modern standards of socialization rules the relationship between the elite and high culture – which it consumes and parades, as seen in the abundance of excerpts from classical, international literature, cited, both accurately yet at the same time disparagingly, by title character and narrator of the 1881 work. Paralleling this, capitalist activity in the periphery enjoys the same sort of flirtatious privilege as regards the archaic and modern elements of capital accumulation. That is why, for instance, a slave owner can call upon Adam Smith's liberalism to attack the abolitionist movement. But rather than signs of intellectual inconsistency, these bizarre contradictions surface from roots that lie in the particular ideological elasticity of modern rationality when transplanted to the periphery of the capitalist metropolis. The vague universality of such, points to its fundamental class bias, further exposed by its shameless, convenient appropriation by the elite.

What looked like an anomalous, specifically Brazilian, combination between modernity and archaism thus becomes the open expression of the hidden constitutive fracture of metropolitan normality. In Arantes' synthesis: 'inasmuch as the present world exposed its secrets in the periphery of capitalism, which was not a residue, but an integral part of a complex, concomitant evolution, [Brazil] was therefore a living figure of the Dialectic of Enlightenment' (1992: 96–7).

An analysis of the theoretical consciousness of capitalist modernization in the periphery is thus transformed into an analysis of the *unity* of the socioeconomic processes taking place in *both* the centre and in the periphery. In face of the latter, Arantes argues, modernization can no longer be seen as an alternative to archaic social relations: after all, it feeds on, and reproduces them. Besides, if the two moments are connected in the totality of world capitalism, then modernization in the periphery is at once precarious and full-fledged modernization. As indicated above, this aborted/completed modernization (Arantes, 2004: 66) – a formula also expressive of what transpired in Brazil after the 1964 coup – is a recurring theme in Arantes' work.

## THE BRAZILIANIZATION OF THE WORLD

It can be seen that one of Arantes' main concerns is the historical dissociation between the programme of bourgeois modernization and the dialectic that would ground *either* class alliances supposedly conducive to economic development and an eventual abolition of the social alienation bequeathed by dependency *or*, alternatively, the revolutionary interruption of capitalist socialization. Both dealt with the overcoming of an assumed contradiction between the productive forces and the relations of production. In Arantes' reading, the overcoming backfired. His discussions of the phenomenon of

neoliberal globalization explore some aspects of that resulting shape (Arantes, 2004).

### ***Brazilian Neoliberalism***

In the early 2000s, Arantes used neoliberalism and globalization to describe the expansion of financial markets in the 1990s, and the consequent political economic adjustment of national economies to the flow of speculative capitals.

In Brazil, elites, largely within the state apparatus, became local administrators of transnational investments and exerted political pressure conforming public administration to financialization. The result was an eloquent image of contemporary modernization, undertaken in spite of the class alliance with the masses. At its core was the privatization of key public companies. The discourse of the 'reduction of state machinery' – which to this day leaves untouched the surveillance and armed repressive apparatuses, as well as those of financial control – also had practical effects on public services such as health and education, whose importance for a largely underemployed, impoverished population has ever been historically immense. Generally speaking, therefore, it was a project of increasing social inequality.

### ***The North-American Discourse of Brazilianization***

At the same time, Arantes highlighted the emergence of a theoretical discourse of 'third-worldization' or 'Brazilianization' of the world (Luttwak, 1993; Lind, 1995; Gray, 1998). It sought to describe a reversion of the rise in the life standards of the working class in Europe and the United States linked to de-industrialization and financialization. The resulting socioeconomic immobility and stratification, combined with mass incarceration, expressed growing national fragmentation (Rorty, 1998) and, at the least, an

interruption of the parallel between capitalist accumulation and social development.

What Arantes sees in the Brazilianization discourse is an oblique consciousness of aborted modernity that echoes the anti-dualism of the 1970s. Besides, the identification of national fragmentation in 'central' countries had an impact on the progressivist thought of the periphery, whose main idea was, in populist terms, the 'national coalition for development' that would place Brazil on the path of European and North-American progress – ultimately, a dream of successful Keynesian regulation of national economic systems, which now appeared as flawed.

### ***The Collapse of the Bourgeois Civilizational Horizon***

Arantes further sees a long-reaching effect of the category of the nation to describe the economic and sociological problems at stake. The nation is, after all, one of the touchstones of classical bourgeois thought. The class alliance of universality of which modern philosophy spoke had its origin in the political unity of the lower and middle social strata's struggle against Absolutism, for the control of the national state. The anonymity of universality on which modern rationality is founded – Arantes argues – is dependant on an underlying belief in the common destiny implied in the idea of the nation. If the phenomena predicated on globalization and neoliberalism conspire to fragment national unity, they also erode the material basis of modern rationality, so that universalism suffers a second death.

Arantes further focuses on the historical decline of the critical relevance of the categories of classical bourgeois thought in his (sometimes satirical) essays on the Brazilian intelligentsia that, in the mid to late 1990s, chose to advocate Cardoso's administration by evoking its supposedly redemptive modernizing features. Intellectuals such as José Arthur Giannotti are portrayed as eloquent

pedestrians whose only real concern is defending 'governability' at all costs.

Having been objectively deprived of any emphatic ideology by the obsolescence of the classical promises of economic development, those thinkers were reduced to hailing economic modernization and discursively converting the social catastrophe unleashed by privatizations, financial flexibilization and the erosion of social rights into their own allegedly sober realism. Cardoso himself adopted similar tones when he shamefacedly admitted that his own programme was bound to result in increased social exclusion.<sup>1</sup> This cynical realism, which Arantes terms 'single-minded thought' (Arantes, 2004: 115), is invulnerable to traditional ideological critique: it openly admits that national economies are in the hands of transnational investors, and that public administration can do nothing better than locally create 'competitive' conditions for their operation, no matter the cost – 'there is no alternative', to quote Margaret Thatcher's famous dictum.

### ***Consequences for the Socialist Imagination***

Neoliberal technicism is thus symptomatic of bourgeois rationality's dead end. The transformations that placed it in such a position, though, are ample enough to have affected socialist thought as well. After all, the latter sought to oppose the former by relying on its inner contradictions, but was deprived of its dialectic.

To further understand what is at stake here, it is important to recall that neoliberal politics was in part devised as a tool for the destruction of the labour movement that had been in quick and powerful ascension especially after 1968. That social movement had been gaining momentum from the economic contraction caused by the end of the post-war reconstruction cycle, as well as from the political frustration with the conciliatory politics adopted by leftist parties who, in addition, remained ambiguously uncritical of the

many signs of authoritarianism in the USSR. But in the wake of numerous credit crises and the economic turmoil caused by the oil and dollar shocks, neoliberalism won a series of victories against the Left, culminating in Latin American military coups.

For Arantes, understanding those defeats requires reconstructing the inner theoretical limitations of socialist politics. Relying on Singer and Machado (1996) he defines socialist politics as advocating the overcoming of the alienation of bourgeois society by expanding production. The socialist imagination relies on the development of the forces of production. This is further connected to the two-step strategy (Wallerstein, 2004) in which socialism depended on the capture of the state – and was thus tied to the sort of economic control and social administration embedded in its structures. Arantes' argument is that, inasmuch as it was premised on classical bourgeois forms, the socialist imagination is affected by their decay.

Therefore, in the late 1990s and early 2000s, Arantes spoke of how modernization had become a purely technical matter, bereft of any potentially transcendent possibility. In the administrative spheres where the ideal of national economic development used to function as a powerful political inspiration, neoliberal ideology, now preaches the functionalization of national economies by transnational financial valorization, at the same time advertising the threatening, destructive character of capitalism. The provocative Marxian idea that capital is accumulation as an end-in-itself, no longer privy to the Critique of Political Economy, becomes one of the mottoes of official economists.

### **MILITARIZED SOCIAL ADMINISTRATION**

In order to describe the specificities of collapsed but ongoing modernization, Arantes (2007) turns to certain contemporary

alterations in warfare, exemplified by the 'preventive wars' waged by the United States and its allies since the 1990s.

While war has traditionally played an essential role in the understanding of capitalism, Arantes notes that military destruction and occupation, classically a means for the control of national economies, have now been converted; destroying entire countries and subjecting survivors to a tendentially permanent martial regime in which the combined military occupation and infrastructural reconstruction provide a few monopoly holders the opportunity of tapping into titanic volumes of public resources.

### ***Smart Bombs, Stupid Intellectuals***

Meanwhile, a self-entitled 'cosmopolitan' intelligentsia, objectively sterilized by the self-centred character of modernity, decides to demonstrate bizarre enthusiasm for the debatable fact that 'preventive wars' function as wilful acts on the part of those unleashing them. According to Arantes, the identification of this volitive sense results from a contrast with the previous period: during the Cold War, nuclear arsenals were fundamentally unusable: the first act of war would also be the last. But the high-tech equipment developed since then is highly deployable: its 'surgical' nature tends to considerably diminish proportional losses on the side of the operators of war. Therefore, the decision to make war becomes possible, and the very idea of a preventive war is imbued with that decisional character.

However, given the political economic conditions of the contemporary world discussed above, such a decision has no basis, except for pure accountancy. Nevertheless, so as to carefully keep themselves oblivious to their own obsolescence, the aforementioned intelligentsia spin a political discourse veiling self-centred economic activity by eloquently hailing the decision to go to war as the resurrection of the national sovereignty.

That is how Habermas (1999) and Honneth (1997), among others, quoted by Arantes, welcomed the cosmopolitan rationality, the nobility, the justice and the morality of the First Gulf War.

### ***Just Wars and Military Asymmetry***

By focusing on the doctrine of 'just wars', Arantes also remarks on its obliquely adequate description of contemporary reality. In Augustine's original formulation in the *City of God*, the possibly just character of wars between sovereigns derived from the moral arbitration of the Holy Church. Inasmuch as it transcended the political borders of humanity, and was thus allegedly distant from its material concerns, the Church had the necessary neutrality and moral superiority to dispense mundane justice. In Arantes' appropriation of Augustine's stance, moral superiority finds a macabre secular parallel in the asymmetric economic and military superiority of the United States in today's world. In practice, that asymmetry exempts the US-led military coalitions from all moral or political judgement: the largest military apparatus in the world cannot be forced to give satisfaction for its decisions, inasmuch as it cannot be coerced into obedience by any existing authority.

### ***Territorial Administration and Permanent Exception***

Arantes notes that 'just wars' also cause an alteration in the international division of labour. They target comparatively underdeveloped peripheries that, instead of being incorporated into the world market through economic dependence, as was formerly the case, now have their social and productive structure destroyed (Altvater, 1997) and supply sufficiently low-priced resources.

Notably, in Libya's and Iraq's case, before foreign intervention, a productive structure

was maintained only in an environment of fragmented national unity, kept together by strongly militarized states. In cases such as these, the imperative of reducing costs in an oil-based system seems to demand the removal of state mediation. In other scenarios, however, incorporation in the international circuit of financial valorization does depend on such mediation, albeit also in the form corresponding to a collapsed social pact: the continual deployment of systemic violence. That is the case in financialized peripheries such as Brazil, where neoliberal modernization combines the destruction of the social service system with the restructuring of national institutions of financial supervision required by transnational capital and incremental militarization of the police.

The classical bourgeois category of the nation state is thus reconfigured. Since class-alliance modernization cannot take place, and since the way to a rupture with capitalist accumulation is barred, then the nation can no longer support a political imagination concerned with social progress, and is reduced to a concept of territorial administration concerned only with the production of the conditions for local economic exploitation through state control, military action and surveillance. The state is gradually given the shape of the main coordinator of that administration, while its role as provider of social assistance is eroded. Besides, this domestic, strategic administration of the national territory is expressed transnationally in the 'cosmopolitan wars' (Zolo, 1997) discussed above.

Therefore, from such a viewpoint, the state's maintenance of economic exploitability is a result of a sort of permanent war waged against the peripheries: spaces occupied by a population that exceeds the needs of economic activity and, therefore, is composed of individually disposable persons. Internationally speaking, the US army, inasmuch as it functions as a sort of 'global cavalry' – to borrow an expression employed by a neo-conservative think tank (AEI,

2003) – projects a global space pinpointed by failed states – the 'interstices of globalization' (Smith, 2003: xv) – for which redeeming modernization is no longer an option, and in which systemic violence is the virtual key for mineral exploration and financial valorization.

## CONTEMPORARY CAPITALISM: BOURGEOIS TEMPORALITY AT A STANDSTILL

In *O Novo Tempo do Mundo* ('The new time of the world'), his most recent book, Arantes (2014) condenses some of the arguments deployed in his two previous works, focusing on their consequences for some basic categories of classical bourgeois society – specifically, time and labour.

### *Modernity and the Temporality of the Elite*

One of the foundations of bourgeois ideology was the awareness of the potentially ample reach of social activity, first self-consciously articulated during the defeat of Absolutism. Soon after it was further distilled in the concept of 'modernity' – the time of historical novelty (Koselleck, 2004). The term expressed the inauguration of a connection between finite human agency and very long periods of time, and had a libertarian expression in the universalist image of humanity taking control of its own destiny. However, being concretely rooted in the administrative power of the modern state, that image was strongly connected to the experience of a tiny elite for whom the stages of operation were comparatively gigantic territories and, virtually, the world as a whole.

The main vehicle of that operation was, from the start, capitalist accumulation: in the forms of industrialization, colonization, and the military imposition of a commercial logic

on distant populations, their extermination, enslavement, and the economic functionalization of their territory.

### ***Universalism, Progress and the Normalization of Social Change***

The modern 'discovery' of temporality as world history thus involved a conflict: on the one side the temporality of the elite, employing the modern state, consolidated and expanded capitalism; on the other, a tedious and rigidly controlled temporality, the subsumption of labour. Bourgeois universalism's image of a cohesive society represented the possibility of unifying the two temporalities in the collective experience of social progress. Since the first political institutions of the bourgeoisie theoretically allowed for the participation of the common people in the political process, and that participation soon clashed with fundamental geographical and class boundaries, progress represented historical action in the moralizing terms of labour, construing the possibility of a normalization of social change that would take the place of troublesome revolutionary ruptures.

### ***Civil War Regimes***

However, in Arantes' description, this regime of normalized social change is the obverse of the dissolved class alliance, as expressed in the gap between the two diverging temporalities. Therefore, its historical complement is a succession of regimes of popular oppression, or civil war waged by the state against the people, paradigmatically conceptualized in terms of colonial genocide, the formalization of exception as the constitutional instrument of the politico-economic elites, the new imperialist social administration of the late 1900s (Agamben, 2005; Arendt, 1968), the regime of exception under the Third Reich (Neumann, 2009; Dejours, 1998; Torrente,

2002) and the contemporary penal state (Wacquant, 2009).

Revolving around those paradigms, Arantes' argument articulates the decay of the nation as the space of class alliance in the struggle of the elites against organized labour throughout the 1900s, as well as the development of belligerent nationalism and the 'total war' of 1914, with the ensuing amplification of European governments' power. In the United Kingdom, for instance, governmental emergency powers were prolonged through the 1920s, legalizing the state's violent response to increasingly organized unions. In the wake of the First World War, the Russian Revolution and its German and Spanish reverberations prolonged and intensified the civil aspect of the armed conflict, until National Socialism gave it a stable form. In *O Novo Tempo do Mundo* (Arantes, 2014), therefore, the discussion undertaken in *Extinção* (Arantes, 2007) is inserted in a broader historical perspective.

### ***The Subjective Labour of Exception***

In the Third Reich, Arantes looks for a paradigm of the social experience of labour in the rational submission of those who, confronted with the threat of genocide, became collaborators with the Nazi regime. Arantes highlights the voluntary and involuntary logic of this act wherein the exercise of the will is checked by the palpable possibility of annihilation. He then goes on to compare it to the historical imposition of the selling of labour power through so-called primitive accumulation.

Immersion in the temporality of labour is thus shown to be a reaction to a threat. Under National Socialism, the grinding tediousness of that temporality is unthinkable increased due to the repulsive nature of the labour of genocide. That nature demands of the labourer subjective engagement with, and through the development of personal

approaches to, the work at hand, enabling the labourer to spend shorter time on each individual repulsive task. Of course, that also amounts to subjective investment in increasing labour efficiency.

This has implications for the problem of exception as the fundamental operational mode of the contemporary state. Bureaucracy is the expression of modernization's technical development and rational social administration, and, from the standpoint of the historical temporality of the elite, that is the dimension that matters. But bureaucracy as the repetitiveness of protocols is also the epitome of the confined temporality of the private, individual subject: in this sense, the labour of bureaucracy is the quintessence of labour. In public administration, however, the improvisation resulting from the subjective investment aimed at contracting the grinding temporality of labour entails a breach of protocol. In ample territorial scales, in which administrative decisions of enormous impact are concentrated in the hands of a few bureaucrats, the breach of protocol is converted into improvised arbitrariness: in other words, exception.

It is important to note that such arbitrariness is the consequence of modern bureaucracy, and not some archaic symptom of pre-modernity. It is, at once, the essential characteristic of the overdeveloped state apparatus of National Socialism (Neumann, 2009) and that of the developed state apparatus *tout court*. Increased rationalization entails increasingly powerful, and at the same time increasingly arbitrary, bureaucrats giving the Weberian 'iron cage' a sinister twist. In this sense, in addition to formally incorporating exception into the state, modernization also normalizes the social experience of informal exception.

### ***The Penal State***

The next aspect of Arantes' analysis to consider is how post-war state investment in the reconstruction of Europe and in the Cold War

apparatus sustained, for a short period, the Keynesian class alliance. Total mobilization and government spending combined permanent military readiness with a functioning welfare system (Marcuse, 1966), but the scheme was short-lived, as suggested by the discussion of neoliberalism above. To understand the disintegration of the post-war system, Arantes appropriates Wacquant's (2009) account of the transformation of welfare in 'prisonfare'.

In the Keynesian period, impoverished populations in the centre used to be the target of social assistance programmes aimed at sustaining their capacity for work. Parts of that population were episodically subjected to a system of incarceration that had historically imbued them with the discipline of obedience required by efficient wage labour. Political economic transformations in Europe and the United States, beginning in the 1970s and culminating in the 1990s, introduced the withdrawal of social rights, the precarization of labour and the depression of the labour market. Impoverished populations were now administered as numerically redundant groups. On the one hand, social assistance began to accept degrading labour conditions. On the other hand, those groups became permanently exposed to a destructive punitive system which lost all concern with their reintroduction in the labour market.

Wacquant (2009) demonstrates that the principles internally organizing this punitive system aim at the production of suffering, and the destruction of the subjective capacity for wage labour. Moreover, the expansion of the mechanisms of control and surveillance turn increasing portions of those populations into virtually unemployable groups. As Arantes points out, this all resonates with the militarized social administration employed in peripheral countries, where overcrowded prisons and high levels of police lethality express the limitations of the economic integration of the population by contemporary capitalism, as well as the class content of governmental action.

## ***The Temporality of Permanent Decomposition***

Arantes concludes his analysis with the consideration of the openly illegitimate character of the governing elites in contemporary capitalism. Outside strict academic circles, sheer violence has become, Arantes argues, the most dominating feature of today's socio-political experience in Western societies. That violence has economic and military components; public statistics continually disclose increasing economic polarization worldwide. The response to that inequality is a routinization of protest; reflecting the collapse of progress and of the class alliance that sustained social cohesion. At the same time, the obverse of that collapse is a self-centred capitalist accumulation taking place in complete dissociation with the civilizational prospects which had seemed to be embedded in the technical development of the means of production and administration.

The wilful experience of the historical dimension of capitalism thus becomes a privilege of the elites. Detached from the life of common people, historical action cannot, and need not, aim at a conscious, radical transformation of social reality: only its exponential intensification. In this world, the rational projection of long-term agency, with worldwide reach, impacts most people as the product of someone else's decisions – and, further, as a threat. Imposing-looking fellows in suits continually reproduce highly specialized discourses, while political lobbies involving the weapons, energy, construction and logics sectors and mathematical models on the fluctuation of the markets direct speculative attacks, and armed coalitions permanently transform entire countries in fields for the deployment of state-funded projects of destruction and reconstruction.

For ordinary people, historical temporality refuses to be expressed as what already exists. The narrow terms imposed by infinite cyclical debt on each and every public administration on Earth transform all problems of

state action into meagre accountancy matters. Realist political discourse is exempt from any transcendence by the monstrous predicament imposed by an obviously destructive production apparatus on which the lives of almost every human being ultimately depends. That dependence mockingly portrays every political idealization incapable of finding in the reproduction of capitalism an escape route leading to its abolition.

In this context – our socio-historical context – Arantes' work contributes to the cognitive liberation of the consciousness of the fact that our present lack of prospects is not the result of some historical accident, but of the specific consistency of modernization.

# Fredric Jameson

Carolyn Lesjak

Fredric Jameson's work might best be characterized as a series of political and methodological commitments: to Marxism, dialectics, historical materialism, narrative, the aesthetic, and the utopian. An unrepentant dialectician who continues to insist on the particular efficacy of dialectical criticism in the current moment, Jameson espouses an assertion he made in one of his earliest books, *Marxism and Form* (1971), namely, that 'the great themes of Hegel's philosophy – the relationship of part to whole, the opposition between concrete and abstract, the concept of totality, the dialectic of appearance and essence, the interaction between subject and object – are once again the order of the day' (xix). Although this pronouncement came in 1971 at a time when 'the order of the day' was being defined in terms of a newly postindustrial capitalism, or 'monopoly capitalism in the West', Jameson subsequently modified these terms in his most famous and wide-reaching book *Postmodernism, or, The Cultural Logic of Late Capitalism* (the titular

essay of which was published in *New Left Review* in 1984), where Ernest Mandel's concept of late capitalism names the nature of postindustrial society, and postmodernism names the cultural logic of the current mode of production. Indeed, the need to continue to hone new concepts to understand our contemporary moment, itself a function of the dialectic, defines Jameson's career as a whole.

Since the publication of the *Postmodernism* book in 1991, a prodigious output of new books has followed, including books on modernism (*A Singular Modernity: Essay on the Ontology of the Present* and its companion piece, *The Modernist Papers*), science fiction (*Archaeologies of the Future: The Desire Called Utopia and Other Science Fictions*), Bertolt Brecht (*Brecht and Method*), Hegel (*The Hegel Variations*) and Marx (*Representing 'Capital'*), the dialectic (*Valences of the Dialectic*), realism (*The Antinomies of Realism*), and literary form (*The Ancients and the Postmoderns: On the*

*Historicity of Forms*). In this same 25 years, Jameson has also written articles on current political and media events and issues, from an essay on the HBO series *The Wire* to *An American Utopia: Dual Power and the Universal Army*, in which he boldly offers up as a 'candidate' for a model of Utopia the universal army and proposes a plan for the full militarization of American society, with militarization meaning 'neither war nor the bearing of weapons, nor even military drills, but rather the discipline involved in ensuring that the functions required for society's existence be secured by something like conscription' (2016: 28). This most recent foray into contemporary politics, more so than any of his other writing, has provoked the Left; as the publisher's blurb for the book incites, 'Many will be appalled at what they will encounter in these pages – there will be blood! But perhaps one has to spill such (ideological) blood to give the Left a chance'. Despite the potential bloodshed, a veritable Jameson industry has developed in the same period, with many monographs dedicated to his work, as well as the publication of *The Jameson Reader* (2007), and numerous interviews with Jameson.

The colloquial interview format, in particular, has offered a more accessible path into Jameson's work, known for its difficulty, at both the level of the sentence and at the broader level of its conceptual ordering. At the same time, the interviews showcase the dialectical complexities always present in Jameson's work. In an essay 'On Not Giving Interviews' that introduces a book of interviews entitled *Jameson on Jameson: Conversations on Cultural Marxism* (2007), for example, Jameson reflects on the structure of the interview itself and what it can and cannot offer as a space for thought. In the process, the very movement of Jameson's own thought is clearly on display. On the one hand, the interview can shed light on the interrelationships among one's work – with the following caveat: 'To discover the kinship between earlier positions or interests and

much later ones is, to be sure, not quite so satisfying: as though you never really moved from the spot after all, or kept returning to it' (2007: 1). But then, he reflects, there is a better way to come at this issue and that is 'to grasp one's relationship to such a system as one of learning a code or a language' (1), which does not so much influence us in any conventional sense as take hold of us. 'A philosophy grips us', he suggests,

because it suddenly has answers for our questions and solutions to our problems: but that is the least of it, and the answers and solutions are what become most quickly dated. What electrifies us is not so much those, but rather the new language in which the need – the questions and problems – suddenly become visible in the first place. (1–2)
